From the time of William III. life and terminable annuities have been a favourite mode in England either of borrowing money or of commuting, and thus gradually paying off, the existing funded debt. At first, and indeed until comparatively recent times, the system of life annuities resulted in serious loss to the country, owing to the calculation of the rate of annuity on too high a scale, a result arising from imperfect data on which to base estimates of the average duration of life. The system of life annuities was sometimes combined in England with that of perpetual annuities, or interest on the rent of land, life annuity forming a sort of additional inducement to lenders of limited means to invest their money. At one time the form of life annuities known as tontine was much in vogue both in England and France, the principle of the tontine being that the proceeds of the total amount invested by the contributors should be divided among the survivors, the last survivor receiving the whole interest or annuity. The results of this system were not, however, encouraging to the state. In England, at least, the terminable annuity has been a favourite mode of borrowing from the time of William II.; it has been generally conjoined with a low rate of permanent interest on the sum borrowed. Thus in 1700 the interest on the consolidated debt amounted to only £260,000, while the terminable annuities payable amounted to £308,407. In 1780 a loan of 12 millions was raised
at 4% per annum, with the additional benefit of an annuity of £1, 165. 3½. at the end of eighty years. Even so late as the Crimean War in 1855, a loan of £6 millions at 3% per annum was contracted, the contributors receiving in addition an annuity of 1½. 6d. per £100 for thirty years.

The third method of contracting terminable loans, that of gradual repayment or amortization within a certain limit of years, has been a favourite one among certain nations, and specially commends itself to those whose credit is at a low ebb. When the final term of repayment is fixed upon, a calculation is easily made as to how much is to be paid half-yearly until the expiry of the term, so that at the end the whole, principal and interest, may be paid. The amount which therefore will be paid will largely represent interest, but, as at each half-yearly drawing of the numbers of the bonds to be finally paid off the principal will be gradually reduced, there will be more and more money set free from interest for the reduction of the actual debt. This method, as we have said, has its advantages, and when conjoined with stipulations as to liberty of conversion to debt bearing a lower rate of interest than that originally offered, and when the bonds are not issued at a figure much below par, might be the most satisfactory method of raising money for a state whose financial condition is in a state of temporary or even permanent emergency. What is known as the "Morgan loan" of France in 1870 was contracted on such conditions.

The last form of temporary loan, that repayable in bulk at a fixed date, is one which, when the sum is of considerable amount, is apt to be attended with serious disadvantages. The repayment may have to be made at a time when a state may not be in a position to meet it, and so to keep faith with its creditors may have to borrow at a higher rate in order to pay their claims. It has, however, worked well in the United States, most of the debt of which has been contracted on the principle of optional payment at the end of a short period, say five years, and compulsory payment at the end of a longer period, say twenty years. Thus the loan of £15 millions of dollars contracted in 1862 was issued on this principle, at 6%, and so with other loans between that year and 1868. In European states, however, the risks of embarrassment are too great to permit of the application of this method on an extensive scale; and for loans of great amount the methods most likely to yield satisfactory results are loans bearing quasi-perpetual interest, or those repayable by instalments on the basis of half-yearly drawings within a certain period.

What are known as lottery loans are greatly favoured on the continent, either as an independent means of raising money, or as an adjunct to any of the methods referred to above. These must not be confounded with the lottery pure and simple, in which the contributors run the risk of losing the whole of their investment. The lottery loan has been found to work well for small sums, when the interest is but little below what it would have been in an ordinary loan, and when the percentage thus set aside to form prizes of varying amounts forms but a small fraction of the whole interest payable. The principle is that each contributor of such a loan has a greater or less chance of drawing a prize of varying amount, over and above the repayment of his capital with interest.

What are known in England as eschequer bills and treasury bills may be regarded as loans payable at a fixed period of short duration, from three months upwards, and bearing very insignificant interest, even so low as ¾%. They are a useful means of raising money for immediate wants and for local loans, and form handy investments for capitalists who are reserving their funds for a special purpose. Eschequer bills are simply a special form of the funded debt, to be paid off generally within a certain period of years.

