INITIALS USED IN VOLUME XVIII. TO IDENTIFY INDIVIDUAL CONTRIBUTORS, WITH THE HEADINGS OF THE ARTICLES IN THIS VOLUME SO SIGNED.

A. Ca. Arthur Cayley, LL.D., F.R.S.
See the biographical article, Cayley, Arthur.

Principal of New College, Hampstead. Member of the Board of Theology and the Board of Philosophy, London University. Author of Studies in the inner Life of Jesus; &c.

A. E. S. Arthur Everett Shipley, M.A., D.Sc., F.R.S.

A. F. P. Albert Frederick Pollard, M.A., F.R.Hist.S.

A. Go.* Rev. Alexander Gordon, M.A.
Lecturer on Church History in the University of Manchester.

A. G. D. Arthur George Doughty, M.A., Litt.D., C.M.G.

See the biographical article, Harnack, Adolf.

A. H. S. Sir A. Houtum-Schindler, C.I.E.
General in the Persian Army. Author of Eastern Persian Irak.

A. J. G. Rev. Alexander James Greive, M.A., B.D.
Professor of New Testament and Church History at the United Independent College, Bradford. Sometime Registrar of Madras University and Member of Mysore Educational Service.

A. J. L. Andrew Jackson Lamoureux.
Librarian, College of Agriculture, Cornell University. Formerly Editor of the Rio News, Rio de Janeiro.

A. L. Andrew Lang.
See the biographical article, Lang, Andrew.

A. M. C. Agnes Mary Clerke.
See the biographical article, Clerke, A. M.

A. N. Alfred Newton, F.R.S.
See the biographical article, Newton, Alfred.

A. Se.* Adam Sedgwick, M.A., F.R.S.
Professor of Zoology at the Imperial College of Science and Technology, London. Fellow, and formerly Tutor, of Trinity College, Cambridge. Professor of Zoology in the University of Cambridge, 1907-1909.

See the biographical article, Gutschmid, Alfred, Baron von.

A. Wa. Arthur Waugh, M.A.

1 A complete list, showing all individual contributors, with the articles so signed, appears in the final volume.
INITIALS AND HEADINGS OF ARTICLES

B. J. Bernhard Jügel (1825-1886). Formerly Professor of Classical Philology in the University of Innsbruck. Author of Mongolische Märchensammlung; Über Wesen und Aufgabe der Sprachwissenschaft; and On the Present of Mongolian Researches.

B. M.* Budgett Meakin (1866-1906). Formerly Editor of the Times of Morocco. Author of The Land of the Moors; The Moorish Empire; Life in Morocco; &c.

C. C. Charles Creighton, M.A., M.D., King's College, Cambridge. Author of A History of Epidemics in Britain; Jenner and Vaccination; and

C. F. B. Charles Francis Bastable, M.A., LL.D. Regius Professor of Laws and Professor of Political Economy in the University of Dublin. Author of Public Finance; Commerce of Nations; Theory of International Trade; &c.

C. J. F.* Constance Joselyn Foulkes. Translator of Morelli's Italian Painters; &c.

C. M. Creedomille Mijatovich. Senator of the Kingdom of Servia. Envoy Extraordinary and Minister Plenipotentiary of the King of Servia to the Court of St. James's, 1895-1900, and 1902-1903.

C. Mo. William Cosmo Monkhouse. See the biographical article, Monkhouse, William Cosmo.

D. F. T. Donald Francis Tovey. Author of Essays in Musical Analysis: comprising The Classical Concerto, The Goldberg Variations, and analyses of many other classical works.

E. St. Eugene Stock. Formerly Editorial Secretary of the Church Missionary Society.

F. G. M. B. Frederick George Meeson Beck, M.A. Fellow and Lecturer of Clare College, Cambridge.

F. G. P. Frederick Gymer Parsons, F.R.C.S., F.Z.S., F.R.ANTHROP.INST. Vice-President, Anatomical Society of Great Britain and Ireland. Lecturer on Anatomy at St Thomas's Hospital and the London School of Medicine for Women, London. Formerly Hunterian Professor at the Royal College of Surgeons.

F. N. M. Colonel Frederic Natasha Maude, C.B. Lecturer in Military History, Manchester University. Author of War and the World's Policy; The Leipzig Campaign; The Jena Campaign.

F. O. B. Frederick Orpen Bower, M.A., D.Sc., F.R.S. Regius Professor of Botany in the University of Glasgow. Author of Practical Botany for Beginners; &c.

F. We. Frederick Wedmore. See the biographical article, Wedmore, Frederick.

G. A. B. George A. Boulegger, D.Sc., Ph.D., F.R.S. In charge of the collections of Reptiles and Fishes, Department of Zoology, British Museum. Vice-President of the Zoological Society of London.

G. G. S. George Gregory Smith, M.A. Professor of English Literature, Queen's University, Belfast. Author of The Days of James IV; The Transition Period; Specimens of Middle Scots; &c.

G. H. Fo. George Herbert Fowler, F.Z.S., F.L.S., Ph.D. Formerly Berkeley Research Fellow, Owens College, Manchester; and Assistant Professor of Zoology at University College, London.

G. P. R. Gerald Philip Robinson. President of the Society of Mezzotint Engravers. Mezzotint Engraver to Queen Victoria and to King Edward VII.

G. Sa. George Saintsbury, LL.D., D.C.L. See the biographical article, Saintsbury, G.

G. Sn. Grant Showerman, A.M., Ph.D. Professor of Latin in the University of Wisconsin. Member of the Archaeological Institute of America. Member of American Philological Association. Author of With the Professor; The Great Mother of the Gods; &c.
INITIALS AND HEADINGS OF ARTICLES

G. W. T. REV. GRIFFITHES WHEELER THATCHER, M.A., B.D.
Warden of Camden College, Sydney, N.S.W. Formerly Tutor in Hebrew and Old Testament History at Mansfield College, Oxford.

H. B. W. HORACE BOLINGBROKE Woodward, F.R.S., F.G.S.

H. Ch. HUGH CHISHOLM, M.A.

H. E. KARL HERMANN ETHÉ, M.A., Ph.D.
Professor of Oriental Languages, University College, Aberystwyth (University of Wales). Author of *Catalogue of Persian Manuscripts in the India Office Library, London* (Clarendon Press); &c.

H. Fr. HENRI FRANTZ.

H. F. B. HORATIO ROBERT FORBES BROWN, J.L.D.
Editor of the Calendar of Venetian State Papers, for the Public Record Office. Author of *Life on the Lagoons; Venetian Studies; John Addington Symonds, a Biography*; &c.

H. F. G. HANS FRIEDRICH GADOW, F.R.S., Ph.D.
Strickland Curator and Lecturer on Zoology in the University of Cambridge. Author of "Amphibia and Reptiles," in the *Cambridge Natural History*.

H. H. L. HENRY HARVEY LITTLEJOHN, M.A., M.B., F.R.C.S. (Edin.), F.R.S. (Edin.)
Professor of Forensic Medicine in the University of Edinburgh.

H. L. H. HARRIET L. HENNESSY, M.D. (Brux.), L.R.C.P.I., L.R.C.S.I.

H. L. S. H. LAWRENCE SWINBURNE (d. 1907).

H. M. S. HENRY MORSE STEPHENS, M.A.
Balliol College, Oxford. Professor of History and Director of University Extension, University of California. Author of *History of the French Revolution; Modern European History*; &c.

Professor of Geography at University College, Reading. Formerly Vice-President, Royal Meteorological Society. Lecturer in Physical Geography, Oxford. Author of *Meteorology; Elements of Weather and Climate*; &c.

H. O. HERMANN OELSNER, M.A., Ph.D.
Taylorian Professor of the Romance Languages in University of Oxford. Member of Council of the Philological Society. Author of *A History of Provençal Literature*; &c.

H. St. HENRY STUART, M.A.
Author of *Idola Theatri; The Idea of a Free Church; Personal Idealism*.

H. S. J. HENRY STUART JONES, M.A.
Formerly Fellow and Tutor of Trinity College, Oxford, and Director of the British School at Rome. Member of the German Imperial Archaeological Institute. Author of *The Roman Empire*; &c.

H. S. M. HENRY SMITH MUNROE, D.Sc., Ph.D.
Professor of Mining, Columbia University, New York.

H. S. W. HENRY SPENCER WILKINSON, M.A.
Chichele Professor of Military History, University of Oxford. Fellow of All Souls' College. Author of *The Brain of an Army*; &c.

H. T. A. REV. HERBERT THOMAS ANDREWS.

H. W. H. HOPE W. HOGG, M.A.
Professor of Semitic Languages and Literatures in the University of Manchester.

H. W. C. D. HENRY WILLIAM CARLESS DAVIS, M.A.
Fellow and Tutor of Balliol College, Oxford. Fellow of All Souls' College, Oxford, 1895-1902. Author of *England under the Normans and Anveds; Charlemagne*.

H. W. R.* REV. HENRY WHEELER ROBINSON, M.A.
Professor of Church History in Rawdon College, Leeds. Senior Kennicott Scholar, Oxford, 1901. Author of *Hebrew Psychology in Relation to Pauline Anthropology* (in Mansfield College Essays); &c.

I. A. ISRAEL ABRAMS, M.A.
Reader in Talmudic and Rabbinic Literature in the University of Cambridge. Formerly President, Jewish Historical Society of England. Author of *A Short History of Jewish Literature; Jewish Life in the Middle Ages; Judaism*; &c.

J. A. C. *SIR JOSEPH ARCHER CROWE, K.C.M.G.*
See the biographical article, CROWE, SIR J. A.

MEDAL (Fr. médaille, from Lat. metallem), strictly the term given to a memorial piece, originally of metal, and generally in the shape of a coin, used however not as currency but as an artistic product. "Medallion" is a similar term for a large medal, but is now usually restricted to a form of bas-relief in sculpture. The term "medallist" is, artistically, extended by analogy to pieces of the same character not necessarily shaped like coins. The history of coins and medals is inseparable, and is treated under the general heading of Numismatics. That article may be supplemented here by an account of (1) the more recent progress in the art of the medallist, and (2) the use of medals for war decorations.

1. The medal—as it is understood to-day—enjoys a life entirely independent of the coin on the one hand, and, on the other, of the sculptured medallion, or bas-relief; and its renais-
sance is one of the chief phenomena in art during the period since about 1870. It is in France that it has risen to the greatest perfection. Its popularity there is well-nigh universal; it is esteemed not only for memorials of popular events and of public men, but also for private celebrations of all kinds. No other nation approaches in excellence—in artistic feeling, treatment, and sensitiveness of execution—the artists and the achievements of France. In England, although the Royal Academy seeks to encourage its students to practise the art, the prize it offers commonly induces no competition. The art of the medallist is not properly appreciated or understood, and receives little or no support. The prevailing notion concerning it is that it consists in stamping cheap tokens out of white metal or bronze, on which a design, more or less vulgar, stands out in frosty relief from a dazzling, glittering background. These works, even the majority of military and civic medals, demonstrate how the exquisite art of the Renaissance had been degraded in England—almost without protest or even recognition—so that they are, to a work of Roty or Chaplain, what a nameless daub would be to a picture by Rembrandt or Velasquez.

It is probable that Jacques Wiener (d. 1600), of Belgium, was the last of the medallists of note who habitually cut his steel dies entirely with his own hand without assistance, though others in some measure do so still. Although most modern workers, exclusively medallists, have themselves cut dies, they now take advantage of the newest methods; and the graveur en médailles has become simply a médaillier. His knowledge of effect is the same—though the effect sought is different; in earlier times the artist thought chiefly of his shadows; now he mainly regards his plans. Otherwise his aims are not dissimilar. At the present day the medallist, after making conscientious studies from life (as if he were about to paint a picture), commonly works out his design in wax, or similar substance, upon a disk of plaster about 12 or 14 inches in diameter. From that advanced model a simple mould, or matrix, is made, and a plaster cast is taken, so that the artist can complete his work in the utmost perfection. Then, if a struck medal is required, a steel cast is made, and from that a reduction to the size required for the final work is produced by means of the machine—the tour à réduire. It is this machine which has made possible the modern revival, and has revolutionized the taste of designers and public alike. It was invented by Contamin, who based it upon that tour à portrait which Houlot produced in 1766, and which helped to fame several engravers now celebrated. This machine was first exhibited in Paris in 1859, and was sold to the Munich Mint; while a similar invention, devised at the same time by the English engraver Hill, was acquired by Wyon for £2000, and was ultimately disposed of to a private mint in Paris. From that city comes the machine, based by the French inventor M. Ledru upon the two already referred to, now in use at the Royal Mint in London. A well-served medallist, therefore, need trouble himself nowadays about little beyond the primary modelling and the final result, correcting with his own hand only the slightest touches—refining, perfecting—but sometimes merely confining himself to giving his directions to the professional engraver. The great majority of the artistic medals at present in the world (in the great collection of France there is a total of not fewer than 200,000 medals) are cast, not struck. There is in them a charm of surface, of patina, of the metal itself, which the struck medal, with all the added beauties which it allows of delicate finish and exquisite detail, can hardly give. But the production of the cast medal is much slower, much more uncertain, and the number of fine copies that can be produced is infinitely smaller. All the early medals were cast, being first modelled in wax, and then cast by the cire perdue (waste wax) process.

1 The method of preparing the dies, &c., is the same for medals as for coins, save that for larger and heavier work more strokes are required, as in the case of L. Coudray's popular "Orphée"—rather a sculpture-relief than a medal. The dies are capable of a great yield before becoming quite worn-out; it is said that no fewer than three million copies were struck of Professor J. Tautenhayn's Austrian jubilee medal of the Emperor Francis Joseph. In France, Thonellier's perfected machine, substituting the lever for the screw, has been in use for coins since 1844; but for the striking of medals the same old-fashioned screw-press is retained which had till then been employed both for coins and medals since the time of Louis XIV. In its present form the machine consists of an iron or bronze frame, of which the upper part is fitted with a hollow screw wherein works an inner screw. This screw, moved by steam or electricity, drives the dies, set in iron collars, so that they strike the blank placed between them. This machine can deliver a strong blow to produce a high relief, or a delicate touch to add the finest finish. In the Paris Mint these machines can be struck with comparative ease and rapidity. A hydraulic press of nearly two million pounds pressure is utilized for testing the dies.
process, and were usually worked over by the chaser afterwards; indeed, it was not until the beginning of the 16th century that dies, hitherto used only for coins executed in low relief, were employed for larger and bolder work. The medallists of these days always worked in delicate, yet bold, and only adorned to use silver and gold as a luxurious taste began to demand the more precious metals. There is little doubt that the material to be preferred is dull silver (mat or soblé—sandblasted) as the work, with all its variations of light and shade, can be better seen in the delicate grey of the surface.

The medal, properly considered, is not sculpture. Vasari was happy in his definition when he described the medallic art as the link between sculpture and painting—that is to say, painting in the round with the colour left out. Less than sculpture, it need not be less dignified; if it be, then it is simply a sort of the conventions of low relief, and by compositions of position and design, dependent on shape, from which sculpture, even when the relief is the lowest, is in a great measure free. In the medal, otherwise than in sculpture, elaborate perspective and receding planes are not out of place. The genius of the modern Frenchman rebelled against the rule that commonly governed the medal during the decadence, and has triumphed in his revolt, justifying the practice by his success. The modern medalist, therefore, may aim at being decorative yet vigorous, reticent and dignified, delicate and graceful, as his fancy may dictate; it may be, and often is, all these in turn. Imagination, fancy, symbolism, may always be brought into play, allied to a sense of form and colour, of arrangement and execution. By the demonstration of these qualities the artist is to be differentiated from the skillful, mechanical die-sinker, who spreads over the art the blight of his heavy and insensitive hand and brain. So with portraiture. Accurate likenesses of feature as well as character and expression are now to be found in all fine works, such as are sought only by an artist of keenly sensitive temperament. It is thus that he can claim a place among the great and the to-day into metallic history, beautifully seen and exquisitely recorded; thus that the figure on the medal is no longer a mere sculpturesque symbol, but a thing of flesh and blood, suave and graceful in composition, and as pleasing in its purely decorative design as imagination can inspire or example suggest. It is thus that the art, while offering easy means of permanent memorial, has afforded to men of restricted means the eagerly seized opportunity of forming small collections of masterpieces of art at a small outlay.

France.—In France, the example of Oudiné, coming after that of David d'Angers, did much to infuse the spirit of the modern medallist, but Chapu, by his essentially modern treatment, did more. To Ponscarme (pupil of Oudiné) is chiefly due the fact that the greater number of the medals he executed were the subject on the medal, the suppression of the raised rim, and the abandonment of the typographic lettering hitherto in vogue, together with the mechanical regularity of its arrangement. Descorge, with his semi-pictorial treatment, was followed by Daniel Dupuis, whose delicate and playful fancy, almost entirely pictorial, makes us forget the material and the die. J. C. Chaplain is unsurpassed as a modeller of noble heads, including those of four presidents of the French Republic—MacMahon, Casimir-Perier, Faure and Loubet—and his allegorical designs are finely imagined and admirably worked out (see Plate); but L. Oscar Roty (pupil of Ponscarme) is at the head of the French school of medallists. His command of the mastery of the technique of his art, but also of his originality of arrangement, of the poetic charm of his symbolism and his allegories, the delicate fancy, the exquisite touch, the chasteness and purity of taste—were the marks of a modern sentiment to an obvious feeling for the Greek. Though expressly less virile than Chaplain, Roty is never effeminate. To Roty belongs the credit of having first revived the form of the mythological medal, which had been abandoned and forgotten along with many other traditions of classical music (see Plate). Alphé Dubois, Lagrange, and Borrel must be mentioned among those who are understood to engrave their own dies. Followed by them are L. Hubert de Berdoulat, Vincenzo Henri Dubois, Patey, Boyotte (see Plate)—all sterling artists if not innovators. Medallists of more striking originality but less finish, and of less classical rank, are the Michelinian, Levillain, who loves as much as Baudinelli to make over-dramatized versions of his muscular anatomy, Charpentier, and their school, who aim at a manner which makes less demand of highly educated artistry such as that of Roty or of Chaplain. It is learned and accomplished in its way, but lumpy in its result; breadth is gained, but refinement and finish are lost. Another mode of medallist is that of the modern capitalist, who want to give some idea of the industry of the modern medallist, and the encouragement accorded to him—that between 1879 and 1900 M. Roty executed more than 150 pieces, each having an obverse and reverse prefers it above all. Austria.—The two leading medallists of the Austrian school are Josef Tautenhayn (see Plate) and Anton Scharf, both highly accomplished, yet this last-named, with his conception of taste, ability and "keeping," which distinguishes the French medals. About 330 pieces have come from the hand of Anton Scharf. Stefan Schwartz, Franz Pawlik, Staniek, Marschall and J. Tautenhayn, junior, are the only other artists who have risen to eminence.

Germany.—A characteristically florid style is here cultivated such as lends itself to the elaborate treatment of costume, armorial bearings, and the like; but delicacy, distinction, and the highest execution are models which artists who aim to accompany even the most vigorous or elaborate designs—are lacking in a great degree. Professors Hildebrand and Kowarzik have wrought some of F. Parkes’ works there produced.

Belgium.—Although sculpture so greatly flourishes in Belgium, the medal work shows little promise of rivaling that of France. The influence of the three brothers Wiener (Jacques, Léopold and Charles)—good medallists of the old school—has not yet been shaken off. The remarkable architectural series by the first-named, and the coinage of the second, have little affinity with the spirit of the modern medal. As many as has the D. Malzey, followed by Paul Dubois, J. Dillens (a follower of the French medalist, Davon and Vicqouze (see Plate)—whose plaque for the Brussels Exhibition award (1887) is original, but more admirable in design than in finish. Holland.—In Holland the graceful, artistic and owing to the fact that it has called forth many medals of Queen Wilhelmina, and the best of them are doubtless those of Bart van Hove and Wortman. Baars is a more virile artist, who follows Chaplain at a distance. Wienceke is forcing for the Netherlands in his early Netherland manner; the incongruity is not unpleasant.

Switzerland.—The medal is also popular in Switzerland. Here Bovy is the leader of the French tradition and Hans Frits of a more national sentiment. The last-named, however, is more remarkable as a revivalist than as an original artist.

Great Britain.—In England only two medallists of repute can be counted, who practically confine themselves to their art. G. W. de Suilles, of the Royal Mint, best known by the Diamond Jubilee medal of Queen Victoria and by his medal of Sir Gabriel Stokes, and Frank Bowcher (see Plate) by that of Thomas HUDSEY. These artists both cut their own dies when working in England in the manner of the French medallists, but with greater freedom than is the wont of the older school, has produced several examples of the art: the medals commemorative of the South African War and of Queen Victoria (two versions), all of 1900; and many portrait medals and plaquettes of small size have come from the same hand. Besides these, the leading English sculptor have Lower, D. S. Davis, and Poynter, Hano Thorncroft, T. Brock, Onslow Ford, G. Frampton and Goscombe John; but, practising more continually in sculpture, they can claim a much larger number of medals than they sought to acquire that class of dexterity which constant habit alone can give. Alphonse Legros, who has cast a certain number of portrait medals, is usually included in the French school.

American Medallists.—The American medallists Augustus St Gaudens (see Plate) is perhaps the most prominent; but he is not, strictly speaking, a medalist, but a sculptor who can model in the flat.

MEDALS AS WAR DECORATIONS

Although the striking of medals to commemorate important events is a practice of considerable antiquity, yet the custom of using the medal as a decoration, and especially as a device to do honour to those who have rendered service to the state

MEDAL

in time of war, is comparatively modern. It has been supposed that the circular ornaments on the Roman standards had medals in their centres, but there is no evidence to show that this was the case, and the standards shown on the column of Trajan appear only to have had plain bosses in their centres. It is true that the Chinese are said to have used military medals during the Han dynasty (1st century A.D.), but, as far as the West is concerned, we have to come to the 16th century before we find the custom of wearing medals as decorations of honour a recognized institution.

The wearing of decorative medals was common in England in the reign of Henry VIII., but the first medals commemorating a particular event that is recorded were awarded in 1547 to the Thomas Fower for his services in Hungary. These medals are of special interest, and were in all probability (though there is no absolute proof) bestowed as reward for military services rendered to the Crown, are the “Armed” medals of Queen Elizabeth, 1588-1589. Of these there are two. The earliest, generally styled the “Ark in flood” medal, is a large oval medal of silver (2 by 1.75 in.), and bears on the obverse a profile bust of the queen surrounded by the inscription, ELIZABETH D. G. ANGLIÆAE. F. ET HI. REG. On the reverse is an ark on waves, with above the rays of the sun, and around the legend, SÆVAS TRANQUILLA PER VNDAS. This medal is supposed to have been struck in 1588, the following year there was given another medal, a little larger (2-3 by 2.1 in.) and struck in gold, silver and copper. The obverse of this second medal bore a full-face bust of Elizabeth, with the legend, characteristic both of the monarch and the period, DITIOR IN TOTO NON ALTER CIRCULUS ORBE. The reverse has an island around which ships are sailing and sea-monsters swimming, and on the island there are houses, a flourishing bay-tree, standing uninjured by a storm of wind, and lighting emerging from heavy clouds above. The island is inscribed NON IPSA PÆRICVLA TANGVNT. This medal is supposed to have been struck in 1589, but may have been issued at an earlier date.

Other European nationalities were also about this period conferring decorative medals as a reward for war services, as for example, the “Medal to Volunteers” issued in Holland in 1622-1623 and the “Medal of Military Merit” mentioned in Sweden in 1636. Here it may be noted that in following the history of medals as used as a decoration to reward military services, only those of British origin need be dealt with in detail, since Great Britain has utilized them in a much greater degree than any other nationality. The countless minor wars of the 19th century, waged by the forces of the Crown of every class, navy, army and auxiliary, have no equivalent in the history of other states, even in that of France, the United States and Russia. The great wars of the 19th century were divided by long intervals of peace, and the result is that with most of the great military powers the issue of campaign medals has been on a small scale, and in the main decorations have taken the form of “Orders” (see KNIGHTHOOD AND CHIVALRY: Orders), or purely personal decorations for some meritorious or exemplary service.

During the reign of Charles I. (1625-1649), we come across numerous medals and badges; a considerable number of these were undoubtedly associated with, and given, even systematically, as rewards for war services; for a royal warrant “given at our Court of Oxford, the eighteenth day of May, 1643, to Sir William Parkhurst, Knight, and Thomas Bushell, Esquire, Wardens of our Mint, to provide from time to time certain Badges of silver, containing our Royal image, and that of our dearest son, Prince Charles, to be delivered to wear on the breast of every man who shall be certified under the hands of their Commanders-in-Chief to have done us faithful service in the Forlorn-hope.” From the foregoing it must not be deduced that this medal was in any way intended to reward special valour. In those days “forlorn-hopes” were not volunteers for some desperate enterprise, as to-day, but a tactical advanced guard which naturally varied, both in numbers and arm of the service, according to ground and circumstances. That a very free distribution of the award was contemplated is evident from the fact that “soldiers” alone were specified as recipients and that a clause was inserted in the warrant strictly forbidding the sale of the medal. This letter ran:

“... And we do, therefore, most straitly command, that no soldier at any time do sell, nor any of our subjects presume to buy, or wear, any of these said Badges, other than to them to whom we shall give the same, and that under such pain and punishment as our Council of War shall think fit to inflict, if any shall presume to offend against this our Royal command.”

As there are in existence several medals of this period which bear the effigies of both the king and Prince Charles, it is uncertain which in particular was used for the “forlorn-hope” award. Very probably it is one, an oval silver-gilt medal (1.7 by 1.3 in.) which bears on the obverse a three-quarters (r.) bust of Charles I., and on the reverse a profile (l.) bust of Prince Charles (see Mayo, Medals and Decorations of the British Army and Navy, vol. 1, No. 16, Plate 5, No. 3). During the Commonwealth: (1649-1660), parliament was lavish in the award of medals in recognition of war services, and for the first time we find statutory provision made for their bestowal as naval awards, in the shape of acts of parliament passed Feb. 22, 1648 and April 7, 1649 (cap. 12, 1648 and cap. 21, 1649), and Orders in Council of May 8 and Nov. 19 and 21, 1649, and Dec. 26, 1652. There is no doubt whatever that there was a “Medal of the Parliament” for sea service issued in 1649. This medal, oval (-95 by -85 in.) and struck in gold and silver, had on the obverse an anchor, from the rock of which are suspended two shields, one bearing the cross of St. George, and the other the Irish harp. The motto is MERVISTL. On the anchor stock, T. S. The reverse has on it the House of Commons with the Speaker in the chair. This medal is referred to in a minute of the Council of State of Nov. 15, 1649:

“(5) That the Formes of the medals which are now brought in to be given to the severall Mariners who have done good service this last Suime be approved off, viz: the Armes of the Coffon wealth on one side with MARS PAX et MICH: and the picture of the House of Coffons on the other.”

That there was a “Medal of the Parliament” for land service as well, is proved by the following extract from the Journals of the House of Commons (vii. 6, 7):

“Resolved, That a Chain of Gold, with the Medal of the Parliament, to the Value of One Hundred Pounds, be sent to Colonel Mackworth, Governor of Shrewsbury, as a mark of the Parliament’s Favour, and good acceptance of his fidelity: And that the Council of State do take care for the providing the same, and sending it forthwith.”

This order was duly carried out, as is shown in the minutes of the Council of State, June 2 and July 30, 1652, but there is no trace to-day of either medal or chain. It is not unlikely that this medal is one figured at page 117 of Evelyn’s Numismata (the engraving, unnumbered, is placed between Nos. 39 and 40, and there is no allusion to it in the text), which has on the obverse a representation of the parliament, and on the reverse a bust of the Protector with a camp and troops in the background. The most splendid of all the naval awards of this period were those given for the three victories over the Dutch in 1653, namely:

1 Thomas Simon, master and chief graver of the mint. Most of the medals of this period were his work, and they are considered to be amongst the best specimens of the medallic art that have been produced in the country.
The fight of Feb. 18/20, when Blake, Deane and Monk defeated Van Tromp and De Ruyter, the battle beginning off Portland and ending near Calais; (2) the fight of June 2 and 3, off the Essex coast, when Monk, Deane (killed), Penn and Blake, again defeated Van Tromp and De Ruyter; (3) the fight of 31st of July off the Texel, in which Monk, Penn and Lawson beat Van Tromp in what was the decisive action of the war. The authorization for these awards will be found recorded in the Journals of the House of Commons (vii. 296, 297), under date Aug. 8, 1653. The medals, all oval, and in gold, were given in three sizes, as described below:

A (2 1/2 by 2 in.). Only four of these medals were issued, to Admirals Blake and Monk, each with a gold chain of the value of £300, and to Vice-Admiral Penn and Rear-Admiral Lawson, each with a gold chain of the value of £100. On the obverse is an anchor, from the stock of which are suspended three shields, bearing respectively St George's cross, the saltire of St Andrew, and the Irish harp, the whole encircled by the cable of the anchor. On the reverse is depicted a naval battle with, in the foreground, a sinking ship. Both obverse and reverse have broad, and very handsome, borders of naval trophies, and on the obverse side this border has imposed upon it the arms of Holland and Zeeland. Of these four medals three are known to be in existence. One, lent by the warden and fellows of Wadham College, Oxford (Blake, it may be noted, was a member of Wadham College) was exhibited at the Royal Naval Exhibition of 1891. A second is in the royal collection at Windsor Castle. The third, with its chain, is in the possession of the family of Stuart of Tempفسd House, Bedfordshire. This latter medal is known to have been the only one given to Vice-Admiral Penn, an ancestor of the Stuart family. The one at Windsor is presumably Blake's, as Tancred states "the medal given to Blake was purchased for William IV. at the price of 150 guineas (Tancred, Historical Records of Medals, p. 30). The medal at Wadham was formerly in Captain Hamilton's collection. He purchased it at a low figure, but secrecy was kept as to the owner, and the original chain that was with it went into the melting-pot: there is therefore nothing to show whether it was Monk's or Lawson's, as the chain would have done. It was sold at Sotheby's in May 1882 for £304."

B (2 by 1 1/2 in.). Four of these medals were issued, each with a gold chain of the value of £40, to the "Flag Officers," i.e. to the flag captains who commanded the four flag-ships. The obverse and reverse of this medal are, with the exception of the borders, precisely as in (A). The borders on both sides are a little narrower than those of (A), and of laurel instead of trophies. One of these medals—that given to Captain William Haddock, who was probably Monk's flag-captain in the "Van guard," in the February fight, as he had been in that ship in the previous year, and who commanded the "Hannibal" (44) in the June battle—is now (1909) in the possession of Mr C. D. Holworthy, who is maternally descended from Captain Haddock.

C (1 1/2 by 1 1/4 in.). This medal is precisely the same as (B), but has no border of any kind, and also was issued without the gold chains. It was in all probability one that was issued instead of numbers to the captains and other senior officers of the fleet.

Some of these medals have in the plate of the reverse an inscription: FOR EMINENT SERVICE IN SAVING Y TRIUMPH FIERED IN FIGHT WH Y DVCH IN JULY 1653. The medal so inscribed was given only to those who served in the "Triumph," and commemorates a special service. Blake, incapacitated by wounds received in the fight of February, took no part in this action, but his historic flag-ship, the "Triumph," formed part of the fleet, and early in the battle was boarded by the Dutch fire-ships. Many of the crew threw themselves overboard in a panic, but those who remained on board succeeded by the most inductible and heroic efforts in subduing the flames, and so saving the vessel. But undoubtedly the most interesting of all the medals of the Commonwealth period, is that known as the "Dunbar Medal," authorized by parliament, Sept. 10, 1650, in a resolution of which the following is an extract:—

"Ordered, that it be referred to the Committee of the Army, to consider what Medals may be prepared, both for Officers and Soldiers, that were in this Service in Scotland; and set the Proportions and Values of them, and their number; and present the Estimate of them to the Committee. (Journal of the House of Commons, 1650)."

So came into being, what, in a degree, may be regarded as the prototype of the "war medal" as we know it to-day, for the "Dunbar Medal" is the very earliest that we know was issued to all ranks alike, to the humblest soldiers as well as to the commander-in-chief. It differed however in one very material point from the war medal of to-day—in that it was issued in two sizes, and in several different metals. There is no evidence to show what was the method that governed the issue of this medal; but the medal itself undoubtedly varied in size or metal, or both, according to the rank of the recipient. Of the two sizes in which the medal was issued the smaller, 1 1/2 by 8 1/2 in. was apparently intended for seniors in the respective grades, for it was struck in gold, silver and copper. The larger, 3 1/2 by 1 1/2 in. was struck in silver, copper and lead (see Mayo, op. cit. i. 20-21). On the obverse of both issues of the "Dunbar Medal" is a left profile bust of Oliver Cromwell, with, in the distance, a battle. The reverse of the larger medal has the parliament assembled in one House with the Speaker; and, on the left, a member standing addressing the chair. The reverse of the smaller medal is the same as that of the larger, except that the member addressing the House is omitted. Cromwell himself expressed a wish to the "Committee of the Army, at London," in a letter dated the 4th of February 1650/51, that his likeness, to procure which accurately the committee had sent Mr Simon to Scotland, should not appear on the medal. He writes:—

"If my poor opinion may not be rejected by you, I have to offer to which I think the most noble end, to wit, The Commenoracon of my services, the Merit and the Gratitude to the Army, which might be better expressed upon the Medall, by engraving, as on the one side the Parliament which I hear was intended and will do singularly well, so on the other side an Army, with this inscription over the head of it, The Lord of Hosts which was our Word that day. Wherefore, if I may beg it as a favour from you, I most earnestly beseech you, if I may do it without offence, in the name of the Lord, I pray you, and the Honar, and the Gratitude to the Army, and the Gratitude to you, if you think not fitt to have it as I offer, you may alter it as you see cause; only I do think I may truly saie, it will be very thankfully acknowledged by me, if you will spare the having my Effigies in it."

In spite of this request Cromwell's "Effigies" is made the prominent feature of the obverse of the medal, to which the representation of the "Army" is entirely subordinated. His wish that the "word" for the day should be commemorated in the legend on the obverse, as is also, on the reverse, his suggestion that on one side of the medal there should be a representation of the parliament.

During the reign of Charles II. the issue of medals was numerous, and though we have it on the authority of Evelyn that many of these were bestowed as "gratuities of respect," yet many were given as naval awards; and, for the first time, there appears official authorization for the conferring of particular awards on those who had succeeded in the very hazardous service of destroying an enemy's vessel by the use of fire-ships. In what we now call the "Royal Navy," the word "Dutch," in 1655, and again in an abridged form in 1655—no allusion to those awarded in 1653, but that the custom of rewarding this special service prevailed, there is a piece of strong indirect evidence to show, in the shape of an amusing letter from a certain Captain Cranwill, of "ye Hare Pineke," to the Admiralty Committee, dated Feb. 4, 1655—

1 An excellent reproduction of this medal, both obverse and reverse, is given in Plate 8, figs. 4 and 5, of the same work, and on Plate 9 will be found equally well reproduced facsimiles of the three of that group. (Victeirs and of the Dutch, 1653, figs. 1, 2 and 3 and of the "Medal of the Parliament, for Sea Service," 1649, fig. 1.)
As for ye Pay ye Honors be pleased to order mee for my service in ye Hare Plant, I entreat most hearty thanks, and am ready to serve ye Honors and my Country for ye future.

For though ye Hare be mewed in ye sand yet Cranwell at your mercy still doth stand A fire Ship now doth be Creave, And the Fox faire would he Have, then has hee had both Fox and Hare, then Spanish Admiral stand you Creare. For Cranwell means ye Chaine of goodl to ware; Sett penn to paper it is done, for Cranwell still will be your man, all of which goes to show that it had not been unusual to bestow gold chains, with or without medals, on the captains of fire-ships.

By the “Fighting Instructions” issued 20th of April, 1665, by James, duke of York, lord high admiral, it was provided as follows. In the case of the destruction of an enemy’s vessel of forty guns or more, each person remaining on board the fire-ship till the service was performed was to receive £10, “on board ye Admiral immediately after ye service done,” and the captain a gold medal and “shuthe other future encouragement by preffernent and commande as shall be fitt both to reward him and induce others to perform ye like Service.”

If it was a flag-ship that was fired “ye Recompense in money shall be doubled to each man performing it, and ye medall to yeough probably others to the curiously express ye Eminenseye of ye Service, and his with ye other officers prefferement shalbe suitable to ye merit of it.” This was followed by an “Oder of the King in Council” dated Whitchall 12th of January 1666–1670, in which the lord high admiral is authorized “to distribute a Medall and Chaine to such Captaines of Fire Shipps as in the last Dutch Warr have burnt any Man of Warr, as also to any of them that shall perform any such service in the present Warr with Algiers.” Which Medals and Chains are to be of the price of Thirty Pounds each or thereabouts.

To complete the story of fire-ship awards, it may here be noted (though out of chronological order) that in 1703 revised “Fighting Instructions” were issued by Admiral Sir George Rooke, in which it was provided that the captain was to have his choice between a gratuity of £100, or a gold medal and chain of that value. Lastly an order of the king in council, dated, St James’s, 16th of December, 1742, ordered that all lieutenants of fire-ships (which originally carried no officers of this rank) should be entitled to a gratuity of £50 “in all cases where the Captain is entitled to the Reward of £100.” Though the orders were not conferred, so thorough an investigator as the late John Horsley Mayo, for many years assistant military secretary at the India office, who had special opportunities of access to official records, traced but three authenticated fire-ship awards. Those were: (1) to Captain John Guy, who blew up his fire-ship the “Vevuus” under the walls of St Malo in 1693; (2) to Captain Smith Callis who, with his fire-ship the “Duke,” in 1742, destroyed five Spanish galleys which had put into St Tropez, to the eastward of Marseilles; (3) to Captain James Woodrige, who commanded the British fireships in Air Roads on the 11th of April 1809, when four French sail of the line were burnt. This latter is believed to be the last award of the kind that was issued.

Fire-ships awards are of special interest as affording a precedent, in future naval wars, for the award of special decorations for torpedo services.

It is in this reign also that we first find a case of medals being granted by the Honourable East India Company. The earliest of these would appear to have been a gold medal of the value of £20, conferred on Sir George Oxinden, president at Surat, 1622–1669, in 1668, for considerable civil and military services. Surat was then and until 1687, when Bombay took its place, the seat of government of the Western Presidency, and the most eminent of Sir George’s services was the defence of the Company’s treasures and possessions at that place against Sivajee and the Mahrattas in 1664. It is not known what has become of this medal, but there is indirect evidence to show that it was a circular medal, three inches in diameter. On the obverse the “Arms of the Governor and Company of Merchants of London trading to the East Indies, with crest, supporters, and mottoes,” and around the legend NON MINUS EST VIRTUS QUAM VAERERE PARTAM. On the reverse was probably blank to admit of an inscription. This award was the forerunner of many given by the H.E.I. Co., several of which were “general distributions” of the very highest interest, which will be dealt with together later on.

The awards made in the reigns of James II, William and Mary, William III., Anne, George I., George II., may be very briefly dealt with. Almost without an exception they were either naval or conferred by the Hon. East India Company, and with only perhaps one or two exceptions, they were “personal” as distinct from “general” awards. Of the very few medals awarded by James II., one was an undoubted military award, though curiously enough the recipient was a bishop. This was Peter Mew, who had been made bishop of Bath and Wells in 1672, to “and next year was commanded by the king, in compliance with the request of the gentry of Somerset, to go against Monmouth, and did eminent service at the battle of Sedgemoor, where he managed the artillery; for which he was rewarded with a rich medal” (Hutchin’s History of Dorset, 3rd ed., vol. iv. p. 149).

The reverse of the medal was probably blank.

Almost without an exception they were either naval or conferred by the Hon. East India Company, and with only perhaps one or two exceptions, they were “personal” as distinct from “general” awards. Of the very few medals awarded by James II., one was an undoubted military award, though curiously enough the recipient was a bishop. This was Peter Mew, who had been made bishop of Bath and Wells in 1672, to “and next year was commanded by the king, in compliance with the request of the gentry of Somerset, to go against Monmouth, and did eminent service at the battle of Sedgemoor, where he managed the artillery; for which he was rewarded with a rich medal” (Hutchin’s History of Dorset, 3rd ed., vol. iv. p. 149).
From the Dutch in 1795-96. It is the only instance of a war medal that has merely a verbal design on both obverse and reverse, and moreover it sets a precedent which was followed for too long; that it was only granted twelve years after the services that had earned it had been rendered. Only 123 medals were struck, two in gold for native officers, and 121 in silver for other ranks. Like some preceding, it was worn from the neck suspended from a yellow cord.

4. The "SERINGAPATAM" medal. Authorized,1799, for services in Lord Harris's campaign of that year, and the storm of Serin- gapatam. Obverse: A Silver Lion on a Horse's Head, with the E. and W. Co. Company which will not be dealt with.

No medal awards were made to either the naval or military services for the Seven Years' War, and the American War of Independence. In fact George III. had been more than thirty years on the throne when the first medal award by the Crown was given, in the shape of the navy gold medals, first issued in 1794. It will however be more convenient to deal later with these medals and the army gold medals and crosses for services in the long and arduous struggle of 1793-1815, and to describe here in sequence those medals which were issued by the Honourable East India Company, the issue of which was with certain limitations, "general," thus reverting to the precedent first established in the "Dunbar" award, namely an issue to all ranks. They are nine in number, and are described below in the chronological order of the military operations for which they were awarded.

1. The "DECCAN" medal. Authorized, first in 1784, and again, 1785. Obverse: Figure of Britannia seated on a military trophy, with her right hand holding a wreath of laurel and extended towards a fortress over which the British flag flies. Reverse: Persian inscription: "Obverse: A Seated Persia. Reverse: On the medal itself (of course with the consent of the Company) in memory of good service and intrepid valour, A.D. 1784, A.H. 1199," around. "Like this coin may it endure in the world, and the exer- cises of those lion-hearted Englishmen of great name, victorious from Hindostan to the Deccan, become exalted." This medal was issued in two sizes, diameters 1-6 and 1-25 in. The larger medal was struck both in gold and silver, the smaller in silver only, and both were worn by officers of the next superior rank. The smaller medal was awarded to two large detachments of the Bengal army, denominated the "Bombay Detachment" (authorized 1784), and the "Carnatic Detachment" (authorized 1786), which respectively fought in the west of India and Guzerat, 1778-84, and in the south of India, 1780-84. The medal was not given to any Europeans, only to natives; the larger medal in gold to Subadars, and in silver to "Sepoys." 

A minute of council, dated the 15th of July 1784, a further boon was granted to the "Bombay Detachment," inasmuch as they received the full pay of that of the native officers, at duties levied by the authorities on pilgrims to Cova in Behar. At the large majority of the troops were high caste Hindus, and Cova was, and is the Mecca of Hinduism, this favour must have been much relished by the European officers.

Though the medal was made of copper, the gold medal was worn by officers, silver to field officers, in silver to captains and subalterns, in copper bronzed to non-commissioned officers, and in pure grain tin to privates and sepoys. With regard to this medal there is an incident that is worth recording. The bulk of the troops engaged at Seringapatam were Crown forces, or belonged to the Madras and Bombay presidencies; the only Bengal troops taking part being five battalions of infantry, and artillery detachments. On their return to Bengal no steps were taken with regard to medals till 1807, when medals copied from the Soho Mint one, but 1 in. only in diameter, were made at the Calcutta Mint. Following the Bengal regiments which had flourished during the wars in Europe, these medals, the medals were struck in gold for officers, and in silver for the other ranks. A Bengal native officer therefore wore just the same medal as a general officer of any of the other forces, and similarly a Bengal sepoys wore the same medal as a British captain or subaltern of the Crown. The Bengal medal can easily be distinguished from the others, for in the reverse the artist's initials C.H. are inscribed. "C.H." Some authors, amongst them Lord Harris himself and his second-in-command, Sir David Baird, wore the medal with the red, blue-bordered ribbon, which is the same as that worn with the Army Gold Medal (see below) and was given to native officers. Officers were entitled to the rank of all medals, but no ribbon was issued with the medal, recipients were given to understand that the ribbon would be of a deep maize colour and watered, the shading on the ribbon symbolising the stripes in the fur. The clearing of the neck had been caused by the fact that Wellington's medal (silver gilt), has the maize (or yellow as it is often termed) ribbon, and the medal was undoubtedly more generally worn with this ribbon than with the red. The same also apparently occasional instances of it having been worn with a plain red ribbon.

3. The "EGYPT" medal. Authorized 1801. Obverse: A Sepoy holding the Union Flag in his right hand; in the background a camp. In the exergue, in Persian: "This medal has been presented in commemoration of the defeat of the French Army in Egypt by the victorious and brave English Army. They came out into India for the protection of that Country, and it was not till 1815 that the Company's European officers had the prince regent's sanction to wear them on public occasions. For the first time the issue was absolutely general," to officers, non-commissioned officers, and Sepoys. The medal is of the H.E.I. Co, but it was not till 1851, when the First India G.S. Medal was awarded, that official sanction was given to their being worn by Europeans. The medal was not awarded to general officers, in silver-gilt to field officers, in silver to captains and subalterns, in copper bronzed to non-commissioned officers, and in pure grain tin to privates and sepoys.

A small medal, 1-8 in. in diameter, and was worn in its place the British colours, in his left an enemy's standard reversed, whilst his left foot rests on a dismantled cannon. A fortified town is in the background. Reverse: Within a wreath; "For Services in Mysore, A.D. 1791-1792. Between wreath and rim is an inscription in Persian: "A remembrance of devoted services to the English government at the war of Mysore. Christian Era, 1791-1792, equivalent to the Mahomedan Era, 1205-1206." Like the Deccan "this medal was in two sizes, diameters 1-7 in. and 1-25 in., struck in silver only, and both were suspended from the neck by a yellow cord. The medal was awarded for the operations against Tipoo Sultan, and was bestowed on officers of the Infantry of the Infantry and Cavalry, and on the Artillery Lascars, who either marched by land, or proceeded by sea to the Carnatic and returned to Bengal. The large gold medals were given to Subadars, the large silver to "Jemadars and Serangs," the small silver medals to "Havildars, Naiks, Tindals, Sepoys and Lascars." The award therefore, followed precisely the precedent set in the "Deccan" medal. The medals were made of silver, but were gold medals to the officers of the Infantry of this company. A collection of Captain Whitaker, late 5th Fusiliers, whose collection, and that of Lord Cheylesmore, are probably the two finest that have as yet been brought together. The medal was authorized, 1807. Obverse: An English inscription: "For Services on the Island of Ceylon A.D. 1795-6." Reverse: Persian inscription: "This Medal was presented by the Honourable East India Company at the instance of the H i g e r a 1290-10." This medal was issued in only one size, 2 in. diameter, and was awarded to a small force of Bengal native artillery which formed a fraction of a large body of British and native troops (the rest did not receive the medal) which captured Ceylon from the Dutch in 1795-96. It is the only instance of a war medal that has merely a verbal design on both obverse and reverse, and moreover it sets a precedent which was followed for too long; that it was only granted twelve years after the services that had earned it had been rendered. Only 123 medals were struck, two in gold for native officers, and 121 in silver for other ranks. Like some preceding, it was worn from the neck suspended from a yellow cord.
### Medals and Decorations

**Plate I.**

**Wars of the French Revolution and Napoleon Eras**

- **Army General Service**, 1808-1814
- **Navy General Service**, 1803-1840
- **Waterloo**, 1815

- Medal dated 1865 but authorized 1864.
The commemoration circumference, in the white Burma diameter, three medal.

In February, small medals, for the surrounding of St. George's medal, the obverse, were presented to the Medals

7. The "JAVA" medal. Authorized, 1812. Obverse: A representation of the storming of Fort Cornelius. On a flag-staff this lion, the word Cornelius, and the word Cornetis. Reverse: In Persian: "This medal was conferred in commemoration of the bravery and devotion exhibited by the Sepoys of the East India Company in the capture of Java. 1226, Hegira.

8. The "NEPAL" medal. Authorized, 1816. Obverse: Hills crowned with stockades. In right foreground the colours and bust of the king, and to the left, the word Nepalect. Reverse: In Persian: "This medal was conferred by the Nawab Governor-General Bahadur in testimony of the good service, skill and intrepidity with which the Nepalese troops did the Hills in the years of 1229 and 1230." This was awarded to the native troops of the East India Company who took part in the arduous operations in Nepal in 1814-16. This medal, 2 in. in diameter, marks a very interesting new departure, for it was struck only in silver, and given to all ranks precisely alike, whether the recipient was commissioned or not. It was worn from the usual yellow silk cord.

9. The "BURMAH" medal. Authorized, 1826. Obverse: Representation of the storming of the great pagoda at Rangoon; on the left, a pala tree under which the general and staff, and the river with a boat and a row of the Irrawady river, the Ganges and Irrawaddy's joining in the attack. In exergue, in Persian: "The Standard of the victorious Company conquested by the British Forces on the Irravaddi and Seima, to the credit of the army under General Sir Hugh John 

In all, eighteen actions were recognized by this medal, the complete list of which is as follows:

In all 22 large medals, and 117 small, were awarded; but this does not say that all who were entitled to the medal received it. This is most notably the case with the "Glorious First of June."
deserving of the approbation of the Lords Commissioners of the Admiralty, although I am not enabled to make a particular state-
ment touching this matter. In this respect he was rewarded to 
Rear-Admiral B. Caldwell, fifth in command on the great 
day, to his flag-captain, Captain G. B. Westcott, and to seven other 
captains of line of battle ships engaged. One captain however, who was not 
mentioned in the list of those who were recognised during the 
*jour de force* eminently characteristic of the superb breed of naval 
oficers that the great wars had brought into being. This was 
Collingwood who was not a flag-captain but an officer in the 
Nelson's & Trafalgar, Nile, for Nelson, and Trafalgar, Nile. 
When Collingwood was awarded the medal for St Vincent, where he 
commanded the "Excellent," he flatly refused to receive it unless 
that for the First of June was also conferred upon him, which was 
done, and he was also awarded the Nile and Trafalgar, Nile. 
Captains and officers engaged received the medal. At the Nile, Tronbridge's 
ship, the "Culloden," grounded in entering the bay, and so, strictly 
speaking, he was never engaged in the action; but he was so 
highly esteemed that he was specially included in the award. For his services both before and since, 
and for the great and wonderful exertions he made at the time 
of the action, in saving and getting off his ship.

For Camperdown, one captain, afterwards found guilty by court-
martial of failure in duty, did not receive the medal. Several 
posthumous awards of the smaller medals were made to the relatives 
of officers who were either killed in action or died of wounds. These 
were: on the first of June, Captains Hutt ("Queen"), Wrotasgu 
("Montague"), Harvey ("Brunswick"); at Camperdown, Captain 
Burgess ("Ardent"); at the Nile, Captain Westcott ("Majestic"); and 
at the Surprise, Captain Westcott was doubly unfortunate, for he was one of the 
First of June captains who should have received the medal but did not. 
Captain Miller of the "Theseus" also did not receive his medal for, though 
not killed at the battle of Trafalgar, he was killed in a gale, in an accidental powder explosion the May following, the medal 
arrived after his death, and being returned to the Admiralty. In 
only two of the small medals were officers below the rank, these 
being Sir R. Curtis, captain of the fleet to Lord Howe on the 
First of June, and Nelson, who only flew a commodore's broad 
pendant at St. Vincent. Following this latter precedent Sir R. 
Strachan should have had the large medal for the action of the 4th 
of November 1805, for he also was a commodore, but it was denied 
him for what seems quite an inadequate reason, namely that he was 
junior in rank to Captain Hervey of the "Temeraria," who was the 
second commodore at Trafalgar. Hervey was promoted to rear-

Nelson's two great victories, the Nile and Trafalgar, also earned 
a medal for all ranks that participated in them, these awards were 
not made by the Crown but by the generosity of two private 
individuals, though of course with the king's approval and per-
mission. The first of these is "Davidson's Nile Medal," which Mr 
Alexander Davidson, Nelson's prize agent and a valued friend, 
could be struck at a cost of near £2000, and one of which was presented 
every officer and man engaged at the Nile. The medal, 1½ in. 
in diameter, was given in gold to Nelson and his captains, in 
silver to lieutenants and officers on half pay, and in pewter 
gift to warrant and petty officers, and in copper bronze to seamen 
and marines.

**Obverse:** Hope, standing on a rock in the sea, holding in her 
right hand an olive branch, and supporting with her left side a shield 
which in the bust of Nelson surrounded by the legend: 
"EUROPE'S HOPE AND BRITAIN'S GLORY." Behind the figure is 
entwined with the anchor." REAR-ADMIRAL LORD NELSON OF THE NILE." 
**Reverse:** The French fleet at anchor in Aboukir Bay, the British fleet 
advancing to the attack. The setting sun denotes the time of the 
action, and "VICTORY TO THE TYRANTS OF THE BRITISH 
HORSE & FLEET" fashioned across the bow, and under it "BRITISH 
ARMS," and, in exergue: "VICTORY OF THE NILE AUGUST 1 1798." In 
the reverse engraver when sinking the die forgot to strike the initials of those who were present in the east instead of in the west, and the land which is shown on 
the right should properly be on the left.

Davidson's Nile medal was struck at the Soho Mint, Birmingham, 
by Boulton, and it was this that probably inspired the latter to 
present a medal to all who took part in the battle of Trafalgar.

"Boulton's Trafalgar Medal" was 1 ½ in. in diameter, and given 
in gold to the three admirals, in silver to captains and first-lieuten-
ants, and to Nelson, Russell, Collingwood, and to one or two other ranks. In a very considerable number of 
cases the pewter medals were either returned, or thrown overboard, 
the recipients being disgusted at what they deemed the paltriness of the material. 
Obverse: 3 lines: H: H: HORATIO, VISCOUNT NELSON, K.B. DUKE OF 
BRONTE, &c. Reverse: A representation of the battle, with 
round on a scroll: ENGLAND EXPECTS EVERY MAN WILL 
DO HIS DUTY. TROJAN CASTLE OCTOBER 21 1805.

Both the Davison and the Boulton medals were worn 
suspended from a blue ribbon. These are the only two cases in 
which officers and men of the navy and army have accepted 
and worn medals presented by a private individual.

The Gold Medal given by George III. to the superior officers 
in command at the battle of Maida, in Sicily, on the 4th of July 1806, 
is an award of special interest, for not only was it the first 
Allied military medal awarded by the Crown during the reign, but it was 
moreover the prototype of the superb army gold medals and 
crosses which were so widely distributed during the years that fol-
lowed, so that the Maida award established red with a blue border as the 
regulation military ribbon. The Maida ribbon is in fact precisely 
the same as the Waterloo ribbon shown in Plate I. The Maida 
medal was 1½ in. in diameter and struck in gold only. It 
was issued precisely alike, quite irrespective of rank, to each 
of its seventeen recipients.

**Obverse:** Head of George III., laureated and facing left, with 
below the legend: GEORGIUS TERTIUS REX. Reverse: 
Britannia casting a spear with her right hand, and on her left 
arm the Union shield, above, and approaching her is a Flying 
Sword holding out a wreath. In front of Britannia in four lines, is MAI/
DA/IVL IV/MDCCCVI; behind her the tricornia or trimarca, the 
symbol of Sicily. In the exergue, her core cross.

Two and a half years after the Maida award the king authorized 
the "Army Gold Medal," the first grant of which was 
notified by the commander-in-chief, in a Horse Guards 
commission order, dated the 4th of September 1810. This 
authorized the bestowal of the medal on 170 senior officers 
mentioned by name. 
The battles commemorated were Rolca, Vimiera (1808), 

The Army Gold Medal so awarded was in 
two sizes, large, 2½ in. in diameter, for general officers, 
small, 1½ in. in diameter, for officers of lower rank: and the 
regulations provided that it should be worn from a red ribbon 
edged with blue, the larger round the neck, the smaller on 
the left breast from a button-hole of the uniform. The ribbon 
was the same width, 1½ for both ribbons, and precisely 
the same later on for the Gold Cross. Both large and small 
medals were of identical design, in fact there was no difference, 
either in medals or in ribbons, except in size and the style in which 

**Obverse:** Britannia seated on a globe, holding in her right 
hand a laurel wreath, and in her left, which rests upon a Union 
shield separated by the thistle and the thistle, and in uniform with 
her colors. Reverse: A wreath of laurel, encircling the name of the battle 
or operations for which the medal was granted.

In the following years subsequent orders similar to 
the original grant extended the award of the Army Gold Medal, 
until eventually twenty-four distinct awards were made, 
commemorating twenty-six actions, or series of operations, which 
took place during the Napoleonic Wars, in the Peninsula, but also in North America, 
and both the East and the West Indies.

The Peninsula medals were for Rolca and Vimiera, Sahagun 
and Benevente, Corunna, Talavera, Busaco, Barrosa, Fuentes 
d'Oron, Albuera, Ciudad Rodrigo (1812), Badajoz (1812),
MEDAL

Salamanca, Vittoria, Pyrenees, St Sebastian, Nivelle, Nive, Orthes, Toulouse. The West Indies medals were for Martinique (Feb, 1809) and Guadeloupe (Jan.–Feb, 1810), the North American for Fort Detroit (Aug. 16, 1812), Chateauguay (Oct. 26, 1813) and Chippewa's (July 5, 1813), and there was, lastly, a medal awarded for Java (Aug.–Sept. 1814).

From the above it will be seen that as time went on many officers became entitled to two, three and even more medals, and as this was found inconvenient, the method of granting the award was very materially amended as notified by the commander-in-chief, in a general order, dated Horse Guards, October 7, 1813. This order formulated regulations which were as follows:

1. That one medal only was to be borne by each officer recommended for the distinction.
2. That for a second and a third action a gold clasp was to be attached to the ribbon from which the medal was suspended inscribed with the name of the action.
3. When a fourth distinction was earned, the medal and two clasps were to be replaced by a Gold Cross having the four actions for which it was awarded inscribed upon it, one upon each arm.

On every occasion the recipient was awarded the decoration after the fourth a Gold Clasp worn on the ribbon was added to the Cross.

The regulations further laid down that only officers should be recommended who had been “personally and particularly engaged” on the occasion, and that officers were to be named by “special selection and report of the Commander of the Forces upon the spot, as having merited the distinction by conduct and valor under his own eye.” Whether this was restricted in his selection to General Officers, C.Os. of Brigades, C.O.s of Artillery or Engineers, and certain staff officers holding field rank, and Commanding Officers of Units, and Officers succeeding to such command during an engagement.1 It was also ordered that awards earned by deceased officers should be transmitted “to their respective families.” The Gold Cross that was, under these regulations, instituted is as follows:

A Maltese Cross, 1½ inches square, with an ornamental border; in the centre, a lion, facing right; in each limb of the cross the name of one of the actions for which it was conferred. The back of the cross is the same as the front. The cross was precisely the same irrespective of whether it replaced a large or a small medal.

The clasps were all of the same pattern, whether worn with the medals, the large gold medal, or the small gold medal. They are 3 in. in length by ½ in. in width, and bear, within a border of laurel, the name of the action for which they were conferred. At the close of the war in the Peninsula the issue of this handsome and much coveted decoration was discontinued, the enlargement of the Order of the Bath (January 1815) affording another method of reward which the Crown deemed more appropriate. On the occasion of this extension all officers who had obtained the cross with one clasp, i.e. who had been decorated for five or more actions, were made Knights Commander of the Bath.

In all 847 awards of this superb decoration were made. The medal alone went to 469 officers, whilst 143 received it with one clasp, and 72 with two clasps. The cross was issued singly in 61 cases, with one clasp in 46, with two in 18, with three in 17, with four in 8, and with five clasps in 7 cases. The cross with six clasps was gained by Sir Colin Campbell (Lord Clyde), Sir Alexander Dickson (d. 1840) and Sir George Murray (d. 1840). Two officers, Viscount Beresford and Sir Denis Pack (d. 1823) received it with seven clasps. The duke of Wellington's had nine, the decoration thus commemorating fourteen out of the twenty-six battles, sieges or operations for which the Gold Medal was obtained. The names on the arms of this cross are, ROLEA and VIMIERA, TALAVERA, BUSACO, FUENTES DE ONOR. The clasps are for CIUDAD RIGO, BADAJOZ, SALAMANCA, VITTORIA, PYRENEES, NIVELLE, NIV, ORTHES and TOULOUSE. Not until after the close of the Great War, however, do we meet with the real prototype of the war medal as we know it to-day; for the Waterloo Medal of 1815 is the first actual “general” medal that was ever issued, because it was issued precisely alike to all ranks. In the two weeks in which it have been seen that a medal was given to all ranks, the medals differed either in size or in metal, or in both, according to the rank of the recipient, and in eight out of the nine issued by the Hon. East India Company the award was withheld from the British officers and men employed. Again in none of the cases quoted were the awards made by the Crown. The “Dubar” medal was awarded by the Commonwealth parliament. The men of the Nile and Trafalgar wore their medals through the generosity of private individuals. In the other nine cases the award was made by the direct action of the East India Company. It was with the issue of the Waterloo Medal that all this was changed and for this well-merited and much prized boon the Services owe all gratitude to the duke of Wellington. Writing from Orville on June 28, 1815, to H.R.H. the duke of York, he says:

“I would likewise beg leave to suggest to your Royal Highness (the then Commander-in-chief) the expediency of giving to the non-commissioned officers engaged in the service a gold clasp for a medal. I am convinced it would have the best effect in the army; and, if that battle should settle our concerns, they will well deserve it.

Again, writing from Paris, Sept. 17, 1815, to Lord Bathurst, his then secretary:

“I have long intended to write to you about the medal for Waterloo. I recommend that we should all have the same medal, hung to the same ribbon as that now used with the medals.”

(i.e. the army gold medals and crosses). It is also fair to point out that in his place in the House of Commons, and on the day after the duke’s letter to the commander-in-chief had been penned, William Watkins Wynn urged that medals should be given to the survivors of Waterloo, and that they should be made for both officers and men. If that had been fellows in danger might bear the same badge of honour.” And so came into being that type of “general” medal, which beginning with Waterloo has continued down to the present.

The description of these later medals, and the points of interest about them, will now be given as fully as exigencies of space will allow.

1. Waterloo, 1815.—Awarded by the Prince Regent, 1816. Obverse: half of the head to left, left side of figure, upper part of engravings. Reverse: Figure of Victory seated; in her right hand, a palm branch; in her left, an olive branch. Above, WELLINGTON; below, WATERLOO, JUNE 18, 1815. Ribbon: Crimson with blue borders (the usual clasps not personal).

The notification of this award was made in a memorandum by H.R.H. the commander-in-chief, dated Horse Guards, March 10, 1816, and it is worth noting that the prince regent commanded that the ribbon “shall never be worn but with the medal suspended to it.” The medal was conferred on all the British troops, including the King’s German Legion, present on the 17th June at Quatre Bras, on the 17th in the fighting that took place during the retirement through Genappe to Waterloo, and on the 18th at Waterloo. It was also given to four regiments, 2nd Batt. 35th, 1st Batt. 54th, 2nd Batt. 59th, and 1st Batt. 91st Regiments of Foot, which formed Sir Charles Coleville’s Brigade, which was detached. The reverse of this medal would appear to have been copied from the Greek Coin of Eliss, about 450 B.C., a specimen of which is in the British Museum. The medals most prized by collectors are those of the 1st, 4th, 17th and 28th and 42nd Regiments of Foot, as those regiments suffered very severely and consequently fewer survivors received the medal than in other corps.

2. Gwalior, 1830.—Awarded by the Government of India, 1842. Obverse: The Gateway of the Fortress. Below, GHUZNEE. Reverse: In centre a space for name of recipient; above, 23rd July; below, a mural crown with underneath it 1859; the whole within a laurel ribbon: Particoloured, crimson and green (Plate I.).

This medal originated with Shah Soojah, whose part the Indian government took in the Afghan troubles of the time. His downfall having taken place before the medals were ready, the actual award was made by the Government of India. It was originally ordered (Bengal Military Proceedings, May 27, 1842: Nos. 151 and 152) that the ribbon should be green and yellow, and it was undoubtedly so worn by some recipients; but there is no official record to show why the colours were altered to green and crimson.

XVIII. I 12
MEDAL

The medal was awarded to all troops both of the Crown and of the Company that were actually present at the siege and capture of the fortress, July 21, 22, and 23, 1839.

The Sultan of Turkey, 1841. Obverse: A fortress on which the Turkish flag is flying, and above six stars, below, in Turkish, "The People of Syria; and the Citadel of Acre, A.H. 1258.

The St Jean d’Acre medal, as it is commonly called, was awarded to the officers and men of the British fleet that were engaged in the operation of bombarding and capturing of St Jean d’Acre, April 12, 1840. All names are inscribed in the bombardment and capture of St Jean d’Acre, Nov. 3, 1840. The medal, 1½ in. in diameter, is purely a naval medal therefore, although a few artillery and engineer officers doing duty in the fleet received the medal. It was manufactured in gold, silver, brass and bronze, and also for officers (or field officers), in silver to quarter-deck and warrant officers, and in copper to other ranks. This is the only instance of there being a difference made according to the rank of the recipient since the "Burma" medal.

4. China, 1840–42 (1st Medal); China, 1857–60 (2nd Medal).

-Awarded by Queen Victoria, 1842, 1861. Obverse: Head of Queen Victoria, diademmed. Leg: VICTORIA REGINA Reverse: Naval and military trophy, with behind a palm tree, and in front a shield of the Royal Arms. Above, ARMIS EXPOSERE FASCÉM. In exergue, CHINA 1840–42: Ribbon: Red with white border (Ptn). This medal is nil medal, nil 2nd medal, six—CHINA 1842; FATSHAN 1857; CANTON 1857; TAKU Forts 1858; TAKU Forts 1860; PEKIN 1860–61. The medal was awarded to all the naval and military forces, both of the Crown and of the Hon. East India Company, that took part in the first China War, 1840–42. Another medal was struck, and is to be found in proof, but it was never issued as it was deemed offensive to China. This is the same as that described above; but the reverse had, under the same motto, the British lion triumphing upon the Chinese dragon, and in the exergue, CHINA 1842–56. This medal is similarly awarded to both the naval and military forces, British and Indian, that took part in the second China war, 1857–60. To those however, who were already in possession of the first China medal the second medal was not awarded, they received a clasp China 1842 to go on their original medal, together of course with the clasps to which their services in the second war had entitled them. The second medal was in fact not a new decoration but a reverse. The first China medal was the first to be issued with the effigy of Queen Victoria upon it. The first medal with clasps for the second China war is very rare, and in almost every case would probably be found to be a naval medal. Of the second medal only one was issued with all the five new clasps. This was to a Royal Marine Artilleryman, and it is now in the Cheylesmore collection. Medals specially valued by collectors are those given to the 1st Dragon Guards with the clasp TAKU Forts 1860 and more than that given to the 2nd Dragoons (Ptn) with the clasp ALIWAL 1842.

GHUZNEE CABUL 1842 all within a laurel wreath; above, a crown. No. 4. CABUL 1842 within a laurel wreath; above, a crown. Ribbon: Military ribbon of India (Plate 1). Clasp: G.H. Reverse: For Captain. This medal is a G.O. of the governor-general dated October 4, 1842. It was awarded to all troops, both of the Crown and the Hon. East India Company, who took part in the operations in the Cabul Province in 1842. The medal was issued in two parts, the first of Major-General Pollock at Cabul. The medal with reverse 1, 2 and 3, was awarded to those troops that were with Major-General Sir William Nott in Cabul, and took part in the operations around that place, receptions and sieges of towns. The medal, as described, with reverse 4 was used to denote the actual part taken in the operations by the recipient, in the manner that is now done by clasps. Of these inscriptions are given, to N. MOODIE the right, and to the issues confined to the small portion of his army that Major-General Nott left behind him in Cabul. The medal with the No. 2 reverse is also rare, as its distribution was very limited.

The authority for this medal is the same as that for the First Afghan Medal, and the medal itself was awarded to the troops of the Crown and the Hon. East India Company, that were engaged in the Khost and Kandahar operations. The medal was worn for several months, and finally, before they were eventually relieved from Cabul unharrassed routed and drove off a force of four thousand men. As the medal was given only to 950 in all (forty being awarded to artillerymen, the remainder native troops), it is naturally very scarce.

8. Sine, 1845.—Awarded by Queen Victoria to the forces of the Crown and the Hon. East India Company, under General Sir Colin Campbell, 1845. Obverse: Head of Queen Victoria as on First China Medal. Reverse: 1st. MEENANEE 1845. 2. HYDERABAD 1845. 3. MEENANEE HYDERABAD 1845. In each case the inscription is surrounded by a white laurel wreath and crowned. Ribbon: Military ribbon of India (Plate 1). Clasp: Nil.

The award of a medal for Sir Charles Napier’s conquest of Sine was first notified, as far as the troops of the Crown were concerned, by a G.O. dated 13th July, 1845. The medal was issued with a reverse, showing part of the India Medal, dated July 18, 1843, and it is worth noting that this is the only instance of any medals for Indian service being paid for by the Crown. The notification of a similar award by the Government of India to their own troops, followed in a G.O. by the governor-general, dated September 22, 1843. The award was confined to those who had been present at either Meenane or Hyderabad, and the medals were issued on account of the Government of India. The medal that had been present, no one of course receiving more than one medal for the campaign. In addition to the land forces of the Hon. East India Company, the medal was also given to the naval officers and men of the Honourable East India Company, and the only Crown regiment that received this medal was the 22nd Foot.

The award of a medal to the troops of the Crown and the Company engaged in the Sullay Campaign of 1843 was first notified in governor-general's G.O., dated Camp, Gujwar Residency, January 4, 1845; and the queen’s permission for it to be granted to the troops of the Crown and the Company engaged in the Gujwar Operations was granted by the queen’s warrant of April 1, 1845, the reverse being established and inscribed with the first medal, made at the Calcutta Mint, the second (generally known as the "Flying Victory") was ordered in England, and it was notified that on their arrival the first medals, all of which had been distributed, could be exchanged for the second. The new issue was ready by March 13, 1845, but the recipients apparently preferred the original medals, for very few were exchanged. Both are very rare, for only 2596 medals were ever issued. The military ribbon of India is used, and the gilding of the reverse. A limited number of the small stars of the Gujwar Campaign of 1843 were presented to the officers of the 3rd Auxiliary Artillery, and a few of the captives of the captured Sikhs were given to them, but it is uncertain whether the silver star was substituted for reasons of economy. As there were fewer troops at Punnir than that star is of course the more common.

10. Sultej, 1846–47 (1st Sikh War).—Awarded by Government of India, 1845. Obverse: Head of Queen Victoria as on First China Medal. Reverse: Figure of Victory, standing with in right hand a standard, and in left hand a wreath. The stigmata of the captured Sikh weapons and armour. In exergue, name and year of the first battle of the war in which recipient was engaged. These inscriptions are given, to 2, MOODIE the right, and to the issues confined to the small portion of his army that Major-General Nott left behind him in Cabul. The medal with the No. 2 reverse is also rare, as its distribution was very limited.

ROYAL NAVY AND ROYAL MARINES ONLY.

[The medal has two clasps, the first of which is for the capture of Cabul, and the second for the capture of Punnir.]
This award, given to all the troops, both Crown and Hon. East India Company engaged in the First Sikh War, was first notified in governor-general's G.O. dated Camp, Ferozepore, December 25, 1845, but it was not until the end of January, 1846, that the medals were finally received following a delay of six months. As there was a considerable number of troops engaged in this campaign, the medal is not a very rare one, but a very rare combination is the medal with Ferozeshahr in the engraving. The date of the battle was inscribed with the number of the regiment, company, or corps to which the individual belonged. The reverse of the medal was inscribed with the字 "1st Bengal " and " 2nd Bengal " to certain local West Indian corps; and with the clasps " Fort 1 Whether in one or both actions, only one clasps each awarded. 2 A similar clasps was given with the Navy G.S. medal.
DEIG, NEPAUL, KIRKEE, POONA, KIRKEE-POONA, SINGapore, BHURTOOR, MAHEDIPOR, CORGYAUM, AVA, BHURTOOR.

This medal was awarded "to the surviving officers and soldiers of the Crown and of the East India Company" who took part in any one of the specified actions. It was made in two parts: the one in India, Nepal, and Burma, during the first twenty-five years of the 19th century, "including the officers and seamen of the Royal Navy and the Company's Marine who took part in the first Burmese War (1824-5), and the latter part on which this medal was issued, in addition to the British and Indian forces belonging to the Crown and the Company in the period 1846-79, was awarded for the "clasp" (i.e., the "India, 1851-5 Medals") which should be issued once to each individual entitled: the particular service for which it is granted being recorded upon a Bar, and every subsequent service which may be deserting to the recipient, being recorded upon an additional Bar. This plan would avoid the multiplication of Medals, which has accumulated in late years, which I humbly think is undesirable." In another letter from the Court of Directors to the Government of India, March 1, 1854, this suggestion is approved and it was ordered that after "a suitable design," had been procured (L. C. Wion designed the reverse), "the Medal to be now struck shall in character, the reverse side of which is now granted, viz. 'Pegu,' being recorded on a Bar. In the event of the same soldiers being entitled hereafter to another similar distinction, the same service, it will be recorded on an additional Bar of the same Medal." Occasional mistakes have however been made for, since the issue with the clasp for the Pegu campaign, from which time it has become customary to date the clasp, many instances have occurred over the years of having received the same clasp for different campaigns. The issue to the Persian Expeditionary Force (1855-57, with the clasp "Persia," was awarded by the Court of Directors to officers and soldiers of the Royal Navy and Royal Marines, and by the Directors of the Company, in the month. The first issue of the medal by the Crown was authorized April 15, 1859, with the clasps "North-West Frontier" and "Umbeyla," the former covering various expeditions between 1849 and 1855, and the latter for operations in 1857. The Company, by an order of this date, authorized the clasp "Kaffir," and notified in Army Order 9 of January 1903, the medal, which had meantime been superseded by the third India G.S. medal. This medal was also awarded by the Government of India, and in 1892-93, was limited in number, was only awarded ten years afterwards by King Edward VII., and notified in Army Order 9 of January 1903, the medal, which had meantime been superseded by the third India G.S. medal. The combination of clasps with this medal is very numerous, but medals with more than two or three clasps are rare. Seven is probably the greatest number awarded with any one medal, and a medal with the clasp "Kabul," "North-West Frontier," and "Iwaki 1881-77," "Burma 1885-87," "Hazara 1888," "Samana 1891," and "Hunza 1891," was granted to Bhanga Singh, Sardar Bahadur, who retired as Subadar-Major of No. 1, Duran, Mountain Battery. Sir William Lockhart (Cap.) had the medal with six clasps. The rarest of all the clasps is probably "Hunza 1891," as less than a thousand men were employed, and the majority of these were Cashmere Imperial Service Troops. No European troops received the clasps. "Loosah," "Naga 1879-80," or "Hunza 1891." "Sikkim 1888" is also a rare clasp as only some 2000 troops were employed, the only Europeans being two companies of the 2nd Bengal Infantry and the 27th Punjabis. The last issue of the medal with the clasp "Burma 1885-87," that the precedent was set of awarding the medal and clasp in bronze to "all authorized followers," a precedent that was followed in all subsequent issues.

15. India, 1855-56 (2nd India G.S., officially styled "India, 1854-56"). Awarded to the Government of India as far as the first two issues with their clasps are concerned, all subsequent issues and clasps, with the exception of the last two, by Queen Victoria; the last two issues and clasps by King Edward VII. Obverse: Head of Queen Victoria as in First India Medal. Reverse: Victory standing, crowning a naked warrior sitting. In exergue, a lotus flower and leaves, symbolizing the connexion of the medal with India. Ribbon: Red, with two blue stripes, forming five 1-inch stripes (1824-5), six 1-inch stripes (1846-79), eight 1-inch stripes (1854-56), five 1-inch stripes (1846-79), eight 1-inch stripes (1854-56). When re-issued in 1879 as a "Hindustan" (Plate II.) Clasps: 1877-78-79, 1879-78, 1877-78, 1878-79, 1879-78, 1877-78, 1879.

The command of the queen that a medal should be awarded to the survivors of the forces that had been engaged in the first, second and third Kaffir Wars (1834-35, 1846-47, and 1850-53) was notified by Viscount Hardinge, the commander-in-chief, in a G.O., dated Horse Guards, November 22, 1854. No clasps were issued with this medal. The medal was awarded only to the "regular forces" (including the Cape Mounted Rifles), so local levies did not receive it. The third Kaffir War a small Naval Brigade and a detachment of Royal Marines were engaged. In 1863-64, the second Kaffir War, a further Naval Expedition was issued a clasp for the campaign. This award was notable for which was also entitled to the clasp.

In exergue, 1813. In the exergue of the re-issued medal, the place of the date is taken by a trophy of four assegais and a Zulu shield. Ribbon: Orange, with two narrow blue stripes and two narrow red stripes (Plate II.). Clasps: 1877-78-79, 1879-78, 1877-78, 1878-79, 1879-78, 1877-78, 1879. In both the operations against the Galekas and Gaikas, and in the Zulu War of 1879, the Royal Navy and Royal Marines took part and received the Medal. The clasps issued with this medal were as noted above and record the year, or years, of service covering all the operations in which the recipient was engaged. No one received a Medal with more than one clasp. The medal without a clasp was issued to such troops as were employed in Natal from January to September 1879, but never crossed the border into Zululand.

16. South Africa, 1874-75, 1876-77, 1880-81, 1883-84, 1885-86. Awarded by Queen Victoria, 1884. Obverse: Head of Queen Victoria as in First India Medal. Reverse: Victory rowing a Roman ship, who holds a shield in his right hand, and bears on his left arm a shield on which is the figure of a lion (Plate I.). Ribbon: Red, with two narrow blue stripes and two narrow red stripes (Plate I.). Clasps: ALMA, BALA-KLAVA, INKERMANN, SEBASTOPOL, AFOZ. The last two issues and clasps were re-issued on November 9, 1885, by a commander-in-chief's G.O., dated December 15, 1885. The grant was limited to all troops landing in the Crimea up to September 9, 1855, only those who were on active service after the fall of Sevastopol being the enemy. This latter proviso applied in the main to the naval clasp AFOZ, the period for which award was extended to the end of the first year after the fall of Sevastopol. For this clasp are very ornamental, being in the shape of oak leaves, ornamented with the Royal Naval and Royal Marines, besides the AFOZ clasp, received the clasps BALA-KLAVA, INKERMANN, SEBASTOPOL. The

Royal Navy and Royal Marines.
MEDAL

largest number of clasps to any one medal is four. Certain non-combatants received the medal without a clasp.  

1. Clasp Awarded by Queen Victoria, 1856. Obverse: Head of Queen Victoria as in First China Medal Reverse: Britannia seated and holding a trident in her right hand. In the background are the BALTIC, AFRICA, and the reverse, 1884-1885. Ribbon: Silver with pale green borders (Plate I.). Clasps: Nil. 

This medal was awarded to all of the Allied Forces, both naval and military, employed in the operations in the Baltic in the years 1854 and 1855. The medal is, of course, practically a naval one, but two officers and ninety-nine men of the Royal Engineers were employed in the expedition. 

19. Turkish Crimea Medal.—Awarded by the Sultan, 1856. Obverse: A trophy composed of a field piece, a mortar, and an anchor, the reverse being an impaled imperial and national arms and a map of the Crimea spread over the wheel and breech. Behind the anchor, British, French, and Sardinian flags. The flag of the nation to which the recipient belonged is in the front with that of Turkey, the flags of the other two nationalities being at the sides. In exergue, "Crimea 1855," "La Crimee 1855," or "La Crimee 1855," according as to whether the medal was intended for British, French or Sardinian recipients. Reverse: The Sultan’s cypher, below, in Turkish, "Crimea," and the year of the Hekir, 1271. Ribbon: Crimson watered, with bright green edges (Plate I.). Clasps: Nil. 

This medal was awarded to all of the Allied Forces, both naval and military, employed in the operations in the Crimea. As the ship that conveyed a majority of the English medals was sunk, the remainder were issued indiscriminately, and a large number of the British received medals which were originally intended for other nationalities. 

This award was first noticed in an Admiralty Notice dated, January 30, 1857. It was given to the crews of Her Majesty's ships employed in Arctic exploration, and also "to the officers of the French Navy, and to such volunteers as accompanied those crews." The Hind and Téméraire were engaged in the rescue of the government and citizens of the United States; also to the "commanders and crews of the several expeditions which operated in the zeal and humanity of Her Majesty's subjects." The medals were struck in silver, and were unembossed, the recipients being authorized to have their name inscribed on the medal by their Her Majesty's government, by the Hudson's Bay Company, or from private resources. The medal is worn on the left breast and takes rank as a war medal. It is octagonal in shape, 1½ in., and has affixed to the upper edge a five-pointed star to which is attached a ring for suspension. The head of the queen, which is the work of L. C. Wyon, has never been reproduced on any other medal. 

21. India, 1857-1858. Obverse: Head of Queen Victoria as in First China Medal. Reverse: Britannia standing facing left with a lion on her right side; her right arm is extended holding out a wreath, on her knees a baton, and her left behind a shield inscribed INDIA. In exergue, 1857-1858. Ribbon: White, with two red stripes, forming five ½-inch stripes (Plate I.). Clasps: DELHI MEDAL (Plate I., to Dec. 31, 1857); DECCAN MEDAL (Plate I., to Dec. 31, 1857); RELIEF OF LUCKNOW (Nov. 25, 1857); LUCKNOW (March 2 to 21, 1858); CENTRAL INDIA (Jan. to June 1858). 

The grant of this award was first noticed in a despatch from the Court of Directors to the Government which stated that "the Queen has been graciously pleased to command that a Medal shall be granted to the troops in the Service of Her Majesty, and of the East India Company, who have, or may be, employed in the suppression of the Mutiny in India." This is the last medal given by the Honourable East India Company. The medal without clasps was issued to all who had served in the several lands and provinces of India, and the clasps enumerated above to those who shared in the operations specified. Two or three artillerymen were known to have received the medal, the former with the clasp "Delhi," and the latter with the clasp "Lucknow" and "Central India." The medal with three clasps, viz., "Delhi," "Relief of Lucknow" and "Lucknow" was given only to the 9th Lancers and the Bengal Horse Artillery, and of course in addition to this award the French emperor sent five hundred of the First China Medal. 

In addition to this award the French emperor sent five hundred of the First China Medal, to thirty-two selected non-commissioned officers and men of the army and Royal Marines, and petty officers and seamen of the Royal Navy. Only two of these medals were given to officers, viz., the duke of Cambridge and the lord lieutenant of Ireland, and of course twenty-five of these medals were presented to the king with his own medal. The king of Sardinia also distributed 450 medals to the British forces, of which 50 were given to the Royal Navy and Royal Marines, and 243 to officers and 157 to non-commissioned officers and privates of the army.

various officers who served on the staff, as, for example, Field Marshals Earl Roberts and Sir Henry Norman. With regard to the Royal Navy, there were two groups, the "Mediterranean" and the "Indian Ocean" groups, the last-named including the Pacific operations. The medal was presented by Her Majesty on a bas-relief of the Victoria Memorial, the Victoria Cross, and was accompanied by a scroll bearing the words "Victoria Cross," a gold medallion, and a silver medallion.

2. Clasp Awarded by Queen Victoria, 1868. Obverse: Bust of Queen Victoria, with diadem and veil, around an indented border, between the nine points of which are the letters A.B.Y.S.S.I.N.I.A. Reverse: Within a beaded circle the name of the recipient, "Majesty's Service," and the dates of the operations during which the recipient served. Above, NEW ZEALAND; below, VIRTUTIS HONOR. Ribbon: Blue, with a broad red stripe. 

The grant of this award to the Army was notified in an Army Order, dated March 1, 1869, and its extension to the Royal Navy and Royal Marines by an Admiralty Order, dated June 3, 1869. 

The medal was issued to those who had each served in the Mediterranean during the years 1854-1855, and was awarded to all of the Allied Forces, both naval and military, who had served in the Mediterranean during the years 1854-1855, and was awarded to all of the Allied Forces, both naval and military, who

24. West Africa, 1873-1900.—Awarded (originally as the "Ashantee" medal) by Queen Victoria in 1874, with the exception of the last issue, with clasp "1900," which was awarded by H.M. King Edward VII. Obverse: Clasps: Nil. Reverse: Britannia seated in the act of presenting a laurel wreath to a knight, with the Royal Cypher, and the word "Ashantee" on the reverse. The ribbon is green and yellow, and is divided by a broad red stripe. 

These clasps were all naval awards, but two companies of the West India Regiment also received amongst them the operations between 1854 and 1855, and in addition to this, they were also used to commemorate the operations of the Royal Marines and the Royal Navy in the Pacific operations. 

The medal was presented by Her Majesty on a bas-relief of the Victoria Memorial, the Victoria Cross, and was accompanied by a scroll bearing the words "Victoria Cross," a gold medallion, and a silver medallion.
Africa Medal' (Army Order 243, Dec. 1894) is somewhat of a misnomer, for very frequently the medal has been granted for services in Central Africa and in the Hinterland of the East Coast as well as for services on the West Coast. In all issues since the original '¢Shahistan' medal, the clasp only was given, until 1889, when the whole coin was issued; and 1899, when a new coin and clasp were issued. An exception of those issued with "Mwele, 1895" engraved on the medal, none of these medals have been issued without a clasp since the original issue for the campaign of 1873-74; and the clasp is therefore regarded as forming an integral part of the order. The obverse of the first clasp is the only one that has been issued to regimental units of the British Army as apart from the West India Regiment and local troops. The obverse of this clasp, which was carried on the right breast pocket of the uniform, is inscribed with the medal's name. This clasp was first awarded, and it is said that yellow and black (the Imperial Russian colours) were chosen as the colours of the ribbon, in compliment to his consort the grand duchess Marie of Russia.

The award of this clasp was notified in an Admiralty Order, dated Aug. 23, 1879, and the award was made to the person of every rank and class, who were serving on board Her Majesty's ships 'Alert' and 'Discovery' during the Arctic Expedition of 1879-80, and on board the yacht 'Pandora,' in her voyage to the west and return. The clasp was awarded to the rank and file by Commander (Sir Allen) Young, R.N., whose officers and crew rendered valuable services to Her Majesty's ships when in the Polar Sea. The obverse has a four-petal star, with a clasp or fife and the obverse of the medal has not been reproduced on any other. The reverse by L. C. Wyon is copied from a photograph taken during the expedition of the "Alert" and "Discovery" under Sir George Back in 1875-76.

27. Kabul to Kandahar, 1880.—Awarded by Queen Victoria, 1880. This decoration took the form of a five-pointed star, 1-9 in. across from point to point, with a ball between the points; between the ball and the star was the Imperial Crown and ring for suspension. Obverse: In the centre was a crown surmounted by the monogram of Queen Victoria, surmounted by the Khyber and Kurrum Lancers, 5th Punjab Infantry and 23rd Punjab Pioneers. The bust of the Queen by Sir Edgar Boehm, R.A., has not been reproduced on any war medals.

28. Egyptian Bronze Star, 1882-53.—Awarded by the Khedive 1882. This decoration is in the shape of a five-pointed star (1-9 in. diameter) connected by a small star and crescent to a laureated bar to which the ribbon is attached. Obverse: A front view of the Sphinx, with the desert and pyramids in the rear. Around a double band, upon which are, above, EGYPT, 1882, and below, in Arabic, "Khedive of Egypt, 1890" (the Heera date). In the second and third issues the dates are respectively altered to 1890, 1901 and 1904-86 and 1904-1; the fourth and fifth issues, Reverse: A shield surmounted by the Khedivial monogram, T. M. (Tewfik Mahomed), surmounted by a Crown and Crescent and Star. Ribbon: Dark blue (Plate I). Clasps: At War, 1882-1890; At War, 1890-1901; At War, 1901-1904; At War, 1904-1986.

This star was awarded for the same operations as was the British Egyptian medal above described, but, except for a few officers and men of the Royal Navy, the issue of the clasp TOKAR was confined to British Army officers and men of the Indian Army service.

30. Canada, 1885.—Awarded by Queen Victoria, 1885. Obverse: Head of Queen Victoria as on the West African ('Aschanté') Medal. Reverse: N.B. (for New Brunswick), a maple leaf. Ribbon: Blue-grey, with a crimson stripe on each side (Plate II). Clasps: SASKATCHEWAN.

This decoration is in the shapes of a five-pointed star, 1-9 in. diameter, and the letters of the province or territory in which the service was rendered, connected by a small star and crescent to a laureated bar to which the ribbon is attached.

Niagara Litho. Co., Buffalo, N. Y.
MEDAL

31. Canada (General Service).—Awarded, 1899. Obverse: Head of Queen Victoria, as in Third India G. S. Medal. Reverse: Within a maple wreath, the Dominion flag, above, CANADA, Ribbon: Red, with a blue centre (Plate II.). Clasps: FENJIAN RAID, 1866; FENJIAN RAID, 1870; RED RIVER, 1870. One battle of the King's Royal Rifles received this medal with the Red River Clasp. Otherwise issue confined to Canadian forces.

32. Egypt (Gurkha Medal).—Awarded by Queen Victoria, 1899. Obverse: Half-length effigy of Queen Victoria holding sceptre, by De Saulles, as in "Uganda" medal described below. Reverse: A winged Victory, seated, with on either hand, the Union Jack and the Egyptian flag. The left hand holds a laurel wreath, the right a palm branch. On a tablet below, SUDAN, and below this lotus leaves. Ribbon: Half black, half yellow, divided by a narrow red stripe. Clasps: (a) to officers of the 14th Frontier Force and the King's African Rifles. It is worthy of note that, under British command, that a contingent of Boer mounted riflemen took part in the Somaliland Campaign, within one year of the peace of Vereeniging, and received the medal and clasp. The Somaliland, 1900, clasp represents indeed a considerable campaign in which contingents from Great Britain and India took part.

33. "South African, 1899-1902."—Awarded by King Edward VII, in 1906, to officers of a Queen Victoria's death, by Army Order 94 of 1901. It was given "to all officers, warrant officers, non-commissioned officers and men, of the British, Indian and South African Forces, and Nursing Sisters, who actually served in South Africa between the dates 1899 and 1902, and a date to be fixed hereafter" (the war not being concluded) "to all troops stationed in Cape Colony and Natal at the outbreak of hostilities (Sept. 17, 1899), and to all troops who embarked or were sent thither before Dec. 14, 1899, and a date to be fixed hereafter." The last provision adds a warning of the significance hitherto attaching to "war service" for the troops at St Helena were employed in guarding Boer prisoners while the Army was absent from South Africa 1901 and 1902. Clasps were authorized as follows: BELMONT (Nov. 23, 1899); MOODER RIVER (Nov. 28, 1899); PAARDENDRIEK (Jan. 7, 1899); TALA (Nov. 3, 1899); WEPENER (April 9-25, 1900); JOHANNESBURG (May 6, 1900); DIAMOND HILL (June 11-12, 1900); BELFAST (June 26-27, 1900); WITTEBERGEN (July 1-29, 1900); DEFENCE OF SOUTH WEST AFRICA (Oct. 21, 1900); RELIEF OF KIMBERLEY (Feb. 15, 1900); DEFENCE OF MAFEKING (Oct. 13, 1899—May 17, 1900); RELIEF OF OTTOKA (Oct. 17, 1899—Feb. 19, 1900); ELANDS LAAGTE (Oct. 21, 1899); DEFENCE OF IVOROY (Nov. 3, 1899—Feb. 28, 1899); TUGELA HEIGHTS (Feb. 14—27, 1900); RELIEF OF LADYSMITH (Dec. 15, 1899—Feb. 28, 1900); LAIING'S NEK (June 2-9, 1900). Clasps: for CAPE COLONY, NATURAL ORANGE FREE STATE AND RHODESIA, were given to troops who served within the limits of the respective colonies and states named during the war, without present at any action, fought in those battles, for which a clasp was awarded. Non-enlisted men, of whatever nationality, who drew military pay, were awarded the medal in bronze instead of silver. When not worn, the ribbon was to be worn, without clasp. Volunteers and non-commissioned officers were sent to Mediterranean stations to release the troops from war, for field service were awarded (Feb. 1902) the medal without clasp, "Mediterranean" being substituted for "South Africa" on the ribbon. A clasp was also issued, to any one entitled to the Queen's Medal for South Africa.

34. The "King's" South African Medal was awarded by King Edward VII, in 1902, to be worn in addition to the "Queen's" by those who completed eighteen months' service in South Africa during the war. On the obverse of the medal is the effigy of King Edward, by De Saulles (as on the "Ashanti, 1900," Medal); the reverse is the same as that of the "Queen's" Medal. Ribbon: Red, white and orange (Plate II.). The two clasps awarded were, in accordance with the terms of the award, general in character, to wit, SOUTH AFRICA, 1901 and SOUTH AFRICA, 1902.

This is the first war medal issued by a chartered company since the close of the Company's rule in India. It was awarded to British officers and men of the British service, to the Cape Mounted Rifles, Bechuana Land and Basuto, and to the Chartered Company's own forces, engaged in the Matabeleland and Moshanialand Campaigns 1893, 1896 and 1897.

This medal was awarded to the local forces and also to officers and men of the Indian Army and Royal Navy.

38. Ashanti Star, 1896.—Awarded by Queen Victoria in 1896. Obverse: An imperial crown with "Ashanti, 1896" round it. Reverse: Inscribed "From the Queen." The star is four-pointed, and is crossed by a salute or St Andrew's cross. Ribbon: Yellow with red borders (Plate II.).

This medal was issued for the expedition against Prempeh in 1896. As there was no actual fighting, no medal was given, but sickness claimed many victims, amongst them Prince Henry of Battenberg. The decoration was issued to officers and men of the British Army, Royal Navy and local troops.

39. Ashanti Medal, 1900.—Awarded by King Edward VII, in 1901. Obverse: Head and bust of King Edward VII, in the uniform of Major General. The obverse of the medal is not illustrated in the London Times. The medal was not authorized. Clasps: KUMASSI, 1896. The decoration was given, which was worn with an AN. F. A. A. T. Clasp, together with King Edward VII. It was given only to local forces, and the British officers employed on the staff or in commands.

40. Africa General Service, 1899-1902.—Awarded by King Edward VII, in 1906. (Note: no clasp on this medal). Obverse: Reverse: as in "Uganda" Medal above described. Ribbon: Yellow, with black edges and two narrow green stripes (Plate II.). Clasps: N. NIGERIA, with various dates; S. NIGERIA, with various dates; UGANDA, 1901; JUBALAND, GAMBIA, LANGO, 1901 and 1902; JIDBALLI, KISSI, 1905; SOMALILAND, 1901 and 1902-04; BRITISH CENTRAL AFRICA, 1899-1900; ARO, 1901-02.

This medal represents an almost incessant warfare of a minor, border, and guerrilla nature, which beset the British held areas of the world. It was awarded, some awards being of course retrospective. The clasp "Jubaland" is chiefly a naval award, but all the rest are awarded to British officers and men of all arms. The "Somaliland," 1901, clasp represents indeed a considerable campaign in which contingents from Great Britain and India took part.

41. South Africa, 1899-1902.—Awarded by King Edward VII, in 1906, for "King's" service in South Africa. Obverse: Skull and crossbones issuing from a garland, and clasped by a ribbon; on an embossed background, the date 30th November 1901. Reverse: Bust of Queen Victoria, de Saulles. Reverse: Britain crowning an outstretched laurel wreath towards a body of troops, in the background, the African expeditionary force. The reverse of this clasp represents indeed a considerable campaign in which contingents from Great Britain and India took part. The ribbon of this medal is perhaps more frequently seen than any other British medal.
MEDAL

MEDAL

that of any other British war medal except those for South Africa. In 1903 the medal was re-issued with the military effigy of King Edward VII on the obverse, and the date was omitted from the reverse. The medal is issued in bronze, without clasps, to followers.

Obverse: Military effigy of the king as on Ashanti, 1900, medal. Reverse: A representation of the Potala, Ribbon: Purple-red, edged with green and white stripes (Plate II.). Clasps: GYPSY.

47. India, 1908.—A new India General Service Medal was authorized in 1908, to take the place of the medal granted by A.O. 43, 1857 to officers, and in silver to men, and in bronze to non-enlisted men of all ranks. This medal with clasp bearing the name and date was given to the troops which took part in the North Western Frontier Expedition of 1908. The ribbon is gold.

Obverse: Head and bust of the king in naval uniform, by De Saulles. Reverse: Engraved "5th Dec. 1858, and the five April. 17th 1858 Obverse, with two thin stripes near the edge (Plate II.). Clasps: SOUTH AFRICA, 1899–1902; CHINA, 1900. This medal is restricted to officers of the mercantile marine serving in chartered troop-ships. It is a sort of general service medal, clasp service are as above. Up to 1910 only the above clasps had been authorized.

49. Polar Medal (or Antarctic Medal).—Awarded by King Edward VII in 1905 to officers, and in silver to men, and in bronze to non-enlisted men of all ranks, who belonged to the Antarctic Expedition of 1910. The ribbon is gold.

First awarded to officers and men of the "Discovery" whether belonging to the Royal Navy or not. It is given with a dated clasp for Antarctic exploration service.

Other Medals and Decorations. — The above forty-nine medals are given as rewards for participating in the operations they commemorate, and issued generally to all concerned, irrespective of individual distinction or bravery. There are other classes of medals and decorations, civil as well as military, which must be grouped with them, as being allied in character. These are either (i.) awards personal to the recipient, being an acknowledgment of or reward for special individual services or good conduct (these are civil as well as military in respect of awards for bravery), or (ii.) awards that are simply of a commerative kind, though worn as war medals and for the most part given to officers and soldiers. The more important of these two classes will be named. Orders given for service or conduct are dealt with, for the most part in the article KNIGHTHOOD; but particulars are given here of certain distinctively military orders that have no knighthood rights and duties, and indeed little meaning apart from the deeds or services which led to the award—being so to speak, records of the past, rather than badges of a present membership. Individual decorations for services may be classed as (i.) for gallantry, (ii.) for special merit, and (iii.) for long service and good conduct.

1. Indian Order of Merit.—Awarded by H.E.I. Company and notified by Government of India. April 17th, 1858. Each Class:—A Gold Star, 1½ in. diameter; in the centre, in gold on a ground of dark blue enamel, crossed swords within a circle around which is the legend, REWARD OF VALOUR, the whole encircled by a gold laurel wreath. 2nd Class—Star similar to that of 1st Class, but in silver. Wreath and centre as in 1st Class. 3rd Class—Star exactly similar to that of 2nd Class, but the wreath and centre in silver, and dark blue enamel and silver, respectively. Reverse: Engraved 1st, 2nd and 3rd Class Order of Merit, respectively, but the name of the recipient is not engraved on the decoration when issued. Ribbon: Dark blue, with red edges. This decoration is to be obtained only by a "conspicuous act of individual gallantry" in the field or in the attack or defence of fortified places. It is open to all native officers or soldiers of the Indian Army, "without distinction of rank." Each Class is bestowed for the first act of gallantry for which the recipient is recommended. The 2nd Class is given only to those who possess the third, and for a second act of conspicuous gallantry. The 1st Class is given only to those who possess the 2nd Class and, after that, the recipient of the decoration receives an additional allowance equivalent in the 3rd Class to one-third, in the 2nd to two-thirds, and in the 1st to the whole of the ordinary pay of his rank, over and above what he or his personal act (when his wife, the first received) the pension for the Order of Three years after her husband’s death.

2. Victoria Cross.—Instituted by Royal Warrant, January 29, 1856. A bronze Maltese Cross, ½ in. diameter, with, in the centre, the Royal Crest (lion and crown), and below it a scroll inscribed "FOR VALOUR." There is a bronze laureated bar for suspension, connected with the crown, in black enamel, but the name, rank and corps of the recipient are engraved on the back of the laureated bar. Ribbon: Red for the army; blue for the navy. Clasp: For every additional act of bravery in connection with the same decoration.

Nothing save "the merit of conspicuous bravery" gives claim for the decoration, and it must be evinced by "some signal act of valour or devotion to their country" performed in the presence of the enemy and after the law of nations had been violated (now abrogated, but soon restored to force.). The original Royal Warrant has been supplemented by various Royal Warrants (Oct. 1857, Aug. 1860, Aug. 1861) and by an Act of Parliament so that now every grade and rank of all branches of His Majesty’s Forces, British and Colonial, are eligible, with the single exception of native ranks of the Indian army, who have an equivalent decoration in their own Order of medal. In the clasp have been inserted are not of commissioned rank, the Cross carries with it a pension of £10 a year, and an additional £5 a year for each clasp. A larger grant is sometimes given to holders of the V.C. who are in need of monitory help. In all, up to 1904, the Cross was awarded to 251 recipients (including 15 posthumous awards).

4. Distinguished Conduct (Navy).—Awarded by Royal Warrant, 7th of March 1866. Gold oval badge, enamelled in dark blue, with a monogram composed of the letters V and A, interlaced with an anchor erect, all in gold, surrounded with a garter bordered, described to be of gold "FOR GALLANTRY IN SAVING LIFE AT SEA, and surmounted by a representation of the crown of the prince consort, the whole edged with gold. Ribbon: dark blue, with two white stripes. Clasps are awarded for any subsequent act of conspicuous merit, and were by Royal Warrant of the 12th of April 1867, the decoration was re-instituted in two classes, as follows. 1st Class—Badge precisely as already described. Ribbon: Dark blue, with four white stripes (½ in. wide). Clasps: As authorized in original warrant. 2nd Class—Badge exactly similar to that of the 1st Class, except that it is entirely worked in bronze, instead of gold and bronze. Ribbon: Dark blue, with two white stripes. Clasps: As authorized for 1st Class.

The decoration is awarded only to those who "have, in saving or endeavouring to save the lives of others from shipwreck or other perils at sea, especially during a conflict, evinced "to cases of extreme and heroic daring"; the 2nd for acts which, though great courage may be shown, "are not sufficiently distinguished to deserve the 1st Class of the Order.

5. New Zealand Cross.—Instituted by an Order of the governor of New Zealand in council, 10th of March, 1869. Silver Maltese Cross with gold star on each of the four limbs and in the centre, in a circle within a gold laurel wreath, NEW ZEALAND. Above the Cross a crown in gold, and connected at the top by a V, to a silver bar ornamented with laurel in gold. The name of the recipient is engraved on reverse. Width of Cross, 1½ in. Ribbon: Crimson. Clasps: Authorized for subsequent acts of valour. In authorizing this decoration Sir G. F. Bowen, the then governor, went outside his authority, but the queen ratified the colonial order in council, and authorized "Heart and home" by it may be considered as established from that date by Her direct authority. It was, however, stipulated that the occasion was in no way to form a precedent. The award was to be for those "who may particularly have distinguished themselves in action, or devotion to their duty while on service," and only local Militia, Volunteers or Armed Constabulary, were to be eligible. No clasps were awarded.

To reward "acts of merit above the ordinary duties of the enemy." Only petty officers and seamen of the Royal Navy,

1 Now naval effigy of King Edward VII, as on Transport Service Medal.
and non-commissioned officers and privates of the Royal Marines, are eligible for this decoration. Prior to the institution of this decoration, acts of gallantry by sailors and marines were rewarded by a silver or gold medal, generally known as a "ribbon," for distinguished conduct in the field. It was instituted, viz. the "Meritorious Service" medal. If the holder be a Chief or First Class Petty Officer, or a Sergeant of Marines, the award carries with it an increase of rank. In the case of receipt of the service ends before his reaching one of those ranks, he may receive a gratuity of £20 on discharge.

7. Albert Medal (for saving life on land).—Instituted by Royal Warrant, 25th June, 1857. 1st Class—Similar to that of the 1st Class for saving life at sea, but the enamelling is in red instead of blue, and there is no anchor interlaced with the monogram V.R. Ribbon: Crimson, with two white stripes. Clasps: As authorized for 1st Class.

The conditions governing the award of this decoration are the same that govern the award for saving life at sea. Originally the award was restricted to acts of gallantry performed within British dominions, but this restriction was removed by Royal Warrant, 5th June 1895.

8. Distinguished Conduct in the Field (Colonial).—Instituted by a Royal Warrant, 24th May 1894, which was later cancelled and superseded by Royal Warrant, 31st of May 1895. Obverse: same as the 1st Class for Distinguished Conduct in the Field. Reverse: same as above, but with the following words added above the words "For Distinguished Conduct in the Field." Ribbon: Crimson, with a line of the colonial colour in the centre. Clasps: As authorized for 1st Class for Distinguished Conduct in the Field.

9. Conspicuous Service Cross.—Instituted by an Order in Council, 15th June, 1901. Silver cross, with the reverse side plain; on the cross is the centre, the Imperial and Royal Cypher, E.R.I., surmounted by the imperial crown. Ribbon: Three stripes equal width, outside white, centre blue. Clasps: none authorized.

The Conspicuous Service Cross is a decoration of such a character as to give the award the distinction of the Distinguished Conduct in the Field (Army).

10. Edward Medal.—Founded in 1907 to reward acts of courage in saving life in mines, this medal was extended in 1909 (R.W. Dec. 3) so as to be awarded to persons who, in course of industrial employment, endanger their own lives in saving or endeavouring to save the lives of others from perils incurred in connexion with such employment.

Certain important medals and decorations for saving life are not the gift of the Crown. These are allowed to be worn in uniform on the right breast. They are the medals of the Royal Humane Society, those given by the Board of Trade for gallantry in saving life at sea, the medals of the Royal National Lifeboat Institution, those of the Shipwrecked Fishermen and Mariners' Royal Benevolent Society, Lloyd's Honorary Silver Medal, Liverpool Shipwrecked and Human Society's Medals, and the Stanhope Gold Medal.

All these are suspended from a dark blue ribbon with the exception of the medals of the S.F. and M. Royal Benevolent Society, which has a light blue ribbon, and the Stanhope Gold Medal which has a broad dark blue centre, edged with yellow, and black borders. These medals are usually struck in silver or bronze, but occasionally gold ribbons are supplied. The Stanhope Gold Medal is awarded for the most gallant of all the acts of rescue for which the society have awarded medals during the year. This award has been frequently earned by officers or men of the Royal Navy. It is, in fact, the "VICTORIA CROSS" of awards of this character.

The following are decorations for special merit:

1. Order of British India.—Instituted by General Order of Governor-General of India, 17th of April, 1857. 1st Class.—A gold star of eight points radiated, 1½ in. in diameter, between the lower and upper points of the star are placed a wreath of laurel and oak. In the centre of the wreath is the baton or sceptre. The ribbon has a light blue enamel, a gold lion statant, within a band of dark blue enamel, containing in gold letters ORDER OF BRITISH INDIA, the whole encircled by a gold laurel wreath. The whole hanger is suspended by a gold loop attached by a ring to the top of the crown, and is worn round the neck, outside the uniform. Ribbon: originally sky-blue, changed to crimson 1838. 2nd Class—Gold star similar to that of the 1st class, but smaller, 1¼ in. diameter, and without the crown. The centre also is similar to that of the 1st class star, but the enamelling is all dark blue. Suspended and worn as in the 1st Class. Ribbon: As in 1st Class.

2. The Duke of Cambridge's Bombing Medal.—Instituted in 1858, this has been awarded only to those of the ordinary course native officers of the Indian Army who have, and, confined to them, is a reward for long, honourable and specially meritorious and gallant service. The 1st Class is composed exclusively of officers of and above the rank of Captains, and is awarded to a corresponding rank in the other branches of the service. The 2nd Class is open to all native commissioned officers, irrespective of rank. Originally the order was limited to 100 in the 1st Class and the same in the 2nd Class. Later, in 1895, 215 in the 1st Class and 324 in the 2nd Class. Officers in the 1st Class are entitled to the title of "Sirdar Bahadur," and receive an allowance of two rupees in addition to the pay, allowances or pension of their rank, while those of the 2nd Class are styled "Bahadar," and receive an extra one rupee per diem.

4. Special documents as regards the institution of this decoration are now to be found at the Admiralty, but only engineers were eligible for the award, and it carried no gratuity or annuity. Only six were ever awarded. When, in 1847, engineers were raised to the rank of warrant officers, officers were eligible for this decoration, but it continued. It had a ring for suspension, and was probably worn with the narrow navy blue ribbon of the "Long Service and Good Conduct Medal (Viz. the period)"

5. Meritorious Service Medal (Army and Royal Marines).—Instituted by Royal Warrant, 19th December 1845, for army only; grant extended to Royal Marines by Order in Council, 13th January 1850. Obverse: Circular, with the number in the centre, the name of the officer, and date of the Action. Reverse: FOR MERITORIOUS SERVICE, within a laurel wreath. Ribbon: Crimson for army (Plate II.); navy blue for Royal Marines. Only non-commissioned officers of or above the rank of sergeant are eligible for this decoration. It carries with it an annuity not exceeding £20 per annum; but, as the total sum available is strictly limited, the number of these medals that is issued annually is much less than the number of awards. It is probable that no man may have to wait many years before his turn comes and he receives the award. The qualification for recommendation is long, efficient and meritorious service, and need not necessarily, although in many cases it will, include the discharge of an act of conspicuous gallantry or meritorious service.

6. Conspicuous Service Medal (see Knight-hood) is given only to officers (and naval and military officials of officer rank, not including Indian native officers) for services in war. Often it is the reward of actual conspicuous gallantry under fire, but its purpose, as defined in the Royal Warrant instituting the order, is to reward "individual instances of meritorious or distinguished service in war," and the same document declares that only those shall be eligible who "have performed in the course of their official duties or distinguished service in the field, or before the enemy." In the main, therefore, it is awarded for special services in war, and not for acts of conspicuous gallantry. The Royal Humane Society and the Victorian Cross are, however, considered to be of the same class as the Conspicuous Service Medal, and are generally awarded for acts of conspicuous gallantry. It is a fact generally rendered in action, the order is in no sense a sort of second class of the Victoria Cross. Like the latter, the Distinguished Service Order is generally referred to by its initials.

7. The Royal Red Cross is also an Order. Membership is restricted to women (not necessarily British subjects), and is given as a reward for naval or military nursing service. Instituted 1883.

8. The Kaiser-I-Hind Medal is given for public services in India. The Volunteer Officers' Decoration was instituted in 1892. An oval of silver, crossed at intervals with gold, in the centre the monogram V.R. and crown in gold. Worn from a ring. Ribbon: Dark blue.

This decoration was instituted in 1892, and is the reward of twenty years' service in the commissioned ranks of the volunteer force. It is generally called the "V.D. Since the conversion of the Volunteer Force into the "V.O. Full Dress" in 1901, it is superseded by THE TERRITORIAL OFFICERS' DECORATION. Officers of the Royal Naval Reserve and of the Royal Naval Volunteer Reserve are eligible for a similar decoration (1910.).

This is a reward for "long service with irreproachable character and conduct," the qualifying period of service being 18 years.

Now naval effigy of King Edward VII., as on Transport Service medal.

Other "Meritorious" or "Long Service" medals worn with a ribbon by a gold star have been given to men of the H.E.I. Company's European troops and the Meritorious and Long Service medals of the Indian Native Army.

Now replaced by military effigy of King Edward VII.
9. The Long Service and Good Conduct (Navy) Medal was instituted in 1869. Obverse: A bust of Britannia. Reverse: An anchor in a frame. This was designed for LONG SERVICE IN THE NAVAL FORCE.

10. The Volunteer Long Service Medal.—Instituted in 1894. Has a green ribbon. Obverse: Effigy of Queen Victoria. Reverse: A figure of a griffin with a shield inscribed "FOR LONG SERVICE IN THE VOLUNTEER FORCE." Replaced by the Territorial Long Service Medal (1908), of which the ribbon is green with a yellow centre; and the obverse a bust of the queen. The Militia Long Service Medal (1898) is light blue ribbon, on which is a crowned lion, also a "Best" Medal for the Indian Native Army, which has an orange ribbon.

12. The Medal for Naval Gunnery was instituted in 1904. Ribbon: Red centre, flanked by two narrow white stripes, two broad blue stripes at edges (Plate II).

Amongst medals of the last class may be mentioned the Jubilee Medal of 1887, the Coronation Medal of 1902, the Royal Victoria Medal (this, however, is a sort of class medal of the Royal Victorian Order, for which see Knighthood) and the medals awarded for Durbars.

United States.—The war medals and decorations of the United States, although few in number, are interesting, as they are the only examples of the modern system. They are (as far as we know) divided into two classes—those granted in Peace and those granted in War.

The principal military decoration of the United States is the "Medal of Honor," which was founded for the reward of unusual bravery or special good conduct during the Civil War. In its present form it is a circular medallion in silver, bearing a head of Minerva and round it the United States of America in relief. On each ray of the star is an oak-leaf, and the points themselves are trefoil shaped. A laurel wreath, in green enamel, encircles the whole, and this wreath is surmounted by Valor, which in turn is surmounted by an eagle that attaches the decoration to its ribbon. This last is blue, with thirteen white stars worked on it in silk. Accompanying this decoration there is a small similar medallion, suspended by a ribbon, in which bear a head of Minerva standing, with her left hand resting upon a consul's fasces and her right warding off with a shield the figure of Discord. The background was formed by thirty-four stars.

The original form of the decoration had no encircling wreath; on the rays instead of the oak-leaves, were small wreaths of laurel and oak, and the design in the central medallion was a figure of Minerva standing, with her left hand resting upon a consul's fasces and her right warding off with a shield the figure of Discord. The background was surmounted by a trophy of crossed guns, swords, &c., with eagle above, and the ribbon was designed of the national colours, as red, white, and blue, with alternate red and white stripes, and across the ribbon at the top a broad band of blue (palate gules and argent and a chief azure). The ribbon was attached to the coat by a clasp badge bearing two cormorants and the arms of the United States enclosed in a laurel wreath. This decoration does not have this badge, but is suspended from a concealed bar brooch.

Another special decoration is the "Merit" Medal. This bears on the obverse a crossed sword and shield, supported by ET AVDACIE MONUMENTVM ET PRÆÆMVM, and on the reverse the inscription FOR MERIT, surrounded by an oak-leaf wreath; in the upper part of the exergue is UNITED STATES ARMY, in the lower thirteen stars. The ribbon is red, white and blue, in six stripes, two red stripes divided by a fine white line in the centre, two white on either side of the red and two blue forming the top and outer edges.

We come now to war medals proper, issued generally to all those who took part in the events commemorated.

The Civil War Medal bears on the obverse the portrait of Lincoln, surrounded by the inscription "President of the United States," and on the reverse the words "IN MEMORY OF THE OVERSEAS DEEDS AND DEATHS OF THE U.S. VOLUNTEERS—WITH MALICE TOWARDS NONE, WITH CHARITY FOR ALL." On the reverse is the inscription THE CIVIL WAR, 1861-1865 surrounded by a wreath of oak leaves and olive branches. The ribbon is somewhat similar to that last described; the blue stripe, however, is in the centre, divided as before by a white line, and the red stripes form the outer edges.

The Purple Heart Medal is bestowed on soldiers from the fact that their reverse was copied on other medals, this making it, in a sense, a "general service" medal. On the obverse is a medallion in war costume bearing a spear, in the upper part of the exergue the word "VETERAN," and under it "WITH A WOUND RECEIVED IN THE SERVICE OF THE UNITED STATES." The ribbon is of a similar kind to the former.

On the reverse is composed of (a) an eagle perched on a cannon, supported by a shield with the arms of the United States, rifles, Indian shield, spear and arrows, Filipino dagger and Cuban machete; (b) below this trophy the words FOR THE Distinguished Service of the United States, below, the date 1898, with, on one side of it, a branch of the tobacco-plant, and on the other a sugar-cane. Reverse: As for "Indian Wars" Medal. Ribbon: Centre golden-yellow, with two narrow blue stripes at the edges, the edges themselves being narrow stripes of blue.

The Philippines Insurrection Medal bears on the obverse a medallion, on the right side of a tree of life, and on the left side a warlike device. On the reverse the inscription for PATRIOTISM, FOR FRATERNITY, AND LOYALTY, surrounded by a wreath of oak-leaves (typing the North) and palm branches (typing the South). The ribbon is of a similar kind to the former, but with, on the left, a stripe of blue, the blue being nearest the edge and the red nearest the centre.

The China Relief Medal bears on the obverse a Chinese dragon surrounded by a border, and on the reverse is the words "FOR ACTING AS A RELIEF EXPEDITION, and at bottom, the date 1900-1. Reverse: As for "Indian Wars" medal. Ribbon: Lemon-yellow, with narrow blue edges.

It is interesting to note in the case of two of these medals the national colours of the enemy (Spain and China) furnish those of the ribbon. The national colours adopted by the Filipinos were red and yellow, and, as a sort of negation, the blue, which is the so-called "Congressional" Medals. The Indian ribbon is, similarly, of the colour of the enemy's war paint—vermilion. See, for illustrations and further details of all the medals and decorations, Journal of the [U.S.] Military Service Institution, May-June 1909. Some of the badges of membership of associations of veterans, such as the Loyal Legion, are allowed to be worn as war medals in uniform.

The "Rescue Medal, in gold or silver, is awarded for bravery in saving life by land or sea.

Other States.—As has been mentioned above, foreign decorations for military service usually take the form of Orders in many classes. There are, however, numerous long service decorations, which need not be specified. The most famous of the European war and service decorations are the Prussian Iron Cross, the French Médaille Militaire, and the Russian St. George Cross; all these are individual decorations.

The Iron Cross is the most famous decoration for distinguished service in war. It was founded, in the enthusiasm of the War of Liberation movement, on the 10th of March 1813, and revived at the outbreak of the War for Unity against France, 19th of July 1870. The cross is a Maltese cross of cast iron edged with silver. The 1813-15 crosses have the initials F. W. (Friedrich Wilhelm) in the centre, a crown in the upper limb of the cross, and the date below. Those of 1870 have W. (Wilhelm) in the centre, a crown on the upper and date on the lower limb of the cross. There are certain distinctions between the Grand Cross, which is worn at the neck, the 1st Class Cross, which is worn as an Order suspended from a ribbon, and the 2nd Class Cross, which is worn on the breast. In 1870 war medals were given, bearing on the obverse a Maltese cross superposed on a many-pointed star, and having in its centre a cross. The reverse has K, and a crown, with, for combatants, the words Für Kriegstheere im Kriege, and for non-combatants Für Pflichttreue im Kriege, in each case surrounded by the words Gott war mit uns: Whe die Ehre. The award of the Iron Cross (except the rank and file category) is accompanied by the reverse of 3 medals monthly.

(H.L.S.; C.F.A.)

MEDEA (Gr. Μήδεα), in Greek legend, a famous sorceress, daughter of Aeetes, king of Colchis. Having been thrown into prison by her father, who was afraid of being injured by her witchcraft, she escaped by means of her art and fled to the temple of Helios the Sun-god, her reputed grandfather. She fell in love with Jason the Argonaut, who reached Colchis at this time, and exacted a terrible revenge for his faithlessness (see ARGONAUTS and JASON). After the murder of Jason's
second wife and her own children, she fled from Corinth in her car drawn by dragons, the gift of Helios, to Athens, where she married king Aegeus, by whom she had a son, Medus. But the discovery of an attempt on the life of Theseus, the son of Aegeus, forced her to leave Athens (Apollo dorus i. 9, 28; Pausanias ii. 3, 6-11; Diod. Sic. iv. 45, 46, 54-56). Accompanied by her son, she returned to Colchis, and restored her father to the throne, of which he had been deprived by his own brother Perseus. Medus was regarded as the eponymous hero and progenitor of the Medes. Medea was honoured as a goddess at Corinth, and is said to have become the wife of Achilles in the Elysian fields. The chief seat of her cult, however, was Thessaly, which was always regarded as the home of magic. As time went on her character was less favourably described. In the case of Jason and the Argonauts, she plays the part of a kindly, good-natured fairy; Euripides, however, makes her a barbarous priestess of Hecate, while the Alexandrian writers depicted her in still darker colours. Some authorities regard Medea as a lunar divinity, but the ancient conception of her as a Thessalian sorceress is probably correct. The popularity of the story may be accounted for by the survival of the tale of the murderer of Medea in so large a amount of literature on the subject. The original story was probably contained in an old epic poem called Μεδεία τούτης, the authorship of which was ascribed to Proclus of Phocaea. It is given at some length in the fourth Pythian ode of Pindar, and forms the subject of the Argonautica of Apollonius Rhodius. There is a touching epistle (Medea to Jason) in the Περίκλεια of Ovid. Medea is the heroine of extant tragedies of Euripides and Seneca; those of Aeschylus and Ennius (adapted from Euripides) are lost. Neophron of Sicyon and Melaniphes wrote plays of the same name. Among modern writers on the same theme may be mentioned T. Cornelle, F. Grillparzer and M. Cherubini (opera).

The death of Glauc and the murder of her children by Medea was frequently represented in ancient art. In the famous picture of Tomomachus of Byzantium Medea is deliberating whether or not she shall kill her children; there are copies of this painting in the mural decorations of Herculaneum and Pompeii.

See Léon Mallinger, Médée: étude sur la littérature comparée, an account of Medea in Greek, Roman, middle age and modern literature (1888); and the articles in Daremberg and Saglio’s Dictionnaire des antiquités et Roscher’s Lexikon der Mythologie.

MEDELLIN, a city of Colombia and capital of the department of Antioquia, 150 m. N.W. of Bogota, on a plateau of the Central Cordillera, 4823 ft. above sea-level. Pop. (1906 estimate), 50,000. Medellin, the foundation of which dates from 1674, stands in the valley of the Force, a tributary of the Cauca, and is reputed to be one of the healthiest as well as one of the most attractive cities of the republic. It has a university, national college, school of mines and other educational institutions, assaying and refining laboratories, a public library and a mint. The principal industry of the surrounding country is mining, and gold and silver are exported in considerable quantities. Coffee and hides are also exported, but the trade of the city has been greatly impeded by difficulties of transportation. A railway from Puerto Berrio, on the Magdalena, was begun many years before the end of the 19th century, but political and financial difficulties interposed and work was suspended when only 43 m. were finished. The completion of the remaining 80 m. was part of a larger scheme proposed in 1906 for bringing the Cauca Valley into railway communication with the main line.

MEDENBLIK, a seaport of Holland, on the Zuider Zee, the terminus of a branch railway from Hoorn, 103 m. S. Pop. (1903), 3912. Once the capital of West Friesland and a prosperous town, many of its streets and quays are now deserted, though the docks and basins constructed at the end of the 16th and beginning of the 17th centuries could still afford excellent accommodation for many ships. Close to the harbour entrance stands the castle built by Florens V., count of Holland, in 1285. It has been restored, and is used as a court of justice. The West church, formerly called after St Boniface, the apostle of Germany, was once the richest in Friesland, and belonged from an early date to the cathedral chapter at Utrecht, where, until the Reformation, the pastor of Medemblik had a seat in the cathedral. It contains the tomb of Lord George Murray (q.e.). Among the public buildings are the town-hall (17th century), weigh-house, orphanage, the old almshouse, the house (1613) of the Water Commissioners, and a large building formerly belonging to the admiralty and now used as a state lunatic asylum. There are many interesting brick houses, dating chiefly from the same period as the 17th century, with curious gables and picturesque ornamentation, carving and inscriptions.

MEDFORD, a city, including several villages, of Middlesex county, Massachusetts, U.S.A., on the Mystic river and Lakes, 5 m. N. by W. of Boston. Pop. (1900), 18,244, of whom 4327 were foreign-born; (1910 census) 23,150. The city is served by the Southern Division and a branch of the Western Division of the Boston & Maine railroad, and is connected with Boston and neighbouring cities by electric railways. The Mystic River, a tidewater stream, is navigable for small craft as far as Medford (1895); a canal (1762-1768) was constructed in the same year. The local industries include the manufacture of boots, shoes, barrels, boxes, bicycles, carriages and wagons, food products, iron and steel building materials and machinery. The city covers a land area of about 8 sq. m., along the Mystic river, and extending to the hills. The western portion borders the Upper and Lower Mystic Lakes, which are centres for boating. In the north-west portion of Medford is a part of the Middlesex Fells, a heavily wooded reserve belonging to the extensive Metropolitan Park System maintained by the state. The broad parkways of this system also skirt the Mystic Lakes, and here is the greater part (1907, 267 out of 291 acres) of the grounds of the Massachusetts Audubon Society. These are filled with picturesque scenery and flowers, and are open to the public.

Medford has a public library of about 35,000 volumes, housed in the colonial residence (reconstructed) of Thatcher Magoun. The city has also a city hall, a high school and manual training school, an opera house, and one of the handsomest armory buildings in the country (the home of the Lawrence Light Guard), presented by General Samuel C. Lawrence (b. 1832), a liberal benefactor of Medford institutions and the first mayor of the city (1862-1864). The Salem St.burying Ground, dating from 1685, is one of the oldest burial places in America. The Medford Historical Society maintains a library and museum in the birthplace of Lydia Maria Child. Medford is the seat of Tufts College, planned and founded as a Universalist institution in 1852 by Hosea Ballou, its first president, and others, and named in honour of Charles Tufts (1718-1786), a successful manufacturer, who gave the land on which it stands. The college, which had 1120 students and 217 instructors in 1909, comprises a college of letters, a divinity school, and a school of engineering (all in Medford), and medical and dental schools in Boston; it is now undenominational. Among the twenty college buildings, the Barnum Museum of Natural History (1889), constructed by the Medford Savings Bank, and the Eaton Memorial Library (1907), presented by Mrs Andrew Carnegie in memory of her pastor, are noteworthy. The college endowment amounted in 1908 to $2,500,000.

Medford was first settled in 1630. A considerable portion of its area formed the plantation of Matthew Cradock (d. 1641), first governor of the Massachusetts Bay Company, who in 1630

A prominent Loyalist, whose estate was seized during the War of Independence, but was restored to his heirs about 1800. He endowed the first professorship of law in America—at Harvard College.
MEDHANKARA—MEDIA

sent out agents to settle his lands. John Winthrop's "Ten Hills Farm," partly within the present limits of Medford, was settled soon afterwards. One of the earliest industries was ship-building, John Winthrop's "Blessing of the Bay," built on the Mystic in 1631-1632, being one of the first keels laid on the continent. In 1802 Thatcher Magoun began building sea-going vessels, and many of the famous privateers of the War of 1812 were constructed here. By 1845 Medford employed fully a quarter of all the shipwrights of the state. The industry gradually lost its importance after the introduction of steamships, and the last keel was laid in 1873. Another early industry was the tinning of copper; this was carried on here, especially by the Hall family and, after about 1830, by the Lawrence family, but was discontinued in 1905. The manufacture of brick and tile was an important industry in the 17th century. The Cradock bridge, the first toll-bridge in New England, was built across the Mystic in 1638; over it for 150 years ran the principal thoroughfare, from Boston to Maine and New Hampshire. The course of Paul Revere's ride lay through Medford Square and High Street, and within a half-hour of his passage the Medford minute men were on their way to Lexington and Concord, where they discharged their parts in the engagements with the British. After the Battle of Saratoga many of Burgoyne's officers were quartered here for the winter. The Middlesex Canal was opened through Medford in 1803, and the Boston & Lowell railroad (now the southern division of the Boston & Maine) in 1831. Medford was chartered as a city in 1852.

See Charles Brooks, History of the Town of Medford (Boston, 1855; enlarged by J. M. Usber, Boston, 1886); Historical Register of the Medford Historical Society (1898 et seq.); Proceedings of the 75th Anniversary of the Settlement of Medford (Medford, 1905); S. A. Drake, History of Middlesex County (2 vols., Boston, 1880) and Helen Tilden Wild, Medford in the Revolution (Medford, 1903).

MEDHANKARA, the name of several distinguished members, in medieval times, of the Buddhist order. The oldest flourished about A.D. 1200, and was the author of the Vinaya Artha Samuccaya, a work in the Sinhalese language on Buddhist canon law. Next to him came Arahanta Medhankara, who presided over the Buddhist council held at Polonnaruwa, then the capital of Ceylon, in 1250. The third Vanaratanaka Medhankara, flourished in 1280, and wrote a poem in Pali, Jina Carita, on the life of the Buddha. He also wrote the Pravrajya Siddhi. The fourth was the celebrated scholar to whom King Parakrama Bahu IV. of Ceylon entrusted in 1397 the translation from Pali into Sinhalese of the Jataka book, the most voluminous extant work in Sinhalese. The fifth, a Burmese, was called the Sangharaja Nava Medhankara, and wrote in Pali a work entitled the Loka Padipa Sdra, on cosmogony and allied subjects.

See the Journal of the Pali Text Society, 1882, p. 126; 1886, pp. 62, 67; 1890, p. 63; 1896, p. 43; Maddoorsa, ch. xl, verse 343. (T. W. K. D.)

MEDHURST, WALTER HENRY (1796-1857), English Congregationalist missionary to China, was born in London and educated at St Paul's school. He learned the business of a printer, and having become interested in Christian missions he sailed in 1816 for the London Missionary Society's station at Malacca, which was intended to be a great printing-centre. He became proficient in Malay, in a knowledge of the written characters of Chinese, and in the colloquial use of more than one of its dialects. He was ordained at Malacca in 1819, and engaged in missionary labours, first at Penang, then at Batavia, and finally, when peace was concluded with China in 1824, at Shanghai. There he continued till 1856, laying the foundations of a successful mission. His principal labour for several years, as one of a committee of delegates, was in the revision of existing Chinese versions of the Bible. The result was a version (in High Wén-li) marvellously correct and faithful to the original. With John Stronach he also translated the New Testament into the Mandarin dialect of Nanking. His Chinese-English and English-Chinese dictionaries (each in 2 vols.) are still valuable, and to him the British public owed its understanding of the teaching of Hung-Sew-Tsuen, the leader of the Tai-ping rising (1851-64). The university of New York conferred upon him in 1843 the degree of D.D. Medhurst left Shanghai in 1856 in failing health, and died two days after reaching London, on the 24th of January 1857. His son, Sir Walter Henry Medhurst (1822-1889), was British consul at Hankow and afterwards at Shanghai.

MEDIA, the ancient name of the north-western part of Iran, the country of the Medes, corresponding to the modern provinces of Azerbaijan, Ardalan, Irak Ajemi, and parts of Kurdistan. It is separated from Armenia and the lowlands on the Tigris (Assyria) by the mighty ranges of the Zagros (mountains of Kurdistan; in its northern parts probably called Chaprau, Plin. v. 98), and in the north by the valley of the Araxes (Aras). In the east it extends towards the Caspian Sea; but the high chains of mountains which surround the Caspian Sea (the Parachoas of the ancients and the Elburz, separate it from the coast, and the narrow plains on the border of the sea (Gilan, the country of the Gelae and Amardi, and Mazendaran, in ancient times inhabited by the Tapuri) cannot be reckoned as part of Media proper. The greater part of Media is a mountainous plateau, about 3000-5000 ft. above the sea; but it contains some fertile plains. The climate is warm, with cold winters, and the rains come in long, steady downpours, and the dampness and heat of summer are less felt on the coasts and shores of the Caspian, where the mountains are covered with a rich vegetation. Media contains only one river, which reaches the sea, the Sefid Rud (Amardus), which flows into the Caspian; but a great many streams are exhausted after a short course, and in the north-west is a large lake, the lake of Urmia or Urmiā.1 From the mountains in the west spring some great tributaries of the Tigris, viz. the Dīyāla (Gyndes) and the Kerkeh (Choaspes). Towards the south-east Media passes into the great central desert of Iran, which eastwards of Rhagae (mod. Rai, near Teheran), in the region of the "Caspian gates," reaches to the foot of the Elburz chain. On a tract of about 150 m. the western part of Iran is connected with the east (Khorasan, Parthynia) only by a narrow district (Choarene and Comisene), where human dwellings and small villages can exist.

The people of the Medes, Medes (the Greek form Μῆδος is Ionic for Μάδος) appear in history first in 836 B.C., when the Assyrian conqueror Shalmaneser II. in his wars against the tribes of the Zagros received the tribute of the Amadi (this form, with prophetic ϑ, which occurs only here, has many analogies in the names of Iranian tribes). His successors took many expeditions against the Medes (Medai). Sargon in 715 and 713 subjected them "to the far mountain Bikini," i.e. the Elburz (Demavend) and the borders of the desert. They were divided into many districts and towns, under petty local chieftains; from the names which the Assyrian inscriptions mention, we learn that they were an Iranian tribe and that they had already adopted the religion of Zoroaster. In spite of different attempts of some chieftains to shake off the Assyrian yoke (cf. the information obtained from prayers to the Sun-god for oracles against these rebels: Knudtzon, Assyrische Gebete aus den Sennengötten). Media remained tributary to Assyria under Sargon's successors, Sennacherib, Esar-haddon and Assur-bani-pal.

Herodotus, i. 101, gives a list of six Median tribes (γαέας), among them the Paratraceni, the inhabitants of the mountainous highland of Paratracena, the district of Išahān, and the Magoi, i.e. the Magians, the hereditary caste of the priests, who in Media took the place of the "fire-kindlers" (αφρασιανοί) of the Zoroastrian religion, and who spread from Media to Persia and to the west. But the Iranian Medes were not the only inhabitants of the country. The names in the Assyrian inscriptions prove that the tribes in the Zagros and the northern parts of Media were not Iranians nor Indo-Europeans, but an aboriginal population, like the early inhabitants of Armenia, perhaps connected with the numerous tribes of the Caucasus.

1 Anc. Mantiane, Strabo xi. 529; Martiane, Ptol. vi. 2, 5, probably identical with the name Matiane, Matiene, by which Ptolemy i. 180, 202, iii. 94, v. 49, 52 (lines 72 and 73) they perhaps intended to be a different people in Asia Minor); Polyb. v. 44, 9; Strabo i. 49, ii. 73, xi. 509, 514, 523, 525; Plin vi. 48, designate the northern part of Media.
We can see how the Iranian element gradually became dominant: princes with Iranian names occasionally occur as rulers of these tribes. But the Gaece, Tapuri, Cadusii, Amardi, Utii and other tribes in northern Media and on the shores of the Caspian were not Iranians. With them Polibius v. 44, 9, Strabo xi. 507, 508, 514, and Pliny vi. 46, mention the Anarici, whom they consider as a particular tribe; but in reality their name, the "Not-Arians," is the comprehensive designation of all these small tribes.

In the second half of the 7th century the Medians gained their independence and were united by a dynasty, which, if we may trust Herodotus, derived its origin from Deioces (q.e.), a Median chief in the Zagros, who was, with his kinsmen, transported by Sargon to Hamath (Hamah) in Syria in 715 B.C. The kings, who created this Median Empire, were Phraortes and his son Cyaxares. Probably they were chieftains of a nomadic Median tribe in the desert, the Manda, mentioned by Sargon; for the Babylonian king Nabonidus designates the Medians and their kings always as Manda. The origin and history of the Median Empire is quite obscure, as we possess almost no continuous annalistic information, and not a single tablet or inscription from Media itself. Our principal source is Herodotus, who wrongly makes Deioces the first king and uniter of the whole nation, and dates their independence from c. 710—i.e., from the time when the Assyrian supremacy was at its height. But his account contains real historical elements, whereas the story which Ctesias gave (a list of nine kings, beginning with Arbaces, who is said to have destroyed Nineveh about 880 B.C., preserved in Diod. ii. 32 sqq. and copied by many later authors) has no historical value whatever, although some of his names may be derived from local traditions. According to Herodotus, the conquests of Cyaxares were interrupted by an invasion of the Scythians, who founded an empire in western Asia, which lasted twenty-eight years. From the Assyrian prayers to the Sun-god, mentioned above, we learn that the Median dynasts, who tried rebellions against the Assyrians in the time of Esar-haddon and Assur-bani-pal, were allied with chieftains of the Cimmerians (who had come from the northern shore of the Black Sea and invaded Armenia and Asia Minor), of the Sapardas, Ashguza and other tribes; and from Jeremiah and Zephaniah we know that a great invasion of Syria and Palestine by northern barbarians really took place in 626 B.C. With these facts the traditions of Herodotus must, in some way be connected; but at present it is impossible to regain the history of these times. The only certain facts are that in 606 Cyaxares succeeded in destroying Nineveh and the other cities of Assyria (see PHRAORTES AND DEIOCES).

From then the Median king ruled over the greatest part of Iran, Assyria and northern Mesopotamia, Armenia and Cappadocia. His power was very dangerous to their neighbours, and the exiled Jews expected the destruction of Babylonia by the Medes (Isa. xxi., xiv., xxi.; Jerom. l. ii.). When Cyaxares attacked Lydia, the kings of Cilicia and Babylon intervened and negotiated a peace in 585, by which the Halys was established as the boundary. Nebuchadrezzar married a daughter of Cyaxares, and an equilibrium of the great powers was maintained till the rise of Cyrus.

About the internal organization of the Median Empire we know only that the Greeks derive a great part of the ceremonial of the Persian court, the costume of the king, &c., from Media. But it is certain that the national union of the Median clans was the work of their kings; and probably the capital Ecbatana (see EPHRATA) was to the Persians a new creation.

By the rebellion of Cyrus, king of Persia, against his suzerainAstyages, the son of Cyaxares, in 553, and his victory in 550, the Medes were subjected to the Persians. In the new empire they retained a prominent position; in honour and war they stood next to the Persians; the ceremonial of their court was adopted by the new sovereigns who in the summer months resided in Ecbatana, and many noble Medes were employed as officials, satraps and generals. After the assassination of the usurper Smerdis, a Mede Fravartish (Phraortes), who pretended to be of the race of Cyaxares, tried to restore the Median kingdom, but was defeated by the Persian generals and executed in Ecbatana (Darius in the Behistun inscr.). Another rebellion, in 499, against Darius II. (Xenophon, Hellen. i. 2, 19) was of short duration. But the non-Aryan tribes of the north, especially the Cadusians, were always troublesome; many abortive expeditions of the later kings against them are mentioned.

Under the Persian rule the country was divided into two satrapies. The south, with Ecbatana and Rhagae (Rai), Media proper, or "Great Media," as it is often called, formed in Darius' organization an eleven satrapy (Herodotus iii. 92), together with the Parthians and Ctesiphon; the north, the district of Matiane (see above), together with the mountainous districts of the Zagros and Assyria proper (east of the Tigis) was united with the Alarodians and Saspirians in eastern Armenia, and formed the eighteenth satrapy (Herod. iii. 94; cf. v. 49, 52, vii. 72). When the empire decayed and the Carduchi and other mountainous tribes made themselves independent, eastern Armenia became a special satrapy, while Assyria seems to have been united with Media; therefore Xenophon in the Anabasis ii. 4, 27; iii. 5, 15; vii. 8, 25; cf. iii. 4, 8 sqq., always designates Assyria by a toponym or a non-Aryan.

Alexander occupied Media in the summer of 330; in 328 he appointed Atropates, a former general of Darius (Arrian iii. 8, 4), as satrap (iv. 13, 3, vi. 29, 3), whose daughter was married to Perdiccas in 324 (Arrian vii. 4, 5). In the partition of his empire, southern Media was given to the Macedonian Peithon; but the north, which lay far off and was of little importance for the generals who fought for the inheritance of Alexander, was left to Atropates. While southern Media with Ecbatana passed to the rule of Antigonus, and afterwards (about 310) to Seleucus I, Atropates maintained himself in his satrapy and succeeded in founding an independent kingdom. Thus the partition of the country, which the Persian had introduced, became lasting; the north was named Atropatene (in Plin. vii. 2, Atrapatene; in Ptolem. vi. 2, 5, Tropatene; in Polyb. v. 44 and 55 corrupted in τα σααρτανεα καλωδωμενα) after the founder of the dynasty, a name which is preserved in the modern Azerbaijan; cf. Nöldke, "Atropatene," in Zeitschrift der deutschen morgenl. Gesellschaft, 34, 692 sqq. and Marquart, Erannoshur, p. 193 sqq. The capital was Gazaca in the central plain, and the strong castle Varsha by the river Taces (see Xerxes, xii. 26; Plut. Anton. 38; Ptol. vi. 2, 10) or Vera (Strabo xi. 53), probably identical with the great ruin Takhti Suleiman, with remains of Sassanid fire-altars and of a later palace. The kings had a strong and warlike army, especially cavalry (Polyb. v. 55; Strabo xi. 253). Nevertheless, King Artabazzen was forced by Antiochus the Great in 220 to conclude a disadvantageous treaty (Polyb. v. 53), and in later times the rulers became in turn dependent on the Parthians, on Tigranes of Armenia, and in the time of Pompey who defeated their king Darius (Appian, Mithr. 108), on Antinous (who invaded Atropatene) and on Augustus of Rome. In the time of Strabo (A.D. 17), the dynasty existed still (p. 523); in later times the country seems to have become a Parthian province.

Atropatene is that country of western Asia which was least of all influenced by Hellenism; there exists not even a single coin of its rulers. But the opinion of modern authors—that it had been a special refuge of Zoroastrianism—is based upon a wrong etymology of the name (which is falsely explained as "country of fire-worship"), and has no foundation whatever. There can be no doubt that the kings adhered to the Persian religion; but it is not probable that it was deeply rooted among their subjects, especially among the non-Aryan tribes.

Southern Media remained a province of the Seleucid Empire for a century and a half, and Hellenism was introduced everywhere. "Media is surrounded everywhere by Greek towns, in pursuance of the plan of Alexander, which protect it against the neighbouring barbarians," says Polibius (x. 27). Only Ecbatana retained its old character. But Rhagae became a Greek town, Europolis; and with it Strabo (xi. 524) names Laodicea, Amaean, Heraclea or Achaia (cf. Plin. vi. 48). Most of them were founded
by Seleucus I. and his son Antiochus I. In 221, the satrap Molon tried to make himself independent (there exist bronze coins with his name and the royal title), together with his brother Alexander, satrap of Persis, but they were defeated and killed by Antiochus the Great. In the same way, in 161, the Median satrap Timarchus took the diadem and conquered Babylonia; on his coins he calls himself "the great king Timarchus"; in the next year the legitimate king, Demetrius I., succeeded in subduing the rebellion, and Timarchus was slain. But with Demetrius I. the dissolution of the Seleucid Empire begins, which was brought on chiefly by the intrigues of the Romans, and shortly afterwards, about 150, the Parthian king, Mithradates I. (q.v.), conquered Media (Justin xii. 6). From this time Media remained subject to the Arsacids, who changed the name of Rhagae, or Europus, into Arsacida (Strabo xi. 324), and divided the country into five small provinces (Isidorus Charac.). From the Arsacids or Parthians, it passed in A.D. 226 to the Sassanids, together with Atropatene. By this time the old tribes of Aryan Iran had lost their character and had been amalgamated into the one nation of the Iranians. The revival of Zoroastrianism, which was enforced everywhere by the Sassanids, completed this development. It was only then that Atropatene became a principal seat of fire-worship, with many fire-altars. Rhagae now became the most sacred city of the empire and the seat of the head of the Zoroastrian hierarchy; the Sassanid Avesta and the tradition of the Parsees therefore consider Rhagae as the home of the family of the Prophet. Henceforth the name of Media is used only as a geographical term and begins to disappear from the living language; in Persian traditions it occurs under the modern form Mâh (Armen. Mai; in Syriac the old name Modai is preserved; cf. Marquart, Eranskraft, 18 seq.).

For Mahomedan history see Caliphate; for later history Seljuks and Persia,

MEDIATION (Lat. mediatus, middle), in the international sense, the intervention of a third power, on the invitation or with the consent of two other powers, for the purpose of arranging differences between the latter without recourse to war. Mediation may also take place after war has broken out, with a view to putting an end to it on terms. In either case the mediating power negotiates on behalf of the parties who invoke or accept its aid, but does not go further. Unlike an arbitrating power the mediator limits his intervention to suggestion and advice. His action is liable to be arrested at any time at the will of either party unless otherwise agreed, in which case to arrest it prematurely would be a breach of good faith. The difference between mediation and arbitration may be stated in the words of the Digest (lib. iv. tit. 8 § 1): "Receipse autem arbitrium videtur, ut ait Pedius, qui judicis partes suscepto finemque se suas sententias controversiis impositurum pollicitur. Quod si hactenus intervenit ut experietur an concilio suo vel auctoritate discuti litem patenetur, non videtur arbitrium recepisse." Some writers distinguish mediation from "good offices," but the distinction is of little practical value. We may, if we please, regard "good offices" as inchoate mediation, and "mediation" as the proof that the offices have been carried into effect; thus we may say that a third power renders "good offices" when it brings the parties together so as to make diplomatic negotiations between them possible; whilst if it takes an active part in those negotiations it becomes for the time being a mediator. The spontaneous and successful mediation effort made by President Roosevelt in 1905 to bring together the Russian and Japanese governments, and to secure their appointing delegates to discuss terms of peace, although not strictly mediation, was closely akin to it. 

Mediation in the strict sense there have been many instances: that of Great Britain, in 1825, between Portugal and Brazil; of France, in 1849-1850, when differences arose between Great Britain and Greece; of the Great Powers, in 1868-1869, when the relations of Greece and Turkey were strained to breaking-point by reason of the insurrection in Crete; of Pope Leo XIII., in 1885, between Germany and Spain in the matter of the Caroline Islands. In these cases mediation averted war. The Austro-Prussian War of 1866, the war between Chile and Peru in 1882, and that between Greece and Turkey in 1897, are instances of wars brought to a close through the mediation of neutral powers. Mediation has also been occasionally employed where differences have arisen as to the interpretation of treaties or as to the mode in which they ought to be carried out; as when Great Britain mediated between France and the United States with regard to the Treaty of Paris of the 4th of July 1830. In one case at least mediation has been successful after a proposal for arbitration had failed. In 1844, when war between Spain and Morocco was threatened by reason of the frequent raids by the inhabitants of the Rif on the Spanish settlement of Ceuta, Spain declined arbitration on the ground that her rights were too clear for argument. But both she and Morocco subsequently accepted joint mediation at the hands of Great Britain and France.

The cause of mediation was considerably advanced by the Declaration of Paris of 1856. The plenipotentiaries of Great Britain, France, Austria, Russia, Sardinia and Turkey recorded in a protocol, at the instance of Lord Clarendon, their joint wish that "states between which any misunderstanding might arise should, before appealing to arms, have recourse so far as circumstances might allow (en tant que les circonstances l'admettraient) to the good offices of a friendly power." Article 8 of the Treaty of Paris, concluded in the same year, stipulated that "if there should arise between two signatories to this treaty and the other signing powers any misunderstanding which might endanger the maintenance of their relations, the Porte and each of such powers, before having recourse to the use of force, shall afford the other contracting parties the opportunity of preventing such as extremity by means of mediation." These precedents (in which it will be seen that "good offices" and "mediation" are used interchangeably) were followed in the general act agreed to at the Conference held at Berlin in 1884-1883 the object of which was to secure religious and commercial liberty and to limit warlike operations in the Congo basin. A special form of mediation was proposed by a delegate from the United States at the Peace Conference held at the Hague in 1899, and was approved by the representatives of the powers there assembled. The clause in which this proposal was embodied provided in effect that, whenever there is danger of a rupture between two powers, each of them shall choose a third power to which these differences shall be referred, and that, pending such reference, for a period not exceeding thirty days (unless the time is extended by agreement) the powers at dispute shall not take any offensive or defensive action. If mediation cannot be brought to a conclusion, the powers thus appealed to occupy a position analogous to that of seconds in a duel, who are-authorized to arrange an "affair of honour" between their principals. This novel device has the advantage of toning down, if not of eliminating, personal and national prejudices by which controversy is frequently embittered. It also gets over the difficulty, often met with in arbitration, of choosing a referee satisfactory to both parties. The closer the relations between states become, the more their commercial interests are intertwined, the larger the part which mediation seems destined to play. It is true that states which have accepted the intervention of a mediator remain free to adopt or reject any advice he may give, but the advice of a disinterested power must always add considerable moral weight to the side towards which it inclines.

MEDIATIZATION (Ger. Mediatisierung, from Lat. mediatus, mediate, middle), the process by which at the beginning of the 19th century, a number of German princes, hitherto sovereign as holding immediately of the emperor, were deprived of their sovereignty and mediatized by being placed under that of other sovereigns. This was first done on a large scale in 1803, when by a recess of the imperial diet many of the smaller fiefs were mediatized, in order to compensate those German princes who had been forced to cede their territories on the left bank of the
MEDICAL EDUCATION

Rhine to France. In 1866 the formation of the Confederation of the Rhine involved an extension of this mediatizing process, though the abolition of the empire itself deprived the word "mediatization" of its essential meaning. After the downfall of Napoleon the powers were besieged with petitions from the mediatized princes for the restoration of their "liberties"; but the congress of Vienna (1815) further extended the process of mediatization by deciding that certain houses hitherto "immediate" (i.e., Salm, Isenburg, Leyen) should only be represented mediately in the diet of the new Confederation. On the other hand, at Aix-la-Chapelle (1818) the powers, in response to the representations of the aggrieved parties, abdicated the German provinces and confirmed the French prerogatives. The Congress of Vienna left other mediatized states undisturbed as they were. Of these rights, which included the hereditary right to a seat in the estates, the most valued is that of Ebenbürtigkeit (equality of birth), which, for purposes of matrimonial alliance, ranks the mediatized princes with the royal houses of Europe.

See August Wilhelm Hefter, Die Sonderechte der Soweruren und der Mediatisierten, vormals reichsständischen Häusen Deutschlands (Berlin, 1871). The mediatized families are included in the Almanach der Gotha.

MEDICAL EDUCATION. Up to 1838 each University, Royal College of Physicians or of Surgeons, and Apothecaries' Great Hall in Great Britain and Ireland laid down its own regulations for study and examination, and granted its degree or licence without any State supervision. In that year, pursuant to the Medical Act 21 & 22 Vict. c. 90, the General Medical Council of Medical Education and Registration was established, consisting of twenty-three members, of whom seventeen were appointed by the various licensing bodies and six by the Crown. This number was increased by the amended act of 1838 to twenty-nine, three of the six additional members being elected by the professions as "direct representatives of the medical bodies in the mineral region," and generally as to the requisites for obtaining qualifications; and to visit and inspect examinations either personally or by deputy. If the visitors think the course of study and examination of any licensing body is not sufficient to ensure that candidates obtaining its qualification possess the requisite knowledge and skill for the efficient practice of their profession the Council, on a report being made, may represent the same to the Privy Council. The Privy Council may, if it sees fit, deprive the accused body of its power to grant registrable certificates. From this statement it will be seen that the powers of the Council are limited; nevertheless, by their cautious application, and by the loyal manner in which the licensing bodies have acted on the recommendations and suggestions which have from time to time been made, the condition of medical education has been improved; and although there is not a uniform standard of examination throughout the United Kingdom, the Council has ensured that the minimum requirements of any licensing body shall be sufficient for the production of trustworthy practitioners.

One of the first subjects to which the Council applied itself was the establishment of a system of examinations in general knowledge. Such examinations have to be passed before beginning medical study. On presentation of a certificate to the registrars of the Council, and on evidence being produced that the candidate is sixteen years of age, his name is inscribed on the "Students' Register." The subjects of examinations are: (a) English language, including grammar and composition (marks not exceeding 5% of the total obtainable in this section may be assigned to candidates who show a competent knowledge of French, Irish, Dutch, Latin, and German); (b) mathematics, comprising arithmetic, algebra, as far as simple equations inclusive; geometry, the subject-matter of Euclid, Books I, II, and III, with easy deductions; (c) one of the following optional subjects—Greek, French, German, Italian or any other modern language. Certificates are accepted from all the universities of Great Britain and Ireland, from the leading Indian and colonial universities, from government examination boards, and from "corporations" in the sense of the six major and minor universities, the gymnasium and real-gymnasium, the French diplomas of Bachelor ès Lettres and Bachelor ès Sciences, and corresponding entrance examinations to other continental universities are also accepted.

As regards professional education, the Council divided its resolutions into "requirements" and "recommendations;" the former consisting of demands on the licensing bodies, non-compliance with which renders them liable to be reported to the Privy Council; the latter are regarded merely as suggestions for the general conduct of education and examination. The requirements may be summarized as follows: (a) Registration of bodies: a delay between the date of registration and the date of the final examination for any diploma entitling the holder to be registered under the Medical Acts. (c) In every course of medical examination study of anatomy and surgery; (d) Examinations may not be conducted until the year of the first examination by bodies other than the University. The Council offering no opinion as to the manner in which they should be distributed or combined for the purposes of teaching or examination, this being left to the discretion of the bodies or of the student—(i) physics, including the elementary mechanics of solids and fluids, and the rudiments of heat, light and electricity; (ii) chemistry, including the principles of the science, and the details which are necessary for the study of medicine; (iii) elementary biology: (iv) anatomy: (v) physiology: (vi) materia medica and pharmacy; (vii) pathology; (viii) therapeutics; (ix) medicine, including medical anatomy and clinical medicine; (x) surgery, including surgical anatomy, pathology, and the treatment of wounds in particular peculiar to women and to new-born children; (xii) theory and practice of vaccination; (xiii) forensic medicine; (xiv) hygiene; (xv) mental disease. (d) The first of the four years must be passed at a school or schools of medicine recognized by any of the licensing bodies; provided that the first year may be passed at a university or teaching institution where the subjects of physics, chemistry and biology are taught; and that graduates in arts or science of any university recognized by the Council, who shall have spent a year in the study of these subjects, and have passed in them, shall be held to have completed the first of the five years of medical study. (e) The second and third years must be spent at recognized schools or hospitals, and be marked by an inscribed entry in the student's register. This attendance on the indoor practice of a lying-in hospital, or the student must have been present at not less than twenty labours, five of which shall have been conducted throughout under the direct supervision of a recognized practitioner. The fifth year of study is intended to be devoted to clinical work and may be passed at any one or more public hospitals or dispensary, in respect of clinical instruction: not only is the student under the supervision of a properly qualified practitioner, but six months of this year may be passed as a pupil to a practitioner possessing such opportunities of imparting practical knowledge as shall be satisfactory to the medical authorities. This latter method is rarely employed.

The "recommendations" of the Council contain suggestions which may or may not be acted on by the bodies. For the most part they are complied with in connexion with the system of practical and clinical teaching.

The Council satisfies itself that its requirements are acted on, and that the examinations are "sufficient," by cycles of inspection about every five years of the leading houses of European medicine. Let us imagine a pupil to be inspected by an inspector, who forwards his report to the Council, which sends each report to the body for its information and remarks. As yet it has never been the duty of the Council to report to the Privy Council on any examination and sufficient.

Most universities exact attendance at more classes than the colleges and halls; for instance, botany and natural history are taught to their students, who must attend in these subjects throughout the course of professional education is fairly uniform. Since 1875 attendance on "practical" classes has been called for in all subjects. Under this system the larger classes in theory should systematically be held in large lecture-hall, and the students are taught the use of apparatus and the employment of methods of investigation and observation. Tutorial instruction is super-imposed on teaching by lecture. Much the same plan prevails in the teaching of clinical instruction, the bed-side lesson prevailing regularly, and the students receive the courses of clinical instruction from a specially appointed clinical
tutor, an insight into methods of examination of diseases, and learns practically the use of the microscope and other aids to diagnosis, and of surgical and obstetrical instruments. In fact, it may be said that each subject of instruction is duplicated. If this is taken into account, it may be that the belief that this is full and the belief is rapidly growing that five years is too short a period of study. As a matter of fact, the average time taken to obtain a British licence to practise is upwards of six years. The probability is that the duration of the time necessary will be lengthened by the inclusion of such subjects as physics, biology and chemistry in a "practical scientific" examination, which may have to be undertaken before registration as a medical student, thus leaving the whole five years to be devoted to purely professional study.

The German regulations in regard to professional study are few. They are those for the Staats Examen, for which the university degree is no longer necessary. The regulations for the admission of candidates to the Staats Examen are contained in the royal proclamations of the 22nd of June 1883. They comprise: (a) Certificate of a course of study at a classical gymnasium of the German Empire. In exceptional cases, the same from a classical gymnasium outside the German empire may be considered sufficient. (For details of the course of study and examinations, see Minutes of the Senate of Studies Council, vol. xxvii. appendix 3.) (b) Certificate from a university, certifying a course of medical study of at least nine half-years at a university of the German empire. (c) Certificate that the candidate has passed, entirely at a German university, the medical Vorprüfung, and thereafter has attended for at least four half-years the medical studies of a university. (d) The special testimony of the clinical directors bearing witness that the candidate has taken part as Praktikant (clerk or dresser) during two half-years at the medical, surgical, and gynaecological clinics; has himself delivered two cases of labour in the presence of his teachers or assistant physicians; and has attended for a half-year as Praktikant the clinic for diseases of the eye.

The medical Vorprüfung referred to is necessary alike for the Staats Examen and the degree of Doctor of Medicine. It takes place at the end of the second year (fourth semester), and includes the subjects of experimental physics, chemistry, botany, zoology, anatomy and physiology. It is conducted by a board appointed yearly by the Minister of Education.

No one can practise medicine in France who does not possess the diploma of Doctor of Medicine of a French university. The qualification of Officier de santé is no longer granted. Before he can inscribe as a student of medicine the applicant must have obtained the diplomas of Bachelier es lettres and Diplome d'aptitude. Although the course require five years, study may be completed in four years. A longer time is generally taken before the student proceeds to the final examination for the doctor's degree. Each year is divided into four trimestres; at each trimestre the student must make a new inscription. The trimestres are: (1) November and December, 56 days; (2) January, February, March, 86 days; (3) April, May, June, 86 days; (4) July, August, 56 days. Practically there are no regulations determining the division of the various subjects, or the number of lectures in each course, or requiring the student to attend the courses. The medical faculty of each university puts before the students a scheme recommending a certain number of subjects (Division des études) for each of the four years of the medical course, and, as a matter of fact, this order of study is enforced by the system of intermediate examinations (Examen du fin d'année). All the lecture courses are free, as also are the clinics and the hospital service, and there is no system of ascertaining the regularity of attendance at lectures, or of certificate of attendance. If, however, the student fails to pass the Examen du fin d'année he is debarred from making the next trimester inscription, and thus is deprived of a year's study. The lectures are, however, clearly indicated. In connection with the freedom in attendance on systematic lectures, there are strict direction and control in regard to hospital attendance and practical courses. The student is required to sign a register ad hoc each time he goes in and out. From the beginning of the third year, e.g. from the ninth quarterly inscription, hospital attendance is enforced till the end of the fourth year. No one can renew his trimestral inscription without producing a schedule of his last trimestral stage, showing that during it he had not absented himself more than five times without explanation. Practical work is obligatory during each of the four years.

The didactic systematic courses of lectures, Conferences are held by the assistant-professors (aprèsés) in natural history, physiology, general pathology, internal pathology, external pathology. At the end of the first year the student is examined in osteology, mythology and the anatomy of the human body. By the second year it will be proceed to the study of the anatomy of the heart, of the arterial and venous system, and physiology in all its branches; at the end of the third year, in medicine and surgery; at the end of the fourth year, an examination is held over the whole field of study.

No one is allowed to enter on the study of medicine without passing the Artium examen of a secondary school. This is the requirement under the law of the German state of Prussia. A classical gymnasium. After study for two semesters an examination must be passed in psychology, logic and history. The special professional examinations consist of (1) preliminary scientific, in botany, zoology, physics, chemistry; (2) first special or professional, anatomy (orally and by dissections), physiology, and pharmacology; (3) second special or professional, written examinations in medicine, surgery, medical jurisprudence; practical and oral in operative surgery, in clinical medicine, and clinical surgery; and oral in pathological anatomy, medicine, and surgery. The minimum completion of the full medical course takes six years, of which the first two are devoted to the study of the natural sciences.

AUTHORITIES.—The history of the development of medical education from the earliest times down to 1894 will be found treated of generally in Fuchsmann's Geschichte des medicinischen Unterrichts (Leipzig, 1889-1908) translated by E. H. Hare (London, 1891). Those desiring more special information on the subject in regard to the details of British institutions should consult the annals of the various universities and colleges of Great Britain and Ireland. The following works supply much interesting information regarding the gradual rise and development of teaching and examination: Annals of the Barber Surgeons, by Sydney Young (1890); History of the Royal College of Surgeons of Ireland, by John A. Kennedy (1886); Early Days of the Royal College of Physicians of Edinburgh, by Peel Ritchie (1899); Historical Sketch of the Royal College of Surgeons of Edinburgh, by Gairdner (1886); Minutes of the Faculty of Physicians and Surgeons of Glasgow, by Duncan (1896): The Story of the University of Edinburgh, by Sir A. Grant (1884); University of Glasgow, by Stewart (1891). (J. B. T.)

As late as 1880 medical education in the United States was in a deplorable condition. In the early history of the country, before and shortly after the beginning of the 19th century, the few medical colleges had shown a disordered condition, and the doctors who entered upon their courses, and some effort was made, through the agency of state boards, to control the licence to practise. But as the country increased in population and wealth preliminary requirements were practically abolished, the length of the courses given each year was shortened to four or five months or less, and in the second and final year there was simply a repetition of the courses given during the first year. This is to be attributed mainly to the fact that there was no general national or state supervision of medical training. Medical colleges could obtain incorporation under state laws without difficulty, and brought considerable advantages in the way of prestige and increased practice to those concerned. That the existence of a college depended solely upon the fees of the students encouraged the tendency to make both entrance and graduation requirements as easy as possible, especially as there was no state supervision, and the mere possession of a diploma entitled the holder to practise. Fortunately, during this period the practical character of the clinical instruction given in the better colleges fitted the graduates in some measure for the actual necessities of practice, while the good traditions of medicine as a learned profession, stimulated those who adopted it as a career, so that in the main the body of practitioners deserved and held the confidence and respect of the community. From the middle of the 19th century there has been constant agitation on the part of the physicians themselves for an improvement in medical education. The first notable result was an increase in the time of instruction from two to three years (Chicago Medical College, 1859; Harvard Medical School, 1871), the lengthening of each session to six
months or more, and the introduction of graded courses instead of a repetition of the same lectures every year. The improvement thus began became marked during the decade 1890–1900, amounting almost to a revolution in the rapidity with which the course of instruction was amplified. Many factors co-operated to produce this result: the general development of scientific instruction in the colleges and secondary schools, the influence of the large number of medical graduates who completed their training by study in European states, and the adoption by many states of stringent regulations regarding the licence to practice within their borders, the good examples set by many leading schools in voluntarily raising their requirements for entrance and graduation, and, perhaps above all in its general effect, the agitation continually maintained by several national or state associations which in a measure have exerted the general regulating control that in other countries has been enforced by national legislation. Among the most influential of these associations are the American Medical Association, the American Academy of Medicine, the Association of American Medical Colleges, the Illinois State Board of Health, and the University of the State of New York.

The different states make their own general regulations as to the practice of medicine within their borders. Certain states recognize the medical diplomas granted by other states having equivalent standards of examination. Such certificates are generally required to be (a) of graduation from a "reputable medical school," (b) of moral character, (c) the applicant must be at least twenty-one years of age. These enable the applicant to practice himself before the state for the state examination. In many states the applicant must satisfy the board not only as to his professional, but as to his general education. The standing of the various medical schools is usually left to the state boards, each one determining the matter for its own state, consequently a school may confer a degree recognized as reputable in several states but not in others. Only three or four states regulate the chartering of institutions. In other states any body of men may secure articles of incorporation of a college or school by paying the necessary state fee, without question as to the ability of the incorporators to furnish an education. So strong, however, has been the growth of American public opinion that a four-years' course of medical training has become the standard in medical schools, and in the majority this is in addition to one or two years' training in the natural sciences. There are some sixty-five state boards, and many have adopted strong medical practice acts.

The standard of preliminary requirements for entrance to the medical schools is being gradually raised, and a large number of the states require the existence of at least a high school education at the colleges comprising the Association of Medical Colleges, which numbers more than half the American medical schools, accept as an entrance standard a certificate of at least one year's study at a high school. In the report for 1908 of the United States bureau of education of 71 schools, which report the number of their students having an art degree, it is stated that a degree was held by only 15% of the candidates in medicine. These students were mostly distributed between the Johns Hopkins Medical School (which from the date of its foundation in 1893 has only admitted college graduates, and has in addition stipulated that candidates shall have a knowledge of the fundamental sciences, chemistry, physics, and mathematics), the University of Michigan Medical School (which has a four years' course, which must include French and German, together with mathematics, physics, chemistry, and biology). This tendency is in accordance with the recommended standard of medical education suggested by the Council of Education and Training for Delegates of the American Medical Association, of which the following is a summary:

1. A preliminary of a four-years' high school education or an examination such as would admit to a recognized university.
2. In addition a year of not less than nine months devoted to chemistry, physics and biology and one language (preferably French or German) to be taken at a college of the liberal arts.
3. Four years of study in a medical college having a minimum of a 30-weeks' course each year, with not less than 30 hours' work per week.
4. Graduation from college to entitle a candidate to present himself for examination before a state board.
5. A satisfactory examination to be passed before the state board.

Practically all medical schools admit women, but there are three separate schools of medicine for women: The Women's Medical College of Philadelphia, Pennsylvania; Women's Medical College, Baltimore, Maryland; New York Medical College and Hospital for Women—the last being one of the eighteen homeopathic colleges of the United States.

MEDICAL JURISPRUDENCE, or FORENSIC MEDICINE, that branch of state medicine which treats of the application of medical knowledge to certain questions of civil and criminal law. The term "medical jurisprudence," though sanctioned by long usage, is not really appropriate, since the subject is strictly a branch of medicine rather than jurisprudence; it does not properly include sanitation or hygiene, both this and medical jurisprudence proper being distinct branches of state medicine. The connexion between medicine and the law was perceived long before medical jurisprudence was recognized, or had obtained a distinct appellation. It first took its rise in Germany, and more tardily received recognition in Great Britain. Forensic medicine, or medical jurisprudence proper as distinguished from hygiene, embraces all questions which bring the medical man into contact with the law, and embraces (1) questions affecting the civil rights of individuals, and (2) injuries to the person.

I. Questions Affecting the Civil or Social Rights of Individuals

1. Development of the Human Frame.—The development of the physical and mental powers of the human being is a factor in determining criminal responsibility, terminating the period of criminal, and determining the capacity to confer, to accept, or to give; to exercise, to delegate, or to accept responsibility, or the power of giving validity to civil contracts, and in determining the personal identity of a living person or of a corpse. Human life is usually divided into five periods of infancy, childhood, youth, manhood and old age. Some writers increase the number of these unnecessarily to seven periods.

Infancy is the period from birth till the first or milk set of teeth begin to shed—usually about the seventh year. During this period the body is small in size and stature more, relatively, than at any other period of existence; and the mental faculties undergo great development. The milk teeth, twenty in number, are evolved at one period, and with the aid of the young child make the period of one (or two) years, and ending with the second molar about the termination of the second year. From the size and stature of the body, the development of the teeth, and the more or less advanced state of ossification or solidification of a few months' duration, conclusions may be drawn as to the probable age of the infant.

Childhood extends from the commencement of the shedding of the milk teeth to the age of puberty, usually from the seventh to the fourteenth or fifteenth year. During this period the body expands, as well as the bony structures, without any clearly marked difference in structure being observable between the sexes except that the general development of the male is more expansive than that of the female during this period. The milk teeth are shed, and are replaced by the second or permanent set, thirty-two in number, though these are not all fully developed until many years later. Marked differences between the proportions and the states of the teeth are noticeable even at an early period of childhood, and long before the characteristic functions begin to be developed.
Youth is marked at its commencement by the changes which occur at puberty—the development of the generative organs and the appearance of hair on the genitals, the appearance of a beard in the male, the development of the breasts in the female, the appearance of the monthly flow in the female, and the ability to bear a child. The female is considered the more perfect in view of the male. Marked mental changes now occur, and the generative functions are perfected. Youth terminates at the age of legal majority, twenty-one years, or perhaps the period of time may be extended to twenty-five years of age, as it is with some nations.

Mankhood (or Womanhood) is the period of perfection of all the bodily and mental powers. It ceases in woman with the cessation of the monthly flow about forty-five years of age; but in man it often extends to a much later period of life.

Old Age begins with the decay of the bodily and mental faculties, and terminates by the disappearance of the hair, a gradual whitening of the hair, and the feebleness of the limbs. In its later stages decay of the mental faculties, deafness, obesity or loss of vision, and bowing of the spine are added.

2. Duration of Human Life.—The chances of human life form an important subject of inquiry, and on deductions from comparisons of birth and death rates is founded the system of annuities, insurance against loss in sickness, and the insurance of lives. Since the establishment of compulsory registration of deaths, our knowledge of the ordinary and extraordinary chances of human life has been extended, and surer data are available for calculations of probabilities of life, of survivours, and of the payments which ought to be made in benefit clubs (see Insurance).

3. Personal Identity.—Where the identity has to be established or disproved after long absence, exposure to foreign climates and hardships, wounds, &c., the problem has often been extremely difficult. The data for identifying a person are individual and family likeness, stature, the colour of the eyes, peculiarities of the hand and manner, recollection of antecedent events, but more especially marks on the persons either congenital or acquired. Such are naevi or mother's marks, scars, and disunited or badly united fractures, known to have existed upon the missing person (see Identification). In the case of the living, identification is more often a matter for the police officer than for the medical man. Bertillon and Galton have each devised methods for the identification of criminals (see Anthropometry, and Finger-prints).

4. Marriage.—Under this head the medical jurist has to deal principally with the nubile age, viewed in the light of nature and according to legislative enactments, and with such physical circumstances as affect the legality of marriages, or justify divorce.

In Great Britain the age at which the sexes are first capable of propagating the species is later than in more southern climates. Ordinarily it does not occur before fifteen years of age for the male and fourteen for the female; exceptionally it occurs at the ages of thirteen and of twelve (or even less) respectively in the male and female. By law, nevertheless, parents and guardians may, in England at any rate, force children to marry before the age of fourteen. The only physical circumstances which in Great Britain form a bar to marriage are physical inability to consummate, and the insufficiency of one of the parties at the time of marriage. Both those circumstances have been pleaded and sustained in the law courts. In other countries minor physical circumstances, as disease, are held to invalidate marriage.

5. Impotence and Sterility.—These are of importance in connection with legitimacy, divorce and criminal assaults. Impotence may arise from physical causes, and may be curable or incurable. Impotence (q.v.) is taken cognisance of by the law courts as a ground of divorce, and might, of course, be urged as a defence in a case of rape. Sterility is not a ground of divorce, but might be a question of importance in cases of legitimacy.

6. Pregnancy.—This subject presents one of the widest fields for medicol-legal evidence. The limits of age between which it is possible, the limits of utero-gestation, and the signs of pregnancy may all in turn be the subjects of investigation.

The limits of age between which pregnancy is possible are usually fixed by the appearance and cessation of the monthly flow; and these ordinarily begin about fourteen and cease at forty-five years of age. Exceptionally they appear as early as the tenth year, and may not cease till the end of the fifth decade of life. Cases, however, have occurred where a woman has conceived before menstruating; and a few doubtful cases of conception are recorded in women upwards of fifty or even sixty years of age. The general fact of pregnancy being brought home to the mind of the new-born is that the growth of the month flow—fifty or fifty-four years as the extreme limit of age—must be accepted as the safest guide in practice.

The limits of utero-gestation are not in England fixed by legislation, but the French code fixes the maximum legal period of one hundred days. The ordinary period is forty weeks and a half, or two hundred and eighty-three days from the cessation of the last monthly flux. The term of three months from the first appearance of the monthly flux as furnishing no other means of time is perhaps never exceeded, if ever reached. The uncertainty of the duration of pregnancy is due to the uncertainty of the exact date of conception, which has given rise to the quite justifiable controversy of the physiologist as to the subject. It is well known, however, that among the higher animals the period of gestation is less, and that the time is more certain; and impregnation and conception need not necessarily be coincident.

The dates of pregnancy are of the utmost importance to the medical jurist. He may be called upon to pronounce upon the virtue of a female, to sustain or rebut a plea for divorce, to determine whether a capital sentence shall be carried out, or to determine the probable interval between the two births. Medical jurisprudence classifies the signs of pregnancy as uncertain or certain; it is the former which are most regarded by the public, but the latter are alone of probable value to the jurist. The usual and uncertain signs are the cessation of the monthly flow, nausea, sickness, a darkening of the areola and the formation of a secondary areola around the nipple, enlargement of the breasts, increased size of the mammary glands, fissured and fissured state of the nipple and of the areola, the yellow or greenish coloration of the urine, and the changes in the color and appearance of the secretions of the vagina. They are not to be relied on, and are often attended with a very considerable margin of error.

The signs of pregnancy are of comparatively little importance to the medical jurist; but the signs of recent delivery are all-important. These signs are bruised, swollen, and lacerated state of the external genitals, relaxation and dilatation of the vagina and womb, the existence of a peculiar vaginal discharge known as the lochia, a relaxed and fissured condition of the abdominal walls, a peculiar aspect of the countenance, and the distended state of the breasts due to the secretion of milk. The lochial discharge is the most characteristic sign. All the signs may disappear within ten days of delivery, though this is not usual.

8. Monsters and Hermaphrodites.—To destroy any living human being, however unlike a human creature it may be, is to commit a crime. Blackstone states that a monster which hath not the shape of mankind hath no inheritable blood; but the law hath not defined a monster, nor what constitutes a human form.

The same author states that if, in spite of deformity, the product of birth has human shape, it may be an heir. Hermaphrodites are beings with malformations of the sexual organs, simulating a double sex. Physiologists do not admit, however, the existence of true hermaphrodites with double perfect organs, capable of performing the functions of both sexes.
9. Paternity and Affiliation.—These are often matters of great doubt. A considerable time may elapse between the absence or death of a father and the birth of his reputed child. As has already been said, three hundred days is the utmost limit to which physiologists would extend the period of utero-gestation. This subject involves questions respecting children born during a second marriage of the mother, posthumous children, bastardy, and alleged cases of posthumous children.

10. Presumption of Survivorship.—When two or more persons perish by a common accident, when a mother and her new-born child are found dead, and in a few analogous cases, important civil rights may depend upon the question whether the last child which lived the longest; and in some cases it has been held that the law has been displaced in elucidating the disputes which have arisen in the law courts in such cases.

11. Maladies exempting from Discharge of Public Duties frequently demand the attention of the medical man. He may be called upon to decide whether a man is able to undertake military or naval service, to act as a juryman without serious risk to life or health, or to attend as a witness at a trial.

12. Feigned and Simulated Diseases often require much skill and caution in order to detect the imposture.

13. The Signs of Death.—The determination of the actual existence of death assumes a certain importance in tropical countries, where the necessity for speedy interment may involve a risk of burial alive. Such an accident cannot well occur where a medical man confirms the existence of death, and in the United Kingdom, where burial rarely takes place before the lapse of forty-eight hours, such changes usually occur in the body as to render any error practically impossible. Within a varying period, usually not more than twelve hours, the body becomes rigid, owing to the development of rigor mortis or post mortem rigidity. The blood, which during life is equally distributed throughout the body, gravitates to the most dependent parts and develops a discoloration of the skin which is known as post mortem lividity or post mortem staining. At a variable period of time, dependent upon the cause of death, also the temperature and moisture of the air to which the body is exposed, decomposition or putrefaction sets in. These changes after death are of great importance, not only as affording certain proof of death, but also because they furnish valuable information as to the probable time at which it occurred, and from the fact that they may alter or destroy evidence as to the cause of death.

14. Insanity or Mental Alienation.—A medical man may be required to give evidence in any of the law courts, civil, criminal or ecclesiastical, before commissions de lunatico inquirendo, or before a magistrate, as to the sanity or insanity of an individual; and he may have to sign certificates of unsoundness of mind with the view of providing for the safe custody and proper treatment of a lunatic. Hence he must be familiar with the chief forms of insanity (see Insanity), and be able to distinguish and treat each of these. He will also be required to detect feigned insanity, and to examine persons charged with crime with the view of preventing real lunatics from being treated as criminals.

II.—INJURIES TO THE PERSON

1. Deflation.—The signs of deflation are obscure and uncertain; and it is rather by the coexistence of several of the usual marks than the existence of any one sign, that any just conclusion can be arrived at.

2. Rape.—This crime consists in the carnal knowledge of a woman forcibly and against her will. The proofs of rape apart from the consistency of the woman’s story, mainly depend on the presence of marks of violence, stains, &c. In all charges of rape, the woman and her assailant should be examined as soon as possible by a medical man, but such examination, it is important to remember, can only be carried out with the free consent of the party to be examined. It is to be noted that according to English law the slightest degree of penetration is sufficient to constitute the crime of rape.

3. Mutilation.—This may consist in the cutting or maiming of any member; castration is the most important, and perhaps but rarely effected as a crime. Self-mutilation, giving rise to false accusations, is occasionally resorted to.

4. Criminal Abortion.—This crime consists in unlawfully procuring the expulsion of the contents of the gravid uterus at any period short of full term. It must be noted that while this definition may be held to recognize the induction of premature labour by medical men in certain circumstances, yet, when the operation is necessary, a medical man should always protect himself from possible misconstruction of his action (i.e. criminal intent) by having a consultation with another practitioner. The means employed in criminal abortion to procure the desired result may be classed under three heads: (1) general violence to the body; (2) administration of drugs; (3) instrumental interference with the contents of the uterus. Among the drugs frequently employed for the purpose, although by no means always successfully, are ergot, strong purgatives, iron, rue, pennyroyal, savin.

5. Homicide.—The legal sense of the term homicide excludes such injuries as are the result of either accident or of suicide. It embraces murder or willful homicide, manslaughter or culpable homicide, casual homicide, and justifiable homicide.

Ordinary homicide may be accomplished by several modes that are sometimes ascertained by examination of the body, e.g. poison.

As a preliminary in all cases of homicide, it is the duty of the medical jurisprudent in the first place to ascertain the fact of death, and to distinguish between real and apparent death; and then to determine, if possible, the period at which death took place. Infanticide, or child murder, is by the British law treated with the same severity as the murder of an adult. Indeed infanticide as a crime distinct from murder has no legal recognition. Practically this severity defeats itself, and hence an alternative charge of concealment of birth in England, or concealment of pregnancy in America is always available. When the child is stillborn the inquest does not have to inquire into the fact of birth, but as to the cause of death.

The inquisitiveness of the old law which threw the onus of proof of stillbirth on the mother now no longer exists, and the law demands strict proof of live-birth at the hands of the prosecution. Hence the subject involves nice points of forensic medicine. The child must be proved to have arrived at the period when there was a probability of its living (proof of viability); and as the establishment of respiration is necessary to prove live-birth the evidences of this fact must be carefully investigated. The size and position of the lungs, and the state of the vessels concerned in foetal circulation, must be carefully noted. The foetal lungs are dark, dense and liver-like in appearance and consistence, and sink when immersed in water whilst the fully formed lungs are soft, expanded, and float and crepitant when handled. Minor degrees of respiration are recognized by the appearance of little groups of dilated air-vesticles, and by the fact that, although the lungs are wholly moist, portions of the lung, where the expired air has penetrated, float in water even after submersion to firm pressure in the hand. Care must be taken, nevertheless, to exclude buoyancy of the lung from the fact of respiration in the action of the infant may be expelled by the pressure, and the previously buoyant portion of lung now sinks in water. It is impossible, however, to distinguish certainly between a lung naturally inflated and one artificially insufflated.

It must be borne in mind that, although live-birth cannot be affirmed in the absence of signs of respiration, the presence of these signs is not proof of live-birth in the legal sense of the term. The law demands for live-birth a certain existence of the child after water from the fully formed lungs are compressed, and soft and crepitant when handled. Minor degrees of respiration are recognized by the appearance of little groups of dilated air-vesticles, and by the fact that, although the lungs are wholly moist, portions of the lung, where the expired air has penetrated, float in water even after submersion to firm pressure in the hand. Care must be taken, nevertheless, to exclude buoyancy of the lung from the fact of respiration in the action of the infant may be expelled by the pressure, and the previously buoyant portion of lung now sinks in water. It is impossible, however, to distinguish certainly between a lung naturally inflated and one artificially insufflated.

It must be borne in mind that, although live-birth cannot be affirmed in the absence of signs of respiration, the presence of these signs is not proof of live-birth in the legal sense of the term. The law demands for live-birth a certain existence of the child after water from the fully formed lungs are compressed, and soft and crepitant when handled. Minor degrees of respiration are recognized by the appearance of little groups of dilated air-vesticles, and by the fact that, although the lungs are wholly moist, portions of the lung, where the expired air has penetrated, float in water even after submersion to firm pressure in the hand. Care must be taken, nevertheless, to exclude buoyancy of the lung from the fact of respiration in the action of the infant may be expelled by the pressure, and the previously buoyant portion of lung now sinks in water. It is impossible, however, to distinguish certainly between a lung naturally inflated and one artificially insufflated.

In the case of exposed infants it is important to ascertain the real mother. As such exposure usually takes place soon after the birth, with the signs of recent delivery in the suspected mother is the best method of proving the relation.
**Death from Asphyxia.**—Among the forms of violent death due to this cause are drowning, hanging, strangulation, garrotting, smothering, suffocation from choking, mechanical interference with the expansion of the chest walls, as when persons are crushed together during a panic in a fire, breathing poisonous gases, such as carbonic oxide, or choking on vomitory or other substances. The cases of death from these causes are still more common.

Drowning is thought to produce death occasionally by the suddenness of the shock causing suspension of the functions of circulation and respiration—by shock without a struggle. The usual mode of death is death from exhaustion of the blood through the brain acting as a poison upon that organ; and this is attended with all the phenomena of asphyxia, as in suffocation.

The type of asphyxia from drowning is the result of the immediate exhaustion of the blood, and the immediate death. Oxygen in the arterial blood, through exclusion of air, sinks below the normal, the respiratory movements grow deeper and at the same time more frequent; both the inspiratory and expiratory phases are prolonged in inspiratory which becomes laboured, and of breathing into play, and the breathing becomes hurried. As the blood becomes more and more venous, the respiratory movements continue to increase both in force and frequency, very soon the inspiratory movements become more marked than the expiratory, and every muscle which can in any way assist in expiration is brought into play. The orderly inspiratory movements culminate in expiration, and when infants are overlarge, especially the nervous system, and the convulsions suddenly cease and are followed by a period of calm. The calm is one of exhaustion; all inspiratory movements have ceased, and all the muscles of the body are flexed, at the same time in a state of irritability, and inspiratory movements take place; then these movements become less frequent; the rhythm becomes irregular, so that each breath becomes a more and more dilated breath which becomes more and more the expansion of the whole body; and with extended limbs and a straightened trunk, with the head thrown back, the mouth widely open, the face drawn and the nostrils dilated, the last breath is taken. The above phenomena are not all observed except in cases of sudden and entire exclusion of air from the lungs. In slow asphyxia, where the supply of air is gradually diminished (e.g. in drowning), the phenomena are the same, but with minor differences. The appearances of the body after death in drowning are various. There may be paller of the countenance, or this may be livid and swollen. The air passages are filled with frothy mucus, and there may be blood in the bronchial passages which has been coughed up from the lungs. Eccymosis may be found beneath the site of the cord, or marked asymmetry of the body. There may be even no mark of the cord visible. The mark, when present, usually follows an oblique course, and is high up the neck. The latter are circumstances which may occur after death and are done speedily whilst the body is still warm; there may be a post-mortem mark unresolvable from the mark observed in death from hanging, must not be forgotten.

**Hanging** may result in death from asphyxia, or, as is more particularly the case in judicial hanging, some injury is inflicted on the upper portion of the spinal cord, resulting in instant death. The ordinary accident in judicial hanging is asphyxia: but occasionally the cord is constricted, and the* carotids* are thus cut off from the brain, and the brain is deprived of blood, and the effect is asphyxia. Edema of the brain may be seen or the blood is not drawn into the brain. Necropsy may be accomplished by drawing a cord tightly round the neck, or by forcibly compressing the windpipe (throttling). Hence there may be either a circular mark round the neck, not so oblique as after hanging, or the marks of the fingers may be found about the region of the larynx. There may even be no mark of the cord visible. The mark, when present, usually follows an oblique course, and is high up the neck. The larynx and windpipe may be broken. The mark of the ligation is often low down in the neck. The signs of asphyxia are present in a more marked degree.

**Mephitism.**—In the United Kingdom this last form of death usually results accidently from an escape of carbonic oxide, and has been much increased in many towns owing to the addition of carbonic oxide to the ordinary supply of gas. Carbonic oxide gas is contained in ordinary lighting gas to the extent of about 6 to 8%, and is extremely fatal when inhaled. Inhaled carbonic oxide gas has been used as a mode of suicide. As a mode of assassination it is seldom employed, but is frequently resorted to on the continent of Europe by suicides, charcoal fumes being commonly used for the purpose.

**Death from Starvation.**—Cases occur in which it is important to distinguish this from other modes of death. In such cases the skin becomes harsh and dry, and may acquire a peculiar odour; the subcutaneous fat disappears; the gums shrink away from the teeth; the tongue and mouth become dark-coloured and dry; the eyes are bloodshot; the intestines become thin and their coats translucent; the gall-bladder is distended. The period of total abstinence from food required to kill an adult is unknown, and greatly depends upon whether there be access to liquid. In some cases persons have been able to subsist on little or no nourishment for long periods, the body being in a state of quasi-suffocation.

**Death from Extreme of Temperature.**—(1) Death from cold is not often observed in the British Isles. A portion only of the body, as the extremity of a limb, may perish from extreme cold. After the first sensation of tingling experienced on exposure to severe cold, loss of sensation supervenes, with languor and an irresistible propensity to sleep. The tendency to this form an extreme danger in such cases. (2) Death from extreme heat usually occurs in the form of burning and scalding, attended with destruction of a large portion of the cutaneous structures. Here the cause of death is obvious. The human body is capable of exposure to temperatures injurious to the integument. The same degree of burnt; a Turkish bath is a considerable period with impunity. Sunstroke is a cerebral affection brought on by too great exposure to a hot atmosphere, especially whilst undergoing fatigue.

**Death by Lightning.**—Lightning or an electric current may cause instant death. No visible marks of the effects of the electric current may be left, or the body may be singed or discoloured, or the skin may be perforated at one or two spots.

**Injuries or Wounds.**—These include in a medico-legal sense not only those characterized as incised, punctured, contused, stab, stab wounds, bullet wounds, injuries produced by firearms, fractures, dislocations, &c. One of the chief questions which have to be decided in all forms of violent death is whether it was the result of accident, suicide or murder. In cases of fatal wounding, among the points to be noted, which will help to decide the question, are the situation, direction and extent of the wound, the position in which the body and any weapon may be found, together with the presence and distribution of any blood marks and the signs of a struggle. In wounds caused by firearms the injury, if suicidal, is usually situated in a vital and accessible part of the body, the temple, mouth, and chest being the favourite situations; whilst it is less frequently the case with those resulting from an attempt at suicide. In such cases the characteristic appearances resulting from the discharge of the weapon close to the body, viz. beside the wound of entrance of the bullet, there are singeing of the cuticle and hair, and blackening of the area immediately surrounding the wound, from particles of un consumed powder being driven into the skin and from the smoke of the discharge. These effects are naturally not produced when the weapon is discharged at a distance exceeding 2 or 3 ft., as usually happens in cases of homicidal shooting. They may also be wanting in undoubted suicidal wounds produced by revolvers and cartridges filled with amonite or other smokeless powders. Death from burning is generally accidental, very rarely suicidal, and when homicidal is usually employed to conceal traces of other violence inflicted upon the body. In large conflagrations death is not always due to burning. Charred bodies may be found presenting various injuries due to the fall of beams, crushing, the trampling of others trying to escape, &c., or fractures and lacerations may be due simply to the combustion of the heat. Death may result from such injuries, or from suffocation by carbonic oxide gas, before the victim is affected by the actual fire. Spongy superficial combustion of the body has been stated to occur, but the evidence upon which the cases rest is not well authenticated.

Punctured wounds or stab marks require minute attention; for there have been instances in which death has been produced by an instrument so small as a pin thrust into a vital part. Wounds of the head are always dangerous, especially if the blow has been severe. The person so wounded may die without division of the skin, or fracture.
of the bones, as happens in what is known as concussion of the brain. Contusions which do not divide the skin may fracture the skull; or the inner table of the skull may be fractured without the outer being broken or depressed. Even wounds of the scalp may prove fatal; the prolongation extending into the brain, the wounds of the head are more dangerous than cuts, as more likely to excite fatal inflammation. When the brain and its membranes are injured, all such wounds are generally fatal. Wounds of the face, however, are more often dangerous, always disfiguring, and productive of serious inconvenience. Wounds of the neck are always serious whenever more than the skin is divided. This last is an important fact; because we are not always to consider the spot where the body of a person killed by a wound of the head, and apparently remaining where he fell, is found as that in which the fatal wound was inflicted. Instances have occurred of persons surviving severe wounds of the head for several days. Broken ribs are never without dangerous consequences; but they may be subject to the chance of inflammation extending forwards. Wounds penetrating both sides of the chest are generally considered as fatal; but possibly there may be recovery from such. Wounds of the abdomen, when the peritoneum is completely destroyed, may be considered as simple wounds, unless when inflicted with great force, so as to bruise the contents of the abdominal cavity; in that case they may produce death without breach of surface, from rupture of some viscous, as for instance the bladder, or a bowel. The latter are produced immediately fatal, from the chance of inflammation extending forwards. Wounds of the stomach or intestines, or of the gall-bladder, generally prove mortal, from the effusion of their contents into the peritoneal cavity producing fatal inflammation. Wounds of the liver, spleen or kidneys are generally soon mortal, from the great vascularity of those organs. Wounds of the extremities, when fatal, are generally found arisen from the consequences of inflammation and gangrene, or from the shock to the system when large portions of the limb are forcibly removed, as in accidents from machinery, and in wounds from firearm.

Blood Stains.—The examination of blood stains is a frequent and important operation in criminal charges. Blood stains when fresh and abundant can be recognized without difficulty, but when old, or after being acted upon by certain substances, their identity is not readily determined.

The tests which may be applied to a suspected stain consist of: (1) A special photographic process is sometimes employed, with some fluid which will soften and cause separation of the dried blood corpuscles without altering their characteristic appearance. Such fluids are solutions of glycine and water or a specific gravity of 1.387, and 10% solution of bichromate of potash, which affords evidence of the nature of the stain. (2) Chemical tests. (a) Heat applied to a solution obtained by soaking some of the stained fabric in water, the blood solution is red, and blood stained glass exhibits a red color on application of heat, while at the same time a buff-colored precipitate is formed. (b) On applying a drop of freshly prepared tincture of guaiacum and then some ozone ether or peroxide of hydrogen to the stain, a blue color is obtained if blood be present. Many other substances, however, give the same reaction. (c) If, even to the smallest particle of dried blood, a fragment of common salt and some glacial acetic acid be added, and the latter is then heated, the blood will be allowed to dry away, rhomboid crystals—haemin crystals—will be found to have formed, and they can be recognized under the microscope. (3) Spectroscopic test. A thin solution containing albumin or a blood solution containing haematin, which have two dark bands between Fraunhofer's lines D and E (oxy-haemoglobin). On adding ammonium sulphide to the solution, the haematin is reduced and only one broad dark band is seen (reduction of albumin). On adding sodium peroxide to the solution of blood, alkaline haematin is formed, and this again is transformed on the further addition of ammonium sulphide into reduced haematin of haemomorrhage, which gives a very characteristic spectrum of bands between Z and O (gaseous putrefaction). The production of these three different spectra from a red-coloured solution is characteristic of blood. Old blood stains are insoluble in water, whereas recent stains are readily soluble in cold water, yielding a blue stain which, if compared with soap solution tends to fix or render blood stains insoluble. Vegetable dyes may likewise give red solutions, but they may be distinguished from blood by the addition of ammonium, which alters the colour of the former, but rather intensifies the red colour of a blood stain.

The differentiation between human blood stains and those produced by the blood of other animals, more especially domestic animals, is a matter of great importance to the medical jurisprudence. When the blood stain is fresh, measurement of the corpuscles may decide the question, but in the case of dry and old stains it is impossible to distinguish the blood by this method. A further method, however, which enables the distinction to be made not only between human blood and that of other animals (with the exception of Simiasidae), but also between the bloods of different animals. The method depends upon the fact that if an animal (A), such as a dog or rabbit, is inoculated with the blood or serum of another animal (B), then the blood or serum of A is found to produce a specific reaction (nearly, the production of a cloudlessness or precipitation) when added to a solution of the blood of a similar animal to B, and that species of animal only. If, therefore, human blood serum is injected into an animal, its blood after a time affords an "anti- poison" to which produces no reaction. The specific detectible blood solutions and not in those formed from the blood of other animals.

10. Poisoning.—There is no exact definition of a poison (q.e.) Popularity, substances which destroy or endanger life when swallowed in small quantity are called poisons, but a scientific definition would also include many substances which are injurious to health in large doses or only after repeated administration, and which act not only when swallowed, but also when taken into the system through other channels, e.g. the skin or the lungs. The treatment of some of these substances relates to poisons, their nature, methods of detection, the symptoms following their ingestion and treatment of poisoning, is called Toxicology, and is one of the most important subjects included under the term Medical Jurisprudence.

The medical evidence in cases of poisoning rests upon—(1) the symptoms produced during life; (2) the post mortem appearances; (3) the chemical analysis and detection of the substance in the body, or in the excretions and vomited matters, or in articles of food; (4) experiments on animals in the case of certain poisons where other conclusive evidence is difficult to obtain. The treatment of cases of poisoning is dependent on the substance taken, but the general principles which should be followed are: (a) to get rid of the poison by means of the stomach-pump, or by washing out the stomach with water through a soft rubber tube, or by giving an emetic such as mustard, sulphate of zinc, ipecacuanha; (b) to neutralize the poison by giving a substance which will form with it an innocuous compound (e.g. in the case of the strong acids by administering magnesia or common whiting), or which has an opposite physiological action (e.g. atropine in opium poisoning); (c) to promote the elimination (from the body) of the poison, which may be done by strong diuretics; (d) general treatment of any dangerous symptoms which appear, as by stimulation in collapse or artificial respiration in asphyxia.

Food Poisoning (see also ADULTERATION).—Foods may prove noxious from a variety of causes: (1) The presence of metallic poisons, as in peas artificially coloured with copper salts, in tinned foods from dissolved tin salts, &c. (2) The contamination of any food with the specific germs of disease, as for example, milk infected with the germ of enteric fever. (3) The presence in meat of parasites, such as the Trichina spiralis, or of disease in animals, capable of transmission to man, such as tuberculosis, or the presence of poison in the flesh of animals which have fed on substances harmless to them but poisonous to human beings. Grain may be infected with parasitic fungi of a poisonous character, as for example Claviceps purpurea, causing epidemics of ergotism. (4) Foods of various kinds may contain saprothetic bacteria which elaborate certain poisons, either before or after the food is taken. It is chiefly in relation to food-poisoning from the last-mentioned cause that our knowledge has been increased in recent years. Many cases of food-poisoning, previously of mysterious origin, can now be explained by the action of bacteria and the products which they give rise to—tob-albusomes, ptomaines, toxins—by splitting up proteid substances. It is not necessary that the food should show evident signs of putrefaction. It may not do so. Food poisoning may yet from the application of a non-poisonous or even beneficial substance to the food, produce an irritation almost immediately, followed by various nervous symptoms. In such cases a chemical poison, developed by putrefactive bacteria before the food was eaten, quickly acts upon the system. Foods or foods in process of digestion may not appear for many hours after ingestion of the food, and then come on suddenly and with great
severity—there has been a period of incubation. In such cases the food when swallowed has contained the bacteria, but the poisonous toxin has been elaborated by them afterwards in the system during the period preceding the onset of symptoms. In both varieties of poisoning the symptoms are similar, consisting of giddiness, rigors, vomiting, purging and pain in the abdomen—together with great prostration, fever, muscular twitchings, disturbances of vision, delirium and coma. The varieties of meat which have most frequently given rise to poisoning (Botulinus) are pork, ham, veal, sausages, brawn, various kinds of meat pies and potted meats. Pig flesh appears to be specially liable to become infected. A point of considerable interest, which has sometimes given rise to doubt as to the poisonous character of meat in certain instances, is, that the same food may be poisonous at one time and not at another. Thus it may be harmless when freshly prepared, cause fatal effects if left for a week, and be perfectly innocuous when kept for a month. This is explained by the fact that the toxic substances take some time to develop, and after development are still further split up by the bacteria into other bodies of a harmless nature.

In some fish—e.g., Trachinus draco, or sea weaver—the poison is a physiological product of certain glands. In others the poison is not known, as in the family Scrombidae, to which the disease Kakhe has been attributed. In the United Kingdom the poisonous effects produced by fish are due to bacterial agency after death, and instances have occurred from the eating of herrings, mackerel, dried salt codfish, caviare, tinned salmon and tinned sardines. Shellfish may also contain destructive forms which are not removed by the development in them (oysters and mussels) of ptomaines. Brierger discovered a ptomaine in poisonous mussels to which he gave the name myltotoxin. It is now fully proved that oysters and mussels may become contaminated with the organism of typhoid fever if placed in specifically polluted water, and thus transmit the disease to human beings. Milk, as already stated, may be contaminated with the infection of scarlet fever and other diseases. It may also contain ptomaines of bacterial origin, which may constitute the cause of infantile diarrhoea, and others, having a fatal effect upon adults. Cheese has frequently caused poisoning. Vaughan discovered a toxic substance in milk and cheese—erythroxylon—but there are other toxic substances of bacterial origin sometimes present in cheese to which poisonous effects have probably been due. Mushroom-poisoning results from the eating of poisonous fungi in mistake for edible mushrooms. The causes of poisoning in such cases may be either muscarin in the fungus Amanita muscaria, or phallin in Amanita phalloides.