There are two principal methods of issuing or effecting a loan. Either the state may appeal directly to capitalists and invite subscriptions, or it may delegate the negotiation to one or more bankers. The former method has been occasionally followed in France and Russia, but in practice it has been found to be attended with so many disadvantages to the borrowing state or city that the best financial authorities consider it unsound. The great banking-houses have such a command over the money-market that it is difficult to keep even a direct loan out of their hands. The majority of loans, therefore, are negotiated by one or more of these houses, and the name of Rothschild is familiar to every one in connexion with such transactions. By this method a borrowing state can assure itself of having the proceeds of the loan without any delay and with the minimum of trouble. A loan may be issued at, above, or below par, though generally it is either at or below par—par being the normal or theoretical price of a single share in the loan, which has itself been contracting only when the market is undertaking a risk of losing its certainty of making a profit by the back for back share on reimbursement, without discount or premium. Very generally, as an inducement to investors, a loan is offered at a greater or less discount below par the credit of the borrowing government. Sometimes a state may offer to pay at the tender of the highest bidders; for example, the city of Auckland in 1875 invited subscriptions through the Bank of New Zealand to a loan of £100,000 at 5% ½ per cent. which was accepted at par, but which was accepted at the rate of 96% or above. The rate of interest offered generally depends on the credit of the state issuing the loan. England, for example, would have no difficulty in raising any amount at 3½% even less, while less stable states may have to pay 8 or 9%. The nominal percentage is by no means, however, always an index of the cost of a loan to a state, as the history of the debt of England doubtlessly shows. During the 17th century various expedients were employed, besides that of terminable annuities already referred to, to raise money for the great wars of the period, at an apparently low percentage. For example, from 1675 to 1685 a loan of £25,000 was issued at 6½% and ¾ per cent. allotted being sometimes 107½ or even 111½; so that between 1776 and 1785, for the £917,632 actually borrowed by the government, £115,267,993 was to be paid back. In 1797 a loan of £250,000 was issued at 5½%, and 6½% was actually borrowed, at 5½%, the sum of £219 was allotted to the lender. In 1793 a 3½% loan of 45 millions was offered at the price of 7½%, but the lender was satisfied with 6½%, eventhough the rate of par, resulting to this reckless method the debt of Great Britain in 1815 amounted to over 900 millions. France in this respect has been quite as extravagant as England; many of her loans during the 18th century were issued at 7½% and 8½%, took in 9½%, and were actually purchased at 3½%, the sum of £219 was allotted to the lender. In 1793 a 3½% loan of 45 millions was offered at the price of 7½%, but the lender was satisfied with 6½%, eventhough the rate of par, resulting to this reckless method the debt of Great Britain in 1815 amounted to over 900 millions. France in this respect has been quite as extravagant as England; many of her loans during the 18th century were issued at 7½% and 8½%, took in 9½%, and were actually purchased at 3½%, the sum of £219 was allotted to the lender. 

Government has almost uniformly maintained that it is in the long run it is much better for a state to borrow at high interest, even than at an apparently low interest much below par. A state of even the highest rank may find itself in the midst of a crisis that will for a time shake its credit, but when the crisis is past and its credit revives it will be in a much more sound position with a high interest for a debt contracted at par than with a comparatively low interest on a debt much in excess of what it really received. If a state, for example, borrows at 7½% and the interest is paid, and then when again in a flourishing condition reduce the interest on its debt to 4 or even 3%, The United States government actually did so with the debt it had accumulated in the War of 1812 by the practicing the custom of the debt is evidently no injustice to the creditors of a government, when used in a legitimate way. A state is at liberty at any time to pay off its debts, and, if it can raise new money at 4½% to pay off its old debt at 6½% and offer its creditors the option of payment of the principal or of holding it at a reduced interest. Government debts are, however, sometimes reduced after a fashion by no means so legitimate as this. Other states have been even more unprincipled, and have got rid of their debts at one sweep by the simple method of repudiation.