**History of Forensic Medicine**

The true origin of medical jurisprudence is of comparatively recent date, although traces of its principles may be perceived in remote times. Among the ancient Greeks the principles of medical science appear only to have been applied to legislation in certain questions relating to legitimacy. In the writings of Galen we find, however, remarks on the differences between the foetal and the adult lungs; he also treats of the legitimacy of seven months' children and adults; and in his work De utero-gestatione, which was translated into Latin by Deo and printed at Rome, we find that the laws of the Twelve Tables fix three hundred days as the extreme duration of utero-gestation. It is doubtful whether the Roman law authorized medical inspections of dead bodies. In the code of Justinian we find De statu hominum; De poenis et manumissis; De sicariis; De insinpendo ventre custodiendique partu; De muliere quae peperit undecimo mense; De impotentia; De hermaphroditis—titles which show obvious traces of a recognized connexion between medicine and law. It was not, however, by the testimony of living witnesses that such questions were to be settled, but on the authority of Hippocrates.

Medical jurisprudence, as a science, dates only from the 16th century. In 1507 the bishop of Bamberg introduced a penal code in which the necessity of medical evidence in certain cases was recognized; and in 1532 the emperor Charles V. persuaded the Diet of Ratisbon to adopt a uniform code of German penal jurisprudence, in which the civil magistrate was enjoined in all cases of doubt or difficulty to obtain the evidence of medical witnesses,—as in cases of personal injuries, infanticide, pretended poisoning, and disputed live-births. The first code of forensic medicine dates, however, from the publication in 1553 of the Constitutio criminalis carolina in Germany. A few years later Weihër, a physician, having undertaken to prove that witches and demonsiacs are, in fact, persons subject to hypochondriasis and hysteria, and should not be punished, aroused popular indignation, and was with difficulty rescued from the flames by his patron, William duke of Cleves.

At the close of the 16th century Ambrose Paré wrote on monsters, on simulated diseases, and on the art of drawing up medical legal reports; Pinaue also published his treatise on virginity and deflection. About the same time as these stimuli to the study of forensic medicine were being made known in Paris, the first systematic treatise on the science appeared in Sicily in the form of a treatise De relationibus medicorum by Fidele. Paolo Zacchius, the illustrious Roman medical jurist, moreover, published from 1621 to 1635 a work entitled Quaestiones medico-legales, which marks a new era in the history of the science—a work which displays an immense amount of learning and sagacity in an age when chemistry was in its infancy, and physiology very imperfectly understood. The discovery of the circulation of the blood by Harvey soon followed, and gave a new impulse to the study of those branches of forensic medicine having direct relations to physiology; and to Harvey we owe the idea how to apply Galen's observations on the differences between the foetal and the adult lungs to the elucidation of cases of supposed infanticide. About this time, too, Sebiz published two treatises, on the signs of virginity and on the examination of wounds respectively. In the former he contended that the hymen was the real mark of virginity; but this was denied by Augenio and Gassendi. In 1663 Thomas Bartholin investigated the period of human uterine gestation, a subject which engaged the interest of physicians. He also proposed the "hydrostatic test" for the determination of live-birth—a test still in use, and applied by observing whether the lungs of an infant float or sink in water. J. Swammerdam explained the rationale of the process in 1677; but it was not till 1682 that it was first practically applied by Jan Schreyer.

Germany, ever the leader in questions of forensic medicine, introduced the first public lectures on medical jurisprudence. Michaelis gave the first course about the middle of the 17th century in the university of Leipzig; and these were followed by other lectures on forensic medicine, some of which were published, especially in France. In the middle of the 19th century, Professor Tschmeyer of Leipzig published a work on forensics, and the first edition of his System of Medico-legal Evidence appeared in 1822. This work is a vast storehouse of medico-legal information, and a summary of the knowledge of the time.

Professorships for teaching the subject were founded in the German universities early in the 18th century, and numerous treatises on forensic medicine were published. Tschmeyer's Institutionen medicinae legales long formed the text-book of the subject; and Alberti, professor of legal medicine at Halle, in his Systema gave to the world a most complete and laborious treatise on the science. His industrious collection of facts renders his work a precious mine of information. Indeed towards the close of the 18th century the Germans were almost the only cultivators of legal medicine. But in France the celebrated case of Villeblanche attracted attention to the subject, and called forth Louis, who in a memoir on utero-gestation attacked with powerful arguments the pretended instances of protracted pregnancy, and paved the way for the adoption in the Code Napoleon of
three hundred days as the limit of utero-gestation, a period in precise accordance with the ancient Roman law of the Twelve Tables. Louis also wrote on death from hanging, and pointed out the mode by which we may distinguish murder from suicide under such circumstances. It is he who is credited with having been the first in France to publicly teach the just application of medical knowledge to jurisprudence. Froeder's celebrated Traité de médecine légale appeared in 1758, and marks a new era in the annals of medical law.

No British law, however, was systematically on forensic medicine until 1848 when Dr. Samuel Fary published a short treatise on the Elements of Medical Jurisprudence; but this was merely an abridgment of an earlier work of Fazelius. Previous writers—as Mead, Munro, Denman, Percival and the two Hunters—had, however, dealt with fragments of the subject; nevertheless the science as a whole was little appreciated or recognized in this country during the 18th century.

In the 19th century France took the lead, and the institution of three professorships of forensic medicine at the end of the 18th century produced excellent fruits. In 1814 Orfila, a Spaniard by birth, but naturalized in France, published Toxins, a work which revolutionized this branch of medical jurisprudence, and first placed the knowledge of poisons upon a scientific basis. Since the time of Orfila, France has never ceased to have one or more living medical jurists, among the most recent of whom we must enumerate Tardieu, whose treatises on abortion, on poisons, on wounds, &c., are justly celebrated. Germany too industriously pursued the subject, and Casper's great work on forensic medicine will ever remain a classic in the science. In Russia Dragendorff greatly contributed to our knowledge of poisons.

Though forensic medicine may be said to have been entirely neglected in England till the beginning of the 19th century, its progress has since been by no means slow or unimportant; and the subject now forms a recognized and obligatory portion of medical study. The first lectures delivered in Great Britain were given in the University of Edinburgh. Until in 1805 Dr. John Beattie, the first professorship was held by his son in 1803. Dr. Alfred Swaine Taylor gave the first course of lectures delivered in England, at Guy's Hospital in 1831; and in 1863 the university of London made forensic medicine a separate subject for examination and honours for medical graduates. In 1822 there was not in the English language any treatise of authority either on medical jurisprudence or on any important division of the subject; for it was not till the following year that the useful compendium of Paris and Fomblanque was published; and even in the middle of the 19th century medical jurisprudence may be said to have been almost in its infancy, as far as this country is concerned. From 1825 Britain produced an abundant crop of literature on forensic medicine. Sir Robert Christison's admirable treatise on Toxicology, Dr. A. S. Taylor's Principles and Practice of Medical Jurisprudence (1859 edition) have been the most authoritative, &c. Elements of Medical Jurisprudence, Dr. Guy's Forensic Medicine, and Ostogen's Lectures on Medical Jurisprudence have become well-known and widely circulated works. The separate memoirs of Taylor, Christison, Guy and others are also storehouses of facts and deductions in the science. America, too, has not been behindhand in the race. F. Wharton and M. Stillé's Manual, Wormley's Toxicology, and the works of Beck and Reese have furthered the study of the science.

(Paris, 1899).

MEDICI, the name of a family renowned in Italian history for the extraordinary number of statesmen to whom it gave birth, and for its magnificent patronage of letters and art. They emerged from private life and rose to power by means of a very subtle policy that was persistently pursued from generation to generation. The origin of the family is buried in obscurity. Some court historians indeed declare it to have been founded by Perseus, and assert that Benvenuto Cellini's bronze Perseus holding on high the head of Medusa was executed and placed in the Loggia del Lanzi at Florence to symbolize the victory of the Medici over the republic. But this only proves that the real origin of the family is unknown, and equally unknown is the precise signification of the Medicean arms—six red balls on a field of gold.

The name appears in Florentine chronicles as early as the close of the 12th century, although only casually mentioned in connexion with various offices of the republic. The first of the family to be a distinct figure in history was Salvestro del Medici, who, in 1378, took an active part in the Medici of the Ciompi—so called because they were led by a wood-cutter of the name di Lando, and because the chief share in it was taken by the populace, who held the reins of government for some time, and sought to obtain extended political rights. Although Michele di Lando was the nominal chief of the revolt, Salvestro del Medici was his real leader. The latter, although a member of the greater gilds, had joined the lesser and sought to be at their head, in order to lay the foundation of his own power and that of his kindred by attacking the Albizzi, who were the leading men of the greater gilds. The victory of the Ciompi, however, was brief, for in 1378-1379 the lower classes were brought about a reaction, in which they were crushed, and Michele di Lando went into banishment. Nevertheless the lesser gilds had gained some ground by this riot, and Salvestro del Medici the great popularity at which he had aimed. His policy during that period had traced the sole possible road to power in liberty-loving Florence. This was the road henceforth pursued by the Medici.

On Salvestro's death in 1388 the Albizzi repossessed themselves of the government, and conducted the wars of the republic. Vieri del Medici, who seems to have been the next head of the family, understanding the temper of the times, abstained from becoming a popular leader, and left it to his successors to prosecute the task under easier conditions. Then, in the person of Giovanni, son of Averardo Bichi dei Medici (1360-1429), another branch of the family arose, and became its representative branch. Indeed this Giovanni may be considered the actual founder of Medicean greatness. He took little part in political affairs, but realized an immense fortune by trade—establishing banks in Italy and abroad, which in his successor's hands became the most efficient engines of political power. The Council of Constable (1414-1418) enabled the lower-class Medici to realize enormous profits. Besides, like his ancestor Salvestro, he was a constant supporter of the lesser gilds in Florence. Historians record his frequent resistance to the Albizzi when they sought to oppress the people with heavier taxation, and his endeavours to cause the chief weight to fall upon the richer classes. For this reason he was in favour of the so-called law of castato, which, by assessing the property of every citizen, prevented those in power from arbitrarily imposing taxes that unjustly burdened the people. In this way, and by liberal loans of money to all who were in need of it, he gained a reputation that was practically the foundation-stone of the grand family edifice. Giovanni dei Medici died in 1420 leaving two sons, Cosimo (1380-1464) and Lorenzo (1395-1444). From the former proceeded a branch that held unassailable sway for many generations over the nominal republic of Florence, and gave to Italy popes like Leo X. and Clement VII. On the extinction of this elder line in the 16th century, the younger branch derived from Lorenzo, Cosimo's brother, seemed to acquire new life, and for two centuries supplied grand-dukes to Tuscany.

Cosimo, surnamed Cosimo the Elder, to distinguish him from the many others bearing the same name, and honoured after his death by the title of pater patriae, first succeeded in solving the strange problem of becoming absolute ruler of a republic keenly jealous of its liberty, without holding any fixed office, without suppressing any previous form of government, and always preserving the appearance and demeanour of a private citizen. Born in 1389, he had reached the age of forty at the time of his father's death. He had a certain amount of literary culture, and throughout his life showed much taste and an earnest love both for letters
and art. But his father had mainly trained him to commerce, for which he had a special liking and aptitude. He was devoted to business to the day of his death, and like his forefathers derived pecuniary advantage from his friendly relations with the papal court. He accompanied Pope John XXIII. to the Council of Constance, transacted a vast amount of business in that city, and made very large gains. He then travelled in Germany, and after his return to Florence discharged several ambassadorial missions. At the death of his father he was possessed of a vast fortune and an extended experience, and inherited the leadership of the opposition to the then dominant party of the greater gilds headed by Rinaldo degli Albizzi, Palla Strozzi and Niccolò da Uzzano. Of gentle and kindly manners, generous in lending and even in giving money whenever he could gain popularity by that means, at critical moments he frequently came to the succour of the government itself. He was very dexterous in turning his private liberalities to account for the increase of his political prestige, and showed no less acumen and still fewer scruples in making use of his political prestige for purposes of pecuniary profit. Indeed, whenever his own interests were at stake, he showed himself capable of positive villainy, although this was always tempered by calculation. Cosimo proved his skill in these knavish arts during the war with the Medici of Luca. He had joined the Albizzi in urging on this war, and many writers assert that he turned it to much pecuniary advantage by means of loans to the government and other banking operations. When, however, military affairs went badly, Cosimo joined the discontented populace in invectives against the war and those who had conducted it. This won him an enormous increase of popularity, but the hatred of the Albizzi and their friends augmented in equal degree, and a conflict became inevitable. The Albizzi, who were far more impetuous and impatient than Cosimo, were now bent upon revenge. In 1433, one of their friends, Bernardo Guadagni, was elected gonfalonier, and thereupon Cosimo dei Medici was called to the palace and summarily imprisoned in the tower. A general assembly of the people was convoked and a balia chosen, which changed the government and sent Cosimo into exile. Undoubtedly the Albizzi party would have preferred a heavier sentence, but they did not dare to attempt their enemy's life, being well aware of the great number of his adherents. Cosimo had some apprehension that he might be poisoned in prison, but Federigo dei Medici, captain of the palace guard, showed him the utmost kindness and, to soothe his fears, voluntarily shared his meals. On the 3rd of October the prisoner was sent to Padua, his allotted place of exile.

The Albizzi speedily saw that they had done either too much or too little. While seeking to keep the government entirely in their own hands, they beheld the continual growth of the Medici party. When it was necessary to make a campaign in Romagna against the mercenary captains commanding the forces of the duke of Milan, it was plainly seen that in banishing Cosimo the republic had lost the only citizen banker in a position to assist it with considerable loans. The Florentines were defeated by Piccinino in 1434, and this event greatly increased the public exasperation against the Albizzi. Meanwhile Cosimo, who had gone to Padua as a private individual, was entertained there like a prince. Then, being permitted to transfer his residence to Venice, he entered on a course of lavish expenditure. He was overwhelmed with letters and appeals from Florence. Finally, on the 1st of September 1434, a signory was elected composed of his friends, and his recall was decreed. Rinaldo degli Albizzi determined to oppose and replace him. Cosimo entered Piazza with a band of armed men; but his attempt failed, and he left the country to return no more. The Medici were now reinstated in all their former dignities and honours, and Cosimo, on the evening of the 6th of September, rode past the deserted mansions of the Albizzi and re-entered his own dwelling after an exile of a year. For three centuries, dating from that moment, the whole history of Florence was connected with that of the house of Medici.

Cosimo's first thought was to secure himself against all future risk of removal from Florence, and accordingly he drove the most powerful citizens into exile to all parts of Italy. Nor did he spare even his former political adversary, Palla Strozzi, although the latter had been favourable to him during the recent changes. His rigour in this particular case was universally censured, but Cosimo would tolerate no rivals in the city, and was resolved to abase the great families and establish his power by the support of the lower classes. He was accustomed to say that states could not be ruled by paternosters. Still, when cruelty seemed requisite, he always contrived that the chief odium of it should fall upon others. When Nerio Capponi, the valiant soldier and able diplomatist, was gained to his favour, he was even more pitiable, and his influence was further increased by the friendship of Baldaccio d'Anghiarini, captain of the infantry, Cosimo resolved to weaken his position by indirect means. Accordingly, when in 1441 a partisan of the Medici was elected gonfalonier, Baldaccio was instantly summoned to the palace, imprisoned, murdered, and his body hurled from the window. No one could actually fix this crime upon Cosimo, but the majority believed that he had thus contrived to rid himself of one enemy and cripple another without showing his hand. It was impossible for Cosimo alone to assume the mantle of type, and therefore he was forced to assume it worth his while to become gonfalonier, since the term of office had only lasted two months. It was necessary to discover some other way without resorting to violence; he accordingly employed what were then designated "civil methods." He managed to attain his object by means of the balia. These magistracies, which were generally renewed every five years, placed in the ballot-bags the names of the candidates from whom the signory and other chief magistrates were to be chosen. As soon as a balia favourable to Cosimo was formed, he was assured for five years of having the government in the hands of men devoted to his interests. He had comprehended that the art of politics depended rather upon individuals than institutions, and that he who ruled men could also dictate laws. His foreign policy was no less astute. His great wealth enabled him to supply money not only to private individuals, but even to foreign potentates. Philippe de Comines tells us that Cosimo frequently furnished Edward IV. of England with sums amounting to many hundred thousand florins. When Tommaso Parentucelli was still a cardinal, and in needy circumstances, Cosimo made him consider- able loans without demanding guarantees of payment. On the cardinal's accession to the see, he was Neri V, in the same year, very well disposed towards Cosimo, and employed the Medici bank in Rome in all the affairs of the curia. At the time when Francesco Sforza was striving for the lordship of Milan, Cosimo foresaw his approaching triumph, showed him great friendship, and aided him with large sums of money. Accordingly, when Sforza became lord of Milan, Cosimo's power was doubled. Without the title of prince, this merchant showed royal generosity in his expenditure for the promotion of letters and the fine arts. Besides his palace in the city, he constructed noble villas at Careggi, Fiesole and other places. He built the basilica of Fiesole, and that of St Lorenzo in Florence, and enlarged the church and monastery of St Mark. Even in distant Jerusalem he endowed a hospice for the use of pilgrims. The artists of the day comprised men like Donatello, Brunelleschi, Ghiberti, Luca della Robbia, and many others, and Cosimo's magnificent commissions not only developed their powers but stimulated other men of wealth to the patronage of art. Without being a scholar, Cosimo had a genuine taste for letters. He purchased many Greek and Latin manuscripts; he opened the first public library at St Mark's at his own expense, and founded another in the abbey of Fiesole. The Greek refugees from Constantinople found a constant welcome in his palace. During the Council of Florence (1439-1442), Gemistus Pletho spoke to him with enthusiasm of the Platonic philosophy. Cosimo was so deeply attracted by the theme that he decided to have the young Marsilio Ficino trained in philosophy and Greek learning in order to make a Latin translation of the complete works of Plato. And thus a
version was produced that is still considered one of the best extant, and that Platonic academy was founded which led to such important results in the history of Italian philosophy and letters. On the 1st of August 1464 Cosimo breathed his last, at the age of seventy-five, while engaged in listening to one of Plato's dialogues.

The concluding years of his life had been years of little happiness for Florence. Being old and infirm, he had left the government to the management of his friends, among whom Luca Pitti was one of the most powerful, and they had ruled with disorder, corruption and cruelty. The lordship of Florence accordingly did not pass without some difficulty and danger into the hands of Piero, surnamed the Gouty, Cosimo's only surviving legitimate son. Afflicted by gout, and so terribly crippled that he was only able to use his tongue, the new ruler soon discovered that a plot was on foot to overthrow his power. However, showing far more courage than he was supposed to possess, he had himself borne on a litter from his villa to Florence, defeated his enemies' designs, and firmly re-established his authority. But his success may be mainly attributed to the enormous prestige bequeathed by Cosimo to his posterity. Piero died at the end of five years' reign on the 9th of December 1469, leaving two sons, Lorenzo (1449-1492) and Giuliano (1453-1478). The younger, the gentler and less ambitious of the pair, was quickly removed from the world. Lorenzo, on the contrary, at once seized the reins of state with a firm grasp, and was, chronologically, the second of the great men bestowed upon Italy by the house of Medici. In literary talent he was immensely superior to Cosimo, but greatly his inferior in the conduct of the commercial affairs of the house. In politics he had nobler conceptions and higher ambitions, but he was more easily carried away by his passions, less prudent in his revenge, and more disposed to tyranny. He had still to learn the lessons of his predecessors in the earliest years under the guidance of Ficino and other leading litterati of the day. At the age of eighteen he visited the different courts of Italy. At his father's death he was only twenty-one years old, but instantly showed his determination to govern Florence with greater despotism than his father or grandfather. He speedily resorted to the system of the batte, and was very dexterous in causing the first to be chosen to suit his purpose. He then proceeded to humiliate the great families and exalt those of little account, and this was the policy he constantly pursued. His younger brother Giuliano, being of a mild and yielding disposition, had only a nominal share in the government.

Lorenzo's policy, although prosecuted with less caution, was still the old astute and fortunate policy initiated by Cosimo. But the grandson bestowed no care upon his commercial interests, although squandering his fortune with far greater lavishness. Accordingly he was sometimes driven to help himself from the public purse without ever being able to assist it as Cosimo had done. All this excited blame and enmity against him, while his greed in the matter of the alum mines of Volterra, and the subsequent lack of that unhappy city, were criticised for which there was no excuse. Among his worst enemies were the Pazzi, and, as they formed a very powerful clan, he sought their ruin by competing with them even in business transactions. They were on the point of inheriting the large property of Giovanni Borromeo when Lorenzo hurriedly caused a law to be passed that altered the right of succession. The hatred of the Pazzi was thereby exacerbated to fury. And in addition to these things there ensued a desperate quarrel with Pope Sixtus IV., a man of very impetuous temper, who, on endeavouring to erect a state on the frontiers of the Florentine republic for the benefit of his nephews, found a determined and successful opponent in Lorenzo. Consequently the Pazzi and Archbishop Salvati, another enemy of Lorenzo, aided by the nephews of the pontiff, who was himself acquainted with the whole matter, determined to put an end to the family. On the 26th of April 1478, while Giuliano and Lorenzo were attending high mass in the cathedral of Florence, the former was mortally stabbed by conspirators, but the latter was able to beat back his assailants and escape into the sacristy. His life was preserved, and no longer having to share the government with all his brothers, Lorenzo seized the opportunity to wreak cruel vengeance upon his foes. Several of the Pazzi and their followers were hanged from the palace windows; others were hacked to pieces, dragged through the streets, and cast into the Arno, while a great many more were condemned to death or sent into exile. Lorenzo seemed willing and able to become a tyrant. But he stopped short of this point. He knew the temper of the city, and had also to look to fresh dangers threatening him from without. The pope had communicated him, put Florence under an interdict, and, being succeeded by a cardinal, tried to establish a new bishopric, in order to retain his supremacy. But Lorenzo decided to renew the usual manage at the close of that term and have another elected equally favourable to his aims. This was often a difficult achievement, and Lorenzo showed much dexterity in overcoming all obstacles. In 1480 he compassed the institution of a new council of seventy, which was practically a permanent batte with extended powers, inasmuch as it not only elected the chief magistrates, but had also the administration of numerous state affairs. This permanent council of devoted adherents once formed, his security was firmly established. By this prudent proceeding, he kept the citizenry at arm's length, and as the affairs of the state were always conducted by intelligent and experienced men, who promoted the public prosperity. Florence was still called a republic; the old institutions were still preserved, if only in name. Lorenzo was absolute lord of all, and virtually a tyrant. His immorality was scandalous; he kept an army of spies; he frequently meddled in the citizens' most private affairs, and exalted men of the lowest condition to important offices of the state. Yet, as Guicciardini remarks, "if Florence was to have a tyrant, she could never have found a better or more pleasant one."

In fact, Lorenzo's government made enormous progress. The civil equality of modern states, which was quite unknown to the middle ages, was more developed in Florence than in any other city of the world. Even the condition of the peasantry was far more prosperous than elsewhere. Lorenzo's authority was not confined to Tuscany, but was also very great throughout the whole of Italy. He was on the friendliest terms with Pope Innocent VIII., from whom he obtained the exaltation of his son Giovanni to the cardinalate at the age of fourteen. This boy-cardinal was afterwards Pope Leo X. From the moment of the decease of Sigismund IV., the luxuries of Florence and Rome became the basis of Lorenzo's foreign policy. By its means he was able to prevent the hatreds and jealousies of the Sforzas of Milan and the Aragonese of Naples from bursting into the open conflict that long threatened, and after his death actually caused, the beginning of new and irreparable calamities. Hence Lorenzo was styled the needle of the Italian compass.

But the events we have narrated cannot suffice for the full comprehension of this complex character, unless we add the record of his deeds as a patron of letters and his achievements as a writer. His palace was the school and residence of illustrious men. Within its walls were trained the two young Medici afterwards known to the world as Leo X. and Clement VII. Ficino, Poliziano, Pico della Mirandola and all members of the Platonic academy were its constant habitués. It was here that Pulci gave readings of his Morgante, and Michelangelo essayed the first strokes of his chisel. Lorenzo's intellectual powers were of exceptional strength and versatility. He could speak with
MEDICI (FAMILY)

equal fluency on painting, sculpture, music, philosophy and poetry. But his crowning superiority over every other Maecenas known to history lay in his active participation in the intellectual labours that he promoted. Indeed at certain moments he was positively the leading spirit among the litterati of his time. He was an elegant prose writer, and was likewise a poet of real originality. At that period Italians were forsaking erudition in order to forward the revival of the national literature by recurring to the primitive sources of the spoken tongue and popular verse. It is Lorenzo's lasting glory to have been the initiator of this movement. Without being—as some have maintained—a poet of genius, he was certainly a writer of much finish and eloquence, and one of the first to raise popular poetry to the dignity of art. In his Ambra, his Caccià del falcone and his Nencia da Barbenino, he gives descriptions of nature and of the rural life that he loved, with the graphic power of an acute and tasteful observer, joined to an ease of style that occasionally sins by excess of homeliness. Both in his art and in his politics he learnt upon the people. The more oppressive his government, the more did he seek in his verses to incite the public to festivities and joll it to slumber by sensual enjoyments. In his Ballate, or songs for dancing, and more especially in his carnival songs, a kind of verse invented by himself, Lorenzo displayed all the best qualities and worst defects of his muse. Marvelously and spontaneously elegant, very truthful and fresh in style, fertile in fancy and rich in colour, they are often of a most revolting indecency. And these compositions of one selling a priory station in the city were not sung by their author in the public streets, in the midst of the populace.

Lorenzo left three sons—Pietro (1471-1503), Giovanni (1475-1521) and Giuliano (1479-1516). He was succeeded by Pietro, whose rule lasted but for two years. During this brief term he performed no good deeds, and only displayed inordinate vanity and frivolity. His conduct greatly helped to foment the hatred between Lodovico Sforza and Ferdinand of Naples, which hastened the coming of the French under Charles VIII., and the renewal of foreign invasions. No sooner did the French approach the frontiers of Tuscany than Pietro, crazed with fear, hastened to meet them, and, basely yielding to every demand, accepted terms equally humiliating to himself and the state. But, returning to Florence, he found that the enraged citizens had already decreed his deposition, in order to reconstitute the republic, and was therefore compelled to escape to Venice. His various plots to reinstate himself in Florence were all unsuccessful. At last he went to the south of Italy with the French, was drowned at the passage of the Garigliano in 1503, and was buried in the cloister of Monte Cassino.

The ensuing period was adverse to the Medici, for a republican government was maintained in Florence from 1494 to 1512, and the city remained faithful to its alliance with the French, who were all-powerful in Italy. Cardinal Giovanni, the head of the family, resided in Rome, playing the part of a circle of literati, artists and friends, seeking to increase his popularity, and calmly waiting for better days. The battle of Ravenna wrought the downfall of the fortunes of France in Italy, and led to the rise of those whose fortunes the revolution of 1494 had injured. The republic and reinstate the Medici. Pietro had now been dead for some time, leaving a young son, Lorenzo (1492-1519), who was afterwards duke of Urbino. The following year (1513) Cardinal Giovanni was elected pope, and assumed the name of Leo X. He accordingly removed to Rome, leaving his brother Giuliano with his nephew Lorenzo in Florence, and accompanied by his cousin Giulio, who was a natural son of the Giuliano murdered in the conspiracy of the Pazzi, and was soon destined to be a cardinal and ultimately a pope. Meanwhile his kinmen in Florence continued to govern that city by means of a balia. And thus, being masters of the whole of central Italy, the Medici enjoyed great authority throughout the country and their ambition plumed itself for still higher flights. This was the moment when Niccolò Machiavelli, in his treatise The Prince, counselled them to accomplish the unity of Italy by arming the whole nation, and expelling its foreign invaders.

Leo X., who is only indirectly connected with the history of Florence, gave his name to the age in which he lived in consequence of his magnificent patronage of art and letters in Rome. But he was merely a clever unattractive man, who loved the literary gifts of his father Lorenzo. He surrounded himself with versifiers and inferior writers, who splenified his board and accompanied him wherever he went. He liked to lead a gay and untroubled life, was fond of theatrical performances, satires and other intellectual diversions. His patronage of the fine arts, his genuine affection for Raphael, and the numerous works he caused to be executed by him and other artists, have served to confer an exaggerated glory on his name. He had not the remotest idea of the grave importance of the Reformation, which indeed he unconsciously promoted by his reckless and shameless sale of indulgences. The whole policy of Pope Leo X. consisted in oscillating between France and Spain, in always playing fast and loose, and deceiving both powers in turn. Yet the evil results of this contemptible policy never seemed to disturb his mind. He finally joined the side of the emperor Charles V., and in 1521, at the time of the defeat of the French by the Spanish troops on the river Adda, he ceased to breathe at his favourite villa of Magliana.

Giuliano dei Medici had died during Leo's reign, in 1516, without having ever done anything worthy of record. He was the husband of Philippa of Savoy, one of whose sons, a natural son, Ippolito dei Medici (1512-1553), who afterwards became a cardinal. Lorenzo, being of more ambitious temper, was by no means content to remain at the head of the Florence government hampered by many restrictions imposed by republi
can institutions, and subject to the incessant control of the pope. In his eagerness to aggrandize his kinsmen, the latter had further decided to give Lorenzo the duchy of Urbino, and formally invested him in its rights, after expelling on false pretences its legitimate lord, Francesco Maria della Rovere. This prince, however, soon returned to Urbino, where he was joyously welcomed by his subjects, and Lorenzo regained possession only by a war of several months, in which he was wounded. In 1519 he also died, worn out by disease and excess. By his marriage with Madeleine de la Tour d'Auvergne, he had one daughter, Caterina dei Medici (1519-1589), married in 1533 to Henry, duke of Orleans, afterwards king of France. She played a long and sinister part in the history of that country. Lorenzo also left a natural son named Alessandro, inheriting the frizzled hair and projecting lips of the negro or mulatto slave who had given him birth. His miserable death will be presently related. Thus the only three successors of the chief branch of the Medici, Cardinal Giulio, Ippolito and Alessandro were all of illegitimate birth, and left no legitimate heirs.

Cardinal Giulio, who had laboured successfully for the reinstatement of his family in Florence in 1512, had been long attached to the person of Leo X., as his trusted factotum and companion. He had been generally regarded as the mentor of the pope, who had no liking for hard work. But in fact, his frivolity notwithstanding, Leo X. always followed his own inclinations. He cared little for that attitude for command, and pursued his shuffling policy without any mental anxiety. Giulio, on the contrary, shrank from all responsibility, muddled his brains in weighing the reasons for and against every possible decision, and was therefore a better tool of government in others' hands than he was fit to govern on his own account. When Giuliano and Lorenzo died, the pope appointed the cardinal to the government of Florence. In that post, restricted within the limits imposed by republican institutions, and acting under the continual direction of Rome, he performed his duties fairly well. He cared the citizens with hopes of extended liberties, which, although never satisfied, were fulfilled, long and lived to serve men's minds in a pleasant flutter of expectation; and when the more impatient spirits attempted to raise a rebellion he speedily quenched it in blood.

When, after the death of Leo X. and the very brief pontificate
of Adrian VI, he was elected pope (1523) under the name of Clement VII, he entrusted the government of Florence to Cardinal Silvio Passerini conjointly with Alessandro and Ippolito, who were still too young to do much on their own account. The pontificate of Leo X. had been a time of felicity to himself if of disaster to Italy and the Church. The reign of Clement, on the contrary, was fatal to himself as well. His policy, like that of Leo X., consisted in perpetual oscillation between France and Spain. By his endeavours to trick all the world, he frequently ended in being tricked himself. In 1525 he was the ally of the French, who then suffered a terrible defeat at Pavia, where their king Francis I. was taken prisoner. The armies of Charles V. triumphantly advanced, without Clement being able to oppose any effectual resistance. Both Rome and Florence were threatened with a feudal absolution. Thus far we have had no occasion to speak of the younger branch of the Medici, descended from Lorenzo, brother to Cosimo the elder. Always in obscurity, and hitherto held in check by the elder line, it first entered the arena of history when the other was on the point of extinction. In fact the most valiant captain of the papal forces was Giovanni dei Medici, afterwards known by the name of Giovanni delle Bande Nere. His father was Giovanni, son of Pier Francesco, who was the son of Lorenzo, the brother of Cosimo dei Medici. History has little to tell of the elder Giovanni; but his wife Caterina Sforza, of whom he was the third husband, was a woman of more thanordinary worth. Giovanni dei Medici married her in 1497, but died in 1498, leaving her with one son who was christened Lodovico, but afterwards took his father's name of Giovanni (1498-1536). Trained to arms from his earliest years, this youth inherited all the energy of his mother, whose Sforza blood seemed to infuse new life into the younger branch of the Medici. Notwithstanding his extreme youth, he had already achieved the title of the best captain in Italy. He had always fought with immense dash and daring, and was devoting low pay earned by his soldier. He was the only leader who opposed a determined resistance to the imperial forces. He was seriously wounded at Pavia when fighting on the French side. On his recovery he joined the army of the League, and was much enraged by finding that the duke of Urbino, commander of the Venetian and papal forces, would never decide on attacking. When the imperial troops were struggling through the marshes of Mantua, surrounded on every side, and without stores or ammunition, Giovanni could not resign himself to inactivity like his colleagues in command. He was ignorant that the imperialists had just received supplies and artillery from the duke of Ferrara, and therefore daringly attacked them with a small body of men without taking any precautions for defence. One of the first shots fired by the enemy injured him so fatally that he died a few days after. He was married to Maria Salviati, by whom he had one son, Cosimo (1519-1574), who became the first grand duke of Tuscany, and indeed the founder of the grand duchy and the new dynasty. Meanwhile the imperial army pursued its march upon Rome, captured the Eternal City after a few hours' combat, and cruelly sacked it during many days (1527). Having been defeated at Pavia, the pope took refuge in the castle of St. Angelo, whence he only effected his escape after some months. He then signed a treaty of alliance with the emperor (1529), who sent an army to besiege Florence and restore the Medici, whom the people had expelled in 1527 on the re-establishment of the republic. After an heroic defence, the city was forced to surrender (1530); and, although it was expressly stipulated that the ancient liberties of Florence should be respected, every one foresaw that the conditions would be violated. In fact, pope and emperor immediately began to dispute as to which should be the new lord of the city. Clement VII had inherited the traditional family dislike for the younger branch of his kin, and so the choice lay between the two bastards Ippolito and Alessandro. The former being a cardinal, the latter was chosen. Alessandro, who already bore the title of duke of Città di Penna, came to Florence in 1531, and by imperial patent was nominated head of the republic. According to the terms of this patent, the former liberty enjoyed under the Medici was to remain intact. But no previous ruler of the city had enjoyed a credibility so firmly established by imperial patent, and such power was incompatible with the existence of a republic. Moreover, Clement VII. showed dissatisfaction with the uncertainty of the power conferred upon his kinsman, and finally succeeded in obtaining additional privileges. On the 4th of April 1532 a parliament was convoked for the last time in Florence, and, as usual, approved every measure proposed for acceptance. Accordingly a new council was formed of two hundred citizens elected for life, forty-eight of which were to constitute a senate. Alessandro, as duke of the republic, filled the post of gonfalonier and carried on the government with the assistance of three senators, changed every three months, who took the place of the suppressed signory. The duke's chief advisers, and the contrivers of all these arrangements were Baccio Valori, Francesco Vettori and above all Francesco Guicciardini—men, especially the latter two, of lofty political gifts and extensive influence. The mind and character of Duke Alessandro were as yet comparatively unknown. At first he seemed disposed to rule with justice and in his own person, but on encountering difficulties that he was unable to overcome, he began to neglect the business of the state, and acted as if the sole function of government consisted in Hulling the people by festivities and corrupting it by the absolute life of which he set the example. The question of the moment was the transformation of the old republican régime into a princeedom; as an unavoidable result of this change it followed that Florence was no longer to be the ruling city to whose inhabitants alone belonged the monopoly of political office. When the leading Florentine families realized not only that the republic was dissolved, but that they were reduced to equality with those whom they had hitherto regarded as their inferiors and subjects, their rage was indescribable, and hardly a day passed without the departure of influential citizens who were resolved to achieve the overthrow of their new rulers. They found a leader in Cardinal Ippolito dei Medici, who was then in Rome, embittered by the preference given to Alessandro, and anxious to become his successor with the least possible delay. Under the pressure of terror the duke at once became a tyrant. Hearrisoned the different cities, and began the erection in Florence of the Fortezza da Basso, built chiefly as a storehouse of Filippo Strozzi, who afterwards met his death within its walls. In 1534 Clement VII. died, and the election fell on Paul III., from whom Cardinal Ippolito hoped to obtain assistance. Accordingly the principal Florentine exiles were despatched to Charles V. with complaints of Alessandro's tyranny and his shameless violation of the terms upon which the city had surrendered. Cardinal Ippolito also represented his own willingness to carry on the government of Florence in a more equitable manner, and promised the emporer a large sum of money. Reply being delayed, the emperor's representative became so impatient that he set out to meet Charles in Tunis, but on the 10th of August 1535 died suddenly at Itri, poisoned by order of Alessandro. Such at least was the general belief, and it was confirmed by the same fate befailing other enemies of the duke about the same time. On the emperor's return from Africa, the exiles presented themselves to him in Naples, and the venerable patriot Jacopo Nardi pleaded their cause. Duke Alessandro, being cited to appear, came to Naples accompanied by Francesco Guicciardini, who by speaking in his defence rendered himself odious to all friends of liberty, and irritated the temper of his illustrious namee. The cardinal being dead, it was hard to find a successor to Alessandro. On this account, and perhaps to some extent through the emperor's personal liking for the duke, the latter rose higher than before in the imperial favour, married Margaret of Austria, the natural daughter of Charles,
and returned to Florence with increased power. And now Alessandro indulged unchecked in the lowest excesses of tyranny, and although so recently a bridegroom gave way to increased libertinism. His whole time was passed in vicious haunts and in scandalous adventures. In order to conceal the obscurity of his birth, he left his mother to starve, and it was even asserted that he finally got rid of her by poison.

His constant associate in this disgraceful routine was his distant kinsman Lorenzo, generally known as Lorenzino del Medici. Of the younger branch of the Medici, the latter was second cousin of the Cosimo already mentioned as the son of Giovanni delle Bande Nere. He had much culture and literary talent, but led an irregular life, sometimes acting like a madman and sometimes like a villain. He was a writer of considerable elegance, the author of several plays, one of which, the Arildia, was held to be among the best of his age, and he was a worshipper of antiquity. Notwithstanding these tastes, when in Rome he knocked off the heads of some of the finest statues of the age of Adrian, an act by which Clement VII. was so incensed that he threatened to have him hanged. Thereupon the Medici family fled to Florence, where he became the friend of Duke Alessandro, and his partner in the most licentious excesses. They went together to houses of ill-fame, and violated private dwellings and convents. They often showed themselves in public mounted on the same horse. All Florence eyed them with disgust, but no one foresaw the tragedy that was soon to take place.

On the evening of the 5th of January 1537, after a day passed in the usual excesses, Lorenzino led the duke to his own lodging, and left him there, promising shortly to return with the wife of Leonardo Gini. Alessandro, worn out by the exertions of the day, fell asleep on the couch awaiting Lorenzino's return. Before long the latter came accompanied by a desperado known as the Scoronconclo, who aided him in falling on the sleeper. Roused by their first thrusts, the duke fought for his life, and was only despatched after a violent struggle. The murderers then lifted the body into a bed, hid it beneath the clothes, and Lorenzino having attached a paper to it bearing the words vincit amor patris, laudumque immensae cupidit, they both fled to Venice. In that city Lorenzino was assassinated some ten years later, in 1548, at the age of thirty-two, by order of Alessandro's successor. He wrote an Apologia, in which he defended himself with great skill and eloquence, saying that he had been urged to the deed solely by love of liberty. For this reason alone he had followed the example of Brutus and played the part of friend and courtier. The tone of this Apologia is so straightforward, sometimes even so eloquent and lofty, that we should be tempted to give it credence were it possible to believe the assertions of one who not only by his crime but by the infamy of his previous and subsequent career completely gave the lie to his vaunted nobility of purpose. By Alessandro's death the elder branch of the Medici became extinct, and thus the appearance of the younger line was heralded by a bloody crime.

When the duke's absence from his own palace was discovered on the morning of the 6th of January he was at first supposed to have spent the night with one of his mistresses; but soon, some alarm being felt, search was made, and Cardinal Cybo was the first to discover the murder. Enjoicing the strictest secrecy, he kept the corpse concealed for three days, and then had it interred in the sacristy of San Lorenzo. Meanwhile he had hastily summoned Alessandro Vitelli and the other captains, so that, by the time Alessandro's death was made public, the city was already filled with troops. The cardinal then convoked the council of forty-eight to decide upon a successor, Alessandro's only issue was a natural son named Giulio, aged five. The cardinal favoured his election, in the hope of keeping the real sovereignty in his own hands. But he speedily saw the impossibility of carrying out a design that was ridiculed by all. Guicciardini, Vettori and others of the leading citizens favoured the choice of Cosimo, the son of Giovanni delle Bande Nere. He was already in Florence, was aged seventeen, was keen-witted and aspiring, strong and handsome in person, heir to the enormous wealth of the Medici, and, by the terms of the imperial patent, was Alessandro's lawful successor. Charles V. approved the nomination of Cosimo, who without delay seized the reins of government with a firm grasp. Like Alessandro, he was named head of the republic; and Guicciardini and others who had worked hardest in his cause hoped to direct him and keep him under their control. But Cosimo soon proved that, his youth notwithstanding, he was resolved to rule unshackled by republican forms and disposed to act as conquerors. The Florentines had now an absolute prince who was likewise a statesman of eminent ability.

On learning the death of Alessandro and the election of Cosimo, the exiles appreciated the necessity for prompt action, as delay would be fatal to the overthrow of the Medicean rule. They had received money and promises from France; they were strengthened by the adherence of Filippo Strozzi and Baccio Valori, who had both become hostile to the Medici through the infamous conduct and mad tyranny of Alessandro; and Strozzi brought them the hope of his personal fortune and the prowess of his distinguished captain, his son Piero. The exiles assembled their forces at Mirandola. They had about four thousand infantry and three hundred horse; among them were members of all the principal Florentine families; and their leaders were Bernardo Salviati and Piero Strozzi. They marched rapidly, and entered Tuscany towards the end of July 1537. Cosimo on this occasion displayed signal capacity and presence of mind. Informed of the exiles' movements by his spies, he no sooner learned their approach than he ordered Alessandro Vetelli to collect the best German, Spanish and Italian infantry at his disposal, and advance against the enemy without delay. On the evening of the 31st of July Vetelli marched towards Prato with seven hundred picked infantry and a band of one hundred horse, and on the way fell in with some Spanish foot soldiers who joined the expedition. At early dawn the following morning he made a sudden attack on the exiles' advanced guard close to Montemuro, an old fortress converted into a villa belonging to the Nerli. Having utterly routed them, he proceeded to storm Montemuro, where Filippo Strozzi and a few of his young comrades had taken refuge. They made a desperate resistance, but were soon overcome, and then, overpowered by superior numbers, were obliged to yield themselves prisoners. The main body of the army was still at some distance, having been detained in the mountains by heavy rains and difficult passes, and, on learning the defeat at Montemuro, its leader turned back by the way he had come. Alessandro Vetelli re-entered Florence with his victorious army and his fettered captives. Cosimo had achieved his first triumph.

All the prisoners, who were members of great families, were brought before Cosimo, and were received by him with courteous coldness. Soon, however, a scaffold was erected in the Piazza, and on four mornings in succession four of the prisoners were beheaded. Then the duke saw fit to stay the executions. Baccio Valori, however, and his son and nephew were beheaded on the 20th of August in the courtyard of the Bargello. Filippo Strozzi still survived, confined in the Fortezza da Basso, that had been built at his expense. His family was illustrious, he had numerous adherents, and he enjoyed the protection of the French king. Nevertheless Cosimo only waited some plausible pretext to rid himself of this dreaded enemy. He brought him to trial and had him put to the question. But this cruelty led to nothing, for Strozzi denied every accusation and bore the torture with much fortitude. On the 18th of December he was found dead in his prison, with a blood-stained sword by his side, and a slip of paper bearing these words: exoriare aliquis nostris ex ossibus ulter. It was believed that, having renounced all hope of his life being spared, Strozzi had preferred suicide to death at the hands of the executioner. Some, however, thought that Cosimo had caused him to be murdered, and adopted this mode of concealing the crime. The young prince's cold-blooded massacre of his captives cast an enduring shadow upon his reign and dynasty. But it was henceforward plain to all that he was
a man of stern resolve, who went straight to his end without scruples or half-measures. Before long he was regarded by many as the incarnation of Machiavel's Prince, an insatiable and, by his own admission, he joined daring to talent and prudence, was capable of great cruelty, and yet could practise mercy in due season." Guicciardini, who still pretended to act as mentor, and who on account of his many services had a certain influence over him, was obliged to withdraw from public life and busy himself with writing his History at his villa of Arcetri. He died in this retreat in 1540, and it was immediately rumoured that the duke had caused him to be poisoned. This shows the estimation in which Cosimo was now held. He punished with death all who dared to resist his will. By 1540 sentence of death had been pronounced against four hundred and thirty-five conscientious fugitives, and during his reign one hundred and forty men and six women actually ascended the scaffold, without counting those who perished in foreign lands by the daggers of his assassins. He reduced the old republican institutions to empty forms, by making the magistrates mere creatures of his will. He issued the sternest edicts against the rebels, particularly by the law known as the "Polverina," from the name of its proposer Jacopo Polverini. This law decreed not only the confiscation of the property of exiles, but likewise that of their heirs, even if personally acquired by the latter. Cosimo ruled like the independent sovereign of a great state, and always showed the capacity, firmness, and courage demanded by that station. Only, his state being small and weak, he was forced to rely chiefly upon his personal talent and wealth. It was necessary for him to make heavy loans to the different European sovereigns, especially to Charles V., the most rapacious of them all, and to give enormous bribes to their ambassadors. Besides, he had to carry on wars for the extension of his dominions; and neither his inherited wealth nor the large sums gained by confiscating the estates of rebellious subjects sufficed for all this outlay. He was accordingly compelled to burden the people with taxes, and thus begin at once to diminish its strength.

Cosimo bore a special grudge against the neighbouring republics of Siena and Lucca. Although the latter was small and weak, and the former garrisoned by Spaniards, yet the spectacle of free institutions at the frontiers of his own state served as a continual incitement to subjects disaffected to the new régime. In fact Francesco Burlamacchi, a zealous Lucchese patriot, had conceived the design of re-establishing republican government in all the cities of Tuscany. Cosimo, with the emperor's help, succeeded in having them classified, but their power was broken by an insignificant state making no pretence of authority, whereas Siena was an old and formidable foe to Florence, and had always given protection to the Florentine exiles. It was now very reluctantly submitting to the presence of a Spanish garrison, and, being stimulated by promises of prompt and efficacious assistance from France, rose in rebellion and expelled the Spaniards in 1552. Cosimo instantly wrote to the emperor in terms that appealed to his pride, asked leave to attack Siena, and begged for troops to ensure the success of his enterprise. As no immediate answer arrived, he feigned to begin negotiations with Henry II., and used this pretext for tempting the Spaniards, who obtained a contingent of German and Spanish infantry. Siena was besieged for fifteen months, and its inhabitants, aided by the valour of Piero Strozzi, who fought under the French flag, made a most heroic resistance, even women and children helping on the walls. But fortune was against them. Piero Strozzi sustained several defeats, and finally the Sienese, having exhausted their ammunition and being decimated by famine and the sword, were obliged to capitulate on honourable terms that were shamelessly violated. By the varied disasters of the siege and the number of fugitives the population was reduced from forty to eight thousand inhabitants. The republicans, still eager to resist, withdrew to Montalcino. Cosimo now ruled the city and territory of Siena in the name of Charles V., who always refused him its absolute possession. After the emperor's abdication, and the succession of Philip II. to the Spanish throne, Cosimo at last obtained Siena and Porto Ferrajo by giving up his claim to a sum of 200,000 ducats that he was to have received from Charles V.

In 1559 Cosimo also captured Montalcino, and thus formed the grand-duchy of Tuscany, but he continued to govern the new state—i.e. Siena and its territories—separately from the old. His rule was intelligent, skilful and despotically; but his enormous expenses drove him to raise large sums of money by special contrivances unsuited to the country and the people. Hence, notwithstanding the genius of its founder, the grand-duchy held from the first the elements of its future decay. Cosimo preferred to confer office upon men of humble origin in order to have pliable tools, but he also liked to be surrounded by a courtier aristocracy on the Spanish and French pattern. As no Tuscan rising longer existed, he created new nobles, and tempted foreign ones to come by the concession of various feudal privileges; and, to turn this artificial aristocracy to some account, he founded the knightly order of St Stephen, charged with the defence of the coast against pirates, which in course of time won much honour by its prowess. He also established a small standing army for the protection of his frontiers; but he generally employed German and Spanish troops for his wars, and always had a foreign bodyguard. At the commencement of his reign he opposed the popes in order to maintain the independence of his own state; but later, to obtain help, he truckled to them in their weakness, and thus the extent of giving up to the Inquisition his own confident, Piero Carnesecchi, who, being accused of heresy, was beheaded and burnt in 1567. In reward for these acts of submission, the popes showed him friendship, and Pius V. granted him the title of grand-duke, conferring the patent and crown upon him in Rome, although the emperor had always withheld his consent. The measure most injurious to Tuscany was the fiscal system of taxes, of which the sole aim was to extort the greatest possible amount of money. The consequent damage to industry, commerce and agriculture was immense, and, added to the devastations caused by the Sienese War, led to their utter ruin. Otherwise Cosimo did not neglect useful measures for the interior prosperity of his state. He was no Maccenas; nevertheless he restored the Pisan university, enlarged that of Siena, had the public records classified, and also executed public works like the Santa Trinità bridge. During the great inundations of 1557 he turned his whole energy to the relief of the sufferers.

In 1559 he had espoused Eleonora of Toledo, daughter of the viceroy of Naples, by whom he had several children. Two died in 1563, and their mother soon followed them to the grave. It was said that one of these boys, Don Garcia, had murdered the other, and then been killed by the enraged father. Indeed, Cosimo was further accused of having put his own wife to death; but neither rumour had any foundation. He now showed signs of illness and failure of strength. He was not old, but worn by the cares of state and self-indulgence. Accordingly in 1564 he resigned the government to his eldest son, who was to act as his lieutenant, since he wished to have power to resume the sceptre on any emergency. In 1570, by the advice of Pope Pius V., he married Camilla Martelli, a young lady of whom he had been infatuated. She was his confidant, and thus he shared the last years and ten months, after a reign of thirty-seven years, leaving three sons and one daughter besides natural children. These sons were Francesco, his successor, who was already at the head of the government, Cardinal Ferdinand, and Piero. Francesco I., born in 1541, began to govern as his father's lieutenant in 1564, and was married in 1565 to the archduchess Giovanna of Austria. On beginning to reign on his own account in 1574, he speedily manifested his real character. His training in the hands of a Spanish mother had made him suspicious, false and despotic. Following the way of every one aloof, he carried on the government with the assistance of a few devoted ministers. He compelled his step-mother to retire to a convent, and kept his brothers at a distance from Florence. He loved the privileges of power without its burdens. Cosimo had known how to maintain his independence, but Francesco cast
himself like a vassal at Austria's feet. He repaid his reward by obtaining from Maximilian II, the title of grand-duke, for which Cosimo had never been able to win the imperial sanction, but he forfeited all independence. Towards Philip II, he showed even greater submissiveness, supplying him with large sums of money wrung from his overtaxed people. He held entirely aloof from France, in order not to awake the suspicions of his protectors, at Rome, traded on his own account, thus earning so much gold that was ruinous to the country. He raised the tax upon corn to so high a rate that few continued to find any profit in growing it, and thus the Maremme, already partly devastated during the war with Siena, were converted into a desert. Even industry declined under this system of government; and, although Florence founded porcelain manufactories and pietra dura works, they did not rise to any prosperity until after his death. His love of science and letters was the only Medicanean virtue that he possessed. He had an absolute passion for chemistry, and passed much of his time in his laboratory. Sometimes indeed he gave audience to his secretaries of state standing before a furnace, bellows in hand. He took some useful measures to promote the rise of a new city at Leghorn, which at that time had only a natural and ill-sheltered harbour. The improvement of Leghorn had been first projected by Cosimo I., and was carried on by all the succeeding Medicini. Francesco was a slave to his passions, and was led by them to scandalous excesses and deeds of bloodshed. His example and neglect of the affairs of the state soon caused a vast increase of crime even among the people, and, during the first eighteen months of his reign, there occurred no fewer than one hundred and sixty-eight murders. In default of public events, the historians of this period enlarge upon private incidents, generally of a scandalous or sanguinary kind. In 1575 Orazio Pucci, wishing to avenge his father, whom Cosimo had hanged, determined to get up a conspiracy, but, soon recognizing how firmly the Medicanean rule had taken root in the country, desisted from the attempt. But the grand-duke, on hearing of the already abandoned plot, immediately caused Pucci to be hanged from the same window of the Palazzo Vecchio, and even from the same iron stanchion, from which his father before him had hung. His companions, who had fled to France and England, were pursued and murdered by the ducale emissaries. Their possessions were confiscated, and the "Polverina" law applied, so that the conspirators' heirs were reduced to penury, and the grand-duke gained more than 300,000 ducats.

Next year Isabella dei Medici, Francesco's sister, was strangled in her nuptial bed by her husband, Paolo Giordano Orlandi, whom she had betrayed. Piero dei Medici, Francesco's brother, murdered his wife Eleonora of Toledo from the same motive. Still louder scandal was caused by the duke's own conduct. He was already a married man, when, passing one day through the Piazza of St Mark in Florence, he saw an exceedingly beautiful woman at the window of a mean dwelling, and at once conceived a passion for her. She was the famous Bianca Cappello, a Venetian of noble birth, who had eloped with a young Florentine named Pietro Buonaventuri, to whom she was married at the time that she attracted the duke's gaze. He made her acquaintance, and, in order to see her frequently, nominated her husband to a position in his service. But from this Bianca derived so much insolence, even to the nobility, that one evening he was found murdered in the street. Thus the grand-duke, who was thought to have sanctioned the crime, was able to indulge his passion unchecked. On the death of the grand-duchess in 1578 he was privately united to Bianca, and afterwards married her publicly. But she had no children, and this served to poison her happiness, since the next in succession was her bitter enemy, the cardinal Ferdinand. The latter came to Florence in 1587, and was ostentatiously welcomed by Bianca, who was most anxious to conciliate him. On the 18th of October of the same year the grand-duke died at his villa of Poggio a Caiano, of a fever caught on a shooting excursion in the Maremme, and the next day Bianca also expired, having ruined her health by drugs taken to cure her sterility. But rumour asserted that she had prepared a poisoned tart for the cardinal, and that, when he suspiciously insisted on the grand-duke tasting it first, Bianca despairingly swallowed a slice and followed her husband to the tomb.

Such was the life of Francesco dei Medici, and all that can be said in his praise is that he gave liberal encouragement to a few artists, including de Giovanni Bologna. (58.) He was the founder of the Uffizi gallery, of the Medici theatre, and the villa of Pratolino; and during his reign the Della Cruciana academy was instituted.

Ferdinand I. was thirty-eight years of age when, in 1587, he succeeded his brother on the throne. A cardinal from the age of fourteen, he had never taken holy orders. He showed much tact and experience in the management of ecclesiastical affairs. He was the founder of the Villa Medici at Rome, and the purchaser of many priceless works of art, such as the Niobe group, and many of her statues afterwards transported by him to Florence. After his accession he retained the cardinal's purple until the time of his marriage. He was in all respects his brother's opposite. Affable in his manners and generous with his purse, he chose a most typical of the proposed mildness of his rule—a swarm of bees with the motto Majestate tantum. He instantly pardoned all who had opposed him, and left his kinsmen at liberty to choose their own place of residence. Occasionally, for political reasons, he committed acts unworthy of his character; but he re-established the administration of justice, and sedulously attended to the business of the state. He was the revived under his rule and regained the independence and political dignity that his brother had sacrificed to love of ease and personal indulgence. He favoured commerce, and effectually ensured the prosperity of Leghorn, by an edict enjoining toleration towards Jews and heretics, which led to the settlement of many foreigners in that city. He also improved the harbour and facilitated communication with Pisa by means of the Naviglio, a canal into which a portion of the water of the Arno was turned. He nevertheless retained the reprehensible custom of trading on his own account, keeping banks in many cities of Europe. He successfully accomplished the draining of the Val di Chiana, cultivated the plains of Pisa, Fucecchio and Val di Nievole, and executed other works of public utility at Siena and Pisa. But his best energies were devoted to the foreign policy by which he sought to emancipate himself from subjection to Spain. On the assassination (1586) of Henry III. of France Ferdinand supported the claims of the king of Navarre, undeterred by the opposition of Spain and the Catholic League, who were dismayed by the prospect of a Huguenot succeeding to the throne of France. Hence he was compelled to burden his subjects with enormous taxes, forgetting that while guaranteeing the independence of Tuscany by his loans to foreign powers he was increasingly sapping the strength of future generations. He at last succeeded in obtaining the formal investiture of Siena, which Spain had always considered a fief of her own.

During this grand-duke's reign the Tuscan navy was notably increased, and did itself much honour on the Mediterranean. The war-galleys of the knights of St Stephen were despatched to the coast of Barbary to attack Bona, the headquarters of the corsairs, and they captured the town with much dash and bravery. In the following year (1608) the same galleys achieved their most brilliant victory in the archipelago over the stronger fleet of the Turks, by taking nine of their vessels, seven hundred prisoners, and jewels of the value of 2,000,000 ducats.
Ferdinand I. died in 1609, leaving four sons, of whom the eldest, Cosimo II., succeeded to the throne at the age of nineteen. Cosimo II. was at first assisted in the government by his mother and a council of regency. He had a good disposition, and the fortune to reign during a period when Europe was at peace and Tuscany blessed with abundant harvests. Of his rule there is little to relate. His chief care was given to the galleys of St Stephen, and he sent them to assist the Druses against the Porte. On one occasion he was involved in a quarrel with France. Concino Concini, the Marshal d'Ancre, being assassinated in 1617, Louis XIII. claimed the right of transferring the property of the murdered man to De Luyens. Cosimo, refusing to recognize the confiscation decreed by the French tribunals, demanded that Concini's son should be allowed to inherit. Hence followed much ill-feeling and mutual recriminations between the two countries, finally brought to an end by the intervention of the duke of Lorraine.

Like his predecessors, Cosimo II. studied to promote the prosperity of Leghorn, and he deserves honour for abandoning all commerce on his own account. But it was no praiseworthy act to pass a law depriving women of almost all rights of inheritance. By this means many daughters of the nobility were driven into convents against their will. He gave scanty attention to the general affairs of the state. He was fond of luxury, spent freely on public festivities and detested troubles. Tuscany was apparently tranquil and prosperous; but the decay of which the seeds were sown under Cosimo I. and Ferdinand I. was rapidly spreading, and became before long patent to all and beyond all hope of remedy. The best deed done by Cosimo II. was the protection accorded by him to Galileo Galilei, who had removed to Padua, and there made some of his grandest discoveries. The grand duke recalled him to Florence in 1610, and nominated him court mathematician and philosopher. Cosimo died in February 1621. Feeling his end draw near, when he was only aged thirty and all his sons were still in their childhood, he hastened to arrange his family affairs. His mother, Cristina of Lorraine, and his wife, Maddalena of Austria, were nominated regents and guardians to his eldest son Ferdinand II., a boy of ten, and a council of four appointed, whose functions were regulated by law. After Cosimo's death, the young Ferdin- and was sent to Rome and Vienna to complete his education, and the government of Tuscany remained in the hands of two jealous and quarrelsome women. Thus the administration of justice and finance speedily went to ruin. Out of submission to the pope, the regents did not dare to maintain their legitimate right to inherit the duchy of Urbino. Cosimo's confers on the new Tuscan nobility, which became increasingly insolent and worthless. They refused the practice of trading on their own account, and, without reaping much benefit thereby, did the utmost damage to private enterprise.

In 1627 Ferdinand II., then aged seventeen, returned to Italy and assumed the reins of government; but, being of a very gentle disposition, he decided on sharing his power with the regents and his brothers, and arranged matters in such wise that each was almost independent of the other. He granted the title of grand-duke to his eldest son, a title which Florence and Tuscany were ravaged by the plague in 1630, he showed admirable courage and carried out many useful measures. But he was totally incapable of energy as a statesman. When the pope made bitter complaints because the board of health had dared to subject certain monks and priests to the necessary quarantine, the grand-duke insisted on his officers asking pardon on their knees for having done their duty. On the death in 1631 of the last duke of Urbino, the pope was allowed to seize the duchy without the slightest opposition on the part of Tuscany. As a natural consequence the pretensions of the Roman church became increasingly exorbitant; ecclesiastics usurped the functions of the state and the ancient laws of the republic, together with the regulations decreed by Cosimo I. as a check upon similar abuses, were allowed to become obsolete. On the extinction of the line of the Gonzagas at Mantua in 1627, war broke out between France on the one side and Spain, Germany and Savoy on the other. The grand duke, uncertain of his policy, trimmed his sails according to events. Fortunately peace was re-established in 1631. Mantua and Monferrato fell to the duke of Nevers: marriage and France had always declined to come. But Europe was again in arms for the Thirty Years' War, and Italy was not at peace. Urban VIII. wished to aggrandize his nephews, the Barberini, by wresting Castro and Ronciglione from Odoardo Farnese, duke of Parma and brother-in-law to Ferdinand. Farnese marched his army through Tuscany into the territories of the pope, who was greatly alarmed by the attack. The grand-duke was drawn into the war to defend his own state and his kinsman. His military operations, however, were of the feeblest and often the most laughable character. At last, by means of the French intervention, peace was made in 1644. But, although the pope was forced to yield, he resigned none of his ecclesiastical pretensions in Tuscany. It was during Ferdinand's reign that the septuagenarian Galileo was obliged to appear before the Inquisition in Rome, which treated him with infamous cruelty. On the death of this great and unfortunate man, the grand-duke wished to erect a monument to him, but was withheld by fear of the opposition of the clergy. The dynasty as well as the country now seemed on the brink of decay. Two of the grand-duke's brothers had already died childless, and Ippolito, the sole survivor of a royal line, the only remaining heir was his son Cosimo, born in 1642.

Like nearly all his predecessors, Ferdinand II. gave liberal patronage to science and letters, greatly aided therein by his brother Leopold, who had been trained by Galileo Galilei, and who joined with men of learning in founding the celebrated academy Del Cimento, of which he was named president. This academy took for its motto the words Promovo e ripropovo, and followed the experimental method of Galileo. Formed in 1657, it was dissolved in 1660 in consequence of the jealousies and dissensions of its members, but during its brief existence was renowned for the number and impetus of its works.

Cosimo III. succeeded his father in 1670. He was weak, vain, bigoted and hypocritical. In 1661 he had espoused Louise of Orleans, niece of Louis XIV., who, being enamoured of duke Charles of Lorraine, was very reluctant to come to Italy, and speedily detested both her husband and his country, of which she refused to learn the language. She had two sons and one daughter, but after the birth of her third child, Giovan Gastone, her hatred for her husband increased almost to madness. She first withdrew to Poggio a Caiano, and then, survivor was unable to get any assistance from France, where, although supposed to live in convivial seclusion, she passed the greater part of her time as a welcome visitor at court. Even her testamentary dispositions attested the violence of her dislike to her husband.

Cosimo's hypocritical zeal for religion compelled his subjects to multiply services and processions that greatly infringed upon their working hours. He wasted enormous sums in pensioning converts—even those from other countries—and in giving rich endowments to sanctuaries. Meanwhile funds often failed for the payment of government clerks and soldiers. His court was attended by a crowd of men without dignity, exacted much money for dainties for his table, adorned his palace with costly foreign hangings, had foreign servants, and filled his gardens with exotic plants. He purchased from the emperor the title of "Highness" in order to be the equal of the duke of Savoy. He remained neutral during the Franco-Spanish War, and submitted to every humiliation and requisition exacted by the emperor. He had vague notions of promoting agriculture, but accomplished no results. At one time he caused eight hundred families to be brought over from the Morea for the cultivation of the Maremme, where all of them died of fever. But when, after the revolution of the Edict of Nantes, French Huguenots offered to apply their labour and capital to the same purpose, the grand duke's religious scruples refused them refuge. So ruin fell upon Tuscany. Crime and misery increased, and the poor, who only asked for work, were given alms and sent oftener to church. This period
witnessed the rise of many charitable institutions of a religious character under the patronage of the grand-duke, as for instance the congregation of San Giovanni Battista. But these could not remedy the general decay.

Cosimo’s dominant anxiety regarded the succession to the throne. His eldest son Ferdinand died childless in 1713. The pleasure-loving Giovan Gastone was married to Anna Maria of Saxe-Lauenburg, widow of a German prince, a wealthy, coarse woman wholly immersed in domestic occupations. After living with her for some time in a Bohemian village, Giovan Gastone yielded to his dislike to his wife and her country, withdrew to France, and ruined his health by his excesses. After a brief return to Bohemia he finally separated from his wife, by whom he had no family. Thus the dynasty was doomed to extinction.

thought on ascending it was to regain strength enough to pass the remainder of his days in enjoyment. He dismissed the spies, parasites and bigots that had formed his father’s court, abolished the pensions given to converts, suppressed several taxes, and prohibited the organized espionage established in the family circle. He wished to live and let live, and liked the people to be amused. Everything in fact bore a freer and gayer aspect under his reign, and the Tuscans seemed to feel renewed attachment for the dynasty as the moment of its extinction drew near. But the grand-duke was too feeble and incapable to accomplish any real improvement. Surrounded by gay and dissipated young men, he entrusted all the cares of government to a certain Giuliano Dami, who drove a profitable trade by the sale of offices and privileges. In this way all things were in the hands of corrupt individuals; while the grand-duke, compelled to pass the greater part of his time in bed, vainly sought diversion in the company of buffoons, and was only tormented by perceiving that all the world disposed of his throne without even asking his advice. And when, after prolonged opposition, he had resigned himself to accept Don Carlos as his successor, the latter led a Spanish army to the conquest of Naples, an event afterwards leading to the peace of 1735, by which the Tuscan succession was transferred to Francesco II., duke of Lorraine, and husband of Maria Theresa. Giovano Gastone was finally obliged to submit even to this. Spain withdrew her garrisons from Tuscany, and Austrian soldiers took their place and swore fealty to the grand-duke on the 5th of February 1737. He expired on the 9th of July of the same year. Such was the end of the younger branch of the Medici, which had found Tuscany a prosperous country, where art, letters, commerce, industry, and agriculture flourished,

**MEDICI (FAMILY)**

Cosimo had a passing idea of reconstituting the Florentine republic, but, this design being disavowed by the European powers, he determined to transfer the succession, after the death of Giovano Gastone, to his sister Anna Maria Luisa, who in fact survived him. For this purpose he proposed to annul the patent of Charles V., but the powers objected to this arrangement also, and by the treaty of 1718 the quadruple alliance of Germany, France, England and Holland decided that Parma and Tuscany should descend to the Spanish Infante Don Carlos. The grand-duke made energetic but fruitless protests.

Cosimo III. had passed his eightieth year at the time of his decease in October 1723, and was succeeded by his son Giovano Gastone, then aged fifty-three. The new sovereign was in bad health, worn out by dissipation, and had neither ambition nor aptitude for rule. His throne was already at the disposal of foreign powers, and his only
and left her poor and decayed in all ways, drained by taxation, and oppressed by laws contrary to every principle of sound economy, downtrodden by the clergy, and burdened by a weak and vicious aristocracy.

MEDICI, GIACOMO (1817-1882), Italian patriot and soldier, was born at Milan in January 1817. Exiled in 1835, he fought in Spain during the Peninsular war of 1816 and 1818, joined Garibaldi at Montevideo. Returning to Italy with Garibaldi in 1848, he raised a company of volunteers to fight against Austria, and commanded the volunteer vanguard in Lombardy, proceeding thence to Rome, where he gained distinction by defending the "Vascello," a position near the Porta San Pancrazio, against the French. During the siege of Rome he himself was wounded. In the war of 1859 he commanded a volunteer regiment, and was sent by Cavour into Tirol. In 1860 he tried in vain to dissuade Garibaldi from the Marsala expedition, but, after his chief's departure, he sailed for Sicily with the second Garibaldina, taking part in the abortive campaign in Lombardy, from which he forced Messina to capitulate after an eight days' siege. Joining the regular army, he was appointed military commander of Palermo, in which capacity he facilitated the abortive campaign of Garibaldi in 1862. In 1866 he commanded the division which invaded Tirol, but the effect of his victories was neutralized by the conclusion of peace. Returning to Palermo he did good work in restoring order in Sicily. He became a senator in 1870, and marquis of the "Vascello" and first aide-de-camp to the king in 1876. He died on the 9th of March 1892.

MEDICINE.—The science of medicine, as we understand it, has for its province the treatment of disease. The word "medicine" (Lat. medicina: sc. ars, art of healing, from mederi, to heal) may be used very widely, to include Pathology (q.v.), the theory of the causation of disease, or, very narrowly, to mean only the drug or form of remedy prescribed by the physician—this being more properly the subject of Therapeutics (q.v.) and Pharmacology (q.v.). But it is necessary in practice, for historical comprehensiveness, to keep the wider meaning in view. Disease (see Pathology) is the correlative of health, and the word is not capable of a more penetrating definition. During the time of Galen, however, it has been usual to speak of the life of the body either as proceeding in accordance with nature (κακός φύσις, secon guid naturam) or as overstepping the bounds of nature (πάρα φύσις, praeter naturam). Taking disease to be a deflexion from the line of health, the first requisite of medicine is an extensive and intimate acquaintance with the norm of the body. The structure and functions of the body form the subject of Anatomy (q.v.) and Physiology (q.v.).

The medical art (ars medicina) divides itself into departments and subdivisions. The most fundamental division is into integral and separative medicine, or into medicine proper and surgery (q.v.). The treatment of wounds, injuries and deformities, with operative interference in general, is the special department of surgical practice (the corresponding parts of pathology, including inflammation, repair, and removable tumours, are sometimes grouped together as surgical pathology); and where the work of the profession is highly subdivided, surgery becomes the exclusive province of the surgeon, while internal medicine remains to the physician. A third great department of practice is formed by obstetric medicine or midwifery (see Onstetrics); and dentistry (q.v.), or dental surgery, is given up to a distinct branch of the profession.

A state of war, actual or contingent, gives occasion to special developments of medical and surgical practice (military hygiene and military surgery). Wounds caused by projectiles, sabres, &c., are the special subject of naval and military surgery; while under the head of military hygiene we may include the general subject of ambulances, the sanitary arrangements of camps, and the various forms of epidemic camp sickness.

The administration of the civil and criminal law involves frequent relations with medicine, and the professional subjects most likely to arise in that connexion, together with a summary of causes célèbres, are formed into the department of Medical Jurisprudence (q.v.).

In preserving the public health, the medical profession is again brought into direct relation with the state, through the public medical officers.

HISTORY OF MEDICINE.

Medicine as Portrayed in the Homeric Poems.—In the state of society pictured by Homer it is clear that medicine has already had a history. We find a distinct and organized profession; we find a system of treatment, especially in regard to injuries, which must have been the work of long experience to frame; we meet with a nomenclature of parts of the body substantially the same (according to Darenberg) as that employed long afterwards in the writings of Hippocrates; in short, we find a science and an organization which, however imperfect as compared with those of later times, are yet very far from being in their beginning. The Homeric heroes themselves are represented as having considerable skill in surgery, and as able to proceed with admirable precision and skill in the treatment of injuries. In this respect, as in many others, the Homeric class, represented by Machaon and Podalirius, the two sons of Asclepius, who are treated with great respect. It would appear, too, from the Athêlêpia of Archinus (quoted by Welcker and Hâser) that the duties of these two were not precisely the same. Machaon's task was more especially to heal injuries, while Podalirius had received from his father the gift of "recognizing what was not visible to the eye, and tending what could not be healed." In other words, a rough indication is seen of the separation of medicine and surgery. Asclepius appears in Homer as a Thessalian king, not as a god, though in later times divine honours were paid to him. There is no sign in the Homeric poems of the subordination of medicine to religion which we find in certain Egyptian monuments. The whole system of Egyptian medicine was in the hands of those who were in those countries, with medical functions—all circumstances which throw grave doubts on the commonly received opinion that medicine derived its origin in all countries from religious observances.

Although the actual organization of medicine among the Homeric Greeks was thus quite distinct from religion, the worship of Asclepius (or Asklepios) as the god of healing demands some notice. This cult spread very widely among the Greeks; it had great civil importance, and lasted even into Christian times; but there is no reason to attribute to it any special connection with the development of medical science. The profession of medicine. sick persons repaired to the temples of Asclepius in order to be healed, just as in modern times relief is sought by a devotional pilgrimage or from the waters of some sacred spring, and then as now the healing influence was sometimes sought by deputy. The sick person, or his representative, after ablation, prayer and sacrifice, was made to sleep on the hide of the sacrificed animal, or at the feet of the statue of the god, while sacred rites were performed. In his sleep (incubatio, incubus) the appropriate remedy was indicated by a dream. Moral or dietetic remedies were more often prescribed than drugs. The record of the cure was inscribed on the columns or walls of the temple; and it has been thought that in this way was introduced the custom of keeping "records" of diseases. The physicians of the Hippocratic school thus learnt to accumulate clinical experience.

But the priests of Asclepius were not physicians. Although the latter were often called Asklepids, this was in the first place to indicate their real or supposed descent from Asclepius, and in the second place as a complimentary title. No medical writing of antiquity speaks of the worship of Asclepius in such a way as to
imply any connexion with the ordinary art of healing. The two systems were not rivals, for their views were not contradictory, and if they were ever united it must have been before the times of which we have any record. The theory of a development of Greek medicine from the rites of Asklepius, though defended by eminent modern scholars, is not tenable, for although Hippocrates, like his predecessors, shared the medical lore of Asklepius, there is no evidence that he recognized, at least in acute diseases, a natural process which the humours went through—being first of all crude, then passing through coction or digestion, and finally being expelled in the form of sweat or cement, or curdled and transformed in the body. The duty of the physician was to foresee these changes, "to assist or not to hinder them," so that the sick man might conquer the disease with the help of the physician. The times at which these processes were to take place were naturally looked upon with anxiety; and it was a cardinal point in the Hippocratic system to foretell them with precision. Hippocrates, influenced as is thought by the Pythagorean system of number and music, is said to have based on days of certain rules, in some cases on odd, in others on even numbers—the celebrated doctrine of "critical days." This false precision can have had no practical value and it may have enforced habits of minute observation. It follows from what has been said that prognosis, or the art of foretelling the course and event of the disease, was a strong point with the Hippocratic physicians. In this they have perhaps never been excelled. Diagnosis, or recognition of the disease, must have been necessarily imperfect, when no scientific nosology or system of disease existed, and the knowledge of anatomy was quite insufficient to allow of any accurate method of determining the functions of the body, but symptoms were no doubt observed and interpreted skillfully. The pulse is not spoken of in any of the works now attributed to Hippocrates himself, though it is mentioned in other works of the c. 300 B.C.

In the treatment of disease, the Hippocratic school attached great importance to diet, the variations necessary in different diseases being minutely defined. Medicines were regarded as of secondary importance, but not neglected, two humours being mentioned at different places in the Hippocratic works. Blood-letting was known, but not greatly practised. The highest authority was always that of the patient's case, and not the mere time to the right moment, and the general principle enforced of making all influences—internal and external—co-operate for the relief of the patient. The principles of treatment just mentioned apply more especially to the cure of acute diseases, but the same general characters and attributes of the Hippocratic school. In chronic cases diet, exercise and natural methods were chiefly relied upon.

The school of Cnidus, as distinguished from that of Cos, of which Hippocrates is the head, appears to have differed in attaching more importance to the differences of special diseases, and to have made more use of drugs. A treatise on the diseases of women, contained in the Hippocratic collection, and of remarkable practical value, is attributed to this school.

The above sketch of Hippocratic medicine will make it less necessary to dwell upon the details relating to subsequent medical schools, and for which, therefore, we need not here speak. But it is necessary to dwell upon the relative position of the Hippocratic school and the Hippocratic system. Direct opponents or repudiators of the authority of Hippocrates were rare, all generally appealing to his authority. But, insensibly, the least valuable part of the Hippocratic work, the post-Hippocratic, was made permanent; the most valuable, the practical, neglected.

Post-Hippocratic Medicine.—After Hippocrates the progress of medicine in Greece does not call for any special remark in such a sketch as this, but mention must be made of one great name. Though none of Aristotle's writings are strictly medical, he has by his researches in anatomy and physiology contributed greatly to the progress of medicine. It should also be remembered that he was of an Asklepian family, and received that partly medical education which was traditional in such families, and also himself is said to have practised medicine as an amateur. Moreover, his works on zoology, on the parts and structures of the animal body, have been of great service to the physiologist of the c. 1800. The Hippocratic school was one of those of Theophrastus, who may be considered the founder of the study of botany. Among his encyclopedic writings were some on medical subjects, of which fragments only have been preserved. The Peripatetic school may have been more favourably situated than the others for the study of medicine, on account of the multitudinous details of natural knowledge, than any other; but there is no evidence that any of the philosophical schools had important influence on the progress of medicine. The fruit of Aristotle's teaching and example was less Kerynia or medical than Asklepius.

The century after the death of Hippocrates is a time almost blank in medical annals. It is probable that the science, like others, flourished in the general intellectual development of Greece, but the communal supremacy, the development of the period are almost entirely lost, and were so even in the time of Galen. Galen classes them all as of the dogmatic school; but, whatever may have been their characteristics, they are of no importance in the history of the science.
Alexandrian School of Medicine.—The dispersion of Greek science and intellectual activity through the world by the conquests of Alexander and his successors led to the formation of more than one learned centre, in which medicine among other sciences was represented. Pergamum was early distinguished for its medical school; but in this as in other respects its reputation was ultimately effaced by the more brilliant fame of Alexandria. It is here that the real continuation and development of Hippocratic medicine can be traced.

In one department the Alexandrian school rapidly surpassed its Greek original—namely, in the study of anatomy. The dissection of the human body, of which some doubtful traces or hints only are found in Greek times, was assiduously carried out, being favoured or even suggested perhaps by the Egyptian custom of disembowelling and embalming the bodies of the dead. There is no doubt that the organs were also examined by opening the bodies of living persons—criminals condemned to death being given over to the anatomists for this purpose.

The eminent names stand in the first rank as leaders of the two earliest schools of medicine which arose in Alexandria: Herophilus and Erasistratus.

Herophilus (335-280 B.C.) was a Greek of Chalcedon, a pupil of the schools both of Cos and of Cnidus. He was especially noted for his profound researches in anatomy (see i. 802), and in the knowledge and practice of medicine he appears to have been equally remarkable. He was himself a great anatomist and adopted his theory of the humours. He also made extensive use of drugs and of bleeding. The reputation of Herophilus is attributed to the fact that he was a considerable medical writer. It is said that he wrote works about him and his writings, and he is further spoken of with the highest respect by Galen and Celsus. By the general voice of the medical world of antiquity he was placed only second to Hippocrates.

Erasistratus (d. 280 B.C.) was the contemporary and rival of Herophilus. Little is known of his life, except that he spent some time at the court of Seleucus Nicator at Antioch before coming to Alexandria. There he seems to have lived and worked with a large practice, for a long time. He is said to have taken up his abode in the latter city. His numerous works are also almost entirely lost, fragments only being preserved by Galen and others. Erasistratus, instead of following Hippocrates as Herophilus did, depreciated him, and seems to have been rather aggressive and independent in his views. He appears to have leaned to mechanical explanations of the symptoms of disease, as was adopted by the schools of Alexandria, and he was the first to separate the brain from the spinal cord. He tried to explain or relieve many of the symptoms of disease, and employed a great variety of drugs. He was longer-lived than that of Herophilus, for it still numbered many adherents in the 3rd century after Christ, a century after the latter had become extinct.

The Erasistrates paved the way for what was in some respects the most important school which Alexandria produced, that known as the Roman, which, though it recognized no master by name, may be considered to have been founded by Phyllinus of Cos (280 B.C.), a pupil of Herophilus; but Scarpnnon, a great name in antiquity, and Celsus of Tarentum, who traced the empirical doctrine back to the times of Herophilus and the Hippocrates, and adopted many observations and conclusions of Hippocrates as well as his own, are also amongst the most eminent Roman physicians. The most striking peculiarity of the empirics was that they rejected anatomy, regarding it as useless to inquire into the causes of things, and, thus, as they contended, being the more minute in their observations, they reduced the matter of their practice to the special symptoms of diseases, and employed a great variety of drugs. It was longer-lived than that of Herophilus, for it still numbered many adherents in the 3rd century after Christ, a century after the latter had become extinct.

Roman Medicine.—The Romans cannot be said to have at any time originated or possessed an independent school of medicine. They had from early times a very complicated system of superstitions, medicine, or religion, related to disease and the cure of disease, borrowed, as is thought, from the Etruscans; and, though the saying of Pliny that the Roman people got on for six hundred years without doctors was doubtless an exaggeration, and not, literally speaking, exact, it must be accepted for the broad truth which it contains.

The Roman people, therefore, it is, so far as we are able to trace it, as an importation from Greece.

The first Greek physician whose name is preserved as having migrated to Rome was Archagathus, who came over from the Peloponnesus in 218 B.C.; but there were probably others before him. In Rome, as in Greece, people for a long time, the number of such physicians who sought their fortune in the capital, was very large. The bitter words of M. Porcius Caton, who disliked them as he did other representatives of Greek culture, are evidence of this. The most eminent of these earlier Greek physicians at Rome was Asclepiades, the friend of Cicero (born 124 B.C. at Prusa in Bithynia). He came to Rome as a young man, and soon became distinguished both for his medical skill and his oratorical power. He introduced a system which, so far as we know, was his own, though founded upon the Epicurean philosophical creed; on the practical side it conformed pretty closely to the Stoic rule of life, and he regarded himself as having acquired the better stamp of Romans in the later times of the republic. According to Asclepiades all diseases depended upon alterations in the size, number, arrangement or movement of the "atoms," of which, according to the doctrine of Epicurus, the universe was composed. These atoms moved by chance, but the regularity of these movements ("pœmia") through which the juices of the body were conveyed. This doctrine, of which the developments need not further be followed, was important chiefly in so far that it was perfectly distinct from the theories of the corporeal body already mentioned. The treatment of disease Asclepiades attached most importance to diet, exercise, passive movements or frictions, and the external use of cold water—short, to a modified athletic training. He rejected the vis medica in natura, pointing out that nature in many cases only did not help but marred the cure. His knowledge of disease and surgical skill were, as appears from the accounts given by Celsus and Galen Aurelius, very considerable. Asclepiades had many pupils who adhered more or less closely to his doctrines, but it was especially one of them, Themison, who gave permanence to the teachings of his master by framing out of them, with some modifications, a new medical school which was called "Christian" and to which was connected this basis a school which lasted for many centuries in successful rivalry with the Hippocratic tradition, which, as we have seen, was up to that time the prevailing influence in medicine.

The Roman method was long held as an example of the method of observation and experiment by the physiologists as well as the methodici or methodists. Its main principles were that it was useless to consider the causes of a disease, or even the organ affected, until the disease had been thoroughly examined by the senses, and submitted to the judgment by analogy. These three bases of knowledge were known as the "tripod" of the empirics. It should not, however, be forgotten that the empirics read and industriously commented on the works of Hippocrates and later Hippocratic writers. They were extremely successful in practical matters, especially in surgery and in the use of drugs, and a large part of the routine knowledge of diseases and remedies which became traditional in the times of the Roman empire is believed to have been acquired by them. Treatment was given in the larger sense, closely connected with the philosophical sect of the Sceptics, whose leader, Sextus (200 B.C.), was an empirical physician. It lived and flourished far beyond this time, when transplanted to Rome, not less than in its native Alexandria, and appears to be recognizable even up to the beginning of the middle ages.
consequence if it was too lax, and in the "mixed state" acting according to the predominant condition. This simple rule of treatment was the system or "method" from which the school took its name.

The methodists agreed with the empirics in one point, their contempt for anatomy; but, strictly speaking, the true dogmatists stood on a different foundation from the Hippocratic school. Besides Themison, its systematic founder, the school boasted many physicians eminent in their day, among whom Theopassus of Tralles, a half-educated and boastful pretender, was a most notorious and venal impostor. I am "art is long," promising his scholars to teach them the whole of medicine in six months, and had inscribed upon his tomb "barbaricus," as being superior to all living and bygone physicians.

In the ancient medical works, much greater name appears than we are entitled to attribute, in the modern sense. But, in the works of the methodists, that of Soranus of Ephesus, a physician mentioned with praise even by Tertullian and Augustine, who practiced at Rome in the reigns of Trajan and Hadrian. Soranus is known by a work, still extant, containing a detailed account of the system of medicine by the Latin work of Caesil Aurelius, three centuries later, on acute and chronic diseases, which is based upon, if not, as some think, an actual translation of, the chief work of Soranus, and which is the principal source of our knowledge of the methodical school. The work on diseases of women is the only complete work on that subject which has come down to us from antiquity, and shows remarkable fullness of practical knowledge in relation to its subject. It is notable as a treatise of research and instruction, which has been reinvented in modern times, was used by Soranus; and specimens of still earlier date, showing great mechanical perfection, have been preserved. The methodic school is slighted by moderns, but acute and chronic diseases is also full of practical knowledge, but penetrated with the theories of the methodists.

The methodic school lasted certainly for some centuries, and influenced the medical practice of the middle ages, which were overshadowed by the greater reputation of Galen. It was the first definite product of Greek medicine on Roman soil, but was destined to be followed by others, which kept up a more or less successful rivalry with it, and with the Hippocratic tradition.

The so-called patriotic school was founded by Athenaeus, in the 2nd century after Christ. According to its doctrines the normal as well as diseased actions of the body were to be referred to the operation of the prana or universal soul. This doctrine, crudely transferred to the empirical, philosophical speculation, was intended to reconcile the humoral (or Hippocratic) and solidist (or methodic) schools; but the methodists seem to have claimed Athenaeus as one of themselves.

The methodists held the undebated right to name Rufus or Ephesus (about the year AD. 100), and Archigenes (fl. A.D. 90), who is mentioned by Juvenal. Although no system or important doctrine of medicine was originated by the Roman intellect, and though the practice of the profession was probably almost entirely in the hands of the Greeks, the whole picture which we have of medical thought and activity in Roman times is due to a Latin pen, and to one who was, in all probability, not a physician. A. Cornelius Celsus, a Roman patrician, who lived probably in the first century of our era, wrote a book, to which he gave the name of the "Methods" or "Medical Practitioner," of learning the art and science of general knowledge. Whether he was a practising physician or not has been a matter of controversy. The conclusion supported by most evidence seems to be that he practised on his friends and dependants, but not as a remunerative profession. His well-known work, De medicina, was one of a series of treatises intended to embrace all knowledge proper for a man of the world. It was not meant for the physicians, and was certainly little read by them, as Celsus is quoted by no medical writer, and when referred to by Pliny, is spoken of as an author not a physician. There is no doubt that his work is chiefly a compilation; and Darenberg, with other scholars, has traced a large number of other passages of the Latin text to the Greek originals from which they were translated. In the description of surgical operations the vagueness of the language seems sometimes to show that the author had not performed such himself; but in other parts, and especially in his historical introduction, he speaks with more confidence; and everywhere he compares and criticizes with learning and judgment. The whole body of medical literature belonging to the Hippocratic and Alexandrian times is ably summarized, and a knowledge of the state of medical science up to and during the times of the author is thus conveyed to us which can be obtained from no other source. The work of Celsus is thus for us only second in importance to the Hippocratic writings and the works of Galen; but it is valuable rather as a part of the history of medicine than as the subject of that history. It forms no link in the general chain of medical tradition, for the simple reason that the influence of Celsus (putting aside a few scantly allusions in medieval times) commenced in the 15th century, when his works were first discovered in manuscript or committed to the press. Since then, however, he has been almost up to our own times the most popular and widely read of all medical classics, partly for the reasons already indicated, partly because he was one of the few of those classics accessible to readers of Latin, and partly also because of the general tendency of the moderns to classificatory schemes.

Of Pliny, another encyclopedic writer, a few words must be said, though he was not a physician. In his Natural History we find as complete a summary of the popular medicine of his time as Celsus gives of the scientific medicine. Pliny disliked doctors, and lost no opportunity of depreciating regular medicine; nevertheless he has left many quotations from, and many details about, medical authors which are of the highest value. He is useful to us for what he wrote about the history of medicine, not for what he contributed. Like Celsus, he had little influence on the general medical thought of his time.

We now come to the writer who, above all others, gathered up into himself the divergent and scattered threads of ancient medicine, and out of whom again the greater part of modern European medicine has flowed. Galen was a man furnished with all the anatomical, medical and philosophical knowledge of his time; he had studied all kinds of natural curiosities, and had stood in near relation to important political events; he possessed enormous industry, great practical sagacity and unbounded literary facility. He had, in fact, every quality necessary for an encyclopedic author even for a literary and scientific one. He found the medical profession of his time split up into a number of sects, medical science confounded under a multitude of dogmatic systems, the social status and moral integrity of physicians degraded. He appears to have made it his object to reform these evils, to reconcile scientific acquirements and practical skill, to bring back the unity of medicine as it had been understood by Hippocrates, and at the same time to raise the dignity of medical practitioners.

Galen was as devoted to anatomical and, so far as then understood, physiological research as to practical medicine. He worked enthusiastically at dissection, though, the liberty of the Alexandrian schools no longer existing, he could dissect only animals, not the human body. He was a good observer and a good reasoner, but, as an anatomist and pathologist, he is very much inferior to the Hippocratic, philosophical, to show the wisdom of the Creator in making everything fit to serve its purpose; and a practical, to aid the diagnosis, or recognition, of disease. The first led him into a teleological view, which is a mistake and a weakness, and to which the second was successfully attained by giving greater precision and certainty to medical and surgical practice in difficult cases. His general physiology was essentially founded upon the Hippocratic theory of the four elements, with which he combined the notion of spirit (pneuma) penetrating all parts, and mingled with the humours in different proportions. It was on this field that he most vehemently attacked the prevailing atomistic and materialistic views of the methodic school, and his conception of the pneuma became in some respects half metaphysical. His own researches in special parts of physiology were important, but do not strictly belong to our present subject.

The application of physiology to the explanation of diseases, and of surgery, was chiefly by the theory of the temperaments or mixtures which Galen founded upon the Hippocratic doctrines of the humours, but developed with marvellous and fatal ingenuity. The normal condition or temperament of the body depended upon the proper proportion of the four elements—hot, cold, dry, and wet. From facts and observations of the phenomena of the "simulacra" ("distinguers"), which, though not diseases, were the occasions of disease. Equal importance attached to faulty mixtures or maladjustments of these. Besides the physical deviations of the different species from the normal condition of the body, there were others which were due to diet, or to the temperament of the patient, and were more or less determined by circumstances of life or disposition of character. In all these deviations, these imbalances, Galen showed extreme ingenuity in explaining all symptoms and all diseases on his system. No pheno- menon was left without a recognition of its importance and influence, though it was precisely in his fine-sense subtlety that he departed furthest from scientific method and practical utility, it was this very subtlety which enabled him to throw his readers back on this subject, and thus to increase the greatness of the science. It is clear that Galen's work is a great fact in medical history, and that it has been an important part of the history of medicine until the present time.
The history of medicine in Roman times is by no means the same thing as the history of the fate of the works of Galen. For some centuries the methodic school was popular at Rome, and produced one physician, Caelius Aurelianus, who must be pronounced, next to Celsus, the most considerable of the Latin medical writers. His date was in all probability still within the 1st or the 2nd half of the 1st century AD, and the beginning of the 3rd. His works have been much admired for the purity of the Greek style, and his accurate descriptions of disease; but, as he quotes no medical author, and is quoted by none before Alexander of Aphrodisias at the beginning of the 3rd century, it is clear that he belonged to no school and founded none, and thus his position in the chain of medical tradition is quite uncertain. Alexander of Aphrodisias, who lived and wrote at Athens in the time of Septimius Severus, is best known by his commentaries on Aristotle, but also wrote a treatise on fevers, still extant.

**Ancient Medicine after Galen.**—The Byzantine school of medicine, which belonged to the 4th and 5th centuries, was closely connected with the schools, followed closely in Galen’s footsteps, and its writers were chiefly compilers and encyclopaedists. The earliest is Orisbasius (326-403), whose date and position are fixed by his being the friend and court physician of Julian the Apostate. He was a Greek of Pergamum, educated in Alexandria, and long resident in Byzantium. His great work ἰατρικὴ ἐπιθεώρησις, of which only about one-third has been preserved, is a medical encyclopaedia founded on the works of Hippocrates, Galen, Dioscorides (c.f. A.D. 50) and certain Greek writers who are otherwise very imperfectly known. The work is thus one of great historical value but of no originality. The next writer is the famous (A.D. 550), a compiler who closely followed Orisbasius, but with inferior powers, and whose work also has an historical but no original value. A higher rank among medical writers is assigned to Alexander of Tralles (520-595), whose doctrine was that of an eclectic. His practical and therapeutical rules are evidently the fruit of his own experience, though it would be difficult to attribute them to any decided advance in medical knowledge.

Cassiodorus (flourished about the middle of the 6th century), the most celebrated of the monks of Gaul, was the author of a large number of medical works, of which the most important is his treatise on medicine, called the *Royal Book,* which was the standard authority among the Arabs up to the time of Avicenna (A.D. 980-1037) and was more than once translated into Latin and printed. Other

1 See Dacier, *Cat. Cod. Or. Lug. Bat. ii. 296."
writers of this century need not be mentioned here; but the next, the 11th century, is given as the probable though uncertain date of a work which had a great influence on the medieval Arabic medicine, a work of Dioscorides whose originality is obscure, and of whose very existence some historians have doubted, thinking that the name was assumed by some medieval Latin writer. The work De simples, by a name now unknown, was one of the chief medical works in the 12th century. It was translated into Arabic, and also into Latin, and was worked upon by the majority of medieval Arab physicians. For the role it played in medical education and in the formation of Arab medicine see above, under Dioscorides. The Arabic translation of the De simples was entitled De simples, and the name, which has not been satisfactorily explained, is thought by some scholars to be derived from the name of the Roman Emperor Diocletian, who lived in the 3rd century, while others believe it to be a homonymous of a Greek term, meaning a collection of simples. The work was divided into five parts, each dealing with a different branch of medicine. It was originally written in Greek and was translated into Arabic and Latin. The Arabic translation was later translated into Hebrew, and the Hebrew version was translated into Latin. The Latin version was the most widely used and was translated into many other languages. The work was used as a textbook in medieval universities and was one of the most important medical works of the time. It was used as a textbook in universities until the 19th century.
Among the writers it may be sufficient to mention here Galen, of the school of Salerno. His name, whose Practica, or medical compendium, was afterwards several times printed; and Trotula, believed to be the wife of the last-named professor, was but little known before the advent of Arabian medicine. In the transitional period, when the Arabian school began to influence European medicine, but before the Salernitan physicians were superceded, comes Nicolaus Preneposus, who wrote the Practica, or compendium, of foreign or compound medicines, which became the standard work on the subject, and the foundation of many later compilations. An equally popular writer was Gilles de Corbeil (Argelius Corbollenus), at one time a teacher at Salerno, afterwards court physician to Philip Augustus of France, who composed several poems in Latin hexameters on medical subjects. Two of them, on the urine and the pulse respectively, attained the position of medical standards.

None of these Salernitan works rise much above the rank of compilations, being founded on Hippocrates, Galen and later Greek writers, with an unmistakable mixture of the doctrines of the methodists. But they often show much practical experience, and exhibit the naturalistic method of the Hippocratic school. The general plan of treatment is dietetic rather than pharmaceutical, though the art of preparing drugs had reached a high degree of complexity at Salerno. Anatomy was as little regarded as it was in the later ancient schools, the empiric and medical, but demonstrations of the parts of the body were given on swine. Although it might seem that Galen was wiser in his medicine, that of Salerno, still its decline was arrested at a time when every other branch of learning was rapidly falling into decay; and there can be no doubt that the observation of patients in hospitals, and probably clinical instruction, were made use of in learning and teaching. The school of Salerno thus forms a bridge between the ancient and the modern medicine, more direct than less conspicuous than that circuitous route, through Byzantium, Bagdad and Cordova, by which the teachings of Galen had been preserved, and finally entered the European world. Though the glory of Salerno had departed, the school actually existed till it was finally dissolved by an edict of the emperor Napoleon I. in the year 1811.

**Introduction of Arabian Medicine: The Scholastic Period.**—About the middle of the 12th century the Arabian medical writers began to be known by Latin translations in the Western world. Constantinus Africanus, a monk, was the author of the first Latin version of the Liber de Historia Naturalium (A.D. 1129); his labours were continued chiefly to the less important and less bulky Arabic authors, of whom Aly was the most noted; the real classics were not introduced till later. For some time the Salernitan medicine held its ground, and it was not till the conquest of Toledo by Alphonso of Castile that any large number of Western scholars came in contact with the learning of the Spanish Moors, and systematic efforts were made to translate their philosophical and medical works. Jewish scholars, often under the patronage of Christian bishops, were especially active in the work. In Sicily also the Oriental tendencies of Frederick Barbarossa and his followers were manifest in the writings of the Oriental, Guglielmo Cremona, a physician of Toledo (1114-1187), made translations, it is said by command of Barbarossa, from Avicenna and others. It is needless to point out the influence of the crusades in making Eastern ideas known in the Western world. The influence of Arabian medicine soon began to be felt even in the Hippocratic city of Salerno, and in the 13th century is said to have had an even balance with the older medicine. After this time the foreign influence predominated; and by the time that the Aristotelian dialectic, in the introduction of which the Arabs had so large a share, especially that in the 13th century, the Arabian version of Greek medicine reigned supreme in the medical profession. That this movement coincided with the establishment of some of the older European universities is well known. The history of medicine in the period now opening is closely combined with the history of scholastic philosophy. Both were infected with the same dialectical subtlety, which was, from the nature of the subject, especially injurious to medicine.

At the same time, through the rise of the universities, medical learning was much more widely diffused, and the first definite forward movement was seen in the school of Montpellier, where a more rigid method of instruction was early established, and the medical school united with faculties of law and philosophy. The medical school owed its foundation largely to Jewish teachers, themselves educated in the Moorish schools of Spain, and imbued with the intellectual independence of the Averroists. Its rising prosperity coincided with the decline of the school of Salerno. Montpellier became distinguished for the practical and empirical spirit of its medical work, as contrasted with the dogmatic and scholastic teaching of Paris and other universities. In Italy, Bologna and Padua were earliest distinguished for medical studies—the former preserving more of the Galenic tradition, the latter the Averroism. Among later European universities contributed little—the reputation even of Paris being of later growth.

The supremacy of Arabian medicine lasted till the revival of learning, when the study of the medical classics in their original language worked another revolution. The medical writers of this period, who chiefly drew from Arabian sources, have been called Arabists (though it is difficult to give any clear meaning to this term), and were afterwards known as the neoteries.

The medical literature of this period is extremely voluminous, but essentially second-hand, consisting mainly of commentaries on Hippocrates, Galen, Avicenna and others, or of compilations and compendia still less original than commentaries. Among these may be mentioned the Conciliator of Peter of Abano (1250-1313), the Dialogator of Jacob de Doni (1298-1350), both of the schools of Padua, and the Pondeus medicinae of the Salernitan Matthaeus Sylvaticus (d. 1342), a sort of medical glossary and dictionary. But for us the most interesting fact is the first appearance of Englishmen in the study of Arabic medicine. A medical compendium was distinguished, according to the tendency of Hiser, by a practical tendency characteristic of the British race, and fostered in the school of the unknown master.
Two of the most important results of the revival of learning were indeed such as are excluded from the scope of this brief sketch—namely, the reawakening of anatomy, which to a large extent grew out of the study of the works of Galen, and the investigation of medicinal plants, to which a fresh impulse was given by the revival of Dioscorides (A.D. 50) and other ancient naturalists. The former brought with it necessarily a more accurate conception of physiology, and thus led up to the great discovery of Harvey, which was the turning-point in modern medicine. The latter gave rise, on the one hand, to the modern science of botany, on the other to a more rational knowledge of drugs and their uses. At the same time, the humanists applied themselves, with great success, to the East, by introducing a variety of new plants, greatly accelerating the progress both of botany and pharmacology.

But it was not in these directions that improvement was first looked for. It was at first very naturally imagined that the simple revival of classical and especially of Greek literature would at once produce the same brilliant results in medicine as in literature and philosophy. The movement of reform started, of necessity, with scholars rather than practising physicians—more precisely with a group of learned men, whom we may call the humanists, from whom this is quoted. The humanists, the medical humanists, equally enthusiastic in the cause of letters and of medicine. From both fields they hoped to expel the evils which were summed up in the word barbarism. Nearly all medieval medical literature was condemned under this name; and for it the humanists proposed to substitute the originals of Hippocrates and Galen, thus leading back medicine to its fountain-head. Since a knowledge of Greek was still confined to a small body of scholars, and a still smaller proportion of physicians, the first task was to translate the Greek classics into Latin. To this work several learned physicians, chiefly Italians, were put to work. One of these was Giovanni di Monte or Montanus (1498-1532), and many others in Italy. In northern Europe should be mentioned Gulielmus Copus (1471-1532) and Günther of Andernach (1487-1584), better known as Guinerius Andernacensis, both for a time professors at Paris; and, among the greatest, Thomas Linacre (about 1460-1524; see LINACRE). A little later Janus Cornarius or Hagenbut (1500-1558) and Leonhard Fuchs (1501-1566) in Germany, and John Kaydell of Caerleon (1475-1517) in England, can be mentioned. A contemporary of Janus Cornarius, Champerius (Champerius or Campegius) of Lyons (1472-1539), a contemporary of Rabelais, and the patron of Servetus, wrote with fantastic enthusiasm on the superiority of the Greek to the Arabian physicians, and possibly did something to enlist in the same cause the two far greater men just mentioned. Rabelais not only lectured on Galen and Hippocrates, but edited some works of the latter; and Michael Servetus (1511-1553), in a little tract Syrourum universa ratio, defended the practice of Galen as compared with that of the Arabian. The great Aldine Press made an important contribution to the work, by editiones princeps of Hippocrates and Galen in the original. Thus was the campaign opened against the medieval and Arabian writers, till finally Greek medicine assumed a predominant position, and Galen took the place of Avicenna. The result was recorded in a formal manner by the Florentine Academy, sometime shortly before 1555: "Quae, excusso. Arabice et barbaree sertvititis medicae juge, ex professo se Galenicam appellavit et prolifigato barbaro- rum exercitu unum tumult et solum Galenum, ut optimum artis medicæ autorem, in omnibus se sequiturum poletica est. Janus Cornarius, from whom this is quoted, adds, however, that the Arabians still reigned in most of the schools of medicine, and that the Italian and French authors of works called Practica were still in high repute. The triumph of Galen- ism was therefore not complete by the middle of the 16th century. It was probably a good 30, and earliest, in the schools of Italy and in those of England, where the London College of Physicians might be regarded as an offshoot of the Italian schools. Paris was the stronghold of conservatism, and Germany was stirred by the teachings of one who must be considered apart from all schools—Paracelsus. The nature of the struggle between the rival systems may be well illustrated by a formidable controversy about the rules for bleeding in acute diseases. This operation, according to the Arabian practice, was always performed on a vein at a distance from the organ affected. The Hippocratic and also Galenic rule, to let blood from, or near to, the diseased organ, was revived by Pierre Brissot (1470-1524), a professor in the university of Paris. His attempt at reform, which was taken to be, as in effect it was, a revolt against the authority of the Arabian masters, led to his expulsion from Paris, and the formal prohibition by the parliament of France. Upon this apparently trifling question arose a controversy which lasted many years, occupied several universities, and led to the interposition of personages no less important than the pope and the emperor, but which is thought to have largely contributed to the final downfall of the Arabian medicine.

Paracelsus and Chemical Medicine.—Contemporary with the school of medical humanists, but little influenced by them, lived in Germany a man of strange genius, of whose character and importance the account which we are about to give is sufficiently suggestive. Paracelsus put to use a combination of a remarkable quality in Paracelsus (c. 1490-1541) is his revolutionary independence of thought, which was supported by his immense personal arrogance. Himself well trained in the learning and medical science of the day, he despised and trampled upon all traditional and authoritative teachings. He began his lectures at Basel by burning the books of Avicenna and others; he afterwards boasted of having read no books for ten years; he protested that his shoe-huckles were more learned than Galen and Avicenna. On the other hand, he spoke with respect of Hippocrates, and wrote a commentary on his Aphorisms. In this we see a spirit very different from the enthusiasm of the humanists for a purer and nobler philosophy than the scholastic and Arabian versions of Greek thought. There is no record of Paracelsus' knowledge of Greek, and as, at least in his student days, the most important works of Greek medicine were very imperfectly known, it is probable he had little first hand acquaintance with Galen or Hippocrates, while his breach with the humanists is the more conspicuous from his lecturing and writing chiefly in his native German.

Having thus made a clean sweep of nearly the whole of Galenism, Paracelsus put in its place? Certainly not pure empiricism, or habits of objective observation. He had a dogma of his own—one founded, according to his German expositors, on the views of the Neoplatonists, of which a few disjointed specimens must here suffice. The human body was a "microcosm" which corresponded to the "macrocosm," and contained in itself all parts of visible nature,—sun, moon, stars and the poles of heaven. To know the nature of man and how to deal with it, the physician should study, not anatomy, which Paracelsus utterly rejected, but all parts of external nature. Life was a perpetual germinative process controlled by the indwelling spirit or Archeus; and diseases, according to the mystical conception of Paracelsus, were not natural but spiritual. Nature was sufficient for the cure of most diseases; art had only to interfere when the internal physician, the man himself, was tired or incapable. Then some remedy had to be introduced which should be antagonistic, not to the disease in a physical sense, but to the spiritual seed of the disease. These remedies were arcana—a word corresponding partly to what we now call specific remedies, but implying a mysterious connexion between the remedy and the essence of the disease. Arcana were often shown to be such by their physical properties, not only by such as heat, cold, &c., but by fortuitous resemblances to certain parts of the body; thus arose the famous doctrine of "signatures," or signs indicating the virtues and uses of natural objects, which was afterwards developed into great complexity. Great importance was also attached to chemically prepared remedies as containing the essence or spiritual quality of the material from which they were derived. The actual therapeutic resources of Paracelsus included a
large number of metallic preparations, in the introduction of some of which he did good service, and, among vegetable preparations, the tincture of opium, still known by the name he gave it, laudanum. In this doubtless he derived much advantage from his knowledge of chemistry, though the science was as yet not disentangled from the secret traditions of alchemy, and was often mixed up with imposture.

German historians of medicine attach great importance to the reform introduced about the middle of the 16th century in his writings of many scientific truths of later times. That his personality was influential, and his intrepid originality of great value as an example in his own country, is undeniable. As a natural philosopher he was afterwards called to London. But his importance in the universal history of medicine we cannot estimate so highly. The chief immediate result we can trace is the introduction of a general medical and especially antimony, the use of which became a kind of badge of the disciples of Paracelsus. The use of these remedies was not, however, necessarily connected with a belief in his system, which seems to have spread little beyond his own country. Of the followers of Paracelsus some became more mystical quacks and impostors. Others, of more learning and better repute, were distinguished from the regular physicians chiefly by their use of chemical remedies. In France the introduction of antimony gave rise to a bitter controversy which lasted into the 17th century, and led to the expulsion of some men of mark from the Paris faculty. In England "chemical medicine" is first heard of and was in like manner extemned and was assailed by the College of Physicians and the Society of Apothecaries. But it should be remembered that all the chemical physicians did not call Paracelsus master. The most notorious of that school in England, John Alsbury, was, as far as the record goes, independent of the medical school. He relies upon Arnold de Villanova and Raimon Lull. From this time, however, it is always possible to trace a school of chemical practitioners, who, though condemned by the orthodox Galenists, held their ground, till in the 17th century a successor of Paracelsus arose in the celebrated J. B. Van Helmont.

**Consequences of the Revival of Ancient Medicine.**—The revival of Galenic and Hippocratic medicine, though ultimately it conferred the greatest benefits on medical sciences, did not immediately produce any important or salutary reform in practical medicine. The standard of excellence in the ancient writers was indeed far above the level of the 16th century; but the fatal habit of taking at second hand what should have been acquired by direct observation retarded progress more than the possession of better models assisted it, so that the fundamental faults of medieval science remained uncorrected.

Nevertheless some progress has to be recorded, even if not due directly to the study of ancient medicine. In the first place the 15th and 16th centuries were notable for the outbreak of certain epidemic diseases, which were unknown to the old physicians. Of these the chief was the "sweating sickness" or "English sweat," especially prevalent in, though not confined to, the country whence it is named. Among many descriptions of this disease, that by John Kaye or Caelus, already referred to, was one of the best, and of great importance as showing that the works of Galen did not comprise all that could be known in medicine. The spread of syphilis, a disease equally unknown to the ancients, and the failure of Galen's remedies to cure it, had a similar effect.

In another direction the foundations of modern medicine were being laid during the 16th century—namely, by the introduction of clinical instruction in hospitals. In this Italy, and especially the renowned school of Padua, took the first step, where Giovanni De Monte (Montanus), (1498-1552), already mentioned as a humanist, gave clinical lectures to the patients in the hospital of St. Francis, which may still be read with interest. Pupils flocked to him from all European countries; Germans are especially mentioned; a Polish student reported and published some of his lectures; and the Englishman Kaye was a zealous disciple, who does not, however, seem to have done anything towards transplanting this method of instruction to his own country. Inspections of the dead, to ascertain the nature of the disease, were made, though not without difficulty, and thus the modern period of the science of morbid anatomy was ushered in.

**Medicine in the 17th Century.**—The medicine of the early 17th century presents no features to distinguish it from that of the preceding century. The practice and theory of medicine were mainly founded upon Hippocrates and Galen, with ever-increasing additions from the chemical school. But the development of mathematical and physical science soon introduced a fundamental change in the habits of thought with respect to medical doctrine.

These discoveries not only weakened or destroyed the respect for authority in matters of science, but brought about a marked tendency to mechanical explanations of life and disease. When William Harvey by his discovery of the circulation furnished an explanation of many vital processes which was reconcilable with the ordinary laws of mechanics, the efforts of medical theorists were naturally directed to bringing all the departments of medicine under similar laws. It is often assumed that the writings and influence of Bacon did much towards introducing a more scientific method into medicine and physiology. But, without discussing the general philosophical position or historical importance of Bacon, it may safely be said that his direct influence can be little traced in medical writings of the first half of the 17th century. Harvey, as is well known, spoke sightly of the great chancellor, and it is not till the rapid development of physical science in England and Holland in the latter part of the century, that we find Baconian principles explicitly recognized.

The dominant factors in the 17th-century medicine were the discovery of the circulation by William Harvey (published in 1628), the mechanical philosophy of Descartes and the contemporary progress of physics, the teaching of Van Helmont on chemical products and the rise of morbid processes, and finally, combined of all these, and inspiring them, the rise of the spirit of inquiry and innovation, which may be called the scientific movement. Before speaking in detail of these, we may note that by other influences quite independent of theories, important additions were made to practical medicine. The method of clinical instruction in hospitals, commenced by the Italians, was introduced into Holland, where it was greatly developed, especially at Leiden, in the hands of Francis de la Boe, called Sylvius (1641-1672). It is noteworthy that concurrently with the rise of clinical study the works of Hippocrates were more and more valued, while Galen began to sink into the background.

At the same time the discovery of new diseases, unknown to the ancients, and the keener attention which the great epidemics of plague caused to be paid to those already known, led to more minute study of the natural history of disease. The most important disease hitherto undescribed was rickets, first made known by Arnold de Boot, a Friesian who practised in Ireland, in 1649, and afterwards more fully in the celebrated work of Francis Glisson (1597-1677) in 1651. The plague was carefully studied by Isbrand de Diémerbroek, in his De Peste (1646), and others. Nathaniel Hodges of London (1629-1668) in 1665 seems to have been the first who had the courage to make a post mortem inspection of a plague patient. Christopher Bennet (1617-1655) wrote an important work on consumption in 1654. During the same period many new remedies were introduced, the most important being cinchona-hark, brought to Spain in the year 1640. The progress of pharmacy was shown by the publication of Dispensatories or Pharmacopoeias—such as that of the Royal College of Physicians of London in 1618. This, like the earlier German works of the same kind (on which it was partly founded), contains both the traditional (Galenical) and the modern or chemical remedies.

**Van Helmont.**—The medicine of the 17th century was especially distinguished by the rise of systems; and we must first speak of an eccentric genius who endeavoured to construct a system for himself, as original and opposed to tradition as that of Paracelsus. J. B. Van Helmont (1614-1678) was the son of a man of noble family in Brussel, who, after mastering all other branches of learning as then understood, devoted himself with enthusiasm to medicine and chemistry. By education and position a little out of the ordinary course of profession, he took up in medicine an independent attitude. Well acquainted with the doctrines of Galen, he rejected them as thoroughly as Paracelsus did, and borrowed from the latter some definite ideas as well as his revolutionary spirit. The archeus of Paracelsus
appears different, but with still further complications the whole body was controlled by the "arche medico" and the soul of the organ and its parts by the "arche insi," which are subject to the central arches. Many of the symptoms of diseases were caused by local irritations or disturbances of the physical principles actuated by modifying the ideas of the body. These and other notions cannot be here stated at sufficient length to be intelligible. It is enough to say that on this fantastic basis Helmont constructed a phlogistic chemistry of which, of course, the result cannot be from medicine, though it weakened the authority of the old dogma.

The movement led rather to the formation of schools or systems of thought, which under various names lasted on into the 18th century. Among them is the celebrated school of medicine referred to as the "arche medico" and its followers. The most important of these were the so-called ıatro-physical or mechanical and the ıatro-chemical schools.

Iatro-Physical School.—The ıatro-physical school of medicine grew out of physiological theories. Its founder is held to be G. A. Borelli (1608-1679), whose treatise De motu animalium, published in 1680, is regarded as marking an epoch in physiology. The tendency of the school was to explain the actions and functions of the body on physical, and especially on mechanical, principles. The movements of bones and muscles were referred to the action of levers; the functions of the stomach were regarded as essentially a process of trituration; nutrition and secretion were shown to be dependent upon the tension of the vessels, and so forth. The developments of this school belonged rather to the history of physiology, where they appear, seen in the light of modern science, as excellent though premature endeavors in a scientific direction. But the influence of these theories on practical medicine was not great. The more judicious of the mechanical or physical school restrained what a judicious modern physiologist does, from too immediate an application of their principles to daily practice. Mechanical theories of disease were based on an equation of mechanical forces in various modes and degrees.

Iatro-Chemical School.—The so-called ıatro-chemical school stood in a much closer relation to practical medicine than the ıatro-physical; for, instead of merely the use of chemical medicines in addition to the traditional, or, as they were called in distinction, "Galenic" remedies, but a theory of pathology or causation of disease entirely different from the prevailing "humoral" pathology. Its chief aim was to reconcile the new views in physiology and chemistry with practical medicine. In some theoretical views, and in the use of certain remedies, the school owed a good deal to Van Helmont's Paretochemical School of 1643-1716. Jean-Baptiste Pelletier (1639-1716), also is usually ranked with them. One of the most elaborate developments of the system was that of Archibald Pitcairn (1652-1713), a Scottish physician who became professor at Leiden. His so-called ıatrochemical school did not, however, get beyond the ıatrochemical stage.

MEDICINE [HISTORY]

The doctrine of ıatrochemical school became widely spread in Holland and Germany; later in France and Italy. In England they were not generally accepted till adopted with some modifications by Thomas Willis the great anatomist (1621-1675), who is the chief English representative of the chemical school. Willis was as thorough-going a chemist as Sylvius. He regarded all bodies, organic and inorganic, as different mixtures of chemicals, and the phenomena of science as being the first being only found abundantly in animal bodies. The "intimate movement of particles" in every body, or fermentation, was the explanation of many of the processes of life and disease. The secretion and excretion of the body fluids were regarded as the results of the varied actions of chemical processes depending upon different proportions, movements and combinations of these particles. The elaborate work Pharmacoeutic rationalis (1674), based on these views, had, however, been forgotten. But some parts of Willis's works, such as his descriptions of nervous diseases, and his account (the earliest) of diabetes, are classical contributions to medical knowledge. Indeed it is through the agency of these and other chemical secrets Willis made some important steps. The chemical school met with violent opposition, partly from the adherents of the ancient medicine, partly from the ıatro-mechanical school. Towards the end of the 17th century appeared an English medical reformer who sided with none of these schools, but may be said in some respects to have surpassed and dispensed with them.

Sydenham and Locke.—Thomas Sydenham (1624-1689) was educated at Oxford and at Montpellier. He was well acquainted with the works of the ancient physicians, and probably fairly so with chemistry. Of his knowledge of anatomy nothing definite can be said; it was to do without hypothesis, and study the actual diseases in an unbiased manner. As his model in medical methods, Sydenham repeated and pointedly refers to Hippocrates, and his great admirer Hippocrates the Humanist. He resembled his Greek master in the high value he set on the study of the "natural history of disease," in the importance he attached to "epidemic observation,"—that is, the recognition of certain causes in modifying disease; and further in his conception of the healing power of nature in disease, a doctrine which he even expanded beyond the teaching of Hippocrates. According to Sydenham, a disease is nothing more than an effort of nature to restore the health of the patient by the elimination of the morbific matter. The extent to which his practice was influenced by this and other principles is evident from the ıatrochemical conceptions of many diseases as being something specific; but he had the rare merit of never permitting himself to be enslaved even by his own theories. Still less was his mind warped by either of the two great systems, the classical and the chemical, which then divided the medical world. Sydenham's influence on European medicine was very great. His principles were welcomed as a return to nature by those who were weary of theoretical disputes. He introduced a milder and better way of treating fevers—especially small-pox, and gave strong support to the use of specific medicines—especially Peruvian bark. He was an advocate of bleeding, and often carried it to excess. Another important point in Sydenham's work is his clear recognition of many diseases as being what would be now called specific, and not due merely to an alteration in the primary qualities or humours of the older schools. From this springs his high appreciation of specific medicines.

There is an interesting letter from Sydenham to his friend John Locke. The great sensational philosopher was a thoroughly trained physician, and practised privately. He was a student of Sydenham's who shared and defended many of Sydenham's principles, and henceforth considered himself to be even more thorough-going than the "English Hippocrates." It is deeply to be regretted in the interests of medicine that he did not write more. It is, however, reasonable to suppose that his commanding influence often makes itself felt in the words of Sydenham. One sentence of Locke's, in a letter to William Molyneux, sums up the practical side of Sydenham's teaching: "You cannot imagine how far a little observation carefully made by a man not tied up to the four humours [Galen], or salt, sulphur and mercury [Paracelsus], or to acid and alcali [Sylvius and Willis] can go. It is a new and better way of medicine; and has been followed more and more, though very stubborn and dangerous; and that with very little and common things, and almost no medicine at all."

We thus see that, while the great anatomists, physiologists and chemists were the men of the 18th century, experimental medicine, with its foundations which were later on built up into the fabric of scientific medicine, little good was done by the premature application of their half-understood principles to practice. The reform of practical medicine was by the effects of the ıatrochemical school of thought, in rejecting all hypothesis and returning to the unbiased study of natural processes, as shown in health and disease. The doctrines of Sylvius, however, were sometimes profitably studied and dealt with without explaining them; and, by turning men's minds away from explanations and fixing them on facts, he enriched medicine with a method more fruitful than any discoveries in detail. The system of medicine was not at an end, though the dogmatic spirit long survived.

The 18th Century.—The medicine of the 18th century is notable, like that of the latter part of the 17th, for the striving
MEDICINE

The organizer, and almost the constructor, of the modern method of clinical instruction, the services of Boerhaave to the progress of the science of medicine have been immense, and he must be overrated. In his teaching, as in his practice, he avowedly followed the most celebrated practitioners and professors, and Sydenham, both of whom he enthusiastically admired. In his medical doctrines he must be pronounced an eclectic, though he was himself manifestly a determined opponent of metaphysical explanations, and of the chemical doctrines, gave to his own rude mechanical explanations of life and disease almost the dogmatism completeness of a theoretical system. His countryman and pupil, George Cheyne (1671-1743), who lived some years at Bath, published a new theory of fevers on the mechanical system, which had a great reputation. Their English contemporaries and successors, John Freid, William Cole, and Richard Mead, leaned also to mechanical explanations, but with a distrust of systematic theoretical completeness, which was perhaps partly a national characteristic, partly the result of the teaching of Sydenham and Locke. Freid (1675-1728) in his Emnennologia gave a mechanical explanation of the phenomena of menstruation. He is also one of the most distinguished writers on the history of medicine. Cole (1635-1716) (see above) published mechanical hypotheses concerning the causation of fevers which closely agree with those of the Italian iatro-mechanical school. More distinguished in his own day than any of these was Mead (1673-1754), one of the most accomplished and socially successful physicians of his age. He was the pupil of the equally popular and successful John Radcliffe (1652-1714), who had been removed from Sydenham a contempt for book-learning, and belonged to no school in medicine but the school of common sense. Radian left, however, no work requiring mention in a history of medicine. Mead, a man of great learning and intellectual activity, was an ardent advocate of the mathematical doctrines. "It is very evident," he says, "that all other means of improving medicine have been found ineffectual, by the stand it was at for two thousand years, and that, since mathematicians have set themselves to the study of it, men already begin to talk so intelligibly and comprehensively not only of the greatest but matters, that it is to be hoped that mathematical learning will be the distinguishing mark of a physician and a quack." His Mechanical Account of Poisons, in the first edition (1702) gave an explanation of the effects of poisons, as acting only on the blood. Afterwards he modified his hypothesis, and referred the disturbances produced to the "nervous liquor," which he supposed to be a quantity of the "universal elastic matter" diffused through the universe, by which Newton explained the phenomena of light,—i.e. what was afterwards called the "Newton's rings." His book on the "Physical Theories of the Sun and Moon over Human Bodies" (1704), equally inspired by Newton's discoveries, was a premature attempt to assign the influence of atmospheric pressure and other cosmical causes in producing disease. His works contain, however, many original experiments, and excellent practical observations. James Keill (1673-1719) applied Newtonian and mechanical principles to the explanation of bodily functions with still greater accuracy and completeness; but his researches have more importance for physiology than for practical medicine.

Boerhaave.—None of these men founded a school—a result due in part to their intellectual character, in part to the absence in England of medical schools equivalent in position and importance to the universities of the Continent. An important academic position was, on the other hand, one of the reasons why a physician not very different in his way of thinking from the English physicians of the eighteenth century was able to achieve a great degree of position in the medical world. Hermann Boerhaave (1668-1738) was emphatically a great teacher. He was for many years professor of medicine at Leiden, where he lectured five hours a day, and excelled in influence and reputation not only his greatest forerunners, Montanus of Padua and Sylvius of Leiden, but probably every subsequent teacher. The hospital of Leiden, though with only twelve beds, was available teaching, became the centre of medical influence in Europe. Many of the most eminent English physicians of the 18th century studied there; Gerard Van Swieten (1700-1772), a pupil of Boerhaave, transplanted the methods of his teaching to Vienna, and founded the noted Vienna school of medicine.
The appreciation of his work in physiology belongs to the history of that science; we are only concerned here with its influence on medicine. Haller's definition of irritability as a property of muscular tissues, which was supposed to be compressed at the root of the prevailing hypothesis respecting animal activity. It was no longer necessary to suppose that a half-consumed body, or a body without blood, was nervous as described in the work of the Continent system; and it is difficult now to understand why it attracted so much attention in its day. To us at the present time it seems merely a dialectical attempt to explain the property of irritability as arising from nervous force, power, stimulus, &c., being used in such a way as not to correspond to any precise physical conceptions, still less to definite material objects or forces. One recommendation of the system was that it was capable of harmonic action, and of producing a similar effect in the case of similar phenomena. Brown may be said to have been the first advocate of the modern stimulant or feeding treatment of fevers. He advocated the use of "animal drinks" because he believed that to produce symptoms of the latter, and hence to cause the disease."
"similis similibus curatur," which he explained as depending on the law that in order to get rid of a disease some remedy must be given which is similar to the disease, although weaker. The original malady being thus got rid of, the vital force would easily be able to cope with and extinguish the slighter disorder of which Brown's act was the cause. Something very similar was held by Brown, who taught that "indirect debility" was to be cured by a lesser degree of the same stimulus as had caused the original disturbance. Generally, however, Hahnemann's views were opposed to those of Brown; and sometimes a practice similar to that of Brown was denounced by Hahnemann as a "lawless" and "irrational act of treatment," and condemned as a "medicinal destruction of health." In order to select remedies which should fulfil the indication of producing symptoms like those of the disease, Hahnemann made many observations of the action of drugs on healthy persons. 

He did not originate this line of research, for it had been pursued, if not originated, by Haller, and cultivated systematically by Tommasini; an Italian "contra-stimulator"; but he carried it out with much elaboration. His results, nevertheless, were vitiated by being obtained in the interest of a theory, and by singular want of discrimination. In his second period he developed the theory of "potentiality" or dynamization——namely, that medicines gained in strength by being diluted, if the dilution was accompanied by shaking or pounding, which was supposed to "potentize" or increase the potency of the medicine. On this principle Hahnemann ordered his original tinctures to be reduced in strength to one-fiftieth; these first dilutions again to one-fiftieth; and so on, even till the thirtieth dilution, which he himself used by preference, and to which he ascribed the highest "potentiality." From a theoretical point of view, this is one of the most interesting systems, pretending to universality, which modern medicine neither accepts nor finds it worth while to controvert. In the treatment of disease his practical innovations came at a fortunate time, when the practice of the apothecary system had only partially been superseded by the equally injurious opposite extreme of Brown's stimulant treatment. Hahnemann's use of mild and often quite inert remedies contrasted favorably with these. Good, however, as these first dilutions were found upon simplicity in prescribing, when it was the custom to give a number of drugs, often heterogeneous and inconsistent, in the same prescription. But these indirect benefits were quite independent of the truth or falsity of his theoretical system.

Positive Progress in the 18th Century.—In looking back on the repeated attempts in the 18th century to construct a universal system of medicine, it is impossible not to regret the waste of brilliant gifts and profound acquirements which it involved. 

In Italy the tradition of the great anatomists and physiologists of the 17th century produced a series of accurate observers and experimentalists. Among these was Maria Valsalva (1666-1733), still better known as an anatomist; Giovanni Maria Lancisi (1654-1726), also an anatomist, the author of a classical work on the diseases of the heart and aneurisms; and Ippolito Francesco Alberchini (1662-1738), whose researches on the same class of diseases were no less important.

In France, Jean Baptiste Séanc (1663-1770) wrote also an important work on the affections of the heart. Sauvages, otherwise B. F. de LaCroix (1706-1767), gave, under the title "Nostologie methodique," a natural-history classification of diseases; and Broussais, in 1804-1805, published a treatise on the known general diseases. But the state of medicine in that country till the end of the 18th century was unsatisfactory as compared with some other parts of Europe.

In England the brilliancy of the early part of the century in practical medicine was hardly maintained to the end, and presented, indeed, a certain contrast with the remarkable and unflagging progress of surgery in the same period. The roll of the College of Physicians does not furnish many distinguished names. Among these should be mentioned John Fothergill (1712-1780), who was one of the most active and original of the so-called "practical physicians" of the period, and who is known as the "father of phthisiology"; Robert Willan, physician to the London Hospital, who was one of the first to recognize theconnexion between tuberculosis and consumption; and John Percival, who, by his works on the diseases of the chest and lungs, greatly contributed to the scientific knowledge of the subject. In the Discovery of Jenner's Vaccine, Great Britain was the first country to make the most of the discovery. The practice of inoculation, however, was not unknown to some of the physicians of the day, but it was not generally adopted until the latter part of the century.
the steps which led to this wild and long since exploded theory. It led, among other consequences, to an enormous misuse of bleeding. Leeches were his favourite instruments, and so much so that he is said to have used 100,000 in his own hospital wards during one year. He was equalled if not surpassed in this excess by his follower Jean Bouillaud (1796-1881), known for his important work on heart diseases. Broussais’s system, to which he gave the name of “Medicine physiologique,” did much indirect good, in fixing attention upon morbid changes in the organs, and thus led to the rise of the strongly opposed anatomical and pathological school of Corvisart, Laennec and Bayle.

Jean Nicolas Corvisart (1733-1816) has already been mentioned as the introducer into France of Auenbrugger’s work on percussion. He introduced some improvements in the method, but the only real advance was the introduction of mediate percussion by Pierre Adolphe Pierry (1794-1879) in 1826. The discovery had, however, yet to be completed by that of auscultation, or listening to sounds produced in the chest by breathing, the movements of the heart, &c. The combination of these methods constitutes what is now known as “Diagnosis Rénale.” Hyacinthe Laennec (1781-1826) was the inventor of this most important perhaps of all methods of medical research. Except for some trifling notices of sounds heard in certain diseases, this method was unknown until Laennec was definitely expounded in an almost complete form in his work De l’auscultation médicale, published in 1819. Laennec attached undue importance to the use of the stethoscope, and laid too much weight on specific signs of specific diseases. Still, the method in itself is not afraid of improvement. The result of his discovery was an entire revolution in the knowledge of diseases of the chest; but it would be a mistake to regard the fact as due to the use of the stethoscope in isolation, but to the simultaneous study of the condition of the diseased organs as seen after death. Without the latter, it is difficult to see how the information conveyed by sounds could ever have been verified. This increase of knowledge is therefore due, not to auscultation alone, but to auscultation combined with morbid anatomy. In the case of Laennec himself this qualification takes nothing from his fame, for he studied so minutely the relations of post-mortal appearances to their antecedents that, had he lived longer, his research in morbid anatomy would have made him famous.

The pathologico-anatomical method was also followed with great zeal and success by Gaspard Laurent Bayle (1774-1816), whose researches on tubercle, and the changes of the lungs and other organs in consumption, are the foundation of most that has been done since his time. It was of course antecedent to the discovery of auscultation. Starting from these men arose a school of physicians who endeavoured to give to the study of symptoms the same precision as belonged to anatomical observations, and by the combination of these methods a new era of medicine. Among these were Auguste François Chomel (1738-1828), Pierre Alexandre Lonis (1787-1872), Jean Cruveilhier (1791-1874) and Gabriel Andral (1797-1876). Louis, by his researches on pulmo-nary affection and typhoid fever, and the chief reticence of refute the doctrines of Broussais. In another respect also he aided in establishing an exact science of medicine by the introduction of the numerical or statistical method. By this method only can the fallacies which are attendant on drawing conclusions from isolated cases be avoided; and thus the chief objection which has been made to regarding medicine as an inductive science has been removed. Louis’s method was improved and systematized by Louis Denis Jules Gavarret (1800-1890); and its utility is now universally recognized. During this brilliant period of French medicine the superiority of the school of Paris could hardly be contested. Attention must be again directed to the works of Pierre Antoine de Chaptal (1771-1862), Louis Léon Rostan (1750-1866), Jean Louis D’Alibert (1766-1837), Pierre François Olivier Rayet (1793-1867) and Armand Trouseau (1801-1866), the eloquent and popular teacher.

English Medicine from 1800 to 1840.—The progress of medicine in England during this period displays the same characteristics as at other times, viz., a gradual and uninterrupted development, without startling changes such as are caused by the sudden rise or fall of one system or another. There were two great names of English birth; Erasmus Darwin (1731-1802), the grandfather of the great Charles Darwin, alone makes an exception. In his Zoonomia (1794) he expounded a theory of life and disease which had some resemblance to that of Brown, though arrived at (he says) by a different chain of reasoning.

Darwin’s work shows, however, the tendency to connect medicine with physical science, which was an immediate consequence of the scientific discoveries of the end of the 18th century, when Priestley and Cavendish in England exercised the same influence as Lavoisier in France. The English school of medicine was also profoundly stirred by the teachings of the two brothers William and John Hunter, especially the latter—who must therefore be briefly mentioned, though their own researches were chiefly concerned with subjects lying a little outside the limits of this sketch. William Hunter (1718-1783) was known in London as a brilliant teacher of anatomy and successful obstetric physician; his younger brother and pupil, John Hunter (1728-1793), was also a teacher of anatomy, and practised as a surgeon. His immense contributions to anatomy and pathology cannot be estimated here, but his services in stimulating research and training investigators belong to the history of general medicine. They are sufficiently evidenced by the fact that Edward Jenner and Matthew Baillie were his pupils.

The same scientific bent is seen in the greater attention paid to morbid anatomy (which dates from Baillie) and the more scientific method of studying diseases. An instance of the latter is the work of Robert Willan (1757-1812) on diseases of the skin—a department of medicine in which abstract and general views had been hitherto, in injuries and burns, by following the natural-history method of Sydenham, at once put the study on a sound basis; and his work has been the starting-point of the most important modern researches. About the same time Charles Williams (1757-1817), a scientific investigator of remarkable power, and the author of a celebrated essay on cew, published observations on alterations in the urine, which, though little noticed at the time, were of great value as assisting in the important discovery made some years afterwards by Richard Bright.

These observarions, which cannot be mentioned here, belong to the period when English medicine was still almost influenced by the French school. Shortly after 1815, however, when the continent of Europe was again open to English travelers, many English doctors studied in Paris, and the discoveries of their great French contemporaries began to be known. The method of auscultation was soon introduced into England by pupils of Laennec. John Forbes (1787-1861) in 1824, and William Stokes (1804-1876) of Dublin in 1825, published treatises on the use of the stethoscope. Forbes also translated the works of Laennec and Auenbrugger, and an entire revolution was soon effected in the teaching of medicine, which, with James Hope (1801-1841) and Peter Mere Latham (1789-1875) further developed this subject, and the former was also known for his researches in morbid anatomy. The combination of clinical and anatomical research led, as in the hands of the great French physicians, to important discoveries by English investigators. The discovery by Richard Bright (1789-1854) of the disease of the kidneys known by his name to prove to be one of the most momentous of the century. It was published in Reports of Medical Cases 1827-1831. Thomas Addison (1793-1860) takes, somewhat later, a scarcely inferior place. The remarkable physiological discoveries of Sir Charles Bell (1774-1842) and Marshall Hall (1790-1857) for the first time rendered possible the discrimination of diseases of the spinal cord. Several of these physicians were also eminent for their clinical teaching—an art in which Englishmen had up till then been greatly deficient.

Although many names of scarcely less note might be mentioned among the London physicians of the early part of the century, we must pass them over to consider the progress of medicine in Scotland and Ireland.

In Scotland during the 18th century the medical schools of Edinburgh and Glasgow were making rapid strides. One of the most famous names was that of William Cullen (1710-1790), whose name is now known in this country as a great teacher. His pupil, James Gregory (1736-1821), was not unworthy. His works include An Attempt to Valorize the Dangers of Labour (1767), and An Essay towards the Establishment of a Society for the Infractions of Hospitals (1780). This led to the foundation of the Royal College of Physicians in Edinburgh in 1793. Another famous Edinburgh teacher was William Playfair (1755-1829), whose works are still widely known. These great teachers maintained in the northern university a continuous tradition of successful teaching, which the difference in academic and other circumstances rendered hardly possible in London. Nor was the northern school wanting in special investigators, such as John Abercrombie (1780-1844), known for his work on diseases of the brain and spinal cord, published in 1828, and many others. Turning to Ireland, it should be said that the Dublin school in this period produced two physicians of the highest distinction. Robert James Graves (1796-1853) was a most eminent clinical teacher and observer, whose lectures are regarded as the
model of clinical teaching, and indeed served as such to the most popular teacher of the Paris school in the middle of this century, Trouseau. William Stokes (1804–1878) was especially known for his teachings on diseases of the chest and of the heart, and for his clinical teaching.

German Medicine from 1800 to 1840.—Of the other countries of Europe, it is now only necessary to mention Germany. Here the chief home of positive medicine was still for a long time Vienna, where the new Vienna school continued and surpassed the glory of Stern. Doctrines (1815–1855) are, the so-called and in some respects corrected, the art of ascertaining as left by Laennec, Karl Rokitansky (1804–1878), by his colossal labours, placed the science of morbid anatomy on a permanent basis, and enriched it by numerous discoveries of detail. Most of the ardent cultivators of this science in Germany in the next generation were his pupils. In the other German schools, though some great names might be found, as Moritz Heinrich Romberg (1795–1873), the founder of the modern era in the study of nervous diseases, the general spirit was scholastic and the result barren till the teaching of one man, whom the modem German physicians generally regard as the regenerator of scientific medicine in their country, made itself felt. Johann Lucas Schönlein (1793–1864) was first professor at Würzburg, afterwards at Zürich, and for twenty years at Berlin (from 1839–1859). Schönlein's positive contributions to medical science were not large; but he made in 1839 one discovery, apparently small, but in reality most suggestive, namely, that the contagious disease of the head called favus is produced by the growth in the hair of a parasitic fungus. In this may be found the germ of the startling modern discoveries in parasitic diseases. His discussions of the so-called "natural history school"; but his real merit was that of the founder or introducer of a method. In the words of H. Häser: "Schönlein has the incontestable merit of having been the first to establish in Germany the exact method of the French and the English, and to impregnate this method with the vivifying spirit of German research."

Modern Progress.—In recent times the positive bent of modern knowledge and methods in other spheres of science and thought, and especially in biology, has influenced medicine profoundly. Minute accuracy of observation was inculcated by the labours and teachings of the great anatomists of the 17th century, and, for modern times, experimental physiology was instituted by Harvey, anatomy having done little to interpret life in its dynamic aspects. For medicine in England Harvey did what William Gilbert did for physics and Robert Boyle for chemistry: he insisted upon direct interrogation of natural processes, and thereby annihilated the ascendancy of mere authority, which, while nations were in the making, was an essential principle in the welding together of heterogeneous and turbulent peoples. The degradation of medicine between Galen and Harvey, if in part it consisted in the blind following of the authority of the former physician, was primarily due to other causes; and its new development was not due to the discovery of the experimental method alone: social and political causes also are concerned in the advance even of the exact sciences. Among such contributory causes is the more familiar intercourse of settled nations which we enjoy in our own day; the ideas of one nation rapidly permeate neighbouring nations, and by the means of printed books penetrate into remotest provinces and into distant lands. Hence the description of the advance of medicine in western Europe and America may for the latest stage be taken as a case in point, with the exception of the transatlantic nation by nation, which in the history of earlier times was necessary. Italy lost the leading place she had taken in the new development of science. The several influences of modern Germany, France and America became of the first importance to English medicine; but these tides, instead of pursuing their courses as independent streams, have become confluent. The work of Theodor Schwann (1810–1882), Johannes Müller (1801–1878), Rudolph Virchow, and Karl Ludwig (1816–1895) in Germany, of R. T. H. Laennec and Claude Bernard in France, was accepted in England, as that of Matthew Baillie, Charles Bell, Bright, Graves and others of the British school, quickly made itself felt abroad.

The character of modern medicine cannot be summed in a word, as, with more or less aptness, that of some previous periods may be. Modern medicine, like modern science, is as boldly speculative as it has been in any age, and yet it is as observant as in any naturalistic period; its success lies in the addition to these qualities of the method of verification; the fault of previous times being not the activity of the speculative faculty, without which no science can be fertile, but the lack of methodical reference of all and sundry propositions, and parts of propositions, to the test of experiment. In no department is the experimental method more continually justified than in that of the natural history of disease, which at first sight would seem to have a certain independence of it and a somewhat exclusive value of its own. Hippocrates had no opportunity of verification by necropsy, and Sydenham ignored pathology; yet the clinical features of many but recently described diseases, logy, for example, as that named after Graves, and myxoedema, both associated with perversions of the thyroid gland, lay as open to the eye of physicians in the past as to our own. Again, to the naturalist the symptoms of tabes dorsalis were distinctive enough, had he noted them. No aid to the trained eye was necessary for such observations, and for many others: yet, if we take Sir Thomas Watson (1792–1882) as a modern Sydenham, we may find in his lectures no suspicion that there may be a paity of muscular co-ordination apart from deprivation of strength. Indeed, it does not seem to have occurred to any observer during the century in the varieties of kinds of paraplegia. Thus it was, partly because the habit of acceptance of authority, waning but far from extinguished, dictated to the clinical observer what he should see; partly because the eye of the clinical observer lacked that special training which the habit and influence of experimental verification alone can give, that physicians, even acute and practised physicians, failed to see many and many a symptomatic series which went through its evolutions conspicuously enough, and needed for its appreciation no unknown aids or methods of research, nor any further advances of pathology. We see now that the practice of the experimental method ends with a new vision both the experimenter himself and, through his influence, those who are associated with him in medical science, even if these be not themselves actually engaged in experiment; a new discipline is imposed upon old faculties, as is seen as well in other sciences as in those on which medicine more directly depends. And it is not only the perceptions of eye or ear which tell, but also the association of concepts behind these adits of the mind. It was the concepts derived from the experimental method of Harvey, Lavoisier, Liebig, Claude Bernard, Heimholtz, Darwin, Pasteur, Lisfranc and others which, directly or indirectly, trained the eyes of clinicians to observe more closely and accurately; and not of clinicians alone, but also of pathologists, such as Matthew Baillie, Cruveilhier, Rokitansky, Bright, Virchow to name but a few of those who, with (as must be admitted) new facilities for necropsies, began to pile upon us discoveries in morbid anatomy and histology. If at first in the 18th century, and in the earlier 19th, the discoveries in this branch of medical knowledge had a certain isolation, due perhaps to the possessions of the science of anatomy and the depth of the knowledge of the physician, and were brought into co-ordination with the clinical phenomena of disease. The great Morgagni, the founder of morbid anatomy, himself set the example of carrying on this study parallel with clinical observation; and always insisted that the clinical story of the case should be brought side by side with the revelations of the necropsy. In pathology, indeed, Virchow's (1821–1902) influence in the transfiguration of this branch of science may almost be compared to that of Darwin and Pasteur in their respective domains. In the last quarter of the 19th century the conception grew clearer that morbid anatomy for the most part demonstrates...
disease in its static aspects only, and also for the most part in the particular aspect of final demolition; and it became manifest as pathology and clinical medicine became more and more thoroughly integrated, that the processes which initiate and are concerned in this dissolution were not revealed by the scalpel.

Again, the physician as naturalist, though stimulated by the pathologist to delineate disease in its fuller manifestations, yet was hampered in a measure by the didactic method of constructing "types" which should command the attention of the disciple and rivet themselves on his memory; thus too often those incipient and transitory phases which initiate the paths of dissolution were missed. Not only so, but the physician, thus fascinated by "types," and impressed by the silent monuments of the pathological museum, was led to localize disease too much, to isolate the acts of nature, and to forget not only the continuity of the phases which lead up to the exemplary forms, or link them together, but to forget also that even between the types themselves relations of affinity must exist—and these oftentimes none the less intimate for apparent diversities of form, for types of widely different form may be, and indeed often are, more closely allied than types which have more superficial resemblance—and to forget, moreover, how largely negative is the process of abstraction by which types are imagined. Upon this too static a view, both of clinical type and of post-mortem-room pathology, came a despairing spirit, almost of fatalism, which in the contemplation of organic ruins lost the hope of cure of organic diseases. So prognosis became pessimistic, and the therapeutics of the abler men negative, until fresh hopes arose of stemming the tides of evil at their earliest flow.

Such was medicine, statically ordered in pathology, statically ordered in its clinical concepts, when, on the 24th of November 1859, the Origin of Species was published. It is no exaggeration to say that this epoch-making work brought to birth a world of conceptions as new as the work of Copernicus. For the natural philosopher the whole point of view of things was changed; in biology not only had the anthropocentric point of view been banished, but the ancient concept of perpetual flux was brought home to ordinary men, and entered for good into the framework of thought. The study of comparative pathology, yet in an inchoate stage, and of embryology, illuminated and enlarged biological conceptions, both normal and abnormal; and the erst reale substantias in corpore disappeared forever—at any rate from physiology and medicine. Before Darwin—if the name of Darwin may be used to signify the transformation of thought with which he was the chief artist—natural objects were regarded, not in medicine and pathology only, as a set of hidebound events; and natural operations as moving in fixed grooves, after a fashion which it is now difficult for us to realize. With the melting of the ice the more daring spirits dashed into the new current with such ardour that for them all traditions, all institutions, were thrown into hotchpot; even elderly and sober physicians took enough of the infection to liberate their minds, and, in the field of the several diseases and in that of post-mortem pathology, the hollowness of classification by superficial resemblance, the transitoriness of forms, and the flow of processes, broke upon the view. Thus it came about not only that classifications of disease based on superficial likeness—such as jaundice, dropsy, inflammation—were broken up, and their parts redistributed, but also that even more set diseases began to lose their settlements, and were recognized as terms of series, as transitory or culminating phases of perturbation, which might be traced to their origins, and in their earlier stages perhaps withheld.

The doctrine of heredity in disease thus took a larger aspect; the view of morbid series was no longer bounded even by the life of the individual; and the propagation of taints, and of morbid varieties of man, from generation to generation proved to be no mere repetition of fixed features but, even more frequently, to be modes of development or of dissolution betraying themselves often in widely dissimilar forms, in series often extending over many lives, the terms of which at first sight had seemed wholly disparate. Thus, for example, as generations succeed one another, nervous disorders appear in various guise; epilepsy, megrim, insanity, asthma, hysteria, tabes dorsalis; a motley array at first sight, seemed to reveal themselves as terms of a morbid series; not only so, but certain disorders of other systems also might be members of the series, such as certain diseases of the skin, and even peculiar susceptibilities or immunities in respect of infections from without. On the other hand, not a few disorders proved to be alien to classes to which narrower views of causation had referred them; of such are tubersals, neurtitis, infantile palsy or tetanus, now removed from the category of primary nervous diseases and placed in one or other of the class of infections; or, conversely, certain forms of disease of the joints are now regarded with some certainty as members of more than one series of diseases chiefly manifest in the nervous system. In the effects of simpler poisons the recognition of unity in diversity, as in the affiliation of a peripheral neuritis to arsenic, illustrated more definitely this serial or etiological method of classifying diseases. On the other hand, inheritance was dismissed, or survived only as a "susceptibility," in the cases of tubercle, leprosy and some other maladies now recognized as infectious; while in others, as in syphilis, it was found that, in whatever way the infective element passed from parent to offspring. These new conceptions of the multiplicity in unity of disease, and of the fluidity and continuity of morbid processes, might have led to vagueness and over-boldness in speculation and reconstruction, had not the experimental method been at hand with clues and tests for the several series. Of this method the rise and wonderful extension of the science of bacteriology also furnished no inconsiderable part.

In the disease of the scalp called favus, Schönlein had discovered a minute mycelial fungus; a remarkable discovery, for it was the first conspicuous step in the attribution to bacteria of the causation of disease. In a few years Schönlein thus did something to introduce new and positive conceptions and exact methods into Germany; but unfortunately his own mind retained the abstract habit of his country, and his abilities were dissipated in the mere speculations of Schelling. Similarly Karl Hoffmann of Würzburg wasted his appreciations of the newer schools of developmental biology in fanciful notions of human diseases as reversions to normal stages of lower animals; scrofula being for him a reversion to the insect, ticks to the mollusc, epilepsy to the oscillaria, and so forth. More sagacious was Richard von Volkmann, who, besides giving the clue to the nature of many diseases and to the continuity of many morbid series, by bacteriology certain diseases, such as actinomycosis, have been recognized for the first time.

As the prevalence of the conceptions signified and inspired by the word "phlogiston" kept alive ontological notions of disease, so the dissipation of vitalistic conceptions in the field of physics prepared men's minds in pathology for the new
Fever and inflammatory processes.

The older ontological notions of disease were based on the idea that febrile states were the result of an entity, fever, which was distinct from the essence of inflammation. Broussais had done much to destroy the notion of fever as an entity, but by exaggerations in other directions he had discredited the value of his main propositions. Yet, although, as Andral and other French physicians maintained, many extensive febrile processes take their origin from some local inflammation, it was true and most useful to insist, as Broussais vehemently insisted, that "fever" is not a substance, but a generalization drawn from symptoms common to many and various diseases springing from many various and often local causes; from causes agreeing perhaps only in the factor of elevation of the temperature of the body.

To the establishment of this new conception the improvement and general use of the clinical thermometer gave invaluable advantages. This instrument, now indispensable in our daily work at the bedside, had indeed long been known both to physiologists (Haller) and to clinicians. In the 18th century A. de Hahn, and, in the United Kingdom, George Clegern (1716-1798) of Dublin and James Currie (1756-1805), carried on the use of the thermometer in fever; and on the continent of Europe in later years F. G. F. von Bärensprung (1822-1865) and Ludwig Traube (1818-1876) did the same service; but it is to the work of Karl August Wunderlich (1815-1879) that we owe the establishment of this means of precision as a method of regular observation both in pathology and in clinical medicine. By his almost exhaustive comparison of febrile movements as symptomatic processes Wunderlich dealt the last blow to the existing doctrine of the "entity" of "fever"; while on the clinical side Bretonneau and Louis, in 1862-1872, by their careful clinical and pathological studies of forms of fever, relieved the new doctrine of the extravagances of Broussais, and prepared the way for the important distinction of enteric from typhus fever by A. P. Stewart (1813-1883), William Jenner, William Budd (1811-1886), Charles Murchison (1830-1879), J. H. F. Autenrieth (1772-1853), Heinrich Gustav Magnus (1802-1870), Hux and others. By the learned and accomplished Armand Trousseau British and German influences were carried into France.

Meanwhile Cohnheim and Metchnikoff were engaged in destroying the ontological notion of fever only, but also of inflammation, of which, as a local event, an ontological conception was no less strongly implanted. By his researches on the migration of the white corpuscles of the blood of Cohnheim, on the bases laid by Virchow, brought the processes of inflammation within the scope of the normal, seeing in them but a modification of normal processes under perturbations of relatively external incidence; even the formation of abscess was thus brought by him within the limits of perversion of processes not differing essentially from those of health; and "new formations," "plastic exudations," and other discontinuous origins of an "essential" pathology, fell into oblivion. And it is not alien from the present point of view to turn for a moment to the light thrown on the cardio-arterial pulse and the measurement of its motions by the more intimate researches into the phenomena of the circulation by many observers, among whom in the 19th century James Hope, E. J. Marey (1830-1904) and C. F. W. Ludwig will always take a leading place. By them the demonstration of Harvey that the circulation of the blood is in large part a mechanical process, and nowhere independent of mechanical laws, was considerably enlarged and extended. In particular, the fluctuations of the pulse in fevers and inflammations were better understood, and accurately registered; and we can scarcely realize now that before Harvey the time of the pulse seems not to have been counted by the watch. Discovery in these various directions then led physicians to regard fever and inflammation not as separable entities, but as fluctuating symptom groups, due to swervings of function from the normal balance under contingent forces.

As to such reforms in our conceptions of disease the advances of bacteriology profoundly contributed, so under the stress of consequent discoveries, almost prodigious in their extent and revolutionary effect, the conceptions of the etiology of disease underwent no less a transformation than the conceptions of disease itself. It is proper to point out here how intimately a pathology thus regenerated modified current conceptions of disease, in the linking of disease to oscillations of health, and the regarding poison as but one of the modifications of the normal set up by the indication of external causes; not a few of which indeed may be generated within the body itself—"autogenous poisoning." The appreciation of such modifications, and of the working of such causes, has been facilitated greatly by the light thrown upon normal processes by advances in physiology; so dependent is each branch of knowledge upon the advances of contiguous and incident studies. To biological chemistry we have been deeply indebted during the latter half of the 19th century. In 1872, Hoppe-Seyler (1845-1895) gave a new beginning to our knowledge of the chemistry of secretion and of excretion; and later studies have increased the range of physiological and pathological chemistry by investigations not only into the several stages of albuminoid material and the transitions which all foodstuffs undergo in digestion, but even into the structure of protoplasm itself. Digestion, regarded not long ago as little more than a trituration and "coction" of ingesta to fit them for absorption and transfer them to the tissues, now appears as an elaboration of peptones and kindred intermediate products which, so far from being always bland, and mere bricks and mortar for repair or fuel for combustion, pass through phases of change during which they become so unfit for assimilation as to be positively poisonous. The formation of prussic acid at a certain period in the vital processes of certain plants may be given as an example of such phases; and poisons akin to muscarin seem to arise frequently in development or regression, both in animals and plants. Thus the digestive function, in its largest sense, is now seen to consist, not only in preparation and supply, but in no small measure also of protective and antidotal conversions of the matters submitted to it; coincidently with agents of digestion proper are found in the circuit of normal digestion "anti-substances" which neutralize or convert poisons in their various phases; as an autochthonous ferment, such as rennet for instance, calling forth an anti-renet, and so on. Now as our own bodies thus manipulate substances poisonous and antidotal, if in every hour of health we are averting self-intoxication, so likewise are we concerned with the various intruding organisms, whose processes of digestion are as dangerous as our own; if these destructive agents, which no doubt are incessantly gaining admission to our bodies, do not meet within us each its appropriate compensatory defensive agent, dissolution will begin. Thus, much of infection and immunity are proving to be but special cases of digestion, and teleological conceptions of protective processes are modified.

Under the name of chemotaxis (W. Pfeiffer) are designated certain of the regulative adaptations by which such ends are attained. By chemical warnings the defensive processes seem to be awakened, or summoned; and when we think of the infinite variety of such possible phases, and of the multitude of corresponding defensive agents, we may form some dim notion of the complexity of the animal blood and tissues, and within them of the organic molecules. Even in normal circumstance their play and counterplay attractive and repellant, must be manifold almost beyond conception; for the body may be regarded as a collective organization consisting of a huge colony of micro-organisms become capable of a common life by common and mutual arrangement and differentiation of function, and by toleration and utilization of each other's peculiar products; some organs, such as the liver, for example, being credited with a special power of neutralizing poisons, whether generated under normal conditions or under abnormal, which gain entrance from the intestinal tract. As a part of these discoveries has arisen another but kindred doctrine
that of hormones (Starling), juices prepared, not for excretion, not even for partial excretion, but for the fulfillment of physiological equilibrium. Thus the reciprocity of the various organs, maintained throughout the divisions of physiological labour, is not merely a mechanical stability; it is also a mutual equilibrium of functions incessantly at work on chemical levels, and on those levels of still higher complexity which seem to rise as far beyond chemistry as chemistry beyond physics. Not only are the secreted juices of specialized cells thus set one against another in the body, whereby the various organs of the body maintain a mutual play, but the blood itself also in its cellular and fluid parts contains elements potent in the destruction of bacteria and of their secretions. Thus endowed, the blood, unless overwhelmed by extraordinary invasions, does not fall in stability and self-purification. So various are the conditions of self-regulation in various animals, both in respect of their peculiar and several modes of assimilating different foods, and of protecting themselves against particular dangers from without, that, as we might have expected, the blood from different species, or even perhaps from different individuals, are found to be so divergent that the healthy serum of one species may be, and often is, poisonous to another; not so much in respect of adventitious substances, as because the phases of physiological change in different species do not harmonize; each by its peculiar needs has been modified until, in their mutual equilibration, life, they vary so much about the mean as to have become almost if not quite alien one to another.

In the preservation of immunity then, in its various degrees and kinds, not only is the chemistry of the blood to be studied, but also its histology. By his eminent labours in cellular pathology, Virchow, and Metchnikoff, gave the last blow to the mere humoral pathology which, after an almost unchallenged prevalence for some two thousand years, now finds a resting-place only in our nursery. Now the cellular pathology of the blood has been discovered, in the advantage of preventive medicine. For some of these, as redwater (pyrosoma), antidotes are already found; for others, as for Texas fever—of which the parasite is unknown, but the mode of its transmission, by the mosquito, discovered (Finlay-Reed)—preventive measures are reducing the prevalence.

It is obvious that the results of such advances prescribe for the clinical physician methods which cannot be pursued without expert assistance; a physician engaged in busy practice cannot himself undertake even the verifications required in the conduct of individual cases. Still in modern laboratory work is as far out of the reach of the untaught as performance on a musical instrument. In spite, therefore, of the encyclopaedic tradition which has persisted from Aristotle through the Arab and medieval schools down to Herbert Spencer, it is forced upon us in our own day that in a pursuit so many-sided as medicine, whether in its scientific or in its practical aspect, we have to submit more and more to that division of labour which has been a condition of advance in all other walks of life. It is now fully recognized that diseases of infants and children, of the insane, of the generative organs of women, of the larynx, of the eye, have been brought successively into the light of modern knowledge by "specialists," and by them distributed to the profession; and that in no other way could this end have been attained. That the division of labour, which may seem to disintegrate the calling of the physician, really unites it, is well seen in the clinical laboratories which were instituted in the later 19th century, and which are destined to a great future. By the approach of skilled pathologists to the clinical wards, a link is forged between practitioners and the men of science who pursue pathology disinterestedly. The first clinical laboratory devoted to the study of infectious diseases was that of Von Ziemssen (1829-1833) at Munich, founded in 1883; and, although his example has not yet been followed as it ought to have been, enough has been done in this way, at Johns Hopkins University and elsewhere, to prove the vital importance of the system to the progress of modern medicine.

At the same time provision must be made for the integration of knowledge as well as for the winning of it by several adits. A conspicuous example of the incalculable evil wrought by lack of integration is well seen in the radical divorce of surgery from medicine, which is one of the most mischievous legacies of the middle ages, for whose mischiefs the new science is so deeply rooted in our institutions, in the United Kingdom at any rate, as to be hard to obliterate. That the methods and the subject-matter of surgery and of medicine are substantially the same, and that the advance of one is the advance of the other, the division being purely artificial and founded merely on accidents of personal bent and skill, must be insisted upon at this time of our history. The distinction was never a scientific one, even in the sense in which the word science can be used of the middle ages; it originated in social conceptions and in the contempt for mechanical arts which came of the cultivation of "idols," as the "science" with "matter," and which, in the dawn of modern methods, led to the derision of Boyle by Oxford humanists as one given up to "base and mechanical pursuits." Had physicians been brought into contact with facts as hard as those faced by the surgeons of the 16th century (cf. Ambrose Par6), their art would not have lain so long in degradation. It is under this closer occupation with mechanical conditions that surgery to-day is said—not without excuse, but with no more than superficial truth—to have made more progress than medicine. Medicine and surgery are, in truth, joints of the same body; Pasteur shed light on both surgery and medicine, and when Lister, his disciple, penetrated into the secrets of wound fevers and septicemia, he illuminated surgery and medicine alike, and, in the one sphere as in the other, co-operated in the destruction of the idea of "essential fevers" and of inflammation as an "entity." Together, then, with the necessary multiplication of specialization, one of the chief lessons of the latter moity of the 19th century was the unity of medicine in all its branches—a unity strengthened rather than weakened by special researches, such as those into "medical" and "sur- gical" immunity, the "scientific" truths of physiology and the absurdity of the distinction. Surgeons, physicians, oculists, laryngologists, gynaecologists, neurologists and the rest, all are working in allotments of the same field, and combining to a common harvest.

While pathology then, which is especially the "science of medicine," was winning territory on one side from physiology, of which in a sense it is but an aspect, and on another by making ground of its own in the post mortem room and museum of morbid anatomy, and was fusing these gains in the laboratory so as to claim for itself, as a special branch of science by virtue of peculiar concepts, its due place and provision—provision in the establishment of chains of and special laboratories for its chemical and biological subdivisions—clinical medicine, by the formal provision of disciplinary classes, was illustrating the truth of the experience that teaching and research must go hand-in-hand, the one reinforcing the other: that no teacher can be efficient unless he be engaged in research also; nay, that for the most part even the investigator needs the encouragement of disciples. Yet it was scarcely until the last quarter of the 19th century that the apprenticeship system, which was a mere introduction into the "art and mystery of a craft," was recognized as antiquated and, in its virtual exclusion of academic study, even mischievous. In place of it, systematic clinical classes have become part of the scheme of every efficient school of medicine. A condition of this reform was the need of a preliminary training of the mind of the pupil in pure science, even in physics and chemistry; that is to say, before introduction
into his professional studies. The founding of new teaching universities, in which England, and even France, had been at some disadvantage as compared with Scotland and Germany, strengthened the movement in favour of enlarging and liberalizing technical training, and of anticipating technical instruction by some broader scientific discipline; though, as in all times of transition, something was lost temporarily by a departure from the old discipline of the grammar school before a new scheme of training the mind in scientific habits and conceptions was established or fully apprehended. Yet on the whole, even from the beginning, the influence of the 'new' was so great that it seemed for a time there was no "learned physician," who took a literary, fastidious and meditative rather than an experimental interest in his profession, and, as in great part a descendant of the humanists, was never in full sympathy with experimental science. At the risk no doubt of some defects of culture, the newer education cleared the way for a more positive temper, awoke a new sense of accuracy and of verification, and created a sceptical attitude towards all conventions, whether of argument or of practice. Among the drawbacks of this temper, which on the whole made for progress, was the rise of a school of excessive scepticism, which, forgetting this school, whether in England or abroad, of empiricism, despised those degrees of moral certainty that, in so complex a study and so tentative a practice as medicine, must be our portion for the present, and even for a long future, however great the triumphs of medicine may become. This scepticism took form in the school, most active between 1860 and 1880, known as the school of "Exponent Medicine." These teachers, genuinely touched with a sense of the sanctity of our knowledge, of our confidence in abstract terms, of the insecurity of our alleged "facts," case-histories and observations, alienated from traditional dogmatism and disgusted by meddlesome polypharmacy—enlightened, moreover, by the issue of cases treated by means such as the homoeopathic, which were practically "exponent." —urged that the only course open to the physician, duly conscious of his own ignorance and of the mystery of nature, is to put his patient under diet and nursing, and, relying on the tendency of all equilibriums to recover themselves under perturbation, to await events (Vis medicatrix naturae). Those physicians who had occupied themselves in the study of the exact sciences, or more closely or more exclusively of the wreckage of the post mortem room, were the strongest men of the "Exponent Medicine." But to sit down helpless before human suffering is an unendurable attitude. Moreover, the insight into origins, into initial morbid processes revealed by the pathologists, awoke more and more the hope of dealing with the elements of disease, with its first beginnings; and in the field of therapeutics, chemical and biological experiment, as in the case of digitalis, mercury and the iodides, was rapidly simplifying remedies and defining their virtues, so that these agents could be used at the bedside with more precision. Furthermore, the aversion from drugs destined to direct the attention of the men's minds to remedies taken from the region of the physical forces, of electricity (G. B. Duchenne, 1866-1875), of gymnastics (Ling, 1776-1839), of hydrotherapy (V. Priessnitz), of massage (Weir Mitchell), of climate (James Clarke), of diet (R. B. Todd, King Chambers, &c.), and even of hypnotism (James Braid 1795-1860), while with the improvement of the means of locomotion came the renewal of the old faith and the establishment of new methods in the use of mineral springs. These and such means, often in combination, took much of the place formerly given to the use of drugs.

Again, a new spirit dictated the use of the physical or "natural" methods on a larger scale in the field of prevention.

Hygiene. From the new regard given by physiologists and pathologists to the study of origins, and in the new hopes of thus dealing with disease at its springs, not only in individuals but in cities and nations, issued the great school of Preventive Medicine, initiated in England—E. A. Parkes (1819-1876), J. Simon, Sir B. W. Richardson (1828-1896), Sir H. W. Adland (1815-1900), Sir G. Buchanan (1831-1895), and forwarded in Germany by Max von Pettenkofer (1818-1901). Hygiene became for pathology what "milieu" is for physiology. By the modification of physical conditions on a national scale a prodigious advance was made in the art of preventing disease. The ghastly roll of infantile mortality was quickly purged of its darkest features (Ballard and others); aided by bacteriology, sanitary measures attained some considerable degree of exactness; public medicine gained such an ascendency that special training and diplomas were offered at universities; and in 1875 a consolidated act was passed for the United Kingdom establishing medical officers of health, and responsible lay sanitary authorities, with no inconsiderable powers of enforcing the means of public health in rural, urban, port and other jurisdictions, with summary methods of procedure. A department of public health was formed within the precincts of the Local Government Board; government laboratories were established, and machinery was devised for the notification of infectious diseases. The enormous growth of towns during the second half of the 19th century was thus attended with comparative safety to these great aggregates of mankind; and the death-rates, so far from being increased, relatively decreased in substantial proportions. In 1878 the Public Health Act was passed in the case of the infectious diseases of animals. The establishment in England of the Register of qualified practitioners and of the General Medical Council (in 1858) did something, however imperfectly, to give unity to the profession, unhappily bisected by "the two colleges"; and did much to organize, to strengthen and to purify medical education and qualification. In 1876 women were admitted to the Register kept by the Council. In 1871 the Anatomical Act of 1832 was amended; and in 1876 the Vivisection Act was passed, a measure which investigators engaged in the medical sciences of physiology and pathology represented as likely to prevent in England the advance of knowledge of living function, both in its normal balance and in its aberrancies, and moreover to slacken the habit of incessant reference of propositions to verification which is as necessary to the clinical observer as to the experimentalist. However the opinion of later generations may stand in respect of the Vivisection Act, it will surely appear to them that the other acts, largely based upon the results of experimental methods, strengthening and consolidating the medical profession, and fortifying the advance of medical education, led directly to a fundamental change in the circumstances of the people in respect of health. The intelligent classes have become far better educated in the laws of health, and less disposed to quackery; the less intelligent are better cared for and protected by municipal and central authority. Thus the housing of the poor has been improved, though this difficult problem is yet far from solution; not the large towns only, but the larger villages also, are cleansed and drained; food has been submitted to inspection by skilled officers; water supplies have been undertaken on a vast scale; personal cleanliness has been encouraged, and with wonderful success efforts have been made to bring civilized Europe back from the effects of a long wave of Oriental asceticism, which in its neglect and contempt of the body led men to regard filth even as a virtue, to its pristine cleanliness under the Greeks and Romans. During the latter half of the 19th century the death-rate of many towns was reduced by something like 50%. Some plagues, such as typhus fever, have been dispelled; others, such as enteric fever, have been almost banished from large areas; and there is much reason to hope that cholera and plague, if introduced, could not get a footing in western Europe, or in any case could be combated on scientific principles, and greatly reduced. Temperance in the use of alcohol has followed the demonstrated not only of its unimportance as a food or tonic, but also of its harmfulness, save in very small quantities. In the earlier part of the 19th century, and in remoter districts even in its later years, the use of alcohol was regarded not as a mere indulgence, but as essential to health; the example of teetotters, as seen in private life and in the returns of the insurance offices, has undermined this prepossession. From the time of Plato medicine has been accused of ministering to the survival of unfit persons, and to
MEDICINE

[MODERN PROGRESS]

their propagation of children. But bodily defect is largely a result of evil circumstances, in the prevention of which the physician is not unsuccessfully engaged, and the growth of sympathy means a stronger cement of the social structure. At any rate the mean standard of health will be raised, perhaps enormously.

In the tropics, as well as in Europe, such methods and such researches threw new light upon the causes and paths of the terrible infections of these climates. In 1880, two years before Koch discovered the bacillus of tubercle, C. L. A. Laveran (b. 1845) discovered the parasite of malaria, and truly conceived its relations to the disease; thus within two years were made two discoveries either of which was sufficient to make the honour of a century.

Before the end of the 19th century this discovery of the blood parasite of malaria was crowned by the hypothesis of Patrick Manson, proved by Ronald Ross, that malaria is propagated by a certain genus of gnat, which acts as an intermedim-host of the parasite. Cholera (Haffkine) and yellow fever are yielding up their secrets, and falling under some control. The 20th century, by means of this illumination of one of the darkest regions of disease, may diminish human suffering enormously, and may make habitable rich and beautiful regions of the earth's surface now, so far as man's work is concerned, condemned to sterility. Moreover, freedom of trade and of travel has been promoted by a reform of the antiquated, cumbersome, and too often futile methods of quarantine—a reform as yet very feeble and incomplete, but founded upon a better understanding of the nature and propagation of disease.

Special Departments.—Hitherto we have presented a survey of the progress of the science and practice of medicine on general lines; it remains to give some indication of the advance of these subjects of study and practice in particular departments. As regards infections, it is not to be supposed that our knowledge of these maladies has been advanced by pathology and bacteriology only. In the clinical field also it has received a great enlargement. Diphtheria, long a slight plauge among mankind, was not carefully described until by Pierre Bretonneau in 1826; and since his time our conception of this disease has been extended by the study of later, secondary and incidental phases of it, such as neuritis, which had always formed part of the diphtheritic series, though the connexion had not been detected. Influenza, again, was well known to us in 1836-1840, yet clinical observers had not traced out those sequelz which, in the form of neuritis and mental disorder, have impressed upon our minds the persistent virulence of this infection, and the manifold forms of its activity. By the discovery of the bacillus of tubercle, the physician has been enabled to place the field of disease arising not from essential defects in the body, but from external contingencies, is vastly enlarging; while on the other hand the great variability of individuals in susceptibility explains the very variable results of such extrinsic causes. Coincidently therewith, the hope of neutralizing infections by fortifying individual immunity has grown brighter, for it appears that immunity is not a very radical character, but one which, as in the case of vaccination, admits of modification and accurate adjustment in the individual, in no long time and by no very tedious methods. Evidence is accumulating which may end in the explanation and perhaps in the prevention of the direst of human woes—cancer itself, though at present inquiry is being directed rather to intrinsic than to extrinsic causes.

When, leaving the infections, we look for evidence of progress in our knowledge of more or less local diseases, we may begin with the nervous system. It is in this department, from its abstruseness and complexity, that we should expect the advance of anatomy and physiology—normal and morbid—to be most delayed. If we consult the medical works even of the middle of the 19th century we shall find that, in the light of the present time, accurate knowledge in this sphere, whether clinical, pathological or therapeutical, could scarcely be said to exist. Even in the hands of J. A. Lockhart Clarke (1817-1880), one of the earliest investigators of nervous pathology, the improvement of the compound microscope had not attained the aehromatism, the penetration and the magnification which have since enabled J. L. C. Schroeter-van der Kolk (1797-1862), Albert von Kölliker, Santiago Ramon y Cajal, C. Golgi (b. 1844) and others to reveal the minute anatomy of the nervous centres; while the discrimination of tissues and morbid products by stains, as in the silver and osmic acid methods, and in those known by the names of Carl Weigert or Marchi, had scarcely begun. In England the Hospital for the Paralysed and Epileptic was founded in 1859, where Charles E. Brown-Séquard (1817-1894), J. Hughlings-Jackson, Thomas Buzzard, Henry C. Bastian (b. 1837), Sir W. R. Gowers and David Ferrier (b. 1843) found an adequate field for the clinical and pathological parts of their work. In France, in the wards of the Hôtel Dieu, Guillaume Benjamin Duchenne (1806-1875), in association with Trouseau and in his private clinic, pursued his memorable clinical and therapeutical researches into the diseases of the nervous system; and Jean-Martin Charcot (1825-1893), in his asylum for the wrecked of humanity—the Salpêtrière—discovered an unworked mine of chronic nervous disease. M. H. Romberg (1795-1873) and Theodor Meynert (1833-1892) also were pioneers in the study of nervous diseases, but it was not till later in the century that Germany took a high place in this department of medicine. The discoveries of the separate paths of sensory and motor impulses in the spinal cord, and consequently of the laws of reflex action, by Charles Bell and Marshall Hall respectively, in their illumination of the phenomena of nervous function, may be considered with the discovery in the region of the vascular system of the circulation of the blood; for therein a key to large classes of normal and abberant functions and a fertile principle of interpretation were obtained. Nor was the theory of reflex action confined to the more “mechanical” functions. By G. H. Lewes and others the doctrine of “cerebral reflex” was suggested, whereby actions, at first achieved only by incessant attention, became organized as conscious or subconscious habits; as for instance in the playing on musical or other instruments, when acts even of a very simple order become directly follow the impulses of sensations, conscious adaptation and the deliberate choice of means being thus economized. This law has important ethical and political bearings; but in the province of disease this advance of what may be compared to the interlocking of points and signals has had wide influence not only in altering our conceptions of disease, but also in enlarging our views of all perturbations of function. The grouping of reflex “units,” and the paths wherein impulses travel and become associated, have been made out by the physiologist (Sherrington and others) working on the healthy animal, as well as by the record of disease; and not of spontaneous disease only for the artificial institution of month by month. In animals pathologic has led to many of these discoveries, as in the method of A. V. Waller (1816-1870), who tracked the line of nervous strands by experimental sections, and showed that when particular strands are cut off from their nutritive centres the consequent degeneration follows the line of the separated strands. By similar methods nature, unassisted, betrays herself but too often; in many instances—probably originating primarily in the nervous tissues themselves—the course of disease is observed to follow certain paths with remarkable consistency, as for instance in diseases of particular tracts of the spinal cord. In such cases the paths of degeneration are so neatly defined that, when the tissues are prepared after death by modern methods, they are plainly to be seen running along certain columns, the subdivisions...
of which in the normal state may hardly be distinguishable one from another: some run in strips along the periphery of the spinal cord, at its anterior, middle, and posterior segments that by case may be; in other cases such strips occur within its substance, whether along columns of cells or of white matter. It is needless to point out how such paths of disease, in their association with characteristic symptoms, have illuminated the clinical features of disease as well as the processes of normal function.

Not, however, all diseases of the nervous system conduct themselves on these definite paths, for some of them pay no attention to the geography of structure, but, as one may say, blunder indiscriminately among the several parts; others, again, pick out particular paths whereby their disease is disseminated immediately continuous, or even contiguous. Diseases of the latter kind are especially interesting, as in them we see that parts of the nervous structure, separated in space, may nevertheless be associated in function; for instance, wasting of a group of muscles associated in function may depend on a set of central degenerations occurring in parts whose connexion, in spite of dissociation in space, we thus perceive. The indiscriminating diseases, on the other hand, we suspect not to be primarily of nervous origin, but to depend rather on the agency of other constituent tissues of the system, as of the skin, or enter by the external surface. These, arguing inversely, we may learn something of the respective natures of these influences and of the way in which the nervous system is affected secondarily.

Yet even the distribution of toxic matters by the blood is not necessarily followed by general and indiscriminate injury to the nervous elements. In infantile palsy, for example, and in tabes dorsalis, there is good reason to believe that, definitely as the traces of the disease are found in certain physiologically distinct nervous elements, they are due nevertheless to toxic agents arriving by way of the blood. Here we enter upon one of the most interesting chapters of disorders and modes of disorder of this and of other systems. It has come out more and more clearly of late years that poisons do not betray even an approximately indifferent affinity for all tissues, which indeed a little reflection would tell us to be a priori improbable, but that each tends to fix itself to this cell group or to that, picking out parts for which they severally have affinities. Chemical, physiological and pathological research is exploring the secret of these more refined kinds of "anchorage" of molecules. In 1899 Stimson and in 1890 Landsteiner discovered and afterwards elaborated, a substitution of molecules in certain compounds a stimulant could be converted into a sedative action; thus by the addition of the methyl group CH₃ to the molecule of strychnine, thebaine or brucine, the tetanizing action of these drugs is converted into a paralyzing action. The number of these instances, and the variety of them, are now known to be very large; and it is supposed that what is true of these simpler agents is true also of far more elaborate phases of vital metabolism. Now, what is remarkable in these and many other reactions is not only that effects apparently very opposite may result from minute differences of molecular construction, but also that, whatever the construction, agents, not wholly indifferent to the body or part, tend to anchor themselves to organic molecules in some way akin to them. Highly complex as are all animal tissues, or nearly all, yet in this category of high complexity are degrees higher and higher again of which we can form little conception, so elaborate they are, so peculiar in their respective properties, and probably so fugitive. It is this wide range of dynamic peculiarities above the common range of known physical and chemical molecules which excites our wonder; and a reflection of these peculiar properties is seen in their affinities for this or that toxic or constructive agent, whereby the peculiarity, for example, of a particular kind of nerve cell may be altered, antagonized, reinforced or converted. On the other hand, the reagents by which such modifications are apt to be produced are not necessarily simple; many of them likewise are known to be of very high degrees of complexity, approaching perhaps in complexity the molecules to which they are akin. Of such probably are the toxins and antitoxins of certain infections, which, anchoring themselves not by any means indiscriminately, but for peculiarly adapted molecules, by such anchorage antagonize them or turn them to favourable or unfavourable issues. Toxins may thus become so closely keyed into their corresponding atom groups, as for instance in tetanus, that they are no longer free to combine with the antitoxin; or, again, an antitoxin injected before a toxin may anticipate it and, preventing its mischievous adhesion, dismiss it for excretion. In the mutual behaviour of such cells, toxins, and antitoxins, and again of microbes themselves, we may demonstrate even on the field of the microscope some of the modes of their actions, when seem to partake in great measure at any rate of a chemical quality (agglutinins, coagulins, chemotaxis). It is too convenient here to add that such reactions and modifications, if more conspicuous in the nervous system, are of course not confined to it, but are concerned in their degree in all the processes of metabolism, being most readily traced by us in the blood.

Many other diseases formerly regarded as primarily diseases of the nervous system are not such; but, by means of agents either introduced into the body or modified there, establish relationships after the affinities of these in contiguous associated parts of the structure, modifying the functions of these elements, or again in distant and peripheral parts; the perturbations of nervous function being secondary and consequent. Of such are tetanus and diphtheria, now known to be due to the establishment from without of a local microbic infection, from which focus a toxin is diffused to the nervous matter. The terrible nervous sequel of some forms of inflammation of the membranes of the brain, again, are due primarily to microbic invasion rather of the membranes than of their nervous contents; and many other diseases may be added to these.

The grave poisons in such diseases as influenza, diphtheria, beriberi, or ensuing on the absorption of lead, are in the main not central, but due to a symmetrical peripheral neuritis.

Among diseases not primarily nervous, but exhibited in certain phenomena of nervous disorder, are diseases of the blood-vessels. Much light has been thrown upon the variations of arterial and venous blood pressures by Karl Ludwig (1816-1895) and his many followers: by them not only the diseases of the circulatory system itself are studied, but also the effects of secondary diseases of the nervous system—which depend intimately on the mechanical integrity of the circulation of the blood as well as on the chemical integrity of the blood itself. With changes of the pressures of the blood in arteries, veins or capillaries, and in the heart itself and its respective chambers, static changes are apt to follow in these parts; such as degeneration of the coats of the arteries, due either to the silent tooth of time, to persistent high blood pressures, or to the action of poisons such as lead or sphyphilitic lesion of the arteries, and likewise of other fibrous tissues, often involves grave consequential damage to nervous structures fed or supported by such parts. Some of the most successful of the advances of medicine as a healing art have followed the detection of syphilitic disease of the vessels, or of the supporting tissues of nervous centres and of the peripheral nerves; so that, by specific medication, the treatment of paralytic, convulsive, and other terrible manifestations of nervous disease thus secondarily induced is now undertaken in early stages with definite prospect of cure.

Not of less importance in this respect, and in other disorders many of them of grave incidence, is the knowledge of the phenomena of embolism and of thrombosis, also gained during the latter half of the 19th century—W. S. Kiktes (1822-1864), R. Virchow. By embolism is meant the more or less sudden stoppage of a vessel by a plug of solid matter carried thither by the current of the blood; be it a little clot from the heart or, what is far more pernicious, an infective fragment from some focus of infection in the body, by which messengers new foci of infection may be scattered about the body. Thrombosis is an accident
of not dissimilar character, whereby a vessel is blocked not by a travelling particle, but by a clotting of the blood in situ, probably on the occasion of some harm to the epithelial lining of the vessel. Such injuries are apt to occur in syphilitic endarteritis, or senile arterial decay, whereby an artery may be blocked permanently, as if with an embolus, and the area supplied by it, in so far as it was dependent upon this vessel, deprived of nutrition. These events, although far more mischievous in the brain, the functions of which are far-reaching, and the collateral circulation of which is ill-provided, are seen very commonly in other parts.

It is in the structure of the brain itself that modern research has attained the most remarkable success. In 1861 an alleged "centre" of speech was detected, by a combination of clinical and pathological researches, by Paul Broca (1824-1880). By these means also, in the hands of Hughlings-Jackson, and more conclusively by experimental research initiated by G. T. Ferrier (b. 1836) and H. E. Hitzig (b. 1834), but pursued independently and far more systematically and thoroughly by David Ferrier (b. 1843) and his disciples, it was proved that the cerebrum is occupied by many such centres or exchanges, which preside over the formulation of sensations into purposive groups of motions—kinaesthesia of H. Charlton Bastian (b. 1837). The results of these experimental researches by many inquirers into the constitution of the brain have transformed our conceptions of cerebral physiology, and thrown a flood of light on the diseases of the brain. Not only so, but this mapping of the brain in anesthetics and their effects has often enabled medical practitioners to determine the position of disease; in a certain few cases of tumour or abscess, so precisely that he may be enabled to open the skull above the part affected and to extirpate it—operations which are surely a triumph of science and technical skill (Lister, W. MacEwen, V. Horsley).

The remarkable discovery of the dual nature of the nervous system, of its duplex development as a lower and upper system of "neurons," has shed much light upon the problems of practical medicine, but this construction is described under BRAIN; NEUROPATHOLOGY; MUSCLE AND NERVE, &c.

In mental diseases the first and most important work has been done. The chief work has been the detection of chronic changes in the cortex of the brain, by staining and other histological methods, in degenerative affections of this organ—Theodor Meynert (1833-1892), W. Griesinger (1817-1886), Bevan Lewis—and in the separation from insanity due to primary disease or defect of nerve elements of such diseases as general paralysis of the insane, which probably arise, as we have said, by the action of poisons on contiguous structures—such as blood-vessels and connective elements—and invade the nervous matter secondarily; and its subjection often enables us to ascertain the moral fabric directly; intrinsic toxic processes which may be suspected on the detection of neurin and cholnin in the fluids of the brain (F. W. Mott). Truer conceptions of normal psychology have been transformed for us those of the morbid—P. Pinel (1745-1826), Griesinger, Henry Maudsley (b. 1835), Mercier, Kränkel, Rivers—and indicated more truly the relations of sanity to insanity.

In the treatment of insanity little has been done but to complete the non-restraint system which in principle belongs to the earlier part of the 19th century (Pinel, Tuke, R. G. Hill, J. W. Parker). An enormous accumulation of lunatics of all sorts and degrees seems to have paralyzant importance has been done and may be carried with the whole domestic establishment, with a few young assistants under him. The life of these insane patients is as bright, and the treatment as humane, as a barrack life can be; but of science, whether in pathology or medicine, there can be little. A considerable step in advance is the establishment by the London County Council of a central laboratory for this purpose. With an eminent pathologist at its head, this laboratory valuable reports are in course of issue. Provision for the reception and treatment of insanity in its earliest and most curable stages can scarcely be said to exist. Sufferers from mental disease are still regarded too much as troublesome persons to be hidden away in humane keeping, rather than as cases of manifold and obscure disease, to be studied and treated by the undivided attention of physicians of the highest skill. The care and education of idiots, initiated by Guggenbuhl and the infant-making way in England, and if as yet insufficient, is good of its kind.

By the genius of René Théophile Laennec (1781-1826), diseases of the lungs and heart were laid on a foundation so broad that his successors have been occupied in detail and refinement rather than in reconstruction. In heart disease the chief work of the latter half of the 19th century was, in the first quarter, such clinical work as that of William Stokes and Peter Mere Latham (1759-1873); and in the second quarter the fuller comprehension of the vascular system, central and peripheral, with its cycles and variations of blood pressure, venous and arterial. Moreover, the intricacies of structure and function within the heart itself have been more fully discriminated (W. H. Gaskell, Aschoff, A. Keith, Wenkebach, J. Mackenzie). By the greater thoroughness of our knowledge of the physics of the circulation—Etienne l'Empereur, b. 1830), Karl Ludwig (1816-1899), Leonard Hill—we have attained to a better conception of such events as arterial disease, apoplexy, "shock," and so forth; and pharmacologists have defined more precisely the virtues of curative drugs. To the discovery of the parts played in disease by thrombosis and embolism we have referred above. With this broader and more accurate knowledge, the conditions of the health of the circulation a corresponding efficiency has been gained in the manipulation of certain remedies and new methods of treatment of heart diseases, especially by baths and exercises.

As regards pulmonary disease, pneumonia has passed more and more definitely into the category of the infections: the modes of invasion of the lungs and pleura by tuberculosis has been more and more accurately followed; and the treatment of these diseases, in the spheres both of prevention and of cure, has undergone a radical change. Instead of the close protection from the outer air, the respirators, and the fancy diets of our fathers, the modern physician can put in the open air in all weathers, is fed with solid food, and in his exercise and otherwise is ruled with minute particularity according to the indications of the clinical thermometer and other symptoms. The almost reckless reliance on climate, which, at Davos for instance, marked the transition from the older to the modern methods, has of late been sobered, and supplemented by more systematic attention to all that concerns the mode of life of the invalid. The result is that, both in physicians and in the public, a more hopeful attitude in respect of the cure of phthisis has led to a more earnest grappling with the problem in its earliest stages and in every phase, with a correspondingly prolonged programme; and the results, if not in every instance, are still such as to be regarded with approval. Indeed, in such early stages, and in patients who are enabled to command the means of an expensive method of cure, phthisis is no longer regarded as desperate; while steps are being taken to provide for those who of their own means are unable to obtain these advantages, by the erection of special sanatoriums on a more or less charitable basis. Perhaps no advance in medicine has done so much as the study of tuberculosis to educate the public in the methods and value of research in medical subjects, for the results, and even the methods, of such labours have been brought before the community in the open air in all weathers, and at a cost which is small compared with the value of the knowledge so obtained. Indeed, to every home in the land.

It was in the management of pleurisy that the aid of surgical means first became eminent in inward disease. In the treatment of effusions into the pleura and, though with less advantage, of pericardial effusions, direct mechanical interference was practised by one physician and another, till these means of attaining rapid and complete cure took their places as indispensable, and were extended from thoracic diseases to those of the abdominal and many other parts formerly beyond the reach of direct therapeutics. Lord Lister's discoveries brought these new methods to bears with a certainty and a celerity previously undreamed of; and many visceral maladies, such as visceral ulcers, disease of the pancreas,
stone of the kidney or gall-bladder, perityphlitis, ovarian dropsy, which in the earlier part of the 19th century were either fatal or crippling, are now taken promptly and safely in hand, and dealt with successfully. Even for internal cancer cure or substantial relief is not infrequently obtained. We have said that this advance is often quoted, not very wisely, to signify that in modern progress medicine has fallen behind surgery—as if the art of the physician were not one and indivisible. On the contrary, in the hands of Coopers and of Czerny (especially in gynaecology) have personally taken operative procedures in hand is some good omen that in time the unreal and misleading schism between medicine and surgery may be bridged over.

In the department of abdominal disease progress has been made, not only in this enormous extension of means of cure by operative methods, but also in the verification of diagnosis. The first recognition of a disease may be at a necropsy, but then usually by irresponsible pathologists; it is another matter when the physician himself comes under repute for failing to seize a woe of which he has no chance remained to him, by section of the abdomen during life. The abdomen is still the "full of surprises"; and he who has most experience of this deceptive region will have least confidence in expressing positive opinions in particular cases of disease without operative investigation. Besides the attainments mentioned above, in respect of operative progress, many important revisions of older rule-of-thumb knowledge have come about, and not a few other substantial discoveries. Among the revisions may be adduced some addition to our knowledge of dyspepsia, attained by analytic investigations into the contents of the stomach at various stages of digestion, and by examining the part played of the parietal glands of the stomach through the physicist. Thus the defects, whether of this secretion or of that, and again of motor activity, the state of the valvular junctions, the volume of the cavities, and their position in the abdomen, may be ascertained, and dealt with as far as may be; so that, although the fluctuations of chemical digestion are still very obscure, the application of remedies after a mere traditional routine is no longer excusable. In our conceptions of the later stages of assimilation and of excretion, with the generation of poisons (auto-intoxication) in the intestinal tract, there is still much obscurity, and the man of average knowledge, perhaps in some degree, the positive knowledge has been gained, partly by the physician himself, partly by the physicist. Of such are the better understanding of the functions of the liver in normal catabolism, in the neutralization of poisons absorbed from the intestines or elsewhere, in the causation of jaundice, and in diabetes [Bernhard Naunyn (b. 1839) and F. W. Pavy]. Nor must we forget the unfolding of a new chapter of disease, in the nosology of the pancreas. In diabetes this organ seems to play a part which is not yet precisely determined; and one fell disease at least has been traced to a violent access of inflammation of this organ, caused perhaps by entry of foreign matters into its ducts. The part of the pancreas in digestion also is better understood. The part of the spleen in the motley group of dyspepsias and anæmias, conspicuous as it often is, still remains very enigmatic.

The peritoneum is no longer regarded with awe as inviolable; by modern methods, if not as manageable as other lymphatic sacs, it is at any rate accessible enough without considerable risk to life. Not only in its bacteriological relations are the conditions of peritonitis recognized in its various kinds, but also the state known as "shock" turns out to be quasi-mechanical, and avoidable by measures belonging in considerable part to this category. Thus, by the avoidance both of toxemia and of shock, peritonitis and other dangers of the abdomen, such as strangulations or intussusceptions of the bowels, formerly desperate, can in many cases be dealt with safely and effectively.

Our knowledge of diseases of the kidneys has made no great advance since the time of Richard Bright. In the sphere of physiology and in the interpretation of associated arterial diseases much obscurity still remains; as, for instance, concerning the nature of the toxic substances which produce those bilateral changes in the kidneys which we call Bright's disease, and bring about the "uremia" which is characteristic of it. Lardaceous disease, however, here and in other regions, now appears to be due to the specific toxins of pyogenic micro-organisms. In stone of the kidney a great advance has been made in treatment by operative means, and the formation of these stones seems to recent observers to depend less upon constitutional bent (gout) than upon unhealthy local conditions of the passages, which in their turn again may be due to the action of micro-organisms.

To Thomas Addison's descriptions of certain anæmias, and of the disease of the suprarenal capsules which bears his name, something has been added; and W. Hunter's researches on the severer anæmias are doing much to elucidate these subtle maladies. And on the influence of these inconspicuous bodies and of the pituitary body in sustaining arterial blood pressures physiologists have thrown some important light.

The secret of the terrible puerperal septicaemia was read by J. P. Semmelweiss (q.v.), wherein he proved himself to be the greatest of Lister's forerunners (see LISTER). The "diseases peculiar to women" (see Gynaecology) have received attention from early times, but little progress had been made in their interpretation till the 19th century. In the middle part of the century, by a natural exaggeration of the importance of newly-discovered local changes in the pelvic organs, much harm was done to women by too narrow an attention to the site, characters and treatment of these; the meddlesomeness of the physician becoming in the temperament of woman a morbid obsession. To James Matthews Duncan (1826-1890) we chiefly owe a saner and broader comprehension of the relative importance of the local and the general conditions which enter into the causation of uterine and ovarian disorders.

In operations for diseases of the pelvis, ovarian dropsy, cancer of the uterus, and other grave diseases of the region, success has been stupendous.

In the subject of diseases of the skin much has been done, in the minuter observation of their forms, in the description of forms previously unrecognized, and in respect of bacterial and other causation and of treatment. The comparison of observations in various climates and peoples has had some weight; while in the better knowledge of their causes their treatment has found permanent advantage. Not only is the influence of bacteria in the causation of many of them newly revealed, but it is now recognized also that, even in skin diseases not initiated by microbic action, microbes play a considerable and often a determining part in their perpetuation; and that the rules of modern aseptic surgery are applicable with no little success to skin therapeutics. We have learned that "constitutional" causes play a smaller part in them than was supposed, that a large number of diseases of the skin, even if initiated by general disorder, are or soon become local diseases, being, if not initiated by local infection yet perpetuated thereby, so that, generally speaking, they are to be cured by local means.

The diseases of children have not lacked the renewed attention, the successful investigation, and the valuable new lights which have been given to other departments of medicine. That infantile paralysis is an infection, and that its unhappy sequels are now treated with more hope of restoration, has been indicated already. Infantile diarrhoea has also been recognized as a common infection (Ballard), and the means of its avoidance and cure ascertained. The conditions of diet and digestion in children are now far better understood, and many of their maladies, formerly regarded as organic or incomprehensible, are cured or prevented by dietetic rules. Rickets, scurvy and "marasmus" may be instanced as diet diseases in children. Acute inflammation of the ear, with its alarming extensions to the cerebral cavity, is now dealt with successfully by surgical means, and infected sinuses or even encephalic abscesses are reached and cleansed. The origins, kinds and processes of meningitis are more clearly distinguished, and referred each to its proper cause—for the most part bacterial.

As by the discovery of stethoscopy by Laennec a new field of medical science and art was opened up, so, more recently, inventions of other new methods of investigation in medicine
have opened to us other fields of little less interest and importance. Of such is the ophthalmoscope, invented by H. von Helmholtz in 1851. By the revelations of this instrument not only have the diseases of the eye been illuminated, but much light has been thrown also upon the part of the eye in more general maladies; as, for instance, in syphilis, in diabetes, in kidney diseases, and in diseases of the brain—F. C. Donders (1819-1880), Alfred von Gräfe (1830-1890) and others. A remarkable help to the cure of headaches and wider nervous disorders has come out of the better appreciation and correction of errors of refraction in the eye. Radiography has become a great thing for the diagnosis of diseases already appreciable, and may prove more and more valuable hereafter. In 1879 the use of the spectroscope in medicine was pointed out by Dr. Charles A. MacMunn (b. 1832). By E. du Bois-Reymond, Robert Remak (1815-1865), Carlo Matteucci (1811-1868), Guillaume Duchenne (1806-1875), the value of electricity in medicine, greater in diagnosis perhaps than in therapeutics, was demonstrated. By the sphygmo gram (E. J. Marey, 1863) attention was drawn to the physical features of the circulation, to the signs of degeneration of the arterial tree, and less the function of the flushing of the capillaries. As we have said under the consideration of diseases of the heart, the kymographs of Ludwig and his pupils brought out these fluctuations far more accurately and completely. By these, and other instruments of precision, such as the thermometer, of which we have already spoken, the eminently scientific discipline of the measurement of functional movements, so difficult in the complex science of biology, has been cultivated. By the laryngoscope, invented about 1850 by Manuel Garcia the celebrated singing-master, and perfected by Johann Czermak (1828-1873) and others, the diseases of the larynx have been brought into the general light which has been shed on all fields of disease; and many of them, previously known more or less empirically, submitted to precise definition and cure. Of such we may cite tuberculosis of the larynx, formerly so incurable as distressing; and “adenoids”—a disease revealed by intrascopic methods— which used grievously to thwart and stifle the growth both of mind and body in children, are now promptly removed, to the infinite advantage of the rising generation. To the value of stains in clinical diagnosis, especially in investigation of per sions of the blood in many maladies, we have already some reference. The discovery of Roentgen rays has also extended the physician’s power of vision, as in cases of aortic aneurysm, and other thoracic diseases. By photography and diagrammatic records the clinical work of hospital wards has been brought into some better definition, and teaching made more accurate and more wholesome. The separation of the alkaloids belongs neither to the earlier part of the 19th century, but the administration of these more accurate medications by means of hypodermic injection (see Thera peutics) belongs to the latter. The ancient practice of trans fusion has been placed on a more intelligible footing, and by the method of saline injections made more manageable as a means of relief or even of cure. Finally, calculation by statistics (William Farr, Karl Pearson, and others) has been brought into line with other scientific methods: the method is a difficult one, and one full of pitfalls for the unwary, yet when by co-operation of physician and mathematician its applications have been perfected its services will appear more and more indispensable.

Among the achievements of the medicine of the 19th century the growth of the medical press must not be forgotten. In England, by the hand of the Lancet (founded in 1823), the tyranny of prescription, invertebrate custom, and privilege abused was defied and broken down; freedom of learning was regained, and promotion thrown open to the competent, independently of family, gild and professional status. For the record and diffusion of rapidly growing knowledge, learned societies, universities and laboratories, greatly increased in number and activity, issued their transactions in various fields; and by means of year books and central news-sheets the accumulation of knowledge is organized and made accessible.

It is interesting to find that, with all this activity in the present reformed methods of research and verification are not confined to the work of the passing day; in the brilliant achievements of modern research and reconstruction the maxim that “Truth is the daughter of Time” has not been forgotten. In the field of the History of Medicine the work of scholars such as Francis Adams of Banchory (1766-1861), William A. Greenhill (1814-1894) and C. Creighton in England, Maximilien P. Littre (1801-1881) and Charles V. Daremberg (1817-1872) in France, and Heinrich Häser (1811-1888) and August Hirsch, Diels, Weltmann and Julius Pagel in Germany, will prove to our children that tradition was as safe in our hands as progress itself.

Osler, The Principles and Practice of Medicine (1909); Allbutt and Rolleston, A System of Medicine (1906-1910); Sir Patrick Manson, Tropical Medicine (1907); Frederick Taylor, A Manual of the Practice of Medicine (1908).

MEDINA, JOSE TORIBIO (1852-1935), Chilean bibliographer, was born at Santiago, and was educated for the bar. His first publication, when a very young man, was a metrical translation of Longfellow’s Evangeline. When twenty-two he was appointed secretary to the legation at Lima. After his return he published a history of Chilean literature (1878), and a work upon the aboriginal tribes (1884). In this latter year he was appointed secretary of legation in Spain, and availed himself of the opportunity of examining the treasures of the old Spanish libraries. These researches, repeated on subsequent visits to Spain, and also to France and England, enriched him with a mass of historical and bibliographical material. Among his publications may be mentioned the Biblioteca hispano-americana, a catalogue of all books and pamphlets relating to Spanish America printed in Spain; the Bibliotheca hispano-chilena, a similar work, commenced in 1897; the standard and magnificent history of printing in the La Plata countries (1892); comprehensive works on the Inquisition in Chile, Peru and the Philippines; and the standard treatise on South American medals (1899). In addition, Señor Medina produced the fullest bibliographies yet attainable of books printed at Lima, Mexico and Manilla, and a number of other books and other minor writings. No other man had rendered anything like the service to the cause of the literary history and bibliography of the Spanish colonies.