When a state has a variety of loans at varying rates of interest, it may consolidate them into a single debt at uniform interest. For example, in 1751 several descriptions of English debt were consolidated into one fund bearing a uniform interest of 3½%, an operation which gave origin to the familiar term "consol" ("consolidated certificates") by which a loan was known. A special tax or fund was appropriated to the payment of the interest on each particular loan. This was the original meaning of the "funds," a term which has now come to signify the national debt of the country. The origin of the term "funded" to express the idea of a debt which has been recognized as at least quasi-permanent, and for the payment of the interest on which regular provision is made. Unfunded or floating debt, in the other hand, means a loan whose provision requires to be made, which has been obtained for temporary purposes with the intention of paying them off within a brief period. Exchequer and treasury bills are included in this category, as also the unsecured portion of the national debt which has been regarded as at least semi-permanent, and for the payment of the interest on which regular provision is made. National debt, again, is divided into eternal and internal, according as the loans have been raised within or without the country—
some states, generally the smaller ones, having a considerable amount of exclusive internal debt, though it is obvious that the bulk of national debts are both external and internal.

We referred above to various ways of reducing the burden of a debt, and also to methods of contracting loans by which within a certain period they are amortized or extinguished. Most states, however, are burdened with enormous quasi-permanent debts, the reduction or extinction of which gives ample scope for the financial skill of statesmen. A favourite method of accomplishing the establishment of what is known as a sinking fund, formed by the setting aside of a certain amount of national revenue for the reduction of the principal of the debt.

(J. S. F.)

The following table shows the general state of the world's public indebtedness at the beginning of the 20th century, divided according to the more important countries, the bracketed figures in black type indicating the position of the country referred to under each heading in the list. The figures are given by preference for the year 1900, as more representative, in a case like this, than for some later years; for the Boer War, as regards the United Kingdom, and also the Russo-Japanese War, introduced new debt and new considerations, hardly fair to the comparison, while this stands at the end of a long period of peace. The figures in every case are not to be supposed to be absolutely accurate; statistics of national debts differ, often remarkably, and it is practically impossible to give a perfectly satisfactory comparison, owing partly to difficulties of computing the exchange, partly to inaccurate accounts, and partly to the varieties of debt (reproductive or non-reproductive, &c.).

The Principal Public Debts of the World, 1900.

</table>
the amount required for payment of interest forming a (new) sinking fund devoted to repayment of capital. This fixed charge was gradually reduced from about 20 millions to 26 millions in 1888, to 25 millions in 1890, and to 23 millions in 1899. The amount paid off during this period by means of old sinking fund, terminable annuities and new sinking fund, down to March 1900, was £153,288,693, or an annual average of £6,468,276.

It will be observed that the burden of the debt incurred previously to 1874 has thus been borne very unequally by different generations of posterity. While the generations immediately succeeding the Napoleonic war paid off about £2,000,000 a year, the taxpayers between 1876 and 1900 paid at three times that rate. They did so largely without knowing it, since a large part of the amount was wrapped up in the terminable annuities; but it is very questionable justice that so large a proportion of the burden should have been imposed upon them.

The great bulk of the funded national debt consists of what are known as "consols." This name dates from 1753, when the first government stock or Consols, consisting of £140,000 in a consolidated into one, amounting to £373,821. These "consolidated annuities" formed the germ of what has since become the type of British government stock. At the same time some of the annuities at a higher rate of interest were combined and the interest reduced to 3% and this stock was known as "reduced," the two 3% stocks remaining side by side, until in 1854 the 3% government stock was also converted into 3% under the style of "new threes." "Consol," "reduced," and "new threes" formed thenceforward a solid body of British 3% stock, until in 1888 the whole amount was converted (see Conversions below) by Mr. (afterwards Lord) Goschen into 2 1/2% "Consols" were added to from time to time when fresh loans were needed: from 39 millions in 1771 they rose to 71 millions in 1781, to 101 millions in 1783, 278 millions in 1801, 334 millions in 1811, and 400 millions in 1818; but in 1888 they had decreased, by redemptions, to £122,681,035. "Reduced" were also added to: from 17 millions in 1754 they rose to 61 millions in 1811, and the annual annuities at 3% were diminished to 102 millions in 1869, and to £68,917,433 in 1887, when they were converted with "consols" into the new consols (or "Goschen") at 2 1/2% to be reduced to 2 1/2% in 1903.

The lowest price ever quoted for "consols" was 47½ on 20th September 1797, owing to the mutiny at the Nore; the highest was £112 in 1896 owing to scarcity of stock, the operation of the sinking funds, and the demand for investment of savings bank moneys. The high premium to which consols rose towards the end of the century may be briefly explained. *Part passe* with the reduction of the debt went a dwindling of the amount of consols open to investors, and hence occurred a continued normal appreciation of the stock. In 1877 the amount of British government stock per head of the population was £40, 106; in 1896 this figure had decreased to £14, 125. The ordinary law of supply and demand would therefore in any case tend to increase the price of government stock. This has always happened. The amount of 3% diminished from 528 millions in 1817 to 498 in 1827, and to 497 in 1837, and the average prices in these years were 73, 83 and 90; additions were made to the stock, and in 1847 (the amount being 510 millions) the price was 86½; again the amount decreased, and in 1852 (500 millions) the price was 98½; then a great conversion raised the amount to 734 millions in 1854, and the price went down to 90½; but as the amount decreased again to 480 millions, and the price rose well above par; and though the reduction in interest in 1888 set back the price, it rose again as the amount of available stock diminished. Many causes, into which it is not necessary to enter here, but in keeping with the demand for money, have reduced it to the level of the government stock. Moreover, apart from the fact that in 1882 there were 689 millions of 3% and in 1900 only 501 millions of 2 1/2%, in existence, the amount held by government departments and therefore practically locked up from the market, gradually increased, until from this cause alone the amount of available stock was diminished by upwards of 200 millions; and a large amount more was practically locked up by being held by trustees, or by banks, insurance societies, &c. The savings banks deposits, increasing as they did by about £1,000,000 per month (owing partly to the sinking of 1894 of the maximum limit), had a large attraction in government securities; and the compulsory activity of the government as a buyer of consols, both on this account and also for sinking fund purposes (in order to obtain stock to redeem debt on the increased scale from time to time), was an abnormal cause for sending the price of consols high above par. Even at that figure (the average prices for consols being 101½, in 1894, 106⅓ in 1895, 110 in 1896, 114⅓ in 1897, 110½ in 1898 and 103½—having fallen owing to war prospects—in 1899) it was difficult for the government brokers to obtain consols, and it was principally owing to this state of things that in 1899 Sir Michael Hicks-Beach reduced the current charge for the consols (and pro bands the new sinking fund) from £25,000,000 to £23,000,000.

It may be useful to give the figures for the British national debt in 1902, after the disturbance due to the South African War. During the years 1901 and 1902 the new sinking fund was suspended, as well as the payments on the terminable annuity debt applicable to repayment of capital (except in so far as annuities to individuals were concerned); so that the debt was not reduced, as it would otherwise have been, by £4,547,000 in 1900 and £4,631,000 in 1901. On the contrary, it was increased by fresh borrowings. Consols were raised (in 1901 and 1920) to the extent of £52,000,000; a "War Loan" of 2% stock and bonds, redeemable in 1910, was raised (1900) to the amount of £3,000,000; 21% exchequer bonds were raised (in 1900) to the amount of £24,000,000, and treasury bills (in 1899 and 1900), £13,000,000. The total war borrowing amounted accordingly to £59,000,000, raised at a discount of (£6,585,000) 4-14%. This includes the whole new borrowing in 1902, a portion of which was intended after the peace to be paid back in the current year, but for this no allowance can here be made. The accompanying table shows the totals for the "dead-weight debt" in 1900, 1901 and 1902, and, for convenience, also the "other capital liabilities."

- Consols: £32,000,000

British National Debt Conversions.—The great bulk of the funded debt of the United Kingdom consists of annuities, which are described as perpetual, because the state is under no obligation to pay off at any time the capital debt which they represent. All that the public creditor can claim is to receive payment of the instalments of annuity as they fall due. On the other hand, the government has the right to redeem the annuities ultimately by payment of the capital debt; though it may, and frequently does, bind itself not to exercise that right as regards a particular stock of annuities until after a definite period. So long as a stock is thus guaranteed against redemption, the only way in which the annual charge for that portion of the debt can be reduced is by the government buying back the annuities in the open market at their current price, which may be more or may be less than the nominal debt, according to general financial conditions and to the state of the national credit. The liability of the stock to redemption at par, when the period of guarantee has expired, prevents its market price from rising materially above that level. To enable the right of compulsory redemption to be enforced, it is only necessary that the government should