MEDINA, or rather AL-MEDINA (the city), or MEDINAT RASUL ALLAH (the city of the apostle of God), a town of the Hejaz in Arabia, about 820 m. by rail S.S.E. of Damascus, in 2° 5' N., 46° E., just the refuge of Mahomet on his emigration from Mecca, and a renowned place of Moslem pilgrimage, consecrated by the possession of his tomb. The name Medina goes back to the Koran (sur. xxxiii. 60); the old name was Yathrib, the Lathrippa of Ptolemy and Lathrippa of Stephanus Byzantius.

Medina stands in a basin at the northern extremity of an elevated plain, on the western skirt of the mountain range which divides the Red Sea coast-lands from the central plateau of Arabia. At an hour’s distance to the north it is dominated by Mount Ohod, an outlying spur of the great mountains, the scene of the well-known battle (see Mahomet), and the site of the tomb and mosque of the Prophet’s uncle Hamza. To the east the plain is bounded by a long line of hills eight or ten hours distant, over which the Nejd road runs. A number of torrent courses (of which Wadi Kanat to the north, at the foot of Mount Ohod, and W. Al-Bakh, some miles to the south, are the most important) descend and form reservoirs in the neighbourhood of the town to unite farther west at a place called Zaghba, whence they descend to the sea through the “mountains of the Tehama”—the rough country between Medina and its vicinity. For the record and diffusion of rapidly growing knowledge, learned societies, universities and laboratories, greatly increased in number and activity, issued their transactions in various fields; and by means of yearbooks and central news-sheets the accumulation of knowledge is organized and made accessible.

1 This is a very rough estimate. The road from Yambu on the Red Sea, which runs somewhat north of east, is by Burton’s estimate 152 m. From Medina to Mecca by the inland or high road he makes 424 m. The usual road near the coast by Rabigh and Khulesa and thence to W. Fatima cannot be very different in length. Caravans traverse it in about ten or eleven days.
MEDINA

port of Yambu—under the name of W. Idam. Southwards from Medina the plain extends unbroken, but with a slight rise, as far as the eye can reach. The convergence of torrent-courses in the neighbourhood of Medina makes this one of the best-watered spots in northern Arabia. The city lies close to one of the great volcanic centres of the peninsula, which was in violent eruption as late as A.D. 1266, when the lava stream approached within an hour's distance of the walls, and dammed up W. Kanat. The result of this and older prehistoric eruptions has been to confine the underground water, so important in Arabian tillage, which can be reached at any point of the oasis by sinking deep wells. Many of the walls are brackish, and the natural fissures of the volcanic soil is in many places impregnated by the salt with which it is impregnated; but the date-palm grows well everywhere, and the groves, interspersed with gardens and cornfields, which surround the city on all sides except the west, have been famous from the time of the Prophet. Thus situated, Medina was originally a city of agriculturists, not like Mecca a city of merchants; nor, apart from the indispensable trade in provisions, has it ever acquired commercial importance like that which Mecca owes to the pilgrimage. Landowners and cultivators are still the population of the city.1

The latter, who are called Nakhawila, and more or less openly profess the Shi'ite opinions, marry only among themselves. The townsmen proper, on the other hand, are a very motley race.2 New settlers remain behind with each pilgrimage; attracted by the many offices of profit connected with the mosque, the stipends paid by the sultan to every inhabitant, and the gains to be derived by pilgrim-cicerones (Musawwirs) or by those who make it a business to say prayers at the Prophet's mosque for persons who send a fee from a distance, as well as the alms which the citizens are accustomed to collect when they go abroad, especially in Turkey. The population of the city and suburbs may be from 16,000 to 20,000.

The city proper is surrounded by a solid stone wall,3 with towers and four massive gateways of good architecture, forming an irregular oval running to a kind of angle at the north-west, where stands the castle, held by a Turkish garrison. The houses are good stone buildings similar in style to those of Mecca; the streets are narrow but clean, and in part paved.4 There is a copious supply of water conducted from a tepid source (ez-Zarka) at the village of Kuba, 3 m. south, and distributed in underground conduits and wells of Medina. The only important building, is the mosque of the Prophet, in the eastern part of the city, a spacious enclosed court between 400 and 500 ft. in length from north to south, and two-thirds as much in breadth. The minarets and the lofty dome above the sacred graves are imposing features; but the circuit is hemmed in by houses or narrow lanes, and is not remarkable except for the principal gate (Bab al-Salam) at the southern end of the west front, facing the sacred graves, which is richly inlaid with marble and fine tiles, and adorned with golden inscriptions. This gate leads into a deep portico, with ten rows of pillars, running along the southern wall. Near the farther end of the portico, not adjoining the walls, is a sort of doorless house or chamber hung with rich curtains, which is supposed to contain the graves of Mahomet, Abu Bekr and Omar. To the north of this is a smaller chamber of the same kind, draped in black, which is said to represent the tomb of Fatima. Both are enclosed with an iron railing, so closely interwoven with brass wire-work that a glimpse of the so-called tombs can only be got through certain apertures, where intercessory prayer is addressed to the prophet, and pious salutations are paid to the other saints.4 The portico in front of the railing is not ineffective, at least by night-light. It is paved with marble, and in the eastern parts is brackish, and covered with carpets; the southern wall is clothed with marble pierced with windows and covered with a sort of painted glass, and the great railing has a striking aspect; but an air of tawdryness is imparted by the vulgar painting of the columns, especially in the space between the tomb and the pulpit, which has received, in accordance with a tradition of the Prophet, the name of the Garden (rauda), and is decorated with barbaric attempts to carry out this idea in colour.5 The throng of visitors passing along the south wall from the Bab al-Salam to salute the tombs is separated from the Garden by an iron railing. The latter, which has always been enclosed by Omar and Othman, was entirely reconstructed on a grander scale and in Byzantine style by Greek and Coptic artificers at the command of the caliph Walid and under the direction of Omar Ibn Abd-al-Aziz. The enlarged plan included the hills above named, which were pulled down. Thus the place of the Prophet's burial was brought within the mosque; but the recorded discontent of the city at this step shows that the feeling which regards the tomb as the great glory of the mosque, and the pilgrimage to it as more important than any that can be undertaken except that to Mecca, was still quite unknown. It is not even certain what was done at this time to mark off the graves. Ibn 'Abd Rabbih, in the beginning of the 10th century (Ib'd, Cairo ed., iii. 360), describes the enclosure as a hexagonal wall, rising within three cubits of the ceiling of the portico, clothed in marble for more than a man's height, and above that height daubed with the unguent called khuluk. This may be supplemented from Istanbali, who calls it a lofty house without a door. That there are no grave-stones or visible tombs within is certain from what is recorded of occasions when the place was opened up for repairs. Ibn Jubair (p. 193 seq.) and Samhudi speak of a small casket adorned with silver, fixed in the eastern wall, which was supposed to be opposite the head of the Prophet, while a silver nail in the south wall indicated the point to which the corpse faced, and from which the salutation of worshippers was to be addressed (Burton misquotes). The European failure (mentioned and refuted, e.g. in Histoire des Arabes par l'abbé de Marigny, t. i. p. 46, Paris, 1750) of the coffin suspended by magnets is totally unknown to Moslem tradition. The smaller chamber of Fatima is comparatively modern. In the time of Ibn Jubair and of Ibn Batuta (unless

1 The pilgrimage to Medina, though highly meritorious, is not obligatory, and so is not considered to be a general concourse at one time, and no fair like that of Mecca.

2 A small number of families in Medina still claim to represent the old 'Awar, the 'defenders' of Mahomet; there are also some Siddiqiyyah, claiming descent from Abu Bekr. But in fact the old population emigrated en masse after the sack of Medina by Moslim in 683, and passed into Spain in the armies of Musa. In the 13th century one old man of the Khazzan family and one of the Abn tribe were all that remained of the old stock in Medina (Maqari, i. 187; Dozy, Mus. d'Espagne, i. 111). The aristocratic family of the Beni Hosain, who claim descent from the martyr of Kerbela, and so from the Prophet, have apparently a better established pedigree.

3 According to Ibn Khallikan (Slane's trans. iii. 927) the walls are of the 12th century, the work of Jamal ud-Din al-Ishahidi.

4 The Baalit or great walled street of Medina, a very unusual feature in an Eastern town, dates from the 1st century of Islam. (See Wustenfeld's abstract of Samhudi, p. 115.)

5 Kubā is famous as the place where the Prophet lived before he entered Medina, and the site of the first mosque in which he prayed. It lies amidst orchards in the richest part of the oasis.

XVIII. 3
MEDINA—MEDINA

SIDONIA, DUKE OF

MEDINA—MEDINA

SIDONIA, DUKE OF

MEDINA, a village of Orleans county, in north-west New York, U.S.A., about 40 m. N.E. of Buffalo, and on Oak Orchard Creek. Pop. (1900), 4716, (857 foreign-born); (1905, state census), 5114; (1910) 6853. It is served by the New York Central & Hudson River railroad, by the Buffalo, Lockport & Rochester (interurban) railway, and by the Erie Canal. On Oak Orchard Creek and near the city are electric power plants, at the Medina Falls and at a large storage dam (60 ft. high) for water power, built in 1902. In the neighbourhood are extensive apple, peach and pear orchards; and vegetables, especially beans, are grown. There are valuable quarries of Medina sandstone, a good building material, and of marble, and the sands, which are very close to brownish red, readily shaped and split, and less likely than limestone to crack or than granite to wear slipperily; it was first found at Medina in 1837. There was a saw-mill on the creek near here in 1805, but the place was little settled before 1824, and its growth was due to the Erie Canal. It was incorporated in 1832.

MEDINA SIDONIA, DON ALONSO PEREZ DE GUZMAN EL BUENO, 7TH DUKE OF (1530-1613), the commander-in-chief of the Spanish Armada, was born on the 10th of September 1530. He was the son of Don Juan Claro de Guzman, eleventh of the 6th duke, and of his wife Doña Leonor Manrique de Zúñiga y Sotomayor. His father died in 1555, and Don Alonso became duke, and master of one of the greatest fortunes in Europe, on the death of his grandfather in 1539. The family of Guzman was originally lords of Abiados, on the southern slope of the Picos de Europa in the hill country of Leon. The name is believed to be a contraction or corruption of Gundamarics, i.e., son of Gundamar. An early family tradition represents them as having come from Britain, and they may have descended from one Gundamar, who held a coast of Spain in the 10th century. It is in the 10th century that they first appear, and they grew great by the reconquest of the country from the Mahomedans. The branch to which the dukedom of Medina Sidonia belonged was founded by Alonso Perez de Guzman (1256-1309), surnamed El Bueno, the good, in the sense of good at need, or stout-hearted. In 1296 he defended the town of Tarifa on behalf of Sancho IV., and when the besiegers threatened to murder one of his sons whom they held as a prisoner if he did not surrender, he allowed the boy to be killed. He was rewarded by great grants of crown land. The duchy of Medina Sidonia, the tithes and manors of which were bestowed by John II., in 1445 on one of his descendants, Juan Alonso de Guzman, count of Niebla. The addition "El Bueno" to the family name of Guzman was used by several of the house, which included many statesmen, generals and colonial viceroys. The 7th duke was betrothed in 1505 to Ana de Silva y Mendoza, who was then four years of age, the daughter of the prince of Ebro. In 1527 when the duchess was a little more than ten years of age, the pope granted a dispensation for the consummation of the marriage. The scandal of the time, for which there appears to be no foundation, accused Philip II. of a love intrigue with the princess of Ebro. The unravelling and unmerited favour he showed the duke has been accounted for on the ground that he

AUTHORITIES.—Medina has been described from personal observation by Burckhardt, who devoted himself to it in 1815, and Burton, who made the pilgrimage in 1853. Sadlier on his journey from Kafir to Yambu (1819) was not allowed to enter the holy city. Burckhardt was prevented by ill-health from examining the city and country with the thoroughness which the extraordinary features which he describes to the north of Medina, as reported to him by the report of "Abd el-Razzaq," who performed the pilgrimage in 1878, on a medical commission from the English government. The chief Arabic authority besides Ibn 'Abd Rabbi and Ibn Jubair is Sambuli, of whose history Wattenfyl published an abstract in the Göttingen Abhandlungen, vol. ix. (1861). It goes down to the end of the 15th century. The topography of the country about Medina is data only by the best informed cartographers, such as the Dutch and the Arabic, supplying the material for this topic. Some good information concerning Medina is contained in the 2nd volume of Doughty's Travels in Arabia Deserta.

1 The titles and grandeeship passed, in accordance with Castilian law, by marriage of a daughter and heiress in 1777, to the marquess of Vilafranca, and have since remained in that house.
took a paternal interest in the duchess. Don Alonso, though he bore the name of El Bueno, was a man of mean spirit. He made no serious effort to save his mother-in-law from the persecution she suffered at the hands of Philip II. His correspondence is full of whining complaints of poverty, and appeals to the king for pecuniary favours. In 1581 he was created a knight of the Golden Fleece, and was named captain-general of Lombardy. By pressing supplications to the king he got himself exempted on the ground of poverty and poor health. Yet when the marquess of Santa Cruz (q.v.) died, on the 9th of February 1588, Philip bestowed on Don Alonso the Governorship of Lombardy, a position which he held almost 20 years. He was chosen even before Santa Cruz was actually dead, and was forced to go in spite of his piteous declarations that he had neither experience nor capacity, and was always sick at sea. His conduct of the Armada justified his plea. He was even accused of showing want of personal courage, and was completely broken by the sufferings of the campaign, which turned his hair grey.

The duke retained his posts of "admiral of the ocean" and captain-general of Andalusia in spite of the contempt openly expressed for him by the whole nation. When an English and Dutch armament assailed Cadiz in 1596 his cloth and timidity were largely responsible for the loss of the place. He was held up to ridicule by Cervantes in a sonnet. Yet the royal favour continued unabated even under the successor of Philip II. In 1606 the obstinacy and folly of the duke caused the loss of a squadron which was destroyed near Gibraltar by the Dutch. He died in 1615.

See Cesario Duro, La Armada invincible (Madrid, 1884), which gives numerous references to authorities.

**MEDINA SIDONIA, or MEDINASIDONIA, a town of southern Spain, in the province of Cadiz, 21 m. by road E. of Cadiz. Philip II. (1548-1555) appointed Medina Sidonia to an isolated hill surrounded by a cultivated plain. It contains a fine Gothic church, several convents, and the ancestral palace of the dukes of Medina Sidonia. It has a small agricultural trade, chiefly in wheat and oats.**

Medina Sidonia has been identified by some with the Asido of Pliny, but this is uncertain. Under the Visigoths the place was erected into a bishopric (Asidonum), and attained some importance; in the beginning of the 8th century it was taken by Tariq. In the time of Idrisi (12th century) the province of Shaduna or Shidona included, among other towns, Seville, and Carmona; later Arab geographers place Shaduna in the province of Seville.

**MEDIOLANUM, or MEDIOLANUM (mod. Milan, q.v.), an ancient city of Italy, and the most important in Gallia Transpadana. Livy attributes its foundation to the Galli Insurbres after Bellobesus after their defeat of the Etruscans, in the time of the old Tarquin. According to other authorities, the Etruscan city of Melpum which preceded it was destroyed in 356 B.C. Objects of the Bronze age have been found outside the city on the south. The name itself is Celtic. The Romans defeated the Insurbres in 225--222 B.C., and extended Mediolanum itself in the latter year. Its inhabitants rebelled some twenty years later in the Hannibalic War, but were defeated and finally reduced to obedience in 156 B.C. They probably acquired Latin rights in 89, and full civic rights in 49 B.C., as did those of the other towns of Gallia Transpadana. It appears later on (but not before the 2nd century A.D.) to have become a colony. It acquired a certain amount of literary eminence, for we hear of youths going from Comum to Mediolanum to study. In Strabo's time it was on an equality with Verona, but smaller than Pavia, but in the later times of the empire its importance increased. At the end of the 3rd century it became the seat of the governor of Aemilia and Liguria (which then included Gallia Transpadana also, consisting of the 9th and 11th regions of Augustus), and at the end of the 4th, of the governor of Liguria only, Aemilia having one of its own thenceforth. From Diocletian's time onwards the praefectus praetorio and the imperial vicar of Italy also had their seat here; and it became one of the principal mints of the empire. The emperors of the West resided at Mediolanum during the 4th century, until Honorius preferred Ravenna, and in 402 transferred his court there. Its importance, described in the poems of Ausonius, is demonstrated by its many inscriptions, and the interest and variety of its contents. In these the rarity of the mention of its chief magistrates is surprising: and it is not impossible that owing to its very importance the right of appointing them had been taken from it (as Mommsen thinks). The case of Ravenna is not dissimilar. The inscriptions indicate a strong Celtic character in the population. Procopius speaks of it as the first city of the West, after Rome, and says that when it was captured by the Goths in 539, Philip II. (1548-1555) several of the inhabitants were killed. It was an important centre of traffic, from which roads radiated in several directions—as railways do to-day—to Comum, to the foot of the Lacus Verbanus (Lago Maggiore), to Novaria and Vercellae, to Ticinum, to Laus Pompeia and thence to Placentia and Cremona, and to Bergomum. None of these roads had an individual name, so far as we know. To its secular power corresponds the independent position which its Church took in the time of St Ambrose (q.v.), bishop of Milan in 374-397, who founded the church which bears his name, and here baptized St Augustine in A.D. 395. Cadiz is an ancient city of the Phœnicians, and was used throughout the diocese. Theodosius indeed did penance here at Ambrose's bidding for his slaughter of the people of Thessalonica. After his death the period of invasions begins; and Milan felt the power of the Huns under Attila (452), of the Heruli under Odoacer (476) and of the Goths under Theodoric (493). When Bellissarius was sent by Justinian to recover Italy, Datius, the abishop of Milan, joined him, and the Goths were expelled from the city. But Uraia, nephew of Vitigis the Gothic king, subsequently assaulted and retook the town, after a brave resistance. Uraia destroyed the whole of Milan in 539; and hence it is that this city, once so important a centre of Roman civilization, possesses so few remains of antiquity. Nares, in his campaigns against the Goths, had invited the Lombards to his aid. They came in a body under Alboin, their king, in 568, and were soon masters of all Italy. They entered Milan in the next year, but Pavia became the Lombard capital. Of Roman remains little is to be seen above ground, but a portico of sixteen Corinthian columns near S. Lorenzo, which may belong to the baths of Hercules, mentioned by Ausonius, or to the palace of Maximiun. Close to the Torre del Sarto, which remains of an ancient bridge and (possibly) of the walls of Maximian were found: and many remains of ancient buildings, including a theatre, have been discovered below ground-level. The objects found are preserved in the archaeological museum in the Castello Sforzesco. (See Milan.)

See Th. Mommsen in Corp. Inscrip. Latin. (Berlin, 1883), v. 617 sqq. (with full bibliography); Notizie degli Scavi, passim.

(T. A.)

**MEDITERRANEAN SEA.** The Mediterranean is all that remains of a great ocean which at an early geological epoch, before the formation of the Atlantic, encircled half the globe along a line of latitude. This ocean, already diminished in area, retreated after Oligocene times from the Iranian plateau, Turkestan, Asia Minor and the region of the north-west Alps. Next the plains of eastern Europe were lost, then the Aralo-Caspian region, southern Russia and finally the valley of the Danube. The "Mediterranean region," as a geographical unit, includes all this area; the Black Sea and the Sea of Marmora are within its submerged portion, and the climate of the whole is controlled by the oceanic influences of the Mediterranean proper. Professor Suess, to whom the above description is due, finds that the Mediterranean forms no exception to the rule in affording no evidence of elevation or depression within historic times; but it is noteworthy that its present basin is remarkable in Europe for its volcanic and seismic activity. Submarine earthquakes are in some parts sufficiently frequent and violent as seriously to interfere with the working of telegraph cables. Suess divides the Mediterranean basin into four physical regions, which afford probably the best means of description: (1) The western Mediterranean, from Gibraltar to Malta and Sicily,
MEDITERRANEAN SEA

enclosed by the Apennines, the mountains of northern Africa, and of southern and south-eastern Spain (Cordillère bétique). (2) The Adriatic, occupying the space between the Apennines and the Dinaric group (Südaes compares the Adriatic to the valley of the Brahmaputra). (3) A part surrounded by the fragments of the Dinara-Taurus arch, especially by Crete and Cyprus. This includes the Aegean and the Black Sea, and its margin skirts the south coast of Asia Minor. These three parts belong strictly to Eurasia. (4) Part of the coastal region of Indo-Africa, terraced downwards in successive horizontal planes from the South, reaching the sea in the Little Syrtre, and continuing to the southern depressions of Syria, Malta and Gozo are the only islands of the Mediterranean which can be associated with this section, and, as we know, the mountain chain of north-west Africa belongs to Eurasia. Murray (1888) estimates the total area of the Mediterranean at 813,000 sq. m. Karsten (1894) breaks it up into parts as follows:

- Western Mediterranean: 841,993 sq. km.
- Sicilian-Ionian basin: 767,658
- Greece and Levant basin: 767,652
- Adriatic Sea: 130,656

Total: 2,599,559

A more recent calculation by Krümmel gives the total area as 2,697,570 sq. km, or 1,145,830 sq. m. (See OCEAN.) Murray estimates the total surface of the Mediterranean drainage area, with which must be included the Black Sea, at 2,934,500 sq. m., of which 1,420,800 are Euranian and 1,153,800 are African. The principal rivers entering the Mediterranean directly are the Nile from Africa, and the Po, Rhone and Ebro from Europe.

The physical divisions of the Mediterranean given above hold good in describing the form of the sea-bed. The western Mediterranean is cut off by a bank crossing the narrow strait between Sicily and Cape Bon, usually known as the Adventure Bank, on which the depth is nowhere 200 fathoms. The mean depth of the western basin is estimated at 881 fathoms, and the deepest sounding recorded is 2040 fathoms. In the eastern Mediterranean the mean depth is nearly the same as in the western basin. The Sicilian-Ionian basin has a mean depth of 885 fathoms, and the Levant basin, 703 fathoms. Deep water is found close up to the coast of Sicily, Greece, Crete and the edge of the African plateau. The steepest slope observed occurs off the island of Sapienza, near Navarino, where 1720 fathoms has been found only 10 miles from land. In 1897 the ship "Washington" obtained depths of 2220 fathoms in the middle of the eastern Mediterranean; and the Austrian expeditions in the "Pola" discovered in the "Pola Deep" (35° 44' N, 21° 45' E), south-west of Cape Matapan, a maximum depth of 2060 fathoms. Between these two deep areas a ridge runs in a north-westerly direction 550 fathoms from the surface—possibly a projection from the African plateau. Another bank 1100 fathoms from the surface runs south from the east end of Crete, separating the Pola Deep from the depths of the Levant basin, in which a depth of 1960 fathoms was recorded near Makri on the coast of Asia Minor. The later expedition of the "Pola" discovered the "Rhodes Deep" (36° 5' N, 28° 36' E), with a maximum depth of 2110 fathoms: this deep is closed to the south-east by a ridge running south-east, over which the depth is 1030 fathoms. Off the coast of Syria the "Pola" obtained four soundings of more than 1100 fathoms, and between Cyprus and the coast of Syria-Malaya only 550 fathoms. Murray gives the following figures for the areas and volumes of the Mediterranean at different depths:

<table>
<thead>
<tr>
<th>Depth</th>
<th>Area</th>
<th>Volume</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fathoms</td>
<td>Sq. Miles</td>
<td>Cub. Miles</td>
</tr>
<tr>
<td>0-100</td>
<td>201,300</td>
<td>80,950</td>
</tr>
<tr>
<td>100-500</td>
<td>210,300</td>
<td>92,650</td>
</tr>
<tr>
<td>500-1000</td>
<td>81,300</td>
<td>189,200</td>
</tr>
<tr>
<td>1000-2000</td>
<td>263,250</td>
<td>217,050</td>
</tr>
<tr>
<td>Over 2000</td>
<td>15,500</td>
<td>1,750</td>
</tr>
<tr>
<td></td>
<td>813,000</td>
<td>709,800</td>
</tr>
</tbody>
</table>

which gives a mean depth over all of 768 fathoms. The following table is due to Karsten:

<table>
<thead>
<tr>
<th>Volume. Mean Depth.</th>
<th>Western Mediterranean 1,356,512</th>
<th>Sicilian-Ionian basin 1,242,549</th>
<th>Levant 1,16,599</th>
<th>Adriatic Sea 31,444</th>
</tr>
</thead>
<tbody>
<tr>
<td>881</td>
<td>885</td>
<td>793</td>
<td>133</td>
<td></td>
</tr>
</tbody>
</table>

Krümmel gives the total volume of the basin as 4,249,920 cubic kilometers or 1,019,400 cubic statute miles, and the mean depth as 768 fathoms. (See OCEAN.)

Metemperatures.—As already stated, the "Mediterranean region" forms a distinct climatic unit, chiefly due to the formation extension of the Mediterranean Sea. The prevailing winds in this region, which the sea traverses longitudinally, are westerly, but the sea itself causes the formation of bands of low barometric pressure during the winter season, within which cyclones frequently develop, while in summer the region comes under the influence of the polar margin of the tropical high pressure belt. Hence the Mediterranean region is characterized by periodic winter rains, the distinctive feature being less sharply defined from north to south, and the amount of total annual fall increasing in the same direction. The climate becomes more continental in type as we go west, and in the east, but these generalities—the elevated plateaus of Algeria and Spain cause a rise of pressure in winter and delay the rainy seasons: the rains set in earlier in the west than in the east, and the total fall is greatest in the west. Temperatures: in the west, the annual mean varies from 66° F. to 77° F. In the west the Atlantic influence limits the mean annual range to about 10°—12° F., but in the east this increases to 36° and even 40°. The eastern basin is warmer than the western, and this is exaggerated in the eastern region by local land winds, which replace the cool sea-breezes of summer: overcoats are ordinarily worn in Spain and Italy till July, and are then put aside till October. Local winds form an important feature in nearly all the coast climates of the Mediterranean, especially in winter, where they are primarily caused by the rapid change of temperature between the land and sea, and to the presence of the land surface of great violence, occur in the Rhone valley (the Mistral), in Istria, and Dalmatia (the Bora), and in the western Caucasus. In summer a north-west trade or wind, the Maestro, occurs in the Adriatic. The Gulf Stream changes the climate of the winter season; in the Adriatic it is usually accompanied by cloud and moisture, often by rain. In Sicily and southern Italy the Sirocco occurs at all seasons; it is a dry, dusty wind from south-east or south-west. The dust is chiefly of local origin, and partly comes from the Sahara. Similar winds are met with in Spain (the Leveche), but they reach their greatest development in the Simoons of Algeria and Syria, and the Khamsin of Egypt.

Temperature.—The mean surface temperature of the waters of the Mediterranean falls from south-east, where it is over 70° F., to north-west, the average at the coast of the Gulf of Lyons being 66°. The surface of the Ionian basin and Gulf of Sardinia is warmed by the Gulf Stream and thence by the Strait of Messina to the Gulf of Corinth. A similar distribution is found in all fathoms from the surface, temperature falling from 66° near the Adriatic to 55° to 60° G. At the bottom temperature falls in the west to 49° and 50°, but below 250 fathoms temperatures are practically uniform to the bottom, 55° in the western basin and 56° in the eastern. The basin expresses the cohesion in the Pola Deep was 63°.

Salinity.—In the extreme west the salinity of the surface water is about 36.5 per mille, and it increases eastwards to 37.6 east of Sardinia and 39.0 and upwards in the Levant. Observations of salinity in the depths of the western Mediterranean are very deficient, but the average is probably between 38.0 and 38.5. In the eastern basin the "Pola" expedition observed salinities of 38.7 to 38.9 to the east of a line joining Cape Matapan with Alexandria, and 38.2 to 38.4 west of the line. The salter waters apparently tend to make their way westwards close to the African coast, and at the bottom the highest salinities have been observed south of Crete. Eunotitski states that the saltiest water of the whole basin occurs in the Aegean Sea.

Circulation.—There is little definite circulation of water within the Mediterranean itself. In the straits joining it with the Atlantic and Black Sea the fresher surface waters of these seas flow inwards to assist in making good the loss by evaporation at the surface of the Mediterranean, and in both cases dense water makes its way outwards along the bottom of the channels, the bottom waters being less than the volume and delivery than the inflow. Elsewhere local surface currents are developed, either drifts due to the direct action of the winds, or streams produced by wind action. In these the water acts against the current and against these the net current is due to the dignity of a distinct current system, although they are often sufficient to obliterate the feebler tidal action characteristic of the Mediterranean. Dr Natterer, the chemist of the "Pola" expeditions, has expressed the opinion that the pelagic fauna is solely due to the want of circulation in the depths.
The genuineness of trance mediumship can no longer be called in question. The problem for solution is the source of the information. The best observed case is that of Mrs. Piper of Boston; at the outset of her career, in 1884, she did not differ from the ordinary American trance medium. In 1885 the attention of Professor William James of Harvard was attracted to her; and for twenty years she remained under the supervision of the Society for Psychical Research. During that period three phases may be distinguished: (1) 1884-1891, trance utterances of a "control" calling himself Dr. Phineas, a French physician, of whose existence in the body no trace can be found; (2) 1892-1896, automatic writing by a "control" known as "George Pelham," the pseudonym of a young American author; (3) 1896 onwards, supervision by "controls" purporting to be identical with those associated with Stainton Moses. There is no evidence for regarding Mrs. Piper as anything but absolutely honest.

The material remains unpublished, partly on account of its intimate character. Many of those to whom the communications were made have been convinced that the "controls" are none other than discarnate spirits. Probably no absolute proof of identity can be given, though the reading of sealed letters would come near it; these have been left by more than one prominent psychical researcher, but so far the "controls" who claim to be the writers of them have failed to give their contents, even approximately.

Professor Flournoy has investigated a medium of very different character, known as Hariot Smith; against her good faith nothing can be said, but her phenomena-trance utterance and glossolalia—have undoubtedly been produced by her own mind. These represent her to be the reincarnation of a Hindu princess, and of Marie Antoinette among others, but no evidence of identity has been produced. The most striking phenomenon of her trance was the so-called Martian language, eventually shown by analysis to be a derivative of French, comparable to the languages invented by children in the nursery, but more elaborate.

MEDLAR, Mespilus germanica, a tree of the tribe Pomeae of the order Rosaceae, closely allied to the genus Pyrus, in which it is sometimes included; it is a native of European woods, &c., from Holland southwards, and of western Asia. It occurs in hedges, &c., in middle and south England, as a small, much-branched, deciduous, spinous tree, but is not indigenous. The medlar was well known to the ancients. Pickering (Chron. Hist. Pl. p. 201) identifies it with a tree mentioned in a Sian-yu ode (She-King, ii. 1, 2), 827 B.C. It is the weedy of Theophrastus and Mespilus of Pliny. The Latin mespilus or mespilium became in Old French mesle or medle, "the fruit," meslier, medlier, "the tree." The modern French nèfle is from a corruption nospilium of the Latin. The German Mispel preserves the original more closely. The well-known fruit is globular, but depressed above, with leafy persistent sepals, and contains stones of a hemispherical shape. It is not fit to eat until it begins to decay and becomes "battered," when it has an agreeable acid and somewhat astrigent flavour. Several varieties are known in cultivation. The large Dutch medlar, which is very widely planted, is a naturally crooked growth with a large, much-flattened fruit inferior in quality to the Nottingham, which is a tree of upright habit with fruits of about 1 in. diameter, superior to any other variety. There is also a stoneless variety with still smaller fruits, but the quality is not so good.

The medlar is propagated by budding or grafting upon the white-thorn, which is most suitable if the soil is dry and sandy, or on the quince if the soil is moist; the pear stock also succeeds

MEDIUM—MEDLAR

Deposits.—A great part of the bottom of the Mediterranean is covered with blue mud, frequently with a yellow upper layer containing a considerable proportion of carbonate of lime, chiefly shells of pelagic Foraminifera. In many parts, particularly in the eastern Mediterranean, it is calcareous, being derived from limestone three or four inches thick, with the formation of carbonate of lime by the agency of calcareous ooze. The deposits are undergoing oxidation, and the consequent precipitation of carbonate of lime and other substances from the waters nearer the surface. This view, however, has not met with general acceptance.

MEDIUM, primarily a person through whom, as an intermediate, communication is deemed to be carried on between living men and spirits of the departed, according to the spiritistic hypothesis; such a person is better termed sensitive or automatist. The phenomena of mediumship fall into two classes, (1) "physical phenomena" (q.v.) and (2) trance and automatic phenomena (utterances, script, &c.); both these may be manifested by the same person, as in the case of D. D. Home and Stainton Moses, but are often independent.

I. No sufficient mass of observations is to hand to enable us to distinguish between the results of trickery and hallucination, but it is certain, as everyone knows, that spiritseers are suspicious persons on the other; but the evidence for raps and lights is good; competent observers have witnessed supposed materializations and there is respectable evidence for movements of objects.

Mediumship in the modern sense of the term may be said to have originated with the Rochester rappings of 1848 (see Spiritualism); but similar phenomena had been reported by such authors as Apollonius of Tyana; they figure frequently in the lives of the saints; and the magician in the lower stages of culture is in many respects a counterpart of the white medium. Among physical mediums who have attained celebrity may be mentioned D. D. Home (q.e.), Stainton Moses and Eusapia Palladino; the last has admittedly been fraudulent at times, but no deceit was ever proved of Home; Stainton Moses sat in a private circle and no suspicion of his good faith was ever aroused.

W. Stainton Moses (1839-1892) was a man of university education, a clergyman and a schoolmaster. In 1872 he became interested in spiritualism and soon began to manifest mediumistic phenomena, which continued for some ten years. These included, besides trance communications, raps, telekinesis, levitation, production of lights, perfumes and musical sounds, apports and materialized hands. But the conditions under which the experiments were tried were not sufficiently rigid to exclude the possibility of normal causes being at work; for no amount of evidence that the normal life is marked by no lapse from rectitude affords a presumption that uprightness will characterize states of secondary personality.

Eusapia Palladino has been observed by Sir O. Lodge, Professor Richet, F. W. H. Myers, and other eminent investigators; the first named reported that none of the phenomena in his presence went beyond what could be accomplished in a normal manner by a free and uncontrolled person; but he was convinced that movements were produced without apparent contact.

Among other phenomena asserted to characterize the mediumship of Eusapia are the production of temporary prolongations from the medium's body; these have been seen in a good light by competent witnesses. It was shown in some sittings held at Cambridge in 1895 that Eusapia produced phenomena by fraudulent means; but though the evidence of this is conclusive it has not been shown that her mediumship is entirely fraudulent. Automatic records of sances can alone solve the problems raised by physical mediumship. It has been shown in the Davey-Hodgson experiments that comparisons cannot, even for a short period, be invalidated, and that in the presence of the observations many omissions and errors are inevitable. Even were it otherwise, no care could provide against the possibility of hallucination.

II. The genuineness of trance mediumship can no longer be called in question. The problem for solution is the source of the information. The best observed case is that of Mrs. Piper of Boston; at the outset of her career, in 1884, she did not differ from the ordinary American trance medium. In 1885 the attention of Professor William James of Harvard was attracted to her; and for twenty years she remained under the supervision of the Society for Psychical Research. During that period three phases may be distinguished: (1) 1884-1891, trance utterances of a "control" calling himself Dr. Phineas, a French physician, of whose existence in the body no trace can be found; (2) 1892-1896, automatic writing by a "control" known as "George Pelham," the pseudonym of a young American author; (3) 1896 onwards, supervision by "controls" purporting to be identical with those associated with Stainton Moses. There is no evidence for regarding Mrs. Piper as anything but absolutely honest.

The material remains unpublished, partly on account of its intimate character. Many of those to whom the communications were made have been convinced that the "controls" are none other than discarnate spirits. Probably no absolute proof of identity can be given, though the reading of sealed letters would come near it; these have been left by more than one prominent psychical researcher, but so far the "controls" who claim to be the writers of them have failed to give their contents, even approximately.

Professor Flournoy has investigated a medium of very different character, known as Hariot Smith; against her good faith nothing can be said, but her phenomena—trance utterance and glossolalia—have undoubtedly been produced by her own mind. These represent her to be the reincarnation of a Hindu princess, and of Marie Antoinette among others, but no evidence of identity has been produced. The most striking phenomenon of her trance was the so-called Martian language, eventually shown by analysis to be a derivative of French, comparable to the languages invented by children in the nursery, but more elaborate.

MEDLIE, or MEJIDIE, the name of a military and knightly order of the Turkish Empire, and also of a silver Turkish coin, worth twenty piastres. The coin was first struck in 1844, and not again issued till 1852 by Sultan Abd-ul-Mejid, whose name was therefore given to them. (See Knighthood and Chivalry: § Orders of Knighthood.)
well on ordinary soils. It produces the best fruit in rich, loamy, somewhat moist ground. The tree may be grown as a standard, and chiefly requires pruning to prevent the branches from rubbing each other. The fruit should be gathered in November, on a dry day, and laid out upon shelves. It becomes "bletted" and fit for use in two or three weeks. The Japanese medlar is Eriobotrya japonica (see LOQUAT), a genus of the same tribe of Rosaceous.

MÉDOC, a district in France adjoining the left bank of the Gironde from Blanquefort (N. of Bordeaux) to the mouth of the Gironde. Its length is about 50 m., its breadth averages between 6 and 7 m. It is formed by a number of low hills, which separate the Landes from the Gironde, and is traversed only by small streams; the Gironde itself is muddy, and often enveloped in fog, and the region as a whole is far from picturesque. Large areas of its soil are occupied by vineyards, the products of which form the finest growths of Bordeaux. (See WINE.)

MEDUSA, the name given by zoologists to the familiar marine animals known popularly as jelly-fishes; or, to be more accurate, to those jelly-fishes\(^1\) in which the form of the body resembles that of an umbrella, bell or parachute. The name medusa is suggested by the tentacles, usually long and often numerous, implanted on the edge of the umbrella and bear the stinging organs of which sea-bathers are often disagreeably aware. The tentacles serve for the capture of prey and are very contractual, held back past the rim of the bell, or, a great number are retracted and forming corkscrew-like curls. Hence the animals have suggested to vivid imaginations the head of the fabled Gorgon or Medusa with her chevelure of writhing snakes.

The medusa occurs as one type of individual in the class Hydrozoa (q.v.), the other type being the polyp (q.v.). In a typical medusa we can distinguish the following parts. The umbrella-like body bears a circle of tentacles at the edge, whereby the body can be divided into a convex subumbrella or exumbral surface and a concave subumbrella or subumbral surface. The vast majority of jelly-fish are directed, with the bell downwards, the subumbrela downwards. A few species, however, attach themselves temporarily or permanently to some firm object by the exumbral surface of the body, and then the subumbrelal surface is directed upwards. From the centre of the subumbrelal surface hangs down the manubrium, like the handle of an umbrella or the clapper of a bell, bearing the mouth at its extremity. In addition to the tentacles, the margin of the umbrella bears sense-organs, which may be of several kinds and may attain a high degree of complexity. Medusae capture their prey, consisting of small organisms of various kinds, especially Crustacea, by means of the tentacles which hang out like fishing-lines in all directions. When the prey comes into contact with the tentacles it is paralysed, and at the same time held firmly, by the barbed threads shot out from the stinging organs or nematocysts. Then by contraction of the tentacles the prey is drawn into the mouth. Medusae thus form an important constituent of the plankton or floating fauna of the ocean, and compete with fish and other animals for the food-supply furnished by minute forms of life.

A medusa has a layer of muscles, more or less strongly developed, running in a circular direction, with the surface of the subumbrella, the contractions of which are antagonized by the elasticity of the gelatinous substance of the body. By the contraction of the subumbrelal circular muscles the concavity of the subumbrella is increased, and as water is thereby forced out of the subumbrelal cavity the animal is jerked upwards. In this way jelly-fish progress feebly by the pumping movements of the umbrella. Besides the circular subumbrelal muscles, there may be others running in a radial direction, chiefly developed as the longitudinal retractor muscles of the manubrium. In some cases the circular subumbrelal muscles form a rim known as the velum (p., see fig. i), projecting into the subumbrelal cavity just within the ring of marginal tentacles. The two principal

The mouth of the oral arms are the starting-point of a further series of variations; they may be simple flaps, crinkled and folded in various ways, or they may be subdivided, and then the branches may simulate tentacles in appearance. In the genus Rhiostoma, common on the British coasts and conspicuous on account of its large size, the oral arms, originally distinct and four in number, undergo concrescence, so that the entrance to the mouth is reduced to two somewhat fan-shaped orifices and canals.\(^5\)

Like the external structure, the internal anatomy of the medusa shows a complete radial symmetry, and is simple in plan but often complicated in detail (see fig. i). As in all Hydrozoa (q.v.) the body wall is composed of two cell-layers, the ectoderm and endoderm. Between which is a structureless gelatinous secreted layer, the mesogloea. As the name jelly-fish implies, the mesogloea is greatly developed, and about five tons of jelly. It is formed by processes of the cells of the ectoderm and endoderm; or it may contain cells which have migrated into it from these two layers. The ectoderm covers the whole external surface of the animal, while the endoderm lines the coelenteron or gastrovascular space; the two layers meet each other, and become continuous, at the edge of the mouth.

The mouth leads at once into the true digestive cavity, divisible into an oesophageal region in the manubrium and a more dilated cavity, the stomach (s.), occupying the centre of the umbrella. From the stomach, canals arise termed the radial canals (r.c.); typically four in number, they run in a radial direction to the edge.

---

\(^5\) For other variations of the medusae, often of importance for systematic classification, see HYDROMEDUSAES and SCYPHIOMEDUSAES.
of the umbrell. There the radial canals are joined by a ring-canal, which, in the case of the free-swimming medusa, runs down the axis of each tentacle; in many cases, however, the cavity of the tentacle is obliterated and instead of a canal the tentacle contains a mere exumbrell, and in others the mouth opens into the radial canal system; ring-canal and tentacle-canals, constitute together the gastrovascular system and are lined throughout by endoderm, which forms the inner surface of the body-wall and the endodermal lining of the radial canals and tentacle-canals together as in the so-called endoderm-lamella (c.e.), a most important feature of medusan morphology, the nature of which will be apparent when the development is described. As a general rule, the medusae, whether zooids or only the members of the gastrovascular system; in a few cases, however, excretory pores are found on the ring-canal, but there is never any anal opening.

The sense-organs of medusae are of two classes: (1) pigment spots, light-sensing organs which may become elaborated into eye-like structures with lens, retina and vitreous body; (2) organs of the sense of balance or orientation, commonly termed otocyst or statocyst. The sense-organs are always located at the margin of the umbrella and may be distinguished from the morphological point of view into two categories, as are or are not, derived from modifications of tentacles; in the former case they are termed tentacle-sensory organs (For fuller information upon the sense-organs see HYDROMEDUSAE.)

Medusae are nearly always of separate sexes, and instances of hermaphroditism are rare. The gonads or generative organs may be either mesothyrid or endo-thyrid; the gonads are endo-thyrid, they are formed on the floor of the stomach; when ectodermal they are formed on the subumbrellar surface. The actinulae are the young of both the stomach and the tentacles, of the radial canals, or in more than one of these regions. Medusae often have the power of budding, and the buds are formed either on the manubrium, or at the margin of the umbrella, or on an outgrowth from the subumbrellar surface.

The internal anatomy of the medusa is as variable as its external features. The mouth may lead directly into the stomach, without any oesophagus. The stomach may be situated in the middle of the disk, or may be drawn out into the base of the manubrium, so that the disk is occupied only by the radial canals. On the other hand the stomach may have lobes extending to the ring-canal, so that radial canals and stomach are clearly divided. The stomach of the actinula becomes the exumbrella, and the peristome becomes the subumbrella. The crown of tentacles thus comes to form a fringe to the margin of the body, and the hypostome becomes the anal opening. The stomach is a complex organ of form and function; the cavity or coelenteron becomes of compressed lenticular form, and the endoderm lining it can be distinguished as an upper or exumbrellar layer and a lower or subumbrellar layer. The peristome develops in thickness of the gelatinous mesogloea, especially on the exumbrellar side; as a result the flattened coelenteron is still further compressed so that in certain spots its cavity is obliterated, and its exumbrellar and subumbrellar layers of endoderm come into contact and undergo concrescence. As a rule four such areas of concrescence or cathammata (E. Haeckel) are formed. The cathammatial areas may remain very small, mere wedge-shaped partitions dividing up the coelenteron into a four-lobed stomach, the lobes of which communicate at the periphery of the body by a spacious ring-canal. More usually each cathamma is a wide triangular area, reducing the peripheral portion of the coelenteron to a narrow lip, the opening of a ring-canal above described. The two apposed layers of endoderm in the cathammatial area undergo complete fusion to form a single layer of epithelium, the endoderm-lamella of the adult medusa.

Medusae, when they reproduce themselves by budding, always produce medusae, but when they reproduce by the sexual method the embryo produced from the egg grows into medusae in some cases, and into polyp-like, actinula-like, or ctenostome medusae in other cases. In this way complicated cycles of alternating generations arise, which are described fully in HYDROMEDUSAE and SCYPHOMEDUSAE.

Medusae are exclusively aquatic animals and for the most part live in the marine waters where they are most abundant. Known is Linnæus's "the stamp of the most faithful and conscientious research," and raising him to the highest rank as a palaeontologist. Besides many separate contributions to science, he prepared with W. M. Gabby (1839-1878), two volumes on the palaeontology of California (1864-1866); and also a Report on the Invertebrate Cretaceous and Tertiary Fossils of the Upper Missouri Country (1876). He died at Washington, on the 22nd of December 1876.

MEDWAY—MEEK

MEEVER, a river in the south-east of England. It rises in the Forest Ridges, S.W. of East Grinstead in Sussex, and, increased by many feeders from these picturesque hills, has an easterly course to the county boundary, which it forms, turning northward for a short distance. Entering Kent near Ashurst, its course becomes north-easterly, and this direction is generally maintained to the mouth. The river passes Tonbridge, receiving the Eden from the west, and later the Teise and Beult from the north, and at last, all these rivers washing the Weald in a curve, it flows to the south of the North Downs. These hills are breached by the Medway in a beautiful valley, in which lies Maidstone, generally much narrower than the upper valley. The characteristic structure of this part of the valley is considered under the heading Downes. Below Maidstone the valley forms a perfect basin, the hills descending upon it closely above Rochester. Below this city the river enters a broad, winding estuary, passing Chatham, and at Sheerness joining that of the Thames, so that the Medway may be considered a tributary, and its drainage area of 662 sq. m. reckoned as part of that of the greater river. The length of the Medway is about 60 m., excluding its many lesser windings. The estuary is navigable for sea-going vessels drawing 24 ft. up to Rochester Bridge. A considerable traffic is carried on by small vessels up to Maidstone, and by barges up to Tonbridge, the total length of the navigation being 43 m. The marshy lowlands along the course of the river have yielded extensive remains of Roman pottery, a plain ware of dark slate-colour.

MEBRANA, or Mianj, a village in Sind, India, on the Indus 6 m. N. of Hyderabad. Pop. (1901), 562. It is famous as the scene of the battle in which Charles Napier, with only 1,200 men, routed the army of the maharajah of Sindh, 11th February 1843. The result of this victory was the conquest and annexation of Sind.

MEEK, FIELDING BRADFORD (1817-1876), American geologist and palaeontologist, the son of a lawyer, was born at Madison, Indiana, on the 20th of December 1817. In early life he was in business as a merchant, but his leisure hours were devoted to collecting fossils and studying the rocks of the neighbourhood of Madison. Being unsuccessful in business he turned his whole attention to science, and in 1838 he gained employment in the U.S. Geographical and Geological Surveys, and in the states of Wisconsin and Minnesota. In 1852 he became assistant to Professor James Hall at Albany, and worked at palaeontology with him until 1858. Meanwhile in 1853 he accompanied Dr F. V. Hayden in an exploration of the "Bad Lands" of Dakota, and brought back valuable collections of fossils. In 1858 he went to Washington, where he devoted his time to the palaeontological work of the United States geological and geographical surveys, his work bearing "the stamp of the most faithful and conscientious research," and raising him to the highest rank as a palaeontologist. Besides many separate contributions to science, he prepared with W. M. Gabby (1839-1878), two volumes on the palaeontology of California (1864-1866); and also a Report on the Invertebrate Cretaceous and Tertiary Fossils of the Upper Missouri Country (1876). He died at Washington, on the 22nd of December 1876.

MEER—MEERSCHAUM

MEER, JAN VAN DER (1632-1679), more often called Vermeer of Delft—not to be confounded with the elder (1628-1691) or younger (1659-1705) Van der Meer of Haarlem, or with Van der Meer of Utrecht—was one of the excellent Dutch painters about whom the Dutch biographers give us little information. 1 Van der Meer, or Vermeer, was born in Delft, and was a pupil of Carel Fabritius, whose junior he was by only eight years. The works by Fabritius are few, but his contemporaries speak of him as a man of remarkable power, and the paintings now ascertained to be from his hand, and formerly attributed to Rembrandt, prove him to have been deeply imbued with the spirit and manner of that master. Whether Van der Meer had ever any closer relation to Rembrandt than through companionship with Fabritius remains uncertain. In 1653 he married Catharina Bolens, and in the same year he entered the guild of St Luke of Delft, becoming one of the heads of the guild in 1662 and again in 1670. He died at Delft in 1675, leaving a widow and eight children. His circumstances cannot have been flourishing, for at his death he left twenty-six pictures undischised of, and his widow had to apply to the court of insolvency to be placed under a conservator, whom was Leewenhoeck, the naturalist.

For more than two centuries Van der Meer was almost completely forgotten, and his pictures were sold under the names and forged signatures of the more popular De Hooch, Metsu, Ter Borch, and even of Rembrandt. The attention of the art-world was first called to this most original painter by Thore, an exiled Frenchman, who described his then known works in Musées de la Hollande (1838-1860), published under the assumed name of W. Bürger. The result of his researches continued in his Galerie Swermond and Galerie d’Arenberg, was afterwards given by him in a charming, though incomplete, monograph (Gazette des beaux-arts, 1866, pp. 297, 438, 542). The task was prosecuted with success by Havard (Les Artistes hollandais, and by Obreen (Nederlandsche Kunstgeschiedenis, Dl. iv.), and we are now in a position to refer to Van der Meer’s works. His pictures are rarely dated, but one of the most important, in the Dresden Gallery, bears the date 1650, and thus gives us a key to his styles. With the exception of the “Christ with Martha and Mary” in the Coats collection at Glasgow, it is perhaps the only one, hitherto recognized, that has figures of life size, though his authorship is claimed for several others. The Dresden picture of a “Woman and Soldier,” with other two figures, is painted with remarkable power and boldness, with great command over the resources of colour, and with wonderful expression of life. For strength and colour it more than holds its own beside the neighbouring Rembrandts. To this early period of his career belong, from internal evidence, the “Reading Girl” of the same gallery, the “Lute-player” and masthead of the Deventer, “The Supreme Judge of the Hague,” the “Walking Woman,” and the small street view, both identified with the Six collection at Amsterdam, the former now in the Rijksmuseum; the magnificent “The Letter” also at Amsterdam, “Diana and the Nymphs” (formerly ascribed to Vermeer of Utrecht) at the Hague Gallery, and others. In all these we find the same brilliant style and vigorous work, a solid impasto, and a crisp, sparkling touch. His first manner seems to have been influenced by the pieder of painter-churchman Rembrandt, who died in 1669, but which in Holland lasted into the last quarter of the century. During the final ten or twelve years of his life Van der Meer adopted a second manner. We now find his painting thin and tight, and his colours paler and softer. Instead of masculine vigour we have refined delicacy and subtlety, but in both styles beauty of tone and perfect harmony are conspicuous. Throughout all his work may be traced his love of lemon-yellow and of blue of all shades. Of his second style typical examples are to be seen in “The Coquettes” of the Brunswick Gallery, in the “Woman Reading” in the Van der Hoop collection now at the Rijksmuseum at Amsterdam, in the “Lady at a Casement” belonging to Lord Powerscourt (exhibited at the Royal Academy, 1876) and in the “Music Master and Pupil” belonging to the King (exhibited at the Royal Academy, 1876). Van der Meer’s authentic pictures in public and private collections amount to about thirty. There is but one in the Louvre, the “Lace Maker”; Dresden has the two afore-mentioned, while Berlin has three, all acquired in the Swermond collection, and the Czernin Gallery of Vienna is fortunate in possessing a fine picture, believed to represent the artist in his studio. In the Arenberg Gallery at Brussels there is a remarkable head of a girl, half the size of life, which seems to be intermediate between his two styles. Several of his paintings are in private foreign collections.

In all his work there is a singular competence and charm. His tone is usually silvery with pastry shadows, and the lighting of his interiors is equal and natural. In all cases his figures seem to move in life and air, and in this respect he resembles greatly his fellow-worker De Hooch. It is curious to read that, at one of the auctions in Amsterdam about the middle of the 18th century, a De Hooch is praised as being “nearly equal to the famous Van der Meer of Delft.”

Sebastien Havard, Van der Meer (Paris, 1888); Vanzypke, Vermeer de Delft (Brussels, 1908), and Holstede de Groot, Jan Vermeyen van Delft (Leipzig, 1909).

MEERANE, a town in the kingdom of Saxony, 9 m. N. of Zwickau and 37 S. of Leipzig by rail. Pop. (1909), 26,005. It contains a fine medieval church (Evangelical). It is one of the most important industrial centres of Germany for the manufacture of dyewood and mixed clays, and in these products has a large export trade, especially to America and the Far East. There are also extensive dyeworks, tanneries and machine factories. See Leopold, Chronik und Beschreibung der Fabrik- und Handelsstadt Meerane (1865).

MEERSCHAUM, a German word designating a soft white mineral sometimes found floating on the Black Sea, and rather suggestive of sea-foam (Meerschaum), whence also the French name for the same substance, écaume de mer. It was termed by E. F. Glocker sepiolite, in allusion to its remote resemblance to the “bone” of the sepi or cuttle-fish. Meerschaum is an opaque mineral of white, grey or cream colour, breaking with a conchoidal or fine earthy fracture, and occasionally though rarely, fibrous in texture. It can be readily scratched with the nail, its hardness being about 2. The specific gravity varies from 0.980 to 1.275, but the porosity of the mineral may lead to error. Meerschaum is a hydrous magnesium silicate, with the formula H$_2$MgSi$_2$O$_7$ or Mg$_2$SiO$_4$.H$_2$O.

Most of the meerschaum of commerce is obtained from Asia Minor, chiefly from the plain of Eski-Shehr, on the Haidar Pasha-Angora railway, where it occurs in irregular nodular masses, in alluvial deposits, which are extensively worked for its extraction. It is said that in this district there are 4000 shafts leading to horizontal galleries for extraction of the meerschaum. The principal workings are at Sepehdji-Ojdjahi and Kemikdji-Ojdjahi about 15 m. S.S.E. of Eski-Shehr. The mineral is associated with magnesite (magnesium carbonate), the primitive source of both minerals being a serpentinite. When first extracted the meerschaum is soft, but it hardens on exposure to solar heat or when dried in a warm room. Meerschaum is found also, though less abundantly, in Greece, as at Thebes, and in the islands of Euboea and Samos; it occurs also in serpentinite at Hurshlicht near Kromau in Moravia. It is found to a limited extent at certain localities in France and Spain, and is known in Morocco. In the United States it occurs in serpentinite at North Hartwick, near Norwich, New York, and in South Carolina and Utah.

Meerschaum has occasionally been used as a substitute for soap and Fuller’s earth, and it is said also as a building material; but its chief use is for tobacco-pipes and cigar-holders. The
natural nodules are first scraped to remove the red earthy matrix, then dried, again scraped and polished with wax. The rudely shaped masses thus prepared are sent from the East to Vienna and other manufacturing centres, where they are turned and carved, smoothed with glass-paper and Dutch rushes, heated in wax or steerine, and finally polished with bone-ash, &c. Imitations are made in plaster of Paris and other preparations.

The soft, white, earthy mineral from Länderhütten, in Vermland, Sweden, known as aphroditite (ἀφροδίτη, foam), is closely related to meerschaum. It may be noted that meerschaum has sometimes been called magnesite (μαγνήσιτης).

MEERUT, a city, district and division of British India, in the United Provinces. The city is half-way between the Ganges and the Jumna, and has two stations on the North-Western railway, 37 m. N.E. from Delhi. Pop. (1901), 118,129. The city proper lies south of the cantonments, and although dating back to the days of the Buddhist emperor Asoka (c. 250 B.C.) Meerut owes its modern importance to its selection by the British government as the site of a great military station. In 1805 it is mentioned as “a ruined, depopulated town.”

The cantonment was established in 1806, and the population rose to 29,014 in 1847, and 82,035 in 1853. The town is an important administrative centre of the division. Meerut is situated in the 7th division of the northern army, with accommodation for horse and field artillery, British and native cavalry and infantry. It was here that the first outbreak of the Mutiny of 1857 took place. (See Indian Mutiny.)

The District of Meerut forms part of the upper Doab, or tract between the Ganges and the Jumna, extending from river to river. Area, 2354 sq. m. Though well wooded in places and abundantly supplied with mango groves, it has but few patches of jungle or waste land. Sandy ridges run along the low watersheds which separate the numerous small streams; but with this exception the whole district is one continuous expanse of careful and prosperous tillage. Its fertility is largely due to the system of irrigation canals. The Eastern Jumna canal runs through the whole length of the district, and supplies the rich tract between the Jumna and the Hindan with a network of distributary streams. The main branch of the Ganges canal passes across the centre of the plateau in a sweeping curve and waters the midland tract. The Antpshahr branch supplies irrigation to the Ganges slope, and the Agra canal passes through the southern corner of Loni pargana from the Hindan to the Jumna. Besides these natural and artificial channels, the country is everywhere cut up by small water-courses. The Burh Ganga, or ancient bed of the Ganges, lies at some distance from the modern stream; and on its bank stood the abandoned city of Hastinapaur, the legendary capital of the Pandavas at the period of the Mahabharata, said to have been deserted many centuries before the Christian era, owing to the encroachments of the river.

The comparatively high latitude and elevated position of Meerut make it one of the healthiest districts in the plains of India. The average temperature varies from 57° F. in January to 89° in June. The rainfall is small, less than 30 in. annually. The only endemic disease in the district is malarial fever; but small-pox and cholera occasionally visit it as epidemics. The population in 1901 was 1,540,175, showing an increase of 10-6% in the decade. The principal crops are wheat, pulse, millet, sugar-cane, cotton and indigo, but this last crop has declined of late years almost to extinction. The district is traversed by the North-Western railway, and also contains Ghaziabad, the terminus of the East Indian system, whence a branch runs to Delhi, while a branch of the Oudh & Rohilkhand railway from Moradabad to Ghaziabad was opened in 1900.

The authentic history of the district begins with the Moslem invasions. The first undoubted Mahommedan invasion was that of Kutbeddien in 1191, when Meerut town was taken and all the Hindu temples turned into mosques. In 1398 Timür captured the fort of Loni after a desperate resistance, and put all his Hindu prisoners to death. He then proceeded to Delhi, and after his memorable sack of that city returned to Meerut, captured the town, razed all the fortifications and houses of the Hindus, and put the male inhabitants to the sword. The establishment of the great Mogul dynasty in the 16th century, under Baber and his successors, gave Meerut a period of internal tranquillity and royal favour. After the death of Aurangzeb, however, it was exposed to alternate Sikh and Mahommédan invasions. From 1707 till 1775 the country was the scene of perpetual strife, and was only rescued from anarchy by the exertions of the military adventurer Walter Reinhardt, afterwards the husband of the celebrated Begum Samru, who established himself at Sardhâna in the north, and ruled a large estate.

The southern tract, however, remained in its anarchic condition under Mahommédan exactions until the fall of Delhi in 1853, when the whole of the country between the Jumna and the Ganges was ceded by Sindhsia to the British. It was formed into a separate district in 1818. In the British period it has become memorable for its connexion with the Mutiny of 1857.

The Division of Meerut comprises the northern portion of the Doab. It consists of the six districts of Dehra Dun, Saharanpur, Muzaffarnagar, Meerut, Bulandshahr and Aligarh. Area, 11,392 sq. m.; pop. (1901), 5,976,711, showing an increase of 21.39% during the decade. (See Meerut District Gazetteer (Allahabad, 1904).

MEETING (from “to meet,” to come together, assemble, O. Eng. meeten; cf. Du. moeten, Swed. möta, Goth. gamaitan, &c., derivatives of the Teut. word for a meeting, seen in O. Eng. mot, moot, an assembly of the people; cf. witanagemol), a gathering together of persons for the purpose of discussion or for the transaction of business. Public meetings may be either those of statutory bodies or assemblies of persons called together for social, political or other purposes. In the case of statutory bodies, by-laws usually fix the quorum necessary to constitute a legal meeting. That of limited companies may be either by reference to the capital held, or by a fixed quorum or one in proportion to the number of shareholders. It has been held that in the case of a company it takes at least two persons to constitute a meeting (Sharp v. Daws, 1886, 2 Q.B.D. 26). In the case of public meetings for social, political or other purposes no quorum is necessary. They may be held, if they are for a lawful purpose, in any place, on any day and at any hour, provided they satisfy certain statutory provisions or by-laws made under the authority of a statute for the safety of persons attending such meetings. The control of a meeting and the subjects to be discussed are entirely within the discretion of those convening it, and whether the meeting is open to the public without payment, or subject to a charge or to membership of a specified body or society, those present are there merely by virtue of a licence of the conveners, which licence may be revoked at any time. The person whose licence is revoked may be requested to withdraw from the meeting, and on his refusal may be ejected with such force as is necessary. If he employs violence to those removing him he commits a breach of the peace for which he may be given into custody. An important English act has dealt for the first time with the disturbance of a public meeting. The Public Meeting Act 1908 enacted that any person who at a lawful public meeting acts in a disorderly manner for the purpose of preventing the transaction of the business for which the meeting was called together shall be guilty of an offence, and if the offence is committed at a political meeting held in any parliamentary constituency between the issue and return of a writ, the offence is made an illegal practice within the meaning of the Corrupt and Illegal Practices Prevention Act 1883. Any person who incites another to commit the offence is equally guilty. A public meeting is usually controlled by a chairman, who may be appointed by the conveners or elected by the meeting itself. On the chairman falls the duty of preserving order, of calling on persons to speak, deciding points of order, of putting questions to the meeting
MEGALOPOLIS

for decision, and declaring the result and other incidental matters.

In England it is illegal, by a statute of George III. (Seditious Meetings Act 1817), to hold a public meeting in the open air within 1 m. of Westminster Hall during the sitting of Parliament.

MEGALOPOLIS, an ancient city of Arcadia, Greece, situated in a plain about 20 m. S.W. of Tegea, on both banks of the Helisson, about 21 m. above its junction with the Alpheus. Like Messene, it owed its origin to the Theban general Epaminondas, and was founded in 370 B.C., the year after the battle of Leuctra, as a bulwark for the southern Arcadians against Sparta, and as the seat of the Arcadian Federal Diet, which consisted of ten thousand men. The builders were protected by a Theban force, and directed by ten native oecists (official “founders”),

who likewise attended to the peopling of the new city, which apparently drew inhabitants from all parts of Arcadia, but especially from the neighbouring districts of Macenalia and Parrhasia. Forty townships are mentioned by Pausanias (vii. 27, 3-5) as having been incorporated in it. It was 50 stadia in circumference, and was surrounded with strong walls. Its territory was the largest in Arcadia, extending northward 24 m. The city was built on a magnificent scale, and adorned with many handsome buildings, both public and private. Its temples contained many ancient statues brought from the towns incorporated in it. After the departure of Epaminondas, Lycomedes of Mantinea succeeded in drawing the Arcadian federation away from its alliance with Thebes, and it was consequently obliged to make common cause with Athens. An attempt on the part of the federated to use the treasures of the temple of Zeus at Olympia led to internal dissensions, so that in the battle of Mantinea (362) one half of the Arcadians fought on the side of the Spartans, the other on that of the Thebans. After this battle many of the inhabitants of Megalopolis sought to return to their former homes, and it was only by the assistance of three thousand Thebans under Pammenes that the authorities were able to prevent them from doing so. In 353, when Thebes had her hands full with the so-called Sacred War, the Spartans made an attempt to reduce Megalopolis; but the Thebans sent assistance and the city was rescued. Not sure of this assistance, the Megapolitans had appealed to Athens, an appeal which gave occasion to the oration of Demosthenes, Ἱππολόγον Ἀλεξανδρὸν. The Spartans were now obliged to conclude peace with Megalopolis and acknowledge her autonomy. Nevertheless their feeling of hostility did not cease, and Megalopolis consequently entered into friendly relations with Philip of Macedon. Twenty years later, when the Spartans and their allies rebelled against the power of Macedon, Megalopolis remained firm in its allegiance, and was subjected to a long siege. After the death of Alexander, Megalopolis was governed by native tyrants. In the war between Cassander and Polyperchon it took part with the former and was besieged by the latter. On this occasion it was able to send into the field an army of fifteen thousand.

In 234 B.C. Lydiades, the last tyrant of Megalopolis, voluntarily resigned his power, and the city joined the Achaean League. In consequence of this it was again exposed to the hatred of Sparta. In 222 Cleomenes plundered it and killed or dispersed its inhabitants, but in the year following it was restored and its inhabitants reinstated by Philopoemen, a native of the city. After this, however, it gradually sank into insignificance. The only great men whom it produced were Philopoemen and Polybius the historian. Lycortas, the father of the latter, may be accounted a third. In the time of Pausanias the city was mostly in ruins.

The site of Megalopolis was excavated by members of the British School at Athens in the years 1890-1892. The description of Pausanias is so clear that it enabled Curtius, in his Peleponnesos, to give a conjectural plan that was found to tally in most respects with the reality. The town was divided into two approximately equal parts by the river Helisson, which flows through it from east to west. The line of the walls may be traced, partly by remains, partly by the contours it must have followed, and confirms the estimate of Polybius that they had a circuit of 50 stades, or about 53 m. It is difficult to see how the river bed, now a byroad and chiefly waste, was dealt with in ancient times; it must have been embanked in some way, but there are no remains to show whether the fortification wall
MEGANUCLEUS—MEGAPODE

Peristeropodes (Proc. Zool. Soc., 1868, p. 296). Their most remarkable habit is that of leaving their eggs to be hatched without incubation in the ground (as reptiles do), or in a mound of earth, leaves and rotten wood which they scratch up. This habit attracted attention nearly four hundred years ago,1 but the accounts given of it by various travellers were generally discredited, and as examples of the birds, probably from their unattractive plumage, appear not to have been brought to Europe, no one of them was seen by any ornithologist or scientifically described until near the end of the first quarter of the 19th century. The first member of the family to receive authoritative recognition was one of the so-called "mecyclocyous" birds of the Phalangidae family, commonly known as the brush-turkey, and was originally described by J. Latham in 1821 under the misleading name of the New Holland vulture. It is the Cathartes lathami of modern ornithologists, and is nearly the size of a hen turkey. This East Australian bird is of a sooty-brown colour, relieved beneath by the lighter edging of some of the feathers, but the head and neck are nearly bare, beset with fine bristles, the skin being of a deep pinkish-red, passing above the breast into a large wattle of bright yellow. The tail is commonly carried upright and partly folded, somewhat like that of a domestic fowl. Allied to it are three or four species of Targellius, from New Guinea and adjacent islands.

Another form, an inhabitant of South and West Australia, commonly known in England as the mallee-bird, but to the colonists as the "native pheasant"—the Lipoa ocellata, as described by J. Gould in the Proc. Zool. Soc. (1840), p. 126, has much shorter tarsi and toes, the head entirely clothed, and the tail expanded. Its plumage presents a combination of greys and browns of various tints, interspersed with white, and white and buff, the wing-coverts and feathers of the back becoming dark near the base behind, and there was an oval or sub-circular patch, within which the scientific name of the bird is given, while a stripe of black feathers with a median line of white extends down the front of the throat from the chin to the breast. There is but one species of this genus known, as is also the case with the next to be mentioned, a bird long known to inhabit Celebes, but not fully

1 Antonio Pigafetta, one of the survivors of Magellan's voyage, records in his journal, under date of April 1521, among the peculiarities of the Philippines, that a bird was discovered having the following characteristics: "... there is a bird that appears to me to have a large, yellow egg, 1704."

MEGANUCLEUS (also called Macronucleus), in Infusoria (q.v.), the large nucleus which undergoes direct (amitotic) division in fission, and is lost during conjugation, to be replaced by a nucleus, the result of the karyogamy of the microsporid.

MEGAPODE (Gr. μεγᾶς, great and πόδη, foot), the name given generally to a small but remarkable family of birds, characteristic of some parts of the Australian region, to which it is almost peculiar. The Megapodiidae, with the Crabacies and Phasianidae, form that division of the sub-order Galli named by Huxley

(E. G. R.)

was carried across the river at either end or along the parallel embankments so as to make two separate enclosures. There must have been, in all probability, a bridge to connect the two halves of the city, but the foundations seen by Leake and others, and commonly supposed to belong to such a bridge, proved to be only the substructures of the precinct of Zeus Soter. The buildings north of the river were municipal and were grouped round the square agora. One, of which the complete plan has been recovered, is the portico of Philip, a splendid building, which bounded the agora on the north; it was 300 ft. long, with three rows of columns running its whole length, three in the outer line to each one in the two inner lines; it had a set of steps at each end. Of a second portico of west of the agora was found the precinct of Zeus Soter: it consists of a square court surrounded by a double colonnade, and faced on the west side by a small temple; on the east side was an entrance or propylaeum approached by a ramp. In the midst of the court was a substructure which has been variously interpreted as an altar or as the base of the great group of Zeus and Megalopolis, which is recorded to have stood here. North of this was the Stoa Myropolis, forming the east boundary of the agora, and, between this and the Stoa of Philip, the Archelai were the foundations for an earlier wooden precinct, but they consist of a square plot surrounded by a double colonnade, and faced on the east side by a small temple; on the east side was an entrance or propylaeum approached by a ramp. In the midst of the court was the Stoa Myropolis, the colonnade of the east, which, as well as the gutter in front, were dedicated by a certain Antiochus; the orchestra is about 100 ft. in diameter; and in place of the western parados is a closed room called the Scanotheca. The chief peculiarity, however, lies in the great portico already mentioned, which has its base about 4 ft. 6 in. above the level of the orchestra. It was much too lofty to serve as a proscenium; yet, if a proscenium of the ordinary Greek type were erected in front, it would hide the lower part of the columns. Such a proscenium was actually erected in later times; and beneath it the foundations for an earlier wooden precinct, which was probably erected only when required. In later times steps were added, leading from the base of the portico to the level of the orchestra. The theatre was probably used, like the theatre at Athens, for political assemblies; but the adjoining Thersilion provided covered accommodation for the Arcadian ten thousand in wet weather. It is a building unique in plan, sloping up from the centre towards all sides like a theatre. The roof was supported by columns that were placed in lines radiating from the centre, so as to obscure as little as possible the view of an orator in this position from all parts of the building; there were two entrances in each Anx. See MEGAPODE (E. A. Gardner, W. Loring, C. G. Richards, W. J. Woodhouse; Architecture, by R. W. Schultz) Supplemental. Paper issued by the Society for the Promotion of Hellenic Studies, 1892; Journal of Hellenic Studies, xii, 328; A. G. Bather: p. 319, E. F. Benson ("Thersilion"); 1808, p. 15, J. B. Bury ("Double City"); W. Dörpfeld ("Das griechische Theater"); O. Puchstein, ("Griechische Bühne" (Theatre).
MEGARA—MEGARA HYBLAEA

described until 1846,1 when it received from Salomon Müller (Arch. f. Naturgeschichte, xii. p. 1, p. 116) the name of Macrocephalon maleo, but, being shortly afterwards figured by Gray and Mitchell (Gen. Birds, iii. pl. 123) under the generic term of Megapodophal, has since commonly borne the latter appellation. This bird bears a helmet-like protuberance on the back of its head, all of which, as well as the neck, is bare and of a bright colour, while the rest of the body is glossy black above, and beneath roseate-white.

Of the megapodes proper, constituting the genus Megapodus, about fifteen species are admitted. The birds of this genus range from the Samoa Islands in the east, through the Tonga group, to the New Hebrides, the northern part of Australia, New Guinea and its neighbouring islands, Celebes, the Pelew Islands and the Ladrones, and have also outliers in detached portions of the Indian Region, as the Philippines (where indeed they were first discovered by European), Labuan, and even the Nicobars—though none is known from the intervening islands of Borneo, Java or Sumatra. Within what may be deemed their proper area they are found, says A. R. Wallace (Geogr. Dist. Animals, ii. 341), "on the smallest islands and sandbanks, and can evidently pass over a few miles of sea with ease."

Indeed, proof of their roaming disposition is afforded by the fact that the bird described by Lesson (Voy. Coquille: Zoologie, p. 703) as Alectohia auritili, but now considered to be the young of Megapodus freycineti, flew on board his ship when more than 2 m. from the nearest land (Guebe), in an exhausted state, it is true, but that may be attributed to its youth. The species of Megapodus are about the size of small fowls, the head generally crested, the tail very short, the feet enormous, and, with the exception of M. wallachi (Proc. Zool. Soc., 1860, Ave, pl. 171), from the Moluccas, all have some sombre plumage.

Megapodes are shy terrestrial birds, of heavy flight, and omnivorous diet. In some islands they are semi-domesticated, although the flesh is dark and generally unpalatable. (A. N.)

MEGARA, an ancient Greek town on the road from Attica to Corinth. The country which belonged to the city was called Megara or Μεγαρᾶ; it occupied the broader part of the isthmus between Attica, Boeotia, Corinth, and the two gulfs, and its whole area is estimated by Clinton at 143 sq. m. The range of Mount Geranea extends across the country from east to west, forming a barrier between continental Greece and the Peloponnesus. The shortest road across this range passes along the eastern side of the mountains, and the most direct is the so-called "Sciron Road," which leads to the mythic home of the robber Sciron. The only plain in the rugged little country was the White Plain, in which was situated the only important town, Megara. The modern town of Megara is situated on two low hills which formed part of the ancient site; it is the chief town of the eparchy of Megarid; pop. about 6,500. It contains few remains of antiquity, except of the aqueduct and basin, said to have been made by the architect Eupalinus for the tyrant Theagenes.

(E. G.)

From the somewhat conflicting evidence of mythology it may be gathered that in prehistoric days Megara had maritime intercourse with the southern Aegean. The early inhabitants, whose race is unknown, were extirpated or absorbed in the Dorian migration, for in historic times the city had a homogeneous Dorian population. Favoured by its proximity to two great waterways and by its two ports, Nisaea on the Saronic and Pegae on the Corinthian Gulf, Megara took a prominent part in the commercial expansion of Greece from the 8th century onwards, and for two hundred years enjoyed prosperity out of proportion to the size of its territory. Its trade was mainly directed towards Sicily, where Megarans colonized Attica established by Hybla (Megara Hyblaea) and Selinus, and towards the Black Sea, in which region the Megarians were probably pioneers of Greek commerce. In the Sea of Marmora they had to face the competition of the Samians, with whom they waged a war concerning the town of Perinthus, and of Miletus; but on the Bosphorus they established themselves by means of settlements at Chalcedon and, above all, Byzantium (founded, according to tradition, 675 and 658 respectively). In the Black Sea they were not able to establish colonies, and the products they exchanged for textiles spun from the wool of their own country. Their chief colonies in this sea were Astacus and Heraclea in Bithynia, and another Heraclea in the Crimea. In the later 7th century this current of trade dwindled in face of the great commercial and colonizing activity of Miletus; it probably received further injury through the subsequent interference of Athens on the Hellespont. Simultaneously Megarian commerce in Sicily began to be supplanted by Corinth and Corcyra.

Megara's economic development entailed a change in the distribution of wealth, and consequently of political power, which is commented upon in the elogies of Theognis (774). The original land-holding aristocracy, which had probably initiated and for a time monopolized commerce, was partly supplanted by prosperous middlemen. At the same time, the cultivation of the land with its fruits was reduced, leaving its hold upon the community of artisans. In the ensuing party struggles the city passed under a tyrant, Theagenes (about 640), who reorganized it. He reduced the Megarians too large to produce great changes. The power of the nobles would seem to have been more effectively broken in a war with Athens, in which Megara ultimately lost the island of Salamis (about 570, see SOLON), for shortly afterwards the conspiracy of the middle class, with revulsion against tyranny, and eventually was fixed as an oligarchy of a moderate type.

During the Persian wars the state, which had recently joined the Peloponnesian League, could still muster 3000 hoplites. But the subsequent expansion of Athens ruined the commerce of Megara, and the town itself was threatened with absorption by some powerful neighbour. In 459 an attack by Corinth, which had always coveted Megara's territory, induced the people to summon the Athenians, who secured Megara in battle and by the construction of long walls between the capital and its port Nisaea. In 445 a revulsion of feeling led the Megarians to massacre their Athenian garrison. The Athenians retaliated by placing an embargo upon Megarian trade throughout their empire (432), and in the Peloponnesian War, which the Megarians had consequently striven to hasten on, reduced their neighbours to misery by blockade and devastation. In 424 they nearly captured Megara, in collusion with a democratic party within the town, and succeeded in securing Nisaea, which they held till 410. In the 4th century Megara recovered some of its previous strength and took an important part in politics, its only notable move being the participation in the final conflict against Philip II. of Macedon (338). During the Macedonian supremacy the town passed in turn from Cæsarean hands to Great Antiochus; in 312 it was incorporated in the Achaean League. Megara suffered severely during the Civil War of 48 B.C., but seems at some later period to have recovered new strength. It retained its independence; it maintained itself as a place of some size in subsequent centuries, as it was described; and it was razed in A.D. 1500. The inhabitants of the modern village are mostly of Albanian origin.

In literature Megara figures as the reputed home of the comedian Susrion, and in the 4th century gave its name to a school of philosophy founded by Euclid.

MEGARA HYBLAEA (perhaps identical with HYBLA MAJOR), an ancient city of Sicily, on the E. coast, 12 m. N.N.W. of Syracuse, founded in 728 B.C. by Megarean colonists, who had previously settled successively at Trotilon, Leontini and Thapsus. A hundred years later it founded Selinus, apparently because it had no room for development. It never seems to have been a town of great importance, and had no advantages of position. It was destroyed by Gelon about 481 B.C., and its walls seem to have been razed to the ground. In the Athenian war against Syracuse (415–413) Lamachus proposed (it being then deserted) making it the Athenian base of operations; but his advice was not taken, as it is more probable the Syracusans fortified it. In 309 it was still fortified; but, after Marcellus captured it, in 214, we hear little more of it. Excavations carried on in 1891 led to the discovery of the
northern portion of the western town wall, which in one section served at the same time as an embankment against floods (it was apparently more conspicuous in the time of P. Clüver, *Sicilia*, p. 133), of an extensive necropolis, about 1000 tombs of which have been explored, and of a deposit of votive objects from a temple. The harbour lay to the north of the town.

See P. Orsi in *Monumenti dei Lincei* (1891), i. 689–950; and *Atti del congresso delle scienze storiche*, v. 181 (Rome, 1904). (T. As.)

MEGARIAN SCHOOL OF PHILOSOPHY. This school was founded by Euclides of Megara, one of the pupils of Socrates. Two main elements went to make up the Megarian doctrine. Like the Cynics and the Cyrenaics, Euclides started from the Socratic principle that virtue is knowledge. But into combination with this he brought the Eleatic doctrine of Unity. Perceiving the difficulty of the Socratic dictum he endeavoured to give to the word "knowledge" a definite content by divorcing it absolutely from the sphere of sense and experience, and confining it to a sort of transcendental dialectic or logic. The Eleatic unity is Goodness, and is beyond the sphere of sensible apprehension. This goodness, therefore, alone exists; matter, motion, growth and decay are figments of the senses; they have no existence for Reason. "Whatever is, is!" Knowledge is of ideas and is in conformity with the necessary law of thought. Hence Plato in the *Sophist* describes the Megarians as "the friends of ideas." Yet the Megarians were by no means in agreement with the Platonic idealism. For they held that ideas, though eternal and immoveable, have neither life nor action nor movement.

This dialectic, initiated by Euclides, became more and more opposed to the testimony of experience; in the hands of Eubulides and Alexinus it degenerated into hair-splitting, mainly in the form of the *reductio ad absurdum*. The strength of these men lay indestructive criticism rather than in construction; as dialecticians they were successful, but they contributed little to ethical speculation. They spent their energy in attacking Plato and Aristotle, and hence earned the opprobrious epithet of *Eristic*. They used their dialectic subtlety to disprove the possibility of motion and decay; unity is the negation of change, increase and decrease, birth and death. None the less, in ancient times they received great respect owing to their intellectual pre-eminance. Cicero (Academics, ii. 42) describes their doctrine as a "nobilis disciplina," and identifies them closely with Parmenides and Zeno. But their most immediate influence was upon the Stoics (§ 4), whose founder, Zeno, studied under Stilpo. This philosopher, a man of striking and attractive personality, succeeded in fusing the Megarian dialectic with Cynic naturalism. The result of the combination was in fact a juxtaposition rather than a compound; it is manifestly impossible to find an organic connexion between a practical code like Cynicism and the transcendental logic of the Megarians. But it served as a powerful stimulus to Zeno, who by descent was imbued with oriental mysticism.

For bibliographical information about the Megarians, see EUCLEIDES; EUBULIDES; DIOGENES CRONUS; STILPO. See also ELATIC SCHOOL; CYNICS; STOICS; and, for the connexion between the Megarians and the Eleatics, MENDEXMUS and PHAEDO. MEGARON, the principal hall of the ancient Greek palace, situated in the andron or men's quarter. Examples have been found at Tiryns and Mycenae, and references are made to it in the *Iliad* and the *Odyssey*.

MEGATHERIUM (properly *Megatherium*), a huge extinct edentate mammal from the Pleistocene deposits of Buenos Aires, typifying the family *Megatheridae* (or *Megalotheriidae*), and by far the largest representative of the Edentata. Except, indeed, for its relatively shorter limbs *Megatherium americanum* rivalled an elephant in bulk, the total length of the skeleton being 18 feet, five of which are taken up by the tail. The *Megatheridae*, which include a number of genera, are collectively known as ground-sloths, and occupy a position intermediate between the sloths and the ant-eater; their skulls being of the type of the former, while their limbs and vertebrae conform in structure to those of the latter. As in the other typical South American edentates, there are no teeth in the front of the jaws, while those of the cheek-series usually comprise five pairs in the upper and four in the lower. In nearly all the other Pleistocene forms these teeth were subcylindrical in shape, with the summit of the crown (except sometimes in the first pair) forming a cup-like depression; enamel being in all cases absent. From all these *Megatherium* differs in the form and structure of the teeth.

In form, as shown in fig. 2, the teeth are quadrangular prisms, each of which is surmounted by a pair of transverse ridges. They grew apparently throughout life, and were implanted to a great depth in the jaws, being 7 or 8 in. in length, with a cross-section of at least an inch and a half. The ridges on the crown are due to the arrangement of the vertical layers of hard dentine (fig. 3, d), softer vascular dentine (e) and cement (c). The skull is relatively small, with the lower jaw very deep in its central portion, and produced in part into a long snout-like synphysium for the reception, doubtless, of a large and fleshy tongue (fig. 2). Unlike sloths, the *megatherium* has seven cervical vertebrae; and the spines of all the trunk-vertebrae incline backwards. The pelvis and hind-limbs are much more powerful than the fore-quarters; thereby enabling these animals, in all probability, to rear themselves on their hind-quarters, and thus pull down the branches of trees. If not, indeed, in some cases to bodily uproot the trees themselves. Large chevron-bones are suspended to the vertebrae of the tail, which was massive, and probably afforded a support when the monster was sitting up. The humerus has no foramen, and the
whole fore-limb was very mobile. The first front toe was rudimentary, having no phalanges, but the fifth was rather less aborted, although clawless; the other three carried enormous claws, protected by reflected sheaths. The hind-foot is remarkable for the great backward projection of the calcaneum, and likewise for the peculiar shape of the astragalus; the middle toe alone carries a claw, this being of huge size, and enameled like those of the fore foot. No trace

of a bony armour in the skin has been detected; but, from the evidence of other genera, it may be assumed that the body was clothed in a coat of long, coarse hair. Although similar teeth occur in the phosphorite beds of South Carolina, which may have been transported from elsewhere, no undoubted remains of Megatherium are known from North America.

The typical species ranged from Argentina and Chili to Brazil. For certain small ground-dwights from Patagonia with Megatherian-like teeth, see MvLODON. (R. L. E.)

MEGHNA, a river of India. It forms, in the lower part of its course, the great estuary of the Bengal delta, which convey to the sea the main body of the waters of the Ganges and the Brahmaputra, which unite at Goalanda in Faridpur district. The united waters, turbid and of great depth, are sometimes split into half a dozen channels by sand-banks, sometimes spread into a wide sheet of water. The river enters the sea by four principal mouths, enclosing the three large islands of Dakshin Shahbazpur, Hatia and Sandwip. It is navigable by native boats and river steamers all the year; but the navigation is difficult and sometimes dangerous on account of shifting sand-banks and snags, and boisterous weather when the monsoon is blowing. The most favourable season is between November and February. Alluvion and diluvion are constantly taking place, especially along the seaboard, and in Noakhali district the land is said to have made rapid advance on the sea; while the islands fringing the mouth are annually being cut away and redeposited in fresh shapes. The regular rise of the tide is from 10 to 13 ft., and at springs the sea rushes up in a dangerous bore. It is greatest at the time of the biennial equinoxes, when navigation is sometimes impeded for days together. The tidal wave advances like a wall topped with foam of the height of nearly 20 ft., and at the rate of 15 m. an hour; in a few minutes it is past, and the river has changed from ebb to flood tide. A still greater danger is the "storm wave" which occasionally sweeps up the Meghna under a cyclone.

MEHÁDIA, a market town of Hungary, in the county of Krassó-Széredény, 287 m. S.E. of Budapest by rail. Pop. (1900), 2402. The town is the site of the ancient Roman colony Ad Mediam, near which passed the Roman road from the Danube to Dacia. It contains the ruins of a fortress, and other Roman remains. In its neighbourhood are the famous Hercules baths (Hungarian, Herculesfürdo). These are situated in a narrow rocky ravine in the valley of the Cserna, where there are 32 hot springs, of which nine are in use, the most powerful being the Hercules spring. The springs are all strongly impregnated with salts of sulphur, iodine, bromine and chlorine, and their average temperature is 70° to 145° F. They were famous in the Roman period under the name of Thermæ Herculis or Fontes Herculis. Their popularity is attested by numerous inscriptions and relics. After the fall of the Roman Empire they fell into disuse until 1775, but have been turned times until now and have been much frequented.

MEHMET ALI (1769–1849), pasha and afterwards viceroy of Egypt, was born at Kavala, a small seaport on the frontier of Thrace and Macedonia. His father, an Albanian, was an ağa, a small yeoman farmer, and he himself lived in his native town for many years as a petty official and trader in tobacco. In 1798 he became second in command of a regiment of bashi-bazouks, or volunteers, recruited in his neighbourhood to serve against Napoleon in Egypt. He took part in the battle of Aboukir (July 25, 1798), was driven into the sea with the routed Turks, and was saved from drowning by the gig of the British admiral, Sir Sidney Smith. In 1801 he returned to Egypt, in command of his regiment, and on the 9th of May distinguished himself by heading a bold cavalry charge at the battle of Rafahinieh. In the troubled years that followed, Mehemet Ali, leader of a compact body of Albanian clansmen, was, in the best position to draw advantage from the struggle for power between the Mamelukes and the representatives of the Porte. In 1803 he cast in his lot with the former; in 1804 he turned against them and proclaimed his loyalty to the sultan; in 1805 the sheiks of Cairo, in the hope of putting a stop to the intolerable anarchy, elected him pasha, and a year later an imperial firman confirmed their choice. The disastrous British expedition of 1807 followed; and while at Constantinople the prestige of the sultan was being undermined by the series of revolutions which in 1808 brought Mahomed II. to the throne, that of Mehemet Ali was enhanced by the exhibition at Cairo of British prisoners and an avenue of stakes decorated with the heads of British slain.

The situation revealed to the astute Albanian boundless possibilities. For great as his ambitions were, and great in number was the blow to the Egyptian scheme and the economic success of the public revenues, it was not without a semblance of his chance victories, he was too shrewd an observer not to recognize the superiority of European methods of warfare; and as the first step towards the empire of which he dreamed he determined to create an army and a fleet on the European model. In 1808 the building and organization of the navy was begun with the aid of French officers and engineers. In 1811 the massacre of the Mamelukes left Mehemet Ali without a rival in Egypt, while the foundations of his empire beyond were laid by the war against the Wahhabis and the conquest of the holy cities of Mecca and Medina. The Wahhabí War, indeed, dragged on till 1818, when Ibrahim (q.v.), the pasha's son, who in 1816 had driven the remnant of the Mamelukes into Nubia, brought it to an end. This done, the pasha turned his attention southward to the vast country watered by the Upper Nile. In 1820 the oasis of Siwa was subdued by his arms; in 1823 he laid the foundations of Khartum.

By this time Mehemet Ali was the possessor of a powerful fleet and of an army of veterans disciplined and drilled by European officers. To obtain these money had been necessary and to raise money the pasha had instituted those internal "reforms"—the bizarre system of state monopolies and the showy experiments in new native industries which are described in the article Egypt (q.v.). The inherent viciousness of these expedients had, however, not as yet been revealed by their inevitable results, and Mehemet Ali in the eyes of the world was at once the most enlightened and the most powerful of the sultan's vails. To Mahomed II., whose whole policy was directed to strengthening the authority of the central power, this fact would have sufficed to make him distrust the pasha and desire his downfall, and it was sorely against his will that, in 1822, the ill-success of his arms against the insurgent Greeks forced him to summon Mehemet Ali to his aid. The immediate price was the pashalik of Crete; in the event of the victory of the Egyptian armys the pashaliks of Syria and Damascus were to fall to Mehemet Ali, that of the Morea to his son Ibrahim. The part played by Mehemet Ali in the Greek War is described elsewhere (see Turkey: History; Greece: History; Greek Independence, War of
MEHEMET ALI

Ibrahim). The intervention of the powers, culminating in the
shattering of the Egyptian fleet at Navarino (q.v.), robbed him
of his reward so far as Greece was concerned; the failure of his
arms in face of this intervention gave Sultan Mahmud the excuse
he desired for withholding the rest of the stipulated price of his
assistance.

This disappointment of his ambition would not perhaps in
itself have sufficed to stir Mehemet Ali to revolt against his
master; but the influence of popular feeling in the other
aspects of the pasha thought it wise to forestall.
The sultan's policy had been consistently directed to crushing the overgrown power of his
vassals; in the spring of 1831 two rebellious pashas, Hussein of
Bosnia and Mustafa of Scutari, had succumbed to his arms;
and, since he was surrounded and counselled by the personal
enemies of the pasha of Egypt, it was likely that, so soon as he
should feel himself strong enough, he would deal in like manner
with Mehemet Ali. It was to anticipate this peril that Mehemet
Ali determined himself to open the struggle: on the 1st of Novem-
ber 1831 a force of 6000 Egyptian infantry and 5000
soldiers crossed the frontier into Syria and met at Jaffa the fleet
which brought Ibrahim as commander-in-chief. The combined forces
at once laid siege to St Jean d'Acro.

The stubborn resistance of the garrison delayed Ibrahim's
progress; and, meanwhile, wild rumours went abroad as to Mehe-
met Ali's intentions. He was master of the holy cities, and the
official Monteur Ottoman denounced his supposed plan of aiming
at the caliphate in collusion with the sherifs of Mecca. As for
the pasha himself, he loudly disclaimed any such disloyal pre-
tensions; his aim was to chastise Abdullah, pasha of Acre, who had
harboured fugitives from his "reforms" to the territory of Khusrov,
who had encouraged him in his refusal to surrender them; to
secure the fulfilment of the sultan's promise with regard to Syria
and Damascus. Mahmud, on the other hand, was torn between
hatred of the pasha and hatred of the Christian powers which
had forced him to make concessions to the Greeks. Voices urged
him to come to terms with Mehemet Ali, secure peace in Islam,
and turn a united face of defiance against Europe; and for a while
he harboured the idea. He was conscious of his own intense
unpopularity, the outcome of his efforts at reform; he knew that
he was not popular in opinion. Mehemet Ali was the descendant of
Islam against the infidel caliph, and that the issue of a struggle with him
was more than doubtful. He was hampered by the unpaid debt
to Russia; by unrest in Bosnia and Albania; above all, by the
revolt of the Greek Islands, which had left his navy, deprived of
its best sailors, in no condition to dispute the Egyptian com-
mand of the sea. In the end, however, his pride prevailed; in
April 1833 the Turkish commander-in-chief Hussein Pasha left
Constantinople for the front; and in the third week in May the
ban of outlawry was launched against Mehemet Ali.

Meanwhile, Ibrahim had occupied Gaza and Jerusalem as well
as Jaffa; on the 27th of May, a few days after the publication
of the ban, Acre was stormed; on the 15th of June the Egyptians
occupied Damascus. Ibrahim pressed on with characteristic
rapidity, his rapid advance being favoured by the friendly
attitude of the various sections of the Syrian population, whom
he had been at pains to conciliate. He defeated the Ottoman
advance-guard at Homs on the 9th of July and at Hamah on
the 11th, entered Aleppo on the 17th, and on the 20th inflicted
a crushing defeat on the main Turkish army under Hussein
Pasha at the pass of Bellan. All Syria was lost to the sultan, and
the Egyptian advance-guard passed the mountain defiles
into Adana in Asia Minor.

Mahmud, in desperation, now turned for help to the powers.
Russian aid, though promptly offered, was too double-edged a
weapon to be used save at the last extremity. Austrian diplo-
macy was, for the moment, that of Russia. France had broken
her long tradition of friendship for Turkey by the occupation of
Algiers. Great Britain, prodigal of protests of goodwill,
alone remained; and to her Mahmud turned with a definite offer
of an offensive and defensive alliance. Stratford Canning, who
was at Constantinople for the purpose of superintending the
negotiations for the delimitation of the frontiers of Greece, wrote
home urging the government to accept, and suggesting a settle-
ment of the Egyptian question which foreshadowed that of 1842.
Palmerston, however, did not share Canning's belief in the
possible regeneration of Turkey; he held that an isolated inter-
vention of Great Britain would mortally offend not only Russia
but France, and that Mehemet Ali, disappointed of his ambitions,
would find in France a support that would make him doubly
dangerous.

In September Sultan Mahmud, as a last independent effort,
despatched against Ibrahim the army which, under Reşhid Pasha,
had been engaged in pacifying Albania. The result was the
crowning victory of the Egyptians at Konia (Dec. 21). The
news reached Constantinople at the same time as Count Muraviev
arrived on a special mission from the tsar. The Russian offers
were at once renewed of a squadron of battleships and of a land
force for the protection of the capital. Efforts were made to
escape the necessity of accepting the perilous aid. Ottoman
agents, backed by letters from the French chargé d'affaires, were
sent to Mehemet Ali and to Ibrahim, to point out the imminence
of Russian intervention by Mehemet Ali of the sultan's terms.
And himself went to Alexandrià, where, backed by the Austrian agent,
Count Prokesch-Osten, he announced to the pasha the tsar's
immutable hatred of rebels. Mehemet Ali merely protested the
complete loyalty of his intentions; Ibrahim, declaring that as a
soldier he had no choice but to obey his father's orders, advanced
to Adium-Karahissar and Kutalab, whence he wrote to the sultan
asking his gracious permission to advance to Brusa. He was at
the head of 100,000 men, well organized and flushed with victory;
the Ottoman army survived only as demoralized rabble. Panic
seized the Seraglio and at the beginning of February the assis-
tance of Russia was formally demanded. The representatives
of France and Great Britain made every effort to secure a
reversal of this fatal step; but, while they were threatening
and promising, Russia was acting, and on the 20th of February
a Russian squadron entered the Bosphorus.

In view of this it became necessary for the objecting powers
to take a new line. The new French ambassador, Admiral Roussin,
had arrived on the 17th; he now, with the full concurrence of
Mandeville, the British chargé d'affaires, persuaded the Porte
to invite the Russians to withdraw, undertaking that France would
seek the acceptance by Mehemet Ali of the sultan's terms.
A period of suspense followed. The Russian squadron was
detained by contrary winds, and before it could sail peremptory
orders arrived from the tsar for it to remain until Ibrahim should
have repassed the Taurus mountains. Meanwhile, Mehemet Ali
had scornfully rejected the offers of the Porte; he would be
content with nothing but the concession of his full demands—Syria,
Ichell, Aleppo, Damascus and Adana. France and Great Britain
now urged the sultan to yield, and in March a Turkish agent
was sent to Ibrahim to offer the pashaliks of Syria, Aleppo and
Damascus. The crisis was precipitated by the arrival on the 5th
of April of a second division of the Russian fleet in the Bosphorus,
and of a Russian force of 6000 men, which landed on the Asiat-
ic shore. The Porte now tried once more to modify its terms; but
the Western powers were now intent on getting rid of the Russians
at all costs, and as a result of the pressure they brought to bear
on both parties the preliminary convention of Kutalab, conced-
ing all the Egyptian demands, was signed on the 8th of April, and
Ibrahim began his withdrawal. The convention stipulated for
the bestowal of the pashalik of Adana on Ibrahim; but when on
the 16th he received the official list of appointments, he found
that he had been expressly reserved by the sultan. He at
once arrested his march; but the pressure of famine in the capital,
caused by the cutting off of supplies from Asia and the presence
of the large Russian force, compelled Mahmud to yield, and on
the 3rd of May a firman ceded Adana to Ibrahim under the pretext
of appointing him muhassil, or collector of the revenue.

When Lord Ponsonby, the new British ambassador, arrived at

1 Canning's original memorandum is in the Foreign Office Records
in the volume marked F.O. Turkey: From Sir Stratford Canning
(August to December, 1832). It bears elaborate pencil notes
in Palmerston's handwriting, in part already obliterated.
Constantinople on the 1st of May he found Russia practically in possession. Sultan Mahmud was to the last degree embittered against the powers which, with lively protestations of friendship, had forced him to humble himself before his hated vassal. Russia had given him deeds, not words; and to Russia he committed himself. At the end of March or early in April several Russian agents had arrived on the 22nd of April; Russian engineers were busy with the fortifications along the Straits; Russian agents alone were admitted to the sultan's presence. "It is a manifest," wrote Lord Ponsonby, "that the Porte stands in the relation of vassal to the Russian government." The relation was soon to be yet more manifest. Before, on the 9th of July, the Russian fleet, with the Russian troops on board, weighed anchor for the Black Sea, there was signed at the palace of Unkier Skelassi the famous treaty (July 8, 1833) which, under the guise of an offensive and defensive alliance, practically made Russia the custodian of the gates of the Black Sea. (See Turkey: History.)

Mehemet Ali had triumphed, but he was well aware that he held the fruits of his victory by a precarious tenure. He was still but a vassal among the rest, holding his many pashaliks nominally by the sultan's will and subject to annual reappointment; and he knew that both his power and his life would be forfeit so soon as the sultan should be strong enough to deprive him of them. To achieve this one end, indeed, became the overmastering passion of Mahmud's life, to defeat it the object of all Mehemet Ali's policy. So early as 1834 it seemed as though the struggle would be renewed; for Mehemet Ali had extended to his new pashaliks his system of monopolies and conscription, and the Syrians, finding that they had exchanged Turkish whips for Egyptian scorpions, rose in a passion of revolt. It needed the intervention of Mehmet Ali in person before, in the following year, they were finally subdued. Meanwhile it had needed all the diplomatic armory of the powers to prevent Mahmud hastening to the assistance of his "oppressed subjects." The threats of Great Britain and France, the failure of Russia to back him up, induced him to refrain; but sooner or later a renewal of the war was inevitable; for the sultan, with but one end in view, was reorganizing his army, and Mehemet Ali, who in the autumn of 1834 had assumed the style of viceroy and sounded the powers as to their attitude in the event of his declaring his complete independence, refused to continue to pay tribute which he knew would be used against himself. The crisis came in 1838. In March the Egyptians were severely defeated by the revolted Arabs of the Hauran; and the Porte, though diplomatic pressure kept it quiet, hurried on preparations for war. Mehemet Ali, too, had small reason for postponing the conflict. The work of Moltke, who with other German officers who had been engaged in organizing the Turkish army, threatened to destroy his superiority in the field; the commercial treaty signed by the Ottoman government with Great Britain (Aug. 10), which applied equally to all the territories under his rule, threatened to destroy at a blow the lucrative monopolies which supplied him with the sinews of war. Months of suspense followed; for the powers had threatened to cast their weight into the scale against whichever side should prove the aggressor, and Mehemet Ali was too astute to make the first move. In the end Mahmud's passion played into his hands. The old sultan thirsted to crush his rebellious vassal, at any cost; and on the 21st of April 1839 the Ottoman army, stationed at Bir on the Eufrates, crossed the stream and invaded Syria. On the 23rd of June it was attacked and utterly routed by the Egyptians. On the old man died, unconscious of the fatal news, leaving his throne to Abdul-Mejid, a lad of sixteen. To complete the desperation of the situation the news reached the capital that Ahmed Pasha, the Ottoman admiral-in-chief, had sailed to Alexandria and surrendered his fleet to Mehemet Ali, on the pretext that the sultan's advisers were sold to the Russians.

So far as the forces of the Ottoman Empire were concerned, 1 From Lord Ponsonby, F.O., Turkey, May 22, 1833.

Mehemet Ali was now absolute master of the situation. The grand vizier, in the sultan's name, wrote beseeching him to avoid the further shedding of Mussulman blood, offering him a free pardon, the highest honour of the state, the hereditary pashalik of Egypt for himself, and Syria for Ibrahim until he should succeed his father in Egypt. Mehemet Ali replied diplomatically; for, though these offers fell far short of his ambitions, a studious moderation was essential in view of the doubtful attitude of the European powers.

On the 27th of July the ambassadors of the five powers presented to the Porte a joint note, in which they declared that an agreement on the Eastern Question had been reached by the five Great Powers, and urged it "to suspend all definite decision made without their concurrence, pending the effect of their interest in its welfare." The necessity for showing a united front justified the diplomatic inexactitude; but the powers were agreed on little except the need for agreement. Especially was this need realized by the British government, which feared that Russia would seize the occasion for an isolated intervention under the treaty of Unkier Skelassi. On the 1st of August Palmerston wrote to Ponsonby impressing upon him that the representatives of the powers, in their communications with the Porte, "should act not only simultaneously in point of time, but identically in point of manner"—a principle important in view of later developments; for it was tantamount to preserving the appearance of unanimity in view of the divergent views within the concert. France and Great Britain had hitherto acted together through common opposition to the supposed designs of Russia. Austria, too, now that the revolutionary spectres of 1848 had been laid, was reverting to her traditional opposition to Russia in the affairs of the Near East, and Metternich supported Palmerston's proposal of an international conference at Vienna. Everything depended on the attitude of the emperor Nicholas. This was ultimately determined by his growing distrust of Austria and his desire to maintain the dual monarchy and the alliance with Great Britain. With this view of the situation in view of the concert of the Powers, it was altogether impossible to preserve the appearance of an agreement between the Powers, and the second led him to drive a wedge into the Anglo-French entente by making direct overtures to Great Britain. Palmerston listened to the tsar's proposals, conveyed through Baron Brunnow, "with surprise and admiration." The emperor Nicholas was prepared to accept the views of Great Britain on the Turco-Egyptian question; to allow the Treaty of Unkier Skelassi to lapse; to act henceforth in the Ottoman Empire only in concert with the other powers; to sign an agreement closing the Dardanelles to the war-ships of all nations and to extend the same principle to the Bosporus. Finally, Brunnow was empowered to arrange a coalition of the great powers with a view to the settlement of the Egyptian question; and in this coalition the tsar was willing, for political reasons, that France should be included, though he stated his personal preference for her exclusion.

To these views Austria and, as a natural consequence, Prussia acceded without difficulty. The attitude of France was a more doubtful quantity. In France Mehemet Ali had become a popular hero; under him French civilization had gained a foothold in Egypt; he was regarded as invincible; and it was hoped that in alliance with him French influence in the Mediterranean would be supreme. Palmerston, on the other hand, believed that the Ottoman empire would never be secure until "the desert had been placed between the pasha of Egypt and the sultan; and the view that the coalition should be directed against Mehemet Ali was shared by the other powers. In the circumstances France should either have loyally accepted the decision of the majority of the concert, to return for an agreement closing the Dardanelles to the war-ships of all nations and to extend the same principle to the Bosporus. Finally, Brunnow was empowered to arrange a coalition of the great powers with a view to the settlement of the Egyptian question; and in this coalition the tsar was willing, for political reasons, that France should be included, though he stated his personal preference for her exclusion.
Egypt, a proposition to which Palmerston, though sincerely anxious to preserve the Anglo-French entente, refused to agree. The tension of the situation was increased when, on the 20th of February 1840, Thiers came into power. The diplomacy of Guizot, backed now by Austria and Prussia, had succeeded in persuading Palmerston to concede the principle of allowing Mehemet Ali to receive, besides Egypt, the pashalik of Acre as far as the frontiers of Tripoli and Damascus (May 7). Thiers, having refused to listen to any suggestion for depriving him of any part of Syria; but, indeed, in the correspondence and leaving the concert, he continued the negotiations, and before long circumstances came to the knowledge of the British government which seemed to prove that he was only doing so with a view to gaining time in order to secure a separate settlement in accordance with French views.

The opportunity for this arose from a change in the situation at Constantinople, where the dismissal of Khusrev Pasha had, in Mehemet Ali's view, removed the main obstacle to his reconciliation with the sultan. He proposed to the French consul-general at Alexandria to make advances to the Porte in order to effect a settlement. In the circumstances the proper course for Thiers to have pursued would have been to have communicated to the powers, to whom he was bound by the moral engagement of the 27th of July 1839, the new conditions arising out of Mehemet Ali's offer. Instead he wrote to Guizot, on the 30th of June, saying that the situation argued strongly in favour of postponing any decision in London, adding: "I have written to Alexandria and Constantinople to counsel moderation on both sides; but I have been careful to forbid the agents to enter on their own account, and as a French undertaking, on a negotiation of which the avowed aim is a direct arrangement. If such an enterprise is imposed on us, you will be in a position to deny it." The discovery of what seemed an underhand intrigue on the part of France produced upon the powers exactly the effect for which Thiers had deprecated it. The demand was regarded as an attempt to ruin the work of the concert and to secure for France a "complete individual triumph" at Alexandria and Constantinople; and their countermove was to sign at London on the 15th of July, without the concurrence of France, a convention with the Porte for the settlement of the affairs of the Levant. By this instrument it was agreed that the terms to be offered to Mehemet Ali having been concerted with the Porte, the signatory powers would unite their forces in order to compel the pasha to accept the settlement. As to the terms to be offered, it was arranged that, in the event of Mehemet Ali yielding within ten days, he should receive the hereditary pashalik of Egypt and the administration for life of southern Syria, with the title of Pasha of Acre and the possession of the fortress of St Jean d'Acre. At the end of ten days, should he remain obdurate, the offer of Syria and Acre would be withdrawn; and if at the end of another ten days he was still defiant, the sultan would hold himself at liberty to withdraw the whole offer and to take such measures as his own interests and the counsels of his allies might suggest to him.

The news of this "mortally affront" to the honour of France caused immense excitement in Paris. The whole press was clamorous for war. Thiers declared that the alliance with Great Britain was shattered, and pressed on warlike preparations; even Louis Philippe was carried away by the fever. The immediate effect was that Mehemet Ali, confident of French assistance, maintained a defiant attitude. The situation, however, was rapidly changed by the unexpected results of the armed intervention of the Allies. The appearance of the combined British, Austrian and Russian fleets, under Sir Charles Napier, off Beirut (Aug. 11) was the signal for a general rising of the Syrians against Ibrahim's tyranny. On the 11th of September, Suleiman Pasha not having obeyed the summons to evacuate the town, the bombardment was begun, and Ottoman troops were landed to co-operate with the rebels. On the 3rd of October Beirut fell; and Ibrahim, cut off from his communications by sea, and surrounded by a hostile population, began a hurried retreat southward. On the 3rd of November Acre surrendered to the allied fleet. Mehemet Ali's power in Syria had collapsed like a pricked bubble; and with it had gone for ever the myth of his humane and enlightened rule. The sole question now was whether he should be allowed to retain Egypt itself.

On the 15th of September the sultan, who had broken off all negotiations with Mehemet Ali on receipt of the news of the Syrian revolt, acting on the advice of Lord Ponsonby, declared the pasha deposed, on the ground that the term allowed by the Convention of London had expired, and nominated his successor. Mehemet Ali received the news with his accustomed sang-froid, observing to the consuls of the four powers, who had come to notify their own removal, that "such denunciations were nothing new to him; that this was the fourth, and that he hoped to get over it as well as he had done the other three with the help of God and the Prophet." In the end his confidence proved to be justified. The news of the events in Syria and especially of the deprivation of Mehemet Ali had produced in France what appeared to be an exceedingly dangerous temper; the French government declared that it regarded the maintenance of Mehemet Ali in Egypt as essential to the European balance of power; and Louis Philippe sought to make it clear to the British government, through the king of the Belgians, that, whatever might be his own desire to maintain peace, in certain events to do so would be to risk his throne. Palmerston, indeed, who did not believe that under the Bourgeois Monarchy France would translate her brave words into action, was in favour of settling the Turco-Egyptian question once for all by depriving Mehemet Ali of Egypt as well. The influences against him, however, were too powerful. Metternich protested against a course which would result, in his opinion, either in a war or a revolution in France; King Leopold enlarged on the wickedness and absurdity of risking a European war for the sake of putting an end to the power of an old man who could have but few years to live; Queen Victoria that this was the minister's fourth to come to terms with France and relieve the embarrassment of the "dear King"; and Lord Melbourne, with the majority of the cabinet, was in favour of compromise. When therefore, on the 8th of October, Guizot, in an interview with Palmerston, presented what was practically an ultimatum on the part of France, "it was determined that this intimation should be met in a friendly spirit, and that Lord Palmerston should see the Ministers of the other powers and agree with them to acquaint the French that they with England would use their good offices to induce the Porte not to insist on the deprivation of Mehemet Ali so far as Egypt is concerned." In accordance with this Palmerston instructed Ponsonby to press upon the sultan, in the event of Mehemet Ali's speedy submission, not only to withdraw the sentence of deprivation but to confer upon him the hereditary pashalik of Egypt.

For a while it seemed that even this would not avert a European war. Thiers still maintained his warlike tone, and the king's speech prepared by him for the opening of the Chambers on the 28th of October was in effect a declaration of defiance to Europe. Louis Philippe himself, however, was not prepared to use this language; whereupon Thiers resigned, and a new cabinet was formed under M. Napoléon; with Guizot as foreign secretary. The equivocal tone of the new speech from the Throne raised a storm of protest in the Chambers and the country. It was, however, soon clear that Palmerston's diagnosis of the temper of the French bourgeois was correct; the clamour for war subsided; on the 4th of December the address on the Egyptian Question proposed by the government was carried, and peace was assured. Nine days earlier Sir Charles Napier had appeared with a British squadron off Alexandria and, partly by persuasion, partly by threats, had induced Mehemet Ali to submit to the sultan and to send back the Ottoman fleet, in return for a guarantee
MEHIDPUR—MEIKTILA

of the hereditary pashali of Egypt. This arrangement was ratified by Palmerston; and all four powers now combined to press it on the reluctant Porte, pointing out, in a joint note of the 30th of January 1841, that "they were not conscious of advising a course out of harmony with the sovereignty and legitimate rights of the sultan, or contrary to the duties imposed on the Pasha of Egypt as a subject appointed by His Highness to govern a province of the Ottoman Empire." This principle was elaborated in the firman, issued on the 13th of February, by which the sultan conferred on Mehemet Ali and his heirs by direct descent the pashali of Egypt, the greatest care being taken not to bestow any rank and authority greater than that enjoyed by other viziers of the empire. By a second firman of the same date Mehemet Ali was invested with the government of Nubia, Darfur, Khordofan and Sinnam, with their dependencies. On the 10th of June the firman was solemnly promulgated at Alexandria.

Thus ended the phase of the Egyptian Question with which the name of Mehemet Ali is specially bound up. The threatened European conflict had been averted, and presently the wounded susceptibilities of France were healed by the invitation extended to her to take part in the Straits Convention. As for Mehemet Ali himself, he now passes off the stage of history. He was an old man; his mind was soon to give way; and for some time before his death on the 2nd of August 1849 the reins of power were held by his second successor Ibrahim. Probably no Oriental ruler, not even excepting Ali of Jannina, has ever stirred up so much interest among his contemporaries as Mehemet Ali. The spectacle of an Eastern despot apparently advancing on the lines of European progress was in itself as astonishing as new. Men thought they were witnessing the dawn of a new era in the East; Mehemet Ali was hailed as the most beneficient and enlightened of princes; and political philosophers like Jeremy Bentham, who sent him elaborate letters of good advice, thought to find in him the means for developing their theories in virgin soil. In fact the pasha was an illiterate barbarian, of the same type as his countryman Ali of Jannina, courteous, cruel, astute, full of wiles, avaricious and boundlessly ambitious. He never learned to read or write, though late in life he mastered colloquial Arabic; yet those Europeans who were brought into contact with him praised alike the dignity and charm of his address, his ready wit, and the astonishing perspicacity which enabled him to read the motives of men and of governments and to deal effectively with each situation as it arose.

The latest account of Mehemet Ali and the European crisis arising out of his revolt is that by W. Allison Phillips in vol. x. ch. xvii. of the Cambridge Modern History (1907). The bibliography attached to this chapter (p. 892) gives a list of all the principal published works on this subject, and also of most of the unpublished Foreign Office records bearing on the subject. Of the works mentioned C. de Freycinet's La Question d'Egypte (Paris, 1905) gives the most authoritative account of the diplomatic developments.

MEHIDPUR, or MAHIPUR, a town of India, in Indore state of Central India, on the right bank of the Sone, 1543 ft. above the sea, and 24 m. N. of Ujjain. Pop. (1901), 6685.

Though of some antiquity and frequented by Hindu pilgrims, it is best known for the battle fought in the neighbourhood on the 20th of December 1817, in which Sir John Malcolm defeated the army of Holkar. The result was the Treaty of Mandasor and the pacification of Malwa. Mehidpur was again the scene of some sharp fighting during the Mutiny. The British cantonment, placed here in 1817, was removed in 1838.

MÉHUL, ÉTIENNE HENRI (of ÉTIENNE NICOLAS) (1763–1817), French composer, was born at Givet in Ardennes, on the 24th of June 1763. His father being too poor to give him a regular musical education, his first ideas of art were derived from a poor blind organist of Givet; yet such was his aptitude that, when ten years old, he was appointed organist of the convent of the Récollets. In 1775 an able German musician and organist, Wilhelm Hauser, was engaged for the monastery of Lavaldieu, a few miles from Givet, and Méhul became his occasional pupil. In 1778 he was taken to Paris by a military officer, and placed himself under Edelmann, a good musician and harpsichord player. His first attempts at instrumental composition in 1781 did not succeed, and he therefore turned his attention to sacred and dramatic music. Gluck gave him advice in his studies. After various disappointments during his efforts for six years to obtain, at the Grand Opéra, a representation of his Cora et Alonso, he offered to the Opéra Comique his Euphrosyne et Coradin, which, being accepted and performed in 1790, at once fixed his reputation. His opera of Stratonice was also received with enthusiasm in 1792. After several unsuccessful operas, his Adrien appeared, and added much to his fame, which was further increased by his three best works, Le Jeune Henri, Ulkah and Joseph, the finest of the series. Ulkah was written for an orchestra without violins. Méhul held a post as one of the four inspectors of the Paris Conservatoire, but this office made him feel continually the insufficiency of his early studies, a want which he endeavoured to remedy by incessant application. Timoléon, Ariodant and Bion followed. Epicure was composed by Méhul and Cherubini jointly; but the superiority of the latter was evident. Méhul's next opera, L'Irato, failed. After writing forty-two operas, besides a number of songs for the festivals of the republic, cantatas and oratorios of various kinds, his health gave way, from an affection of the chest, and he died on the 18th of October 1817 in Paris.

See Lives by Pougéin (1879), Vielard (1850), and Quatremère de Quincy (1818).

MEIBOM, HEINRICH (1555–1625), German historian and poet, was born at Lemu on the 4th of December 1555, and died on the 20th of September 1625 in Helmstedt, where he held the chair of history and poetry since 1583. He was a writer of Latin verses (Paradisarum horationarum libri III, 1818) and his talents in this direction were recognized by his pupil Ribbert II., who enalled him; but his claim to be remembered rests on his services in elucidating the medieval history of Germany.

His Opuscula historica ad res germanicas spectantia was edited and published in 1660 by his grandson, Heinrich Meibom (1638–1700), who was professor of medicine and then of history and poetry at Helmstedt, and incorporated his grandfather's work with his own Rerum germanicarum scriptores (1668).

MEIDERICH, a town of Germany, in the Prussian Rhine province, 23 m. by rail N.E. of Rhurhot, whose river harbour is in great part within its confines. Pop. (1905), 40,822. Iron and steel works, coal-mines, saw-mills, brickworks, and machine-shops furnish the principal occupations of the inhabitants. Meiderich, which is first mentioned in 874, was united with Duisburg in 1905.

See Gracher, Tausendjährige Geschichte von Meiderich (1893).

MEIKTILA, a district and division in Upper Burma. The district is the most easterly of the districts in the dry zone, and has an area of 2183 sq. m. It lies between Kyaukse, Myingyan, Yamethin, and on the east touches the Shan States. It is a slightly undulating plain, the gentle slopes of which are composed of black "cotton" soil and are somewhat arid. The only hills above 300 ft. are on the slopes of the Shan hills. The lake is the chief feature of the district. It is artificial, and according to Burmese legend was begun 2400 years ago by the grandfather of Gautama Buddha. It is 7 m. long, averages half a mile broad, and covers an area of 3 3/4 sq. m. With the Minthla and other connected lakes it irrigates a large extent of country.

There are small forest reserves, chiefly of cuch. Large numbers of cattle are bred. The chief agricultural products are rice, sesame, cotton, peas, maize, millet and gram. Pop. (1901), 252,305. Famines in 1891, 1895 and 1896 led to considerable emigration. The climate is healthy except in the submontane townships. The temperature rises to 100° F. and over between the months of March and June, and the mean minimum in January is about 61°. The rainfall is uncertain (36-79 in. in 1893, 25-59 in. in 1897). The vast majority
of the population are Buddhists. The headquarters town, Meiktilla, stands on the banks of the lake, which supplies good drinking water. Pop. (1901), 7203. A wing of a British regiment is stationed here. A branch railway connects it to Thazi station with the Rangoon-Mandalay line, and continues westward to its terminus on the Irrrawaddy at Myingyan.

The division includes the districts of Meiktilla, Kyaukse, Yamethin and Myingyan, with a total area of 10,852 sq. m., and a population (1901) of 922,807, showing an increase of 10-2% in the preceding decade, and giving a density of 91 inhabitants to the square mile. All but a small portion of the division lies in the dry zone, and cultivation is mainly dependent on irrigation.

**Meihac, Henri** (1831-1897), French dramatist, was born in Paris on the 21st of February 1831, and while a young man began writing fanciful articles for the newspapers and vaudevilles for the theatres, in a vivacious boulevardier spirit which brought him to the front. About 1860 he met Ludovic Halévy, and the two began a collaboration in writing for the stage which lasted for twenty years. An account of their work is given under Halévy. Meihac wrote a few pieces with lesser collaborators. In 1888 he was elected to the Academy. He died in Paris in 1897.

**Meinberg**, a village and watering-place of Germany, in the principality of Lippe-Detmold, situated in a pleasant valley under the Teutoburger Wald, 12 m. S.E. from Detmold by the railway to Altenbeken. Pop. (1860), 1300. The waters of Meinberg, which attract annually about 1200 visitors, are sulphur springs, and are used for drinking, bathing and inhalation. They became known in the 18th century.

**Meineke, Johann Albrecht Friedrich August** (1790-1870), German classical scholar, was born at Soest in Westphalia on the 8th of December 1790. After holding educational posts at Jenkau and Danzig, he was director of the Joachimsthal gymnasium in Berlin from 1826 to 1856. He died at Berlin on the 12th of December 1870. He was distinguished in conjectural criticism, the comic writers and Alexandrine poets being his favourite authors.

His most important works are: *Gracorum comiciorum fragmenta* (1835-1837), the first volume of which contains an essay on the development of Greek comedy and an account of its chief representatives; Aristophanes (1860); *Analesa alexandrina* (1843, containing the fragments of Rhiannus, Euphorion, Alexander of Aetolia, and Parthenius); Callimachus (1861); *Thesaurus, Bonum Moschus* (3rd ed., 1856); *Alciphron* (1853); *Strabo* (2nd ed., 1866), and *Vindicialis strabonianae* (1852); *Stobaeus* (1855-1866); Athenaeus (1856-1862). See monographs by F. Kanke (1871), H. Sauge (1872), and E. Fiebig (1904). Some *Mishnah* in *Allgemeine deutsche Biographie*, XXI. (1885); also Sandy, *Hist. Class. Schol.* (1908), iii. 117.

**Meiningen**, a town of Germany, capital of the duchy of Saxe-Meiningen, romantically situated in forests on the right bank of the Werra, 40 m. S. of Eisenach by rail. Pop. (1905), 15,689. It consists of an old town and several handsome suburbs, but much of the former has been rebuilt since a fire in 1874. The chief building is the Elisabethenborg, or the old ducal palace, containing several collections; it was built mainly about 1380, although part of it is much older. Other buildings are the Hanneberger Haus with a collection of antiquities, and the town church, with twin towers, built by the emperor Henry II. in the 11th century. The theatre enjoyed for many years (1875-1890) a European reputation for its actors and scenic effects. The English garden, a beautiful public park, contains the ducal mortuary chapel and several monuments, including busts of Brahmens and Jean Paul Richter.

Meiningen, which was subject to the bishops of Würzburg (1000-1542), came into the possession of the duke of Saxony in 1535, having in the meantime belonged to the counts of Henneberg. At the partition of 1660 it fell to the share of Saxe-Altenburg, and in 1680 became the capital of Saxe-Meiningen.

**Meir**, Jewish rabbi of the 2nd century, was born in Asia Minor and according to legend was a descendant of the family of Nero. He was the most notable of the disciples of Aquila (q.v.), and after the Hadrianic repressions of A.D. 135 was instrumental in refounding the Palestinian schools at Usha. Among his teachers was also Elisha ben Abuya (q.v.), and Meir continued his devotion to Elisha after the latter's apostasy. He is said to have visited Rome to rescue his wife's sister. His wife, Beruriah, is often cited in the Talmud as an exemplar of generosity and faith. She was a daughter of the martyr Ḥananiah ben Teradion. On one occasion Meir, who had been frequently troubled by his ungodly neighbours, uttered his wish that his name should be blotted out (Ps. civ. 35) let sins be blotted out, not sinners"; whereupon Meir prayed for the evildoers' conversion. But she is best known for her conduct at the sudden death of her two sons.

It was the Sabbath, and Meir returned home towards sunset. He repeatedly asked for the children, and Beruriah, after parrying his question, said: "Some time ago a precious thing was left with me on trust, and now the owner demands its return. Must I give it back?" "How can you question it?" rejoined her husband. Beruriah then led him to the bed and there were stretched the bodies of the children, fainted into tears. But the wife explained that was the treasure of which she had spoken, adding the text from Job: "The Lord gave and the Lord hath taken away; blessed be the name of the Lord." Meir himself was the author of many famous sayings: "Look not to the flask, but to its contents. Many a new vessel contains old wine, but there are old casks which do not contain even new wine." "Condolet not with a mourner while his dead is laid out before him." "Man cometh into the world with closed hands as though claiming the ownership of all things; but he departeth hence with hands of limp, as if to show that he taketh naught with him." "What God does is well done." "The tree itself supplies the handle of the axe which cuts it down." His wisdom was proverbial, and to him was in particular assigned an intimate acquaintance with fables, and he is reported to have known 300 Fox-Fables. "With the death of Rabbi Meir," says the Mishnah (Sota ix. 15), "Fableists ceased to be." Meir's wide sympathies were shown in his inclusion of all mankind in the hopes of salvation (Sifra to Leviticus xviii. 5). He was certainly on friendly terms with heathen scholars.

Among the topics which Meir contributed largely to the body of the Mishnaic Code.

Meir left Palestine some time before his death, owing to disagreements between him and the Patriarch. He died in Asia Minor, but his love for the Holy Land remained dominant to the last. "Bury me," he said, "by the shore, so that the sea may washes the land of my fathers may touch also my bones." The tomb shown as that of Meir at Tiberias is inauthentic.

**Meir of Rothenburg** (c. 1215-1293), German rabbi and poet, was born in Worms c. 1215. He played a great part in organizing the Jewish communal life of the middle ages in Alsace, where he remained until his death in 1293.

His friends offered to find a ransom, but he declined the suggestion, fearing that the precedent would lead to extortion in other cases. He wrote glosses to the Talmud (to Sapho phil) and many Responsa of the utmost value for historical research. Through his disciples Asher ben Yeḥiel and Mordecai ben Hillel, Meir exercised much...
influence on subsequent developments of Judaism. He was also a liturgical poet of considerable merit. One of his finest elegies is translated into English in Nina Davis's Songs of Exile.

See L. Ginzberg, Jewish Encyclopedia, viii. 437-440. (I. A.)

MEIRINGEN, the principal village on the Hasle (or the upper Aar) valley in the Swiss canton of Bern. It is built at a height of 1960 ft. on the right bank of the Aar and on the level floor of the valley, but is much exposed to the south wind (or Fohn), and has several times been in great part destroyed by fire (1595, 1879 and 1891). It has 997 inhabitants, all German-speaking and Protestant. The parish church is ancient, and above it is a part of the ruins of the medieval castle of Resti. Meiringen is frequented by travellers in summer, as it is the meeting-point of many routes: from Interlaken by the lake of Brienz and Brienz, from Lucerne by the Brunig railway (28 m.), from Engelberg by the Joch Pass (7267 ft.), and from the upper Valais by the Grimsel Pass (7100 ft.), and from Grindelwald by the Great Scheidegg Pass (6454 ft.). Many waterfalls descend the hill-sides, the best known being the Reichenbach, near Alphach, while the great gorge pierced by the Aar through the最先stone barrier of the Kirchert is remarkable. The village and valley belonged of old to the emperor, who in 1334 gave the advowson to the Knights of St Lazarus, by whom it was sold in 1722 to the Austin Canons of Interlaken, on the suppression of whom in 1798 it passed to the state.

In 1879 the emperor mortgaged the valley to the lords of Weissenburg, who sold it in 1834 to the town of Bern. (W. A. B. C.)

MEISSEN, a town of Germany, in the kingdom of Saxony, on both banks of the Elbe, 15 m. N.W. from Dresden, on the railway to Leipzig via Döbeln. Pop. (1905), 33,336. The old town lies on the left bank of the river, between the streams Meisse and Triebisch, and its irregular hilly site and numerous fine old buildings make it picturesque. Most of its streets are narrow and uneven. The cathedral, one of the finest early Gothic buildings in Germany, stands on the Schlossberg, 160 ft. above the town. It is said to have been founded by the emperor Otto the Great, but the present building was begun in the 13th century and was completed about 1450. Here are tombs of several rulers and princes of Saxony, including those of Albert and Ernest, the founders of the two existing branches of the Saxon house. The cathedral also contains works by Peter Vischer and Lucas Cranach and several other interesting monuments. A restoration, including the rebuilding of the two towers, was carried out in 1903-1908. Adjoining the cathedral is the castle, dating from 1471-1483, but restored and named the Albrechtsburg about 1570. Another restoration was undertaken after 1866, when a series of historical frescoes was painted upon its walls. A stone building of the 13th century connects the Schlossberg with the Afra berg, which owes its name to the old convent of St Afra. The convent was suppressed by Duke Maurice in 1543, and was by him converted into a school (the Fürsten Schule), one of the most renowned classical schools in Germany, which counts Lessing and Gellert among its former pupils. Other public buildings of interest are the town-hall, built in 1479 and restored in 1873; the fine town church, called the Frauenkirche or Marienkirche; the Nikolaikirche and the Afrakirche. The Franciscan church is now used as a museum of objects connected with the history of Meissen. Since 1710 Meissen has been the seat of the manufacture of Dresden china. Till 1850 the royal porcelain factory was in the Albrechtsburg, but in that year it was transferred to a large new building in the Triebischtal, near the town. Meissen also contains iron foundries, factories for making earthenware stoves and pottery, sugar refineries, breweries and tanneries. A considerable trade is carried on in the wine produced in the surrounding vineyards, and other industries are spinning and weaving.

Meissen was founded about 920 by Henry the Fowler (see MEININGEN). From 1051 Meissen was the seat of a line of bishops, who ranked as princes of the empire. During the 15th century the town suffered greatly from the Hussites, and it was captured by the imperial troops during the war of the league of Schmallkalden, and again in the Thirty Years' War. In 1637 it suffered much from the Swedes, and in 1745 it fell into the hands of the Prussians. The bridge over the Elbe was destroyed by the French in 1813, and again by the Saxons in June 1866 in order to impede the march of the Prussians on Dresden. Collin on the right bank of the Elbe was incorporated with Meissen in 1901.

See Reinhard, Die Stadt Meissen, ihre Merkwürdigkeiten (Meissen, 1884); All-Meissener, All-Meissener Bilder (Meissen, 1888); Jäschke, Meissen und seine Kirchen (Leipzig, 1902); and Gersdorf, Urkundenbuch der Stadt Meissen (Leipzig, 1873).

MEISSEN, a German margravate now merged in the kingdom of Saxony. The mark of Meissen was originally a district centring round the castle of Meissen or Missia on the Middle Elbe, which was built about 920 by the German king Henry I., the Fowler, as a defence against the Slavs. After the death of Gero, margrave of the Saxon east mark, in 965, his territory was divided into five marks, one of which was called Meissen. In 985 the emperor Otto II. bestowed the office of margrave upon Eckhard I., margrave of Merseburg, and the district comprising the marks of Meissen, Merseburg and Zeitz was generally known as the mark of Meissen. In 1002 Eckhard was succeeded by his brother Gunzelin, and then by his sons Hermann I. and Eckhard II. Under these margraves the area of the mark was further increased, but when Eckhard II. died in 1046 it was divided, and Meissen proper was given successively to William and Otto, counts of Weimar, and Egbert II., count of Brunswick. Egbert was a rival of the emperor Henry IV. and died under the imperial ban in 1064. Eckhard had mortgaged the mark to his son Helmold, and on his death in 1090, it was inherited by his son Henry II., whose claim on the mark was contested by Thimo's son Conrad. When Henry died without issue in 1123 Meissen was given by the emperor Henry V. to Hermann II., count of Wintzenburg; but, renewing his claim, Conrad won the support of Lothair, duke of Saxony, afterwards the emperor Lothair II., and obtained possession in 1136. Conrad, called the Great, extended the boundaries of Meissen before mortgaging it in 1155 in favour of his son Otto, known as the Rich. Otto appointed his younger son Dietrich as his successor and was attacked and taken prisoner by his elder son Albert; but, after obtaining his release by order of the emperor Frederick I., he had only just renewed the war when he died in 1190. During his reign silver mines were opened in the Harz Mountains, towns were founded, roads were made, and the general condition of the country was improved. Otto was succeeded by his son Albert, called the Proud, who was engaged in warfare with his brother Dietrich until his death in 1195. As Albert left no children, Meissen was seized by the emperor Henry VI. as a vacant fief of the empire; but Dietrich, called the Oppressed, secured the mark after Henry's death in 1197. Dietrich married Jutta, daughter of Hermann I., landgrave of Thuringia, and was succeeded in 1221 by his infant son Henry, surnamed the Illustrious; who on arriving at maturity obtained as reward for supporting the emperor Frederick II. against the pope a promise to succeed his uncle, Henry Raspe IV., as landgrave of Thuringia. In 1245 Henry's son Albert was betrothed to Margaret, daughter of Frederick II.; and Pleitennrand, a district west of Meissen, was added to his possessions. Having gained Thuringia and the Saxony palatinate on his uncle's death in 1247, he granted sections of his lands to his two sons in 1265, but retained Meissen. A series of family feuds followed. His second son Dietrich died in 1285, and on Henry's own death in 1288 Meissen was divided between his two remaining sons, Albert (called the Degenerate) and Frederick, and his grandson Frederick Tutta, the son of Dietrich. Albert was engaged in struggles with his three sons, who took him prisoner in 1301. It was not until 1317 that he was released at the will of the German king Rudolph I. About this time he sold his portion of Meissen to his nephew Frederick Tutta, who held the title
of margrave and ruled the greater part of the mark until his death in 1291. Albert's two remaining sons, Frederick and Dietrich or Diezman, then claimed Meissen; but it was seized by King Adolph of Nassau as a vacant fief of the empire, and was for some time retained by him and his successor King Albert I. In the course of constant efforts to secure the mark the brothers Frederick and Dietrich defeated the troops of King Albert at Lucka in May 1307 and secured partial possession of their lands. In this year Dietrich died and Frederick became reconciled with his father, who, after renouncing his claim on Meissen for a yearly payment, died in 1310. Frederick then obtained possession of the greater part of the mark, Frederick was invested with it by the German king Henry VII. in 1310. During these years the part of Meissen around Dresden had been in the possession of lower Lusatia, was taken prisoner. Surrendering lower Lusatia he was released, but it was only at Waldemar's death in 1319 that the mark obtained possession of Meissen. Frederick, who was surnamed the Peaceful, died in 1323 and was followed as margrave by his son Frederick II., called the Grave, who added several counties to his inheritance. From this latter Frederick's death in 1349 until 1381 the lands of the family were ruled by his three sons jointly; but after the death of his eldest son Frederick III. in 1381 a division was made by which Meissen fell to his youngest son William I. In 1407 William was succeeded by his nephew Frederick, called the Warlike, who in 1423 received from the emperor Sigismund the electoral dukedom of Saxe-Wittenberg. The mark then became merged in the duchy of Saxony, and at the partition of 1485 fell to the Albertine line. As Meissen was relieved from the attacks of the Slavs by the movement of the German boundary to the east, its prosperity increased. Many towns were founded, among which were Dresden, Leipzig and Erfurt; Chemnitz began its textile industry; and although the condition of the peasants was wretched, that of the townsmen was improving. The discoveries of silver brought great wealth to the margraves, but they resorted at times to edicts, which were contributions from the nobles and ecclesiastics, who met in a kind of diet. During this period the mark of Meissen lay on both banks of the Elbe, and stretched from Bohemia to the duchy of Saxe-Wittenberg, embracing an area of about 3000 sq. m.

MEISSONIER, JEAN LOUIS ERNEST (1815-1891), French painter, was born at Lyons on the 21st of February 1815. From his schooldays he showed a taste for painting, to which some early sketches, dated 1823, bear witness. After being placed with a druggist, he obtained leave from his parents to become an artist, and, owing to the recommendation of a painter named Potier, himself a second class Prix de Rome, he was admitted to Léon Cogniet's studio. He paid short visits to Rome and to Switzerland, and exhibited in the Salon of 1831 a picture then called "Les Bourgeois Flamands" ("Dutch Burgers"), but also known as "The Visit to the Burgomaster," subsequently purchased by Sir Richard Wallace, in whose collection (at Hertford House, London) it is, with fifteen other examples of this painter. It was the first attempt in France in the particular genre which was destined to make Meissonier famous: microscopic painting—miniature in oils. Working hard for daily bread at illustrations for the publishers—Curmer, Hetzel and Duboechier—he also exhibited at the Salon of 1836 the "Chess Player" and the "Errand Boy." After some not very happy attempts at religious painting, he returned, under the influence of Chenavard, to the class of work he was born to excel in, and exhibited with much success the "Game of Chess" (1841), the "Young Man playing the 'Cello"" (1842), "The Painter in his Studio" (1843), "The Guard Room," the "Young Man looking at Drawings," the "Game of Piquet" (1845), and the "Game of Bowls"—works which show the finish and correctness of his technique, and assured his success. After his "Soldiers" (1848) he began "A Day in June," which was never finished, and exhibited "A Smoker" (1849) and "Bravos" ("Les Bravı", 1852). In 1855 he touched the highest mark of his achievement with "The Gamblers," "The Student," "The Statue of Liberty," "La Rixe," which was presented by Napoleon III. to the English Court. His triumph was sustained at the Salon of 1857, when he exhibited nine pictures, and drawings; among them the "Young Man of the Time of the Regency," "The Painter," "The Shoeing Smith," "The Musician," and "A Reading at Diderot's." To the Salon of 1861 he sent "The Emperor at Sollering," "A Shoing Smith," "A Musician," "A Painter," and "M. Louis Fould"; to that of 1864 another version of "The Emperor at Sollering," and in 1864, he exhibited "A Gaspard Quarter," and in 1867 "Desaix and the Army of the Rhine." Meissonier worked with elaborate care and a scrupulous observance of nature. Some of his works, as for instance his "1825," remained ten years in course of execution. To the great Exhibition of 1878 he contributed sixteen pictures: the portrait of Alexandre Dumas which had been seen at the Salon of 1877, "Cuirassiers of 1805," "A Venetian Painter," "Moreau and his Staff before Hohenlinden," a "Portait of a Lady," the "Road to La Saline," the "Two Friends," the "Outpost of the Grand Guard," "A Scout," and "Drawing his Memoirs." Thenceforward he exhibited less in the Salons, and sent his works to smaller exhibitions. Being chosen president of the Great National Exhibition in 1883, he was represented there by such works as "The Pioneer," "The Army of the Rhine," "The Arrival of the Guests," and "Saint Mark." On the 24th of May 1884 an exhibition was opened at the Petit Gallery of Meissonier's collected works, including 146 examples. As president of the jury on painting at the Exhibition of 1885 he contributed some new pictures. In the following year the New Salon was formed (the National Society of Fine Arts), and Meissonier was president. In exhibitions there in 1885 he exhibited "The Road to Les Sables," and in 1887 "Le Barricade," which, shortly after his death, his "Barricade" was displayed there. A less well-known class of work than his painting is a series ofetchings: "The Last Supper," "The Skill of Vaillamme the Lute Player," "The Little Smoker," "The Old Smoker," the "Preparations for a Duel," "Anglers," "Troopers," "The Reporting Sergeant," and "Polichinelle," in the Hertford House collection. He also tried lithography, but the prints are now scarcely to be found. Of all the painters of the century, Meissonier was one of the most fortunate in the matter of payments. His "Cuirassiers," now in the late duc d'Aumale's collection at Chantilly, was bought from the artist for £10,000, sold at Brussels for £11,000, and finally resold for £16,000. Besides his genre portraits, he painted some others: those of "Doctor Lefrere," of "Chenavard," of "Vanderbilt," of "Doctor Guyon," and of "Stanford." He also collaborated with the painter français in a picture of "The Park at St Cloud." In 1838 Meissonier married the sister of M. Steinheil, a painter. Meissonier was attached by Napoleon III. to the imperial staff, and accompanied him during the campaign in Italy and at the beginning of the war in 1870. During the siege of Paris in 1871 he was colonel of a marching regiment. In 1840 he was awarded a third-class medal, a second-class medal in 1843, first-class medals in 1844 and 1845 and medals of honour at the great exhibitions. In 1846 he was appointed knight of the Legion of Honour and promoted to the higher grades in 1856, 1867 (June 29), and 1880 (July 12), receiving the Grand Cross in 1889 (Oct. 29). He nevertheless cherished certain ambitions which remained unfulfilled. He hoped to become a professor at the École des Beaux Arts, but the appointment he desired was never given to him. On various occasions,
too, he aspired to be chosen deputy or made senator, but he was not elected. In 1861 he succeeded Abel de Pujol as member of the Academy of Fine Arts. On the occasion of the centenary festival in honour of Micheangelo in 1876 he was the delegate of the Institute of France to Florence, and spoke as its representative.

Meissonier was an admirable draughtsman upon wood, his illustrations to *Les Contes Maudits* (engraved by Lavoyer), to Lamartine’s *Fall of an Angel*, to Paul and Virginia, and to *The French Painted by Themselves* being among the best known. The leading engravers and etchers of France have been among engaged upon plates from Meissonier, and many of these plates command the highest esteem of collectors. Meissonier died in Paris on the 21st of January 1891. His son, Jean Charles Meissonier, also a painter, was his father’s pupil, and was admitted to the Legion of Honour in 1889. See Alexandre, *Histoire de la peinture militaire en France* (Paris, 1891); Lauren, *Notice sur Meissonier* (Paris, 1892); Gréard, *Meissonier* (Paris and London, 1897); T. G. Dumas, *Maltes modernes* (Paris, 1884); Ch. Fercourt, *Meissonier, 15 vie—son avare* (Paris, 1901); J. W. Mollett, *Illustrated Biography of Modern Artists: Meissonier* (London, 1882).

**MEISSONIER, JUSTE AURÈLE** (1663-1750), French goldsmith, sculptor, painter, architect, and furniture designer, was born at Turin, but became known as a worker in Paris, where he died. His Italian origin and training were probably responsible for the extravagance of his decorative style. He shared, and perhaps surpassed, the rich and capricious fancies of Oppenland and Gersaint, since he dealt with the Baroque in its most daring and flamboyant developments. Rarely does he leave a foot or two of undecorated space; the effect of the whole is futile and fatiguing. It was because Meissonier carried the style of his day to its extreme that he acquired so vast a popularity. Like the English brothers Adam at a later day he not only as architect built houses, but as painter and decorator covered their internal walls; he designed the furniture and the candlesticks, the supports for the decanters on the table; he was ready to produce a snuff-box as watch case or a sword hilt. Not only in France, but for the nobility of Poland, Portugal and other countries who took their fashions and their taste from Paris, he made designs, which did nothing to improve European taste. Yet his achievement was not wholly without merit. His work in gold and silver-plate was often graceful and sometimes bold and original. He was least successful in furniture, where his twirls and convolutions, his floral and rocaille motifs were conspicuously offensive. He was appointed keeper of the XV. *Destinataire de la chambre d’arrondissement*; the post of designer for *les pompes funèbres* et galantes was also held alongside that of *Orfèvre du roi*.

For our knowledge of his work we are considerably indebted to his own books of design: *Livre d’ornements en trente pièces; Livre d’orfèvrerie d’église en six pièces*, and *Ornements de la carte chronologique.***

**MEISTERSINGER** (Ger. for “master-singer”), the name given to the German lyric poets of the 14th, 15th and 16th centuries, who carried on and developed the traditions of the medieval Minnesingers (q.v.). These singers, who for the most part, belonged to the artisan and trading classes of the German towns, regarded as their masters the founders of their guild twelve poets of the Middle High German period, among whom were Wolfram von Eschenbach, Konrad von Würzburg, Reinmar von Zweter and Frauenlob. The last mentioned of these, Frauenlob, is said to have established the earliest Meistersinger school at Mainz, early in the 14th century. This is only a tradition, but the institution of such schools originated undoubtedly in the upper Rhine district. In the 14th century there were schools at Mainz, Strassburg, Frankfurt, Würzburg, Zürich and Prague; in the 15th at Augsburg and Nuremberg, the last becoming in the following century, under Hans Sachs, the most famous of all. By this time the Meistersinger schools had spread all over south and central Germany; and isolated guilds were to be found farther north, at Magdeburg, Breslau, Götitz and Danzig.

Each gild numbered various classes of members, ranging from beginners, or *Schüler* (corresponding to trade-apprentices), to *Schaufreunde* (who were equivalent to Gesellen or journey-men), to *Meister*, a Meister being a poet who was merely able to write new verses to existing melodies but had himself invented a new melody. The poem was technically known as a *Bar* or *Gesetz*, the melody as a *Ton* or *Weis*. The songs were all sung in the schools without accompaniment. The rules of the art were set down in the so-called *Tabulae* (pl. of the law-book of the gild. The meetings took place either in the Rathaus, or town hall, in public as they were held—as was usually the case on Sunday, in the church; and three times a year, on Easter, Whitmas and Christmas, special festivals and singing competitions were instituted. At such competitions or *Schulsingen* judges were appointed, the so-called *Merkers*, whose duty it was to criticize the competitors and note their offences against the rules of the *Tabulatur*.

The literary value of the Meistersinger poetry was hardly in proportion to the large part it played in the life of the German towns of the 15th and 16th centuries. The medieval lyric decayed, and in place of it a new style—unvention, composition, the form, the number of syllables, the melody; and it was such externals that attracted the interest of these burgher-poets. Poetry was to them a mechanical art that could be learned by diligent application, and the prizes they had to bestow were the rewards of ingenuity, not of genius or inspiration. Consequently we find an extraordinary development of strophic forms corresponding to the many new “tones” which every Meistersinger regarded it as his duty to invent—tones which have the most remote and often ridiculous names, such as *Gestreiftsafranblumleimveis, Fettdachweis, gebläunte Paradiesweis, &c.* The verses were adapted to the musical strophes by a merely mechanical counting of syllables, regardless of rhythm or sense. The meaning, the sentiment, the thought, were the last things to which the Meistersingers gave heed. At the same time there was a certain healthy aspect in the cultivation of the Meistersang among the German middle classes of the 15th and 16th centuries; the Meistersinger poetry, if not great or even real poetry, had—especially in the hands of a poet like Hans Sachs—many germs of promise for the future. As the medieval lyric waned, a necessary venuer the faith of the German burgher, his blunt good sense and honesty of purpose. In this respect it was an important factor in the rise of that middle-class literature which found its most virile expression in the period of the Reformation. The Meistersang reached its highest point in the 16th century; and it can hardly be said to have outlived that epoch, although the traditions of the Meistersingers Schools lingered in south German towns even as late as the 19th century.

Specimens of Meistersinger poetry will be found in various collections, such as J. J. Gébert, *Altdutsche Volks- und Meisterlieder* (1817); K. Bartsch, *Meisterlieder der Kolmarter Honschtscr* (Publ. of the Stuttgart Literaturarchiv, vol. lviii.; 1862). Of the older sources of information about the Meistersinger the most important are Adam Puschmann’s *Vergleichender Bericht des deutschen Meistersangs zusammt der Tabulatur* (1571; reprinted in W. Braune’s *Neuwurck der deutscber Literaturwerke* des 16. und 17. Jhhr., 73, 1880), and J. C. Wagenson, Die Meister der Nürburger Meisterweis der altdutschen Meistersanges (1811); F. Schror von Carolfeld, *Zur Geschichte des deutschen Meistersangs* (1872); R. von Lilienen, *Über den Inhalt der allgemeinen Bildung in der Zeit der Scholastik* (1876); G. Jacobshoff, “Die musikalische Bildung der Meistersänger” (Zeitschrift für deut. Allertum, xx., 1876); O. Lyon, *Minne- und Meistersang* (1882); K. Mey, *Der Meistersang in Geschichte und Kunst* (1892). The art of the Meistersingers has been best described by Richard Wagner in his music drama *Parsifal* (1882).

**MEKONG, or ME Nam KONG** (pronounced *Kawong*), sometimes known as the Cambodia River, the great river of Indo-China, having its origin in the Tibetan highlands. It is the third or fourth longest river in Asia and the seventh or eighth in the world. It is about 2800 m. in length, of which 1200 flow through portions of the Chinese Empire and Tibet and 1600 through French territory. Its sources are not definitely settled, but it is supposed to rise on the slopes of Daz-Nag-Lung-Mung in about
33° N., 93° E., at an altitude of 16,700 ft. above sea-level. Throughout the greater part of its course in Tibet, where it is called the Dza-Chu, it flows south-eastwards to Chimiando, on the great east and west caravan route from China to Lhasa. At this point it is about 10,000 ft. above sea-level. From here it flows south-westwards through little-known mountain wastes. Below Dayal in lat. 26° it is known by the Chinese name of Lantsan Kiang. For the next 300 m. of its course the Lantsan Kiang, or, as it was called in 1892, when it formed the border of China, inhabiting its rugged valley, the Me-kong, is very little known to us. The river flows beneath bare and rocky walls. A few scattered villages of Lusus and Mososs exist in this region; there is no trade from north to south. In 25° 18' N. the Tall-iBhamo caravan route, described by Colborne Baker, crosses the river by one of those iron suspension bridges which are a feature of Yun-nan, at a height of 4700 ft. above sea-level. From this point to Chiang or Kung Hung, the head of the old confederacy of the Sibawang Funna or Twelve States, it is little known; the fact that it falls some 300 ft. for each degree of latitude indicates the character of the river. Under the provisions of the Anglo-French agreement of January 1896, from the Chinese frontier southwards to the mouth of the Nam Hok the Me-kong forms the frontier between the British Shan States on the west and the territories acquired from Siam by France in 1893. By the treaty of 1893, from that point southwards to about 13° 30' N. it is also the frontier between French Indo-China and Siam, and a zone extended 25 kilometres inland from the right bank, within which the Siamese government agreed not to construct any fortified port or maintain any armed force. This 25-kilometre zone, which extends from the French frontier to within the borders of Warm, was ceded to the Siamese as a token of friendship in 1826. But the river reappears in Pliny as "Scandinavia." Mela's descriptive method is peculiar and inconvenient. Instead of treating each continent separately he begins at the Straits of Gibraltar, and describes the countries adjoining the south coast of the Mediterranean; then he goes round by Syria and Asia Minor to the Black Sea, and so returns to Spain along the north shore of the Euxine, Propontis, &c. After treating the Mediterranean islands, he next occupies the Mediterranean littoral—to west, north, east and south successively—from Spain and Gaul round to India, from India to Persia, Arabia and Ethiopia; and so again works back to Spain round south Africa. Like most classical geographers he conceives the Indian Ocean as a separate part of the world, and Eastern Asia looked to him as resembling his own country, and had no existence whatever amongst the ancients. The course of the river is described in the geographical part of Pliny's *Historia naturalis* (where Mela is cited as an important authority) the *De situ orbis* is the only formal treatise on the subject in classical Latin. Nothing is known of the author except his name and birthplace—the small town of Tingentera or Cingentera in southern Spain, on Algeciras Bay (Mela ii. 6, § 96; but the text is here corrupt). The date of his writing may be approximately fixed by his allusion (iii. 6 § 49) to a proposed British expedition of the reigning emperor, almost certainly that of Claudius in A.D. 43. That this passage cannot refer to Julius Caesar is proved by several references to events of Augustus's reign, especially to certain new names given to Spanish towns. Mela has been without probability identified by some with L. Annanus Mela of Corduba, son of Seneca the rhetorician, and brother of the great Seneca.

The general views of the *De situ orbis* mainly agree with those current among Greek writers from Eratosthenes to Strabo; the practice of producing *Mela* is probably due to Augustus. But Pomponius Mela, described by ancient geographers as the compiler of the map of the world (except perhaps the one made by Ptolemy; and he regards the Caspian Sea as an inlet of the Northern Ocean, corresponding to the Persian and Arabian (Red Sea) gulfs on the map. His Indian conceptions are inferior to those of some earlier Greek writers; he supposed the Himalaya to occupy the south-eastern angle of Asia, whence the coast trended northwards to Scythia, and then swept round westward to the Mediterranean. His method, which is of European origin, and his conception of the Earth, are those of Greek and Roman geographers, and his list of Greek writers for whom he refers is not without interest. He alludes to Homer and the Greek poets for the first time to name the Oedipus or Orkeyns, which he defines and locates pretty correctly. Of northern Europe his knowledge was imperfect, but he speaks vaguely of a great bay ("Codanus sinus") to the north of Germany, among whose many islands he names the "Tellus." Several of the former names of the Danube have been adopted by the Danes, and his name reappears in Pliny as "Scandinavia." Mela's descriptive method is peculiar and inconvenient. Instead of treating each continent separately he begins at the Straits of Gibraltar, and describes the countries adjoining the south coast of the Mediterranean; then he goes round by Syria and Asia Minor to the Black Sea, and so returns to Spain along the north shore of the Euxine, Propontis, &c. After treating the Mediterranean islands, he next occupies the Mediterranean littoral—to west, north, east and south successively—from Spain and Gaul round to India, from India to Persia, Arabia and Ethiopia; and so again works back to Spain round south Africa. Like most classical geographers he conceives the Indian Ocean as a separate part of the world, and Eastern Asia looked to him as resembling his own country, and had no existence whatever amongst the ancients. The course of the river is described in the geographical part of Pliny's *Historia naturalis* (where Mela is cited as an important authority) the *De situ orbis* is the only formal treatise on the subject in classical Latin. Nothing is known of the author except his name and birthplace—the small town of Tingentera or Cingentera in southern Spain, on Algeciras Bay (Mela ii. 6, § 96; but the text is here corrupt). The date of his writing may be approximately fixed by his allusion (iii. 6 § 49) to a proposed British expedition of the reigning emperor, almost certainly that of Claudius in A.D. 43. That this passage cannot refer to Julius Caesar is proved by
undertook to obtain possession of the oxen of the Thessalian prince Iphiclus. As Melampus had foretold, he was caught and imprisoned, but was released by Phylacus (the father of Iphiclus) on giving proof of his powers of divination, and was finally presented with the oxen as a reward for having restored the virility of the son. Melampus subsequently obtained a share in the kingdom of Argos in return for having cured the daughters of its king Proetus, who had been driven mad for offering resistance to the worship of Dionysus or for stealing the gold from the statue of Hera. At Asgothaina in Megara there was a sanctuary of Melampus, and an annual festival was held in his honour. According to Herodotus, he introduced the cult of Dionysus into Greece from Egypt, and his name ("black foot") is probably a symbolical expression of his character as a Bacchic propitiatory priest and thus (Peller). According to the traditional explanation, he was so called from his foot having been tanned by exposure to the sun when a boy. In his character of physician, he was the reputed discoverer of the herb melampodium, a kind of heliobore. Melampus and Bias are symbolic representatives of cunning and force.

See Apollodoros i. 9, 11, 12; ii. 2, 2; Odysseus, xv. 225-240; Dios. Sic. iv. 68; Herodotus ii. 49; ix. 34; Pausanius ii. 18, 4; iv. 36, 3; scholarist on Theocritus iii. 43; Ovid, Metam. x. 325; C. Eckermann, Melampus und seine Gelehrten (1840). Melampus is also the name of the author of a short treatise of little value on Divination by means of Palpitation (Παλπάω) and Birthmarks (Βιτραχία). It probably dates from the time of Ptolemy Philadelpheus (3rd cent. B.C.). Edition by J. C. Franz, Scriplores physiognomiae veteres (1780).

MELANCHLAENI—MELANCHTHON

This appointment marked an epoch in German university education; Wittenberg became the school of the nation; the scholastic methods of instruction were set aside, and in a Discourse on Reforming the Studies of Youth Melanchthon gave proof, not only that he had caught the Renaissance spirit, but that he was fitted to become one of its foremost leaders. He began to lecture on Homer and the Epistle to Titus, and in cont.

1 Her character is evidenced by the familiar proverb—

Wor mehr will verzeihen

Denn sein Pfleg kann erheben,

Der muss zuletzt verderben

Und sein Name ist sein Menchen—

of which Melanchthon said to his students "Didici hoc a mea matri, vos etiam obstant." (For Melanchthon's Latin version of the saying see Corpus reformatorum, x. 469.)
conference further attempts were made to settle the Reformation controversy by a compromise, and Melanchthon, from his conciliatory spirit and facility of access, appeared to the defenders of the old faith the fittest of the reformers to deal with. His historical instinct led him ever to revert to the original unity of the church, and to regard subsequent errors as excrescences rather than proofs of an essentially anti-Christian system. He was weary of the rabies theologorum, and dreamed that the evangelical leaven, if tolerated, would purify the church's life and doctrine. In 1537, when the Protestant divines signed the Lutheran Articles of Schmalkalden, Melanchthon appended to his signature the reservation that he would allow a popish provision provided he allowed the gospel and did not claim to rule by divine right.

The year after Luther's death, when the battle of Mühlberg (1547) had given a seemingly crushing blow to the Protestant cause, an attempt was made to weld together the evangelical and the papal doctrines, which resulted in the compilation by Pfug, Sidonius and Agricola of the Augsburg "Interim." This was proposed to the two parties in Germany as a provisional ground of agreement till the decision of the Council of Trent. Melanchthon, aware of his own inner conflict, was convinced that the Interim was inadmissible, yet so far as matters of indifference (adiaphora) were concerned it might be received. Hence arose that "adiaphoristic" controversy in connexion with which he has been misrepresented as holding among matters of indifference such cardinal doctrines as justification by faith, the number of the sacraments, as well as the dominion of the pope, feast-days, and so on. The fact is that Melanchthon sought, not to minimize differences, but to veil them under an intentional obscurity of expression. Thus he allowed the necessity of good works to salvation, not in the old sense; proposed to allow the two sacraments, but only as rites which had no inherent efficacy to salvation, and so on. He afterwards retracted his compliance with the adiaphora, and never really swerved from the views set forth in the Loci communnes; but he regarded the surrender of more perfect for less perfect forms of truth or of expression as a painful sacrifice rendered to the weakness of erring brethren. Luther, though he had probably uttered in private certain expressions of dissatisfaction with Melanchthon, maintained an unbroken friendship with him; but after Luther's death certain smaller men formed a party emphasizing the extremest points of their master's doctrine. Hence the later years of Melanchthon were occupied with controversies within the Evangelical church, and fruitless conferences with his Romanist adversaries. He died in his sixty-third year, on the 19th of April 1560, and his body was laid beside that of Martin Luther in the Schlosskirche at Wittenberg.

His ready pen, clear thought and elegant style, made him the scribe of the Reformation, most public documents on that side being drawn up by him. He never attained entire independence of Luther, though he gradually modified some of his positions from those of the pure Lutheranism with which he set out. His development is chiefly noteworthy in regard to these two leading points—the relation of the evangelium or doctrine of free grace (1) to free will and moral ability, and (2) to the law and poenitentia or the good works connected with repentance. At first Luther's cardinal doctrine of the sanctification of his disciples was opposed by him, with any view of free will; and, following Luther, he denounced Aristotle and philosophy in general, since "philosophers attribute everything to human power, while the sacred writings represent all moral power as lost by the fall." In the first edition of the Loci (1521) he held, to the length of fatalism, the Augustinian doctrine of irresistible grace, working according to God's immutable decrees, and denied freedom of will in matters civil and religious alike. In the Augsburg Confession (1530), which was largely due to him, freedom is claimed for the will in non-religious matters, and in the Loci of 1553 he calls the denial of freedom Stoicism, and "the negation of the divine ordination the ruin of all the human constitution that is from the very beginning contrary to all worthiness, in the recipient, subordinate to the Divine causality. In 1553, combating Laurentius Valla, he did not deny the spiritual incapacity of the will per se, but held that this is strengthened by the will not of God, to which it can cleave. The will co-operates with the word and the Holy Spirit. Finally, in 1543, he says that the cause of the difference of final destiny among men lies in the different method of treating grace which is possible to believers as to others. Man may pray for help and reject grace. This he calls free will, as the power of laying hold of grace. Melanchthon's doctrine of the three concurrent causes in conversion, viz. the will of God, the will of man, and the grace of God, was the semi-Pelagian position called Synergism, which was held by some of his immediate followers.

Concerning the relation of grace to repentance and good works, Luther was disposed to make itself evident by his conduct. Melanchthon, however, for whom ethics possessed a special interest, laid more stress on the law. He began to do this in 1527 with his "Lutheran Sensus urbis," urging the people in the necessity of repentance, and to bring in the whole mass of the law to bear upon men in order to faith. This brought down upon him the opposition of the Antinomian Johannes Agricola. In the second edition of 1535, Melanchthon laid more stress on the co-existence of justification and good works in the believer on a secure basis by declaring the latter necessary to eternal life, though believer's destiny thereto is already fully guaranteed in his justification. In the Loci of 1543 he did not retract the doctrine of the necessity of good works in order to salvation, and to this he added, in the Leipzig Interim, "that this in no way countenances the denial of the deeper grace in the works." Melanchthon was led to lay more and more stress upon the law and moral ideas; but the basis of the relation of faith and good works was never clearly brought out by him, and he at length left the discussion of this question to his friend Joachim Camerarius (1566), a new annotated edition of which is much needed. The best modern life is that by Georg Ellinger (Berlin, 1902); next is that of Karl Schmidt (Elberfeld, 1861). The celebration in 1867 of the 400th anniversary of Melanchthon's birth produced many short biographies and Festreden, among them works by J. W. Richard (New York and London, 1898); George Flacius (London, 1897); Karl Sell (Halle, 1897); Ferdinand Cohrs (Halle, 1897); Betsyag and Haenisch to E. Borchard; and Rothe's Festrede (1860) also is good. The most learned of modern Melanchthonians was probably Karl Hartfelder, who wrote Philipp Melanchthon als Præsector Germaniae (Berlin, 1884); Melanchthoniani paedagogia (Leipzig, 1892), giving in the first named two full bibliographies, one of all works written on Melanchthon, the other of all works written by him (in chronological order). The reader believed that a good deal of unpublished material is still left in German and foreign libraries. Thus three long unknown letters are published in the Quellen und Forschungen of the König. Preuss. Inst., at Romford, in 1899; and a number of collections of the Cardinal of Augsburg and one to Lazarus von Schwendich. Melanchthon turned his way to the Council of Trent as elector of Saxony and the cardinal had offered to meet him at Dillingen. He appointed him to the censorship of the Council, but this was not a national synod, which would have been a better means of arriving at the truth.

MELANESIA, one of the three great divisions of the oceanic islands in the central and western Pacific. It embraces the Bismarck Archipelago, N.E. of New Guinea, the Louisiade, Solomon, Santa Cruz, New Hebrides and Loyalty islands, New Caledonia, Fiji and intervening small groups. The name (Gr. μελανίς, black, and ἄγρος, island) is derived from the black colour of the prevailing native race, the Papuan and its allied tribes. Many of these differ widely from the parent race, but all the Melanesian peoples have certain common characteristics which distinguish them sharply from the inhabitants of Polynesia and Micronesia. Their civilization is lower. The Melanesians are mostly "negroid," nearly black, with crisp, curly hair elaborately dressed; their women hold a much lower position than among the Polynesians; their institutions, social, political and religious, are simpler, their manners ruder; they have few写出。
MELANTHIUS, a noted Greek painter of the 4th century B.C. He belonged to the school of Sicyon, which was noted for fine detail work.

MELBA [NELLIE PORTER ARMSTRONG] (1859— ), British operatic soprano, née Nellie Porter Mitchell, was born at Burnley, near Melbourne, Australia, her father being a contractor, of Scotch blood. She sang at a local concert when six years old, and was given a good musical education. In 1882 she married Captain Charles Armstrong, and in 1886 went to study singing in Paris under the famous teacher, Madame Mathilde Marchesi, whose daughter, Madame Blanche Marchesi, also a famous singer, was associated with her. In 1887 she made her début in opera at Dover, taking the stage-name of Madame Melba from her connexion with Melbourne. In the next year she sang the part of Lucia, which remained one of her famous rôles, at Covent Garden, London; and, though critics complained of her coldness as an actress, her liquid voice and brilliant execution henceforth made her famous as the greatest successor to Patti, in pure vocalization, on the operatic stage. She maintained this position for over twenty years, her triumphs being celebrated in every country. See an "authorized" biography by Agnes G. Murphy (1909).

MELBOURNE, WILLIAM LAMB, 2nd Viscount (1770-1848). English statesman, second son of the 1st Viscount Melbourne, by his marriage with the daughter of Sir Ralph Milbanke, bart., was born on the 15th of March 1770. His father, Peniston Lamb (1748-1829), was the son of Sir Matthew Lamb, bart. (d. 1768), who made a large fortune out of the law, and married Miss Coke of Melbourne Hall; in 1770 he was made baron and in 1781 Viscount Melbourne in the Irish peerage, and in 1815 was created an English peer. After completing his course at Trinity College, Cambridge, William Lamb studied law at the university of Glasgow, and was called to the bar in 1804. In 1805 he married Lady Caroline Ponsonby (1785-1828), daughter of the 3rd earl of Bessborough. She was, however, separated from him in 1825. Lady Caroline Lamb acquired some fame as a novelist by her romance of Glenarvon, which was published anonymously in 1810 and was afterwards (1865) reissued under the title of The Fatal Passion. On entering parliament in 1806 the Hon. William Lamb (as Lord Melbourne then was) joined the opposition under Fox, of whom he was an ardent admirer; but his Liberal tendencies were never decided, and he not infrequently supported Lord Liverpool during that statesman's long tenure of office. During the short ministry of Canning in 1827 he was chief secretary for Ireland, but he afterwards for a time adhered to the small remnant of the party who supported the duke of Wellington. The influence of Melbourne as a politician dates from his succeeding to the peerage in 1829. Disagreeing with the duke of Wellington on the question of parliamentary reform, he entered the ministry of Grey as home secretary in 1830. For the duties of this office at such a critical time he was deficient in insight and energy, but his political success was independent of his official capacity; and when the ministry of Grey was wrecked on the Irish question in July 1834 Melbourne was chosen to succeed him as prime minister. In November following he had to give place to a Conservative ministry under Peel; but he resumed office in April 1835, and remained prime minister till 1841. He died at Melbourne House, Derbyshire, on the 24th of November 1848.

Lord Melbourne was without the qualification of attention to details, and he never displayed those brilliant talents which often form a substitute for more solid acquirements. Though he possessed a fine and flexible voice, his manner as a speaker was ineffective, and his speeches were generally ill-arranged and destitute of oratorical point. His political advancement was due to his personal popularity. He had a thorough knowledge of the private and indirect motives which influence politicians, and his genial attractive manner, easy temper and vivacity, if occasionally coarse, was helpful to confer on him a social distinction which led him to take great and 投资

Melbourne was succeeded as 3rd viscount by his brother, Frederick James Lamb (1835), who was British ambassador to Russia from 1831 to 1841. On the 3rd viscount's death the titles became extinct, but the estates passed to his sister Emily Mary (1787-1880), the wife of Lord Palmerston.

See W. McC. Torrens, Memoirs of Lord Melbourne (1878); Lloyd Sanders, Lord Melbourne's Papers (1889); A. Hayward's essay (from the Quarterly Review, 1879) in "Eminent Statesmen (1880).

MELBOURNE, the capital of Victoria, and the most populous city in Australia. It is situated on Hobson's Bay, a northern bend of the great harbour of Port Phillip, in Bourke county, about 500 m. S.W. of Sydney. The suburbs extend along the shores of the bay for more than 10 m., but the part distinctively known as the "city" occupies a site about 3 m. inland on the north bank of the Yarra river. The appearance of Melbourne from the sea is by no means picturesque. The busy shipping suburbs of Port Melbourne and Williamstown occupy the flat alluvial land at the mouth of the Yarra. But the city itself has a different aspect; its situation is relieved by numerous gentle hills, which show up its fine public buildings to great advantage; its main streets are wide and well kept, and it has an air of prosperity and comfort. The city, especially known as the "city" occupies two hills, and along the valley between them runs the thoroughfare of Elizabeth Street. Parallel to this is Swanston Street, and at right angles to these, parallel to the river, are Bourke Street, Collins Street and Flinders Street—the first being the busiest in Melbourne, the second the most fashionable with the best shops, and the third, which faces the river, given up to the maritime trade. These streets are an eighth of a mile apart, and between each is a narrower street bearing the name of the wider, with the prefix "Little." The original plan seems to have been to construct these narrow streets to give access to the great business houses which, it was foreseen, would be built on the frontage of the main streets. This plan, however, miscarried, for space grew so valuable that large warehouses and business establishments have been erected in these lanes. Little Flinders Street, in which the great importers' warehouses are mainly situated, is locally known as "the Lane." In the centre of the city some of the office buildings are ten, twelve or even fourteen storeys high. The main streets are 90 ft. wide, and the lanes somewhat less than half that width. Round the city lies a circle of populous suburbs—to the north-east Fitzroy (pop. 11,412) and Collingwood (37,749), to the east Richmond (37,824), to the south-east Prahran (40,441), to the southwest South Melbourne (40,619), to the north-west Port Melbourne (12,176), and to the north-west North Melbourne (18,126). All these suburbs lie within 3 m. of the general post office in Elizabeth Street; but outside them and within the 5 m. radius is another circle—toward the east Kew (9469) and Hawthorn (21,430), to the south-east St Kilda (26,542) and Brighton (10,047), to the south-west Williamstown (14,925) and Footscray (18,318), to the north-west Essendon (17,626), and Fremington and Altona (10,040), and to the north Brunswick (24,141). Numerous small suburbs fill the space between the two circles, the chief being Northcote, Preston, Camberwell, Toorak, Caulfield, Elsternwick and Coburg. Some of these suburbs are independent cities, others separate municipalities. In spite of the value of land, Melbourne is not a crowded city.

The Parliament House, standing on the crown of the eastern hill, is a massive square brick building with a pillared freestone façade approached by a broad flight of steps. The interior is lavishly decorated and contains, besides the legislative chambers, a magnificent library of over 50,000 volumes. At the top of

Collins Street a building in brown freestone is occupied by the Treasury, behind which and fronting the Treasury Park another palatial building houses the government offices. A little further on is St Patrick’s Roman Catholic cathedral, the seat of the archbishop of Melbourne, a building of somewhat sombre blue-stone. Two striking churches face each other in Collins Street, the Scots church, a Gothic edifice with a lofty spire, and the Independent church, a fine Saracenic building with a massive campanile. The seat of the Anglican bishop, St Paul’s cathedral, has an elegant exterior and a wealth of elaborate workmanship within, but stands low and is obscured by surrounding warehouses. On the western hill are the law courts, a fine block of buildings in classic style surmounted by a central dome. In Swanston Street there is a large building where under one roof are found the public library of over 100,000 volumes, the museum of sculpture, the art gallery, and the museum of ethnology and technology. In connexion with the art gallery there is a travelling scholarship for art students, endowed by the state. The Exhibition Buildings are situated on a hill in Carlton Gardens; they consist of a large cruciform hall surmounted by a dome and flanked by two annexes. Here on the 9th of May 1901 the first federal parliament of the Australian commonwealth was opened by King George V. (as duke of Cornwall and York). The Trades Hall at Carlton is the meeting-place of the trades-union societies of Victoria, and is the focus of much political influence. The Melbourne town hall contains a central chamber capable of accommodating 5000 people. The suburbs of Collingwood, Brunswick, Fitzroy, and the south eastern part of Fitzroy have each a town hall. The residence of the governor of the colony is in South Melbourne, and is surrounded by an extensive domain. The university is a picturesque mass of buildings in large grounds about a mile from the heart of the city. It comprises the university buildings proper, the medical school, the natural history museum, the Wilson Hall, a magnificent building in the Perpendicular style, and the three affiliated colleges, Trinity College (Anglican), Ormond College (Presbyterian) and Queen’s College (Wesleyan). The university, established in 1855, is under economical, and grants of £5000 a year to the faculties of arts, law, medicine, science, civil engineering and music; instruction in theology is left to the affiliated colleges. Melbourne has numerous state schools, and ample provision is made for secondary education by the various denominations and by private enterprise. Of theatres, the Princess and the Theatre Royal are the most important. Other public buildings include the mint, the observatory, the Victoria markets, the Melbourne hospital, the general post office, the homoeopathic hospital, the custom house and the Alfred hospital. Many of the commercial buildings are of architectural merit, notably the banks, of which the bank of Australasia, a massive edifice of Doric order, and the Gothic Australian bank are the finest examples.

The public gardens and parks of Melbourne are extensive. Within the city proper the Fitzroy Gardens are a network of avenues bordered with oak, elm and plane, with a “fern-tree gully” in the centre; they are ornamented with casts of famous statues, and ponds, fountains and classic temples. The Treasury, Flagstaff and Carlton Gardens are of the same class. Around the city lie five great parks—Royal Park, in which are excellent zoological gardens; Yarra Park, which contains the lawn and ornamental garden; Botany Park, and the botanical gardens on the banks of the river; Albert Park, in which is situated a lake much used for boating; and Studley Park on the Yarra river, a favourite resort which has been left in a natural state. Besides these parks, each suburb has its public gardens, and at Fleming-ton there is a fine race-course, on which the Melbourne cup races are run every November, an event which brings in a large influx of visitors from all parts of Australia. Melbourne has a complete tramway system; all the chief suburbs are connected with the city by cable trams. The tramways are controlled by a trust, representing twelve of the metropolitan municipalities. The chief monuments and statues of the city are the statue of Queen Victoria in the vestibule of the Houses of Parliament, and a colossal group commemorating the explorers Robert O’Hara Bourke (b. 1820) and William John Wills (b. 1834), who died of starvation in 1861 on an expedition for the crossing of Australia from south to north. There are also the statue to Sir Redmond Barry, first chancellor of the university, outside the public library, the Gordon statue in Spring Street, a replica of that in Trafalgar Square, London, and a statue of Daniel O’Connell, outside St Patrick’s cathedral.

Port Melbourne, originally called Sandridge, is about 2 m. distant from the city, with which it is connected by rail and tramway. It has two large piers, alongside of which vessels of almost any tonnage can lie. One of these piers is served by the railway, and here most of the great liners are berthed. Vessels drawing 22 ft. of water can ascend the river Yarra to the heart of the city. There are 2 m. of wharves along each bank of the river, with two large dry-docks and ship-repairing yards and foundries. Below Queen’s Bridge is an expansion of the river Yarra as wide as the Pool, in which the largest ships using the river can turn with ease. Leading from a point opposite the docks is the Coode canal, by means of which the journey from the city to the mouth of the river is shortened by over a mile. As a port Melbourne takes the first place in Australia as regards tonnage. It is also a great manufacturing centre, and both city and suburbs have their distinctive industries. The chief are tanning, fellmongery, wool-washing, bacon-curing, flour milling, brewing, iron-founding, brick-making, soap-boiling, the manufacture of pottery, candles, cheese, cigars, snuff, jams, biscuits, jewelry, furniture, boots, clothing and leather and worsteds.

The climate of Melbourne is exceptionally fine; occasionally hot winds blow from the north for two or three days at a time, but the proportion of days when the sky is clear and the air dry and mild is large. Snow is unknown, and the average annual rainfall is 25·58 in. The mean annual temperature is 57·3° F., corresponding to that of Washington in the United States, and to Lisbon and Messina in Europe. The city is supplied with water from the Yan Yean works, an artificial lake at the foot of the Plenty Range, nearly 19 m. distant. The little settlement of the year 1835, out of which Melbourne grew, at first bore the native name of Dootigala, but it was presently renamed after Viscount Melbourne, premier of Great Britain at the time of its foundation. In June 1836 it consisted of only thirteen buildings, eight of which were turf huts. For two years after that date a constant stream of squatters with their sheep flowed in from around Sydney and Tasmania to settle in the Port Phillip district, and by 1845 the population of the town had grown to 11,000. The discovery of gold at Ballarat in 1851 brought another influx of population to the district, and the town grew from 30,000 to 100,000 in the course of two or three years. In 1842 Melbourne was incorporated and first sent members to the New South Wales parliament. A strong popular agitation caused the Port Phillip district to be separated from New South Wales in 1851, and a new colony was formed with the name of Victoria, Melbourne becoming its capital. In 1901 Melbourne became the temporary capital of the Australian commonwealth pending the selection of the permanent capital in New South Wales. The population of the city proper in 1901 was 68,374, and that of ‘greater Melbourne’ was 496,697.

MELBOURNE, a market town in the southern parliamentary division of the county of Derbyshire, in the hundred of Hardwick, 8 m. S.W. of Manchester, on the Midland railway. Pop. (1901), 3506. It lies in an undulating district on a small southern tributary of the Trent, from which it is about 2 m. distant. The church of St Michael is a fine example of Norman work, with certain late details, having clerestoried nave, chancel and aisles, with central and two western towers. Melbourne Hall, a building of the time of William III., surrounded by formal Dutch gardens, stands in a domain owned at an early date by the bishops of Carlisle, whose title the barn remains near the church. They obtained the manor in 1333. In 1511 Robert de Holland fortified a mansion here, and in 1527 this castle belonged to Henry, earl of Lancaster; but it was dismantled in 1560, and little more than the site is now traceable. The title of Viscount Melbourne was taken from this town. There are manufactures of silk, and boots and shoes.
MELCHERS—MELEAGER

MELCHERS, (JULIUS) GARI (1860— ), American artist, was born at Detroit, Michigan, on the 11th of August 1860. The son of a sculptor, at seventeen he was sent to Düsseldorf to study art under von Gebhardt, and after three years went to Paris, where he worked at the Académie Julien and the École des Beaux Arts. Attracted by the pictorial side of Holland, he settled at Eemnes; his first important post was at Utrecht. "The Scorn," brought him charming and considerable mention at the Paris Salon of 1886. He became a member of the National Academy of Design, New York; the Royal Academy of Berlin; Société Nationale des Beaux Arts, Paris; International Society of Painters, Sculptors and Engravers, London, and the Secession Society, Munich; and, besides receiving a number of medals, his decorations include the Legion of Honour, France; the order of the Red Eagle, Germany; and knight of the Order of St Michael, Bavaria. Besides portraits, his chief works are: "The Supper at Emmaus," in the Krupp collection at Essen; "The Family," National Gallery, Berlin; "Mother and Child," Luxembourg; and the decoration, at the Congressional Library, Washington, "Peace and War."

MELCHIAD, or MILTADIS (other forms of the name being Meltiades, Meliades, Milciades and Militides), pope from the 2nd of July 316, to the 11th January 314. He appears to have been an African by birth, but of his personal history nothing is known. The toleration edicts of Galerius and of Constantine and Licinius were published during his pontificate, which was also marked by the holding of the Lateran synod in Rome (315) at which Caeccilianus, bishop of Carthage, was acquitted of the charges brought against him and Donatus condemned. Melchiades was preceded and followed by Euschius and Silvester I. respectively.

MELCHITES (lit. Royalists, from Syriac melcha, a king), the name given in the 5th century to those Christians who adhered to the creed supported by the authority of the Byzantine emperor. The Melchites therefore are those who accept the decrees of Chalcedon and Chalcedonized in the Nestorians and Jacobite Church (q.v.). They follow the Orthodox Eastern liturgy, ceremonial and calendar, but acknowledge the papal and doctrinal authority of Rome. They number about 80,000, are found in Syria, Palestine and Egypt, and are under the immediate rule of the patriarch of Damascus and twelve bishops.

MELCHIZEDEK (Heb. for "king of righteousness"; or, since Ġedek is probably the name of a god, " Giớiek is my king"), king of Salem (Josh. 10:12) and priest of El (El 'dyon), in the Bible. He brought forth bread and wine to Abraham on his return from the expedition against Chedorlaomer, and blessed him in the name of the supreme God, possessor (or maker) of heaven and earth; and Abraham gave him tithes of all his booty (Gen. xiv. 18—20). Biblical tradition tells us nothing more about Melchizedek (cf. Heb. vii. 3); but the majestic figure of the king-priest, prior to the priesthood of the law, to whom even the father of all Israel paid tithes (cf. Jacob at Bethel, Gen. xxvii. 22), suggested a figurative or typical application, first in Psalm cx. to the vicegerent of Yahweh, seated on the throne of Zion, the king of Israel who is to come after the order of Melchizedek, and then, after the Gospel had ensured the Messianic interpretation of the Psalm (Matt. xxii. 42 seq.), to the kingly priesthood of Jesus, as that idea is worked out at length in the Epistle to the Hebrews.

The theological interest which attaches to the idea of the pre-Aaronic king-priest in these typical applications is practically independent of the historical questions suggested by the narrative of Gen. xiv. The episode of Melchizedek, though connected with the main narrative by the epithets given to Yahweh in Gen. xiv. 22, breaks the connection of the story of Genesis 15 and 21, and may perhaps have come originally from a separate source. As the narrative now stands Salem must be sought in the vicinity of "the king's dale," which from 2 Sam. xvii. 18, probably, but not necessarily, lay near Jerusalem. That Salem is Jerusalem, as in Psalm lxxvi. 2,

1 It is to be noted also that the name is of the same form as Adoni-zedek, king of Jerusalem (Josh. x. 29), and also as the Hebrew Araunah of 2 Sam. xxiv. 16 is probably a corruption of the similar compound Adonjah (2 Sam. vii. 10, etc.).

2 The god 'Elōw was also Phoenician; see Driver, Genesis, p. 105; Lagrange, Réligions Semitiques, Index, s.v.

3 The ancient and common view; but even in the 15th century B.C. Jerusalem was known as Uru-salim. Jerome and others have identified Salem with one or other of the various places which bear that name, e.g. the Ṣālāmah of John iii. 23, 8 m. south of Beth-shean. In a genuine record of extreme antiquity the union of the king and priest in one, as in the worship of the supreme deity of the Canaanites, and the widespread practice of the non-religious attribution of a title of deity to a prominent person of the tribe, although no difficulty; but, if the historical character of the narrative is not doubted, the date of the conception must be regarded as anterior to the rise of the temporal authority of the high priests after the exile. So far no evidence has been found in the cuneiform inscriptions or elsewhere in support either of the genuineness of the episode in its present form, or of the antiquity which has been attributed to it. (1) E. Schürer, Gesch. Einzel. Gesch., p. 395 sqq. An ancient legend identifies Melchizedek with Shem (Palestine Targum, Jerome on Isa. xl., Ezech. Syrus in loco).

MELOCOMBE, GEORGE BUBB DODDINGTON, BARON (1621—1762), English politician. His father's name was Bubb, but the son took the name of Doddington on inheriting a large property by the death of an uncle of that name (1720). He was educated at Oxford. In 1715 he was returned to parliament as member for Winchelsea, and was sent as envoy extraordinary to Spain. He carried on a scandalous traffic in the five or six parliamentary votes which he controlled, his turgid writings and freely furnishing food for the political satirists and caricaturists of the time. His most estimable public action was his defence of Admiral Byng in the House of Commons (1757). From 1722 to 1754 he sat in parliament for Bridge-water; from 1724 to 1740 was a lord of the treasury; and, in 1744, became treasurer of the navy under Henry Pelham, and, again in 1755, under Newcastle and Fox. In April 1761 he was raised to the peerage as Baron Melcombe of Melcombe Regis in Dorsetshire. He died at La Trappe, his Hammersmith house, on the 28th of July 1762. His wife, acknowledged only after the death of another lady to whom he had given a bond that he would marry no one else, died without issue. He was a wit and a friend of wits, a good scholar, and something a Maccaroni; Thomson's "Summer" was dedicated to him, Fielding addressed to him an epistle and Edward Young a satire. He was a leading spirit of the "Hell-fire" Club, whose members, called "Franziscans," from their founder Sir Francis Dashwood (d. 1781), held their revels in the ruined Cistercian abbey of Medmenham, Bucks.

His diary, published in 1784, reveals him in his character of practical statesman and throws a curious light on the political methods of the time.

MELEAGER (Gk. Mελέαγρος), in Greek legend, the son of Oeneus, king of Calydon, and Althaea. His father having neglected to sacrifice to Artemis, she sent a wild boar to ravage the land, which was eventually slain by Meleager. A war broke out between the Calydonians and Curetes (led by Althaea's brothers) about the disposal of the head and skin, which Meleager awarded as a prize to Atalanta, who had inflicted the first wound; the brothers of Althaea lay in wait for Atalanta and robbed her of the spoils, but were slain by Meleager. When Althaea heard this, she cursed Meleager, who withdrew, and refused to fight until the Curetes were on the point of capturing the city of Calydon. Then, yielding to his wife's entreaties, he sallied forth and defeated the enemy, but was never seen again, having been carried off by the Erinyes, who had heard his mother's curse (or he was slain by Apollo in battle). According to a later tradition, not known to Homer, the Moerae appeared to Althaea when Meleager was seven days old, and announced that the child would only live as long as the log blazing on the hearth remained unbroken. Althaea thereupon seized the log, extinguished the flames, and hid it in a chest. She feared for her brothers' death, she relighted the log, and let it burn away until Meleager died.3 Then, horrified at what she had done, she hanged herself, or died of grief. The sisters of Meleager were

1 It is to be noted also that the name is of the same form as Adoni-zedek, king of Jerusalem (Josh. x. 29), and also as the Hebrew Araunah of 2 Sam. xxiv. 16 is probably a corruption of the similar compound Adonjah (2 Sam. vii. cap. 290).
changed by Artemis out of compassion into guinea fowls and removed to the island of Leros, where they mourned part of their life for the brother. The life and adventures of Meleager were a favourite subject in ancient literature and art. Meleager is represented as a tall, vigorous youth with curly hair, holding a javelin or a boar’s head, and accompanied by a dog.

See R. Kekulé, De fabula meleagris dissertatio (1861); Surber, Die Meleagerage (Zürich, 1890); articles on “Meleager” and “Meleagrides” in Roscher’s Lexicon der Mythologie; L. Peller, Griechische Mythologie: Apostoloiours. i. 8; Homer, Iliad, ix. 527; Diod. Sic. iv. 34; Dio Chrysostom, Or. 67; Hyginus, Fab. 171; Ovid, Metam. viii. 290–435. In the article Greek Art (fig. 41) the hunting of the Calydonian boar is represented on a fragment of a frieze from a heroon.

MELEDA (Serbo-Croatian, Mijet; Lat. Melita), the most southerly and easterly of the larger Adriatic islands of the Austrian province of Dalmatia. Pop. (1900), 1617. Meleda lies south of the Sablancello promontory, from which it is divided by the Meleda Channel. Its length is 23 m.; its average breadth 2 m. It is of volcanic origin, with numerous chasms and gorges, of which the longest, the Babinopolje, connects the north and south of the island. A little to the east of the town, on the north, is a port of call for tourist steamers. Meleda has been regarded as the Melita on which St Paul was shipwrecked, this view being first expounded, in the 10th century, by Constantine Porphyrygenitus. As at Malta, a “St Paul’s Bay” is still shown.

MELENGANO (formerly Marignano), a town of Lombardy, Italy, in the province of Milan, 11 m. S.E. of that city by the railway to Piacenza, 280 ft. above sea-level. Pop. (1901), 6782. There are remains of a castle of the Visconti. Its military importance is due to its position at the crossing of the river Lambro. It was a stronghold of Milan in her great struggle against Lodii, and is famous for the victory of Francis I. of France over the Swiss in 1515, known as the battle of Marignano, and for the action between the French and Austrians in 1859.

MELENDEZ VALDÉS, JUAN (1754–1817), Spanish poet, was born at Ribera del Fresno, Badajoz, on the 11th of March 1754. Destined by his parents for the priesthood, he graduated in law at Salamanca, where he became indoctrinated with the ideas of the French philosophical school. In 1786 with Batlle, a pastoral in the manner of Garcilaso de la Vega, he won a prize of 20,000 ducats; another of 10,000 was awarded to Jovellanos, through whose influence he was appointed to a professorship at Salamanca in 1783. The pastoral scenes in Las Bodas de Camacho (1784) do not compensate for its undramatic nature, but it gained a prize from the municipality of Madrid. A volume of verses, lyrical and pastoral, published in 1785, caused Melendez Valdés to be hailed as the first Spanish poet of his time. This success induced him to resign his chair at Salamanca, and try his fortune in politics. Once more the friendship of Jovellanos obtained for him in 1789 a judgeship at Saragossa, whence he was transferred two years later to a post in the chancery court at Valladolid. In 1797 he dedicated to Godoy an enlarged edition of his poems, the new matter consisting principally of unsuccessful imitations of Milton and Thomson; but the poet was rewarded by promotion to a high post in the treasury at Madrid. On the fall of Jovellanos in 1798 Melendez Valdés was dismissed and exiled from the capital; he returned in 1808 and accepted office under Joseph Bonaparte. He had previously denounced the French usurper in his verses. He now outraged the feelings of his countrymen by the grossest flattery of his foreign master, and in 1813 he fled to Alais. Four years afterwards, in 1817, he returned to Madrid, but poverty and infirmity forced his return to Spain in 1800. In natural talent and in acquired accomplishment Melendez Valdés was not surpassed by any contemporary Spaniard; he failed from want of character, and his profound insincerity affects his poems. Yet he has fine moments in various veins, and his imitation of Jean Second’s Basia is notable.

MELEUTIS OF ANTICTHO (d. 381), Catholic bishop and saint, was born at Melitene in Lesser Armenia of wealthy and noble parents. He first appears (c. 357) as a supporter of Acacius, bishop of Caesarea, the leader of that party in the episcopate which supported the Homoean formula by which the emperor Constantius sought to effect a compromise between the Homoeans and the Homousians. Meleutis thus makes his début as an ecclesiastic of the court party, and as such became bishop of Sebastie in succession to Eustathius, deposed as an Homousian heretic by the synod of Melitene. The appointment was presented by the Homoean clergy, and Meleutis retired to Beroea. According to Socrates he attended the synod of Sardica in the autumn of 359, and then subscribed the Acacian formula. Furthermore, he became bishop of Antioch, in succession to Eudoxius, who had been raised to the see of Constantinople. Early in the following year he was in exile. According to an old tradition, supported by evidence drawn from Epiphanius and Chrysostom, this was due to a sermon preached before the emperor Constantius, in which he revealed Homousian views. This explanation, however, is rejected by Loofs; the sermon contains nothing inconsistent with the Acacian position favoured by the court party; on the other hand, there is evidence of conflicts with the clergy, quite apart from any questions of orthodoxy, which may have led to the bishop’s deposition.

The successor of Meleutis was Euzoeus, who had fallen with Arius under the ban of Athanasius; and Loofs explains the subtila fidei mutatio which St Jerome (ann. Abr. 2376) ascribes to Meleutis to the dogmatic opposition of the deposed bishop to his successor. In Antioch itself Meleutis continued to have adherents, who held separate services in the “Apostolic” church in the old town. The Meletian schism was complicated, moreover, by the presence in the city of another anti-Arian sect, stricter and more consistent with the Homousian formula, maintaining the tradition of the deposed bishop Eustathius and governed at this time by the presbyter Paulinus. The synod of Alexandria sent deputies to attempt an arrangement between the two anti-Arian Churches; but before they arrived Paulinus had been consecrated bishop by Lucifer of Calaris, and when Meleutis—free to return in consequence of the emperor Julian’s contemptuous policy—reached the city, he found himself one of three rival bishops. Meleutis was now between two stools. The orthodox Nicene party, notably Athanasius himself, held communion with Paulinus only; twice, in 365 and 371 or 372, Meleutis was exiled by decree of the Arian emperor Valens, and further complication was added when, in 375, Vitalis, one of Meleutis’s prebendaries, was consecrated bishop by the heretical bishop Apollinaris of Laodicea.

Meanwhile, under the influence of his situation, Meleutis had been more and more approaching to the views of the newer school of Nicene orthodoxy. Basil of Caesarea, throwing over the cause of Eustathius, championed that of Meleutis who, when after the death of Valens he returned in triumph to Antioch, was hailed as the leader of Eastern orthodoxy. As such he resided, in October 379, over the great synod of Antioch, in which the dogmatic agreement of East and West was established; it was he who helped Gregory of Nazianzus to the see of Constantinople and consecrated him; it was he who presided over the second ecumenical council at Constantinople in 381. He died soon after the opening of the council, and the emperor Theodosius, who had received him with especial distinction, caused his body to be carried to Antioch and buried with the honours of a saint. The Meletian schism, however, did not end with his death. In spite of the advice of Gregory of Nazianzus and of the Western Church, the recognition of Paulinus’s sole episcopate was refused, Flavian being consecrated as Meleutis’s successor. The Eustathians, on the other hand, elected Evagrius as bishop on Paulinus’s death, and it was not till 415 that Flavian succeeded in re-uniting them to the Church.

Meleutis was a holy man, whose ascetic life was all the more remarkable in view of his great private wealth. He was also a man of learning and culture, and widely esteemed for his honourable, kindly and straightforward character. He is venerated as a saint and confessor in both the Roman Catholic and Orthodox Eastern Churches.
See the article G. F. Loofs in Herzog-Hauck, Realencyklopädie (ed. 1897, Leipzig), xii. 552, and authorities there cited.

MELETIUS OF LYCOPOLIS (4th century), founder of the sect known after him as the "Meletians," or as the "Church of the Martyrs," in the district of Thebes in Egypt. With Peter, archbishop of Alexandria, he was thrown into the Nile, and his importance is due to his refusal to receive, at least until the persecution had ceased, those Christians who during the persecutions had renounced their faith, and then repented. This refusal led to a breach with Peter, and other Egyptian bishops who were willing to grant absolution to those who were willing to do penance for their infidelity. Meletius, after regaining his freedom, held his ground and drew around him many supporters, extending his influence even so far away as Palestine. He ordained 26 bishops and encroached upon Peter's jurisdiction. The Council of Nicaea in 325 upheld the bishop, but Meletius was allowed to remain bishop of Lycopolis though with merely nominal authority. His death followed soon after. His followers, however, took part with the Arians in the controversy with Athanasius and existed as a separate sect till the 5th century.

See Achilles in Herzog-Hauck, Realencyklopädie, xii. (1908) 558, with the authorities there cited, and works on Church History.

MELEFI, a city and episcopal see of Basilicata, Italy, in the province of Potenza, 50 m. by railroad N. of the town of that name. Melifi is picturesquely situated on the lower slopes of Monte Vulture, 1591 ft. above sea-level. Pop. (1901), 14,547. The castle was originally erected by Robert Guiscard, but as it now stands is mainly the work of the Doria family, who have possessed it since the time of Charles V.; and the noble cathedral which was founded in 1153 by Robert's son and successor, Roger, has had a modern restoration (though it retains its campaniles) in consequence of the earthquake of 1857. The city is built on one of the richest olive groves of the inhabitants persisting. It is the centre of an agricultural district which produces oil and wine. In the town hall is a fine Roman sarcophagus found 6 m. W. of Venosa.

Melfi does not seem to occupy an ancient site, and its origin is uncertain. By the Normans it was made the capital of Apulia in 1031, and fortified. The council held by Nicholas I. in 1069, that of Urban II. in 1089, the rebellion against Roger in 1133 and the subsequent punishment, the plunder of the town by Barbarossa in 1184, the attack by Richard, count of Aquitaine in 1190, and the parliament of 1223, in which Frederick II. established the constitution of the kingdom of Naples, form the principal points of interest in the annals of Melfi. In 1534 Joanna I. of Naples bestowed the city on the archbishopric of Melfi, but it was shortly afterwards captured, after a six months' siege, by the king of Hungary, who transferred it to Conrad the Wolf. In 1592 Goffredo Marzano was made count of Melfi, III., governor of the city and captain of the family, and they retained it for one hundred and seven years till the time of Charles V. An obstinate resistance was offered by the city to Lautrec de Foix in 1528; and his entrance within its walls was followed by the massacre of 18,000 of its citizens.

See G. de Lorenzo, Venosa et la regione del Vulture (Bergamo, 1896).

MELCERCES, in Greek legend, the son of the Boeotian prince Athamas and Ino, daughter of Cadmus. Ino, pursued by her husband, who had been driven mad by Hera because he had brought up the infant Dionysus, threw herself and Melicertes into the sea from a high rock between Megara and Corinth. Both were changed into marine deities—Ino as Leucothea, Melicertes as Palamemon. The body of the latter was carried by a dolphin to the Isthmus of Corinth and deposited under a pine tree. Here it was found by his uncle Sisyphus, who had it removed to Corinth, and by command of the Nereids instituted the Isthmian games and sacrifices in his honour. There seems little doubt that the cult of Melicertes was of foreign, probably Phoenician, origin, and introduced by Phoenician navigators on the coasts and islands of the Aegean and Mediterranean. He is a native of Boeotia, where Phoenician influences were strong; at Tenedos he was propitiated by the sacrifice of children, which seems to point to his identity with Melkart. The premature death of the child in the Greek form of the legend is probably an allusion to this.

The Romans identified Palamemon with Portunus (the harbour god). No satisfactory origin of the name Palamemon has been given. It has been suggested that it means the "wrestler" or "struggler" (σφαίρα) and is an epithet of Heracles, who is often identified with Melcart, but there does not appear to be any tradition of connexion between the north African god and Palamemon.

MELETIUS, an influential Phoenician, was also known as the "burning lord" (Ba'al-hamman), but seems little common in a god of the sea and a god of Libyca. See Ovid, Metam. iv. 416-542, Fasti, vi. 485; Hyginus, Fab. 2; Pausanias iv. 44, ii. 10; Philostorbus, Icones, ii. 16; articles by Toutain in Darmenberg and Saglio's Dictionnaire des antiquités grecques et romaines, L. Ronningen in Roscher's Lexicon der Mythologie; T. Fröhlich, Griechische Mythologie; R. Brown, Semitic Influence in Hellenic Mythology (1898).

MELILLA, a Spanish fortified station and penal settlement on the north coast of Morocco, south of Cape Tres Forcas and 135 m. E.S.E. of Ceuta. Pop. about 9000. The town is built on a huge rock connected with the mainland by a rocky isthmus. There is a harbour, only accessible to small vessels; the roadstead outside is safe and has deep water a mile to the east of the town and the landing-place, where a mole is cut out of the rock, there is a steep ascent to the upper town, characteristically Spanish in appearance. The town is walled, and the isthmus protected by a chain of small forts. A Moorish custom-house is placed on the Spanish border beyond the fort of Santa Isabel, and is the only authorized centre of trade on the Rif coast between Tetuan and the Algerian frontier. It thus forms the entrepôt for the commerce of the Rif district and its hinterland. Goat skins, eggs and beeswax are the principal exports, cotton goods, tea, sugar and candles being the chief imports. For this period 1900-1905 the annual value of the trade was about £2,000. Melilla, the first place captured by Spain on the African mainland, was seized from the Moors in 1490. The Spaniards have had much trouble with the neighbouring tribes—turbulent Rifians, hardly subject to the sultan of Morocco. The limits of the Spanish territory round the fortress were fixed by treaties with Morocco in 1859, 1860, 1861 and 1894. In 1893 the Rifians besieged Melilla and 25,000 men had to be despatched against them. In 1908 two companies, under the protection of El Rophi, a chieftain then ruling the Rif region, started mining, and iron from some 15 m. of the Mergu in the railway to the mines was begun. In October of that year the Rifians revolted from the Rophi and raided the mines, which remained closed until June 1909. On the 9th of July the workmen were again attacked and several of them killed. Severe fighting between the Spaniards and the tribesmen followed. The Rifians having submitted, the Spaniards, in 1910, restarted the mines and undertook harbour works at Mar Chica.

MÉLINE, FÉLIX JULES (1838-1908), French statesman, was born at Remiremont on the 20th of May 1838. Having adopted the law as his profession, he was chosen a deputy in 1872, and in 1879 he was for a short time under-secretary to the minister of the interior. In 1880 he came to the front as the leading spokesman of the party which favoured the protection of French industries, and he had a considerable share in fashioning the protectionist legislation of the years 1890-1902. From 1883 to 1885 Meline was minister for agriculture, and in 1888-1889 he was president of the Chamber of Deputies. In 1896 he became premier (président du conseil) and minister for agriculture, offices which he vacated in 1898. At one time he edited La République française, and after his retirement from public life he wrote Le Retour à la terre et la surproduction industrielle, tout en faveur de l'agriculture (1905).

MÉLINGUE, ÉTIENNE MARIN (1808-1879), French actor and sculptor, was born in Caen, the son of a volunteer of 1792. He early went to Paris and obtained work as a sculptor on the church of the Madeleine, but his passion for the stage soon led him to join a strolling company of comedians. Finally chance gave him an opportunity to show his talents, and at the Porte Saint Martin he became the popular interpreter of romantic
drama of the Alexandre Dumas type. One of his greatest successes was as Benvenuto Cellini, in which he displayed his ability both as an actor and as a sculptor, really modelling before the eyes of the audience a statue of Hebe. He sent a number of statuettes to the various exhibitions, notably one of Gilbert Louis Duprez as William Tell. Melineng’s wife, Théodore Thiesset (1813–1886), was the actress selected by Victor Hugo to create the part of Guanhumara in Buryavges at the Comédie Française, where she remained ten years.

See Dumas, Une Vie d’Artiste (1854).

MELIORISM (Lat. melior, better), in philosophy, a term given to a view of the world which believes that at present the sum of good exceeds the evil, and that, in the future, good will continually gain upon evil. The term is said to have been invented by George Eliot to express a theory mediating between optimism and pessimism. The pragmatic movement in philosophy which puts stress upon the duty and value of effort is naturally favourable to the melioristic view: the best things that have been said recently in favour of it are found in books such as William James’s Pragmatism.

MELISSUS OF SAMOS, Greek philosopher of the Eleatic School (q.v.), was born probably not later than 470 B.C. According to Diogenes Laërtius, i., 24, he was not only a thinker, but also a political leader in his native town, and was in command of the fleet which defeated the Athenians in 442. The same authority says he was a pupil of Parmenides and of Heraclitus, but the statement is improbable, owing to discrepancy in dates. His works, fragments of which are preserved by Simplicius and attested by the evidence of Aristotle, are devoted to the defence of Parmenides’s doctrine. They were written in Ionic and consist of long series of argument. Being, he says, is eternal. It cannot have had a beginning because it cannot have begun from not-being (cf. ex nihil nihilo nihil), nor from being (ex pote from pote nihilo). It cannot suffer destruction; it is impossible for being to become not-being, and if it became another being, there would be no destruction. According to Simplicius (Physica, i., 22b), he differed from Parmenides in distinguishing being and absolute being (τὸ ἀληθὲς ἐστὶ). He goes on to show that eternal being must also be unlimited in magnitude, and, therefore, one and unchangeable. Any change whether from internal or external source, he says, is unhinkable; the One is unvarying in quantity and in kind. There can be no division inside this unity, for any such division implies space or void; but void is nothing, and, therefore, is not. It follows further, being is incorporeal, inasmuch as all body has size and parts. The fundamental difficulty underlying this logic is the paradox more clearly expressed by Zeno and to a large extent represented in almost all modern discussion, namely that the evidence of the senses contradicts the intellect. Abstract argument has shown that change in the unity is impossible; yet the senses tell us that hot becomes cold, hard becomes soft, the living dies, and so on. From a comparison of Melissus with Zeno of Elea, it appears that the spirit of dialectic was already tentatively at work, though it was not conscious of its own power. Neither Melissus nor Zeno seems to have observed that the application of these destructive methods struck at the root not only of multiplicity but also of the One whose existence they maintained. The weapons which they forged in the interests of Parmenides were to be used with equal effect against themselves.

See Ritter and Preller, §§ 159–166; Brandis, Commentationem eleasticarum, pt. 1, p. 185; Mullich, Aristotelis de Melisse, Xenophane, Gorgia; Pabst, De Melissi sanitatem fragmentis (Bonn, 1889), and histories of philosophy.

MELITO, bishop of Sardis, a Christian writer of the 2nd century, mentioned by Eusebius (Hist. Eccl. iv. 21) along with Hegesippus, Dionysius of Corinth, Apollinaris of Hierapolis, Irenaeus, and others, his contemporaries, as a champion of orthodoxy and upholder of apostolic tradition. Of his personal history nothing is known, and of his numerous works (which are enumerated—with quotations—by Eusebius) only a few fragments are extant. They included an Apologia addressed to Antoninus some time between A.D. 169 and 180, two books relating to the paschal controversy, and a work entitled Eudoyal (selections from the Old Testament), which contained the first Christian list of the books of the Old Covenant.” It excludes Esther, Nehemiah and the Apocrypha. The fragments have been edited with valuable notes by Routh (Reliquiæ sacrae, vol. i., 1814). These are sufficient to show that Melito was an important figure in Asia Minor and took much part in the paschal, Marcionite and Montanist controversies.

It seems more doubtful whether the Apologia of Melito “the Philosopher” discovered in a Syriac translation by Henry Tattam (1786–1868), and subsequently edited by W. Cureton and by Pitta-Renan, ought to be attributed to this writer and not to one of his followers. The Khois (clavis), edited by Pitta-Renan, is a much later Latin collection of mystical explanations of Scripture.

See A. Harnack, Texte und Untersuchungen, i. 240–278 (Leipzig, 1882); Erwin Preuschen, s.e. “Melito” in Herzog-Hauck’s Real-encyclopaedie, xiii., 1903, giving full list of works and bibliography.

MELKSHAM, a market town in the Wiltshire parliamentary division of Wiltshire, England, 95½ m. W. of London by the Great Western railway. Pop. of urban district (1901), 2,450. It lies in a valley sheltered by steep chalk hills on the east, its old-fashioned stone houses lining a single broad street, which crosses the Upper Avon by a bridge of four arches. The church preserves some remnants of Norman work and a Perpendicular west window of rare beauty.

Melksham is a woollen town, where coco-nut fibre and hair cloth are woven, flour-mills and dye-works. On the discovery of a saline spring in 1816, baths and a pump-room were opened, but although two other springs were found later, the attempt to create a fashionable health resort failed. The surrounding deer-forest was often visited by Edward I. Lacock Abbey, 3 m. distant, was founded in 1242 for Austin canonsess, and dissolved in 1539. Portions of the monastic buildings remain as picturesque fragments in and near the modern mansion called Lacock Abbey.

MELLE, a town of western France, capital of an arrondissement in the department of Deux-Sèvres, on the left bank of the Béronne, 21 m. E.S.E. of Niort by rail. Pop. (1906), 2231. Melle has two churches in the Romanesque style of Poitou, St Pierre and St Hilaire, the latter ornamented with sculptured arcading. The hospital has a richly carved doorway of the 17th century. The church of St Savinien (11th century) serves as a prison. The town has trade in farm-produce, mules and other live stock; distilling is carried on. Melle (Metallum) derives its name from the lead mine worked here during the Roman occupation and in the early middle ages. At the latter period it had a mint. In later times it was a possession of the counts of Maine.

MELLITIC ACID (benzene hexacarboxylic acid), C_6(COOH)_6, was first discovered in 1799 by M. H. Klaproth in the mineral honeystone, which is the aluminium salt of the acid. The acid may be prepared by warming honeystone with ammonium carbonate, boiling off the excess of the ammonium salt and adding ammonia to the solution. The precipitated alumina is filtered off, the filtrate evaporated and the ammonium salt of the acid purified by recrystallization. The ammonium salt is then converted into the Melle (the name of another of the same town) salt of ammonium and salt decomposed by sulphurised hydrogen.

The acid may also be prepared by the oxidation of pure carbon, or of hexamethyl benzene, in the cold, by alkaline potassium permanganate (F. Schulze, Ber., 1871, 4, p. 802; C. Friedel and J. M. Crafts, Ann. chim. phys., 1884 [i.], p. 470). It crystallizes in fine silky needles and is soluble in water and alcohol. It is a very stable compound, chlorine, concentrated nitric acid and hydrochloric acid having no action upon it. It decomposes on dry distillation into carbon dioxide and pyromellitie acid, C_6H_4O_4; when distilled with lime it gives carbon dioxide and benzene. Long digestion of the acid with excess of phosphorus pentachloride results in the formation of the acid chloride, C_6(COCI)_6, which crystallizes in needles melting at 190° C. By heating the ammonium salt of the acid to 150–160° C. as long as ammonia is evolved, a mixture of paramide (mellimide), C_6[CO(NH_2)_3], and ammonium eurephate is obtained. The mixture may be separated by dissolving out the ammonium eurephate with water. Paramide is a white amorphous powder, insoluble in water and alcohol.
MELLITUS (d. 624), bishop of London and archbishop of Canterbury, was sent to England by Pope Gregory the Great in 601. He was consecrated by St Augustine before 604, and a church was built for him in London by Aethelberht, king of Kent; this church was dedicated to St Paul, and Mellitus became first bishop of London. About ten years later the East Saxons revolted and the heathenish monk Fintigenna, especially friendly with his see. He took refuge in Kent and then in Gaul but soon returned to England, and in 619 became archbishop of Canterbury in succession to Laurentius. He died on the 24th of April 624.

MELLONI, MACEDONIO (1795-1834), Italian physicist, was born at Parma on the 17th of April 1795. From 1824 to 1831 he was professor at Parma, but in the latter year he was compelled to escape to France, having taken part in the revolution. In 1839 he went to Naples and was soon appointed director of the Vesuvian observatory, a post which he held until 1848. Mellonin received the Rumford medal of the Royal Society in 1834. In 1835 he was elected correspondent of the Paris Academy, and in 1839 a foreign member of the Royal Society. He died at Portici near Naples of cholera on the 11th of August 1854. Mellonin's reputation as a physicist rests especially on his discoveries in radiant heat, made with the aid of the thermomultiplier or combination of thermopile and galvanometer, which, soon after the discovery of thermoelectricity by T. J. Seebeck, was employed by him jointly with L. Nobili in 1831. His experiments were especially concerned with the power of transmitting dark heat possessed by various substances and with the changes produced in the heat rays by passage through different materials. Substances which were comparatively transparent to heat he designated by the adjective "diathermane," the property being "diathermanêté," while for the heatint or heat-coloration produced by passage through different materials he coined the word "diathermane." In English, however, the terms were not well understood, and "diathermane," was generally used as the equivalent of "diathermanêté." In consequence Mellonin about 1841 began to use "diathermique" in place of "diathermane," "diathermicide" in place of "diathermanêté," and "thermocrose" for "diathermane." His most important book, La thermocrose ou la coloration calorifique (vol. i., Naples, 1850), was unfinished at his death. He studied the reflection and polarization of radiant heat, the magnetism of rocks, electrostatic induction, daguerrotype, &c.

MELODRAMA (a coined word from Gr. μέλος, music, and ἥδη, action), the name of several species of dramatic composition. As the word implies, melodrama is properly a dramatic mixture of music and action, and was first applied to a form of dramatic musical composition in which music accompanied the spoken words and the action, but in which there was no singing. The first example of such a work has generally been taken to be the Pygmalion of J. J. Rousseau, produced in 1775. This is the source of romantic dramas depending on sensational incident with exaggerated appeals to conventional sentiment rather than on play of character, and in which dramatäis persona follow conventional types—the villain, the hero wrongfully charged with crime, the persecuted heroine, the adventurer, &c. At first the music was of some importance, forming practically a running accompaniment suitable to the situations—but this has gradually disappeared, and, if it remains, is used mainly to emphasize particularly strong situations, or to bring on or off the stage the various principal characters. Such plays first became popular in France at the beginning of the 19th century. One of the most prolific writers of melodramas at that period was R. C. G. de Fronsacq (1773-1844). The titles of some of his plays give a sufficient indication of their character; e.g. Victor, où l'enfant de la forêt (1797); Carlina, ou l'enfant du mystère (1801); Le Monastère abandonné, ou la malédiction paternelle (1816). Another form of melodrama came from the same source, but developed on lines which laid more emphasis on the music, and is of some importance in the history of opera. Probably the first of this type is to be found in Georg Benda's Ariadne auf Naxos (1774). The most familiar of such melodramas is Gay's Beggar's Opera. In these the dialogue is entirely spoken. In true opera the spoken dialogue was replaced by recitative. It may be noticed that the speaking of some parts of the dialogue is not sufficient to class an opera as a melodrama, as in this form it is proved by the example of an opera grave-digging scene, accompanied by "Fidelio," and the incantation scene in Der Freischiitz. To this the English term "declaration" is usually applied; the Germans use Melodram. But see Opera.

MELODY (Gr. μέλος, a choral song, from μελός, tune, and ρηθ, song). In musical philosophy and history the word "melody" must be used in a very abstract sense, as that aspect of music which is concerned only with the pitch of successive notes. Thus a "melodic scale" is a scale of a kind of music that is based on the harmonic system; and thus we call ancient Greek music "melodic." The popular conception of melody is that of "air" or "tune," and this is so far from being a primitive conception that there are few instances of such melody in recorded music before the 17th century; and even folksongs, unless they are of recent origin, deviate markedly from the criteria of tunefulness. The modern conception of melody is based on the interaction of every musical category. For us a melody is the surface of a series of harmonies; and an unaccompanied melody so far implies harmony that if it so behaves that simple harmony in expressing clear key-relationships would be difficult to find for it in the music. Again, we do not feel music as melodious unless its rhythm is symmetrical; and this, taken together with the harmonic rationality of modern melody, brings about an equally intimate connexion between melody on a large scale and form on a small scale. In the article on SONATA FORMS it is shown that there are gradations between the form of some kinds of single melody like "Barbara Allen" (see Ex. 1) and the larger dance forms of the suite, and then, again, gradations between these and the sonata form which their immense range of expression and development. Lastly, we may observe that, of all the melodic forms, the most strict melodic, namely, the rise and fall of the pitch, is intimately connected by origin with the nature of the human voice, and in later forms is enlarged fully as much by the characteristics of instruments as by parallel developments in rhythm, harmony and form. Thus modern melody is the musical surface of rhythm, harmony, form and instrumentation; and, if we take Wagnerian Leitmotiv into account, we may as well add drama to the list. In short, melody is the surface of music.

We may here define a few technicalities which may be said to concern definitely the "head" of melody than any other; but see also HARMONY and RHYTHM.

1. A theme is a melody, not necessarily or even usually complete, except when designed for a set of variations (q.v.), but of sufficient independent coherence to supply a musical sentence. Thus a fugue-subject is a theme, and the first and second subjects in sonata form are more or less complex groups of themes.

2. A figure is the smallest fragment of a theme that can be recognized when transformed or detached from its surroundings. The grouping of figures into new melodies is the most obvious resource of "development" or "working-out" in the sonata-forms (see Ex. 2-7), besides being the main resource by which fugues are carried on at those moments in which the subjects and counter-subjects are not present as wholes. In 16th-century polyphony melody consists mainly of figures thus broken off from a canto fermo (see CONTRAPUNTAL FORMS).

3. Polyphony is simultaneous multiple melody. In 16th-century music and in fugue-writing every part is as melodious as every other. The popular cry for melody as an antidote to polyphony is thus really a curious perversion of the complaint that one may have too much of a good thing. Several well-known classical melodists of polyphonic composition, being formed by an inner melody appearing as it were through transparent places in the outer melody, which it thus completes. This is especially common in music for the pianoforte, where the tone of long notes rapidly glides over the words of Chopin are full of examples. In Bach's works for keyed instruments figures frequently have a double meaning on this principle, as, for instance, in the peculiar kind of counter-subject in the 15th fugue of the 2nd book of the Wohltemperirtes Klavier. A good familiar example of simple melodic polyphony, as written by the composer, would need two voices to sing it, is that
which begins the second subject of Beethoven's *Waldstein Sonata* (Op. 53, first movement, bars 35-42, where at the third bar of the melody a lower voice enters and finishes the phrase).

4 (a) **Conjunct movement** is the movement of melody along adjacent degrees of the scale. A large proportion of Beethoven's melodies are conjunct (see Ex. 2, fig. B).

4 (b) **Disjunct movement**, the opposite of conjunct, tends, though by no means always, to produce arpeggio types of melody, i.e. melodies which move up and down the notes of a chord. Certain types of such melody are highly characteristic of Brahms; and Wagner, whose melodies are almost always of instrumental origin, is generally disjunct in diatonic melody and conjunct in chromatic (Ex. 2, fig. C, is a disjunct figure not forming an arpeggio).

For various other melodic devices, such as inversion, augmentation and diminution, see CONTRAPUNTAL FORMS.

We subjoin some musical illustrations showing the treatment of figures in melody as a means of symmetry (Ex. 1), and development (Ex. 2-7), and (Ex. 8-13) some modern melodic transformations, differing from earlier methods in being immediate instead of gradual. (D. F. T.)

MELON (Late Lat. melo, short form of Gr. μῆλον, a kind of gourd; μήλων, apple, and πῦρ, ripe), Cucumis melo, a polymorphic species of the order Cucurbitaceae, including numerous varieties.\(^1\) The melon is an annual trailing herb with palmately-lobed leaves, and bears tendrils by means of which it is readily trained over trellises, &c. It is monoeocious, having male and female flowers on the same plant; the flowers have deep five-lobed campanulate corollas and three stamens. Naudin observed that in some varieties (e.g. of Cantaloupe) fertile stamens sometimes occur in the female flowers. It is a native of south Asia "from the foot of the Himalayas to Cape Comorin,"\(^2\) where it grows spontaneously, but is cultivated in the temperate and warm regions of the whole world. It is variable both in diversity of foliage and habit, but much more so in the fruit, which in some varieties is no larger than an olive, while in others it rivals the gourd (Cucurba maxima). The fruit is globaral, ovate, spindle-shaped, or ribbed; sometimes, riddled by hollows or furrows, variously coloured externally, with white, green, or orange flesh when ripe, scented or scentless, sweet or insipid, bitter or even nauseous, &c. Like the gourd, the melon undergoes strange metamorphoses by crossing its varieties, though the latter preserve their characters when alone. The offspring of all crossings are fertile. As remarkable cases of sudden changes produced by artificially crossing races, M. Naudin records that in 1859 the offspring of the wild melons m. sauvage de l'Inde (C. melo agris) and m. z. d'Afrique, le petit m. de Figari bore different fruits from their parents, the former being ten to twelve times their size, ovate, white-skinned, or more or less scented, and with reddish flesh; though another individual bore fruits no larger than a nut. The offspring of m. de Figari after being crossed bore fruits of the serpent-melon. On the other hand, the serpent-melon was made to bear ovoid or reticulated fruit.

Naudin thinks it is probable that the culture of the melon in Asia is as ancient as that of all other alimentary vegetables. The Egyptians grew it, or at least inferior races of melon, which were either indigenous or introduced from Asia. The Romans and doubtless the Greeks were familiar with it, though some forms may have been described as cucumbers. Columella seems to refer to the serpent-melon in the phrase ut colubro ... centrum cubat flexa. Pliny describes them as pepones (xii. 23 to xx. 6) and Columella as melones (xi. 2, 53). The melon began to be extensively cultivated in France in 1629, according to Olivier de Serres, Gerard (Herball, 1772) figured and described in 1597 several kinds of melons or pompons, but he has included gourds under the same name.

The origin of some of the chief modern races, such as \(\text{a} \) Cantaloup, \(\text{b} \) Dudaum, and probably the netted sorts, is due to Persia and the neighbouring Caucasian regions. The first of these was brought to Rome from Armenia in the 16th century, and supplies the chief sorts grown for the French markets; but many others are doubtless artificial productions of west Europe.

The water-melon (Citrrullus vulgaris) is a member of a different genus of the same order. It has been cultivated for its cool refreshing fruit since the earliest times in Egypt and the Orient, and was known before the Christian era in southern Europe and Asia.

The melon requires artificial heat to grow it to perfection, the rock and cantaloup varieties succeeding with a bottom heat of 70° and an atmospheric temperature of 75°, rising to 80° in the case of the former; and the Persimmon melon heat of 75°, gradually increasing to 80°, and an atmospheric temperature ranging from 75° to 80° when the fruit is swelling, as much sun heat as the plants can bear is allowed at all times. The melon requires a rich turfy loam, somewhat heavy, with which a little well-dug, rotted dung, especially that of pigeons or owls, should be used, in the proportion of one-fifth mixed in the compost of loam. The seedlings are grown either in boxes with frames and benches, or in pots, or in hotbeds on beds of fermenting manure, when the soil should be about a foot in thickness, or in pits heated either by hot water or fermenting matter, or in houses heated by hot water, in which case the soil should be 15 to 18 in. thick. Heating materials should be well prepared, and, since the heat has to be kept up by linings, it is a good plan to introduce one or two layers of faggots in building up the bed. A mixture of dung and leaves makes a more subtilized heat.

For all ordinary purposes September is early enough for sowing the first crop, as well-flavoured fruits can scarcely be looked for before May. The seeds may be sown singly in 3-in. pots in a mixture of leaf-mold with a little loam, the pots being plunged in a bottom heat of 75° to 80°, and as near the glass as possible, in order that the young plants may not be drawn up. The full or ridge of soil should be about a foot in thickness, the rest of the surface being covered made up nearly to the same level. If the fruit-bed is not ready when the roots have nearly filled the pots, they must be shifted into 4-inch pots, for they must not get starved or pot-bound. Two or three plants are generally sown in each pot, which after the soil is placed in the centre of each light, and the rest of the surface is covered over to a similar depth as soon as the roots have made their way through the mound.

The melon being one of those plants which produce distinct male and female flowers, it is necessary to its fertility that both should be produced, and that the pollen of the male flower should, like that of the corn, be carried by the wind. Should the wind fail, the melon should be conveyed, or the stigma of the female flower should be approached with the blossom of the male flower. The melon is a perennating plant, and, to be fruitiferous, it should be sown in the spring, in a warm, or at least a little to one side, so as to permit water to drain away. Before the process of ripening commences, the roots should have a sufficient supply of moisture, so that none may be required from that time until the fruit is cut.

When the melon is grown in a house there should be a good depth of drainage over the tank or other source of bottom heat, and on this should be placed turfs, grass side downwards, below the soil, which should not be less than 15 and need not be more than 18 in. in thickness. The compost should be made moderately firm, and only half the bed should be made up at first, the rest being added as the roots require. It should be as bright and light as possible, and supplied with artificial manure or manure water. The stems may be raised up or trained in the usual way, or the rafters of a pine stove may be utilized for the purpose. If the trellis is to be used, it should be painted with a mixture of lime and water, or a mixture of lime and rice-bran, in order that it can be taken down and conveniently stowed away when not in use.

The presence of too much moisture either in the atmosphere or in the soil is apt to cause the plants to slump off at the neck, but this may be checked by applying a little fresh-slaked lime round the stem of the plant.

Melons are liable to the attack of red spider, which are best removed by syringing with rain-water, and prevented by keeping a fairly humid atmosphere; green or black fly should also be watched for and removed by fumigation with tobacco smoke or by "vaporizing."

The varieties of melon are continually receiving additions, and as newer varieties spring into favour, so the older ones drop out of cultivation. A great deal depends on getting the varieties true to name, as they are very liable to get cross-fertilized by insect agency. Some of the most common are

- **Scarlet-fleshed.**—Blenheim Orange, Frogmore Orange, Invincible, Sutton's Scarlet, and Triumph.
- **White-fleshed.**—Golden Orange, Hero of Lockinge, Longleat Perfection, Royal Favourite.
- **Green-fleshed.**—British Queen, Epicure, Exquisite, Monarch, Ringleeder.

The market-gardeners round Paris and other parts of France chiefly cultivate varieties of Cantaloup melon known as the Prescott violet à chassier and Prescott fond blanc—both excellent in flavour. These are grown by pansies on stone floors, the fruits of which is allowed to mature on each plant. If secured early in the season—say in June—from 25 to 35 francs can be obtained for each fruit in the Paris markets; later fruits, however, drop down to 2 francs each, or even less when there is a glut (see J. Weathers, French Market-Gardening).

**MELORIA,** a rocky islet, surrounded by a shoal, almost opposite Leghorn. It was the scene of two naval battles of the
middle ages. The first, on the 3rd of May 1241, was fought between the fleet of the emperor Frederick II. Hohenstaufen, surnamed Stupor Mundii, in alliance with Pisa, against a Genoese squadron bringing a number of English, French and Spanish prelates to attend the council summoned to meet at the Lateran by Gregory IX. Three Genoese galleys were sunk and twenty-two carried prisoners to the camp of the emperor. The second, fought on Sunday the 6th of August 1284, was of higher historical importance. It was a typical medieval sea-fight, and accomplished the ruin of Pisa as a maritime power. The main division of the enemy was thus made at Genoa, which had broken out for the last time in 1282; the immediate cause being the incompatible claims of the two cities to sovereignty over the islands of Sardinia and Corsica. The earlier conflicts of the war in 1282, 1283 and the spring of 1284, had been favourable to Pisa. Though the city was united with the Catalans and with Venice in hostility to Genoa, and though it had chosen a Venetian, Alberto Morosini, as its Podestà, it received no help from either. The Genoese, who had the larger and more efficient fleet, sent their whole power against their enemy. When the Genoese appeared off Meloria the Pisans, with their five galleys and a large number of lighter vessels, surnamed their squadron after the prelates of the church, and forbode the destruction of the island, decided the prize to the plateau above the harbour, on which are situated Plaka, the chief town, and Kastro, rising on a hill above it, and other villages. The ancient town of Melos was nearer to the entrance of the harbour than Adamanta, and occupied the slope between the village of Trypete and the landing-place at Klima. Here is a theatre of Roman date and some remains of town walls and other buildings, one with a fine mosaic excavated by the British school at Athens in 1896. Numerous fine works of art have been found on this site, notably the Aphrodis of Melos in the Louvre, the statue of the Virgin by the sculptor, and the beautiful archaic Apollo in Athens. The position of Melos, between Greece and Crete, and its possession of obsidian, made it an important centre of early Aegean civilization. At this time the chief settlement was at the place now called Phylakopi, on the north-east coast. Here the excavations of the British school cleared many houses, including a palace of "Mycenaean" type; there is also a town wall. Part of the site has been washed away by the sea. The antiquities found were of three main periods, all preceding the Mycenaean age of Greece. Much pottery was found, including examples of a peculiar style, with decorative designs, mostly floral, and also considerable deposits of obsidian. There are some traditions of a Phoenician occupation of Melos. In historical times the island was occupied by Doriens from Laconia. In the 6th century it again produced a remarkable series of vases, of large size, with mythological subjects and orientalizing ornamentation (see Greek Art, fig. 9), and also a series of terra-cotta reliefs.

Though Melos inhabitants sent a contingent to the Greek fleet at Salamis, it held aloof from the Attic league, and sought to remain neutral during the Peloponnesian War. But in 416 B.C. the Athenians, having attacked the island and compelled the Melians to surrender, slew all the men capable of bearing arms, made slaves of the women and children, and introduced 500 Athenian colonists. Lysander restored the island to its Dorian possessors, but it never recovered its former prosperity. There were many Jewish settlers in Melos in the beginning of the Christian era, and Christianity was early introduced. During the "Frankish" period the island formed part of the duchy of Naxos, except for the few years (1547-1583) when it was a separate lordship under Marco Sanudo and his daughter.

Antimilos or Anti Milo, 52 m. north-west of Milo, is an uninhabited mass of trachyte, often called Eremomilo or Desert Melos. Kimola, or Argentiere, less than 1 m. to the north-east, was famous in antiquity for its figs and fuller's earth (Kymolia 79), and contained a considerable city, the remains of which cover the cliff of St Andrews. Polinos, Polybos or Polito (anc. Polyegea) lies rather more than a mile south-east of Kimilos. It was the subject of dispute between the Melians and Kimolians. It has long been almost uninhabited.

See Leycester, "The Volcanic Group of Milo, Anti-Milo, &c.\" in Jour. Roy. Geog. Soc. (1852); Tournefort, Voyage; Leake, Northern Greece, iii.; Prokesch von Osten, Denkwaerthen. &c.; Burian, Geog. von Griechenland, ii.; Jour. Heil., Stud. xvi., xvii., xviii.; Excursions at Phylakopi, Inscription, grece, xii. ii. 107 sqq.; on coins found in 1909, see Jameson in Rev. Num. 1909, 188 sqq. (E. G.) MELOZZO DA FORLÌ (c. 1438-1494), Italian painter, the first who practised foreshortening with much success, was born at Forlí about 1438; he came, it is supposed, of a wealthy family named Ambrosi. In all probability, Melozzo studied painting under Piero de' Franceschi, of Borgo St Sepolcro; he seems also to have been well acquainted with Giovanni Santi, the father of
MELROSE

Raphael. It has been said that he became a journeyman and colour-grinder to some of the best masters, in order to prosecute his studies; this lacks confirmation. Only three works are extant which can safely be assigned to Melozzo: those in the Louvre, the National Gallery, London, and the Barberini Palace, Rome, are disputable. (1) He painted in 1472 the vault of the chief chapel in the church of the Apostoli in Rome, his subject being the "Ascension of Christ"; the figure of Christ is so boldly and effectively foreshortened that it seems to "burst through the vaulting"; this fresco was taken down in 1771, and the figure of Christ is now in the Quirinal Palace, not worthy of special admiration save in its perspective quality; while of the other portions, almost Raphaelesque in merit, are in the sacristy of St Peter's. (2) Between 1475 and 1480 he executed a fresco, now transferred to canvas, and placed in the Vatican picture-gellery, representing the appointment of Platina by Pope Sixtus IV, as librarian of the restored Vatican library. (3) In the Collegio at Forlì is a fresco by Melozzo, termed the "Pestapepe," or Pepper-grinder, originally painted as a grocer's sign; it is an energetic specimen of rather coarse realism, now much damaged. Melozzo also painted the cupola of the Capocchio church at Forlì, but it has been destroyed, and it has been executed at Urbino some of the portraits of great men (Plato, Dante, Sixtus IV., &c.) which are now divided between the Barberini Palace and the Campana collection in Paris; this, however, is doubtful, and it is even questionable whether Melozzo was ever at Urbino. In Rome he was one of the original members of the academy of St Luke, founded by Sixtus IV. He returned to Forlì, probably towards 1480, and died in November 1494. He contributed sensibly to the progress of pictorial art; and, without being remarkable as a colourist, gave well graded lights, with general care and finish, and fine dignified figures. His works bear a certain resemblance to those of his contemporary Mantegna. Marco Palmezzano was his pupil; and the signature "Marcus de Melotius" on some of Palmezzano's works, along with the general affinity of style, has led to their being ascribed to Melozzo, who has hence been incorrectly called "Marco Melozzo."

MELROSE, a city of Middlesex county, Massachusetts, U.S.A., about 7 m. N. of Boston. Pop. (1890) 8519; (1900) 12,962, of whom 2924 were foreign-born and 150 were negroes; (1910 census) 15,715. It is served by the Boston & Maine railroad, and by inter-urban electric railways. The city covers 4-8 sq. m. of broken, hilly country, in which is a part of the state park of Middlesex Fells; it includes the villages of Melrose, Melrose Highlands, Wyoming, and Fells. In 1905 the total factory product was valued at $64,590,020 (an increase of 176-6% over the value of the factory product in 1900). The principal products are rubber shoes (at the village of Fells), skirts (at the village of Wyoming), and leather and silverware (at Melrose Highlands). The water supply of Melrose, like that of Stoneham and of Medford, is derived from the metropolitan reservoir called Spot Pond in Stoneham, immediately west of Melrose. The city was the home of Samuel Adams Drake (1833-1905), American historian, whose History of Middlesex County (Boston, 1880; vol. 2, "Melrose," by E. H. Gose) should be consulted; and of William Frederick Poole (1821-1894), the librarian and the originator of indexes of periodical literature. Melrose was settled about 1633, and was a part of Charlestown until 1649, and of Malden until 1850. The eastern part of Stoneham was annexed to it in 1853. In 1899 it was chartered as a city; the charter came into effect in 1900. The name is said to be due to a resemblance of the scenery to that of Melrose, Scotland.

MELROSE, a police burgh of Roxburghshire, Scotland. Pop. (1901) 2705: It lies on the right bank of the Tweed, 374 m. S.E. of Edinburgh, and 19 m. N.W. of Jedburgh, via St Boswells and Roxburgh, by the North British railway. The name—which Bede (730) wrote Malros and Simeon of Durham (1370) Melros—is derived from the Celtic mo ard ros, "bare moor," and it was by Sir Walter Scott's Abbots and Monastery as "Kennaquhair." In consequence of the beauty of its situation between the Eildons and the Tweed, the literary and historical associations of the district, and the famous run of Melrose Abbey, the town has become a resort and a holiday

MELROSE, the name commemorating the fact that on the 25th of July 1536, in which the Scots defeated the Douglases and Kers. Trade is almost wholly agricultural. The main streets run from the angles of the triangular market-place, in which stands the market cross, dated 1642, but probably much older. Across the river are Gattonside, with numerous orchards, and Allerly, the home of Sir David Brewster from 1827 till his death in 1868.

Melrose Abbey, the original Columban monastery was founded in the 7th century at Old Melrose, about 21 m. to the east, in the loop of a great bend of the Tweed. It was colonized from Linlithgow, Eata, a disciple of Aidan, being the first abbot (651), and Boisil and Cuthbert being prior here. It was burned by Kenneth Macalpine in 830 during the wars between Scot and Saxond, and, though rebuilt, was deserted in the middle of the 11th century. The chapel, dedicated to St Cuthbert, continued for a period to attract many pilgrims, but this usage gradually declined and the building was finally destroyed by English invaders. Meanwhile in the 13th and 14th centuries the monastery was enlarged, and a little higher up the Tweed, the first Cistercian settlement in Scotland, with monks from Rievaulx in Yorkshire. Lying in the direct road from England, the abbey was frequently assaulted and in 1322 was destroyed by Edward II. Rebuilt, largely by means of a gift of Robert Bruce, it was nearly burned down in 1385 by Richard II. Erected once more, it was reduced to ruin by the earl of Hertford (afterwards the Protector Somerset) in 1455. Later the Reformers dismantled much of what was left. The adaptation of part of the nave to the purposes of a parish church and the use of the building as a quarry did further damage. The ruins, however, now the property of the duke of Buccleuch, are carefully preserved. Of the conventual buildings apart from the church nothing has survived but a fragment of the cloister with a richly-carved round-headed doorway and some fine arcading. The abbey, cruciform, is in the Decorated and Perpendicular styles, with pronounced French influence, due probably to the master mason John Morow, or Morreau, who, according to an inscription on the south transept wall, was born in Paris. The south front is still beautiful. The west front and a large portion of the north half of the nave and aisle have perished, but the remains include the rest of the nave, the two transepts, the chancel and choir, the two western piers of the tower and the sculptured roof of the east end. From east to west it measured 256 ft., the nave 60 ft. wide and the width of the transepts from north to south is 115 ft. The nave had an aisle on each side, the north noticeably the narrower, the south furnished with eight chapels, one in each bay. Both transepts contained an eastern aisle, and the chancel a square chapel at its west end on each side. Over the south transept aisle, which was the chapel of St Bridget, is the clerestory passage, which ran all round the church. The choir extended westwards for three bays beyond the tower and terminated in a stone rood-screen. Sir Walter Scott has immortalized the east window, in The Lay of the Last Minstrel, but the south window with its flowing tracery is even finer. In the carving of windows, aisles, cloister, capitals, bosses and doorheads no design is repeated. The heart of Robert Bruce was buried at the high altar, and in the chancel are the tombs of Sir William Douglas, the Knight of Liddesdale (1300-1535), James 2nd earl of Douglas (1336-1388), the victor of Otterburn; Alexander II; and Michael Scot "the Wizard" (1175-1234)—though not the author, the epitaph to this is the tomb of Sir Brian Layton, who fell in the battle of Acrum Moor (1544). At the door leading from the north transept to the sacristy is the grave of Joanna (d. 1328), queen of Alexander II.

The monuments of the abbacy, preserved in the archives of the earl of Morton, were edited by Cosmo Innes for the Bannatyne Club and published in 1837 under the title of Liber sancte Melsi Monasterii. Among the documents is one of the earliest specimens of the Scots dialect. The Chronicle of Melrose, preserved among the Cotton MSS., was printed at Oxford in 1684 by William Fuller and by the Bannatyne Club in 1835 under the editorship of John Stevenson.
MELTON MOWBRAY—MELVILLE, ANDREW

MELTON MOWBRAY, a market town in the Melton parliamentary division of Leicestershire, England, pleasantly situated in a fertile vale, at the confluence of the Wreake and the Eye. Pop. of urban district (1901), 7454. It is 105 m. N.N.W. from London by the Midland railway, and is served by a joint branch of the London & North Western and Great Northern railways. The church of St Mary, a fine cruciform structure, Early English, and later, with a lofty and richly ornamented central tower, was enlarged in the reign of Elizabeth. Melton is the centre of a celebrated hunting district, in connexion with which there are large and magnificent parks. It is known for its pork pies, and has a trade in Stilton cheese. There areibrearies and tanneries and an important cattle market. There are blast furnaces in the neighbouring parish of Askoford for the smelting of the abundant supply of iron ore in the district. During the Civil War Melton was in February 1644 the scene of a defeat of the parliamentary forces by the royalists. It is the birthplace of John Henley the orator (1692–1759).

MELUN, a town of northern France, capital of the department of Seine-et-Marne, situated north of the forest of Fontainebleau, 28 m. S.S.E. of Paris by rail. Pop. (1906), 11,200. It is sheltered on three sides by the Seine, a principal portion lies on the slope of a hill on the right bank; on the left bank is the most modern quarter, while the old Roman town occupies an island in the river. On the island stands the Romanesque church of Notre-Dame (11th and 12th centuries), formerly part of a nunnery, the site of which is occupied by a prison. The other public buildings are on the right bank of the river. Of these, the most striking is the church of St Aspais, an irregularly shaped structure of the 15th and 16th centuries, on the apse of which may be seen a modern medallion in bronze, the work of the sculptor H. Chappu, representing Joan of Arc as the liberator of Melun. The hôtel-de-ville (1847)—in the construction of which an old mansion and turrets have been utilized—and the tower of St Bartholomew of the 16th and 18th centuries are also of interest. In the courtyard of the former there is a monument to Jacques Amyot, the translator of Plutarch, who was born at Melun in 1513. Among the rich estates in the neighbourhood the most remarkable is the magnificent château of Vaux-le-Vicomte, which belonged to Nicholas Fouquet, intendant of finances under Louis XIV. Melun is a market for grain and farm produce, and its industries include brewing, tanning, distilling, sawing and the manufacture of agricultural implements, candles, fur garments, lime, cement and plaster.

In Caesar’s Gallic wars Melun (Melodunum) was taken by his lieutenant Labienus, in order to facilitate the attack of Lutetia by the right bank of the Seine. It was pillaged by the Normans, and as residence of the first kings of England, and the race of Capet; Robert and Philip I. both died here. In 1539 Melun was given up by Jeanne de Navarre to her brother, Charles the Bad, but was taken by the dauphin Charles and Bertrand Duguesclin. In 1420 it made an heroic defence against Henry V. of England and his ally the duke of Burgundy. Ten years later the people of Melun, with the help of Joan of Arc, drove out the English. It was occupied by the League in 1589, and retaken by Henry IV. in the following year.

MÉLUSINE, the tutelary fairy of the house of Lusignan, was the eldest daughter of the fairy Pressine, to avenge whose wrongs she shut up her father in a mountain in Northumberland. For this she was condemned to be metamorphosed every Saturday into a woman-serpent—that is, to be a serpent from the hips downwards. She might, however, be eventually saved from this punishment if she could find a husband who would never see her on a Saturday. Such a husband was found in Raymond, nephew of the count of Poitiers, who became rich and powerful through the machinations of his wife. She built the castle of Lusignan and many other of the family castles. When at length her husband gave way to his curiosity, and saw her taking the bath of purification on a Saturday she flew from the castle in the form of a serpent. Thenceforward the death of a member of the house of Lusignan was heralded by the cries of the fairy serpent. "Pousser des cris de Mélusine" is still a popular saying.

This history is related at length, with the adventures of Mélusine’s numerous progeny, by Jean d’Arras, in his Chronique de la princesse, written in 1387 at the desire of John, Duke of Berry, for the amusement of the duke and of his sister Marie of France, Duchess of Bar. It is one of the most charming of the old prose romances in manner and style, and is natural in spite of the free use of the marvellous. An attempt has been made by Jules Baudot in Les Princesses Yolande et les ducs de Bar (Paris, 1900) to make it a roman à clé and to identify the personages. Mélusine, Mélusine or Merlusine is, however, simply the spirit of the fountain of Lusignan, and the local Poitevin myth is attached to her name. The name is variously and fancifully given. Some writers have supposed Merlusine to be a corruption of mère Lucine (mater Lucina), the deity invoked in child-birth. She has been identified with Mélisende, widow of a king of Jerusalem, and with Mervat, wife of Geoffroi de Lusignan.

The Mélusine of Jean d’Arras was printed by Adam Steinschaber at Geneva in 1478, and was reprinted many times in the 15th and 16th centuries. It has been translated into Spanish, English, German and Flemish. Modern editions are by J. C. Brunet (Paris, 1854), and by E. Lecesne for the Academy of Arras (Arras, 1888). In English translation it is edited from a unique MS. in the British Museum by A. K. Donzel, for the E.E.T.S. (1885). The tale was versified in the 14th century by a poet called Coudrette, whose poem was published in 1834 by Franciscus Michel. See also S. Baring-Gould, Curious Myths of the Middle Ages, pp. 470 seq. (new ed., 1881); and J. C. Brunet, Manuel de l’histoire (vol. ii., 1862, s.v. Jean d’Arras).

MELVILLE, ANDREW (1545–1622), Scottish scholar, theologian and religious reformer, was the youngest son of Richard Melville (brother to Melville of Dysart), proprietor of Baldov near Montrose, at which place Andrew was born on the 1st of August, 1545. His father fell at the battle of Pinkie (1567), fighting in the van of the Scottish army, and, his wife having died soon after, the orphan was cared for by his eldest brother Richard (1522–1575). At an early age Melville began to show a taste for learning, and his brother did everything in his power to give him the best education. The rudiments of Latin he obtained at the grammar school of Montrose, after leaving which he learned Greek for two years under Pierre de Marsiliers, a Frenchman whom John Erskine of Dun had induced to settle at Montrose; and such was Melville’s proficiency that on going to the university of St Andrews he excited the astonishment of his masters by using St. Cletus’s text of Virgil, which even else where were not understood. On completing his course, Melville left St Andrews with the reputation of “the best poet, philosopher, and Grecian of any young master in the land.” He then, in 1564, being nineteen years of age, set out for France to perfect his education at the university of Paris. He there applied himself to Oriental languages, but also attended the last course of lectures delivered by Tertumus in the Greek chair, as well as those of Peter Ramus, whose philosophical method and plan of teaching he afterwards introduced into the universities of Scotland. From Paris he proceeded to Basel (1566) to study civil law, and though only twenty-one he was apparently at once made a regent in the college of St Marceon. After a residence of three years, however, political troubles compelled him to leave France, and he went to Geneva, where he was welcomed by Theodore Beza, at whose instigation he was appointed to the chair of humanity in the academy of Geneva. In addition to his teaching, however, he also applied himself to studies in Oriental literature, and in particular acquired from Cornelius Bertram, one of his brother professors, a knowledge of Syriac. While resided at Geneva the massacre of St Bartholomew in 1572 drove an immense number of Protestant refugees to that city, including several of the most distinguished French men of letters of the time. Among these were several men learned in civil law and philosophical science, and their society increased Melville’s knowledge of the world and enlarged his ideas of civil and ecclesiastical liberty. In 1574 Melville returned to Scotland, and almost immediately received the appointment of principal of Glasgow University, which had fallen into an almost ruinous state, the college having been shut and the students dispersed. Melville,
however, set himself to establish a good educational system. He enlarged the curriculum at the college, and established chairs in languages, science, philosophy and divinity, which were confirmed by charter in 1577. His fame spread through the kingdom, and students flocked from all parts of the country, and even from abroad, which the college was not in a position to admit.

He assisted in the reconstruction of Aberdeen University in 1575, and in order that he might do for St Andrews what he had done for Glasgow, he was appointed principal of St Mary’s College, St Andrews, in 1580. His duties there comprehended the teaching, not only of theology, but of the Hebrew, Chaldee, Syrac and Rabbinical languages. The ability of his lectures was universally acknowledged, and he created a taste for the study of Greek literature. The reformed, however, which his new modes of teaching involved, and even some of his new doctrines, such as the non-infallibility of Aristotle, brought him into collision with other teachers in the university.

He was moderator of the General Assembly in 1582, and took part in the organization of the Church and the Presbyterian method. Troubles arose from the attempts of the court to force a system of Episcopacy upon the Church of Scotland (see SCOTLAND, CHURCH OF), and Melville prosecuted one of the “ tulchan ” bishops (Robert Montgomery, d. 1600). In consequence of this he was summoned before the Privy Council in February 1584, and had to flee into England in order to escape an absurde charge of treason against them. The close of Melville’s career was lengthened imprisonment and not improbably his life. After an absence of twenty months he returned to Scotland in November 1585, and in March 1586 resumed his lectures in St Andrews, where he continued for twenty years; he became rector of the university in 1590. During the whole time he protected the liberties of the Scottish Church against all encroachments of the government. That in the main he and his coadjutors were fighting for the constitutionally guaranteed rights of the Church is admitted by all candid inquirers (see in particular The History of England from 1063 to 1616, by S. R. Gardiner, vol. i., chap. 13). The chief charge against him is that his fervour often led him to forget the reverence due to an “ anointed monarch.” Of this, however, it is not easy to judge. Manners at that time were rougher than at present. When the king acted in an arbitrary and illegal manner he needed the reminder that though he was king over men he was only “ God’s silly vassal.” Melville’s rudeness (if it is to be called so) was the outburst of just indignation from a man zealous for the purity of religion and regardless of consequences to himself. In 1599 he was deprived of the rectorship, but was made dean of the faculty of theology. The close of Melville’s career was lengthened imprisonment and not improbably was at length brought about by James in characteristic fashion. In 1606 Melville and seven other clergymen of the Church of Scotland were summoned to London in order “ that his majesty might treat with them of such things as would tend to settle the peace of the Church.” The contention of the whole of these faithful men was that the only way to accomplish that purpose was a free Assembly. Melville delivered his opinion to that effect in two long speeches with his accustomed freedom, and, having shortly afterwards written a sarcastic Latin epigram on some of the ritual practiced in the chapel of Hampton Court, and some eavesdropper having conveyed the lines to the king, he was committed to the tower, and detained there for four years.

On regaining his liberty, and being refused permission to return to his own country, he was invited to fill a professor’s chair in the university of Sedan, and there he spent the last eleven years of his life. He died at Sedan in 1622, at the age of seventy-seven.

See McCries, Andrew Melville (ed. 1819); Andrew Lang, History of Scotland (1902).

MELVILLE, ARTHUR (1838–1904), British painter, was born in Scotland, in a village of Haddingtonshire. He took up painting at an early age, and though he attended a night-school and studied afterwards in Paris and Grez, he learnt more from practice and personal observation than from school training. The remarkable colour-sense which is so notable a feature of his work, whether in oils or in water-colour, came to him during his travels in Persia, Egypt and India. Melville, though comparatively little known during his lifetime, was one of the most powerful influences in contemporary art, especially in his broad decorative treatment with water-colour. Though his vivid and movement are apparently recorded with feverish haste, they are the result of careful deliberation and selection. He was at his best in his water-colours of Eastern life and colour and his Venetian scenes, but he also painted several striking portraits in oils and a powerful colossal composition of “ The Return from the Crucifixion ” which remained unfinished at his death in 1904. At the Victoria and Albert Museum is one of his water-colours, “ The Little Bull-Fight— Bravo, Toror ” and another, “ An Oriental Goatherd,” is in the Weimar Museum. But the majority of his pictures have been absorbed by private collectors and reproductions of them are rare.

A comprehensive memorial exhibition of Melville’s works was held at the Royal Institute Galleries in London in 1906.

MELVILLE, HENRY DUNDAS, 1ST VISCOUNT (1747–1811), British statesman, fourth son of Robert Dundas (1665–1753), lord president of the Scottish court of session, was born at Edinburgh in 1742, and was educated at the high school and university there. Becoming a member of the faculty of advocates in 1763, he soon acquired a leading position at the bar; and he had the advantage of the success of his half-brother Robert (1713–1781), who had become lord president of session in 1760. He became solicitor-general to Scotland in 1766; but after his appointment as lord-advocate in 1775, he gradually relinquished his legal practice to devote his attention more exclusively to public business. In 1774 he was returned to parliament for Midlothian, and joined the party of Lord North; and notwithstanding his provincial dialect and ungraceful manner, he soon distinguished himself by his clear and argumentative speeches. After holding subordinate offices under the marquesses of Lansdowne and Pitt, he entered the cabinet in 1791 as home secretary. From 1794 to 1801 he was secretary at war under Pitt, who conceived for him a special friendship. In 1802 he was elevated to the peerage as Viscount Melville and Baron Dunira. Under Pitt in 1804 he again entered office as first lord of the admiralty, when he introduced numerous improvements in the details of the department. Suspicions had arisen, however, as to the financial management of the admiralty, of which Dundas had been treasurer between 1782 and 1800; in 1802 a commission of inquiry was appointed, which reported in 1805. The result was the impeachment of Lord Melville in 1806, on the initiative of Samuel Whitbread, for the misappropriation of public money; but he had become lord president of session in 1800 more than formal negligence lay against him, he never again held office. An earldom was offered in 1806 but declined; and he died on the 28th of May 1817.

He was the son of Robert, and Viscount Melville (1771–1851), filled various political offices and was first lord of the admiralty from 1821 to 1827 and from 1838 to 1830; his name is perpetuated by that of Melville Sound, because of his interest in Arctic exploration. His eldest son, HENRY DUNDAS, 3rd Viscount (1801–1876), a general in the army, played a distinguished part in the second Sikh War.

MELVILLE, HERMAN (1851–1891), American author, was born in New York City on the 1st of August 1819. He shipped as a cabin-boy at the age of eighteen, thus being enabled to make his first visit to England, and at twenty-two sailed for a long whaling cruise in the Pacific. After a year and a half he deserted his ship at the Marquesas Islands, on account of the cruelty of the captain; was captured by cannibals on the island of Nukahiva, and detained, without a word, four months; was rescued by the crew of an Australian whaling ship, which he joined, and two years later reached New York. Thereafter, with the exception of a passenger voyage around the world in 1860, Melville remained in the United States, devoting himself to literature—though for a considerable period (1866–1885) he held a post in the New York custom-house—and being perhaps Hawthorne’s most intimated
friend among the literary men of America. His writings are numerous, and of varying merit; his verse, patriotic and other, is forgotten; and his works of fiction and of travel are of irregular execution. Nevertheless, few authors have been enabled so freely to introduce romantic personal experiences into their books: in his first work, *Typbee: A Peep at Polynesian Life, or Four Months' Residence in a Valley of the Margarets* (1846), he described his escape from the cannibals; while in *Omo, a Narrative of Adventures in the South Seas* (1847), *White Jacket*, or *The World in a Man-of-War* (1856), and especially *Moby Dick, or The Whale* (1851), he portrayed seafaring life and character with vigorous, original, and spirited effort from personal knowledge equally the work of Cooper, Marryat, and Clark Russell. The records of adventure were followed by other tales so turgid, eccentric, opiniative, and loosely written as to seem the work of another author. Melville was the product of a period in American literature when the fiction written by writers below Irving, Poe and Hawthorne was measured by humble artistic standards. He died in New York on the 28th of September 1891.

**MELVILLE, JAMES (1536-1614),** Scottish reformer, nephew of Andrew Melville (q.v.), was born on the 26th of July 1536. He was educated at Montrose and St Leonard's College, St Andrews. In 1556 he published *my own Life*, a principal product of Glasgow of which his uncle was principal, and within a year became one of the regents. When his uncle was appointed, in 1586, principal of the New (after, St Mary's) College, St Andrews, he was transferred to the chair of Oriental languages there. For three and a half years he lectured in the university, chiefly on Hebrew, but he had to flee to Berwick in May 1584 (a few months after his uncle's exile) to escape the attacks of his ecclesiastical enemy, Bishop Adamson. After a short stay there and at Newcastle-on-Tyne, and again at Berwick, he proceeded to London, where he joined some of the leaders of the Scottish Presbyterian party. The taking of Stirling Castle in 1587, the having received ecclesiastical positions in the north, he returned to Scotland in November of that year, and was restored to his office at St Andrews. From 1586 to his death he took an active part in Church controversy. In 1589 he was moderator of the General Assembly and on several occasions represented his party in conferences with the court. Despite his antagonism to James's episcopal schemes, he appears to have won the king's respect. He answered, with his uncle, a royal summons to London in 1606 for the discussion of Church policy. The uncompromising attitude of the Kincamen, though it made the excuse for sending the elder to the Tower, brought no further punishment to James than easy detention within ten miles of Newcastle-on-Tyne. During his residence there it was made clear to him by the king's agents that he would receive reward if he supported the royal plans. In 1613 negotiations were begun for his return to Scotland, but his health was broken, and he died at Berwick in January 1614.

Melville has left ample materials for the history of his time from the Presbyteriant standpoint, in (a) correspondence with his uncle Andrew Melville (MS. in the library of the university of Edinburgh), and (b) a diary (MS. in the Advocates' Library, Edinburgh). The latter is written in a vigorous, fresh style, and is especially direct in its descriptions of contemporaries. His sketch of John Knox at St Andrews is one of his best passages.

As a writer of verse he compares unfavourably with his uncle. All his pieces, with the exception of a *Vilbas suppleis* to King James, are written in Scots. He translated a portion of the *Zodiacus vitae* of Palingenus, and adapted some passages from Scaliger under the title of *Description of the Spawnyarts natural!* His *Spiritual Preparations of a Pastor to his People* (1598), *The Black Basid*, a lamentation for the kirk (1611), *Three may keep Counsell*, give *Twa be away, The Belief of the Singing Soul, David's Tragic Fal*, and a number of Sonnets show no originality and indifferent taste.

The Diary was printed by the Bannatyne Club in 1829, and by the Wodrow Society in 1842. Large portions of it are incorporated in David Calderwood's (1575-1650) *History of the Kirk of Scotland* (1608). For the whole and the specifics see Thomas M'Crie's *Life of Andrew Melville*.

**MELVILLE, SIR JAMES (1553-1617),** Scottish diplomatist and memoir writer, was the third son of Sir John Melville, lord of Raith in the county of Fife, who was executed for treason in 1548. One of his brothers was Robert, 1st Baron Melville of Monimail (1557-1621). James Melville in 1549 went to France to become page to Mary Queen of Scots. Serving on the French side at the battle of St Quentin in 1557 Melville was wounded and taken prisoner. He subsequently carried out a number of diplomatic missions for Henry II. of France. On Mary's return to Scotland in 1561 she gave Melville a pension and an appointment in her household, and she employed him as special emissary to reconcile Queen Elizabeth to her marriage with Darnley. After the murder of Darnley in February 1567, Melville joined Lord Herries in boldly warning Mary of the danger of her projected marriage with Bothwell, and was only saved from the fate of Bothwell by the courageous resolution of the queen. During the troubled times following Mary's imprisonment and abdication Melville conducted several diplomatic missions of importance, and won the confidence of James VI. when the king took the government into his own hands. Having been adopted as his heir by the reformer Henry Balnaves, he inherited from him, at his death in 1579, the estate of Halkhill in Fife; and he retired thither in 1603, refusing the request of James to accompany him to London on his accession to the English throne. At Halkhill Melville wrote the *Memoirs of his Own Life*, a valuable authority for the history of the period, first published by his grandson, George Scott, in 1683. Sir James Melville died at Halkhill on the 13th of November 1617. By his wife, Christina Boswell, he had one son and two daughters; the elder of these, Elizabeth, who married John Colville, *de jure* 3rd Baron Colville of Culross, has been identified with the authoress of a poem published in 1603, entitled *Ane Godlie Dreame*.

See the *Memoirs* mentioned above, of which the most modern edition is that prepared by T. Thompson for the Bannatyne Club (Edinburgh, 1827).

**MELVILL VAN CARNEBEE, PIETER, BARON (1816-1856),** Dutch geographer, was born at the Hague on the 20th of May 1816. He traced his descent from an old Scottish family, originally, it is said, of Hungarian extraction. Destined for the navy, in which his grandfather Pieter Melvill van Carnbee (1743-1810) had been admiral, he imbibed a taste for hydrography and cartography as a student in the college of Medemblik, and he showed his capacity as a surveyor on his first voyage to the Dutch Indies (1833). In 1839 he was again in the East, and was attached to the hydrographical bureau at Batavia. With the assistance of documents collected by the old East India Company, he completed a map of Java in five sheets, accompanied by sailing directions (Amsterdam, 1842). He remained in the East till 1845 collecting materials for a chart of the waters between Sumatra and Borneo (two sheets, 1845 and 1846). On his return to Holland he was attached to the naval department with the charge of studying the history of the hydrography of the Dutch East Indies. He also undertook, in connexion with P. F. von Siebold, the publication of the *Moniteur des Indes*, a valuable series of scientific papers, mainly from his own pen, on the foreign possessions of Holland, which was continued for three years. In 1850 Melvill returned to India as lieutenant of the first class and adjutant to Vice-Admiral van den Bosch; and after the premature death of this commander he was again appointed keeper of the charts at Batavia. In 1853 he obtained exemption from active naval service that he might devote himself to a general atlas of the Dutch Indies. But in 1856 he fell a victim to climate, dying at Batavia on the 24th of October. In spite of delays in engraving, twenty-five sheets of the atlas were already finished, but it was not till 1862 that the whole plan, embracing sixty sheets, was completed by Lieut. Colonel W. F. Versteeg. In 1843 Melvill received the decoration of the Netherland's Lion, in 1849 that of the Legion of Honour.

**MEMBRANELLE, an organ in Ciliate Infusoria (q.v.), a flattened assemblage of adherent cilia, like the plates of Ctenophora (q.v.): such are arranged in a series in the adoral wreath of the Heterotrichaceae Oligotrichaceae and Hypotrichaceae and constitute the posterior girdle of Peritricha.
MEMEL—MEMLING

MEMEL, a town of Germany, in the kingdom of Prussia, the most northerly town of the German empire, 91 m. by rail N.E. of Königsberg, at the mouth of the Dange, and on the bank of a sound, called the Memeler Tief, which connects the Kurische Haff with the Baltic. Pop. (1905), 20,687. On the side next the sea the town is defended by a citadel and other fortifications, and the entrance to the harbour is protected by a lighthouse. Memel has been, since 1854, subject to destructive fire. It possesses iron-foundries, shipbuilding yards, breweries, distilleries, and manufactories of chemicals, soap and amber wares. By far the most important interest of the town, however, is its transit trade in timber and the grain and other agricultural products of Lithuania, and also herrings and other kinds of fish. The timber is brought by river from the forests of Russia, and is prepared for export in numerous saw-mills. The annual value of timber exported is above £1,000,000. A Prussian national memorial was unveiled here in the presence of the emperor William II. in September 1907.

Memel was founded in 1252 by Poppo von Osten, grand master of the Teutonic order, and was at first called New Dortmund and afterwards Memelburg. It soon acquired a considerable trade, and joined the Hanseatic League. During the 13th, 14th and 15th centuries, it was frequently burned by Polish and Lithuanian Poles, and in the 17th century it remained for some time in the possession of Sweden. In 1757, and again in 1813, it was occupied by Russian troops. After the battle of Jena, King Frederick William III. retired to Memel; and here, in 1807, a treaty was concluded between England and Prussia. The poet Simon Dach was a native of Memel.

See J. Sembratzen, Geschichte der kölnisch preussischen See- und Handelsstadt Memel, (Memel, 1900); and Memel in 1750 Jahrhundert (Memel, 1902).

MEMEL, or NIEMEN, a river of Russia and Prussia, rising in the Russian government of Minsk at an altitude of 580 ft. and flowing generally west as far as Grodno. Thence it runs north to Kovno, separating Poland from Russia, and at Kovno it turns west again, still dividing Poland from Russia, until it enters the Prussian province of East Prussia, through which it flows west and north-west past Tilsit for a distance of 70 m. and finally enters the Kurisches Haff by several arms. Of these, those principally used for navigation are the Russ, and its chief branch the Atmat. The Russ is connected with the outlet of the Kurisches Haff at Memel by a canal; while another canal links the Gilge arm southward with the Pregel. Considerable quantities of timber are floated down the Memel, and large amounts of corn shipped down it and its navigable tributary the Vilja. The lowlands of Tilsit are protected against inundation by dikes. Total length of the river, 490 m.; area of its basin, 34,950 sq. m. It is navigable for large vessels as far as Grodno.

See H. Keller, Memel, Pregel und Weichselstrom (2 vols., Berlin, 1900); and Schickert, Wassertwege und Deichwesen in der Memel- niederung (Königsberg, 1901).

MEMLING, HANS (c. 1430–1494), Flemish painter, whose art gave lustre to Bruges in the period of its political and commercial decline. Though much has been written respecting the rise and fall of the school which made this city famous, it remains a moot question whether that school ever truly existed. Like Rome or Naples, Bruges absorbed the talents which were formed and developed in humber centres. Jan Van Eyck first gained repute at Milan; and from the Hague he before he acquired a domicile elsewhere, and Memling, we have reason to think, was a pupil artist before he settled at Bruges. The annals of the city are silent as to the birth and education of a painter whose name was in accurately spelled by different authors, and whose identity was lost under the various appellations of Hans and Hausse, or Hemling, Memling, and Memlic. But W. H. J. Weale mentions a contemporary document discovered in 1889, according to which Memling "drew his origin from the ecclesiastical principality of Mayence," and died at Bruges on the 11th of August 1494. He probably served his apprenticeship at Mayence or Cologne, and later went to Bruges. His works date from 1467 to Bruges until about 1467, and certainly not as a wounded fugitive from the field of Nancy. The story is fiction, as is also the report that he was sheltered and cured by the Hospitalers at Bruges, and, to show his gratitude, refused payment for a picture he had painted. Memling did indeed paint for the Hospitalers, but he painted not one but many pictures, and he did so in 1470 and 1486, being probably known to his patrons of St John by many masterpieces even before the battle of Nancy. Memling is only connected with military operations in a moderate and distant sense. His name appears on a list of subscribers to the loan which was raised by Maximilian of Austria to push hostilities against France in the year 1480. In 1477, when he is falsely said to have fallen, and when Charles the Bold was killed, he was under contract to furnish an altarpiece for the gild-chapel of the book-sellers of Bruges; and this altarpiece, now preserved, under the name of the "Seven Griefs of Mary," in the gallery of Turin, is one of the fine creations of his riper age, and not inferior in any way to those of 1479 in the hospital of St John, which for their part as hardly less interesting an illustration of the master's power than the "Last Judgment" in the cathedral of Danzig. Critical opinion has been unanimous in assigning the altarpiece of Danzig to Memling; and by this it affirms that Memling was a resident and a skilled artist at Bruges in 1473; for there is no doubt that the "Last Judgment" was painted and sold to a merchant at Bruges, who shipped it there on board of a vessel bound to the Mediterranean, which was captured by a Danzig privateer in that very year. But, in order that Memling's repute should be so fair as to make his pictures purchasable, as this had been, by an agent of the Medici at Bruges, it is incumbent on us to acknowledge that he had furnished sufficient proofs before that time of the skill which excited the wonder of such highly cultivated patrons.

It is characteristic that the oldest allusions to pictures connected with Memling's name are those which point to relations with the Burgundian court. The inventories of Margaret of Austria, drawn up in 1524, allude to a triptych of the "God of Pity" by Rogier van der Weyden, of which the wings containing angels were by "Master Hans." But this entry is less important as affording testimony in favour of the preservation of Memling's work that in the second-fifteenth century another Flemish craftsman. For ages Rogier van der Weyden was acknowledged as an artist of the school of Bruges, until records of undisputed authenticity demonstrated that he was bred at Tourna and settled at Brussels. Nothing seems more natural than the conjunction of his name with that of Memling as the author of an altarpiece, since, though Memling's youth remains obscure, it is clear from the style of his manhood that he was taught in the painting-room of Van der Weyden. Nor is it beyond the limits of probability that it was Van der Weyden who received commissions at a distance from Brussels, and first took his pupil to Bruges, where he afterwards dwelt. The clearest evidence of the connexion of the two masters is that afforded by pictures, particularly an altarpiece, which has alternately been assigned to each of them, and which may possibly be due to their joint labours. In this altarpiece, which is a triptych ordered for a patron of the house of Sforza, we find the style of Van der Weyden in the central panel of the Crucifixion, and that of Memling in the episodes on the wings. Yet the whole piece was assigned to the former in the Zambecari collection at Bologna, whilst it was attributed to the latter at the Middleton collection in 1893; so showing how connection with one another semblance might be traced between the two artists than that disclosed in later works of Memling, but the delicate organization of the younger painter, perhaps also a milder appreciation of the duties of a Christian artist, may have led Memling to realise a sweet and perfect ideal, without losing, on that account, the feeling of his master. He certainly exchanged the asceticism of Van der Weyden for a sentiment of less energetic concentration. He softened his teacher's asperities and bitter hardness of expression.

In the oldest form in which Memling's style is displayed, or rather in that example which represents the Baptist in the gallery of Munich, we are supposed to contemplate an effort of the year 1470. The finish of this piece is scarcely surpassed, though the subject is more important, by that of the "Last Judgment" of Danzig.
MEMMINGEN—MEMNON

But the latter is more interesting than the former, because it tells how Memlinc, long after Rogier's death and his own settlement at Bruges, preserved the traditions of sacred art which had been applied in the first part of the century by Rogier van der Weyden to the altarpiece of Our Lady, and by Memlinc's master, Dhaerde or Memlinc himself, to purge his master's manner of excessive stringency, and add to his other qualities a velvet softness of pigment, a delicate transparency of colours, and yielding grace of slender forms. That such a beautiful work as the "Altarpiece of Our Lady" has been long lamented. During the Thirty Years' War it was alternately occupied by the Swedes and the Imperialists. In May 1800 the French gained a victory over the Austrians near Memmingen.

See Dobel, Memmingen im Reformationszeitalter (Augsburg, 1877-1878), and Clauys, Memminger Chronik, 1826-1892 (Memmingen, 1894).

MEMMIUS, GAUS (incorrectly called Gemelius, "The Twin"). Roman orator and poet, tribune of the people (66 B.C.), friend of Lucretius and Catullus. At first a strong supporter of Pompey, he quarrelled with him, and went over to Caesar, whom he had previously attacked. In 54, as candidate for the consulship, he lost Caesar's support by revealing a scandalous transaction in which he and his fellow candidate had been implicated (Cic. Ad Att. iv. 15-18). Being subsequently condemned for illegal practices at the election, he withdrew to Athens, and afterwards to Mytilene. He died about the year 40. He is remembered chiefly because it was to him that Lucretius addressed the De rerum natura, perhaps with the idea of making him a convert to the doctrines of Epicurus. It appears from Cicero (Ad Fam. xiii. 1) that he possessed an estate where were the ruins of Epicurus' house, and that he had determined to build on the site a house for himself. According to Ovid (Trist. ii. 433) he was the author of erotic poems. He possessed considerable oratorical abilities, but his contempt for Latin letters and preference for the Greek models impaired his efficiency as an advocate (Cic. Brut. 70).

Another Gaus Memmius, tribune in 111 B.C., attacked the aristocrats on a charge of corrupt relations with Jugurtha. Memmius subsequently stood for the consulship in 99, but was slain in a riot stirred up by his rival the praetor Glauce. Sallust describes him as a statesman, but Cicero (De oratore, ii. 59, 70) had a poor opinion of him.

MEMNON, in Greek mythology, son of Tithonus and Eos (Dawn), king of the Aethiopians. Although mentioned in Hesiod and the Odyssey, he is rather a post-Homeric hero. After the death of Hector he went to assist his uncle Priam against the Greeks. He performed prodigies of valour, but was slain by Achilles, after he had himself killed Antilochus, the son of Nestor and the friend of Achilles. His mother, Eos, removed his body from the field of battle, and it was said that Zeus, moved by her tears, bestowed immortality upon him. According to another account, Memnon was engaged in single combat with Achilles; after he had slain Telamon, the son of Memnon, his own mother moved to the battlefield and bestowed immortality on her son. Achilles was then slain by Memnon, but the swarms of his arrows had time to come to his aid (Dictys Cretensis iv. 6; Quintus Smyrnaeus ii.; Pindar, Pythia, vi. 31). His mother wept for him every morning, and the early dew-drops were said to be her tears. His companions were changed into birds, called Memnonides, which came every year to fight and lament over his grave, which was variously located (Ovid, Metam. xiii. 576-622; Pausanias x. 31). The story of Memnon was the subject of the lost Aethiopis of Arctinus of Miletus; the chief source from which our knowledge of him is derived is the second book of the Posthomerica of Quintus Smyrnaeus (itself probably an adaptation of the works of Arctinus and Memnon). His exploits and death are described at length. As an Aethiopian, Memnon was described as black, but was noted for his beauty. The fight between Achilles and Memnon was often represented by Greek artists, as on the chest of Cypselus, and more than one Greek play was written bearing his name as a title. In later times the tendency was to regard Memnon as a real historical figure. He was said to have built the royal citadel of Susa, called after him the Memnonion, and to have been sent by Teutamas, king of Assyria, to the assistance of his vassal Priam (Diod. Sic. ii. 22). In Egypt, the name of Memnon was connected with the colossal statues of Amenophis (Amenhotep) III. near Thebes, two of which still remain. The more northerly of these was partly destroyed by an earthquake (27 B.C.) and the upper part thrown down. A curious phenomenon then occurred. Every morning, when the rays of the rising sun touched the statue, it gave forth musical sounds, like the
MEMNON OF RHODES—MEMPHIS

Memnon of Rhodes, brother of Mentor (q.v.), with whom he entered the services of the rebellious satrap Artabazus of Phrygia, who married his sister. Mentor after the conquest of Egypt rose high, but Memnon, who had taken refuge with Artabazus at the Macedonian court, became a zealous adherent of the Persian king; he assisted Mentor in subduing the rebellious satraps and dynasts in Asia Minor, and succeeded him as general of the Persian troops. In the pseudo-Aristotelian Oeconomica, ii. 28, stories are told of his methods of obtaining money and evading his obligations; thus he extorted a large sum of money from the conquered inhabitants of Lamptacus and cheated his soldiers out of a part of their pay. He owned a large territory in eastern Troas (Arrian i. 17, 8; Strabo xlii. 587). He gained some successes against Philip II. of Macedon in 336 (Diod. xvii. 6; Polygen. v. 44, 4, 5 and 39) and commanded the Persian army against Alexander's invasion. Convinced that it was impossible to meet Alexander in a pitched battle, his plan was to lay waste the country and retire into the interior, meanwhile organizing resistance on sea (where the Persians were far superior to the Macedonians) and carrying the war into Greece. But his advice was overruled by the Persian satraps, who forced him to fight at the Granicus. After his defeat he tried to organize the maritime war and occupied the Greek islands, but in the beginning of 333 he fell ill and died (Arrian ii. 1, 1).

MEMORANDUM OF ASSOCIATION, in English company law, a document subscribed to by seven or more persons associated for any lawful purpose, by subscribing to which, and otherwise complying with the requirements of the Companies Acts in respect of registration, they may form themselves into an incorporated company, with or without limited liability (see COMPANY).

MEMORIAL DAY (or Decoration Day), a holiday observed in the northern states of the United States on the 30th of May, in honour of soldiers killed in the American Civil War, and especially for the decoration of their graves with flags and flowers. Before the close of the Civil War the 30th of May was thus celebrated in several of the southern states; in the North there was no fixed day commonly celebrated until 1868, when (on the 5th of May) Commander-in-Chief John A. Logan, of the Grand Army of the Republic, issued a general order designating the 30th of May 1868 "for the purpose of strewing with flowers or otherwise decorating the graves of comrades who died in defense of their country during the late rebellion"; Logan did this "that it will be kept up from year to year." In 1882 the Grand Army urged that the "proper designation of May 30 is Memorial Day"—not Decoration Day. Rhode Island made it a legal holiday in 1874, Vermont in 1875, and New Hampshire in 1877; and by 1910 it was a legal holiday in all the states and territories save Alabama, Alaska, Arkansas, Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina and Texas. In Virginia the 30th of May is observed as a Confederate Memorial Day. The 3rd of June (the birthday of Jefferson Davis) is observed as Confederate Memorial Day in Louisiana and Tennessee; the 26th of April in Alabama, Florida, Georgia and Mississippi; and the 10th of May in North Carolina and South Carolina.

MEMPHIS, the capital of Egypt through most of its early history, now represented by the rubbish mounds at Bedrâshen on the W. bank of the Nile 14 m. S. of Cairo. As the chief seat of the worship of Ptah, the artisan god (Hephaestus), Memphis must have existed from a very remote time. But its greatness probably began with Menes (q.v.), who united the kingdoms of Upper and Lower Egypt, and is said to have secured the site for his capital near the border of the two lands by diverting the course of the river eastward. Memphis was the chief city of ancient Egypt; though its early days it was known as "the white walls" or "the white wall," a name which clung to its citadel down to Herodotus's day. The residence here of Pepi I. of the Vth Dynasty, as well as his pyramid in the necropolis, was named Mu-nfr, and this gradually became the usual designation of the whole city, becoming Meni, Memb in late Egyptian, i.e. Memphis. It was also called Hâkephtah, "Residence of the ka of Ptah," and this name furnishes a possible origin for that of Egypt (Âptwstos). Various dynasties had their ancestral seats elsewhere and individual kings built their palaces and pyramids; and the favour of the Pyramid Age was divided among the Memphite necropolises; but Memphis itself had been generally the centre of the government and the largest city in Egypt until the New Empire (Dyns. XVIII.–XX.), when Thebes took the lead. In the succeeding period it regained its ancient position. The government of the Persian satrap was seated in Memphis. After the conquest of Alexander the city quickly lost its supremacy to his new foundation, and although it remained the greatest native centre, its population was less than that of Alexandria. In the time of Strabo (xvii. 587) it was the second city of Egypt, inferior only to Alexandria, and with a mixed population like the latter. Memphis was still important, though declining at the time of the Moslem conquest. Its final fall was due to the rise of the Arabic city of Fustat on the right bank of the Nile almost opposite the northern end of the old capital; and its ruins, so far as they still lay above ground, gradually disappeared, being used as a quarry for the new city, and afterwards for Cairo. The remains of "Meni" were still imposing late in the 12th century, when they were described by 'Abdallâsî. Now the ruins of the city, the great temple of Ptah, the dwelling of Apis, and the palaces of the kings, are traceable only by a few stones among the palm trees and fields and heaps of rubbish. But the necropolis has been to a great extent protected by the accumulations of blown sand. Pyramids of the Old and Middle kingdoms form a chain 20 m. long upon the edge of the valley from Giza to Dahshur. At Saqqara, opposite Memphis itself, the step-pyramid of Zoser of the IIIrd Dynasty, several pyramids of the Vth and VIth Dynasties, and innumerable mastaba-tombs of the Old Kingdom, are crowded together in the cemetery. Later tombs are piled upon and cut through the old ones. One of the chief monuments is the Serapeum or sepulchre of the Apis bulls, discovered by Mariette in 1851. From 1905 J. E. Quibell was charged by the Service des Antiquités solely with the excavations in this vast necropolis. His principal discovery has been the extensive remains of the Coptic monastery of St Jeremias, with remarkable sculptures and frescoes. Flinders Petrie began the systematic exploration of the ruins of Bedrâshen, and in three seasons cleared up much of the topography of the ancient city, identifying the mound of the citadel and palace, a foreign quarter, &c. Among his finds not the least interesting is a large series of terra-cotta heads representing the characteristic features of the foreigners who thronged the bazaars of Memphis. They date from the Persian rule down to...
MEMPHIS—MENA, JUAN DE

The Ptolemaic era and are evidently modelled by Greek workmen. In the Old Testament Memphis is mentioned under the names of Moph (Hos. ix. 6) and Noph (Isa. xxx. 13; Jer. ii. 16; Ezek. xxx. 13, 16).

See J. de Morgan, Carte de la nécropole memphite (Cairo, 1897); Baedeker’s Egypt; J. E. Quibell, Excavations at Saqqara (2 vols., Cairo, 1906–1909); W. M. Flinders Petrie, Memphis I, and The Palace of Apries (Memphis II) (London, 1909). (F. L. G.)

MEMPHIS, a port of entry and the largest city of Tennessee, U.S.A., and the county-seat of Shelby county, on the Mississippi river, in the S.W. corner of the state. Pop. (1860), 22,625; (1870), 40,226; (1880), 33,592; (1890), 64,495; (1900), 102,320, of whom 510 were foreign-born and 49,010 were negroes; (1910) census, 121,105. It is served by the Chicago, Rock Island & Pacific, the St Louis & San Francisco, the Illinois Central, the Southern, the Louisville & Nashville, the Nashville, Chattanooga & St Louis, the St Louis South-Western, the St Louis, Iron Mountain & Southern and the Yazoo & Mississippi Valley railways, and by steamboats on the Mississippi. The river is spanned here by a cantilever railway bridge 1805 ft. long, completed in 1892. The city is finely situated on the south Chickasaw Bluffs, more than 40 ft. above high water; the streets are broad, well paved and pleasantly shaded; and a broad levee overhung by four cotton-clad squares. In the heart of the city, are many fine old trees and a bust of President Andrew Jackson.

In 1900 the city had about 1000 acres of parks and 144 m. of parkways, besides two race-courses. Overton Park has beautiful playgrounds and a good zoological collection. Five miles from Memphis is a National Cemetery. Among the prominent buildings are the United States Government building, the county Court house, Cotton Exchange, Business Men’s Club, Goodwyn Institute, containing an auditorium and the public library, the Cossett Free Library, Grand Opera House, Lyceum Theatre, Auditorium, Gayoso Hotel, Memphis Evening Scimitar building, the Illinois Central three story brick bank and post office, the Equitable building, Memphis Trust building, Tennessee Trust building, the Bank of Commerce, Woman’s building (containing offices for business women), Masonic Temple, Odd Fellows’ building and the Commercial Appeal building. Among educational institutions are the College of Christian Brothers (Roman Catholic, opened in 1871), Memphis Hospital Medical College, College of Physicians and Surgeons, Hannibal Medical College for negroes and Le Moyne Normal Institute, also for negroes. Memphis is the see of a Protestant Episcopal bishopric. The city is supplied with water from more than eighty artesian wells, having an average depth of about 400 ft.

Owing to its situation at the head of deep water navigation on the Mississippi, Memphis has become a leading commercial city of the southern states; its trade in cotton, lumber, groceries, mules and horses is especially large. The city also manufactures large quantities of cotton-seed oil and cake, lumber, flour and grist-mill products, foundry and machine-shop products, confectionery, carriages and wagons, paints, furniture, bricks, cigars, &c. The Illinois Central and the St Louis & San Francisco railways have workshops here. The total value of the city's manufactures increased from $73,244,535 in 1890 to $17,025,626 ($14,233,483 being factory product) in 1900, and to $21,346,817 (factory product) in 1905, an increase of 50% over the value of the factory product in 1900.

Chickasaw Bluffs were named from the Chickasaw Indians, who were in possession when white men first came to the vicinity. Late in the 17th century the French built a fort on the site of Memphis, and during most of the 18th century this site was held either by the French or the Spanish. In 1797 it passed into the possession of the United States. By a treaty of the 19th of October 1818, negotiated by General Andrew Jackson and General Isaac Shelby, the Chickasaws ceded all their claims east of the Mississippi, and early in 1819 Memphis was laid out in accordance with an agreement entered into by John Overton (1766–1833), Andrew Jackson and James Winchester (1752–1836), the proprietors of the land. Its name was suggested from the similarity of its situation on the Mississippi to that of the Egyptian city on the Nile. Memphis was incorporated as a town in 1827, and in 1849 was chartered as a city. Near Memphis, on the 6th of June 1862, a Union fleet of 9 vessels and 68 guns under Commodore E. D. Porter defeated a Confederate fleet of 8 vessels and 28 guns under Commander J. E. Montgomery after a contest of little more than one hour, three of the Confederate vessels being destroyed and four of them captured, and from this victory until the close of the war the city was in possession of the Union forces. In August 1864, however, a Confederate force under General N. B. Forrest raided it and captured several hundred prisoners. The decrease of population between 1870 and 1880 was due to the ravages of yellow fever in 1873, 1878 and 1879. The epidemic of 1878, retailed in over two thousand deaths and that of 1879, in a total of 5150, of whom 4250 were whites and 900 negroes. At the return of the fever in 1879 better care and stricter quarantine arrangements prevailed, but there were 407 deaths. During the epidemics of 1878 and 1879 fully two-thirds of the population fled from the city, many of whom died of the fever at other places, and a still larger number did not return. For three months during each year business was suspended, and all ingress or egress except for the most necessary purposes was forbidden. The city was left almost bankrupt, and as a means of relief the city of Memphis on 1 January 1879 repealed the city charter, and, assuming exclusive control of its taxation, substituted it simply as a “taxing district,” placing its government in the hands of a “legislative council.” This anomalous proceeding was declared constitutional by the supreme court of Tennessee. Subsequently the streets were cleansed and repaved, an improved sewer system was put in operation, and the water supply was obtained from artesian wells. In 1891 a new city charter was obtained, and in 1907 the “Houston plan” (see Houston, Texas) was adopted for Memphis by the state legislature. The act, however, was declared unconstitutional by the state supreme court, and a new charter was adopted in 1909, taking effect on the 1st of January 1910, providing for a government by five commissioners, each having charge of a separate department.

See J. M. Keating, History of the City of Memphis and Shelby County, Tennessee (Syracuse, 1888); James Phelan, History of Tennessee (Boston, 1889).

MENA, JUAN DE (1411–1456), Spanish poet, was born at Córdova in 1411. In the twenty-fourth year he matriculated at the university of Salamanca, and studied later at Rome. His scholarship obtained for him the post of Latin secretary at the court of Castile; subsequently he became historiographer to John II. and magistrate at Córdova. According to the Epistola of Valerio Francisco Romero, Mena died from natural causes in 1456; popular tradition, however, ascribes his death to a fall from a mule. Though nominally the king’s chronicler, Mena had no share in the Crónica de Don Juan II.; the statement that he wrote the first part of the Celestina (q.v.) is rejected; but three authentic specimens of his curious prose exist in the comedia El Laberinto de Fortuna, dedicated to John II.; in the oldest manuscripts it consists of 297 stanzas, but three more stanzas were added to it later, and hence the alternative popular title of Las Trescentas. The Laberinto is modelled on Dante, and further contains reminiscences of the Roman de la rose, as well as episodes borrowed from Virgil and Lucan. It is marred by excessive emphasis and pedantic diction, and the arte mayor measure in which it is written is monotonous; but many octaves are of such excellence that the arte mayor metre continued in fashion for nearly a
MENA, PEDRO

century. The poem, as a whole, is tedious; yet its dignified expression of patriotic spirit has won the admiration of Spaniards from Cervantes' time to our own.

A critical edition of the Laberinto has been issued by R. Foulché-Delboeuf (Macon, 1904).

MENA, PEDRO DE (d. 1603), Spanish sculptor, was born in Adra. He was a pupil of his father as well as of Alonso Cano. His first conspicuous success was achieved in work for the convent El Angel de Granada, including figures of St Joseph, St Antony of Padua, St Diego, St Pedro Melantara, St Francis and Santa Clara. In 1652 he signed a contract for sculptural work on the choir stalls of the cathedral at Malaga—this work extending over four years. Other works are, statues of the Madonna and child and of St Joseph in Madrid, the polychromatic figures in the church of St Isidoro, the Magdalena and the Gertrudis in the church of St Martin (Madrid), the crucifixion in the Nuestra Señora de Gracia (Madrid), the statuette of St Francis of Assisi in Toledo, and of St Joseph in the St Nicholas church in Murcia. Between 1673 and 1679 Mena worked at Cordova. About 1680 he was in Genoa of Modena and Ferrara, where he remained until 1682. He died in Malaga in 1803. He and Mora (q.v.) may be regarded as artistic descendants of Montañés and Alonso Cano, but in technical skill and the expression of religious motive his statues are unsurpassed in the sculpture of Spain. His feeling for the nude was remarkable. Like his immediate predecessors he excelled in the portrayal of contemplative figures and scenes; Mena's drawing of Santiago leaping upon his charger is good, and the carving admirable, but the necessary movement for so spirited an action is lacking.

See B. Haendel, Studien zur Geschichte der spanischen Plastik (Strassburg, 1900).

MENABREA, LUIGI FEDERICO, Marquis of Valdora (1809—1866), Italian general and statesman, was born at Chambéry on the 4th of September 1809. He was educated at the university of Turin, where he qualified as an engineer and became a doctor of mathematics. As an officer of engineers he replaced Cavour in 1831 at the fortress of Bardo. He then became professor of mechanics and construction at the military academy and at the university of Turin. King Charles Albert sent him in 1848 on diplomatic missions to secure the independence of Parma and Ferrara. He entered the Piedmontese parliament, and was attached successively to the Ministries of War and Foreign Affairs. He belonged to the right centre, and until the events of 1859 he believed in the possibility of a compromise between the Vatican and the state. He was major-general and commander-in-chief of the engineers in the Lombard campaign of 1859. He superintended the siege works against Peschiera, was present at Palestro and Solferino, and repaired the fortifications of some of the northern fortresses. In 1860 he became lieutenant-general and conducted the siege of Gaeta. He was appointed senator and received the title of count. Entering the Ricasoli cabinet of 1861 as minister of marine, he held the portfolio of public works until 1864 in the succeeding Farini and Minghetti cabinets. After the war of 1866 he was chosen as Italian plenipotentiary for the negotiation of the treaty of Prague and for the transfer of Venetia to Italy. In October 1867 he succeeded Rattazzi in the premiership, and was called upon to deal with the difficult situation created by Garibaldi's invasion of the Papal States and by the catastrophe of Mentana. Menabrea dissuaded Garibaldi and instituted judicial proceedings against him; but in negotiations with the French government he protested against the retention of the temporal power by the pope and insisted on the Italian right of interference in Rome. He was in the secret of the direct negotiations between Victor Emanuel and Napoleon III. In June 1869, and refused to entertain the idea of a French alliance unless Italy were allowed to occupy the Papal States, and, on occasion, Rome itself. On the eve of the assembly of the Oecumenical Council at Rome Menabrea extended to the Italian government its observance of any measures directed against Italian institutions. He withdrew from seminary students in 1869 the exemption from military service which they had hitherto enjoyed. Throughout his term of office he was supported by the finance minister Count Cambry Digny, who forced through parliament the grist tax proposed by Quintino Sella, though in an altered form from the earlier proposal. After a series of changes in the cabinet, and many crises, Menabrea resigned in December 1869 on the election of a new chamber in which he did not command a majority. He was made marquis of Valdora in 1875. His successor in the premiership, Giovanni Lanza, in order to remove him from his influential position as aide-de-camp to the king, sent him to Spain as minister plenipotentiary. There he remained until in 1882 he replaced General Cialdini at the Paris Embassy. Ten years later he withdrew from public life, and died at Saint Capin on the 24th of May 1896.

MÉNAGE, GILLES (1613—1692), French scholar, son of Guillaume Ménage, king's advocate at Angers, was born in that city on the 15th of August 1613. A tenacious memory and an early enthusiasm for learning carried him speedily through his literary and professional studies, and he practised at the bar at Angers as early as 1634. In the same year he pleaded several causes before the parlement of Paris, but illness induced him to abandon the legal profession for the church. He became prior of Montdidier without taking holy orders, and lived for some years in the household of Cardinal de Retz (then coadjutor to the archbishop of Paris), where he had leisure for literary pursuits. Some time after 1648 he quarrelled with his patron and withdrew to a house in the cloister of Notre-Dame, where he gathered round him on Wednesday evenings those literary assemblies which he called "Mercuriales." Chapelain, Pellisson, Conrart, Sarrazin and Du Bos were among the habitués. He was admitted to the Della Crusca Academy of Florence, but his caustic sarcasm led to his exclusion from the French Academy. Ménage made many enemies and suffered under the satire of Boileau and of Mollière. Mollière immortalized him as the pedant Vadius in Les Femmes savantes, a portrait Ménage pretended to ignore. He died in Paris on the 23rd of July 1692.

Of his works the following may be mentioned: Poésie latina, gallica, graeca, et italicæ (1666); Origini della lingua italiana (1669); Dictionnaire d'yméologie (1660 and 1670); Observations sur la langue française (1672—1676), and Anti-Batilie (1690).

MENAGERIE, a collection of wild animals kept for show or exhibition. The word is particularly applied to travelling exhibitions of wild animals, attached to a circus or other show, zoological gardens "(q.v.) being the term generally applied to large stationary and permanent exhibitions, arranged on a systematic and permanent system.

Menagiers, Fr. message, Lat. mansionaticum, mansio, house, cf. "manage") originally meant the administration of a household or farm, with special reference to the live stock.

MENAHEM (Hebrew for "consoler"), a king of Israel. He was the son of Gadi (i.e. perhaps, a man of Gad), and during the disturbances at the death of Jeroboam II. seized the throne and reigned ten years (2 Kings xv. 14—18). The scene of his revolt was Tirzah, the old seat of the kings of Israel between Jeroboam I. and Omri (which period the present closely follows). It was a move not only after perpetrating nameless cruelties at Tappuah 1 on the border of Ephraim and Mannasseh that the counter revolt of Shallum, son of Jabelah (perhaps a Gileadite), was suppressed. Towards the end of his reign Tiglath-Pileser IV. marched against north Syria, and among his tributaries mentions Menahem 2 together with Rezin of Damascus, and kings of Tyre, Gebal, &c. (c. 738 B.C.). According to the Old Testament account the Assyrian king even advanced against Israel, and only withdrew in consideration of a tribute amounting to about 400,000, a bond on his talents (i.e. about 3,000,000 shekels) was raised by assessing every wealthy person at 50 shekels. The act was hardly popular, and the internal troubles which he had quelled

1 Scarcely Tipshah (2 Kings xv. 16) on the Ephrathites.
2 The identification of the Israelite king with Me-ni-hi-(im)-ni of Sa-me-ri-ma-as on the Ass. inscription has been unnecessarily doubted.
The lifetime, 69), These in. victory Terence praised The some from It doubtless 30 subsequently southward Siam. It that Doi Robert generally is at the flows Menam, Stephenson, 2016 2 whose Britannia whose main MENAM, MENAI STRAITS, Pekahiah, whose 1, 230 tube, the tower, the base & the tower, the breadth of the roadway was 69 ft.; the breadth of the roadway including two carriage-ways and a footpath is 30 ft. The sixteen suspending chains are carried 60 ft. through rock. Their sustaining power has been calculated at 2016 tons, while the whole weight of the suspended part of the bridge is only 489 tons. During a gale a slight oscillation is noticeable on the bridge itself and from the shore. The tubular bridge carries the London & North Western railway. Here the channel is about 1100 ft. wide, and divided in the main by the Britania Rock, bare at low water. The tide generally rises 20 ft., with great velocity. The principal measurements are: each abutment 176 ft.; from abutment to side tower, 230 ft.; from side tower to central tower, 460 ft.; breadth of each side tower at road-level, 32 ft.; breadth of central tower, 45 ft. 5 in. The total length of the roadway is 1841 ft. 5 in. The Britannia tower measures at its base 62 by 52½ ft.; with a height of 230 ft. There are 101 ft. between the sea at high tide and the bridge roadway bottom. The limestone used is from Penmon, 4 m. from Beaumaris. Four stone lions couchant guard the approaches to the Britannia Bridge. The name of the Britannia Rock was given to it on the 9th of November 1849, the last on the 13th of September 1850. The total cost was £621,865. The engineer of the tubular bridge was Robert Stephenson, who was assisted by Sir William Fairbairn and Eaton Hodgkinson.

MENAM, or ME NAM (literally the “mother water” or “main river”), a river of Siam, the chief highway of the interior, on whose yearly rise and fall depends the rice crop of Lower Siam. Rising in the Lao or Siamese Shan state of Nan, at a height of 1400 ft. upon the shoulders of the mountain mass of Doi Luang, it is first known as the Nam Nong, through which flows the river named that name. As the Nam Nan, still a mountain stream, it flows southward through the state so named between high forested ranges, and, notwithstanding the frequent rapids along its course, the natives use it in dug-outs for the transport of hill produce. From Utrarat, where it leaves the hills of the Lao country, it flows southward through the plain of Lower Siam, and is navigable for flat-bottomed native craft of considerable capacity. It is here known as the Nam, or Menam Pchai. Below Pchai the river flows through forest and swamp, the latter providing vast overflow basins for the yearly floods. When the rain of November comes, there descends upon their peninsula a heavy deluge of rain that continues until the fall of the river after the rains. Below Pittunakol the waters of the Menam Yom, the historic river of Siam, upon which two of its ancient capitals, Sawankalok and Sukotai, were situated, meander by more than one tortuous clayey channel to the main river, and combine to form the Nam Po. At Paknam Po the main western tributary comes in, the shallow Me Ping, the river of Rahang and Chiang Mai, bringing with it the waters of the Me Wang. As the chief duty-station for teak, which is floated in large quantities down all the upper branches of the river and as a place of transhipment for both, Paknam Po is an important and growing town. From this point southwards the river winds by many channels through the richest and most densely populated portion of Siam. About Chai nat the Tachin branches off, forming the main western branch of the Menam, and falling into the gulf at a point about 24 m. west of the bar of the main or Bangkod river. At Ayuthia, another of the ancient capitals of Siam, the Nam Sak flows in the river Charisius. A great admiral affording communication with the rich tobacco district of Petchabun, and draining the western slopes of the Korat escarpment.

MENANDER (342–201 B.C.), Greek dramatist, the chief representative of the New comedy, was born at Athens. He was the son of well-to-do parents; his father Diopithes is identified by some with the Athenian general and governor of the Thracian Chersonese known from the speech of Demosthenes De Chersonese. He doubtless derived his taste for the comic drama from his uncle Alexis (q.v.). He was the friend and associate, if not the pupil, of Theon, his tutor, and was on intimate terms with Demetrius of Phalerum. He also enjoyed the patronage of Ptolemy Soter, the son of Lagus, who invited him to his court. But Menander, preferring independence and the company of his mistress Glycera in his villa in the Peiraicæ, refused. According to the note of a scholiast on the Ibis of Ovid, he was drowned while bathing; his countrymen built him a tomb on the road leading to Athens, where it was seen by Pausanias. A well-known statue in the Vatican, formerly thought to represent Marius, is now generally supposed to be Menander (although distinguished archaeologists dispute this), and has been identified with his statue in the theatre at Athens, also mentioned by Pausanias.

Menander was the author of more than a hundred comedies, but only gained the prize eight times. His rival in dramatic art and also in the affections of Glycera was Philemon (q.v.), who appears to have been more popular. Menander, however, believed himself to be the better dramatist, and, according to Aulus Gellius, used to ask Philemon: “Don’t you feel ashamed whenever you gain a victory over me?” According to Psellus, Calace (Porphyry in Eusebius, Praep. x. 3, 13) he was guilty of plagiarism; his Menaldaivos being taken bodily from the Okanontes of Antiphanes. But, although he attained only moderate success during his lifetime, he subsequently became the favourite writer of antiquity. Copies of his plays were known to Suidas and Eustathius (10th and 11th centuries), and twenty-three of them, with commentary by Psellus, were said to have been in existence at Constantinople in the 16th century. He is praised by Plutarch (Comparison of Menander and Aristophanes) and Quintilian (Instit. x. 1. 69), who accepted the tradition that he was the author of the speeches published by Philemon and the disguised orators, and imitator of Euripides, he resembles him in his keen observation of practical life, his analysis of the emotions, and his fondness for moral maxims, many of which have become proverbial: “The property of friends is common,” “Whom the gods love die young,” “Evil communications corrupt good manners” (from the Thais, quoted in 1 Cor. xv. 33). These maxims (chiefly monostichs) were afterwards collected, and, with additions from other sources, were edited as Μηνανδρος γνωμαι μοδοσισων, a kind of moral textbook for the use of schools.

Mennachus, Andria, Hecatomnorumones and Adelphi of Terence (called by Caesar “dimissi Menander”) were avowedly taken from Menander, but some of them appear to be adaptations and combinations of more than one play; thus, in the Andria were combined Menander’s 'Aldia and Periothia, in the Eunuchus the Eunuchs and Kolla, while the Adelphi was compiled partly from Menander and partly from Diphilus. The original of Terence’s Heucra (as of the Phormio) is generally supposed to be, not Menander, but Apollodorus of Carystus. The Bacchides and Stichus of Plautus were probably based upon Menander’s Διώρησαν and Philemaos, but the Poenulus does not seem to be from the Ἀκριόρροος nor the Mostellaria from the Φαέμα, in spite of the similarity of titles. Caecilius Statius, Lucius Lavinius, Turnilius and Attilius also imitated Menander. He was further credited with the authorship of some epigrams of doubtful
authenticity; the letters addressed to Ptolemy Soter and the discourses in prose on various subjects mentioned by Suidas are probably spurious.

Till the end of the 19th century, all that was known of Menander were fragments published by A. Meineke (1855) and T. Kock, *Comitiorum actiorum fragmenta*, iii. (1888). They consist of some 150 verses or parts of verses, in addition to a considerable number of non-contiguous passages. The fragments by Suidas, sometimes ascribed to Menander, are all longer than the fragmentary texts known to us, and they are divisible into three groups:

1. young and ancient (380–50 B.C.),
2. remarkable and best known (250–175 B.C.),
3. doubtful or spurious (175–150 B.C.).

From 1877 to 1907 papyri were discovered in different parts of Egypt, containing fragments of considerable length, amounting to some 1,400 lines. In 1897, about eighty lines of the *Acharnai* were published by C. Croiset, and from *Eunuchae* came a hundred lines (half in a very mutilated condition) from the KÄA; in 1906, two hundred lines from the middle of the *Epiumenei*, and the part preserved of the *Menander* by E. Croiset. Sixty-three lines from the *Eunuchae*, generally well preserved; sixty-three lines (the prologue, list of characters, and the first scene), from the *Heptastichon*; three hundred and forty lines from the *Alcibiad*; the identification of the two last plays is not considered absolutely certain; and twenty lines from an unknown comedy. Subsequently, part of a third copy of the *Epiumenei* was found in Egypt, some one hundred and forty lines, which were already known, while the remainder were new. (Abhandlungen der königl-sächsischen Gesellschaft der Wissenschaften, Leipzig, 1908).

It is doubtful whether these fragments, which are of sufficient length and of the same quality, serve as the basis for the reconstruction of the works of Menander as a writer of comedies, justify the great reputation enjoyed by him in ancient times. With the exception of a scene in the *Eunuchae*, which would appeal to the literary Athenians, the subject is too foreign to their interests; the various parts of the comedy, the situations are conventional, and the plots, not of a highly edifying character, are lacking in originality. Menander's chief interest lies in the relationship of language and poetry, as a poet of satyrs and comedians, and naturalness of which he puts into the mouth of his dramatic personae. It is remarkable that the maxims, which form the chief part of the earlier collections of fragments, are few in the later.

On Menander generally see monographs by C. Benno (1854) and G. Guizot (1855); J. Geffcken, *Studien zu Menander* (1885); H. Lübbe, *Menander und sein Stil* (1885); J. Denis, *La Comédie grecque* (1886); B. H. W. Horn, *Egyptian art* (1900). Editions of the fragments: *fragments* by J. Nicole, with translation and notes (1898) and by B. F. Grenfell and A. S. Hunt, with revised text and translation (1909). Translation of the *Menander* by Croiset, with introduction, notes and translation (Cairo, 1907); J. van Leeuwen, with Latin notes (2nd ed., 1908); L. Bodin and F. Maxon, *Extralits de Menandre* (Samia et Epitrepontes, 1908); E. Croiset, *L'Art rhétorique*, critical ed., and translation (1908); C. Robert, *Der neue Menander* (text reconstructed, 1908); Wilamowitz-Möllendorff, *Der Menander von Kairo* in *Neue Jahrbiicher für das klassische Altertum* (1908), pp. 34–62; German trans. by C. Robert, *Szenen aus Menander* (1908); English by Unus Miltorom (1909). See also Villamovitz-Möllendorff, *Der Landmann des Menander* in *Neue Jahrbiicher* (1900); G. Sartre, "The Inheritance of the Greek Comedy in Rhin.,* Mitt. 497, 104; F. Leo, "Der Neue Menander" in *Hermes*, xiii. 120; E. (J. H. F.).

**MENANDER** (Milinda), a Greco-Indian dynasty. When the Graeco-Indian kingdom Demetrius had been beaten by Eucratides of Bactria, about 160 B.C., and the kingdom of Eucriatides (q.v.) dissolved after his assassination (c. 150 B.C.), a Greek dynasty maintained itself in the Kabul Valley and the Punjab. The date assigned of this dynasty is 200 B.C., but the two zoological authors are Apollodotus and Menander, who conquered a great part of India. Trogus Pompeius described in his forty-first book (see the prologue) "the Indian history of these kings, Apollodotus and Menander," and Strabo, xi. 516, mentions from Apollodotus of Artemita, the historian of the Parthians, that Menander "conquered more tribes than Alexander, as he crossed the Hyphasis to the east and advanced to the Jassamus; he and other kings (especially Demetrius) occupied also Patalene (the district of Patala near Hyderbad on the head of the delta of the Indus), which he divided into four districts (i.e. Syrastene, in mod. Gujarat, Brahman Saurashtra) and the kingdom of Sigerdis (not otherwise known); and they extended their dominion to the Sises (i.e. the Chinese) and Phryni (?)."

The last statement is an exaggeration, probably based upon the fact that from the mouth of the Indus trade went as far as China.

That the old coins of Apollodotus and Menander, with Greek legends, were still in currency in Barygaza (mod. Broach), the great port of Gujarat, about A.D. 70 we are told by the *Periplus maris Erythraei*, 48. We possess many of these coins, which follow the Indian standards and are artistically degenerate as the older Graeco-Bactrian and Graeco-Indian coins, with bilingual legends (Greek and Kharoshhi, see BACTRIA). Apollodotus, who must have been the earlier of the two kings, bears the titles Soter, Philopator, and "Great King"; Menander, who must have reigned a long time, as his portrait is young on some coins and old on others, calls himself Soter and "Just" (bikasa). Their reigns may be placed about 140–80 B.C. Menander appears in Indian traditions as Milinda; he is praised by the Buddhists, whose religion he is said to have adopted, and who in the *Milindapanha or Milinda Panho* (see below), the Fed of Milinda and Buddha, in many of the books (nos. 1 to xxxv, xxxvi) relate his discourses with the wise Nâgasena.

According to the Indians, the Greeks conquered Aroydia and Pataliputra (Palimbothra, mod. Patna); so the conjecture of Cunningham that the river Isamus of Strabo is the Son, the great southern tributary of the Ganges (near Patna), may be true. The Buddhists praise the power and military force, the energy and wisdom of "Milinda:" a Greek tradition preserved by Plutarch (Proc. rep. ges. 26, 6) relates that "when Menander, one of the Bactrian kings, died on a campaign after a mild rule, and the successor of the two self-referential state; till at last his ashes were divided between them in equal parts." (The Buddhist tradition relates a similar story of the relics of Buddha.) Besides Apollodotus and Menander, we know from the coins a great many other Greek kings of western India, among whom two with the name of Straton are most conspicuous. The last of them, with degenerate coins, seems to have been Hermæus Soter. These Greek dynasts may have maintained themselves in some part of India till about 40 B.C. But at this time the west, Kabul and the Punjab were already in the hands of a barbarous dynasty, most of whom have Iranian (Parthian) names. The question of the Aracaid off (cf. Vincent A. Smith, "The Indo-Parthian Dynasties from about 150 B.C. to A.D. 100," in *Zeitschrift der deutschtem morgenländischen Gesellschaft*, 1906, i. 69 sqq.). Among them were, two kings named Acez, Vonones and especially Gonophores or Hyophores are the most conspicuous. The latter, whose date is fixed by an inscription from the Kabul Valley dated from the year 103 of the Samvat era (= A.D. 46), is famous by the legend of St Thomas, where he occurs as king of India under the name of Gundaphor. Soon afterwards the Graeco-Indian kingdom was divided into three, the Huns conquered Bactria in 130 B.C., invaded India and founded the great Indo-Scythian kingdom of the Kushan dynasty. (See BACTRIA; and PERSIA: Ancien History.) (Ed. M.)

**Milinda Panho** is preserved in Pali, in Ceylon, Burma and Siam, but was probably composed originally in the extreme northwest of India, and in a dialect spoken in that region. Neither date nor author is known; but the approximate date must have been about the 2nd century of our era. The work is entitled *Milinda Panho*—that is, *The Questions of King Milinda*. In it the king is represented as corresponding to a Buddhist Bhikhu named Nâgasena in number of incidents, and as borrowing many of the questions and philosophy; and as receiving, in each case, a convincing reply. It is a matter of very little importance whether a tradition of such some conversations having really taken place had survived to the time when the author wrote his book. In any case he composed both problems and answers; and his work is an historical romance, written to discuss certain points in the faith, and to invest the discussion with the interest arising from the story in which it is set. This plan is carried out with great skill. An introduction, giving the past and present lives of Milinda and Nâgasena, is admirably adapted to fill the reader with the idea of the great ability and energy of the two persons; the exposition of the two questions and the dialogue of the two interlocutors; and the short questions and the long answers, and the strictness of the conditions and the variety of the subjects, which would appeal most strongly to the intellectual taste of the India of that age. And the style of the book is very picturesque. Each particular question is treated under a new light, in a new space, and is treated in a popular way. But the earnestness of the author is not concealed; and he occasionally rises into a very real eloquence. The work is several times quoted as authority by Buddhists, who wrote in Pali, and it is the only work, not in the canon, which receives this honour.
The Milinda has been edited in Pali by V. Trencenek, and translated, with annotations and introductions in which the historical and critical points made in this article are discussed in detail. There is space here to mention only one further fact. M. Sylvain Lévy, working in collaboration with M. Specht, has shown that the Pali is nearly three hundred years older than the Chinese works written between the 5th and 7th centuries, on the Questions of Milinda. They purport to be translations of Indian works. It is not, however, translations of the Pali text. They give, with alterations and additions, a summary of the older forms of the Pali text, and are probably derived from a recension that may be older than the Pali.

MENANDER, of Laodicea on the Lycus, Greek rhetorician and commentator. Two incomplete treatises on epicdetic (or show) speeches have been preserved. The latter is generally considered that they cannot be by the same author. Bursian attributes the first to Menander, whom he placed in the 4th century, and the second to an anonymous rhetorician of Alexandria Trias, who possibly lived in the time of Dioctian. Others, from the superscription of the Paris MS, assign the first to Genethlius of Petrae in Palestine. In view of the general tradition of antiquity, that both treatises were the work of Menander, it is possible that the author of the second was not identical with the Menander mentioned by Suidas, since the name is frequently occurring in later Greek literature. The first treatise, entitled 3a3euvras tov 3a3etxevov, discusses the different kinds of epicdetic speeches; the second, Peri 3a3etxevov, has special titles for each chapter.

Text in L. Spengel's Rhetores graeci, iii. 329-346, and in C. Bursían's " Der Rhetor Menandros und seine Schriften in Mündl. der beyerd. Akad. der Wissenschaften, xvi. (1882); Sylvain Lévy, 3a3euvra der Menander, 1892; W. Nitsche, Der Rhetor M. und d. Schönen zu Demosthenes; J. E. Sandys, Hist. of Classical Scholarship (1906), i. 338; W. Christ, Gesch. der griechischen Literatur (1886), § 559.

MENANDER PROTECTOR (Ippokraté, i.e. one of the imperial bodyguards), Byzantine historian, was born in Constantinople in the middle of the 6th century A.D. The little that is known of his life is contained in the account of himself quoted by Suidas. He at first took up the study of law, and abandoned it for a life of pleasure. When his fortunes were low, the patronage accorded to literature by the emperor Maurice (582) encouraged him to try writing history. He took as his model Agathias (p.v.), who like him had been a jurist, and his history begins at the point where Agathias leaves off. It embraces the period from the arrival of the Cotgritiun Hnni in Thrace during the reign of Justinian in 538 down to the death of the emperor Tiberius in 582. Considerable fragments of the work are preserved in the excerpts of Constantine Porphyrogenitus and in Suidas. Although the style is sometimes bombastic, he is considered trustworthy and is one of the most valuable authorities for the historical matters. He was an eye-witness of some of the events he describes. Like Agathias, he wrote epigrams, one of which, on a Persian magus, who became a convert to Christianity and died the death of a martyr, is preserved in the Greek anthology (Anth. Pal. i. 107).

The fragments will be found in C. W. Müller, Proef. hist. graec. iv. 244 (1862), and are topics of not three, Chinese works, written by graeci minores, ii; see also C. Krumhacher, Geschichte der byzantinischen Literatur (1897).

MENANGKABOS, the most civilized of all the true Malays of Sumatra, inhabiting the mountains above Padang. Their district is regarded as the cradle of the Malay race, and thence began, about 1160, those migrations which ended in the true Malay people becoming the dominant race throughout the peninsula and the Malay Archipelago. The Menangkabos are said to be the original conquerors of the island, and the real form of the word is Menang-Karbau ("victory of the buffalo"), in reference to a local legend of a fight between a Sumatan and Javanese buffalo, ending in victory for the former. Though converts to Islam, the ancient confederate village communities and the matriarchal system still exist. The people are divided into clans, the chiefs together forming the district council. Early in the 19th century a religious sect was founded among the Menangkabos, known as "Padrís," from its zealous proselytism, or Orang púiş (white men). From the convert, being dressed in white. The tendency was towards asceticism, the chief tenet being the prohibition of opium, the use of which made a capital offence. The sect brought a large portion of the interior of Sumatra under its rule, but the neighbouring tribes asked the Dutch to protect them, and this led to the Netherlands government acquiring the Menangkabos territory.

MÉNARD, JOACHIM (1820—1889), French magistrate and orientalist, was born at Cherbourg on the 16th of April 1820. He was educated for the law, and became vice-president of the civil tribunal of Rouen in 1878, and a member of the cour d'appel three years later. But he became best known by his studies on the cuneiform inscriptions. Among his works on the subject of Assyriology are: Recueil d'alphabets des écritures cuniformes (1860); Exposé des éléments de la grammaire assyrienne (1868); Le Sylabaire assyrien (2 vols., 1869-1873); Les Langues perdues de la Perse et de l'Assyrie (2 vols., 1885-1886); Les Pierres gravées de la Haute-Asie (2 vols., 1885-1886). He also collaborated with Julius Oppert. He was admitted to the Academy of Inscriptions in 1887, and died in Paris on the 30th of August 1889.

His daughter DELPHINE (5, 1850) received a prize from the Academy for her article "Les communautés zoostastreennes de l'Inde (1898), and was sent in 1900-1901 to British India on a scientific mission, of which she published a report in 1903.

MÉNARD, LOUIS NICOLAS (1822—1901), French man of letters, was born in Paris on the 10th of October 1822. His versatile genius occupied itself in turn with chemistry, poetry, painting and history. In 1843 he published, under the pseudonym of L. de Senneville, a translation of Prométhée délivré. Turning to chemistry, he discovered colloidion in 1846, but its value was not recognized at the time; and its application later to surgery and photography brought him no advantage. Louis Ménard was a socialist, always in advance of the reform movements of his time. After 1848 he was condemned to imprisonment for his Prologue d'une révolution. He escaped to London, returning to Paris only in 1852. Until 1860 he occupied himself with classical studies, the fruits of which are to be seen in his Polèmes (1853), Polythéisme hellénique (1863), and two academic theses, De sacra poesi graecorum et La Morale avant les philosophes (1860). The next ten years Ménard spent chiefly among the Barzibon artists, and exhibited several pictures. He worked at the Hôtel des Invalides, and in the Délibérations de la Société des artistes. In 1887 he became professor at the École des arts décoratifs, and in 1895 professor of universal history at the Hôtel de Ville in Paris. His Réveries d'un philosophe mystique (1876), which contained sonsets, philosophical dialogues and some stories, was followed in 1896 by Poèmes et rêveries d'un philosophe mystique. Ménard died in Paris on the 12th of February 1901.

His works include: Histoire des anciens peuples de l'orient (1882); Histoire des Israélites d'après l'eségèse biblique (1883), and Histoire de l'art (1884-1886). His articles were collected as an Appreciation of Maurice Barrès's Voyage de Sparte.

MENASHA (an Indian word meaning "thorn" or "island"), an city of Winnebago county, Wisconsin, U.S.A., 88 m. of Milwaukee, and 14 m. N. of Oshkosh, attractively situated at the N. extremity of Lake Winnebago at its outlet into the Fox river. Pop. (1890), 4581; (1900), 5589 (1533 foreign-born); (1905, state census), 5606; (1910), 6081. Menasha is served by the Minneapolis, St Paul & Sault Ste Marie, the Chicago, Milwaukee & St Paul, and the Chicago & North-Western railways, and by an inter-urban electric railway system. Several bridges across the Fox River connect Menasha with Neenah, Appleton, and Oshkosh. It really forms the central point of the state, being equally distant from Milwaukee, at the mouth of the river and divided about equally between the cities, is a picturesque and popular summer resort.
Menasseh had good water power and among its manufactures are paper and sulphite pulp, lumber, wooden-ware and cooperation products, woolen and knit goods, leather, boats and bricks. The first white man to visit the site of Menasseh was probably Jean Nicolet, who seems to have come in the winter of 1634–1635 and to have found here villages of Fox and Winnebago Indians. Subsequently there were French and English trading posts here. The city was settled permanently in 1848, and was chartered in 1874.

**Menasseh ben Israel** (c.1604–1657), Jewish leader, was born in Lisbon about 1604, and was brought up in Amsterdam. His family had suffered under the Inquisition, but found an asylum first in La Rochelle and later in Holland. Here Menasseh rose to eminence not only as a rabbi and an author, but also as a printer. He established the first Hebrew press in Holland. One of his earliest works *El Conciliador* won immediate reputation. It was an attempt at reconciliation between apparent discrepancies in various parts of the Old Testament. Among his correspondents were Vossius, Grotius and Huet. In 1638 he decided to settle in Brazil, as he still found it difficult to provide in Amsterdam for his wife and family, but this step was rendered unnecessary by his appointment to direct a college founded by the Pereiras.

In 1644 Menasseh met Antonio de Montesinos, who persuaded him that the North-American Indians were the descendants of the lost ten tribes of Israel. This supposed discovery gave a new impulse to Menasseh's Messianic hopes. But he was convinced that the Messianic age needed as its certain precursor the settlement of Jews in all parts of the known world. Filled with this idea, he turned his attention to England, whence the Jews had been expelled since 1290. He found much Christian support in England. During the Commonwealth the question of the readmission of the Jews was often mooted under the growing desire for religious liberty. Besides this, Messianic and other mystic hopes were current in England. In 1650 appeared an English version of the *Hope of Israel*, a tract which deeply impressed public opinion. Cromwell had been moved to sympathy with the Jewish cause partly by his tolerant leanings, but chiefly because he foresaw the importance for English commerce of the presence of the Jewish merchant princes, some of whom had already found their way to London. At this juncture Jews received full rights in the colony of Surinam, which had been English since 1650. In 1655 Menasseh arrived in London. It was during his absence that the Amsterdam Rabbis excommunicated Spinoza, a catastrophe which would probably have been avoided had Menasseh—Spinoza's teacher—been on the spot. One of his first acts on reaching London was the issue of his *Humble Address* to the Lord Protector, but its effect was.washed away by the issue of Pareto's able but unfair *Short Diversion*. Cromwell summoned the Whitehall Conference in December of the same year. To this conference were summoned some of the most notable statesmen, lawyers and theologians of the day. The chief practical result was the declaration of Judges Glynne and Steele that "there was no law which forbade the Jews' return to England." Though, therefore, nothing was done to regularize the position of the Jews, the door was opened to their gradual return. Hence John Evelyn was able to enter in his *Diary* under the date Dec. 14, 1655, "Now were the Jews admitted." But the attack on the Jews by Pyrane and others could not go unanswered. Menasseh replied in the finest of his works, *Vindiciae judaorum* (1656). "The best tribute to its value is afforded by the fact that it has since been frequently reprinted in all parts of Europe when the calumny it denounced have been revivified" (L. Wolf). Among those who used in this way Menasseh's *Vindiciae* was Moses Mendelssohn (q.v.). Soon after Menasseh left London Cromwell granted him a pension, but he died before he could enjoy it. Death overtook him at Middelburg, as he was conveying the body of his son Samuel home for burial.

Menasseh ben Israel was the author of many works, but his English tracts remain the only ones of importance. His *De termino vitae* was translated into English by Pococke, and his *Conciliator* by G. H. Lindo. Among his other works were a ritual compendium *Tesoros dos diasim*, and a treatise in Hebrew on immortality (*Nishkah hayyim*). He was a friend of Rembrandt, who painted his portrait and engraved four etchings to illustrate his *Piedra gloriosa*. These are preserved in the British Museum.

**Menius**, the latinized form of Mang-tsze, "Mr. Mang," or "Mang the philosopher," a Chinese moral teacher whose name stands second only to that of Confucius. His statue or spirit-tablet (as the case may be) has occupied, in the temples of the sage, since our 11th century, a place among "the four assessors," and since A.D. 1530 his title has been "the philosopher Mang, sage of the second degree."

The Mangs or Mang-suns had been in the time of Confucius one of the three great clans of Lü (all descended from the marquis Hwan, 711–604 B.C.), which he had endeavoured to curb. Their power had subsequently been broken, and the branch to which Mencius belonged had settled in Ts'ū, a small adjacent principality, the name of which remains in T'sū hsien, a district of Yench'au Shan-tung. A magnificent temple to Mencius is the chief attraction of the district city. The large marble statue of Mencius in the courtyard shows much artistic skill, and gives the impression of a man strong in body and mind, thoughtful and fearless. His linear representative lives in the city, and thousands of Mangs are to be found in the neighbourhood.

Mencius, who died in the year 289 B.C., had lived to a great age—some say to his eighty-fourth year, placing his birth in 372 B.C., and others to his ninety-seventh, placing it in 385. All that we are told of his father is that he died in the third year of the child, who was thus left to the care of his mother. Her virtues and dealings with her son were celebrated by a great writer in the 1st century before our era, and for two thousand years she has been the model mother of China.

Mencius is more than forty years old when he comes before us as a public character. He must have spent much time in study, investigating questions as to the fundamental principles of morals and society, and brooding over the condition of the country. The history, the poetry, the institutions and the great men of the past had received his attention. He intimates that he had been in communication with men who had been disciples of Confucius. That sage had become to him the chief of mortal men, the object of his untingering admiration; and in the doctrines which he had impressed upon the hearts of his followers he retained the truth for want of an appreciation of which the bonds of order all round him were being relaxed, and the kingdom hastening to anarchy.

When he first comes forth from Ts'ū, he is accompanied by several eminent disciples. He had probably imitated Confucius in becoming the master of a school, and encouraging the resort to it of inquiring minds that he might resolve their doubts and unfold to them the right methods of government. One of his sayings is that it would be a greater delight to the superior man to get the youth of brightest promise around him and to teach and train them than to enjoy the revenues of the kingdom. His intercourse with his followers was not so intimate as that of Confucius had been with the members of his selected circle; and, while he maintained his dignity among them, he was not able to secure from them the same homage and reverent admiration.

More than a century had elapsed since the death of Confucius, and during that period the feudal kingdom of Chü had been showing more and more of the signs of dissolution, and portentous errors that threatened to upset all social order were widely disseminated. The sentiment of loyalty to the dynasty had disappeared. Several of the mandarins and other feudal princes of earlier times had assumed the title of king. The smaller fiefs had been absorbed by the larger ones, or reduced to helpless dependence on them. Ts'in, after greatly extending its territory,
had broken up into three powerful kingdoms, each about as large as England. Mencius found the nation nominally one, and with the traditions of two thousand years affirming its essential unity, but actually divided into seven monarchies, each seeking to subdue the others under itself. The consequences were constant warfare and chronic misery.

In Confucius's time we meet with recluses who had withdrawn in disgust from the world and its turmoil; but these had now given place to a new class of men, the eunuchs, who lived in great magnificence, and by their power provided with arts of war or schemes of policy which they recommended to the contending chiefs, ever ready to change their allegiance as they were moved by whim or interest. Mencius was once asked about two of them, "Are they not really great men? Let them be angry, and all the princes are afraid. Let them live quietly, and the flames of trouble are everywhere extinguished." He looked on them as little men, and delighted to proclaim his idea of the great man in such language as the following:

"To dwell in love, the wide house of the world, to stand in prosperity, the correct seat of the child, and to walk in hardship, the great path of the world; when he obtains his desire for office, to practise his principles for the good of the people, and when that desire is disappointed, to practise them alone; to be above the power of those that make disciples and above the poverty and mean condition to make swerve from the right, and by power and force to make bend—these characteristics constitute the great man."

Most vivid are the pictures which Mencius gives of the condition of the people in consequence of the wars of the states.

"The royal ordinances were violated; the multitudes were oppressed; the suppression of food and drink flooded away like water." It is not wonderful that, when the foundations of government were thus overthrown, speculations should have arisen that threatened to overthrow what he considered to be the foundations of truth and all social order. "A shrill-tongued barbarian from the south," as Mencius called him, proclaimed the dissolution of ranks, and advocated a return to primitive simplicity. He and his followers maintained that learning was quackery, and statemanship craft and oppression, that prince and peasant should be on the same level, and every man do everything for himself. Another, called Yang-chū, denied the difference between virtue and vice, glory and shame. It was the same with all at death. The conclusion therefore was: "Let us eat and drink; let us gratify the ears and eyes, get servants and maidsens, beauty, music, wine; when the day is insufficient, carry it on through the night. Each one for himself." Against a third heresiarch, of a very different stamp, Mencius felt no less indignation. This was Mo Ti, who found the source of all the evils of the time and of all time in the want of mutual love. He taught, therefore, that men should love others as themselves; princes, the states of other princes as much as their own; children, the parents of others as much as their own. Mo, in his gropings, had got hold of a noble principle, but he did not apprehend it distinctly nor set it forth with discrimination. To our philosopher the doctrine appeared contrary to the Confucian orthodox about the five relations of society; and he attacked it without mercy and with an equal confusion of thought. "Yang's principle," he said, "is 'each one for himself,' which does not acknowledge the claims of the sovereign. Mo's is 'to love all equally,' which does not acknowledge the peculiar affection due to a father. But to acknowledge neither king nor father is to be in the state of a beast. The way of benevolence and righteousness is stopped up."

On this ocean of lawlessness, wickedness, heresies and misery Mencius looked out from the quiet of his school, and his spirit was stirred to attempt the rescue of the people from mistake and error. "If Heaven," he said, "wishes that the kingdom should enjoy tranquillity and good order, who is there besides me to bring it about?" He formed his plan, and proceeded to put it in execution. He would go about among the different kings till he should find one among them who would follow his counsels and commit to him the entire administration of his government. That obtained, he did not doubt that in a few years there would be a kingdom so strong and so good that all rulers would acknowledge its superiority, and the people hasten from all quarters to crown its sovereign as monarch of the whole of China. This plan was much the same as that of Confucius had been; but, with the bolder character that belonged to him, Mencius took in one respect a position from which "the master" would have shrank. The former was always loyal to Ch'âu, and thought he could save the country by a restoration; the latter saw the day of Ch'âu was past, and the time was come for a revolution. Mencius's view was the more correct, but he was not wiser than the sage in forecasting for the future. They could think only of a reformed dynasty or of a changed dynasty, ruling according to the model principles of a feudal constitution, which they described in glowing language. They desired a repetition of the golden age in the remote past; but soon after Mencius disappeared from the stage of life there came the sovereign of Ch'in, and solved the question with fire and sword, introducing the more to the military genius of their founders than to the wisdom and organizing ability of the learned men, the statesmen, who were their bosom friends and trusted counsellors. Why should not he become to one of the princes of his day what I Yün had been to Thang, and Thài-kung Wang to King Wăn, and the duke of Ch'âu to Wô and Ch'âng? But, though Mencius might be the equal of any of those worthies, he knew of no prince like Thang and the others, of noble aim and soul, who would adopt his lessons. In his eagerness he overlooked this condition of success for his enterprise. He might meet with such a ruler as looked for a coadjutor, regarded him as a bad one, and make him the coadju tor that he required. On the strength of these paraventures, and attended by several of his disciples, Mencius went for more than twenty years from one court to another, always baffled, and always ready to try again. He was received with great respect by kings and princes. He would not enter into the service of any of them, but he occasionally accepted honorary offices of distinction; and he did not scruple to receive large gifts which enabled him to live and move about as a man of wealth. In delivering his message he was as fearless and outspoken as John Knox. He lectured great men, and ridiculed the vain fashions of the courtiers and court-princes. He unfolded the plan of his scheme to the kings, and pointed out the path to universal sway; but it was all in vain. He could not stir any one to honourable action. He confronted heresy with strong arguments and exposed it with withering sarcasm; but he could work no deliverance in the earth. The last court at which we find him was that of Lû, probably in 310 B.C. The marquis of that state had given office to Yo-châng, one of Mencius's disciples, and he hoped that this might be the means of a favourable hearing for himself. So it had nearly happened; on the suggestion of Yo-châng the marquis had ordered his carriage to be yoked, and was about to step into it and proceed to bring Mencius to his palace, when an unworthy
Mencius

favourite stepped in and diverted him from his purpose. The disciple told his master what had occurred, reproaching the favourite for his ill-timed intervention; Mencius, however, said to him, "A man's advancement or the arresting of it may seem to be effected by others, but is really beyond their power. My not finding in the marquis of Lü's household the minister who would confide in his goodness to prevail in prayer is from Heaven."

Mencius accepted this incident as a final intimation to him of the will of Heaven. He had striven long against adverse circumstances, but now he bowed in submission. He withdrew from courts and the public arena. According to tradition he passed the last twenty years of his life in the society of his disciples, discoursing to them, and giving the finishing touches to the record of his conversations and opinions, which were afterwards edited by them, and constitute his works. Mencius was not so oracular, nor so self-contained, as Confucius; but his teachings have a vivacity and sparkle all their own.

Mencius held with Confucius—and it was a doctrine which had descended to them both from the remotest antiquity—that royal government is an institution of God. An ancient sovereign had said that "Heaven, having produced the people, appointed for them rulers, and appointed for them teachers, who should be assisting in their advancement;" from which it appears that the manifest incompetency of all the rulers of his time to ask how it could be known on what individual the appointment of Heaven had been bestowed, must have been, as a matter of course, ascertained only from his personal character and his conduct of affairs. The people must find out the will of Heaven as to who should be their ruler for themselves. There was another old saying which he seems to have appropriated to himself—"Heaven is all vast and hears as the people hear." He taught accordingly that, while government is from God, the governors are from the people;—σωφρονίς ὑπὸ τούτῳ. No claim then of a divine right, should be allowed to a sovereign if he were not exercising a rule for the good of the people. "The people are the most important part of a nation; the altars to the spirits of the land and grain are the second; the sovereign is the least." Mencius was not afraid to follow this utterance to its consequences. The monarch whose rule is injurious to the people, and who is deaf to remonstrance and counsel, should be dethroned. In such a case "killing is no murder," but when the sovereign is ignoring his own people, and making himself in his original subordinate position as to draw all eyes and hearts to himself. Let him then raise the standard not of rebellion, but of righteousness, and be the agent who shall be the highest dignity. Mencius hoped to find one among the rulers of his day who might be made into such a minister, and he counselled one and another to adopt measures with that object. It was in this counsel he might be in assuming, but he held that the house of Ch'u had forfeited its title to the throne.

A good government according to his ideal must be animated by a spirit of beneficence, and ever pursue a policy of righteousness. Its aims must be, first, to make the people well off, and next, to educate them. No one was fit to occupy the throne who could be happy while any of the people were miserable, who delighted in the sufferings of others, and longed in passion to see the multitudes, which did not in a measure share with him. Game laws received his emphatic condemnation. Taxes should be light, and all the regulations for agriculture and commerce of a character which promote and encourage them. The rulers which he supposed to be fit for government had reference to the existing condition of his country, but they are susceptible of wide application. They carry in them schemes of drainage and irrigation for land, and of free trade for commerce. But it must be he contented, and a sufficient and certain livelihood be secured for all the people. Without this their rights, their property, and their persons cannot proceed to every form of wild licentiousness. They would break the law, and it was necessary to punish them—punish those whom his neglect of his own duties had plunged into poverty, of which crime was the consequence. He does not, however, suppose the people to be made well off, Mencius taught that education should be provided for them all. He gave the marquis of Ch'u a programme of four kinds of educational institutions, which he wished him to establish in his state—in the villages and the towns, for the poor as well as the rich, so that none might be ignorant of his duties in the various relations of society. But he would not have the ruler say, "I should lose the confidence of the people, and be incapable of doing anything to prevent the realization of such a government. Any ruler might become, if he would, "the minister of Heaven," who was his ideal, and "the exemplary man," but he never allowed the idea of forcefulness to be put into his head.

"The great man is he who does not lose his child-heart."
The sense of shame is to a man of great importance. When one is ashamed of having been without shame, he will afterwards not have occasion for shame.

"Benevolence is the distinguishing characteristic of man. As embodied in his conduct, it may be called the path of duty."

"There is an ordinance for everything; and a man should receive submissively what may be correctly ascribed thereto. He who has the correct idea of what Heaven's ordinance is will not stand beneath a tottering wall. Death sustained in the discharge of one's duties may be called, but is described to be the death. Death under handcuffs and fetters cannot be correctly so ascribed."

"When one by force subdues men, they do not submit to him in heart. When he subdues them by virtue, in their hearts' core the mark of the God is sincerely submitted."

Two translations of the works of Mencius are within the reach of European readers: that by Stanislaus Julien, in Latin (Paris, 1824-1829); and that forming the second volume of Legge's Chinese Classics (Hong-Kong, 1862). The latter has been published at London (1875) without the Chinese text. See also E. Faber. The Mind of Mencius, or Political Economy founded on Moral Philosophy (translated from the German by A. B. Hutchinson (London, 1882). (J. L.E.)

MENDE, a town of south-eastern France, capital of the department of Lozère, 59 m. N.N.E. of Millau by rail. Pop. (1906), town 5246; commune 7007. Mende is picturesquely situated on the left bank of the Lot, and at the foot of the Millat cliff, which rises 1000 ft. above the town, and terminates the Causse de Mende. The town is the seat of a bISHOP. Its cathedral St. Peter was founded in the 12th century by Pope Urban V., and above the town, the two towers, respectively 380 and 210 ft. high, were added by Bishop François de la Rovère in the early part of the 16th century. Partly destroyed during the devastation of the town by the Protestants in 1579 and 1580, it was rebuilt in the 17th century, and in 1874 a statue of Urban V. was erected in front of it. A RENAISSANCE tower of the ancient citadel now serves as the belfry of the church of the Penitents, and a 14th-century bridge crosses the Lot. The town is a convenient centre for visitors to the gorges of the Tarn. It is the seat of a prefect and a court of assizes, and has a tribunal of first instance and a chamber of commerce. The chief industry is the manufacture of soaps and shalloons, known as Mende stuffs, exported to Spain, Italy and Germany.

Mende (Mimate) grew up around the hermitage, partly excavated in the side of the Millat cliff, to which St Privat, bishop of Javalors, retreated after the destruction of that town, and where he was subsequently slain by the Vandals, who had pursued him thither, about 408. In the 14th century the new town became the civil, as it had previously been the ecclesiastical, capital of the department of Lozère.

MENDELEEFF, DMITRI IVANOVICH (1834-1907), Russian chemist, the youngest of a family of seventeen, was born at Tobolsk, Siberia, on the 7th of February (n.s.) 1834. After attending the gymnasium of his native place, he went to study natural science at St Petersburg, where he graduated in chemistry in 1856, subsequently becoming privy-councilor. In 1866 he went to Heidelberg, where he started a laboratory of his own, but returning to St Petersburg in 1861, he became professor of chemistry in the technological institute there in 1863, and three years later succeeded to the same chair in the university. In 1890 he resigned the professorship, and in 1893 he was appointed director of the Bureau of Weights and Measures, a post which he occupied till his death.

Mende1eoff's original work covered a wide range, from questions in applied chemistry to the most general problems of chemical and physical theory. His name is best known for his work on the Periodic Law. Various chemists had traced numerical sequences among the atomic weights of some of the elements and noted connexions between them and the properties of the different substances; but it was left to him to give a full expression to the generalization, and to treat it not merely as a system of classifying the elements according to certain observed facts, but as a "law of nature" which could be relied upon to predict new facts and to disclose errors in what were supposed to be old facts. Thus in 1871 he was led by certain gaps in his tables to assert the existence of three new elements so far unknown to the chemist, and to assign them definite properties. These three he called eka boron, eka aluminum, and eka silicon; and his prophecy was completely vindicated within fifteen years by the discovery of gallium in 1875, scandium in 1879, and germanium in 1886. Again, in several cases he ventured to question the correctness of the "accepted atomic weights," on the ground that they did not correspond with the Periodic Law, and here also he was justified by subsequent investigation. In 1902, in an "attempt to a chemical concept of the atom," the other, he put forward the hypothesis that there are in existence two elements of smaller atomic weight than hydrogen, and that the lighter of these is a chemically inert, exceedingly mobile, all-pene- trating and all-pervading gas, which constitutes the ether. Mende1eoff also devoted much study to the nature of such "indefinite" compounds as solutions, which he looked upon as homogeneous liquid systems of unstable dissociating com- pounds of the solvent with the substance dissolved, holding the opinion that they are merely an instance of ordinary definite compounds, and not, as some supposed, to Dalton's laws. In another department of physical chemistry he investigated the expansion of liquids with heat, and devised a formula for its expression similar to Gay-Lussac's law of the uniformity of the expansion of gases, while so far back as 1861 he anticipated T. Andrews's conception of the critical temperature of gases by defining the absolute boiling-point of a substance as the temperature at which cohesion and heat of vaporization become equal to zero and the liquid changes to vapour, irrespective of the pressure and volume. Mende1eoff wrote largely on chemical topics, and his most widely known book probably being The Principles of Chemistry, which was written in 1868-1870, and has gone through many subsequent editions in various languages. For his work on the Periodic Law he was awarded in 1882, at the same time as L. Meyer, the Davy medal of the Royal Society, and in 1905 he received his Copley medal. He died at St Petersburg on the 2nd of February 1907.

MENDELISM. To define what some biologists call Mendelism briefly is not possible. Within recent years there has come to biologists a new idea of the nature of living things, a new conception of their potentialities and of their limitations; and for this we are primarily indebted to the work of Gregor Mendel. Peasant boy, monk, and abbot of Brunn, this remarkable man at one time interested himself in the workings of heredity, and the experiments devised by him and carried out in his cloister garden are to-day the basis of that exact knowledge of the physiological process of heredity which biologists are rapidly extending in various directions. This extension Mendel never saw. Born in 1822 he published the account of his experiments in 1865, but it was not until 1900, eighteen years after his death, that biologists came to appreciate what he had accomplished. That year marked the simultaneous rediscovery of his work by three distinguished botanists: Hugo de Vries, C. Correns and E. Tschermak. Thenceforward Mendel's ideas have steadily gained ground, and, as the already strong body of evidence in their favour grows, they must come to exert upon biological conceptions an influence not less than those associated with the name of Darwin.

Dominant and Recessive.—Mendel chose the common pea (Pisum sativum) as a subject for experiment, and investigated the effects of crossing different varieties. In his method he differed from previous investigators in concentrating his attention on the mode of inheritance of a single pair of alternative characters at a time. Thus on crossing a tall with a dwarf and paying attention to this pair of characters alone, he found that the hybrids (or F1 generation) were all tall and that no intermediates appeared. This led him to term the tall character dominant and the dwarf character recessive. On allowing these hybrids to fertilize themselves in the ordinary
way he obtained a further generation which on the average was composed of three tall to one dwarf. Subsequent experiment showed that the dwarfs always bred true, as did also one out of every three tall; the two remaining tall behaved as the original hybrids in giving three tall to one dwarf. Having regard to the characters, tallness and dwarveness, three and only three kinds of peas exist, viz. dwarfs which breed true, tall which breed true, and tall which give a finite proportion of tall and dwarfs. The relation between these three forms may be briefly summarized in the subjoined scheme, in which pure tall and dwarf are represented by T and D respectively, while [T] denotes the tall which do not breed true. Experiments were also made with several other pairs of characters, and the same mode of inheritance was shown to hold good throughout.

Unit-Characters.—As Mendel clearly perceived, these definite results lead inevitably to a precise conception of the constitution of the reproductive cells, or gametes; and to appreciate fully the change wrought in our point of view necessitates a brief digression into the essential features of the reproductive process. A sexual process (see Sex) is almost universal among animals and plants, and consists essentially of the union of two gametes, of which one is produced by either parent. Every gamete contains small definite bodies known as chromosomes, and the number of these is, with few known exceptions, constant for the gametes of a given species. On the fusion of two gametes the resulting cell or zygote has therefore a double structure, for it contains an equal number of chromosomes brought in by the paternal and by the maternal gamete —in the case of a plant by the pollen grain as well as by the ovule. By a process of repeated division the zygote gives rise to a plant (or an animal) whose cells apparently retain the double structure throughout. Certain of the cells of such a zygote become the germ cells and are set apart, as it were, for the formation of gametes. Histology has shown that when this occurs the cells lose the double structure which they had hitherto possessed, and that as the result of a process known as the reduction division gametes are formed in which the number of chromosomes is one half of that which characterizes the cells of the zygote. It is generally acknowledged that the chromosomes play an important part in the hereditary process, and it is possible that the divisions which they undergo in gametogenesis are connected with the observed inheritance of characters. We shall refer later to the few observations which seem to connect the two sets of phenomena.

Our conception of what occurs when a cross is made between two individuals may be illustrated by the diagram which forms fig. 2. Zygotes are here represented by squares and gametes by circles. The dominant and recessive characters are indicated by small plain and black rectangles. Each zygote must contain two and each gamete but one of these unit-characters. Zygotes such as the original parents which breed true to a given character are said to be homozygous for that character, and from their nature such homozygotes must produce identical gametes. Consequently when a cross is made only one kind of zygote can be formed, viz. that containing both the dominant and recessive unit-characters. When the germ-cells of such a heterozygote split to form gametes, these, as indicated in fig. 2, will be of two sorts containing the dominant and recessive characters respectively, and will be produced in equal numbers. If we are dealing with a hermaphrodite plant such as the pea the ovules will consist of one half bearing only the dominant character and one half bearing only the recessive character; and this will be true also of the pollen grains. Consequently each dominant ovule was an equal chance of being fertilized by a dominant or by a recessive pollen grain, and the dominant ovules must therefore give rise to equal numbers of dominant homozygous and of heterozygous plants. Similarly the recessive ovules must give rise to equal numbers of recessive homozygotes and of heterozygotes. Hence of the total offspring of such a plant one quarter will be pure dominants, one quarter recessives, and one half heterozygotes as indicated in fig. 2. Where one character is completely dominant over the other, heterozygotes will be indistinguishable in appearance from the homozygous dominant, and the F2 generation will be composed of three plants of the dominant form to each recessive. These are the proportions actually found by Mendel in the pea and by many other more recent observers in a number of plants and animals. The experimental facts are in accordance with the conception of unit-characters and their transmission from zygote to gamete in the way outlined above; and the numerical results of breeding experiments are to be regarded as proving that in the formation of gametes from the heterozygote the unit-characters are treated as unbleeding entities separate cleanly, or segregating, from one another. From this it follows that any gamete can carry but one of a pair of unit-characters and must therefore be pure for that character. The principle of the segregation of characters in gametogenesis with its natural corollary, the purity of the gametes, is the essential part of Mendel's discoveries. The quite distinct phenomenon of dominance observed by him in Pisum occurs in many other cases, but, as will appear below, is by no means universal.

Illustrations.—Mendelian inheritance in its simplest form, i.e., for a single pair of characters, has already been shown to occur in many species of animals and plants, and for many very diverse characters. In some cases complete dominance of one of the pair of unit-characters occurs; in others the form of heterozygote is more or less intermediate. Fresh cases are continually being recorded and the following short list can but serve to give some idea of the variety of characters in which Mendelian inheritance has been demonstrated.

A. Dominance nearly or quite complete. (The dominant character is given first.)
- Tall and dwarf habit (pea, sweet pea).
- Long pollen and round pollen (sweet pea).
- Starch and sugar endosperm (maize).
- Beardless and bearded condition (wheat).
- Prickliness and smoothness of fruits (Datura).
- Palm and fern leaf (Prunus).
- Purple and red flowers (sweet pea, stocks, &c.).
- Fertility and sterility of anthers (sweet pea).
- Susceptibility and immunity to rust (wheat).
- Rose comb and single comb (towls).
- Black and white plumage in pheasants.
- Grey and black coat colour (rabbits, mice).
- Bay and chestnut coat colour (horses).
- Polled and horned condition (cattle).
- Short and long "Angora" coat (rabbits).
- Normal and waltzing habit (mice).

Deformed hand with but two phalanges in digits and normal hand (man).
B. Absence of dominance, the heterozygote being more or less intermediate in form.

Black and white splashed plumage (Andalusian fowls). Lax and dense ears (+ and −).

Six rowed and two rowed ears (barley).

**Dominance.**—The meaning of this phenomenon is at present obscure, and we can make no suggestion as to why it should be complete in one case, partial in another, and entirely absent in a third. When found it is as a rule definite and orderly, but there are cases known where irregularity exists. The extra toe characteristic of certain breeds of fowls, such as Dorking, behaves generally as a dominant character, but in certain cases it has been ascertained that a fowl without an extra toe may yet carry the extra toe character. It is possible that in some cases dominance may be conditioned by the presence of other features, and certain crosses in sheep lend colour to the supposition that sex may be such a feature. A cross between the polled Suffolk and the horned Dorset breeds results in horned rams and polled ewes only, though in the F1 generation both sexes appear with and without horns. At present the simplest hypothesis which fits the facts is that horns are dominant in the male and recessive in the female. It is important not to confuse cases of apparent reversal of dominance such as the above with cases in which a given visible character may be the result of two entirely different causes. One white hen may give only colour chicks by a coloured cock, whilst the same cock with another white hen, indistinguishable in appearance from the former, will give only white chickens containing a few dark ticks. There is here no reversal of dominance, but, as has been abundantly proved by experiment, there are two entirely distinct classes of white fowls, of which one is dominant and the other recessive to colour.

**The Presence and Absence Hypothesis.**—Whether the phenomenon of dominance occur or not, the unit-characters exist in pairs, of which the members are seemingly interchangeable. In virtue of this behaviour the unit-characters forming such a pair have been termed allelomorphic to one another, and the question arises as to what is the nature of the relation between two allelomorphs. The fact that such cases of heredity as have been fully worked out can all be formulated in terms of allelomorphic pairs is suggestive, and has led to what may be called the "presence and absence" hypothesis. An allelomorphic pair represents the only two possible states of any given unit-character in its relation to the gamete, viz. its presence or its absence. When the unit-character is present the quality for which it stands is manifested in the zygote: when it is absent some other quality previously concealed is able to appear. When the unit-character for yellowness is present in a pea the seeds are yellow, when it is absent the seeds are green. The green character is underlying in all yellow seeds, but can only appear in the absence of the unit-character for yellowness, and greenness is allelomorphic to yellowness because it is the expression of absence of yellowness.

**Dihybridism.**—The instances hitherto considered are all simple cases in which the individuals crossed differ only in one pair of unit-characters. Mendel himself worked out cases in which the parents differed in more than one allelomorphic pair, and he pointed out that the principles involved were capable of indefinite extension. The inheritance of the various allelomorphic pairs is to be regarded as entirely independent. For example, when two individuals AA and aa are crossed the composition of the F1 generation must be AA + 2Aa + aa.

If we suppose that the two parents differ also in the allelomorphic pair B−b, the composition of the F1 generation for this pair will be BB + 2Bb + bb. Hence of the zygotes which are homozygous for AA one quarter will carry also BB, one quarter bb, and one half Bb. And similarly for the zygotes which carry Aa or aa. The various combinations possible together with the relative frequencies of their occurrence may be gathered from fig. 3. Of the 16 zygotes there are:—

- 9 containing A and B
- 3 containing B but not A
- 3 A but not B
- 1 neither A nor B

In a case of dihybridism the F1 zygote must be heterozygous for the two allelomorphic pairs, i.e. must be of the constitution Aa Bb. It is obvious that such a result may be produced in two ways, either by the union of two gametes, AB and aB, or of two gametes AB and ab. In the former case each parent must be homozygous for one dominant and one recessive character; in the latter case one parent must be homozygous for both the dominant and the other for both recessive characters. The results of a cross involving dihybridism may be complicated in several ways by the reaction upon one another of the unit-characters belonging to the separate allelomorphic pairs, and it will be convenient to consider the various possibilities apart.

1. The simplest case is that in which the two allelomorphic pairs affect entirely distinct characters. In the pea tallness is dominant to dwarfness and yellow seeds are dominant to green. When a yellow tall is crossed with a green dwarf the F1 generation consists entirely of tall yellows. Precisely the same result is obtained by crossing a tall green with a dwarf yellow. In either case all the four characters involved are visible in one or other of the parents. Of every 16 plants produced by the tall yellow F1, 9 are tall yellows, 3 are tall greens, 3 are dwarf yellows, and 1 is a dwarf green. If we denote the tall and dwarf characters by A and a, and the yellow and green seed characters by B and b respectively, then the constitution of the F1 generation can be readily gathered from fig. 4.

2. When the two allelomorphic pairs affect the same structure we may get the phenomenon of novelties appearing in F1 and F2. Certain breeds of fowls have a "rose" and others a "pea" comb (fig. 4). On crossing the two a "walnut" comb results, and the offspring of such walnuts bred together consist of 9 walnuts, 3 roses, 3 peas, and 1 single comb in every 16 birds. This case may be brought into line with the scheme in fig. 3 if we consider the allelomorphic pairs concerned to...
be rose \((A)\) and absence of rose \((a)\), and pea \((B)\) and absence of pea \((b)\). The zygotic constitution of a rose is therefore \(AAbb\), and of a pea \(aaBB\). A zygote containing both rose and pea is a walnut: a zygote containing neither rose nor pea is a single. The peculiar feature of such a case lies in the fact that absence of rose and absence of pea are the same thing, i.e. single; and this is doubtless owing to the fact that the characters rose and pea both affect the same structure, the comb.

3. Cases exist in which the characters due to one allelomorphic pair can only become manifest in the presence of a particular member of the other pair. If in fig. 3 the characters due to \(B-b\) can only manifest themselves in the presence of \(A\), it is obvious that this can happen in twelve cases out of sixteen, but not in the remaining four, which are homozygous for \(aa\). An example of this is to be found in the inheritance of coat colour in rabbits, rats and mice where the allelomorphic pairs concerned are wild grey colour \((B)\) dominant to black \((b)\) and pigmentation \((A)\) dominant to albinism \((a)\). Certain albinos \((aabb)\) crossed with blacks \((AAbb)\) give only greys \((AaBb)\), and when these are bred together they give 9 greys, 3 blacks and 4 albinos. Of the 4 albinos 3 carry the grey character and 1 does not, but in the absence of the pigmentation factor \((A)\) this is not visible. The ratio 9 : 3 : 4 must be regarded as a 9 : 3 : 3 : 1 ratio, in which the last two terms are visibly indistinguishable owing to the impossibility of telling by the eye whether an albinos carries the character for grey or not.

4. The appearance of a zygotic character may depend upon the coexistence in the zygote of two unit-characters belonging to different allelomorphic pairs. If in the scheme shown in fig. 3 the manifestation of a given character depends upon the simultaneous presence of \(A\) and \(B\), it is obvious that 9 of the 16 zygotes will present this character, whilst the remaining 7 will be without it. This is shown graphically in fig. 5, where the 9 squares have been shaded and the 7 left plain. The sweet pea offers an example of this phenomenon. White sweet peas breed true to whiteness, but when certain strains of whites are crossed the offspring are all coloured. In the next generation \((F_1)\) these \(F_1\) plants give rise to 9 coloured and 7 whites in every 16 plants. Colour here is a compound character whose manifestation depends upon the co-existence of two factors in the zygote, and each of the original parents was homozygous for one of the two factors necessary to the production of colour. The ratio 9 : 7 is in reality a 9 : 3 : 3 : 1 ratio in which, owing to special conditions, the zygotes represented by the last three terms are indistinguishable from one another by the eye.

The phenomena of dihybridism, as illustrated by the four examples given above, have been worked out in many other cases for plants and animals. Emphasis must be laid upon the fact that, although the unit-characters belonging to two pairs may react upon one another in the zygote and affect its character, their inheritance is yet entirely independent. Neither grey nor black can appear in the rabbit-unless the pigmentation factor is also present; nevertheless, gametic segregation of this pair of characters takes place in the normal way among albino rabbits, though its effects are never visible until a suitable cross is made. In cases of trihybridism the Mendelian ratio for the forms appearing in \(F_2\) is 27 : 9 : 9 : 9 : 3 : 3 : 3 : 1, i.e. 27 showing dominance of three characters, three groups of 9 each showing dominance of two characters, three groups of 3 each showing dominance of one character, and a single individual out of 64 which is homozygous for all three recessive characters. It is obvious that the system can be indefinitely extended to embrace any number of allelomorphic pairs.

**Reversion.**—Facts such as those just dealt with in connexion with certain cases of dihybridism throw an entirely new light upon the phenomenon known as reversion on crossing. This is now seen to consist in the meeting of factors which had in some way or other become separated in phlogeny. The albino rabbit when crossed with the black "reverts" to the wild grey colour, because each parent supplies one of the two factors upon which the manifestation of the wild colour depends. So also the wild purple sweet pea may come as a reversion on crossing two whites. In such cases the reversion appears in the \(F_1\) generation, because the two factors upon which it depends are the dominants of their respective allelomorphic pairs. Where the reversion depends upon the simultaneous absence of two characters it cannot appear until the \(F_2\) generation. When fowls with rose and pea combs are crossed the reversionary single comb characteristic of the wild Gallus bankivus first appears in the \(F_2\) generation.

**Genetic Coupling.**—In certain cases the distribution of characters in heredity is complicated by the fact that particular unit-characters tend to become associated or coupled together during gametogenesis. In no case have we yet a complete explanation of the phenomenon, but in view of the important bearing which these facts must eventually have on our ideas of the gametogenic process an illustration may be given. The case in which two white sweet peas gave a coloured on crossing has already been described, and it was seen that the production of colour was dependent upon the meeting of two factors, of which one was brought in by each parent. If the allelomorphic pairs be denoted by \(C-c\) and \(R-r\), then the zygotic constitution of the two parents must have been \(CCrr\) and \(ccRR\) respectively. The \(F_1\) plant may be either purple or red, two characters which form an allelomorphic pair in which the former is dominant, and which may be denoted by the letters \(B-b\). If \(B\) is brought in by one parent only the \(F_1\) plant will be heterozygous for all three allelomorphic pairs, and therefore of the constitution \(CcRr\). In the \(F_2\) generation the ratio of coloured to white must be 9 : 7, and of purple to red 3 : 1; and experiment has shown that this generation is composed on the average of 27 purples, 9 reds and 28 whites out of every 64 plants. The exact composition of such a family may be gathered from the accompanying table (fig. 6). So far the case is perfectly smooth, and it is only on the introduction of another character that the phenomenon of partial coupling is witnessed. Two kinds of pollen grain occur in the sweet pea. In some plants they are oblong in shape, whilst in others they are round, the latter condition being recessive to the former. If the original white parents were homozygous for long and round respectively the \(F_1\) purple must be heterozygous, and in the \(F_2\) generation, as experiment has shown, the ratio of longs to rounds for the whole family is 3 : 1. But among the purples there are about twelve longs to each round, the excess of longs here being balanced by the reds, where the proportion

---

**FIG. 6.**

(Description of the figure would be here, but not included in the text.)
is long to about 3.5 rounds. There is partial coupling of long pollen with the purple colour and a complementary coupling of the red colour with round pollen. This result would be brought about if it were supposed that seven out of every eight purple gametes produced by the F1 plant carried the long pollen character, and that seven out of every eight red gametes carried the round pollen character. The facts observed fit in with the supposition that the gametes are produced in series of sixteen, but how such result could be brought about is a question which for the present must remain open.

_Spurious Allelomorphism._—Instances of association between characters are known in which the connection is between the dominant member of one pair and the recessive of another. In many sweet peas the standard folds over towards the wings, and the flower is said to be hooded. This "hooding" behaves as a recessive towards the erect standard. Red sap colour is also recessive to purple. In families where purples and reds as well as erect and hooded standards occur it has been found, as might be expected, that erect standards are to hooded ones, and that purples are to reds as 3:1. Were the case one of simple dihybridism the F2 generation should be composed of 9 erect purples, 3 hooded purples, 3 erect reds and 1 hooded red in every 16. Actually it is composed of 8 erect purples, 4 hooded purples and 4 erect reds. The hood will not associate with the red, but occurs only on the purples. Cases like this are best interpreted on the assumption that during gametogenesis there is some form of repulsion between the members of the different pairs—in the present instance between the sex and the variety—that for the erect standard—so that all the gametes which contain the purple factor are free from the factor for the erect standard. To the process involved in this assumption the term _spurious allelomorphism_ has been applied.

_Sex._—On the existing evidence it is probable that the inheritance of sex runs upon the same determinate lines as that of other characters. Indeed, there occurs in the sweet pea what may be regarded as an instance of sex inheritance of the simplest kind. Most sweet peas are hermaphrodite, but some are found in which the anthers are sterile and the plants function only as females. This latter condition is recessive to the hermaphrodite one and segregates from it in the ordinary way. Most cases of sex inheritance, however, are complicated, and it is further possible that the phenomena may be of a different order in plants and animals. Instructive in this connexion are certain cases in which one of the characters of an allelomorphing pair may be coupled with a particular sex. The pale _lactucolor_ variety of the common mustard ( _Brassica grossulariata_ ) is recessive to the normal, and in families produced by hermaphroditic parents in which all the offspring are pale, the sex is always that of the normal. Though the sexes occur in approximately equal numbers, all the _lactucolor_ in such families are females; and the association of sex with a character exhibiting normal segregation is strongly suggestive of a similar process obtaining for sex also. Castle has worked out similar cases in other Lepidoptera and has put forward an hypothesis of sex inheritance in the basis of the Mendelian segregation of sex determinants. An ovum or spermatozoon can carry either the male or the female character, but it is essential to Castle's hypothesis that a male spermatozoon should fertilize only a female ovum and vice versa, and consequently on his view all zygotes are heterozygous in respect of sex. Whether any such gametic selection as that postulated by Castle occurs here or elsewhere must for the present remain unanswered. Little evidence exists for it at present, but the possibility of its occurrence should not be ignored.

More recently evidence has been brought forward by Bateson and others (3) which supports the view that the inheritance of sex is on Mendelian lines. The analysis of cases where there is a closer association between a Mendelian character and a particular sex has suggested that femaleness is here dominant to maleness, and that the latter sex is homozygous while the former is heterozygous.

_Chromosomes and Unit-Characters._—Breeding experiments have established the conception of definite unit-characters existing in the cells of an organism: in the cell histology has demonstrated the existence of small definite bodies—the chromosomes. During gametogenesis there takes place what many histologists regard as a differentiating division of the chromosomes: at the same period occurs the segregation of the unit-character. Is there a relation of identity between the unit-character and the visible chromosome, and if so what is this relation? The researches of E. B. Wilson and others have shown that in certain Hemiptera the character of sex is definitely associated with a particular chromosome. The males of _Pro- tentor_ possess thirteen chromosomes, and the qualitative division on gametogenesis results in the female production of equal numbers of spermatooza having six and seven chromosomes. The somatic number of chromosomes in the female is fourteen, and consequently all the mature ova have seven chromosomes. When a spermatoozon with seven chromosomes meets an ovum the resulting zygote has fourteen chromosomes and is a female; when a spermatoozon with six chromosomes meets an ovum the resulting zygote has thirteen chromosomes and is a male. In no other instance has any such definite relation been established, and in many cases at any rate it is certain that it could not be a simple one. The gametic number of chromosomes in wheat is eight, whereas the work of R. H. Biffen and others has shown that the number of unit-characters in this species is considerably greater. If there therefore exists a definite relation between the two it must be supposed that a chromosome can carry more than one single unit-character. It is not impossible that future work on gametic coupling may throw light upon the matter.

_Heredity and Variation._—It has long been realized that the problems of heredity and variation are closely interwoven, and that whatever throws light upon the one may be expected to illuminate the other. Recent as has been the rise of the study of genetics, it has, nevertheless, profoundly influenced our views as to the nature of these phenomena. Heredity we now perceive to be a method of analysis, and the facts of heredity constitute a series of reactions which enable us to argue towards the constitution of living matter. And essential to any method of analysis is the recognition of the indivisibility of the individual. Constitutional differences of a radical nature may be concealed beneath apparent identity of external form. Purple sweet peas from the same pod, indistinguishable in appearance and of identical ancestry, may yet be fundamentally different in their constitution. From one may come purples, reds and whites, from another only purples and reds, from another purples and whites alone, whilst a fourth will produce none but purples. We must learn to take into account of the radical differences in constitution which may underlie external similarity must necessarily be doomed to failure. Conversely, we realize to-day that individuals identical in constitution may yet have an entirely different ancestral history. From the cross between two fowls with rose and pea combs, each of irreproachable pedigree for generations, come single combs in the second generation, and these singles are precisely similar in their behaviour to singles bred from strains of unblemished ancestry. In the ancestry of the one is to be found no single over a long series of years, in the ancestry of the other nothing but singles occurred. The creature of given constitution may often be built up in many ways, but once formed it will behave like others of the same constitution. The one sure test of the constitution of a living thing lies in the nature of the gametes which it carries, and it is the analysis of these gametes which forms the province of heredity.

The clear cut and definite mode of transmission of characters first revealed by Mendel leads inevitably to the conception of a definite and clear-cut basis for these characters. Upon this structural basis, the unit-character, are grounded certain of the phenomena now termed variation. Varieties exist as such in virtue of differing in one or more unit-characters from
what is conventionally termed the type; and since these unit-characters must from their behaviour in transmission be regarded as discontinuous in their nature, it follows that the variation must be discontinuous also. A present tendency of thought is to regard the discontinuous variation or mutation as the material upon which natural selection works, and to consider that the process of evolution takes place by definite steps. Darwin’s opposition to this view rested partly upon the idea that the discontinuous variation—Mendel’s units—would be so rare that it might be unknown, and that the swamping effects of intercrossing with the normal form. Mendel’s work has shown that this objection is not valid, and the precision of the mode of inheritance of the discontinuous variation leads us to inquire if the small or fluctuating variation can be shown to have an equally definite physiological basis before it is admitted to play any part in the production of species. Until this has been shown it is possible to consider the discontinuous variation as the unit in all evolutionary change, and to regard the fluctuating variation as the uninherits effect of environmental accident.

The Human Aspect.—In conclusion we may briefly allude to certain practical aspects of Mendel’s discovery. Increased knowledge of heredity means increased power of control over the living thing, and as we come to understand more and more the architecture of the plant or animal we realize what can and cannot be done towards modification or improvement. The experiments of Biffen on the cereals have demonstrated what may be done with our present knowledge in establishing new, stable and more profitable varieties of wheat and barley, and it is impossible to doubt that as this knowledge becomes more widely disseminated it will lead to considerable improvements in the methods of breeding animals and plants.

It is not, however, in the economic field, important as this may be, that Mendel’s discovery is likely to have most meaning for us: rather it is in the new light in which man will come to view himself and his fellow creatures. To-day we are almost entirely ignorant of the unit-characters that go to make the difference between one man and another. A few diseases, such as alacetonuria and congenital catacar, a digital malformation, and probably eye colour, are as yet the only cases in which inheritance has been shown to run upon Mendelian lines. The complexity of the subject must render investigation at once difficult and slow; but the little that we know to-day offers the hope of a great extension in our knowledge at no very distant time. If this hope is borne out, if it is shown that the qualities of man, his body and his intellect, his immunities and his diseases, even his very virtues and vices, are dependent upon the ascertainable presence or absence of definite unit-characters whose mode of transmission follows fixed laws, and if also man decides that his life shall be ordered in the light of this knowledge, it is obvious that the social system will have to undergo considerable changes.

BIBLIOGRAPHY.—In the following short list are given the titles of papers dealing with experiments directly referred to in this article. References to most of the literature will be found in (11), and a complete list to the date of publication in (3).

of the same name, Mendelssohn's work possessed some of the charm of its Greek exemplar. What most impressed the German world was its beauty and lucidity of style—features to which Mendelssohn still owes his popularity as a writer. The Phidias was an immediate success, and besides being often reprinted in German was speedily translated into nearly all the European languages, including English. The author was hailed as the "German Plato," or the "German Socrates"; royal and other aristocratic friends showered attentions on him, and it is no exaggeration to assert with Kayserling that "no stranger who came to Berlin failed to pay his personal respects to the German Socrates."

So far, Mendelssohn had devoted his talents to philosophy and criticism; now, however, an incident turned the current of his life in the direction of the cause of Judaism. Lavater was one of the most ardent admirers of Mendelssohn. He described him as "a companionable, brilliant soul, with piercing eyes, the body of an Aesop—a man of keen insight, exquisite taste and wide erudition ... frank and open-hearted." Lavater was fired with the ambition to convert his friend to Christianity. In the preface to a German translation of Bonnet's book on Christian Evidences, Lavater publicly challenged Mendelssohn to refute Bonnet or if he could not then to "do what wisdom, the love of truth and honesty must bid him, what a Socrates would have done if he had read the book and found it unanswerable." This appeal produced a painful impression. Bonnet resented Lavater's action, but Mendelssohn was bound to reply, though opposed to religious controversy. As he put it: "Suppose there were living among my contemporaries a Confucius or a Solon, I could, according to the principles of faith, love and admire the great man without falling into the ridiculous idea that I must convert a Confucius or a Solon."

Here we see the germs of Mendelssohn's Pragmatism, to use the new current term. He shared this with Lessing; in this case, at all events, it is probable that the latter was indebted to Mendelssohn. But before discussing this matter, we must follow out the consequences of Lavater's intrusion into Mendelssohn's affairs. The latter resolved to devote the rest of his life to the emancipation of the Jews. Among them secular studies had been neglected, and Mendelssohn saw that he could best remedy the defect by attacking it on the religious side. A great chapter in the history of culture is filled by the influence of translations of the Bible. Mendelssohn added a new section to this chapter by his German translation of the Pentateuch and other parts of the Bible. This work (1783) constituted Mendelssohn the Luther of the German Jews. From it, the Jews learned the German language; from it they imbibed culture; with it there was born a new desire for German nationality; as a result of its popularity was inaugurated a new system of Jewish education. Some of the conservatives among the Jews opposed these innovations, but the current of progress was too strong for them. Mendelssohn was the first great champion of Jewish emancipation in the 18th century. He it was who induced C. W. Dohn to publish in 1781 his epoch-making work, On the Civil Amelioration of the Condition of the Jews, a memorial which played a great part in the triumph of toleration. Mendelssohn himself published a German translation of the Vindiciae judaorum by Menasseh ben Israel. The excitement caused by these proceedings led Mendelssohn to publish his most important contribution to the problems connected with the position of Judaism in relation to the general life of nations.

This work was the Jerusalem (1783; Eng. trans. 1838 and 1852). It is a forcible plea for freedom of conscience. Kant described it as "an irrefutable book." Its basic idea is that the state had no right to interfere with the religion of its citizens. As Kant put it, this was "the proclamation of a great reform, which, however, will be slow in manifestation and in progress, and which will affect not only your people but others as well." Mendelssohn asserted the pragmatic principle of the possible plurality of truths: that just as various nations need different constitutions—to one a monarchy, to another a republic, may be the most congenial to the national genius—so individuals may need different religions. The test of religion is its effect on conduct. This is the moral of Lessing's Nathan the Wise, the hero of which is undoubtedly Mendelssohn. The parable of the three rings is the epitome of the pragmatic position. One direct result of this pragmatism was unexpected. Having been taught that there is no absolutely true religion, Mendelssohn's own descendants—a brilliant circle, of which the musician Felix was the most noted—left the Synagogue for the Church. But despite this, Mendelssohn's thought was found to be a strengthening bond in Judaism. For he maintained that Judaism was less a "divine need, than a revealed life." In the first part of the 19th century, the criticism of Jewish dogmas and traditions was associated with a firm adherence to the older Jewish mode of living. Reason was applied to beliefs, the historic consciousness to life. Modern reform in Judaism is parting to some extent from this conception, but it still holds good even among the liberals.

Of Mendelssohn's remaining years it must suffice to say that he progressed in fame numbering among his friends more and more of the greatest men of the age. His Mor genüber, which appeared in 1785, and he died as the result of a cold contracted while carrying to his publishers in 1786 the manuscript of a vindication of his friend Lessing, who had predeceased him by five years.

Mendelssohn had six children. His sons were: Joseph (founder of the Mendelssohn banking house, and a friend and benefactor of Alexander Humboldt), whose son Alexander (d. 1871) was the last Jewish descendant of the philosopher; Abraham (who married Leah Bartholdy and was the father of Fanny Hensch and Felix Mendelssohn Bartholdy); and Nathan (a mathematical engineer of considerable repute). His daughters were Dorothea, Recha and Henriette, all brilliantly gifted women.

MENDELSSOHN-BARTHOLDY, JAKOB LUDWIG FELIX (1809-1847), German composer, grandson of Moses Mendelssohn (q.v.), was born in Hamburg on the 3rd of February 1809. In consequence of the troubles caused by the French occupation of Hamburg, Abraham Mendelssohn, his father, migrated in 1811 to Berlin, where his grandmother Fromet, then in the twenty-fifth year of her widowhood, received the whole family into her house, No. 7 Neue Promenade. Here Felix and his sister Fanny received their first instruction in music from their mother, under whose care they progressed so rapidly that their exceptional talent soon became apparent. Their next teacher was Madame Bigot, who, during the temporary residence of the family in Paris in 1816, gave them valuable instruction. On their return to Berlin they took lessons in thoroughbass and composition from Zelter, in pianoforte-playing from Ludwig Berger, and in violin-playing from Henning—the care of their general education being entrusted to the father of the novelist Paul Heyse. Felix first played in public on the 24th of October 1818, taking the pianoforte part in a trio by Wooll. On the 11th of April 1819 he entered the Berlin Singakademie as an alto, and in the following year began to compose with extraordinary rapidity. His earliest dated work is a cantata, In rührend feierlichen Tönen, completed on the 13th of January 1820. During that year alone he produced nearly sixty movements, including songs, pianoforte sonatas, a trio for pianoforte, violin and violoncello, a sonata for violin and pianoforte, pieces for the organ, and even a little dramatic piece in three scenes. In 1821 he wrote five symphonies for stringed instruments, each in three movements; motets for four voices, an
MENDELSSOHN-BARTHOLDY

opera, in one act, called Soldatenliebschaft; another, called Die beiden Pädagogen; part of a third, called Die wandernden Comödianten; and an immense quantity of other music of different kinds, all showing the precocity of his genius. The original autograph copies of these early productions are preserved in the Berlin Library, where they form part of a collection which fills forty-four large volumes, all written with infinite neatness, and for the most part carefully dated—a sufficient proof that the methodical habits which distinguished his later life were formed in early childhood.

In 1821 Mendelssohn paid his first visit to Goethe, with whom he spent sixteen days at Weimar, in company with Zelter. From this year also dates his first acquaintance with Weber, who was then in Berlin superintending the production of Der Freischütz; and from the summer of 1822 his introduction, at Cassel, to another of the greatest of his contemporaries, Ludwig Spohr. During this year his pen was even more prolific, producing, among other works, an opera, in three acts, entitled Die beiden Neffen, oder der Onkel aus Boston, and a pianoforte concerto, which he played in public at a concert given by Frau Anna Mildé.

It had long been a custom with the Mendelssohn family to give musical performances on alternate Sunday mornings in their dining-room, with a small orchestra, which Felix always conducted, even when he was not tall enough to be seen without standing upon a stool. For each of these occasions he produced some new work—playing the pianoforte pieces himself, or entrusting them to Fanny, while his sister Rebecca sang, and his brother Paul played the violoncello. In this way Die beiden Neffen was first privately performed, on the fifteenth anniversary of his birthday, the 3rd of February 1824. Between the 3rd and the 31st of March in this year he composed his fine symphony in C minor, now known as Op. 10, and soon afterwards the quartet in B minor, Op. 3, and the (posthumous) pianoforte sextet, Op. 110. In this year also began his lifelong friendship with Moscheles, who, when asked to receive him as a pupil, said, "If he wishes to take a hint from me, as to anything new to him, he can easily do so; but he stands in no need of lessons."

In 1825 Abraham Mendelssohn took Felix to Paris, where among other musicians then resident in the French capital he met the two most popular dramatic composers of the age, Rossini and Meyerbeer, and lived on terms of intimacy with Hummel, Kalkbrenner, Rode, Baillot, Herz, and many other artists of European celebrity. On this occasion also he made his first acquaintance with Cherubini, who, though he rarely praised any one, expressed a high opinion of his talent, and recommended him to write a Kyrie, for five voices, with full orchestral accompaniments, which he himself described as "exceeding in thickness" anything he had attempted. From letters written at this period we learn that Felix’s estimate of the French school of music was far from flattering; but he formed some friendships in Paris, which were renewed on later occasions. He returned to Berlin with his father in May 1825, taking leave of his Parisian friends on the 19th of the month, and interrupting his journey at Weimar for the purpose of paying a second visit to Goethe, to whom he dedicated his quartet in B minor. On reaching home he must have worked with greater zeal than ever; for on the 10th of August in this same year he completed an opera, in two acts, called Die Hochzeit des Camacho, a work of considerable importance.

No ordinary boy could have escaped uninjured from the snares attendant upon such a life as that which Mendelssohn now lived. Notwithstanding his overwhelming passion for music, his general education had been so well cared for that he was able to hold his own, in the society of his seniors, with the grace of an accomplished man of the world. He was already recognized as a leading spirit by the artists with whom he associated, and these artists were men of acknowledged talent and position. The temptations to egoism by which he was surrounded would have rendered most clever students intolerable. But the natural amiability of his disposition, and the healthy influence of his happy home-life, counteracted all tendencies towards self-assertion.

Soon after his return from Paris, Abraham Mendelssohn removed from his mother’s residence to No. 3 Leipziger Strasse, a roomy, old-fashioned house, containing an excellent music-room, and in the grounds adjoining a "Gartenhaus" capable of accommodating several hundred persons at the Sunday performances.1 In the autumn of the following year this "garden-house" witnessed a memorable private performance of the work by means of which the greatness of Mendelssohn’s genius was first revealed to the outer world—the overture to Shakespeare’s Midsummer Night’s Dream. The finished score of this famous composition is dated "Berlin, August 6, 1824"—its author was only seventeen and a half years old. Yet in no later work does he exhibit more originality of thought, more freshness of conception, or more perfect mastery over the details of technical construction, than in this delightful inspiration.

The overture was first publicly performed at Stettin, in February 1826, by the orchestra of the young composer, who was at once accepted as the leader of a new and highly characteristic manifestation of the spirit of progress. Henceforth we must speak of him, not as a student, but as a mature and experienced artist.

Meanwhile Camacho’s Wedding had been submitted to Spontini, with a view to its production at the opera. The libretto, founded upon an episode in the history of Don Quixote, was written by Klingemann, and Mendelssohn threw himself into the spirit of the romance with a keen perception of its peculiar humour. The overture to this work of his was first heard at the opera’s return from Stettin, produced on the 29th of April 1827, and received with great apparent enthusiasm; but a cabal was formed against it, and it never reached a second performance. The critics abused it mercilessly; yet it exhibits merits of a very high order. The solemn passage for the trombones, which heralds the first appearance of the knight of La Mancha, is conceived in a spirit of reverent appreciation of the idea of Cervantes, which would have done honour to a composer of lifelong experience.

Mendelssohn was annoyed at this injustice, and some time elapsed before his mind recovered its usual bright tone; but he continued to work diligently. Among other serious undertakings, he formed a choir for the study of the choral works of Sebastian Bach, then unknown to the public; and, in spite of Zelter’s opposition, he succeeded, in 1829, in inducing the Berlin Singakademie to give a public performance of the Passion according to St Matthew, under his direction, with a chorus of between three and four hundred voices. The scheme succeeded beyond his warmest hopes, and proved the means of restoring to the world great compositions which had never been heard since the death of Bach. But the obstructive party were offended; and at this period Mendelssohn was far from popular among the musicians of Berlin.

In April 1829 Mendelssohn paid his first visit to London. His reception was enthusiastic. He made his first appearance before an English audience at one of the Philharmonic Society’s concerts—then held in the Argyll Rooms—on the 25th of May, conducting his symphony in C minor from the pianoforte, to which he was led by John Cramer. On the 30th he played Weber’s Concertstück, from memory, a proceeding at that time extremely unusual. At a concert given by Drouet, on the 24th of June, he played Beethoven’s pianoforte concerto in E flat, which had never before been heard in the country; and the overture to A Midsummer Night’s Dream was also, for the first time, presented to a London audience. On returning home from the concert, Attwood, then organist of St Paul’s Cathedral, left the score of the overture in a hackney coach, whereupon Mendelssohn wrote out another, from memory, without an error. At another concert he played, with Moscheles, his still unpublished concerto in E, for two pianoforte and

1 After Mendelssohn’s death this house was sold to the Prussian government; and the "Herrenhaus" now stands on the site of the garden-house.
orchestra. After the close of the London season he started with Klingemann on a tour through Scotland, where he was inspired with the first idea of his overture to The Isles of Fingal, returning to Berlin at the end of November. Except for an accident to his knee, which lamed him for some time, his visit was highly successful and laid the foundation of many friendships and connections in March and April. The visit to England formed the first division of a great scheme of travel which his father wished him to extend to all the most important art centres in Europe. After refusing the offer of a professorship at Berlin, he started again, in May 1830, for Italy, pausing on his way at Weimar, where he spent a fortnight with Goethe, and reaching Rome, after many pleasant interruptions, on the 1st of November. No excitement prevented him from devoting a certain time every day to composition; but he lost no opportunity of studying either the countless treasures which form the chief glory of the great city or the manners and customs of modern Romans. He attended, with insatiable curiosity, the services in the Sistine Chapel; and his keen power of observation enabled him to throw much interesting light upon them. His letters on this subject, however, lose much of their value through his incapacity to comprehend the close relation existing between the music of Palestrina and his contemporaries and the ritual of the Roman Church. His Lutheran education kept him in ignorance even of the first principles of ordinary chanting; and it is amusing to find him describing as enormities peculiar to the papal church customs familiar to every village singer in England, and as closely connected with the structure of the "Anglican chant" as with that of "Gregorian music." Still, though he could not agree in all points with Baini, the greatest ecclesiastical musician then living, he shared his admiration for the Improperia, the Miserere, and the cantus planus of the Lamentations and the Exultet, the musical beauty of which he could understand, apart from their ritual significance.

In passing through Munich on his return in October 1831 he composed and played his pianoforte concerto in G minor, and accepted an invitation (never fulfilled) to compose an opera for the Munich theatre. Pausing for a time at Stuttgart, Frankfort and Düsseldorf he arrived in Paris in December, and passed four pleasant months in the renewal of acquaintances formed in 1825, and in close intercourse with Liszt and Chopin. On the 10th of February 1832 the overture to A Midsummer Night's Dream was played at the conservatoire, and many of his other compositions were brought before the public; but he did not escape disappointments with regard to some of them, especially the Reformation symphony, and the visit was brought to an end by his falling ill of fever, which attacked of choler, from, which, however, he rapidly recovered.

On the 23rd of April 1832 he was again in London, where he twice played his G minor concerto at the Philharmonic concerts, gave a performance on the organ at St Paul's, and published his first book of Lieder ohne Worte. He returned to Berlin in July, and during the winter he gave public performances of his Reformation symphony, his concerto in G minor, and his Walpurgisnacht. In the following spring he paid a third visit to London for the purpose of conducting his Italian symphony, which was played for the first time, by the Philharmonic Society, on the 13th of May 1833. On the 26th of the same month he conducted the performances at the Lower Rhine festival at Düsseldorf with such brilliant effect that he was at once offered, and accepted, the appointment of general-music-director to the town, an office which included the management of the music in the principal churches, at the theatre, and at the rooms of two musical associations.

Before entering upon his new duties, Mendelssohn paid a fourth visit to London, with his father, returning to Düsseldorf on the 27th of September 1833. His influence produced an exceedingly favourable impression upon the concert-reception; but his relations with the management of the theatre were not altogether pleasant; and it was probably this circumstance which first led him to forsake the cultivation of the opera for that of sacred music. At Düsseldorf he first designed his famous oratorio St Paul, in response to an application from the Cäcilien-Verein at Frankfort, composed his overture to Die schöne Melusine, and planned some other works of importance. He liked his appointment, and would probably have retained it much longer had he not been invited to undertake the direction of the Gewandhaus concerts at Leipzig, and thus raised to the highest position attainable in the German musical world. To this new sphere of labour he removed in August 1835, opening the first concert at the Gewandhaus, on the 4th of October, with his overture Die Meeresstille, a work possessing great attractions, though by no means on a level with the Midsummer Night's Dream, The Isles of Fingal, or Melusine.

Mendelssohn's reception in Leipzig was most enthusiastic; and under their new director the Gewandhaus concerts prospered exceedingly. Meanwhile St Paul steadily progressed, and was first produced, with triumphant success, at the Lower Rhine festival at Düsseldorf, on the 22nd of May 1836. On the 3rd of October it was first sung in English, at Liverpool, under the direction of Sir George Smart; and on the 16th of March 1837 Mendelssohn again directed it at Leipzig.

The next great event in Mendelssohn's life was his happy marriage, on the 28th of March 1837, to Cecilie Charlotte Sophie Jeanrenaud. The honeymoon was scarcely over before he was again summoned to England to conduct St Paul, at the Birmingham festival of 1837, and to arrange the first performance of his overture to his second oratorio, Elijah. He played on the organ at St Paul's and at Christ Church, Newgate Street, with an effect which exercised a lasting influence upon English organists. It was here also that he first contemplated the production of his second oratorio, Elijah.

Passing over the composition of the Lobgesang in 1840, a sixth visit to England in the same year, and his inauguration of a scheme for the erection of a monument to Sebastian Bach, we find Mendelssohn in 1841 recalled to Berlin by the King of Prussia, with the title of Kapellmeister. Though his appointment resulted in the production of Antigone, Oedipus Colonos, Athalie, the incidental music to the Midsummer Night's Dream, and other great works, it proved an endless source of vexation, and certainly helped to shorten the composer's life. In 1842 he came to England for the seventh time, accompanied by his wife, conducted his Scotch symphony at the Philharmonic, again played the organ at St Peter's, Cornhill, and Christ Church, Newgate Street, and was received with honour by the queen and the prince consort. He did not, however, permit his new engagements to interfere with the direction of the Gewandhaus concerts; and in 1843 he founded in Leipzig the Gewandhaus conservatoire which soon became the best musical college in Europe, opening it on the 3rd of April in the buildings of the Gewandhaus. In 1844 he conducted six of the Philharmonic concerts in London, producing his new Midsummer Night's Dream music, and playing Beethoven's pianoforte concerto in G with extraordinary effect. He returned to his duties at Berlin in September, but succeeded in persuading the king to free him from his most onerous engagements.

After a brief residence in Frankfort, Mendelssohn returned to Leipzig in September 1845, resuming his old duties at the Gewandhaus, and the conservatoire which soon became the best musical college in the world. Here he remained, with little interruption, during the winter—introducing his friend Jenny Lind, then at the height of her popularity, to the critical frequenters of the Gewandhaus, and steadily working at Elijah, the first performance of which he conducted at the Birmingham festival, on the 26th of August 1846. The reception of this great work was enthusiastic. Unhappily, the excitement attendant upon its production, added to the irritating effect of the worries at Berlin, made a serious inroad upon the composer's health. On his return to Leipzig he worked on as usual, but it was clear that his health was seriously impaired. In 1847 he visited England for the tenth and last time, to conduct four performances of Elijah at Exeter Hall, on the 16th, 23rd, 28th and 30th of April, one at Manchester on the 20th, and one at Birmingham on the 27th.
MENDES

But the exertion was beyond his strength. He witnessed Jenny Lind's first appearance at Her Majesty's Theatre, on the 4th of May, and left England on the 9th, little anticipating the trial that awaited him in the tidings of the sudden death of his sister Fanny, which reached him only a few days after his arrival in Frankfurt. The loss of his mother in 1842 had shaken him much, but the suddenness with which this last and greatest misfortune struck him took him aback. He fell to the ground insensible, and never fully recovered. In June he was so far himself again that he was able to travel, with his family, by short stages, to Interlaken, where he stayed for some time, illustrating the journey by a series of water-colour drawings, but making no attempt at composition for many weeks. He returned to Leipzig in September, bringing with him fragments of Christus, Loreley, and some other unfinished works, taking no part in the concerts, and living in privacy. On the 9th of October he called on Madame Frege, and asked her to sing his latest set of songs. She left the room for lights, and on her return found him in violent pain and almost insensible. He lingered for four weeks, and on the 4th of November he passed away, in the presence of his wife, his brother, and his three friends, Moscheles, Schleinitz, and Ferdinand David. A cross marks the site of his grave, in the Alte Dreißigkiglets Kirchhof, at Berlin.

Mendelssohn's title to a place among the great composers of the century is incontestable. His style, though differing little in the broad outlines from that of his forefathers, is characterized by a vein of melody peculiarly his own, and easily distinguishable by those who have studied his works, not only from the genuine effusions of contemporary writers, but from the most successful of the servile imitations with which, even during his lifetime, the music-shops were deluged. In less judicious hands the rigid symmetry of his phrasing might, perhaps, have palpied upon the ear; but under his skilful management it serves only to impart an additional charm to thoughts which derive their chief beauty from the evident spontaneity of their conception. In this, as in all other matters of a purely technical character, he regarded the accepted laws of art as the medium by which he might most certainly attain the ends dictated by the inspiration of his genius. Though caring nothing for rules, except as means for producing a good effect, he scarcely ever violated them, and was never weary of impressing their value upon the minds of his pupils. His method of counterpoint was modelled in close accordance with that practised by Sebastian Bach. This he used in combination with an elastic development of the sonata-form, similar to that engraved by Beethoven upon the lines laid down by Haydn. The principles involved in this arrangement were strictly conservative; yet they enabled him, at the very outset of his career, to invent a new style no less original than that of Schubert or Weber, and no less remarkable as the embodiment of canons already consecrated by classical authority than as a special manifestation of individual genius. It is thus that Mendelssohn stands before us as at the same time a champion of conservatism and an apostle of progress; and it is chiefly by virtue of these two apparently incongruous though really compatible phases of his activity that his influence and example availed, for so many years, to hold in check the violence of reactionary opinion which injudicious partisanship afterwards fanned into revolutionary fury.

Concerning Mendelssohn's private character there have never been two opinions. As a man of the world he was more than ordinarily accomplished—brilliant in conversation, and in his lighter moments overflowing with sparkling humour and ready repartee; and from that of his more serious business of life, and never weary of working for the general good. As a friend he was unvaryingly kind, sympathetic and true. His earnestness as a Christian needs no stronger testimony than that afforded by his own delineation of the character of St Paul; but it is not too much to say that his heart and life were pure as those of a little child.

(W. S. R.)

This article has the unique value of being the record of an eminent musical scholar who was an actual pupil of Mendelssohn. His work has added considerably to the reputation of a man whom even his contemporaries knew to be greater than his works. Mendelssohn's aristocratic horror of self-advertisement unites him for特殊 purposes. His influence was not extraordinary when, at the age of twenty, his first opus was accepted for publication by the famous pianist, and at the age of twenty-one, his first composition, "Romantic" pioneer Schumann soon followed; but, as being more difficult to explain away, and more embarrassing to reverence and concert, it remains a subject of controversy. Meanwhile Mendelssohn's reputation, except as the composer of a few inexplicably beautiful and original orchestral pieces, has vanished and been replaced by a pure fiction known as the "Mendelssohn tradition" of orchestral composition. This fiction is mainly due to the work made by Wagner on his experiences of English orchestral playing. remarks which, though not very good-natured, do not bear the full construction popularly imputed to them. If Beethoven had come and conducted in England, Mendelssohn's expostulations with careless players would have been met by responses to the "Beethoven tradition"; and, if Wagner had shared Mendelssohn's reluctance to putting on record remarks likely to wound individual, professional and national sensibilities, it might not have been impossible that reproaches against slipshod and mechanical playing might nowadays be met by references to the "Wagner tradition." Notwithstanding, Mendelssohn also found a few of the main themes on the main items in the overloaded English orchestral programmes, to the detriment of the rest.

Mendelssohn's influence on the earlier career of Joachim, notably his work in the formation of his idio-specific features, and his love for the Parma, from the beginning of the movement, and displayed extraordinary metrical skill in his first volume of poems, Philomela (1863). In later volumes—Poésies, 1ère série (1875), which includes much of his earlier verse, "Soirs mornes," Contes épiques, Philoméla, &c; Poésies (7 vols., 1885), a new edition largely augmented; Les Poésies de Catulle Mendès (3 vols., 1892); La Grive des sagnes (1892), &c.—his critics have noted that the elegant verse is distinguished rather by dexterous imitation of different writers than by any marked originality. His artistic sensibility and fecundity of Mendels's talent is shown in a series of his critical and miscellaneous essays, and short stories, in the latter of which he continues the French tradition of the licentious conte. For the theatre he wrote: La Parti du roi (1872), a one-act verse comedy; Les Frères d'armes (1873), drama; Justice (1877), in three acts, characterized by a hostile critic as a hymn in praise of suicide; the libretto of a light opera, Le Capitaine Fracasse (1878), founded on Théophile Gautier's novel; La Femme de Tabarin (1878); Médeée (1880), in three acts and in verse; La Reine Fiammette (1889), a conte dramatique in six acts and in verse, the scene of which is laid in the Orient; the libretto of the ballet of which is Bar-Cochbeas, the Syrian pseudo-Messiah, for the music of C. Erlanger; Scarron (1905); Ariane (1906), for the music of Massenet; and Glagity (1906). His critical work includes: Richard Wagner (1886); L'Art au théâtre (3 vols., 1896-1900), a series of dramatic criticisms reprinted from newspapers; and a report addressed to the minister of public instruction and of the fine arts on Le Mouvement poétique français de 1867 à 1900 (new ed., 1903), which includes a bibliographical and critical dictionary of the French poets of the 19th century. Perhaps the most famous of his novels are: Le Roi vierge (1880) in which he introduces Louis II. of Bavaria and Richard Wagner; La Maison de la vielle (1894), and Gog (1897). He married in 1866 Milde Judith Gautier, younger daughter of the poet, from whom he was subsequently separated.
MENDICANCY

MENDIP HILLS

On the 9th of February 1909, early in the morning, his dead body was discovered in the railway tunnel of Saint Germain. He had left Paris by the midnight train on the 7th, and it is supposed that, thinking he had arrived at the station, he had opened the door of his compartment while still in the tunnel.

MENDICANCY (from Lat. mendicus, in a condition of beggary, a word of unknown origin), a state or condition of being a beggar, the practice of obtaining a livelihood by asking alms. The word "mendicant," also found in the French form "mendiant," appears to have come into use through the English friars.

MENDICANT MOVEMENT AND ORDERS. The facts concerning the rise of the Orders of Mendicant Friars are related in the articles on the several orders (Franciscans, Dominicans, Carmelites, Augustinian Hermits), and in that on Monasticism (§ 11), where the difference between friars and monks is explained. The purpose of this article is to characterize the movement as a whole, and to indicate the circumstances that produced it. The most striking phenomenon in connexion with the beginnings of the mendicant order is the rapidity with which the movement spread. Within a generation of the death of the two, Gasquet mentions a half dozen orders (1226), their institutes had spread all over Europe and into Asia, and their friars could be numbered by tens of thousands. In all the great cities of Western Europe friarieties were established, and in the universities theological chairs were held by Dominicans and Franciscans. And when at the middle of the century the other great mendicant orders of Carmelites and Austin Friars, and also Servites (q.v.) arose their propagation showed that the possibilities of the mendicant movement had not been exhausted by the Dominicans and Franciscans. Lesser mendicant orders sprang up in all directions—Gasquet mentions a half dozen such that found their way into England (English Monastic Life, p. 241)—in such numbers that the Council of Lyons in 1274 found it necessary to suppress all except the orders already named. Moreover, beside the various orders of friars, there were the lay Tertiaries that arose and spread far and wide in connexion with the Franciscans and other mendicants, and the similar institute of the Humiliati (see Tertiaries). These facts clearly show that the Mendicant Movement responded to widely spread and deeply felt needs of the time. These needs found expression not only in the Mendicant orders within the Church, but also in a number of movements, less formal and revolutionary religious sects. There was this in common among the Cathari, Waldenses, Albigenses and other heretical bodies that overran so many parts of Western Europe in the second half of the 13th century and the beginning of the 13th, that they all inveighed against the wealth of the clergy, and preached the practice of austerity and poverty and a return to the simple life of Christ and the Apostles. Thus the sects no less than the Mendicant orders bear witness to the existence of spiritual needs in Western Christendom, which the Mendicant orders went a long way towards satisfying. Probably the most crying need was that of priests to minister to the great city populations, at that time growing up with such rapidity, especially in Italy. During the 10th, 11th and 12th centuries the Church had been organized on the lines of the prevailing feudal system—the bishops and abbots were feudal barons, and the effects of the system were felt throughout the ranks of the lower clergy. The social fabric was built up not on the towns, but on the great landlords; and when the centre of gravity began to move, first of all in Italy, to the towns, and crowded populations began to be massed together in them, the parochial systems broke down under the weight of the new conditions, and the people were in a state of spiritual and moral no less than physical destitution. So, when the friars came and established themselves in the poorest localities of the towns, and brought religion to the destitute and the outcasts of society, assimilating themselves to the conditions of life of those among whom they worked, they supplied a need with which the parochial clergy were unable to cope.

The friars responded not only to the new needs of the age, but to its new ideas—religious, intellectual, social, artistic.

It was a period of religious revival, and of reaction against abuses that followed in the wake of the feudal system; and this religious movement was informed by a new mysticism—a mysticism that fixed its attention mainly on the humanity of Christ and found its practical expression in the imitation of His life. A new intellectual wave was breaking over Western Europe, symbolized by the university and the scholastic movements; and a new spirit of democratic freedom was making itself felt in the growing commercial towns of Italy and Germany. There is no need to labour the point that the Mendicants responded to the needs arising from these new and spiritual conditions of Catholic Christianity, for the fact lies upon the surface of history. But a few words are necessary on the central idea from which the Mendicants received their name—the idea of poverty. This was St Francis's root idea, and there is no doubt—that it was disputed—that it was borrowed from him by St Dominic and the other Mendicant founders. St Francis did not intend that begging and alms should be the normal means of sustenance for his friars; on the contrary, he intended them to live by the work of their hands, and only to have recourse to begging as a temporary need. But as the friars soon came nearly all to live on begging, and to spiritual ministrations, and the communities grew larger, it became increasingly difficult for them to support themselves by personal work; and so the begging came to play a greater rôle than had been contemplated by St Francis. But his idea certainly was that his friars should not only practise the utmost personal poverty and simplicity in their life, but that they should have the minimum of possessions—no lands, no funded property, no fixed sources of income. The maintaining of this ideal has proved unworkable in practice. In the Dominican Order and the others that started as mendicant it has been mitigated or even abrogated. Among the Franciscans themselves it has been the occasion of endless strife, and has been kept alive only by dint of successive reforms and fresh starts, each successful for a time, but doomed always, sooner or later, to yield to the inexorable logic of facts. The Capuchins (q.v.) have made the most permanently successful effort to maintain St Francis's ideal; but even among them mitigations have had to be admitted. In spite, however, of all mitigations the Franciscans have nearly always presented to the world an austere and simple, evangelical poverty by the poorness and simplicity of their lives and surroundings.

On the subject-matter of this article the best thing in English is the Introductory Essay by the Capuchin Fr. Cuthbert on "The Spirit and Genius of the Franciscan Friars," in The Friars and how they came to England (1903); see also the earlier chapters of Emil C. von Sydow's Italic mystique (1899).

MENDIP HILLS, a range in the north of Somersetshire, England. Using the name in its widest application, the eastern boundary of the range may be taken to be formed by the upper valleys of the rivers Frome and Brue, and the depression between them. The range extends from these north-westward with a major axis of about 23 m., while the outliers of Waverley Down and Bleadon Hill continue it towards the shore of the Bristol Channel. The range is generally about 6 m. in width, and its total area about 130 sq. m. Its south-western face descends to the low "moors" or marshes drained by the Axe and other streams, the small towns of Axbridge, Cheddar and Wells lying at the foot of the hills. Towards the north-east its limits are less clearly defined, for high ground, intersected by narrow vales, extends as far as the valley of the Avon. A depression, followed by the road between Radstock and Wells, strikes across the range about its centre; the principal elevations lie west of this, and to the area thus defined the name of the Mendips is sometimes restricted. The summit of the hills is a gently swelling plateau, which reaches its extreme height in the north—1068 ft. The Mendips consist principally of Carboniferous Limestone. Fine cliffs and scarps occur on the flanks of the plateau, as in the gorge of Cheddar, and there is a wonderful series of caverns, the result of water action. The surface of the plateau is often broken by deep holes.
MENDOZA, A. H. DE—MENDOZA, P. G. DE

("swallets") into which streams flow. Some of the caves, such as those at Cheddar, are easy of access, and attract many visitors owing to the beauty of the stalagitic formations; others, of greater extent and grandeur, have only been explored, or partly explored, with great difficulty. Some caves have yielded large quantities of animal remains (hyaenid and bear bones, and others), together with traces of prehistoric human occupation. Among such Wookeny Hole, where the river Axe issues from the foot of a cliff, may be mentioned. Lead was worked among the Mendips at a very early period. Some of the Roman workings, especially in the neighbourhood of Charterhouse-on-Mendip, have yielded pigs of lead inscribed with the names of emperors of the 1st and 2nd centuries A.D., together with an abundance of smaller objects.

MENDOZA, ANTONIO HURTADO DE (1593–1644), Spanish dramatist, was born about the end of the 16th century in the province of Asturias, became page to the count of Saldaña (son of the duke de Lerma), and was recognized as a rising poet by Cervantes in the Viaje del Paraiso (1614). He rose rapidly into favour under Philip IV., who appointed him private secretary, commissioned him comedias palaciegas for the royal theatre at Aranjuez, and in 1623 conferred on him the orders of Santiago and Calatrava. Most of his contemporaries and rivals paid court to "el discreto de palacio," and Mendoza seems to have lived on the friendly terms with all his brothers and dramatists, except Ruiz de Alarcón. He is said to have been involved in the fall of Olivares, and died unexpectedly at Saragossa on the 16th of September 1644. Only one of his plays, Querer por sólo querer, was published with his consent; it is included in a volume (1624) containing his semi-official account of the performances at Aranjuez in 1622. The best edition of Mendoza’s plays and verses bears the title of Obras liricas y cómicas, divinas y humanas (1728). Much of his work does not rise above the level of graceful and accomplished verse; but that he had higher qualities is shown by El Marido hace mujer, a brilliant comedy of manners, which forms the chief source of Molière’s École des maris.

The Fiestas que se hizo en Aranjuez y Querer por sólo querer were translated into English by Sir Richard Fanshawe, afterwards ambassador at Madrid, in a posthumous volume published in 1671.

MENDOZA, DIEGO HURTADO DE (1503–1575), Spanish novelist, poet, diplomatist and historian, a younger son of the count of Tendillas, governor of Granada, was born in that city in 1503. The celebrated margrave of Santillana was his great-grandfather. On leaving the university of Salamanca, Mendoza pursued his interrupted legal studies, serving under Charles V., in Italy, and attended lectures at the universities of Bologna, Padua and Rome. In 1537 he was sent to England to arrange a marriage between Henry VIII. and the duchess of Milan, as well as a marriage between Prince Louis of Portugal and Mary Tudor. Despite the failure of his mission, he preserved the confidence of the emperor, and in 1539 was appointed ambassador at Venice; there he patronized the Aldi, procured copies of the Greek manuscripts belonging to Cardinal Bessarion, and acquired other rare codices from the monastery of the Franciscans at Athos. The first edition of Josephus was printed (1544) from the texts in Mendoza’s collection. He acted for some time as military governor of Siena, represented Spain diplomatically at the council of Trent, and in 1547 was nominated special plenipotentiary at Rome, where he remained till 1554. He was never a favourite with Philip II., and a quarrel with a courtier resulted in his banishment from court (June 1568). The remaining years of his life, which were spent at Granada, he devoted to the study of Arabic, to poetry, and to his history of the Moorish insurrection of 1568–1570. He died in 1575.