1 Other causes are redemption of land tax, variation in capital value of terminable annuities and minor treasury operations.
have command of sufficient funds for the purpose of paying off the stockholders, or should be able to raise those funds by borrowing at a rate of interest lower than that borne by the stock. Any circumstances which might tend to raise the price of the stock above par would also assist the government in raising its redemption money on more favourable terms. When the amount of stock to be dealt with is large, the raising by a fresh loan of the amount required for redemption would occasion great disturbance in the money market, and would leave quite out of account the value of the existing stock to a lower rate of interest by agreement with the stockholders, whose reluctance to accept a reduction of income is overborne by their knowledge that the power of redemption exists and will be put in force if necessary. The opportunity for conversion may be looked for when the price of a redeemable stock stands steadily at or barely above par. Observation of the movements in the price of other securities will serve to show whether this stationary price represents the real market value of the stock, or whether that value is subject to depression owing to an expectation of the stock being converted or redeemed. Accordingly, the course of prices of other government stocks which are free from the liability to redemption, of the stocks of foreign countries and the colonies, and of the large municipalities, must be watched by government in order to determine, first, whether the conversion of a redeemable stock is feasible, and, secondly, to what extent the reduction of the interest in the stock may be carried.

The credit for the first measure of conversion belongs to Walpole, though it was carried through by Stanhope, his successor as chancellor of the exchequer. In 1714 the legal rate of interest for private transactions, which had been fixed at 6% in the year of the Restoration, was reduced to 5% by the act 12 Anne, stat. 2, c. 16. But the bulk of the national debt still bore interest at the nominal rate of 8% in the currency of Anne and the frequent irregularities in public payment had hitherto precluded any considerable borrowing at lower rates. Walpole saw that the first requirement was to give increased confidence to the public creditor by reducing the rates of interest. The act 24 was passed to this end. It was introduced through the medium of the House of Commons, which invited advances not exceeding £60,000, to be repaid with interest at 4% out of the first supplies of the year. The result was none of the supplies was made, and the rate of interest, as only a sum of £45,000 was offered on those terms. A further resolution was then passed, substituting 5% as the rate of interest. It was then suggested to the public creditors that this rate might be reduced to 4%, after which the reduction of interest on their own debts, the Bank of England and the South Sea Company. The Bank of England agreed to assist the government by advancing 4½ millions at the reduced rate, to be employed in paying off any of the general creditors who might refuse assent to the conversion. The assistance was not required, as all the creditors signed assent. The debts thus dealt with amounted altogether to about 25½ millions, and the annual saving of interest effected (that is, the difference between the old rate and the 4% for which bills for which the Bank had been receiving over 7%) was £29,000.

Walpole had a further opportunity of effecting a conversion in 1737. In that year he was again left to his own devices in the scheme for the gradual reduction of the 4%. As a financial measure the scheme would doubtless have succeeded; but Walpole, moved against the day by the consideration for his capitalist supporters, opposed and for the time defeated, a measure which, accomplished by a subsequent bill of 1739, was afterwards carried through by Pelham as chancellor of the exchequer in 1740 and embodied in the act 23 Geo. II. c. 1. By that act holders of the 4% securities were to be allowed to exchange them for 3½% securities on the 1st of January next following the passing of the act, a further reduction to 3% thereafter. It was necessary to continue the rate of 4% for the first year, as any objecting stockholders could not be paid off without a year’s notice. Three months were allowed for signifying assent to the proposal. At first it was viewed with disfavour, and both the Bank and the East India Company opposed it. But the pens of the government pamphleteers were busily occupied in showing the advantages of the offer, and at the end of one month those holding nearly 39,300,000 of the 4% and 3½% were more than two-thirds of the whole. A further opportunity was afforded to waverers by a second act of 1740. Private creditors were allowed three months more for consideration; but for holders accepting the act it was to be in the intermediate period of 3½% interest was reduced from seven years to five. These terms brought in an additional £15,600,000 of stock; and the amount of stock at which the conversion was paid off at par by means of a new loan. The annual saving of interest on the stock converted was at first £272,000, increasing to £344,000 after seven years.