His Guerra de Granada was published at Lisbon by Luís Tribaldos de Terradillos in 1617; the delay was doubtless due to Mendoza’s severe criticism of contemporaries who survived him. In some passages the author deliberately imitates Sallust and Tacitus; his style is, on the whole, vivid and trenchant, his information is exact, and in critical insight he is not inferior to Mariana. The attribution to Mendoza of Lazarillo de Tormes is rejected by all competent scholars, but that he excelled in picaresque malice is proved by his indelicate verses written in the old Castilian metres and in the more elaborate measures imported from Italy. M. P. Herberstein is believed to be the author of the letters to Feliciano de Silva and to Captain Salazar, published by Antonio Paz y Melia in Sales Españolas (Madrid, 1900).

MENDOZA, PEDRO GONZALEZ DE (1425–1493), Spanish cardinal and statesman, was the fourth son of Iñigo Lopez de Mendoza, marquess of Santillana, and duke of Spinetta. He was born at Guadalajara in New Castle, the chief lordship of his family, on the 3rd of May 1428. The house of Mendoza claimed to descend from the lords of Llidio in Alava, and to have been settled in Old Castle, in the 11th century. One chief of the house had been greatly distinguished at the battle of the Navas de Tolosa in 1212. Another had been Admiral of Castile in the reign of Alphonso the Wise. Peter the Cruel had endowed them with the lordships of Hita and Buitrago. The greatness of the Mendozas was completed by Pedro Gonzalez, who sacrificed his life to save King John I. at the battle of Aljubarrota in 1358. His father, the cardinal, is represented to have written the title he bore for the greater part of his life—as a poet, and was conspicuous during the troubled reign of John II. Loyalty to the Crown was the traditional and prevailing policy of the family. Pedro Gonzalez, the future cardinal, was sent into the Church mainly because he was a younger son and that he might be handsomely provided for. He had no vocation, and was an example of the worldly, political and martial prelates of the 15th century. In 1452 at the age of twenty-four, he was chosen by the king John II. to be bishop of Calahorra, but did not receive the pope’s bull till 1454. As bishop of Calahorra he was also señor, or civil and military ruler, of the town and its dependent district. In his secular capacity he led the levies of Calahorra in the civil wars of the reign of Henry IV. He fought for the king at the second battle of Olmedo on the 20th of August 1467, and was wounded in the arm. During these years he became attached to Doña Mencia de Lemus, a Portuguese lady-in-waiting of the queen. She bore him two sons, Rodrigo, who was once selected to be the husband of Lucrezia Borgia; and Diego, who was the grandfather of the princes of Eboli of the reign of Philip II. (see Peraez, Avrocor.) By another lady of a Valladolid family he had a third son, Juan Antonio, who afterwards emigrated to France, and became bishop of Siguenza. In 1473 he was created cardinal, was promoted to the archbishopric of Seville and named chancellor of Castile. During the last years of the reign of King Henry IV. he was the partisan of the Princess Isabella, afterwards queen. He fought for her at the battle of Toro on the 1st of March 1476; had a prominent part in placing her on the throne; and served her indefatigably in her efforts to suppress the disorderly nobles of Castile. In 1482 he became archbishop of Toledo. During the conquest of Granada he contributed largely to the maintenance of the army. On the end of January 1492 he occupied the town in the name of the Catholic sovereigns. Though his life was worldly, and though he was more soldier and statesman than priest, the "Great Cardinal," as he was commonly called, did not neglect his duty as a bishop. He used his influence with the queen and also at Rome to arrange a settlement of the disputes between the Spanish sovereigns and the papacy. Though he maintained a splendid household as archbishop of Toledo, and provided handsomely for his children, he devoted part of his revenue to charity, and with part he endowed the college of Santa Cruz de Valladolid. His health broke down at the time Queen Isabella visited and nursed him on his deathbed. It is said that he recommended her to choose as his successor the Franciscan Jimenez de Cisneros.
MENDOZA  MENEDEMUS  127

a man who had no likeness to himself save in political faculty and devotion to the authority of the Crown. He died at Guadalajara on the 11th of January 1492.

The life of the cardinal, by Salazar de Mendoza, Cronica del gran cardenal Don Pedro Gonzales de Mendoza (Toledo, 1625), is discursive and garrulous but valuable. See also Prescott, History of Ferdinand and Isabella.

MENDOZA, a province of western Argentina, bounded N. by San Juan, E. by Santa Fe and the territory of La Pampa, S. by the territories of La Pampa and Neuquen, and W. by the republic of Chile. Area, 56,502 sq. m.; pop. (1893), 116,136; (1909, estimated), 159,780. The Andes are the principal mountainous part, and a considerable part of the territory is covered by the great Cordillera, its foothills and flanking ranges. The eastern part is an arid, sandy, level plain, with extensive saline basins, having no vegetation other than coarse grasses and thickets of low, spiny mimosas and "chañar" (Gouriaea decorlica). The fertile, populated districts of the province border on the Cordillera, particularly in the north where numerous streams from the snow-clad summits supply water for irrigation. The secondary ranges in this part of Mendoza are the Sierra de Los Paramillos, which encloses the Uspallata Valley, and the Sierra del Tunuyán, which encloses a number of populous valleys drained by the Tunuyán river and its tributaries. One of the largest of these is the Yucu Valley. Farther south the country becomes more arid and sparsely populated, and unsubdued tribes of Indians for a long time prevented its exploration. In this region the Sierra de Payén and Sierra del Nevado (otherwise known as the Sierra Quero Matro Pellon) extend in a north-easterly direction. With the exception of the Rio Grande in the south-west of the province, which forms the principal source of the Colorado, all the rivers of the province flow eastward and southerly into the great saline depression of western Argentina, which includes a great part of the province of San Luis and La Pampa. The Andean streams rise in the higher snow-clad elevations, but their waters become impregnated with saline matter soon after reaching the plain, and are eventually lost in the saline marshes and lagoons of southern Mendoza and La Pampa. These Andean rivers are the Mendoza, Tunuyán, Diamante and Atuel, with their numerous tributaries, all of which discharge into the sluggish river which flows from the Huanacache lagoon, on the San Juan frontier, southward to the marshes and lagoons of La Pampa. The upper part of this brackish, swampy stream is called the Desaguadero, and the lower Salado. It forms the eastern boundary line of the province down to the 36th parallel. With the exception of the elevated districts of the Andes, the climate of Mendoza is hot and dry. On the plains the rainfall is insignificant, but on the slopes of the Cordillera rains are frequent and winter cold is severe. Agriculture is the principal occupation where irrigation can be used, the province having a high reputation for its raisins and wines. Alfalfa is an important product, being grown for fattening the cattle driven through the province to the Chilean markets. The mineral resources of the province are said to be good, but receive little attention. Mendoza is found in the vicinity of San Rafael, the Diamante river, and it is claimed that coal exists in the same region. Although Mendoza was settled by Spanish colonists from Chile as far back as 1550, its development has been hindered by its isolated position. This isolation was broken in 1884 by the completion of the Argentine Great Western railway to the provincial capital. Since then a railway has been built northward to San Juan, and another line was in 1908 under construction through the Andes to connect with the Chilean railway system. In addition to Mendoza, the capital of the province, the principal towns (hardly more than villages) are Guaymallén, Malpá, San Martín, Luján and San Rafael. The provinces of Mendoza, San Juan and San Luis, which were settled from Chile and were for a long time governed from Santiago, were at first called the province of Cuyo, and are still spoken of as the "Cuyo provinces."

MENDOZA, a city of Argentina, capital of Mendoza province, 632 m. by rail W.N.W. of Buenos Aires. Pop. (1904, estimate), 32,000. It stands on a plain near the foot of a secondary Andean range called the Sierra de los Paramillos, at an elevation of 3230 ft. The surrounding district is arid, but has been irrigated and is covered with gardens, orchards and cultivated fields. The city is about 15 m. N. of the Mendoza, or Luján river, whose waters are utilized for irrigation and for the requirements of the city by means of a channel which leaves the main river a little above the town of Luján and runs to the Tulumaya river and the lagoons of Huanacache. This channel is called El Zanjón, and is believed to have been opened by Guaymallén, the chief of the Guarapés who inhabited this district at the time the Spaniards first entered the country. It is supposed that the Lenca people who inhabited the region before the Spaniards were driven away by the Indians from the northern part of the country, and that consequently the river has a broad road paved with streets and numerous public squares. The Zanjón and another stream called the Guaymalén traverse the city, and the principal streets have water flowing through them and are shaded by poplars. Because of earthquake risks, the public buildings are neither costly nor imposing. The private residences are commonly of one story, built with wooden frames filled in with adobe. The climate is hot, dry and enervating, notwithstanding the elevation and the proximity of the Andes. The surrounding districts produce fruit, vegetables, alfalfa and grapes. The vineyard industry is prominent, and raisins and wine are exported. The position of the city on the main highway from the Andes into Chile, by way of the Uspallata or Cumbre pass (highest point 12,870 ft.), has given the city commercial importance. It has railway connexion with the principal cities of the republic, including the ports of Rosario, Buenos Aires and Bahía Blanca, and also with the capital of San Juan.

Mendoza was founded by Captain Pedro del Castillo, who had been sent from Santiago across the Andes in 1559 by García Hurtado de Mendoza, the governor of Chile, to conquer and annex the territory extending N.E. to Tucuman. The city was founded about 1566, and the capital of the province of Cuyo, and belonged to Chile down to 1776, when the province was transferred to the newly created viceroyalty of La Plata. It was the headquarters of General San Martín while he was organizing an army for the liberation of Chile, and greatly assisted him with men and money. Under republican administration Mendoza suffered much from revolutions. Moreover, on the 20th of March 1861, the city was destroyed by an earthquake and a fire which followed. Not a building was left standing, and the loss of life was estimated at 12,000. The French geologist Bravard, who had predicted the catastrophe, was one of its victims. The populus, in the streets, together with some species of fruit-trees, were first planted in Mendoza by a Spaniard, Juan Cobos, in 1809, who thus became one of its greatest benefactors.

MENEDEMUS, Greek philosopher, and founder of the Eretrian school of thought, was born at Eretria about 350 and died between 278 and 275 B.C. Though of noble birth, he worked as builder and tentmaker until he was sent with a military expedition to Megara, where, according to Diogenes Laertius, he heard Plato and resolved to devote himself to philosophy. It is now likely that he heard one of Plato's followers, in much as Plato died when he was only four years old, if the above dates are correct. At Megara he formed a life-long friendship with Asclepides, with whom he toiled in the night that he might study philosophy by day. He was subsequently a pupil first of Stilpo and then of Phaedo of Ellis, whose school he transferred to Eretria, by which name it was afterwards known. In addition to his philosophical work, he took a leading part in the political affairs of his city from the time of the Didachon until his death, and obtained a remission of the tribute to Demetrius. His friendship with Antigonus Gonatas seems to have roused suspicion as to his loyalty, and he sought safety first in the temple of Amphiaras at Oropus, and later with Antigonus, at whose court he is said to have died of grief. Other accounts say that he starved himself to death on failing to induce Antigonus to free his native city. His philosophical views are known only in part. Athenaeus quotes Epicrates as stating that he was a Platonist, but other accounts credit
him with having preferred Stilpo to Plato. Diogenes Laërtius (ii. 134 and 135) says that he declined to identify the Good with the Useful, and that he denied the value of the negative proposition on the ground that affirmation alone can express truth. He probably meant to imply that qualities have no existence apart from the knower, and his position in ethics we learn from Plutarch (De virt. mor. 2) and from Cicero (Acad. ii. 42) that he regarded Virtue as one, by whatever name it be called, and that it is intellectual. Cicero's evidence is the less valuable in that he always assumed that Menelæmus was a follower of the Megarian. Diogenes says that he left no writings, and the Eretrian school disappeared after a short and unobtrusive existence.

Beside the ancient sources quoted above, see H. Mallett, Histoire de l'époque des dix-huit ans, p. 184. Also the articles Megarian School; Phaedo; Stilpo.

**MENELAUS**, in Greek legend, son of Atreus (or Pleisthenes), king of Sparta, brother of Agamemnon and husband of Helen. He was one of the Greeks who entered Troy concealed in the wooden horse (Vergil, Aeneid, ii. 264) and recovered his wife at the sack of the city. On the voyage homewards his fleet was scattered off Cape Malea by a storm, which drove him to Egypt. After eight years' wandering in the east, he landed on the island of Phæos, where Proteus revealed to him the means of appeasing the gods and securing his return. He reached Sparta on the day on which Orestes was holding the funeral feast over Aegisthus and Clytaemnestra. After a long and happy life in Lacedæmon, Menelaus, as the son-in-law of Zeus, did not die but was translated to Elysium (Homer, Odyssey, ili. iv.). His grave and that of Helen were shown at Therapnae, where he was worshipped as a god (Pausanias iii. 19, 9). He was represented in works of art as carrying off the body of the dead Patroclus or lifting up his hand to slay Helen.

**MENELEK II.** (Shahal Marjem), emperor of Abyssinia, officially negus negusti (king of kings) of Ethiopia (1844—1889), son of Haili Meliccoth, king of Shoà, who was born in 1844, and claimed to be a direct descendant of Solomon by the queen of Sheba. On the death of his father in 1853 he was kept a prisoner at Gondar by Kassai, the governor, who had seized the throne under the title of Theodore III. But having succeeded in effecting his escape he was acknowledged king of Shoà, and at once attacked the usurper. These campaigns were unsuccessful, and he turned his arms to the west, east and south, and annexed much territory to his kingdom, still, however, maintaining his divine right to the crown of Ethiopia. After the death of Theodore in 1888 he continued to struggle against his successor, the emperor Menelik I and Menelik II, and the latter (better known as King John of Abyssinia). Being again unsuccessful, he resolved to await a more propitious occasion; so, acknowledging the supremacy of Johannes, in 1886 he married his daughter Zoëdita (b. 1876) to the emperor's son, the Ras Area; he was thereupon declared heir to the empire, and on his side acknowledged the Ras Area as his successor. Ras Area died in May 1888, and the emperor Johannes was killed in a war against the dervishes at the battle of Gallabat (Matema) on the 10th of March 1889. The succession now lay between the late emperor's natural son, Theodore III, and Menelik, with whom the latter, who had previously been declared by a large majority on the 4th of November, and consecrated shortly afterwards. Menelek had married in 1883 Taitu (b. 1854) a princess of Tigré, a lady who had been married four times previously and who exercised considerable influence. Menelek's clemency to Mangasha, whom he compelled to submit and then made viceroy of Tigré, was ill repaid by a long series of revolts. In 1889, at the time when he was claiming the throne against Mangasha, Menelek signed at Ucciali a treaty with Italy acknowledging Italian claims to the Asmara district. Finding, however, that according to the Italian view of one of its articles the treaty placed his empire under Italian domination, Menelek denounced it; and after defeating the Italians at Amba-Alagi, he compelled them to capitulate at Adowa in February 1896, and a treaty was signed recognizing the absolute independence of Abyssinia. His French sympathies were shown in a reported official offer of treasure towards payment of the indemnity at the close of the Franco-Prussian War, and in February 1897 he concluded a commercial treaty with France on very favourable terms. He also gave assistance to French officers who sought to reach the upper Nile from Abyssinia, there to join forces with the Marchand led only to studying. He became sent Nilewards. A British mission under Sir Rennell Rodd in May 1897, however, was cordially received, and Menelek agreed to a settlement of the Somali boundaries, to keep open to British commerce the caravan route between Zalla and Harrar, and to prevent the transit of munitions of war to the Mahdists, whom he proclaimed enemies of Abyssinia. In the following year the Sudan was reconquered by an Anglo-Egyptian army and thereafter cordial relations between Menelek and the British authorities were established. In 1889 and subsequent years, Menelek sent forces to co-operate with the British troops engaged against the Somali mullah, Mahomed Abdullah. Menelek had in 1898 crushed a rebellion by Ras Mangasha (who died in 1900) and he directed his efforts henceforth to the consolidation of his authority, and in a certain degree, to the opening up of his country to western civilization. He had granted in 1894 a concession for the building of a railway to his capital from the French port of Jibuti, but, alarmed by a claim made by France in 1902 to the control of the line in Abyssinian territory, he stopped for four years the extension of the railway beyond Dire Dawa. When in 1906 France, Great Britain and Italy came to an agreement on the subject, Menelek officially reiterated his full sovereign rights over the whole of his empire. In May 1909 the emperor's grandson Lij Yasu, or Jassu, then a lad of thirteen, was married to Romanie (b. 1902), granddaughter of the negus Johannes. Two days later Yasu was publicly proclaimed at Adis Ababa as Menelek's successor. At that time the emperor was seriously ill and as his ill-health continued, a council of regency—from which the emperor was excluded—was formed in March 1910. (See also Abyssinia.)

**MENÉNDEZ Y PELAYO, MARCELINO** (1856—1910), Spanish scholar and critic, was born at Santander on the 3rd of November 1856. In 1871—1872 he studied under Milà y Fontanals at the university of Barcelona, whence he proceeded to the central university of Madrid. His academic successes had never been surpassed; a special law was passed by the Cortes to enable him to become a professor at the age of twenty-two, and three years later he was elected a member of the Spanish Academy. But before this date (1882) he was well known throughout Spain. His first volume, Estudios críticos sobre escritores monárquicos (1876), had attracted little notice, and his scholarly Horacio en la critica, 1837—1891, and Música clásica y moderna (1892), through his Ciencia española (1878), a collection of polemical essays defending the national tradition against the attacks of political and religious reformers. The unbending orthodoxy of this work is, if possible, still more pronounced in his Historia de los heterodoxos españoles (1880—1886), and the writer was hailed as the champion of the ultramontane party. His lectures (1881) on Calderón established his reputation as a literary critic; and his work as an historian of Spanish literature was continued in his Historia de las ideas estéticas en España (1881—1891), his Historia de la poesía moderna (1890—1903) of Lope de Vega, his Antología de poetas hispanoamericanos (1890—1906), and his Orígenes de la novela (1905).

**MENENUS LANATUS, AGRIPPA**, Roman patrician and statesman, consul 503 B.C. On the occasion of the first secession of the people to the Sacred Mount, Agrippa, who was known to be a man of moderate views, was one of the commissioners empowered by the senate to treat with the seceders. On this occasion he recited the well-known fable of the belly and the members.

Liv. ii. 16, 32, 33; Dion. Halic. v. 44—47; vi. 49—88, 96; Val. Max. iv. 4.2.

**MENES**, the name of the founder of the 1st Dynasty of historical kings of Egypt. He appears at the head of the lists not only in Herodotus and Manetho, but also in the native Turin Papyrus of Kings and the lists of Abydos, while the list
of Sakkara begins with the sixth king of the 1st Dynasty, a fact which may throw some doubt on the supposed foundation of Memphis by Menes. Until recently he was looked upon as semi-mythical, but the discovery of the tombs of many kings of the 1st Dynasty including probably that of Menes himself, as well as an abundance of remains still at Memphis, has given him a personality. He was probably ruler of Upper Egypt and conquered the separate kingdom of Lower Egypt.

See Egypt: K. Sethe, “Menes und die Grundung von Memphis,” in his Untersuchungen zur Geschichte und Alterthumskunde Aegyptens, i.ii. 121.

MENGS, ANTONY RAPHAEL (1728-1770), German painter, was born in 1728 at Augsburg in Bohemia, but his father, Ismael Mengs, a Danish painter, established himself finally at Dresden, whence in 1741 he took his son to Rome. The appointment of Mengs in 1749 as first painter to the elector of Saxony did not prevent his spending much time in Rome, where he had married in 1748, and abjured the Protestant faith, and where he became in 1754 director of the Vatican school of painting, nor did this hinder him on two occasions from obeying the call of Charles III. of Spain to Madrid. There Mengs produced some of his best work, and specially the ceiling of the banquetting-hall, the subject of which was the Triumph of Trajan and the Temple of Glory. After the completion of this work in 1777, Mengs returned to Rome, and there he died, two years later, in poor circumstances, leaving twenty children, seven of whom were pensioned by the king of Spain. Besides numerous paintings, in Rome and Berlin, Mengs executed at Dresden, Persens and Andromeda at St. Petersburg, and the ceiling of the Villa Albani must be mentioned among his chief works. In England, the duke of Northumberland possesses a Holy Family, and the colleges of All Souls and Magdalene, at Oxford, have altar-pieces by his hand. In his writings, in Spanish, Italian and German, Mengs has put forth his eclectic theory of art, which treats of perfection as attainable by a well-schemed combination of diverse excellences—Greek design, with the expression of Raphael, the chiaroscuro of Correggio, and the colour of Titian. His intimacy with Winckelmann—who constantly wrote at his dictation—has enhanced his historical importance, for he formed no scholars, and the critic must now concur in Goethe’s judgment of Mengs in Winckelmann and sein Jahrhundert; he must deplore that so much learning should have been allied to a total want of initiative and poverty of invention, and embodied with a strained and artificial manerism.

See Opere di Antonio Raffaello Mengs (Parma, 1780); Mengs Werke, Übersetzung G. F. Prange (1786); Zeitschrift für bildende Kunst und für die Zeitgenossen von Mengs (Milan, 1780); Woermann, Ismael und Raphael Mengs (Leipzig, 1893).

MENGTSZE, a city in the S.E. of the province of Yunnan, China. Pop. about 12,000. It was selected by the French convention of 1886 as the seat of the overland trade between Tongking and Yunnan, and opened two years later. It is beautifully situated in the centre of a valley basin on a plateau 3500 ft. above sea-level. The country round is fertile and well cultivated, and the place must have been one of considerable wealth before the Taiping rebellion, as the ruins of many fine temples attest. A considerable overland trade has sprung up since the opening of Mengtsze. Of the import trade Hong-Kong supplied 86%, and of the export trade 79%, Cochín-China, Tongking and Annam claiming the remainder. Tin (68%) and opium (27-8%) are the principal exports, and textiles (71%), mostly cottons, and tobacco (4%) are the chief imports. On the Tongking side this trade follows the Red River route as far as Manhao, which is distant from Mengtsze about 40 m., though the navigation of the river is difficult. From Manhao the transit is by coolies or pack animals. Concessions have been obtained by the French government to build a line of railway from the Tongking frontier at the town of Laokay via Mengtsze to Yunnan-fu. The climate is equable and healthy.

MENHADEN, economically one of the most important fishes of the United States, known by a great number of local names, “menhadon” and “moss linker” being those most generally in use. The Indians and white settlers used it as a manure, and the name is Narragansett for “fertilizer.” Its scientific name is Clupea (or Allos) menhaden and Brevoortia tyrannus. It is allied to the European species of shad and pilchard, and, like the latter, approaches the coast in immense shoals, which are found throughout the year in some part of the littoral waters between Maine and Florida, the northern shoals retiring into deeper water or to more southern latitudes with the approach of cold weather. The average size of the menhaden is about 12 in. It is too bony and oily for a table-fish, but is used as bait for cod and mackerel. A large fleet is engaged in the fishery; and a great number of factories extract the oil for tanning and currying, and for adulterating other more expensive oils, and manufacture the refuse into a valuable guano.

MENIAL, that which belongs to household or domestic service, hence, particularly, a domestic servant. The idea of such service being derogatory has given the term of contempt. The word is derived from an obsolete meenie or meyney, the company of household servants or retainers; a Scottish form is menstl. The origin is to be found in the O.Fr. mesnie, popular Lat. mansio, from mansio, mansion, from which comes Fr. maison, house.

MÉNIER, ÉMILE JUSTIN (1826-1881), French manufacturer and politician, was born at Paris in 1826. In 1853, on the death of his father, Antoine Brutus Ménié, he became proprietor of a large drug factory, founded in 1813 by the latter at Saint Denis, near Paris, and in 1857 at Noisiel-sur-Marne. Antoine Brutus Ménié had also manufactured chocolate in a small way, but Emile Justin from the first devoted himself specially to chocolate. He purchased cocoa-growing estates in Nicaragua and beet-fields in France, erected a sugar-mill, and equipped himself in other ways for the production of chocolate on a large scale. In 1864 he sold his interest in the drug-manufacturing business, and thenceforth confined himself to chocolate, building up an immense trade. Ménié was a keen politician, and from 1876 till his death had a seat in the French Chamber, his general views being strongly Republican, while he consistently opposed protection. He was also the author of several works on fiscal and economic questions, notably L’impôt sur le capital (1872), La Réforme fiscale (1872), l’Économie rurale (1875), L’Avenir économique (1875-1878), Atlas de la production de la richesse (1878). He died at Noisiel-sur-Marne in 1884, his sons succeeding to the business.

MÉNIÈRE’S DISEASE, a form of auditory vertigo, first described by a French physician, Emile Antoine Ménérie, in 1861. It usually attacks persons of middle age whose hearing has been previously normal. A. Politzer gives the following as the principal causes: intense heat and exposure to the sun, dysentery, inflammation of the ear andmemoias, etc. The disease presents itself in various forms, but the most usual is the apoplectic form, due to haemorrhage into the labyrinth, followed by more or less complete deafness in either or both ears. The attack usually sets in with dizziness, noises in the ears, nausea, vomiting and staggering gait, and the patient may suddenly fall down with loss of consciousness. The seizures are usually paroxysmal, occurring at irregular intervals of days or weeks. Between the attacks the equilibrium may be disturbed, there being marked nystagmus and unsteadiness of gait. The attacks of vertigo tend to become less frequent and may entirely pass away, but the deafness may remain permanent. The treatment is directed towards relieving the troublesome head symptoms by the application of cold compresses. The drug that has proved most serviceable in diminishing the dizziness is potassium iodide, administered daily for at least a month. Politzer considers that the attacks may be averted by producing rarefaction of the air in the external meatus of the ear by means of a specially devised aspirating tube.

MENIN (Flemish Meenen), a town of Belgium in the province of West Flanders situated on the Lys 7 m. S. of Courtrai. Pop. (1904), 19,377. It manufactures linen and flannel, and in the neighbourhood are extensive tobacco plantations. It was first
fortified in 1528, and in 1685 Vauban made it one of the strongest places on the French frontier, but the fortifications were razed in 1748 by the treaty of Aix-la-Chapelle.

**MENINGITIS** (from Gr. μεγενς, a membrane), a term in medicine applied to inflammation affecting the membranes of the brain (cerebral meningitis) or spinal cord (spinal meningitis) or both.

Meningitis (or Acute Hydrocephalus) is a disease due to inflammation of the meninges of the brain produced by the presence of a tubercle bacillus. This disease is most common in children under ten years of age, but may affect adults. The tuberculous constitution is an important factor in this malady. In numerous cases it is manifestly connected with bad hygienic conditions, with insufficient or improper feeding, or with over exercise of the mental powers, all of which will doubtless more readily exert their influence where an inherited liability exists, and the same may be said regarding its occasional occurrence as one of the after consequences of certain of the diseases of childhood, especially measles and whooping-cough.

There are certain typical features characterizing the disease in each of its stages. The premonitory symptoms are mostly such as are connected with the nutritive balance. A fall off in the general strength of the child is often observed for a considerable time before the characteristic phenomena of the disease appear. The patient, if a child, becomes listless and easily fatigued, loses appetite, and is readily excited. The slightest headache after exertion, and the child becomes unusually irritable. These symptoms may persist during many weeks; but on the other hand such premonitory indications may be entirely wanting, and the disease be developed to all its apparently decided features.

The onset is in most instances marked by the occurrence of vomiting, often severe, but sometimes only slight, and there is in general obstinate constipation. In not a few cases the first symptoms are convulsions, which, however, may in this early stage subside, and remain absent, or reappear at a later period. Headache is one of the most constant of the earlier symptoms, and is generally intense. It is sometimes connected with so great a sense of pressure on the patient to scream, with a peculiar and characteristic cry. There is great intolerance of light and sound, and general nervous symptoms, which are present to a greater or less extent. The temperature ranges from 106° to 103° F.; yet the pulse is not quickened in proportion, being on the contrary rather slow, but exhibiting a tendency to irregularity, and liable to become rapid on slight exertion. The breathing, too, is somewhat irregular. Symptoms of this character, constituting the stage of excitement, continue for a period varying from one to two weeks, when they are succeeded by the stage of depression. There is now a marked change in the patient, which is apt to lead to the belief that a favourable turn has taken place. The patient becomes quieter and inclines to sleep, but it will be found on careful watching that this apparent quietness is in many cases only a condition of partial stupor into which the child has sunk. The vomiting has ceased, and there is less fever; the pulse is slower, and shows a still greater tendency to irregularity than before, while the breathing is of markedly uncomf ortable character. Rapid breathing at a time when the eyes are long drawn out and sinking away at another. There is manifestly little suffering, although the peculiar cry may still be uttered, and the patient lies prostrate, occasionally rolling the head uneasily upon the pillow, or picking at the bedclothes or at his face with his fingers. He does not ask for food, but readily swallows what is offered. The countenance is pale, but is apt to flush up suddenly for a time. The eyes present important alterations, the pupil being dilated or unequal, and scarcely responding to light. There may be double vision, or partial or complete blindness. Squinting is common. Fever is present to a greater or less extent, the skin being flaccid, and there may be occasional profuse sweating due to paralysis of the part, and one or more limbs may be likewise paralysed.

To this succeeds the third or final stage, in which certain of the former symptoms recur, while others become intensified. This is generally a return of the fever, the temperature rising sometimes very high. The pulse becomes feeble, rapid, and exceedingly irregular, as is also the case with the breathing. Coma is profound, but yet the patient may still be alert. Slow movements are not so readily as before. Convulsions are apt to occur, while para lytic, more or less extensive, affects portions of the body or groups of muscles. There are now no more fits, and with this is generally absolute, complete blindness and often deafness. In this condition the patient’s strength undergoes rapid decline, and the body becomes markedly emaciated. Death takes place either suddenly in a fit, or after gradual decline from exhaustion. Slowly but surely death does not occur for the patient, who, it may be for many days previously, lay in state of profound stupor, to awake up, ask for food and drink, call the nurse about the room, and then drop off into a deep sleep, or become unconscious, or wake up from time to time, as if the symptoms were somewhat, but in general death takes place within three weeks from the onset of the symptoms. The disease may be said to almost invariably fatal, yet cases presenting all the principal symptoms occasionally recover.

Meningitis may be done in the way of prevention of this disease, and, in its earlier stages, even in the way of cure. It is most important in families where the history indicates a tuberculous or scrofulous tendency, or where the history shows that the hydcolis has already occurred, that every effort should be used to fortify the system and avoid the causes already alluded to as favouring the development of the disease during that period in which children are liable to suffer from it. With this view wholesome food, warm clothing, cleanliness, regularity, and the avoidance of over-exertion, physical and mental, are of the utmost consequence.

Timely treatment may be of importance, but convulsions occasionally return the symptoms when they arise. The maintenance of the patient’s strength by light nourishment and the use of sedatives to compose the nervous system are the measures most likely to be beneficial. The use of iodine, hot baths, liniment of the gums, is the medicinal agent of most value for this purpose. Should convulsions occur, they are best treated by chloral or chloroform.

In what is known as suppurative, or simple acute meningitis (non-tubercular), the disease arises from various causes, and the symptoms are similar to those described above.

In posterior-basic meningitis, inflammation of the membranes investing the posterior basic spinal cord, the chief symptoms are fever, with severe pain in the back or lombs shooting downwards into the limbs (which are the seat of frequent painful involuntary startings), accompanied with a feeling of tightness round the body.

The local symptoms bear reference to the portion of the cord the membranes of which are involved. The symptoms, if the inflammation is located in the cervical portion of the muscles of the arms and chest are spasmodically contracted, and there may be difficulty of swallowing or breathing, or embarrassed heart’s action, while when the disease is seated in the lower portion, the lower limbs and the bladder and rectum are the parts affected in this way. At first there is excited sensibility (hyperesthesia) in the parts of the surface of the body in relation with the portion of cord affected. As this area of hyperesthesia disappears, a partial loss of power in the affected muscles, and also partial anaesthesia. These various phenomena may entirely pass away, and the patient, after some weeks or months recover; or in the other cases they may increase, and end in permanent paralysis.

Some observers regard these forms as sporadic cases of cerebro-spinal fever; and Still, William Hunter and George Nuttall have isolated an organism similar to the diplococcus intracellularis, while Henry Koplik in New York found cases of typical posterior-basic meningitis due to the diplococcus intracellularis.

The treatment is directed to allaying the pain and inflammatory articular laryngitis, and to negligent physicians.

The patient should have perfect rest in the recumbent, or better still in the prone, position. Cold applications to the spine may be used. So far as is possible to the functions of the bladder and bowels, and to the condition of the skin with the view of preventing sores, is all-important.

Cerebro-spinal fever or epidemic cerebro-spinal meningitis, popularly called "spotted fever," is an infectious disease occurring sporadically or in epidemics, and due to the diplococcus intracellularis discovered by Weichselbaum in 1887. This disease was not recognized until the 19th century. It was first described at Geneva in 1805 and small outbreaks followed in Paris (1814), Metz and Genoa (1851), and Westphalia (1822), but in the United States there was a widespread epidemic, including New England and spreading as far as Kentucky and Ohio. Fresh outbreaks in Europe took place between 1837 and 1850. In 1837 it prevailed in the south of France chiefly amongst troops in garrison, and fresh outbreaks continued throughout France in 1846 with epidemics in Algiers, Italy and Sicily. In Great Britain it first showed itself in the Irish workhouses in 1846, where it was known as "the black death" or "malignant purpuric fever." After 1866 except for sporadic cases it disappeared from Great Britain, but small outbreaks took place in the United States from 1885 to 1900 in New York. In 1905 there was an extensive epidemic in New York followed by an outbreak in Scotland in 1906, and in Scotland and Ireland in 1907-1908. The registrar-general's returns for 1907 give 1018 deaths in Scotland due to the disease, of which 711 were at Glasgow and 148 at Edinburgh. In the same year Belfast was visited by a severe epidemic, 495 deaths out of the total death-rate of 631 taking place in that district.
MENIPPUSS

The mode of infection is obscure, but the organism is thought to gain access to the circulation through the mucous membrane of the nose and conjunctiva, as the organism has been isolated from the mucous membrane of the nose of those suffering from the disease but from healthy persons who have been in contact with cases. Cerebro-spinal fever has an undoubted tendency to follow bad sanitary conditions and to prevail in damp, sunless houses. From this it follows that epidemics and their usual children and young adults, and Kokplik states that few recoveries take place in children under two years of age.

The disease is sudden and accompanied with tubercular meningitis, in which the onset is gradual. The attack comes on sharply with intense headache, rigors and vomiting. The pain soon localization in the back of the neck and occiput, and then moves through the spine. This is soon followed by a characteristic symptom, namely retraction of the head. The head is drawn back and rigidly fixed, the spine arched and the limbs drawn up, and muscular spasms may take place. There is general hyperaesthesia, the slightest contact producing pain. More or less fever is present, but the temperature is not characteristic. The headache continues with great severity and restlessness and delirium are common features of the first day. In the second, the periods when the patient is comatose. Twitching of the limbs and general convulsions may occur and facial paralysis is frequent. Paralysis of the limbs, causing squatting, dilatations and contractures of the pupils are common. Abnormalities of the conduction system are usual.

Some of the most striking symptoms are the rashes. These usually occur about the fourth day of illness and vary widely in character, being erythematous, hæmorrhagic, maculose, papular, or purpuric, and symmetrical or in spots. The rashes have usually no relation to the gravity of the disease, but severe cutaneous haemorrhages usually indicate a severe form of illness. Should the patient survive the first shock of the disease, no further complications result. The convalescence is gradual. Serous effusion may take place into joints which are painful, red and swollen as in acute rheumatism.

In general, all the symptoms known as the fulminating type, and death may take place within 12 to 24 hours of the onset. Death usually occurs between the fifth and the eighth day, but many cases drag on for weeks with rapid and protracted convalescence. The mortality rate has varied in different epidemics. Hirsch's tables of forty-one epidemics give a mortality of from 25 to 75%, and Koplík rates it at 48 to 90%. During 1907, 623 cases of cerebro-spinal fever were notified in Boston, and deaths numbered 205. During that year the disease was made notifiable in 48 Irish urban and 55 rural districts. The mortality in Dublin was 75%. Osler states that in children under the age of one year and over, the mortality is 75%.

The changes found after death from cerebro-spinal fever are an acute inflammation of the pia-arachnoid membrane both of the brain and spinal cord, with effusion of serum or pus into the ventricles and general paralysis of the organs. The serous effusion become purulent that it has been found purulent in a case where death took place within five hours from the apparent onset. The operation of lumbar puncture (or puncture of the spinal canal between L 1 and L 2) has been used with great success in making an accurate diagnosis by bacteriological examination of the contents of the spinal fluid. Lumbar puncture too has been found to be of eminent service in many cases, the withdrawal of from 30 to 50 cc. of the spinal fluid serving to relieve pressure and at least temporarily ameliorate the symptoms.

Up to a few years ago it may be said that there was no effective treatment for cerebro-spinal fever but that of endeavouring to alleviate pain by the administration of opium, but with the recent introduction of serum therapy the future is full of hope. In the epidemic in New York (1905) the serum of Flexner and Jebb was used with marked success. The serum was given as a single injection, the death-rate where the serum was used sinking to 40.3% as against 90% without. Like other serum treatments, to get the best results the serum must be administered early in the disease. Of 251 cases injected during the first week of the disease the mortality was only 18%, while of 107 others injected after the first week of the disease the mortality was double that amount. When given subcutaneously by the duet of Philip of Brussels and Maillezais the death-rate was 58.9%, and to obtain good results it must be injected directly into the spinal canal after the removal of a certain amount of the spinal fluid. The injections are then continued daily as required according to Dr. Jebb. Dr. Koplík and Dr. Hayford. Of 275 cases treated by ordinary means, the death-rate was 72.3%, but in 90 cases treated with injections of Flexner's and Jebb's serum the death-rate was only 30.5%.

Dr. Jebb has published a series of cases treated with the highly immune serum of patients who have recovered from the disease with encouraging results.

MENIPPUSS. of Gadara in Coele-Syria, Greek cynic and satirist, lived during the 3rd century B.C. According to Diogenes Laëritius (vi. 8) he was originally a slave, amassed a fortune as a money-lender, lost it, and committed suicide through grief. His works (written in a mixture of prose and verse) are all lost. He discussed serious subjects in a spirit of raillery, and especially delighted in attacking the Epicureans and Stoics. His writings exercised considerable influence upon later literature. One of the dialogues attributed to Lucian, his avowed imitator, who frequently mentions him, is called Menippus. But this dialogue is regarded with suspicion, and since the sub-title ("The Oracle of the Cynics") resembles that of a work ascribed to Menippos by Diogenes Laëritius, it has been suggested that it is really the work of Menippos himself, or at any rate imitated from his Néauph, upon the author, whether Lucian or another. It is well known that the Menippean satires of M. Terentius Varro, the fragments of which give an idea of this kind of composition, were called after Menippus of Gadara (see Teufel-Schwahe, Hist. of Roman Literature, § 165, 3).

BIBLIOGRAPHY.—F. Ley, De vita scriptuque Menipp. cymici (Copenhagen, 1839); R. H. Shilling, Lucian und sein Nachsch. (1850); T. Mommsen, Sillographium graecorum reliquiae (1885), with an account of Menippos and similar writers. Menippus found an imitator in later times in Justus Lipsius, author of a Satyr. menippean (1637); also in the French dramatist, M. de Motley; in the poet laureate; and in the authors of the famous Satyr. Menippe (1953; latest editions by C. Marcilly, Paris, 1882; J. Frank, Oppeln, 1884), written against the Holy League during the reign of Henry IV.

MENIUS, JUSTUS (1490-1558), Lutheran theologian, whose name is Latinized from Jost or Just (i.e. Jodocus) Menig, was born at Fulda, of poor but respectable parents, on the 13th of December, 1490. Entering the university of Erfurt in 1514, he took the bachelor's degree in 1515, the master's in 1516. At this time, in association with the keen humanists Conrad Mutian, Crotus Rubeanus and Eoban Hess, he was of sceptical tendency; moving to Wittenberg in 1516, he became evangelical under the teaching of Melanchthon and the preaching of Luther. After travel in Italy (1521-1522) he was appointed (1523) town's preacher at Wittenberg, but was soon transferred to the charge of Mühlberg, under Erfurt. Here he published his commentary on Acts (1524) and married. He resigned his charge (1525) and opened a school at Erfurt, but the town council insisted on his resigning his professorship, and in 1526 he was appointed at Jena, where in the same year he was elected president of the university. He worked in conjunction with Luther's friend, John Lange, and was opposed by the Franciscans under Conrad Kling. Hence he left for Gotua (1528), resumed teaching, and enjoyed the friendship of Friedrich Myconius. Duke John of Saxony had placed him on the commission for church visitation in Thuringia, and in 1529 appointed him pastor and superintendent at Eisenach, where for eighteen years he administered church affairs with tact, and fostered the spread of education. In 1550 he brought out his Oconomia christianae (a treatise in German on the right ordering of a Christian household) with a dedication to the duchess Sybill of Saxony and a preface by Luther. His tractate, written in concert with Myconius, controverting der Wiederkäuer Lehre und Geheimnis (1550) was also prefixed by Luther. The reversion to the Roman communion of his old friend Crotus led to his mordant Responsor amici (1532, anon.) to the Apologia (1531) of Crotus. He took his part in the theological disputations of the time, at Marburg (1550), the Concordia at Wittenberg (1536), the Convention at Schmalkalden (1537), the discussions at Hagenau and Worms (1540). His tractate (1548) against the permission of bigamy in accordance with certain customary usages; this manuscript is in the Heidelberg university library. In 1552 he removed to Mühlhausen, being appointed by Duke Henry of Saxony for the ordering of the church there. On the death of Myconius (1546) he was entrusted with the oversight of Gота, in addition to that of Eisenach; to Gота he returned in 1547. The remainder of his life was not happy. He was against the Leipzig Interim (1548) with its compromise on some Catholic usages, and was involved in controversies and quarrels; with Georgius Merula, against whom he maintained the need of exorcism in

baptism; with Osianer's adherents in the matter of justification; with his colleague, Nicholas von Amstorf, to whom he had resigned the Eisenach superintendency; with Flacius Illyricus, and others. He lost favour with Duke John Frederic of Saxony, fell into bad health, was deposed (1555) from his offices, and was discharged from his duties by his all lawful authority, and forced to retire, after the college at Eisenach (1556). He died at Leipzig on the 11th of August 1558. He was twice married, and had several sons, of whom Eusebius held a chair of philosophy at Wittenberg, and married Melanchthon's grand-daughter, Anna Sabinus. Schmidt gives a full bibliography of the numerous writings of Menius, who translated several of Luther's biblical commentaries into German. His Oeconomia was reprinted in 1855.

MENKEN, ADAH ISAACS (1835–1868). American actress, was born in New Orleans, the daughter of a Spanish Jew, her name being Dolores Adion Fuertes. Left in poverty at the age of thirteen, she made her first appearance as a dancer in her native city. She had a great success there and in other southern cities, including Havana, and she afterwards aspired to act in serious parts. In 1856 she married John Isaacs Menken, translated Adios to Adah, and thus took the name she there-after bore through various matrimonial ventures. In 1864 she appeared at Astley's in London as Mazeppa, a performance of an absolute idol of the time, and the event was a triumph from its first to its last performance. She went to France and France she became intimate with many literary men—Swinburne, Charles Reade, Dickens (to whom she dedicated in 1868 a volume of verse, Infelicia), Gautier and Dumas the elder. Paris saw her for a hundred nights in Les Pirates de la Savone, and she also played in Vienna and again in London. She died in Paris on the 10th of August 1868.

MENNONTES, a body of religiousists who take their name from Menno Simons (see below), the most valued exponent of their principles. They maintain a form of Christianity which, discarding the sacerdotal idea, owns no authority outside the Bible and the enlightened conscience, limits baptism to the believer, and lays stress on those precepts which vindicate the sanctity of human life and of a man's word. The place of origin of the views afterwards called Mennonite (see BAPTISTS) was Zurich, where in 1523 a small community left the state church and (from Jan. 18, 1525) adopted the tenet of believers' baptism. Unlike other Reformers, they denied at once the Christian character of the existing church and of the civil authority, though, in common with the first Christians, it was their duty to obey all lawful authority, the civil law of the realm. By Protestants as much as by Catholics this position was not unnaturally regarded as subversive of the established foundations of society. Hence the bitter persecutions which, when the safety of toleration was not imagined, made martyrs of these humble folk, who simply wished to cultivate the religious life apart from the world. There was something in this ideal which answered to that medieval conception of separation from the world which had left many middle-class society in Europe; and the revolt from Rome had prepared many minds to this idea of separation from the pursuit of holiness in a society pledged to primitive discipline. Hence the new teaching and practice spread rapidly from Switzerland to Germany, Holland and France. While the horrors of the Münster fanaticism, which culminated in 1534, made Anabaptism a byword, and increased the severity of the persecution directed against all Baptists indiscriminately, the reaction against the fatal errors of the Münster experiment increased also the adherents of communities which discarded the sword; thus Menno was brought into their ranks. Each community was independent, united with others only by the bond of love. There was no bishop (in the Greek Church), but "exhorters," chosen by the members, among them "elders" for administering baptism and the Lord's Supper; an arrangement so readily renewed that the sure way of putting down such a body was the execution of all its constituents, often by drowning, an appropriate end, according to Zwinglei's quip. The remnant of the Swiss Mennonites (not tolerated till 1719) broke in 1620 into two parties, the Uplanders (or Amish, from their leader Jacob Amen) holding against the Lowlanders that excommunication of husband or wife dissolved marriage, and that razors and bushy beards were unlawful. In Holland the Mennonites have always been numerous. An ofshot from them at Rhijnburg in 1619, founded by the four brothers, farmers, Van der Kode, and named Collegianten from their meetings, termed collegia (thus, as not churches, escaping the penal laws), has been compared to the Plymouth Brethren, but differed in so far as they required no conformity of religious opinion, and recognized no office of teacher. With them, as Martineau notes, Spinoza had "an intense fellow-feeling." Later, the exiled Socinians from Poland (1660) were in many cases received into membership. There had previously been overtures, more than once, for union with Mennonites on the part of Polish Socinians, who agreed with them in the rejection of oaths, the refusal to take human life, the consequent abstinence from military service and magisterial office, and in the Biblical basis of doctrine; differences of doctrinal interpretation precluded any fusion. In Holland the Mennonites were exempted from military service in 1575, from oath-taking in 1585, from public office in 1617. In Zeeland exemption from military service and oaths was granted in 1577; afterwards, as in Friesland, a heavy poll tax was the price of exemption from military service; but since 1795 they have enjoyed a legal exemption. The religious union of the Mennonites of the Vosges were exempted from military service in 1703, an exemption confirmed by Napoleon, who employed them in hospital service on his campaigns. That he did not exempt the Dutch Mennonites is due to the fact that "they had ceased to present a united front of resistance to military claims" (Martineau); in fact they sent a large band of volunteers to Waterloo (Barclay). While in Germany the Mennonites exist in considerable numbers, more important are the German Mennonite colonies in southern Russia, brought there in 1788 by Catherin II. and freed, by the grant of complete religious liberty, from the hardships imposed by Prussian military law. These colonies have sent many emigrants to America, where their oldest community was settled (1683) at Germantown, Pennsylvania. Their settlement in Canada dates from 1786. Among the American Mennonites there are three sections, and a progressive party, known as New School Mennonites.

S. Cramer gives (1903) the following statistics: in all, some 250,000 members, of whom over 80,000 are in the United States, 70,000 in Holland and Prussia, 30,000 in Canada, 18,000 in Germany, and 50,000 in Switzerland, 800 in France, and the same number in Poland and Galicia. (A. Go.)*

MENNO SIMONS (1492–1559), religious leader, was born in 1492 at Wittemarsum in Friesland. Of his parentage (apart from his patronymic) and education nothing is known. He was not a man of learning, nor had he many books; for his knowledge of early Christian writers he was partly indebted to the Chronica or compilations of Sebastian Franck. At the age of twenty-four he entered the priesthood, becoming one of two curates under the incumbent of Pinjum, a village near his birthplace. He abandoned his vocation, and, freed by the grant of complete religious liberty, took up the study of law, and indulgent and living. Having heard of Frisian Freerks, who had been repudiated in the previous December of Emden, introduced further questions. Menno was not satisfied with the insufficient answers which he got from Luther, Euer and Bullinger; he resolved to rely on Scripture alone, and from this time describes his preaching as evangelical, not sacramental. In 1532 he exchanged his curacy for a living at Wittemarsum, in response to a popular call. Anabaptism of the Münster type
repelled him. His first tractate (1535, first printed 1567) is directed against the "horrible and gross blasphemy of John of Leiden"—though the genuineness of this tract has been doubted. A brother of Menno joined the insurgent followers of John Matthyssoon, and was killed at Bolsward (April 1535). Blaming the leaders by whom these poor people had been misled, Menno blamed himself for not having shown them a straight course. Accordingly on the 12th of January 1536, he left the Roman communion. There were now among the so-called Anabaptists four parties, the favourers of the Münster faction, the Batenburgers, extremists, the Melchiorites and the Obbenites. For a time Menno remained aloof from both Melchior Hofman and Obbe Philipsz. Before the year was out, yielding to the prayer of six or eight persons who had freed themselves from the Münster spell, he agreed to become their minister, and was set apart (January 1537) to the eldership at Groningen, with imposition of hands by Obbe Philipsz, who is regarded as the actual founder of the Mennonite body. In fact, Obbe left the body and is stigmatized as its Demas. Menno repudiated the formation of a sect; those who had experienced the "new birth" were to him the true Christian church, which was limited by no decree of reprobation. His Christology was in the main orthodox, though he rejected terms (such as Trinitity) which he could not find in Scripture, and held a Valentinian doctrine of the celestial origin of the flesh of Christ. His church discipline was drawn from the Swiss Baptists. Silent prayer was a feature of the worship; sermons were without texts. Neither baptism (by pouring on the head) nor the Lord's Super (with the ascension) were permitted; they were divine ordinances which reflected the believer's inward state. Marriage with outsiders was prohibited; women had no part in church government. Oaths and the taking of life were absolutely forbidden; hence the magistracy and the army were for the Mennonite unlawful calling; but magistrates were to be obeyed in all things not prohibited by Scripture. The subsequent career of Menno was that of an active missioner: his changes of place, often compulsory, are difficult to trace. He was apparently much in East Friesland till 1541; in North Holland, with Amsterdam as centre, from 1541 to 1543; again till 1545 in East Friesland (where he held a disputation at Emmen with John à Lasco in January 1544); till 1547 in South Holland; next, about Lübeck; at Wismar in 1553-1554 (he held two disputations with Martin Micronius at Norden in February 1554); lastly at Wuustwele, a village near Oldeslo, between Hamburg and Lübeck, where he died on the 13th of January 1559. He had married one Gertrude at Groningen, and left a daughter, by whom the dates of his birth and death were communicated to P. J. Twisch, for his Chronyck (1619).

Menno's writings in Plattdeutsch, printed and unprinted places, are numerous, with much sameness, and what an unfriendly critic would call wool-gathering; through them shines a character attractive by the sincerity of its simple and warm spirituality, the secret of Menno's influence. The collection of his Opera Omnia Theologica (Amsterdam, 1681), folio, in a Dutch version, comprises twenty-three tracts, with reference to nine unprinted. His main principles will be found in his Das Fundament des Christlichen Lebers (1539, 8vo). A selection (Gedrucktebriefe) from his writings, in a German version, in honour of the (supposed) centennial of his death was edited by J. Mannhardt (Danzig, 1861) with an appendix from the writings of Dirk Philipsz (1864-1870), brother of Obbe, and Menno's henchman. His writings are published in English at Elkhart, Indiana.

Since the publication of the Leben (1637) by A. M. Cramer, eight has been thrown on the period by the researches of Dr. Hoppe Schopper; see also de Vries, Mennonische Nederland, 1696; R. Barclay, Inner Life of Religious Societies of the Commonwealth (1876) for a good account of Mennonite anticipations of Quaker views and practices; F. C. Fleischer, Mennon Simons, eine Laufschachtel (Leipzig, 1891), and a biography of Menno; V. Krul, Sibbe, Gierman; E. J. Comment, in Hauck's Realencyklopädie (1903); a separate article in the same, Mennoniten, by S. Cramer, gives a survey of the origin and ramifications of the movement in Europe and America. (A. Go.)

MENOMINEE—MENSHIKOV

MENOMINEE, a city and the county-seat of Menominee county, Michigan, U.S.A., on Green Bay, at the mouth of the Menominee river, a branch of the Mississippi, and on the county-seat, about 12,888, of whom 11,586 were foreign-born; (1910 census), 19,507. It is served by the Chicago & North-Western, the Chicago, Milwaukee & St Paul, the Wisconsin & Michigan, and the Ann Arbor railways, and is connected by five bridges with Marinette, Wisconsin. Menominee has several parks, and harbour and dock facilities for the heaviest lake vessels. It is one of the largest lumber centres in the United States; it has excellent water power, and there are manufactures of wire, steel, electrical appliances, mill and mining machinery, shoes, beet sugar and paper. The use of beet-pulp instead of India-rubber for dairy cows has promoted the dairy farming industry for the city.

A trading post was established here in 1799, but settlement was not begun until 1833. Menominee became the county-seat in 1874, was chartered as a city in 1883, and in 1891 and in 1901 it was re-chartered; in 1903 an amendment to the charter created a municipal court. The city is named after the Menominee Indians, an Algonquian tribe formerly ranging over a considerable territory in Wisconsin and Michigan, who seem to have been first visited by whites in 1634, when Nicolet found them at the mouth of the Menominee river, and now number about 1,500, most of them being under the Green Bay school superintendency, Wisconsin. The name is the Chippewa word for wild rice, which formed part of the food of the tribe.

MENOMONEE, a city and the county-seat of Dunn county, Wisconsin, U.S.A., about 64 m. E. of St Paul, Minnesota, on the Red Cedar river. Pop. (1890), 5,141; (1900), 5,655, of whom 1772 were foreign-born; (1905), 5,473; (1910), 5,936. It is served by the Chicago, Milwaukee & St Paul, and the Chicago, St Paul, Minneapolis & Omaha railways. The city is widely known for its institutions, of which the most part founded or supported by James Huff Stout (1848-1910), a prominent local lumberman. Among them are the Mabel Tainter Memorial Library, the Dunn County School of Agriculture, the Dunn County Normal Training School, the Stout Institute for the training of teachers of domestic science &c., institutions in which public school children receive physical training. The city has grain elevators, and manufactures of bricks and tiles, foundry and machine shop products, carriages and wagons and flour. Menomonee is an important market for dairy products and livestock. Menomonee was settled about 1846 and was chartered as a city in 1882. The first free travelling library in the state was established here in 1866 by James Huff Stout.

MENSA and MAREA, semi-nomadic pastoral tribes of Africans occupying part of the Abyssinian highlands included in the Italian colony of Eritrea, and the adjacent coast plains of the Red Sea. They have for neighbours the Habab and Beni-Amer tribes, as well as Abyssinians. The Marea are found chiefly in the valley of the Khor Anzeba, the Mensa dwelling farther north. These tribes claim Arab origin, tracing their descent from an uncle of the Prophet. Under Abyssinian influence they were Christians, but became Mahomedans in the 10th century. They speak a dialect of Tigrean (Abyssinian). On the death of a Marea the head of every dependent tigre or slave family must give his heirs a cow. The tribes avenge an illegitimate birth by putting parents and child to death.

MENSHIKOV, ALEXANDER DANILOVICH, prince (1663-1729), Russian statesman, was born not earlier than 1660 nor later than 1663. It is disputed whether his father was an ostler or a bargee. At the age of twenty he was gaining his livelihood as a seaman on ships of Moscow as a vendor of meal-pies. His handsome looks and smart sallies attracted the attention of Francois Lefort, Peter's first favourite, who took him into his service and finally transferred him to the tsar. On the death of Lefort in 1699, Menshikov succeeded him as prime favourite. Ignorant, brutal, grasping and corrupt as he was, he deserved the confidence of his master. He could drill a regiment, build a frigate, administer a province, and decapitate a rebel with equal facility. During the tsar's first foreign tour, Menshikov worked by his side in the dockyards of Amsterdam, and acquired a thorough knowledge of colloquial German and Dutch. He took an active

MENSHIKOV—MENSURATION

part in the Azov campaigns (1695-96), and superseded Ogilvie as commander-in-chief during the retreat before Charles XII. in 1708, subsequently participating in the battle of Holowczyn, the reduction of Mazepa, and the crowning victory of Poltava (June 26, 1709), where he won his marshal's bâton. From 1709 to 1714 he served during the Courland, Holstein and Pomeranian campaigns, but then, as governor-general of Ingris, with the rank of marshal, he was prominent with a leading part in the civil administration. Menshikov understood perfectly the principles on which Peter's reforms were conducted, and was the right hand of the tsar in all his gigantic undertakings. But he abused his omnipotent position, and his depredations frequently brought him to the verge of ruin. Every time the tsar returned to Russia he received fresh accusations of peculation against "his Serene Highness." Peter's first serious outburst of indignation (March 1711) was due to the prince's laying in Poland. On his return to Russia in 1712, Peter discovered that Menshikov had winked at wholesale corruptions in his own governor-generalship. Peter warned him "for the last time" to change his ways. Yet, in 1713, he was implicated in the famous Solov'ey process, in the course of which it was demonstrated that he had defrauded the government of 100,000 roubles. He only owed his life on this occasion to a sudden illness. On his recovery Peter's fondness for his friend overcame his sense of justice. In the last year of Peter's reign fresh frauds and defalcations of Menshikov came to light, and he was obliged to appeal for protection to the empress Catherine. It was chiefly through the influence of Menshikov and his colleagues that Peter's relation with Catherine was maintained, and he visited her on the last day of his life, on February 25, 1725. Catherine was raised to the throne. Menshikov was committed to the Petrine system, and he recognized that, if that system were to continue, Catherine was, at that particular time, the only possible candidate. Her name was a watchword for the progressive faction. The placing of her on the throne meant a final victory over ancient prejudices, a vindication of the new ideas of progress. During her short reign (February 1725—May 1727), Menshikov was practically absolute. On the whole he ruled well, his difficult position serving as some restraint upon his natural inclinations. He contrived to prolong his power after Catherine's death by means of a forged will and a coup d'état. While his colleague Tolstoi would have raised Elizabeth Petrovna to the throne, Menshikov set up the youthful Peter II., son of the tsarevich Alexis, with himself as dictator during the prince's minority. He now aimed at establishing himself definitely by marrying his daughter Mary to Peter II. But the old nobility, represented by the Dolgorukis and the Golitsins, united to overthrow him, and he was deprived of all his dignities and offices and expelled from the capital (Sept. 9, 1727). Subsequently he was deprived of his enormous wealth and title, and his whole family were banished to Berezov in Siberia, where he died on the 12th of November 1729. See G. V. Esoiv, Biography of A. D. Menshikov (Rus.) (St Petersburg, 1875); N. I. Kostomarov, The History of Russia in the biographies of her great Men (Rus.), vol. ii. (St Petersburg, 1888, etc.); R. Nisbet Bain, The First Romanov (London, 1909); ibid. The Publics of Peter the Great, ch. 2-4 (Westminster, 1897). (R. N. B.)

MENSHIKOV, ALEXANDER SERGIEIVICH, PRINCE (1727—1869), great-grandson of the preceding, was born on the 11th of September 1787, and entered the Russian service as attaché at the embassy at Vienna. He accompanied the emperor Alexander throughout his campaigns against Napoleon, and retired from army service in 1823. He then devoted himself to naval matters, became an admiral in 1834, and put the Russian navy, which had fallen into decay during the reign of Alexander, on an efficient footing. At the time of the dispute as to the Holy Places he was sent on a special mission to Constantinople, and when the Crimean war broke out he was appointed commander-in-chief by land and sea. He commanded the Russian army at the Alma and in the field operations round Sevastopol. In March 1855 he was recalled, ostensibly and perhaps really, on account of failing health. He died on the 2nd of May 1869 at St Petersburg.

MENSURATION (Lat. mensura, a measure), the science of measurement; or, in a more limited sense, the science of numerical representation of geometrical magnitudes.

1. Scope of the Subject.—Even in the second sense, the term is a very wide one, since it comprises the measurement of angles (plane and solid), lengths, areas and volumes. The measurement of angles belongs to trigonometry, and it is convenient to regard the measurement of the lengths of straight lines (i.e., of distances between points) as belonging to geometry or trigonometry; while the measurement of curved lengths, except in certain special cases, involves the use of the integral calculus. The term "mensuration" is therefore ordinarily restricted to the measurement of areas and volumes, and of certain simple curved lengths, such as the circumference of a circle.

2. This restriction is to a certain extent arbitrary. The statement that, if the adjacent sides of a rectangle are represented numerically by 3 and 4, the diagonal is represented by \( \sqrt{3^2 + 4^2} \), or by the formula \( a \cdot b \), is provided with the traditional method of mensuration. The distance between two points can, at any rate in theory, be measured directly, by successive applications of the unit of measurement. But an area or a volume cannot generally be measured by successive applications of the unit of area or volume; intermediate processes are necessary, the result of which is expressed by a formula. The chief exception is in the use of liquid measure; this is of importance from the educational point of view (§ 12).

3. The measurement is numerical, i.e., it is representation in terms of a unit. The process of determining the area or volume of a given figure therefore involves two separate processes; viz. the direct measurement of certain magnitudes (usually lengths) in terms of a unit, and the application of a formula for determining the area or volume from these data. Mensuration is not concerned with the first of these two processes, which forms part of the art of measurement, but only with the second. It might, therefore, be described as that branch of mathematics which deals with formulae for calculating the numerical measurements of lengths, areas and volumes, in terms of numerical data which determine the area or volume. The process, therefore, is numerical; the method of mensuration is arithmetic.

4. It is also convenient to regard as coming under mensuration the consideration of certain derived magnitudes, such as the moment of a plane figure with regard to a straight line in its plane, the calculation of which involves formulae which are closely related to formulae for determining areas and volumes.

5. On the other hand, the scope of the subject, as described in § 3, is limited by the nature of the methods employed to obtain formulae which can be applied to actual cases. Up to a certain point, formulae of practical importance can be obtained by the use of graphical methods or of geometrical methods. Beyond this point, analytical methods must be adopted, and the student passes to trigonometry and the infinitesimal calculus. These investigations lead, in turn, to further formulae, which, though not obtainable by elementary methods, are nevertheless simple in themselves and of practical utility. If these are included in the description "mensuration," the subject thus consists of two heterogeneous portions—elementary mensuration, comprising methods and results, and advanced mensuration, comprising certain results intended for practical application.

6. Mensuration, then, is mainly concerned with quadrature-formulae and cubature-formulae, and, to a not very clearly defined extent, with the methods of obtaining such formulae; a quadrature-formula being a formula for calculating the numerical
7. This use of formulae for dealing with numbers, which express magnitudes in terms of units, constitutes the broad difference between mensuration and ordinary geometry, which knows nothing of units. Mensuration involves the use of geometrical theorems, but it is not concerned with problems of geometrical construction. The area of a rectangle, for instance, is found by calculation from the lengths of the sides, not by construction of a square of equal area. On the other hand, it is worth noticing that the words "quadrature" and "cubature" are originally due to geometrical rather than numerical considerations; the former implying the construction of a square whose area shall be equal to that of a given surface, and the latter the construction of a cube whose volume shall be equal to that of a given solid.

8. There are two main groups of subjects in which practical needs have tended to develop a separate science of mensuration. The first group comprises such subjects as land-surveying; here the measurements in the elementary stages take place in a plane, and the consideration of volumes necessarily constitutes a later stage; and the figures to be measured are mostly not movable, so that triangulation plays an important part. The second group comprises the mechanic arts, in which the bodies to be measured are solid bodies which can be handled; in these cases, plane figures appear mainly as sections of a solid. In developing a system of mensuration-formulae the importance of this latter group of cases must not be overlooked.

A third group, of increasing importance, comprises cases in which curves or surfaces arise out of the application of graph methods in engineering, physics and statistics. The general formulae applicable to these cases are largely approximative.

9. Relation to other Subjects.—As a result of the importance both of the formulae obtained by elementary methods and of those which have involved the previous use of analysis, there is a tendency to dissociate the former, like the latter, from the methods by which they have been obtained, and to regard mensuration as consisting of those mathematical formulae which are concerned with the measurement of geometrical magnitudes (including lengths), or, in a slightly wider sense, as being the art of applying these formulae to specific cases. Such a body of formulae cannot, of course, be regarded as constituting a science; it has no power of development from within, and can only grow by accretion. It may be of extreme importance for practical purposes; but its educational value, if it is studied apart from the methods by which the formulae are obtained, is slight. Vitality can only be retained by close association with more abstract branches of mathematics.

10. On the other hand, mensuration, in its practical aspect, is of importance for giving reality to the formulae themselves and to the principles on which they are based. This applies not only to the geometrical principles but also to the arithmetical principles, and it is therefore of importance, in the earlier stages, to keep geometry, mensuration and arithmetic in close association with one another; mensuration forming, in fact, the link between arithmetic and geometry.

11. It is in reference to the measurement of areas and volumes that it is of special importance to illustrate geometrical truths by means of concrete cases. That the area of a parallelogram is equal to the area of a rectangle on the same base and between the same parallels, or that the volume of a cone is one-third that of a cylinder on the same base and of the same height, may be established by a proof which is admitted to be rigorous, or be accepted in good faith without proof, and yet fail to be a matter of conviction, even though there may be a clear conception of the relative lengths of the diagonal and the side of a square or of the relative areas of parallelograms and squares. This is owing to difficulty in realizing the numerical expression of an area or a solid in terms of a specified unit, while the same difficulty does not arise in the case of linear measure or liquid measure, where the number of units can be ascertained by direct counting. The difficulty is perhaps less for volumes than for areas, on account of the close relationship between solid and fluid measure.

12. The main object to be aimed at, therefore, in the study of elementary mensuration, is that the student should realize the possibility of the numerical expression of areas and volumes. The following are some important points.

(i) The double aspect of an area should be borne in mind; i.e., area should be treated not only as length multiplied by length, but also as volume divided by thickness. There are, indeed, certain advantages in preferring the latter to the former, and in proceeding from volumes to areas rather than from areas to volumes. While, for instance, it may be difficult to realize the equality of two plots of ground of different shapes, it may be easy to realize the equality of the amounts of a given material that would be required to cover them to a particular depth. This method is unconsciously adopted by the teacher who illustrates the equality of area of two geometrical figures by cutting them out of cardboard of uniform thickness and weighing them.

(ii) The very earliest stages of mensuration should be directed simply with arithmetical processes.

(iii) Association of solid measure with liquid measure, presenting numerical measure directly in different aspects, may be avoided; and may also be preserved by treating volumes as found from linear dimensions with the volumes of the same bodies as found by the use of measures of capacity. Here, as usual, the British systems of measures produce a difficulty which would not arise under the metric system.

(iv) Solids of the same substance should be compared by measuring and also by weighing; the comparison being then extended to areas of uniform thickness, and also to volumes.

(v) The idea of an average may be introduced at an early stage, methods of calculating an average being left to a later stage.

13. Classification.—The methods of mensuration fall for the most part under one or other of three main heads, viz., arithmetical mensuration, geometrical mensuration, and analytical mensuration.

14. The most elementary stage is arithmetical mensuration, which comprises the measurement of the areas of rectangles and the volumes of solids; and cubic blocks for the mensuration of volumes. The measure of the area of a rectangle is thus presented as the product of the measures of the sides, and arithmetic and mensuration are developed concurrently. The commutative law for multiplication is directly illustrated; and subdivisions or groupings of the units lead to such formulae as \((a + a)(b + b) = ab + ab + a b + a b\). Association with other branches of science is maintained by such methods as those mentioned in § 12.

15. The use of the square bricks familiarizes the scholar with the ideas of square, area of side, of side of a square, area of a rectangle, and of right angles. The conception of the right angle is strengthened, by contrast, by the use of bricks in the form of a rhombus.
The difficulties to which reference has been made in § 11 are largely due to the abstract nature of the process involved in the second of the above steps. The difficulty should, wherever possible, be removed by making the process of division and rearrangement complete. This is not always done. To say, for instance, that the area of a right-angled triangle is half the area of the rectangle contained by the two sides, is not to say what the area is, but what it is the half of. The proper statement is that, if \( a \) and \( b \) are the sides, the area is equal to the area of a rectangle whose sides are \( a \) and \( b \); this being, in fact, a particular case of the proposition that the area of a trapezium is equal to the area of a rectangle whose sides are its breadth and the arithmetic mean of the lengths of the two parallel sides. This mode of statement helps to establish the idea of an average. The development of the formula \( \frac{1}{2}ab \), where \( a \) and \( b \) are numbers, should be regarded as a later step.

Elementary trigonometrical formulae, not involving the conception of an angle as generated by rotation, belong to this stage; the additional geometrical idea involved being that of the proportionality of the sides of similar triangles.

16. The third stage is analytical mensuration, the essential feature of which is that account is taken of the manner in which a figure is generated. To prevent discontinuity of results at this stage, recapitulation from an analytical point of view is desirable. The area of a figure, has, so far been regarded as a figure bounded by one pair of parallel straight lines and another pair at right angles to them, so that the conception of "rectangularity" has had reference to boundary rather than to content; analytically, the rectangle must be regarded as the figure generated by an ordinate of constant length moving parallel to itself with one extremity on a straight line perpendicular to it. This is the simplest case of generation of a plane figure by a moving ordinate; the corresponding figure for generation by rotation of a radius vector is a circle.

To regard a figure as being generated in a particular way is essentially the same as to regard it as being made up of a number of successive elements, so that the analytical treatment involves the idea of the method and the use of the infinitesimal calculus. It is not, however, necessary that the notation of the calculus should be employed throughout.

A plane figure bounded by a continuous curve, or a solid figure bounded by a continuous surface, may generally be most conveniently regarded as generated by a straight line, or a plane area, moving in a fixed direction at right angles to itself, and changing as it moves by the rule which defines the curve. It follows that the use of Cartesian co-ordinates leads to important general formulae, such as Simpson's formula.

The treatment of an angle as generated by rotation, the investigation of the relations between trigonometrical ratios and circular measure, the application of interpolation to trigonometrical tables, and the general use of graphical methods to represent continuous variation, all imply an analytical onlook, and must therefore be deferred to this stage.

17. There are certain special cases where the treatment is really analytical, but where, on account of the simplicity or importance of the figures involved, the analysis does not take a prominent part.

(i) The circle, and the solid figures allied to it, are of special importance. The ordinary definition of a circle is equivalent to definition as the figure generated by the rotation of a radius of constant length in a plane, and is thus essentially analytical. The ideas of the centre and of the constancy of the radius do not, however, enter into the elementary conception of the circle as a round figure. This elementary conception is of the figure as already existing, rather than of its method of description; the test of circularity being the possibility of rotation within a surrounding figure so as to keep the two boundaries always completely in contact. In the ordinary elementary treatment of the circle, the problem is to find the idea of sphericity, which would be tested in a similar way, and is in fact so tested, at an early stage by tactile perception, and at a more advanced stage by mechanical methods; the next step being the conicality of the central section, as roughly tested (where the sphere is small) by visual perception, i.e. in effect, by the circularity of the cross-section of a circumscribing cylinder; and the ideas of the centre and of non-central sections follow later.

It seems to follow that the consideration of the area of a circle should precede the consideration of its perimeter, and that the consideration of the volume of a sphere should precede the consideration of its surface-area. The proof that the area of a circle is proportional to the square of its radius would therefore precede the proof that the perimeter is proportional to the diameter; the former of these facts, however, is not a necessary consequence of the latter. The development of a curve line as the limit of the sum of a number of straight lengths presents special difficulties. The ratio \( \frac{1}{2}r \) would thus first appear as the ratio of the average breadth of a circle to the greatest diameter; the interpretation of \( r \) as the ratio of the circumference to the diameter being a secondary one. This order follows, in fact, the historical order of development of the subject.

(ii) Developable surfaces, such as the cylinder and the cone, form a more convenient class, so far as the calculation of their area is concerned. The process of unrolling is analytical, but the unrolled area can be measured by methods not applicable to other surfaces.

(iii) Solids of revolution of the second class which can be conveniently treated by the two theorems of Pappus (§ 33).

18. The above classification relates to methods. The classification of results, i.e. of formulae, will depend on the purpose for which the collection of formulae is required, and may involve the grouping of results obtained by very different methods. A collection of formulae relating to the circle, for instance, would comprise not only geometrical and trigonometrical formulae, but also approximate formulae, such as Huygens's rule (§ 91), which are the result of advanced analysis.

The present article is not intended to give either a complete course of study or a complete collection of formulae, and therefore such only of the ordinary formulae are given as are required for illustrating certain general principles. For fuller discussion of reference should be made to Geometry and Trigonometry, as well as to the articles dealing with particular figures, such as Circle, Cylinder, &c.

19. The most important formulae are those which correspond to the use of rectangular Cartesian co-ordinates. This implies the treatment of a plane or solid figure as being wholly comprised between two parallel planes or planes, regarded by convention as being vertical; the figure being generated by an ordinate or section moving at right angles to itself through a distance which is called the breadth of the figure. The length or area obtained by dividing the area or the volume of the figure by its breadth is the mean ordinate (mean height) or mean section (mean sectional area) of the figure.

Quadrate-formulae or cubature-formulae may sometimes be conveniently replaced by formulae giving the mean ordinate or mean section. In the earlier stages it is best to use both methods, so as to develop the idea of an average (§ 12). In the present article the formulae for area or volume will be used throughout.

20. Approximation.—The numerical result obtained by applying a formula to particular data will generally not be exact. There are two kinds of causes producing want of exactness.

(i) The formula itself may not be numerically exact. This may happen in either of two ways.

(a) The formula may involve numbers or ratios which cannot be expressed exactly in the ordinary notation. This is the case, for instance, with formulae which involve \( \pi \) or trigonometrical ratios. This inexactness may, however, be ignored, since the numbers or ratios in question can generally be obtained to a greater degree of accuracy than the other numbers involved in the calculation (see (iii) below).

(b) The formula may only be approximative. The length of the arc of a circle, for instance, is known if the length of the chord and its distance from the middle point of the arc are known; but it may be more convenient in such a case to use a formula such as Huygens's rule than to obtain a more accurate result by means of trigonometrical tables.

(ii) Data may be such that an exact result is impossible.

(a) The nature of the bounding curve or surface may not be exactly known, so that certain assumptions have to be made, a formula being then used which is adapted to these assumptions. This may be brought about in the simplest case by an approximately circular figure, or to a plane figure implies certain assumptions as to the nature of the bounding curve. Such a figure is approximate, in that it is known that the result of its application will only be approximately correct; it differs from a exact form of the kind mentioned in (b) above, in that it is adopted of necessity, not by choice.

(b) It must, however, be remembered that in all practical applications of formulae the data have first to be ascertained by direct measurement; and this measurement involves a certain margin of error.
MENSURATION

The two sources of error mentioned under (a) and (b) above are closely connected. For instance, we require the area of a circular grass-plot of measured diameter. As a matter of fact, no grass-plot is truly circular; and it might be found that if the breadth in various directions were measured, the width of circular would reveal itself. Thus the inaccuracy in taking the measured diameter as the datum is practically of the same order as the inaccuracy in taking the grass-plot to be circular.

(iii) In dealing with cases where actual measurements are involved, the error (i) due to accuracy of the formula will often be negligible in comparison with the error (ii) due to inaccuracy of the data. For this reason, formulae, which will only give approximate results are usually classed together as rules, whether the inaccuracy lies as (in the case of Huygens's rule) in the formula itself, or (as in the case of Simpson's rule) in its application to the data.

21. It is necessary, in applying formulae to specific cases, not only on the one hand, to remember that the measurements are only approximate, but also, on the other hand, to give to any ratio such as \( \pi \) a value which is at least more accurate than the measurements. Suppose, for instance, that in the example given in \( \S 20 \) the diameter as measured is 1 ft. 3 in. If we take \( \pi = 3.14 \) and find the area to be 26.288 sq. ft. in. = 28.65 sq. ft., we make two separate mistakes. The main mistake is in giving the result as true to a small fraction of a square inch; but, if this degree of accuracy had been possible, it would have been wrong to give \( \pi \) a value which is in error by more than 1 in 200.

Calculations involving feet and inches are sometimes performed by means of duodecimal arithmetics; i.e., in effect, the tables of square intermediate units, and of cubic measure are amplified by the insertion of the square of the unit.

For square measure-

- 1 square foot = 1 foot.
- 1 square inch = 1 foot.

While for cubic measure-

- 1 cubic inch = 1 cubic foot.
- 1 cubic foot = 1 cubic foot.

When an area has been given in terms of square feet, squares and square inches, the prime and square inches have to be reduced to square inches; and similarly with the calculation of volumes. The value of \( \pi \) for duodecimal arithmetic is 3.1415926535897932.

22. Areas of Plane Rectilinear Figures.—The following are expressions for the areas of some simple figures; the expressions in (i) and (ii) are of course exact, whilst those in (iii) to (vi) involve dissection and rearrangement.

(i) Square: side \( a \). Area = \( a^2 \).

(ii) Rectangle: sides \( a \) and \( b \). Area = \( ab \).

(iii) Right-angled triangle: sides \( a \) and \( b \), enclosing the right angle. Area = \( \frac{1}{2}ab \).

(iv) Parallelogram: two opposite sides \( a \) and \( b \), distance between them \( h \). Area = \( ah \).

(v) Triangle: one side \( a \), distant \( h \) from the opposite angle. Area = \( \frac{1}{2}ah \).

If the data for any of these figures are other than those given above, trigonometrical ratios will usually be involved. If, for instance, the data for the triangle are sides \( a \) and \( b \), enclosing an angle \( C \), the area is \( \frac{1}{2}ab \sin C \).

23. The figures considered in \( \S 22 \) are particular cases of the trapezium, which is a quadrilateral with two parallel sides. If these sides are \( a \) and \( b \), at distance \( h \) from one another, the area is \( \frac{1}{2}(a + b)h \). In the case of the triangle, for instance, \( b = 0 \), so that the area is \( \frac{1}{2}ah \).

The trapezium is sometimes called a "trapezoid," but it will be convenient to reserve this term for a different figure (\( \S 24 \)).

The most important form of trapezium is that in which one of the two remaining sides of the figure is at right angles to the two parallel sides. The trapezium is then a right trapezium; the two parallel sides are called the sides, the side at right angles to them the base, and the fourth side the leg.

By producing the two parallel sides of any trapezium (e.g., a parallelogram) and drawing a line at right angles to them, outside the figure, we see that it may be treated as the difference of two right trapeziums.

It is, however, more simple to convert it into a single right trapezium. Let \( AB \) (fig. 1) be a trapezium, the sides \( CA \) and \( DB \) being parallel. Draw any straight line at right angles to \( CA \) and \( DB \) (produced if necessary), meeting them in \( M \) and \( N \). Along \( CA \) and \( DB \), on the same side of \( MN \), take \( MA = CA \), \( NB = DB \); and join \( AB' \). Then \( MA'B'N \) is a right trapezium, whose area is equal to that of \( C \); and it is related to the latter in such a way that, if any two lines parallel to \( AC \) and \( BD \) meet \( AB, CD, MN, A'B' \), in \( E, G, P, E' \), and \( F, H, F \), respectively, then the piece \( EPQF \) of the right trapezium is equal to the area of the intersection of the GEFH of the original trapezium.

The right trapezium so constructed may be called the equivalent right trapezium. In the case of a parallelogram, an equivalent right trapezium is a rectangle; in the case of a triangle, it is a right-angled triangle.

24. If we take a series of right trapezia, such that one side (\( \S 23 \)) of the first is equal to one side of the second, the other side of the second is equal to one side of the third, and so on, and place them with their bases in a straight line and their equal sides adjoining each other, we get a figure such as \( MABCD \) (fig. 2), which has two parallel sides MA and SF, a base MS at right angles to these, and a side (\( \S 22 \)) equal to the sides AB, BC; the remainder of the figure being outside the space between MA (produced) and SF (produced). A figure of this kind will be called a trapezoid.

(i) If from the other angular points B, C, D, E, perpendiculars BN, CP, DQ, ER, are drawn to the base MS (fig. 2), the area is MN. (\( MP + NP \) + NP + NP + RS. SF). The lines MA, NB, PC, . . . are called the ordinates of the figure, and the projections of the sides AB, BC, CD, . . . on the base.

(ii) A special case is that in which A coincides with M, and F, with S. The figure then stands on a base MS, the remainder of its boundary being a broken line from M to S. The formula then becomes:

\[ \text{area} = \{MP + NQ + PC + . . . + QS \} = \text{RE}. \]

The area is half the sum of the products obtained by multiplying each ordinate by the distance between the two adjacent ordinates. It would be possible to regard this form of the figure as the general one; the figure considered in (i) would then represent the special case, in which the two end-pieces of the broken line are at right angles to the base.

(iii) Another special case is that in which the distances MN, NP, PQ, . . . RS are all equal. If this distance is \( h \), then the area is \[ = \{MN + NP + PC + . . . + QS \}. \]

25. To find the area of any rectilinear figure, various methods are available.

(i) The figure may be divided into triangles. The quadrilateral, for instance, consists of two triangles, and its area is the product of half the length of one side by the sum of the perpendiculars drawn from this diagonal to the other two angular points. For figures of more than four sides this method is usually convenient, except for some cases as that of a regular polygon, which can be divided into triangles by radii drawn from its centre.

(ii) Suppose that two angular points \( A \) and \( E \), are given, and that \( AB \) and \( AE \) are to form a diagonal AE, and that the whole of the figure lies between lines through \( A \) and \( E \) at right angles to AE. Then the figure is (usually) the sum of two trapezoids on base AE, and its area can be calculated as in \( \S 24 \).

\[ \{AP + NB + NQ + PC + PE + EQ + ET + SF + SA \} \]

are called the offsets from the diagonal to the angular points, the area of the polygon in fig. is given by the expression

\[ \{AP + NB + NQ + PC + PE + EQ + ET + SF + SA \}. \]

It would be noticed (a) that \( AP, NQ, . . . \) SA are taken in the cyclical order of the points ABC . . . GAD, and (b) that in fig. 3, if AN and NB are regarded as positive, then SF, TG, ET and SA are negative. Positive offsets will arise if in moving from \( A \) to \( E \) along the perimeter of either side of the figure the projection of the moving point does not always move in the direction AE.

(iii) Any two straight lines intersecting but not intersecting the figure, and drawn perpendiculars As, Bs, CAs, Ds . . . Fs, Gs to this line. Then, with proper attention to signs,

\[ \text{area} = \{gb + Wa + ab + ac . . . + cc + . . + g9\}. \]

(iv) The figure may be replaced by an equivalent trapezoid, on the system explained in \( \S \), take any base \( XX' \), and draw lines at right angles to this base through all the angular points of the figure.
Let the lines through B, G, C, and D and P (fig. 4) cut the boundary of the figure again in B', G', C', and D', and the base \( XX' \) in K, L, M, N, and P; the points A and E being at the extremities of the figure, and the lines through them meeting the base in a and e. Then, if we take ordinates KB, KG, KC, KD, and PE parallel to BB', GG', CC', DD', FF', and are the area of the base \( abedf \), it will be the equivalent circumscribed prism, and any ordinate equal to the base of \( abedf \) from the base to the top of this prism will be equal to the portion of this ordinate (produced) which falls within the original figure.

26. Volumes of Solids with Plane Faces.—The following are expressions for the volumes of some simple solids.

(i) Cuboid of sides a, b, c; volume = abc.

(ii) Rectangular parallelepiped: sides a, b, c; volume = abc.

(iii) Right prism. Volume = length of edge \( \times \) area of end.

(iv) Oblique prism. Volume = length \( \times \) area of end \( \times \) area of cross-section; the "height" being the perpendicular distance between the two ends.

The parallelepiped is a particular case.

(v) Pyramid with rectangular base. Volume = height \( \times \) area of base.

The tetrahedron is a particular case.

(vi) Wedge; parallel edges a, b, c; area of cross-section S. Volume = \( \frac{1}{6} h(a + b + c)S \).

This formula holds for the general case in which the base is a trapezium; the wedge being thus formed by cutting a triangular prism by any two planes.

(vii) Pyramid of pyramid with rectangular base; height \( \Delta \); areas of ends (i.e. base and top) A and B. Volume = \( \frac{1}{3}h(A + \sqrt{AB + B}) \).

27. The figures considered in \( \S 26 \) are particular cases of the \( \text{prismoid} \) (or \( \text{prismatic} \)), which may be defined as a solid figure with two parallel plane rectilinear ends, each of the other (i.e. the lateral) faces being a triangle with an angular point in one end of the figure and its opposite side in the other. Two adjoining faces in the same plane may together make up a trapezium. More briefly, there may be defined as a polyhedron with two parallel faces containing all the vertices.

If R and S are the ends of a prismoid, A and B their areas, \( h \) the perpendicular distance between the plane faces and \( C \) the area of a section by a plane parallel to R and S and midway between them, the volume of the prismoid is

\[ \frac{1}{3}h(A + C + B). \]

This is the \textit{prismoidal formula}.

The formula is a deduction from a general formula, considered later (\( \S 58 \)), and may be verified in various ways. The most instructive is the regard for the prismoid as built up (by addition or subtraction) of simpler figures, which are particular cases of it.

(i) Let R and S be the vertex and the base of a pyramid. Then \( A = 0, \quad C = 1B, \quad \text{and volume } = \frac{1}{3}h(1A + 4C + B). \)

The tetrahedron is a particular case.

(ii) Let R be one edge of a wedge with parallel ends, and S the face containing the other two edges. Then \( A = 10, \quad C = 1B, \quad \text{and volume } = \frac{1}{3}h(B + 4C + B). \)

(iii) Let R and S be two opposite edges of a tetrahedron. Then the tetrahedron may be regarded as the difference of a wedge with parallel ends, one of the ends being R, and a pyramid whose base is a parallelogram, one side of the parallelogram being S (see fig. 9, \( \S 58 \)). Hence, by (i) and (ii), the formula holds for this figure.

(iv) For the prismoid in general let ABCD... be one end, and A'B'C'D'... the other. Take any point P in the latter, and form triangles by joining P to each of the sides AB, BC, CD, DB, CA, DA, and also to each of the edges. Then the prismoid is divided into a pyramid with vertex P and base ABCD... and a series of tetrahedra in the same way as PABD... and so on.

Denoting the constant ratio by \( \frac{1}{4} \), the area of a circle is \( \pi a^2 \), where \( a \) is the radius of the circle, and \( \pi = 3.14159 \) approximately. The expression \( 2\pi a \) for the length of the circumference of a circle of radius \( a \) is the diameter in the center of a small circle of radius \( a \), when \( a \) becomes indefinitely small; this is an element of length of the circle.

The lengths of arcs of the same circle being proportional to the angles subtended by them at the center, we get the idea of circular measure.

Let \( O \) be the common center of two circles, of radii \( a \) and \( b \), and let sides enclosing an angle \( \theta \) (circular measure) cut their circumferences in A, B, C, and D, respectively (fig. 5). Then the area of ABDC is

\[ \frac{1}{2} \theta \pi a^2 - \frac{1}{2} \theta \pi b^2. \]

If we bisect \( AB \) and \( CD \) in \( P \) and \( Q \) respectively, and describe the arc PQ of a circle with center O, the length of this arc is \( \frac{1}{2} \theta \pi a^2 \), and the area \( ABDC = ABX \) arc PQ. The figure ABDC is a sector of an annulus which is the portion of a circle left after cutting out a concentric circle.

29. By considering the circle as the limit of a polygon, it follows that the formulae (i) and (v) of \( \S 26 \) hold for a right circular cylinder and a right circular cone; i.e.

volume of right circular cylinder = length \( \times \) area of base;

volume of right circular cone = height \( \times \) \( \pi \) area of base.

These formulae also hold for any right cylinder and any cone.

30. The curved surfaces of the cylinder and of the cone are \textit{developable} surfaces; i.e., they can be unrolled on a plane.

The curved surface of any right cylinder (whether circular or not) becomes a rectangle, and therefore its area = length \( \times \) perimeter of base. The curved surface of a right circular cone becomes a sector of a circle, and its area = \( \frac{1}{2} \) slant height \( \times \) perimeter of base.

31. If \( a \) is the radius of a sphere, then

(i) volume of sphere = \( \frac{4}{3} \pi a^3; \)

(ii) surface of sphere = \( 4 \pi a^2 \) curved surface of circumscribing cylinder.

The first of these is a particular case of the prismoidal formula (\( \S 58 \)). To obtain (i) and (ii) together, we show that the volume of a sphere can be obtained by dividing the cube whose edge is the diameter; denoting the constant ratio by \( \lambda \), the volume of the sphere is \( \lambda^3 \), and hence, by taking two concentric spheres (cf. \( \S 28 \)), this ratio \( \lambda \) of the surface of the sphere may be split up into elements, each of which is equal to a corresponding element of the curved surface of the circumscribing cylinder, so that \( 3 \lambda^2 = \text{cylindrical surface} = \pi \rho^2 = \text{cylindrical surface} \).

Hence \( \lambda = \frac{1}{6} \).

The total surface of the cylinder is \( 4 \pi a^2 + \pi \rho^2 = 4 \pi a^2 \), and its volume is \( 2 \pi \rho^2 = 2 \pi a^3 \). Hence

volume of sphere = \( \frac{4}{3} \pi \) volume of circumscribing cylinder;

surface of sphere = \( \frac{1}{2} \) surface of circumscribing cylinder.

These latter formulae are due to Archimedes.

The \textit{moments} and \textit{centroids} of a surface or of a solid material body there is a point, fixed with regard to the body, such that the moment of the body with regard to any plane is the same as if the whole mass were collected at that point; the moment being the sum of the products of each element of mass of the body by its distance from the plane.

This point is the centroid of the body.

The ideas of moment and of centroid are extended to geometrical figures, whether solid, superficial or linear. The moment of a figure with regard to a plane is found by dividing the figure into elements of volume, area or length, multiplying each element by its distance from the plane, and adding the products. In the case of a plane figure, the moment of a figure of plane bounded by a straight line in the plane is the same as the moment of the region with regard to a perpendicular plane through this line; i.e., it is the sum of the products of each element of area or length by its distance from the straight line.

The centroid of a figure is a point fixed with regard to the figure, and such that its moment with regard to any plane (or, in the case of a plane area or line, with regard to any line in the plane) is the same as if the whole volume, area or length were concentrated at this point. The centroid is sometimes called the centre of volume, centre of area, or centre of arc. The proof of the existence of the centroid of a figure is the same as the proof of the existence of the centre of gravity of a body. (See \textit{Mechanics}.)

The moment as described above is sometimes called the \textit{first moment}.

The second moment, \textit{third moment},... of a plane or solid figure are found in the same way by multiplying each element by the square of its distance from the line or plane with regard to which the moments are being taken.

If we divide the first, second, third,... moments by the total volume, area or length of the figure, we get the \textit{mean distance}, \textit{mean cube of distances}, mean cube of \textit{diameter}, etc., of the figure from the line or plane. The mean distance of a plane figure from a line in its plane, or of any figure from a plane, is therefore the same as the distance of the centroid of the figure from the line or plane.

We sometimes require the moment of a plane area with regard to a parallel line through the centroid by

\[ M_1 = N_1 - xz N_0, \]

\[ M_2 = N_1 - 2xz N_0 + yz N_2 = N_1 - x^2 N_6, \]

\[ M_3 = N_1 - 3xz N_0 - 3yz N_2 + 21 z^2 N_6 + \ldots + (-)^{r+1} r! z^r N_1 + \ldots = N_1 - x^2 N_6; \]

\[ M_4 = N_1 - 4xz N_0 - 6yz N_2 + 30 z^2 N_6 + \ldots + (-)^{r+1} r! z^r N_1 + \ldots = N_1 - x^2 N_6. \]
where $x$ is the distance between the two lines $= N/N_s$. These formulae also hold for converting moments of a solid figure with regard to a plane into moments with regard to a parallel plane through the centroid, $x$ being the distance between the two planes. A line through the centroid of a plane figure (drawn in the plane of the figure) is a central line, and a plane through the centroid of a solid figure is a central plane, of the figure.

This point is its centroid, i.e., the point of intersection of its diagonals. The first moment of a plane figure with regard to a line in its plane may be regarded as obtained by dividing the area into elementary strips by a series of parallel lines indefinitely close together, and taking the moments of each strip at its centre. Similarly, the first moment of a solid figure may be regarded as obtained by dividing the figure into elementary prisms by two sets of parallel planes, and considering the moments of each prism at the point of intersection of its diagonal with the reference plane.

53. Solid.——If the solid figure be revolved about a solid or surface generated by the revolution of a plane closed figure or a plane continuous line about a straight line in its plane, not intersecting it, is a solid of revolution, or surface of revolution, the straight line being its axis. The revolution need not be complete, but may be through any angle.

54. The section of a solid of revolution by a plane at right angles to the axis is an annulus or a sector of an annulus, according as there are two or more such figures. If the solid is divided into elements by a series of such planes, and if $h$ is the distance between two consecutive planes making sections such as $ABDC$ in fig. 5, the volume of the element bounded by the planes is approximately $h \times AB \times \times PO = h. AB. OP. \phi$. The corresponding element of the revolving figure is approximately a rectangle of area $h. y, x$, the height of the rectangle being $y$, the distance of the point of revolution from the axis. Hence the total volume of the solid is $M. \phi$, where $M$ is the sum of the quantities $h. AB. OP. \phi$, i.e., is the moment of the figure with regard to the axis. The volume is therefore approximately the product of the area of the revolving figure, and $y$ is the distance of its centroid from the axis.

55. If a plane figure revolves about an external axis in its plane, the volume of the solid generated by the revolution is equal to the product of the area of the figure and the distance travelled by the centroid of the figure.

56. If any line in a plane revolves about a plane parallel to and at a distance from the external axis, the volume of the solid generated by the revolution is equal to the product of the area of the figure and the distance travelled by the centroid of the figure.

57. The mensuration of earthwork involves consideration of quadrilaterals whose dimensions are given by special data, and of prismoids whose sections are such quadrilaterals. In the ordinary case, the three of the four lateral surfaces of the prismoid are at right angles to the two ends. In special cases two of these three lateral surfaces are equally inclined to the third.

58. Let $A, B, C, D$, fig. 7, be the distance, measured at right angles to BC, from the middle point of BC to AD. Also, let angle $ABC = x$, angle $BCD = y$, angle between BC and AD = $\phi$. Then (as the difference of two triangles) $\frac{AB}{\cos \psi - \cos \phi}$

59. This formula gives the value of $\theta$ in terms of the values of $h$, $\psi$, and $\phi$, which are known.

60. The formulae $m = \cot \psi - \cot \phi$ and $n = \cot \psi + \cot \phi$ give the values of $\theta$ in terms of $h$, $\psi$, and $\phi$, which are known.

61. The volume of the prismoid is $\frac{1}{2} + \frac{1}{2}h + \frac{1}{2}m$. The mensuration of graphs.

62. (A) Preliminary.——In § 23 the area of a right trapezium has been expressed in terms of the base and the two sides; and in § 34 the area of a somewhat similar figure, the top having been replaced by an arc of a parabola, has been expressed in terms of its base and of three lengths which may be regarded as the sides of two separate figures of which it is composed. We have now to consider the extension of the formulae of this kind to other figures, and their application to the calculation of the moments and volumes.

63. The plane figures with which we are concerned come mainly under the description of graphs of continuous variation. Let $E$ and $F$ be two magnitudes so related that whenever $E$ has any value (within certain limits) $F$ has a definite corresponding value. Let $u$ and $x$ be the numerical expressions of the magnitudes of $E$ and $F$. On any line $OX$ take a length $ON$ equal to $x$, and from $N$ draw $NP$ at right angles to $OX$ and equal to $u$; $G$ and $H$ being convenient units of length. Then we may, ignoring the units $G$ and $H$, speak of ON and $NP$ as being equal to $x$ and $u$ respectively. Let $KA$ and $LB$ be the positions of $NP$ corresponding to the extreme values of $x$. Then the different positions of $NP$ will (if $x$ may have any value from OK to OL) trace out a figure on base $KL$, and extending from $KA$ to $LB$; this is called the graph of $F$ in respect of $E$. The term is also sometimes applied to the line along which the point $P$ moves as $N$ moves from $K$ to $L$.

To illustrate the importance of the mensuration of graphs, suppose that we require the average value of $u$ with regard to $x$. It may be shown that this is the same thing as the mean distance
of elements of the graph from an axis through O at right angles to
OX. Its calculation therefore involves the calculation of the
area and the first moment of the graph.

MENSURATION

40. The processes which have to be performed in the mensuration
of figures of this kind are in effect processes of integration; the
distinction lies in the fact that the frequencies of the abscissae
which lie in the range of values of \( x \) under discussion.

If, for instance, the graph were a trapezium, the calculation of the
area would be equivalent to finding the integral, from \( x = a \) to \( x = b \), of the expression of the form \( px + q \). This
would involve determining, for every ordinate \( y \), the base \( pa + q \) and the base \( pb + q \), and the expression of the
integral in terms of these data would require certain eliminations.
The calculation is, however, often not the final result of such an
elimination in terms of the data, without the necessity of going
through the intermediate processes.

41. Trapezettes and Briquettes.—A figure of the kind described in
the last article is called a trapezette. A trapezette may therefore
be regarded as a plane figure bounded by two straight lines, a base at right angles
to them, and a top which may be of any shape but is such that every
ordinate from the base cuts it in one point and one point only; or,
alternatively, it may be defined as the figure generated by an ordinate
which moves in a plane so that its foot is always on a straight line
to which the ordinate is at right angles, the length of the ordinate varying in any manner as it does so. The distance between the two
straight sides, i.e. between the initial and final position of the
ordinate, is the breadth of the trapezette. Any line drawn from the
base, at right angles to it, and terminated by the top of the trapezette,
is called a "trapezette." The area bounded by this figure is a trapezette.

Either or both of the bounding ordinates may be zero; the top, in
that case, meets the base at that extremity. Any plane figure
may be reduced to a trapezette by an extension of the method of § 25 (iv).

42. The corresponding solid figure, in its most general form, should be
described as being constructed to represent the relation of a magnitude
to a magnitude. The two magnitudes \( a \) and \( b \) in this equation are functions, and it would
stand on a plane base, and be comprised within a cylindrical boundary
whose cross-section might be of any shape. We are not concerned with
divisions of this kind, but only with cases in which the base is a rectangle. The
figure is such as would be produced by removing a piece of a rectangular prism, and is called a briquette. A briquette may therefore
be defined as a trapezette bounded by a pair of parallel planes, another pair of parallel planes perpendicular to
these, a base at right angles to these four planes (and therefore rectangular), and a top which is a surface of any form, but such that
every ordinate from the base cuts it in a line and point only. It may be regarded as generated either by a trapezette moving
in a direction at right angles to itself and changing its top but keeping its base, unaltered, or by an ordinate moving so that its foot has
every possible position within a rectangular base.

43. Representation and Definitions.—The ordinate of the trapezette
will be denoted by \( u \), and the abscissa of this ordinate, \( i.e. \), the distance of its foot from a certain fixed point or origin \( O \) on the base (or the base extended to \( + \infty \) and \( - \infty \), as the case may be), will be denoted by \( x \). The sides of the trapezette are the "abscissae"; their
abscissae being \( x_a \) and \( x_b + \theta \), where \( H \) is the breadth of the trapezette.

The "mid-ordinate" is the ordinate from the middleordinate of the
base, i.e. the ordinate whose abscissa is \( x_a + \frac{1}{2} H \).

The "mean ordinate" or "average ordinate" is an ordinate of length \( l \)
such that \( H \) is equal to the area of the trapezette, and apparently appears as a calculated length rather than as a definite line in the
figure; except that, if there is only one ordinate of this length, a line
drawn through its extremities is so placed that the area of the trapezette
lying above it is equal to a corresponding area below it and
outside the trapezette. Formulas giving the area of a trapezette
should in general also be expressed so as to state the value of the
mean ordinate (§§ 12 (v), 15, 16).

The "ordinate" is the ordinate which divides the area of
the trapezette into two equal portions. It arises mainly in
statistics, when the ordinate of the trapezette represents the relative frequency of the magnitude represented by the abscissa \( x \); the magnitude of the abscissa corresponding to the
median ordinate is then the "median value of \( x \)."

The "central ordinate" is the ordinate through the centroid of the
trapezette (§ 32). The distance of this ordinate from the axis
of \( u \) (i.e. from a line drawn through \( O \) parallel to the ordinates) is
equal to the mean distance (§ 32) of the trapezette from this axis;
moments with regard to the central ordinate are therefore sometimes
described as "moments referred to \( O \)."

The data of a trapezette are usually its breadth and either the
bounding ordinates or the mid-ordinates of a series of minor trapezettes.
When it is divided into \( n \) parts, it is divided into \( n + 1 \) ordinates.
If there are \( m \) of these strips, and if the breadth of each is \( h \), so that
\( H = mh \), it is convenient to write \( x \) in the form \( x_a + mh \), and to
denote it by \( x_a \), the corresponding value of \( u \) being \( u_a \). The data are
then \( x_a \), the mid-ordinates \( u_a \), \( u_{a+1} \), \( u_{a+2} \), \( \ldots \), or the mid-ordinates \( u_{a+1} \), \( u_{a+2} \), \( \ldots \).

44. In the case of the briquette the position of the foot of the
ordinate is expressed by co-ordinates \( x, y \), referred to a pair of axes
parallel to a pair of sides of the base of the briquette. If the
lengths of these sides are \( H \) and \( K \), the coordinates of the angles
of the base,—i.e. the co-ordinates of the edges of the briquette—are
\( (x_0, y_0) \), \( (x_1 + H, y_0) \), \( (x_0 + H, y_K) \), and \( (x_1, y_K) \).

The briquette may usually be regarded as divided into a series of
macro-briquettes, viz. \( u_{a}, u_{a+1}, \ldots, u_{b-1}, u_b \), or (if the mid-ordinates of one set of parallel faces, viz. \( u_1, u_2, \ldots, u_i, \ldots \),
or the mid-ordinates of the other set, viz. \( u_{i+1}, u_{i+2}, \ldots, u_n, \ldots \), are considered) the "minor briquettes," theordinate from the centre being the "central ordinate."
The volume of a briquette can be found in this way if the area of the section by any principal plane can be expressed in terms of the distance of this plane from a fixed plane of the same set. The result of treating this area as if it were the ordinate of a trapezette leads to special formulae, when the data are of the kind mentioned in § 44.

49. (B) Mensuration of Graphs of Algebraical Functions.—The first class of cases to be considered comprises those cases in which \( u \) is an algebraical function of \( x \), i.e. is the form \( u = f(x) \). The trapezette is then a right trapezium, and its area, if \( m = 1 \), is \( \frac{1}{2}(m_a + u) \) or \( h u \).

50. The simplest case is that in which \( u \) is constant or is a linear function of \( x \), i.e. \( u = m_1 + m_2 x \). The trapezette may be expressed in terms of the two bounding ordinates and the mid-ordinate of the strips. If we take these to be \( u_0 \) and \( u_N \), and \( x_0 \) so that \( m = 2 \), we have

\[
\text{area} = \frac{1}{2}h(u_0 - u_N + 2u_1 + u_{N-1}).
\]

This is Simpson’s formula.

If instead of \( u_0 \) and \( u_N \), we have four ordinates \( u_0, u_1, u_2, u_3 \), so that \( m = 3 \), it can be shown that

\[
\text{area} = \frac{1}{3}h(u_0 + 3u_1 + 3u_2 + u_3).
\]

This is Simpson’s second formula. It may be deduced from the formula given above. Denoting the areas of the three strips by \( A, B, C \), we have the relation

\[
A = B; \quad B = C; \quad A + B + C = 2\text{area of trapezette}
\]

and

\[
\text{area of trapezette} = \frac{1}{3}(A + 3B + C).
\]

51. The next case is that in which \( u \) is a quadratic function of \( x \), i.e. is of the form \( u = ax^2 + bx + c \). The trapezette is then a parabolic trapezette, and its area, if \( m = 1 \), is \( \frac{1}{2}h(u_m + ax + b) \) or \( h(u_0 + u_N) \).

52. Simpson’s two formulae (in §§ 49, 50) may also apply if \( u \) is an algebraical function of the form \( u = ax^2 + bx + c \) and \( u = ax^2 + bx \). Generally, if the area of the trapezette for which \( u \) is an algebraical function of \( x \), with an arbitrary function of \( x \) (i.e. a rational integral function of \( x \)) is to be expressed in terms of the two bounding ordinates and the mid-ordinate of the strips, we may write

\[
\text{area} = \frac{1}{2h}h(u_0 - u_N + 2u_1 + u_{N-1}).
\]

This is Simpson’s second formula. It may be deduced from the formula given above. Denoting the areas of the three strips by \( A, B, C \), we have the relation

\[
A = B; \quad B = C; \quad A + B + C = 2\text{area of trapezette}
\]

and

\[
\text{area of trapezette} = \frac{1}{3}(A + 3B + C).
\]

53. When \( u \) is of degree 4 or 5 in \( x \), we require at least five ordinates. If \( m = 4 \), and the data are \( u_0, u_1, u_2, u_3, u_4 \), we have

\[
\text{area} = \frac{1}{6}h(u_0 + 3u_1 + 3u_2 + u_3 + u_4).
\]

For functions of higher degrees in \( x \) the formulae become more complicated.

54. The general method of constructing formulae of this kind involves the use of the integral calculus and of the calculus of finite differences for the area of the trapezette being \( mh \). It may be shown that its area is

\[
\text{area} = \frac{1}{2h}h(u_0 + u_N + 2u_1 + u_{N-1}) + \frac{1}{24}(u_1 - u_0 + u_N - u_{N-1}).
\]

55. The general formulae of § 54 (\( p \) being replaced in (i) by \( m \)) may in the same way be applied to obtain formulae giving the area of a trapezette in terms of the two bounding ordinates of the strips, the series being taken up to \( \frac{1}{m^4}u_m \) or \( \frac{1}{m^5}u_m \) at least, where \( u \) is of degree \( 2f \) or \( 2f + 1 \) in \( x \). Thus we find from (i) that Simpson’s second formula, for the case where the top is a parabola (with axis, say, \( y \), being perpendicular at right angles to the base) and there are three strips of breadth \( h \), may be replaced by

\[
\text{area} = \frac{h}{3}(u_0 + 2u_1 + 3u_2).
\]

This might have been deduced directly from Simpson’s first formula, by a series of eliminations.

56. For the area of a parabola, we can express the area in terms of the bounding ordinates of two strips, but, if we use mid-ordinates, we require three strips; so that, in each case, three ordinates are required. The question then arises whether, by taking the limiting case as to the position of the ordinates, we can reduce their number.

Suppose that in fig. 6 (§ 34) we draw ordinates \( QD \) midway between \( KA \) and \( MC \), and \( RE \) midway between \( MC \) and \( LB \), meeting the top in \( D \) and \( E \) (fig. 8) and join \( DE \), meeting \( KA \), \( LB \), and \( MC \) in \( H, J \), and \( W \). Then it may be shown by a simple algebraical argument that the area of the trapezium \( KHJB \) is greater than the area of the trapezette \( KACBL \).

If we were to take \( QD \) and \( RE \) closer to \( MC \), the former area would be still greater. If, on the other hand, we take these ordinates very close to \( KA \) and \( LB \) respectively, the area of the trapezette would be the greater. There is therefore some intermediate position such that the two areas are equal, i.e. such that the area of the trapezette is represented by \( KL \). Hence we have

\[
\text{area} = \frac{1}{2}(QD + RE).
\]

57. To find this position, let us write \( QM = MR = \theta \). Then

\[
WC = \theta, \quad VC = (1 - \theta) CV.
\]

Hence the area of the trapezette and of the trapezium will be equal if

\[
1 = \theta = \frac{1}{1 + \sqrt{3}}.
\]

This value of \( \theta \) is the same for all parabolas which pass through \( D \) and \( E \) and have their axes at right angles to \( KL \). It follows that, by taking two ordinates in a certain position with regard to the bounding ordinates, the area of any parabolic trapezette whose top passes through their extremities can be expressed in terms of these ordinates and of the breadth of the trapezette.

The same formula will also hold (§ 52) for any cubic trapezette through these points.

58. The Prismatical Formula.—It follows from §§ 48 and 51 that, if \( V \) is a solid figure extending from a plane \( K \) to a parallel plane \( L \) and if it is bounded by a section parallel to a plane \( S \) and \( S' \), it is possible to divide the section into \( m + 1 \) parts and to consider the area of each of these sections as a quantic of the function of the distance of the section from a fixed plane parallel to them, Simpson’s formula may be applied to find the volume of the solid. If the areas of the two ends in the planes \( K \) and \( L \) are \( S_1 \) and \( S_2 \) and the area of the mid-section (i.e. the section by a plane parallel to these planes and midway between them) is \( S \), the volume is

\[
V = \frac{V}{R} + \frac{S}{R^2} + \frac{S_1}{R^3} + \frac{S_2}{R^4}.
\]

To show that the area of a cross-section of a prismoid is of the form \( ax^2 + bx + c \), where \( x \) is the distance of the section from one end, we may proceed as in § 27. In the case of a pyramid, of height \( h \), the area of a section by a plane parallel to the base and at distance \( x \) from the vertex is clearly \( \frac{1}{h^2}x^2 \) of the area of base. In the case of a wedge or a parallelepiped whose parallel ends the ratio \( \frac{a}{b} \) is replaced by \( \frac{a}{h} \).

For a tetrahedron, two of whose opposite edges are \( AB \) and \( CD \), we require the area of the section by a plane parallel to \( AB \) and \( CD \). Let the distance between the parallel planes through \( AB \) and \( CD \) be \( h \), and let \( x \) be the distance at plane \( x \) from the plane through \( AB \) cut the edges \( AC \).
BC, BD, AD, in p, Q, R, S (fig. 9). Then the section of the pyramid by this plane is the parallelogram PQRS. By drawing AC and AD, and the points in which the plane through CD and D meet the plane through AB and B, we see that the area of PQRS is $(x)/2 - y/2$ and that of $ADCD$ is $x/2 - y/2$. The common section of the two planes then becomes the base of a prismoidal figure which coincides with it approximately, provided that the further inaccuracies so introduced are comparable with the original inaccuracies of measurement.

The relation between the inaccuracy of the data and the additional inaccuracy due to substitution of another figure is similar to the relation between the inaccuracies in measurement of a figure which is supposed to be of a given form (§ 20). The volume of a frustum of a cone, for instance, can be expressed in terms of certain magnitudes by a certain formula; but not only will there be some error in the measurement of these magnitudes, but there is not any material figure which coincides with the case of a frustum of a cone. The deviation from conical form is relatively less than the errors of measurement. The conditions are thus similar to those which arise in interpolation (q.e.). The data are the same in both cases; the fact that in the case of a frustum of a cone the magnitudes of certain ordinates; the problem of interpolation is to determine the values of intermediate ordinates, while that of

menstration is to detect the form of the section of the prismoidal figure. If, as is usually the case, the ordinate throughout each strip of the trapezette can be expressed approximately as an algebraical function of the abscissa, the application of the integral calculus gives the area of the trapezette.

Mensuration.

There are three classes of cases to be considered. In the case of mathematical functions certain conditions of continuity are satisfied, and the extent to which the value given by any particular formula can be extended by means of analysis is a limiting process, one of the conditions of continuity (which imply the continuity not only of $u$ but also of some of its differential coefficients) are satisfied, subject to the small errors in the values of $u$ actually given; the limits of these errors are known.

The only necessary consideration is to consider the trapezette and the briquette, since the cases which occur in practice can be reduced to one or other of these. The simplest is the determination of the volume of an equidistant ordinates, as described in §§ 43-45. The terms quadrature-formula and cubature-formula are sometimes restricted to formulae for expressing the area of a trapezette, or the volume of a briquette, in terms of such data. Thus a quadrature-formula is a formula for expressing $[A_1, u]$ or $/f$ in terms of the sum of various values of $x$ in combination with certain values of $y$; these values not necessarily the abscissae. A cubature-formula is a formula for expressing the volume of the trapezette, the extensions to the briquette being only treated briefly.

The trapezoidal formula for expressing the area of a trapezette is a simple formula for expressing the area of the trapezette by a series of trapezoids. If the data are $w_0, w_1, ... w_n$, the figure formed by joining the tops of these ordinates is a trapezoidal figure with $w_0$, $w_1$, $w_n$ as bases, and $w_{n-1}$ as the altitude. Starting from an ordinate $w_{n-1}$, the result of integrating with respect to $x$ through a distance $2h$ is (in the example considered in § 61) the same as the result of the operation $x/(x + E)$. $x$ is a function of $y$, and $x$ is found by the operation of double integration, consisting of two successive operations, one being with regard to $x$, and the other with regard to $y$; and these operations may (in the cases in which we are considering the approximation of any given ordinate to the limit of a series) be performed both operations, in order to obtain the volume, is the result of the operation denoted by the product of these two expressions; and in this process, the values of $E$ and of $E'$ may be dealt with according to the algebraical laws.

The methods of §§ 59 and 60 can similarly be extended to finding the proposition of the central ordinate of a briquette, or the mean $q$-dimensional area of the section $o, o_1, o_2, ... o_n$, by the method of § 37 (iv).

The formula is known as the prismatical formula. 59. Moments.—Since all points on any ordinate are at an equal distance from the axis of $z$, it is evident that the first moment of $z$ with regard to the ordinate $z$ is $z$. The formula can then be applied to finding the moments of certain volumes.

In the case of the parabolic trapezette, for instance, $z$ is of degree 3 in $x$, and therefore the first moment is $z(x^3 + 2a^2 + a^3)$.

If $z$ is an algebraical function of $x$, then the result will be $z(x^3 + 2a^2 + a^3)$, and the mean value of $z$ will be $z(x^3 + 2a^2 + a^3)$. In the case, therefore, of any solid which can be described as a plane section 101}
tangential area may be expressed in terms of chordal areas. If we write \( C_i \) for the chordal area obtained by taking ordinates at intervals \( T_i \) two of the \( C_i \), and \( T_i \), as seen from above, is everywhere convex or everywhere concave, the true area lies between \( C_i \) and \( T_i \).

62. Other Rules for Trapezettes.—The extension of this method consists in superimposing the trapezette into minor trapezettes, each consisting of two or more strips, and replacing each of these minor trapezettes by a new figure, whose ordinate \( v \) is an algebraical function of \( x \); this function being \( c(x) \), so that the new figure shall coincide with the original trapezette, and the aggregate area of the substantiated figures, we have \( A = \sum B \), where \( B \) denotes approximate equality.

63. Simpson's formula to each of these, we have

\[
A \approx \frac{3}{2} \sum (u_i + 4v_i + u_{i+1})
\]

This is Simpson's rule.

64. If, similarly, \( m = 3 \), the repeated application of Simpson's second formula gives Simpson's repeated rule.

\[
A \approx \frac{3}{2} \sum (u_i + 3v_i + u_{i+1})
\]

65. If intermediate ordinates are given, and \( m = 3 \), the repeated application of the formula of § 55 will give

\[
A \approx \frac{3}{2} \sum (u_i + 3v_i + u_{i+1}) + \frac{3}{4} (u_i + 2v_i + u_{i+1})
\]

66. The formulae become complicated when the number of strips in each of the minor trapezettes is large. The method is then modified by replacing by an expression which gives the areas of the subordinated figures approximately. This introduces a further inaccuracy; but this latter may be negligible in comparison with the main inaccuracies already involved (cf. § 70 (iii)).

67. Suppose, for instance, that \( m = 4 \), and that we consider the trapezette as a whole; the data being the bounding ordinates. Since there are seven of these, \( v \) will be of degree 6 in \( x \); and we shall have (§ 54 (i))

\[
A = \begin{vmatrix} u_0 & v_0 & u_1 & v_1 & u_2 & v_2 & u_3 & v_3 & u_4 & v_4 & u_5 & v_5 & u_6 \end{vmatrix}^{\frac{1}{k}} \begin{vmatrix} 1 & 0 & 0 & 0 & 0 & 0 & 0 \end{vmatrix}
\]

68. For the expression on the right-hand side being an approximate expression for \( B \), and differing from it only by \( \frac{1}{k} \), this is Weddle's rule. If \( m \) is a multiple of 6, we can obtain an expression for \( A \) by arranging the given group of ordinates in various ways and considering, for example, the area of the trapezette (§ 68 (i)).

69. The following are some examples of formulas for the area of a parabolic trapezette.

\[
A = \frac{1}{2} (C_i + C_{i+1} - T_i) - \frac{1}{2} (C_j + C_{j+1} - T_j)
\]

where \( P, Q, R, \ldots \) satisfy the \( k \) equations

\[
P + Q + R + \ldots = 1;
\]

\[
P^2 + Q^2 + R^2 + \ldots = 0;
\]

\[
P^3 + Q^3 + R^3 + \ldots = 0;
\]

\[
P^{k-1} + Q^{k-1} + R^{k-1} + \ldots = 0.
\]

The last \( k - 1 \) of these equations give

\[
1/P, 1/Q, 1/R \ldots = \rho^2 (p^2 - q^2) (p^2 - r^2) \ldots
\]

\[
\rho^2 (p^2 - q^2) (p^2 - r^2) \ldots = \rho^2 (p^2 - q^2) \ldots
\]

Combining this with the first equation, we obtain the values of \( P, Q, R, \ldots \)

60. The same method applies to the area of the region bounded by the ordinates of the same curve. Hence, in the first place to see whether the fundamental assumption is that group of ordinates is a perfect approximation, it is necessary to take the successive differences of \( u \) and it is then just as easy, in most cases, to use the formula which directly involves these differences and therefore shows the degree of accuracy of the approximations.

61. The method, therefore, consists in taking a simple formula, such as the trapezoidal rule, and correcting it to suit the particular conditions. The difference between \( C_i \) and the true area is made up of a series of errors by chords and areas; this difference becoming less as we subdivide the figure into a greater number of strips.

62. The fact that \( C_i \) does not give the true area is due to the fact that in passing from one extremity of the top of any strip to the other extremity the tangent to the trapezette changes its direction. We have therefore in the first place to see whether the fundamental assumption is true in terms of the directions of the tangents.

63. Let KAB (fig. 10) be one of the strips of breadth \( h \). Draw the tangents at \( A \) and \( B \), and through \( T \) draw a line parallel to KA and LB, meeting the chord AB in C and the chord AB in V. Draw AE and BE parallel to this line, and DF and TG perpendicular to LB. Then \( AD = EB = h \), and the triangles AVD and BVE are equal.

64. The area of the trapezette is less (in fig. 10) than the area of the trapezoid KBAL by two-thirds of the area of the triangle ATB (§ 34). This latter area is

\[
\Delta \text{BE} - \Delta \text{ATD} = \Delta \text{BTG} - \Delta \text{ATD} = \frac{h^2}{2} \sin \gamma - \frac{h^2}{2} \sin \delta
\]

Hence, if the angle which the tangent at the extremity of the ordinate in question makes with the axis at \( h \), the area from \( u_i \) to \( u_{i+1} \) is

\[
u_{i+1} - u_i = h^2 \sin \gamma - \sin \delta
\]

Then, by summation,

\[
A = h^2 \sin \gamma - \sin \delta
\]

This, in the notation of §§ 56 and 54, may be written

\[
A = C_i - \frac{1}{2} \frac{h^2}{2} \sin \gamma - \sin \delta
\]

Since \( h = H/m \), the inaccuracy in taking \( C_i \) as the area varies as \( 1/m^2 \).

65. It might be shown in the same way that

\[
A = T_i + \frac{1}{2} \frac{h^2}{2} \sin \gamma - \sin \delta = T_i + \frac{1}{2} \frac{h^2}{2} \sin \gamma - \sin \delta
\]

The above formulae apply only to a parabolic trapezette. Their generalization is given by the Euler-Maclaurin formula.
MENSURATION

If \( z < A \), then we have the quantities of the moments of the data are a series of ordinates. To find the \( p \)th moment, when \( u_0, u_1, u_2 \ldots \) are given, we have only to find the area of a trapezette whose ordinates are \( x^2 p_0, x^2 p_1, x^2 p_2 \ldots \).

81. There is, however, a certain set of cases, occurring in statistics, in which the data are not a series of ordinates, but the areas \( A_1, A_2, \ldots, A_m \) of the strips bounded by the consecutive ordinates \( u_0, u_1, \ldots, u_m \). The determination of the moments in these cases involves special methods, which are considered in the next two sections.

82. The most simple case is that in which the trapezette tapers out in such a way that the curve forming its top has very close contact, at its extemities, with the base; in other words, the differential coefficients \( u, v, \ldots \) may be practically negligible for \( x = \pm a \), and for \( x = \pm b \). The method adopted in these cases is to treat the areas \( A_1, A_2 \ldots \) as if they were ordinates placed at the points for which \( x = x_1, x = x_2, \ldots \), to calculate the moments on this assumption, and then to apply certain corrections. If the first, second, \( \ldots \) moments, so calculated, before correction are denoted by \( p_1, p_2, \ldots \), we have

\[
\begin{align*}
p_0 & = p_1 x_1 A_1 + x_2 A_2 + \cdots + x_m A_m - 1, \\
p_0 & = p_2 x_1 A_1 + x_2 A_2 + \cdots + x_m A_m - 1, \\
p_1 & = p_2 x_1 A_1 + x_2 A_2 + \cdots + x_m A_m - 1,
\end{align*}
\]

These are called the raw moments. Then, if the true moments are denoted by \( p_1, p_2, \ldots \), their values are given by

\[
\begin{align*}
p_1 & = p_1 + \frac{1}{2} (d \rho_0 - \rho_0), \\
p_2 & = p_2 + \frac{1}{2} (d \rho_1 - \rho_1), \\
p_3 & = p_3 + \frac{1}{2} (d \rho_2 - \rho_2), \ldots
\end{align*}
\]

where \( \rho_0 \) (or \( \rho_0 \)) is the total area \( A_1 + A_2 + \cdots + A_m \); the general expression being

\[
r_h \rho_0 - \rho_h = \frac{1}{2} \lambda_1 (d \rho_0 - \rho_0) - \cdots - \frac{1}{2} \lambda_{h+1} (d \rho_h - \rho_h),
\]

where

\[
\lambda_1 = \frac{1}{\lambda_{h+1}}, \quad \lambda_{h+1} = \frac{1}{\lambda_1}, \quad \lambda_h = \frac{1}{\lambda_{h+1}}, \quad \lambda = \frac{1}{\lambda_{h+1}}.
\]

The establishment of these formulae involves the use of the integral calculus.

The position of the central origin is given by \( x = r_0 \), and therefore is given approximately by \( x = r_0 \). To find the moments with regard to the central origin, we must use this approach value, and transform by means of the formulae given in \( \S \) 32. This can be done either before or after the above corrections are made. If the transformation is made first, and if the resulting raw moments with regard to the (approximate) central origin are \( \rho_1, \rho_2, \ldots \), the true moments \( \mu_1, \mu_2, \mu_3, \ldots \), with regard to the central origin are given by

\[
\begin{align*}
\mu_0 & = \rho_0, \\
\mu_1 & = \frac{1}{2} (d \rho_0 - \rho_0), \\
\mu_2 & = \frac{1}{2} (d \rho_1 - \rho_1), \\
\mu_3 & = \frac{1}{2} (d \rho_2 - \rho_2), \ldots
\end{align*}
\]

83. These results may be extended to the calculation of an expression of the form \( \int x_n u(x) dx \), where \( \phi(x) \) is a definite function of \( x \), and the conditions with regard to \( x \) are the same as in \( \S \) 22.

(i) If \( \phi(x) \) is an explicit function of \( x \), we have

\[
\phi(x) = \frac{1}{2} \lambda_1 (d \phi(x) - \phi(x)) - \cdots - \frac{1}{2} \lambda_{h+1} (d \phi(x) - \phi(x)),
\]

the coefficients \( \lambda_1, \lambda_2, \ldots, \lambda_{h+1} \) having the values given in \( \S \) 82.

(ii) If \( \phi(x) \) is not given explicitly, but is tabulated for the values \( x_1, x_2, \ldots \), a simple formula of (i) applies, provided we take

\[
\phi(x) = \left(1 - \frac{x^2}{2 \lambda^2} + \frac{x^4}{2 \lambda^2} - \cdots \right) \phi(x).
\]

The formulae can be adapted to the case in which \( \phi(x) \) is tabulated for \( x = s_0, x_1, \ldots \).

84. In cases other than those described in \( \S \) 82, the \( p \)th moment with regard to the axis of \( u \) is given by

\[
r_u = s_0 u A - s_0^2 p_{u,1},
\]

where \( A \) is the total area of the original trapezette, and \( s_{p,1} \) is the area of a trapezette whose ordinates are \( u_0, u_1, \ldots, u_m, \ldots \) at the points for which \( x = s_0 + \Delta s, s_0 + 2 \Delta s, \ldots \), beginning and ending with the bounding ordinates, are \( x = s_0 + \Delta s, x = s_0 + 2 \Delta s, \ldots \). The value of \( s_{p,1} \) has to be found by a quadrature-formula. The generalized formula is

\[
\int_0^a x^p u(x) dx = A \phi(s_0) - T_r,
\]
where $T$ is the area of a trapezette whose ordinates at successive distances $h$ are 0, $A(x)$, $(A_1 + A_2)\phi(x_2)$, ..., $(A_i + A_{i+1})\phi(x_i)$, the accents denoting the first differential coefficient.

85. Volume and Moments of a Briquette.—The application of the methods of §§ 75-79 to the calculation of the volume of a briquette leads to complicated formulæ. If the conditions are such that the methods of § 61 cannot be used, or are too complicated to be given too much weight to particular ordinates, it is best to proceed in the manner indicated at the end of § 48; i.e. to find the areas of one set of parallel sections, and treat these as the areas of a trapezette whose area will be the volume of the briquette.

86. The formulæ of § 82 can be extended to the case of a briquette whose top has close contact with the base all along its boundary; the data being the ordinates of the minor briquettes formed by the planes $x = x_0$, $x = x_1$, ..., $y = y_0$, $y = y_1$. To construct the formulæ of the § 82 in pairs. Thus we find (eg. $\phi$, $\phi_1$,

$$S_{\phi_i} = \int \int \int f(x, y) \, dx \, dy$$

we first calculate the raw values $s_{\phi_0}, s_{\phi_1}, ..., s_{\phi_0}$, $s_{\phi_1}, ..., s_{\phi_0}$, $s_{\phi_1}, ..., s_{\phi_0}$, on the assumption that the volume of each minor briquette is concentrated along its mid-ordinate (§ 44), and then obtain the formulae of correction by multiplying the formulæ of § 82 in pairs. There are

$\phi(x, y)$ is the total volume of the briquette.

87. If the data of the quadrates are not in whole numbers, the volumes of the minor briquettes, but the condition as to close contact is not satisfied, we have

$$\int_{x_0}^{x_1} \int_{y_0}^{y_1} f(x, y) \, dx \, dy = \int_{x_0}^{x_1} \left[ \int_{y_0}^{y_1} f(x, y) \, dy \right] \, dx + \int_{y_0}^{y_1} \left[ \int_{x_0}^{x_1} f(x, y) \, dx \right] \, dy$$

where $s_{\phi_0}$ is the total volume of the briquette.

88. If the data of the quadrates are not in whole numbers, the fourth expression represents the volume of a briquette, to be calculated in the same way as $R$ above.

89. Cases of Failure.—When the sequence of differences is not such as to enable any of the foregoing methods to be applied, it is sometimes possible to amplify the data by measurement of intermediate ordinates, and then apply a suitable method to the amplified series. There is, however, a certain class of cases in which no subdivision of intervals beyond the first is possible; viz., those in which the top of the figure is, at one extremity (or one part of its boundary), at right angles to the base. The Euler-Maclaurin formulæ (§ 75) assumes that the bounding values of $f(x)$, $f(x')$, are not infinite; this condition is not always in the cases here considered. It is also clearly impossible to express $u$ as an algebraic function of $x$ and $y$ if some value of $du/dx$ or $dy/dx$ is to be infinite.

90. To completely satisfactory methods have been devised for dealing with these cases. One method is to construct a table for interpolation of $x$ in terms of $u$, and from this table to calculate values of $x$ corresponding to values of $u$. This condition is good result; viz. $\int f(x, y) \, dx$ at right angles to the base. The Euler-Maclaurin formulæ (§ 75) assumes that the bounding values of $f(x)$, $f(x')$, are not infinite; this condition is not always in the cases here considered. It is also clearly impossible to express $u$ as an algebraic function of $x$ and $y$ if some value of $du/dx$ or $dy/dx$ is to be infinite.

91. To completely satisfactory methods have been devised for dealing with these cases. One method is to construct a table for interpolation of $x$ in terms of $u$, and from this table to calculate values of $x$ corresponding to values of $u$. This condition is good result; viz. $\int f(x, y) \, dx$ at right angles to the base. The Euler-Maclaurin formulæ (§ 75) assumes that the bounding values of $f(x)$, $f(x')$, are not infinite; this condition is not always in the cases here considered. It is also clearly impossible to express $u$ as an algebraic function of $x$ and $y$ if some value of $du/dx$ or $dy/dx$ is to be infinite.

FIG. 11.
MENTAWI—MENZEL, A. F. E. VON

(1903). For examples of measurement of areas by geometrical construction, see G. C. Turner, *Graphics applied to Arithmetic, Mensuration and Statics* (1907). Discussions of the approximate calculation of definite integrals will be found in works on the infinitesimal calculus; see e.g. E. Courant, *A Course in Mathematical Analysis* (1905; trans. by E. H. Hedrick). For the methods involving finite differences, see references under DIFFERENCES, CALCULUS OF.

The MENTAWI, south of the Mentones, are some twenty small islands in all, of which the majority lie close to or between the four largest—Siberut, Sikaban or Sipora, North Pageh and South Pageh. The two last (also called Pagi or Poppy) are sometimes termed the Nassau Islands. The total land area is 1224 sq. m. The islands are included in the administration of Padang, Sumatra. They are apparently volcanic. Coral reefs lie off the coasts and render them difficult of access.

The natives in language and customs present affinities with some Polynesians, and have been held to be a survival of the eastward immigration of peoples of Carthaginian stock which inhabited the islands before the introduction of Islam. They established the "pre-Malay" peoples (such as the Dyaks and Battas) in the Malay Archipelago. The islands produce some coco-nuts, sago, trepang and timber.

MENTEITH, or MONTEITH, a district of south Perthshire, Scotland, roughly comprising the territory between the Teith and the Forth. Formerly it was a stewartry and gave the title to an earldom. The title was first held by Gilchrist, a Celtic chief ennobled by Malcolm IV., and passed successively to Walter Comyn (d. 1238), to a branch of the Stewarts, and finally to the Grahams, becoming extinct in 1694. The lake of Menteith, situated in 51° 23' m. S. of Loch Lomond, was two miles long by one mile broad, and contains three islands. On Inchmahome (Gaetic, "the Isle of Rest") are the ruins of an Augustinian priory founded in 1238 by Walter Comyn. It is Early English, with an ornate western doorway. The island was the residence of Queen Mary, when a child of five, for a few months before her departure to France in 1548. On Inch Talla stands the ruined tower of the earls of Menteith, dating from 1428.

The village of Port of Menteith (pop. of parish, 1888), on the north shore of the lake, is 54 m. north by west of the station of the same name on the North British Railway Company's Perth-Glasgow line, which is one of the broadest in Scotland.

MENTONE (Fr. Menton), a town in the department of the Alpes Maritimes in south-east France, situated on the shore of the Mediterranean, about 15 m. by rail E. of Nice. Pop. (1901), 9044. It is built in the form of an amphitheatre on a rocky promontory, which divides its semicircular bay into two portions. The main town is composed of two parts. Below, along the seashore, is the town of hotels and foreigners, while above, and inaccessible to wheeled vehicles, is that of the native Mentonese, with steep, narrow and dark streets, clinging to the mountain side around the Bouchet castle which was once its protection against pirates. In the old town is the church of St Michel, rebuilt in great part since an earthquake in 1887, while below, in the principal street, the Corniche road, is the monument set up in 1866 to commemorate the union (in 1860) of Mentone with France. East of the main town is the suburb of Garavan, sheltered by cliffs, and filled with hotels. A mile and a half farther on is the Pont St Louis, which marks the frontier between France and Italy, while beyond it Sir Thomas Hanbury's villa at La Murtolara is soon reached, with its marvellous gardens of 250 acres. West of the main town there is a more hotel belt scattered along the coast towards Cap Martin. This is a pine-covered promontory which shelters the Bay of Mentone on the west, and is crowned by a great hotel, not far from which is the villa of the ex-empress Eugénie. Facing south-east, and sheltered on the north and west by mountains, the Bay of Mentone has a delicious climate and is frequented by invalids. The mean for the year is 61°F., while that for the winter is 72°F. in the sun, and 55°F. in the shade. Frost occurs on the average only once in ten years. Besides the charms of its climate Mentone offers those of an almost tropical vegetation. Lemon-trees, olive-trees and pines rise in successive stages on surrounding slopes. The district produces 40,000,000 lemons yearly, and this is its principal natural wealth. In the east bay is the harbour, constructed in 1850. It has a depth of about 26 ft., and is sheltered by a jetty about 400 yds. in length. The harbour is frequented by pleasure yachts and a few coasting vessels.

Mentone was probably the Lummone of the Itineraries, but no Roman remains exist. After having belonged to the counts of Ventimiglia and a noble Genoese family, it was purchased about the middle of the 14th century by the Grimaldis, lords of Monaco. During the First Republic and the First Empire it belonged to France, but on the Restoration it reverted to Prince of Monaco, who subjected it to such exactions that in 1848 its inhabitants proclaimed the town (with Roquebrune on the west) independent, under the protection of Sardinia. In 1860 both Mentone and Roquebrune were purchased by France from the prince of Monaco, and added to the department of the Alpes Maritimes then formed out of the county of Nice, ceded the same year to France by Sardinia.

MENTOR, in Greek legend, the son of Alcimus and the faithful friend of Odysseus. During the absence of the latter, Mentor was entrusted with the care of his household and the guardianship of his son Telemachus. The word "mentor" is now used in English in the sense of a chief instructor, a word which is probably connected with the etymology of the name, from the root mon-, seen, in Lat. monere, to advise, monitor, adviser.

The *New English Dictionary* points out that the transferred use is due less to Homer's Odyssey than to Fénéon's *Télémaque*, in which Mentor is a somewhat prominent character.

MENTOR OF RHODES, brother of Memnon (q.v.), a Greek condottiere who appears first in the service of the rebellious satrap Artabazus of Phrygia in 353. When Artabazus had rebelled a second time and was in 353 forced to flee with Memnon into Macedonia, Mentor entered the service of the Egyptian king Ptolemy I., and afterwards of Seleucus I. He was afterwards brought by the Greek mercenaries to support the rebellious king Tennes (Tebatin) of Sidon against Artaxerxes III. But Tennes and Mentor betrayed the besieged town to the Persians (344 B.C.). Tennes was killed after his treason, but Mentor gained the favour of the king. It was due largely to him that Egypt was conquered in 343 (Diod. xvi. 45 sqq.). He now closely allied himself with the eunuch Bagos (q.v.), the all-powerful vizier of Artaxerxes III. He was appointed general in Asia Minor, and with the help of Artabazus and Memnon, whose pardon and recall he obtained from Alexander the Great, successfully subjugated Lydia and Asia Minor. As a reward he became one of the chief satraps of Asia Minor. It was he who became famous among them was Hermias of Atarneus, the protector of Aristotle, who had become master of some towns of Aeolis and Troas. By treachery he made him prisoner and occupied his town (342 B.C.); Hermias was executed by order of the king (Diod. xvi. 52; Polyena. vi. 48; pseudo-Arist. Oecon. ii. 27; Strabo xiii. 610; Didymus' commentary on Demosthenes *Phil*. 4, p. 6; cf. Diog. Laërt. vi. 9). Shortly afterwards Mentor died, and was succeeded by his brother Memnon. His son Thymondas commanded in the naval war against Alexander and at Issus (Arr. Hist. ii. 11 13), (Ed. M.)

MENZEL, ADOLPH FRIEDRICH ERDMANN VON (1815—1905), German artist, was born at Breslau on the 8th of December 1815. His father was at the head of a school for girls, and intended to educate his son as a professor; but he would not thwurt his taste for art. Left an orphan in 1832, Menzel had to maintain his family. In 1833 Sachse of Berlin published his first work, an album of pen-and-ink drawings reproduced on stone, to illustrate Goethe's little poem, "Künstlers Erdenwallen."

He executed lithographs in the same manner to illustrate *Dichtungen* of Klopstock, *Künstlers Erdenwallen*, pp. 834-836; "The Five Senses" and "The Prayer," as well as diplomas for various corporations and societies. From 1839 to 1842 he produced 400 drawings, reviving at the same time the technique of engraving on wood, to illustrate the *Geschichte Friedrichs des Grossen* ("History of Frederick the Great") by Franz Kugler. He subsequently brought out *Friedrichs des Grossen Armee in ihrer Uniformierung* ("The Uniforms of the Army under Frederick the Great"), *Soldaten Friedrichs des Grossen* ("The Soldiers of Frederick the Great"); and finally, by
order of the king Frederick William IV., he illustrated the works of Frederic the Great, "Illustrationen zu den Werken Friedrich des Grossen" (1843-1849). By these works Menzel established his claim to be considered one of the first, if not actually the first, of the illustrators of his day in his own line. Meanwhile Menzel had set himself to study unaided the art of painting, and he soon produced a great number of copies of pictures, always showing keen observation and honest workmanship—subjects dealing with the life and achievements of Frederic the Great, and scenes of everyday life, such as "In the Tuileries," "The Ball Supper," and "At Confection." Among the most important of these works are "The Forge" (1875) and "The Market-place at Verona." Invited to paint "The Coronation of William I. at Koenigsberg," he produced an exact representation of the ceremony without regard to the traditions of official painting. Menzel died at Berlin on the 9th of February 1903. In Germany he received many honours, and was the first painter to be given the order of the Black Eagle.

MENZEL, WOLFGANG (1798-1853). German poet, critic and literary historian, was born on the 21st of June 1798, at Waldenburg in Silesia, studied at Breslau, Jena and Bonn, and after living for some time in Aarau and Heidelberg finally settled in Stuttgart, where, from 1830 to 1838, he had a seat in the Wurttemberg Diet. His first work, a clever and original volume of poems, entitled Sirockverse (Heidelberg, 1823), was followed in 1824-1825 by a popular Geschichte der Deutschen in three volumes and in 1829 and 1830 by Rekole and Narcissus, the dramatized version of his republished Lysistrata chiefly rests. In 1831 he published the romance of Furor, a lively picture of the period of the Thirty Years' War; his other writings include Geschichte Europas, 1789-1815 (2 vols. Stuttgart, 1853), and histories of the German War of 1866 and of the Franco-German War of 1870-71. From 1826 to 1848 Menzel edited a "Literaturblatt" in connexion with the Morgenblatt; in the latter year he transferred his allegiance from the Liberal to the Conservative party, and in 1852 his "Literaturblatt" was revived in that interest. In 1856 his political sympathies again changed, and he opposed the "particularism" of the Prussian " Junkers" and the anti-unionism of south Germany. He died on the 23rd of April 1873 at Stuttgart. His library of 18,000 volumes was afterwards acquired for the university of Strassburg.

MENZELINSK, a town of eastern Russia, in the government of Ufa, 142 m. N.W. of the town of Ufa, and 10 m. from the left bank of the Kama. Pop. (1897), 7542. Its fair is one of the most important in the southern Ural region for cattle, hides, furs, grain, tea, manufactured articles, crockery, &c., which are sold to the annual value of £500,000. The town was founded in 1584.

MEPHISTOPHELES, in the Faust legend, is the name of the Prussian "famulus" and the anti-unionism of south Germany. He died on the 23rd of April 1873 at Stuttgart. His library of 18,000 volumes was afterwards acquired for the university of Strassburg.

MEPPHEL, a town in the province of Drente, Holland, 1½ m. by rail N. by E. of Zwolle. Pop. (1903), 10,470. It is favourably situated at the confluence of a number of canals and rivers which communicate with the Zulder Zee by the Meppeler Diep, and rose rapidly into prominence in the 19th century. The chief business is in butter, eggs, cattle and pigs, while bleaching, dyeing, and shipbuilding are also carried on here.

MEQUINEZ (the Spanish form of the Arabic Miknasa), a city of Morocco, situated 1600 ft. above the sea, about 70 m. from the west coast and 36 m. W.S.W. of Fez, on the road to Rabat, in 33° 56' N., 5° 50' W. The town wall with its four-cornered towers is pierced by nine gates, one, the Bab Bardain, with fine tile-work. A lower wall of wider circuit protects the luxuriant gardens in the outskirt. Mequinez at a distance appears a city of palaces, but it possesses few buildings of any note except the palace and the mosque of Mulai Ismail, which serves as the royal burying-place. The palace, founded in 1634, was described in 1821 by John Windsch in his Journey to Mequinez (London 1825) as "about 4 m. in circumference, the whole building exceeding massy, and the walls in every part very thick; the outward one about a mile long and 25 ft. thick." The interior is composed of oblong court-yards surrounded by buildings and arcades. These buildings are more or less square with pyramidal roofs ornamented outside with green glazed tiles, and inside with and topped, last (Faust, ed. 1866, i. 25), which is certainly supported by the fact that almost all the names of devils in the magic-books of the 16th century are derived from the Hebrew word.

"Als es war unstatt ist west dass es zu Grunde geht."

The Mephistophiles of the Faust-books and the puppet plays passed with little or no modification into literature as the Mephistophiles of Marlowe's Faustus. Mephistophiles has the kobold quality; not only is Faustus supported above, but he is born, accordingly eats sumptuous fare; he indulges in horse-play and is addicted to practical joking of a homely kind. He is, however, also the devil, as the age of the Reformation conceived him: a fallen angel who has forsook his former estate, and departed from God, in order to attain the glories of heaven, in order to accentuate the horrors of the hell to which he triumphantly drags him. Goethe's Mephistophiles is an embodiment of another conception of the devil. The Mephistophiles are indeed preserved: the practical joke, for instance, in the scene in Auerbach's Keller shows that he has not altogether shed his character as kobold; and, like the planet-spirits of the old magic he appears alternately in animal and human shape. He is also identified with the devil; thus, in accordance with old German tradition, he is dressed as a nobleman (ein edler Junker), all in red, with a little cap of stiff silk, a cock's feather in his hat, and a long pointed top that at the witch's Sabbath on the Brocken he is hailed as the "knight with the horse's hoof," and Sybel in Auerbach's Keller is never too drunk not to notice that he limps. But his limp is the only mark. We know that he is Lazaro, and that his "hands of fire." He could not, like Marlowe's Mephistophiles or Milton's Satan, regrettably paint the glories of the height from which he has been hurled; for he denies the distinction between high and low, since "everything that comes into being deserves to be destroyed." He is, in short, not the devil of Christian orthodoxy, a spirit conscious of the good against which he is in revolt, but akin to the Evil Principle of the older dualistic systems, with their conception of the eternal antagonism between good and evil, light and darkness, creation and destruction (verder The Faust). (W. A. F.)
richly carved and painted woodwork in Mauresque style. The walls are tiled to a height of 4 or 5 ft., and above they are finished in plaster, whitewashed or carved into filigree work. The population numbers being between thirty and forty thousand. Idris, writing in A.D. 1100, calls the place Takarat, and describes it as an ordinary citadel, from which the town gradually developed, taking its name from the Minaksa Berbers.

**MERAN**, the chief town of the administrative district of the same name, situated in the Austrian province of the Tirol, 20 m. by rail N.W. of Bozen, on the Brenner line, while the Vintschgau railway connects it with Mals, 37 m. N.W. It is the chief town in the upper Adige valley, a region which bears the special name of the Vintschgau, and is on the high road either to Landeck and the Lower Engadine by the Reschen Scheideck Pass (4902 ft.), or more directly to the Lower Engadine by the Münsters valley and the Ofen Pass (7071 ft.). In 1900 Meran had 9284 inhabitants (or, with the neighbouring villages of Untermais and Obermais, 13,201), mainly German-speaking and Romanist. The town is picturesquely situated, at a height of 1637 ft., at the entrance of the vine-clad Kitzelberg, and on the right bank of the Passer River, just above its junction with the Adige or Etsch. Meran proper consists mainly of one long narrow street, the Laubengasse, flanked by covered arcades, but the name is often used to include several adjacent villages, Untermais and Obermais being on the left bank of the Passer, while Gratsch is on its right bank and north-west of the main town. The most noteworthy buildings are the parish church (14th to 15th centuries) and the old residence (15th century) of the counts of the Tirol. Meran is best known as a much-frequented resort, famed for its healthful climate and the patients seeking a cure by reason of the purity of the air and the comparative immunity of the place from wind and rain in the winter. It is also visited in spring for the whey cure and in autumn for the grape cure.

To the north-west, on the Kitzelberg, is the half-ruinied castle of Tirol (2006 ft.), the original seat of the family which gave its name to the county. Meran may have been built on the site of a Roman settlement, but is first mentioned in 857. From the 12th century to about 1420 it was the capital of the ever-extending land named after it Tirol, but then had to give way to Innsbruck, while the building of the Brenner railway (1854–1867) and the rise of Bozen have decreased its commercial importance.

(W. A. B. C.)

**MERBECK (or MARBECK), JOHN** (d. c. 1358), English theological writer and musician, was organist of St. George's, Windsor, about 1540. Four years later he was convicted of heresy and sentenced to the stake, but received a pardon owing to the intervention of Gardiner, bishop of Winchester, though Gardiner had himself censured Merbeck for compiling an English Cordwandel of the Bible. This work, the first of its kind in English, was published under its dedication to Edward VI. In the same year Merbeck published his annotated Book of Common Prayer, intended to provide for musical uniformity in the use of the First Prayer Book of Edward VI., which was several times reprinted in the 15th century. Merbeck wrote several devotional and controversial works of a strongly Calvinistic character, and a number of his musical compositions are preserved in manuscript in the British Museum, and at Oxford and Cambridge. He died, probably while still organist at Windsor, about 1585. His son, Roger Merbeck (1536–1605), a noted classical scholar, was appointed public orator in the university of Oxford in 1564, and in 1565 became a canon of Christ Church and was elected provost of Oriel; he left Oxford on account of an unfortunate marriage, and took to medicine as a profession, becoming the first registrar of the College of Physicians in London, and chief physician to Queen Elizabeth.

**MERCADIER** (d. 1200), French warrior of the 12th century, and chief of freebooters in the service of Richard I. of England. In 1183 he operated for Richard, then duke of Aquitaine, in the Limousin and the Angoumois, taking castles and laying waste the country. We know nothing of him during the ten years 1184–1194, but after Richard's return from Palestine, Mercadier accompanied him everywhere, travelling and fighting by his side. Richard eulogized Mercadier's exploits in his letters, and gave him the estates left by Adémar de Baimac, who died without heirs about 1190. During the various wars between Richard and Philip Augustus of France, Mercadier fought successively in Berry, Normandy, Flanders and Brittany. When Richard was mortally wounded at the siege of Châlus in March 1199, Mercadier avenged him by hanging the defenders of the château and flaying the crossbowman who had shot the king. Mercadier then entered the service of territory of Provence-Gascony. On Easter Monday, the 10th of April 1200, he was assassinated while on a visit to Bordeaux to pay his respects to Eleanor of Aquitaine, who was bringing from Spain Blanche of Castile. His murderer was an agent of Brandin, another freebooter in the service of John.

See Geraud, Mercadier, in Bibliothèque de l'École des Chartes, 1st series, t. liii., pp. 417-443.

**MERCANTILE (or COMMERCIAL) AGENCIES**, the name given in America to organizations designed to collect, record and distribute to regular clients information relative to the standing of firms, and to some extent of industries. Some of the most important of these commercial agencies are the American and English House of Brooks, The American Commercial Register, and The House of Poston and Company. Among the best known of the insurance agencies, which are also important, are: The Marine Insurance Agency, The London and Liverpool Insurance Company, The London and North Western Insurance Company, and The City of London Insurance Company.

**MERCANTILE SYSTEM**, the name given to the economic policy which developed in Europe at the close of the middle ages. The doctrine of the mercantile system, stated in its most extreme form, made wealth and money identical, and regarded it therefore as the great object of a community so to conduct its dealings with other nations as to attract to itself the largest possible share of the precious metals. Each country's interest was to export the utmost possible quantity of its own manufactures and to import as little as possible of those of other countries, receiving the difference of the two values in gold and silver. This difference is called the balance of trade, and the balance is favourable when more money is received than is paid. Governments might resort to all available expedients—prohibition of, or high duties on, the importation of foreign wares, bounties on the export of home manufactures, restrictions on the export of the precious metals—for the purpose of securing such a balance.

But this statement of the doctrine, though current in textbooks, does not represent correctly the views of all who belonged to the mercantile school. Many members of that school were much too clear-sighted to entertain the belief that wealth consists exclusively of gold and silver. The mercantilists may best be described, as W. G. F. Roscher remarked, not by any definite economic theorem which they held in common, but by a set of theorectic tendencies, commonly found in combination, though severely prevailing in different degrees in different minds. The underlying principles may be enumerated as follows: (1) the importance of possessing a large amount of the precious metals; (2) an exaltation (a) of foreign trade over domestic, and (b) of the industry which works up materials over that which provides them; (3) the value of a dense population as an element of national strength; and (4) the employment of state action in furthering artificially the attainment of the ends proposed.
The discoveries in the New World had led to a large development of the European currencies. The old feudal economy, founded principally on dealings in kind, had given way before the new "money economy," and the dimensions of the latter were everywhere expanding. Circulation was becoming more rapid, distant communications more frequent, city life and movable property more important. The mercantilists were impressed by the fact that money is wealth sui generis, that it is at all times in universal demand, and that it puts into the hands of its possessor the power of acquiring all other commodities. The period, again, was marked by the formation of great states, with powerful governments at their head. These governments required men and money for the maintenance of permanent armies, which, especially for the religious and Italian wars, were kept up on a great scale. Court expenses, too, were more lavish than ever before, and a larger number of civil officials was employed. The royal domains and dukes were insufficient to meet these requirements, and taxation grew with the demands of the monarchies. Slaves saw that for their own good they must flourish. But manufactures make possible a denser population and a higher total value of exports than agriculture; they open a less limited and more promptly extensible field to enterprise. Hence they became the object of special governmental favour and patronage, whilst agriculture fell comparatively into the background. The growth of manufactures reacted on commerce, to which a new and mighty arena had been opened by the establishment of colonies. These were then viewed simply as estates to be worked for the advantage of the mother countries, and the aim of statesmen was to make the colonial trade a new source of public revenue, as such nature, as the nation, working for its own power, and the greater ones for predominance, they entered into a competitive struggle in the economic no less than in the political field, success in the former being indeed, by the rulers, regarded as instrumental to pre-eminence in the latter. A national economic interest came to exist, of which the government made itself the representative head. States became a sort of artificial hothouse for the rearing of urban industries. Production was subjected to systematic regulation, with the object of securing the goodness and cheapness of the exported articles, and so maintaining the place of the nation in foreign markets. The industry must have been, in part directly by the state, but largely also through privileged corporations and trading companies. High duties on imports were resorted to, at first perhaps mainly for revenue, but afterwards in the interest of national production. Commercial treaties were a principal object of diplomacy, the end in view being to exclude the competition of other nations in foreign markets, whilst in the home market as little room as possible was given for the introduction of anything but raw materials from abroad. The colonies were prohibited from trading with other European nations than the parent country, to which they supplied either the precious metals or raw produce purchased with home manufactures. That the efforts of governments for the furtherance of manufactures and commerce under the mercantile system were really effective towards that end is admitted by Adam Smith, and cannot reasonably be doubted, though doctrinaire free-traders have often denied it. Technical skill must have been promoted by their encouragements; whilst new forms of national production were fostered by attracting workmen from other countries, and by lightening the burden of taxation on struggling industries. Communication and transport by land and sea were more rapidly improved; and the social dignity of the industrial professions was enhanced relatively to that of the classes before exclusively dominant.

The foundation of the mercantile system was at the time when it took its rise inspired by the situation of the European nations. Such a policy had been already in some degree practised in the 14th and 15th centuries, thus preceding any formal exposition or defence of its speculative basis. At the commencement of the 16th century it began to exercise a widely extended influence. Charles V. adopted it, and his example contributed much to its predominance. Henry VIII. and Elizabeth conformed to it. The leading states soon entered on a universal competition for manufacturing and commercial preponderance. Through almost the whole of the 17th century the prize, so far as commerce was concerned, remained in the possession of Holland, Italy having lost her former ascendency by the opening of the new maritime routes, and Spain and Germany being depressed by protracted wars and internal dissensions. The admiring envy of Holland felt by English politicians and economists appears in the writers as Raleigh, Mun, Child, and Temple. Cromwell, by his Navigation Act, which destroyed the carrying trade of Holland and founded the English empire of the sea, and Colbert, by his whole economic policy, domestic and international, were the chief practical representatives of the mercantile system.

See G. Schmoller, The Mercantile System (Eng. trans., 1896); also the articles, BALANCE OF TRADE; FREE TRADE; PROTECTION; PHYSICOCHEMICAL SCHOOL, &c.

MERCAPTONS (Thio-alcohols), organic chemical compounds of the type R-SH (R = an alkyl group). The name is derived from mercurium caprans, in allusion to the fact that these compounds react readily with mercuric oxide to form crystalline mercury derivatives. The mercaptans may be prepared by the action of the alkyl halides on an alcoholic solution of potassium hydroxide; by the reduction of the sulphone-chlorides, e.g. CH₃SONOCl (chlorides of sulfonic acids), by heating the salts of esters of sulphuric acid with potassium hydroxide, and by heating the alcohols with phosphorus pentasulphide. They are crystalline liquids with a characteristic offensive smell. On oxidation by nitric acid they yield sulphonic acids. They combine with aldehydes and ketones, with elimination of water and formation of mercaptals and mercaptols. (See Sulphonal.)

Methyl mercaptan, CH₃SH, is a liquid which boils at 5.8° C. (752 mm.), and forms a crystalline hydrate with water, Eikyl mercaptan, CH₂(SH)₂, is a colourless liquid which boils at 36-9° C. It is used commercially in the preparation of sulphonal (g.a.). The mercury salt, Hg(SCH₂)₂, crystallizes from alcohol in plates. When heated with alcohol to 190° C. it decomposes into mercury and ethylidene.

MERCATOR, GERARDUS [latinized form of GERHARD KREMER] (1512-1594), Flemish mathematician and geographer, was born at Rupelmonde, in Flanders, on the 4th of March 1512. Having studied at Bois-le-Duc and Louvain (where he matriculated on the 29th of August 1530, and became licentiate in October 1532), he met Gemma Frisius, a pupil of Aplian of Ingolstadt, who at the request of the emperor Charles V. had settled in Louvain. From Frisius young Kremer derived much of his inclination to cartography and scientific geography. In 1534 he founded his geographical establishment at Louvain; in 1537 he published his earliest known map, now lost (Terraæ sancæ descriptio). In 1537-1540 he executed his famous survey and map of Flanders (Exercitissima Flandriae descriptio), of which a copy exists in the Musée Plantin, Antwerp. At the order of Charles V. Mercator made a complete set of instruments of observation for the emperor's campaigns: when these were destroyed by fire, in 1546, another set was ordered of the same maker. In 1538 appeared Mercator's map of the world in (north and south) hemispheres, which was rediscovered in 1878 in New York; this work shows Ptolemy's influence still dominant over Mercatorian cartography. In 1541 he issued the celebrated terrestrial globe, which he dedicated to Nicolas Perreauot, father of Cardinal Granvelle: this was accompanied by his Libellus de usu globi, which is said to have been presented to Charles V. In 1546 a terrestrial globe followed. Mercator early began to incline towards Protestantism; in 1553 he had retired for a time from Louvain to Antwerp, partly to avoid inquiry into his religious beliefs; in 1544 he was arrested and prosecuted for heresy, but escaped serious consequences (two of the forty-two arrested with him were burnt, one beheaded, two buried alive). He now thought seriously of emigrating; and when in 1552 Cassander, ordered by the duke of Juliers, Cleves and Berg to organize a university at Duisburg, offered Mercator the chair of cosmography the offer was accepted. The organization of the
Mercenary—Mercerizing

Mercenary (Lat. mercenarius, from merc, reward, gain), one who serves or acts solely for motives of personal gain, particularly a soldier who offers himself for service in any army which may hire him. The name is sometimes used as a term of reproach by nations who raise their armies by conscription, of armies raised by voluntary enlistment whose members are paid a more or less living wage.

Mercer (through Fr. mercier, from popular Lat. mercierius, a dealer, merc, merces, merchandise), a dealer in the more costly textiles, especially in silks and velvets. The word formerly had a wider meaning. Mercer, according to W. Herbert [Handbook of the Trade in Produce of Great Britain, 1834] comprehended all things sold by retail by the 'little balance' or small scales (in contradistinction to the things sold by the 'beam' or in gross), and included not only toys, together with haberdashery and various other articles connected with dress, but also spices and drugs. Many of the articles in which they dealt fell later within the sphere of other trades; thus the trade in the smaller articles of dress was taken over by the haberdashers (q.v.). The trade in silk seems to have been originally in the hands of the 'silkmen and throwsters.' The Mercers' Company can point to the first silk mill in England, which was set up in a paupers' house (St. James's) for the benefit of the paupers of the city of London, and is also the wealthiest both in trust and corporate property. The first charter was obtained in 1393, but the mercers appear to have been formed into a guild much earlier. Herbert finds the mercers as patrons of a charity a few years after 1172, and one Robert Searle, who was mayor in 1214, was a "mercier." A further charter was granted in 1424, with the right to use a common seal. The history of the company is closely connected with the name of Richard Whittington (q.v.), and later with that of Dean Colet, who chose the company as the manager of St Paul's School. (See LIVERY COMPANIES.)

Mercerizing, the term applied to a process, discovered in 1844 by John Mercer, a Lancashire calico printer, which consists in treating cotton (and to a limited extent other plant fibres) with strong caustic soda or certain other reagents, whereby morphological and chemical changes are brought about in the fibre. Thus, if a piece of bleached calico be immersed in caustic soda of 50° T. strength (sp. gr. 1.25), it rapidly changes in appearance, becoming stiff and translucent, but when taken out and well washed in running water it loses these properties and apparently reverts to its original condition. On closer examination, however, the fabric is found to have shrunk considerably both in length and breadth, so as to render the texture quite different in appearance to that of the original calico; it is also considerably stronger, and if dyed in the same bath along with some of the untreated fabric is found to have acquired a greatly increased affinity for colouring matters. This peculiar action is not restricted to caustic soda, similar effects being obtained with sulphuric acid of 105° T., nitric acid of 8° T., and other reagents. Mercer assumed that a definite compound, corresponding to the formula C₇H₅O₂Na₂ is formed when the cotton is steeped in caustic soda, and that this is decomposed by subsequent washing with water into a hydrated cellulose C₃H₅O₇H₂O, which would account for the fact that in the air-dried condition mercerized cotton retains about 5% more hygroscopic moisture than ordinary cotton. This view is strengthened by the observation that when cotton is immersed in nitric acid of 8° T. it acquires similar properties to cotton treated with caustic soda. If, after immersion in the nitric acid, it is squeezed and then dried "without washing" in a vacuum over burnt lime, it is found to have formed a compound which corresponds approximately to the free nitric acid and a hydrated cellulose.

When viewed under the microscope, mercerized cotton is seen to have undergone considerable morphological changes, inasmuch as the lumen or central cavity is much reduced in size, while the fibre has lost its characteristic band-shaped appearance and becomes rounded.

In Mercer's time the process, which he himself termed "sodaizing" or "fulling," never acquired any degree of com-
mercial success, partly on account of the expense of the caustic soda required, but mainly on account of the great shrinkage (20 to 25%) which took place in the cloth. An important application of the process in calico printing for the production of permanent crisp or "crépon" effects, which was originally devised by Mercier, was in use in 1800-1801 and is still largely practised by calico printers (see Textile Printing). Another application, also dependent upon the shrinking action of caustic soda on cotton, was patented in 1854 by Depouilly, and is still made use of in certain goods consisting of wool and cotton or silk and cotton. In the manufacture of such goods cotton binding threads are introduced at definite intervals in the warp or weft, or both, and the piece is passed through cold caustic soda, washed, passed through dilute sulphuric acid, and washed again till neutral. The cotton contracts under the influence of the caustic soda, while both wool and silk remain unaffected, and the desired crimped or puckered effect is thus obtained.

By far the most important application of the mercerizing process is that by which a permanent lustre is imparted to cotton goods; this was discovered in 1789 by H. A. Lowe, who took out a patent for his process in that year, this being supplemented by a further patent in 1800. Since Lowe's invention did not receive sufficient encouragement, he allowed his patents to lapse and the process thus became public property. It was not until 1805, when Messrs Thomas & Prevost repatented Lowe's invention, that actual interest was aroused in the new product and the process became a practical success. Their patent was subsequently annulled on the ground of having been anticipated.

The production of a permanent lustre on cotton by mercerizing is subject to a very roughly defined process and may be effected in two ways. According to the first method, the cloth is treated in a stretched condition with strong caustic soda, and is then washed, while still stretched, in water. After the washing has been continued for a short time, the cloth is removed, and the cloth that the soda has acquired a permanent lustre or gloss similar in appearance to that of a spun silk but not so pronounced. According to the second method, which constitutes but a slight modification of the first, the cotton is immersed in caustic soda of the strength required for mercerizing, and is then taken out, stretched slightly beyond its original length, and then washed until the tension slackens.

Not all classes of cotton are equally suited for being mercerized. Thus, in the case of yarns the most brilliant lustre is always obtained on twofold or multifield yarns spun from long-stapled cotton (Egyptian or Sea Island). Single yarns made from the same quality of cotton do not grow on so few in proportion by the process, and are consequently seldom mercerized; and the same applies to twofold yarns made from ordinary American cotton. In piece-goods, lustrous yarns are by no means the best, for it is considered that the yarn used for weaving should be twofold. In the great majority of cases, the mercerizing of cotton, whether it be in the yarn or in the piece, is done before bleaching, but sometimes it is done after bleaching, even after dyeing. The strength of the caustic soda employed in practice is generally between 55 and 60° Tw. The temperature of the caustic soda has a material influence on its action on the cotton fibre, very much stronger solutions being required to produce the same effect at elevated temperatures than at the ordinary temperature, while, on the contrary, by lowering the temperature it is possible to obtain a great lustre with considerably weaker lye.

Cotton yarn may be mercerized either in the hank or in the warp, and a great number of machines have been patented and constructed for the purpose. The simplest form of machine for hank mercerizing consists of two long steel rollers onto which the hanks are placed and spread out evenly. The upper roller, the bearings of which run in a slotted groove, is then raised by mechanical means until the hanks are taut. Caustic soda of 60° Tw. or more is applied, and the upper roller is caused to revolve slowly, the hanks acting as a belt and causing the lower roller to revolve simultaneously. After about three minutes the caustic soda begins to be absorbed, and the hanks are washed in hot water until they slacken, when they are taken off and rinsed, first in dilute sulphuric acid (to neutralize the alkaline and facilitate washing), and then in water till neutral. The hanks are then bleached in the ordinary way, or are mercerized a second time, or are diluted with water and brought about in the lustre by these operations. Cotton warps are usually mercerized on a machine similar in construction to a four-box dyeing machine (see Dyeing), but instead of the diagram for their construction and the soda eather at each end of the first box with a double nip (three rollers). The first box contains caustic soda, the second water, the third dilute sulphuric acid, and the fourth water.
West Saxons at Cirencester in 628. In the Mercian regnal tables, however, he is assigned a reign of only twenty-one years, which, as his death took place in 654 or 655, would give 634 as the date of his accession, presumably on the overthrow of Edwin, or perhaps on that of Cawdwalla. During the reign of Oswald Penda clearly reigned under the suzerainty of that king. In 642, however, Oswald was slain by Penda in a battle at a place called Maserfeld, which has not been identified with certainty. During the early part of Oswio's reign the Northumbrian kingdom was repeatedly invaded and ravaged by the Mercians, and on one occasion (before 651) Penda besieged and almost captured the Northumbrian royal castle at Bamberough. At the same time he extended his rule in other parts of Mercia, and expelled from the throne of Wessex Coenwulf, who had divorced his sister. Indeed, at this time nearly all the English kingdoms must have acknowledged his supremacy. The kingdom of Middle Anglia, which appears to have included the counties of Northampton, Rutland, Huntingdon, and parts of Bedfordshire, Cambridgeshire, Leicestershire and Lincolnshire, was formed into a dependent principality under his son Peada. At this time also the territory corresponding to the modern counties of Cheshire, Shropshire and Herefordshire seems to have been occupied. The last of these counties the Chronicle of the Saxon bishops of Worcester says, was occupied by Penda, and retired later to have been under the government of another son of Penda, named Merewald. In 654 or 655 Penda again invaded Northumbria, with a huge army divided into thirty *legiones*, under a royal prince, among whom were Æthelhere, king of East Anglia, and several Welsh kings. He was defeated and slain, however, by Oswio, at a river called the Winwaed. Mercia then came again under Northumbrian rule. Peada, the eldest son of Penda, was allowed to govern the part south of the Trent, while north Mercia was placed in charge of Northumbrian officials. Penda, although he did not prohibit the preaching of Christianity, had remained a heathen to the end of his life. His death was followed by the conversion of his kingdom. Peada had embraced Christianity on his marriage with a daughter of Oswio, and under him the first Mercian bishopric was founded. Shortly afterwards Peada was murdered; but in 658 the Mercians rose under his younger brother Wulfhere and threw off the Northumbrian supremacy.

Wulfhere seems to have been a vigorous ruler, for he extended the power of Mercia as far as it had reached in the days of his father, and even farther. According to the Chronicle he invaded Wessex as far as Ashdown in Berkshire in the year 661. At the same time he conquered the Isle of Wight, which he gave to Æthelwulf, king of Sussex. Between the years 661 and 665 he was defeated by the Northumbrian king Ecgfrith and had to give up Lindsey. In 675 he again fought with the West Saxons under Aescwine, and shortly afterwards died. His brother Æthelred, who succeeded him, invaded Kent in the following year, and in 679 fought a battle on the Trent against Ecgfrith, by which he recovered Lindsey. After this, however, we hear little of Mercian interference with the other kingdoms for some time; and since it is clear that during the last 15 years of the 7th century Wessex, Essex, Sussex and Kent were frequently involved in strife, it seems likely that the Mercian king had somewhat lost hold over the south of England. In 704 Æthelred resigned the crown and became a monk, leaving his kingdom to Coenred, the son of Wulfhere. Coenred also abdicated five years later and went to Rome. Coelred, the son of Æthelred, who succeeded, fought against the West Saxon king Ine in 715. On his death in the following year Æthelwald, a distant relative, came to the throne, and for a time Mercia seems to have been independent. He was slain by one of the Mercian thegns in a battle fought over all the kingdom south of the Humber. He reigned for 41 years. After his murder in 757 the Mercian throne was held for a short time by Beornred. He was expelled the same year by Offa, who soon restored the power of Mercia, which seems to have received some diminution during the later years of Æthelwald. Offa's policy was apparently the extinction of the dependent kingdoms. In his reign the dynasties of Kent, Sussex and the Hwicc seem to have disappeared, or at all events to have given up the kingly title. In 787 he associated his son Ecgfrith with him in the kingdom, and after his death (790) Ecgfrith reigned alone for a few months. On the death of Ecgfrith the throne passed to Coenwulf, a descendant of Dytha, father of Penda. In 821 Coenwulf was succeeded by his brother Ceawlin, who was deprived of the throne in 823, being succeeded by Beornwulf. In 825 Beornwulf was defeated by Ecgberht, king of Wessex, and in the same year he was overthrown and slain by the East Angles. The supremacy now passed to Wessex.

In 827 Ludeca, the successor of Beornwulf, was slain in battle with five of his eals. Wigmil, who succeeded him, was expelled two years later by Ecgberht, but regained the throne in the following year. In 847 he was succeeded by Ceolwulf I. In 853 Ceolwulf II, who had married Æthelwulf, daughter of Æthelwulf. His power seems to have been more or less dependent on the West Saxons. In 853, with the assistance of Æthelwulf he reduced North Wales to subjection. Again in 854 his power seems to have been reduced by the resistance against the Danes under Loðbrok's sons, who at this time invaded Mercia after their overthrow of the Northumbrians at York. No battle took place, and the Mercians subsequently made peace with the Danes. In 872 the Danes occupied London on their return from invading Wessex, after which a truce was again made. In 873 the Danes encamped at Torksey in Lincolnshire, and although another truce ensued, they advanced in the following year to Repton, and Beornred was driven from the kingdom. He went to Rome, where he remained until his death. In 874 Ceolwulf, a king's thegn or baron, was made king by the Danes, and definitely acknowledged their overlordship. In 877, after the second invasion of Wessex, the Danes seem to have taken the eastern part of Mercia into their own hands. How long Ceolwulf reigned over the western portion is unknown. About the year 884 the most important person in English Mercia was an earl, Æthelred, who accepted the suzerainty of Alfred, and in or before the year 887 married his daughter Æthelflaed. Æthelred and Æthelflaed appear to have had practically regal power, though they did not use the royal title. In 886 London, which had been recovered by Alfred from the Danes, was restored to Æthelred. During the invasion of 893-97 English Mercia was again repeatedly ravaged by the Danes; but in the last of these years, by the united efforts of Alfred and Æthelred, they were at length expelled. With this exception, Watling Street, the Ouse and the Lea, continued to be the boundary between Mercia and the Danish kingdom of East Anglia down to the death of Æthelred, between 910 and 912. The government was then carried on by Æthelflaed, who built a number of fortresses, and in conjunction with her brother, King Edward the Elder, succeeded in expelling the Danes from Derby and Leicester by the year 917-18. After her death in the latter year her daughter Æfwyn was soon deprived of the government by Edward, and Mercia was definitely annexed to Wessex.

From this time onwards its existence as a separate kingdom was at an end, though during the last years of Eadwig's reign the Mercians and Northumbrians set up Eadgar as king. In the last century of the Saxon period the earls of Mercia frequently occupied a semi-royal position. The most important of these were Ælfhere under Eadgar, Edward and Æthelred, Eadric whose father, after the last-mentioned king, and Leofric, under the Danish kings.

**MERCIE, MARIUS J. E. ANTONIN** (1845-1924) French sculptor and painter, was born in Toulouse on the 30th of October 1845. He entered the *École des Beaux Arts*, Paris, and studied under Falguière and Jouffroy, and in 1868 gained the Grand Prix
de Rome. His first great popular successes were the "David" and "Gloria Victis," which was shown and received the medal of honour of the Salon. The bronze was subsequently placed in the Square Montholon. "The Genius of the Arts" (1877), a relief, was the medalist, in substitution for Scotty's "République III.", a similar work for the tomb of Michelet (1879) is in the cemetery of Père la Chaise; and in the same year Mercier produced the statue of Arago with accompanying reliefs, now erected at Perpignan. In 1882 he repeated his great patriotic success of 1874 with a group "Quand Même!" replicas of which have been set up at Belfort and in the garden of the Tuletiers. "Le Souvenir" (1885), a marble statue for the tomb of Mme Charles Ferry, is one of his most beautiful works. "Regret," for the tomb of Cabanel, was produced in 1892, along with "William Tell," now in Luxembourg. Mercier also designed the monuments to "Meissonier" (1895), erected in the Jardin de l'Infante in the Louvre, and "Faidherbe" (1896) at Lille, a statue of "Thiers" set up at St Germain-en-Laye, the monument to "Baudry" at Père-la-Chaise, and that of Louis-Philippe and Queen Amélie for their tomb at Dreux. His stone group of "Justice" is at the Hôtel de Ville, Paris. Numerous other statues, portrait busts, and medallions came from the sculptor's hand, which gained him a medal of honour at the Paris Exhibition of 1878 and the grand prize at that of 1889. Among the paintings exhibited by the artist at the Louvre, to which was awarded a gold medal the "Leda" (1858), and "Michael-angelo studying Anatomy" (1883)—his most dramatic work in this medium. Mercier was appointed professor of drawing and sculpture at the École des Beaux Arts, and was elected a member of the Académie Française in 1891, after being awarded the biennial prize of the institute of 1880 in 1887.

MERCIER, HONORÉ (1840-1894), Canadian lawyer and statesman, was the son of Jean Baptiste Mercier, farmer, and of Marie Kimeiner, his wife. He was born in the village of St Athanase d'Iberville on the 15th of October 1840. The family had long resided in the parish of St Malo, Magony, and later removed to Iberville. Mercier entered the Jesuit College of St Mary, Montreal, at the age of fourteen, and throughout his life retained a warm friendship for the society. He married, firstly in 1866 Leopoldine Boivin, and secondly in 1871 Virginie St Denis. On the completion of his course at St Mary's he studied law in the office of Lafortune and Papineau, in St Hyacinthe, and was admitted to the bar of the province in April 1865. At the age of twenty-two he became the editor of the conservative Courrier de St Hyacinthe, and in this position presided so far as possible over the political affairs of the town, which was then represented the interests of Quebec, under the Act of Union (1840); but when Sicotte accepted a seat on the bench Mercier joined the Opposition, and contributed largely to the defeat of the Ministerial candidate. In 1864 he vigorously opposed the scheme of confederation, on the ground that it would prove fatal to the distinctive position held by the French Canadians. He resumed the editorship of the Courrier in 1866; but after a few months retired from journalism, and for the next five years devoted all his energy to his profession. At the commencement of the year 1871 the national party was organized in Quebec, and Mercier was appointed in the Sicotte of the party on the platform. In August 1872 he was elected as a member of the House of Commons for the county of Rouville, and proved a vigorous opponent of Sir John A. Macdonald on the question of separate schools for New Brunswick. He was a candidate at the general elections in 1874; but retired on the eve of the contest in favour of another candidate of his own party. Mercier entered the arena of provincial politics in May 1879 as solicitor-general in the Joly government, representing the county of St Hyacinthe; and on the defeat of the ministry in October he was returned for the town of St Jérôme as a member of the Opposition. On the retirement of M. Joly from the leadership of the Liberal party in Quebec in 1883 Mercier was chosen as his successor. Towards the close of 1883 the French-Canadian mind was greatly agitated over the execution of Louis Riel, leader of the north-west rebellion, and in consequence of the attitude of Mercier on this question the Liberal minority in the Legislative Assembly, which had been reduced to fifteen, rapidly gained strength, until at the general elections held in October 1886 the province was carried in the Liberal interest. In January 1887 Mercier was sworn in as premier and attorney-general, and from this moment he exercised the functions of a regular and extraordinary provincial government, in passing without opposition the Jesuit Estates Act, a measure to compensate the order for the loss of property confiscated by the Crown. This act came before the Federal House for disallowance, but was carried on division. When Mercier appealed to the electorate in 1890, his policy was endorsed, and he was able to give effect to many important measures. Early in 1891 he negotiated a loan in Europe for the province, and whilst on a visit to Rome he was created a count of the Roman Empire by Leo XIII., who three years previously had conferred upon him the rank of a commander of the order of St Gregory the Great. Of commanding presence, firm, decisive, courteous in manner, convincing in argument, and deeply attached to his native province, he had all the qualities of a popular leader. For a few years he was the idol of the people of Quebec, and French Canada loomed large in the public eye; but towards the end of 1891 serious charges were preferred against his ministry, on the ground that subsidies voted for railways had been diverted to political use, and he was dismissed by the lieutenant-governor. At the ensuing elections held in March 1892 he was returned for the county of Bonaventure, but the art of true poesy and policy was he who wrote in prose. The most important of his miscellaneous works are L'An 2440 (1770); L'Essai sur l'Art Dramatique (1773); necessità (1801); L'Histoire de France, 1781-1788 (1880). He decried French tragedy as a caricature of antique and foreign customs in bombastic verse, and advocated the comédie larmoyante as understood by Diderot. To the philosophers he was entirely hostile. He denied that modern science had made any real advance; he even carried his conservatism so far as to maintain that the earth was a circular flat plain which revolution the sun. Mercier wrote some sixty dramas, among which may be mentioned Jean l'Empereur (1772); La Destuction de la Ligue (1782); Jenneval (1769); Le Juge (1774); Natalie (1755) and La Brouette du vinaigrier (1775). In politics he was a Moderate, and as a member of the Convention he voted against the death penalty for Louis XVI. During the Terror he was imprisoned, but was released after the fall of Robespierre. He died in Paris on the 25th of April 1814.

MERCK, JOHANN HEIRICH (1747-1791), German author and critic, was born at Darmstadt on the 11th of April 1747, a few days after the death of his father, a chemist. He studied law at Giessen, and in 1767 was given an appointment in the paymaster's department at Darmstadt, and a year later himself became paymaster. For a number of years he exercised considerable influence upon the literary movement in Germany; he helped to found the Frankfurter gelehrte Anzeigen in 1775, and was one of the chief contributors to Nicolai's Allgemeine Bibliothek. In 1792 he accompanied the Landgravin Caroline of Hesse-Darmstadt to St Petersburg, and on his return was a guest of the duke Charles Augustus of Weimar in the Wartburg. Unfortunate speculations brought him into pecuniary embarrassment in 1788, and although friends, notably Goethe, were ready to come to his assistance, his losses—combined with the death of five of his children—so preyed upon his mind that he committed
suicide on the 27th of June 1791. Merck distinguished himself mainly as a critic; his keen perception, critical perspicacity and refined taste made him a valuable guide to the young writers of the Sturm und Drang. He also wrote a number of small treatises, dealing mostly with literature and art, especially painting, and a few poems, stories, narratives and the like; but they have not much intrinsic importance. Merck's letters are particularly interesting and instructive, and throw much light upon the literary conditions of his time.

MERCURIAN—MERCURY

The estate of Mercœur in Auvergne, France, gave its name to a line of powerful lords, which became extinct in the 14th century, and passed by inheritance to the dauphins of Auvergne, counts of Clermont. In 1426 it passed to the Bourbons by the marriage of Marie de Bourbon, dauphine of Bourbon, count of Montpensier. It formed part of the confiscated estates of the Constable de Bourbon, and was given by Francis I. and Louise of Savoy to Antoine, duke of Lorraine, and his wife, Renée de Bourbon. Nicolas of Lorraine, son of Duke Antoine, was created duke of Mercœur and a peer of France in 1569. His son Philippe Emmanuel (see below) left a daughter, who married the duc de Vendôme in 1609.

MERCURE, PHILIPPE EMMANUEL DE LORRAINE, Duc de (1538–1602), French soldier, was born on the 9th of September 1538, and married Marie de Luxembourg, duchesse de Penthièvre. In 1582 he was made governor of Brittany by Henry III., who had married his sister. Manœuvre put himself at the head of the League in Brittany, and had himself proclaimed protector of the Roman Catholic Church in the province in 1588. Invoking the hereditary rights of his wife, who was a descendant of the dukes of Brittany, he endeavoured to make himself independent in that province, and organized a government at Nantes, calling his son "prince and duke of Brittany." With the aid of the Spaniards he defeated the duc de Montpensier, whom Henry IV. had sent against him, at Craon in 1592, but the royal troops, reinforced by English contingents, soon recovered the advantage. The king marched against Mercœur in person, and received his submission at Angers on the 20th of March 1598. Mercœur subsequently went to Hungary, where he entered the service of the emperor Rudolph II., and fought against the Turks, taking Stuhlweissenburg (Székes-Fehérvár) in 1599. Mercœur died on the 10th of February 1602.

MERCURY (MERCURUS), in Roman mythology, the god of merchandise (merca) and merchants; later identified with the Greek Hermes. His nature is more intelligible and simple than that of any other Roman deity. In the native Italian states no trade existed till the influence of the Greek colonies on the coast introduced Greek customs and terminology. It was no doubt under the rule of the Tarquins that merchants began to ply their trade. Doubtless the merchants practised their religious ceremonies from the first, but their god Mercurius was not officially recognized by the state till the year 495 B.C. Rome frequently suffered from scarcity of grain during the unsettled times that followed the expulsion of the Tarquins. Various religious innovations were made to propitiate the gods; in 496 the Greek worship of Demeter, Dionysus and Persephone was established in the city, and in 495 the Greek god Hermes was introduced into Rome under the Italian name of Mercurius (Livy ii. 21, 27), as protector of the grain trade, especially with Sicily. Peller thinks that at the same time the trade in grain was regulated by law and a regular college or guild of merchants instituted. This college was under the protection of the god; its annual festival was on the 15th (the ides) of May, on which day the temple of the god had been dedicated at the southern end of the Circus Maximus, near the Aventine; and the members were called mercuriales as well as mercaturae. Mommssen, however, considers the mercuriales to be a purely local guild—the pagani of the Circus valley. The 15th of May was chosen as the feast of Mercury, obviously because Maia was the mother of Hermes, that is of Mercury; and she was worshipped along with her son by the mercuriales on this day. According to Peller, this religious foundation had a political object; it established on a legitimate and sure basis the trade between Rome and the Greek colonies of the coast, whereas formerly this trade had been exposed to the capricious interference of government officials. Like all borrowed religions in Rome, it must have the elements of the terminology of its Greek original (Festus p. 257). Mercury became the god, not only of the mercatores and of the grain trade, but of buying and selling in general; and it appears that, at least in the streets where shops were common, little chapels and images of the god were erected. There was a spring dedicated to Mercury between his temple and the Porta Capena; every shopman drew water from this spring on the 15th of May, and sprinkled it with a laurel twig over his head and over his goods, at the same time entreatying Mercury to remove from his head and his goods the guilt of all his deceits (Ovid, Fasti, v. 673 seq.). This spring mercurialis was popularly used as equivalent to "cheat."

Roman statuettes of bronze, in which Mercury is represented, like the Greek Hermes, standing holding the caduceus or staff in the one hand and a purse in the other (an element very rare in purely Hellenic representations), are exceedingly common.

MERCURY, in astronomy, the smallest major planet and the nearest to the sun; its symbol is $\gamma$. Its proximity to the sun makes the telescopic study of its physical constitution extremely difficult. The result is that less is known on this subject than in the case of any other planet. Even the time of rotation on its axis is uncertain. J. H. Schröter inferred a period of rotation of 24 h. 35 m. 30 s., which is in seeming agreement with the observations of K. L. Harding. This period was generally accepted, though Herschel had been unable to see any changes indicating rotation. In 1882 G. Schiaparelli began a careful study of the face of the planet with a refractor of 8 in. aperture, subsequently replaced by one of 18 in. His unexpected conclusion was that the rotation of Mercury resembles that of the moon, in having its period equal to that of its orbital revolution. As the moon always presents the same face to the earth, so Mercury must, in this case, always present very nearly the same face to the sun. Schiaparelli also announced that the axis of rotation of the planet is nearly perpendicular to the plane of its orbit. The rotation being uniform, while the orbital motion, owing to the great eccentricity of the orbit, is affected by a very large inequality, it would follow that there is a libration in longitude of nearly 24° on each side of the mean position. Percival Lowell in 1897 took up the question anew by combining a long series of measured diameters of the planet with drawings of its apparent surface. The seeming constancy of the surface appearance was considered to confirm the view of Schiaparelli as to the slow rotation of the planet. But there is wide room for doubt on the question.

The period of orbital revolution of Mercury is nearly 88 days, or somewhat less than three months. Consequently, the period of synodic revolution is less than four months, during which the entire round of phases is completed. When near greatest elongation Mercury shines as a star of the first magnitude, or brighter; but in the latitudes of central and northern Europe it is so near the horizon soon after sunset as to be generally obscured by vapours or clouds.

The eccentricity of the orbit, $e=0.20$, is far greater than that of any major planet, and nearly the average of that of the minor planets. Consequently, its distance and its greatest elongation from the sun vary widely with its position in its orbit at the time.

The mass of Mercury can be determined only from its action upon Venus; this is so small that the result is doubtful. Leverrier adopted in his tables $1:3,000,000$ as the ratio of the mass of Mercury to that of the sun. S. Newcomb, from the action upon Venus, reduced this to one-half its amount, or $1:6,000,000$. 
G. W. Hill, basing his conclusions on the probable density of the planet, estimated the mass to be less than 1,000,000,000. The adoption of a mass even as large as that of Newcomb implies a greater density than that of the earth, but it is not possible to estimate the probability that such is the case.

The most interesting phenomenon connected with Mercury is that of its occasional transit over the disc of the sun at inferior conjunction. These occur only when the planet is near one of its nodes at the time. The earth, in its orbital revolution, passes through the line of the nodes of Mercury about the 8th of May and the 10th of November of each year. It is only near one of these times that a transit can occur. The periodic times of Mercury and the earth are such that the transits are generally repeated in a cycle of 46 years, during which 8 transits occur in May and 6 in November. The following table shows the Greenwich mean time of the middle of all the transits from 1677, the date of the first one accurately observed, until the end of the present century.

A perplexing problem is offered by the secular motion of the perihelion of Mercury. In 1845 Leverrier found that this motion, as derived from observation of the transits, was greater by 35° per century than it should be from the gravitation of all the other planets. This conclusion has been fully confirmed by subsequent investigations, a recent discussion showing the excess of motion to be 49° per century. It follows from this either that Mercury is acted upon by some unknown masses of matter, or that the intensity of gravitation does not precisely follow Newton's law. The most natural explanation was proposed by Leverrier, who attributed the excess of motion to the action of a group of intra-Mercurial planets. At first this conclusion seems to be confirmed by the fact that occasional observations of the transit of a dark object over the sun had been observed. But no such observation was ever made by an experienced astronomer, and the frequent photographs of the sun, which have been taken at the Greenwich observatory and elsewhere since 1870, have never shown the existence of any such body. We may therefore regard it as certain that, if a group of intra-Mercurial planets exists, its members are too small to be seen when projected on the sun's disk. During the eclipses of 1900 and 1905 the astronomers of the Harvard and Lick Observatories photographed the sky in the neighbourhood of the sun so fully that the stars down to the 7th or 8th magnitude were imprinted on the plates. Careful examination failed to show the existence of any unknown body. It follows that if the group exists the members must be so small as to be entirely invisible. But in this case they must be so numerous that they should be visible as a diffused illumination on the sky after sunset. Such an illumination is shown by the zodiacal light. But such a group of bodies, if situated in the plane of the ecliptic, would produce a motion of the node of Mercury equal to that of its perihelion, while the observed motion of the node of Mercury is somewhat less than that computed from the gravitation of the known planets. The same is true of the node of Venus, which might also be affected by the same attraction. To produce the observed result, the inclination of the ring would have to be greater than that of the orbit of either Mercury or Venus. In 1859 Newcomb showed that the observed motions, both of the perihelion of Mercury and of the nodes of Mercury and Venus, could be approximately represented by the attraction of a ring of inter-mercurial bodies having a mean inclination of 9° and the mean node in 48° longitude. He also showed that if the ring was placed between the orbits of Mercury and Venus, the inclination would be 7.5° and the longitude of the node 35°. The fact that the zodiacal light appears to be near the ecliptic, and the belief that, if it were composed of a lens of discrete particles, their nodes would tend to scatter themselves equally around the invariable plane of the solar system, led him to drop these explanations as unsatisfactory, and to prefer provisionally the hypothesis that the sun's gravitation is not exactly as the inverse square. (See Gravitation.)

In 1896 H. H. Seeliger made a more thorough investigation than his predecessor had done of the attraction of the matter producing the zodiacal light, assuming it to be formed of a series of ellipsoids. He showed that the motions of the nodes and perihelion could be satisfactorily represented in this way. The following are the three principal elements of the hypothetical orbits as found by the two investigators:

The demonstration by E. W. Brown that the motion of the moon's perigee is exactly accordant with the Newtonian law of gravitation, seems to preclude the possibility of any deviation from that law, and renders the hypothesis of Seeliger the most probable one in the present state of knowledge. But the question is still an open one whether the zodiacal light has an inclination of the ecliptic as great as that computed by Seeliger. This is a difficult one because the action on Mercury is produced by the inner portions of the matter producing the zodiacal light. These are so near the sun that they cannot be observed with certainty, possibly during a total eclipse. (S. N.)

**MERCURY** (symbol Hg, atomic weight = 200), in chemistry, a metallic element which is easily distinguished from all others by its being liquid at even the lowest temperatures naturally occurring in moderate climates. To this exceptional property it owes the synonyms of quicksilver in English (with the Germans Quecksilber is the only recognized name) and of hydrargyrum (from ἰδραγυρός, water, and ἰδρύμα, silver) in Graeco-Latin. This metal does not appear to have been known to the ancient Jews, nor is it mentioned by the earlier Greek writers. Theophrastus (about 300 B.C.) mentions it as prepared from a scum by treatment with copper and vinegar; Dioscorides obtained it from the same mineral with the aid of iron, employing at the same time a primitive distillation apparatus. With the alchemists it was a substance of great consequence. Its appearance commended it as a substance for investigation; many of its compounds, especially corrosive sublimate and calomel, were studied, and improved methods for extracting and purifying the metal were devised. Being ignorant of its susceptibility of freezing into a compact solid, they did not recognize it as a true metal, and yet, on the authority of Geber, they held that mercury (meaning the predominating element in this metal) enters into the composition of all metals, and is the very cause of their metallicity (see Element). When, about the beginning of the 16th century, chemistry and scientific medicine came to merge into one, this same mysterious element of “mercury” played a great part in the theories of pathology; and the metal,
Mercury

Mercury is transported in steel bottles closed by a screw stopper; the Almaden and Idrian bottles contain 76 lb; and until the 1st of June 1904, the Californian bottles contained 76½ lb of mercury; they now hold 75 lb. From the smaller works the metal is sometimes sent out in sheepskin bags holding 55 lb of mercury.

Metallurgy.—Chemically speaking, the extraction of mercury from ores is a single matter. Metallic mercury is easily volatilized, and separated from the gangue, at temperatures far below redness, and cinnabar at a red heat is readily reduced to the metallic state by the air and atmospheric moisture. The air is therefore used as a reducing agent, in the first case as iron sulphide, in the second as calcium sulphide and sulphurate, in the third as sulphur dioxide. A close iron retort would at first suggest itself as the proper kind of vessel, but it has been found that the operation is much more rapid when carried out in a stove, where the temperature can be controlled. The first operation, at one time, acted upon in a few small establishments—for instance, in that of Zweibrücken in the Palatinate, where lime was used as a decomposing agent; but the method has now been discarded in favour of the direct exposure of the ore to the oxidizing flame of a furnace, and the mercury vapour, which gets diffused through an immense mass of combustion gases, is recovered in more or less imperfect condensers.

With the exception of the massive deposits of Almaden in Spain and a few of those in California and Idria, cinnabar occurs in forms that can be reduced to metallic mercury without undergoing plastic changes and the process of separation between the metallic mercury and the rest of the ore is usually practised. Wet concentration has not been successful, because it necessitates ore crushing and extensive slime leaching of the mercury ore. The wet process of concentration is carried out directly with less loss and expense. At Almaden in Spain the ores average from 5 to 7%, but in other parts of the world much poorer ores have to be treated. In California, in spite of the high grade of the ores, the concentration was carried on containing not more than 2½% to be mined and roasted at a profit.

The furnaces originally used at Almaden and Idria differ only in the condensing plant. The roasting was carried out in internally fired, vertical shafts of brickwork, and, at Almaden, the vapours were led through a series of bottles named aludes, so arranged that the neck of one entered the sole of the next; and at Idria the vapours were led through the chambers of a colchak-pan, charged with charcoal, and are condensed. The alude furnace, which was designed in 1633 by Lopez Saavedra Barba in Huacavallca, Peru (where cinnabar was discovered in 1566), and introduced at Almaden in 1646 by Bustamante, by whose name it is sometimes known, is now discarded, and the condenser, the alude furnace, is purified by straining through dense linen or chamois leather bags.

The most important improvements in the metallurgy of mercury are the introduction of furnaces for treating coarse ores, and condensers, the alude, which are continuous, and which work continuously. The most successful of these continuous furnaces was a modification of Count Rumford's continuous linke furnace. This furnace was introduced at New Almaden by J. B. Randol, who designed it and built it in connexion with the extraction of mercury. The success of the continuous coarse-ore furnace at New Almaden led Randol to attempt the continuous treatment of fine ores also, and the Huettenroeder Scott furnace, the results of whose experiments solved the problem completely. It contains several vertical shafts in which the descending ore is retarded at will by inclined shelving, which causes it to be exposed to the flames as long as may be necessary to roast it thoroughly. The time of treatment is determined by the rapidity with which the roasted ore is withdrawn at the bottom. Several similar furnaces are in use, as the Knox and Osborne, the Livermore and the California-Sparks. The fumes from the roasting furnaces are received in masonry chambers, usually provided with water-cooled pipes; from these they pass through earthenware pipes, and finally through the condensers, which are made of lead, and which are arranged in series. The mercury is recovered at a point at which most of it is entangled in masses of soot that cover the condenser walls, and this is only recovered after much labour.

The conditions for effective condensation are: (1) The furnace gases should be well oxidized, to hold the oxidation of an excess of soot. Gas firing would meet this requirement better than the use of wood or coal. (2) The volume of permanent gases passing through the furnace should be reduced to a minimum, and the oxidizer of the condensers should be sufficient to reduce the velocity of the escaping gases, and the surface large enough for cooling and for the adhesion of condensed mercury. The latter requirement is generally fulfilled by using a large number of small apertures in the path of the cooled gases. (4) The temperature of the escaping gases should not exceed 15° to 20° C., but cooling below this temperature would not give any adequate return for the energy consumed. (5) The cooling should be done by running water or air. Water sprays, acting directly on the fumes, have not given good results, on account of the difficulty of recovering "fouled" quicksilver from the water. (6) The use of an auxiliary draught is absolutely necessary to control the operation of the

1 Estimated.
furnaces and condensers and to avoid the salvation of the workmen. (6) The condenser should be easily and quickly cleaned during the operation of the furnace. (7) Both furnaces and condensers should have a sufficient amount of space for the prevention of clogging of the condenser. (8) There is a great need of some substance for the construction of quicksilver condensers which shall be strong enough to be made thin, be a good conductor of heat, and resistant to the action of mercury and dilute sulphuric acid; and also resist the action of mercury and warm dilute sulphuric acid, and be not too expensive.

Concentrated solutions are best prepared from the "soot," not by pressure, but by the opposite treatment. A machine in use for this purpose at New Almaden, devised by Colonel von Leicht, consists of an iron bowl, perforated at the bottom, in which revolves a vertical shaft, carrying a number of blades which toss the "soot" (mixed with ashes and a little coal oil) into the air, so that the entangled mercury is free to run out through the bottom of the bowl. The residue from which no more mercury can be extracted mechanically is retain the pure metal.

The losses of treatment are: (1) Furnace loss, which is easily reduced to nothing, and (2) condenser loss, which can never be zero. The latter consists of mercury lost as vapour and as dust, and its minimum amount is determined not by the richness of the ore but by the volume of escaping gases, their velocity and temperature. The percentage of loss will be higher with a poor than with a rich ore. On a rich ore, and the ore is not extracted entirely. But in poorly arranged plants, under bad management they may easily be doubled or even trebled. The Huettner and the Arizona furnace costs with condensers in California are about $30,000, and require a labor of $30 a day (from 21 in. to dust) in 24 hours at a cost of from $1 to $62 per ton.

Purification.—Commercial mercury, as a rule, only needs to be forced through chamois leather or allowed to run through a very fine hole in a piece of window-silk for several hours. But having the power of dissolving most other metals, is very liable to get contaminated, and requires then to be purified. For this purpose many chemical methods have been proposed; the commonest consist in allowing the metal to fall in a very fine stream through a column of a mixture of nitric acid and mercuric nitrate, or of sulphuric acid, or of potassium bichromate and sulphuric acid; the metal being subsequently dried and filtered through a piece of paper filter. The only really exhaustive method is distillation in a vacuum out of a glass apparatus. Many forms of apparatus have been devised to effect this. Recent researches have shown, however, that the metal obtained is not chemically pure, there being found in the distillate traces of other metals. Absolutely pure mercury does not at all adhere to any surface which does not consist of a metal soluble in mercury. Hence the least quantity of it, when placed on a sheet of paper, forms a neatly rounded-off globule, which retains its form on being rolled about, and, when subdivided, breaks up into a number of equally perfect globules, which tend to coalesce when dry, but remain separate if otherwise suspended in the air. Any minute trace of lead or tin causes it to "draw tails." A very impure metal may adhere even to glass, and in a glass vessel, instead of the normal convex, form an irregular flat meniscus.

Properties.—Pure mercury is a freely flowing liquid, which does not freeze at 0° C.; it is a beautiful white, soft, malleable mass, having a lustre and perfect metallic lustre; in very thin layers it transmits a bluish-violet light. It freezes at about -39° C. (Mallet gives -38.85°; Hutchins, -39.44°) with contraction, and the formation of a white, very ductile and malleable mass, easily cut with a knife, and exhibiting crystals belonging to the cubic system. When heated the metal expands very uniformly, and vaporizes at about 360°; the volatility is generally increased by the presence of impurities; its high expansion and the wide range of temperature over which it is fluid render it especially valuable as a thermometric fluid (see THERMOMETER). The vapour is colorless, and possesses an absorption spectrum that shows the molecules are monatomic. Its specific gravity at 0° is 13.5959, i.e., it is about half as heavy again as copper for volume, a quarter as heavy again as lead, and nearly twice as heavy as zinc; this property is used to account in the construction of barometers and air-pumps. Its specific heat is about 0.033 (see CALORIMETRY); its electrical conductivity is involved in the definition of the ohm (see CONDUCTION, ELECTRIC); and its thermal conductivity is about two thirds that of silver.

Pure mercury remains unchanged in dry air, oxygen, nitric acid, carbon dioxide, ammonia and some other gases at ordinary temperatures; hence its application for collecting and measuring gases. In damp air it slowly becomes coated with a film of mercuric oxide; and when heated for some time in air or oxygen it becomes transformed into the red mercuric oxide, which decomposes into mercury and oxygen when heated to a higher temperature; this reaction is of great historical importance, since it led to the discovery of oxygen at the hands of Priestley and Scheele. The halogen elements, which form compounds combine directly with the metal. Mercury is not attacked by dilute sulphuric acid; the strong acid, however, dissolves it on heating with the formation of sulphur dioxide and mercuric or mercuric sulphate according as mercury is in excess or not. Hydrochloric acid has no action. Dilute nitric acid readily attacks it, mercurous nitrate being formed in the cold with excess of mercury, mercuric nitrate with excess of acid, or with strong nitric acid. The metal dissolves in solutions containing chloro or bromine to form respectively mercurous chloride and bromide.

Mercury readily dissolves many metals to form a class of compounds termed amalgams, which have considerable applications in the arts.

Compounds of Mercury. Mercury forms two well-defined series of salts—the mercuric salts derived from the oxide HgO, and the mercurous salts from the oxide HgO; the existence of these salts can hardly be inseparably connected with a variable valency, i.e., that mercury is monovalent in mercurous, and divalent in mercuric compounds, for according to Bunsen, no metallic compound of calomel (Hg2) has the formula HgCl2.

Mercuric Oxide, HgO, is a compound of mercury and oxygen when caustic potash acts on calomel; it is decomposed by light or on trituration into mercury and mercuric oxide. Mercuric oxide, HgO, melts with a flash in two hours at 301°; it is a white powder (also known as "red precipitate," or as mercurius precipitatius per se) by heating the metal in air, or by calcining the nitrate, and as an orange-yellow powder by precipitating a solution of a mercury salt with a strong nitric acid.

Mercurous Oxide, Hg2O, is a metallic oxide, of which the yellow form is the most reactive and is transformed into the red when heated to 400°. If the red oxide be heated it becomes black, and after clearing off a crust, and on further heating to 600° it decomposes into mercury and oxide, as in the formation in water, to which it imparts an alkaline reaction and strongly metallic taste. A peroxide is obtained as a brown solid from mercury dioxide, HgO2, by heating with 5% hydrogen peroxide at 60°. Mercury and mercurous chlorides, known respectively as calomel (HgO) and corrosive sublimate (HgO), are two of the most important salts of mercury. Mercury bromide, HgBr2, is a yellowish-white powder, insoluble in water. Mercuric bromide, HgBr2, forms crystals, sparingly soluble in cold water, readily in hot, and prepared by the direct union of its components. Mercurous iodide, HgI2, is a yellowish-green powder obtained by heating its components to about 250°, or by triturating them with a little alcohol; it is also obtained by precipitating a solution of mercurous nitrate with potassium iodide. It is blackened by exposure to light. Mercuric iodide dissolves in water to form a solution of mercuric iodide, HgI2, on standing. Mercury solutions of mercuric chloride and potassium iodide under a microscope, yellow rhombic plates are seen to be formed which are transformed very quickly into scarlet quadrate octahedra. On heating to about 120°, this precipitate form is transformed into the tetragonal crystals of mercurous iodide, K2HgI4, which may be obtained in lemon-yellow crystals. A strongly alkaline solution of this salt is known as Nessler's reagent, and is specially used for determining traces of ammonia (see below). Mercuric iodide dissolves in water to form a solution of mercuric iodide, HgI2, on standing. Mercury solutions of mercuric chloride and potassium iodide under a microscope, yellow rhombic plates are seen to be formed which are transformed very quickly into scarlet quadrate octahedra. A strongly alkaline solution of this salt is known as Nessler's reagent, and is specially used for determining traces of ammonia (see below). Mercuric iodide dissolves in water to form a solution of mercuric iodide, HgI2, on standing.
Mercury; it is the principal ore, occurring in nature as the mineral cinnabar (q.e.), and is extensively used as a pigment, vermilion (q.e.). It is obtained by the electrolysis of a solution of mercury nitrate, and the compound thus formed is known in pharmacy as <i>Aethiops mineralis</i>, and also by precipitating a mercuric salt with sulphuretted hydrogen. It is only slightly active and is less toxic; it dissolves in water, and gives a yellow compound, 2HgS, HgCl2; and it dissolves in potassium sulphide solutions to form double salts of variable composition.

<code>Mercuoric Sulfate</code>, HgSO4, is a white, sparingly soluble, crystalline substance obtained by adding sulphuric acid to a solution of mercuric nitrate. <code>Mercuropic sulphate</code>, HgSO4, is a white, soluble salt, precipitated by adding bicarbonate of soda to a solution of mercuric nitrate; or on digestion with water, it decomposes into a basic salt, HgSO4, HgO known as turbith or turpeth mineral, and into an acid salt, HgSO4, 2SO3, which is used as a skin disinfectant. HgSO4 is obtained as brilliant red, hexagonal crystals by heating mercury with phosphorus iodide to 300° and removing the mercuric iodide simultaneously formed by means of potassium iodide solution. <code>Mercuoric phosphate</code>, Hg3(PO4)2, are obtained as white precipitates by adding sodium phosphate to solutions of mercuric salts and mercuric nitrate respectively.

<code>Mercuoric Compounds</code>.—By the action of ammonia and ammonium salts mercury compounds yield a number of substances, many of which have long been used in medicine. By the action of dry ammonia on calomel mercurico-ammmonium chloride, NH4HgCl, is formed, and calomel with calomel, mercurico-ammnomium chloride, NH3HgCl. By adding ammonia to a solution of mercuric chloride, mercurico-ammnomium chloride, known in pharmacy as *infusible precipitate*, NH3HgCl, is precipitated; this is the *white precipitate* or *mercuric precipitate* NH3HgCl, is also obtained by adding a solution of mercuric chloride to hot solutions of ammonium chloride and ammonia so long as the two substances separate out on cooling. By precipitating a strongly alkaline solution of mercuric iodide in potassium iodide (Nessler's solution) there is obtained a yellow precipitate of NH4HgI4; this precipitate is the most delicate test for ammonia, a yellow coloration being given by minute traces. By passing dry ammonia over precipitated mercuric oxide at 130°, a nitride NH3Hg is obtained. The oxide and ammoniacal ammonia gives the stable and basic mercuric hydride, NH4Hг. The chemistry of these compounds has been especially studied by K. A. Hofmann and E. C. Marburg (Zeit. Anorg. Chem., 23, p. 126); these chemists formulate "infusible precipitate" as Hg(NH3)Cl, fusible precipitate as Hg(NH3)Cl2, and "Millon's base" as (HO)Hg(NH2)OH, thus postulating three distinct types of compounds, (1) amidochlorides; (2) amines; (3) substituted ammonium derivatives.

<code>Analysis</code>.—Mercury compounds, when heated in a closed tube with sodium carbonate, yield a grey to black sublimate of metallic mercury, which readily unites to form visible globules. The metal is precipitated by solutions of hydrocyanic acid, a coating being formed on the copper, which becomes silvery on rubbing, and disappears when the quicksilvered copper is heated in a sublimation tube. Sulphuric and hydrochloric acids with hydrocyanic acid give a white precipitate of calomel, which becomes jet-black on treatment with ammonia. Stannous chloride, in its twofold capacity as a chloride and a reducing agent, precipitates both mercuric and metallic compounds, at first as calomel, and on addition of an excess of reagent, the precipitate becomes grey through conversion into finely-divided quicksilver. Sulphured hydrogen, when added very gradually to an acid mercuric solution, gives at first an almost white precipitate, which, on addition of more and more reagent, assumes successively a yellow, orange and at last jet-black colour. The black precipitate is HgS, which is identified by its great heaviness, and by being insoluble in boiling nitric and in boiling hydrochloric acid. A mixture of the two (aqua regia) dissolves it as chloride.

"Mercurocy" mercury is quantitatively estimated by precipitating as calomel and weighing the precipitate on a tared filter at 100°. The precipitate is sublimated by heating it in an airtight tube with lime, the metal being collected and weighed, or by precipitating the solution with an excess of stannous chloride. More convenient is the method of precipitating it sulphide by an excess of sulphured hydrogen, and weighing the precipitate on a tared filter; or by means of a Gooch crucible.

Pharmacology and Therapeutics

The use of mercury as a therapeutic agent is of comparatively recent date. To the Greeks and Romans its value was unknown, and the Arabian physicians only used it for skin affections. It was not till the middle of the 16th century that the special properties of mercury were fully appreciated, but since that time the metal has continued to hold a high though fluctuating value as a remedy. At first the metal in a finely divided state or in vapour was used; but very soon its various compounds were found to be endowed with powers even greater than those of the metal itself, and with the discovery of new compounds the number of mercurial medicines has largely increased.

The British Pharmacopoeia contains some twenty-five mercurial preparations, including those of calomel (q.e.), Only the useful properties of these forms of treatment will be enumerated. These are used in Hydroargyroctum Creta, or "grey powder," which consists of one part of mercury to two of prepared chalk. The powder of this valuable and won universal value, is, in the doses of 4-10 grms., as old as ancient medicine. It is inexcelsibile with alkalies, alkaline carbonates, potassium iodide, albumen and many other substances, and should therefore be prescribed alone. It is decomposed by impure water, and distilled water is therefore used in no local action on the skin. The metallic salts, and especially the chloride and iodide, are probably the most powerful of all known antiseptics. One part of the perchloride in 500,000 will prevent the growth of a large number of bacteria, while the iodide in 1,000,000 is only slightly affected by it. The iodide of mercury is also employed in surgery—kills all known bacteria. The action is apparently specific and not due to the fact that perchloride of mercury precipitates albumen, including the albuminous bodies of bacteria, for bacteria, on the other hand, will form clots when in strong solution, are caustic. It is important to observe that the volatility of metallic mercury and many of its compounds causes their absorption by the lungs even when no such effect is intended. Mercury is freely absorbed when used in a collyrium, though it does not coagulate albumen. These salts cannot be employed for sterilizing metallic instruments, which they tarnish. As these drugs are essentially poisons they must be used with the greatest care in surgical practice, and as they are particularly pernicious to the secretory structure of the kidney they must not be employed as antiseptics in diseases where renal inflammation is already present or probable. They are therefore contra-indicated for application to the throat in scarlet-fever or to the uterus in eclampsia. The stronger mercurial ointments kill cutaneous parasites and also possess some degree of antiputrid action, especially when the cause of the putrefaction is brought out in the form of ointment, and though it does not coagulate albumen. These salts cannot be employed for sterilizing metallic instruments, which they tarnish. As these drugs are essentially poisons they must be used with the greatest care in surgical practice, and as they are particularly pernicious to the secretory structure of the kidney they must not be employed as antiseptics in diseases where renal inflammation is already present or probable. They are therefore contra-indicated for application to the throat in scarlet-fever or to the uterus in eclampsia. They are therefore contra-indicated for application to the throat in scarlet-fever or to the uterus in eclampsia.

Single doses of mercury or its compounds have no action upon the mouth, the characteristic salivation being produced only after very many doses. Their typical action on the bowel is purgative, the effect varying with the state of the mercury. The most readily inactivated by calomel is a powerful irritant. The calomel is then usually employed as a saline aperient to complete its action, as in the blue pill and black draught, of former days. Mercurials do not, however, in these cases, in which the mercury is employed on suppression of secretion, the action being mainly exerted on the muscular wall of the bowel. The bile is rapidly removed from the duodenum, before any re-absorption can occur, and the bacterial action which
decomposes the bile-pigment is arrested by the antiseptic power of the

drug, so that the excreta are of a very dark colour. The classical

experiments of William Rutherford (1839-1890), of Edinburgh,

showed that calomel does not increase the amount of bile formed

by the liver, and that the pigments which are secreted by the liver to a

degree. The value of calomel in hepatic torpor is as an excretory, not a

decay, cholagogue, the gall-bladder being stimulated to expel its stagnant

contents. In large doses mercurials sometimes produce albuminuria for
generation of mercuric chloride. When peroxide of mercury is inhaled,

some observers assert that mercury is a haematinic, increasing,

like iron, the amount of haemoglobin in the blood. Whilst this is
doubtful it is certain that large doses, when continued, produce
marked anaemia. The excretion of the drug is accomplished by all

the secreting glands, including the breasts, if these are functioning.

All the secretions of the body, except that of the pectus glands

of the stomach, are stimulated, but it is typically one of the drugs that are

cumulative, like arsenic and digitalis.

Mercury is largely used in afflictions of the alimentary canal, and

has proved the most efficient of many calcareous and albuminous

diseases and arterial degeneration. But its value in syphilis (see

VENEREAL DISEASES) far outweighs all its other uses.

**Textology.**—Acute poisoning by mercurials usually occurs in the

case of a soldier who has swallowed some gastro-intestinal inflammation, with vomiting, frequent "rice-water" stools and extreme

collapse. The treatment, except when the case is seen at an early

stage, white of an egg may be administered, the chief antipathy

is the antidote, forming an insoluble compound with the peroxide.

Chronic poisoning (hydrargyrismus or mercurialism) is of great

importance, since any indication of its symptoms must be closely

watched for in patients who are under mercurial treatment. Usually

the first symptom is slight tenderness of the teeth while eating, and

some foetor of the breath. These symptoms become more marked

and the gums become red, the onset of severe inflammation, being spongy,

vaccinal and prone to bleed. The salivary glands are swollen and

tender, and the saliva pours from the mouth, and may amount to

pints in the course of a day. The teeth become quite loose and may

fall out. The tongue is covered with a thick, opaque, yellow or

ulcerate, the jaw-bone necroses, haemorrhages occur in various

parts of the body, and the patient dies of anaemia, septic inflamma-

tion or exhaustion. The treatment consists, besides stopping the

intake of poison and relieving the symptoms, in the mercury is slow,

and it is typically one of the drugs that are cumulative, like arsenic

digitalis.

**Bibliography.**—For the history of mercury see B. Neumann,

*Die Metalle* (1906); A. Rössing, *Geschichte der Metalle* (1901).

The general literature is abundant; see O. Taffel, *Dissertationen

anorganischen Chemie*, and H. Moissan, *Traité de chimie minière*.

For the metallurgy reference may be made to Carl Schnabel, *Hand-

book of Metallurgy* (1906), and to F. Louis (*Mercure* (1787-1841).

MERCY (or MERC), FRANZ, FREIHERR VON, lord of Mandr

andollenburg (d. 1645), German general in the Thirty Years' War,

who came of a noble family of Lorraine, was born at Longwy between 1590 and 1598. From 1606 to 1630 he was

engaged in the imperial service. By the latter year he had

attained high military rank, and after distinguishing himself at the

first battle of Breitenfeld (1631) he commanded a regiment of

foot on the Rhine and defended Rhenenfeld against the

Swedes with utmost bravery, surrendering only after enduring

a five-months' siege. He now became general officer of

cavalry (General-Feldwachtmeister), and in 1635, 1636 and 1637

took part in further campaigns on the Rhine and Doubs. In

September 1638 he was made master-general of ordnance in the

army of Bavaria, then the second largest army in Germany.

In the next campaign he was practically commander-in-chief of the

Bavarians, and at times also of an allied army of Imperialists and

Bavarians. He was now considered one of the foremost

soldiers in Europe, and was made general field marshal in 1643,

when he won his great victory over the French marshals Rantzenau

tuttlingen (Nov. 24–25), capturing the marshal and seven

of his lieutenants and taking 3000 prisoners. In 1645 he

was made commander of the Bavarian army, now under the Duke of

Engenh (afterwards the great Condé) and the vicomte de Turenne.

He fought, and in the end lost, the desperate battle of Freiburg, but

revenged himself next year by inflicting upon Turenne the defeat of

Mergenthal (Marienthal). Later in 1645, fighting once more against Engibbon

Turenne, Mercy was killed at the battle of Nordlingen (or

Aillerheim) at the crisis of the engagement, which, even without

Mercy's guiding hand, was almost a drawn battle. He died on

the 3rd of August 1645. On the spot where he fell, English

crowned a memorial with the inscription *Sua visor, heros calcis*.

His grandnephew CLAUDIUS FLORIMOND, COUNT MERCY

DE VILLETS (1666-1734), Imperial field marshal, son of his brother

Kasper, who fell at Freiburg, was born in Lorraine, and entered

the Austrian army as a volunteer in 1682. He won his com-

mission at the great battle of Vienna in the following year; and

during seven years of campaigning in Hungary rose to the rank

of Rittmeister. A wound sustained at this time permanently

injured his sight. For five years more, up to 1697, he was

employed in the Italian campaigns, then he was called back to

Hesse. He was Prince of Hesse-Kassel, and won on the field of Zenta two

grades of promotion. He displayed great daring in the following

campaigns of the Spanish Succession War in Italy, twice fell into the

hands of the enemy in fights at close quarters and for his conduct at the surprise of Cremona (Jan. 31, 1702)

received the emperor's thanks and the proprietary colonelcy of

a newly raised cuirassier regiment. With this he took part in

the Rhine campaign of 1703, and the battle of Friedlingen, and

his success as an intrepid leader of raids and forays became well

known to friend and foe. He was on that account selected early in

1704 to occupy the Lower Baden, and was appointed to the

rank he was engaged in the battle of Schellenberg (July 2,

1704). In the rest of the war he was often distinguished by his

fiercely courage. He rose to be general of cavalry in the course

of these ten years. His resolute leadership was conspicuous at

the battle of Peterwardein (1710) and he was soon afterwards

commander of the Banat of Temesvár. At the great

battle of Belgrade (1717) he led the second line of left

cavalry in a brilliant and decisive charge which drove the Turks

clear of the field. He was then placed in command of the

administration of the Banat, which after more than 150 years of

rule needed a humane and capable governor. But before his

work was done he was once more called away to a command in

the field, this time in southern Italy, where he fought the battle

of Francavilla (June 20, 1719), took Messina and besieged

Palermo. For eleven years more he administered the Banat,

reorganizing the country as a prosperous and civilized

community. In 1734 he was made a general field marshal in the

army, but on the 29th of June was killed at the battle of Parma

while personally leading his troops. He left no children, and

his nephew passed to Cornel Argenteau, from whom came the

family of Mercy-Argenteau (see below).

MERCY (adapted from Fr. *mercy*, Lat. *merces*, reward, compensation, pardon, pity or forgiveness. The Latin word was

used in the early Christian ages for the reward that is given in

heaven to those who have shown kindness without hope of return. The French word, except in such phrases as *Dieu merci*, *sans

merci*, is principally used in the sense of "thanks," and is

seen in the old English expression "gramercy," i.e. *grant merci*.

*Great, many thanks, which Johnson took for "grant me mercy."

In the medieval Church there were seven "corporate" and seven

"spiritual works of mercy" (*opera misericordiae*); these were

(a) the giving of food to the hungry and drink to the thirsty,

(b) the converting of sinners, teaching of the ignorant, giving

counsel to the doubtful, forgiveness of injuries, patience under

difficulty, prayer for the living and for the dead. The order of

the Sisters of Mercy is a religious sisterhood of the Roman Church.

It is founded chiefly in England and Ireland, but there are branches

in the United States of America, in South America and in Aus-

tralia and New Zealand. It was founded in 1827 in Dublin by

Miss Catherine McAuley (1787-1841). The object was to per-

form the corporal and spiritual works of mercy.
Austrian minister at Turin, at St Petersburg, and in 1766 at Paris, where his first work was to strengthen the alliance between France and Austria, which was cemented in 1770 by the marriage of the dauphin, afterwards Louis XVI., with Marie Antoinette, daughter of the emperor, and Maria Theresa. When four years later Louis and Marie Antoinette ascended the throne, Mercy-Argenteau became one of the most powerful personages at the French court. He was in Paris during the turbulent years which heralded the Revolution, and his powerful aid was given first to Loménie de Brienne, and then to Necker. In 1792 he became governor-general of the Belgian provinces, which had just been reduced to obedience by Austria, and here his ability and experience made him a very successful ruler. Although at first in favour of moderate convicts, Mercy-Argenteau supported the action of Austria in making war upon his former ally after the outbreak of the Revolution, and in July 1794 he was appointed Austrian ambassador to Great Britain, but he died a few days after his arrival in London.

MERE. 1. (From Lat. merus, pure, unmixed; O. Fr. mier), an adjective primarily indicating something pure and unmixed; thus “mere wine” implied pure and undiluted wine, as “mere folly” expressed folly pure and simple. Modern usage has, however, given both to the adjective “mere” and the adverb “merely” a depreciatory and disparaging idea, so that expressions like “the mere truth,” a “mere statement of fact,” &c., often convey the impression that they are far from being “mere” in the sense of “entire” or “absolute,” but are, on the contrary, fragmentary, imperfect, &c. The earliest use of the word “mere” is retained in some legal phrases, especially in the phrase “mere motion,” that is, of one’s own initiative without help or suggestion from the outside. Another legal phrase is “mere right” (law Latin jus merum), i.e. right without possession.

2. A word which appears in various forms in several Teutonic and other languages; cf. Dutch and Ger. Meer. From the cognate Lat. mare are derived the Romanic forms, e.g. Fr. mer, Span. mar, &c.; the word appears also in the derivative “marsh” for “marish”; the ultimate origin has been taken to be an Indo-European root, meaning “to die,” i.e. to be without life, to faint away, &c. Among the earliest uses of the word was as a term of art, e.g. the marsh or estuary; also the name given to lakes, pools and shallow stretches of water inland. In the Fen countries a mere signifies a marsh or a district nearly always under water.

3. (Derived from an O. Eng. source, mire, a wall or boundary; cognate with Lat. murus, a wall), a landmark or boundary, also an object indicating the extent of a property without actually enclosing it. A special meaning is that of a road, which forms a dividing line between two places. A “meresman” is an official appointed by parochial authorities to enclose and improve a parish mere and to report upon the condition of the roads, bridges, waterways, &c., within them. In the mining districts of Derbyshire a mere is a certain measurement of land in which lead-ore is found.

MEREED, GEORGE (1828-1900), British novelist and poet, was born at Portsmouth, Hampshire, on the 12th of February 1828; the parish church register records his baptism on the 9th of April. About his early life few details are recorded, but there is a good deal of quasi-autobiography, derived apparently from early associations and possibly antipathies, in some of his later novels, notably Eavan Harrington and Harry Rick mond, as to which the judicious may speculate. He had, as he used to boast, both Welsh (from his father) and Irish blood (from his mother) in his veins. His father, Augustus Armstrong Meredith, was a naval outfitter at Portsmouth (mentioned as such in Maryat’s Peter Simple); and his grandfather, Melchisedek Meredith, clearly suggested the “Old Mel” of Eavan Harrington. Melchisedek was 35 when in 1790 he was initiated as a freemason at Portsmouth; and he appears to have been known locally as “the count,” because of a romantic story as to an inheritance which once had at Bath; he was churchwarden in 1801 and 1824; and some of the church plate still bears his name.

Meredith’s mother died when he was three years old, and he was made a ward in chancery. He was sent to school at Newfield on the Rhine, and remained in Germany till he was sixteen. During these impressionable years he imbibed a good deal of the German spirit; and German influence, especially through the media of poetry and music, can often be traced in the cast of his thought and sentiment, as well as in some of the intricacies of his life. Return was made to a solicitor in London, but he had little inclination for the law, and soon abandoned it for the more congenial sphere of letters, of which he had become an eager student. At the age of twenty-one he began to contribute poetry to the magazines, and he eked out a livelihood for some years by journalism, for the Daily News and other London papers, and for the Lpswatch Journal, for which he wrote leaders; a certain number of his more characteristic fugitive writings are collected in the memorial edition of his works (1910). In London he became one of the leading spirits in the group of young philosophical and poetical radicals who edited and contributed to the Athenaeum, Morley, Frederic Harrison, Cotter Morison and Admiral Maxse. But during the years when he was producing his finest novels he was practically unknown to the public. In 1840 he married Mrs Nicholas, daughter of Thomas Love Peacock, the novelist, a widow, eight years his senior, whose husband had been accidentally drowned a few months after her first marriage (1844), and who had one child, a daughter; but their married life was broken by separation; she died in 1861, and in 1864 Meredith married Miss Vulliamy, by whom he had a son and daughter. His second wife died in 1885. Up to that time there is little to record in the incidents of his life; he had not been “discovered” except by an “honourable minority” of readers and critics. It must suffice to note that during the Austro-Italian War of 1866 he acted as special correspondent for the Morning Post; and though he saw no actual fighting, he enjoyed, particularly at Venice, opportunities for a study of the Italian people which he turned to account in several of his novels. Towards the close of 1867, when his friend John Morley paid a visit to America, Meredith undertook in his absence the editorship of the Fortnightly Review for Messrs Chapman & Hall. They were not only his literary advisers and his critical friends, but were also his literary advisers, in which capacity he left a reputation for being not eminently wise in his selection of the books to be published, but both critical and encouraging to authors of promise whose works he found himself obliged to reject. Thomas Hardy and George Gissing were among those who expressed their grateful sense of his assistance. He was indeed one of the last of the old school of “publishers’ readers.” In his early married life he lived near Weybridge, and later at Copsham between Esher and Leatherhead, while soon after his second marriage he settled at 19nt Cottage, Micklem, near Dorking, where he remained for the rest of his life.

Meredith’s first appearance in print was in the character of a poet, and his first published poem “Chillian Wallah,” may be found in Chambers’s Journal for the 7th of July 1849. Two years later he put forth a small volume of Poems (1851), which was at least fortunate in eliciting the praise of two judges whose opinion was of the first importance to a beginner. Tennyson was at once struck by the individual flavour of the verse, and declared of one poem, “Love in the Valley,” that he could not get the lines out of his head. Charles Kingsley’s eulogy was at once more public and more particular. In Fraser’s Magazine he subjected the volume to careful consideration, praising it for richness and quaintness of tone that reminded him of Herrick, for completeness and coherence in each separate poem, and for the animating sweetness and health of the general atmosphere. At the same time he censured the laxity of rhythm, the occasional lack of polish, and the tendency to
overload the description with objective details to the con-
fusion of the principal effect. No doubt as a result of Kinglake’s
introduction, two poems by Meredith appeared in Fraser’s
Magazine shortly afterwards; but with the exception of these,
and a sonnet in the Leader, he did not publish anything for
the next five years. In the meanwhile he was busy upon his
first essay in prose fiction. It was early in 1856 that the Shaving
of Shagpat, a work of singular imagination, humour and romance,
made its appearance. Modelled upon the stories of the Arabian
Nights, it catches wind and action which pleased him long before
of Orientalism, and in this genre it remains a unique triumph in
modern letters. Though unappreciated by the multitude,
its genius was at once recognized by such contemporaries as
George Eliot and Dante Gabriel Rossetti, the latter of whom was
one of Meredith’s intimate friends. For his next story it occurred
to Meredith to turn his familiarity with the life and legendary
tradition of the Rhinelander into a sort of imitation of the
gothesqueerie of the German romantiasts, and in 1857 he
put forth Farina, a Legend of Cologne, which sought to
transferred Meredith at once to a new sphere and
and to the altitude of his accomplishment. With this novel
Meredith deserted the realm of fancy for that of the philosophical
and psychological study of human nature, and Richard Feveral
was the first, as it is perhaps the favourite, of those wonderful
studies of motive and action which placed him among the
demigods of English literature. The essential theme of this
fine criticism of life is the question of a boy’s education. It
depicts the abortive attempt of a proud and opinionated father,
hide-bound by theory and precept, to bring up his son to
a perfect state of manhood through a “system” which controls
all his early circumstances and represses many of the natural
and wholesome instincts and impulses of adolescence. The
love scenes in Richard Feveral are gloriously natural and full
of vitality, and the book throughout marked a revolution in the
English treatment of manly passion. Those who have not
read this novel will be surprised to find the chapters
which were afterwards omitted, have lost, however, the key
to many passages in the story. In the following year Meredith
contributed to Once a Week, and in 1861 published as a book
the second of his novels of modern life, Even Harrington, origi-
nally with the sub-title “He Would be a Gentleman”—in
allusion to the hero being the son of “Old Mel,” the tailor—
which contains a richly humorous—in its unrevised form,
spindily farcical—plot, with some magnificent studies of character.
Afterwards revised, a certain amount of the farcical
element was cut out, with the result that, considered as comedy,
it has weak spots; but the Countess de Salard remains a genuine
creation. A year later he produced his finest volume of poems,
titled Modern Love, and Poems of the English Roadside,
with Poems and Ballads. An attack upon the dramatic poem
which gives the volume its title appeared in the Spectator,
and is memorable for the fact that Meredith’s friend, the poet
Swinburne, with one of his characteristically generous impulses,
replied (Spectator, June 7, 1862) in a spirit of fervent eulogy.
Some of the individual “sonnets” (of sixteen lines) into which
Modern Love is divided are certainly worthy of being ranked with
the most subtle and most intense poetic work of the 19th century.

Returning to fiction, Meredith next published Emilia in
England (1864), afterwards renamed Sandra Belloni. His
powerful story Rhoda Fleming (1862) followed soon afterwards.
Vittoria, published in the Fortnightly Review in 1866, and in
book form in 1867, is a sequel to Emilia in England. Four years
later appeared The Adventures of Harry Richmond in the pages of
Cornhill (1870–1871). Its successor was Beauchamp’s Career
(Fortnightly Review, 1874–1875), the novel which Meredith usually
is described as his own favourite. Its hero’s character is supposed
to have been founded upon that of Admiral Maxse. Sandra
Belloni, Rhoda Fleming, Vittoria and Beauchamp are all master-
pieces of his finest period, rich in incident, character and work-
manship. “The House on the Beach” and “The Case of
General Opie and Lady Camper” (New Quarterly Magazine,
1877) were slight but glittering exercises in comedy; the next
important novel was The Egoist (1879), which shows an increase in
Meredith’s twistedness of literary style and is admittedly
hard to read for those who merely want a “story,” but which,
through its theme and the real drama of the human spirit
is an astonishment producing. In an interesting series of stories
which Meredith delivered at the London Institution in 1877
his main thesis was that a man without a sense of comedy
is dead to the finer issues of the spirit, and the conception
of Sir Wiloughby Paternoe, the central figure of The Egoist,
is an embodiment of this idea in the flesh. The Tragic Comedians
(1880), the next of Meredith’s novels, slighter in texture than
his others, combines the spirits of comedy and tragedy in
the story of the life of Ferdinand Lassalle, the German Socialist.
Reading of Earth (1888) gave further evidence of the wealth
of thoughts and vigour of expression which Meredith brought
into the making of verse. To “the general,” no doubt,
Meredith’s verse is prohibitive, or nearly so—for, after all,
he has written some poems, like “Martin’s Puzzle,” “The
Old Chartist,” and “Juggling Jerry,” which anybody can read
with ease. But his most characteristic style in verse is so
concentrated that any one accustomed to “straightforward
writing, and unwilling to read with the mind rather than with
the eye, must needs, he put off. His readers, of
the verse even more than of the prose, must be prepared to
meet him on a common intellectual footing. When once that
is granted, however, the music and magic of such poems as
“Seed-time,” “Hard Weather,” “The Thrush in February,”
“The South-Wester,” “The Lark Ascending,” “Love in
the Valley,” “Melampus,” “A Faith on Trial,” are very real,
and all their occasional obscurities of diction.

Meredith had now completed his sixtieth year, and with his
advancing years the angles of his individuality began to grow
sharper, while the difficulties of his style became accentuated.
The increase in mannerism was marked in One of Our Conquerors
(1891), otherwise a magnificent rendering of a theme full of
both tragedy and comedy, and in the poem of “The Empress
Purse” (1892). Neither Lord Ormment and His Aminta (1894)
or The Amazing Marriage (1895) reached the level of the
earlier novels, though in the latter he seemed to catch an after-
glow of genius. In 1898 appeared his Odes in Contribution
to the Song of French History, consisting of one ode (“France,
December 1870”) reprinted from Ballads and Poems (1871),
and three others previously unpublished; a fine example of
his lofty thought, and magnificent—if often difficult—and
individual diction. In 1901 another volume of verse, A Reading
of Life, appeared. In later years too he contributed occasional poems to newspapers and reviews and similar publications, which were collected after his death (Last Poems, 1910). His comedy, The Sentimentalists, was performed on the 1st of March 1910; his early but unfinished novel, Celt and Saxon, was also posthumously published in that summer.

From the early 'nineties onward Meredith's fame had been firmly established. His own literary contemporaries still living could join hands with the younger generation of enthusiastic admirers in insisting on a greatness of which they themselves had been unable to persuade the public. He was chosen to succeed Tennyson as president of the Authors' Society; on his seventieth birthday (1899) he was presented with a congratulatory address by thirty of the most prominent men of letters of the day; before he died he had been included by the king in the Order of Merit; and in various other ways his position as the chief living English writer had come to be popularly recognized. The critics discussed him; and new editions of his books (both prose and verse), for which there had long been but scanty demand, were called for. One of the results was that Meredith, with very doubtful wisdom, recast some of his earlier novels; and in the sumptuous "authorized edition" of 1897 (published by the firm of Constable, of which his son, W. R. Meredith, was then partner), was inserted what were largely new parts, and some made in some of them. In fact, a reader who compares the first and last editions either of Richard Feverel or Even Harrington will notice changes little short of revolutionary. Even in the previously current editions of 1878 onwards, published by Chapman & Hall, Richard Feverel had been considerably shortened as compared with the original three-volume edition; but it was now robbed again of some of its best-known passages. It is no doubt competent to an author himself to revise his earlier published work even to the extent to which Meredith has done in the 1897 edition revised these novels; but certainly it is not necessary to accept his judgment when this involves the excision in old age of some of the most virile passages of books that were written in the full glow and vigour of his prime. In Constable's memorial edition (1910) of his complete works the excisions were published separately, and are therefore on record for those to consult who care. But the wise will read Richard Feverel and Even Harrington in the original versions.

Meredith's literary quality must always be considered in the light of the Celtic side of his temperament and the peculiarities of his mental equipment. His nature was intuitive rather than rational; his mental processes were abrupt and far-reaching; and the suppression of connecting associations frequently gives his language, as it gave Browning's, but even to a greater extent, the air of an impenetrably nebulous obscurity. This criticism applies mainly to his verse, but is also true of his prose in many places, though there is much exaggeration about the difficulties of his novels. When once, however, his manner has been properly understood, it is seen to be inseparable from his method of intellelction, and to add to the narrative description both vividness of delineation and intensity of realization. The essential respect in which Meredith's method of describing action and emotion in narrative differs from that of convention is that, while the ordinary method is to relate what happens from the point of view of the onlooker, Meredith frequently describes it from the point of emotion of the actor; and his influence in this direction has largely modified the art of fiction. Herein lies the secret of the peculiar brilliancy of his style, derived from his combination of the narrator with the creator, or—in its strict sense—the seer. The reader, by the transference of the interest from the audience to the stage, by the matter of the story coming into the very soul of the large arena, is made to feel as he feels and act as he acts. Moreover, Meredith's instinct for psychology is so intimate, and his sense of motive and action so true, that the interaction of character and character directly dominates the sequence of events depicted in his imaginary world, and discloses the moral idea or criticism of life, instead of the preconceived "moral" being merely illustrated by the plot. In building up the minds, actions, creeds, and tragedies or comedies of his imaginary personalities amid the selected circumstances, and inspiring them with the identical motives and educational influences of life itself, Meredith spent an elaboration and profundity of thought and an originality and vigour of analysis upon his novels which in explicitness go far beyond what had previously been attempted in fiction, and which give to his works a philosophical value of no ordinary kind. Simplicity can scarcely be expected of his language, for the interplay of ideas is in itself original and complex, and their interpretation is necessarily original and complex too. But when Meredith is at his best he is only involved with the invocation of his subject; the aphorisms that dot his style are simple when the idea they convey is simple, elaborate only in its elaboration. Pregnant, vividly graphic, capable of infinite shades and gradations, his style is a much finer and subtler instrument than at first appears, and must be judged finally by what it conveys to the mind, and not by its superficial sound upon the conventional ear. It owes something to Jean Paul Richter; something, too, to Carlyle, with whose methods of narrative and indebtedness to the apparatus of German metaphysics it has a good deal in common. To the novelist Richardson, too, a careful reader will find in Meredith, both in manner and matter (notably in The Egoist and in Richard Feverel) echoes in "Mrs Grandison" in Richard Feverel he even recalls "Sir Charles Grandison" by name; and nobody can doubt that Sir Willoughby Patterne, both in idea and often in expression, was modelled on Richardson's creation. Careful students of the early 19th-century English novel will find curious echoes again in Meredith of Bulwer-Lytton's (Baron Lytton's) literary manner and romantic outlook.1 But he was, after all, an originator, and at first suffered in estimation on that score; he wrote in his own way, and what is most characteristic of him are the general ideas and the methods of his great master, he has his own tone of voice, his own fashion of expressing an idea. Feeling, perception, reflection, judgment, have equal shares in determining his architectonic relation to a problem or a situation. He rings changes on the changing emotions of humanity, but every chime rings true. He is a literary artist. He takes great themes, not little ones; the characters in his fiction are personalities, human beings, neither "heroes" nor "sports"; and he does not descend to pander to lubricity or cater for the "reading public." His gallery of portraits of real human women, not dolls, would alone place him among the few creators in English literature.

1 The fact that Bulwer-Lytton's son, the 1st Earl of Lytton, Meredith's junior by three years, took the pen-name of "Owen Meredith," led occasionally to some confusion among uninstructed contemporaries, and even the suggestion of a family connexion.

But when Meredith is at his best he is only involved with the invocation of his subject; the aphorisms that dot his style are simple when the idea they convey is simple, elaborate only in its elaboration. Pregnant, vividly graphic, capable of infinite shades and gradations, his style is a much finer and subtler instrument than at first appears, and must be judged finally by what it conveys to the mind, and not by its superficial sound upon the conventional ear. It owes something to Jean Paul Richter; something, too, to Carlyle, with whose methods of narrative and indebtedness to the apparatus of German metaphysics it has a good deal in common. To the novelist Richardson, too, a careful reader will find in Meredith, both in manner and matter (notably in The Egoist and in Richard Feverel) echoes in "Mrs Grandison" in Richard Feverel he even recalls "Sir Charles Grandison" by name; and nobody can doubt that Sir Willoughby Patterne, both in idea and often in expression, was modelled on Richardson's creation. Careful students of the early 19th-century English novel will find curious echoes again in Meredith of Bulwer-Lytton's (Baron Lytton's) literary manner and romantic outlook. But he was, after all, an originator, and at first suffered in estimation on that score; he wrote in his own way, and what is most characteristic of him are the general ideas and the methods of his great master, he has his own tone of voice, his own fashion of expressing an idea. Feeling, perception, reflection, judgment, have equal shares in determining his architectonic relation to a problem or a situation. He rings changes on the changing emotions of humanity, but every chime rings true. He is a literary artist. He takes great themes, not little ones; the characters in his fiction are personalities, human beings, neither "heroes" nor "sports"; and he does not descend to pander to lubricity or cater for the "reading public." His gallery of portraits of real human women, not dolls, would alone place him among the few creators in English literature. It is beyond our scope here to enter into details concerning the philosophy which represents Meredith's "criticism of life." Broadly speaking, it is a belief in the righteousness and wholesomeness of nature, when Nature—"Sacred Reality"—is lovingly and faithfully and trustfully sought and known by the pure use of reason. Man must be "obedient to Nature, not her slave." Mystical as this philosophy occasionally becomes, it is yet an inspiring one, clean, austere and practical; and it is always dominated by the categorical imperative of self-knowledge and the striving after honesty of purpose and thought. A strong vein of political Radicalism runs through Meredith's creed. It is, however, a Radicalism allied to that of the French philosophers, rather than to the contemporary developments of British party politics, though in later life he gave his open support to the Liberal party. In spite of his German upbringing Meredith was always strongly French in his sympathies, and his appreciation of French character at its best and at its worst is finely shown in his Napoleon odes. In the main his politics may be summed up as a striving after liberty for reason and conscience and the constant progress of humanity—

The cry of the conscience of life; Keep the young generations in health, And beget them no tumbled house.
It is part of Meredith's philosophy—and this must be remem-
bred in considering his diction—that verbal expression is
not a matter of right thought also and action. Hence is derived
his passion for verbal analysis. Hence also his impulse towards
and vindication of poetry—meaning still "the best words in
the best order"; and hence his own dictum, otherwise perhaps
hard to undiscerning minds, that Song itself is the test by which
truth may be tried. The passage occurs in "The Empty
Purse"—a poem which throughout is a careful though mannered
exposition of Meredith's general views on life—
Ask of thyself: This furious Yea
Is a speech I think to reprove,
In the cause I would have prevail,
For seed of a nourishing wheat,
Is it accepted of Song?
Does it sound to the mind through the ear,
Right sober, pure sane? has it disciplined feet?
Thou wilt find it a test severe;
Unerring whatever the theme.
Rings it for Reason a melody clear,
We have bidden old Chaos retreat,
We have called on Creation to hear;
All forces that make us one full stream.
Meredith is generally ranked far less high as a poet than
as a novelist. But he can only be understood and appreciated
properly by those who realize that not prose (in the ordinary
sense) but poetry was to him the highest form of expression,
and that only in it could he fully deliver his message, as a
writer who aspired to contribute something more to the common
stock of ideas than could be embodied dramatically in prose
fiction.
On Meredith's 80th birthday in 1908, the homage of the
English literary world was again paid in an address of con-
gratulation. But his health, which for many years had been
precocious, was now failing. He died at Flint Cottage, Box Hill,
Surrey, on the 18th of May 1909. A strong feeling existed
that he should be buried in Westminster Abbey, and a petition
to that effect, which was approved by the prime minister,
Mr Asquith, was signed by a large number of men of letters.
But this was not to be. A memorial service was held in
the abbey, but Meredith's own remains, after cremation, were
interred at Dorking by the grave of his second wife. He had
died only a brief span after his old friend Swinburne, his affection
for whom had never grown abated; and it was felt
that with the end of a great epoch in English literary history
had closed. They were the last of the great Victorians; and
in Meredith went the writer who had raised the creative art of
the novel, as a vehicle of character and constructive philosophy,
to its highest point—a point higher indeed than most contem-
porary readers were prepared for. The estimate of his genius
formed by "an honourable minority," who would place him in
the highest class of all, by Shakespeare, has yet to be confirmed
by the wider suffrage of posterity.
A carefully compiled bibliography by John Lane was included in
George Meredith: Some Characteristics, by R. Le Gallienne (1890).
This sympathetic essay in criticism was the first substantial publi-
cation addressed to that stimulation of a wider appreciation of
Meredith which was carried on by several later books, perhaps the
best of which is M. Sturge Henderson's George Meredith: Novelist
Poet, Reformer (1908): but such earlier testimonies to Meredith's
importance as justin McCarthy's, in his History of Our Own Time,
must not be overlooked.

MEREKOVSKY (or Merejkovsky), DMITRI SERGEYEV-
VICH (1865— ), Russian novelist and critic, was born at
St Petersburg in 1865. His trilogy of historical romances,
collectively entitled Christ and Antichrist, has been translated
into many European languages, notably English and French.
It comprises Smert Bogos (Eng. trans. "The Death of the
Gods," London, 1901), the central figure in which is Julian
the Apostate; Voskremenie Bogi ("The Forerunners," London,
1902), which describes the life and death of Leonardo da Vinci;
and Antilhkristi Petr i Alaksey ("Peter and Alexis," London,
1905), which is based on the tragic story of the relations between
Peter the Great and his son. The influence of Sienkiewicz
may be traced in many of Merejkovsky's writings, which include
critical studies of Pliny the Younger, Calderon, Montaigne,
Ibsen, Tolstoy (Tolstoy as Man and Artist, London, 1902),
and Gorki and other Russian writers. Merejkovsky married
Zinaida Nikolaevna, known in Russia for her polished essays and
short stories written under the pseudonym of Zinaida
Hippius (or Gippius); her collected poems (1889-1903) were
published in Moscow in 1904.
MERES, FRANCIS (1562-1647), English divine and author,
was born at Kirton in the Holland division of Lincolnshire
in 1665. He was educated at Pembroke College, Cambridge,
where he graduated B.A. in 1587, and M.A. in 1591. Two
years later he was incorporated M.A. of Oxford. His kinsman,
John Meres, was high sheriff of Lincolnshire in 1596, and appar-
ently helped him in the early part of his career. In 1602 he
became rector of Wing in Rutland, where he had a school.
He died on the 29th of January 1647. Meres rendered immense
service to the history of Elizabethan literature by the publication
of his Palladis Tamia, Wits Treasury (1598). It was one of
a series of volumes of short pithy sayings, the first of which was
Poetiæ europææ: Wits Commonwealth (1597), compiled by John
Bodenham or by Nicholas Ling, the publisher. The Palladis
Tamia contained moral and critical reflections borrowed from
various sources, and embraced sections on books, on philosophy,
on music and painting, and a famous "Comparative Dictionary
of our English poets with the Greek, Latin, and Italian poets."
This chapter enumerates the English poets from Chaucer to
Meres's own day, and in each case a comparison with some
classical author is instituted. The book was issued in 1634
as a school book, and has been partially reprinted in the Ancient
Critical Essays (1811-1815) of Joseph Haslwood, Professor
E. Arber's English Garner, and Gregory Smith's Elizabethan
Critical Essays (1904). A sermon entitled Gods Arithmetick
(1597), and two translations from the Spanish of Luis de Granada
entitled Granados Delectus and the Sinners Guide (1598) com-
plete the list of his works.
MERGANSER, a word due to C. Gesner (Hist. animalium
iii. 120) in 1555, and for long used in English as the general
name for a group of fish-eating ducks possessing great diving
powers, and forming the genus Mergus of Linnaeus, now regarded
by ornithologists as a sub-family, Merginae, of the family
Anatidae. The mergansers have a long, narrow bill, with a small
but evident hook at the tip, and the edges of both mandibles beset
by numerous horny denticulations, whence in English the name of
saw-bill is frequently applied to them. Otherwise their structure does not much differ from that of other diving ducks of
the same general type. All the species bear a more or less developed crest or tuft on the head. Three of them, Mergus merganser or castor,
M. serrator, and M. albellus, are found over the northern parts
of the Old World, and of these the first two also inhabit North
America, which has besides a fourth species, M. cucullatus,
said to have occasionally visited Britain. M. merganser,
commonly known as the goosander, is the largest species, being
nearly as big as the smaller geese, and the adult male in breeding
attire is a very beautiful bird, conspicuous with his dark glossy-
green head, rich salmon-coloured breast, and the upper part of
the body and wings black and white. This full plumage
is not assumed till the second year, and in the meantime,
as well as in the post-nuptial dress, the male much resembles
the female, having, like her, a reddish-brown head, the upper
parts grey and the lower white. In this condition the bird
is often known as the "dun diver." This species breeds abund-
antly in many parts of Scandinavia, Russia, Siberia and North
America, and occasionally in Scotland. M. serrator, commonly
called the red-breasted merganser, is a somewhat smaller bird;
and, while the fully-dressed male wants the delicate hue of
the lower parts, he has a gorget of russet mottled with black,
below which is a patch of white feathers, broadly edged with
black. Both these species have the bill and feet of a bright
redish-orange, while the much smaller M. albellus, known as the
smew, has these parts of a lead colour, and the breeding
plumage of the adult male is white, with quaint crescentic
markings of black, and the flanks most beautifully vermiculated.
MERGIENTHEIM—MERIAN

M. cucullatus, the hooded merganser of North America, is in size intermediate between M. albellus and M. serrator; the male is easily recognizable by his broad semicircular crest, bearing a fan-shaped patch of white, and his elongated subcapulars of white edged with black. The conformation of the trachea in the male of M. merganser, M. serrator and M. cucullatus is very like that of the ducks of the genus Clangula, but M. cucullatus has a less exaggerated development more resembling that of the ordinary Fuligula. From the southern hemisphere two species of Merugs have been described, M. octosceaeus or brasilianus, L. P. Vieillot (N. Dict. d'Hist. naturelle, ed. 2, vol. xiv. p. 222; Gal. des oiseaux, tom. ii. p. 209, pl. 283), inhabiting South America, of which but few specimens have been obtained, having some general resemblance to M. serrator, but much more darkly coloured, and M. australis, Hombrón and Jacquetom (Ann. sc. nat. zoologie, ser. 2, vol. xvi. p. 320; Voy. au Pd Sud, oiseaux, pl. 31, fig. 2), known only by the unique example in the Paris Museum procured by the French Antarctic expedition in the Auckland Islands.

Often associated with the mergansers is the genus Marganetta, the so-called torrent-ducks of South America, of which six species have been described; but they possess spiny tails and have their wings armed with a spur. These with Hymenoleaumus Malacorkynuchus, the blue duck of New Zealand, and Salvadorina waigiuensis of Waigiu are placed in the sub-family Marganetinae. (A. N.)

MERGENTHEIM, a town of Germany, in the kingdom of Württemberg, situated in the valley of the Tauber, 7 m. S. from Lauda by rail. Pop. (1895), 4355. It contains an Evangelical and three Roman Catholic churches, a Latin and other schools, and a magnificent castle with a natural history collection and the archives of the Teutonic order. This is now used as barracks. The industries of the town include tanning, the manufacture of agricultural machinery and wine-making. Near the town is a medicinal spring called the Karlsbad.

Mergentheim (Mariae domus) is mentioned in chronicles as early as 1058, as the residence of the family of the counts of Hohenlohe, who early in the 13th century assigned the greater part of their estates in and around Mergentheim to the Teutonic order. It rapidly increased in fame, and became the most important of the eleven commanderies of that society. On the secularization of the Teutonic Order in Prussia in 1525, Mergentheim became the residence of the grand master, and remained so until the final dissolution of the order in 1809. See Höring, Das Karlsbad bei Mergentheim (Mergentheim, 1887); and Schmitt, Garnisonsgeschichte der Stadt Mergentheim (Stuttgart, 1895).

MERGER (Fr. merger, to sink), in law, the sinking or "drowning" of a lesser estate in a greater, when the two come together in one and the same person without any intervening estate. In order to effect a merger the two estates must vest in the same person at the same time, must be immediately expectant one on the other, and the expectant estate must be larger than the preceding estate. The term is also used for the extinguishment of any right, contract, &c., by absorption in another, e.g., the acceptance of a higher security for a lower, or the embodying of a simple contract in a deed.

MERGUI, the southernmost district of Lower Burma, in the Tenasserim division, bounded on the W. by the Bay of Bengal and on the E. by Siam. Area 9789 sq. m. Two principal ranges cross the district from north to south, running almost parallel to each other for a considerable distance, with the Tenasserim river winding between them till it turns south and flows through a narrow rocky gorge in the westernmost range to the sea. The whole district, from the water's edge to the loftiest mountain on the eastern boundary, may be regarded as almost unbroken forest. The timber trees found towards the interior, and on the higher elevations, are of great size and beauty, the most valuable being teak (Tectona grandis), then-gan (Hopea odorata), ko-gyeng (Dipterocarpus laevis), &c. The coast-line of the district, off which lies an archipelago of two hundred and seven islands, is much broken, and for several miles inland is very little raised above sea-level, and is drained by numerous muddy tidal creeks. Southwards of Mergui town it consists chiefly of low mangrove swamps alternating with small fertile rice plains. After passing the mangrove limits, the ground to the east gradually rises till it becomes mountains, even to the peaks of the rivers, and finally culminates in the grand natural barrier dividing Burma from Siam. The four principal rivers are the Tenasserim, Le-nya, Pakchan and Palaau, the first three being navigable for a considerable distance. Coal is found on the banks of the Tenasserim and its tributaries, but is still unworked. Gold, copper, iron and manganese are also found in various parts of the district, and there are tin mines at Mallun, upon which European methods have been tried without much profit, owing to the cost of labour.

From the notices of early travellers it appears that Mergui, when under Siamese rule, before it passed to the Burmese was a rich and densely peopled country. On its occupation by the British in 1824–1825 it was found to be almost depopulated—the result of border warfare and of the cruelties exercised by the Burmese conquerors. At that time the entire inhabitants numbered only 10,000. It had a population of 88,744 in 1901, showing an increase of 20% in the decade and giving a density of 9 inhabitants to the sq. m. Mergui carries on a flourishing trade with Rangoon, Bassein and the Straits Settlements. The chief exports consist of rice, rattans, torches, dried fish, areca-nuts, seeds, molasses, sun-shade, edible birds' nests and tin. The staple imports are piece goods, tobacco, cotton, earthenware, tea and sugar. The climate is remarkably healthy, the heat due to its tropical situation being moderated by land and sea breezes. The rainfall is very heavy and usually exceeds 150 inches.

Mergui town has risen into prominence in recent years as the centre of the pearling trade in the neighbouring archipelago. The pearling grounds were practically unknown in 1890, but in the following decade they produced pearls and mother-of-pearl of considerable value. In 1901 the population was 11,987; but the census is taken at a low time, when the fishermen and their families are away in the islands. There is a considerable coasting trade with other Burmese ports and with the Straits Settlements.

MERGUI ARCHIPELAGO, a cluster of islands in the Bay of Bengal, near the southern coast of Lower Burma. They are chiefly noted for their picturesque beauty, some of them rising to 3000 ft. They are only sparsely inhabited by the island race of Selunag.

MERIAN, MATTHEW (1593–1650), Swiss engraver, was born in Basel, on the 25th of September 1593. The family came originally from near Delémont, but in his grandfather's time settled in Basel, where in 1553 it obtained the burgsership of the city. As Matthew early showed signs of artistic tastes, he was placed (1606) under the care of Dietrich Meyer, a painter and engraver of Zürich (1572–1659). He went on to Nancy in 1613, where he already displayed considerable talents as an engraver on copper. After studying in Paris, Stuttgart (1616) and the Low Countries, he came to Frankfurt, where in 1618 he married the eldest daughter of J. T. de Bry, who was a publisher and bookseller, lately with an engraving firm. Merian worked for some time with his father-in-law, J. Opperhaim, but then returned to Basel, whence he came back (1624) to Frankfurt after Bry's death (1633), in order to take over his business;
MÉRIDA—MERIDIAN

this remained in his family till 1726, when, after a great fire that destroyed most of the books in stock, it came to an end. In 1625 Merian became a burgger of Frankfort, then the great centre of the book trade in Germany, and lived there till his death on the 22nd of June 1650. Among his many works two deserve to be specially mentioned. The first is the long series of works, each entitled Topographia, which contained descriptions of various countries, illustrated by copper plates, largely done by Merian himself, while the accompanying text was due to Martin Zeiller (1589-1661), an Austrian by birth. The first volume was published in 1642 and described Switzerland, with the Grisons and the Valais; it contains the first known view of the glaciers of Grindelwald. The second, "Austria," appeared in 1649, but the volume relating to Upper Saxon and Bohemia (1650) was the last issued by Merian himself. "France" appeared in 1655-1656, while in 1688 the series (extending to 30 parts, in 18 vols.) came to an end with "Italy," the volume as to Rome having appeared in 1681. The other great enterprise of Merian was the series entitled Theatrum Europaeum, which appeared in 21 parts between 1635 and 1738—it is a historical chronicle of events in Europe from 1617 onwards. In 1625-1650 Merian published a series of illustrations to the Bible, and in 1649 A Dance of Death. But he is best remembered by his residence at Frankfort and by the many four-gate weirs that he built for the protection of the Rhine. His best work, Wenceslaus Hollar (1607-1677), of Prague, settled in London (1635-1643, 1652-1677), and worthily carried on the Merian tradition. (W. A. B. C.)

See Life, by H. Eckardt (Basel, 1887).

MÉRIDA, a city of Mexico and capital of the state of Yucatan, 23 m. by rail S. of Progresso, its port on the Gulf of Mexico. Pop. (1900), 43,693, the Maya element being predominant. Mérida is the centre of an isolated railway system, connected with the ports of Progresso and Campeche, and having short lines radiating in all directions to Peto, Valladolid and Izamal. It stands on a broad, partly open plain near the northern border of the peninsulars, where the thin loose soil covering a limestone foundation permits the rapid percolation and evaporation of the rainfall, and therefore supports a comparatively scanty vegetation. It is highly favourable to maquilcultivation, however, and Mérida is the centre of the henequen, or sisal fibre, industry. There is an imposing 16th-century cathedral facing upon the principal plaza, together with the government and episcopal palaces. There are also an old university, with schools of law, medicine and pharmacy, an episcopal seminary and other educational institutions. The most interesting building in the city is a Franciscan convent, dating from 1550, and containing about 60 friars. It is surrounded by a wall 40 ft. high and 8 ft. thick. It once harboured no less than 2000 friars, but has been allowed to fall into complete decay since the expulsion of the order in 1820. The manufactures include straw hats, hammocks, cigars, soap, cotton fabrics, leather goods, artificial stone, and a peculiar distilled beverage called estabolento. The exports are henequen, or sisal fibre, hides, sugar, rum, chicle and indigo—all products of the vicinity. Mérida was founded in 1542 by the younger Francisco de Montejo on the site of a native city called Tihoo, or Tihui, of which the name is derived from the word tihui or terrae, in allusion to the abundance of the invaders. It became an episcopal see in 1561.

MÉRIDA (anc. Augusta Emerita, capital of Lusitania), a town of western Spain, in the province of Badajoz, on the right bank of the river Guadiana, 30 m. E. of Badajoz. Pop. (1900), 11,168. Mérida is an important railway junction, for here the Madrid-Badajoz railway meets the lines from Seville, Huelva and Cáceres. No Spanish town is richer in Roman antiquities. Most of these are beyond the limits of modern Mérida, which is greatly inferior in area to the ancient city. Chief among them is the Roman bridge, constructed of granite under Trajan, or, according to some authorities, under Augustus, and restored by the Visigoths in 686 and by Philip III. in 1610. It consisted 51 arches, 17 of which were destroyed during the siege of Badajoz (1812), and measured 2575 ft. in length. There are a few remnants of Roman temples and of the colossal wall which encircled the city, besides a Roman triumphal arch, commonly called the Arco de Santiago, and a second Roman bridge, by which the road to Salamanca was carried across the small river Albergarras (Alba Regia). The Moorish almudar or citadel was originally the chief Roman fort. From the Lago de Prosperpina, or Charca de la Albuera, a large Roman reservoir, 3 m. north, water was conveyed to Mérida by an aqueduct, of which 37 enormous piers remain standing, with ten arches in three tiers built of brick and granite. The massive Roman theatre is in good preservation; there are also a few vestiges of an amphitheatre and of a circus which measured 485 yds. by 120. Other Roman remains are exhibited in the archaeological museum, and much Roman mosaic is incorporated in the 16th-century Mudéjar church of the College of the Jesuits, the palace of the dukes of La Roja, the palace of the counts of Los Cobos, and the convent of Santa Eulalia, which is said by tradition to mark the spot where St Eulalia was martyred (c. 300).

Augusta Emerita was founded in 25 B.C. As the capital of Lusitania it soon became one of the most splendid cities in Iberia, and was large enough to contain a garrison of 90,000 men. Under the Visigoths it continued to prosper, and was made an archbishopric. Its fortifications included five castles and eighteen four-gate weirs, and after the final doom it was stormed by the Moors in 711. Its Moorish governors attended there frequently, and sometimes successfully, asserted their independence, but Mérida was never the capital of any large Moorish state. In 1120 its archbishopric was formally transferred to Santiago de Compostela, and in 1228, when Alphonso IX. of Leon expelled the Moors, Mérida was entrusted to the order of Santiago, in whose keeping it soon sank into decadence.

S.S.W. of Hartford. Pop. of the township in 1880 (1870), 28,695; (1910), 32,066; of the city (1900), 24,296, of whom 7215 were foreign-born; (1910), 27,265. Meriden is served by the New York, New Haven & Hartford railway and by an inter-urban electric line. The city is bisected by Harbor Brook, a small stream, and through the S.W. part of the town flows the Quinnipiac river. A short distance N.W. of the city, in Hubbard Park, an attractive reservation of more than 900 acres, are the Hanging Hills, three elevations (West Mountain, South Mountain, and Cat-Hole Mountain) in a broken range of trap ridges, which have retained the evergreen forest of the lowlands of the Connecticut valley; they rise to a height of about 700 ft. above the sea. In their vicinity, near the boundary of Berlin township, is Merimeque, one of the city's four reservoirs. Meriden is the seat of the Connecticut School for Boys (Reformatory). There are also a public library (1899), a state armoury, a hospital, the Curtis Home for orphans and aged women, and a tuberculosis sanitarium supported by the city. Meriden is one of the most important manufacturing cities of Connecticut, and in 1905 produced 59-9% of the plated ware manufactured in the state, and much sterling silver. In 1905 the factory product was valued at $13,793,548, an increase of 17-1% over that of 1900. Meriden was originally a part of the township of Wallingford, but a tract in the northern part of this township was designated as Meriden by an Indian deed of 1664. It was made a separate parish under that name in 1728, but did not become a separate township until 1806. The city was chartered in 1867.

See G. W. Perkins, Historical Sketches of Meriden (West Meriden, 1849); C. H. S. Davis, History of Wallingford (Meriden, 1870), South Meriden and C. Bancroft Gillespie, A Century of Meriden (Meriden, 1906).

MERIDIAN, a city and the county-seat of Lauderdale county, Mississippi, U.S.A., about 90 m. E. of Jackson. Pop. (1900), 10,624; (1900), 14,020, of whom 5787 were negroes; (1910 census), 23,285. It is served by the Southern, the Alabama Great Southern, the Mobile & Ohio, and the New Orleans & North Eastern and the Alabama & Vicksburg (Queen &
Crescent Route) railways. It is the seat of the East Mississippi Insane Hospital, of the state Masonic Widows and Orphans Hospital and of the Meridian Female College (opened in 1901), the Meridian Male College (opened in 1903), and, for negroes, the Lincoln School (Congregational) and Meridian Academy (Methodist Episcopal). The city is an important market for cotton grown in the surrounding country, and is the principal manufacturing city in the state. Its factory products, chiefly railway supplies and cotton products, increased in value from $1,924,465 in 1900 to $3,267,600 in 1905, or 69.8% in five years. Mineral waters (especially lithia) are bottled in and near the city. Meridian was laid out in 1854 at the junction of the two railroads crossing as a city in 1860. In February 1864 General William Tecumseh Sherman, with an army of about 20,000, made an expedition from Vicksburg to Meridian, then an important railway centre and dépôt for Confederate supplies, chiefly for the purpose of making inoperative the Mobile & Ohio and the Jackson & Selma railways; on the 14th of the month his army entered Meridian, and within a week destroyed nearly everything in the city except the private houses, and tore up over 110 m. of track. In the "Meridian riot" of 1871—a prominent episode of reconstruction—the freedmen of several months' duration, being mobbed, had shot the presiding judge, the whites, especially a party from Alabama interested in the trial, killed a number of negroes and burned a negro school. On the 2nd of March 1906 a cyclone caused great loss of life and property.

**Meridian** (from the Lat. *meridianus*, pertaining to the south or mid-day), in general a direction toward the south or toward the position of the sun at mid-day. The terrestrial meridian of a place is the great circle drawn on the earth's surface from either pole through the place. As determined astronomically the celestial meridian is the great circle passing through the terrestrial pole and the zenith. The terrestrial meridian as practically determined is the circle on the earth's surface in which the plane of the celestial meridian cuts that surface. Owing to local deviations of the plumb-line the meridian thus determined does not strictly coincide with the terrestrial meridian as ordinarily defined, but the deviation, though perceptible in mountainous regions, is so minute that it is generally ignored.

**Mérimée, Prosper** (1803–1870), French novelist, archaeologist, essayist, and in all these capacities one of the greatest masters of story-telling in the 19th century. He was born at Paris on the 28th of September 1803. His grandfather, of Norman abstain, had been a lawyer and steward to the maréchal de Broglie. His father, Jean François Léonor Mérimée (1757–1836), was a painter of repute. Mérimée had English blood in his veins on the mother's side, and had English proclivities in many ways. He was educated for the bar, but entered the public service instead. A young man at the time of the Romantic movement, he felt its influence strongly, though his peculiar temperament prevented him from joining any of the circles of the period. Nothing was more prominent among the romantics than the fancy, as Mérimée himself puts it, for "local colour," the more unfamiliar the better. He exhibited this in an unusual way. In 1825 he published what purported to be the dramatic works of a Spanish lady, Clara Gauzé, with a preface stating circumstantially how the supposed translator, one Joseph L'Estrange, had met the gifted poetess at Gibraltar. This was followed by a still more audacious and still more successful *supercherie*. In 1827 appeared a small book entitled *la Guêla* (the anagram of Gauzé), and giving itself out as translated from the Illyrian of a certain Hyacinthe Maglunovich. This book, which has greater formal merit than Clara Gauzé, is said to have been taken in Sir John Bowring, a competent Slav scholar, the Russian poet Poushkin, and some German authorities, although not only had it no original, but, as Mérimée declares, a few words of Illyrian and a book or two of travels and topography were the author's only materials. In the next year appeared a short dramatic romance, *La Jacquerie*, in which are visible Mérimée's extraordinary faculty of local and historical colour, his command of language, his grim irony, and a certain predilection for tragic and terrible subjects. Carmen (1845) was one of his numerous points of contact with the men of the Renaissance. This in its turn was followed by a still better piece, the *Chronique de Charles IX.* (1839), which stands towards the 16th century much as the *Jacquerie* does towards the middle ages. All these works were to a certain extent second-hand. But they exhibited all the future literary qualities of the author save the two chiefest, his wonderfully severe and almost classical style, and his equally classical solidity and statuesqueness of construction.

He had already obtained a considerable position in the civil service when was chartered as chargé d'affaires to two different ministers. He was then appointed to the more congenial post of inspector-general of historical monuments. Mérimée was a born archaeologist, combining linguistic faculty of a very unusual kind with accurate scholarship, with remarkable historical appreciation, and with a sincere love for the arts of design and construction, in the former of which he had some practical skill. In his official capacity he published numerous reports, some of which, with other similar pieces, have been republished in his works. He also devoted himself to history proper during the latter years of the fully monarchy, and published numerous essays and works of criticism, especially on Spanish, Russian and ancient Roman history. He did not, however, neglect novel writing during this period, and numerous short tales, almost without exception masterpieces, appeared, chiefly in the *Revue de Paris*. The best of all, *Colomba*, a Corsican story of extraordinary power, appeared in 1840. He travelled a good deal; and in one of his journeys to Spain, about the middle of Louis Philippe's reign, he made an acquaintance destined to influence his future life not a little—that of Mme de Montijo, mother of the future empress Eugénie. Mérimée, though ill-tempered and the most cynical of men, was a devoted friend, and shortly before the accession of Napoleon III. he had occasion to show this. His friend, Libri Carucci dalla Sommaja, was accused of having stolen valuable manuscripts and books from French libraries, and Mérimée took his part so warmly that he was actually sentenced to and underwent fine and imprisonment. He had been elected of the Academy in 1844, and also of the Academy of Inscriptions, of which he was a prominent member. Between 1840 and 1850 he wrote more tales, the chief of which were *Arpège Guillo* (1845), *Philippes* (1847), this last, on a Spanish subject, hardly ranking below *Colomba*. The empire made a considerable difference in Mérimée's life. His sympathies were against democracy, and his habitual cynicism and his irreligious prejudices made legitimism distasteful to him. But the marriage of Napoleon III. with the daughter of Mme de Montijo at once enlisted what was always strongest with Mérimée—the sympathy of personal friendship—on the emperor's side. He was made a senator, but his most important rôle was that of a constant and valued private friend of both the "master and mistress of the house," as he calls the emperor and empress in his letters. He was occasionally charged with a kind of irregular diplomacy, and, once, in the matter of the emperor's Caesar, he had to give literary assistance to Napoleon. But for the most part he was strictly the *ami de la maison*. At the Tuileries, at Compiègne, at Biarritz, he was a constant though not always a very willing guest, and his influence over the empress was very considerable and was fearlessly exerted, though he used to call himself, in imitation of Scarron, "le bouron de sa majesté." He found, however, time for not a few more tales, of which more will be said presently; and the essays which are not the least of his literary achievements, while they have an extraordinary interest of matter. One of these consists of the letters which have been published as *Lettres à une inconnue*, another of the letters addressed to Sir Anthony Panizzi, librarian of the British Museum. After various conjectures it seems that the *inconnue* just mentioned was a certain Mlle Enaquin of Boulogne. The acquaintance extended over many
years; it partook at one time of the character of love, at another of that of simple friendship, and Mérimée is exhibited in the letters under the most surprisingly diverse lights, most of them more or less amiable, and all interesting. The correspondence with Panizzi has somewhat less personal interest. But Mérimée often visited England, where he had many friends (among whom the late Mr Ellice of Glengarry was the chief), and certain similarities of taste drew him closer to Panizzi personally, while during part of the empire the two served as the channel of unofficial diplomacy between the emperor and certain English statesmen. These letters are full of shrewd aprecus on the state of Europe at different times. Both series, and others since published, abound in gossip, in amusing anecdotes, in sharp literary criticism, while both contain evidences of a cynical and Rabelaisian or Swiftian humour which was very strong in Mérimée. This characteristic is said to be so prominent in a correspondence with another friend, which now lies in the library at Avignon, that there is but little chance of its ever being printed. A fourth collection of letters, of much inferior extent and interest, has been printed by Blaise de Bry, and the title of Lettres à une autre inconnue (1873), and others still by d'Haussonville (1888), and in the Revue des Deux Mondes (1896). In the latter years of his life Mérimée suffered very much from ill-health. It was necessary for him to pass all his winters at Cannes, where his constant companions were two aged English ladies, friends of his mother. The Terrible Year found him completely broken in health and anticipating the worst for France. He lived long enough to see his fears realized, and to express his grief in some last letters, and he died at Cannes on the 23rd of September 1870.

Mérimée's character was a peculiar and in some respects an unfortunate one, but by no means unintelligible. Partly by temperament, partly it is said owing to some childish experience, when he discovered that he had been duped and determined never to be so again, not least owing to the example of Henri Beyle (Stendhal), who was a friend of his family, and of whom he said much, Mérimée appears at a comparatively early age to have imposed upon himself as a duty the maintenance of an attitude of sceptical indifference and sarcastic criticism. Although a man of singularly warm and affectionate feelings, he obtained the credit of being a cold-hearted cynic; and the latter part of his life being fragmentary and disinterested, he was abused as a hanger-on of the imperial court. Both imputations were wholly undeserved, and indeed were prompted to a great extent by political spite or by the resentment felt by his literary equals on the other side at the cool ridicule with which he met them. But he deserved in some of the bad as well as many of the good senses of the term the name of a man of the Renaissance. He had the warm partisanship and amiability towards friends and the scorpio-like sting for his foes, he had the ardent delight in learning and especially in matters of art and belles lettres, he had the sceptic's, the voluptuousness, the curious delight in the contemplation of the horrible, which marked the men of letters of the humanist period. Even his literary work has this Renaissance character. It is tolerably extensive, amounting to some seventeen or eighteen volumes, but its bulk is not great for a life which was not short, and which was occupied, at least nominally, in little else. About a third of it consists of the letters already mentioned. Rather more than another third consists of the official work which has been already alluded to—reports, essays, short historical sketches; the chief of which latter is a history of Pedro the Cruel (1843), and another of the curious pretended known in Russian story as the false Demetrius (1832). Some of the literary essays, such as those on Beyle, on Turguenev, &c., where a personal element enters, are excellent. Against others and against the larger historical sketches—admirable as they are—Taine's criticism that they want life has some force. They are, however, all marked by Mérimée's admirable style, by his sound and accurate scholarship, his strong intellectual grasp of whatever he handled, his cool unprejudiced views, his marvellous faculty of designing and proportioning the treatment of his work. In purely archaeological matters his Description des peintures de Saint-Savin is very noteworthy. It is, however, in the remaining third of his work, consisting entirely of tales either in narrative or in dramatic form, and especially in the former, that his full power is perceived. He translated a certain number of things (chiefly from the Russian); but his fame does not rest on these, on his already-mentioned youthful supercheries, or on his later semi-dramatic works. There remain about a score of tales, extending in point of composition over exactly forty years, or more length the that of Colomba, the longer, which fills about one hundred and sixty-six pages of the Oeuvres Completes de la redoute (1820), which fills just half a dozen. They are unquestionably the best things of their kind written during the century, the only nouvelles that can challenge comparison with them being the very best of Gautier, and one or two of Balzac. The motives are sufficiently different. In Colomba and Mateo Falcone (1829), the Coriscan point of honour is drawn on; in Carmen (written apparently after reading Borrow's Spanish books), the gipsy character; in la Venus d'Ille (1837) and Loksits (two of the finest of all), certain grisly supercheries, in the former case that known in a milder form as the ring given to Venus, in the latter a variety of the were-wolf fancy. Arèse Guilot is a singular satire, full of sarcastic pathos, on popular morality and religion; la Chambre bleue, an 18th-century conte, worthy of C. P. J. Crébillon for grace and wit, and superior to him in delicacy; The Capture of the Redoubt just mentioned is a perfect piece of description; l'abbé au bain is again satirical; la Double méprise (the authorship of which was objected to Mérimée when he was elected of the Acadamy) is an exercise in analysis strongly impregnated with the spirit of Stendhal, but better written than anything of that writer's. These stories, with his letters, assure Mérimée's place in literature at the very head of the French prose writers of the century. He had undertaken an edition of Brantôme for the Bibliothèque Elzéviriennne, but it was never completed.

Mérimée's works have only been gradually published since his death. There is no uniform edition, but almost everything is obtainable in the collections of MM. Charpentier and Calmann Lévy. Most of the sets of letters above referred to from those to the first inconnue, where the introducer was Taine, have essay-prefaces on Mérimée. Maurice Tournoux's Prosper Mérimée, sa bibliographie (1876) and Prosper Mérimée, ses portraits (1879), are useful, while Émile Faguet and many other critics have dealt with him incidentally. But the best single book on him by far is that of Saintsbury, which was translated into French by the Correspondance inédite (1897) gives little that is substantive, but supplies and corrects a good many gaps or faults in earlier editions. English translations, especially of Colomba and Carmen, are numerous. The latter was translated into English in 1880 with an introduction; and the same writer has also prefixed a much more elaborate essay, containing a review of Mérimée's entire work, to an American translation.

(M. Sa.)

**MERINO**. The Spanish name for a breed of sheep, and hence applied to a woollen fabric. The Spanish word is generally taken to be an adaptation to the sheep of the name of an official (merino) who inspected sheep pastures. This word is from the medieval Latin majorinus, a steward, head official of a village, &c., from major, greater.

The merino is a white short-wool sheep, the male having spiral horns, the ewes being generally hornless. It is bred chiefly for its wool, because, though an excellent grazer and very adaptable, it matures slowly and its mutton is not of the best quality. The wool is close and wavy in staple, reaching 4 in. in length, and supports 34 pounds, all proportionate of carding; it is also a very popular and excellent material form that little but the mullen, which should be of an orange tint, and hoofs, are left uncovered. The best wool is produced on light sandy soils.

The merino is little known in Great Britain, the climatic moisture of which does not favour the growth of the finest wools, but it predominates in all regions where sheep are bred for their wool rather than their mutton, as in the western United States, Cape Colony, Australia, New Zealand and Argentina. In Australasia, especially in New Zealand, the merino has been crossed with Lincolns, Leicesters, Shropshires and other breeds, with the result of improving the quality.
of the mutton while sacrificing to some extent that of the wool.

The merino sheep appears to have originated in Africa, whence it was brought by the Moors to Spain and thence spread over Europe, especially to Austria-Hungary, Germany and France. The best-known breeds are the Rambouillet, a large merino named after the village near Paris, to which it was imported towards the end of the 18th century, and the Negretti, which stands in closer relationship to the old Spanish stock and has shorter wool but a more wrinkled fleece. Imports to America began about the beginning of the 19th century. The so-called American merino, the Delaine, the Vemiano and the Rambouillet, are well-known breeds in the United States.

The term "merino" is widely employed in the textile industries with very varied meanings. Originally it was restricted to denote the wool of the merino sheep reared in Spain, but owing to the superiority of the wools grown on merino sheep and shipped from Botany Bay, the name as applied to wool was replaced by the term "botany." In the dress-goods and knitting trades the term "merino" still implies an article made from the very best soft wool. The term "cashmere," however, is frequently confused with it, although true cashmere goods should be made from true cashmere and not, as is often the case, from the finest botany wool. In the hosierly and remanufactured materials trades the term "merino" is applied to fibre-mixtures of cotton and wool in contradistinction to "all wool" goods.

**MERIONETH** (Welsh, Merionwydd), a county of North Wales, bounded N. by Carnarvon and Denbigh, E. by Denbigh and Montgomery, S.E. by Montgomery, S. by the Dovey (Dyfi) estuary, dividing it from Cardigan, and W. by Cardigan Bay. It is nearly triangular, its greatest length from N.E. to S.W. being about 45 m., its greatest breadth about 30 m. The relief is less bold than that of Carnarvon, but the scenery is richer and more picturesque varied. The highest summits are the peaks of Cader Idris (p.8) including Pen y gader (the head of the chair; 2927 ft.); Aran Fawddwy (2970 ft.); Arenig fawr (2600 ft.); Y Llethr (2475 ft.) and Rhiobell fawr (2313 ft.). Perhaps the finest of the valleys are those of Dyfi (Dovey) Dysyni, Tal y llyn (forehead of the lake), Maw (Mawddach), and Festinog. The Dyfrdwy (Dee) drains Bala Lake (Llyn Tegid or Dinlimcerek), which is fed by the brooks rising at the foot of the Llethr. The Dyfrdwy leaves the lake at the north-east corner, near Castell Goronyo (erected 1202, hardly traceable), flowing slowly to Corwen, after which it is rapid, and receives the tributaries Alwen, Ceirolg, Clywedog and Alun. The Dyfi (Dovey) rising in a small lake near Aran Fawddwy, passes Machynlleth, and expands into an estuary of Cardigan Bay. Rising north of the Aran, the Mawddach (Maw) runs south-west some 12 m., being joined by rivulets. Traeth bach is formed by the Dywryd streamlet among others. Other streams are the Uwion, Eden, Cain (variously spelled). Besides Bala and Tal y llyn lakes, there are among the hills over fifty more, e.g. Llyn Myngwyn. Among the waterfalls may be mentioned Rhiadr y glyn (cascade of the glen), near Corwen, Rhaeadr (black), and Pistyll Cain (Cain's waterspot), some 150 ft. high.

A mountain tract of the county, 15 m. from north to south by 10 from east to west, stretching from the coast inland, is of the Cambrian age, composed of grits, quartzites and slates, and comprising the Merionethshire antclline. The central portion of this tract is occupied mainly by Harlech Grits and Merionethian slates; it is of Mesozoic date, east and south. The Lingula beds, which are pierced by numerous dikes and intrusive masses, mostly greenstone. The andesitic rock of Rhobell-fawr is one of the greatest igneous masses in the district. The Lingula beds are quarried and mined for slate at Festinog, and near Dolgelley gold is obtained from a quartz vein, while near Barmouth manganese has been worked. Bordering the Cambrian area are also the Arans. These are a series of isolated beds of the Lingula f. beds, which are interstratified with and overlaid by accumulations of volcanic ashes, felspathic traps or lava-flows, which form the rugged heights of Cader Idris, the Arans, the Arenigs, Manod and Moelwyn; and these are in turn overlain by the Llandeilo and Bala beds, the latter including the Bala lime-stone. Lead and copper ores have been worked near Towy.

Here and there along the eastern boundary Llandovery and Wenlock strata are included. The structure of the Silurian tract is synclinal; in the Berwyn mountains the Ordovician rocks again appear with associated andesitic and felsitic lavas and tuffs. West of Llangar, near Corwen, is a small patch of Carboniferous limestone. Glacial drift with boulder clay is a prominent feature in the valleys and on the mountain sides. A good deal of blown sand fringes the coast, and south of Harlech. At the Llyn Arenig Bach a deposit of kieselguhr has been found.

The climate varies much with the elevation, from bleak to genial, as at Aberdyfi (Aberdovey). Grain crops cover a small area only, green crops being poor, and fruits practically nil. While the soil is generally thin, there are fertile tracts in the valleys, and there is some reclaimed land. The small, hardy ponies (known as of Llanbedr, Conway Valley) are now almost restricted to this county and Montgomeryshire. Manufactures include woollen stockings, &c., at and near Bala, flannels at Dolgelley (Dolgella), Towy, and a few other places. Slate is the chief staple. The Cambrian railway skirts the coast from Portmadoc to Aberdyfi. At Barmouth junction a branch crosses to Dolgelley, where it is joined by a branch of the Great Western railway. Bala and Festinog are also united by the Great Western, and Festinog is further joined with Llanudno junction by the London & North Western railway, and with Portmadoc (Minfford) by the narrow gauge railway, a light line track. In 1865, running as a tramway line using 700 ft. in larne near Towy. The tourist traffic is a source of livelihood to many of the inhabitants. The coast is almost unnavigable, owing to sandbanks, and the only havens are Barmouth and Aberdyfi.

The area of the ancient county is 427,810 acres or 670 sq. m., with a population in 1891 of 49,212 and 1901 of 49,149. In the 19th century, however, the population nearly doubled. The area of the administrative county is 422,018 acres. Welsh is the tongue par excellence of Merionethshire. The county returns one member to parliament, and has neither parliamentary nor municipal borough. The county (in acres) is: 236,054. (Barmouth and Minffordd), 221,411, Dolgelley (Dolgella), 243,714, Betws-y-Coed (11,435), Mallwyd (885), Towy (3756). The shire is in the north-west circuit, and assizes are held at Dolgelley. It is partly in the diocese of St Asaph and partly in that of Bangor, and has 37 ecclesiastical parishes and districts, with parts of four others.

**History and Antiquities.**—This is the only Welsh county retaining in English its primitive British name, latinized into *Merionitia*, a subdivision of *Britannia Secunda*, and in *Shropshire*’s territory. The poet Chaucer made use of the name; the county is remote, and facilities of access in his day, and it was never made the field of battle in Saxon, Danish or Norman times, nor indeed until close on the period of Welsh loss of independence. There are not many remains, Celtic, Roman or medieval. Caer Drewyn, a British fort on the Dee, is near Corwen, where Owen Gwynnedd was posted to repel Henry II. and whither Owen Glendower retired before Henry IV. The numerous cromlechs are chiefly near the coast. The Roman *via occidentalis* ran through the county from south to north and was joined by a branch of Watling Street at Tomen y Mwr (perhaps *Hiri Mvnt* on Samuel Hely's map) not far from Castell Prysc. Tomen y mwr (deirius of the wall) and Castell Prysc have yielded Roman bricks, tiles, urns and coins. Castell y bere, an extensive ruin, and once one of Wales's largest castles, has not been inhabited since the time of Edward I. Cymmer Abbey (Y Fanner) near Dolgelley, a Cistercan establishment founded about 1200, and dissolved by Henry VIII., is most perfect at the east end, with lancel windows, and against the south wall there are a few Gothic pillars and arches. The architecture varies from Norman to Renaissance. Towy y Bala, estimate for repair of which is to be a Roman encampment. It was afterwards occupied by the Welsh, to check the English lords marchers. Moel Offrew is near Dolgelley. Among the county families may be mentioned that of Hengwrt, since the Hengwrt Welsh MSS. are famous in north Wales and among all Celtic scholars.

**MERISTEM** (Gr. μεριστής, divided or divisible), a botanical term for tissue which has the power of developing new
MERIVALE, C.—MERLIN, P. A.

forms of tissue, such as the cambium from which new wood is developed.

MERIVALE, CHARLES (1808-1853), English historian and dean of Ely, the second son of John Herman Merivale and Louisa Heath Drury, daughter of Dr Drury, head master of Harrow, was born on the 8th of March 1808 in Hackaton (1779-1844) was an English barrister, and, from 1831, a commissioner in bankruptcy; he collaborated with Robert Bland (1779-1825) in his Collections from the Greek Anthology, and published some excellent translations from Italian and German. Charles Merivale was at Harrow School (1818 to 1824) under Dr Butler. His chief friends were Charles Wordsworth, afterwards bishop of St Andrews, and Richard Chenevix Trench, afterwards archbishop of Dublin. In 1824 he was offered a writership in the Indian civil service, and went for a short time to Harleybury College, where he was distinguished for proficiency in Oriental languages. But he eventually decided against an Indian career, and went up to St John's College, Cambridge, in 1826. Among other distinctions he came out as fourth classic in 1830, and in 1833 was elected fellow of St John's. He was a member of the Apostles' Club, his fellow members including Tennyson, A. H. Hallam, Monckton Milnes, W. H. Thompson, Trench and James Spedding. He was fond of athletic exercises, had played for Harrow against Eton in 1824, and in 1829 rowed in the first inter-university boat-race, when Oxford won. Having been ordained in 1833, he undertook college and university supervisory duties in the University of St Andrews, and applied for a preachership at Whitchurch. In 1848 he took the college living of Lawford, near Manningtree, in Essex; he married, in 1850, Judith Mary Sophia, youngest daughter of George Frere. In 1863 he was appointed chaplain to the Speaker of the House of Commons, declined the professorship of modern history at Cambridge in 1869, but in the same year accepted from Mr Gladstone the deanship of Ely, and until his death on the 27th of December 1893 devoted himself to the best interests of the cathedral. He received many honorary academical distinctions. His principal work is A History of the Jews in Egypt, from the time of the early kingdom, which came out between 1850 and 1863; but he wrote several smaller historical works, and published sermons, lectures and Latin verses. Merivale as a historian cannot be compared with Gibbon for virility, but he takes an eminently common-sense and appreciative view. The chief defect of his work, inevitable at the time it was composed, is that, drawing the materials from contemporary memoirs rather than from inscriptions, he relies on literary gossip rather than on numismatics and epigraphy. The dean was an elegant scholar, and his rendering of the Hyperion of Keats into Latin verse (1862) has received high praise. See Autobiography of Dean Merivale, with selections from his correspondence, edited by his daughter, Judith A. Merivale (1890); and Family Memorials, by Anna W. Merivale (1884).

MERIVALE, HERMAN (1866-1874), English civil servant and author, elder brother of the preceding, was born at Dawlish, Devonshire, on the 8th of November 1806. He was educated at Harrow School, and in 1823 entered Oriel College, Oxford. In 1825 he became a scholar of Trinity College and also won the Ireland scholarship, and three years later he was elected fellow of Balliol College. He became a member of the Lynch Temple and practised on the western circuit, being made in 1841 recorder of Falmouth, Helston and Penzance. From 1837 to 1842 he was professor of political economy at Oxford. In this capacity he delivered a course of lectures on the British Colonies in which he dealt with questions of emigration, employment of labour and the allotment of public lands. The reputation he secured by these lectures had much to do with his appointment in 1847 as assistant under-secretary for the colonies, and in the next year he became permanent under-secretary. In 1839 he was transferred to the permanent under-secretaryship for India, receiving the distinction of C.B. In 1870 Merivale was made D.C.L. of Oxford. He died on the 8th of February 1874. Besides his Lectures on Colonization and Colonies (1841), he published Historical Studies (1865), and completed the Memoirs of Sir Philip Francis (1867); he wrote the second volume of the Life of Sir Henry Lawrence (1872) in continuation of Sir Herbert Edwards's work.

A tribute to his powers as an original thinker by his chief at the Colonial Office, Sir Edward Bulwer-Lytton, is printed with a notice of his career which his brother contributed to the Transactions (1884) of the Devonshire Association.

MERKARA, the capital of the province of Coorg, in Southern India, situated on a plateau about 4000 ft. above the sea. Pop. (1901), 6732. It consists of two quarters: the fort, containing the public offices, the old palace, and the residence of the commissioner; and the native town of Mahadevapet. Here are the headquarters of the Coorg and Mysore Rifles, a body of volunteers chiefly composed of coffee planters.

MERLIN ANTOINE CHRISTOPHE (1764-1834), French revolutionist, called "of Thionville," to distinguish him from his namesake (see below), was born at Thionville on the 13th of September 1762, being the son of a procureur in the baillilage of Thionville. After studying theology, he devoted himself to law, and in 1788 was an avocat at the parlement of Metz. In 1790 he was elected municipal officer of Thionville, and was sent by the department of Moselle to the Legislative Assembly. On the 23rd of October 1791 he moved and carried the institution of a committee of surveillance, of which he became a member. It was he who proposed the law sequestrating the property of the nobility and clergy, and he took an important part in the guillotining of the 20th of June 1792 and in the revolution of the 10th of August of the same year. He was elected deputy to the National Convention, and pressed for the execution of Louis XVI., but a mission to the army prevented his attendance at the trial. He displayed great bravery in the defence of Mainz. He took part in the reaction which followed the fall of Robespierre, sat in the Council of the Five Hundred under the Directory, and at the coup d'état of the 18th Fructidor (Sept. 4, 1797) demanded the deportation of certain republicans. In 1798 he ceased to be a member of the Council of Five Hundred and was appointed director-general of posts, being sent subsequently to organize the army of Italy. He retired into private life at the proclamation of the consulate, and lived in retirement under the consulate and the empire. He died in Paris on the 14th of September 1833.

MERLIN, PHILIPPE ANTOINE, COUNT (1754-1838), French politician and lawyer, known as Merlin "of Douai," was born at Arleux (Nord) on the 30th of October 1754, and was called to the French bar in 1775. As an indefatigable student, he collaborated in the Régime de justice (1778), and in the Répertoire de jurisprudence (1788) by J. N. Guyot, the later editions of which appeared under Merlin's superintendence, and also contributed to other important legal compilations. Elected to the states-general as deputy for Douai, he was one of the chief of those who applied the principles of liberty and equality embodied in the decree of the 4th of August 1789 to actual conditions. On behalf of the committee appointed to deal with feudal rights, he presented to the Convention reports on the seignorial rights which were subject to compensation, on hunting and fishing rights, forestry, and the right of passage. He carried legislation for the abolition of primogeniture, secured equality of inheritance between relations of the same degree, and between men and women. His numerous reports to the Constituent Assembly were supplemented by popular exposition of current legislation in the Journal de législation. On the dissolution of the Constituent Assembly he became judge of the criminal court at Douai. He was no advocate of violent measures; but, as deputy to the Convention, he voted for the death of Louis XVI., and as a member of the council of legislation he presented to the Convention on the 17th of September 1793 the infamous law permitting the detention of suspects. He was closely allied with his namesake Merlin "of Thionville," and, after the counter-revolution which brought about the fall of Robespierre,
he became president of the Convention and a member of the Committee of Public Safety. His efforts were primarily directed to the prevention of any recrudescence of the tyranny exercised by the Jacobin Club, the commune of Paris, and the revolutionary tribunal. He persuaded the Committee of Safety to take upon itself the closing of the Jacobin Club, on the ground that it was an administrative rather than a legislative measure. He recommended the readmission of the survivors of the Girondin party to the Convention, and drew up a law limiting the right of insurrection; he had also a considerable share in the foreign policy of the victorious republic. With Cambacérès he had been commissioned in April 1794 to report on the civil and criminal legislation of France, with the result that after eighteen months’ work he produced his Rapport et projet de code des délits et des peines (10 Vendémiaire, an. IV.). Merlin’s code abolished confiscation, branding and imprisonment for life, and was based chiefly on the penal code drawn up in September 1791. He was made minister of justice (Oct. 30, 1795) under the Directory, and showed excessive rigour against the emigrants. After the coup d’état of the 18th Fructidor he became (Sept. 5, 1797) one of the five directors, and was accused of the various failures of the government. He retired into private life (June 18, 1799), and had no share in the revolution of the 18th Brumaire. Under the consul he accepted a modest place in the court of cassation, where he soon became procureur-général. Although he had no share in drawing up the Napoleonic code, he did more than any other lawyer to fix its interpretation. He became a member of the council of state, count of the empire, and grand officer of the Legion of Honour; but having resumed his functions during the Hundred Days, he was one of those banished on the second restoration. The years of his exile were devoted to his Répertoire de jurisprudence (5th ed., 18 vols., Paris, 1827–1828) and to his Recueil alphabétique des questions de droit (4th ed., 8 vols., Paris, 1827–1828). At the revolution of 1830 he was able to return to France, when he re-entered the Institute of France, of which he had been an original member, being admitted to the Académie des Sciences Morales et Politiques. He died in Paris on the 26th of December 1838.

His son, Antoine François Eugène Merlin (1778–1854), was a well-known general in the French army, and served through most of Napoleon’s campaigns.

See M. Mignet, Portraits et notices historiques (1852), vol. i.

**MERLIN** (Welsh, Myrrddhin), the famous bard of Welsh tradition, and enchanter of Arthurian romance. His history as related in this latter may be summarized as follows. The infernal powers, aghast at the blow to their influence dealt by the Incarnation, determine to counteract it, if possible, by the birth of an Antichrist, the offspring of a woman and a dragon, and one of the lads on the ground that he has been subjected to the diabolic experiment, their property is destroyed, one after the other perishes miserably, till one daughter, who has placed herself under the special protection of the Church, is left alone. The demon takes advantage of an unguarded moment of despair, and Merlin is engendered. Thanks, however, to the prompt action of the mother’s confessor, Blaise, in at once baptizing the child of this abnormal birth, the mother truly protesting that she has had intercourse with no man, Merlin is claimed for Christianity, but remains dowered with demoniac powers of insight and prophecy. An infant in arms, he saves his mother’s life and confounds her accusers by his knowledge of their family secrets. Meanwhile Vortigern, king of the Britons, is in despair at the failure of his efforts to build a tower in a certain spot; however high it may be reared in a day, it falls again during the night. He consults his diviners, who tell him that the foundations must be watered with the blood of a child who has never had a father; the king accordingly sends messengers through the land in search of such a prodigy. They come to the city where Merlin and his mother dwell at the moment when the boy is cast out from the companionship of the other lads on the ground that he has had no father. The messengers take him to the king, and on the way he astonishes them by certain prophecies which are fulfilled to their knowledge. Arrived in Vortigern’s presence, he at once announces that he is aware alike of the fate destined for him and of the reason, hidden from the magicians, of the fall of the tower. It is built over a lake, and beneath the waters of the lake in a subterranean cavern lie two dragons, a white and a red; when they turn over the tower falls. The lake is drained, the correctness of the statement proved, and Merlin’s position as court prophet assured. Henceforward he acts as adviser to Vortigern’s successors, the princes Ambrosius and Uther (subsequently Uther-Pendragon). As a monument to the Britons fallen on Salisbury Plain he brings from Ireland, by magic means, the stones now forming Stonehenge. He aids Uther in his passion for Yguelne, wife to the duke of Cornwall, by Merlin’s spells Uther assumes the form of the husband, and on the right of the duke’s death Arthur is engendered. At his birth the child is committed to Merlin’s care, and by him given to Antor, who brings him up as his own son. On Arthur’s successful achievement of the test of the sword in the “perron,” Merlin reveals the truth of his parentage and the fact that he is by hereditary right, as well as by divine selection, king of the Britons. During the earlier part of Arthur’s reign Merlin acts as counsellor; then he disappears mysteriously from the scene. According to one account he is betrayed by a maiden, Nimue or Niniane (a king’s daughter, or a water-fairy, both figure in different versions), of whom he is enamoured, and who having beguiled him a knowledge of magical spells is drawn into his magic. Merlin is living in a rocky tomb. This version, with the great cry, or Brail, by which the magician uttered before his death, appears to have been the most popular. Another represents his prison as one of air; he is invisible to all, but can see and hear, and occasionally speak to passers by; thus he holds converse with Gawain. In the prose Perceval he retires voluntarily to an “Esplumeor” erected by himself, and is seen no more of man.

The curious personality of Merlin is now generally recognized as being very largely due to the prolific invention of Geoffrey of Monmouth. Nennius, upon whose Historia Geofredi enlarged and added a “Vita Merlini,” of which the story of Vortigern and the tower, but the boy’s name is Ambrosius. Geoffrey calls him Merlin-Ambrosius, a clear proof that he was adapting Nennius’ story. He represents the sage in his rôle of court diviner, his “Prophecies” being incorporated in later manuscripts of the Historia. Subsequently Geoffrey enlarged on the theme, composing a Vita Merlini in which we find the magician in the rôle of a “possessed” wood-keeper, fleecing the haunts of men, and consorting with beasts. This gave rise to the idea that there had originally been two Merlins, Merlin-Ambrosius and Merlin-Argivester, a view so far discarded by the leading scholars. The Viz was so successful that Geoffrey obtained as reward the bishopric of St Asaph.

Welsh vernacular literature has preserved a small but interesting group of poems, strongly national and patriotic in character, which are attributed to Merlin (Myrddhin).

A few years after Geoffrey’s death Merlin’s adventures were amplified into a romance, the first draft of which is attributed to Robert de Borron, and which eventually took the form of a lengthy introduction to the prose Lancelot and cyclic recitation of the Arthurian legend.

The romantic, as distinguished from legendary or historical Merlin, exists in the following forms: (a) a fragmentary poem preserved in a unique manuscript of the Bibliot. nat. (this gives no more than the introduction to the story); (b) a prose rendering of the above, of which a fair number of copies exist, generally in English, as in the form of a Vulpian poem on the early history of the Grail, known as Joseph of Arimathoe, and in two cases followed by a Perceval and Mori Artus, thus forming a small cycle; (c) the Ortelius, a Vulgate rendering, of which numerous copies exist (see Dr Sommer’s edition); and (d) two continuations to the above, each represented by a single manuscript—(d1) the “Huth Merlin,” which was utilized by Malory for his translation, and also by a part of the compilation used by the Spanish and Portuguese translators, and (e) a very curious manuscript, 337, Bibl. nat. (fonds Francais), which Paulin Paris calls the Livre Artus, containing much matter not found elsewhere.

M. La Villemarqué’s “critical study” (Myrddhin, ou l’enchanter
MERLON—MERMAIDS

Merlin, 1861) cannot be regarded as much more trustworthy than Geoffrey himself. The story of the tower, and the boy without a father, has been critically examined by Dr Gaster, in a paper read before the Folk-Lore Society (vol. xxxii., pp. 239-90). Dr Gaster cites numerous oriental parallels to the tale, and sees in it the germ of the whole Merlin legend. Alfred Nutt (Revue Celtique, vol. xxvii.) has since shown that Appropriately, the Mermaid is a Danish legend of unknown parentage, and it seems more probable that the Boy without a father theme was generally associated with the Celtic magic manROLLER, and especially in Ireland, with particularity the 41 years ago the late Mrs Ward of the British Museum drew attention to certain passages in the life of St Kentigern, relating his dealing with a "possessed" being, a dweller in the woods, named Lailoken, and which suggests a genuine adventure personage and those assigned by Geoffrey to Merlin in the Vita; the text given by Mr Ward states that some people identified Lailoken with Merlin (see R. of Lorn., vol. vii., p. 121). love the examination of the sources of the Vita Merlini (Annales de Bretagne, vol. xv.), has pointed out the more original character of the "Lailoken" fragments, and declares that Geoffrey knew the Scottish tradition and utilized it for his Vita. He also comes to the conclusion that the Welsh Merlin poems, with the possible exception of the Dialogue between Merlin and Taliesin, are posterior to, and inspired by, Geoffrey's work. So far the researches of scholars appear to be, not to the result that the legend of Merlin, as we know it, is of complex development, combined from traditions of independent and widely differing origin. Most probably there is a certain sub-human distinctly classical; all the rest may have been: probably was, a bard and soothsayer of that name, and it is by no means improbable that curious stories were told of his origin. It is worth noting that Layanom, whose translation of Wace's Brut is of the most authentic kind; its point is that the compiler of the text, gives a much more favourable form of the "Birth" story: the father is a glorious and supernatural being, who appears to the mother in her dreams. Layanom lived on the Welsh border, and the possibility of his being drawn from genuine British tradition is generally recognized. The poem relating a dialogue between Merlin and his brother bard, Taliesin, may also derive from genuine tradition. Further than this we can hardly venture to go; the probability is that anything more told of the character and career of Merlin rests upon the imaginative powers and faculty of combination of Geoffrey of Monmouth.

Meriche (Soc. des anciens textes francais, 1880); Merlin, ed. Wheatley (Early English Text Society, 1890); Arthur and Merlog, ed. Kölping.

MERLON, in architecture, the solid part of an embattled parapet between the embrasures, sometimes pierced by loopholes. The word is French, adopted from Ital. merkone, possibly a shortened form of mergale, connected with Lat. mergae, a ditch, or a diminutive moerulus, from murreus (moerusal), a wall.

MERMAIDS and MERMEN, in the folk-lore of England and Scotland, a class of semi-human beings who have their dwelling in the sea, but are capable of living on land and of entering into social relations with men and women. They are easily identified, at least in some of their most important aspects, with the Old German Merimini or Meerfrau, the Icelandic Hafgufa, Marzygr, and Marnemill (mod. Marbendill), the Danish Hafman or Maremind, the Irish Merrow or Mermach, the Marie-Morgan of Brittany and the Meroworm of Wales;

and they have various points of resemblance to the vodyana or water-sprite and the ruskala or stream-fairy of Russian mythology. The typical mermaid has the head and body of a woman, usually of exceeding loveliness, but below the waist is fashioned like a fish with scales and fins. Her hair is long and beautiful, and she is often represented, like the Russian ruskalka, as combing it with one hand while in the other she holds a looking-glass. For a time at least a mermaid may become to all appearance an ordinary human being; and an Irish legend ("The Overthrowing of Loug Neagh and Linncluden," New Finds in Shetland and Welsh Folk-Lore, in Gentleman's Magazine (1882).) says they can become men or women, with mare, a maid; but, though mare vix occurs in Beowulf, mare-maid does not appear till the Middle English period (Chaucer, Romuunt of the Rose, &c.). In Cornwall the fishermen say mer-maid and merwoman, and mermaid, and merman, but the last is a corruption, and the true form of waters appears to be of later origin. "The Mermaid of Martin Meek" (Roby's Traditions of Lancashire, vol. ii.) is an example of this. The form of the word; and such "mer-women are known to the country-people as various parts of England, as in Newport, County Offaly, where the town is said to be drowned by the woman's agency.

the Mermaid," in Joyce's Old Celtic Romances, represents the temporary transformation of a human being into a mermaid.

The mermaid legends of all countries may be grouped as follows. (a) A mermaid or mermaids either voluntarily or under compulsion reveal things that are about to happen. Thus the two mermaids (merewip) Hadebruc and Siglent in the Niblungenlied, disclose his future course to the hero Hagen, who, having got possession of their garments, which they had left on the shore, compels them to pay ransom. In this way, according to Resius, a mermaid appeared to a peasant of Samsoe, foretold the birth of a prince, and moralized on the evils of intemperance, &c. (Kong Fredericks den andens Kroneske, Copenhagen, 1680, p. 302). (b) A mermaid imparts supernatural powers to a human being. Thus in the beautiful story of "The Old Man of Cury" (in Hunt's Popular Romances of the West of England, 1871) the old man, instead of silver and gold, obtains the power of doing good to his neighbours by breaking the spells of witchcraft, chasing away diseases, and discovering thieves.

(c) A mermaid has some one under her protection, and for wrong done to her ward exacts a terrible penalty. One of the best and most detailed examples of this class is the story of the "Mermaid's Vengeance" in Hunt's book already quoted. (d) A mermaid falls in love with a human being, lives with him as his lawful wife for a time, and then, some compact being unwittingly or intentionally broken by him, departs to her true home in the sea. Here, if its mermaid form be accepted, the typical legend is undoubtedly that of Mélusine (q.v.), which, being made the subject of a romance by Jean d'Arsas, became one of the most popular folk-books of Europe, appearing in Spanish, German, Dutch and other versions, and has been translated into many languages and enlites him to go live with her below the sea; or a merman wins the affection or captures the person of an earthborn maiden. This form of legend is very common, and has naturally been a favourite with poets. Macphail of Colonsay successfully rejects the allusions of the mermaid of Corrievrekin, and comes back after long years of trial to the maid of Colonsay. The Danish ballads are especially full of the theme; as "Agnete and the Merman," an antecedent of Matthew Arnold's "Forsaken Merman"; the "Deceitful Merman, or Marstig's Daughter"; and the finely detailed story of Rosmer Hafsand (No. 40 in Grimm). In relation to man the mermaid is usually of evil issue if not of evil intent. She has generally to be bribed or compelled to utter her prophecy or bestow her gifts, and whether as wife or paramour she brings disaster in her train. The fish-tail, which in popular fancy forms the characteristic feature of the mermaid, is really of secondary importance; for the true Teutonic mermaid—probably a remnant of the great cult of the Vanir—had no fish-tail; and this symbolic appendage occurs in the mythologies of so many countries as to afford no clue to its place of origin. The Swing, and, in the later representations, the Sirens of classical antiquity, the Phoenician Dagon, and the Chaldean Oannes are all well-known examples; the Ottawas and other American Indians have their man-fish and woman-fish (Jones, Traditions of the North American Indians, 1830); and the Chinese tell stories not unlike our own about the sea-women of their southern seas (Dennis, Folklore of China, 1875). Quasi-historical instances of the appearance or capture of mermaids are common enough, and serve, with the frequent use of the figure on signboards and coats of arms, to show how thoroughly the myth had taken hold of the popular imagination. (3) See Leyden's "The Mermaid," in Sir Walter Scott's Border Minstrelsy.

(4)Compare the strange account of the quasi-human creatures found in the Nile given by Theophractus, Historiae, viii. 16, pp. 292-302, of Beke's edition, and localized on the east bank of the Nile. as those of the Ellis, Byron, Phené, Sketchington and other families. The English heralds represent the creatures with a single tail, the French and German heralds frequently with a double one.

(5)See the paper in Journ. Brit. Arch. Assoc., xxxviii., 1882, by H. S. Cuming, who points out that mermaids or mermen occur in the arms of Earls Caledon, Howth and Sandwich, Viscounts Boyne and Gisborne, Lords Latymer and Scot of Abbotsford, as well as of the Earls of Arundel,烊on, Phené, Sketchington and other families. The English heralds represent the creatures with a single tail, the French and German heralds frequently with a double one.
A mermaid captured at Bangor, on the shore of Belfast Lough, in the 16th century, was not only baptized, but admitted into some of the society of the clergy as a natural child. This is described by his name, Merobadus (Notes and Queries, Oct. 21, 1882); and Stowe (Annales, under date 1877) relates how a man-fish was kept for six months and more in the castle of Orford in Suffolk. As showing how legendary material may gather round a simple fact, the oft-told story of the sea-woman of Edam is particularly interesting. The oldest authority, Joh. Gerbrandus a Leydis, a Carmelitte monk (d. 1504), tells (Annales, &c., Frankfurt, 1620) how in 1403 a wild woman came through a breach in the dike into Purmerlake, and, being found by some Edam milkmaids, was ultilised by the Haarlem women, and afterwards married to one man. Nobody could understand her, but she learned to spin, and was wont to adore the cross. Ocka Scharlensis (Chroniken van Friesland, Leeuward, 1507) reasons that she was not a fish because she could spin, and she was not a woman because she could live in the sea; and thus in due course she got fairly established as a genuine mermaid. Vosmaer, who has carefully investigated the matter, enumerates forty writers who have repeated the story, and shows that the oldest ones speak only of a woman (see "Beschr. van de zoogen. Meermin der stad Haarlem," in Verh. van de Holl. Maatsch. van K. en Wet., part 23, No. 1786).

The best account of the mermaid-myth is in Baring-Gould's Myths of the Middle Ages. See also, besides works already mentioned, Pontoppidan, who in his logically credulous way collects much matter to prove the existence of mermaids; M. L. Tellenius (Hague, 1755); Grimm, Deutsche Mythologie, i. 404, and Altd. Heldendieder (1811); Waldron's Description and Travels in the, Hist. and Stat. Act. of the Isle of Man; Folk-lore Society's Record, vol. ii.; Nagler, Hist. and Trad. Tales connected with the South of Scotland; Sibyllot, Traditions de la haute Bretagne (1882), and Contes des marins (1889).

**MEROBAUDES, FLAVIUS** (5th century A.D.), Latin rhetorician and poet, probably a native of Baetica in Spain. He was the official laureate of Valentinian III. and Aëtius. Till the beginning of the 19th century he was known only from the notice of him in the Chronicle (year 443) of his countryman Eutropius, where he is praised as a poet and orator, and mention is made of statues set up in his honour. In 1813 the base of a statue was discovered at Rome, with a long inscription belonging to the year 435 (C.I.L. vi. 1744) upon Flavius Merobaudes, celebrating his merits as warrior and poet. Ten years later, Niebuhr discovered some Latin verses on a palimpsest in the monastery of St Gall, the authorship of which was traced to Merobaudes, owing to the great similarity of the language in the prose preface to that of the inscription. Formerly the only place known under the name of Merobaudes was a short poem (56 hexameters) *De Christo*, attributed to him by B. M., to Claudian by another; but Ebert is inclined to dispute the claim of Merobaudes to be considered either the author of the *De Christo* or a Christian.

The "Panegetic" and minor poems have been edited by B. G. Niebuhr (1824); by J. Bekker in the Bonn Corpus scriptorum hist. Byz. (1836); the "De Christo" in T. Birt's Claudian (1829), where the authorship of Merobaudes is upheld; see also A. Ebert, Geschichte der Literatur des Mittelalters im Abendlande (1889).

**MEREO,** the general name (as Island of Meroe) for the region bounded on three sides by the Nile (from Khartum to Khartum), the Atbara, and the Blue Nile; and the special name of an ancient city on the east bank of the Nile, 877 m. from Wadi Halfa by river, and 554 by the route across the desert, near the site of which is a group of villages called Bakarawiya. The site of the city is marked by over two hundred pyramids in three groups, of which many are in ruinous condition. After the site was described by Sir Archibald Forbes, among whom F. Caillaud (Voyage à Meroé, Paris, 1826-1828) deserves special mention, some excavations were executed on a small scale in 1834 by G. Ferrini (Cenni sugli scavi operati nella Nubia e catalogo degli oggetti ritrovati, Bologna, 1837), who discovered (or professed to discover) various antiquities, chiefly in the form of jewelry, now in the museums of Berlin and Munich. The ruins were examined in 1854 by C. R. Lepsius, who brought many plans, sketches and copies, besides actual antiquities, to Berlin. Further excavations were carried on by E. W. Budge in the years 1903 and 1905, the results of which are recorded, his work, The Egyptian Sudan: its History and Monuments (London, 1907).

Troops were furnished by Sir Reginald Wingate, governor of the Sudan, who made paths to and between the pyramids, and sank shafts, &c. It was found that the pyramids were regularly built over sepulchral chambers, containing the remains of bodies either burned or buried without being mummified. The most interesting objects found were the reliefs on the chapel walls, already described by Lepsius, and containing the names with representations of queens and some kings, with inscriptions of the time of their reigns (besides reliefs with inscriptions in the Meroitic language, and some vessels of metal and earthenware. The best of the reliefs were taken down stone by stone in 1905, and set up partly in the British Museum and partly in the museum at Khartum. In 1910, in consequence of a report by Professor Sayce, excavations were commenced in the mounds of the town and the necropolis by J. Garstang on behalf of the university of Liverpool, and the ruins of a palace and several temples were discovered, built by the Meroite kings.

(See further ETHIOPIA.)

*Meropa* was probably also an alternative name for the city of Napata, the ancient capital of Ethiopia, built at the foot of Jebel Barkal. The site of Napata is indicated by the villages of Sanam Abu Dom on the left bank of the Nile and Old Merawi on the right bank of the river. New Merawi, 1 m. east of Sanam Abu Dom and on the same side of the river, was founded by the Sudan government in 1905 and made the capital of the mudiriah of Dongola.

(D. S. M. *)

**MEREOPE,** the name of several figures in Greek mythology. The most important of them are the following: (1) The daughter of Cypselus, king of Arcadia, and wife of Cressephontes, ruler of Messenia. During an insurrection Cressephontes and two of his sons were murdered at the throne seized by Polyphontes, who forced Merope to marry him. A third son, Aepytus, contrived to escape, and, subsequently returning to Messenia, put Polyphontes to death and recovered his father's kingdom (Apollodorus ii. 8, 5; Pausanius iv. 3, 6). The fortunes of Merope have furnished the subject of tragedies by Euripides (Cressephontes, not extant), Voltaire, Maffei and Matthew Arnold.

(2) The daughter of Atlas and wife of Sisyphus. She was one of the seven Pleiades, but remained invisible, hiding her light for shame at having become the wife of a mortal (Apollodorus ii. 4; Pausanius iii. 10, 2). The story of Merope.

**MEROVINGIANS,** the name given to the first dynasty which reigned over the kingdom of the Franks. The name is taken from Merovech, one of the first kings of the Salian Franks, who succeeded to Clodio in the middle of the 5th century, and soon became the centre of many legends. The chronicler known as Fredegarius Scholasticus relates that a queen was once sitting by the seashore, when a monster came out of the sea, and by this monster she subsequently became the mother of Merovech, but this myth is due to an attempt to explain the hero's name, which means "the sea-born." At the great battle of Mauriac (the Catalaunian fields) in which Attilus checked the invasion of the Huns (491), there were present in the Roman army a few Frankish foederati, and a later document, the *Vita Iusti*, states that Merovech (Merovingus) was their leader. Merovech was the father of Childeric I. (457-481), and grandfather of Clovis (481-511), under whom the Salian Franks conquered the whole of Gaul, except the kingdom of Burgundy, Provence and Septimania. The sons of Clovis divided the dominions of their father between them, made themselves masters of Burgundy (531), and in addition received Provence from the Ostrogoths (537); Septimania was not taken from the Arabs till the time of Pippin, the founder of the Carolingian dynasty. From the death of Clovis to that of Dagobert (639), the Merovingian kings displayed considerable energy, both in their foreign wars and in the numerous wars against one another in which they found an outlet for their barbarian instincts. After 639, however, the race began to decline, one after another the kings succeeded to the throne,
but none of them reached more than the age of twenty or twenty-five; this was the age of the "rois fantaisistes." Henceforth the real sovereign was the mayor of the palace. The mayors of the palace belonging to the Carolingian family were able to keep the throne vacant for long periods of time, and finally, in 751, the mayor Pippin, with the consent of the pope Zacharias, sealing King Childerich III. to the same office, St. Omer, and shut up his young son Thierry in that of St. Wandrille. The Merovingian race thus came to an end in the cloister.

Dain, Die Könige der Germanen, vii. (Leipzig, 1894); by the same author, Uergeschichte der germanischen und romanischen Völker, iii. (Berlin, 1883); W. Schultz, Deutsche Geschichte von der Urzeit bis zu den Karolinen, i. (Leipzig, 1886).

Merovingian Legend.—It has long been conceded that the great French national epics of the 11th and 12th centuries must have been founded on a great fund of popular poetry, and that many of the episodes of the Chansons de geste belong to historical events anterior to the Carolingian period. Floviant is obviously connected with the Gesta Dagoberti, and there are traces of the influence of popular songs on the Frankish heroes in Gregory of Tours and other chroniclers. See G. Kurbth, Hist. post des Merovings (Paris, Brussels and Leipzig, 1893); A. Darmesteter, De Flovante etветиествe gallo poemaе (Paris, 1877); Flovani (Paris, 1859): ed. MM. F. Courtois and G. D'Herblay, ed. P. Roussel, Origine et retraces de flovante francese (Florence, 1884), with which e. C. Paris in Romanic, xiii, 602 seq.; F. MERRILL, a city and the county-seat of Lincoln county, Wisconsin, U.S.A., 185 m. N.W. of Milwaukee, on both sides of the Wisconsin river. Pop. (1910 census), 8698. It is served by the Chicago, Milwaukee & St. Paul railroad. The city is situated about 1270 ft. above the sea and has an invigorating climate. Brook trout and various kinds of game, including deer, abound in the vicinity. Grandfather Falls and the Delles of the Prairie river are picturesque places near the city, and furnish good water-power. The principal public building is the Lincoln county court house, and the city contains the T. B. Scott free library, a fine high-school, and the Ravn hospital, a private institution. Riverside Park is maintained by a corporation, and a park along the Prairie river is owned and maintained by the city. Merrill is an important hardwood lumber market, and its principal industry is the manufacture of lumber and lumber products. The manufacture of paper and paper pulp and of lathes is also important. In 1905 the factory products were valued at $3,260,638. There are granite quarries and brickyards in the vicinity. Merrill was settled in 1880 and incorporated as a village in 1889, and chartered as a city in 1883.

MERRIMAC, a river in the north-eastern part of the United States, having its sources in the White Mountains of New Hampshire, and flowing south into Massachusetts, and thence east and north-east into the Atlantic Ocean. With its largest branch it has an extreme length of about 183 m. The Merrimac proper is formed at Franklin, New Hampshire, by the junction of the Pemigewasset and Winnipesaukee rivers. The former is the larger branch and rises in the White Mountains in Grafton county. It is fitted with an outlet of Lake Winnipesaukee. The valley of the Merrimac was formed before the glacial period and was filled with drift as the ice retreated; subsequently the high flood plain thus formed has been trenched, terraces have been formed, and at different places, where the new channel did not conform to the pre-glacial channel, the river has come upon buried ledges, relatively much more resistant than the drift below, and waterfalls have thus resulted. The river falls 269 ft. in a distance of 110 m. from Franklin to its mouth. The greater part of the total fall is at six points, and at each of four of these is a city which owes its importance in great measure to the water-power thus provided, Lowell and Merrimack Falls. However, the river at Lowell has a fall of 30 ft. (Pawtucket Falls), and at Manchester there is a fall of 55 ft. (Amoskeag Falls). The region drained by the river is 4553 sq. m. in extent, and contains a number of lakes, which together with some artificial reservoirs serve as a storage system. On the navigable portion of the river, which extends 174 m. above its mouth, are the cities of Newburyport, near Haverhill, at the head of navigation. In 1890–1906 the Federal government dredged a channel from Newburyport to Haverhill (14.5 m.) 7 ft. deep and 150 ft. wide at mean low water; vessels having a draft of 12.5 ft. could then pass over the outer bar of Newburyport.

MERRIMAN, HENRY SETON (d. 1903), the pen-name of Hugh Stowell Scott, English novelist. He was a member of the firm of Henry Scott & Sons, and was for some years an underwriter at Lloyd's. His literary career began in 1889 with The Phantom Future, and he made his first decided hit with his Russian story, The Sowers (1896), which was followed by many other well-constructed novels remarkable for excellence of plot and literary handling. The author was an enthusiastic traveller, many of his journeys being undertaken with his friend Stanley Weyman. He was about forty when he died at Melton, near Ipswich, on the 19th of November 1903. Among his most successful books were Reden's Corner (1898); The Isle of Unrest (1899); In Kedaro's Tents (1897); The Velvet Glove (1900); The Vulture (1900); Barlasch of the Guard (1903); and The Last Hope (1904).

MERRITT, WESLEY (1836–1916), American soldier, was born in New York City on the 16th of June 1836. He graduated at West Point in 1860, and was assigned to the cavalry service. He served in Utah (1861) and in the defences of Washington (1861–62); learnt the field duties of his arm as aide (1862) to General Philip St George Cooke, who then commanded the cavalry of the Army of the Potomac; became brigadier-general, United States Volunteers, in June 1863; and in September 1863 was placed in command of a brigade of regular cavalry in the Army of the Potomac. He won great distinction in the Virginian campaigns of 1864–65 and in Sheridan's Valley campaign, being brevetted major-general of volunteers for his conduct at Winchester and Fisher's Hill, and brigadier-general of the regular army for his services at Five Forks. In the final campaign about Richmond he did such good service in command of a cavalry division that he was brevetted major-general in the regular army and was promoted major-general of volunteers. With other two Federal commissioners he arranged with the Confederate commanders for the surrender of the Army of Northern Virginia. He was mustered out of the Volunteer Service in February 1866, and in July became lieutenant-colonel of the 9th cavalry in the regular army, being promoted gradually to major-general (1893). He served in the Big Horn and Yellowstone Indian campaigns (1876) and in the expedition to relieve the command of Major Thorburn, who was killed in 1879 by the Utes; was superintendent at West Point (1882–87); and commanded the military department of Missouri in 1887–95, and that of the Atlantic in 1897–98. He was assigned in May 1898 to the command of the United States forces on the Philippines, for Dewey's victory; stormed Manila on the 13th of August; and was military governor of the islands until the 29th of August, when he left Manila for Paris to join the peace commission. From 1899 until his retirement from active service in June 1900 he commanded the Department of the East.

MERSEBURG, a town of Germany, in the Prussian province of Saxony, on the river Saale, 10 m. by rail S. of Halle and 15 m. W. of Leipzig. Pop. (1905), 20,024. It consists of a quaint and irregularly built old town, a new quarter, and two extensive suburbs, Altenburg and Neumarkt. The cathedral, which was restored in 1861–1866, has a choir, a crypt and two towers of the 11th, a transept of the 13th and a late Gothic nave of the 16th century. Among its numerous monuments is one to Rudolph of Swabia, the rival of the emperor Henry IV. It contains
Mersen, Treaty of—Mersyn, Treaty of

a great organ dating from the 17th century. Near the cathedral is the Gothic palace, formerly the residence of the bishops of Mersburg, and now used as public offices. The town hall and the Ständehaus, where the meetings of the provincial estates were held, are also noteworthy buildings. The industries include the manufacture of machinery, paper and celluloid, and tanning and brewing.

Mersburg is one of the oldest towns in Germany. From 968 until the Reformation, it was the seat of a bishop, and in addition to being for a time the residence of the margraves of Meissen, it was a favourite residence of the German kings during the 10th, 11th and 12th centuries. Fifteen diets were held here during the middle ages, when its fairies enjoyed the importance which was afterwards transferred to those of Leipzig. The town suffered severely during the Peasants' War and also during the Thirty Years' War. From 1657 to 1738 it was the residence of the dukes of Saxe-Mersburg.

See E. Hoffmann, Historische Nachrichten aus Alt-Mersburg (Mersburg, 1843).

Mersen (Meerssen), Treaty of, a treaty concluded on the 8th of August 879 at Mersen, in Holland, between Charles the Bald and his half-brother, Louis the German, by which the kingdom of their nephew Lothair II. (d. 869) was divided between them. Charles received a portion of the kingdom of Lothair afterwards called Lorraine, extending from the mouths of the Rhine to Toul, together with the town of Besançon, the Lyonnais, the Viennois, the Vivarais, and the Uzége, i.e. the lands acquired by Lothair II. in 863 at the death of his brother Charles of Provence; while Louis had the cities of Cologne, Trier, and Verdun, and also Meissen, Meus, and the Varais, i.e. the greater part of the diocese of Besançon. The boundary between the two realms was marked approximately by the valleys of the Meuse and Moselle and by the Jura. Great importance has been attached to the determination of this frontier by some historians, who consider that it coincided with the dividing line between the Teutonic and Romance races and languages; but nothing is known of the bases upon which the negotiations were effected, and the situation created by this treaty came to an end in 879.

Mersenne, Marin (1588-1648), French philosopher and mathematician, was born of peasant parents near Oizé (Sarthe) on the 8th of September 1588, and died in Paris on the 1st of September 1648. He was educated at the Jesuit College of La Flèche, where he was a fellow-pupil and friend of Descartes. In 1611 he joined the Minim Friars, and devoted himself to philosophic teaching in various convent schools. He settled eventually in Paris in 1620 at the convent of L’Annonciade. For the next four years he devoted himself entirely to philosophic and theological writing, and published Questiones celeberrimae in Genesis (1623); L’Impétit de désîtes (1624); La Vrîte des sciences (1624). These works are characterized by wide scholarship and the narrowest theological orthodoxy. His greatest service to philosophy was his enthusiastic defence of Descartes, whose agent he was in Paris and whom he visited in exile in Holland. He submitted to various eminent Parisian thinkers a manuscript copy of the Meditations, and defended its orthodoxy against numerous clerical critics. In later life, he gave up speculative thought and turned to scientific research, especially in mathematics, physics and astronomy. Of his works in this connexion the best known is L’Harmonie universelle (1636), dealing with the theory of music and musical instruments.

Among his other works are: Entiédos elementorum libri, 8c. (Paris, 1625); Universæ geometriae synopsis (1644); Les Méchaniques de Galilée (Paris, 1634); Questions inues ou rcrèrations des savants (1634); Questions théologiques, physiques, &c. (1634); Nouvelles de la découverte du cap de bonne espérance (1656) (q.v.). See Baillet, Vie de Descartes (1691); Potié, Éloge de Mersenne (1816).

Mersey, a river in the north-west of England. It is formed by the junction of the Goyt and the Etherow a short distance below Marple in Cheshire on the first-named stream. The Goyt rises in the neighbourhood of Axe Edge, south-west of Buxton, and the Etherow in the uplands between Penistone and Glossop, watering the narrow Longdendale in which are several reservoirs for the Manchester water supply. The Mersey thus drains a large part of the Peak district of Derbyshire and of the southern portion of the Pennine system. The general direction from Marple is westerly. At Stockport the river Tame joins from the north, rising in the moors to the north-east of Oldham, and the Mersey soon afterwards debouches upon the low plain to the west of Manchester, which lies on its northern tributary, the Irwell. The Tame joins from the south-east near Heailey, and the main river, passing Warrington, begins to expand into an estuary before reaching Runcorn and Widnes, which face each other across it. The estuary, widening suddenly at the junction of the Weaver from the south-east, 28 m. below Runcorn, is 3 m. wide off Ellesmere Port, but narrows to less than ½ m. at Liverpool, and hardly exceeds a mile at the mouth in the Irish Sea. The fall of the Mersey is about 1000 ft. in all and about 300 from Marpâ; its length, including the Goyt, is 70 m. exclusive of lesser windings, and it drains an area of 1596 sq. m. The estuary is one of the most important commercial waterways in the world. (See Liverpool and BIRKENHEAD.) The Manchester Ship Canal (q.v.) joins the estuary through Eastham Locks, skirts its southern shore up to Runcorn, and crosses the river several times. From the name of the river was taken the title of Lord Mersey in 1910 by Sir John Bigham (b. 1840), on his elevation to the peerage after serving as a judge of the high court from 1897 to 1909 and president of the divorce court 1909-1910.

Mersina, a town on the south-eastern coast of Asia Minor, and capital of a sanjak in the vilayet of Adana. Pop. about 15,000 including many Christians, Armenians and European. Its existence as a port began with the siting up of the harbour of Tarsus and Pompeopolis, east and west, in the early middle ages; but it did not rise to importance till the Egyptian occupation of Cilicia (1382). It is now the busiest port on the south coast, being the terminus of the railway from Tarsus and Adana, by which (but still more by road) the produce of the rich “Alcian” plain comes down. It is served by most of the Levantine steamship companies, and is the best point of departure for visitors desiring to see Tarsus, the Cilician remains, and the finest scenery of the East Taurus. There is, however, no enclosed harbour, but only a good jetty. The making of a breakwater has long been under consideration. The anchorage in the roadstead is good, but the bay shoals for a long way out, and is exposed to swell from south-west and south. Mersina is an American mission centre, and the seat of a British vice-consul. Like all lowland Cilicia, it has a notoriously bad summer climate, and all inhabitants, who can do so, migrate to stations on the lower slopes of Taurus.

(D. G. H.)

Mervyr Tydfil, or Mervyr Tidyll, a municipal, county and parliamentary borough, and market-town of Glamorgan, south Wales, situated in a bleak and hilly region on the river Taff, on the Glamorganshire Canal, and the Brecon and Merthyr, Great Western, North Western, Tafl Vale and Rhymney railways, 25 m. N.W. of Cardiff, 30 E.N.E. of Swansea, and 176 from London. Pop. (1901), 69,228. The town is said to have derived its name from the martyrdom of St Tydfil, daughter of Brychan, who was put to death by Saxons in the 5th century. It is for the most part irregularly built and was formerly subject to severe epidemics due to the want of sanitation; but it now possesses a supply of the purest water from the less-silting Taff, and is on the higher slope of the Breconshire Beacons. The town owes its early industrial prosperity to the abundant ironstone and coal of the district, and it thus became at an early date the chief seat of the iron industry in Wales. Four great ironworks were established here between 1759 and 1782. With the earliest, that of Downsl, the Guest family were associated, first as partners and later as sole owners from 1782 to 1901 when the works were disposed to the company of Guest, Keen and Netteilf. In 1765, Cyfarthfa was started by Anthony Bacon, and when firmly established, sold in 1794 to Richard Crawshay by whose descendants the works were
carried on till the owners formed themselves in 1806 into a limited company (Crawshay Brothers Cyfarthfa Limited), the controlling interest in which has since been acquired by the Dowlais Company. The Plymouth works, started soon after Cyfarthfa, by Wilkinson and Guest, passed later into the hands of Anthony Hill from whose descendants they were purchased in 1863. They were closed down in 1888, but the collieries belonging to them continue to be worked on a large scale, yielding over 2000 tons of coal a day. The fourth great ironworks, those of Pen-y-darren, were carried on from 1782 to 1859. It was at Dowlais (in 1836) that Bessemer steel was first rolled into rails, but the use of puddled iron was not wholly abandoned at the works till 1882. It has now eighteen blast furnaces, and extensive collieries are also worked by the company, and large branch works were opened on the sea-board at Cardiff in 1891. Cyfarthfa was converted into steel works in 1883. The iron ore used is mainly imported from Spain. Merthyr Vale is almost entirely dependent on coal-mining and has one of the largest collieries in south Wales (Nixon's Navigation). The population of this district more than quintupled between 1861 and 1891.

From 1850 the government of the town was vested in a local board of health which in 1894 became an urban district council; by charter granted on the 5th of June 1905, it was vested in a corporation consisting of a mayor, 8 aldermen and 24 councillors. It was made a county borough from the 1st of April 1908. It comprises about 17,759 acres, is divided into eight wards and besides the older town, it includes Penydarren (1 m. N.E.), Dowlais (2 m. N.E.), Plymouth (1 m. S.) and Merthyr Tydfil. In 1888 it was in competition with Aberdare and Mountain Ash, and has now a stipendiary magistrate since 1874. The parliamentary borough which was created and given one member in 1832 and a second in 1867, includes the parish of Aberdare and parts of the parishes of Llanwonno, Merthyr Tydfil and Vainor (Brecon).

There is an electric tramway (completed in 1905) from the town to Cefn and Dowlais. In 1901 about 50% of the population above three years of age spoke both Welsh and English, 77% spoke Welsh only, and the remaining English only. The ancient parish of Merthyr Tydfil has been divided into five ecclesiastical parishes (Merthyr, Cyfarthfa, Dowlais, Pentrebach, and Penydarren) and part of another parish (Treharris). These six parishes form the rural deanery of Merthyr in the archdeaconry and diocese of Llandaff, and in 1896 had nine churches and fifteen mission rooms. An inscribed stone (Artbeu) has been built into the east wall of the parish church; and two other inscribed stones removed from Abercarn Farm in the greater Taff valley now lie in the parish churchyard. The old structure of the parish church has been entirely removed except the base of the tower. There is a Roman Catholic church in Penydarren Park and another at Dowlais. The Nonconformists, of which the chief denominations are the Baptists, Congregationalists and Methodists—Wesleyan and Calvinistic—had in 1906 82 chapels, 49 of which were used for Welsh services and 33 for English.

The public buildings include, besides the churches, a town hall and law courts (1868), drill hall (1866), library, market house, a county intermediate school, general hospital built in 1857 and enlarged in 1897, and an isolation fever hospital, a theatre (1894) and a fountain presented by Sir W. T. Lewis as a memorial to the pioneers of the town's industry. At Dowlais there are two railway termini (1900) and a free library which have been provided by the owners of the Dowlais Works, Oddfellows' hall (1878), and a fever hospital (1866). At Thomas Town there is a recreation ground of 16 acres, formed in 1902. In 1908 the corporation purchased Cyfarthfa Castle (formerly the residence of the Crawshay family) with a park of 62 acres including a lake of 6 acres.

The Roman road from Cardiff and Gelliger to Brecon passed through Merthyr and the remains of the fort were discovered in Penydarren park in 1902. Three miles to the north of Merthyr, on a limestone rock about 470 ft. above the lesser (eastern) Taff are the ruins of Morfais Castle, built about 1286 by Gilbert de Clare on the northern limits of his lordship of Glamorgan, its erection causing a serious feud between him and de Bohun, earl of Hereford, who claimed its site as part of the lordship of Brecknock.

(M.L.T.)

MERULA—MERU

(Merula, Georgius (the Latinized name of Giorgio MIRLANI; c. 1430–1494), Italian humanist and classical scholar, was born at Alessandria in Piedmont. The greater part of his life was spent at Venice and Milan, where he held a professorship and continued to teach until his death. To Merula we are indebted for the edition of Lucan's Pharsalia (1478), for the Pseudo-Plutarch, and for the Sermo de baptismo, 1480.)

MERU, MERU or MAUS, an oasis and town of Asia, in the Transcaspian province of Russia. The oasis is situated on the S. edge of the Kara-kum desert, in 37° 36' N. and 62° E. It is about 230 m. N. from Herat, and 280 S.S.E. from Khiva. Its area is about 1900 sq. m. The great chain of mountains which, under the names of Paropamisus and Hindu-Kush, extends from the Caspian to the Pamirs is interrupted some 180 m. south of Meru. Through or near this gap flow northwards in parallel courses the rivers Heri-rud (Tejend) and Murghab, until they lose themselves in the desert of Kara-kum. Thus they make Meru a sort of watch tower over the entrance into Afghanistan on the north-west and at the same time create a stepping-stone or stapect between north-east Persia and the states of Bokhara and Samarkand. The present inhabitants of the oasis are Turkomans of the Tekke tribe. In 1897 they numbered approximately 240,000. The oasis is irrigated by an elaborate system of canals cut from the Murghab. The country has at all times been renowned throughout the East for its fertility. Every kind of cereal and many fruits grow in great abundance, e.g. wheat, millet, barley and melons, also rice and cotton. Silk worms are bred. The Turkomans possess a famous breed of horses and keep camels, sheep, cattle, asses and mules. They are excellent workers in silver and noted as armourers, and their carpets are superior to the Persian. They also make felt and a rough cloth of sheep's wool. The heat of summer is most oppressive. The least wind raises clouds of fine dust, which fills the air, renders it so opaque as to obscure the noonday sun, and make respiration difficult. In winter the climate is very fine. Snow falls rarely, and when it does, it melts at once. The annual rainfall rarely exceeds 5 in., and there is often no rain from June till October. While in summer the thermometer goes up to 95° F., in winter it descends to 19° S. The average yearly temperature is 60°. Here is a Russian imperial region of 436 sq. m., artificially irrigated by works completed in 1895.

History.—In Hindu (the Pauranas), Parsi and Arab tradition, Meru is looked upon as the ancient Paradise, the cradle of the Aryan families of mankind, and the name of Mourn the human Being. Under the name of Margu it occurs in the cuneiform (Behistun) inscriptions of the Persian monarch Darius Hystaspis, where it is referred to as forming part of one of the satrapies of the ancient Persian Empire. It afterwards became a province (Margiana) of the Graeco-Syrian, Parthian and Persian kingdoms. On the Margus—the Eparrus of Arzrur and now the Murghab—stood the capital of the district, Antiocchia Margiana, so called after Antiocchus Soter, who rebuilt the city founded by Alexander the Great.
About the 5th century, during the rule of the Persian Sassanian dynasty, Merv was the seat of a Christian archbishopric of the Nestorian Church. The town was occupied (A.D. 646) by the lieutenants of the caliph Othman, and was constituted the capital of Khorasan. From this city as their base the Arabs, under Kotaiba (Qutaiba) ibn Moslim, early in the 8th century brought under subjection Balkh, Bokhara, Ferghana and Kashgaria, and penetrated into China as far as the province of Kan-suh. In the latter part of the 8th century Merv became obnoxious to Islam as the centre of heretical propaganda preached by Mokanna (q.v.). In 874 Arab raids in Central Asia came to an end. During the 9th century Merv, like Samarqand and Bokhara, of Timur-i Tekkes, was one of the great schools of learning, and the celebrated historian Yaqut studied in its libraries. In 1040 the Seljuk Turks crossed the Oxus from the north, and having defeated Masud, sultan of Ghazni, raised Toghurl Beg, grandson of Seljuk, to the throne of Persia, founding the Seljukian dynasty, with its capital at Nishapur. A younger brother of Toghurl, Daud, took possession of Merv and Herat. Toghurl was succeeded by his nephew Alp Arslan (the Great Lion), who was buried at Merv. It was about this time that Merv reached the zenith of her glory. During the reign of Sultan Sanjar or Seljuk, in the middle of the 11th century, Merv was overrun by the Turkish tribes of the Ghuzz from beyond the Oxus. It eventually passed under the sway of the rulers of Khwarizm (Khiva).

In 1221 Merv opened its gates to Tule, son of Jenghiz Khan, chief of the Mongols, on which occasion most of the inhabitants are said to have been butchered. From this time forward the city began to decay. In the early part of the 14th century the town was made the seat of a Christian archbishopric of the Eastern Church. On the death of the grandson of Jenghiz Khan Merv was included in (1280) in the possessions of Timur-i Leng (Tamerlane), Mongol prince of Samarqand. In 1395 the city was occupied by the Uzbegs, who five years later were expelled by Ismail Khan, the founder of the Safawid dynasty of Persia. Merv remained in the hands of Persia until 1787, when it was captured by the emir of Bokhara. Seven years later the Bokharans razed the city to the ground, broke down the dams, and converted the district into a waste. When Sir Alexander Burns traversed the country in 1832, the Khivans were the rulers of Merv. About this time the Tekke Turkomans, then living on the Merv-rud, were forced by the Persians to migrate northward. The Khivans continued to be the advanced of the Valikhanov tribes, but ultimately, about 1856, the latter became the sovereign power in the country, and remained so until the Russians occupied the oasis in 1883.

The ruins of Old Merv cover an area of over 15 sq. m. They consist of a square citadel (Bairam Ali Khan kalah), 13 m. in circuit, built by a son of Tamerlane and destroyed by the Bokharians, and another kalah or walled inclosure known as Abdullah Khan. North from these lies the old capital of the Seljuks, known as Sultan Kalah, and destroyed by the Mongols in 1300. Its most conspicuous feature is the bazaar of Sultan Sanjar, reputedly dating from the 12th century. East of the old Seljuk capital is Giaur Kalah, the Merv of the Nestorian era and the capital of the Arab princes. North of the Old Seljuk capital are the ruins of Iskender Kalah, probably to be identified with the ancient Merv of the Seleucid dynasty.

New Merv, the present chief town of the oasis, founded in the first quarter of the 10th century, is on the Transcaspian railway, 380 m. by rail south-west from Samarqand. It stands on both banks of the Murghab, 820 ft. above the Caspian. Population, 87,000, including Russians, Armenians, Turkomans, Persians and Jews. It has a meteorological observatory. Corn, raw cotton, hides, wool, nuts and dried fruit are exported.

MERX, ADALBERT (1838–1900), German theologian and orientalist, was born at Bleicherode near Nordhausen on the 2nd of November 1838. He studied at Jena, where he became extraordinary professor in 1869. Subsequently he was ordinary professor of philosophy at Tübingen, and in 1873 professor of theology at Giessen. From 1875 till his death he was professor of theology of Heidelberg. In the course of his researches he made several journeys in the East. Among his many works are: Grammatica syriaca (1867–1870); Vocabulary of the Tigré language (1868); Das Gedicht vom Hio (1871); Die Prophetie des Joel und ihre Auslegung (1879); Die Saadkindische Übersetzung der Hoherleiter ins Arabische (1882); Christomathia targumica (1888); Historia artis grammaticae zpud Syros (1889); Ein samaritanisches Fragment (1893); Idee und Grundlinien einer allgemeiner Geschichte der Mosaisch (1893). Merv, devoted much of his later work to the publication of the ancient monuments of the Sinaitic Pen. He was elected in 1892 by Mrs Agnes Smith Lewis (see Bible, iv. 321, ad fin.), the results being embodied in Die vier kanonischen Evangelien nach ihrem ältesten bekannten Texte (1897–1905). His last work was an edition of the books of Moses and Joshua. He died at Heidelberg on the 6th of August 1900.

MÉRYON, CHARLES (1821–1868), French etcher, was born in Paris in 1821. His father was an English physician, his mother a French dancer. It was to his mother's care that Méryon's childhood was confided. But she died when he was only five years old. Méryon entered the French navy, and a corvette "Le Rhin" made the voyage round the world. He was already a draughtsman, for on the coast of New Zealand he made pencil drawings which he was able to employ, years afterwards, as studies for etchings of the landscape of those regions. The artistic instinct developed, and, while he was yet a lieutenant, Méryon left the navy. Finding that he was colour-blind, he determined to devote himself to etching. He entered the work room of one Blery, from whom he learnt something of technical matters, and to whom he always remained grateful. Méryon was by this time poor. It is understood that he might have had assistance from his kindred, but he was too proud to ask it. And thus he was reduced to the need of executing for the sake of daily bread much work that was mechanical and irksome. Among learners' work, done for his own advantage, are to be counted some studies after the Dutch etchers such as Zeeman and Adrian van de Velde. Having proved himself a surprising copyist, he proceeded to labour of his own, and began that series of etchings which are the greatest embodiments of his greatest conceptions—the series called "Eaux-fortes sur Paris." These plates, executed from 1850 to 1854, are never to be met with as a whole; they were never expressly published as a set. But they none the less constituted in Méryon's mind an harmonious series.

Besides the twenty-two etchings "sur Paris," characterized below, Méryon did seventy-two etchings of one sort and another—ninety-four in all being catalogued in Wedmore's Méryon and Méryon's Paris; but these include the works of his apprenticeship and of his decline, adroit copies in which his best success was in the sinking of his own individuality, and more or less dull portraits. Yet among the seventy-two prints outside his professed series there are at least a dozen that will aid his fame. Three or four beautiful etchings of Paris do not belong to the series at all. Two or three etchings, again, are devoted to the illustration of Bourges, a city in which the old wooden houses were as attractive to him for their own sakes as were the stone-built monuments of Paris. But generally it was when Paris engaged him that he succeeded the most. He would have done more work, however—though he could hardly have done better work—if the material difficulties of his life had not pressed upon him and shortened his days. He was a bachelor, unhappy in love, and yet, it is related, almost as constantly occupied with love as with work. The depth of his imagination and the surpassing mastery which he achieved almost from the beginning in the technicalities of his craft were appreciated only by a few artists, critics and connoisseurs, and he could not sell his etchings, or could sell them only for about rod. apiece. Disappointment told upon him, and, frugal as was his way of life, poverty must have affected him. He became subject to hallucinations. Enemies, he said, waited for him at the corners of the streets; his few friends robbed him or owed him that which they would
never pay. A few years after the completion of his Paris series he was lodged in the madhouse of Charenton. Its order and care restored him for a while to health, and he came out and did a little more work, but at bottom he was exhausted. In 1867 he returned to his asylum, and died there in 1868. In the middle years of his life, just before he was placed under confinement, he was much associated with Bracquemond and with Flameng—skilled practitioners of etching, while he was himself an unde- niable genius. The old-world pugnacity of his spirit is that one by Bracquemond under which the sitter wrote that it represented "the sombre Méryon with the grotesque visage."

There are twenty-two pieces in the Eaux-fortes sur Paris. Some of them are insignificant. That is because ten out of the twenty-two were destined as headpiece, tailpiece, or running commentary on some more important plate. But each has its value, and certain of the smaller pieces throw great light on the aim of the entire set. Thus, one little plate—not a picture at all—is devoted to the record of verses made by Méryon, the purpose of which is to lament the life of Paris. The misery of the town Méryon had to illustrate, as well as its splendour. The art of Méryon is completely misconceived when his etchings are spoken of as views of Paris. They are often "views," but they are so just so far as is compatible with their being likewise the visions of a poet and the compositions of an artist. It was an epic of Paris that Méryon determined to make, coloured strongly by his personal sentiment, and affected here and there by the occurrences of the moment—in more than one case, for instance, he hurried with particular affection to etch this impression of some old-world building which was on point of destruction. Nearly every etching in the series is an instance of technical skill, but even the technical skill is exercised most happily in those etchings which have the advantage of impressive subjects, and which the collector willingly cherishes for their mysterious suggestiveness or for their pure beauty. Of these, the Abside de Notre Dame is the general favourite; it is commonly held to be Méryon's masterpiece. Light and shade play wonderfully over the great fabric of the church, seen over the spaces of the river. As a draughtsman of architecture, Méryon was complete; his sympathy with its various styles was broad, and his work on its various styles unbiased and of equal perfection—a point in which it is curious to contrast him with Turner, who, in drawing Gothic, often drew it with want of appreciation. It is evident that architecture must enter largely into any representation of a city, however much such representation may be a vision, and however little a chronicle. Besides, the architectural portion even of Méryon's labour is but indirectly imaginative; to the imagination he has given freer play in his dealings with the figures, whether the people of the street or of the river or the people who, when he is most frankly or even wildly symbolical, crowd the sky. Generally speaking, his figures are as regards draughtsmanship, "landscape-painter's figures." They are drawn more with an eye to grace than to academic correctness. But they are not "landscape-painter's figures" at all when all we are concerned with is not the method of their representation but the purpose of their introduction. They are seen then to be in exceptional accord with the sentiment of the scene. Sometimes, as in the case of La Morgue, it is they who tell the story of the picture. Sometimes, as in the case of La Rue des Mauvais Garçons—with the two passing women bent together in secret converse—they at least suggest it. And sometimes, as in L'Arche de Vau de Noce, their expres- sive gestures in opposition that give vitality and animation to the scene. Dealing perfectly with architecture, and perfectly, as far as concerned his peculiar purpose, with humanity in his art, Méryon was little called upon by the character of his subjects to deal with Nature. He drew trees but badly, never representing foliage happily, either in detail or in mass. But to render the characteristics of the city, it was necessary that he should know how to portray a certain kind of water—river-water, mostly sluggish—and a certain kind of sky—the grey obscured and lower sky that broods over a world of roof and chimney. This water and this sky Méryon is thoroughly master of; he notes with observant affection their changes in all lights.

Méryon's excellent draughtsmanship, and his keen appreciation of light, shade and tone, were, of course, helps to his becoming a great etcher. But a living authority, himself an eminent etcher, and admiring Méryon thoroughly, has called Méryon by preference a great original engraver—so little of Méryon's work accords with Sir Seymour Haden's view of etching. Méryon was anything but a brilliant sketcher; and, if an artist's success in etching is to be gauged by the rapidity with which he records an impression, Méryon's success was not great. There can be no doubt that his work was laborious and deliberate, instead of swift and impulsive, and that of some other virtues of the etcher—"selection" and "abstraction" as Hamerton has defined them—he shows small trace. But a genius like Méryon is a law unto himself, or rather in his practice of his art he makes the laws by which that art and he are to be judged.

It is worth while to note the extraordinary enhancement in the value of Méryon's prints. Probably of no other artist of genius, not even of Whistler, could there be cited within the same period a rise in prices of at all the same proportion. Thus the first state of the Strype, "that with the verses,"—selling under the hammer in 1873 for £5, sold under 700 for £100. The first state of the "Galérie de Notre Dame," selling in 1873 for £5, and at M. Wasset's sale in 1880 for £11, fetched in 1899 at a "Touze" auction sale £100 or three years after it was first issued sold for half a crown in May 1899. The first state of "Wasset's, not of course M. Delteil's 'first state,' which, like nearly all his first states, is in fact a trial proof) the first state of the Etienne de la Falaise, "A girl looking out of the window," was sold at the "Touze" sale in 1876, realized 60£ at a sale in May 1906. The second state of the "Morgue" (Wedmore) sold in 1905 for £65; and Wedmore's second of the "Abside," which used to sell throughout the 'seventies for 4£ or 5£, reached in November 1906 more than £200. At no period have even Dürers or Rembrandts risen so swiftly and steadily.

MESA (Span. meson, from Lat. mensa, a table), in physical geography, a high table-land capped with hard rock, being the remnant of a former plateau. This type is general where strata are horizontal. In the process of denudation the hard rock acts as a flat protective cap preserving the regions between stream valleys or other places where denudation is especially active, in the form of "table-mountains" or "fortress-hills." Many examples are found in Spain, North and South Africa, the Bad Lands and Colorado regions of North America, in Arabia, India and Australia.

MESHCHERYAKS, or MESHCHERS, a people inhabiting eastern Russia. Nestor regarded them as Finns, and even now part of the Mordvinians (of Finnish origin) call themselves Meshchers. Klaproth, on the other hand, supposed they were a mixture of Finns and Turks, and the Hungarian traveller Reguli discovered that the tatarized Meshchers of the Obi closely resembled Hungarians. They formerly occupied the basin of the Oka (where the town Meshchersk, now Meshchovsk, has maintained its name) and of the Sura, extending north-east to the Volga. After the conquest of the Kazan Empire by Russia, part of them migrated north-eastwards to the basins of the Kama and Byelaya, and thus the Meshchers divided into two branches. The western branch became Russified, so that the Meshcheryaks of the eastern parts of Penza, Saratov, Ryazan and Vladimir have adopted the customs, language and religion of the conquering race; but their ethnographical characteristics can be easily distinguished in the Russian population of the governments of Penza and Tambow. The eastern branch has taken on the customs, language and religion of Bashkirs, with whom their fusion is still more complete.

MESHED (properly Mashhad, "the place of martyrdom"), capital of the province of Khorasan in Persia, situated in a plain watered by the Kashaf-rud (Tortoise river), a tributary of the
Hari-rud (river from Herat, which after its junction with the Khashi is called Tejen), 460 m. E. of Teheran (450 by road) and 200 m. N.W. of Herat, in 36° 17' N., 59° 36' E., at an elevation of 3,800 ft. Its population is about 70,000 fixed and 10,000 floating, the latter consisting of pilgrims to the shrine of Imam Reza.1

The town is of irregular shape, about 6 m. in circumference and surrounded by a mud wall flanked with towers. In the south-western corner of the enclosure stands the citadel (ark), within a wall 25 ft. high and a broad dry ditch which is 40 ft. on all parts and can be flooded from numerous irrigation courses. The city has five gates, and from one of them, called Bala Khiaban gate (upper Khiaban), the main street (Khiaban), 25 yds. broad, runs in a north-west-south-east direction, forming a fine avenue planted with plane and mulberry trees and with a stream of water running down its middle. The shrine of Imam Reza is the most venerated spot in Persia, and yearly visited by more than 100,000 pilgrims. Eastwick thus describes it (Journal of a Diplomat's Three Years' Residence in Persia, London, 1864):

"...the shrine seemed to be about 150 paces square. It was paved with large flagstones and in the centre was a beautiful kiosk or pavilion, covered with gold and raised over the reservoir of water for ablutions. This pavilion was built by Nadir Shah, and its northern, western and southern sides of the quadrangle ran, at some 10 ft. from the ground, a row of alcoves, similar to that in which I was sitting, and filled with mullas in white turbans and dresses. In each of the sides was a gigantic archway, the base of which was a square from above the ground to the height of the top of this square wall must have been 90 or 100 ft. The alcoves were white, seemingly of stone or plaster; but the archway was covered with blue varnish or blue tiles, with beautiful inscriptions in white and gold. Over the western archway was a white cage for the muzzaz, and outside it was a gigantic minaret 120 ft. high, and as thick as the Duke of York's column in London. The beauty of this minaret cannot be exaggerated. It had an exquisitely carved capital, and above that a light pillar, severely 10 ft. high; and this and the shaft below the capital, or about 20 ft., were covered with gold. All this part of the mosque (shrine) was built by Shah Abbas. In the centre of the eastern side of the quadrangle two gigantic doors were thrown open to admit the people into the adytum or inner mosque (shrine) where is the marble tomb of Imam Reza, surrounded by a silver railing with knobs of gold. There was a flight of steps ascending to these doors, and beyond were two smaller doors encrusted with jewels—the rubies were particularly fine. The inner mosque would contain 100,000 persons. Over the dome a rose entirely covered with gold, with two minarets at the sides, likewise gilt all over. On the right of the Imam's tomb is that of Abbas Mirza, grandfather of the reigning Shah.2 Near him several other princes and chiefs of note are interred. Just below the golden dome, which is in striking contrast with it, was a smaller dome of bright blue. Here begins the mosque of Gauhar Shad.3 The quadrangle is larger than that of Shah Abbas; and at the inner side it is an immense blue dome, out of which quantities of grass were growing, the place being too sacred to be disturbed. In front of the dome rose two lofty minarets covered with blue tiles. In the boulevard of the Bala Khiaban is a kitchen supported by the revenues of the shrine, where 800 persons are fed daily."

The buildings of the shrine together with a space extending to about one hundred yards beyond the gates of the shrine on each side is sanctuary (bash). Within it are many shops and lodgings, and criminals, even murderers, may live there in safety. The only other notable buildings in the place are some colleges (medresseh), the oldest being the M. Do-dar, i.e. "college of two doors," built in 1439 by Shah Rukh, and some fine caravanserais, two dating from 1680.

1 Abul Hassan Ali, al Reza, commonly known as Imam Reza, the eighth imam of the Shiites, a son of Musa al Kazim, the seventh imam, and according to one of the traditions from whom both sects of Shiites claim descent, had such hopes under the caliphate of Marmān. Gold coins (diinars) of this caliph are extant on which al Reza's name appears with the title of heri-apparent. The Imam died in March 919 in the village Sama and was buried two miles from the town of Merv, in the open desert, near the city of Meshed. The Shiites he is a martyr, being believed to have been poisoned by Marmān.

2 This refers to Nasr ud-din (d. 1890), grandfather of Shah Mahommed Ali (1907).

3 Gauhar Shad was the wife of Shah Rukh (1404-1447), and was murdered by that monarch's successor Abu Said, August 1, 1457. Her mosque was built in 1418.

Without the pilgrims who come to visit it, Meshed would be a poor place, but lying on the eastern confines of Persia, close to Afghanistan, Russian Central Asia and Transcapia, at the point where a number of trade routes converge, it is very important politically, and the British and Russian governments have maintained consulates-general there since 1819. Meshed had formerly a great transit trade to Central Asia, of European manufactures, mostly Manchester goods, which came by way of Trebizond, Tabriz and Teheran; and of Indian goods and produce, mostly much madder from Jutka and green teas, which came by way of Reza-Abbasi. With the opening of the Russian railway from the Caspian to Merv, Bokhara and Samarkand in 1885-1887, Russian manufacturers were enabled to compete in Central Asia with their western rivals, and the value of European manufactures passing Meshed in transit was much reduced. In 1894 the Russian government enforced new customs regulations, by which a heavy duty is levied on Anglo-Indian manufactures and produce, excepting pepper, ginger and drugs, imported into Russian Asia by way of Persia; and the importation of green teas is altogether prohibited except by way of Batum, Baku, and Meshed, and the Transcapian railway. Since then the transit trade has been practically nil. In 1890 General Maclean, the British consul-general, reported that there were 650 silk, 40 carpet and 320 shawl looms at work. The carpet-looms at work now number several hundreds, while looms of silk and shawl number less than half what they did in 1890.

Meshed has telegraph (since 1876) and post (since 1879) offices, and the Imperial Bank of Persia opened a branch here in 1891. The climate is temperate and healthy. The coldest month is January, with a mean temperature of about 32° F., while the hottest month is July, with a mean of 82°. The highest temperature recorded in a period of six years was 101°, the lowest 15°. The mean annual rainfall during nine years (1809-1907) was nearly 9 in., about one-eighth of it being represented by snow.

(MESHERIBIYA (drinking places), the Arabic term given to the projecting oriel windows in Cairo, enclosed with lattice-work, through which a good view of the street can be obtained by the occupants without being seen; the term was derived from the small semicircular bow, in which porous water-bottles are placed to cool by evaporation in the air.

MESMER, FRIEDRICH (or FRANZ) ANTON (1733-1819), Austrian doctor, from whose name the word "Mesmerism" was coined (see HYPONOTISM), was born at Weil, near the point at which the Rhine leaves the Lake of Constance, on the 23rd of May 1733. He studied medicine at Vienna under the eminent masters of that day, Van Swieten and De Haen, took a degree, and commenced practice. Interested in astrology, he imagined that the stars exerted an influence on beings living on the earth. He identified the supposed force first with electricity, and then with magnetism; and it was but a short step to suppose that striking diseased bodies with magnets might effect a cure. He published his first work (De planetarum influentia) in 1766. Ten years later, on meeting with J. J. Gassner in Switzerland, he observed that the priest effected cures by manipulation alone. This led Mesmer to discard the magnets, and to suppose that some kind of occult force resided in himself by which he could influence others. He held that this force permeated the universe, and more especially affected the nervous systems of men. He removed to Paris in 1775, and in a short time the French capital was thrown into a state of great excitement by the marvellous effects of mesmerism. Mesmer soon made many converts; of these: he excited the indignation of the medical faculty of Paris, who stigmatized him as a charlatan; still the people crowded to him. He refused an offer of 20,000 francs from the government for the disclosure of his secret, but it is asserted that he really told all he knew privately to any one for 100 louis. He received private rewards of large sums of money. His consulting apartments were dimly lighted and hung with mirrors; strains of soft music occasionally broke the profound silence; and the patients sat round a kind of vat in which various chemical ingredients were concocted. Holding each others'
hands, or joined by cords, the patients sat in expectancy, and 
then Mesmer, clothed in the dress of a magician, glided amongst 
them, affecting this one by a touch, another by a look, and 
making "passes" with his hand towards a third. Nervous 
ladies became hysterical or failed; some men became convulsed, 
or were seized with palpitations of the heart or other bodily 
disturbances. The government appointed a commission of 
physicians and members of the Academy of Sciences to investi-
gate these phenomena; Franklin and Bailly were members of 
this commission, and drew up an elaborate report admitting 
many of the facts, but contesting Mesmer's theory that there 
was an agent called animal magnetism, and attributing the 
effects to physiological causes. Mesmer himself was undoubt-
edly a mystic; and, although the excitement of the time led 
him to indulge in mummerly and sensational effects, he was 
honest in the belief that the phenomena produced were real, and 
called for further investigation. For a time, however, animal 
magnetism fell into disrepute; it became a system of downright 
jugglery, and Mesmer himself was denounced as a shallow 
empiric and impostor. He withdrew from Paris, and died at 
Meersburg in Switzerland on the 5th of March 1815. He left 
miscellaneous, the most distinguished of whom was the marquis 
de Puységur.

MESNAGER (or LE MESNAGER), NICOLAS (1695-1714), 
French diplomatist, belonged to a wealthy merchant family. 
He gave up a commercial career for the law, however, and 
became advocate before the parlement of Rouen. In 1706 he 
was sent as deputy of Rouen to the council of commerce, 
which was established in Paris for the control of French trade. 
Here he made his mark, and was chosen to go on three missions 
to Spain, between the years 1704 and 1705, to negotiate financial 
arrangements. In August 1711 he was sent on a secret mission 
to London to detach England from the alliance against France, 
and succeeded in securing the adoption of articles which 
formed the base of the later Treaty of Utrecht. As a reward for 
his skill he was made one of the three Frenchplenipotentiaries 
sent to Utrecht in January 1712, and had the honour of signing 
the treaty the next year. As he had used much of his own 
large fortune to keep up his state as ambassador, he was granted 
a pension by the grateful king of France. His portrait by 
Hyacinthe Rigaud is in the gallery of Versailles.

MESNE (an Anglo-French legal form of the O. Fr. meien, 
mod. moyen, mean, Med. Lat. mediamus, in the middle, cf. 
"mean"), middle or intermediate, an adverb used in several 
legal phrases. A mesne lord is one who has tenants holding 
under him, while himself holding of a superior lord. Mesne 
process was such process as intervened between the beginning 
and end of a suit (see Process). Mesne profits are profits 
derived from land, whilst in wrongful distress, they are 
claimed in damages for trespass either in a separate action or 
joined with an action for the recovery of the land. The plaintiff 
must prove that he has re-entered into possession, his title 
during the period for which he claims, the fact that the 
defendant has been in possession during that period, and the amount 
of the mesne profits. The amount recovered as mesne profits need 
not be limited to the rental value of the land, but may include 
a sum to cover such items as deterioration or reasonable costs of 
getting possession, &c.

MESOCEPHALIC, a term applied by anthropologists to those 
skulls which exhibit a cephalic index intermediate between the 
dolichocephalic and brachycephalic crania (see Craniodometry). 
Taking the longer diameter of a skull, i.e. the one from front to 
back, as 100, mesocephalic skulls are those of which the trans-
verse diameter varies between 75 to 80.

MESODES of Crete, Greek lyric poet, who lived during the 
2nd century A.D. He was a freedman of the emperor 
Hadrian, on whose favourite Anthinous he is said to have written 
a panegyric. Two epigrams by him in the Greek anthologies 
(Anthol. poët. xiv. 63, xvi. 323) and a hymn to Nemesis 
are extant. The hymn is of special interest as preserving 
the ancient musical notation written over the text. Two 
other hymns—to the muse Calliope and to the sun—formerly 
assigned to Dionysius of Alexandria, have also been attributed 
to him.

See J. F. Bellermann, Die Hymnen des Dionysius und Mesodeses 
(1840); C. de Jan, Musici scriptores graeci (1899); S. Reinach in 
Revue des études grecques, iii. 272; S. Reinach in 
Revue des études latines, 1880, p. 487; cf. E. Maillé in 
Revue des études grecques, iv. 77; and M. J. Casanova in 
Revue des études grecques, iv. 191. See also J. F. Bellermann, 
Die Hymnen des Dionysius und Mesodeses (1840). H. F. 
Tischler, in Monatsschrift für die Klassische Philologie, 
xxv. 242, remarks on the names Mesos and Mesos in Greek 
hymnology.

MESONERO ROMANOS, RAMÓN DE (1803-1882), Spanish 
prose-writer, was born at Madrid on the 19th of July 1803, 
and at an early age became interested in the history and topography 
of his native city. His Manual de Madrid (1831) was published 
when literature was at a low ebb in Spain; but the author's 
curious researches and direct style charmed the public, and next 
year, in a review entitled Cartas españolas, under the pseudonym 
of "El Circulo," published by his brother, Raimundo de Mesonero, 
life and memory of the social life of which were subsequently collected 
and called Panorama matritense (1835-1836). Mesonero Romanos 
was elected to the Spanish Academy in 1838 and, though he 
continued to write, had somewhat outlived his fame when he 
issued his pleasing autobiography, Memorias de un setentón, 
natural y vecino de Madrid (1880). He died at Madrid on the 
30th of April 1882, shortly after the publication of his Obras 
completas (8 vols., 1801).

MESOPOTAMIA (Mésopotâmia, sc. χώραν or χώρα, from μῆ 
or, middle, ποταμός, river), one of the Greek renderings of the earlier 
Semitic names for the river-country that stretches 
eastward from northern to Mediterranean Syria. The earliest 
appearance of a Semitic name of this kind is in the last para-
graph of the biography of Ahmose of el-Khâb, the aged officer 
of Tethmosis (Thutmose) i. As early as therefore as the 16th 
seventeenth b.c. the name Naharin (N'h'ren) was in use. That 
the name was connected with nahar (a river) was plain to some 
of the Egyptian scribes, who wrote the word with determinative 
for water in addition to that for "country." 

The scribes show no suspicion, however, of the name's being 
anything but a singular.1 Is it possible that a consciousness that 
the word was not a plural can have survived till the early Christian 
pericope in which the Targum of Onkelos rendered Naharin, 
the river Euphrates by "the river Euphrates" (Pethor of Aram which is 
in the Euphrates: Deut. xxviii, 4 [5])? The Naharin or Naharen 
of the Egyptian texts appears some five generations later in the Canaanitc 
of the Amarna letters in the form Nagrim, which, however, would seem 
therefore to be the pronunciation then prevalent in Phoenicia 
(Gebal) and Palestine (Jerusalem). About the same time Naharin 
(N-r-y-n) is given as the northern boundary of Egypt's domain 
(year 30 of Amenophis or Amenophis III.), over against Kush in 
the south (tomb of Khamhot; Breasted, Anc. Rec. ii. 350). 

The origin of the name is suggested by the Euphrates being 
called the river of Naharin, "on the Kannah stele more fully "the 
water of the Great Bend (pfr nr) of Naharin (N-h-r-n)" (Breasted, 
Anc. Rec. ii. 263), or on the Constantinoople obelisk simply "the 
Great Bend of Naharin (loc. cit., note d). The precise 
meanings of the name are not known. It is generally recognized 
that the name Nagrim of the Euphrates he is probably thinking of 
the great sweep round between Birejik-Zemgma and Rałyka-Nicephorium. 
All this seems to indicate that the Euphrates was looked upon as 
consisting of two or more branches, and that the Great Bend 
scends in the eastward flow of the Euphrates water system as a whole, thought of as encompassing Naharin. 
The Sea of the Great Bend would seem to be the sea led by 
the north-to-south waters of Naharin, just as the Mediterranean, 
led by the south-to-north waters of the Nile, is called the 
Great Circle (in nr).

For many centuries after Amenophis IV. the name cannot be 
found. The next occurrence is in Hebrew (Gen. xxvi. 10 = 1), 
where the district from which a wife for Isaac is brought is called 
Aram-Naharaim. The diphthongal pronunciation of the termina-
} 

1The threefold n after Nahar in a stele of Persian or Greek 
times (healing of Bentresh) is probably only the determinative 
for "water," a fourth n being accidentally omitted (Breasted, 
Ancient Records, ii. 3 343). 

For instance, Damask, which means, the Damascus portion of 
the Aramaic domain; and Ephraim, which means, the 
Ephraim portion of the (Israelitish) highlands—EV 'Mount Ephraim.' 

It is also possible that the poet hesitated between the names 
Hauran and Haran, and that both of the rivers Hauran, has not met with favour. 

Padan has been connected phonetically with Putha, west of 
the Euphrates, and explained by others as a synonym for Harran.
used for the whole Euphrates-Tigris country. That would provide a useful name for an important geographical unit, but it is too misleading. In view of historical and geographical facts there is much to be said for applying the name Mesopotamia to the country drained by the Khabur, the Belikh, and the part of the Euphrates connected therewith. It would thus include the country lying between Babylonia on the south and the Armenian Taurus highlands on the north, the maritime Syrian coast, and parts of the region below the Tigris. That is practically the sense in which it is treated in this article. We may begin, however, with the definition of Jesur by the Arabic geographers, who take it as representing the central part of the Euphrates-Tigris system, the part, namely, lying between the alluvial plains in the south and the mountainous country in the north. Measured on the Euphrates, this would be from the place where the river, having bored its way through the rocks, issues on to the high plain a little above Samsat (Samosata) only 1,500 ft. above the sea, to somewhere about Hit (Is=1d), where, probably less than 150 ft. above the sea, it begins to make its way through the alluvial deposits of the last few millennia. In these 750 m. it has descended less than 1,400 ft. Measured on the Tigris Mesopotamia would stretch from somewhere between Jesur-ibn-Omar and Moshul to somewhere below Tekrit.

In the tract defined, physical changes unconnected with civilization have been slight as compared with those in Babylonia; the two great rivers, having cut themselves deep channels, could not shift their courses far.

i. Natural Divisions.—The stretch from Samsat and Jesur-ibn-Omar to the alluvial plain seems to divide itself naturally into three parallel belts, highland watershed district, undulating plains and steppe. (1) The Taurus foothill barrier that shuts off the east to west course of the Euphrates and Tigris culminates centrally in the rugged volcanic Karanja-Dagh range, which breaks the alluvial plain eastwards by the mountainous district of Tatr-Abdin (the modern capital Midyat is at a height of 3,500 ft.) and westwards by the elevated tract that sends down southwards the promontory of J. Tektek (c. 1,500 ft.). (2) At the line where this east to west wall ends begins the sea of undulating plains where there is enough rain for abundant wheat and barley. (3) From the alluvial flats up towards the undulating plains is an extensive stretch of steppe land almost destitute of rain. Not far above the transition from the barren steppe is a second mountain wall (125 m. in some extremities) roughly parallel with the first, consisting of the Seleucid chain (al-Khabur), which has continued eastwards by the mountainous district of Tatr-Abdin to Ist-Serut in the south, where it joins the Tell Kebab (about 1,500 ft.), and then the 'Abd al-Aziz range (border), veering to its western end as if to meet the Tektek promontory from the north.

ii. Drainage.—The water system is thus determined. West of Tektek drains into the Belikh, east of Tektek into the Khabur. A remarkable drainage line is that where the two rivers, the Belikh and the Khabur, is towards the left bank of the Euphrates, for the Mesopotamian watershed seems to be only some 15 m. or less from the Tigris until, south of the Sinjar range, it lies farther west, and the Tharthar river is possible. The Belikh (Belic, Bilech, Belorun), a stream some 30 ft. wide, has its main source some 50 m. north in the 'Ain Khalil ar-Ra'man, but receives also the waters of the united Nahd al-Kultan (in its upper course formerly called the 'Dam, Xepro) from Edessa and Kupar Dagh, and the Julub from Tektek Dagh about as much farther north. The Khabur (Chabur, Chaburas), 80-100 ft. wide, before its last 40 m. reach in a southerly direction, has south from Tell Kebab (about 1,500 ft.), near which are united the Jaggagh (earlier, Hirmas, 20 ft. in width), which has come 50 m. from Nashinib in the north-east, bringing with it the water of the main streams from the Tatr Abdin highlands; the north 'Awi, which certain sources bring much water due south from Mardin and the main stream of the Khabur, which has come 60 m. from Ras al'Ain in the north-west, bringing with it the water of the two plains slowly rising up in the north. The Tharthar (Aysanin Tartar, in Turkul-Ninib II.'s inscriptions) begins in the Sinjar range and runs southwards, to lose itself in the desert a little above the latitude of Hit. So it is no wonder that its participation in the Euphrates (Annales de la Soc. Arch. de l'Orient, 199). The Arabic geographers represent the Tharthar as connected at its upper end (by a canal?) with the Khabur system.

In general the Tigris is considered to belong to Assyria or Babylonia, and at all west of the Euphrates to Arabia or Syria.

II. Historical Divisions.——During the period from the time of the great Assyrian empire down to the foundation of the Arab caliphate, from about the middle of the 1st millennium, Mesopotamia is divided into four different political fractions. These political divisions, as will be shown, are not so much determined by geographical peculiarities as by the hard fact that the whole of Mesopotamia was at this time divided into four different political states, whose boundaries were defined by certain streams and by certain mountain ranges. In the region of the Tigris and Euphrates, the political situation was as follows:

1. The Syro-Aramaean kingdom of the Assyro-Babylonian period.
2. The Median empire, which had conquered the kingdom of the Assyro-Babylonian period.
3. The kingdom of the Medo-Persian empire, which had conquered the Median empire.
4. The kingdom of the Persian empire, which had conquered the kingdom of the Medo-Persian empire.

These political divisions were determined by the geographical peculiarities of the country, and by the hard fact that the whole of Mesopotamia was at this time divided into four different political states, whose boundaries were defined by certain streams and by certain mountain ranges. In the region of the Tigris and Euphrates, the political situation was as follows:

1. The Syro-Aramaean kingdom of the Assyro-Babylonian period.
2. The Median empire, which had conquered the kingdom of the Assyro-Babylonian period.
3. The kingdom of the Medo-Persian empire, which had conquered the Median empire.
4. The kingdom of the Persian empire, which had conquered the kingdom of the Medo-Persian empire.

These political divisions were determined by the geographical peculiarities of the country, and by the hard fact that the whole of Mesopotamia was at this time divided into four different political states, whose boundaries were defined by certain streams and by certain mountain ranges. In the region of the Tigris and Euphrates, the political situation was as follows:

1. The Syro-Aramaean kingdom of the Assyro-Babylonian period.
2. The Median empire, which had conquered the kingdom of the Assyro-Babylonian period.
3. The kingdom of the Medo-Persian empire, which had conquered the Median empire.
4. The kingdom of the Persian empire, which had conquered the kingdom of the Medo-Persian empire.

These political divisions were determined by the geographical peculiarities of the country, and by the hard fact that the whole of Mesopotamia was at this time divided into four different political states, whose boundaries were defined by certain streams and by certain mountain ranges. In the region of the Tigris and Euphrates, the political situation was as follows:

1. The Syro-Aramaean kingdom of the Assyro-Babylonian period.
2. The Median empire, which had conquered the kingdom of the Assyro-Babylonian period.
3. The kingdom of the Medo-Persian empire, which had conquered the Median empire.
4. The kingdom of the Persian empire, which had conquered the kingdom of the Medo-Persian empire.

These political divisions were determined by the geographical peculiarities of the country, and by the hard fact that the whole of Mesopotamia was at this time divided into four different political states, whose boundaries were defined by certain streams and by certain mountain ranges. In the region of the Tigris and Euphrates, the political situation was as follows:

1. The Syro-Aramaean kingdom of the Assyro-Babylonian period.
2. The Median empire, which had conquered the kingdom of the Assyro-Babylonian period.
3. The kingdom of the Medo-Persian empire, which had conquered the Median empire.
4. The kingdom of the Persian empire, which had conquered the kingdom of the Medo-Persian empire.

These political divisions were determined by the geographical peculiarities of the country, and by the hard fact that the whole of Mesopotamia was at this time divided into four different political states, whose boundaries were defined by certain streams and by certain mountain ranges. In the region of the Tigris and Euphrates, the political situation was as follows:

1. The Syro-Aramaean kingdom of the Assyro-Babylonian period.
2. The Median empire, which had conquered the kingdom of the Assyro-Babylonian period.
3. The kingdom of the Medo-Persian empire, which had conquered the Median empire.
4. The kingdom of the Persian empire, which had conquered the kingdom of the Medo-Persian empire.
iii. Character of Surface.—(1) The tracts between the Belbek and the Euphrates is in its middle section exceedingly fertile, as is implied by the name "nilhaima", and so named by (2) Strab. Geogr., 13, 11, 5, 80) the same is true of the southern portion also. The plain extending from Urfa to a dozen miles below Harrán has a rich red-brown humus derived from the Negro soil. (Ritter, v. 1908, 131, 20) "Abd al-'Azîz Sinjîr mountain wall are intersected by the many streams of the Khâbûr system (the Arab geographer Mustaufi speaks of 300 feeders), which under favourable political and administrative conditions may be made to retain their course throughout the year. Bitumen (Nisibîs) rice is cultivated with success. (3) The country of the mountain range is steppe land, imperfectly known, and of little value, except for the pasturing of the steppe animals. The rivers (on which see Euphrates, Tigris) it consists mainly of grey deltaic flats covered with selenite; and a little below the surface, gypsum. Bitumen is found at Hit, whence perhaps its name is derived. (4) Sukkîl Nînîs' î.'s inscription referred to above), and near the Tîgrîs.

iv. Climate.—Mesopotamia combines strong contrasts of climate, and is a connecting link between the mountain region of western Asia, and the desert of Arabia. At Dîr ez-Zôr, for example, the heat is intense. (1) In the steppe, during the sandstorms which frequently blow from the West Arabian desert the temperature may rise to 122° F. On the other hand, in winter the warm currents coming in from the Persian Gulf being met to a large extent by northerly currents from the snow-covered tracts of Armenia, are condensed down on to the plain and discharge moisture enough to give birth to snow and rain. (2) Bitumen (in the winter), in mid winter, since the high temperature air from the gulf is drawn up the valleys of the Euphrates and the Tigris there may be, and still are, signs of snow. (3) The snow is followed by the rolling plains is soon parched. So when the hot sandstorms blow in the lower steppe the scorching heat is carried right up to the foot of the mountains. On the other hand, since the spurs of the Taurus bring the winter cold a long way south, and the cold increases from west to east as we leave the mild coast of the Mediterranean, far down into the Mesopotamian plain the influence of the snow-covered ridges can be felt, and although the spurs and ice are not infrequent, and although there is no point of sufficient altitude to retain snow for long, the temperature may fall as low as 14°F., especially if the cold north winds are blowing. Thus in the first winter rains clothe the plain with verdure, and by the beginning of the year various bulbous plants are in bloom. The full summer development is reached in June. By the end of August everything is burnt up; August and September are the low-water months in the rivers, March to May of the thaw.

v. Flora.—(1) Botanical lists have been published by von Oppenheim (Vom Mittelmeer zum Persischen Golf, ii. 373-388) of a collection made in 1853 containing 43 entries for Mesopotamia, and by E. Herzfeld (Herbarausfahnen aus Kal'at-Serbû-Asur, in Belieft ii. Zur Ort. Lit.-Zit., 1908, pp. 39-57) of a collection made in 1878; the latter is considered by the more modern botanists to be the more accurate. (2) The following are among the more important products of the central zone of Mesopotamia: wheat, barley, rice (e.g. at Surûl), the Khâbûr, milk, sesameum (for oil, instead of olive), tobacco, poppy, cotton, hemp, safflower, tobacco; Medicago sativa (for horses); cucumber, melons, water-melons, figs (those of Sinjîr famed for sweetness), dates (being the staple of the population, especially in the desert), pear, fig (those from the plains are good), willow and sumach (by the Euphrates). The sides of Karâj-Dâgh, J. Abd el-'Azîz and Sinjîr are wooded, but not now the neighbourhood of Nîsibîs. (3) In the steppe the vegetation is that which prevails in similar soil from Central Asia to Algeria; but many of the arborescent plants that grow in the rockier and more irregular plateaux of western Asia, and especially of Persia, have been reported as missing. Endless masses of wild oats, being brought to a few species, cover the face of the country—large Cucurbita, Cynaraeae and Umbilíferae—also large quantities of liquories (Glycyrrhiza glabra and echinata) and Logenaniaceae, and Rosaceae, and Vitis vinifera (at Urfa), and other genera. Other plants are found in the desert; but, long-haired desert hare. The following are rare: wild ass; beaver, said to have been observed on the Euphrates, wolf, among others a variety of bâbîl (the 'Abdîl); the "Opuntia ficus ilex" common in the desert, domestic animals in the steppe the first place belongs to the camel; next come goat and sheep (not the ordinary fat-tailed variety); the common cattle is often kept by the Arabs and the Franks on the Euphrates and the Tigris; on the Euphrates is found the Indian zebu.

vii. Towns.—The towns that have survived are on the rivers. Such towns as have been identified by von Oppenheim (cf. above), Râjûl (see Harrán, ii. p. 368) are often kept by the Arabs and the Franks on the Euphrates and the Tigris; on the Euphrates is found the Indian zebu. Râjûl, (see Harrán, ii. p. 368) is a rising town on the right bank, where there is (since 1867) a stone bridge, 'Ana (on an island: see Harrán, Hit (f. Bab. I'd.), on the Euphrates: Jozefret ibn 'Omar, Mrâsîn, Tîkri, on the Tigris: Edessa (cites. Harrâr (?)), on confluents of the Belbek; Verâneînî (Tela), Râs al-'Ain (Rhesae- na), Mârdîn (half-way up the mountain wall), and Nâsîbîn (Assyr. Nasnû, Nîsibîn, Nîsibis), on confluents of the Khâbûr; Sinjîr (Singars) on the Tâmûr. Villages are more numerous than has often been supposed. Von Oppenheim counted in the district west of Edessa and Harrân, in a stretch of two days' march, 300 flourishing villages. At Harrân, however, how much Mesopotamia was traversed with the rivers of the lines of the rivers are marked at frequent intervals by the ruins of flourishing towns of Assyrian, Roman and Caliphate times. At Harrân, Sinjîrî, Calbes, Tell Abîmar, Kût ut en-Najîm, Balîk-Qarîsîyî (Carpiqa), Cieresium, on the Euphrates: Kuyunîl, Nyâmîr, on the Tigris; Khšorsâbîl on a small tributary; 'Abîânî, Tell Kahlâtî, on the Khâbûr. The interesting oasis town el-'Hadîr (Hatra) is near the Tâmûr. Excavation has hardly begun. The country is covered with countless mounds (tellis), each of which marks the site of a town. The documents from the ancient Tîrqa said to have been found at 'Ishira, a few miles below Kârîkîsî, are referred to above, p. 376, (4). At Harrân, Nîsibîs, near Harrân, in 1901 a slab (Pognon, Inscrip. sém. de la Syrie, Plate xxvi. No. 59) with a base relief and an inscription of the governor of Dûr, Mushësh-Shimnûn, (Nebû Turayîn), The site of this ancient town is near the town of Tharthar. In 1904, an inscription of a Nabûnûsîd's was found in 1906 some 15-20 W. of Eski-Harrân, a little nearer to it than to Hmeira, which is west of Eski-Harrân, an hour and a half north-east of the ruins of Harrân. Parts of Mesopotamia have probably always harboured wandering tribes. Exactly how far the intervening lands beyond reach of the streams have been done so it is difficult to make out. Fraser (Short Cut to India, p. 134) notes that "the low desert plains the direct rainfall is insufficient for agricultural purposes.

viii. Political Divisions.—On the whole the natural life of the country has been reflected in the political divisions which have of course varied in only minor details and those which occur most often occurring. In the pre-Persian period, besides those referred to elsewhere, we may cite Kashuvari (Tûr 'Abîdin), Guznun (Gozan of 2 Kings xvii. 6; in the Khâbûr district), Bit Adîn (Oseoreo), Karâkutch (north-west corner and beyond); in the Roman period, Oseoreo (g.v.), Mydowdiana (in the east), and in Syriac usage Bêth 'Arâbyê (between Nîsibîs and Mûsîl); in the Arab period, Dirâbekr (Tûr 'Abîdin), Diit Re'da (Mydowdiana), Diit Mu'dar (Oseoreo).

ix. Roads.—The routes of communication have probably changed little in the last 2000 years. It has not yet been proved that Edessa is an ancient city (see Edessa: § 2) but it probably was, and was in fact the new city of Barbour Harrân, which bears a name which seems to indicate its position as a highway centre. (1) An obvious series of routes followed the course of the rivers; from Thapsacûs (Dîlsine) down the Euphrates to Harrân and Elis (Eski-Harrân) and from Thapsacûs up the Khâbûr. The Euphrates was crossed at Birejık (Tîh Bârshi?), or Jerabuls (Carmisheù), or Tell A'marr (unidentified), or Thapsacûs. (2) From Harrân to the modern Kuruk Kaya (Tûr 'Abîdin), Karâja Dâgh to Diit Re'da was also well known. The same is doubtless true of the route from Oseoreo by Râs al-'Ain and Nâsîbîn, and that by Verâneînî and Mârdîn to the Tigris. About other cross-roads, such as those from Harrân to Tell Shaddîdea on the lower Khâbûr, or from 'Ana by al-'Hadîr to Mûsîl it is difficult to say.

Functionally, Mesopotamia is the domain that lies between Babylonia and the related trans-Tigris districts on the one hand, and the west Asian districts of Maritime Syria and Asia Minor on the other. It possesses, then, a land, compounded of an exacting history. The great rivers, in later times theoretically regarded as its boundaries, have never really been barriers (cf. F. Wincker, Allorient. Forschungen, iii. 348), whence the vagueness of the geographical terminolohy in all times. Its position, along with its character, has prevented it sometimes, if ever, playing a really independent part.

Who the earliest inhabitants of Mesopotamia in approximately historical times were is not yet clear. It is possible that its
from the names of Ushpia who, according to Shlamaner S. and Esarhaddon, built the temple, and Kikia who, according to Ashur-rem-nishehu, built the city wall. The considerable number of such names already found in First Dynasty records seems to show that people of this race were to be found at home as far south as Babylonia. Whether they were really called Shubarû, as Ungnad suggests, we may know later.

When Khammurabí's fifth successor saw the fall of the Amorite dynasty in consequence of an inroad of "Hittites," these may have been Mesopotamian Shubarû-Mitanni; but they may, as Ungnad suggests, represent rather an assimilation of the Hittites of later times. It is possible that in any case not to connect with this catastrophe the carrying away to Khani of the Marduk statue afterwards recovered by Agum, one of the earlier kings of the Kassite dynasty. Whether Hittites were still resident at Khani we do not know. The earlier Kassite kings of Babylon still maintained the Amorite claim to "...the four quarters;" but it is improbable that there was much force behind the claim, although we have a document from Khani dated under Khashshilash. It is just as uncertain how long Asshur remained under the Babylonian suzerainty as to whether there is enough information to say that Assyrian rule was really of the same type as that of Amurru and Sumer. It is clear, however, that the Hittites of Asshur were still the dominant political element, and that the relations of Asshur to western Mesopotamia was under the early kings whose names have lately been recovered. All these matters will no doubt be cleared up when more of the many tells of Mesopotamia are excavated. Only two have been touched: 'Arbân on the Khâbûr, where remains of a palace of uncertain date, among other things an XVIII dynasty scarab, were found by Layard in 1851, and Tell Khalaf, where the conquerors join, and remains of the palace of a certain Kapar, son of Hanpan of "Hittite" affinities but uncertain date, were found by von Oppenheim in 1899. A long inscription of a certain Shamshâd-Adad [Samsi-Adad], extracts from which are quoted by Delitzsch (Mitt. d. Deutsch Or.-Gesellschaft No. 21 p. 90), unfortunately cannot be dated exactly, or with certainty even approximately; but if Delitzsch and Ed. Meyer are right, it belongs to a time not many generations after Agum recovered the Marduk statue. Shamshâd-Adad's claims extend over the land between the Tigris and the Euphrates, and he says that he erected memorials of himself on the shore of the Great Sea.

The mystery of the Hykxos has not yet been solved; but it is not impossible that they had relations with Mesopotamia. Babylon and Amurru had begun to decline then, and the officer of Tethmosis [Thutmosis] I., mentions Naharin (late 16th century) he does not say anything about the inhabitants. He seems to imply, however, that there was more than one state. The first mention of Mitanni, as we see, is under Tethmosis III., who clearly crossed the Euphrates. It is at least possible that common enmity to Mitanni led to a treaty with Assyria (under Ashur-nadin-akhe). Victorious expeditions into Naharin are claimed for Amenophis IV, Tethmosis IV, and Amenophis III.

The Egyptian references are too contemporaneous to name the rulers but Shashšašar may have begun his reign during the lifetime of Tethmosis III., and from cuneiform sources we know the names of six other Mitanni rulers. As they all bear Aryan names, and in some of their treaties appear Aryan deities (Indra, Varuna, Mitra, &c.), it is clear that Mesopotamia had now a further new element in its population, bearing apparently the name Kharî. Many of the dynasts in North Syria and Palestine in the time of Tushratta bear names of the same type. The most natural explanation is that Aryan had made their way into the highlands east of Assyria, and thence bands had penetrated into Mesopotamia, peacefully or otherwise, and then, like the Turks in the end of the Seljuk period and the Mongol dynasties. The language of the Mitanni state, however, was neither Aryan nor Semitic, and may very well be that of the mysterious "Hittite" hieroglyphic inscriptions (see Hittites). Mitanni was one of the great powers, and alongside of Egypt and Babylonia, able to send to Egypt the Ninevites 'Iššar; and at this time as much as at any

1 Ungnad, Belit. z. Assy. VI. v. 13.
3 Winckler has identified the Kharî with the Arvans, to whom he assigns a state in Armenia (Or. Lit.-Zelt., July 1910).

On the theory that it was climatic changes in Arabia that drove the Semites to seek new homes along the route mentioned above, see L. W. King, History of Assur and Akkad (1910), which appeared after this article was written.

See the preceding note.

connection with the north, and Asia Minor, goes back to a very early date. It may be that some of the early north Babylonian kingdoms, such as Kish, extended control farther. The earliest Babylonian monarch of whose presence in Mesopotamia there is positive evidence is Lugalzaggisi (before 2500 B.C.), who claims, with the help of En-li, to have led his countless host victorious to the Mediterranean. His empire, if he founded one, was before long eclipsed, however, by the rising power of the Semites. Excavation in Mesopotamia may in time cast some light on the questions whether the Semites really reached Babylonia by way of Mesopotamia,1 when, and whom they found there, and whether they partly settled there by the way. Whether Shušshana-Mihanmišr and Remush (often called Ur-nâsh) really preceded, and to some extent anticipated, "Sargon" i.e. Shargâni-sharri, as L. W. King now2 plausibly argues, is not certain; nor whether the 32 kings who revolted and were conquered by Man'isutus, as we now learn, were by the Mediterranean, as Winckler argued, or by the Persian Gulf, as King holds. That Sargon was or became supreme in Mesopotamia cannot be doubted, since there is contemporary evidence that he conquered Amurru. The three versions of the proceedings of Sargon (Sharru-ôn-NA) in Sûr leave us in doubt what really happened; they are, however, a good confirmation of the view that Sargon must have been in control of the whole of northern Babylonia and Sumer before he advanced into the maritime district (and perhaps beyond: see Sargon), what is referred to in the Omens and the Chronicle 26,472 may be, as Winckler argued (Or. Lit.-Zelt. 1907, col. 256), an immigration of new elements into Sûr—in that case perhaps one of the early representatives of the "Hittite" group. According to the Omens text Sargon seems to have settled colonies in Sûr, and suggestions of an anticipation of the later Assyrian policy of transportation have been found by King (op. cit.) under the rulers of this time, and there are evidences of lively intercommunication. Mesopotamia certainly felt the Sumero-Babylonian civilization early. It was from the special type of cuneiform developed there, apparently, that the later Assyrian forms were derived (Winckler, Allorien. Forsch. i. 86 seq.). What the "revolt of all lands" ascribed to the later part of Sargon's reign means is not yet clear; but he or his son quickly suppressed it. Mesopotamia would naturally share in the wide trade relations of the time, probably reaching as far as Egypt. The importance of Harrân was doubtless due not only to its fame as a seat of the Moon-god Sin, honoured also aœst of the Assur, and to its political position, but also to its trade-relations. Contemporary records of sales of slaves from Amurru are known.

When the Semitic settlers of the age of Sargon, whom it is now common with some justice to call Akkadians (see Sumrû), had become thoroughly merged in the population, there appeared a new immigrant element, the Amûrû, whose advance as far as Babylonia is to be traced in the troubled history of the post-Gudean period, out of the confusion of which there ultimately emerged the Khammurabi dynasty. That the Amûrû passed through Mesopotamia, and that some remained, seems most probable. Their god Dagan had a temple at Tîraqâ (only 'îshān, a little below Circeium), the capital of Khâna (several kings of which we now know by name), probably taking the place of an earlier deity. At Tîraqâ they had month names of a peculiar type. It is not improbable that the incorporation of this Mesopotamian kingdom with Babylon was the work of Khammurabi himself.

Not quite so successful eventually was the similar enterprise farther north at Assûr (or Assur [g.e.]) on the east margin of Mesopotamia, although we do not know the immediate outcome of the struggle. Thus Amûrû and the first Babylonian king, Šumu-abî. Possibly the rulers of Babylon had a freer hand in a city that they apparently raised to a dominant position than the Semitic rulers of Assûr, who seem to have succeeded to men of the stock which we have hitherto called Mitanni, if we may judge 1

See the preceding note.
other, we must think of common political relations binding the districts east and west of the Euphrates. The king mentioned above (Shaushatir) conquered Assur (Assur), and Assyria remained subordinate to Mitanni till near the middle of the 14th century, when, on the death of Tushratta, it overthrew Mitanni with the help of Alshe, a north Mesopotamian state, the allies dividing the territory between them. The Hittite king's interference restored the Mitannite state as a protectorate, but with a smaller territory, probably in the north-west, where it may have survived long.

Assyria was now free, and Ashur-uballit [Assur-ubahirit] acc. to Sayce] knew how to make use of his opportunities, and, in the words of his great grandson, "broke up the forces of the widespread Shubari" (A.K.A., p. 7, 1. 32 seq.). Knowing what we know of the colonizing power of the Assyrians, we may assume that among the "Mitanni" and other elements in the Mesopotamian population there would now be an increase of people of "Assyrian" origin. On the tangled politics of this period, especially Mesopotamia's relations with the north-west, the Boghaz-Keui documents may be expected to throw a great deal of light on it. We note also a little more of the successive occupants and the Amorites in the Naharain district, beset by great powers on three sides. When Mitanni fell Babylon no doubt adhered to its older claims on Mesopotamia; but the Kassite kings could do little to contest the advance of Assyria, although several rectifications of the boundary between their spheres are reported.

Mitanni's fall, however, had opened the way for others also. Hence when Ashur-uballit's grandson, Arik-den-ilii (written Arameans. P.U.D.III), carried on the work of enforcing Assyria's claim to the heirship of Mitanni, he is described as conquering the warrioes 1 (?) of the Akhlam and the Subi. The references to these people, who practically make their first appearance in the Amarna correspondence, 2 show that they were unsettled bands who took advantage of the loosening of authority to introduce themselves into various parts of the country, in this case Mesopotamia. Gradually settlements were made, the names of many of which are given by the various Assyrian kings who had at one time or another to assert or reassert supremacy over them—such as Chindanu, Luq, Subi along the South Euphrates boundary of Mesopotamia, and various districts bearing names compounded with Bit, settlement (see above), such as Bit-lintu, Bit-lis, and the called Amorites, see Eressa), or Bit-Zamani in the north near Diarbekr. The specific name Arameaean first appears in the annals of Tiglath-pileser I., unless we identify the Arimi of Shalmaneser I. in Tur 'Abdin with the Aramu, but the name may probably with fitness be applied to a very large number of the communities mentioned from time to time. Their position in Mesopotamia must have been very like that of the Shammar at the present time (see ad fn.). As they gradually adopted settled life in various parts of the country the use of Aramaic spread more and more (see below, § 8 "Persians").

Meanwhile Mesopotamia continued to be crossed and re-crossed by the endless marches of the Assyrian kings (such as Adad-nirari, Shalmaneser I. and his son), building and rebuilding the Assyrian empire (see BABYLONIA and ASSYRIA), and eventually pushing their conquests towards Asia Minor at the expense of the Hittite district. II, on the fall of the Kassites, Nebuchadrezzar I. established more direct relations between Mesopotamia and Babylon, his work was presently undone by the vigorous campaigns of Tiglath-pileser I., who seems to have even won Egypt's sanction of his succession to the Hittite claims. The newly recovered (1909) tablet of Tukulti-Ninhib, the grandfather of Shalmaneser II, is interesting from its account of an expedition down the course of the Tharthâr to Hit=ID (river and town now first mentioned in cuneiform sources) and up the Euphrates to the Khabûr district.

2 On a wrongly supposed much earlier occurrence of the name Achlamu, see Klio, vi. 193 n. 2.
3 So for example A. Sarda, Die Araméer, 5 (1902).

Now that Mesopotamia had passed out of the hands of Babylon, all that the later kings could do was to encourage local Mesopotamian rulers in their desire for independence (Nabu-apluldin). These were convinced that Assyria was master, but refused their tribute when they thought they dared. To thoroughly overpower the troublesome Bit-Adini (see above, § 3, viii.), which had naturally been aided by the states west of the Euphrates, Shalmaneser II. (860-829) settled Assyrians in their midst. Harrân was one of the few places that remained in his side during the great insurrection that darkened his last years. Similarly the province of Guzan (Heb. Gozan, Ps. Ashurârû), on the Khabûr, held with the capital Asshur in the insurrection that occurred in 763 (the year of the eclipse), when evidently some one (an Adad-nirari?) wore the crown, at least for a time. Harrân was clearly closely associated with Asshur in the rights and institutions of which the subject many partied in the new Assyrian empire that began with Tiglath-pileser IV. (see BABYLONIA and ASSYRIA). When the policy of transporting people from one part of the empire to another was developed, new elements were introduced into Mesopotamia, amongst them perhaps the tribal treachery of whom has been found in the neighbourhood of Harrân at Kunnû. 4 These new elements must have been more organically attached to the Assyrian state as such than the older inhabitants, to whom the affairs of state at Nineveh would be of little interest. On the conditions at Harrân some light is thrown by the census partly preserved in Ashurbanipal's library. 5 The governors of several Mesopotamian cities, such as Naqishin, Amid, took their turn as eponyms; but this would not have much significance for the people. Hence even the fall of Nineveh (605 B. C.), apart from what such cities in Mesopotamia, was held by its last kings suffered through the invasion, first perhaps of Nabopolassar, who in 605 B. C. claimed to be lord of Shubarû, and then of the Medes, would be a matter of comparative indifference; tribute paid to Babylon was just as hard to find as if it were going to Nineveh. Nechâ did not succeed, like his great XVIIIth dynasty predecessor, in crossing the Euphrates. He was defeated by Nebuchadrezzar at Carchemish (605 B.C.), and Mesopotamia was confirmed to Babylon. Its troubles began again shortly after Nebuchadrezzar's death; the Medes seized Mesopotamia and besieged Harrân. Before long, however, the overthrow of Assyges by Cyrus cleared Mesopotamia, and Nabonidus (Nabû-aplûûdûn) was left to draw on the resources of the whole of Syria for the purpose, to restore the famous temple of Sin at Harrân, where a few years later he erected in memory of his mother, who seems to have been a priestess there, the stele published in 1907 by Pognon.

The fragmentary nature of the records does not enable us to follow the steps by which Cyrus became master of Mesopotamia, in which he probably met with little or no resistance. Persians. How much of Mesopotamia was involved in the revolt of what the Persian inscription calls Assyria (Ašur) is not clear. Nor does it appear with certainty to which of the twenty satrapies into which, according to Herodotus, the Persian empire was divided, Mesopotamia belonged; probably it was included in 'Abar nâhdrâ. The fact is, we have no information from native sources. 6 The probability is that conditions remained very much what they had been; except that the policy of transportation was not continued. The satrap and other high officials would naturally be of Persian extraction; but local affairs were probably managed in the old way, and there was no important shift of population. The most obvious fusion had by this time been merged in the general body of the people. These settlers doubtless influenced the "Assyrian" language; 7 but gradually, especially in the west, their own language more.

3 For the history from the time of Herodotus onwards, see Ritter, Erdkunde, x. 6-284.
4 M. Streck, Klio, vi. 222 seq.
and more prevailed. Although Aramaic inscriptions of the Assyrian period, like those of Zanjírjí or that of King ZKR of Harran, have been found in Mesopotamia, the only in the time of Shalmaneser II. mention is made of an Aramaean letter (Harper, *Ass. Bab. Letters*, No. 872, obv. l. 10), and Aramaic notes on cuneiform documents begin to appear. Weights with Aramaic inscriptions (the oldest from the reign of Shalmaneser IV., 727–222) were found at Calah. By the Achaemenian period Aramaic had become the international language, and was adopted officially.

How Mesopotamia was affected by the passing of Persian armies on their way to suppress revolts in Syria or Egypt, or to conquer those that had not submitted from the whole it probably enjoyed an unwanted peace. The expedition of Cyrus the Younger, with which Xenophon has made us so familiar, only skirted the left bank of the Euphrates. The route followed by Alexander, though he also crossed at Thapsacus, took him unresolved across the northern parts; but the poor people of Mesopotamia suffered from the measures taken by their satrap Mazaeus to impede Alexander's progress. In spite of this, where Cyrus failed Alexander succeeded. What would have happened had Alexander lived we can only guess. Under the Sassanids Babylon was moved across the Euphrates to Seleucia; but before long the central authority was transferred to the other side of Mesopotamia, Antioch or elsewhere—a fateful move. It is improbable that cuneiform and the Babylonian language continued to be used in Mesopotamia during the Hellenistic period, as it did in Babylonia, where it was certainly written as late as the last century B.C., and may have been a learned language till the second Christian century. Unfortunately there are no native documents from the pre-Christian Hellenistic period. That the Hellenizing process went as far as it did in Syria is unlikely, and even there Aramaic remained the language of the people, even in the towns (cf. *Edessa*). Still, Greek influence was considerable.

This would be mainly in the towns, the growth of which was quite a feature of the Macedonian rule in Mesopotamia (*Pliny*, vi. 30, § 117). This is seen in the Greek names which now appear: such are Seleucia opposite Samosata, Apamea (= Birejik) opposite Zeugma, Hierapolis (= Membij), Europos, Nicatior, Amphipolis (= Thaspascus, or near it), Nicephorium (er-Ra‘kkáz), Zenodotium (stormed by Crassus), all on or by the Euphrates; *Edessa* (q.v.) on the upper waters of the Belikh, *Hierapolis* (especially above the confluence with the Belikh). These are all in the Osroene district; but Nasibin became an Antioch, and as its district was known as Mygdonia (from Macedon) there were doubtless many other Greek settlements. To a less extent the same influences would be at work in towns called even by Western writers by their real names, such as Batanae, Carrhae (Charran), Rhesaina.

Mesopotamia naturally had its share of suffering in the struggles that disturbed the time, when Eumenes or Seleucus traversed it or wintered there. It was invaded and temporarily annexed in 245 by Ptolemy III. Euergetes in his rapid expedition to beyond the Tigris. When Molon revolted on the accession of the youthful Antiochus III. (224 B.C.) he entered Mesopotamia from the south. Antiochus skirted the northern highlands by way of Nasibin. How far the natives of Mesopotamia shared the desire of the Greek settlers (*Joseph. Antiq.* xiii. 5, 11, § 184–186) to help Demetrius II. Nicator in checking the aggressions of the rising power of Parthia under Mithradates I. we do not know. It was in Mesopotamia that a large part of the army of Antiochus VII. Sidetes was destroyed in 130 B.C., and the Syrian kings did not again seriously attempt to assert their rule beyond the Euphrates. When Phraates II. turned the Scythians against Mesopotamia, and Phraates III. advanced with them, he had not even Mesopotamia suffered from the plunderers (*Joh. Antioch*, in Müller iv. 561). The immigration of Arabs

1 Probably the latest cuneiform document of certain date is a contract of 68 b.c. (cf. *Kia*, vi. 223 n. 3).

must have been going on for long. About this time they even founded a dynasty in Aramaean Osroene (see *Edessa*).

Of the rise of the Sassanids to the Parthian empire, Mesopotamia with a definite part of the Parthian empire, of which the Euphrates became the western boundary; but in 92 B.C. on that river his ambassador met Sulla, though the long duel did not begin immediately.

It was perhaps a Parthian governor of Mesopotamia that was called in to help Strato of Beroea against Demetrius III.; but before long Mesopotamia was a Roman province, and there to the growing dominions of Armenia under its ambitious king Tigranes, perhaps with the consent of Sinatruces (Sanatruces). The lost territory, however, was recovered by Phrares III., and Mesopotamia was again a part of the Parthian empire. When Vologaeses I. annexed the district of Osroene, the Romans put an end to the real rivalry with Rome. Mesopotamia now simply being the scene of the struggle when Antonius in 36 finally decided to make his disastrous attempt against Phrares IV. by way of Armenia. In a.d. 62 Younger Vologaeses I. was invited to secure the throne of Artabanus III. in Mesopotamia, and it was there that he saw his army melt away. The affairs of Armenia continued to be the source of friction between Parthia and Rome, and we have changed accounts several times. The expedition against Rome of Vologaeses I. (q.v.) of a.d. 62 reached no further westwards than Nisibis, and in 66 a peaceable arrangement was come to. Of the half-century that preceded Trajan's great oriental undertaking not much is known. When in 115 Trajan entered Mesopotamia from the north no serious resistance was offered, and it became a province as far as Singara. The woods at Nisibis, however, provided material for the boats with which in 161 he crossed the Tigris. Hatra, an interesting fortress which seems to have been Aramaean, fell, and the army advanced to Hit, where it found the fleet that was subsequently transferred to the Euphrates. Meanwhile the revolts that occurred in the Persian Gulf, in which the Jews had an important hand, Nisibis and *Edessa* suffered capture and destruction. Hatra successfully withstood siege, however, and Hadrian abandoned Mesopotamia, setting the boundary at the Euphrates. Again for half a century there is not much to relate. Then, when Vologaeses, yielding to his growing discontent, took advantage of the death of Antonius to invade Armenia and to try and maintain the Euphrates as the boundary of places such as Nicephorium, *Edessa*, Nisibis, western Mesopotamia was once more Roman as far as the Khbûtár, Carrhae becoming a free city and Osroene a dependency.

By this time Christianity had secured a foothold; perhaps first among the Jews and then among the Persians. On which documents in the Edessan dialect of Aramaic, known as Syriac, have been preserved. Unfortunately they contain practically nothing that is not of Christian origin. On the death of Aurelius Hatra aided Nigar against Septimius Severus in 194; Osroene rose against Rome, and Nisibis was besieged and other Roman places taken; but Septimius Severus appeared in person (195), and from Nisibis as headquarters subdued the whole country, of which he made Nisibis metropolis, raising it to the rank of a colony, the Sinjar district, where Arabs from Yemen had settled, being incorporated. On setting everything in order, only at this time did he cross the Euphrates, and after his departure in 198 the Parthians withdrew. Again the Euphrates bore a Roman fleet. Hatra, however, was besieged twice in vain. Peace then prevailed till Carralla's unpromising attack on Parthia in 216, after he had reduced Osroene to a province. On his assassination near Carrhae (217), Macrinus was defeated at Nisibis and had to purchase peace, though he retained Roman Mesopotamia, reinstating the princely house in Osroene.

The power of Ardashir, the Sassanian, however, was already rising, and the Parthian Artabanus died in battle in 224 (or 227); his prosperous and himself the successor of the Achaemenides. Hatra resisted the first Persian attack as it

The earliest inscription in Syriac yet known dates from a.d. 77, and was found at Serrín (opposite Kā‘al-en-Najm) by von Oppenheim.
had resisted Rome; but Mesopotamia was over run, Nisibis and Ctesiphon was taken (533). It was immediately, indeed, recovered by Alexander Severus, and retained, whatever was the precise success of the war; but Nisibis and Ctesiphon was retaken by the Persians in the reign of Maximin. Under Gordian III. in 242 Mesopotamia was entered by a great Roman army which recovered Ctesiphon and Nisibis. and defeated the Persians at Rhesaena; but when Gordian, after a difficult march down the Khābīr, was murdered at Zaita below Circesium, Philip the Arabian (344) made the best terms he could with Shapur I. Whatever they were the Romans were not to have been really withdrawn. A rest for Mesopotamia seems to have followed; but in 258 Shapur, tempted by the troubles in the Roman empire, overran the country taking Nisibis and Ctesiphon, and investing Edessa, and when Valerian invaded Mesopotamia he was eventually made prisoner, by Edessa (260). After Shapur's cruel victories in Syria, however, he was defeated by Odaenathus, who relieved Edessa, and Mesopotamia became for ten years practically part of an Arabian Empire (see PALMYRA), as it was to be four centuries later. In consequence of the revolt of Zenobia Mesopotamia was lost to the Romans and the Elamite frontier. Aurelian overthrew the Palmyran rule; but he was assassinated before he could carry out his intended expedition against Persia. Probus was assassinated before he was able to do anything (or much), and although Carus easily overran Mesopotamia, which became Roman again, and even took Ctesiphon, the Romans retired on his death (283-4). The next incident is the defeat of Galerius, between Ctesiphon and Callinicus, where he had entered Mesopotamia (about 296), in the war provoked by Nareses in consequence of his relations with Armenia. When it was retrieved by a signal victory, Diocletian advanced to Nisibis and thence dictated terms of peace by which Mesopotamia to the Tigris was definitely ceded to Rome (298).

One result of the connexion with Rome was, naturally, that Mesopotamia came within the range of the Decian and later the Diocletian persecutions (see EDessa: § Sasanian Period). At the Nicene Council there were bishops from Nisibis (Jacob), Rhesaena, Macedonopolis (on the Euphrates, west of Edessa), and Persia (Harnack, Mission and Expansion of Christianity, ii. 146; see generally 143-152).

After a forty years' peace the struggle was resumed by Shapur II. Nisibis and Ctesiphon endured unsuccessful siege (338, 346, 359, although meanwhile Constantine had suffered defeat at Singara (348). Then Mesopotamia enjoyed two short rests (separated by a sharp struggle) while the rivals were engaged elsewhere, when in 363 Julian (q.v.) made his disastrous attempt, and Jovian bought peace at the price, among other things, of Singara and Nisibis—i.e. practically all eastern Mesopotamia. The surrender of Nisibis, which had been in the possession of Rome for so many generations, caused consternation among the Christians, and Ephraem (q.v.) moved to Edessa, where his 'school of the Persians' soon became famous (see Edessa), and after the war of 421, in which the north-east of Mesopotamia was chiefly concerned, the Romans failed to take Nisibis, and it became a natural rallying point for the Nestorians after the decision of Ephesus (431). Matters were still more complicated when the Western Christians of Edessa found themselves unable to accept the ruling of Chalcedon against Monophysitism in 451 (see monophysites), and there came to be three parties: Nestorians (q.v.), Jacobites (see Jacobite Church) and Melchites (q.v.).

In the beginning of the 6th century there was another severe struggle in Mesopotamia, which found such anonymous Syriac historians (see Edessa), and in infringement of agreement the Romans strongly fortified Dāsa against Nisibis. The Persian invasion of Syria under Kavadh I. (q.v.) was driven back by Belisarius; but the latter was defeated in his pursuit at Rakka (531). The peace begun by Chosroes I. (532) was not long kept, and Roman Mesopotamia, except the pagan Harran, suffered severely (540), Edessa undergoing a trying siege (544). The fifty years' peace also (562) was short lived; the Romans again failed in an attempt to recover Nisibis (573), whilst Chosroes' siege of Dārā was successful. Mesopotamia naturally suffered during the time of confusion that preceded and followed the accession of Chosroes II., and the Romans recovered their old frontier (591).

With the accession of Phocas (602) began the great war which shook the two kingdoms. The loss of Edessa, where Nareses revolted, was temporary; but the Roman fortress of Dārā fell after nine months' siege (c. 603); Harran, Rās al-'Ām and Edessa followed in 607, many of the Christian inhabitants being transplanted to the Far East, and Chosroes carried the victorious arms of Persia far into the Roman Empire. Finally, he proclaimed the tide, and Kavadh II. restored the conquests of his predecessor. The Syrian Christians, however, found that they had only exchanged the domination of a Zoroastrian monarch for an unsympathetic ecclesiastical despotism. In the confusion that followed, when men of letters had to live and work in exile, Nisibis set up for a time (631-632) a grandson of Chosroes II. Finally all agreed on Yazdegird III.; but, while Chosroes II. and Heraclius had been at death grips with each other a great invasion was being prepared in Arabia.

The Arab tribes in Mesopotamia were now Christian, and Heraclius at Edessa hoped for their support; but Karkhāiy and Hit succumbed (636), and then Tekrit; and Heraclius retired to Samosata. In 638 he made another attempt, it is said at the entreaty of the Mesopotamian Christians, Arab forces appeared before Rakka, Edessa, Nasībān and other places, and all Mesopotamia was soon in the hands of the Arabs. Henceforth it looked to Damascus and to Kūfā and Bāṣra, instead of to Constantinople or Ctesiphon. The new régime brought welcome relief to the Christian part of the population, for the Arabs took no note of their orthodoxies or heterodoxies. (Moawiya is said to have rebuilt the dome of the great church at Edessa after an earthquake in 678.) Fortunately for Mesopotamia the seats of the factions which immediately broke the peace of Islam were elsewhere; but it could not escape the fate of its geographical position.

The men of Rakka were compelled to help 'Ali, after his march across Mesopotamia from near Māsūl, in getting a bridge made at Rakka to convey his men to Šijfīn. Not long afterwards there was a new excitement in Moawiya's incursion across to the Tigri. The discontents under Yazīd III. was keen in Mesopotamia, where Merwān in fact got a footing, and when the troubles increased after his death his son Hārūn abandoned Damascus in favour of his seat at Harran. His son was besieged by Dābāhik and his Khārjītis and Saffarids in Nasībān; but a fierce battle at Mārīn ended in Merwān's favour (745). The cruelties that accompanied the overthrow of the Omeyyad dynasty excited a revolt, which spread to Mesopotamia, and Harran had to undergo a siege by one of Merwān's sons. It was next besieged by al-Mansūr's brother; but the battle between the brothers was fought at Iturābān. It was decisive, but there were further risings, involving Mesopotamia.1

An inevitable effect of the reign of 'Abūl was that the kindred language of the Arabs gradually killed the vernacular Syriac of Mesopotamia (see Edessa) as the alien Greek and Persian had shown no tendency to do, and the classical period (4th to 8th centuries) of the only Mesopotamian literature we know, such as it is, useful but uninviting, came to an end (see syriac literature). This naturally encouraged grammatical study among the Arab-speaking people the revolution which displaced the Arabian court of Damascus in favour of a cosmopolitan world capital centred at the Babylonian seat of the civilizations dealt with in the preceding paragraphs naturally gave an impulse to the wider scholarship. Translations were made from Greek, as, e.g. by Thābit ib. Qurra of Harrān (d. 901), and Pahlavi.

1 For this and following section see further CALIPHATE and PERSIA: History.
that developed the Muṣṭafiite (Mutasillite) sect. Naṣīḥīn was the scene of another revolt (793) under a Khārijīte leader. Hūrin's son Moṭahṣim displeased the people by creating a bodyguard of Turks, and therefore transferred his seat to Sāmarrā'. This put the caliph for a time in a still more delicate position. Mesopotamia fell partly under the power of Ḥāmid ibn Ṭūlūn of Egypt and his son; but before the end of the 9th century the Arabs were re-established in Mesopotamia. The Hamdāndīs, descendants of the Arab tribe of that name, were in possession of Māsinjah, and in 919 one of them, Harūn ibn ʿAlī, was governor of Dār Raʿ bī. Later the brothers Nāṣīr ad-Daula and Saʿd ad-Daula ruled over Mesopotamia and North Syria respectively as governors of the Mūsul, Naṣīḥīn, Raʾka (944). The Hamdāndīs were followed by the Qayyīlids, who had their seats at various places, such as Māsinjah, Naṣīḥīn, Raʾka, Harīrīn, between 996 and 1004, and probably later under the name of the Māsālik. They arrived at Jerusalem in 1076, the first crusaders reached Asia in 1097, and Bit Adînî became the kūshshiy of Edessa (q.v.). The power of the Seljuqs quickly disintegrated. For the slave of the third Seljuq sultan, Zangi, governor of Iraq, made himself gradually (Mōsul, Sinjar, Jeṣira, Harān) master of Mesopotamia (1128), capturing Edessa in 1144. Mesopotamia fell to one of his sons, Saʿd ad-Dīn and branches sprang up at Sinjar and Jeṣira. To the same period belong other Arab dynasties; Begītugins at Harān, Tekrit, etc.; Ordokch at Edessa; ʿAnā, etc., with Mārīn as their headquarters. By 1185-1186 Salāḥ ad-Dīn had made good his claim to all the others, the Tabārīnids, which the XVIIth and XIXth Egyptian dynasties had attempted in vain. Mesopotamia remained in the hands of the Ayyūbi family till the appearance of the Mongols. To the rule of the Seljuqs succeeded that of the Seljuq Turks, one of them the governor of Egypt that checked the death-bringing flood. Near Bira was the scene of one of their victories (1273), and their extended territory extended to Kārkīṣyā. The Ordokch dynasty survived the Mongol inundation, and it was in the 14th century that its laurate Salīḥ ad-Dīn al-Hilīf flourished. From the Mongol invasions of the 13th century western Asia has never recovered. Then, before the 16th century was over, the stature of the Ordokch was increased by the next dynasty, the Mālūkīs, for whom they finally made room by moving on into Mesopotamia, over which they spread, driving before them their predecessors the Taʾi (whose name the Mesopotamian Araʿmaeans had adopted as a designation for Arab in general), partly north of the Sinjar, partly over the Tigris. Others they forced to abandon the nomadic life, and settle by the Khābhūr (e.g. the Jebur) or the Euphrates. These adjustments, it is supposed, had been effected by 1700.

In 1831 ʿAli, a newly appointed Turkish governor of Baʿḏād, induced Suṣūfī the chief of the Jēber, the more important division of the Sāmarrī Turks, who would not vacate his position, but then refused them the promised payment. To defend himself from the enraged Shammar ʿAlī hanged Suṣūfī from a branch of a tree near the Euphrates and fled. Suṣūfī also succeeded in detaching part of the Shammar under Shīʾūd. He told the ʿAnāza he no longer needed their help. In the futile attempt of the three parties to dislodge the ʿAnāza Shīʾūd lost his life but with the help of the Žubīd the other two succeeded, and Suṣūfī now was supreme "King of the Steppe," levying blackmail as he pleased. Other methods of disposing of him having failed, the Forte made his nephew a rival sheikh of the Bashīr. Instead of helping his brother he mutilated the latter and faced himself at the hands of the pasha, but has since become a hero. Two of his sons became involved in a quarrel with the government, in consequence of which one of them was hanged in 1840. Suṣūfī died of fever in 1856. ʿAlī and Fāṣūn, the eldest son, a peaceable man who had been pasha, became supreme. One of Suṣūfī's widows had fled to her "Tai kindrel in Central Arabia with her youngest son Fāṣūn; but when he grew up she brought him back in the seven-

Finally, half-sedentary tribes on the Khābhūr and the Belīkh became tributary to him, and a more or less active warfare sprang up between the brothers, which ended in a partition of Mesopotamia.

Ferḥān and the South Shammar claimed the steppe south-east of a line from Mōsul to Mayyidīn (just below Karṣaḡī), and Fāṣūn the North Shammar, which Ferḥān took back. After Ferḥān's death the Porte has favoured one after another of his many sons, hoping to keep the South Shammar disunited, especially as they are more than the others. The Shammar have been in undisputed mastery from Urfa to the neighbourhood of Baʿḏād, practically all tribes paying khawwuwa to them, and even the towns, till the government garrisoned them. Some 60 of these more or less nomadic communities, of one or two thousand tents (or houses) each, representing a population of several hundred thousand are described by Oppenheim. Each has its recognized campsite and fortified anchorage. For winter, most of them are Arab and Mahomedan. Some are Christian and some are not Arab; viz. Kurds, Turkomans or Circassians. For some years the Porte has been applying steady pressure on the nomads to induce them to settle, by increasing the number of military posts, by introducing Circassian colonies, as at Ras al-ʿAqu, sometimes by forcible settlement. More land is thus being brought under cultivation, the disturbing elements are being slowly brought under control, and life and property are becoming more secure.

Security is what the government chiefly needs. Hence its primary interest in the railway scheme, with a view to agricultural development and perhaps the growth of cotton; Sir W. Wilcock's irrigation schemes had not up to 1910 affected "Mesopotamia" directly. Apparently the real problem is one of population adequate to effect the improvements demanded. The new régime introduced in 1908 seems to justify a hopeful attitude. Apart from the disturbing effects of recent events in Persia, an exposition of present conditions would show progress. Exact statistics are not available because the vilayet of Mōsul (35,130 sq. m., 331,200 pop.) takes up the whole of what is called the "side of the Euphrates," including the Oserou district, which goes with Aleppo. Urfa is a town of 55,000; Mōsul, 61,000, Baʿḏād, 145,000. The exports of Mōsul for 1908 were (in thousands of pounds sterling): United Kingdom 195, India 42, other countries 52, parts of Turkey 218; the imports: United Kingdom 56, India 16, other countries 35, parts of Turkey 24. The language is in most parts Arabic; but Turkish is spoken in Birejik and Urfa, Kurdish and Armenian south of Dārbeḵ, and some Syriac in Tūr ʿAbdīn. There are Christian missionary institutions of European origin in various places, such as Urfa, Mārīn, Mōsul. An interesting survival of the faiths is to be found in the Yeẓīdīs of the Sinjar district.

AUTHORITIES—Land and People: full references to Greek, Latin, Arabic and other writers are given in Ritter, Erdkunde (13, 6-284, 921-1149); xi. 247-510, 660-762; for the conditions since the Arab conquest, Guy le Strange, Lands of the Eastern Caliphate (1908), chiefly pp. 86-114, is especially useful. Of recent works the following are especially valuable: E. Sachau, Reise in Syrien u. Mesopotamien (1883); M. v. Oppenheim, Vom Mittelmeer zum Persischen Golf, vol. ii. (1890). We may mention further: G. H. Hormuz, The Nearest East (1902), zie "Zur Geographie und Geologie des mesopotamischen Parallellands" (Sarug district), in Klio, i. 443-476; M. Sykes, "Journeys in North Mesopotamia" in Geog. Journal, 27-29; 189-197; Euphrates (1901), op. cit., xxxiv. 61-65 (plans of two castles); D. Fraser, Short Cut to India (1909); W. Kurz, "Beurteilung der Aussichten auf eine Wiederbelebung der Kultur der Euphrat- und Tigriidenfuehrung" in Deutsche geographische Blätter, xxxii. 179-190 (1898); E. Pears, "The Bagdad Railway" in Contemp. Rev., 1908, 570-591; K. Baecker, Palestine and Syria (1906), pp. 389-412. The annual reports on Mesopotamia are those for Aleppo, Mōsul, Baʿḏād and Basra.

MAPS.—The following deserve special mention: v. Oppenheim, op. cit., a most valuable large scale folding map in pockets of volumes; Sachau, op. cit., with small maps; G. Adani, Atlas Syrien, opp. p. 354, and xiv. opp. p. 120; H. Hormuz, op. cit., orographic, &c.

MESOXALIC ACID—MESOZOA

The central cell is formed by the layer of the first two blastomeres, and remains quiescent until surrounded by the micromeres or products of division of the smaller blastomere. It then divides processes. Each of the two small cells are now called "primary germ cells," and they enter into and lie inside the large central cell. The primary germ cells divide until there are eight of them all lying within the axial cell. At this stage the future of the parasite may take one of two directions. Following one path, the animal (now called a "Nematogen") gives rise by the segmentation of its primary germ cells to vermiform larvae which, though smaller, are but replicas of the parent form. Following the other path, the animal (now termed a "Rhombogen") gives origin to a number of "infusoriform larvae," several of these arising from each primary germ-cell. The vermiform larvae leave their Nematogen parent and swimming through the renal fluid attach themselves to the renal cells. They never leave their host, and die in sea-water. The infusoriform larvae have a very complicated structure; they rows of ectodermal cells; here, as in the male, the second ring is larva, they can live in sea-water. They possibly serve to infect new hosts. Some authorities look upon these infusoriform larvae as males, and consider that they fertilize some of the Nematogens,

Mesozoa. Van Beneden gave this name to a small group of minute and parasitic animals which he regarded as intermediate between the Protozoa and the Metazoa. The Mesozoa comprise two classes: (1) the Rhombozoa, which include only the cellular classes of ciliated protozoa in the kidneys of Cephalopods, and (2) the Orthonecida, which include specimens of Ophurids, Polychaetae, Nemertines, Turbellaria and possibly other groups.

Class I. Rhombozoa (E. van Beneden).—These animals consist of a central cell from which certain reproductive cells arise, enclosed in a single layer of flattened and for the most part ciliated cells; some of them are modified at the anterior end and form the polar cap. The Rhombozoa comprises two orders: (a) Dicyemida, ciliated vermiform creatures whose polar cap has 8 or 10 cells arranged in two rows (Dicyema, Kolla, Dicyemnema, Whitman); (b) Metacyemida, non-ciliated animals with no polar cap, but whose anterior ectodermal cells contain refringent bodies and may be produced into wart-like processes (Centroacida, v. Ben, in Ophiofrogs vulgaris; Microcyema in Sepia officinalis). Unlike the Dicyemida, which are found in the renal cells of the animal whose host by their polar cap, the Heterocyemida are free. The anterior ectodermal cells apart from the polar cap are few, some fourteen to twenty.

which then give rise to males again, whereas the females which produce the vermiform embryos arise from unfertilized vermiform larvae. After the infusoriform larvae have escaped from the Rhombogen, and, unlike the vermiform larvae, they can live in sea-water. They possibly serve to infect new hosts. Some authorities look upon these infusoriform larvae as males, and consider that they fertilize some of the Nematogens,
ova which are free in the cylindrical forms; they leave the mother through the disintegration of the cells of the non-ciliated ring, are fertilized and develop parthenogenetically into females both flat and cylindrical.

_Giardia intestinalis_ and _S. giardi_ are said to be hermaphrodite. The parasites first make their appearance in a host in the form of a plasmodium comparable with the sporocyst of a Trematode. By the segregation of nuclei and some of the surrounding protoplasm, germ cells arise which develop into ciliated larvae and ultimately into males and females which only discharge their spermatozoa and ova when they reach sea-water. The product of the consequent fertilization is unknown, presumably it infects new hosts, entering them in the form of a nucleated plasmodium.

The original idea that in the Rhombozoa and Oronchectidae we had animals intermediate between the Protozoa and Metazoa is no longer held. The modern view is that the simplicity of their structure is secondary and not primary, and is correlated with their parasitic habit of life. They are probably derived from some Platyhelminthine ancestor and perhaps come nearer to the Trematoda than to any other group.

**Mesozoic Era.**—In geology, the name given to the period of time between the Palaeozoic and Cenozoic eras; it is synonymous with the older and less satisfactory term "Secondary" as applied to the major divisions of geological time and with the "Flözgebirge" of the Wernerian school. This era is sub-divided into a lower, Triassic, a middle, Jurassic, and an upper, Cretaceous period or epoch. The duration of the Mesozoic era was not more than one fourth of that of the Palaeozoic era, measured by the thickness of strata formed during these periods. It was an era marked by peaceful conditions in the ocean and land and by an evident increase from vegetative activity. The sediments as a whole are characterized by the prevalence of limestones as compared with those of the preceding era; they are seldom much altered or disturbed except in the younger mountain regions. Mammals, represented by small marsupials, and primitive forms of birds and bony fishes make their first appearance in rocks of Mesozoic age. Saurian reptiles played an extremely prominent part; ammomites and belemnites lived in extraordinary variety in the seas along with the echinoids and pelecypods, which had to a great extent supplanted the crinoids and other echinoderms and the prominent sea cucumbers. The first clear indications of monocotyleodontous and dicotyleodontous angiosperms made their appearance, while Cycads and Conifers constituted the bulk of the land flora.

**Mesquite, or Honey Locust**, in botany, a tree, native of the southern United States and extending southwards through Mexico and the Andean region to Chile and the Argentine Republic. It is known botanically as _Prosopis juliflora_, and belongs to the natural order Leguminosae (suborder Mimosoae). It reaches 40 or 50 ft. in height, usually with a trunk not more than 6 to 12 in. in diameter, and divided a short distance above the ground into numerous irregular crooked branches forming a loose straggling head. The remarkable development of its main root in relation to water-supply renders it most valuable as a dry-country plant; the root descends to a great depth in search of water, and does not branch or decrease much in diameter till this is reached. It can thus flourish where no other woody plant can exist, and its presence and condition afford almost certain indications of the depth of the water-level. When the plant attains the size of a tree, water will be found within 40 or 50 ft. of the surface; when it grows as a bush between 50 or 60 ft.; while, when the roots have to descend below 60 ft., the stems are only 2 or 3 ft. high. These woody roots supply valuable fuel in regions where no wood of fuel value is produced above ground. The leaves are compound, the main axis bearing two or sometimes four secondary axes on which are borne a number of pairs of narrow bluish leaflets. The minute greenish-white fragrant flowers are densely crowded on slender cylindrical spikes from 1½ to 4 in. long; the long narrow seeds are constricted between the seeds, of which they remain from ten to thirty surrounded by a thick spongy layer of sweet pulp. The wood is heavy, hard and close-grained, but not very strong; it is almost indestructible in contact with soil, and is largely used for fence-posts and railway ties. The ripe pods supply the Mexicans and Indians with a nutritious food; and a gum resembling gum arabic exudes from the stem.

An allied species _Prosopis pubescens_, a small tree or tall shrub, native of the arid regions of the south-western United States, is known as the screw-bean or screw-pod mesquite from the fact that the pods are coiled into a spiral-like spiral; they are used for fodder and are sweet and nutritious, but smaller and less valuable than those of the mesquite.

For a fuller account of these trees see Charles Sprague Sargent, _Silva of North America_, iii. p. 99 (1892).

**Mess** (an adaptation of O. Fr. _mes_, mod. _mets_; Ital. _meso_; derived from the Lat. _missum_, past participle of _mittere_ "to send or place in position"), a service of meat, a dish sent to table. The term is also used of the persons who are in the habit of eating their meals together, and thus particularly of the parties into which a ship's company or a regiment is divided, either in the messing lists or in the convenience of catering. Originally, a mess in this sense was a group of four persons sitting at one table and helped from the same dishes. In the Inns of Court, London, the original number is preserved, four benchers or four students dining together.

In early times the word mess was applied to food of a more or less liquid character, as soup, porridge, broth, &c. It is probably in allusion to the sloppy nature of semi-liquid messes of food that a mess has come also to mean a state of disorder, confusion and discomfort. "Sleet takes the word in this sense to be a variant of "mash," originally to mix up.

**Message** (a word occurring in slightly different forms in several languages, e.g. Fr. _message_, Span. _mensaje_, Ital. _messaggio_; adapted from the Low Lat. _missatuum_, from _mittere_), a communication either verbal, written or printed, sent from one person to another. Message is the term generally applied to the official communications addressed by the heads of states to their legislatures at the opening of the session or at other times. These also, though written, are borne and delivered by special messengers and have the force of a face to face speech. The sessional and other messages to Congress of the president of the United States of America are printed in the United States Government Printing Office. Washington and John Adams delivered them in person but the practice was discontinued by Jefferson.

"Messenger" is of the same derivation; the earlier form of the word was _mesager_ (cf. _passenger_, _scavenger_). In ordinary language the word means one who is charged with the delivery of a message. In Scottish law a messenger-at-arms is an official appointed by Lyon-King-at-Arms to execute summonses and letters of diligence connected with the Court of Sessions and Court of Justiciary (see _Writ_ : _§ Scotland_). Technically the term "messenger" is given to an endless rope or chain, passing from the capstan to the cable so that the latter may be hauled in when the messenger is wound round the capstan; also to a similar contrivance for hauling in a dredge.

**Messianic, ANDRE CHARLES PROSPER_ (1853— ),_** French musician, was born at Montluçon on the 30th of December 1853; he studied at Paris, and in 1874 became organist at St Sulpice. He was for some time a pupil of Saint-Saëns. In 1876 he won the gold medal of the Société des Compositeurs with a symphony. In 1880 he was appointed music director at the Theatre des Variétés. In 1885, he completed Firmin Bernicat's comic opera _Français des beaux bleus_; and in 1885 produced his own operettas, _La Fauvette du temple_ and _La Bérarnoise_, the latter being performed in London in 1888. His ballet _Les Deux pigeons_ was produced at the Paris Opéra in 1886. But it was the production of his comic opera _La Basoche_ in 1890 at the Opéra Comique (English version in London the following year) that established his reputation; and subsequently this was increased by such tuneful and tasteful light
MESSALLA CORVINUS—MESSAPII

operas as Madame Chrysanthème (1893), Miretelle (1894), Les Petites Michus (1897), and Véronique (1898), the latter of which had a great success in London. Roman families, wrongly for some years at the Opéra Comique in Paris, Messager's services were also secured in London in 1901 and later years as one of the directors of the Covent Garden opera.

MESSALLA CORVINUS, MARCUS VALERIUS (64 B.C.—A.D. 8), Roman general, author and patron of literature and art. He was educated partly at Athens, together with Horace and the younger Cicero. In early life he became attached to republican principles, which he never abandoned, although he avoided offending Augustus by too open an expression of them. He married the sister of a freedman who should be bestowed upon Augustus, and yet resigned the appointment of prefect of the city after six days' tenure of office, because it was opposed to his ideas of constitutionalism. In 43 B.C. he was proscribed, but managed to escape to the camp of Brutus and Cassius. After the battle of Philippi (42) he went over to Antony, but subsequently transferred his support to Octavius. In 31 Messalla was appointed consul in place of Antony, and took part in the battle of Actium. He subsequently held commands in the East, and suppressed the revolted Aquitanians; for this latter event he was given the special name Augustus, and the poet Sulpicia—has been called "the Messalla circle." With Horace and Tibullus he was on intimate terms, and Ovid expresses his gratitude to him as the first to notice and encourage his work. The two panegyrics by unknown authors (one printed among the poems of Tibullus as iv. 1, the other included in the Catalepton, the collection of small poems attributed to Virgil) indicate the esteem in which he was held. Messalla was himself the author of various works, all of which are lost. They included Memoirs of the civil wars after the death of Caesar, used by Suetonius and Plutarch; bucolic poems in Greek; translations of Greek speeches; occasional satirical and erotic verses; essays on the minutiae of grammar. As an orator, he followed Cicero instead of the Atticizing school, but his style was affected and artificial. Later critics considered him superior to Cicero, and Tiberius adopted him as a model. Late in life he was a member of the practice of the Roman law, but is said to have followed the profession of a freedman. The inscription to which Tiberius attributed De proponi Augusti Caesaris bearing the name of Messalla, but really a 17th-century production.

Monographs by L. Wiese (Berlin, 1826), J. M. Valton (Gröningen, 1874), L. Fontaine (Versailles, 1878); H. Schulz, De M. V. octate (1886); J. B. "Messalla in Aquitania" by J. P. Postgate in Classical Review, March 1903; W. Y. Sellars, Roman Poets of the Augustan Age. Horace and the Elegiac Poets (Oxford, 1892), pp. 213 and 221 to 228; the spurious poem ed. by R. Mecenate (1820).

Two other members of this distinguished family of the Valerian gens may be mentioned:

1. Marcus Valerius Messala, father of the preceding, consul in 53 B.C. He was twice accused of illegal practices in connexion with the elections, but on both occasions was acquitted. In 45 B.C. he was obviously guile, through the eloquence of his uncle Quintus Hortensius; on the second he was condemned. He took the side of Caesar in the civil war. Nothing appears to be known of his later history. He was married for fifty-five years and wrote a work on the science of divination.

Cicero, Ad Fam. vi. 18, viii. 4, ad Atticum, iv. 16; Dio Cassius xl. 17, 45; Bellum aefricanum, 28;Macrobius, Saturnalia, i. 9, 14; AE. variedo, vi. 113.

2. Manius Valerius Maximus Corvinus Messalla, consul 253 B.C. In this year, with his colleague Manius Otacilius (or Octacilius) Crassus, he gained a brilliant victory over the Carthaginians and Syracusans; the honour of a triumph was decreed to him alone. His relief of Messana obtained him the cognomen Messalla, which remained in the family for nearly 800 years. To commemorate his Sicilian victory, he caused it to be pictorially represented on the wall of the Curia Hostilia, the first example of an historical fresco at Rome. He is said also to have brought the first sun-dial from Catana to Rome, where it was set up in the Forum.

Polybius i. 16; Dio, Sic. xii. 34; Zonaras viii. 9; Pliny, Nat. Hist., vii. 60, xxxiv. 4 (7).

MESSALLINA, VALERIA, the third wife of the Roman emperor Claudius (g.n.). She was notorious for her profligacy, avarice and ambition, and exercised a complete ascendency over her weak-minded husband, with the help of his all-powerful freedmen. During the absence of Claudius from the city, Messallina forced a handsome youth named Galus Silius to divorce his wife and go through a regular form of marriage with one of the freedmen. He was warned by the fate of another freedman Polybius, who had been put to death by Messallina, informed Claudius of what had taken place, and persuaded him to consent to the removal of his wife. She was executed in the gardens of Lucullus, which she had obtained on the death of Valerius Asiaticus, who through her machinations had been condemned on a charge of treason. She was only twenty-six years of age. By Claudius she was the mother of the unfortunate Britannicus, and of Octavia, wife of Nero.

See Tacitus, Annals, xi. 1–38; Dio, Cassius ix. 14—31; Juvenal vi. 150, vii. 131, xiv. 87; Mommsen, Claudius; Mommsen, Her. of the Romans under the Empire ch. 401; A. Stahl, "Agrippina" in Bilden aus dem Alterthum, iv. (1865).

MESSAPII, an ancient tribe which inhabited, in historical times, the south-eastern peninsula of "heel" of Italy, known variously in ancient times as Calabria, Messapia and Iapygia. Their chief towns were Uzentum, Rudiae, Brundisium and Uria. They are mentioned (Herod. vii. 170) as having inflicted a serious defeat on the Greeks of Tarentum in 473 B.C. Herodotus adds a tradition which links them to the Cretans subjects of "King Minos." Their language is preserved for us in a scanty group of sporadic inscriptions collected by Droop. There are not only a few contain more than proper names, and in a few glosses in ancient writers collected by Mommsen (Unteritalische Dialekten, p. 70). Unluckily very few originals of the inscriptions are now in existence, though some few remain in the museum at Taranto. The only satisfactory transcripts are those given by (1) Mommsen (local. cit.) and by (2) I. P. Droop in the Annals of the British School at Athens (1905–1906), xil. 137, who includes, for purposes of comparison, as the reader should be warned, some specimens of the unfortunately numerous class of forged inscriptions. A large group of the inscriptions collected by Droop are reprinted in the appendices to Fabretti's Corpus inscriptionum italicarum are forgeries, and the text of the rest is negligently reported. It is therefore safest to rely on the texts collected by Mommsen, cumbered though they are by the various readings given to him by various authorities. In spite, however, of these difficulties some facts of considerable importance have been established.

The inscriptions, so far as it is safe to judge from the copies of the older finds and from Droop's facsimiles of the newer, are all in the Tarentine-Ionic alphabet (with [ for v and [ for 4). For limits of date 400–150 B.C. may be regarded as approxi-
mately probable; the two most important inscriptions—those of Bindei and Vaste—may perhaps be assigned provisionally to the 3rd century B.C.

Mommsen's first attempt at dealing with the inscriptions and the language attained solid, if not very numerous, results, chief of which were the genitival character of the endings—'ihi and 'ebi; and the conjunctival value of 'ebi (local. cit. 79–84 sqq.). Since that time (1850) very little progress has been made. There is, in fact, only one attempt known to the present writer to which the student can be referred as proceeding upon the thoroughly scientific lines, that of Professor Alf Torp in Indoger-
mansische Forschungen (1895), v., 195, which deals fully with the two inscriptions just mentioned, and practically sums up all that is either certain or probable in the conjectures of his predecessors. Hardly more than a few words can be said to have been separated and translated with certainty—kalatara (mas.

*gen. sing.) "of a herald" (written upon a herald's staff which was once in the Naples Museum); oran (acc. sing. fem.) "arable
Messenia—Messenia

land"; "mazes," "greater" (neut. acc. sing.), the first two syllables of the Latin maiestas; while tepise (3rd sing. aorist indic.) "placed," or "offered," and forms corresponding to the article (Ion = Greek τὸ) seem also reasonably probable.

Some phonetic characteristics of the dialect may be regarded as quite certain: (1) the change of the original short ð to ð (as in the last syllable of the genitive kalatares); (2) of final -m to -n (as in aran); (3) of *ni- *-si respectively to -nn- *-θ and *-ss- as in dazones "Dasônus," dazónnhi "Dasõnys"; daselbst, gen. dasethÕthi "Dazetius, Dasethi," from the shorter stem daset-; Vallasso for Vallassio (a derivative from the shorter name Valla); (4) the loss of final ð (as in tepise), and probably of final ð (as in -des, perhaps made "set") from the root of ð of ð-Des, change of original dh to ð (anda = Gr. θῦρα and bh to b (beran = Lat. ferant); (6) -s before (at least some) consonants becomes -ã- (Basta, earlier bhôra), (7) very great interest attaches to the form pensahek—which Torp very probably identifies with the Oscan stem pompajo—which is a derivative of the Indo-European numeral *pence "five."

If this last identification be correct it would show that in Messapian (just as in Venetic and Ligurian) the original velars were retained as gutturals and not converted into labials. The change of ð to ð, exceedingly interesting, is of frequent phonetic association with the northern branch of Indo-European such as Gothic, Albanian and Lithuanian, and not appearing in any other southern dialect hitherto known. The Greek Αφοῦσια appears in the form Aprodita (dat. sing., fem.). The use of double consonants which has been already pointed out in the Messapian inscriptions has been very acutely connected by Deuce with the tradition that the same practice was introduced at Rome by the poet Ennius who came from the Messapian town Rudiae (Festiús, p. 203 M).

It should be added that the proper names in the inscriptions show the regular Italic system of gentile nomen preceded by a personal praenomen; and that some inscriptions show the interesting feature which appears in the Tables of Heraclae of a crest or coat of arms, such as a triangle or an anchor, peculiar to familiar families. The same reappears in the Iovilae (q.v.) of Capua and Cumae.

For further information the student must be referred to the sources already mentioned and further to W. Deese in a series of articles, "The acropolis of the acropolis with a statue by the famous Argive sculptor Ageadas, originally made for the Messenian helots who had halted at Naupactus at the end of the third Messenian War." But what chiefly excited his wonder was the strength of its fortifications, which excelled all those of the Greek world. Of the wall, some 33 m. in extent, considerable portions yet remain, especially on the north and north-west, and almost the entire circuit can still be traced, affording the finest extant example of Greek fortification. The wall is flanked by towers about 31 ft. high set at irregular intervals: these have two storeys with loopholes in the lower and windows in the upper, and are entered by doors on a level with the top of the wall which is reached by a SHORT ascended by a series of steps. Of the gates two can be located, the eastern or Laconian, situated on the south side of the saddle uniting Ithome and Eua, and the northern or Arcadian gate. Of the former but little remains: the latter, however, is excellently preserved and consists of a circular court about 20 yds. in diameter with inner and outer gates, the latter flanked by square towers some 11 yds. apart. The lintel of the inner gate was formed by a single stone 18 ft. 3 in. in length, and the marble of the circular court is of astonishing beauty and accuracy. The other buildings which are here—Cassyta (naval) stadium, the council chamber or Bouleuterion, and the propylæum or entrance to the market—while on the shoulder of the mountain are the foundations of a small temple, probably that of Artemis Laphria.

MESSENE (Gr. Μεσσηνία or Μεσσηνία); the S.W. district of the Peloponnesus, bounded on the E. by Mt Tágyctus, on the N. by the river Neda and the Arcadian Mountains, on the S. and W. by the sea. Its area is some 825,000 acres, considerably less than that of Shropshire or Wiltshire. Historically and economically its most important part is the great plain, consisting of two distinct portions, watered by the river Pamisus (mod. Parnita) and its affluents. This is the most fertile tract in Greece, and at the present day produces oranges, almonds, figs, grapes and olives in great abundance and of excellent quality. The plain is bounded on the north by the Nomian Mountains (mod. Tetráși, 3710 ft.) and their westerly extensions, the Cyparrissa (4000 ft.), a southern continuation of which forms the northern slope of the Morea, attaining its greatest height in Mt Mathias (mod. Lykódimo 3160 ft.). Off the south coast of this peninsula lie the three Oenussai islands and the islet of Theganussa (Venetikó). In spite of its long coast-line, Messenia has no good harbours except the Bay of Pylos (Navarino), and has never played an important part in Greek naval history.

The earliest inhabitants of Messenia are said to have been Pelasgians and Leleges (q.v.), of whom the latter had their capital at Andania. Then came an Aeolio-Minyan immigration, which apparently extended to Messenia though the Pylos of Nestor almost certainly lay in Triphylia, and not at the site which in historic times bore that name. In the Homeric poems eastern Messenia is represented as under the rule of Menelaus of Sparta, while the western coast is under the Neleids of Pylos, but after Menelaus’s death the Messenian frontier was pushed eastwards as far as Tágyctus. A body of Doriacs under Cresoπhades invaded the country from Arcadia, and, taking as their capital Stényclus in the northern plain, extended first their suzerainty and then their rule over the whole district. The task apparently proved an easy one, and the Dorians blending with the previous inhabitants produced a single Messenian race with a strong national feeling. But the fertility of the soil, the warm and genial climate, the mingling of races and the absence of opposition, combined to render the Messenians no match for their hardy and warlike neighbours of Sparta. War broke out—in consequence, it was said, of the murder of the Spartan king Teleclus by the Messenians—which, in spite of
the heroism of King Urephaes and his successor Aristodemus (q.v.) ended in the subjection of Messenia to Sparta (c. 720 B.C.). Two generations later the Messenians revolted and under the leadership of Aristomenes (q.v.) kept the Spartans at bay for some seventeen years (648-631 B.C., according to Grote): but the stronghold of Ira (Eira) fell after a siege of eleven years, and those Messenians who did not leave the country were reduced to the condition of helots. The next revolt broke out in 462, when a severe earthquake destroyed Sparta and caused great losses among the helots; many of these helots undertook life for some years on the rock-citadel of Ithome, as they had done in the first war; but eventually they had to leave the Peloponnesian and were settled by the Athenians at Naupactus in the territory of the Locris Ozelae. After the battle of Leuctra (371 B.C.), Epaminondas invited the exiled Messenians scattered in Italy, Sicily, Africa, and elsewhere to return to their country; the city of Messene (q.v.) was in 369 to be the capital of the country and, like Megalopolis in Arcadia, a powerful check on Sparta. Other towns too were founded or rebuilt at this time, though a great part of the land still remained very sparsely peopled though independent Messenia never became really powerful or able to stand without external support. After the fall of the Theban power, to which it had owed its foundation, it became an ally of Philip II. of Macedon and took no part in the battle of Chaeroneia (338 B.C.). Subsequently it joined the Achaean League, and we find Messenian troops fighting along with the Achaean and Antigonus Doson at Sellasia in 222 B.C. Philip V. sent Demetrius of Pharos to seize Messene, but the attempt failed and cost the life of Demetrius: soon afterwards the Spartans invaded Naibia of Messene (for taking the city, but was forced to retire by the timely arrival of the Philopoenum and the Megalopolitans. A war afterwards broke out with the Achaean League, during which Philopoemen was captured and put to death by the Messenians (183 B.C.), but Lycurgas took the city in the following year, and it again joined the Achaean League, though much weakened by the loss of Abia, Thuria and Phorae, which broke loose from it and entered the League as independent members (see ACHAEN LEAGUE). In 146 B.C. the Messenians, together with the other states of Greece, were brought directly under Roman sway by L. Mummius, and the city of Sparta was taken by the Romans. In 133 B.C. a decree was passed by the Senate in favour of the Messenians (Tac. Ann. iv. 43).

In the middle ages Messenia shared the fortunes of the rest of the Peloponnesian. It was overrun by Slavic hordes, who have left their traces in many village names, and was one of the chief battlefields of the various powers—Byzantines, Franks, Venetians and Turks— who struggled for the possession of the country. Striking reminders of these conflicts are afforded by the extant ruins of the medieval strongholds of Kalamata, Coron (anc. Asine, mod. Korone), Modon (Methone) and Pylos. At the present day Messenia forms a department with its capital at Kalavryta, and a population numbering (according to the census of 1907) 127,991.

(M. N. T.)

MESSIAH (Dan. x. 25, 46), and Messias (John i. 41; iv. 25), translations (the first form modified by reference to the etymology) of the Greek Messias (Μεσσίας, Messiah), which in turn represents the Aramaic מַשִיָּהוּ (mashı̂a′wû), answering to the Hebrew מָשִיָּהוּ (mashı́yâwû), "the anointed." 1 There can be no doubt that a magical power was ascribed to the anointing oil (cf. Frazer, Golden Bough, 2nd ed., ii. 364 sqq.). The king was thereby rendered sacrosanct (1 Sam. xxiv. 6 sqq.; 2 Sam. i. 14 sqq.; iv. 9 sqq.), and he was considered to be endowed with a special virtue. Thus whosoever curses the king is stoned as though God Himself had been cursed (2 Sam. xix. 25). In ancient Egyptian cultus the priest, after he has solemnly saluted the gods, begins the daily toilet of the god, which consists in sprinkling his image, clothing it with coloured cloths, and anointing it with oil (Erbman, Die aegyptische Religion, p. 49). In the magical texts of Babylonia a similar virtue was attached to oil: "bright oil, pure oil, resplendent oil that bestows magnificence on the Gods . . . the oil for the conjunction (δύτης) of Marduk" (Tallquist, Mabûl series, tablet vii. col. 1, 31 sqq.; cf. Gressmann, Der Ursprung der israelitisch-jüdischen Escholatologie, p. 298 sqq.). We have, in Schrader's K. I. B. v. letter 37 (p. 98), evidence from the Tell el-Amarna tablets that the anointing of kings was practiced in Egypt or Syria in 1450 B.C. (c.) in a letter addressed to the Egyptian king by Ramman-nirari of Nubhassu, in which the intimate relations which in primitive times subsisted between the sorcerer and the king see the citation from Frazer's Early History of Kingship, p. 127, in the article PRIEST, and cf. p. 29: "Classical evidence points to the conclusion that in prehistoric ages . . . the various tribes or cities were ruled by kings who discharged priestly duties" (p. 31). Thus the early kings of Assyria were priests of Assur (Assur), the tutelary deity of Assyria. Tiglath-Pileser I. (c. 1100 B.C.) calls his predecessors, Samuel, Nathan, and Imai-Dagan, Ilhuke (šu-tē-iš) of the God Assur (Prism-insc. col. vii. 62, 63). Later kings, e.g., Shalmaneser II. (Nimrud-oblisk, line 15, monolith, line 11) and Assur-bani-pal (Rassam cyl. col. vii. 94) call themselves by the more definite title of šašu of Assur. The Hebrew word with the article prefixed occurs in the Old Testament only in the phrase "the anointed priest" (Lev. iv. 3, 5, 16; vi. 22 [r.]), but "Yahweh's anointed" is a common title of the king of Israel, applied in the historical books to Saul and David, in 1 Sam. iv. 20 to Zedekiah, and in Isa. xlv. 1 extended to Cyrus. In the Psalms corresponding phrases (My, Thy, His anointed) occur in verses which may be added the lyrical passages 1 Sam. ii. 10, Hab. iii. 13.

In the present attitude of literary criticism it would be most difficult to assert, as Robertson Smith did in the 9th edition of this work, that "in the intention of the writers it [i.e. the term messiah or "anointed"] refers to the king then on the throne." Nor would most recent critics agree with Professor Driver (L.O.T., 8th ed. p. 385) in considering Ps. ii. 1 and lxii. as "presumably pre-exilic." G. Buchanan Gray (J.Q.R., July 1895, p. 638 sqq.) draws a parallel between the "king" in the Psalms and the "servant" in Deutero-Isaiah or Yahweh's "Son" (in Hos. xi. 1, &c.) which is applied to Israel either actual or idealized. It would be possible so to interpret "king" or "anointed" in some Psalms, e.g. lxi., lxxi. and lxxxiv., but hardly in Ps. lxxi., lxxiii. and lxxxiv., where the Messianic reference is strongly personal. 2 In the Psalms the ideal aspect of the kingship, its religious importance as the expression and organ of Yahweh's sovereignty, is prominent. When the Psalter became a liturgical book the historical kingship had gone by, and the idea alone remained, no longer as the interpretation of a present political fact but as part of Israel's religious inheritance. It was impossible, however, to think that a true idea had become obsolete merely because it found no expression on earth for the time being; Israel looked again for an anointed king to whom the words of the sacred hymns should apply with a force.

2 In Ps. lxxxiv. 9 (10) it is disputed whether the anointed one is the king, the priest, or the nation as a whole. The second view is perhaps the best.
never realized in the imperfect kingship of the past. Thus the Psalms were necessarily viewed as prophetic; and meantime, in accordance with the common Hebrew representation of ideal things as existing in heaven, the true king remains hidden with God. The steps by which this result was reached must, however, be considered in detail.

The hope of the advent of an ideal king was only one feature of that larger hope of the salvation of Israel from all evils, which was constantly held forth by all the prophets, from the time when the seers of the 8th century b.c. proclaimed that the true conception of Yahweh's relation to His people could become a social reality only through a great deliverance following a sifting judgment of the most terrible kind. The idea of a judgment so severe as to render possible an entire breach with the guilty past is common to all the prophets, but is expressed in a great variety of forms and images. As a rule the prophets directly connect the final restoration with the removal of the sins of their own age; to Isaiah the last troubles are those of Assyrian invasion, to Jeremiah the restoration follows on the exile to Babylon, to Daniel on the overthrow of the Greek monarchy. But all agree in giving the central place to the replacement or re-creative function of Yahweh. In this conception of the religious subject as the nation of Israel, with a national organization under Yahweh as king, is common to the whole Old Testament, and connects prophecy proper with the so-called Messianic psalms and similar passages which speak of the religious relations of the Hebrew commonwealth, the religious meaning of national institutions, and so necessarily contain ideal elements reaching beyond the empirical present. All such passages are frequently called Messianic; but the term is more properly reserved as the specific designation of one particular branch of the Hebrew hope of salvation, which becoming prominent in post-canonical Judaism used the name of the Messiah as a technical term (which it never is in the Old Testament), and exercised a great influence on New Testament thought—the term "the Christ" (ὁ χριστός) being itself nothing more than the translation of "the Messiah."

In the period of the Hebrew monarchy the thought that Yahweh is the divine king of Israel was associated with the conception that the human king reigns by right only if he reigns by commission or "inunction" from Him. Such was the theory of the kingship in Ephraim as well as in Judah (Deut. xxiii. 11; 2 Kings ix. 6), till in the decadence of the northern state Amos (ix. 11) foretold the reintegration of the Davidic kingdom, and Hosea (iii. 5; viii. 4) expressly associated a similar prediction with the condemnation of the kingship of Ephraim as illegitimate. So the great Judaean prophets of the 8th century connect the salvation of Israel with the rise of a Davidic king, full of Yahweh's Spirit, in whom all the energies of Yahweh's transcendental kingship are as it were incarnate (Isa. ix. 6 seq.; xl. 1 seq.; Micah v.). This conception, however, is not one of the constant elements of prophecy; other prophecies of Isaiah look for the decisive interposition of Yahweh in the crisis of history without a kingly deliverer. Jeremiah again speaks of the future David or righteous sprout of David's stem (xxii. 5 seq.; xxx. 9) and Ezekiel uses similar language (xxxiv., xxxvii.); but that such passages do not necessarily mean more than that the Davidic dynasty shall be continued in the time of restoration under worthy princes seems clear from the way in which Ezekiel speaks of the prince in chs. xlv., xlvii. As yet we have no fixed doctrine of a personal Messiah, but only material from which such a doctrine might be drawn. The religious view of the kingship is still essentially the same as in 2 Sam. vii., where the endless duration of the Davidic dynasty is set forth as part of Yahweh's plan.

There are other parts of the Old Testament—notably 1 Sam., viii., xii. (belonging to the later stratum)—in which the very existence of a human kingship is represented as a departure from the theocratic ideal, and after the exile, when the monarchy had come to an end, we find pictures of the latter days in which its Restoration has no place. Such is the great prophecy of Isa. xl.-xlviii., in which Cyrus is the anointed of Yahweh. So too there is no allusion to a human kingship in Joel or in Malachi; the old forms of the Hebrew state were broken, and religious ideas were fashioned themselves in other shapes. 2 In the book of Daniel it is collective Israel that, under the symbol of a "son of man," receives the kingdom (vii. 15, 18, 22, 27).

Meantime, however, the decay and ultimate silence of the living prophetic word concurred with prolonged political servitude to produce an important change in Hebrew religion. To the prophets the kingship of Yahweh was not a mere ideal, but an actual reality. Its full manifestation indeed, to the eye of sense and to the unbelieving world, lay in the future; but true faith found a great soul and saving image of Yahweh in the hope of the Messiah, by which all history was to be sifted. This was exhibited in the writings of the 2nd and 1st centuries b.c., when the hope too was only to be read in books, and these were interpreted of a future which was no longer the ideal development of forces already at work, but wholly new and supernatural. The present was a blank, in which religious duty was summed up in patient obedience to the law and penitent submission to the Divine chastisements. The scribes were mainly busied with the law; but no religion can subsist on mere law; and the systematization of the prophetic hopes, and of those more ideal parts of the other sacred literature which, because ideal and disavowed from the present, were now set on one line with the prophesies, went on side by side with the systematization of the law, by means of a harmonistic exegesis, which sought to gather up every prophetic image in one grand panorama of the issue of Israel's and the world's history. The beginnings of this process can probably be traced within the canon itself, in the book of Joel and the last chapters of Zechariah; 2 and, if this be so, we see from Zech. ix. that the picture of the ideal king claimed a place in such constructions. The full development of the method belongs, however, to the post-canonical literature, and was naturally much less regular and rapid than the growth of the legal traditions of the scribes. It was in crises of national anguish that men turned most eagerly to the prophecies, and sought to construe their teachings as a promise of speedy deliverance (see APOCALYPTIC LITERATURE). But these books, however influential, had no public authority, and when the yoke of oppression was lightened but a little their enthusiasm lost much of its contagious power. It is not therefore safe to measure the general growth of eschatological doctrine by the apocalyptic books, of which Daniel alone attained a canonical position. In the Apocrypha eschatology has a relatively small place; but there is enough of it to show that it has never been forgotten, and that the imagery of the prophets was accepted with a literalness not contemplated by the prophets themselves.

It was, however, only very gradually that the figure and name of the Messiah acquired the prominence which they have in

1 Most recent critics regard Amos ix. 9-15 as a later addition, and the same view is held by Nowack, Harer and others respecting Hos. iii. 5; thr. continuous development from qdHis. ix. 1-7, xi. 1 seq. are held by Hackmann, Cheyne, Marty, and other critics to be post-exilic; Duhm and others hold that they are genuine. It may be admitted that Isa. xi. 1 seq. might be held to be contemporary with Isa. lv. 3, 4, and to refer to Zerubbabel. Cf. Haggai ii. 21-23, composed seventeen years afterwards. Mic. v. 1-8 can with difficulty be regarded as genuine.

2 The hopes which Haggai and Zechariah connect with the name of Zerubbabel, a descendant of David, hardly form an exception to this statement. There may even be a reference to him in Isa. 1v. 3, 4.  

later Jewish doctrine of the last things and in the official exegesis of the Targums. In the very developed eschatology of Daniel they are, as we have seen, altogether wanting, and in the Apocrypha, both before and after the Maccabean revival, the everlasting throne of David's house is a mere historical reminiscence (Ecclus. xlvii. 11; 1 Macc. ii. 57). So long as the wars of independence occupied the Palestinian Jews, and the Hasmonaean sovereignty promised a measure of independence and felicity under the law, the hope that connected itself with the House of David was not likely to rise to fresh life; especially as a corollary this was one of the numerous passages of Scripture which speak of the ideal king might with a little straining be applied to the rising star of the new dynasty (cf. 1 Macc. xiv. 4-15). It is only in Alexandria, where the Jews were still subject to the yoke of the Gentile, that at this time (c. 140 B.C.) we find the oldest Sibylline verses (iii. 652 seq.) proclaiming the approach of the righteous king whom God shall raise up from the East (Isa. xii. 2). The name Messiah is still lacking, and the central point of the prophecy is not the reign of the deliverer but the subjection of all nations to the law and the temple.

With the growing weakness and corruption of the Hasmonaean princes, and the alienation of a large part of the nation from their cause, the hope of a better kingship begins to appear in Judaea also; at first darkly shadowed forth in the Book of Enoch (chap. xc.), where the white steer, the future leader of God's herd after the deliverance from the heathen, stands in a certain contrast to the actual dynasty (the horned lambs); and then much more clearly, and for the first time with use of the name Messiah, in the Psalm of Solomon, the chief document of the protest of Pharisaism against its enemies the later Hasmonaean Pharisees. This struggle between the Pharisees and Sadducees, between the party of the scribes and the aristocracy, was a struggle for mastery between a secularized hierarchy whose whole interests were those of their own selfish politics, and a party to which God and the exact fulfillment of the law according to the scriptures were all in all. This doctrine had grown up under Persian and Grecian rule, and no government that possessed or aimed at political independence could possibly show constant deference to the punctilios of the schoolmen. The Pharisees themselves could not but see that their principles were politically impotent; the most scrupulous observance of the Sabbath, for example,—and a principle the culminating point of legality,—could not thrust back the heathen. Thus the party of the scribes, when they came into conflict with an active political power, which at the same time claimed to represent the theocratic interests of Israel, were compelled to lay fresh stress on the doctrine that the true deliverance of Israel must come from God. But now the Jews were a nation once more, and national ideas came to the front. In the Hasmonaean sovereignty these ideas took a political form, and the result was the secularization of the kingdom of God for the sake of a harsh and rapacious aristocracy. The nation threw itself on the side of the Pharisees; not in the spirit of punctilious legality, but with the ardour of a national enthusiasm deceived in its dearest hopes, and turning for help from the delusive kingdoms of the Hasmonaean to the true kingship of Yahweh, and to His viceroy the great son of David's house. It is in this connexion that the doctrine and name of Messiah appear in the Psalter of Solomon. The eternal kingship of the House of David, so long forgotten, is seized on as the proof that the Hasmonaean have no divine right. Thou, Lord, art our king for ever and ever... Thou dost choose David as king over Israel, and swears unto him concerning his seed for ever that his kingdom should never fail before Thee. And for our sins sinners (the Hasmonaean) have risen up over us, taking with force the kingdoms which were given to David and his sons, and the throne of David in their pride. But Thou, O Lord, will cast them down and root out their seed from the land, when a man not of our race (Pompey) rises up against them... But Thou, O Lord, hast appointed, to reign over Israel Thy servant; and gird him with strength to crush unjust rulers; to cleanse Jerusalem from the heathen that tread it under foot, to cast out sinners from Thy inheritance; to break the pride of sinners and all their strength as potter's vessels with a rod of iron (Ps. ii. 9); to destroy the lawless nations with the word of his mouth (Isa. xi. 4); to gather a people, and lead them by the hands of Abraham... He shall divide them by tribes in the land, and no stranger and foreigner shall dwell with them; he shall judge the nations in wisdom and righteousness. The nations shall serve under his yoke; he shall glorify the Lord, before all the nations in homage in honor in the beginning. From the ends of the earth all nations shall come to see his glory and bring the weary sons of Zion as gifts (Isa. lv. 5 seq.); to see the glory of the Lord with which God hath crowned him, for he is over them a righteous king taught of God. In his days there shall be no unrighteousness in their midst; for they are all holy and their king the anointed of the Lord (apart from the notion of his ascension to heaven).

This conception is traced in lines too far to be those of a first essay; it had doubtless grown up as an integral part of the religious protest against the Hasmonaean. And while the polemical motive is obvious, and the argument from prophecy against the legitimacy of a non-Davidic dynasty is quite in the manner of the scribes, the spirit of theocratic fervour which inspires the picture of the Messiah is broader and deeper than their narrow legalism. In a word, the Jewish doctrine of the Messiah marks the fusion of Pharisaism with the national religious sentiment of the time.

The Messiah is therefore a leader and a restorer; he is a spiritual and legal restorer, claiming a leader against the Romans as well as deliverance from the Sadducee aristocracy, again sets the idea of the kingship rather than that of resurrection and individual retribution in the central place. Henceforward the doctrine of the Messiah is the centre of popular hope and the object of theological culture. The New Testament is the best evidence of its influence on the masses (see especially Matt. xxi. 9); and the exegesis of the Targums, which in its beginnings doubtless reaches back before the time of Christ, shows how it was fostered by the Jews and preached in the synagogues. It became the faith of the whole Jewish people, and in circles least accessible to such ideas, is proved by the fact that Philo himself (De praem. et poen. § 16) gives a Messianic interpretation of Num. xxiv. 27 (LXX). It must not indeed be supposed that the doctrine was as yet the undisputed faith of the Hebrew nation; it became only the faith of the Hebrew people when they had become Christian. The New Testament proves that the talmudic and the rabbinical interpretation of the Messianic king gave the chief impulse to the war that ended in the destruction of the Jewish state; after the fall of the temple the last apocalypses (Baruch, 4 Ezra) still loudly proclaim the near victory of the God-sent king; and Bar Cocheba, the leader of the revolt against Hadrian, was actually greeted as the Messiah by Rabbi Akiba (cf. Luke xxii. 8). These hopes were again quenched in blood; the political idea of the Messiah, the restorer of the Jewish state, still finds utterance in the daily prayer of every Jew (the Shemoneh Esrei), and is enshrined in the system of Rabbinical theology; but its historical significance was buried in the ruins of Jerusalem.

1 The Targumic passages that speak of the Messiah are registered by Buxtorf, Lex. Chald., s.v.

2 The Messiah has continued from time to time to appear among the Jews. Such was Schermis of Syria (c. 720 A.D.). Soon after, Messianic hopes were active at the time of the fall of the Omayyads, and led to the declaration of the Abad Iusa of Imamah. The false Messiah David Aluri (Alroy) appeared among the warlike Jews in Azerbaijan in the middle of the 12th century. The Messianic claims of Abraham of Saragossa (Alarcon) had a small influence on the Christian movements. In those times encouraged the wildest hopes at a later time. Thus Abarbanel calculated the coming of the Messiah for 1503 A.D.; the year 1500 was in many places observed as a propitious season of penance; and throughout the 16th century the Jews were much more stirred and more than one false Messiah appeared. See also Sabbatai, Sehi.
MESSINA

But this proof that the true kingdom of God could not be realized in an earthly state, under the limitations of national particularism, was not the final refutation of the Old Testament. The last convulsions of political Judaism—a new spiritual conception of the kingdom of God, of salvation, and of the Saviour of God’s anointing, had shaped itself through the preaching, the death, and the resurrection of Jesus of Nazareth. As applied to Jesus the name of Messiah lost all its political and national significance. Between the Messiah of the Jews and the Son of Man who came to give His life a ransom for many there was on the surface little resemblance; and from their standpoint the Pharisees reasoned that the marks of the Messiah were conspicuously absent from this Christ. But when we look on the deeper side of the Messianic conception in the Psalter of Solomon, at the heartfelt longing for a leader in the way of righteousness and acceptance with God which underlies the aspirations after political deliverance, we see that it was in no mere spirit of accomodation to prevailing language that Jesus did not disdain the name in which all the hopes of the Old Testament were gathered up.

Messianic Parallels.—Within the limits of this article it is impossible to attempt any extended survey of parallels to Hebrew Messianic conceptions drawn from other religions. One interesting parallel, as represented by Pseudo-Pharisaic, might be cited from the Bhagavad-gītā, iv. 5–8, in which Krishna says:

"Many are the births that have passed of me and of thee, O Arjuna. All these I know: thou knowest them not, O conqueror of thy foes. Unborn, of imperishable soul, the Lord of all creatures, Taining all by the name of my own name, born by my own power. And whenever, O son of Bharata, there is decay of righteousness and a rising up of unrighteousness, I create myself, for the good of the good and for the destroying of evil-doers, and for the establishing of righteousness I arise from age to age."

Somewhat similar are the avatars of Vishnu, who becomes incarnate in a portion of his essence on ten occasions to deliver mankind from certain great dangers. Krishna himself is usually regarded as one of these avatars. This we may consider as one of the striking parallels which meet us in other religions to that "hope of the advent of an ideal king which was one of the features of that larger hope of the salvation of Israel from all evils, the realization of perfect recognition with Jehovah and the felicity of the righteous in Him," to which reference was made in an early portion of this article and which constitutes the essential meaning of Messianic hope. The Psalter of Solomon, which in the above quoted lines is more closely analogous amid many differences to the later and apocalyptic type of the Messianic idea as it appears in Judaism.

The interesting parallels between the Babylonian Marduk (Merodach) god of light and Christ as a world saviour are ingeniously set forth by Zimmer in K.A.T., 3rd ed., pp. 376–391, but the total impression which they leave is vague. It would carry us too far to consider in this place the details of the Jewish conception of the Messiah and the Messianic times as they appear in the later apocalypses or in Talmudic theology. See for the former the excellent summary of Schürer, Geschichte des jüdischen Volkes im Zeitalter Jesu Christi, 3rd ed., vol. ii, pp. 497–556. See also Weber, Jüdische Theologie, ch. xxiii. For the whole subject see also Drummond, The Jewish Messiah, and Kuenen, Religion of Ancient Israel, 2nd ed. For the Messianic hope of the Pharisees and the Psalter of Solomon see especially Wellhausen, Phariser und Sadduzaeer (Greifswald, 1874). In its ultimate form the Messianic hope of the Jews is an embodiment of the hope of the whole of the world, combining the hope of the last troubles of Israel (called by the Rabbins the "birth pang of the Messiah"), the appearing of the anointed king, the annihilation of the hostile enemy, the return of the dispersed of Israel, the glory and world-sovereignty of the elect, the new world, the resurrection of the dead and the last judgment. But even the final form of Jewish theology shows much vacillation as to these details, especially as regards their sequence and mutual relation, thus betraying the inadequacy of the harmonistic method by which they were derived from the Old Testament and the stormy excitement in which the Messianic idea was developed. It is, for example, on an open question, according to the Rabbins, whether the days of the Messiah belong to the old or to the new world (730735 or 735737), whether the resurrection embraces all men or only the righteous, whether it precedes or follows the Messianic age. Compare Millennium.

We must also pass over the very important questions that arise as to the gradual extinction of the New Testament idea of the Christ from the elements of Jewish political doctrine which had so strongly a hold of many of the first disciples—the relation, for example, of the New Testament Apocalypse to contemporary Jewish thought. A word, however, is necessary as to the Rabbinical doctrine of the Messianic son of Joseph or son of Ephraim, who in Jewish theology is distinguished from and subordinate to the victorious son of David. The Talmud taught for a time the dualism of the apocalyptic of the polemics with Christianity, in which the Rabbins were hard pressed by arguments from passages (especially Isa. liii) which their own exegesis admitted to be Messianic, though it did not accept the Christian inference as to the atoning death of the Messianic king. That the Jews in the time of Christ believed in a suffering and atoning Messiah is, to say the least, unproved and highly improbable. See, besides the books above cited, De Wetten, Geschichte des Messianischen, 2nd ed. The following passages from the Talmud and the Rabbinical literature as quoted by M. Hirsch, "Der Christentum und das Judentum," 3rd ed. (1893), are of interest. See the articles on "Messiah" in Hastings’s D. B. (together with Fairweather’s art., "Development of Doctrine," in extra vol., pp. 295–303) in Ency. Bibl. Also P.R.E., 3rd ed., as well as Hastings’s Introduction of Christ and the Gospels, should be consulted. Comp. Ederseim, Leben und Zeiten des letzten Messias (3rd ed., 1896), 555–565. See also Weber, "Der Messianismus in der Jüdischen Geschichte," Gesch. d. jüd. Volkes im Zeitalter Jesu Christi, 3rd ed., vol. ii, pp. 397–409; a full survey of the literature will be found in Schürer, op. cit., p. 496 sqq.

MESSINA, a city, in Sicily, 7 m. S.S.W. of the promontory of Faro (anc. Promontorium Pelorum), which forms the north-eastern angle of the island, the capital of the province of Messina and the seat of an archbishop. Pop. (1890), 159,812. The site of the town curves round the harbour, between two ridges of Antennaria, the highest point of which is 376 ft. The straits, which take their name from the town, are here about 13 m. wide, and only a little over 2 m. at the promontory of Faro. The numerous earthquakes from which the city had suffered, notably that in 1783, had left it few remains of antiquity. But it was a flourishing and beautiful city when in 1008 one of the most disastrous earthquakes ever recorded destroyed it totally. The earthquake occurred early in the morning of December 28, and so far as Messina was concerned the damage was done chiefly by the shock and by the fires which broke out afterwards; the seismic wave which caused the fatal conflagration did not reach Messina. But there was damage elsewhere along the strait, notably at Reggio, Calabria, which was also totally destroyed. Many other smaller towns suffered both in Sicily and in Calabria; the loss of life was appalling and the distress widespread, in spite of the prompt assistance rendered by Italian naval and military forces and by the crews of British, Russian and German warships and other vessels, and the contribution of funds for relief works from every part of the world. The immediate seismic focus appeared to be in the straits, but Dr E. Saccio pointed out that it was surrounded by a curved line of earth-fracture, following an arc drawn from Messina in the Lipari Islands, from Catanza torina, and so westward; within this arc he held that the crust of the earth is gradually sinking, and is in an unstable condition. According to an official estimate the earthquake caused the loss of 17,283 lives. (See also EARTHQUAKE.)

The façades of buildings at Messina in great part withstood the earthquake, but even when they did so the remainder of the buildings was destroyed. The cathedral, which was completely wrecked, was begun in 1058 and finished by Roger II. It had a fine Gothic façade: the interior had mosaics in the apses dating from 1330, and the nave contained 56 grand columns from the baths of Domitian. This church was brought from a temple of Jupiter on the promontory near Faro, and had a fine wooden roof of 1260. The rest of the edifice was in the baroque style; the high altar (containing the supposed letter of the Virgin Mary to the people of Messina), richly decorated with marbles, lapis lazuli, &c., was begun in 1628 and completed in 1726. The importance of Messina was almost entirely due to its

harbour, a circular basin open on the north only, formed by a steep land curving round like a sickle, from which it took its original name, Zanco (γάκκυν, or rather δάκκυν, the Sicilian equivalent of the Greek ὑγρόνος,1 according to Thucydides, vi. 4).

Zanco was first founded, no doubt on the site of an earlier settlement, by pirates from Cumae, and again more regularly settled, after an unknown interval, by settlers from Cumae under Perieres, and from Chalcis under Cratamenae, in the first quarter of the 8th century B.C. Mylae must have been occupied as an outpost very soon afterwards, but the first regular colony of Zanco was Himera, founded in 648 B.C. After the capture of Milazzo by the Persians in 494 B.C. Skythes, king of Zanco, invited the Ionians to come and settle at Καλή Άστρῃ, then in the occupation of the Sicels (the modern Marina di Caronia, 25 m. east of Cefalu); but at the invitation of Anaxilas of Regium the Samians proceeded instead to the latter place. About 488 B.C. Anaxilas and the Samians occupied Zanco in the absence of Skyes, and it was then that the name was changed to Messene, as the existence of coins of the Samian type, bearing the new name, proves. About 460, however, Anaxilas thoroughly established his authority at Messene, and the types of coinage introduced by him persisted for two centuries.2 When, about 120 B.C., 2 when Alexander zealously supported his son-in-law Terillus in inviting the Carthaginians' invasion of 480 B.C. In 426 the Athenians gained the alliance of Zanco, but soon lost it again, and failed to obtain it in 415.

Messina fell into the hands of the Carthaginians during their wars with Dionysius the elder of Syracuse (307 B.C.). The Carthaginians destroyed the city, but Dionysius recaptured and rebuilt it. During the next fifty years Messina changed masters several times, till Timoleon finally expelled the Carthaginians in 343 B.C. In the wars between Agathocles of Syracuse and Carthage, the city was the sister city of the Carthaginians. After Agathocles' death, his mercenaries, the Mamertines, treacherously seized the town about 282 B.C. and held it. They came to war with Hiero II. of Syracuse and appealed for help to Rome, which was granted, and this led to a collision between Rome and Carthage, which ended in the First Punic War. Messina was almost at once taken by Rome. At the close of the war, in 241 B.C., Messina became a free and allied city (eititas foederata), and obtained Roman citizenship; but the rest of Sicily, probably from Caesar himself. During the civil wars which followed the death of Caesar, Messina, held with Syracuse by Pompeius; and in 31 B.C. was sacked by Octavian's troops. After Octavian's proclamation as emperor he founded a colony here; and Messina continued to flourish as a trading port. In the division of the Roman empire it belonged to the emperors of the East; and in A.D. 547 Belisarius collected his fleet here before crossing into Calabria. The Saracens took the city in A.D. 831; and in 1061 it was the first permanent conquest made in Sicily by the Normans. In 1190 Richard I. of England, with his crusaders, passed six months in Messina. He quarrelled with Tancred, the last of the Hauteville dynasty, and sacked the town. In 1194 the city, with the rest of Sicily, passed into the hands of Henry of Sicily, and then under the emperor Henry VI., who died there in 1197; and after the fall of the Hohenstaufen was defended for Peter I., king of Aragon, and Charles I., count of Anjou. At the time of the Sicilian Vespers (1282), which drove the French out of Sicily, Messina bravely defended itself against Charles of Anjou, and repulsed his attack. Peter I., through his commander Ruggiero di Loria, defeated the French off the Faro; and from 1282 to 1713 Messina consisted a possession of the Spanish royal house. In 1571 the fleet fitted out by the Holy League against the Turk assembled at Messina, and in the same year its commander, Don John of Austria, celebrated a triumph in the city for his victory at Lepanto. Don John's statue stands in the Piazza dell' Annunziata. For one hundred years, thanks to the favours and the concessions of Charles V., Messina enjoyed great prosperity. But the internal quarrels between the Merli, or aristocratic faction, and the Malvezzi, or democratic faction, sowed as they were by the Spaniards, helped to ruin the city (1671-1678). The Messinians suspected the Spanish court of a desire to destroy the ancient senatorial constitution of the city, and sent to France to ask the aid of Louis XIV. in their resistance. Louis despatched a fleet into Sicilian waters, and the French occupied the city. The Spaniards repaid by appealing to Holland, who sent a fleet under Ruyter into the Mediterranean. In 1676 the French admiral, Abraham Duquesne, defeated the combined fleet of the Netherlands and England; but, notwithstanding this victory, the French suddenly abandoned Messina. This was the second time the town once more. The senate was suppressed, and Messina lost its privileges. This was fatal to the importance of the city. In 1743 the plague carried off 40,000 inhabitants. The city was partially destroyed by earthquake in 1783. During the revolution of 1848 against the Bourbons of Naples, Messina was bombarded for three consecutive days. In 1854 the deaths from cholera numbered about 15,000. Garibaldi landed in Sicily in 1860, and Messina was the last city in the island taken from the Bourbons and made a part of united Italy under Victor Emmanuel.

Messina was the birthplace of Diodoirus, the historian (c. 322 B.C.); Aristocles, the Peripatetic; Euhemerus, the rationalist (c. 316 B.C.); Stefano Protonotario, Mazzeo di Ricco and Temmasio di Costanza; the painter of the court of Frederick II. (A.D. 1250); and Antonello da Messina, the painter (1474-1500), of whose works one is preserved. During the 15th century the grammarian, Constantine Lascaris, taught in Messina; and Bessarion was for a time archimandrite there. (T. As.)

MESUAGE (from Anglo-French message, probably, a corruption of mesage, mensage, popular Lat. mansiones, from mansio, whence mod. Fr. messon, from manere, to dwell), in law, a term equivalent to a dwelling-house, and imposing on it the obligation to preserve it in such a state as a dwelling-house. Buildings, orchard, court-yard and garden. At one time "mesuage" is supposed to have had a more extensive meaning than that comprised in the word "house," but such distinction, if it ever existed, no longer survives.

MESTIZO (adopted from the Spanish, the Portuguese form being mestizo, from Lat. mixere, to mix), a term originally meaning a half-breed, one of whose parents was Spanish, and now used occasionally of any half-breed, but especially to denote persons of mixed Spanish (or Portuguese) and American Indian blood. The offspring of such half-breeds are also called mestizos. The feminine form is mestiça.

MESUREUR, GUSTAVE EMIL EUGÈNE (1847— ), French politician, was born at Marcq-en-Barœul (Nord) on the 2nd of April 1847. He worked as a designer in Paris, and became prominent as a member of the municipal council of Paris, rousing much angry discussion by a proposal to rename the Parisian streets which bore saints' names. In 1887 he became president of the council. The same year he entered the Chamber of Deputies, taking his place with the extreme left. He joined the L. Bourgeois ministry of 1893-1896 as minister of commerce, and was vice-president of the Chamber from 1898 to 1902, and presided over the Budget Commission of 1899, 1901 and 1902. He was defeated at the polls in 1902, but became director of the Assistance Publique. His wife, Amélie de Wally (b. 1853), is well known as a writer of light verse and of some charming children's books.

META, the Latin word for the goal which formed the turning-point for the chariot races in the Roman circus. The mete consisted of three conical pillars resting on a single podium. None have been preserved, but they are shown on coins, gems and terra-cotta bas-reliefs.

METABOLIC DISEASES. All disease is primarily due to alterations (Gr. μεταβολή, change), quantitative or qualitative, in the chemical changes in the protoplasm of some or all of the tissues of the body. But while in some pathological states these modifications lead to structural changes, in others they do not produce gross lesions, and the latter conditions are commonly classified as Functional Diseases. When such

---

1 From this word Trapani derives its name.
2 This account is at variance with the literary evidence and rests on that of the coins, as set forth by I. H. Dodd in Journal of Hellenic Studies, xxviii. (1908) 56 sqq.
functional disturbances affect the general nutrition of the body. They have been termed Metabolic Diseases (Stoffwechselkrankheiten). It is impossible to draw a hard and fast line between functional and organic disease, since the one passes gradually into the other, as is well seen in gout. Nor is it always easy to decide how far the conditions are due merely to quantitative alterations in the metabolism and how far to actual qualitative changes, for it is highly probable that many of the apparently qualitative alterations are really quantitative disturbances in one part of the protoplastic mechanism, leading to an apparent qualitative change in the total result of the activity.

Obesity.—It is as fat that the surplus food absorbed is stored in the body; but the power of storing fat varies enormously in different individuals, and in some it may be considered pathological. The reasons of this are very imperfectly understood. One undoubted cause of obesity is a lack of exercise in excess of the energy requirements of the individual. The amount of food may be absolutely large, or large relatively to the muscular energy evolved in mechanical work or in heat-production; but in either case, when fat begins to be deposited, the muscular activity of the body tends to diminish and the loss of heat from the surface is reduced; and thus the energy requirements become less, and a smaller diet is sufficient to yield the surplus food as a deposit of fat. A hard and fast line between fat and carbohydrates, and possibly indirectly from proteids (see Nutrition). Individuals probably vary in their mode of dealing with these substances, some having the tendency to convert them to fat, some to burn them off at once. Carl von Noorden, however, who has studied the metabolism in cases of obesity, finds no marked departure from the normal. It may be that in some persons there is a very perfect absorption of food, but so far no scientific evidence for this view is forthcoming. In all cases the fat stored is available as a source of energy, and this circumstance is taken advantage of in the various fat "cures," which consist in giving a diet containing enough proteins to cover the requirements of the body, with a supply of fats and carbohydrates insufficient to meet the energy requirements of the individual.

This is illustrated by the dietaries of some of the best known of these "cures":—

<table>

</tbody>
</table>

In a normal individual in moderate muscular activity about 3000 Calories per diem are required (see Dietetics), and therefore under the diets of these "cures," especially when accompanied by a proper amount of muscular exercise, the fats stored in the body are rapidly used up.

Diabetes, as distinguished from transitory glycosuria, is produced by a diminution in the power of the tissues to use sugar, which thus accumulates in the blood and escapes in the urine. One great source of energy being unavailable, the tissues have to use more fats and more proteids to procure the necessary energy, and hence, unless these are supplied in very large quantities, there is a tendency to emaciation.

The power of storing and using sugar in the tissues is strictly limited, and varies considerably in healthy individuals. Normally, when about 200 grms. of glucose are taken at one time, some of it appears in the urine within one hour. In some individuals the taking of even 100 grms. leads to a transient glycosuria, while others can take 250 grms. or more and use it all. But even in the same healthy individual the power of using sugar varies at different times and in different conditions, muscular exercise markedly increasing the combustion. Again, some sugars are more readily used than others, and therefore there has a less tendency to appear in the urine when taken in the food. Milk-sugar and laevulose appear in the urine more readily than glucose. This power of using sugar possessed by an individual may depend to a small extent on the capacity of the liver to store as glycogen any excess of carbohydrates absorbed from the food, and some slight cases of transient glycosuria may be accounted for by a diminution of this capacity. But the typical form of diabetes cannot be thus explained. It has been maintained that increased production of sugar is a cause of some cases of the disease, and this view has been supported by Claude Bernard's classical experiment of producing glycosuria by puncturing the floor of the fourth ventricle in the brain of the rabbit. But after such puncture the glycosuria occurs only when glycogen is present in the liver. It is transient and has nothing to do with true diabetes. The fact that various toxic substances, e.g. carbon monoxide, produce glycosuria has been used as an argument in support of this view, but they too seem to affect a conversion of glycogen to glucose, and are effective only when the liver is charged with the former substance. At one time it was thought that the occurrence of glycosuria under the administration of phloridzin proved that diabetes is due to a poison. But the fact that, while sugar appears abundantly in the urine under phloridzin, it is not increased in the blood, shows that the drug acts not by diminishing the power of the tissues to use sugar, but by increasing the excretion of sugar through the kidneys and thus causing its loss to the body. Hence the tissues have to fall back upon the proteids, and an increased excretion of nitrogen is produced. This, however, is a totally different condition from diabetes.

Anything which produces a marked diminution in the normally limited power of the tissues to use sugar will cause the disease in a lighter or graver form. As age advances the activity of the various metabolic processes may diminish irregularly in certain individuals, and it is possible that the loss of the power of using sugar may be sooner impaired in some than in others, and thus diabetes be produced. But Minkowski and von Mering have demonstrated, by experiments upon animals, that pathological changes in the pancreas have probably a causal connection with the disease. They found that excision of that organ in dogs, &c., produced all the symptoms of diabetes—the appearances of sugar in the urine, its increased amount in the blood, the rapid breaking-down of proteids, and the resulting emaciation and azoturia. At the same time the absorption from the intestine of proteids, fats and carbohydrates was diminished. How this pancreatic diabetes is produced has not been explained. It has been suggested that the pancreas forms an internal secretion which stimulates the utilization of sugar in the tissues. Though in a certain number of cases of diabetes disease of the pancreas has been found, other cases are recorded where grave disease of that organ has not produced this condition. But the apparent extent of a lesion is often no measure of the depth to which the functions of the structure in which it is situated are altered, and it is very possible that the functions of the pancreas may in many cases be profoundly modified without our methods of research being able to detect the change. The pancreas consists of two parts, the secreting structure and the epithelial islets, and one or other of these may be more specially involved, and thus alteration in digestion and absorption on the one hand, and changes in the utilization of carbohydrates on the other, may be independently produced. The large doses of extracts of the supra-renal bodies causes glycosuria and an increase of sugar in the blood, but the relationship of this condition to diabetes has not yet been investigated.

The disease may be divided into two forms:—
1. Slight Cases.—The individual can use small quantities of sugar, but the taking of larger amounts causes glycosuria. Supposing that the energy requirements of an individual are met by a diet of—

| Protid | 100 grms. | 410 Calories. |
| Fat   | 100 "     | 930 "         |
| Carbohydrate | 400 " | 1640 " |

then if only 100 grms. of glucose can be used, the energy value of 300 grms., i.e. 1230 Calories, must be supplied from proteids and fats. To yield this, 300 grms. of proteids or 152 grms. of fats would be required. If these are not forthcoming in the diet, they must
be supplied from the tissues, and the individual will become emaciated; hence a diabetic on an ordinary diet is badly nourished, and hence the huge appetite characteristic of the disease.

2. Grave Cases.—From the products of the splitting of proteids sugars and uric acid are formed in the liver, and in more serious form of the disease, even when carbohydrates are excluded from the food, a greater or lesser quantity of the sugar thus formed escapes detection. But probably the increased formation of sugar can yield 113.5 grms. of glucose, i.e. 1 grm. of nitrogen will be set free for each 7.5 grms. of glucose formed. In the urine of grave cases of diabetes on a proteid diet, the proportion of nitrogen to sugar is about 1:10. This may mean that the theoretically possible amount of sugar is not yielded, or that some of the sugar formed is used in the economy. Both hypotheses may be correct, but can be disposed of by the fact that even in grave cases the decomposition of proteid may be used up in the production of sugar, and that in muscular exercise the proportion of sugar may fall.

The in the course of the disease the amount of sugar which the tissues can use varies from day to day. It is in the utilization of glucose — the normal sugar of the body—that the tissues chiefly fail. Many diabetics are able to use lactulose, or the insulin from which it is derived, and lactose (milk-sugar) to a certain extent. It has, however, been observed that under the administration of these sugars the excretion of glucose may be increased, the tissues, apparently by using the foreign sugar, allowing part of the glucose which would otherwise be consumed to pass into the urine.

The increased decomposition of proteid, rendered necessary to supply the energy not forthcoming in the sugar, leads to the appearance of a large quantity of nitrogen in the urine—azoturia—and it also seems to be the point of departure of the carbohydrates. Sulphuric acid and phosphoric acid are formed by oxidation of the sulphur and phosphorus in the proteid molecule. Organic acids of the lower fatty acids and oxalic acid have di-urate and acto-urate with their derivatives acetone also appear in the course of this process. They are not formed from the disintegration of proteids and in part from fats as the result of a modified metabolism induced by the withdrawal of carbohydrates. To neutralize them ammonium is developed and hence the proportion of ammonia in the urine is increased. By the development of these various acids the alkalinity of the blood is diminished. The development of these acids in large quantities is associated with extensive decomposition of proteid, and is sometimes indicative of the onset of a comatose condition, which seems to be due rather to an acid intoxication than to the specific toxic action of these substances.

Myxoedema.—The thyroid gland forms a material which has the power of increasing the metabolism of proteids and of fats; and when the thyroid is removed, a condition of sluggish metabolism, with low temperature and a return of the connective tissues to an embryonic condition, supervenes, accompanied by the appearance of depression of the mental functions and by other nervous symptoms. The disease myxoedema, which was first described by Sir William Gull in 1873, was shown by Ord in 1878 to be due to degenerative changes in the thyroid gland. It affects both sexes, but chiefly females, and is characterized by a puffy swelling of the face and hands, edema of the hands, a low temperature, and mental hebephrenia. The symptoms are similar to those produced by removal of the thyroid, and are indicative of a condition of diminished activity of metabolism.

The nervous symptoms may be in part due to some alteration in the metabolism, leading to the formation of toxic substances. The administration of thyroid gland extract causes all the symptoms to disappear.

Cretinism may now be defined as myxoedema in the infant, and it has been definitely proved to be associated with non-development and retardation of the growth of the head, body, and limbs. The factors of the disease are all due to diminished metabolism, leading to retarded development, and the treatment which has proved of service, at least in some sporadic cases, is the administration of various thyroid preparations.

Exophthalmic Goitre— Graves's Disease or Basedow's Disease.—This disease chiefly affects young women, and is characterized by three main symptoms: increased rate and force of the heart’s action, protrusion of the eyeballs, and enlargement of the thyroid gland. The patient is nervous, often sleepless, and generally becomes emaciated and suffers from slight febrile attacks. The increase in the work of the heart is in part due to the nervous disturbance produced by the hyperactivity of the gland, and the enlargement of the thyroid gland may not be manifest. Various theories as to the pathology of the condition have been advanced, but in the light of our knowledge of the physiology of the thyroid the most probable explanation is an increased functional activity of that gland or of changes in the parathyroids.

Gout has often been divided into the typical and atypical forms. The first is undoubtedly a clinical and pathological entity, but the second, though containing cases of less severe forms of true gout, is largely constituted of imperfectly diagnosed morbid conditions. The accumulation of urate of soda in the tissues in gout formerly led physicians to believe in a causal relationship between an increased formation of that substance and the onset of the disease. Sir A. Garrod's investigations, however, seemed to indicate that diminished excretion rather than increased production is the cause of the condition. He found an accumulation of uric acid in the blood and a diminution in its amount in the urine during the attack. That uric acid is produced in the blood is undoubted, but the changes described by Garrod in the urine, and considered by him as indicative of diminished excretion and retention, are rendered of less value by the imperfections of the analytic method employed. More recent work with better methods has thrown still further doubt upon the existence of such a relationship, and points rather to the accumulation of uric acid being, like the other symptoms of the condition, a result of some unknown modification in the metabolism, and a purely secondary phenomenon. The important fact that in leucæmia (von Jaksch), in lead-poisoning (Garrod), and in other pathological conditions, uric acid may be increased in the blood and in the urine, but that no gouty symptoms supervening, is one of the strongest arguments against the older views. That the gouty inflammation is not caused by the deposit of urate of soda, seems to be indicated by the occurrence of cases in which there is no such deposition. The source of the uric acid which is so widely deposite in the gouty is largely the phosphorus containing nuclei of the food and tissues. The decomposition of urate of soda yields a series of di-urides, the purin bodics, of which uric acid is one. Their excretion is increased when substances rich in nuclei, e.g. sweetbreads, &c., are administered. While uric acid itself has not been demonstrated to have any injurious action on the cells of the tissue, an amount has been found to produce toxic symptoms. After the discovery of this source of uric acid, physiologists for a time inclined to regard it as the only mode of production. But it must be remembered that in birds uric acid is formed from the ammonia compounds coming from the intestine and muscles, just as urea is formed from the same substance in mammals. Uric acid is a di-urate—a body composed of two urea molecules linked by acyclic acid—an unsaturated propionic acid. It is therefore highly probable that in many conditions the ammonia compounds used by the intestines to form urea is not complete, and that a certain amount of uric acid is formed apart from the decomposition of nuclei.

Sir William Roberts has adduced evidence to show that uric acid circulates in the blood in a freely soluble combination or quadrurate—that is, a compound in which one molecule of an acid salt BHU is linked to a molecule of the acid BH3 H2U. These compounds are said to be readily decomposed and the bi-urates formed, which are at first gelatinous but become crystalline. The deposition of urate of soda in joints, &c., has been ascribed to this change. Francis Tunnard, however, has published the results of certain investigations which throw doubt upon this explanation. The most recent investigations on the modification of the gouty have shown that there is undoubtedly a slowing in the rate of elimination of uric acid and also of the total nitrogen of the urine with occasional sudden increases sometimes connected with a gouty paroxysm, sometimes independent of it. Whether this is due to the action of some toxin developed in the body or is caused by a constitutional renal inadequacy is difficult to decide. Certain it is these renal diseases often develop in the course of gout.

Rheumatism.—Rheumatic fever was formerly regarded as due to some disturbance in the metabolism, but it is now known to be a specific micro-organismal disease. The whole clinical picture is that of an infective fever, and it is closely related to gonorrhoeal rheumatism and to certain types of pyaemia. A number of independent observers have succeeded in isolating from cases of rheumatic fever a diplococcus which produces similar
symptoms in the rabbit to those which characterize the disease in man.

Excluding the peculiar changes in the joints which occur in rheumatoid arthritis and in Charcot's disease, and which are almost certainly primary affections of the nervous system, it is found that a large number of individuals suffer from pain in the joints, in the muscles, and in the fibrous tissues, chiefly on exposure to cold and damp or after incisions of diet. This so-called chronic rheumatism appears to be a totally distinct condition from rheumatic fever; and although its pathology is not determined, it looks as if it were due either to a diminished elimination or an increased production of some toxic substance or substances, but so far we have no evidence as to their nature.

Ricketts is undoubtedly a manifestation of a profound alteration of the metabolism in childhood, but how far it is an idiopathic condition and how far a result of the action of toxins introduced from without is not yet definitely known. Kassowitz long ago showed that the bone changes are similar to those which can be produced in animals by chronic phosphorus poisoning, and that they are really irritative in nature. Spillmann, in his work Le Rachitisme, discusses the evidence as regards the action of various conditions, and comes to the conclusion that there is no evidence that it is due to a mere primary disturbance of the metabolism, or to excessive production of lactic acid, or to any specified micro-organismal poisoning. But he adds evidence, perhaps not very convincing, that in the disease there is a specific intoxication derived from the alimentary canal and provoking inflammatory lesions in the bones.

See generally Carl von Noorden, Metabolism and Practical Medicine (1907).

(D. N. P.)

METABOLISM (from Gr. μεταβολή, change), the biological term for the process of chemical change in a living cell (see PHYSIOLOGY).

METAL (through Fr. from Lat. metallum, mine, quarry, and dim. from Gr. μεταλλία, in the same sense as μεταλλαγή, probably connected with μεταλλᾶ, to search after, explore, μετά, after, αλλάς, other). Originally applied to gold, silver, copper, iron, tin, lead and bronze, i.e. substances having high specific gravity, malleability, opacity, and especially a peculiar lustre, the term "metal" became generic for all substances with these properties.

In modern chemistry, however, the metals are a division of the elements, the members of which may or may not possess all these characteristics. The progress of science has, in fact, been accompanied by the discovery of some 70 elements, which may be arranged in order of their "metallic" properties as above indicated, and it is found that while the end members of the group are the most distinctly metallic (or non-metallic), certain central members, e.g. arsenic, may be placed in either division, their properties approximating to both metallic and non-metallic. One chemical differentiation utilizes the fact that metals always form at least one basic oxide which yields salts with acids, while non-metals usually form acidic oxides, i.e. oxides which yield acids with water. This definition, however, is highly artificial and objectionable on principle, because when we speak of metals we think, not of their chemical relations, but of a certain sum of mechanical and physical properties which unites them all into one natural family.

All metals, when exposed in an inert atmosphere to a sufficient temperature, assume the form of liquids, which all present the following characteristic properties. They are (at least practically) non-transparent; they reflect light in a peculiar manner, producing what is called "metallic lustre." When kept in non-metallic vessels they take the shape of a convex meniscus. These liquids, when exposed to higher temperatures, some sooner than others, pass into vapours. What these vapours are like is not known in many cases, since, as a rule, they can be produced only at very high temperatures, precluding the use of transparent vessels. Silver vapour is blue, potassium vapour is green, many others (mercury vapour, for instance) are colourless. The liquid metals, when cooled down sufficiently, some at lower, others at higher, temperatures freeze into compact solids, endowed with the (relative) non-transparent and the lustre of their liquids. These frozen metals in general form compact masses consisting of aggregates of crystals belonging to the regular or rhombic or (more rarely) the quadratic system. Compared with non-metallic solids, they in general are good conductors of heat and of electricity. But their most characteristic, though not perhaps their most general, property is that they combine in themselves the apparently incompatible properties of elasticity and rigidity on the one hand and plasticity on the other. To this remarkable combination of properties more than to anything else the ordinary metals owe their wide application in the mechanical arts. In former times a high specific gravity used to be quoted as one of the characters of the genus; but this no longer holds, since we now know a series of metals lighter than water. All Transitions.—This, in the case of even the solid metals, is perhaps only a very low degree of transparency. In regard to gold this has been proved to be so; gold leaf, or thin films of gold produced chemically on glass plates, transmit light with a green colour. On the other hand, infinitely thin films of silver which can be produced chemically on glass surfaces are absolutely opaque. Very thin films of liquid mercury, according to Melsens, transmit light with a violet-blue colour; also thin films of copper are said to be translucent.

Colour.—Gold is yellow; copper is red; silver, tin, and some others are pure white; the majority are greyish.

Reflection of Light.—Polished metallic surfaces, like those of other solids, divide any incident ray into two parts, of which one is refracted while the other is reflected—with this difference, however, that the former is completely absorbed, and that the latter, in regard to polarization, is quite differently affected. The following values are due to Rubens and Hagen (Ann. der Phys., 1900, p. 357); they express the percentage of incident light reflected. The superiority of silver is obvious.

Crystalline Form and Structure.—Most (perhaps all) metals are capable of crystallization. The crystals belong to the following systems: regular system—silver, gold, palladium, mercury; copper, iron, lead; quadratic system—tin, potassium; rhombic system—antimony, bismuth, tellurium, zinc, magnesium. Perhaps all metals are crystalline, only the degree of visibility of the crystalline arrangement is very different in different metals, and even in the same metal varies according to the slowness of solidification and other circumstances.

Antimony, bismuth and zinc exhibit a very distinct crystalline structure: a bar-shaped ingot readily breaks, and the crystal faces are distinctly visible on the fracture. Tin also is crystalline; a thin bar, when bent, "creaks" audibly from the sliding of the crystal faces over one another; but the bar is not easily broken, and exhibits an apparently non-crystalline fracture.—Class I.

Gold, silver, copper, lead, aluminium, cadmium, iron (pure), nickel and cobalt are practically amorphous, the crystals (where they exist) being so loosely packed as to produce a viscous homogeneous mass.—Class II.

The great contrast in apparent structure between cooled ingots of Class I. and of Class II. appears to be owing chiefly to the fact that in the latter crystallization is the regular system, metals of Class I. form rhombic or quadratic crystals. Regular crystals expand equally in all directions; rhombic and quadratic expand respectively in different directions. It is supposed that the crystals immediately after their formation to be in absolute contact with one another all round, then, in the case of Class I., such contact will be maintained on cooling, while in the case of Class I. the contraction along the two straight lines in general have different values in any two neighbouring crystals, and the crystals consequently become slightly detached from one another. The crystalline structure which exists on both sides becomes visible only in the metals of the first class, and only there manifests itself as brittleness.
Closely related to the structure of metals is their degree of "plasticity" (susceptibility of being constrained into new forms without breach of continuity). This term of course includes as special cases the qualities of "malleability" (capability of being flattened out under the hammer) and "ductility" (capability of being drawn down into wire). But these two qualities do not always go parallel to each other, for this reason amongst others—that ductility in a higher degree than malleability is determined by the tenacity of a metal. Hence tin and lead, though very malleable, are little ductile. The quality of plasticity is developed to very different degrees in different metals, and even in the same species it depends on temperature, and may be modified by mechanical or physical operations.

A bar of zinc, for instance, as obtained by casting, is very brittle; but if heated to 100° or 150° C. it becomes sufficiently plastic to be rolled into the thinnest sheet or to be drawn into wire. Such sheet or wire then remains flexible after cooling, the originally only loosely cohering crystals having got intertwisted and forced into absolute contact with one another—an explanation supported by the fact that rolled zinc has a somewhat higher specific gravity (7.2) than the original ingot (6.9). The same metal, when heated to 200° C., becomes so brittle that it can be powdered in a mortar. Pure iron, copper, silver and other metals are easily drawn into wire, or rolled into sheet, or flattened under the hammer. But all these operations render the metals harder, and detract from their pliability; their original softness can be restored to a "annealing," i.e. by heating them to redness and then quenching them in cold water. In the case of iron, however, this applies only if the metal is perfectly pure. If it contains a few parts carbon, the annealing process, instead of softening the metal, gives it a "temper," meaning a higher degree of hardness and plasticity (see below).

What we have called plasticity must not be confused with the notion of "softness," which means the degree of facility with which the plasticity of a metal can be discounted. Thus lead is far softer than silver, and yet the latter is by far the more plastic of the two. Experiments of H. E. Tresca show that the plasticity of certain metals at least goes considerably farther than had before been supposed.

He operated with lead, copper, silver, iron and some other metals. Round disks made of these substances were placed in a closely fitting cylindrical cavity drilled in a block of steel, the cavity having a circular aperture of two or four centimetres below. By an hydraulic press a pressure of 100,000 kilos was made to act upon the disks, when the metal was seen to "flow" out of the hole like a viscous liquid. In spite of the immense pressure the removal of parts that would have broken the resistance. What came out below was a compact cylinder with a rounded bottom, consisting of so many layers superimposed upon one another. Parallel experiments with layers of dough or butter, and with some common material proved that the particular in all cases moved along the same tracks as would be followed by a flowing cylinder of liquid. Of the better known metals potassium and sodium are the softest; they can be knicked between two fingers, like a piece of paper. Lead first and then tin, the latter being the softest of the metals used in the arts. Among these the softness decreases in about the following order: lead, pure silver, pure gold, tin, copper, aluminium, platinum, pure iron. As liquidity might be looked upon as the ne plus ultra of softness, this is the right place for stating that, while most metals, when heated up to their melting points, pass pretty abruptly from the solid to the liquid state, platinum and iron first assume, and throughout a long range of temperatures retain, a condition of viscous semi-solidity which enables two pieces of them to be "welded" together by pressure into one continuous mass.

According to Prechtl, the ordinary metals, in regard to the degree of facility or perfection with which they can be hammered flat on the anvil, rolled out into sheet, or drawn into wire, form the following descending series—

Hammering. Rolling into Sheet. Drawing into Wire.

Tin. Silver. Silver.
Zinc. Tin. Copper.
Silver. Lead. Gold.
Platinum. Platinum. Tin.

To give an idea of what can be done in this way, it may be stated that iron can be beaten out of leaf to the thickness of 1/100 mm.; and that platinum, by judicious work, can be drawn into wire 1/1000 mm. thick.

By the "hardness" of a metal we mean the resistance which it offers to the file or engraver's tool. Taking it in this sense, it does not necessarily measure, e.g. the resistance of a metal to abrasion by friction. Thus, for instance, 10% aluminium bronze is scratched by an ordinary steel knife-blade, yet the sets of needles used for perforating postage stamps last longer if made of aluminium bronze than if made of steel.

**Elasticity.**—All metals are elastic to this extent that a change of form, brought about by stress, without exceeding certain limit values, will disappear on the stress being removed; strains exceeding the "limit of elasticity" result in permanent deformation or (if sufficiently great) in rupture. Referring the reader to the article ELASTICITY for the theoretical and to the STRENGTH OF MATERIALS for the practical aspects of this subject, we give here a table of the "modulus of elasticity," E (column 2), for millimetre and kilogramme. Hence total strain elongation in millimetres per metre length per kilogramme. Column 3 shows the charge causing a permanent elongation of 0.05 mm. per metre, which, for practical purposes, Wertheim takes as giving the limit of elasticity; column 4 gives the breaking strain. These values may vary within certain limits for different specimens.

**Specific Gravity.**—This varies in metals from 0.94 (lithium) to 23.2 (uranium), and in the same and the same species is a function of temperature and of previous physical and mechanical treatment. It has in general one value for the powder metal as obtained by reduction of the oxide in hydrogen below the melting point of the metal, another for the metal in the state in which it assumes spontaneously on freezing, and this latter value, in general, is modified by hammering, rolling, drawing, &c. These mechanical operations do not necessarily add to the density; stamping, it is true, does so necessarily, but rolling or drawing occasionally causes a diminution of the density. Thus, for instance, chemically pure iron in the ingot has the specific gravity 7.84; when it is rolled out into thin sheet, the value falls to 7.4—when drawn into thin wire, to 7.75. The following table gives the specific gravities of many metals. Where special statements are not made, the numbers hold for the ordinary temperature (15° to 17° or 20° C.), referred to water of the same temperature as a standard, and to hold for the natural frozen metal.

**Thermal Properties.**—The specific heats of most metals have been determined. The general result is that, conformably with Dulong and Petit’s law, the “atomic heats” all come to very nearly the same value (about 6-4); i.e., atomic weight by specific heat =6-4. Thus we have for silver by theory 6-4/108=0-053, and by experiment 0-057 for 10° to 100° C.

The expansion by heat varies greatly. The following table gives the linear expansions from 0° to 100° C. according to Fizeau (Comptes rendus, livill. 1125), the length at 0° being taken as unity.

The coefficient of expansion is constant for such metals only as crystalize in the regular system; the others expand differently in the directions of the different axes. To eliminate this source of uncertainty these metals were employed as compressed powders. The cubical expansion of mercury from 0° to 100° C. is 0.01815 × 10⁻⁴ (Regnault). (See Thermometry.)

**Fusibility and Volatility.**—The fusibility in different metals is very different, as shown by the following table, which, besides including all the fusing points (in degrees C.) of metals which have been determined numerically, indicates those of a selection of other metals by the positions assigned to them in the table.

</tbody>
</table>

For practical purposes the volatility of metals may be stated as follows:

1. Distillable below redness: mercury.
2. Distillable at red heats: cadmium, alkali metals, zinc, magnesium.
3. Volatilized more or less readily when heated beyond their fusing points in open crucibles: antimony (very readily), lead, bismuth, silver.
4. Barely so: gold, copper.
5. Practically non-volatile: (copper), iron, nickel, cobalt, aluminium, also lithium, barium, stronium, and calcium.

In the oxyhydrogen flame silver boils, forming a blue vapour, while platinum volatilizes slowly, and osmium, though insubflue, very readily.

**Latent Heats of Liquefaction.**—Of these we know little. The following numbers are due to Person—Ice, it may be stated, being 50.

</tbody>
</table>

The latent heat of vaporization of mercury was found by Marignac to be 103 to 106.

**Conductivity.**—Conductivity, whether thermic or electric, is very differently developed in different metals; and, as an exact knowledge of these conductivities is of great importance, much attention has been given to their numerical determination (see Conduction, Electric; and Conduction of Heat).

The following table gives the electric conductivities of a number of metals as determined by Matthiessen, and the relative thermal conductivities of (nominally) the same metals as determined by Wiedemann and Franz, with rods about 5 mm, thick, of which one end was kept at 100°C, the rest of the rod in a "vacuum" (of 5 mm. tension) at 19°C. Matthiessen’s results, except in the two cases noted, are from his memoir in Pogg. Ann., 1858, ciii. 428
Metal

In the case of group 1 the action is more or less violent, and the hydroxides formed are soluble in water and very strongly basic; metals of group 2 are only slowly attacked, with formation of relatively little basic and less soluble compounds. Dissolved in hydrochloric acid, the metals which are attacked give off hydrogen gas, while those which are not attacked give off oxygen gas, and are oxidized, with formation of more or less sparingly soluble hydroxides (ThH₂O, PbH₂O₂, BiH₃O₄), which, in the presence of carbonic acid, pass into still less soluble basic carbonates. Iron, when exposed to moisture and oxygen, rusts. This process occurs in the presence of oxygen or air, and it is questionable whether it ever sets in in the absence of carbonic acid (see RusT).

In the presence of cyanogen, intermediate between iron and the following group of metals.

Mercury; if pure, and all the "noble" metals (silver, gold, platinum and platinum-metals), are absolutely proof against water even in the presence of oxygen and carbonic acid.

The metals grouped together above, under 1 and 2, act on steam pretty much as they do on liquid water. Of the rest, the following are readily oxidized by steam at a red heat, with formation of hydrogen gas—iron, oadmum, cobalt, nickel, tin. Bismuth is similarly attacked, but slowly, at a white heat. Aluminium is barely affected even at a white heat; if it is pure; the ordinary impure metal is liable to be very readily oxidized.

Aqueous Sulphuric or Hydrochloric Acid readily dissolves groups 1 and 2, with evolution of hydrogen and formation of chlorides or sulphates. The same holds for the following group (A): magnesium, manganese, thallium, indium, tin. Tin dissolves readily in strong hydrochloric acid as SnCl₂; aqueous sulphuric acid does not act on it appreciably in the cold; but when it is heated, it attacks it rapidly, forming Sn₄Cl₂, which evolves hydrogen gas, with the acid, with evolution of sulphured hydroxide or, when the acid is stronger, of sulphurous acid gas and deposition of sulphur (Calvert and Johnson). A group (B), comprising copper, is, substantially, attacked only in the presence of oxygen or air. Lead is in sufficiently dilute acid, or in stronger acid if not too hot, remains unchanged. A group (C) may be formed of mercury, silver, gold and platinum, which are not touched by either aqueous acid in any circumstances.

Hot (concentrated) sulphuric acid does not attack gold, platinum and platinum-metals generally; all other metals (including silver) are converted into salts by the suitable hydrochloric or aqua regia. In the case of iron, ferric sulphate, Fe₂(SO₄)₃, is produced; tin yields a somewhat indefinite sulphate of its oxide SnO₂.

Nitric Acid (Aqueous) — Gold, platinum, iridium and rhenium only are proof against the action of this powerful oxidizer. Tin and antimony (also arsenic) are converted by it (ultimately) into hydrates of their highest oxides SnO₃, Sb₂O₅ (As₂O₅)—the oxides of tin and antimony being insoluble in water and in the acid itself. All other metals, including palladium, are dissolved as nitrates, the oxidizing part of the reagent being generally reduced to oxides of nitrogen. Iron, zinc, cadmium, also tin under certain conditions, reduce the dioxide, partially at least, to nitrous oxide, NO₂ or ammonium nitrate, NH₄NO₃.

Aqua Regia, a mixture of nitric and hydrochloric acids, converts all metals (even gold, the "king of metals," whence the name) into chlorides, except only rhenium, iridium and rhenium, which, when pure, are not attacked.

Caustic Alkalis.—Of metals not decomposing liquid pure water, or dissolving in alkalis in the ordinary run, copper, silver, lead and bismuth come under the head of hydrogen. The most important of these are aluminium and zinc, which are converted into aluminium, Al(OH)₃ and zincate, Zn(OH)₂, respectively. But even the rest of the variety, when treated with boiling sufficiently strong alkali, are attacked at least superficially; of ordinary metals only gold, platinum, and silver are perfectly proof against the reagents under consideration, and these accordingly are used preferably for the construction of vessels intended for analytical operations involving the use of aqueous caustic alkalis. For commercial purposes iron is universally employed and works well; but it is not available analytically, because the hydroxides (the only part of the salt soluble in water and air) cannot be prevented. Basins made of pure malleable nickel are free from this drawback: they work as well as platinum, and rather better than silver ones do. There is hardly a single metal which has not been against the alkalis to evolve itself when in the cold or water; even platinum is most violently attacked. In chemical laboratories fusions with caustic alkalis are always effected in vessels made of gold or silver, these metals holding out fairly well even in the presence of air. Gold is only of lower value in being less attacked than so well against aqueous alkalis, is most violently attacked by the fused reagents. Yet tongs of caustic soda are fused daily in gold vessels in the laboratories where the metal is used; which seems to show that (clean) iron, like gold and silver, is attacked only by the joint action of fused alkali and air, the influence of the latter being of course minimized in large-scale operations.

Q: Which metals (from those given) do not combine directly with oxygen given as oxygen gas (O₂), although, like silver, they may absorb this gas largely when in the fused condition, but may not be proof against ozone, O₃?

Mercury, within

Metallic Properties.—Iron, nickel and cobalt are the only metals which are attracted by the magnet and can become magnets themselves. But in regard to their power of retaining their magnetism none of them comes at all up to the compound metal steel. See MAGNETISM.

Chemical Changes.—Metals may unite chemically both with metals and with non-metals. The compounds formed in the first case, which may be either definite chemical compounds or solid solutions, are discussed under AtLOyS; in this place only combinations with non-metals are discussed, it being premised that the free metal takes part in the reaction.

Metallic Substances Produced by the Union of Metals with Small Proportions of Non-Metallc Elements.

Hydrogen, as was shown by Graham, is capable of uniting with or being occluded by certain metals, notably with palladium (p.p.), into metal-like compounds.

Oxygen.—Mercury and copper and some other metals are capable of dissolving their own oxides. Mercury, by doing so, becomes viscous and unfit for its ordinary applications. Copper, when pure to start with, suffers considerable deterioration in plasticity. But the presence of moderate proportions of cuprous oxide has been found to correct the evil influence of small contaminations by arsenic, antimony, lead and other foreign metals. Commercial copper sometimes owe their good qualities to this compensating influence.

Arsenic combines readily with all metals into true arsenides, which latter, in general, are soluble in the metal itself. The presence in a metal of even small proportions of arsenic generally leads to a deterioration in mechanical properties. But the presence of moderate proportions of cuprous oxide has been found to correct the evil influence of small contaminations by arsenic, antimony, lead and other foreign metals. Commercial copper sometimes owe their good qualities to this compensating influence.

Silicon, so far as we know, behaves to metals pretty much like carbon, but our knowledge of facts is limited. What is known is cast iron is essentially an alloy of iron proper with 2 to 6% of carbon and more or less of silicon (see Iron). Alloys of copper and silicon were prepared by Deville in 1863. The alloy containing 12% of silicon is white, hard and brittle. When diluted down to 4-8% it assumes the colour and fusibility of bronze, but, unlike that, is tenacious and ductile like iron.

Action of the More Ordinary Chemical Agents on Simple Metals.

The metals to be referred to are always understood to be given in the compact (frozen) condition, and that, wherever metals are enumerated as being similarly attacked, the degree of reaction is given in the order in which the several members are named—the more readily changed metal always standing first.

Water, at ordinary or slightly elevated temperatures, is decomposed more or less readily, with evolution of oxygen gas and formation of a basic hydrate, by (1) potassium (formation of KHO), sodium (NaHO), lithium (LiOH), barium, strontium, calcium (Ba₄H₂O₄, &c.); (2) magnesium, zinc, manganese (Mg₂O₄H₂, &c.).

1 Published in 1860, and declared by Matthiessen to be more exact than the old numbers.
METALLOGRAPHY

This has been effected by pouring the lighter constituent carefully on the surface of the heavier constituent, and allowing solidification to take place. A section through the culot so obtained will show a gradation in structure from pure metal on one side to pure metal on the other. A thin slice of metal is usually cut by means of a hack-saw driven by mechanism. The thickness of the piece should be less than 1 in. and should be held firmly between the fingers it should not be less than 1 in. square. The preliminary stages of polishing are effected by emery paper placed preferably on wooden disks capable of being revolved at a high rate of speed. The finest grade of emery paper that can be obtained is used towards the end of the operation. Before use the finer papers should be rubbed with a hard steel surface to remove any coarse particles. The completion of the operation of polishing is generally effected on wet cloth or parchment covered with a small amount of carefully washed jeweller’s rouge. Various mechanical appliances are employed to minimize the labour and time required for the polishing. These usually consist of a series of interchangeable revolving disks, each of which is covered with emery paper, cloth or parchment, according to the particular stage of polishing for which it is required. In the case of brittle alloys and of alloys having a very soft constituent, which during polishing tends to spread over and obliterate the harder constituents, polishing is in many cases altogether avoided by casting the alloy on the surface of glass or mica. In this way, with a little care, a perfect surface is obtained, and it is only to develop the texture of the material that the polishing is employed. In adopting this method, however, instances have occurred in which the removal of the cast surface has shown a structure differing considerably from the original.

Polishing in Bas-Relief.—If the polishing be completed with fine rouge on a sheet of wet parchment, placed upon a comparatively soft base such as a piece of deal, certain soft constituents of an alloy may often be eroded in such a manner as to leave the hardest portions in relief. For the later stages of polishing H. L. Le Chateller recommends the use of alumina obtained by the calcination of ammonium alum, and for the final polish of soft metals, chromium oxide.

Although in some cases a pattern becomes visible after polishing, yet more frequently a mirror-like surface is produced in which no pattern can be detected, or if there is a pattern it is blurred, as if seen through a veil or mist. This is due to a thin layer of metal which has been dragged, or smeared, uniformly over the whole surface by the friction of the polishing process. Such a surface layer is formed in all cases of polishing, and the peculiar lustre of burnished silver or steel is probably due to this layer. But to the metallographist it is an inconvenience, as it conceals what may be a very characteristic pattern. It is therefore desirable to conduct the polishing so as to make this layer as thin as possible: it is claimed for alumina that it can be so used as to produce a much thinner surface layer than that due to the employment of rouge. The surface layer is very readily removed by appropriate liquid reagents, and, the true surface of the metal having been laid bare, the etching reagent acts differently on the individual substances in the alloy and the pattern can thus be emphasized to any required extent. Osmond divides etching reagents into three classes—acids, alkalies and the neutral or colloidal. For etching a solution of 1% nitric acid, with addition to 10% of hydrochloric acid is useful. It is made by mixing 10 grams of potassium bichromate with 10 grams of sulphuric acid in 100 grams of water. The use of nitric acid requires much experience. It is frequently employed in the examination of steels, Sir W. C. Roberts-Austen preferred a 1% solution in alcohol, but many workers use concentrated acid, and effect the etching by allowing a stream of water to dilute the film of acid left on the surface of the specimen after dipping it. Of the halogens, iodine is the most useful. A solution in alcohol is applied, so that a single drop covers half a square inch of surface. The specimen is then washed with alcohol, and dried with a piece of flaxen or chamois leather. Tincture of iodine also affords a means of identifying lead in certain alloys by the formation of a yellow iodide of lead, while the vapour of iodine has in certain cases been

a certain range of temperatures situated close to its boiling point, combines slowly with oxygen into the red oxide, which, however, breaks down at higher temperatures. All other solids, when heated in oxygen or air, are converted, more or less readily, into stable oxides. Potassium, for example, yields peroxide, K₂O₂ or KO₃; potassium oxide gives Na₂O; the barium-group metals, as well as magnesium, lime, lead, and copper (arsenic oxide, SnO₂, etc.) are converted, when heated, into the corresponding oxides of these metals. Sb₂O₅, Bismuth and antimony give (the latter very readily) sesquisoxide (Bi₂O₃ and Sb₂O₃, the latter being capable of passing into Sb₂O₅). In the same way, a number of metals, which are insoluble when oxidized, are only oxidized at a white heat, and then very slowly, into alumina, Al₂O₃. Tin, at high temperatures, passes slowly into oxide, SnO₂.

Sb₂O₅.—Among the better known metals, gold and aluminium are the only ones which, when heated with sulphur or in sulphur vapour remain unchanged. All the rest, under these circumstances, are converted into sulphides. The metals of the alkali and alkaline earth groups, when burned in sulphur vapour as such or in the presence of oxygen, or the vapour of copper as the last-named metal, are converted into copper sulphydride, CuS, and, as metallic sulphides, into red mercury, Hg₂S. The limit of AgCl, Rossing, A gCu₂Cl, of calcium, CaCl₂, or strontium, SrCl₂, is more limited. All the metals, copper, the one which exhibits the greatest avidity for sulphur, its subsulphide CuS being the stabllest of all heavy metallic sulphides in opposition to dry reactions.

Chlorine.—All metals, when treated with chlorine gas at the proper temperatures, pass into chlorides. In some cases the chlorine is taken up in two instamments, a lower chloride being produced first, in water, ultimately into a higher chloride. Iron, for instance, is converted first into FeCl₂, ultimately into FeCl₃, which practically means a mixture of the two chlorides, or pure FeCl₃ as a final product. Of the several products, the chlorides of gold and platinum (AuCl₃ and AgCl₃) are the only ones that will completely be converted in a water temperature of formation dissociate into metal and chlorine. The ultimate chlorination product of copper, CuCl₂, when heated to redness, decomposes into the lower chloride, CuCl, and chlorine. All the rest, when heated by themselves, volatilize, some at lower, others at higher temperatures.

Of the several individual chlorides, the following are liquids or solids, the majority of which can be derived from glass vessels: AsCl₃, SbCl₅, SnCl₅, BiCl₃, HgCl₂, the chlorides of arsenic, antimony, tin, bismuth, mercury respectively. The following are readily volatilized in a current of chlorine, at a red heat: AlCl₃, CCl₃, FeCl₃, the chlorides of aluminium, chromium, iron. The following, though volatile at higher temperatures, are not volatilized at dull redness: KCl, NaCl, LiCl, NaClO₃, KClO₃, MnCl₂, ZnCl₂, MgCl₂, PbCl₂, AgCl, the chlorides of sodium, potassium, manganese, zinc, magnesium, lead, silver. Somewhat less volatile than the last-named group are the chlorides (MCl₃) of barium, strontium and calcium.

Metallic chlorides, as a class, are readily soluble in water. The following are the most important exceptions: silver chloride, AgCl, and mercuric chloride, HgCl₂, are absolutely insoluble; lead chloride, PbCl₂, and cadmium chloride, CdCl₂, are very sparingly soluble in water. The chlorides AsCl₃, SbCl₅, BiCl₃ are at once decomposed by (liquid) water, with formation of oxide (As₂O₅) or oxychlorides (SnOCl₂, BiOCl₂) and hydrochloric acid. The chlorides MgCl₂, AlCl₃, CrCl₃, FeCl₃, TiCl₄, (and similar derivatives) when exposed to steam, or water in the heat. The same holds in a limited sense for ZnCl₂, CoCl₂, NiCl₂, and even CaCl₂. All chlorides, except those of silver and mercury (and, of course, those of gold and platinum) are oxidized by steam at high temperatures, with elimination of hydrochloric acid.

For the characters of metals as chemical elements see the special articles on the different metals.

Generally A. Rossing Geschichte der Metalle (1901); B. Neumann, Die Metalle (1904); also treatises on chemistry.

METALLOGRAPHY.—The examination of metals and alloys by the aid of the microscope has assumed much importance in comparatively recent years, and it might at first be considered to be a natural development of the use of the microscope in determining the constitution of rocks, a study to which the name petrography has been given. It would appear, however, that it is only since the appearance of the microscope in the hands of the chemist that systematic examinations of metallic substances have been made. There can be no question that in the main it was originated by Dr H. C. Sorby, who in 1864 gave the British Association an account of his work. Following the work of Sorby came that of Professor A. Martens of Charlottenburg, presenting many features of originality. F. Osmond has obtained results in connexion with iron and steel which are of the highest interest. A list of the more important papers by these and other workers will be found in the appended bibliography.

Preparation of the Specimen.—Experience alone can enable the operator to determine what procedure should be adopted in special cases of metal or alloy will afford a trustworthy sample of the whole. In studying a series of binary alloys it has been found advantageous in certain cases to obtain one section which will show in a general way the variation in structure from one end of the series to the other.
used to tint the constituents. Thin coloured films may often be produced by the oxidation of the specimen when heated in air. This, as a means of developing the structure, in the case of the copper alloys is specially useful. Tinted crystals may thus be distinguished from the investing layer caused by the presence of a minute quantity of another constituent. The temper colours produced by heating iron or steel in air are well known. Carbide of iron is less oxidizable than the iron with which it is intimately associated, and it assumes a brown tint, while the iron has reached the blue stage. These coloured films may be fixed by covering with thin films of gelatine.

In some cases the alloy may be attacked electrolytically by exposing it for a few minutes to a weak electric current in a bath of very dilute sulphuric acid. Certain organic bodies give very satisfactory results. The Japanese, for instance, produce most remarkable effects by simple reagents of which an infusion of certain forms of grass is a not unimportant constituent. In the case of iron and steel a freshly prepared infusion of liquoric root has been found to be most useful for colouring certain constituents of steel. Osmond, who was the first to use this reagent, insisted that it should be freshly prepared and always used under identical conditions as regards age and concentration. His method of applying it was to rub the specimen on parchment moistened with it, but he has subsequently modified this "polish attack" by substituting a 2% solution of ammonium nitrate for the liquorice infusion. In each case a small quantity of freshly precipitated calcium sulphate is used on the parchment to assist the polishing.

**Appliances used in Microscopy.**—The method of using the microscope in connexion with a camera for photographic purposes will now be considered. Every micrographer has his own views as to the form of an installation to be adopted, and it will therefore be well to give an illustration of a definite apparatus which has been found to give satisfactory results. It consists of a microscope A with a firm base placed in a horizontal position. The microscope can be connected by a tube B with the expanded camera CC, at the end of which is the usual frame to receive the photographic plate. A practised observer can focus on a plate of clear glass by the aid of a subsidiary low-power microscope lens. If a semi-transparent plate is employed it should be as fine as possible. The surface of the table is cut in such a way near H that the observer who is seated may conveniently examine the object on the stage of the microscope, the portion B turning aside for this purpose. The subsequent focusing is effected by a rod, FFF, and gearing attached to the fine adjustment of the microscope, GA; flap J when raised forms the support of the lamp used for illumination. As an illuminant an arc light has many advantages, as the exposure of the plate used will seldom exceed to seconds. The filament of a Nernst lamp can be used as the source of light; though not so brilliant as the arc it possesses the great advantage of perfect immobility. For the best results, especially with high powers, the source of light must be small, so that its image can be focussed on to the surface of the object; this advantage is possessed by both of these illuminants. Next in value comes the acetylene flame, and an incandescent lamp or a gas lamp with a mantle will give good results, but with much longer exposure. Actual illumination is best effected by a Beck vertical illuminator or a Zeiss prism. It is necessary that the lens used for concentrating the light on the illuminator should be an achromatic one, as colour effects cause trouble in photographing the objects. For lower powers the Lieberkühn parabolic illuminator is useful. Certain groups of alloys show better under oblique illumination, which may be effected by the aid of a good condensing lens, the angle of incidence being limited by the distance of the object from the objective in the case of high magnification. As regards objectives, the most useful are the Zeiss 2 mm., 4 mm. and 24 mm.; two other useful objectives for low powers being 35 mm. and 70 mm., both of which are projecting objectives. A projecting objective, preferably of low power, should be employed with all but the two latter objectives. The immersion lens, the Zeiss 2 mm., is used with specially thickened cedar oil, and if the distance from the objective to the plate is 7 feet, magnifications of over 2000 diameters can easily be obtained. As regards sensitized plates, excellent results have been obtained with Lumière plates sensitive to yellow and green. The various brands of "process" plates are very serviceable where the contrasts on the specimen are not great. Some reproductions of photo-micrographs of metals and alloys will be found in the plate accompanying the article **Alloys**.

**METALLURGY.** The art of extracting metals from their ores; the term being customarily restricted to commercial as opposed to laboratory methods. It is convenient to treat electrical processes of extraction as forming the subjects of Electrochemistry and Electrometallurgy (qq.v.). The following table enumerates in the order of their importance the metals which our subject at present is understood to include; the second column gives the chemical characters of the ores utilized, italics indicating those of subordinate importance. The term "metal" includes carbonate, hydrate, and, when marked with *, silicate.

METALLURGY

Metal. | Character of Ores.
---|---
Mercury | Sulphide, reguline metal.
Antimony | Sulphide, arsenide, oxide.
Bismuth | Sulphide, reguline metal.
Nickel and cobalt | Arsenides.
Platinum, Iridium, &c. | Reguline.

General Sequence of Operations.—Occasionally, but rarely, metal ore is practically pure compact masses, from which the accompanying matrix or “gangue” can be detached by hand and hammer. In most cases the “ore” (see MINERAL DEPOSITS; VEINS), as it comes out of the mine or quarry, is simply a mixture of ore proper and gangue, in which the latter not unfrequently predominates. Hence it is generally necessary to purify the ore before the liberation of the metal is attempted. Most metallic ores are specifically heavier than the accompanying impurities and their purification is generally effected by reducing the crude ore to a fine enough powder to detach the metallic from the earthy part, and then washing away the latter by a current of water, as far as possible (see ORE-DRESSING).

The majority of ores being chemical compounds, the extraction of their metals demands chemical treatment. The chemical operations involved may be classified as follows:—

1. Fiery Operations.—The ore, generally with some “flux,” is exposed to the action of fire. The fire in most cases has a chemical, in addition to its physical, function. Moreover the furnace (q.v.) is designed so as to facilitate the action of the heat and furnace gases in the desired direction. It is intended either to burn out certain components of the ore—in which case it must be so regulated as to contain a sufficient excess of unburned oxygen (or it is meant to oxidize (“reduce”) the ore, when the draught must be restricted so as to keep the ore constantly wrapped up in combustible flame gases (carbon monoxide, hydrogen, marsh-gas, &c.).

The majority of the chemical operations of metallurgy fall into this category, and in these processes other metal-reducing agents than those naturally contained in the fire (or blast) are only exceptionally employed.

2. Amalgamation.—The ore by itself (if it is a reguline one), or with certain reagents (if it is an arsenide), is worked up with mercury so that the latter is dissolved as an amalgam, which can be separated mechanically from the dross. The purified amalgam is distilled, when the mercury is recovered as a distillate while the metal remains.

3. Wet Processes.—Strictly speaking, certain amalgamation methods fall under this head; but, in its ordinary acceptance, the term refers to processes in which the metal is extracted either from the natural ore, or from the ore after roasting or other preliminary treatment, by an acid or salt solution, and from this solution precipitated—generally in the reguline form—by some suitably prepared precipitant.

Few methods of metal extraction at once yield a pure product. What as a rule is obtained is a more or less impure metal, which requires to be “refined” to become fit for the market.

Chemical Operations.—Amalgamation and wet-way processes have limited applications, being practically confined to copper, gold and silver. We therefore here confine ourselves, in the main, to pyro-chemical operations.

The method to be adopted for the extraction of a metal from its ore is determined chiefly, though not entirely, by the nature of the non-metallic component with which the metal is combined. The simplest case is that of the reguline ore—in which case there is no non-metallic element. The important case is that of gold.

Oxides, Hydrates, Carbonates and Silicates.—All iron and tin ores proper fall under this heading: which, besides, comprises certain ores of copper, of lead and of zinc. The first step consists in subjecting the crude ore to a roasting or calcining process, the object of which is to remove the water and carbon dioxide, and burn away, to some extent at least, the sulphur, arsenic or organic matter. The residue consists of an impure oxide of the respective metal, which in all cases is reduced by treatment with fuel at a high temperature. Should the metal be present as a silicate, lime must be added in the smelting to remove the sodium and leaven the silicate. The residue is then roasted in the presence of some solvent for metallic bases. The effect is that the several metals are oxidized away and pass into the molten or semi-molten state. The impurities, such as iron, manganese, &c. The general mode of working these ores is as follows. The ore is first roasted by itself, when a part of the arsenic goes off as such and as oxide, while a complex of lower arsenides remains. This is roasted again, giving the arsenic a further opportunity of being oxidized in the presence of some solvent for metallic bases. The effect is that the several metals are oxidized away and pass into the molten or semi-molten state. The impurities, such as iron, manganese, fluorspar, arsenic, arsenide, nickel, and at any stage the arsenic, is finally oxidized and recovered in the form of a fusible reguline, which sinks down through the slag as a "spieis." (This term has the same meaning in reference to arsenides as "spieis" does in reference to silicates.) At the same time the arsenic, when the process at the right moment, we can produce a spieis which contains only cobalt and nickel, and if at this stage the slags also the flux is removed, we can produce a spieis which contains only cobalt and nickel and a slag which substantially is one of cobalt only. The composition of the spieceis generally varies from AsMe 12 to AsMe 5, where "Me" means one atomic weight of metal in 100, so that in general

$$\text{Me} \approx \frac{2\text{Fe} + 3\text{Co} + 2\text{Ni}}{\text{Fe} + 3 + 2 - 1}.$$
Cobalt is utilized as a blue pigment called "smart"; the nickel-silicate is worked up for metal.

Minor Reagents.—Besides the oxidizing and reducing agents present in the feed, the fluxes added for the production of slags, various minor reagents may be noticed. Metallic iron as a desulphurizer has already been referred to.

At oxide of lead, PBO (litharge), is largely used as an oxidizing agent. At blast furnace, it quickly attacks all metals except silver and gold, and the general result being the formation of a mixed oxide and of a mixed regulus, a distribution, in other words, of both the elements. It is the flux that would result from the leaching of the metal by the slag, and the importance is its action on metallic sulphides, which, in general, results in the formation of three things besides sulphur dioxide, viz., a mixed oxide slag including the excess of litharge, a regulus (the latter more or less reducible metals), and, if the litharge is not sufficient for a complete oxidation, a "mat" comprising the more readily sulphurizable metals. Oxide of lead, besides its most powerful solvent for metallic oxides generally is also largely used for the separation of silver or gold from base metallic oxides.

Metallic lead is to metals generally what oxide of lead is to metallic oxides. It accordingly is available as a solvent taking at small particles of metal diffused throughout a mass of slag, and uniting them into one regulus. This leads us to the process of "cupellation," which serves for the extraction of gold; see also other works on the recovery from base metals.

Fluxes.—All ores are contaminated with more or less gangue, which in general consists of fusible matter, and if left uncharged in the furnace, during the refining process, would result in, metal and less of the less differentiated substance through it, or at least few of the most fusible metals. To avoid this, the ore as it goes into the furnace is mixed with "fluxes" so selected as to convert the gangue into a fusible slag, and such as do not dissolve the metal with it, and then remove it and separates from the later. The quality and proportion of flux should, if possible, be so chosen that the formation of the slag sets in as late as possible; that is, before the metal is beaten; or to hasten the action of the basic oxide of the metal to be extracted may be dissolved by the slag and its removal thus be prevented or retarded. Slags are not a necessary evil; if an ore were free from gangue we should add fluxes, as we do without; but in the absence of metal, one of its functions is to form a layer on the regulus which protects it against the further action of the blast or furnace gases. Fluxes may be arranged under the heads of (1) fluor-spur, (2) basic fluor-spur, (3) basic fluor-spar, and (4) silicate fluxes.

Fluor-spur fuses up at a red heat with silica, sulphates of calcium and barium, and a few other fusible substances into homogeneous mass. It shows little tendency to dissolve basic oxides, such as lime, &c. One part of fluor-spur liquefies about half a part of silica, four parts of calcium sulphate and one and half parts of barium sulphate. Upon these facts its extremely wide application in metallurgy is founded. Carbonate of soda (or potash) the most powerful basic flux. It dissolves silica and all silicates into fusible glasses. On the other hand, borax may be taken as a type for the acid fluxes. At a red heat, when it forms a viscous fluid, it readily dissolves any uncombined basic oxides in it. A gangue of an ore in general consists either of some basic material such as carbonate of lime (or magnesia), ferric oxide, alumina, &c., or of a silicate, a mixture of the two classes of bodies. So any kind of gangue might be liquefied by means of borax or by means of alkaline carbonate; but neither of the two is used otherwise than for assaying; what the metal-smelter does is to add to a basic gangue the proportion of silica, and to an acid ore the proportion of lime, or, indirectly, of ferrous or perhaps manganous oxide, which it may need for the formation of a slag of the proper qualities. The slag must possess the proper degree of saturation. In other words, taking $\text{SiO}_2 + n\text{MeO}$ (where MeO means an equivalent of base) as a formula for the potential slag, $n$ must have the proper value. If $n$ is too small, i.e., if the slag is too acid, it may dissolve part of the material to be recovered; if $n$ is too great, i.e., the slag too basic, it may refuse to dissolve, for instance, the ferrous oxide which is meant to go into it, and this oxide will then be reduced, and its metal (iron in our case) and converted into a regulus, and kept in suspension. The result is under discussion. It is worth noting that oxides of lead and copper are more readily reduced to metals than oxide of iron FeO is to FeO, the latter more readily to FeO than FeO itself to metal, and FeO more readily to metal than manganous oxide is. Oxide of calcium (lime) is not reducible at all. The order of basicity in the oxides (their readiness to go into the slag) is precisely the reverse.

Metallic oxides, and especially the silicates, are the most important problem of scientific metallurgy to determine the relations in this class of bodies between chemical composition and the hand and fusibility and solvent power for certain oxides (CaO, FeO, MgO, Al₂O₃, SiO₂, MnO). In general, any of these oxides may be expressed as $n\text{M}+m\text{SiO}_2+s\text{Fe}+(t\text{Ca}+\text{Al})+r\text{SiO}_2$ (M=Ca, Mg, Fe, K, &c.; &e. =Fe, Fe, al=3\text{Al}). The following relations may use for the giving of the various oxides in general.

It should be possible to represent each quality of a silicate as a function of $x$, to determine the nature of the individual bases that make up the MO and (or or all) O respectively. Our actual knowledge falls far short of this possibility. The problem, in fact, is very difficult, the more so as it is complicated by the existence of aluminates, compounds such as in which an oxide is present in the form of an oxide, and the occasional existence of compounds of fluorides and silicates in certain slags. The formation of slags, or, what comes to the same thing, of the slag, was first studied by Percy, Smith, Bischof, Plattner and others in Germany by Vogt, Doelter, and at the Geophysical laboratory of the Carnegie Institution, Washington.

METAL-WORK. Among the many stages in the development of primeval man, none can have been of greater moment in his struggle for existence than the discovery of the metals, and the means of working them. The names generally given to the three prehistoric periods of man's life on the earth—the Stone, the Bronze and the Iron age—imply the vast importance of the progressive steps from the flint knife to the bronze club, and lastly to the keen-edged iron weapon or tool.

The metals chiefly used in the arts have been gold, silver, copper and tin (the last two generally mixed, for example an alloy called bronze), iron and lead (see the separate articles on these metals). Their peculiarities have naturally marked out each of them for special uses and methods of treatment. The durability and the extraordinary ductility and pliability of gold, its power of being subdivided, drawn out or flattened into wire or leaf of almost infinite fineness, have led to its being used for works where great minuteness and delicacy of execution were required; while its beauty and rarity have, for the most part, limited its use to objects of adornment and luxury, as distinct from those of utility. In a lesser degree most of the qualities of gold are shared by silver, and consequently the treatment of these two metals has always been very similar, though the greater abundance of the latter metal has allowed it to be used on a larger scale and for a greater variety of purposes. The great fluidity of bronze when melted, the slightness of its contraction on solidifying, together with its density and hardness, make it especially suitable for casting, and allow of its taking the impress of the mould with extreme sharpness and delicacy. In the form of plate it can be tempered and annealed till its elasticity and toughness are much increased, and it can then be formed into almost any shape under the hammer and punch. By other methods of treatment, known to the ancient Egyptians, Greeks and others, but now forgotten, it could be hardened and formed into knife and razor edges of the utmost keenness. In many specimens of ancient bronze, small quantities of silver, lead and zinc have been found, but their presence is probably accidental. In modern times brass has been much used, chiefly for the sake of its cheapness as compared with bronze. In beauty, durability and delicacy of surface it is very inferior to bronze, and, though of some commercial importance, has been of but little use in the production of works of art. To such an extent is that the term brass is restricted to an alloy of tin and the alumina part of the metal (called bronze), iron and lead (see the separate articles on these metals).
Iron.—The abundance in which iron is found in so many places, its great strength, its remarkable ductility and malleability in a red-hot state, and the ease with which two heated surfaces of iron can be welded together under the hammer combine to make it specially suitable for works on a large scale where strength with lightness are required—things such as screens, window-grills, ornamental hinges, the like. In its hot plastic state iron can be formed and modelled under the hammer to almost any degree of refinement, while its great strength allows it to be beaten out into leaves and ornaments of almost paper-like thinness and delicacy. With cast iron the process has the reverse value, drawing out and annealing, it gains much in strength and toughness, and the addition of a very minute quantity of carbon converts it into steel, less tough, but of the keenest hardness. The large employment of cast iron is comparatively modern, in England at least only the future dating from the 16th century; it is not, however, incapable of artistic treatment if due regard be paid to the necessities of casting, and if no attempt is made to imitate the fine-drawn lightness to which wrought iron so readily lends itself. At the best, however, it is not generally suited for the finest work, as the great contraction of iron in passing from the fluid to the solid state renders the cast somewhat blunt and spiritless. Among the Assyrians, Egyptians and Greeks the use of iron, either cast or being the favourite metal, almost for all purposes. The difficulty of smelting the ore was probably one reason for this, as well as the now forgotten skill which enabled bronze to be tempered to a steel-like edge. It had, however, its value, of which a proof occurs in Homer (II. xxiii.), where a mass of iron is mentioned as being one of the prizes at the funeral games of Patroclus.

Methods of Manipulation in Metal-Work.—Gold, silver and bronze may be treated in various ways, the chief of which are (1) casting in a mould, and (2) treatment by hammering and punching (Fr. repoussé). The first of these, casting is chiefly adapted for bronze, or wrought, was very limited, bronze almost for all purposes. The difficulty of smelting the ore was probably one reason for this, as well as the now forgotten skill which enabled bronze to be tempered to a steel-like edge. It had, however, its value, of which a proof occurs in Homer (II. xxiii.), where a mass of iron is mentioned as being one of the prizes at the funeral games of Patroclus.

METAL-WORK

FIG. 1.—Monstrance of Copper Gilt; Italian work of the 15th century.

The first of these, casting is chiefly adapted for bronze, or wrought, was very limited, bronze almost for all purposes. The difficulty of smelting the ore was probably one reason for this, as well as the now forgotten skill which enabled bronze to be tempered to a steel-like edge. It had, however, its value, of which a proof occurs in Homer (II. xxiii.), where a mass of iron is mentioned as being one of the prizes at the funeral games of Patroclus.

and elastic bed of cement made of pitch and pounded brick. The design was then beaten into relief from the back with hammers and punches, the pitch bed yielding to the protuberances which were thus formed, and serving to prevent the punch from breaking the metal into holes. The pitch was then melted away from the front of the embossed relief, and applied in a similar way to the back, so that the modelling could be completed on the face of the relief, the final touches being given by the graver. This process was chiefly applied by medieval artists to the precious metals, but by the Assyrians, Greeks and other early nations it was largely used for bronze. The great gates of Shalmaneser II., 858-823 B.C., from Balawat, now in the British Museum, are a remarkable example of this sort of work on a large scale, though in the neighbourhood of the celebrated tin and copper mines, which have been worked from a very early period. The use of lead has been more extended. In sheets it forms the best of all coverings for roofs and even spires. In the Roman and medieval periods it was largely used for coffins, which were often richly ornamented with cast work in relief. Though fusible at a very low temperature, and very soft, it has great power of resisting decay from damp or exposure. Its most important use in artistic form has been in the shape of baptismal fonts, chiefly between the 11th and the 14th centuries. The superior beauty of colour and durability of old specimens of lead is owing to the natural presence of a small proportion of silver. Modern smelters carefully extract this silver from the lead ore, thereby greatly impairing the durability and beauty of the metal.

As in almost all the arts, the ancient Egyptians excelled in their metal-work, especially in the use of bronze and the precious metals. These were worked by casting and hammering, and ornamented by inlay, gilding and enamels with the greatest possible skill. From Egypt perhaps was derived the early skill of the Hebrews. Further instruction in the art of metal-working came probably to the Jews from the neighbouring country of Tyre. The description of the great gold lions of Solomon's throne, and the laver of cast bronze supported on figures of oxen, shows that the artificers of that time had overcome the difficulties of metal-working and founding on a large scale. The Assyrians were perhaps the most remarkable of all ancient nations for the colossal size and splendour of their works in metal; whole circuit walls of great cities, such as Babylon, were said to be covered with metal plates, gilt or silvered. Herodotus, Athenaeus and other Greek and Roman writers have recorded the enormous number of colossal statues and other works of art for which Babylon and Nineveh were so famed. The numerous objects of bronze and other metals brought to light by the excavations in the Tigris and Euphrates valleys, though mostly on a small scale, bear witness to the great skill and artistic power of the people who produced them; while the discovery of some bronze statuettes, shown by inscriptions on them to be not later than 2200 B.C., proves how early was the development of this branch of art among the people of Assyria.

The Metal-Work of Greece.—The early history of metal-working in Greece is extremely obscure, and archaeologists are divided in opinion even on so important a question as the relative use of bronze and iron in the Homeric age. The evidence of Mycenaean remains, as compared with the literary evidence of Homer, is both inadequate and inconclusive (see Aegean Civilization; Greek Art; Arms and Armour, Ancient; Plate, &c.). The poems of Homer are full of descriptions of elaborate works in bronze, gold and silver, which, even when full allowance is made for the exaggeration, show that there was an extensive use in the working and ornamenting of these metals. Homer's description of the shield of Achilles, made of bronze, enriched with bands of figure reliefs in gold, silver and tin, could hardly have been written by a man who had not some personal acquaintance with works in metal of a very elaborate kind. Again, the accuracy of his descriptions of brazen houses—such as that of Alcinous, Od. vii. 81—is borne witness to by Pausanias's mention of the bronze temple of Athena Aleuhoie in Sparta, and the bronze chamber dedicated to Myron in 648 B.C., as well as by the discovery of jewelled and bronze nails, which show that the whole interior of the so-called treasury of Atreus at Mycenae was once covered with a lining of bronze plates. Of the two chief methods of working bronze, gold and silver, it is probable that the hammer process was first practised, at least for statues, among the Greeks, who themselves attributed the invention of the art of hollow casting to Theodorus and Rhoeus, both Samian sculptors, about the middle of the 6th century B.C. Pausanias specially mentions that one of the oldest statues he had ever seen was a large figure of Zeus in Sparta, made of hammered bronze plates riveted together. With increased skill in large castings, and the discovery of the use of copper, by which the cast kind had to be worked into a mere skin-like caviity, hammered or repoussé work was only used in the case of small objects in which lightness was

Fig. 2.—One of the Siris Bronzes.

the treatment of the reliefs is minute and delicate. The "Siris bronzes," in the same museum, are a most astonishing example of the skill attained by Greek artists in this repoussé work (see Brönsted's Bronzes of Siris, 1856). They are a pair of shoulder-pieces from a suit of bronze armour, and each has in very high relief a combat between a Greek warrior and an Amazon. No work of art in metal has probably ever surpassed these little figures for beauty, vigour and expression, while the skill with which the artist has beaten these high reliefs out of a flat plate of metal appears almost miraculous. The heads of the figures are nearly detached from the ground, their substance is little thicker than paper, and yet in no place has the metal been broken through by the punch. They are probably of the school of Prazites, and date from the 4th century B.C. (see fig. 2.)

Copper and tin have been but little used separately. Copper in its pure state may be worked by the same methods as bronze, but it is inferior to it in hardness, strength and beauty of surface. Tin is too weak and brittle a metal to be employed alone for any but small objects. Some considerable number of tin drinking-cups and bowls of the Celtic period have been found in Cornwall
desirable, or for the precious metals in order to avoid large expenditure of metal. The colossal statues of ivory and gold by Phidias were the most notable examples of this use of gold, especially his statue of Athena in the Parthenon, and the one of Zeus at Olympia. The nude parts, such as face and hands, were of ivory, while the armour and drapery were of beaten gold. The comparatively small weight of gold used by Phidias is very remarkable when the great size of the statues is considered.

A graphic representation of the workshop of a Greek sculptor in bronze is given on a fictive vase in the Berlin Museum (see Gerhard’s Trinkschalen, plates xii., xiii.). One man is raking out the fire in a high furnace, while another behind is blowing the bellows. Two others are smoothing the surface of a statue with scraping tools, formed like a strigil. A fourth is beating the arm of an unfinished figure, the head of which lies at the workman’s feet. Perhaps the most important of early Greek works in cast bronze, both from its size and great historical interest, is the bronze pillar (now in the Hippodrome at Constantinople) which was erected to commemorate the victory of the allied Greek states over the Persians at Plataea in 479 B.C. (see Newton’s Travels in the Levant). It is in the form of three serpents twisted together, and before the heads were broken off was at least 20 ft. high. It is cast hollow, all in one piece, and has the names of the allied states engraved on the lower part of the coils. Its size and the beauty of its surface show great technical skill in the founder’s art. On it once stood the gold tripod dedicated to Apollo as a tenth of the spoils. It is described by both Herodotus and Pausanias.

Marble was comparatively but little used by the earlier Greek sculptors, and even Myron, a rather older man than Phidias, 9th and 10th centuries to the Rhenish provinces of Germany and to Italy, and thence to the whole of western Europe; in this way the 18th century smith who wrought the Hampton Court iron gates was the heir to the mechanical skill of the ancient metal-workers of Phoenicia and Greece. In that period of extreme degradation into which all the higher arts fell after the destruction of the Roman Empire, though true feeling for beauty and knowledge of the subtleties of the human form remained for centuries almost dormant, yet at Byzantium at least there still survived great technical skill and power in the production of all sorts of metal-work. In the age of Justinian (first half of the 6th century) the great church of St Sophia at Constantinople was adorned with an almost incredible amount of wealth and splendour in the form of screens, altars, candlesticks and other ecclesiastical furniture made of massive gold and silver.

Metal-Work in Italy.—It was therefore to Byzantium that Italy turned for metal-workers, and especially for goldsmiths, when, in the 6th to the 8th centuries, the basilica of St Peter’s in Rome was enriched with masses of gold and silver for decorations and fittings, the gifts of many donors from Belisarius to Leo III., the mere catalogue of which reads like a tale from the Arabian Nights. The gorgeous Palæ d’oro, still in St Mark’s at Venice, a gold retable covered with delicate reliefs and enriched with enamels and jewels, was the work of Byzantine artists during the 11th century. This work was in progress for more than a hundred years, and was set in its place in 1106 A.D., though still unfinished (see Bellomo, Palæ d’oro di S. Marco, 1847). It was, however, especially for the production of bronze doors for churches, ornamented with panels of cast work in high relief, that Italy obtained the services of Byzantine workmen (see Garrucci, Arte cristiana, 1872–1882). One artist, named Staurachios, produced many works of this class, some of which still exist, such as the bronze doors of the cathedral at Amalfi, dated 1066 A.D. Probably by the same artist, though his name was spelled differently, were the bronze doors of San Paolo fuori le Mura, Rome, careful drawings of which exist, though the originals were destroyed in the fire of 1824. Other important examples exist at Ravello (1107), Salerno (1099), Amalfi (1062), Atrani (1087), and doors at Monreale in Sicily and at Trani, signed by an artist named Barisanus (end of the 12th century); the reliefs on these last are remarkable for expression and dignity, in spite of their early rudeness of modelling and ignorance of the human figure. Most of these works in bronze were enriched with fine lines inlaid in silver, and in some cases with a kind of niello or enamel. The technical skill of these Byzantine metal-workers was soon acquired by native Italian artists, who produced many important works in bronze similar in style and execution to those of the Byzantine Greeks. Such, for example, are the bronze doors of Santa Maria Assunta at Verona (unlike the others, of repoussé, not cast work); those of the Duomo of Pisa, cast in 1180 by Bonannus, and of the Duomo of Troia, the last made in the beginning of the 12th century by Oderisi of Benevento. Another artist, named Roger of Amalfi, worked in the same way; and in the year 1219 the brothers Hubertus and Petrus of Piacenza cast the bronze door for one of the side chapels in San Giovanni in Laterano. One of the most important early specimens of metal-work is the gold and silver altar of Sant’ Ambrogio in Milan. In character of work and design it resembles the Venice Palæ d’oro, but is still earlier in date, being a gift to the church from Archbishop Angilbert II. in 835 A.D. (see Du Sommerard, and D’Agincourt, Moyen Âge). It is signed Wolvenius Magister Phaber; nothing is known of the artist, but he probably belonged to the semi-Byzantine school of the Rhine provinces; according to Dr Rock he was an Anglo-Saxon goldsmith. It is a very sumptuous work, the front of the altar being entirely of gold, with repoussé reliefs and cloisonné enamels; the back and ends are of silver, with gold ornaments. On the front are figures of Christ and the twelve apostles; the ends and back have reliefs illustrating the life of St Ambrose.

The most important existing work of art in metal of the 13th century is the great candelabrum now in Milan Cathedral. It is of gilt bronze, more than 14 ft. high; it has seven branches for
candles, and its upright stem is supported on four winged dragons. For delicate and spirited execution, together with refined gracefulness of design, it is unsurpassed by any similar work of art. Every one of the numerous little figures with which it is adorned is worthy of study for the beauty and expression of the face, and the dignified arrangement of the drapery (see fig. 3). The semi-conventional open scroll-work of branches and fruit which wind around and frame each figure or group is devised with the most perfect taste and richness of fancy, while each minute part of this great piece of metal-work is finished with all the care that could have been bestowed on the smallest article of gold jewellery. Though something in the grotesque dragons of the base recalls the Byzantine school, yet the beauty of the figures and the keen feeling for graceful curves and folds in the drapery point to a native Italian as being the artist who produced this wonderful work of art. There is a cast in the Victoria and Albert Museum.

**Fig. 4.—Silver Repoussé Reliefs from the Pistoia Retable.** During the 13th and 14th centuries in Italy the widespread influence of Niccolò Pisano and his school encouraged the sculptor to use marble rather than bronze for his work. At this period wrought iron came into general use in the form of screens for chapels and tombs, and grills for windows. These are mostly of great beauty, and show remarkable skill in the use of the hammer, as well as power in adapting the design to the requirements of the material. Among the finest examples of this sort of work are the screens round the tombs of the Scala family at Verona, 1350–1375,—a sort of network of light cusped quatrefoils, each filled up with a small ladder (scala) in allusion to the name of the family. The most elaborate specimen of this wrought work is the screen to the Rinuccini chapel in Santa Croce, Florence, of 1371, in which moulded pilasters and window-like tracery have been wrought and modelled by the hammer with extraordinary skill (see Wyatt, *Metal-Work of Middle Ages*). Of about the same date are the almost equally magnificent screens in Sta Trinita, Florence, and at Siena across the chapel in the Palazzo Publico. The main part of most of these screens is filled in with quatrefoils, and at the top is an open frieze formed of plate iron pierced, repoussé, and enriched with engraving. In the 14th century great quantities of objects for ecclesiastical use were produced in Italy. The silver altar of the Florence baptistery was begun in the first half of the 14th century, and not completed till after 1477 (see *Gaz. des beaux-arts*, Jan. 1883). The greatest artists in metal laboured on it in succession, among them Orcagna, Ghiberti, Verrocchio, Ant. Pollaiuolo and many others. It has elaborate reliefs in repoussé work, cast canopies and minute statuettes, with the further enrichment of translucent coloured enamels. The silver altar and retable of Pistoia Cathedral (see fig. 4), and the great shrine at Orvieto, are works of the same class, and of equal importance.

Whole volumes might be devoted to the magnificent works in bronze produced by the Florentine artists of this century, works such as the baptistery gates by Ghiberti, the statues of Verrocchio, Donatello and many others, the bronze screen in Prato cathedral by Simone, brother of Donatello, in 1444–1461, and the screen and bronze ornaments of the tomb of Piero and Giovanni dei Medici in San Lorenzo, Florence, by Verrocchio, in 1472. At the latter part of the 15th century and the beginning of the 16th the Pollaiuoli, Ricci and other artists devoted much labour and artistic skill to the production of candlesticks and smaller objects of bronze, such as door-knockers, many of which are works of the greatest beauty. The candlesticks in the Certosa near Pavia, and in the cathedrals of Venice and Padua, are the finest examples of these. Niccolò Grossi, who worked in wrought iron under the patronage of Lorenzo dei Medici, produced some wonderful specimens of metal-work, such as the candlesticks, lanterns, and rings fixed at intervals round the outside of the great palaces (see fig. 5). The Strozzi palace in Florence and the Palazzo del Magnifico at Siena have fine specimens of these—the former of wrought iron, the latter in cast bronze. At Venice fine work in metal, such as salvers and vases, was being produced, of almost Oriental design, and in some cases the work of resident Arab artisans. In the 16th century Benvenuto Cellini was supreme for skill in the production of enamelled jewellery, plate and even larger works of sculpture (see Flori's *Ben. Cellini*, 1882), and Giovanni de Bologna in the latter part of the same century inherited to some extent the skill and artistic power of the great 15th-century artists.

**Spain.**—From a very early period the metal-workers of Spain have been distinguished for their skill, especially in the use of the precious metals. A very remarkable set of specimens of goldsmith's work of the 7th century are the eleven votive crowns, two crosses and other objects found in 1838 at Guarrazar, and now preserved at Madrid and in Paris in the Cluny Museum (see Du Sommerard, *Musée de Cluny*, 1852). Magnificent works in silver, such as shrines, altar crosses and church vessels of all kinds, were produced in Spain from the 14th to the 16th century—especially a number of sumptuous tabernacles (*custodia*) for the host, magnificent examples of which still exist in the cathedrals of Toledo and Seville. The bronze and wrought-iron screens—*rejas*, mostly of the 15th and 16th centuries—to be found in almost every important church in Spain are very fine examples of metal-work. They generally have moulded rails or balusters, and rich friezes of pierced and repoussé work, the whole being often thickly plated with silver. The common use of metal for pulpits is a peculiarity
of Spain; they are sometimes of bronze, as the pairs in Burgos and Toledo cathedrals, or in wrought iron, like those at Zamora and in the church of San Gil, Burgos. The great candelabrum or tevolarium in Seville Cathedral is the finest specimen of 17th-century metal-work in Spain; it was mainly the work of Bart. Morel in 1562. It is of cast bronze enriched with delicate scroll-work foliage, and with numbers of well-modelled statuettes. Especially in the art of metal-work Spain was much influenced in the 15th and 16th centuries by both Italy and Germany, so that numberless Spanish objects produced at that time owe little or nothing to native designers. At an earlier period Arab and Moorish influence is no less apparent.

**Fig. 6.—Part of the "Eleanor Grill."**

**England.**—In Saxon times the English metal-workers, especially of the precious metals, possessed great skill, and appear to have produced shrines, altar-frontals, retabiles and other ecclesiastical furniture of considerable size and magnificence. Dunstan, archbishop of Canterbury (925-988), like Bernward, bishop of Hildesheim a few years later, and St Eloi of France three centuries earlier, was himself a skilful worker in all kinds of metal. The description of the gold and silver retable given to the high altar of Ely by Abbot Theodwin in the 11th century, shows it to have been a large and elaborate piece of work decorated with many reliefs and figures in the round. In 1241 Henry III. gave the order for the great gold shrine to contain the bones of Edward the Confessor. It was the work of members of the Otho family, among whom the goldsmith's and coiner's crafts appear to have been long hereditary. Countless other important works in the precious metals adorned every abbey and cathedral church in the kingdom. In the 15th century the English workers in wrought iron were especially skilful. The grill over the tomb of Queen Eleanor at Westminster, by Thomas de Leghton, made about 1394, is a remarkable example of skill in welding and modelling with the hammer (see fig. 6). The rich and graceful iron hinges, made often for small and out-of-the-way country churches, are a large and important class in the list of English wrought-iron work. Those on the refectory door of Merton College, Oxford, are a beautiful and well-preserved example dating from the 14th century. More mechanical in execution, though still very rich in effect; is that sort of iron tracery work produced by cutting out patterns in plate, and superimposing one plate over the other, so as to give richness of effect by the shadows produced by these varying planes. The screen by Henry V.'s tomb at Westminster is a good early specimen of this kind of work. The screen to Bishop West's chapel at Ely, and that round Edward VI.'s tomb at Windsor, both made towards the end of the 15th century, are the most magnificent English examples of wrought iron; and much wrought-iron work of great beauty was produced at the beginning of the 18th century, especially under the superintendence of Sir Christopher Wren (see Ebbets, *Iron Work of 17th and 18th Centuries*, 1880). Large flowing leaves of acanthus and other plants were beaten out with wonderful spirit and beauty of curve. The gates from Hampton Court are the finest examples of this class of work (see fig. 7).

From an early period bronze and latten (a variety of brass) were much used in England for the smaller objects both of ecclesiastical and domestic use, but except for tombs and lecterns were but little used on a large scale till the 16th century. The full-length recumbent effigies of Henry III. and Queen Eleanor at Westminster, cast in bronze by the "cire perdue" process, and thickly gilt, are equal, if not superior, in artistic beauty to any sculptor's work of the same period (end of the 13th century) that was produced in Italy or elsewhere. These effigies are the work of an Englishman named William Tole. The gates to Henry VII.'s chapel, and the screen round his tomb at Westminster (see fig. 8), are very elaborate and beautiful examples of "latten" work, showing the greatest technical skill in the founder's art. In latten also were produced the numerous monumental brasses of which a large number still exist in England (see Brasées, Monumental).

In addition to its chief use as a roof covering, lead was sometimes used in England for making fonts, generally tub-shaped, with figures cast in relief. Many examples exist: e.g. at Tidenham, Gloucestershire; Warborough and Dorchester Oxon; Chirton, Wilts; and other places.
METAL-WORK

Germany.—Unlike England, Germany in the 10th and 11th centuries produced large and elaborate works in cast bronze, especially doors for churches, much resembling the contemporary doors made in Italy under Byzantine influence. Bernward, bishop of Hildesheim, 992–1022, was especially skilled in this work, and was much influenced in design by a visit to Rome in the suite of Otho III. The bronze column with winding reliefs now at Hildesheim was the result of his study of Trajan’s column, and the bronze door which he made for his own cathedral shows classical influence, especially in the composition of the drapery of the figures in the panels. The bronze doors of Augsburg (1047–1073) are similar in style. The bronze tomb of Rudolph of Swabia in Merseburg Cathedral (1080) is another fine work of the same school. The production of works in gold and silver was also carried on vigorously in Germany. The shrine of the three kings at Cologne is the finest surviving example. At a later time Augsburg and Nuremberg were the chief centres for the production of artistic works in the various metals. Hermann Vischer, in the 13th century, and his son and grandsons were very remarkable as bronze founders. The font at Wittenberg, decorated with reliefs of the apostles, was the work of the elder Vischer, while Peter and his son produced, among other important works, the shrine of St. Sebald at Nuremberg, a work of great finish and of astonishing richness of fancy in its design. The tomb of Maximilian I., and the statues round it, at Innsbruck, begun in 1521, are perhaps the most meritorious German work of this class in the 16th century, and show considerable Italian influence. In wrought iron the German smiths, especially during the 15th century, greatly excelled. Almost peculiar to Germany is the use of wrought iron for grave-crosses and sepulchral monuments, of which the Nuremberg and other cemeteries contain fine examples. Many elaborate well-canopies were made in wrought iron, and gave full play to the fancy and invention of the smith. The celebrated 15th-century example over the well at Antwerp, attributed to Quintin Matsys, is the finest of these.

France.—From the time of the Romans the city of Limoges has been celebrated for all sorts of metal-work, and especially for brass enriched with enamel. In the 13th and 14th centuries many life-size sepulchral effigies were made of beaten copper or bronze, and ornamented by various-coloured “champlevé” enamels. The beauty of these effigies led to their being imported into England; most are now destroyed, but a fine specimen still exists at Westminster on the tomb of William de Valence (1296). In the ornamental iron-work for doors the French smiths were pre-eminent for the richness of design and skilful treatment of their metal. Probably no examples surpass those on the west doors of Notre Dame in Paris—unhappily much falsified by restoration. The crockets and finials on the flèches of Amiens and Rheims are beautiful specimens of a highly ornamental treatment of cast lead, for which France was especially celebrated. In most respects, however, the development of

Fig. 8.—Part of Henry VII.’s Bronze Screen.

Fig. 9.—Brass Vase, pierced and gilt; 17th century Persian work.
the various kinds of metal-working went through much the same stages as in England.

Damasceen—The metal-workers of the East, especially in brass and steel, were renowned for their skill even in the time of Theophilus, the monkish writer on the subject in the 13th century. But it was during the reign of Shah Abbas I. (d. 1622) that the greatest amount of skill both in design and execution was reached by the Persian workmen. Delicate pierced vessels of gilt brass, enriched by tooling and inlay of gold and silver, were among the chief specialties of the Persians (see fig. 9). A process called by Europeans “damascening” (from Damascus, the chief seat of the export) was used to produce vessels and such metal articles as were adapted for those of the Persians. A pattern was laid upon a metal sheet, the design being traced with a graver in iron or steel, and then gold wire was beaten into the sunk lines, the whole surface being then smoothed and polished. In the time of Cellini this process was copied in Italy, and largely used, especially for the decoration of weapons and armour. The repoussé process both for brass and silver was much used by Oriental workers, and even now fine works of this class are produced in the East, old designs still being adhered to.

(J. H. M.)

Art Metal-Work.—The term “art metal” is applied to those works in metal in which beauty of form or decorative effect is the first consideration, irrespective of whether the object is intended for use or is merely ornamental; and it embraces any article from a Birmingham brass bedstead to works of the highest artistic merit. The term, as definitely distinguishing one branch of metal-working from another, is objected to by many on the ground that no such prefix was required in the best periods of art, and that allied crafts continue to do without it to the present day. Indeed, as long as metal-working remained a handicraft—in other words, until the introduction of steam machinery—every article, however humble its purpose, seems to have been endowed with some traditional beauty of form. The robust, florid and distinctly Roman rendering of the classic, which followed the refined and attenuated treatment associated with the architecture of the brothers Adam, who died in 1792 and 1794, is the last development in England which can be regarded as a national style. The massively moulded ormulu stair balustrade of Northumberland House, now at 49 Prince’s Gate, the candle-lahrs at Windsor and Buckingah Palace, produced in Birmingham by the firm of Messenger; the cast-iron railings with javelin heads and lictors’ fasces, the tri pods, Corinthian column standard lamps and candelabra, boat-shaped oil lamps and tent-shaped lustres with classic mountings, are examples of the metal-work of a style which, outside the eccentric Brightton Pavilion and excursions into Gothic and Elizabethan, was universally accepted in the United Kingdom from the days of the Regency until after the accession of Victoria. Except perhaps the silversmiths, no one was conscious of being engaged in “art metal-working,” yet the average is neither vulgar nor in bad taste, and the larger works are both dignified and suited to their architectural surroundings.

The introduction of gas as an illuminant, about 1816, at once induced a large demand and a novel description of metal fitting; and the craft fell under the control of a new commercial class, intent on breaking with past traditions, and utilizing steam power, electro-deposition, and every mechanical and scientific invention tending to economize metal or labour. But when all artistic perception in Great Britain appeared lost in admiration of the triumphs of machinery and the expansion of trade, a new influence in art matters, that of the prince consort, began to make itself felt. The Great Exhibition, state-aided schools of design, the South Kensington Museum, and the establishment of a Science and Art Department under Government, were among the results of the important art revival which he inaugurated. He is credited with having himself designed candelabra and other objects in metal, and he directly encouraged the production of theumptuous treatise on metal-work by Digby Wyatt, which laid the foundations of the revival. To this work, and that of Owen Jones, can be traced the origin of the eclecticism which has laid all past styles of art under contribution. The Gothic revival also helped the recognition of art, without very directly affecting the movement. It was valuable in teaching how to work within definite limitations, but without slavish copying; it also emancipated a considerable body of craftsmen from the tyranny of manufacturers whose sole idea was that machine-work should supersedes handicraft. Its greatest efforts were the metal chancel-screens designed by Sir G. G. Scott, that for Hereford Cathedral having been exhibited in 1862. It does not appear that the influence either of Owen Jones or Digby Wyatt on metal-working extended beyond bringing a variety of beauty of past styles to the direct notice of designers. Neither can the London silversmiths, though they employed the best talent available, particularly in the decade following the Great Exhibition of 1851, be credited with much influencing the art metal revival. They were rivalled by Elkington of Birmingham, who secured the permanent assistance of at least one fine artist, Morel Ladeuil, the producer of the Elcho Challenge Shield. Perhaps the first actual designer to make a lasting impression on the crafts was Thomas Jeckyll, some of whose work, including gates for Sandringham, was exhibited at the Great Exhibition of 1851. His great rival as a designer was Alfred Stevens, whose influence on English craftsmen might be regarded as almost comparable to that of Michelangelo on that of his Italian contemporaries. Stevens’s designs certainly directly raised the standard of production in several metal-working firms by whom he was employed; whilst in the Wellington Memorial in St Paul’s Cathedral, and in Dorchester House, his work is seen unaltered by commercial considerations. Omitting many whose occasional designs have had little influence on the development of the metal crafts, we come to Alfred Gilbert, whose influence for a time was scarcely less than that of Stevens himself. Monumental works, such as his statue of Queen Victoria at Winchester and his work at Windsor, may be handed down as his greatest achievements, but judged as art metal-work, his smaller productions, such as the centrepiece presented by the army and navy to Queen Victoria on her Jubilee, have been more important.

The charming bronze statuettes of Onslow Ford, the most representative of which are in the Tate Gallery; the work of George Frampton, as seen in the Mitchell Memorial; and the character of the metal-work of W. Stirling Lee, examples of which are the bronze gates of the Adelphi Bank at Liverpool, have all contributed, especially when applied to architectural decoration, to a high standard of excellence. Painters also have frequently designed and modelled for metal-work, for example, Lord Leighton, who produced bronze statuettes of most refined character; and Sir L. Alma-Tadema, who designed the grilles for his studio and entrance hall; but none so conspicuously as Professor H. von Herkomer, who, whether working in gold and enamel, iron, or his favourite alloy, pewter, infuses a freshness into his designs and methods which displays an unusual mastery over materials.

The gift of reproducing effects of nature or art by brush or chisel is not necessarily accompanied by power to design; but a noteworthy exponent of the dual faculty is G. C. Hâité, whose designs are widely applied.

It is chiefly to architecture that metal-work owes its permanent artistic improvement. In England buildings of Norman Shaw and Ernest George demanded quiet and harmonious metal-work; and the custom of these architects of superintending and designing every detail, even for interiors, created the supply. The beautiful but-reedy style of W. Y. architect raises the standard of the crafts; but beyond others Messrs Ashbee, Lethaby and Wilson have taken an active personal interest in schools of metalwork. The technical schools have also been of immense service in creating a class of self-respecting craftsmen, whose wages enable them to regard their work as worthy occupation abounding in interest. Home industries such as the metal-working round Keswick (founded in 1884 by Canon and Mrs Rawnsley), executed during hours of idleness by field labourers and railway porters, educate the passer-by as well as the worker.
CAST BRONZE GATES, ADELPHI BANK, LIVERPOOL.
Designed by W. D. Caroe, the figures by Stirling Lee, executed by Starkie Gardner and Co.
METAL-WORK

RAIN-WATER HEAD, IN LEAD, FOR THE VICTORIA LAW COURTS, BIRMINGHAM,
Designed by Aston Webb and Ingres Bell, and executed by Dent and Hellier.

COVERED BRIDGE OF IRON, SHEATHED IN CAST LEAD, GRAND HOTEL, LONDON.
Designed by William Woodward, and executed by Starkie Gardner and Co.
British architects and artists who design for the principal decorating firms are to-day as conversant with the Renaissance and succeeding styles of France and Italy as medieval revivalists were familiar with the Gothic styles with which they made us so well acquainted. Metal-work more or less based upon every kind of past style is produced in vast quantities, and in some cases so skilful are the workers that modern forgeries and reproductions are almost beyond the power of experts to detect. This large class of designers and craftsmen, to whom is a thorough knowledge of the history of design is a necessary, follows and develops traditional lines. The new art school, on the contrary, breaks wholly with tradition, unless unconsciously influenced by the Japanese, and awards the highest place to originality in design. It is not to be expected that an art-revival following on, and in possession of, all the results of a period of unprecedented activity in scientific research should proceed with the same restraint as heretofore; but the unfettered activity, and the general encouragement to abandon the traditions of art, have no exact parallel in the past, and may yet prove a danger. It is perhaps the very rapidity of the movement that is likely to retard its progress, and to fail to carry with it the wealthy clients and the decorators they employ, or perhaps even to increase the disposition to cling to the reproductions of the styles of the 17th and 18th centuries. The multiplication of art periodicals, lectures, books, photographs, meetings of societies and guilds, museums, schools of arts and crafts, polytechnics, scholarships, facilities for travel, exhibitions, even those of the Royal Academy, to which objects of applied art are now admitted, not only encourages many persons to become workers and designers in the applied arts, but exposes everything to the plagiarist, who travesties the freshest idea before it has well left the hands of its originator. Thus the inspirations of genius, appropriated by those who imperfectly appreciate their subtle beauty and quality, become hackneyed and lose their charm and interest. The keen desire to be unconventional in applied art has spread from Great Britain and the United States to Germany, Austria and other countries, but without well-defined first principles, or limitations. It seems agreed in a general way that the completed work in metal is to be wholly the conception and, as far as possible, the actual handiwork of the designer: casting by the *cire-perdue* process, left practically untouched from the mould, and embossing, being the two most favoured processes. The female figure is largely made use of, and rich and harmonious colours are sought, the glitter of metal being invariably subdued by deadening its lustre, or by patinas and oxides. Gilding, stains and lacquers, electro-plating, chasing, "matting," frosting, burnishing, mechanically produced mouldings and embossments, are all employed, as they are now, and, whatever may be the method, the result, is far from the same. Adopting, indeed, the motives of the middle ages, it is not without reason that the hallmark of the older generation of designers is apparent, beside which other productions, even the most finished, appear crude. The French artist attains his ideal, and it is difficult to imagine, from his standpoint, that the metal-work of the present can be surpassed. The best English metal-worker, on the contrary, is probably not often quite satisfied with the results he attains, perhaps because in Great Britain the pursuit of art has for centuries been selfish and individual, while in France art traditions are hereditary. The metal-work of Belgium is based at present entirely on that of France, without attaining the same standard, unless designed for ecclesiastical uses. In Holland these crafts have not progressed. Italian metal-workers are mainly employed in reproduction; but traditions linger in some remote parts, while the sporadic appearance of craftsmen of a high order is evident that the ancient artistic spirit is not wholly extinct. Similarly, the surprising damascening by Messrs Zuluaga of Madrid in the monument to General Prim, and that of Alvarez of Toledo, give hope that the Spanish craftsman only needs to be properly directed. German and Austrian workers had for years shown more energy than originality, but they have now received the newest English developments and carried them to extremes of exaggeration. For really fresh and progressive indigenous art we may perhaps have, in the near future, to turn to America.
and to Russia, where, having a little artistic past to refer to, designers and craftsmen display unequaled individuality and force. It is from this Near Eastern source that the metal-work of China and Japan, so pleasantly naïve and inexpensive, though becoming undesirably modified as to design through contact with European buyers, is losing none of its matchless technique, which indeed in Japan is still being developed. In any history of the art revival the influence of such firms as Barbedienne and Christofle in Paris and Tiffany in New York cannot be ignored.

**Industrial Metal-Work.**

The malleability and ductility of metals lie at the basis of the work of the gold- and silver-smiths at one extreme, and of the boiler-maker at the other. Sheet metals can be made to assume almost any shape under the hammer, by pressing together, or in one piece under the die, and all the ordinary patterns of the silversmiths, are similarly done. Frequent annealing is necessary to prevent fracture of the metal; but with these and the observance of certain other precautions the molder, whether working in small or large sheets, can avoid the numerous mouldings, by a blunt hardened tool. A great deal of work is done in this way, though this sphere has also been invaded by the draw presses, whose output would seem incredible to those not conversant with the craft. As to bending and forming, these are produced by dozens per minute, and all the movements of feeding and stamping and removal are often automatic. The ductility of metals and alloys is utilized in wire and tubing through their ability to be drawn on long benches. This work also requires frequent annealing, for otherwise the wires or tubes would rupture. Even hard steel is treated in this way to form tubes for the highest hydraulic and steam purposes.

**Platers’ Work (see Boiler).** is distinguished from work in sheet metals by the fact that plates have considerable thickness, which sheets have not. Plates range in thickness from 1/2 in. to 2 in., but in the major majority of cases they do not exceed 1 in. For these thicknesses they are used chiefly for the largest marine boilers. Armour plates which are several inches in thickness do not come in this group, being a special article of manufacture. Sheets are of thicknesses of less than 1/2 in. This distinction of thickness is of importance in its bearing on workshop practice. A thin sheet requires a very different kind of treatment from a thick plate. Not only is more mechanical pressure required for the one than for the other, but the iron which is as expanded in the outer layers of the metal. The layers of union also differ, riveting being adopted for thick plates, and soldering or brazing generally for thin. The geometrical shapes of thick metal are more or less dependent on the outer layers. It is divided into two great departments: the domestic utensil side, on which the brazier’s craft is exercised, and the engineering side, which is concerned in some engine-work, locomotive and marine, and in the thing to manufacture of the brewer’s utensils. The methods of the first are allied to those of the tinman, those of the second to the methods of the plater. Tinmash’s work resembles the lighter part of the work of the coppermith. There is no essential difference in dealing with tin (i.e. sheets of iron or steel coated with tin) and copper of the same thickness. Hence the craft of tinmen and braziers is carried on by the same individuals. There are, however, distinct differences in detail, and in the amount of labour required for the manufacture of the tin. Copper is often used in the inner layers of the metal. The geometry of sheet-metal work and of platers’ and boiler-makers’ work is identical up to a certain stage. The divergence appears when plates are substituted for sheets. A thin plate may have a geometrical pattern marked on it to show the desired outline of the metal. If such a pattern is not so marked, the metal has to be drawn or extended on the outside, and important differences arise. A typical form is the hemisphere, from which many modifications are derived. The production of this is always a tedious task, and details suitable for the purpose. Some is done by hand-work in copper. In thick plates it is not attempted by hand, but pressing is done between dies, or segments of the sphere are prepared separately and riveted together. In metal-work done in thick plates the dimensions marked out must have reference to the final shape of the article. Generally the dimensions are taken as in the middle of the plate, but they may be on the inside or outside according to circumstances. But in any case the thickness must enter into the calculations, whereas in thin sheets no account is taken of thickness. It is in this kind of work—sheet metal that are bent in one plane only—are easily made. The shapes of all polygonal and all cylindrical and conical forms are obtained by simple development—i.e., the development is cut, or bent, and made to lie flat and when cut, are bent or folded to give the required envelopes. Only common geometrical problems are involved in the case of sheets of sensitive thickness, and allowances are made for thickness. But should any compound forming or similar method of working be required, then the directions the layers or fibres of metal are made to glide over one another, extension taking place in some layers but not in others, and this goes on without producing much reduction in the thickness. As a rule, the more susceptible the metal, the smaller the thickness. As a general rule it is restricted to metals which are not cast, for, with some slight exceptions, it is impossible to produce relative movements of the layers in cast iron, steel or cast brass. But rolled metals and alloys can be so treated, copper being the best for the purpose. The methods employed are “raising” by the hammer, and pressing in dies. But the severity of the treatment would tear the material asunder if rearrangement of the particles were not obtained by frequent annealing (p.).

If an object has to be beaten into concave form from a flat thin sheet, the outer portions must be hammered until they occupy a considerable depth, and then, the more internal layers or fibres of the metal being worked, or wrought into a hemisphere and the attempt is made to hammer the edges round, crumpling must occur. This in fact is the first operation in such work. Observation has shown that the fibres of the substances to be worked, the core and surface of the metal, and it is, therefore, impossible to employ the same methods for all metals. As a general rule it is restricted to metals which are not cast, for, with some slight exceptions, it is impossible to produce relative movements of the layers in cast iron, steel or cast brass. who handles constructional forms has to deal with the maintenance of a due relation between absolute strength and a useful degree of elasticity. Only after many failures has the fact been grasped that a workman, with due regard for the strength of material, also has to consider the degree of elasticity. The reasons were not understood until the researches of Wolff demonstrated the difference between the effects of mere break and of ‘living break’, where stress occurs in the metal and stress of one kind only, and the vastly more destructive effects of both kinds alternating.

The texture of metals and alloys is related to the character of their structure. Much has been done to make available the malleable and ductile metals and alloys show a fibrous character when ruptured, the fusible ones a crystalline fracture. The difference is seen both in the workshop and in the specimens ruptured in tension. Fetal fibres, as the metal ruptures if torn asunder shows long lustrous fibres, resembling a threads in appearance. A piece of cast iron, or steel or bronze, showing dark grey, even fibrous character, are wrought iron fibres. The ductile metals and alloys also extend from 10 to 30% with reduction of area before they fracture, the crystalline ones snap shortly without warning. In some instances, however, the method of application of stress exercises an influence. Wrought iron and mild steel may be made to show a short and crystalline fracture by a sudden application of stress, while if drawn asunder slowly they develop the silky, fibrous appearance. The men who design and work in metals have to take account of the different differences and characteristics, and must be careful not to apply treatment suitable to one kind to another of a dissimilar character. Too much heat, for instance, softens the metals and causes them to pass into the state of the work, the sheet metal worker and the foundryman has a great gulf. An artistic taste will recognize the different differences, and not endeavour, apart from questions of strength, to imitate the tracery of wrought iron in cast designs, the foliations of ancient wrought-iron grilles and screens in heavy cast iron. Severe simplicity is also most in harmony with the structure of wrought iron, its strength and its cost, its appearance, its winding in straight lines. From this point of view the lattice-girder bridge is an ideal design in steel.

One of the most valuable characteristics of the iron alloys is their capacity for hardening, which they owe in the main to the presence of certain small percentages of carbon relatively to minute quantities of other elements: as manganese, tungsten, nickel and other elements in lesser degree. The carbon is the material in which the hardened iron alloy. This valuable property not only in regard to cutting tools, but also in prolonging the life of parts subjected to severe friction. Great advances have been made in the utilization of this property as a result of the growth of the precision grinding-machines, which are able to correct the inaccuracies of hardened work as effectually as those of soft materials. It is utilized in the spindles of machine-tools, in the balls and rollers for high-speed bearings, slides, pivots and such like.

Methods of Union.—The methods of union in works in metal are extremely varied. An advantage in casting is that the most complete freedom is possible. In all other methods of construction forms have to be united by other means—as welding, soldering or riveting. The first named are trustworthy, but are evidently unsuitable for the greater portion of engineers’ work, for the other methods are apt to diminish the bearable forces of the simple elements of rivets and bolts have produced immense developments since the days when bolts were made by hand, holes bored or hand-drilled, and rivets formed and closed by hand labour. Nut- and bolt-making machinery, both for forging and screw cutting, operates automatically, and drilling machinery is highly specialized. Hand-riveting on large contracts has been wholly displaced by power-riveting machines. The methods of union adopted are not allowed to impair the strength of structures which is calculated on the weakest sections through the rivet or bolt holes. Hence much ingenuity is exercised in order to obtain the strongest possible connection. In a large percentage of cases the explanation of all the varied forms of riveted joints, which to casual observers often appear to be of a fanciful character.

Protection of Surfaces.—The protection and coloration of metals are an important part of engineering. The engineer uses paints for his iron and steel. A small amount of work is treated by the Bower-Barr and allied processes, by which a coating of malleable plate is left on the metal. Hot tar—Angus Smith’s process—is used for water-pipes. Boiled linseed-oil is employed as a non-corroding coating preceding the application of the lead and iron oxide paints. In steel boilers artificial galvanic couples are sometimes used, but on account of the difficulties in the use of the process not in general use. The maintenance of the metal that the corrosion of the zinc may preserve the steel boiler plates from waste. Various artificial protective coatings are applied to the plates of steel ships. Bright surfaces are protected with oil or lacquer, and with chemical substances and paint or wax. Wrought iron is laquered, though in engineers’ machinery they are as a rule not protected with any coating. For ornamental work lacquering divides favour with colouring—sometimes done in air, as well as lacquers, but often with chemical colourings, of which the copper and iron salts are the chief basis.

LITERATURE.—Prehistoric: Worsaae, Nordiske Oldsager i Kjoben

havn (1854); Perrin, Etude préhistorique—Age du bronze (1870).

Classical: Layard, Ninive et Babylone (1855); Pliny, Natural History, Book IV, 1877; Kühnel, Historia de antichitaten des Altertums (1849); Gerhard, various monographs (1843–1867); Müller, Etrusker, &c., and other works; Campi, Dom Antica torotica (1851); Von Blücher, Die Altertümlichkeit der Kunst (1869); C. Bischoff, Das Kupfer in der vorchristlichen Zeit (1865).

Medieval, &c.: Digby Wyatt, Metal-Work of the Middle Ages (1869); Shaw, Ornamental Metal-Work (1886); Drury Fortnum, Steelhandbuch (1877); King, Handbuch der ausgeschnittenen Messinge in metal du moyen âge (1852–1854); Hefner-Alteneck, Surrerrie du moyen âge (1869); Violette-du-du, Diction du mobilier. “Surrerrrie” &c.; Lacroix, Treve de l’Art relief; S. Denis, and L’Art du moyen âge (various editions); Die Rathmands der Bronzethei zu Augsburg (1860); Kru, Entwürfe für Gold-, Silber- und Bronze-Arbeiter; Lina, Forgerer merowingerium (1864), and Ormschilder, and Surrerrie du moyen âge (1858); Didron, Manuel des œuvres de bronze et d’orferie du moyen âge (1889); Du Sommerard, Arts au moyen âge (1838–1846), and Muste de Chiny (1892); Rico y Sinobas, Trabajos de metales (1871); Bock, Die Gemäldekunde des Mittelalters (1855), and Kleinodien des hell-römischen Reiches; Jouy, Les gemmes et les joyas (1866); Texier, Dictionnaire d’orferie (1857); Virgil Solis, Designs for Gold- and Silversmiths (1212), (lacemaking reproduction, 1662); Molinier, Les Bronzes de la Renaissance (1886); Servant, Les bronzes d’art (1886); Wilhelm Bode, Italian Bronze Statuets of the Renaissance (Eng. trans. by W. Grérot, first 2 vols., 1909).

Books that include treatises on metal work: I.UNKNOWN (ed., 1836), Les Artifices de la métaillerie (1855), and Les Arts de l’art (1886); Sommerard, Arts au moyen âge (1838–1846), and Muste de Chiny (1892); Rico y Sinobas, Trabajos de metales (1871); Bock, Die Gemäldekunde des Mittelalters (1855), and Kleinodien des hell-römischen Reiches; Jouy, Les gemmes et les joyas (1866); Texier, Dictionnaire d’orferie (1857); Virgil Solis, Designs for Gold- and Silversmiths (1212), (lacemaking reproduction, 1662); Molinier, Les Bronzes de la Renaissance (1886); Servant, Les bronzes d’art (1886); Wilhelm Bode, Italian Bronze Statuets of the Renaissance (Eng. trans. by W. Grérot, first 2 vols., 1909).

METAMERISM (Gr. párèsis, after, perhaps, a part; a technical term used in natural science. In chemistry it denotes the existence of different substances containing the same elements in the same proportions and having the same molecular weight, it is a form of isomerism.

In zoology, metamerism is the repetition of parts in an organized body, a phenomenon which is, as E. Hackel, W. Batson and others have recognized, only a special case of a tendency to repetition of structural units or parts which finds one expression in bilateral symmetry. It occurs in almost every group of the animal kingdom, but is most conspicuous in segmented worms; arthropods and vertebrates.

In certain worms (the Cestoida and some Planarians) metameric segmentation is accompanied by the separation of the completed metatermes one by one from the older (anterior) extremity of the chain (strobilation), but it by no means follows that metameric segmentation has a necessary origin in such completion and separation of the “meres.” On the contrary, metamerism seems to arise from a propensity of organisms which is sometimes more (eumerogenesis) and sometimes less (dysmerogenesis) fully exhibited, in some groups not exhibited at all. The most complete and, at the same time, simplest indication of metameric segmentation is to be seen in certain Chaetopods, where some hundreds of segments succeed one another—each practically indistinguishable in structure from the segment in front or from that behind; muscles, right and left appendage or parapodium, colour-pattern of the skin, gut, blood-vessels, coelom, nephridia, nerve-ganglions and nerves are precisely alike in neighbouring segments. The segment which is least like the others is the first, for that carries the mouth and a lobe projecting beyond it—the prostomium. If (as sometimes happens) any of the hinder segments completes itself by developing a prostomium, the chain has developed a prostomium. In another species metamorphic segmentation of a new individual. Compare such an instance of metameric segmentation with that presented by one of the higher Arthropods—e.g. the crayfish. Here the somites are not so clearly marked in the tegumentary structures; nevertheless, by examining the indications given by the paired parapodia, we find that there are twenty-one somites present—a limited definite number which is also the precise number found in all the higher Crustacea.

We can state as a First Law 1 of metameric segmentation: Metamerism
that it is either indefinite in regard to number of metameres or somites produced, or is definite. Animals in the first case we call anomomeristic; those in the second case, nomomeristic. The nomomeristic condition is a higher development, a specialization, of the metameric condition.

The Second LAW, or generalization, as to metamerism which must be noted is that the meres or somites (excepting the first with its pair of appendages, and the last or pair of somites, which may be somewhat greater or less in number, and which constantly differ greatly by modification of the various constituent parts of the mere or somite. Metamerized animals are either homoeometric or heterometric. The reference of the variation in the form of the respective somites on the one hand, or on the other the generation of the group to which the animal belongs. As a matter of convenience we distinguish in the Arthropod as meromes, first, the tegumentary elements so as to suggest separation of the appendages; second, the similar sternal plates. In Chaetopods we should take next to these the masses of circular and longitudinal muscular fibres of the body-wall and the dorsal-ventral muscles. The latter form the third sort of meromere present in the Arthropods. The fourth kind of meromere is constituted by the parapodia or appendages; the fifth by the coelomic pouches and their ducts and external appendages (if any), whether the latter be carried forward as the blood-vessels of the somite; the seventh by the by intermediate (nerve ganglion pair, commissures, connectives and nerve branches). Metamerism can take place in such a way as to produce definite regions of the somites and their appendages, differing in their modification from others. This latter it is convenient to have a special word for such regions of like meres, and we call each a tagma (γραμηνα, a regiment). The word "tagmation" is applicable to the formation of such regions. In the Chaetopods tagmation always occurs to a small extent so as to form the head somites; in some Chaetopods, such as Chaeoterus and the sedentary forms, there is marked tagmation, giving rise to three or even more tagmata. In Arthropods, besides the head, we find very frequently other tagmata, or segments, and it is to be noted that in the possession of each great line or fine of ascent, the tagmation becomes definite and characteristic just as do the total number of meres or somites, which are the measure of the number of cases of each. These are regarded as varying examples of tentative tagmation. The terms homotagmic and amotagmic are applicable with the same kind of implication as the terms nomomeristic and anomomeristic.

The Fourth LAW of metamerism (auto-heterosis of the meromes) is that the meromes of a somite or series of somites may be separately and dissimilarly affected by heteromerism. It is common enough for small changes only to occur in the inner visceral meromes whilst the outer ones undergo large, or at least lesser degrees of change. But of equal importance is the independent "heterosis" of these visceral meromes without any corresponding heteroses of the body wall. As we may cite this specialization of the renal system and the special localization of renal, genital and gastric meromes with obliteration elsewhere, in a few somites in Arthropoda.

The Fifth LAW, relating also to the independence of the meromes as well as to the separate and dissimilar development of the somites or meromes. Metamerism does not always manifest itself in the formation of complete new segments; but one meromere may be retained so as to suggest separation. Thus the meromes are, so to speak, out of harmony with it and exhibit no repetition. Thus, in the hinder somites of the body of Aphis the Cretaceous we find a series of segments corresponding apparently each to a complete single somite; but when the appendages are examined we find that they have multiplied without relation to the other meromes of a somite: we find that the somites carry from ten to fifteen pairs appendages, increasing in number as we pass backwards from the genital plate. Thus we have, in the case of the Chaetopods, an autarchy the meromes in this case. They take on a quasi-independent metamerism and are produced in numbers which have no relation whatever to the number of the other meromes or metameres. This possibility of the independent metamerism of a single meromere must have great importance in the dislocation of dislocated meromes, and no doubt has application to some of the cases of metameric phenomena in Vertebrates.

The Sixth LAW is the law of dislocation of meromes. This is a very important and striking phenomenon. A merome, such as a pod or a leg (of an insect) or a pair of appendages (repeated, frequent), may (by either a gradual or sudden process, we cannot always say which) quit the metamer to which it belongs, and in which it originated, and pass by actual physical transference to another metamer. This is frequently the result of the dislocation of several meromes from that to which the wandering merome belongs in origin. The movement is more usual from behind forward, rather than the reverse direction; but this, probably, has no profound significance and depends simply on the fact that, as a rule, the head must be the chief region of development on account of its containing the sense organs and the mouth.

In the Vertebrata the independence of the meromes is more fully developed than in other metamerized animals. Not only do we get auto-heterosis of the meromes on a most extensive scale, but the process of dislocation of segments is so general that the condition of the meromes is a common phenomenon. Thus, in fishes the pelvic fins may travel forwards to a thoracic and even jugal position in front of the pectoral fins; the branchiomeres lose all relation to the branchial apparatus; the vertebral column is thrown very far out of the normal, and the central nervous nature, and the heart and its vessels may move backwards from their original meromes in higher Vertebrates carrying nerve-loops with them.

The first Law of metamerism is one which has been pointed out to the writer by E. S. Goodrich. It may be called the law of "translocation of heterosis." Whilst actual physical transference of metamerism is a mere occurrence of the law of homoeosis (as the passage of the pelvic fins of some fishes to the front of the pectorals, and in the case of the backward movement of the opisthosoic appendages of spiders, yet the more frequent mode of the intersegmental position of a specialized organ or series of scale or segment of the somites is not by migration of the actual material organ from somite to somite, but by translation of the general or morphogenetic pattern of the somite accompanied by correlative change in all the somites of the series. The phenomenon may be compared to the transposition of a piece of music to a higher or lower key. It is thus that the lateral fins of the rondan fish are transposed to a thoracic position in the form of anal fin, and we see thus that whole regions (tagmata), such as those indicated by the names cervical, thoracic, lumbar and sacral, are translated (accompanied by terminal increase or decrease in the total number of vertebrae) in the course of the metameric development of allied forms (cf. the varying number of cervical somites in allied Reptiles and Birds).

In such a brief enumeration, we will venture to call the Eighth Law of metamerism the law of homoeosis, as it is termed by W. Bateson. Homoeosis is the making of a merome into the likeness of one belonging to another metamer, and is the opposite of the process of "heterosis," or translocation of a metamer. The law here because the result of its operation is to simulate the occurrence of dislocation of meromes and has to be carefully distinguished from that process. A merome can, and does in individual cases of metamerism, assume the form and character of the corresponding merome of a distant somite. Thus the antenna of an insect has been found to be replaced by a perfectly well-formed walking leg, whilst the hindmost somite has taken up the character of an antenna having the form of an antenna. Other cases are frequent in Crustacea, as individual abnormalities. They prove the existence in the mechanism of metameredized animals, of structural conditions which are capable of giving these results. What these structural conditions are is a matter for separate inquiry, which we cannot even touch here.

We now come to the questions of the production of new somites or the addition of new somites to the series, and to the connected problem of the suppression of somites, whole or partial. We state as the Ninth Law of metamerism that new somites or meromes can be produced only by the addition of a new tagma, be it ever so small and gradual evolution — what is called "budding" — of an anterior border of the hindmost somite. This hindmost somite is therefore different from all the other somites and is called the "root" of the backbone. The law of aermatt埼 is that for a" new somite to be, new meromeres or somites are only produced at the anterior border of the telson, except in the Vertebrata. That is the general rule, as some groups of metameredized animals partial exceptions to it occur. It is probably absolutely true for the Arthropoda from lowest to highest. It is not so certain that it is true for the Chaetopoda, and would need modification in statement to meet the cases of fissiparous multiplication occurring among Syllids and Naidids. In the Vertebrata, where tagmation and heterosis of meromes and dislocation of meromes and tagmata are, so to speak, rampant, new formation of meromere (at any rate as regards the series analogous to the somites) may be called "budding." The application of these terms to meromes in series is the point in the chain. Such points are found where two highly diverse "tagmata" abut on one another. It is possible, though the evidence is not complete, that the anterior border of the segment in question, and with it the muscles which are said to be "intercalated." The question of the intercalation of vertebrae in the Vertebrata has received some attention. It has been remembered that a vertebra even taken with its muscular and vascular and neural accessories is only a partial metamer—a merone — and that, so far as complete meromeres are concerned, the vertebrae do conform to the same law as the Arthropods. Inter- calation of meromes (in the Vertebrata) seems to have taken place in Vertebrata in the fishes, while in higher groups intercalation of vertebrae in large series has been an impossibility. The possible explanation of the structural facts established by the comparison of diverse allied vertebrae of this matter forms a very important part of the working of the bone the investigator of vertebrate anatomy, and it is possible that the application of Goodrich's law (the seventh of our list) may throw new light on the matter.

In regard to the diminution in the number of somites in the
METAMORPHISM

The fusion of neighbouring meromes is often achieved by more or less extensive atrophy of the somites concerned, and by arrest of development in the individual ontogeny. This type of fusion is often seen in the appearance of incipient mergogenesis or formation of new somites, and, vice versa, incipient mergogenesis may be misinterpreted as a type of fusion of once separate and fully-formed somites.

TheEleventh Lawmay be stated thus: any somite in the series which is the anterior or posterior somite of a tagma may become polysegmented or unisegmented, or may lose all trace of some of its meromes: and finally, such a somite may disappear and leave no obvious trace in the adult structure of its presence in ancestral forms. This is called the exaltation of a somite. Frequently, however, such "exalted" somites are obvious in the embryo or leave some remnant (e.g. neuromere, muscle or chitin-plate) which can be detected by minute observation. The somite of the maxillipede (third post-oral appendage of Aplysiasum) is a good example of a somite on its way to exaltation.

The second prae-oral and the premaxillary somites of Hexapoda similarly assume the characteristic features of the vanished somites, furnished by the microscopic study of early embryos. The proponent somite of the Arachnida is an example of a somite which is preserved in some members of the group and partially or entirely metamorphosed in other cases, sometimes with fusion of its remnants to neighbouring somites.

TheTwelfth Law of metamermism might very well be placed in logical sequence with the Eleventh Law. The point is that just as the metameric condition is produced by a change in the body of the descendants of unisegmented ancestors, so highly metamered forms—i.e., strongly segmented forms with specialized regions of differentiation—meromized and gradually lose their metamered structure and become apparently and practically unisegmented animals. The change here contemplated is not the atrophy of terminal segments one by one so as to reduce the size of the body, but an increase in size. On the contrary, there is no loss of size or of high organization is necessary. But one by one, and gradually, the metameric grouping of the bodily structures disappears. The cuticle ceases to be thickened in regions—the muscles of the body-wall overrun their somite boundaries. Internal septa disappear. The nerve-ganglia concentrate or else become diffused equally along the cords; one pair of renal coelomoducts and one pair of genital coelomoducts grow to large size and remain—the rest disappear. The appendages atrophy or become limited to one or two pairs which are widely dislocated from their ancestral position. The animal ceases to present any indication of metameric condition, and in its later development its process is frequently to be recognized. We certainly can observe such a change in the posterior region of some Arthropoda, such as the Astacidae and Hymenopodidae. The spiders, and other arachnids, are descended from Chelicerata, such a change has taken place in them, amounting to little short of complete lineamen, though not absolutely complete.

It is a further step to the origin of the Mullusca involve the supposition that such an effacement of once well-marked metamers has occurred in them, leaving its traces only in a few structures such as the multiple gill-plumes and shell-shields of the Clitons and the duplicated renal sacs of Nautilus.

A further matter of importance in this connexion is that when the old metameres have been effaced a new secondary segmentation may arise in the head or worm-like body of the degenerate Acarid, Demodex folliculorum.

Such secondary annulation of the soft body calls to mind the secondary annulation of the metameres of leeches and some earthworms. In fact, the second process may be an allied one to the first subject; but it is worth noting that the secondary annulii marking the somites of leeches and Lumbricidae in definite number and character are perhaps comparably the redundant pairs of appendages on the premaxillae of Aplysia and in some other cases of independent repetition of tegumentary meromes—a sort of ineffectual attempt to subdivide the somite which only prevails when the somite has become susceptible to repeated division. The last law of metamermism which we shall attempt to formulate here, as the Thirteenth, relates to the fusion or blending of neighboring somites. Fusion of adjacent somites has often been erroneously supposed to occur in the study of Arthropoda. There are, however, very varying degrees of fusion which need to be carefully distinguished. The following generalization may be formulated. "The homologous meromes of two or more adjacent somites tend to fuse with one another by a blending of their substance. Very generally, but not invariably, the fused meromes are found as distinct separated structures in the embryo of the animal, in which they unite at a later stage of growth." This from the fusion of neighboring meromes is often achieved by more or less extensive atrophy of the somites concerned, and by arrest of development in the individual ontogeny. Thus, in cases of partial atrophy of somites may simulate the appearance of incipient mergogenesis or formation of new somites, and, vice versa, incipient mergogenesis may be misinterpreted as a type of fusion of once separate and fully-formed somites.

The scheme of the head or prosoma of Arthropoda is a tagma consisting of two, or three, or prothorome or somites in front of the mouth and of one, two, three, up to five or six opisthomerons. The cephalic tagma or prosoma may thus be more or less sharply divided into two subtagmata, the pre-oral and the post-oral.

METAMORPHISM (Gr. μετά, change of, and μορφή, shape), in petrology, the alteration of rocks in their structural or mineral characters by which they are transformed into new types. In the history of rock masses changes of many kinds are inevitable. Loose sands, clays and heaps of shells are gradually converted into sandstones, shales, limestones by the action of percolating water and the pressure of over-lying accumulations. All rocks exposed at the earth's surface or traversed by waters circulating through the earth's crust, undergo changes in their component minerals that may be brought about by chemical alteration and may be attributed to organic action of the atmosphere and of rain. These processes of sedimentation and decomposition, though not unlike those of metamorphism, are not regarded as essentially the same. They are considered, so to speak, normal episodes in the history of rocks to which all are subject. When rocks, however, are exposed to the heat of intrusive masses (granite, &c.) or have been compressed, folded, crushed, and more or less completely recrystallized, they assume new characters so different from their original ones that they are ascribed to a quite distinct class, namely, the metamorphic rocks.

The transformation is always gradual, so that in suitable districts every stage can be followed from an unaltered or nearly unaltered sedimentary or igneous rock to a perfectly metamorphic one. The transition may be slow or rapid, and the abundance of intermediate forms renders it impossible to lay down any hard and fast lines of distinction. A black shale with fossils may in two or three feet pass into a splintered hornfels; a sandstone or grit becomes a hardened grit, a granular gneiss, and a completely recrystallized gneiss sometimes within a few hundred yards; in a thoroughly metamorphic hornblende schist, a felsic hornblende or chlorite-series rock may be easily recognized as little modified dolerites or diabases. Still, the metamorphic rocks as a class have many well-defined characteristics, and in perfectly typical development cover enormous areas of the earth's surface and must be, in the aggregate, of vast thickness. A great number of them are recognizably of igneous origin; others are equally certainly sedimentary. Hence some writers have suggested that they are not entitled to rank as a separate class, but only as states or conditions of other rocks. It is generally agreed, however, that when the primitive structures and the original minerals of sedimentary or igneous rocks are so transformed as to be no longer easily recognizable the rock should be included in the metamorphic class.

Only rarely, however, does metamorphism produce much difference in the chemical composition of the rocks affected. Sandstones become quartzites and quartz schists, limestones are converted into marbles, granite passes into gneiss, and so on, without their bulk composition being greatly modified. From all that we know it seems established that however great the heat and pressure to which metamorphic rocks have been subjected, they have not undergone such chemical change as to make the rock liquid. Hence there has been no opportunity for inter-mixture by solution or diffusion; the changes, including the growth of crystals of new-formed minerals, have gone on in the solid rocks. The chemical molecules already present have aggregated into new combinations and have built up new minerals without travelling for more than infinitesimal distances from the places they occupied in the original rock. Exceptions to this occur, but they are so few that they do not
invalidate the general rule. Thin bands of limestone, for example, may be followed for miles in belts of mica-schist or gneiss, never losing their identity by blending with the rocks on either side of them. By tracing out one of these, we are often able to unravel the highly complicated stratigraphy of metamorphic regions where the rocks have been greatly folded and displaced. Another important consequence of the persistence of the chemical individuality of metamorphosed rocks is that very often an analysis indicates in the clearest possible fashion what was the original nature of the rock mass. Sandstones, limestones, ironstones, shales, granites, dolerites and serpentines may be totally changed in structure and very completely also in mineral composition, but their chemical characters are practically preserved. The alteration arising from the action of pressure alone on rocks of different origin may have much the same composition, e.g., a felspathic sandstone may closely approach a granite, or an impure dolomite may simulate a basic igneous rock. Individual specimens, consequently, cannot always be relegated with perfect certainty to sediments or igneous rocks; but in dealing with a complex containing a variety of types the geologist is rarely long in doubt as to their original nature.

Two distinct kinds of metamorphism are recognized, namely contact metamorphism, or heat metamorphism, and folding or regional metamorphism. The former is associated with intrusive masses of molten igneous rock which were injected at a very high temperature and produced extensive changes in the surrounding rocks. The second occurs in districts where earth folding and the movements attendant on the formation of mountain ranges have flexured and crushed the strata, probably at the same time considerably raising their temperature. Although these processes are very different in their origin, and in the great majority of cases produce quite different rocks on the two sides of a contact, in which the results are closely comparable. A sandstone may be converted into quartzite and a limestone into marble by either kind of metamorphism.

It is best, however, to describe them as phenomena essentially different from one another.

Contact Metamorphism (thermo-metamorphism).—Any kind of rock—igneous or sedimentary—which has come in contact with an igneous molten magma is likely to show alteration of this type. The extent and intensity of the changes depend primarily on three factors: (1) the nature of the rock concerned, and (2) the magnitude of the igneous mass. It is to be expected that a great intrusion of granite will produce more extensive effects of this kind than a narrow dike a few inches or a few feet broad. At the edges of such dikes only a slight induration may be noticeable in the country rock, or there may be recrystallization with formation of new minerals. At a distance a rock commonly shows a change typical of both processes. Shales are baked and hardened, sandstones are rendered more compact or occasionally are partly fused, limestones may be converted into marble containing garnet, wollastonite, augite or other calc-silicates. A great granite boss, which may be ten or twenty miles broad, is often surrounded by a wide aureole of contact alteration. This may be a few hundred yards broad or a couple of miles; in rare cases the breadth of the aureole is only a few yards. These variations may have structural causes; thus when the aureole is narrow the junction of granite with country rock may be vertical; when the aureole is broad the granite may be a little tilted. Earth folding or plate movements will alter the appearance of the aureole. When a broad aureole accompanies a vertical junction we may suppose that molten rock has flowed upwards along this boundary line for a prolonged period, and has gradually raised the rocks to a very high temperature, even at some distance away from the contact. Where the alteration is slight and local there is usually something in the composition of the rocks or in their crystalline structure to account for this.

No less important is the nature of the rocks involved. Where a granite intrudes into a succession of various types of sedimentary and igneous rocks the differences in their behaviour are often very striking. Granites of various types alter in different ways; and limestones, especially if they be marly or argillaceous, are often full of new minerals, when purer shales on each side of them are not visibly affected. Schists and gneisses, being already highly crystalline, are but slightly indurated in contact to these effects. Granites recrystallize by forming new mica plates or hornfels, or by producing calc-silicates by replacing the carbonic acid. In a pure limestone the carbonate merely recrystallizes as marble. This loss of volatile ingredients must occasion a diminution in the bulk of the sedimentary mass involved; in cooling there will be contraction, and fissures are produced which may be filled with igneous dikes or with
Melange

contact its veins eroded, the masses often as actual planes aureoles are not wedged distinct. The igneous rock to the sedimentary, perhaps through the medium of the vapours exhaled. The breadth of the adino belt is as a rule only a few inches or a foot or two.

The vapours given off by intrusive igneous masses may contain substances which combine with the ingredients of the surrounding rocks and thus modify their composition. Boron, fluorine and phosphorus are the principal elements which are transmitted in this way, and minerals such as tourmaline, topaz and mica are the characteristic products in quartzose or argillaceous rocks; while apatite, magnetite and zirconite and chondritide are commonest in limestones. This is a form of pneumatolytic action (see Petro-

MATOLYSIS).

Extreme cases of the mutual interaction of the intrusive rock with the surrounding orogenic rocks are known. In some of these, masses of slate are themselves full of corundum, andalusite, cordierite and other minerals, which appear to indicate the effect of absorbed slate material. Much discussion has taken place as to the importance of such processes in modifying the facies presented by igneous rocks. Granites are alleged to have absorbed impure limestones and thus to have been changed to diorites (Pyrenéens). At the contact of the two rocks a narrow zone of diorite intervenes between the granite and the limestone. In this case an acid rock has become basic (or intermediate) in character; similarly, basic rocks such as gabbro are said to become granitic where they have melted down large quantities of the surrounding sedimentary rocks. It is evident that precisely the same modifications of the igneous rocks are known to occur where these explanations cannot possibly hold good—e.g. among the British isles, the contact of granite with quartzite or mica-schist—they are not due to chemical interaction in the magma and not to any admixture with foreign material.

Such modifications in the igneous rock at its contacts are often said to have given rise to the plagioclase in the aureole or country rocks being exomorphic. The endomorphic changes of the country rocks are, however, not strictly of that of contact alteration. The commonest facies of a fine-grained, sometimes glassy, chilled edge due to rapid solidification from sudden cooling of the magma. The fine-grained marginal facies is often porphyritic, while the interior of the mass is granular or eugranitic. There is often a tendency to develop of special minerals in the edge of intrusive masses. Some of these arise probably from alteration of country rock, e.g. cordierite, andalusite, iron oxides (in granite). At the same time there may be a great abundance of angular or rounded grains which have been brought from the magma. Where granite penetrates gabbro the fragments of the latter are sometimes melted down and digested in the granite till only the crystals of their augite or diabase are left (Skye). Granite margins are not always due to cold intrusion but may be exceedingly rich in quartz and at the same time very coarse-grained or pegmatitic. This seems to arise from the production of facies at the same time as the marginal facies after the granite has to a large extent solidified.

In these facies the intrusive rocks may show the characteristic features of contact metamorphism. They are selvage-like zones, often diffuse, dipping into the magma and often occur in the form of veins deposited by ascending hot waters. Here contact aureoles are common sites for mineral deposits of economic value.

Regional Metamorphism.—The second kind of metamorphism is known as "regional" because it is not confined to narrow areas like contact metamorphism, but affects wide tracts of country.

METAMORPHISM

Regional Metamorphism.

Metamorphic rocks of this kind often cover a large part of a continent (e.g. the centre of Africa or Scandinavia and Finland). Whatever the causes be which produced it, they must have been of widespread operation, either by the intrusion of igneous rocks or by some processes or with definite stages of the earth's development. Where such rocks occur there is generally much evidence of earth movement, accompanied by crushing and folding. They are very characteristic of the central portions of great mountain systems where these have been denuded and their deeper cores exposed. Most geologists believe that this connexion is causal, holding that the culmination of the mountains is due to the crust's due, to shrinkage of a nearly rigid shell upon a cooling core. In the inner, has bent and folded the rocks, and at the same time has crushed and largely recrystallized them. According to this view regional metamorphism is due to plastic flow accompanying the folding; hence the name dynamo-metamorphism is frequently applied to it.

A great number of observations has been collected in all regions of the globe where schistose rocks are abundant. The whole tendency is to point to a consistent physical change, in which the dominant feature which proves that there has been great folding in these rocks is by microscopic and lithological characters which demonstrate that extensive crushing has taken place. Through progressive stages a slate with fossils may be trachy into a phyllite, which becomes a mica-schist, or, in places, a micaeous gneiss. At first, fossil rocks are distorted or torn apart, but they disappear as crystallization advances. The most conspicuous features now present are almost like plastic masses, losing their fossils and becoming crystalline. Grains, quartzites and granites show the effects of crushing, and the pulse and the breaking down of their original clastic or igneous textures, of the aluminous schists (g.s.) and granulites being produced. Moreover, the degree of metamorphism in the rock can often be shown to correspond closely to the extent of the formation. This suggests that the later or more widely distributed schists.

Another argument in favour of dynamo-metamorphism, which has been urged with much insistence by the extreme supporters of the "regional" theory, is the presence of original chemical characters in the metamorphic rocks. Some of them are so near the original igneous rocks that it may be almost like plastic masses, losing their fossils and becoming crystalline. Grains, quartzites and granites show the effects of crushing, and the crushing and the breaking down of their original clastic or igneous textures, of the aluminous schists (g.s.) and granulites being produced. Moreover, the degree of metamorphism in the rock can often be shown to correspond closely to the extent of the formation. This suggests that the later or more widely distributed schists.

Although recrystallization has been complete, the original rock metamorphism has taken place. The metamorphism is a series of nearly uniform intensity over a large area; the sediments, for example, may have all their clastic and organic structures effaced, and in the igneous rocks the texture and whole character of the rock is modified and "stamped" by the metamorphic processes which may have completely disappeared. This, however, is not always the case, especially when the metamorphism is not of very intense degree. Parts of the rock may retain original structures, while others are typical crystalline bed, consolodated as a normal, clastic feature in metamorphic rocks is the schistose nature of the rock, while the schist is the effect of meta-

Widespread. At other times a rock mass, such as an intrusive sill, is schistose at its edges and surrounded by schistose sediments, while near its centre it is almost entirely massive. The hard igneous rocks which have proved to be more rigid than the sediments, in a very wide area of country rock, e.g. cordierite, andalusite, iron oxides (in granite). At the same time there may be a great abundance of angular or rounded grains which have been brought from the magma. Where granite penetrates gabbro the fragments of the latter are sometimes melted down and digested in the granite till only the crystals of their augite or diabase are left (Skye). Granite margins are not always due to cold intrusion but may be exceedingly rich in quartz and at the same time very coarse-grained or pegmatitic. This seems to arise from the production of facies at the same time as the marginal facies after the granite has to a large extent solidified.

In these facies the intrusive rocks may show the characteristic features of contact metamorphism. They are selvage-like zones, often diffuse, dipping into the magma and often occur in the form of veins deposited by ascending hot waters. Here contact aureoles are common sites for mineral deposits of economic value.

METAMORPHISM

mass along certain narrow belts; and that recrystallization was set up along with the development of schistose structure. The operating cause cannot have been anything but pressure, especially as the foliated rocks occur not in the massifs of the meta-
morphic schist but in isolated masses. In the Highlands of Scotland these occur as belts of comparatively narrow width and of high altitude. In the Lake District the metamorphism is expressed in the transition from massive igneous rock to meta-
morphic schist and in the development of the schistose structure. Where such belts are relatively narrow and in the case of those in the Lake District the foliation is restricted to the margins of the belts. The transition from igneous to metamorphic rocks takes place over relatively short distances. The beds of schistose rocks pass imperceptibly into those of the parent rock. The metamorphism is therefore a phenomenon of limited extent.

The quantitative aspect of metamorphism is usually expressed in terms of the grade of metamorphism. The most fundamental of the various grades are the two extremes: the low-grade and the high-grade. The high-grade metamorphic rocks are characterized by the development of foliation and by the presence of metamorphic minerals, such as amphibole, biotite, and micas. The low-grade metamorphic rocks are characterized by the development of petrographic structures, such as porphyroclastic textures and schistose structures.

The grade of metamorphism is a function of the temperature and pressure of the metamorphic environment. The temperature of metamorphism is controlled by the geothermal gradient, which is the rate of increase in temperature with depth. The pressure of metamorphism is controlled by the burial depth of the rocks, which is the depth to which they are buried by overlying sediments.

The metamorphic grade is usually expressed in terms of the type of metamorphic mineral assemblage that is present. For example, the presence of garnet, kyanite, and sillimanite indicates a high-grade metamorphic environment, whereas the presence of chlorite, muscovite, and biotite indicates a low-grade metamorphic environment.

The metamorphic grade is also influenced by the duration of the metamorphic event. The longer the duration of the metamorphic event, the higher the grade of metamorphism.

The metamorphic grade is a function of the time and temperature of the metamorphic event. The metamorphic grade is also influenced by the pressure of the metamorphic environment.

are typical gneisses which may resemble igneous rocks; the schists of later origin exhibit a progressive transition to normal sediments. Without admitting that it is possible to classify metamorphic rocks accurately and completely when they have been altered and imbricated, we may admit that there is much reason to believe that the more intense stages of alteration characterize as a rule the rock masses which were oldest or most deeply situated during the epoch of their formation.

While rocks near the surface which are under comparatively slight pressures yield to stress by fracturing, it is conceivable that at deeper depths the minerals would become plastic and suffer deformation by pressures and which this zone "flowage" as described by van Hise estimates a depth of not more than 12 kilometers, depending on many factors such as the strength of the rocks and nature of the forces. It is the "blowing" as described by van Hise estimates a depth of not more than 12 kilometers, depending on many factors such as the strength of the rocks and nature of the forces. In the east and south part of the state the rapidity of the deformation. Between it and the zone of fracture, which lies above, a gradual transition must take place. Doelter, on the other hand, believes that the depth at which plastic flow begins is at least 5 kilometers, although he states that some rocks which have been so profoundly buried can now be exposed at any part of the earth's surface.

In the attempt to explain the existence of large masses of metamorphic rocks which are perfectly foliated, but at the same time coarsely crystalline, and show no grinding down of their components, as might be expected on the hypothesis of pure dynamo-metamorphosis, E. Bonney urges the hypothesis that many gneisses are igneous rocks which were foliated from the first, and a large body of evidence in many European countries confirms his statement. In his opinion plasticity of rocks is an inherent condition of the substance, and it is not necessarily a banded structure, and contain minerals which are not identical with those of igneous rocks but with the components of the parent rocks together with the foliation to establish the conditions of foliation, and not of the ordinary type as the recrystallized products also have a banding or foliation owing to the pressure acting on them during metamorphism. Bonney urged the hypothesis that many gneissic rocks are metamorphic rocks which exhibit a flow banding and an imperfect idiomorphism of their minerals owing to their having been injected in a half-solid state; the component crystals by mutual attrition assume rounded or lenticular forms. Undoubtedly there is much truth in these hypotheses, yet in both cases they seem to necessitate the presence of extraordinary earth-pressures such as accompany mountain building. We know that heat greatly increases the plasticity of rocks. Assuming that the intrusions take place during an epoch of earth movement, we may be certain that as solidification goes on the pressures will force the rock forward, and the structures will be very different from those assumed by a rock which has crystallized in a condition of rest.

Lastly, there are many geologists who hold that certain kinds of gneisses are due to the injection of plutonic igneous rocks into the strata, the so-called metasomatism. The igneous rock, veins the sediment in every direction; the veins are often exceedingly thin and nearly parallel or branch again and again. In this way a banding or foliation is set up, and the mixed rocks have the appearance of a gneiss. In the sediment, intensely heated, new minerals are set up. The igneous rock digests or absorbs the materials which it penetrates; and it is often impossible to say what is the primary sedimentary stratum. The different bands of gray break up and partly assimilate older basic rocks. Very good examples of this process are known, and they may be much more common than is at present suspected. Conditions which bring about these changes are the same as those that bring about the sudden change in the earth's crust; the igneous rocks may also be much above their consolidation points. It is quite reasonable to believe that at very deep levels absorptions and recrystallizations of igneous rocks go on extensively, while in higher zones there is little or none of this action. (J. S. F.)

**METAMORPHOSIS**

**METAMORPHOSIS**, a term used in zoology in different senses by different authors, and sometimes in different senses by the same author. E. Korschelt and K. Heider, in their work on the development of the Invertebrata, usually apply it to the whole of the larval development. For instance, in their account of the Bryozoa, they say (p. 18, part 2, of the English translation): "The metamorphosis of a Bryozoa larva comprises a more or less protracted free-swimming stage during which no perceptible advance is made in the development of the larva, and the subsequent somewhat complicated changes which bring about its transformation into the first primary zoid of the young Bryozoan colony." Throughout their account of the Crustacea they use the word in the same sense, i.e. as applied to the whole of the changes which the larva undergoes in passing into the adult. On the other hand, in their account of Mollusca they seem to restrict the term to the final change by which the larva passes into the adult form (op. cit., part 4, p. 14). F. Balfour in his great work on Comparative Embryology seems to limit the word to a sudden change in the larval history. For instance, he says: "The chief point of interest in the above development is the fact that the nauplius form becoming gradually converted without any special metamorphosis into the adult condition" (Comparative Embryology, 1885, i. 403). "By the free Cypria stage into which the larva next passes a very complete metamorphosis has been effected" (op. cit. i. 490). "The change undergone by the Tadpole in its passage into the Frog is so considerable as to deserve the name of a metamorphosis" (op. cit. ii. 137).

Finally and most decisive he says in his general account of larvae: "In the larval type [of development] they are born at an earlier stage of development, in a condition differing to a greater or less extent from the adult, and reach the adult state either by a series of small steps or by a more or less considerable metamorphosis" (op. cit. ii. 360).

Here the term will be used in the sense of the last quotations from Balfour and will be regarded as applicable only to those cases of sudden and marked change which frequently occur at the end of the larval period and sometimes at more or less frequent intervals during its course (Crustacea). Some authors (see H. G. Bronn, Thiirreich, "Myriapoda," Bd. 5, Abth. 2, p. 113) have applied the term "metamorphosis" only to those cases of larval development in which the young leaves the water with provision organs which are lost in the later development. Such authors apply the term "anamorphosis" to cases in which the just-hatched young is without provision organs but differs greatly from the mother in size, structure and number of organs.

Such writers apply the term "epimorphosis" when there is merely an acquisition of sexual maturity and increase in size after birth or hatching.

The essential feature of metamorphosis is the sudden bursting into function of new organs, whether these organs suddenly arise or have been gradually formed, without becoming functional in preceding larval stages. Another feature of it is the disappearance of organs which have been of use to the larva but which are not required at all or are not required in the same form in the new environment. The term is only valid in connexion with larval development and is not applied to the sudden changes, due to a change of environment (e.g. the passage of the mammalian embryo from the oviduct into the uterus), which sometimes occur in embryos. Neither is it used in connexion with the sudden changes of conditions which occur at the birth or hatching of an embryo, although, especially in the case of birth, this event is frequently accompanied by profound morphological alteration.

The most familiar examples of metamorphosis are the abrupt changes which occur at the end of the larval history of the frog and many insects. In both these cases there is a sudden and great change of environment; there is a sudden demand for new organs which would have been quite useless in the old environment, and organs which were of use in the old environment and are of no use in the new have to be eliminated. The two examples we have chosen have the advantage of showing us the two methods by which the crisis in the life-history is met.
In the frog (fig. 1) the structural changes which obtain full fruition at the metamorphosis take place gradually during the previous tadpole life. They relate mainly to the alterations of the respiratory organs and vascular system which are required for the purely terrestrial life of the frog, and to the appearance of the paired limbs. The changes in the respiratory and vascular organs are led up to in the tadpole, which during the greater part of its aquatic life is a truly amphibious animal, breathing by lungs as well as by gills; but a sudden change occurs in these organs at the metamorphosis. The limbs which were slowly formed during tadpole life—the posterior pair visibly, the anterior under cover of the operculum (fig. 1, B)—are of no use to the tadpole and must constitute a pure burden to it. The principal events of the metamorphosis are the sudden appearance of the anterior limbs, and the complete closure of the gill aperture (fig. 1, C). The appearance of the anterior limbs and the acquisition of functional importance by both pairs enable the frog to leave the water and pass on to the land to lead its terrestrial life. The other larval organs, such as the gills and the tail, gradually shrink in size and ultimately vanish. In the case of the gills this shrinking had begun before the metamorphosis, but the tail shows no sign of diminution until the frog is ready to pass on to the land.

The distinguishing feature of this type of metamorphosis is that the animal is burdened for a certain period, both before and after, with organs which are useless to it. In the next type, which is exemplified by the metamorphous Insecta, this occurs to a much smaller extent, although the changes of habitat and the corresponding changes of structure are more remarkable. In Insecta the change is usually from a terrestrial or aquatic habitat to an aerial one. The larva of a butterfly is a worm-like organism which creeps on and voraciously devours the foliage of certain plants (fig. 2, C). During its life it undergoes much growth, but no important change in structure. When it leaves the egg it is adapted to live and feed on a particular species of plant, on or near which the eggs are deposited by the parent butterfly. It has powerful biting jaws by which it procures its vegetable food. The adult, on the other hand, is a winged creature which also lives on plants but in quite a different way to the larva (fig. 2, A). It flies from plant to plant and obtains its food by sucking the juices of flowers and other parts. The powerful mandibles of the larva have disappeared and in their place we find a sectorial proboscis formed by the first maxillae [fig. 2, A (4)].

Between the larva and the adult insect there is interposed a resting stage, the so-called pupa (fig. 2, B), during which no food is taken, but very important changes of structure occur. These changes consist of two processes: (1) histolysis, by which most of the larval organs are destroyed by the action of phagocytes; and (2) histogenesis, by which the corresponding organs of the imago are developed from the imaginal disks. The imaginal disks appear to arise in the embryo in which they develop, some of them from the epiblast and some from the hypoblast. They persist practically unchanged through larval life and become active as centres of growth in the pupa. The pupal stage in such a metamorphosis may be compared to a second embryonic stage in which the organs of the adult assume their final shape. In this kind of metamorphosis the larval organs are entirely got rid of in the pupal stage, during which the insect is as a rule incapable of locomotion and takes no food; and the new formation of organs—especially those of locomotion and alimentation—which is necessitated by the totally different habits of the larva and mature insect, is also accomplished at the same period, largely, no doubt, at the expense of the material afforded by the disrupted larval organs. The larva itself does not form any of these organs and carry them about during its active life, though it does possess the very minute centres of growth known as the imaginal disks which burst into activity after the larval life is over. It must not be supposed that in all insects in which the sexual animal has a different habitat from the young form, there is a metamorphosis of the kind just described. In the may-flies and dragon-flies, in which the larva is aquatic, the change is prepared for some time before the actual metamorphosis, the organs which are necessary for the aerial existence being gradually acquired during larval life. In such cases, the metamorphosis belongs to our first type and consists of the act by which the organs previously and gradually acquired suddenly become functional. We have now considered in detail two typical cases of metamorphosis. In the first the change is gradually led up to and the larva is burdened, in its later stages at least, with organs which are of no use to it and only become functional at the metamorphosis. In the other, the change is not led up to. It is sudden, and a kind of second embryonic period is established.
to enable the important and far-reaching transformation to be accomplished. It is clear that the two kinds of metamorphosis only differ in degree and that no line can be drawn between them.

In the Crustacea, as has already been pointed out, many authors apply the term metamorphosis to the whole larval development, which consists of a series of changes leading to the adult form. But this is in our opinion an incorrect use of the word. The typical larval development of a Crustacean consists of a series of small metamorphoses. At each moult new organs which have been developed since the preceding moult become manifest and some of them functional. For instance, the prawn Peneaus leaves the egg as a nauplius larva (fig. 3, A). It issues from the first moult as a metanauplius which has a forked tail, a beginning of the cephalo-thoracic shield, and a large helmet-shaped upper lip. It also possesses stump-like rudiments of the maxillae and two anterior pairs of maxillipeds. After the next moult it is known as a protozoea (fig. 3, B), in which a cephalo-thoracic shield is well developed, the posterior part of the body is prolonged into a tail, in the anterior part of which the thoracic segments are obscurely indicated, and the four pairs of stump-like rudiments have become functional appendages (fig. 3, B (4), (5), (6), (7)). This passes into a later protozoa stage (C) in which the rudiments of the compound eyes and of the abdominal segments are visible beneath the cuticle and in which certain functional changes (jointing, &c.) have appeared in the limbs. This is succeeded by the zoaee stage (fig. 3, D), characterized by the stalked and functional condition of the eyes, the increased size of the abdominal segments, and the appearance of appendages on the sixth of them, the increase of size in the third pair of maxillipeds (8) which had appeared as small rudiments in the preceding stage, and the appearance of the five pairs of posterior thoracic limbs as small biramous appendages. The zoaea stage is followed by the mysis stage (fig. 3, E) in which the thoracic feet are biramous, as in Mysis. From this the adult form proceeds. The transformation is more gradual than would be gathered from this short description, because moult

occur during the later stages from each of which the larva comes with some slight transformation.  

In the life-history of a typical Cirriope there may be said to be two distinct metamorphoses, with gradual developmental stages taking place between them. The animal is hatched as a nauplius. This undergoes a series of moultsw during which increase in size and slight changes in form occur (fig. 4, A, B). At the last of them several organs characteristic of the second
or Cypris stage are discernible [fig. 5 (g), (6)] beneath the cuticle. When this is pulse the free-swimming Cypris larva is liberated with its six pairs of biramous thoracic legs, its biramous compound eyes and its paired compound eyes [fig. 6]. This is the first metamorphosis. After a certain period of free life the Cypris larva attaches itself by its anterior antennae to some foreign object and enters upon the pupal stage (fig. 7). During this the larva takes no food and ceases to move, and undergoes important changes of structure and form beneath the larval cuticle, which invests it like a pupal case. These changes lead to the type, but it is remarkable for the heavy burden of adult structures which the larva, in its later stages at least, carries about (fig. 5). The adult body is, in the main, fashioned out of the larval body, and it is only in its features peculiar to the adult mouth, oesophagus and anus that it is new, and the central nervous system of the larva when present shares the fate of the larval locomotory apparatus. In Asteroids and Ophiuroids the metamorphosis is an investment to foreign objects, the fixation being effected as in Cirripedes by the preoral lobe.

In the Vertebrata a metamorphosis occurs in the lamprey and the Amphibia. In the lamprey a metamorphosis of three or four years as a sexless larva, known as the ammocoete. It then quite rapidly (in three or four days) undergoes a series of changes and becomes converted into the adult. The metamorphosis affects the larval apparatus and other organs, and especially the reproductive organs, which become mature. The adult lives for a few months only, spawning soon after the metamorphosis is complete. This belongs to our second type, but there does not appear to be any resting stage during the few days in which it is effected. In the Amphibia the metamorphosis is fairly exemplified by that of the frog. In many fishes there is a considerable larval development, but this is perfectly gradual and there does not appear to be anything of the nature of a metamorphosis.

In most cases of metamorphosis those organs of the larva, which are found also in the adult, persist through the transformation, undergoing merely the ordinary modifications of development. But it sometimes happens that such organs are completely destroyed and rebuilt during the metamorphosis of the metamorphosis. In some of which the internal organs undergo disruption and are reformed. It happens also in cases in which some part of the larval life is not reserved for the adult.

The observation that the same phenomenon occurs in sponges. In most Echinoderms a similar phenomenon is observed with regard to the oesophagus and the mouth and anus. The above applies completely to this behaviour of the blastopore; that is to say, it is suggested that the primitive mouth or blastopore becomes, or has become in some larval life, highly specialized in connexion with larval needs that it is unable to give rise to both mouth and anus, and in some cases to either. (A. S.)

METAPHOR—METAPHYSICS

METAPHOR (Gr. μεταφορά, transfer of sense, from μεταφέρειν, to carry over), a figure of speech, which consists in the transference to one object of an attribute or name which is usually and literally applied to another, and the transference is therefore a metaphorically as well as metaphorically. It is thus in essence an emphatic comparison, which if expressed formally is a "simile" (Lat. similis, like); thus it is a metaphorical expression to speak of a ship ploughing her way through the waves, but a simile if it takes the form of "the ship, like a plough, moves," &c. The "simile" metaphor, such as the instance given, becomes the "continued" metaphor when the analogy or similitude is worked out in a series of phrases and expressions based on the primary metaphor; it is in such "continued metaphors" that the solecism of "mixed" metaphors is likely to occur.

METAPHYSICS, or METAPHYSICS (from Gr. μέτα, after, φυσικά, things of nature, φύσεως, i.e. the natural universe), the accepted name of one of the four great departments of philosophy (q.v.). The term was first applied to one of the treatises of Aristotle on the basis of the arrangement of the Aristotelian canon made by Andronicus of Rhodes, in which it was placed, after the "physical treatises" with the description τὰ ἀπὸ τὰ φυσικά. The term was used not in the modern sense of above or transcending nature (a sense which μέτα cannot bear), but simply to convey the idea that the treatise so-called comes after the physical treatises. It is therefore nothing more than a literary accident that this term has been applied to that department or discipline of philosophy which deals with first principles. Aristotle himself described the subject matter of the treatise as "First
METAPHYSICS

Philosophy" or "Theology," which deals with being as being (Metaph. I., 1. 3., εἰσιν ἑπτὰν μιᾶς ή θεωρεῖ τὸ ως υ καὶ τὸ τούτου ὑπαρχεῖν κατὰ αὐτήν). From this phrase is derived the later term "Ontology" (q.v.). The misapprehension of the significance of metaphysics, and the misuses of the term "metaphysics," e.g., for that which is concerned with the supernatural, not only by the schoolmen but even as late as 17th-century English writers, and within narrower limits the term has been dangerously ambiguous even in the hands of modern philosophers (see below). In the widest sense it may include both the "first philosophy" of Aristotle, and the theory of knowledge (in what sense can there be true knowledge?), i.e. both ontology and epistemology (q.v.), and this is perhaps the most convenient use of the term; Kant, on the other hand, would represent metaphysics as being "nothing more than the inventory of all that is given us by pure reason, systematically arranged" (i.e. epistemology). The earliest "metaphysicians" concerned themselves with the nature of being (ontology), seeking for the unity which they postulated behind the multiplicity of phenomena (see IONIAN SCHOOL OF PHILOSOPHY and articles on the separate thinkers); later thinkers tended to inquire rather into the nature of knowledge as the necessary pre-requisite of ontological investigation. The extent to which these two attitudes have been combined or separated is discussed in the ensuing article which deals with the various schools of modern metaphysics in relation to the principles of the Aristotelian "first philosophy."1

1. THE SCIENCE OF BEING

Side by side with psychology, the science of mind, and with logic, the science of reasoning, metaphysics is tending gradually to reassert its ancient Aristotelian position as the science of being in general. Not long ago, in England at all events, metaphysics was merged in psychology. But with the decline of dogmatic belief and the spread of religious doubt—as the special sciences also grow more general, and the natural sciences become more metaphysical in respect of what it is expedient to say and forget—many contemporary philosophers—men begin to wonder again about the nature and origin of things, just as it was the decay of polytheism in Greek religion and his own discoveries in natural science which impelled Aristotle to metaphysical questions. There is, however, a certain difference in the way of approaching things. Aristotle emphasized being as being, without always sufficiently asking whether the things whose existence he asserted are really knowable. We, on the contrary, mainly through the influence of Descartes, rather ask what are the things we know, and therefore, in the ensuing article which deals with the various schools of modern metaphysics, and in consequence come to treat metaphysics in relation to psychology and logic, from which epistemology is an offshoot.

To this pressing question then—What is the world as we know it?—three kinds of definite answers are returned: those of materialism, idealism and realism, according to the emphasis laid by metaphysicians on body, on mind, or on both.

Metaphysical materialism is the view that everything known is body or matter; but while according to ancient materialists it is only another body, according to modern materialists mind without a body, and soul without a body.

Metaphysical idealism is the view that everything known is mind, or some mental state or other, which some idealists suppose to require a substantial soul, others not; while all agree that body has no different being apart from mind.

Metaphysical realism is the intermediate view that everything known is either body or soul, neither of which alone exhausts the universe of being. Aristotle, the founder of metaphysics as a distinct science, was also the founder of metaphysical realism, and still remains its main authority. His view was that all things are substances, in the sense of distinct individuals, each of which has a being of its own different from any other, whereas an attribute has only the being of its substance (Met. Z 1–3; Post. An. i. 4.). That bodies in nature are obviously natural substances, and as obviously not the only kind of substance; and that there is supernatural substance, e.g., God, a subsistent perfect, living being, thinking, but without matter, and therefore not a body.

At the present day realism is despised on the ground that its differentiation of body and soul, natural and supernatural, ignores the unity of being. Indeed, in order to oppose this unity of being to the realistic duality, both materialists and idealists describe themselves as monists, and call realists dualists by way of disparagement. But we cannot classify metaphysics by the antithesis of monism and dualism without making confusion worse confounded. Not to mention that it has led to another variety, calling itself pluralism, it confuses materialism and idealism. Extremes meet; and those who believe only in body and those who believe only in mind, have an equal right to the equivocal term "monist." Moreover, there is no real opposition between monism and dualism, for there can very well be one kind of being, without being all body or all soul; and as a matter of fact, Aristotelian realism is both a monism of substance and a dualism of body and soul.

It is in any case unfair to decide questions by disparaging terms, and to argue as if the whole choice were between materialism or idealism, leaving realism out of court. So far this case it would also hide the truth of things, which requires two different kinds of substance, body and soul. The strength of materialism consists in recognizing nature without explaining it away, its weakness in its utter inability to explain consciousness either in its nature or in its origin. On the other hand, it is the virtue of idealism to emphasize the fact of consciousness, but its vice to exaggerate it, with the consequence of resorting to every kind of paradox to deny the obvious and get rid of bodies. There are in reality two species of substances, or entities: body and soul in the one substance, monism and materialism is a monism of substance, in the sense that all things are substances and that all substances, however different, are members of one substance, the whole universe of body and spirit. In this case metaphysics generally will have to recognize three monisms, a materialistic monism of body, an idealistic monism of soul, and a realistic monism of substance, which is also a dualism of substances. But a term so equivocal, leading to an antithesis so misleading as that between monism and dualism, can never represent the real difference between metaphysical schools. We shall return, then, to the clearer and more authoritative division, and proceed to discuss materialism, idealism and realism in their order.

2. MATERIALISM

1. Materialism Proper.—Materialism in its modern sense is the view that all we know is body, of which mind is an attribute or function. Several causes, beginning towards the end of the 18th century, gradually led up to the materialism of Molière, Vogt and Büchner, which flourished in the middle of the 19th century. The first cause was the rapid progress of natural science, e.g., the chemistry of Lavoisier, the zoology of Lamarck, the anatomy of Laplace and the geology of Lyell. These advances in natural science, which pointed to a unity and gradual evolution in nature, were accompanied by a growth in commerce, manufactures and industrialism; the same kind of spirit showed itself in the revolutionary upheaval of 1848, and in the materialistic publications which immediately followed, while these

XVIII. 8
publications have reacted on the industrial socialism of our own time. Meanwhile, philosophic forces to counteract materialism were weak. Realism was at a low ebb. Idealism was reeding for the moment. Hegelianism had made itself unpopular, and its confusion of God, nature and man had led to differences within the school itself (see Hegel).

These causes, scientific, industrial and philosophical, led to the domination of materialism in the middle of the 19th century in Germany, or rather to its revival; for in its main position, that matter and motion are everything and eternal, it was a repetition of the materialism of the 18th century in France. Thus Karl Christopher Vogt (q.v.) repeated the saying of the French physician Cabanis, "The brain is the stomach to digestion, or the liver to the secretion of bile," in the form, "Thought stands in the same relation to the brain as the bile to the liver or the urine to the kidneys." But the new materialism was not mere repetition. J. Moleschott (1822–1853) made a diligent use of the science of his day in his Kreislauf des Lebens (1852). Starting from Lavoisier's discoveries, he held that life is a metabolism, a perpetual circulation of matter from the inorganic world, and back again, and he urged this metabolism against the hypothesis of vital force with which he had imputed to all living beings a soul, though to plants only in the sense of a vegetative, not a sensitive, activity, and in Moleschott's time many scientific men still accepted some sort of vital principle, not exactly soul, yet over and above bodily forces in organisms. Moleschott, like Lotze, not only resisted the whole hypothesis of a vital principle, but also, on the basis of Lavoisier's discovery that respiration is combustion, argued that the heat so produced is the only force developed in the organism, and that matter therefore rules man. He put the whole metabolic view of the world into the following form: Without matter no force, without force no matter. L. Büchner (q.v.) himself said that he owed to Moleschott the first impulse to composing his important work Kraft und Stoff (1855), which became a kind of textbook of materialism. Passing from Moleschott to Lyell's view of the evolution of the earth's crust and later to Darwin's theory of natural selection and environment, he reached the general inference that, not God but evolution of matter, is the cause of the order of the world; that life is a combination of matter which in favourable circumstances is spontaneously generated; that there is no vital principle for humans, because all forces, non-vital and vital, are movements; that movement and evolution proceed from life to consciousness; that it is foolish for man to believe that the earth was made for him, in the face of the difficulties he encounters in inhabiting it; that there is no God, no final cause, no immortality, no freedom, no substance of the soul; and that mind, like light or heat, electricity or magnetism, or any other physical fact, is a movement of matter. Sometimes he spoke of mind as an effect of matter, but, though his expressions may be careless, nothing is to be made of the difference, for he called it movement and effect indifferently in the same context. His definitely expressed view was that psychical activity is "nothing but a radiation through the cells of the grey substance of the brain of a motion set up by external stimuli." E. Haeckel belongs to a slightly later time than the materialists hitherto mentioned. His book Die Welträthel (Eng. trans. J. McCahe, The Riddle of the Universe) identifies substance with body. Starting like his predecessors with the in destructibility of matter, Haeckel makes more than they do of the conservation of energy, and merges the persistence of matter and energy in one universal law of substance, which, on the ground that body is subject to eternal transformation, is also the universal law of evolution. His strong point consists in inferring the fact of evolution of some sort from the consideration of the evidence of comparative anatomy, paleoentology and embryology. On the strength of the conscience of arguments for evolution in the organic world, he carries back the process in the whole world, until he comes to a cosmology which recalls the rash hypotheses of the Presocratics.

He supposes that all organisms have developed from the simple cell, and that this has its origin by spontaneous generation, to explain which he propounds the "carbon-theory," that protoplasm comes from inorganic carbon, and living being from dead. And then he ruminates about the evolution of the solar system, but also supposes that the affinities, pointed out by Lothar Meyer and Mendeleeff, between groups of chemical elements prove an evolution of these elements from a primordial substance, which condenses first into central space, and then into masses, which when they exceed the mean consistency become ponderables, and when they fall below it become imponderables. Here he stops; according to him substances are not eternal and permanent, they develop into measurable bodies, and God is the eternal force or energy of substance. What, then, is the origin of mind or soul? Haeckel answers that it has no origin, because sensation is an inherent property of all substance. He supposes that ascetiscis and tropiscis, as rudimentary sense and will, are the very causes of condensation; that they belong to phynamates, to ponderables and imponderables, to chemical atoms and molecules. Hence, when he returns to organisms, it does not surprise us that he assigns to ova and spermatozoa cell-souls, to the impregnated ovum germ-soul, to plants tissue-souls, to animals nerve-souls; or that he regards man's body and soul as born together in the impregnated ovum, and gradually evolved into man as a human body and soul of lower animals. It appears to his imagination that the affinity of two atoms of hydrogen to one of oxygen, the attraction of the spermatozoan to the ovum, and the elective affinity of a pair of alveoli are all alike, because to sensibilities is everything. But has Haeckel solved the problems of mind? When he applies sensation and will to nature, and through plants to the lowest animals, he considers their sensation and will to be rudimentary and unconscious. Consciousness, according to his own admission, is not found even in all animals, although it is present not only in the highest vertebrates—mammals, birds—but also in ants, spiders, the higher crabs and molluses. He adds that he supposes, in accordance with the hypothesis of substance, that consciousness must be evolved from unconsciousness with the development of sense organs and a central nervous organ. At the same time he admits, firstly, that to mark the barrier between unconscious and conscious is difficult; secondly, that it is impossible to trace the first beginning of consciousness in the lower animals; and, thirdly, that "however certain we are of the fact of this natural evolution of consciousness, we are, unfortunately, not yet in a position to enter more deeply into the question." (Riddle of the Universe, 191.) Thus in presence of the problem which is the crucial key of the question of consciousness, he resorts to his gratuitous hypothesis that everything has mind, and then gives up the origin of conscious mind after all. He is certain, however, that the law of substance somehow proves that conscious soul is a mere function of brain, that soul is a function of all substances, and that God is the force or energy, or soul or spirit, of nature. He, in fact, returns to a calent hylozoism (q.v.), which has tended to revive from time to time in the history of thought. He believes that mind and soul are inherent attributes of all bodies. Curiously enough, he supposes that by making mind a universal attribute of matter he has made his philosophy not materialism, but nonmaterialism. It is really both: monistic, because it reduces substance to one kind; materialistic, because it identifies that one kind of substance with body or matter, and reduces mind to an attribute of matter. It makes no difference to attribute mind to all matter, so long as it is attributed as an attribute. It is at least materialistic to say that unconscious mind is an attribute of nature as to say that conscious mind is an attribute of brain; and this is the position of Haeckel. Materialists seem to dread the word "materialism." Büchner also entertains us with the absurd notion that the word "material" is derived from a Latin word "quidam" and that this is the name given by them to a certain scientific odium attaches, and substitute "monism" for it." (Last Words on Materialism, 273). His reason, however, is different: it is that a philosophy, not of matter as such, but of the unity of force and matter, is not materialism. But if a philosophy makes force an attribute of matter only, as his does, it will recognize nothing but matter possessing force, and will therefore be materialism as well as monism, and in short materialist monism. The point is that neither Büchner nor Haeckel could on their assumptions recognize any force but force of

body, or any mind but mind of body, or any distinct thing or
substance except body. This is materialism.
2. Materialistic
Tendencies.
Besides these direct instances
of materialism, there are philosophers to whom the scientific
tendencies of the age have given a materialistic tendency. In
for example, Eugen Diihring (<?..) was a realist,
whose intention is to prove against Kant a knowledge of the

Germany,

thing in itself by attributing time, space and categories generally
to the real world. But, under the influence of Trendelenburg's
attempt to reconcile thought and being by assigning motion to
both, his Wirklichkeitsphilosophie, in a similar effort after a unity
of being, lands him in the contention that matter is absolute
being, the support of all reality underlying all bodily and mental
states.

So Avenarius

(q.v.)

empiricist anxious to reclaim

was no materialist, but only an
man's natural view of the world

from philosophic incrustations, yet when his Empiriokriticismus
ends in nothing but environment, nervous system, and statements dependent on them, without soul, though within experience, he comes near to materialism, as Wundt has remarked.
In France, again, positivism is not materialism, but rather the
refusal to frame a metaphysical theory. Comte tells us that man
first gets over theology, then over metaphysics, and finally rests
in positivism. Yet in getting over theology he ceases to believe
in God, and in getting over metaphysics he ceases to believe in
soul.
As Paul Janet truly remarked, positivism contains an
unconscious metaphysics in rejecting final causes and an immaterial soul.
Now, when in surrendering theology and meta-

/

physics we have also to surrender God and the soul, we are
not free from materialism.
Positivism, however, shelters itself
behind the vague word " phenomena." Lastly, in England we
have not only an influence of positivism, but also, what is more
important, the synthetic philosophy of Herbert Spencer. The
point of this philosophy is not materialism, but
s encer
realism.,. The author himself says that it is transwhich is realism in asserting objective existence
figured realism
as separate from subjective existence, but anti-realism in denying
that objective existence is to be known. In his Principles of
"
what we are conscious
Psychology he twice quotes his point that
of as properties of matter, even down to its weight and resistance,
are but subjective affections produced by objective agencies
which are unknown and unknowable." This then is his transfigured realism, which, as far as what is known goes, is idealism,

but as far as what exists goes, realism of a sort. His First
Principles, his book on metaphysics, is founded on this same
point, that what we know is phenomena produced by an unknown noumenal power. He himself identifies phenomenon,
appearance, effect or impression produced on consciousness
through any of the senses. He divides phenomena into impressions and ideas, vivid and faint, object and subject, non-ego and
ego, outer and inner, physical and psychical, matter and spirit;
the same antithesis among
all of which are expressions of
phenomena. He holds that all the time, space, motion, matter
known to us are phenomena; and that force, the ultimate of

"
ultimates, is, as known to us, a phenomenon,
of consciousness." If so, then all we know is these

an affection
phenomena,
but produced

affections of consciousness, subjective affections,
by an unknown power. So far as this main point of transfigured
realism is steadily maintained, it is a compound of idealism and
realism, but not materialism.
side either of phenomena or of

But it is not maintained, on the
noumena; and hence its tendency

materialism.
"
"
In the first place, the term
phenomenon is ambiguous, someimes meaning a conscious affection and sometimes any fact
whatever. Spencer sets himself to find the laws of all phenomena.
He finds that throughout the universe there is an unceasing redistribution of matter and motion, and that this redistribution constitutes evolution when there is a predominant integration of matter
and dissipation of motion, and constitutes dissolution where there
is a predominant absorption of motion and disintegration of matter.
He supposes that evolution is primarily integration, from the incoherent to the coherent, exemplified in the solar nebula evolving into the solar system; secondly differentiation, from the more
homogeneous to the more heterogeneous, exemplified by the
solar system evolving into different bodies; thirdly determination, from the indefinite to the definite, exemplified^ bythe

relations.
Next, he supposes that mind obeys the same law of
evolution, and exemplifies integration by generalization, differentiation by the development of the five
senses, and determination
by the development of the order of consciousness. He holds that
we pass without break from the phenomena of bodily life to the
is

phenomena of mental life, that consciousness arises in the course of
the living being's adaptation to its environment, and that there is a
continuous evolution from reflex action through instinct and
memory
up to reason. He throws out the brilliant suggestion that the experience of the race is in a sense inherited
the
individual
which
is
by
true in the sense that animal
organisms become hereditarily better
adapted to perform mental operations, though no proof that any
elements of knowledge become a priori.
Now, Spencer has clearly, though unconsciously, changed the
"
"
meaning of the term
from subjective affection of
phenomenon
consciousness to any fact of nature, in regarding all this evolution,
cosmic, organic, mental, social and ethical, as an evolution of
phenomena. The greater part of the process is a change in the facts
of nature before
consciousness; and in all that part, at all events,
the phenomena evolved must mean
physical facts which are not
conscious affections, but, as they develop, are causes which
gradually
produce life and " consciousness.
Moreover, evolution is defined
of
matter
universally as an
and
integration
dissipation of motion,"
and yet mental, social and moral developments are also called evolution, so that, in accordance with the definition, they are also
integrations of matter and dissipations of motion. It is true that the author
did not see that he was passing from transfigured realism into
materialism. He thinks that he is always speaking of
phenomena
in' the sense of subjective
affections; and in spite of his definition,
he half unconsciously changes the meaning of evolution from a
change in matter and motion, first into a change in states of consciousness, then to a change in social institutions, and finally into
a change in moral motives. He also admits himself that mental
evolution exemplifies integration of matter and dissipation of motion
But here he becomes hopelessly inconsistent,
only indirectly.
because he had already said, in defining it, that " evolution is an
of
matter
and concomitant dissipation of motion "
integration
(First Principles,
145). However, with all the author's disclaimers,
the general effect left on the reader's mind is that throughout the
universe there is an unceasing change of matter and motion, that
evolution is always such a change, that it begins with phenomena
in the sense of physical facts, gradually issues in life and consciousness, and ends with phenomena in the sense of subjective affections
of consciousness.
In the second place, having declared the noumenal power, which
causes phenomena, or conscious affections, to be unknowable, and
having left anybody who pleased to make it a god and an object
of religion, he proceeds to describe it as if it were known force, and
known in two respects as persistent and as resistant force. He
supposes that the law of evolution is deducible from the law of persistent force, and includes in force what is now called energy. Then
and laying
having discussed force as something thoroughly
" material,
the force of which we
special emphasis on resistance, he tells us that
assert persistence is that Absolute Force of which we are indefinitely
conscious as the necessary correlate of the force we know " (First
62).
Principles,
Similarly, both in First Principles and in the
Principles of Psychology, he assigns to us, in addition to our definite
consciousness of our subjective affections, an indefinite consciousness
of something out of consciousness, of something which resists, of
objective existence. Thus it turns out that the objective agency, the
noumenal power, the absolute force, declared unknown and unknowable, is known after all to exist, persist, resist and cause our subjective affections or phenomena, yet not to think or to will. Such a
noumenon looks very like body or matter. Lastly, when a theory
of the world supposes a noumenal power, a resistcnt and persistent
force, which results in an evolution, defined as an integration of
matter and a dissipation of motion, which having resulted in inorganic nature and organic nature, further results without break
in consciousness, reason, society and morals, then such a theory
will be construed as materialistically as that of Haeckel by the reader,
whatever the intention of the author.
It may be urged in reply that the synthetic philosophy could be
made consistent by transferring the knowable resistance and persistence of the unknowable noumenon to knowable phenomena on the
one hand, and on the other hand by maintaining that all phenomena
from the original nebula to the rise of consciousness are only
'*
impressions produced on consciousness through any of the senses,
after all.
But in that case what will become of Spencer's theory
of evolution?
It will have asserted the evolution of man and his
consciousness out of the phenomena of his consciousness. The truth
is that his theory of evolution can be carried through the whole
process without a break, only by giving the synthetic philosophy
a materialistic interpretation, and by adhering consistently to
;

'

V


order of Nature, is the deepest proof of God; and it cannot be the result of evolution, because it is the condition of natural force, and therefore of natural evolution. A second argument for God is the prevailing goodness or adaptation of Nature to the ends of conscious beings, which might conceivably be explained by Leibnizian evolution, but has not yet been explained, and if it were, would not be inconsistent with a divine design in evolution. Further, the very existence of conscious beings is the best proof of the distinct or substantial being of the soul, existing in man with body, in God as pure spirit. It seems hopeless to expect that natural science, even with the aid of evolution, can explain by mere body the origin and nature of this fact of consciousness. If so, materialism is not the whole truth of metaphysics.

3.—THE RISE OF METAPHYSICAL IDEALISM

1. Descartes to Leibnitz.—Metaphysics arises from psychological idealism, and always retains more or less of an epistemological character. Psychological idealism assumes without proof that we perceive nothing but mental objects, and metaphysical idealism draws the logical but hypothetical conclusion that all we can know from these mental objects of sense is mental objects of knowledge. But at first this logical conclusion was not drawn. Descartes, the founder of psychological idealism, having proceeded from the conscious fact, cogito ergo sum, to the non sequitur that I am a soul, and all a soul can perceive is ideas, nevertheless, with his first and obvious conclusion that from these mental ideas I can (by the grace of God) infer things which are extended substances or bodies, as well as thinking substances or souls. He was a psychological idealist and a metaphysical realist. This illogicality could not last. Even the Cartesian school, as it came more and more to feel the difficulty of explaining the interaction of body and mind, and, indeed, any efficient causation whatever, gradually tended to the hypothesis that the real cause is God, who, on the occasion of changes in body, causes corresponding changes in mind, and vice versa. This occasionalism is not idealism, but its emphasis on the will of God gave it an idealistic tendency. Thereupon Spinoza advanced a pantheism which supposed that bodies and souls are not, as Descartes thought, different substances, but merely attributes—the one the extension and the other the thought of one substance, Nature or God. Taking the Aristotelian theory that a substance is a thing in itself, not in Aristotle's sense of any individual existing differently from anything else, but in the novel meaning of something existing alone, he concluded, logically enough from this understanding, that there can be only one substance, and that, as no finite body or soul can exist alone, everything finite is merely a mode of one of the attributes of the one infinite substance which alone can exist by itself. Spinozism, however, though it trimmles down the barrier between body and soul, is not yet metaphysical idealism, because it does not reduce extension to thought, but only says that the same substance is at once extended and thinking—a position more akin to materialism. At the same time Spinoza maintained a parallelism between extension and thinking so close as to say that the order of ideas is the same as the order of things, so that any mode of extension or the idea of it is the same as the extension itself. In other words, under the attribute of extension and under the attribute of thought (see H. H. Joachim's Study of the Ethics of Spinoza, 1901, p. 72). It remained, however, for Schelling to convert this parallelism into identity by identifying motion with the intelligence of God, and so to transform the pantheism of Spinoza into pantheistic idealism. Leibnitz, again, having become equally dissatisfied with Cartesianism, Spinozism and the Epicurean realism of Gassendi, in the latter part of his life came still nearer to Spinoza to metaphysical idealism in his monadology, or half-Pythagorean, half-Brutianic analyses of bodies into monads, or units, or simple substances, indivisible and unextended, but endowed with perception and appetite.

He gradually fell under the dominion of two false assumptions. On the one hand, essentially a mathematician, he supposed that

unity is indivisibility, whereas everything known to be one is merely undivided or individual, and that there must be simple because there are compound substances, although composition only requires something by the simply simple entities. On the other hand, the influence of the mechanics of his day, which had hardly distin-
guished between inertia, or the inability of a body to change itself, and resistance or the ability of bodies to oppose one another, he conceived resistance as a passive resistance, and was able to recognize that in collision the mutual resistance of moving bodies is a force, or active power, of changing their movements in opposite directions. From these two arbitrary hypotheses about corporeal movement, that all bodies are indivisibly simple elements, and that it offers only passive resistance, he concluded that behind bodies there must be units, or monads, which would be at once substantial, simple, and immovable. He further supposed, of that for monads there are "incorporal automata," not interacting like bodies, but each perceiving what was passing in the other, and acting in consequence by appetite, or self-acting. Such mentally endowed substances would be called souls; and as animals, and rational souls, or spirits, of men while he further concluded that all these are derivative monads created by God, the monad of monads. All derivative monads, he allowed, are accompanied by bodies, which are compound monads of the same kind as the monad by a central monad. Further, he explained the old Cartesian difficulty of the relation of body and mind by transforming the Spinozistic parallelism of extension and thought into a parallelism between monads and corporeal bodies; and the motions always proceeding from motions, and perceptions from perceptions; bodies acting according to efficient causes, and souls according to final causes. The only new idea apparent if one asks what happens to one monad to another without actually doing so. Finally, he explained the concom-
ition of these two series, as well as that between the perceptions of different monads, by supposing a pre-established harmony ordained by the primitive monad, God.

Up to this point, then, Leibnitz opened one of the chief avenues to metaphysical idealism, the reduction of the material into the immaterial, the analysis of bodies into mental elements. His theory of bodies involved an idealistic analysis neither into bodily atoms nor into mathematical units, but into mentally endowed simple substances. There remained, however, his theory of the nature of bodies; and here he hesitated between two alternatives. According to one alternative, which consist-
ently flowed from the psychological idealism of Descartes, as well as from his own monadism, he suggested that bodies are real phenomena; phenomena, because they are aggregates of monads, which derive their unity only from appearing together to the mind. But these monads are essential components of the body, and do not seem to result from real monads. In support of this view, he said that bodies are not substances, though substantiae; that their apparent motion and resistance are results of the passions of their monads; that their primary matter is nothing but passive power of their monads; that the series of efficient causes between them is merely phenomenal. According to this alternative, then, there is nothing but mental monads and mental phenomena; and Leibnitz is a metaphysical idealist. According to the other alternative, however, he suggested that at least organic bodies are compound or corporal substances, which are not pheno-
mena; but something realizing or rather substantiating pheno-
mena, and not mere aggregates of monads, but something substantial beyond their monads, because an organic body, though composed of monads, has a real unity (unio realis). From this point of view he believed that the real unity of a body is a vinculum substantiale, which gives it its real continuity and is the principle of its actions; that its primary matter is its own principle of resistance; and that it has not only this passive, but also an active, power of its own. He suggested that this theory of the substantial unity of a body might explain substantia-
tion, by supposing that, while the monads and phenomena of bodies are annihilated by the influence of the forces of nature, the bodies of Leibnitz are substituted. He feared also whether we can explain the mystery of the Incarnation, and other things, unless real bodies or unions are added to monads and phenomena. According to this alternative, these organic bodies are compound or corporal substances, between monads and phenomena; and Leibnitz is a metaphysical realist. He was held to this belief in the sub-
stantiality of bodies by his Christianity, by the influence of

Aristotle, of scholasticism and of Cartesianism, as well as by his own mechanisms. But the strange thing is that at the very end of his life and at the very same time, in 1714-1716, he was writing the idealistic alternative to Remond de Montmort and Dangicourt, and the realistic alternative to Father des Bosses. He must have died in doubt. We cannot, therefore, agree with many recent idealists who regard Leibnitz as one of themselves, though it is true that, when stripped of its realism, his meta-
physics easily passed into the metaphysical idealisms of Lotze and of Fechner. It is true, also, that on its idealistic side the philosophy of Leibnitz is the source of many current views of psychophysical parallelism as well as of the phenomenonism of bodies, and of the analysis of bodies into mental elements.

2. Locke to Hume,—Meanwhile in England, Locke, though differing from Descartes about the origin of ideas, followed him in the illogical combination—of psychological idealism with metaphysical realism. He thought that we perceive nothing but ideas both of primary and of secondary qualities, and yet that somehow we are able to infer that, while our ideas of secondary qualities are not, those of primary qualities are, like sensations, realities of things. Berkeley saw the in-
consistency of this position, and, in association with his denial of God and all we know is nothing but ideas in "mind, spirit, soul, or myself," has the merit of having made, as Paulsen remarks, "epistemological idealism the basis of metaphysical idealism."

According to him, a body such as the sun is my idea, your idea, ideas of other minds, and always an idea of God's mind; and when we have sensible ideas of the sun, what causes them to arise in our different minds is no single physical substance, the sun, but the will of God's spirit. Hume saw that in making all the objects of perception ideas Berkeley had given as little reason for inferring substantial souls as substantial bodies. He there-
fore concluded that all we know from the data of psychological idealism is impressions or sensations, ideas, and associations of ideas, making us believe without proof in substances and causes, together with "a certain unknown, inexplicable something as the cause of our perceptions." We have here, in this sceptical idealism, the source of the characteristically English form of idealism still to be read in the writings of Mill and Spencer, and still the starting-point of more recent works, such as Pearson's Grammar of Science and James's Principles of Psychology.

Hume and Fichte. Hume, for his part, won the recognition of Leibnitz and partly roused by Hume, Kant elaborated his transcendental or critical idealism, which if not, as he thought, the prolegomena to all future metaphysics, is still the starting-point of most metaphysical idealists.

Kant. Kantism consists of four main positions, which it will be well to lay out, as follows:

a. As to the origin of knowledge, Kant's position is that sense, outer and inner, affected by things in themselves, receives mere sensations or sensible ideas (Vorsülzungen) as the matter which sense itself places in the a priori forms of space and time; that thereupon understanding, by means of the synthetic unity of apperception, "I think"—an act of spontaneity beyond sense, in all consciousness one and the same, and combining all my ideas as mine in one univers-
ality—"and under a priori categories, or fundamental notions, such as substance and attribute, cause and effect, &c., unites groups of sensations or sensible ideas into objects and events, and, from one ball, two or more, generates other knowledge, a perception and experience, requiring both sense and understanding, are partly a posteriori and partly a priori, and constitute a knowledge of objects which, being sensations combined by synthetic unity under a priori forms, are more than mere sensations, but less than things in themselves. This first position is psychological idealism in a new form and supported by new reasons; for, if experience derives its matter from mental sensations and its form from mental synthetic combinations, from the additions of mental objects of sense, which, according to Kant, are sensible ideas having no existence outside our thought, not things in them-

b. As to the known world, Kant's position was the logical deduc-
tion that from such phenomena of experience all we can know by logical reason is similar phenomena of actual or possible experience; and therefore that the known world, whether bodily or mental, is not a Cartesian world of bodies and souls, nor a Spinozistic world of one substance, nor a Leibnitzian world of monadic substances
created by God, but a world of sensations, such as Hume supposed, only combined, not by association, but by synthetic understanding into knowledges. To objects of experience, and these are, Natures and substances and causes—a world of phenomena not noumena. This second position is a new form of metaphysical idealism, containing the supposition, which lies at the foundation of later German philosophy, that since understanding shapes the objects it is to understand sensations, and since nature, as we know it, consists of such objects, "understanding, though it does not make, shapes nature," as well as our knowledge. Known nature is a mental construction in part according to Kant.

c. As to existence, Kant's position is the wholly illogical one that, though all known things are phenomena, there are things in themselves, or noumena; things which are said to cause sensations of outer sense and to receive sensations of inner sense, though they are beyond the category of causality which is defined as one of the notions uniting phenomena; and things which are assumed to exist and have the causal attributes, though declared unknowable by any logical use of reason, because logical reason is limited by the mental matter and form of experience to phenomena; and all this according to Kant himself. This third position is a relic of ancient metaphysical realism; although it must be remembered that Kant does not go to the length of Descartes and Locke, who supposed that from mere ideas we could know bodies and souls, but suggests that phenomena, that since understanding shapes the objects in it of may not be heterogeneous (ungeleichartig). In this form we shall find the thing in itself revived by A. Riehl.

The fourth position, the most recent, is that of the post-Kantian idealists, who accept Kant's theory of knowledge, that in spite of its logical inaccessibility to transcendental phenomena, reason in its pure, or a priori, use, contains necessary a priori "ideals" (ideen), and practical reason, in order to account for moral responsibility, postulates that there is no being except in some postulated ideal or noumenon, corresponding to these "ideals": postulates of a real, a free-will to practice morality, of a real immortality of soul to perfect it, and of a real God to crown it with happiness.

The fourth position is the copernic-stone of Kant's metaphysics. It is quite inconsistent with its foundation and structure. Kant first deduced that from the experience of mental phenomena all logical use of reason is limited to mental phenomena, and then maintained that to explain moral responsibility practical reason postulates that there is an ideal and non-Ego object, or noumenon, corresponding to these "ideals": to explain moral responsibility except a logical reason? Nevertheless, in his own mind Kant's whole speculative and practical philosophy was meant to form one system. In the preface to the second edition of the "Critik" he says that it was necessary to limit speculative reason to a knowledge of phenomena, in order to allow practical reason to proceed from morality to the assumption of God, freedom, and immortality, existing beyond phenomena: "Ich musste also das Wissen aufheben, um zum Glauben Platz zu machen. He forgot the existence of an object of moral reason, and therefore of practical reason, to phenomena, and thereby compromised the rationality not only of knowledge, but also of faith.

Fichte now set himself in the "Wissenschaftslehre" (1794) to make transcendental idealism into a system of metaphysical idealism without Kant's inconsistencies and relics of realism. His point was that there are no things in themselves different from minds or acting on them; that man is no product of things; nor does his thinking arise from passive sensations caused by things; nor is the end of his existence attainable in a world of things; but that he is the absolute free activity constructing his own world, which is only his own determination, his self-imposed limit, and means to his duty which all else with him with God. In order to prove this novel conclusion he started a flourish from the Cartesian "I think" in the Kantian form of the synthetic unity of apperception acting by a priori categories; but instead of allowing, with all previous metaphysicians, that the Ego passively receives sensations from something different, and not containing himself with Kant's view that the Ego, by synthetically combining the matter of sensations with a priori forms, postulates these objects, he boldly asserted that the Ego, in its synthetic unity, entirely constructs things; that its act of spontaneity is not mere synthesis of passive sensations, but construction of sensations into an object within itself; and that therefore understanding makes as well as shapes Nature.

This construction, or self-determination, is what Fichte called positing (setzen). According to him, the Ego posits first itself (thesis); secondly, the non-Ego, the other, opposite to itself (antithesis); and, thirdly, this non-Ego within itself (synthesis), so that the Ego proper consists of a third person in relation to the Ego itself. Kant was conscious of this self-determining activity, but forgets itself, the non-Ego seems to be something independent, a foreign limit, a thing in itself, or per se. Hence, it is the one principle of knowledge, the theory of knowledge, which makes Kant's Ego posits the thing per se as existing for itself, a noumenon in the sense of a thing of its own thinking. Further, according to Fichte, on the one hand the Ego posits itself, and on the other the non-Ego posits; and there is the third position of the problem, which is the principal fact about theoretical reason: on the other hand, the Ego posits itself as determining the non-Ego—no subject, no object; this is the principal fact about practical reason. Hence he maintains that the pure Ego, the free-rational Ego, is posited to exist in accordance with the idea, but in the new meaning of a thought, a product of reason. This change led to another. Kant had said that the synthetic unity "I think" is in all consciousnesses, is common to all, and the thing in itself is the fact which all consciousnesses require that the thing in itself should exist in accordance with the idea, but in the new meaning of a thought, a product of reason. This change enabled him to say in the thing in itself being produced by the pure Ego, as its own result. This he contended that it is not the different objects of different thinkers, but the one object of a pure Ego or consciousness common to them all.

According to Kant, the objective is valid for all consciousnesses; according to Fichte, the objective is true for the first time grappled with a fundamental difficulty in metaphysical idealism which is absent from realism, namely, the difficulty of explaining the identity of a thing, e.g. the sun. As long as we maintain that the sun is a thing and that reason cannot know the sun except in the account of there being one sun is simply that one thing causes different phenomena in different minds. But as soon as the thing in itself is converted into something mental, metaphysical idealism must either say that there are as many suns as minds, or that there is one mind and therefore one sun. The former was the alternative of Berkeley, the latter of Fichte.

Thus the complete metaphysical idealism of Fichte's 'Wissenschaftslehre' is formed out of the incomplete metaphysical idealism of Kant's "Critik", is the theory on its epistemological side that the Ego posits the non-Ego as a thing in itself, and yet as only one thing existing for the Ego per se, and on the other hand that the things in themselves are the pure noumenon. In consequence all reality is the Ego and its own determinations, which are objective, or valid for all, as determinations, not of you or of me but of the Ego as an independent free rational being, the Ego. Lastly, Fichte called this system realism, in so far as it posits the thing in itself as another thing; idealism, in so far as it posits it as a noumenon which is a product of its own thinking; and on the whole real idealism or ideal realism.

God does not seem to find much place in the 'Wissenschaftslehre', where mankind is the absolute and nature mankind's product, and where God neither could be an absolute Ego which posits objects in the non-Ego to infinity without ever completing the process, nor could be even known to exist apart from the moral order which is man's destination. Hence in his Philosophical Journal in 1788, Fichte produced a critical essay of Forberg by an essay of his own, in which he used the famous words, "The living moral order is God; we need no other God, and can comprehend no other." Having, however, in consequence, lost his professorship and his mind, Fichte had decided that God is not mere moral order, but also reason and will, yet without consciousness and personality; that not mankind but God is the absolute; that we are only its direct manifestations, free but finite spirits destined by God to posits in ourselves Nature as the material of duty, but blessed when we relapse into the absolute; that Nature, therefore, is the direct manifestation of God, and that the indirect manifestation, and finally, that being is the divine idea or life, which is the reality behind appearances. In this extension of metaphysical idealism he was influenced by his disciple, Schelling. Nevertheless, he maintained that his system was as far as possible an idealism to identify either man or nature with Absolute God. He wanted to believe in the absolute without sacrificing personality and freedom. God for Fichte is man, and determines Nature; this is the final outcome of Fichte's pure idealism.

Fichte completed the process from psychological and epistemological to metaphysical idealism, which it has been necessary to
Noumenal Idealism

Metaphysics

recall from its beginnings in France, England and Germany, in order to understand modern idealism. The assertion of absolute substance by Spinoza incited Schelling and Hegel. The analysis of body into man and mind is the task of the Hegelian. The Spinozist parallelism of extension and thought, and the Leibnizian parallelism of bodily motion and mental action, incited Schelling and Fichte. Berkeley and Hume produced the English idealism of Mill and Spencer, with their successors, and occasioned the German idealism of Kant. Kant's a priori synthesis of sensations into experience lies at the root of all German idealism. But Fichte was the most fertile of all. He carried metaphysical idealism to its height, by not only resolving the body into the mind, but also elevating the action of mind into absolute mental construction, not inferring things in themselves, but originating things from within, mind itself. By changing the meaning of "noumenon" from the thing apprehended (φαινόμενον) to the thought (στίχος), and in the hypothesis of a common consciousness, he started the view that a thing is not yours or my thought, but a common thought of all mankind, and led to the wider view of Schelling and Hegel that the world is an absolute thought of infinite mind. In making the essence of mind, subjectivity and construction, in destroying the separation of theoretical and practical reason, in asserting that mind thinking things as means to ends of the end of itself, he projected the Hegelian philosophy, an idealism, for Schopenhauer and other voluntarists. In making the essence of the Absolute not mere reason, but will, action and life, he anticipated Lotze. In reducing the thing in itself to a thought he projected the neo-Kantian of Lange and Cohen. In the doctrine—no object, no subject—no object, no object—that is, in the utter identification of things with objects of subjects, he anticipated not only Schelling and Hegel, but also Schuppe and Wundt with their congeners. In expanding Kant's act of synthesis till it absorbed the inner sense and the innermost soul, he started the modern paradox that soul is not substance, but subject or activity, a paradox which has been gradually handed down from Schelling and Hegel to Fechner, and from Fechner to Paulsen and Wundt. Meanwhile, through holding with Kant that man is not God, but a free spirit, whose destiny it is to use his intelligence as a means to his duty, he is still the resort of many who vindicate man's independence, freedom, conscience, and power of using nature for his moral purposes, e.g. of Eucken and Münsterberg (qq.v.). Kant and Fichte together became the most potent philosophic influences on European thought in the 19th century, because their emphasis was on man. They made man from things to means to ends of the end of itself, to self-consciousness, to absolute autonomy, and even radicalism. They almost avenged man on the astronomers, who had shown that the world is not made for earth, and therefore not for man. Kant half asserted, and Fichte wholly, that Nature is man's own construction. The Kritik and the Wissenschaftslehre belonged to the revolutionary epoch of the "Rights of Man," and produced as great a revolution in thought as the French Revolution did in fact. Instead of the old belief that God made the world for man, philosophers began to fall into the pleasing dream, I am everything, and everything is I—and even I am God.

4.—Noumenal Idealism in Germany

Noumenal idealism is the metaphysics of those who suppose that all known things are indeed mental, but not all are phenomenal in the Kantian sense, because a noumenon is knowable so long as by a noumenon we mean some mental being or other which we somehow can discover beyond phenomena. The noumenal idealists of Germany assumed, like all psychological idealists, the unproved hypothesis that there is no sense of body, but there is a sense of sensations; and they usually accepted Kant's point, that to get from such sensations to knowledge there is a synthesis contributing mental elements beyond the mental data of sense. They saw also the logic of Kant's deduction, that all we can know from such mental data and mental categories must also be mental. This was the starting-point of their metaphysical idealism. But they disagreed with Kant, and agreed with Fichte about things in themselves or noumena, and contended that the mental things we know are not mere phenomena of sense, but noumena, precisely because noumena are as mental as phenomena, and therefore can be known from similar data that there is that is called objective, or real. They rightly revolted against the inconsistencies of Kant's third and fourth positions about the existence of unknown but postulated things in themselves, hidden from theoretical, but revealed to practical, reason. In a way they returned to the wider opinions of Aristotle, which had come down to Descartes and Locke, that reason in going beyond sense knows more things than phenomena; yet they would not hear of external bodies, or of bodies at all. No realists, they came nearer to Spinozistic pantheism and to Leibnizian monadism, but only on their idealistic side; for they would not allow that extension and body are different from thinking and mind. Their real founder was Fichte, on account of his definite reduction of the noumenal to the mental world. This was indeed the very point—the knowability of a noumenal mental world. At the same time it soon appeared that they could not agree among themselves when they came to ask what it is, but in attempting to define it seem to have gone through the whole gamut of mind. Schelling and Hegel thought it was infinite reason; Schopenhauer, unconscious will; Hartmann, unconscious intelligence and will; Lotze, the activity or spirit of the God; and Paulsen, a world of spiritual actualities comprised in the one spiritual activity, God, in whom we live and move and have our being.

1. Of these noumenal idealisms the earliest in time and the nearest to Fichte's philosophy was the panlogism, begun by Schelling (1775-1854), completed by his disciple Hegel (1770-1831), and then modified by the master himself. Starting from Fichte's "Wissenschaftslehre," Schelling accepted the whole process of mental construction, and the deduction that noumena are knowable products of universal reason, the Absolute. But from the first he was better than Fichte, and had no doubt that the Absolute is God, as he thought, is universal reason, and Nature a product of universal reason, a direct manifestation, not of man, but of God. How is this Absolute known? According to Schelling it is known by intellectual intuition. Kant had attributed to God, in distinction from man's understanding, an intellectual intuition of things. Fichte had attributed to man an intellectual intuition of himself as the Absolute Ego. Schelling attributes to man an intellectual intuition of the Absolute God; and as there is, according to him, but one universal reason, the common intelligence of God and man, this intellectual intuition at once gives man an immediate knowledge of God, and identifies man with God himself.

On Schelling's idealistic pantheism, or the hypothesis that there is nothing but one absolute reason identifying the opposites of subjectivity and objectivity, Hegel based his panlogism. But, while he fully recognized his indebtedness to his master, he differed from him profoundly in one fundamental respect. He rightly objected that the system was wanting in logical proof. He rightly, therefore, rejected the supposed intellectual intuition of the Absolute. He rightly contended that, if we are to know anything beyond sense, we must know it by a process of logical reason. But, unfortunately, he did not mean the logical inferences described in the Organon and the Novum organum. He meant a new "speculative" method, dialectic, founded on an assumption which he had already learnt from Schelling, namely, that things which are different but similar can have the same attribute, and therefore be also the same. With this powerful instrument of dialectic in hand, he attempted to show how absolute reason differentiates itself into subjective and objective, ideal and real, and yet is the identity of both—an identity of opposites, as Schelling had said. By the same dialectic Hegel was able to justify the gradual transformation of transcendental into noumenal idealism by Fichte and Schelling. If things different but similar have the same attributes, and are thereby the same, then in the first place the Kantian categories, though thoughts of mental origin and therefore confined to mind, are nevertheless applicable...
to things, because things, though different from, are the same as, thoughts, and have the categories of thoughts; in the second place, the Fichtian Ego of mankind is not the Absolute Reason of God, and yet is the same Absolute Reason; in the third place, the Schellingian Nature is the 'other' of Spirit, and yet, being a mere reflex of the Idea of Nature, is identical with Spirit; and as this Spirit is in itself, identical with the Absolute, and is therefore the same spirit, and identical with our Spirit, or rather with the Infinite Spirit, or Absolute Reason, which alone exists. The crux of all metaphysical idealism is the difficulty of reconciling the unity of the object with the plurality of subjects. Hegel's assumption of identity in difference at once enabled him to deal with the whole difficulty by holding that different subjects are yet one subject, and any one object, e.g. the sun, is at once different from, and identical with, the one subject which is also many. By the rough magic of this modern Prospero the universal being is not, and yet is, thought, idea, spirit, reason, God. So elastic a solution established a dominant Hegelian school, which is now practically extinct, in Germany, and from Germany spread Hegelianism to France, England, America, and, in fact, diffused it over the civilized world to such an extent that it is still a widespread fashion outside Germany to believe that the world of being is a world of thought.

The plain answer is to contest the whole assumption. Different things, however, have only one resident, never the same. God created man in His own image, and the world in the image of the Divine Idea; but I am not God, and the transitory sun is not the same as God's eternal idea of it. The creatures, however, like, are not the same as the Creator and His thoughts. Each is a distinct thing, as Aristotle said. Reality is not Reason. It is strange that the uttering assumption of panlogism was not at once contended in this plain way. Nevertheless, objection was soon taken to the unsatisfactoriness of the system reared upon it. Schelling himself, as soon as he saw his own formulae exposed in the logic of another dialectic which bore the same, thought to reconcile his system. When he found that the Absolute real is rational, failed to explain evil and sin: indeed, the English reader of T. H. Green's Prolegomena to Ethics can see how awkward is the Hegelian transition from "one spiritual principle" to different men's individual freedom of choice between good and evil. Again, Schelling urged that besides the rational element there must be something else; that there is in nature, as natura naturans, a blind impulsive intelligence or substance which belongs to nature and that even God Himself as the Absolute cannot be pure thought, because in order to think He must have an existence which cannot be merely His thought of it, and therefore pure being is the prior condition, pure mind and spirit. Hegel, however, being a Hegelian dialectic on the ground that, although reason by itself can apprehend notions or essences, and even that of God, it cannot discern a difference either of essence or of idea, demands an apprehension of which experience is required. He now distinguished two philosophies: negative philosophy starting from notions, and positive philosophy starting from being; the former a philosophy of conditions, the latter of cause, i.e., existence. Hegel, he said, had only supplied the logic of negative philosophy; and it must be confessed that the most which could be extracted from the Hegelian dialectic would be some connexion of thoughts without proving any existence of corresponding things. Schelling was right; but he had too much affinity with Hegelian assumptions, e.g. the panlogical confusion of the essences of things with the notions of reason, to which Hegelian philosophy was falling into fresh mysticism, which failed to excuse the effect of his earlier philosophy of identity in the growing materialism of the age.

2. Meanwhile, by the side of panlogism arose the pantheism of Schopenhauer (1788-1860). This new noumenal idealism Schopenhauer began, like the preceding, by combining psychological idealism with the transcendentality of Kant and Fichte. In Die Welt als Wille und Vorstellung Schopenhauer accepted Kant's position that the world as phenomenon is Will (Wille), but he added that the world as noumenal is will (Wille). He opposed the notion of a noumenal will from Kant; but in regarding the noumenal as knowable, as transcendent, as mental, as well as in the emphasis he laid on the activity of will, he resembled Fichte. His theory of the nature of will was his own, and arrived at from a voluntaristic psychology leading to a voluntarist metaphysics of his own. His psychological starting-point was the unproved assumption that the only force of which we are immediately aware is will; his metaphysical goal was the consistent conclusion that in that case the only force we can know, as the noumenal essence of which all else is phenomenal appearance, is Will. From this noumenal will he did not make of the Divine will similar to our rational desire, a will in which an interference and desire of a desirable end and means produces our rational action. He meant an unintelligent, unconscious, restless, endless will. In considering the force of instinct in animals he was obliged to divest will of reason. When he found himself confronted with the blind forces of Nature he was obliged to divest irrational will of feeling. As he resolved one force after another into lower and lower grades of will he was obliged to divest will of all consciousness. In short, his metaphysics was founded on a misnomer, and simply consisted in calling unconscious forces by the name of unconscious will (Unbewusster Wille). This abuse of language brought him back to Leibnitz. But, whereas Leibnitz supposed unconscious will to arise without perception, without feeling, without ideas, and to be the cause of ideas only in us. Hence he rejected the infinite intelligence supposed by Fichte, Schelling and Hegel against whom he urged that blind will produces intelligence, and only becomes conscious in us by using intelligence as a means to ends. He also rejected the idea of a reconciliation of the pantheism of Leibnitz and Hegel, and placed the most irrational of wills at the base of the worst possible worlds (see further SCHEPENHAUER). This pessimistic pantheism gradually won its way, and procured exponents such as J. Frauenstädt, J.Bahnsen, and, more recently, P. Deussen. The accident of its pessimism attracted F. W. Nietzsche, who afterwards, passing from the philosophy of will to the theory of evolution, ended by imagining that the struggle of the will to live produces the survival of the fittest, that is, the right of the strongest and the will to exercise power, which by means of selection may hereafter issue in a new species of superior man—the Ubermenschen. Finally, Schopenhauer's voluntarism has had a profound effect on psychology inside and outside Germany, and to a less degree produced attempts to deduce from voluntaristic psychology new systems of voluntaristic metaphysics, such as those of Paulsen and Wundt.

3. The first to modify the pure voluntarism of Schopenhauer was E. von Hartmann, who (Die Philosophie des Unbewussten, 1866, 1st ed.), advanced the view that the world as noumenal is both unconscious intelligence and unconscious will, thus founding a panpneumatism which forms the basis of the reconciliation of Leibnitzian pantheism of Schopenhauer. In his tract entitled Schelling's positive Philosophie als Einheit von Hegel und Schopenhauer (1866), he further showed that, in his later philosophy, Schelling had already combined reason and will in the Absolute. Indeed, Fichte had previously characterized the life of the Absolute by reason and will without consciousness; and, before Fichte, Leibnitz had asserted that the elements of Nature are monads with unconscious perception and appetite. Hartmann has an affinity with all these predecessors, and with Spinoza, with whom he agrees that there is but one substance unaltered by the plurality of phenomena which are only appearances. Following, however, in the footsteps of Schelling, he idealizes the one extended and thinking substance into one mental being; but he thinks that its essence consists in unconscious intelligence and will, of which all individual intelligent wills are only activities. The merit of this fresh noumenal idealism consists in its correction of the one-sidedness of Schopenhauer: intelligence is necessary to will. But Hartmann's criticism does not go far enough. He ends by outdoing the paradox of Schopenhauer, concluding that Nature in itself is intelligent will, but unconscious, a sort of immanent unconscious God.

As with his master, his reasons for this view are derived, not from a direct proof that unconscious Nature has the mental attributes of intelligence and of will, but from a logic of identity, the same logic which Leibnitz, from the fact that our perceptions are
sensible phenomena. While he was in fundamental agreement
with the first two positions of Kant, he differed from the
third; he did not believe that the causes of sensible phenomena
can be unknown things in themselves. What then are they?

Hermes identified with this era of Leibnitz was
the acceptance of Leibnitzian fallacy that unity is
necessity, which led to the Leibnizian analysis of material bodies into
inherent monads, indivisible and therefore unextended, and
the theory of monadic souls and entelechies. Indeed, from
the time of Leibnitz such attempts either to analyse or to
construct matter had become a fashion.

Lotze agreed with Leibnitz that the things which cause phenomena are immaterial elements,
but added that they are not simple substances, self-acting,
as Leibnitz thought, or preserving themselves against disturbance,
as Herbart thought, but are interacting modifications of
the one substance of God.

In the first place, he resolved the doubt of Leibnitz about bodies
by deciding entirely against his realistic alternative that an organic
body is a substantia realissima phaenomena, and for his idealistic
alternative that every body is a phenomenon and not a substance at
all. In the matter of immaterial elements without accepting their self-action. He believed in reciprocal
action; and the very essence of his metaphysics consists in sub-
stantiating everything in the world, the interrelation of
interaction of immaterial elements, which produce effects on one another and also
in giving each one of them. According to the mechanics of Newton,
when two bodies collide each body moves in another move equally
and in a motion straight line; but it is not necessary for each
body to enter physically into another concrete fact in abstract language by calling it the
conservation of momentum, by talking of one body communicating its motion to the
other bodies exchanged motion as men do money. Now
Lotze took this abstract language literally, and had no difficulty
in showing that, as an attribute is not separated from its substance,
this supposed communication of motion does not really take place:
nothing passes. But instead of returning to the concrete fact of the
equivalence of momentum, by which each body moving makes the
other move oppositely, he denied that bodies do reciprocally act on
one another, and even that bodies as mutually resisting substances
prove to be dependent upon another agent in collision. Having thus rejected all bodily
mechanism, he had to suppose that reciprocal action somehow
takes place between immaterial elements. This brought him to
another difference from Leibnitz as well as from Newton.

According to Leibnitz, while each immaterial element is a monadic substance
and self-acting secondary cause, God is the primary cause of all.
According to Lotze, the connexion required by reciprocity requires
also that the whole of every reciprocal action should take place
within one substance; the immaterial elements act on one another
merely as the modifications of that substance interacting within itself;
and that one substance is God, who thus becomes not merely
the ground of all but the cause of all.

Lotze was led to the Spinozistic unity of substance in the notion
that, according to him, the one substance, God, is not extended at all, and is not
merely thinking, but is a thinking, willing and acting spirit.

Lotze's metaphysics is thus distinguished from the theism
of Newton and Leibnitz by its pantheism, and from the panthe-
ism of Spinoza by its idealism. It is an idealistic pantheism,
which is a denial of all bodily mechanism, a reduction of every-
thinking to nothing but the thinking of the monadic souls, or agent of acts remaining within the agent's being.
At this point, having rejected both the Newtonian mechanism of bodily
movement and the doctrine of monadic substances, he flew to the
Spinozistic unity of substance in the notion
that, according to him, the one substance, God, is not extended at all, and is not
merely thinking, but is a thinking, willing and acting spirit.

Lotze's metaphysics is thus distinguished from the theism
of Newton and Leibnitz by its pantheism, and from the panthe-
ism of Spinoza by its idealism. It is an idealistic pantheism,
which is a denial of all bodily mechanism, a reduction of everything
bodily to phenomena, and an assertion that all real action
is the activity of God. At the same time it is a curious attempt
to restore mechanism and reconcile it with pantheology by using the
word "mechanism" in a new meaning, according to which
God performs His own reciprocal actions within Himself
by uniform laws, which are also means to divine ends. It is also an
tempt to reconcile this divine mechanism with freedom.
In his "Metaphysik" (1879), as in his earlier "Mikrokosmos" (1856-1864),
Lotze vindicated the contingency of freedom by assigning to
God a miraculous power of unconditional commencement,
whereby not only at the very beginning but in the course of
nature there may be new beginnings, which are not effects of
previous causes, though the results of those causes are according to law. Thus his
pantheistic is also a teleological
idealism, which in its emphasis on free activity and moral order
recalls Leibnitz and Fichte, but in its emphasis on the
infinity of God has more affinity to Spinoza, Schelling and Hegel.
Hence his philosophy, like the Hegelian, continually
encounters one with the difficulty that its sacrifice of the distinct being

4. Lotze (1817-1881) elaborated a very different noumenal
idealism, which perhaps we may express by the name "Pan-
teleologism," to express its conclusion that the known
world is denatured into phenomena, which are absolute
or unconscious will, nor the unconscious at all, but the activity
of God; causing in us the system of phenomenal appearances
which we call Nature, or bodies moving in time and space;
but being in itself the system of the universal reciprocal actions
of God's infinite spirit, animated by the design of the supreme
good. The Metaphysik of Lotze in its latest form (1879)
begins with a great truth: metaphysics must be the foundation of
psychology. He saw that the theories of the origin of knowledge
in idealistic epistemology are unsound. Like Aristotle, then,
he arrives at the same conclusion, and but the same conclusion
he was too much a child of his age to keep things known steadily
before him; having asked the metaphysical question he proceeded
to find a psychological answer in a theory of sensation, which
asserted the mere hypothesis that the being which we ascribe
to things on the evidence of sensation consists in their being
felt. He really accepted, like Kant, the hypothesis of a sense
of sensations which led to the Kantian conclusion that the
Nature we know in time and space is mere sensible appearances
in us. Further, from an early period in his Medicinische Psycholo-
ge (1852) he reinforced the transcendental idealism of Kant
by a general hypothesis of "local signs," containing the sub-
ordinate hypotheses, that we cannot directly perceive extension
either within ourselves or without; that spatial bodies outside
could not cause in us spatial images either in sight or in touch;
but that besides the obvious data of sense, e.g. pressure, heat
and colour, there must be other qualitative different excitations
of different nerve-fibres, by means of which, as non-local signs
of localities, the soul constructs in itself an image of extended
space containing different places. This hypothesis of an ac-
quired perception of a space mentally constructed by "local
signs" is supplied Lotze and many succeeding idealists, including
Wundt, with a new argument for the metaphysical idealism.
Lotze concluded that we have no more reason for supposing an external
space like space constructed out of our perceptions, than we
have for supposing an external colour like perceived colour.
Agreeing, then, with Kant that primary qualities are as mental
as secondary, he agreed also with Kant that all the Nature
we know as a system of bodies moving in time and space is

NOMENIAL IDEALISM
all individual substances to the universality of God entails the sacrifice of the individual personality of men. Our bodies were reduced by Lotze to the general ruck of phenomenal appearances. Our souls he tried his best to endow with a quasi-existence, arguing that the unity of consciousness requires an indivisible subject, which is distinct from the plurality of the body but interacting with it, is in a way a centre of independent activities, and is so far a substance, or rather able to produce the appearance of a substance. But at the end of his Metaphysik, from the conclusion that everything beyond phenomena is divine interaction, he drew the consistent corollary that individual souls are simply actions of the one genuine being. His final view was that certain actions of the divine substance are during consciousness gifted with knowledge of themselves as active centres, but during unconsciousness are non-existent. If so, we are not persons with a permanent being of our own distinct from that of God. But in a philosophy which reduces everything to phenomenal appearance except the self-interacting substance of God, there is no room for either the bodies or the souls of finite substances or human persons.

5. Fechner (1801-1887) affords a conspicuous instance of the idealistic tendency to mystify nature in his Panpsychism, or that form of noumenal idealism which holds that the universe is a vast communion of spirits, souls of men, of animals, of plants, of earth and other planets, of the sun, as embraced as different members in the soul of the world, the highest spirit—God, in whom we live and move and have our being; that the bodily and the spiritual, or the physical and the psychical, are everywhere parallel processes which never meet to interact; but that the difference between them is only a difference between the outer and inner aspects of one identical psychophysical process; and yet that both sides are not equally real, because while psychical and physical are identical, the psychical is what a thing really is as seen from within, the physical is what it appears to be to a spectator outside; or spirit is the self-appearance of matter, matter the appearance of one spirit to another. Fechner's panpsychism has a certain affinity both to Stahl's animism and to the hylozoism of materialists such as Haeckel. But, while it differs from both in denying the reality of body, it differs from the former in extending conscious soul not only to plants, as Stahl did, but to all Nature; and it differs from the latter in the different consequences drawn by materialism and idealism from this universal animism. According to Haeckel, matter is the universal substance, spirit its universal attribute. According to Fechner, spirit is the universal reality, matter the universal appearance of spirit to spirit; and they are identical because spirit is the reality which appears. Hence Fechner describes himself as a twigs fallen from Schelling's tree. Schelling's adherent Oken by his Lehrbuch der Naturphilosophie conveyed to his mind the life-long impression that God is the universe and Nature God's appearance. At the same time, while accepting the Schellingian parallelistic identity of all things in God, Fechner was restrained by his accurate knowledge of physics from the extrapolative construction of Nature, which had failed in the hands of Schelling and Hegel. Besides, he was deeply impressed by the fact of man's personality and by the problem of his personal immortality, which brought him back through Schelling to Leibniz, whose Monadologie through time maintains the plurality of monadlike souls and the omnipresence of perception, sketches in a few sections (§§ 23, 78-81) a panpsychic parallelism, though without identity, between bodily motions and psychic perceptions, and, what is most remarkable, already uses the conservation of energy to argue that physical energy pursues its course in bodies without interacting with souls, and that motions produce motions, perceptions produce perceptions. Leibniz thus influenced Fechner, as in other ways he influenced Lotze. Both, however, used this influence freely; and, whereas Lotze used the Leibnizian argument from indivisibility to deduce indivisible elements and souls, Fechner used the Leibnizian hypotheses of universal perception and parallelism of motions and perceptions, in the light of the Schellingian identification of physical and psychical, to evolve a world-view (Weltansicht) containing something which was neither Leibnitz nor Schelling.

Fechner's first point was his panpsychism. Emphasizing the many real analogies between the physical and the psychical, he adduced much stronger evidences that all the mental operations of men and animals require a nervous system, he flew to the paradox that soul is not limited to men and animals, but extends to all bodies, even to the sun, to the world itself, of which, according to him, God is the world-soul. In this doctrine of universal animation he was like Leibnitz, yet very different. Whereas Leibnitz confined a few substances to the sphere of psychical processes and therefore preferred to call the souls of inorganic beings "Entelechies," Fechner extended consciousness to the whole world; and accordingly, whereas Leibnitz believed the Leibnizian body of the Monde des Mondes du Monde and "dans le Monde," Fechner, in the spirit of Schelling, identified God with the soul of the world. Fechner's second point was that, throughout the animated universe, physical processes and psychic processes are not interactions. In his panpsychic parallelism he was again like Leibnitz, and he developed his predecessor's view, that the conservation of energy prevents interaction, into the supposition that alongside the physical there is a parallel psychical conservation of energy. Here, again, he went much further than Leibnitz, but along with Schelling, in identifying the physical and the psychical as outer and inner sides of the same phenomena, in which there are no cognizable processes different.

Fechner's third point carried him beyond all his predecessors, containing as it does the true originality of his "world-view." He advanced the ingenious suggestion that, as body is in body and all living to the soul, so the soul is in the world and conscious only in the world-soul. By this means he explained immortality and vindicated personality. His fourth point was connected with this inclusion of persons in types; he raised the question of the relative necessity to explain the unity of consciousness. Fechner's supposition was that the unity of consciousness belongs to the unity of the whole body; that the seat of the soul is the living body; that the soul changes its place as in different parts a process rises above the "threshold of consciousness"; and that soul is not substance but the single psychical life which has its physical manifestation in the single bodily life. Applying this "synchronological view" of the inclusion of soul in soul, he deduced the conclusion that, as here the nature of one's soul is to unite one's body, so hereafter its essence will be to unite a greater body, while God's spirit unites the whole world by His omnipresence; and he peremptorily asked, in opposition to the "punctual" view, whether God's soul is centred in a point. Lastly, the whole of this "world-view" was developed by Fechner in early life, under the influence of his religious views, when he sought to prove that the common-sense evidence of Christianity which teach us that we are children of God, that this natural body will become a spiritual body, and that, though we are divided from God by sin, yet this division will in the end be terminated in "Deo vivimus, movemus, et sumus." It is important to notice that Fechner maintained this "world-view" in a little book, Das Büchlein vom Leben nach dem Tode, which he originally published in 1824, and which was reissued in the original, but with the preface "Das Büchlein vom Leben nach dem Tode," in 1851, and again in 1852, at a sketch of his Weltansicht. Afterwards in Nauna (1849) he discussed the supposed souls of plants, and inZendesta (1851) the supposed souls of the earth and the rest of the world. Then in 1855 he published his Atonemlehre, partly founded on his physics, but mainly on his metaphysics. Under the influence of Leibnitz, Boscovich, Kant and Fechner he supposed that body is made up of indivisible atoms, which are not bodies, but centres of forces of attraction and repulsion; that impenetrability is a result of repulsive force; and that force itself is only law—taking as an instance that Newtonian attraction is due to the process we do not understand, and neglecting that Newtonian force of pressure and impact whose process we do understand from the collision of bodies already extended and resisting. But, in thus adapting to his own purposes the Cartesian and Newtonian ideas, which had brought him to his own conclusions as to his own metaphysics, which required that the supposed centres of force are not Leibnitzian "monads," but "atoms" or "elements," and that the force of accidence is afterwards supposed, but are elements of a system which in outer aspect is bodily and in inner aspect is spiritual, and obeying laws of spirit. At the same time his synchronological view prevented him from accepting that every soul of every body is not always in a soul always corresponds to a unity of a physical manifold. Thus his metaphysics is Leibnitzian, like that of Lotze, and yet is opposed to the most characteristic feature of monadology—the percipient individual monad.
how far Fechner derived his psychophysics from experience, how far from fallacies of inference, from his romantic imagination and from his theosophic metaphysics, which indeed coloured his whole book on psychophysics. At the very outset he started with his previous metaphysics, and it was not many years before he added to its parallelism in physics, and a parallelism in human nature. He now compared the spiritual and bodily sides of a man to the cave and convex sides of a circle, as inner and outer sides of the same process, which is psychical as viewed from within and physical as viewed from without. He maintained that physical and psychical energy do not interfere, but that the psychical is, like a mathematical quantity, a function of the physical, depending upon the law of conservation. And, according to law exists, such that we may conclude from one to the other, but without one ever being cause of the other. By his psychophysics he meant the exact doctrine of the relations of depen-
dence between psychical and nervous processes. What is it that is unnecessary, not the doctrine. From antiquity men had applied themselves to determine the relations between the physical stimuli and the so-called "intensity" of sensations. He generalized Weber's law (q.e.), in the form that sensation generally increases in intensity as the stimulus increases, or in an arithmetrical progression as the stimulus increases in a geometrical ratio; or increases by the addition of the same amount as the stimulus increases by the same multiple; or increases as the logarithm of the stimulus. But there are a number of important relations of sensations, which are not in "quality," as in the intervals of sounds, which were understood long ago, but also in "intensity," as in the diameter of a circle. This is Fechner's law. By the rules of induction from concomitant variations, we are logically bound to infer the realistic conclusion that outer physical stimuli influence inner psychical processes, which is Fechner's solution of the.senses. In a similar form this conclusion is supported by Fechner, the very opposite conclusion followed from the pre-suppositions of his parallelistic metaphysics, and from the Leibnitzian view of the conservation of energy, which he was the first in our time to use in order to prove that an organism produces a psychical effect, on the ground that physical energy must be exactly replaced by physical energy.

Having satisfied himself in what he called "outer psychophysics," he turned to the "inner psychophysics," and met the.NaN which Be was called "inner psychophysics," or the theory of the relation between nervous and psychical processes. He rightly argued against the old theory that the continuity of nervous processes is cause for the brain is interrupted by mental processes of thought and will: there is a nervous process for every mental process. But two questions then arose. What is the relation between nervous processes? What causes sensation? The first question he answered from his imagination by supposing that, while the external world is stimulus of the nervous process, the nervous process is the immediate stimulus of the sensation, and that the sensation depends on the previous stimulus in the nervous system, when Weber's law proves only that it increases by a constant fraction of the previous stimulus in the external world. The second question he answered from his psychophysical metaphysics, by supposing that within the organism there exists, besides the dependency of sensation on nervous process without cause because the nervous process is physical but the sensation psychical. The nervous process, the sensation, and the psychical process, are one and the same. An increase of the external stimulus on the nervous system to the reaction of the organism on the external world is one series, while the con-
scious process beginning with sensation is only parallel and as it were left high and dry. What then is the cause of the sensation? Huxley, it will be remembered, in similar circumstances, answered this question by degrading consciousness to an epiphenomenon, or by product of the physical process. Fechner was saved from this absurdity, but only to fall into the greater absurdity of his own pana
pyschism. Having long assumed that the whole body is animated throughout, and that there are always two parallel series, physical and psychical, of which one affects the other, the author supposed that one spirit is in another and all in the highest spirit, God. By this means he also explained unconsciousness. In point of fact, many stimuli are beneath the "threshold" of a man's con-
nsciousness. Leibnitz, in the Nouveaux Essais, ii, 11, had also said that transient and accidental things are unconscious, and had further supposed that a perception of which we are, is composed of a quantity of "petites perceptions" of which we are not, conscious. Proceeding on this suggestion, and misled by the psychophysical hypothesis, Fechner held that a conscious sensation, like its stimulus, consists of units, or elements, by summation and increments of which conscious sensations are composed. Fechner's unconsciousness, according to this unnecessary assumption, emerges from an integration of unconscious shocks or tremors. But by the hypothesis of the inclusion of spirit in spirit, he was further able to explain the supernatural character of spiritual sense, while everything whatever is in the consciousness of the highest spirit of God, who is the whole of reality of which the spirits are parts, while the so-called physical world is merely outer appear-
ance of one spirit to another.

Fechner first confused physics and metaphysics in psychophysics, and next proceeded to confuse them again in his work on evolution (Lebensanleih und Entwicklungsgeschichte der Organ-
men, 1873). He perceived that Darwinism attributed too much to accident, and was also powerless to explain the origin of life and of consciousness. But his substitute was as his own hypothesis of panpsychism, in which he supposed that a life, a "cosmogonic" or original condition of the world as a living organism into the inorganic, by the principle of tendency to stability. This was as though on its physical side, always was a living body; and on its psychical side, always the life of the spirit, and so far from life arising from the lifeless, and consciousness from unconsciousness, the life and consciousness of the whole world are the one and the same psychical process. But, an absence of secondary automatism, we ourselves are developed from our own mother-earth by differentiation. By thus supposing a psychical basis to evolution, Fechner, anticipating Wundt, substituted a psychical development of organs for Darwinian accidental variation.

The difficulty of such speculations is to prove that things apparently dead and mindless are living souls. Their interest to the metaphysi-
cian is as the positio to physics on the one hand and to theology on the other. Shall we resign our traditional belief that the greater part of the world is mere body, but that its general adaptability to conscious organisms proves its creation and government by God, and take to the new hypothesis, which, by a transfer of design from God to Nature, supposes that everything physical is alive, and con-
ducts its life by psychical impulses of its own? Fechner himself went even further, and together with design transferred God Himself to Nature. This is the subject of his last metaphysical work, Die Tagesansicht gegenüber der Nachtansicht (1879). The "day-view" (Fechner's) is the view that God is the psychophysical all-embracing energy of the world and consciousness, both the "active" and the "passive" of Hegel and Lotze in its pantheistic tendency. But it does not like theirs, sacrifice our personality; because, according to Fechner, the divine consciousness includes us as a larger circle includes smaller circles. By the "night-view" Fechner meant the view that one spirit in another, Fechner's "day-view" also puts Nature in a different position; neither with Hegel sublimating it to the thought of a God's mind, nor with Lotze degrading it to the phenomena of our human consciousness. It is the former appearance of one spirit to another in the highest of spirits.

We have dwelt on this curious metaphysics of Fechner because it contains the master-key to the philosophy of the present moment. When the later reaction to Kant arose against both Hegelianism and materialism, the nearly contemporary appear-
ance of Fechner's Psychophysik began to attract experimental psychologists by its real as well as its apparent exactness, and both psychologists and metaphysicians by its novel way of putting the relations between the physical and the psychical, man in and man. Fechner saw psychology deriving advantage from the methods, as well as the results, of his experiments, and in 1879 the first psychological laboratory was erected by Wundt at Leipzig. But he had also to endure countless objections to his mathematical statement of Weber's law, to his unnecessary assumption of units of sensation, and to his unjustifiable transfer of the law from physical to physiological stimuli of sensations, involving in his opinion his parallelistic view of body and mind. Among psychologists Helmoltz, Mach, Brentano, Hering, Delboeuf, were all more or less against him. Sigwart in his Logic has also opposed the parallelistic view itself; and James has criticized it from the point of view that the soul selects out of the possibilities of the brain means to its own ends. Nevertheless, largely under the influence of the exaggeration
METAPHYSICS

of the conservation of energy, many psychologists—Wundt, Paulsen, Richl, Joell, Ebbinghaus, Münsterberg, and in England Lewes, Clifford, Romanes, Stout—have accepted Fechner's psychophysical parallelism, as far as at least men and animals are concerned. Most stop here, but some go with Fechner to the full length of his metaphysical parallelism of the physical and spiritual, as psychophysical, throughout the whole world. This idea was extended from Germany to Denmark, where it was embraced by Høffding, and to England, where it was accepted by Romanes, and in a more qualified manner as "a working hypothesis" by Stout. But the most thorough and most eloquent of Fechner's metaphysical disciples was F. Paulsen (q.v.), who spread panpsychism far and wide in his *Einsieht in die Philosophie*.

Here reappear all the characteristic points of Fechner's "world-view"—the panpsychism, the universal parallelism with the identification of physical and psychical, the inclusion of spirit in spirit, the psychophysical view of spirit, and the final "day-view" that all reality is spirit, and body the appearance of spirit to spirit. But Paulsen tries to supply something wanting in Fechner. The originality of Paulsen consists in trying to supply an epistemological explanation of the metaphysics of Fechner, by reconciling him with Kant and Schopenhauer. He borrows from Kant's "rationalism" the hypothesis of a spontaneous activity of the subject; he borrows from Schopenhauer the assumption that everything arises from understanding; and he accepts from Kant's metaphysical idealism the conception that everything we perceive, experience and know about physical nature, and the bodies of which it consists, is essentially psychical. In other words, he makes each of us, and each of our psychical states, the basis of a different theory of human nature and soul, and so does not accept the Kantian conclusion that things in themselves, in the sense of things beyond phenomena, are all unknowable. On the contrary, his contention is that of Fechner—that all knowable things are inner psychical realities beneath outer physical appearances—the invisible symbolized by the visible. Kant, however, had no epistemology for such a contention, because according to him the outer appearances give mere appearance, from which we could not know either body in itself, or soul in itself. Parting, then, from Kant, Paulsen resorts to a paradox which he shares with Fechner and Wundt. He admits, indeed, Kant's hypothesis that by inner sense we are conscious only of mental states, but he contends that this very consciousness is a knowledge of a thing in itself. He agrees with Fechner and Wundt that there is no substantial soul, and that soul is nothing but the mental states, or rather their unity—thus identifying it with Kant's synthetic unity. On this assumption he deduces that in being conscious of our mental states we are conscious of them as an appearance, but as it appears to itself, and therefore can infer similar souls, other psychical unities, which are also things in themselves.

What is the essence of this psychical reality which we thus immediately and mediately know? Here he appeals to Schopenhauer's doctrine that will of some sort is the fundamental fact of mental life. Taking, then, will to be the essential thing in itself of our psychical states, he deduces that psychical things in themselves beyond ourselves are also essentially "wills." Combining with this the central dogma of Fechner that spirit extends throughout the world of bodily appearance, he concludes that the realities of the world are "wills," that bodies are mere appearances of "wills," and that there is one universal and all-embracing spirit which is "will." His ultimate metaphysics, then, is this: Everything is spirit, and spirit is "will." Lastly, by "will" he does not mean "rational desire," which is its proper meaning, but inapplicable to Nature; nor unconscious irrational will, which is Schopenhauer's forced meaning; nor unconscious intelligent will, which is Kant's; but more likely, the true conception of the will to Nature. His "will" is instinct, impulsive feeling, a "will to live," not indeed unconscious, but often subconscious, without idea, with a hunger for more one, and yet permanent, and short, what he calls, after K. E. von Baer, *Zielsträbigkeit*. How persistent is ancient animism! Empedocles, Plato and Aristotile; Telesio, Bruno and Campanella; Leibnitz; the idealists, Schopenhauer and Hartmann, Fechner and Paulsen; and the mathematician and the Haeckel—all have agreed in according some sort of appettition to Nature. So prone are men to exaggerate adaptation into aim! So prone are men to transfer to Nature the providence of God! (see Bacon, *De augmentis*, iii. 4, sub fin.).

Novalis' idealism is not dead in Germany. It died down for a time in the decline of Hegelianism and the rise of materialism. It has been revived. The publication of the second edition of Fichte's *Wissenschaftslehre* has brought all the panpsychism of Schelling and Hegel into its influence. So still more does the pantheism of Schopenhauer. The three most vital idealisms of this kind at the moment are the panpneumatism of Hartmann, combining Hegel with Schopenhauer; the panteleologism of Lotze, reviving Leibnitz; and the panpsychism of Paulsen, continuing Fechner, but with the addition of an epistemology combining Kant with Schopenhauer. All these systems of metaphysics, differ as they may, agree that things are known to exist beyond sensible phenomena, but yet are mental realities of some kind. Meanwhile, the natural substances of Aristotelian realism are regarded with common aversion.

5.—PHENOMENAL IDEALISM IN GERMANY

Phenomenal idealism is the metaphysics which deduces that, as we begin by perceiving nothing but mental phenomena of sense, so all we know at last from these data is also phenomena of sense, actual or possible. So far it is in general agreement not only with Hume, but also with Kant in his first two positions. But it follows Fichte in his revolt against the unknown thing in itself. On the other hand, as the speculative systems of non-idealism, starting from Fichte, succeeded one another, like ghosts who "come like shadows, so depart," without producing conviction, and often in flagrant opposition to the truths of natural science, and when, in consequence, a wave of materialism threatened to submerge mind altogether by reducing it to a function of matter, many philosophers began to despise of the ambitious attempts which had been made to prove that there is a whole world of mind beyond phenomena, as the nomenclasts had supposed. Thus they were thrown back on the limits of human knowledge prescribed by Kant, but purged of the unknown thing in itself by Fichte. Phenomenal idealism is the name of Kantian contention that Nature, as known to science, is phenomena of experience. Unfortunately, the word "phenomenon" is equivocal (see Mind, iv. 300). Sometimes it is used for any positive fact, as distinguished from its cause. But sometimes it also means what appears, or can appear, to the senses, as distinguished from what does not appear, but can be inferred to exist. Now, Kant and his followers start from this second and narrower meaning, and usually narrow it still more by assuming that what appears to the senses is as mental as the sensation, being unexpevableable from it, or from the idea of it, and that an appearance is a mental idea (Vorstellung) of sense; and then they conclude that we can know by inference nothing but such mental appearances, actual and possible, and therefore nothing beyond sensory experience. When, on the other hand, the objects of science are properly described as phenomena, what is meant is not this pittance of sensible appearances, but positive facts of all kinds, whether perceptible or imperceptible, whether capable of being experienced or of being inferred from, but beyond, experience, e.g., the farther side of the moon, which is known to exist, to be there, not as a mental appearance, but as a mental idea. Kant, that Nature as known to science is phenomena, means one thing in Kantism and another thing in science. In the former it means that Nature is mental phenomena, actual and possible, of sensory experience; in the latter it means that Nature is positive facts, either experienced or inferred. It is most important also to notice that Kantism denies, but science asserts, the logical power of reason to infer actual things beyond experience. But the phenomenal idealists have not, any more than Kant, noticed the ambiguity of the term "phenomenon"; they fancy that, in saying that all we know is phenomena in the Kantian sense, they are describing all the positive facts that science knows; and they follow Kant in supposing that there is no logical inference of actual things beyond experience.

1. The Reaction to Kant.—The reaction to Kant ("Zurück zu Kant") was begun by O. Liebmann in *Kant und die Epiphanen* (1865). Immediately afterwards, in 1866, appeared Lange's *Geschichte des Materialismus*. In 1870 J. B. Meyer published his *Kants Psychologie*, and in 1871 H. Cohen his more important *Theorie der Bewahrung*, which led Lange to modify his interpretation of Fichte; and the second edition of Fichte's *Wissenschaftslehre* also published. Lange (q.v.) by his *History of Materialism* has exercised a profound influence, which is due partly to its apparent success in answering materialism by Kantian arguments, and partly to
its ingenious attempt to give to Kantism itself a consistency, which, however, has only succeeded in producing a new philosophy of Neo-Kantism, differing from Kantism in modifying the a priori and rejecting the thing in itself. Lange to some extent modified the transcendentality of Kant's theory of the origin of knowledge. A priori forms, according to Kant, are contributions of the mental powers of sense, understanding, and reason; but, according to Lange, they are rooted in "the physico-psychical organization." This modification was the beginning of a gradual lessening of the antithesis of a priori to a posteriori, until at the last the a priori forms of Kant have been transmuted into "auxiliary conceptions," or "postulates of experience." But this modification made no difference to the Kantian and Neo-Kantian deduction from the epistemological to the metaphysical. Lange entirely agreed with Kant that a priori forms can have no validity beyond experience when he says: "Kant is at any rate so far justified as the principle of intuition in space and time a priori is in us, and it was a service to all alike that he should in this first great example, show that what we possess a priori, just because it arises out of the disposition of our mind, beyond our experience has no longer any claim to validity." (Hist. of Materialism, trans. E. C. Thomas, ii. 203). Hence he deduced that whatever we know from sensations arranged in such a priori forms are objects of our own experience and mental phenomena. Hence also his answer to materialism, Science, says the materialist, proves that all known things are material phenomena. Yes, rejoins Lange, but Kant has proved that material are merely mental phenomena; so that the former's empirically ideal assertions are actually cases of the more surely he is playing into the hands of the idealist— an answer which would be complete if it did not turn on the equivocation of the word "phenomenon," which in science means any positive fact, and not a mere appearance, much less a mental appearance, to sense and sensory experience. Having, however, made a deduction, which is at all events consistent, that on Kantian assumptions all we know is mental phenomena, Lange proceeded to reduce the rest of Kantianism to consistency.

But his ardent love of consistency led him far away from Kant, in the end he proceeded consistently from the assumption, that whatever we think beyond mental phenomena is real, to the logical conclusion that in practical matters our moral responsibility cannot prove the reality of a noumenal freedom, because, as on Kant's assumption we know ourselves from inner sense only as phenomena, we can prove only our phenomenal freedom. Lange thus transmuted inconsistent Kantism into a consistent Neo-Kantism, consisting of these reformed positions: (1) we start with sensations in a priori forms; (2) all things known from these data are mental phenomena of experience; (3) everything beyond is idea, without any corresponding reality being knowable. "The intelligible world," he concluded, "is a world of poetry." Our reflection is that there is a great difference between the essence and the consistency of Kant's philosophy. Its essence, as stated by Kant, was to reduce the logical use of reason to mental phenomena of experience in speculation, in order to extend the practical use of reason to the real noumena, or things in themselves, required for morality. Its consistency, as deduced by Lange, was to reduce all use of reason, speculative and practical, to its logical use of proceeding from the assumed mental data of outer and inner sense, arranged a priori, to mental phenomena of experience, beyond which we can conceive ideas but postulate nothing. As H. Vahlen has pointed out in a pronounced Kantian of the new school, says: "Critical scepticism is the proper result of the Kantian theory of knowledge."

There is only one Neo-Kantian way out of this dilemma, but it is to reduce the ontological and psychological reality. This is the task of A. Riehl, who in Der philosophsche Kritik, (1876, &c.) proposes the non-Kantian hypothesis that, though things in themselves are unknowable through phenomena, they are knowable by empirical intuition, and therefore also by empirical thought starting from intuition. Like all true followers of Kant, Riehl prefers epistemology to metaphysics; yet in reality he founds a metaphysics on epistemology, which he calls "critical realism," so far as it asserts a knowledge of things beyond phenomena, and "critical monism," so far as it holds that these things are unlike both physical and psychological phenomena, but everywhere the same basis of both. He accepts the Kantian position of a unity of consciousness, the a priori synthesis, and that therefore all that natural science knows about matter moving in space is merely phenomena of outer sense; that is, he would agree with Kant that from these data we could not infer things in themselves by reason. But his point is that the very sensation of phenomena or appearances implies the things which appear. Sensory knowledge, he says, "is the knowledge of the relation of things through the relations of the senses to the thing." Further, holding that, "like every other perception, the perception of a human body immediately involves the existence of that body," he concludes that the evidence of a spiritual and transcendent "thingness" of the external world as objective in the Kantian sense of universally valid. He interprets the external world to be the compound of physical and psychical phenomena. He rightly relies on the numerous passages, neglected by Lange, in which Kant regards things in themselves as neither phenomena nor ideas, but things existing beyond both. But his main reliance is on the passage in the Kritik, where Kant, speaking of the Cartesian difficulty of communication between body and soul, suggests that, however body and soul appear to be different in the phenomena of outer and inner sense, what lies as thing in itself the basis of the phenomena of both may perhaps be neither so heterogeneous as to be inconsistent, nor yet specified. Riehl elaborates this bare suggestion into the metaphysical theory that the single base of physical and psychical phenomena can be made, if only not specified, that is to say, that we can establish this paradox of "critical monism," he accepts to a certain extent the psychophysical philosophy of Fechner. He agrees with Fechner that physical and psychical sensations are both nerve and psychical process of mind are really the same psychophysical phenomena, so that the one hand to an observer and on the other hand to one's own consciousness; and that physical phenomena only produce physical phenomena. Thus he concludes that physical and psychical phenomena of mind in space and the psychical phenomena of mind to arise in us as its conscious effects. In order to give a direct perception of such a nonsensical thing, he shows to what strains ideologists are driven in the endeavour to supplement Kant's limits of knowledge to phenomena by some sort of knowledge of things.

2. The Reaction to Hume.—When the Neo-Kantians, led by Lange, had modified Kant's hypothesis of a priori forms, and retracted Kant's admission and postulation of things in themselves beyond phenomena and ideas, and that too without proceeding further in the direction of Fichte and the noumenal idealists, there was not enough left of Kant to distinguish him essentially from Hume. For what does it matter to metaphysics whether by association sensations suggest ideas, and so give rise to ideas of substance and causation a posteriori, or by unity of consciousness combines sensations by a priori notions of substance and causation into objects which are merely mental phenomena of experience, when it is at once allowed by the followers of Hume and Kant alike that reason in any logical use has no power of inferring things beyond the experience of the reasoner? In either case, the effective power of inference, which makes us rational beings, is gone. Naturally then the reaction to Kant was followed by a second reaction to Hume, partly under the name of "Positivism," which has attracted a number of adherents, such as C. Göring (1841-1879), author of an Incompleter System der Kritischen Philosophie (1874-1875) and E. Lass (q.v.), and partly under the name of the "physical phenomenology" of E. Mach.

Ernst Mach (q.v.) is a conspicuous instance of a confusion of physics and psychology ending in a scepticism like that of Hume. He tells us how from his youth he pursued physical and psychological studies, how at the age of fifteen he read Kant's Prolegomena, and later rejected the thing in itself, and came to the conclusion that the world with his ego is one mass of sensations. For a time, under the influence of Fechner's Psychophysic, he thought that Nature has two sides, a physical and a psychological, and added that all atoms have feeling. But in the progress of his physical work, which taught him, as he thought, to distinguish between what we see and what we
mentally supply, he soon passed from this noumenalism to a "universal physical phenomenology." It retains some relics of Fechner's influence; first, the theory of identity, according to which the difference between the physical and psychical is not a dualism, but everything is at once both; and secondly, the substitution of mathematical dependence for physical causality; that, whereas Fechner only denied causality between physical and psychical, Mach rejects the entire distinction between causality and dependence, on the ground that "the law of causality simply asserts that the phenomena of Nature are dependent on one another." He comes near to Hume's substitution of succession of phenomena for real causality. He holds, like Hume, that nothing is real except our sensations and complexes of sensory elements; that the ego is not a definite, unalterable, sharply bounded unity, but its continuity alone is important; and that we know no real causes at all, much less real causes of our sensations; or, as he expresses it, bodies do not produce sensations, but complexes of sensations form bodies. If he has any originality, it consists in substituting for the association of ideas the "economy of thinking," by which he means that all theoretical conceptions of physics, such as atoms, molecules, energy, &c., are mere helps to facilitate our consideration of things. But he limits this power of mind beyond sensations to mere ideas, and like Hume, and also like Lange, holds at last that, though we may form ideas beyond sensations or phenomena, we cannot know things. If we ask how Mach treated in this scepticism, which is contained in his well-known scientific work Die Mechanik in ihrer Entwicklung (1883; ed. 1908) as well as in his psychological work on the Analysis of Sensations (Beiträge zur Analyse der Empfindungen, 1886), we find two main causes, both psychological and epistemological; namely, his views on sense and on inference. In the first place, he displays in its most naked form the common but unproved idealistic paradox of a sense of sensations, according to which touch apprehends not mere pressure but a sensation of pressure, sight apprehends not colour but a sensation of colour, and there is no difference between the sensory operation and the sensible object apprehended by any sense, even within the sentient organism. Hence, according to him, sensations are not apprehensions of sensible objects (e.g. pressures felt) from which we infer similar objects beyond sense (e.g. similar pressures of outside things), but are the actual elements out of which everything known is made; as if sensations were like chemical elements. Within the limits of these supposed sensory elements he accords more freedom to the psychologists, but he denies them any sense; because, following the nativists, Johannes Müller and Helmholtz, he includes sensations of time and space, which, however, are not to be regarded as "pure intuitions" in the style of Kant. But here again he identifies time and space with the sensations of them (Zeitempfindungen and Raumempfindungen). On the assumption, then, that time and space are not objects, but systems, of sensations, he concludes that a body in time and space is "a relatively constant sum of touch-and-light-sensations, joined to the same time-and-space-sensations," that each man's own body is included in his sensations, and that to explain sensations by motions would only be to explain one set of sensations from another. In short, sensations are elements and bodies complexes of these elements. Secondly, his theory of inference contains the admission that we infer beyond sensations: he remarks that the space of the geometr is beyond space-sensations, and the time of the physicist does not coincide with time-sensations, because it uses measurements such as the rotation of the earth and the vibrations of the pendulum. But by inference beyond sense he does not mean a process of concluding from sensible things to similar things, e.g. from tangible pressures to other similar pressures in the external world. Inference, according to him, is merely mental completion of sensations; and this mental completion has two characteristics: it only forms ideas, and it proceeds by an "economy of thought." In the course of his learned studies on the history of mechanics he became deeply impressed with Galileo's appeals to simplicity as a test of truth, and converted what is at best only one characteristic of thinking into its essence. According to him, whatever inferences we make, certain or uncertain, are mere economies of thought, adapting ideas to sensations, and filling out the gaps of experience by ideas; whatever we infer, whether bodies, or molecules, or atoms, or space and time, is immediately affected by all without distinction equably provisional conceptions, things of thought; and "bodies or things are comperous mental symbols for groups of sensations—symbols which do not exist outside thought." Moreover, he applies the same scepticism to cause and effect. "In Nature," says he, "there is no cause and no effect." He thinks that repetitions of similar conjunctions occur in Nature, the connexion of cause and effect only in abstraction. He refers to Hume as recognizing no causality but only a customary and habitual succession, but adds that Kant rightly recognizes the connexion, but with the necessity of the conjunction. But in reality his theory is a new version of Hume's theory of association nor Kant's of an a priori notion of understanding under which a given case is subsumed. He thinks that there is a notion of understanding (Vorstandebegriff), under which every new experience is subsumed, but that it has been developed by former experience, instinctively, and by the development of the race, as part of the economy of thinking. "Cause and effect are therefore," he concludes, "thought-things of economical function (Gedankendinge von Wirtschaft der Funktion)." His philosophy, therefore, is that all known things are sensations and complexes of sensory elements, which are induced by an economy of thinking which cannot carry us beyond Ideas to real things, or beyond relations of dependency to real causes. It is important to understand that Mach had developed this economical view of thought in 1872, more than ten years before the appearance of his work on the history of mechanics Kirchhoff. as he tells us in the preface, where he adds that at a later date similar views were expressed by Kirchhoff in his Vorlesungen über mathematische Physik (1874). Kirchhoff asserted that the whole object of mechanics is "to describe the motions occurring in Nature completely within the simplest manner." This law involves the denial of force as a cause, and the assertion that all we know about force is that the acceleration of one mass depends on that of another, as in mathematics a function depends on a variable; and that even Newton's third law of motion is merely a description of the fact that two material points determine in one another, without reciprocally causing, opposite accelerations. It is evident that Kirchhoff's descriptive is the same as Mach's economical view. "When I say," says Mach, "that a body A exerts a force on a body B, I mean that B, on coming into contradistinction with respect to A, experiences an effect of the one kind, which is not a cause, convert Newtonian reciprocal action into mere interdependency, and, in old terminology, reduce mechanics from a new philosophy of causes to a natural history of mere facts. Now, Mach applies these preconceived opinions to "mechanics in its development," with the result that, though he shows much skill in mathematical mechanics, he misrepresents its development precisely at the critical point of the discovery of Newton's third law of motion. The true order of discovery, however, was as follows:—

(a) Sir Christopher Wren made many experiments before the Royal Society, which were afterwards repeated in a corrected form by Sir Isaac Newton in the Principia, experimentally proving that bodies of ascertained comparative weights, when suspended and impelled against one another, forced one another back by impressing on one another opposite changes of velocity inversely as their weights and therefore masses; that is, by impressing on one another equal but opposite changes of momentum.

(b) Wallis showed that such bodies reduce one another to a joint mass with a common velocity equal to their joint momentum divided by their joint mass, which is equal to their joint velocity. This result is easily deducible also from Wren's discovery, if m and m' be the masses, v and v' their initial velocities, and V the common velocity, then m(v - V) = m'(V - v'), therefore mv + mv' = (m + m')V, and hence v + v' = (m + m')/m.

(c) Wren and Huygens further proved that the law of equal action and reaction, already experimentally established by the former, is deducible from the conservation of the velocity of the common centre of motion, which is the same as the common centre of the bodies, that is, deducible from the fact that their common centre
of gravity does not change its state of motion or rest by the actions of the bodies between themselves; and they further extended the law to bodies, qua elastic.

(3) Newton, first intuitively and then deductively, the third law was originally discovered only as a law of collision or impact between bodies of ascertained weights and therefore masses, impressing on one another equal and opposite changes of momentum, and always maintaining the conservation of momentum. To modify the law to begin with, apart from the subsequent effects of elasticity.

(4) Newton in the Principia, repeating and correcting Wren's observations, and adding further instances from attractive forces of magnetism and gravity, induced the third law of motion as a general law of all forces.

This order of discovery shows that the third law was generalized far beyond what was said in his short note, and was intended to express the law of mutual inertial resistance to motion, not the law of weights or masses, which are not material points or mass-points. It shows that the bodies impress on one another opposite changes of velocity inversely as their weights or masses; and that in doing so they always begin by moving in the same direction.

In spite of this, they may do afterwards in consequence of their elasticities. The two bodies therefore do not penetrate one another, but begin by acting on one another with a force precisely sufficient, instead of penetrating one another, to cause them to form a joint mass with a common velocity. Bodies then are triply extended substances, each occupying enough space to prevent mutual penetration. The conservation of the common velocity, whatever they may do afterwards in consequence of their elasticities.

3. Dualism within Experience.—Besides those philosophies which are reactions to Kant or to Hume, there are a number of other modern systems which start with the common hypothesis that knowledge is experience. The consequence is that whatever is true of experience they transfer to all knowledge. One of the characteristics of actual experience is that its object is, or has been, present to an experiencing subject; and of possible experience it can be present. As a matter of fact, this characteristic differentiates experience from inference. By inference we know that things, such as the farther side of the moon, which cannot be seen directly, are there, but its absence is not experiment. In the experience of the subject on the earth, nevertheless exist. But, on the hypothesis that knowledge contains no inferences beyond experience, it follows that all the objects of knowledge, being objects of experience, are, or have been, or can be, present to an experiencing subject. Hence it is common nowadays to hold that there is indeed a difference between knowed and known, ego and non-ego, subject and object, but that they are inseparable; or that all known things are objects and subjects inseparably connected in

experience. This view, however, is held in different forms; and two opposite forms have arisen in Germany, "immanent philosophy" and "empirio-criticism," the former nearer to Kant, the latter to Hume.

Immanent Philosophy is the hypothesis that the world is not transcendent, but immanent. The consciousness-holders of this view are Anton von Feuerbach, who expresses it in the formula, "Denken eines Seins = gedachtes Phänomen," or "Every thought is an expression of something in the mind of the thinker.

But the best known representative of Immanent Philosophy is W. Schuppe, who, in his Erkenntnistheoretische Logik der Erkenntnisformen (1894), gives the view a wider scope by the contention that the real world is the common content or object of common consciousness, according to him, as according to Fichte, is one and the same in all individuals and that all of them plainly differ in having each its own content, in which Schuppe includes each individual's body as well as the rest of the things which come within the consciousness of each; but they also as plainly agree, e.g. in all admitting one sun. Now, the point of Schuppe is that, so far as they agree, individual consciousnesses are not merely similar, but the same in essence; and this supposed one and the same content of consciousness in different individuals is what he calls consciousness in general (Bewusstsein überhaupt).

While in this identification he follows Fichte, in other respects he is more like Kant. He supposes that the common content is partly a posteriori, or consisting of given data of sense, or of a thing of the understanding of categories of understanding, which, being valid for all objects, are contributed by the common consciousness. He differs, however, from Kant in the inexpressibility of the common content. He says that all data are received from things in themselves, but also because, like Mach, he agrees with the nativists that the data already contain a spatial determinacy and a temporal determinacy, which he regards as a priori elements of the given, not like Kant, as a priori forms of sense. He allows, in fact, no a priori forms except categories of the understanding, and these he reduces, considering that the most fundamental categories of the latter, which in his view are necessary to the judgments that the various data which make up a total impression (Gesamteindruck, Totalindruck) are each different from the others, together identical with the total impression, and coexistent. At the same time, true to the hypothesis of "immanence," he rigidly confines these categories to the given data, for he avoids the inconsistent tendency of Kant to transfer causality from a necessary relation between phenomena to a necessary relation between phenomena and things in themselves as their causes.

Hence he strictly confines true judgment and knowledge to the consciousness of the identity or difference, and the causal relations of the given content of the common consciousness. From this epistemology he derives the metaphysical conclusion that the things we know are indeed independent of my consciousness and of the consciousness of others, and that the consciousness of the one individual is the consciousness of the opposite individual, as Kant observes, that the only argument that bodily forces are not causes at all. In Great Britain Mach's scepticism was welcomed by Karl Pearson to support an idealistic phenomenalism derived from Hume, and by Ward to support the non-material mónads of Leibnitz, and argued that all of these interpretations in metaphysics can take place, and natural science itself is in some danger, until the true history of the evidences of the laws of mechanics are given. Then it will seem much less strange; and in the first place of collision what we know is not material points determining one another's opposite accelerations, but bodies by force of impulsive pressure causing one another to keep apart. Mechanics is a natural philosophy of causes.

Empirio-Criticism.—"Empirio-Criticism" of R. Avenarius (1856—1896) is a philosophy of science, in which he attempted to state the common consciousness of phenomena in the most general terms. He made a distinction of pure existence which he identified with the nature of things as perceived by the world held by all unprejudiced persons. What, then, is this pure existence? "Every human individual," says he,
"originally accepts over against him an environment with manifold parts, other individuals making manifold statements, and what is stated in some way is not upon the environment."

Wundt.

Wundt proves that all idealisms are in a way one. He starts as a phenomenalist from the hypothesis, which we have just described, that knowledge is experience containing subject and object in inseparable connection, and has something in common with the premature attempt of Avenarius to develop the hypothesis of dualism into experience into a scientific philosophy comprehending the universe in the simplest possible manner. Again he agrees with the reaction both to Hume and to Kant in limiting knowledge to mental phenomena, and has affinities with Mach as well as with Lange. His main sympathies are with the Neo-Kantians, and especially with Lange in modifying the a priori, and in extending the power of reason beyond phenomena to an ideal world; and yet the cry of his phenomenalism is not "back to Kant," but "beyond Kant and Fechner" in many details he is with noumenalists; with Fechner in psychology, in psychophysical parallelism, in the independence of the physical and the psychical chains of causality, in reducing physical and psychical to a difference of aspects, in substituting impulse for accident in organic evolution, and in wishing to recognize a gradation of individual spiritual beings; with Schopenhauer and Hartmann in voluntarism; and even with Schelling and Hegel in their endeavour, albeit on an artificial method, to bring experience under notions, and to unite subject and object in one concrete reality. He accepts Fechner's further specification of consciousness into will and substituting activity for substantiality as the essence of soul, as well as in breaking down the antithesis between phenomena and things in themselves. At the same time, in spite of his sympathy with the whole development of idealism since Kant, which leads him to reject the thing in itself, to modify a priori, and to stop at transcendental "ideals," without postulates of practical reason, he nevertheless has so much sympathy with Kant's Krilik as on its theories of sense and understanding to build up a system of phenomenalism, according to which knowledge exists only of pure phenomenal to accord a power of logically forming an "ideal" of God as ground of the moral "ideal" of humanity—though without any power of logically inferring any corresponding reality. He constructs his system on the Kantian order—sense, understanding, reason—and exhibits most clearly the necessary consequence from psychological to metaphysical idealism. His philosophy is the best exposition of the method and argument of modern idealism—that we perceive the mental and, therefore, all we know and conceive is the mental.

Wundt grounds his whole philosophy on four psychological positions: his phenomenalistic theory of unitary experience, his voluntarism, his actualistic theory of soul, and his psychological theory of parallelism. They are positions also which deeply affect, not only the psychological, but also the metaphysical idealisms of our time, in Germany, and in the whole civilized world.

1. His first position is his phenomenalistic theory of unitary experience. According to him, we begin with an experience of ideas, in which object and idea are originally identical (Vorstellungen, Einstellungen). We divide them into subjective and objective factors, and especially in natural science we so far abstract the objects as to believe them at last to be independent things; but it is the office of psychology to warn us against this popular dualism, and to teach us that there is only a duality of psychological and physical, which are divisible, not separable, factors of one and the same content of our immediate experience; and experience is our whole knowledge. His phenomenalistic view is that all we know is mental phenomena, the whole outer world exists for us only in our ideas, and all that our reason can logically do beyond these phenomena is to frame transcendental ideas.

2. His second position is his voluntarism. He agrees with Schopenhauer that will is the fundamental form of the spiritual. He does not mean that will, as we think of it, is an activity derived from sensation, and feeling, as well as will. Moreover, he contends that we can neither have idea without feeling and will, nor will without idea and feeling; that idea alone wants activity; that idea alone wants content; that will is IDEATING and Activity (vorstehende Thätigkeit), which always includes motives
end and consequently idea. He is therefore a follower of Schelling's, as correctly pointed out by Hartmann. Like these, and like his younger contemporary Paulsen, in calling will fundamental he includes impulse (Trieb). Accordingly he divides will into two species: on the one hand, simple volition, or impulse, which in its most primitive motion appears as when and therefore an idea, e.g. the impulse of a beast arising from hunger and sight of prey; on the other hand, complex volition issuing in a volitional act. On this distinction he bases his whole psychology, the adoption of a motive, with or without choice. Like other German voluntarists, he imputes "impulsive will" to the whole organic world. He follows Fechner closely in his answer to Darwin. If he had been less volitional and more economic he would have answered: impulses becoming habits produce structural changes, which are transmitted by heredity; and as an impulse thus gradually becomes secondarily conditioned, the resulting habit will in their turn become secondarily automatic, and so on. As now he supposes feeling even in "impulsive will" to be directed to an end, he deduces the conclusion that in organic evolution the pursuit of final causes predaces and is the origin of mechanism. But at what a cost! He has endowed all the plants in the world with motives, feelings directed to an end, and ideas, all of which, according to him, are required for impulse! He apparently forgets that mere feelings often produce actions, as when oneletones with pain. But even so, have plants even those lowest impulses from feelings of pain or pleasure? Wundt, however, having gone so far, stopped his own work without proceeding further. This is one of the reasons why Fecher, Hartmann and Fechner in endowing the material universe with will or any other mental operation, because his phenomenalism already reduces inorganic nature to mere objects of experiencing subjects. Wundt's philosophy, therefore, new as it was, but was anticipated by the paradox of Descartes: that will is required to give assent to anything perceived (Principia philosophiae, i. 34). Wundt supposes not only that all organisms have outer will, the will to act, but also that every organism has inner will or thinking. Now there is a will to think, and Aristotle pointed out that thinking is in our power whenever one pleases, whereas sense depends on an external cause, e.g. a sight. Also, by will, Wundt means a will to think, e.g. from toothache. But it does not follow that thought is will, or even that there is no thinking without either impulse or will proper. The real source of thinking is evidence. Wundt, however, by supposing the existence of volition, supposes that all thinking is will. Wundt imagines that it is in our power to think at will, whereas we do not choose to think; we think, e.g. from toothache. This is a confusion of will and volition. Wundt, accordingly,叨1supposes that there is no will in the events and objects of the universe, that all events and objects are natural. Fechner added that the soul is the whole unitary spiritual process manifested in the whole unitary bodily process without being a substance. Wundt accepts Fechner's theory of the actuality, and Fechner's sympathy with Wundt's phenomenalism, is supposed to extend through the world of organisms, the whole inorganic world remains a mere object of unitary experience, a unity.

His third position is his actualistic theory of soul, which he shares with Fichte, Hegel, Fechner and Paulsen. When Fichte had rejected the Kantian soul in itself and developed the Kantian act as a mere object, he is considered as a materialist. Wundt is an actualist, and consequently he supposes that the whole is the unity of a man's body. In truth there is no sound answer to Materialism, except that, besides bodily substance, psychical substance is also necessary to explain how mental processes emerge in the brain. Wundt, however, supports Fichte, and Wundt's monism is similar to the philosophical monism that soul is not substans. Wundt, however, has not satisfied himself, like Fechner, that there is no real opposition of body and soul, and consequently of thinking and willing. Wundt believes that his own organism, that his body is only an object abstracted from his unitary experience, which is all that really is of him.

Iv. Hence his fourth point is his psychological theory of parallelism of physical and psychical reduced to identity in unitary experience. Here his philosophy is Fecherian phenomenalism. He accepts Fechner's extension of Weber's law of the external stimuli of sensation, and judiciously remarking that this "physiological interpretation is entirely hypothetical." He accepts psychical and apparent parallelism in the sense that every psychological process has a physiological accompaniment, every physiological function has a psychical counterpart, yet neither is reducible to the other. Parallelism is cause of a psychical process, nor vice versa. Precisely like Fechner, he holds that there is a physical causality and energy and there is a psychical causality and energy, parallels which never meet. He accepts this psychical process, and he accepts this into detail, regarding it as an agency of will directed to ends, causing association and understanding, and further acting on a principle which he calls the heterogeneity of ends; remarking very truly that each part of the whole is not directed towards the same end. But beyond these he observes that beyond these effects follow as unexpected consequences, and that this heterogeneity produces social effects which we call community. Wundt distinguishes experience from the psychical in appearance, he follows Fechner in identifying them in reality; except that Fechner's identification is noumenal, Wundt's phenomenal. Wundt does not allow that we know beyond experience; many souls, and many minds, Wundt does not, therefore, allow that there is a universal series of physical and psychical parallels. According to his phenomenalism, the external stimulus and the psychical stimulus are both parallels of the same psychical process; the external body, as well as...
metaphysics

phenomenal, idealism

my body, is merely an object abstracted from an idea of my experience; and what is really known is that every case of sensory experience is not solvable, into body and soul, physical and psychical factors of one and the same unitary experience. Wundt is confined by his starting-point to his definition that what we know are phenomena, ideas regarded as objects and subjects of experience.

With these four positions in hand, Wundt's philosophy conclusively follows, beginning with his psychology. He begins with the idea of temporal relations, but he insists that these always exist in a psychical compound, from which they can be discovered only by analysis and abstraction; and his paradox that we have no sense of time apart from perception, and no way of knowing where it begins or ends, is no complex idea, but a single psychical idea. Further, Wundt declares that the psychical compound of sensations, with which, according to him, we actually start, is not a complex sensation, but a compound idea; so that I expect to believe that every psychical compound of sensations, and every combination of D, F, A, and have only a compound idea of the chord—as if the hearing of music were merely a series of ideas! Wundt, however, has accepted Lotze's hypothesis of local signs, and adds a hypothesis of temporal signs. He supposes that we have no sensations of space and time, as the nativists suppose, but that, while local signs give us spatial ideas, feelings of expectation are temporal signs giving us temporal ideas, and that these ideas enter into the psychical compound, which is our actual starting-point. It follows that every psychical compound into which temporal and spatial signs enter must be endowed, as time at any rate accompanies all our sensations, it follows that every psychical compound of sensations containing as it does, always temporal, if not also spatial, ideas, must be endowed with a temporal or spatial character.

Wundt's question is how compounded? Wundt's answer is that inner impulsive will, in the form of passive apperception, forms compound ideas by association; so that all psychic processes can be referred to the ordinary associations, which descend from Hume, an association which he calls fusion (Verschmelzung), and supposes that it is a fundamental process of fusing sensations with spatial and temporal ideas into a compound idea. But he also recognizes association by similarity, or assimilation, or "apperception" in Herbart's more confined sense of the word, and association by contiguity, or complication. Recognizing, then, three kinds of association in all, he supposes that they are the first processes, by which inner will, in the form of passive apperception, generates ideas from sense. So far as passive apperception is a further development of Hume's theory, he does not agree with Hume that mind is nothing but sensations, ideas, and associations, but with Kant, that there are higher combinations. According to him, inner decisive will, rising to active apperception, proceeds to what he calls "apperceptive combinations" (Apperceptionsvorstellungen); first: simple combinations of relating and comparing, and then to complex combinations of synthesis and analysis in imagination and understanding; in complex combinations aggregates are generated (Gestaltvorstellungen), and then at last analysis, by dividing an aggregate idea into subject and predicate, forms a judgment (see further Logic). The matter of fact is that, it is a truth, well never yet even confused to a jumble of ideas. Wundt, indeed, is aware of the consequences. If judgment is an analysis of an aggregate idea into subject and predicate, it follows, he says, that "as judgment is definite, so is the concept of the member of an aggregate of ideas to one another" (System der Philosophie, 66, first ed.). He cannot allow any inference of things beyond ideas, for substituting compound ideas for sensations.

In his logic, and especially in his epistemology, Wundt appears as a mediating between Hume and Kant, but with more leaning to the latter. While he regards association as lying at the basis of all knowledge, he does not think it sufficient, and objects that Hume does not account for necessity, nor for substance and causation as known in the sciences. He accepts the whole system of synthesis of understanding which Kant superimposed on his psychology, and adhered to the system of Kant's transcendentalism. Between Hume's and Kant's a priori hypothesis he proposes a logical theory of the origin of ideas beyond experience. He explains that the arrangement of facts requires "general supplementary notions (Hilfs-begriffe), which are not contained in experience itself, but are gained by a process of logical treatment of this experience." Of these supplementary notions he holds that the necessity of the causal relationship, coming from the necessity of thought that all our experiences shall be arranged according to ground and consequent. That these are not only an abstract principle of appearances, as Hume said and Kant allowed, is also Wundt's starting-point. How then do we arrive at causality? Not, says Wundt, by association, as Hume said, but by thinking; not, however, by a mere intellectual act, as was before said, but by the application of the logical principle of ground and consequent (which Leibnitz had called the principle of sufficient reason) as a causal law to empirical appearances, Now, Wundt is aware that this arrangement belongs generally to the connexion of thoughts, the causal law to the combination of empirical appearances. Nevertheless he believes that with every case of sensory experience, or of sensory compound experience, we can apply the logical principle as causal law to this combination, and say that one appearance is the cause of another, thus adding a notion of causality not contained in the experience. He quotes as an instance that Newton in this way added to the planetary appearances contained in Kepler's laws the gravitation conception, and thereby discovered that there was a reason why the appearance of the planets produced the effect of the appearances, and thus discovered that gravitation is the cause of the appearances. But Newton had already discovered before-hand in the mechanics of terrestrial bodies that gravitation could be substituted for any other conception which is produced by the cause from any logical ground beyond experience, any more than he did the third law of motion. Wundt does not realize that, though we can often use a new use of an old idea (eine alte Idee), as "the ground (principium cognoscendi) for deducing the idea, we can do so only when we have previously inferred from experience that this kind of cause produces that kind of effect (see Logik). Otherwise, logical ground remains logical ground, as in any non-causal syllogism, such as the familiar one from "All men are mortal," which causes me to know that I shall die, without telling me the cause of death. Wundt, however, having satisfied himself of the power of mere logical thought beyond experience, goes on to further apply his hypothesis, and supposes that, in dealing with the physical world, logical thinking having added to experience the "supplementary notion" of causality which vary together, adds also the "supplementary notion" of substance as substratum of the connected appearances. But, using substance as he does always in the Kantian sense of permanent substances, he is one of the nativists, and is therefore this time the Aristotelian sense of any distinct thing, he proceeds to make distinctions between the applications of causality and of substance. Even in the physical, he confines substance to matter, or what Aristotle calls "a more or less perfect substance," or "real substance," and passive, and limits substantial causality to potential energy, while he supposes that actual causality is a relation not of substances but of events. On this false abstraction Sigwart has made an excellent criticism in an appendix at the end of his Logic, where he remarks that we cannot isolate events from the substances of which they are attributes. Motions do not cause motions; one body moving causes another body to move: what we do with causation is substances. Secondly, when Wundt comes to the psychical, he naturally infers from his narrow Kantian definition of substance that there is no proof of any real mental operations, and falsely thinks that he has proved that there is no substance mentally operating in the Aristotelian sense. Thirdly, on the grounds that logical thinking adds the notion of substance, as substrates, to experience of the physical, but not of the psychical, and that the most proper being of mind is will, he concludes that wills are not active substances, but substance-generating activities (nicht thätige Substanzen sondern substantzerzeugende Thätigkeit), System, 429).

What kind of metaphysics, then, follows from this compound of psychology and epistemology? As with Kant against Hume, so with Wundt against Mach and Avenarius, the world we know will contain something more than mere complexes of sensations. Wundt's position: with Wundt it will be a world of real causes and some substances, constituted only by experience and partly by logical thinking, or active inner will. But as with Kant, so with Wundt, this world will be only the richer, not the wider, for these notions of understanding; because they are only contributed to the original experience, and, being mentally contributed, only the more surely confine knowledge to experience of mental phenomena. Hence, according to Wundt, the world we know is still unitary experience, distinguished, not separated, into subject and object, aggregates of ideas mediated by judgment and combined by inference, an object of idea elaborated into causes and substances by logical thinking, at most a world of our ideas composed out of our sensations, and arranged under our categories of our understanding by our inner wills, or a world of our ideating wills; but nothing else. It is Wundt's own statement of his solution of the epistemological problem "that on the one hand the whole outer world exists for us only in our ideas, and that on the other hand a consciousness without objects of idea is an empty abstraction which possesses no actuality" (System, 212-213). There remains his theory of reason. His pupil, Oswald Külpe (1862-1930), says in his Einleitung in die Philosophie (1895; 4th ed. 1907) that Wundt in his System derives the right of metaphysics to transcend experience from similar procedure.
within the limits of the special sciences. This is Wundt's view, but only in the sense that reason passes from ideas to "ideals," whether in the special sciences or in metaphysics. Reason, as in most modern psychologies and idealisms, is introduced by Wundt, after all sorts of operations, too late; and, when at length introduced, it is described as going beyond ideas and notions to "ideals" (Ideen), as an ideal continuation of series of thoughts beyond given experience—nothing more. Reason, according to Wundt, is like pure reason according to Kant; except that Wundt, receiving Kantism through Neo-Kantism, thinks that reason arrives at ideals not a priori, but by and with the help of consequences and consequences of consequences, and in ity, will not follow Kant in his inconstant passage from pure to practical reason in order to postulate a reality corresponding to "ideals" beyond experience. Wundt, in fact, agrees with Lange: that reason transcends experience of phenomena only to conceive "ideals." This being so, he finds in mathematics two kinds of transcendence—real, where the transcendent, though not actual in experience, can become partly so, e.g. the divisibility of magnitudes; imaginary, where it cannot, e.g. n-dimensions. He supposes in metaphysics "ideal" consists the demonstrative truth of the Kantian psychological, and ontological "ideals." He supposes reality as well as imaginary transcendence in cosmological "ideals"; the former as to the forms of space and time, the latter as to content, e.g. atoms. But he limits psychological and ontological "ideals" entirely to imaginary transcendence. The result is that he confines metaphysical transcendence to "a process into the imaginary" as regards the substantial and causal content of cosmological "ideals," and altogether as regards psychological and ontological "ideals." Thus, according to him, in the first place reason forms a cosmological "ideal" of a multitude of simple units related; secondly, it forms a psychological "ideal" of a multitude of, wills, or substance-generating activities, which communicate with one another by ideas so that wills ideas in will, while together they constitute a collective will, and it goes on to form the moral ideal of humanity (das sittliche Menschheitsideal); and, thirdly, it forms an ontological "ideal" of God as ground of this moral "ideal," and therewith of all being as means to this end, and an "ideal" of God as world-will, of which the world is development, and in which individual wills participate each in its sphere. Herein," says Wundt, "consists the un blender truth of the two separate propositions that the moral order of the world is the single real proof of the existence of God" (System, 405; cf. 430). "Only," he adds, "the expression proof is here not admissible. Rational "ideals" are in general not provable." As the same limit is applied by him to all transcendent rational "ideals," and especially to those which refer to the content of the notion of the world, and, like all psychological and ontological "ideals," belong to the imaginary transcendent, his conclusion is that reason, in transcending experience, logically conceives "ideals," but never logically infers corresponding realities.

The conclusion that reason in transcending experience can show no motion to a necessity of "ideals" is the only conclusion which could follow from Wundt's phenomenism in psychology, logic, and epistemology. If knowledge is experience of ideas distinguished by inner will of apprehension into subject and object in inseparable connexion, if the starting-point is ideas, if judgment is analysis of an aggregate idea, if inference is a mediate reference of the members of an aggregate of ideas to one another, then, as Wundt says, all we can know, and all reason can logically infer from such data, is in our ideas, and consciousness without an object of idea is an abstraction; so that reason, in transcending experience, can only show the connexion of ideas and "ideals," but infer no corresponding reality beyond, whether in nature, or in Man, or in God. Wundt, starting from a psychology of unitary experience, deduces a consistent metaphysics of no inference of things transcending experience through-out—or rather until he came to the very last sentence of his System der Philosophie (1889), where he suddenly passes from a necessity of "ideals" (Ideen), to a necessity of "faith" (Glauben), without "knowledge" (Wissen). He forgets apparently that faith is a belief in things beyond ideas and ideals, which is impossible in his psychology of judgment and logic of inference. The fact is that his System may easily seem to prove more than it does. He describes it as idealism in the form of ideal realism, because it recognizes an idealizing will requiring substance as substratum or matter for outer relations of phenomena. But when we look for the evidence of any such will beyond ourselves and our experience, we find Wundt offering nothing but an ontological "ideal" of reason, and a moral "ideal" requiring a religious "ideal," but without any power of inferring a corresponding reality. The System then ends with the necessity of "ideal" of world-will, which provides no ground for the necessity of any belief whatever in the being of God, or indeed in any being at all beyond our own unitary experience.

Wundt, however, afterwards wrote an Einleitung in die Philosophie (1901; 4th ed., 1906), in which he speaks of realism in the form of ideal realism as the philosophy of the future. It is not to be idealism which resolves everything into spirit, but realism which gives the spiritual and the material each its own place in phenomena with scientific consciousness. It is not to be dualistic but monistic realism, because matter is not separate from spirit. It is not to be materialistic but ideal realism, because the physical and the psychological are inseparable parallels inexplicable by one another. It is to be monistic ideal realism, like that of Fichte and Hegel; not, however, like theirs idealistic in method, a Phantastisches Begriffsgbude, but realistic in method, a Wissenschaftliche Philosophie. It is to be ideal realism, as in the System. It is not to be a species of idealism, as in the System—but of realism. How are we to understand this change of front? We can only explain it by supposing that Wundt wishes to believe that, beyond the "ideal," there really is proof of a transcendent, ideating, substance-generating will of God; and that he is approaching the noumenal voluntarism of his younger contemporary Paulsen. But to make such a conversion from phenomenism plausible, it is necessary to be silent about his whole psychology, logic, and epistemology, and the consequent limitation of knowledge to experience, and of reason to ideas and "ideals," without any power of inferring corresponding things.

What a pity it is that Wundt had committed himself by his psychology to phenomenism, to unitary experience, and to the limitation of judgment and reason to ideas and ideals! For his phenomenism prevents him from consistently saying the truth inferred by reason—that there is a world beyond experience, a world of Nature, and a will of God, real as well as ideal. To understand Wundt is to discover what a mess modern psychology has made to metaphysics. To understand phenomenal idealism in Germany and the rise of metaphysical idealism in modern times is to discover that psychological is the origin of all metaphysical idealism. If we perceive only what is mental, all that we know is only mental. But who has proved that psychological starting-point? Who has proved that, when I scent an odour in my nostrils, I apprehend not odour but a sensation of odour; and so for the other senses? Sensation, as Aristotle said, is not of itself: it is the apprehension of a sensible object in the organism. I perceive pressure, heat, colour, sound, flavour, odour, in my five senses. Having felt reciprocal pressures in touch, I infer similar pressures between myself and the external world.

6.—English Idealism

1. The Followers of Hume's Phenomenalism.—Compared with the great systems of the Germans, English idealism in the 19th century shows but little originality. It has been largely borrowed either from previous English or from later German idealism, and what originality it has possessed has been mainly shown in that spirit of eclectic compromise which is so dear to the English mind. The predominant influence, on the whole,
has been the phenomenalism of Hume, with its slender store of sensations, ideas and associations, and its conclusion that all we know is sensations without any known thinkers or any other known things. This phenomenalism was developed by James Mill (1773–1836) and J. S. Mill (1806–1873), and has since been continued by A. Bain. It also became the basis of the philosophies of Huxley and of Spencer on their phenomenalistic side. It is true that Spencer's "transfigured realism" contains much that was not dreamt of by Hume. Spencer widens the empirical theory of the origin of knowledge by his brilliant hypothesis of inherited organized tendencies, which has influenced all later psychology and epistemology, and tends to a kind of compromise between Hume and Kant. He describes his belief in an unknower absolute as "carrying a step farther the doctrine put into shape by Hamilton and Mansel." He develops this belief in an absolute in connexion with his own theory of evolution into something different both from the idealism of Hume and the realism of Hamilton, and rather falling under the head of materialism. Nevertheless, as he believes all the time that everything knowable throughout the whole world of evolution is phenomena in the sense of subjective affections of consciousness, and as he applies Hume's distinction of impressions and ideas as a distinction of vivid and faint states of consciousness to the distinction of empty and real spirit and matter, inner and outer phenomena, his philosophy of the world as knowable remains within the limits of phenomenalism. Nothing could be more like Hume than his final statement that what we are conscious of is subjective affections produced by objective agencies unknown and unknowable. The "anti-realism," which takes the lion's share in "transfigured realism," is simply a development of the phenomenalism of Hume. Hume was also at the bottom of the philosophies of G. H. Lewes, who held that there is nothing but feelings, and of W. K. Clifford. Nor is Hume yet dethroned, as we see from the works of Karl Pearson and of William James, who, though an American, has exercised a considerable influence on English thought. The most flourishing time of phenomenalism, however, was during the lifetime of J. S. Mill. It was counteracted to some extent by the study at the universities of the deductive logic of Aristotle and the inductive logic of Bacon, by parts of Mill's own logic, and by the natural realism of Reid, Stewart, and Hamilton, which met Hume's scepticism by ascertaining a direct perception of the external world. But natural realism, as finally interpreted by Hamilton, was too dogmatic, too unsystematic, and too confused with elements derived from Kantian idealism to withstand the brilliant criticism of Mill's Examination of Sir William Hamilton's Philosophy (1862), a work which for a time almost persuaded us that Nature as we know it from sensations is nothing but permanent possibilities of sensation, and oneself only a series of states of consciousness.

2. The Influence of Kant and Hegel.—Nevertheless, there have never been wanting more soothing spirits who, shocked at the narrowness of the popular phenomenalism of Hume, have tried to find a wider idealism. They have, as a rule, sought it in Germany. Before the beginning of the 19th century, Kant had made his way to England in a translation of some of his works, and in an account of the Elements of the Critical Philosophy by A. F. M. Willich, both published in 1798. After a period of struggle, the influence of Kant gradually extended, and, as we see in the writings of Coleridge and Carlyle, of Hamilton and Mansel, of Green and Caird, of Laurie, Martineau and others, the authority of English thought almost equal to that of Hume (see INTELLIGENCE). As the appeal to the English love of experience, and Kant had these advantages over Hume: that within the narrow circle of sensible phenomena his theory of understanding gave to experience a fuller content, and that beyond phenomena, however inconsistently, his theory of reason postulated the reality of God, freedom and immortality. Other and wider German philosophies gradually followed that of Kant to England. Coleridge (1772–1834) not only called attention to Kant's distinction between understanding and reason, but also introduced his countrymen to the noumenal idealism of Schelling. In the Biographia Literaria (1817) he says that in Schelling's Naturphilosophie and System des transcendentalen Idealismus he first found a general coincidence with much that he had toiled out for himself, and he repeated some of the main tenets of Schelling. Carlyle (1795–1881) laid more emphasis on Fichte. At the height of his career, when between 1840 and 1850 many of Fichte's works were being translated in the Catholic Series, he called attention to Fichte's later view that all earthly things are but as a vesture, or appearance under which the Divine idea of the world is the reality. Extravagant as this noumenalism is, it was better than the atheism of the philosophy of Hume. Among other followers of German idealism were J. F. Ferrier (q.v.), who adopted the hypothesis of Schelling and Hegel that there is one absolute intelligence (see his Lectures and Philosophical Remains, 1866, i. 1–33; ii. 545–568), and J. Hutchinson Stirling (q.v.). About the same time Benjamin Jowett (q.v.) had been studying the philosophy of Hegel; but, being a man endowed with much love of truth but with little belief in first principles, he was too wise to take for a principle Hegel's assumption that different things are the same. He had, however, by the time he published his short and straightforward but exhaustive essay on Hegel (1863) in the Encyclopaedia Metropolitana, written by J. Green and E. Caird (q.v.). Both proceeded to take Hegelianism seriously, and between them spread a kind of Hegelian orthodoxy in metaphysics and in theology throughout Great Britain. Green (Prolegomena to Ethics, 1853) T. H. Green, tried to effect a harmony of Kant and Hegel by proceeding from the epistemology of the former to the metaphysics of the latter. Taken for grant the Kantian hypothesis of a sense of sensations requiring synthesis by understanding, and the Kantian conclusion that Nature as known consists of phenomena united by categories as objects of experience, Green argued, in accordance with what has been said of the nature of knowledge, in order to unite the manifold of sensations by relations into related phenomena, requires unifying intelligence, or what Kant called synthetic unity of apperception, which cannot itself be sensation, because it arranges sensations; and he argued, in accordance with Kant's second position, that therefore Nature itself as known requires unifying intelligence to constitute the relations of its phenomena, and to make it a connected world of experience. When Green said that "Nature is the system of related appearances, and related appearances are regulated by an absolute intelligence," he was speaking as a pure Kantian, who could be answered only by the Aristotelian position that Nature consists of related bodies beyond appearances, and by the realistic supposition that there is a factual sense of related bodies, of the inter-resisting members of the organism, from which reason infers similar related bodies beyond sense. But now, whatever opinion we may have about Nature, at all events, as Green saw, it does not come into existence in the process by which this person or that begins to think. Nature is not my nature, nor your nature, but one. From this fact of unity of Nature and of everything in Nature, combined with the two previous positions accepted, not from Nature, but from Kant, Green proceeded to argue, altogether beyond Kant, that Nature, being one, and also requiring unifying intelligence, requires one intelligence, an eternal intelligence, a single spiritual principle, prior to, and the condition of, our individual knowledge. According to him, therefore, Nature is one system of phenomena united by relations as objects of experience, one system of related appearances, one system of one eternal intelligence which reproduces itself in us. The "true account" of the world is that "of the concrete whole, which may be described indifferently as an absolute or eternal intelligence realized in the related facts of the world, or as a system of related facts rendered possible by such an intelligence, partially and gradually reproduces itself in us, communicating piecemeal, but in inseparable correlation, understanding and the facts understood, experience and the experienced world." Nobody can mistake the Schellingian and Hegelian nature of this conclusion. It is the Hegelian view that the world is a system of absolute reason. But it is
not a Kantian view; and it is necessary to correct two confusions of Kant and Hegel, which have been imported with Hegelianism by Green and Caird. Ferrier was aware that in Kant's system "there is no common nature in all intelligence" (Lectures, ii. 368). Green, on the other hand, in deducing his own conclusion that the world is, or is a system of, one eternal intelligence, incautiously put it forward as "what may be called broadly the Kantian view" (Prolegomena, § 36), and added that he follows Kant "in maintaining that a single active conscious principle, by whatever name it be called, is necessary to constitute such a world, as the condition under which alone phenomena, i.e., the whole universe, can be comprehended in a single universe" (§ 38). He admitted, however, that Kant also asserted, beyond this single universe of a single principle, a world of unknowable things in themselves, which is a Kantian not a Hegelian world. But Caird endeavoured to break down even this second barrier between Kant and Hegel. According to Caird, Kant "reduces the inaccessible thing in itself (which he at first speaks of as affecting our sensibility) to a noumenon which is projected by reason itself" (Essays, ii. 495); and in the Transcendental Dialectic, which forms the last part, he states explicitly as an intuitive understanding "whose thought," says Caird, "is one with the existence of the objects it knows" (Ibid. 412, 473). Kant, then, as interpreted by English Hegelians, already believed, before Hegel, that there is one intelligence common to all individuals, and that a noumenon is a thought of this common intelligence, "an ideal of reason"; so that Kant was trying to be a Hegelian, holding that the world has no being beyond the thoughts of one intelligence. But history repeats itself; and these same two interpretations of Kant had already been made in the lifetime of Kant by Fichte, in the two Introductory Lessons to the "Wissenschaftslehre," which he published in his Philosophical Journal in 1797. Now, the curious fact is, that Kant himself wrote a most indifferent letter, dated 7th August 1799 (Kant's Werke, ed. Hartenstein, viii. 600-601), on purpose to repudiate all connexion with Fichte. "Fichte's "Wissenschaftslehre,"" he said, is a completely untenable system, and a metaphysics of fruitless apices, in which he disavowed any participation; his own Kritik he refused to regard as a proaedeutic to beconstrued by the Fichtian or any other standpoint, declaring that it is to be understood according to the less, and he adds, so far as he is concerned, that his own claim in philosophy is so satisfactory to the reason, theoretical and practical, as to be incapable of improvement, and for all future ages indispensable for the highest ends of humanity. After this letter it cannot be doubted that Kant not only differed wholly from Fichte, both about the synthetic unity of apperception and about the thing in itself, but also is to be construed literally throughout. When he said that the act of consciousness "I think," is in allem Bewusstsein ein und dasselbe, he meant, as the whole context shows, not that it is one in all thinkers, but only that it accompanies all my other ideas and is one and the same in my consciousness, while it is different in different thinkers. Though again in the Transcendental Dialect he spoke of pure reason conceiving "ideals" of noumena, he did not mean that a noumenon is nothing but a thought arising only through thinking, or projected by reason, but meant that pure reason can only conceive the "ideal" while, over and above the "ideal" of pure reason, a noumenon is a real thing, a thing in itself, which is not indeed known, but whose existence is postulated by practical reason in the three instances of God, freedom, and immortality. Consequently, Kant's explanation of the unity of a thing is that there is always one thing in itself as a phenomenon, which as understood by us are objectively valid for all our consciousnesses. What Kant never said and what his whole philosophy prevented his saying, was that a single thing is a single thought of a single consciousness; either of men, as in Fichte's philosophy, or of God and man, as in Hegel's. The passage from Kant to Hegel attempted by Green, and the harmony of Kant and Hegel attempted by Green and Caird, are unhistorical, and have caused much confusion of thought. The success, therefore, of the works of Green and Caird must stand or fall by their Hegelianism, which have indeed secured many adherents among metaphysical and partly theological. Among the former we may mention W. Wallace, the translator of most of Hegel's Encyclopädie, who had previously learnt Hegelianism from Ferrier; W. H. Fairbrother, who has written a faithful account of The Philosophy of Thomas Hill Green (1860); R. L. Nettschel, D. G. Ritchie, J. H. Muirhead, J. S. Mackenzie, and J. M. E. M'Taggart, who closes his acute Studies in Hegelian Cosmology (1901) with "the possibility of finding, above all knowledge and volition, one all-embracing unity, which is not only true, but not good, because all truth and all goodness are but distorted shadows of it: a true perfection—das Unbegreifliche, wel es der Begriff selbst ist."

There are still to be mentioned two English Hegelians, who have not confused Kant and Hegel as Green did; namely, Simon Somerville Laurie (1829-1900) and F. H. Bradley (b. 1846), fellow of Merton College, Oxford. Laurie wrote Metaphysics, nova et retusa, a Return to Dualism, which makes particular inferences about outside objects, and that a man, or a dog, through association "attutes" sequence and invariable-ness of succession, and, in fact, gets as far in the direction of causation as he can, and does not become a "cause" at all. His dog who has no higher faculty than "attution," can go no farther; but that a man goes farther by reason. He thinks that "attution" gives us consciousness of an object, but without knowledge, and "attution" becomes a "cause". His dog, therefore, puts him into contact with the German idealists: he accepts from Kant the hypothesis of synthesis and a priori categories, from Fichte the hypothesis that will is necessary to reason, from Schelling and Hegel the hypothesis of a priori categories, synthetic predicates a priori, or, as he also calls them, "dichotomic percepts." Of these the most important is cause, of which his theory, in short, is that by this a priori category and a priori reason a thing is not merely said to be so, but it is stated that an effect may be caused by several alternatives, then negating all but one, next concluding that this one as sufficient reason is cause, and finally, taking the necessity of the causal nexus by consequent causality into identity, e.g. instead of "Fire burns wood," putting "Fire is combustible, wood is combustible." Lastly, while he agrees with Kant about a priori categories, he differs about the "attution." He does not pretend to be got by reason, but he is the farthest point of his dualism, which suggests a realistic theory of knowledge, different in process from Hamilton's, but with the same results. Not so: Laurie is a Hegelian, for himself, and he did, to argue that they are true not only of thoughts but of things; and for the same reason, that things and thoughts are the same. At first in his psychology he speaks of the attution.
and the rational perception of an outside object. But in his metaphysics founded thereon he interprets reality to mean an object outside you and me, but not self-subsistent; not outside universal reason, but only "Bênê reason." He quotes with approval Schelling's phrase, "Nature is visible Intelligence and Intelligence visible Nature." Hence, he concludes with Hegel that there are two fundamental identities, the identity of all reason, and the identity of all reason and all being. Hence he explains, what is a duality for us is only a "quasi-duality," from a standpoint this dualism is unrealism, but merely the distinction of subject and object within idealism. Laurie's metaphysics is an attempt to supply a psychological propaedeutic to Hegelian metaphysics.

Bradley's appearance and reality (1893) is a more original performance. It proceeds on the opposite method of making metaphysics independent of psychology, "Meta-

Bradley's "appearance and reality," says he, "has no direct interest in the origin of ideas" (454) and: "we have nothing to do here with the psychological origin of the perception" (43). This metaphysical method, which we have already seen attempted by Lotze, is the true method, for we know more about things than about the beginnings of our knowledge. Bradley is right to go straight to reality, and right also to inquire for the absolute, in order to take care that his metaphysical view is comprehensive enough to be true of the world as a whole. He is unconsciously returning to the metaphysics of Aristotle in spirit; yet he differs from it toto coelo in the line of thought which harmonizes the supposed that there are fundamental identities, the identity of all reason, and the identity of all reason and all being. Hence he explains, what is a duality for us is only a "quasi-duality," from a standpoint this dualism is unrealism, but merely the distinction of subject and object within idealism. Laurie's metaphysics is an attempt to supply a psychological propaedeutic to Hegelian metaphysics.

Bradley's Appearance and Reality (1893) is more original. It proceeds on the opposite method of making metaphysics independent of psychology, "Meta-
his final conclusion is that "existence—the absolute—is known to us in feeling," and "the external changes are symbolized as motion, because that is the mode of feeling into which all others are translated when objectively considered." Objective consideration is the attitude of looking at the phenomena, whereas subjective consideration is the attitude of any other sensible response." He does not say what happens when we use vision alone and still infer that an external stimulus causes the internal sensation. But his metaphysics is an interesting example of a phenomenalist, sympathizing with noumenalists so different as Hegel and Fechner, and yet maintaining his phenomenalism. In this feature the phenomenalism of Lewes is the English parallel to the German phenomenalism of Wundt. At the same time, and under the derivative influence of Wundt, rather than the more original inspiration of Fechner, W. K. Clifford (p. r.) was working out the hypothesis of psychophysical parallelism to a conclusion different from that of Lewes, and more allied to that of Leibnitz, the prime originator of all these hypotheses. Clifford advanced the hypothesis that the supposed unconscious units of feeling, or psychical atoms, are the "mind-stuff" out of which everything physical and psychical is composed, and are also things in themselves, such as Kant supposed when he threw out the hint that after all "the Ding-an-sich might be of the substance of mind," as well as things formed. As a matter of fact, this "mind-stuff" of Clifford is far more like the "petites perceptions" of Leibnitz, from which it is indirectly derived. This hypothesis Clifford connected with the hypothesis of psychophysical parallelism. He maintained that the physical and the psychical are two orders which are parallel without interference; that the physical or objective order is merely phenomena, or groups of feelings, or "objects," while the psychical or subjective order is both a stream of feelings of which we are conscious in ourselves, and similar streams which we infer beyond ourselves, or, as he came to call them, "effects"; that, if we can imagine the physical universe, then we can imagine the psychical stream of feelings through the whole organic world and beyond it to the inorganic world, as a "quasimental fact"; that at bottom both orders, the physical phenomena and the psychical streams, are reducible to feelings; and that therefore there is no reason against supposing that they are made out of the same "mind-stuff," which is the thing-in-itself. The resemblance of this noumenal idealism to that of Fechner is unmistakable. The difference is that Clifford considers "mind-stuff" to be unconscious, and denies that there is any evidence of consciousness apart from a nervous system. Mind, as he says, is Bois-Reymond's "Ding-an seins" as a universe of a vast brain animated by conscious mind. He disagrees with Fechner's hypothesis of a world-soul, the highest spirit, God, who embraces all psychophysical processes. Curiously enough, his follower G. J. Romanes (p. r.) took the one step needed to bring Cliffordism completely back to Fechnerism. In his Rede Lecture on Mind and Motion (1885), he said that Clifford's deduction, that the universe, although entirely composed of "mind-stuff," is itself mindless, did not follow from his premises. Afterwards, when the lecture was published in Mind and Motion and Mankind (1893), this work also contained a chapter on "The World as an Eject," in which Romanes again contended against Clifford that the world does admit of being regarded as an eject, that is, as a mind beyond one's own. At the same time, he refused to regard this "world-eject" as personal, because personality implies limitation. He concludes that the integrating principle of the whole—the Spirit, as it were, of the Universe—must be something akin to, but immeasurably superior to, the "psychism" of man. Nothing can be more curious than the way in which a school of English philosophers, which originally started from Hume, the most sceptical of phenomenalists, thus gradually passed over to Leibnitz and Fechner, the originators of panspsychistic noumenalism. The Spirit of the Universe contemplated by Romanes is identical with the World-soul contemplated by Fechner.

Karl Pearson (The Grammar of Science, 1892, 2nd enlarged ed., 1900), starting from Hume's phenomenal idealism, has developed views closely allied to Mach's universal physical phenomenology. What Hume called repeated sequence Pearson calls "routine" of perceptions, and, like his master, holds that cause is an antece- dent signification in a routine of perceptions, while he also acknowledges that his teachings are merely the preface to the historic John Stuart Mill's definition of matter as "a permanent possibility of sensations." His views, in his chapter on the Laws of Motion, that the physicist forms a conceptional model of the universe by aid of corpuses, that these corpuses are only symbols for the component parts of perceptual bodies, and that force is a measure of motion, and not its cause, are the views of Mach. At the end of this chapter he says that the only published work from the perusal of which he received any help in working out his own views is that of Mach and Kirchhoff, "Mach's Die Mechanik in ihrer Entwicklung" (1883). Mach's work began in 1872, and Kirchhoff in 1874. But they may very well have been developed independently in Germany and in England from their common source in Hume. Their point is to stretch Hume's phenomenalism so as to embrace all science, by con- tending that mechanism is not at the bottom of phenomena, but is only the conceptual shorthand by aid of which men of science can briefly describe phenomena, and that all science is description and not explanation. These are the views of Mach and Pearson; that is, the latter's "Professor's Note". Can we find any difference, except the mere difference in name? Pearson takes up a position of agnosticism between Clifford's assertion of "mind-stuff" and Mach's denial of things in themselves. James Ward (p. r.), in Naturalism and Agnosticism (1899), starts from the same phenomenalistic views of Mach and Kirchhoff about mechanics; he proceeds to the hypothesis of duality within experience, which we have traced in the phenomenalisms of Schuppe, Avenarius and Wundt, and to the hypothesis of one consciousness, which appears variously in the German idealisms, not of Kant, as Ward thinks, but of Fichte, Schelling, Schuppe; and Mach is merely a different expression or noumenalistic conclusion that Nature is God's Spirit. Though this evinces a thoroughly English love of compromise, yet it is not merely eclectic, but is animated throughout by the inspiration of his "old teacher, Lotze." Lotze, as we saw, rejected bodily mechanism, reduced known bodies to phenomena, and concluded that reality is the life of God. Ward on the whole follows this triple scheme, but modifies it by new arguments founded on later German phenomenalism.

Under the first head he attacks mechanics precisely as Mach had done (see above); if this attack had been consistently carried out it would have carried him no further than Mach. Under the second head, according to Ward, as according to Wundt, knowledge of the dualistic object, or perpetual reality, phenomenon, in the unity of experience, and not believe, as realists do, that either subject or object is distinct from this unity; moreover, experience requires "conation," because it is to interesting objects that the subject attends; conation is required for all synthesis, associative and intellectual; thinking is doing; presentation, feeling, conation are one inseparable whole; and the unity of the subject is due to activity and not to a sub- stratum. But, in opposition to Wundt and in common with Schuppe, he believes that experience is (1) experience of the in- dividual, and (2) experience of the race, which is but an extension of individual experience, and is variously called, in the course of the discussion, universal, collective, conceptual, rational experience, consciousness in general, absolute consciousness, intelligence, and even, after Caird, "a perfect intelligence." He regards this universal experience as the result entirely of intersubjective intercourse, and concludes that its subject is not numerically distinct from the subject of individual experience, but is one and continuous with that its conceptions depend on the perceptions of individual experience. He infers the corollary that universal experience contains the same duality of subjective and objective factors without dualism. He thinks that it is the origin of the causality in which he refers to mind and substance, which he attributes to the interaction of active subjects with their environment and to their intercourse with each other. He applies universal experience, as Schuppe does, to explain the relation of the subject, and its independence from the outside world, to the universal experience, holding that the one sun, and the whole world of intersubjective intercourse, or the "trans-subjective world," though "independent of the individual perceiver as such," is "not independent of the universal experience, but the object of that experience" (ii. 196-197). He applies universal experience
to explain how we come, falsely in his opinion, to believe that the object of experience is an independent thing; and he uses three answers to represent the respective views of Schopenhauer, Leibnitz, and Wundt. He supposes first, that we falsely conclude from the sun being independent of each to being independent of all; secondly, that we falsely conclude that anything which is known to be in experience is in him and therefore one’s own object, while the sun remains outside; and thirdly, that by “refixation” of abstractions, natural science has abstracted the object from experience. The subject is, of course, too abstract, the sun the object, is an independent thing. What, then, could we know from this “duality in experience”? He hardly has a formal theory of inference, but implies throughout his book a dependence of conclusions on premises or phenomena, in order to conclude with ideas, not facts. When we combine his view of Nature under the first head that which is known as knowledge, and his view of knowledge under the second head that knowledge is experience and experience, individual or universal, is of duality of subject and object in the unity of experience, it follows that all we could know from the data would be the experience of the race, one subject consisting of individual subjects, and in Nature single objects in the unity of this universal experience; and beyond we should be able to form conceptions dependent on the perceptions of individual experience in the unity of universal experience that is all. There can be no doubt that Mach, Schuppe and Wundt drew the right phenomenalistic conclusions from such phenomenalistic data. Not only has he, in his later views (as he regards the idea of the “higher self”), that “from a world of spirits to a Supreme Spirit is a possible step.” He had definitely confined universal experience to the one experience of the race. But perhaps Caird’s phrase a perfect intuition which tempted him into the same idea, that the one object of universal experience is not mere mankind, but God Himself. Under the third head, however, his guide is Lotze. The argument may be shortly put as follows: As the Nature which is the object of science is the “sortal of all natural” natures is a spirit, but phenomena and ideas; as mass is not substance, and force is not cause; as activity is not in the physical but in the psychical world; as the laws of Nature are not facts but teleological conceptions, and Nature is teleological, as well as neither mechanical but kine- matical; as the category of causality is to be referred to “conation”; as, in short, “mind is active and matter inert,” what then? One subject of universal experience, one subject of the subject of experience, you would suppose, and that Nature as a whole is its one object. Not so, according to Ward; but “God as the living unity of all, and no longer things, are the conative acts of the one Supreme.” What then, is the relation of God to the one universal experience, the experience of the race, which was under the second head in duality of all knowledge? He does not say. But instead of any longer identifying the experience of the race and universal experience, he concludes his book by saying “our reason is confronted and determined by universal reason.” This is his way of destroying Naturalism and Agnosticism.

4. Personal Idealism.—The various forms of idealism which have been described naturally led in England, even among idealists themselves, to a reaction against all systems which involve the denial of personality. English moral philosophy cannot long tolerate a metaphysics which by merging all minds in one would destroy personality, personal causation and moral responsibility, as James Martineau well said. A new school, therefore, arose of which the protagonist was Andrew Seth Pringle-Pattison (b. 1856; professor of logic and metaphysics at Edinburgh University from 1886) in his Scottish Philosophy (1885), and Hegelianism and Personality (1887).

“Now,” he says, in another passage, “the real self is one and indivisible, and is unique in each individual. This is the unequivocal testimony of consciousness.” What makes his vindication of consciousness altogether the more interesting is that he did it much in contradiction with the Hegelian method. He considers as he does with Hegel that self-consciousness is the highest fact, the ultimate category of thought through which alone the universe is to be comprehended. He is much in the great fact of existence. He agrees also that there is no object without a subject, and that it is difficult to see exactly where he begins to differ from Hegel; but at any rate he believes in different self-conscious persons; he does not use the Hegelian method, but a systematic method. He believes in this personal experience of one’s own self-consciousness; and, though he is not very clear on the subject, he would have to admit that a thing, such as the sun, is a different object in each person’s consciousness. He believes in a systematic method, much in the eclectic notion of reconciling all philosophies. F. C. S. Schiller (b. 1864, fellow of Corpus Christi College, Oxford), in Riddles of the Sphinx (1891), is a more systematic thinker. He rejects the difference between matter and spirit. He agrees with Leibnitz in the analysis of the material into the immaterial, but with Lotze in holding that the many immaterial elements coexist and interact. At the same time he differs from Lotze’s conclusion that acts are the agents of their effects. He believes that substance is activity; differing from both Leibnitz and Lotze herein, and still more in not allowing the existence of the many beyond what is essential to the manifestation of the one. This is a view that the world is a plurality of many coexisting and interacting centres of experience, while will is the most fundamental form of experience. In connexion with these views reference should be made to the words of the editor of this volume, G. T. Ladd (g.s.) also believes in “a larger all-inclusive self,” and goes so far as the paradox that perfect personality is only reconcilable with one infinite being. While Royce is Hegelian, Ladd probably is not, since he held that the one universal experience of the race is not merely mankind, but God Himself. On the other hand, in his psychological works shows that the tenacity of recent psychology is to personality, interpreted idealistically, through a deep-seated antithesis of the idea that a person is, and personality means. By a curious coincidence we have at the time of the appearance of these Essays on Personal Idealism, an American writer, G. H. Howison, published The Limits of Evolution, and other Essays illustrating the Metaphysical Theory of Personal Idealism (1901). In fact there has been an increase of philosophical intercourse between English and American universities, which is a hopeful sign of progress.

The advent of personal idealism is a welcome protest against the confusion of God and man in one mind, and against the confusion of one man’s mind with another’s. The school undoubtedly tends towards realism. I am conscious only of myself, and of my bodily signs. I know the existence of other human persons and minds only through their giving similar bodily signs. If the personal idealist consistently denies other bodies, then the bodily signs become, according to him, only part of his experience, which can prove only the existence of himself. To infer another mind he must infer another body, and the bodily environment including his and other bodies. Again, in being conscious of myself, I am not conscious of my mind in the abstract, but of the mind and its activities, and I cannot separate touching from my tactile organs, seeing from my eyes, or hearing from my ears. I cannot think my body away. Moreover, I am not conscious of my whole personal life at all. How do I know that I was born, though I cannot remember it, and that I shall die, though I am not now conscious of death? How do I know that I am the same person from birth to death? Not by my consciousness, but by knowing the bodies of others—of babies on the one hand, and of old men on the other hand. It is usual to say that the body has not enough unity to be part of the person; the objection is much more true of conscious mind. The truth is that not the unity of conscious mind, but that of the whole of my mind is the important point. The existence of my consciousness is my evidence for my soul. But it does not prove that I am nothing but soul. As a human person, I am body and soul; and the idealistic identification of the Ego with soul or mind, involving the corollary that my body belongs to the non-Ego and is no part of myself, is the reductio ad absurdum of idealism. Lastly, though the personal idealists are right in rejecting the hypothesis of one mind, they are too hasty in supposing that the hypothesis is useless for idealistic purposes. No idealism can explain how we all know one another, except by supposing that we all have one mind. The difficulty of personal idealism is then, is to reconcile the unity of the thing with the plurality of thinkers. The unity of the sun can only be explained either ideistically

1 For Dr Schiller’s views, see further Pragmatism.
by supposing it to be one object of one mind, or realistically by supposing it to be one thing distinct from the many minds which think about it. The former alternative is false, the latter true. Personal idealism, therefore, must end in personal realism.

7.—REALISM

1. Metaphysical and Psychological Realism.—Realism is the view that some known things are bodily, and some are mental. At its best it is the Aristotelian view that bodies are substances. The modern misunderstanding of "substance" has been a main cause of the confusion of modern thought. Aristotle meant by it any distinct thing; e.g. I, you, an animal, a plant, the earth, the moon, the sun, God. He calls each of these, as existing apart, a thing per se (kath' aoró). It is true that, having divided a natural substance into form and matter, he called each element "substance." But these are not primary meanings; and matter, or supposed substratum, in particular, he says, is not actually substance (Met. Z 3) or is only potentially substance (Met. H 1-2). In modern times, Spinoza, by a mere mistake, changed the meaning of "substance" from "existing apart" to "existing alone," and consistently concluded that there is only one. Locke mistook it to mean "substratum," or support of qualities, and naturally concluded that it is unknown. Kant, taking it in the mistaken meaning of Locke, converted it into the a priori category of the permanent substrate beneath the changes of phenomena, and even went so far as to separate it from the thing in itself, as substantive phenomenon from noumenon. When it had thus lost every vestige of its true meaning, Kant's successors naturally began to speak of things as being distinct without being subsumed under the "one" by saying that ego is active, and being is life. Hegel said that spirit is not substance but subject, which to Aristotle would have meant that it is not a distinct thing, yet is a distinct thing. Fechner, Wundt and Paulsen have fixed the conclusion in psychology that soul is not substance but unity of mental life; and Wundt concludes from the modern history of the term that substance or "substrate" is only a secondary conception to that of causality, and that, while there is a physical causality distinct from that of substance, psychical causality requires no substance at all.

The result of this confusion is that the moderns have no name at all for a distinct thing, and, being mere slaves of abstract terms, constantly speak of mere attributes, such as activity, life, will, actuality, unity of mental operations, as if they were distinct things. But an attribute, though real, is not a distinct reality, but only a determinant of a substance, and has no being of its own apart from the substance so determined; whereas a substance, determined by all its attributes, is different from everything else in the world. Though, for simplicity and universality of thought, even in science, we must use the abstraction of attributes, and, by the necessity and weakness of language, must signify what are not substances by nouns substantive, we must guard against the over-abstraction of believing that a thing exists as we abstract it. The point of true realism is Aristotle's point that the world consists of such distinct, though related, things, and therefore of substances, natural and supernatural. Again, the method of true realism is that of Aristotle, and consists in recognizing the independence of metaphysics. The contrary method is psychological metaphysics, which makes metaphysics dependent on psychology, on the ground that the origin of knowledge determines its limits. This is the method which, as we have seen, has led from psychological to metaphysical idealism, by the argument that what we begin by perceiving is mental, and, therefore, what we end by knowing is mental. Now, there is no principle of method superior to that of Aristotle—we must begin with what is known to us. The things best known to man are the things which he now knows as a man. About these known things there is some agreement: about the beginnings of knowledge there is nothing but controversy. We do not know enough about the origin of knowledge to determine its limits. Hence, to proceed from psychology to metaphysics is to proceed from the less to the more known; and the paradoxes of psychological have caused those of metaphysical idealism.

The realist, then, ought to begin with metaphysics without psychological prejudices. He must ask what are known things, and especially what has been discovered in the sciences; in mechanics, in order to find the essence of bodies which is neglected by idealism; in mental science, in order to understand consciousness which is neglected by materialism. With the conviction that the only fair way of describing metaphysics has been to avoid putting forward one system, and even to pay most attention to the dominant idealism, we have nevertheless been driven occasionally to test opinions by this independent metaphysical method. The chief results we have found against idealism are that bodies have not been successfully analysed except into bodies, as real matter; and that bodies are known to exert reciprocal pressure in reducing one another to a joint mass with a common velocity by being mutually impenetrable, as real forces. The chief results we have found against materialism are that bodies evolving account neither for the origin of themselves, their nature, and their fundamental order of resemblance and difference, nor for the nature and origin of consciousness, nor even as yet for their becoming good for conscious beings. Hence we come to the realistic conclusions that among known substances some are bodies, others are souls; that man is body and soul; and that God is a pure soul or spirit. At the same time, while the independence of metaphysics leads us to metaphysical realism, this is not to deny the value of psychology, still less of logic. Besides the duty of determining what we know, there is the duty of determining how we know it. But in order to discharge it, a reform of psychology as well as of metaphysics is required. Two psychological errors, among many others, constantly meet us in the history of idealism—the arbitrary hypothesis of a sense of sensations, or of ideas, and the intolerable neglect of logical inference. Logical inference from sense is a process from sensible to insensible existence. The former error needs something deeper than a Kantian critique of reason, or an Averian criticism of experience; it needs a criticism of the senses. We want an answer to this question—What must we know by the senses in order to enable us to know what we infer by reason in the sciences? Without here aiming at exhaustiveness, we may bring forward against the dominant idealism a psychological theory of sense and reason. By touch I perceive one bodily member reciprocally pressing another in myself, e.g. lip pressing lip; by touch again I perceive one bodily member similarly pressing but not another member in myself, e.g. only one lip pressing; by inference from touch I infer that it is reciprocally pressing another body similar to my other bodily member, i.e. another body similar to my other lip. On this theory, then, founded on the conscious facts of double and single pressure in touch, and on the logic of inference, we may say that we have knowledge of external bodies, and an explanation of the early appearance of that knowledge. The child has only to have its mother's nipple in its mouth in order to infer something very like the mutually pressing parts of its own mouth. Having thus begun by touch and tactile inference, we confirm and extend our inferences of bodies in Nature by using the rest of the senses. This is not to forget that the five senses are not our whole stock or to confine inference to body. We have also the inner sense of consciousness which is inexplicable by body alone. By combining, moreover, our knowledge of Nature with our consciousness of our own works, we can say that Nature is a work of God. Next, finding that He gives signs of bodily works, but no signs of bodily organs, we can infer that God is a Spirit. Finally, returning to ourselves, we can conclude that, while the conscious in God is Spirit without Body, in us it is spirit with body. This final distinction between bodily and spiritual substances we owe to Descartes.

2. The Undercurrent of Modern Realism.—Coming after the long domination of Aristotelian realism, Descartes and Locke, though psychological idealists, were metaphysical realists. Their position was so illogical that it was easily turned into metaphysical idealism. But their psychological method and
idealism produced another mistake—the tendency to a meducium
of realism, as much as seemed to this or that author to follow from
psychological idealism. In Germany, since the victory of Kant
over Wolff, realism has always been in difficulties, which we
can appreciate when we reflect that the Germans by preference
apply the term "realism" to the paradoxes of Herbart (1776-1841),
who, in order to avoid supposed contradictions, supposed
that bodies are not substances, but show (Schei), while "reals"
are simple substances, each with a simple quality, and all preserv-
ing themselves against disturbance by one another, whether
physically or psychologically, but not known to be either
spiritual or spiritualistic. Nor has the simple causality in which
the unity of the real consists. There have indeed been other
realisms in Germany. Trendelenburg (1802-1872), a formidable
opponent of Hegel, tried to surmount Kant's transcendental
idealism by supposing that motion, and therefore time, space and
the categories, though a priori, are common to thought and being.
Duhung, with a similar object, makes matter a common basis.
While these realisms come dangerously near to materialism, that
of the Roman Catholic A. Gûnter (1753-1862), "Cartesius cor-
rectus," erected too mystical an edifice on the premises of
Descartes to sustain a satisfactory result. Yet Güntherism
has produced a school, of which the most distinguished repre-
sentative is the Old Catholic bishop in Bonn, Th. Weber, whose
Metaphysik, completed in 1861, starting from the ego and the
analysis of consciousness, aims at arriving at the distinction
between spirit and nature, and at rising to the spirit of the
Creator. Other realistic systems are those of J. H. von Kirch-
mann (1802-1884), author, among other works, of Die Philosophie
des Wissens (1864) and Über die Principien des Realismus (1875);
Goswin Uphues (b. 1841) profesor in philosophy, that Haile,
directed against the scepticism of Shute's Discourse on Truth,
and Hermann Schwarz (born 1864), who completes the psycho-
logical view of Uphues that we can know objects as they are, by
the metaphysical view that they can be as we know them. But
German realism lacks critical power, and is little better than a
weed overshadowed by the luxuriant forest of German idealism.

In France, the home of Cartesian realism, after the vicissitudes
of sensationalism and materialism, which became connected in
the French mind with the Revolution, the spirit of
Descartes revived in the 19th century in the spiritual-
istic realism of J. F. Cousin, the French psychologist
method of proceeding from consciousness outwards, and the
emphasis laid by him on spirit in comparison with body, pre-
vented a real revival of realism. He essayed to answer Locke
by Kant, and Kant by Reid, Maine de Biran and Schelling.
From Reid he adopted the belief in an external world beyond
sensation, from Biran the explanation of personality by will,
from Schelling the identification of all reason in what he called
"imperical reason," which he supposed to be identical in God
and man, to be subjective and objective, psychological and
ontological. We start, according to him, from a psychological
triplicity in consciousness, consisting of sensation, personal will
and imperical reason, which by a priori laws of causality and
substance carries us to the ontological triplicity of oneself as ego
will, the non-ego as cause of sensation, and God as the abso-
late cause beneath these relative causes. So far this ontological
triplicity is realism. But when we examine his theory of the
non-ego, and find that it resolves matter into active force and
this into animated activity, identifies law with reason, and calls
God absolute substance, we see at once that this spiritual realism
is very far from idealism. About 1850, owing largely to the
教学 of E. Saisset in the spiritulistic school, the influence of
Descartes began to give way to that of Leibnitz. Leibnitz has
been used both realistically and idealistically in France. He
was taken literally by spiritual realists, e.g. by Paul Janet (q.v.).
Janet accepted the traditional ontological triplicity—God, souls
and bodies—and, in answer to Ravaissot, who called this realism
"de-spiritualisme," rejoined that he was content to accept the
title. At the same time, like Cousin, his works show a tendency
to underrate body, tending as they do to the Leibnitzian analysis
of the material into the immaterial, and to the supposition that
the unity of the body is only given by the soul. His emphasis is
on spirit, and he goes so far as to admit that "no spiritualist is