Three-quarters of a century no further conversion was attempted. In that period the total debt had been increased tenfold, and the practice of borrowing in times of war by the issue of funded capital. In 1812, however, the low rate of interest, prevented recourse to conversion, the fear of reducing the burden after peace was restored. But in 1822 Mr. Vansittart — who four years earlier had effected a conversion in the opposite sense of the national debt — succeeded in securing a low rate of interest, and thus prevented recourse to conversion for a number of years reducing the burden after peace was restored. In 1822 Mr. Vansittart, who for four years earlier had effected a conversion in the opposite sense of the national debt, succeeded in securing a low rate of interest. In 1830 and 1840 the annual saving in interest was £5,810,000.

In 1830 the guarantee given on the 4½% stock of 1822 had expired, and the stock stood at a price of 101. Mr. Goulburn decided to attempt its conversion without delay, and accordingly by the act 11 Geo. IV. c. 13 holders were offered in exchange for each £100 of the stock, either £100 of a 3½% stock, irredeemable for ten years, or £70 of a 5% stock, irredeemable for forty-two years, these two options being considered of approximately equal value. The conversion was only partially successful. Thus after ten years the stock was converted, almost wholly into the 3½% stock; the balance of less than £3,000,000 was paid off, and an annual saving of £754,000 in interest was the result.

Following Mr. Goulburn’s fortune to carry out a large and successful conversion in 1844. At that date the funded debt was made up of 3% and 3½% stocks in the proportions of one to three, the latter amounting to £9,000,000, or a trilling amount of 5% stock created in connection with the conversion of 1830. The price of 3% consols ranged about 98, and that of the new 3½%, created in 1830, about 102. A reduction straight-way from 3½ to 3% was not to be looked for, but it was hoped to ensure that reduction ultimately by offering 3½% for the first few years and a guarantee against redemption for a long term. Accordingly the holders of the several 3½% stocks were offered an exchange, as may be seen by the following table, of these stocks for 3% stocks in the following twenty years. Practically the whole of the stock, amounting to £23,000,000, was converted on these terms, only one or two per cent. being left behind. The annual saving of interest was £622,000 a year for ten years, and twice that rate in subsequent years (acts 7 & 8 Vict. cc. 4 and 5).

Mr. Gladstone’s only attempt at the conversion of the debt was made in 1864. In the year 1861 Parliament, after the passage of the act of 1861 making provision for exchange, passed the deed of exchange, which provided for exchanging every £100 for either 8½, 10s. of a 3½% stock guaranteed for 40 years, or £10 of a 2½% stock guaranteed for the same period and at the same rate. Of the amount of £1,500,000 was converted, and the remaining £8,000,000 had to be paid off at par, with some apparent loss of capital, as the current market price of the 3% was less than par. The failure was largely owing to the fact that, between the initiation and the execution of the scheme, the train of events leading up to the Crimean War had become manifest, with unfavourable results.
NATIONALITY—NATIONAL WORKSHOPS

to the public credit. Mr Gladstone had also included, as an optional portion of his plan, liberty to holders of the larger 3% stocks to exchange them, at the market price, for the 3% consols. The consent in 1882, and the whole of the 3% stocks, at a total of £58,000,000, made up as follows: £27,000,000 of consols, a stock which dated from 1752, and which was only redeemed at the end of the year, or without more than 600,000 millions, but no attempt was made to compel acceptance. There was offered for exchange in each £100 of 3% stock a sum of £12 at 22 1/2 or 15 1/2 per cent. The whole amount was irredeemable for twenty-one years. But the amount exchanged into the new stocks was only 22 millions, of which more than one- tenth was stock held by government departments.

The conversion of 1884, with which the British debt was effected by Mr Goschen in 1888. It applied to the whole of the 3% stocks, amounting to a total of £60,000,000, made up as follows: £23,000,000 of consols, a stock which dated from 1752, and was then formed by the consolidation of a number of minor stocks; £59,000,000 of reduced 3% of which the nucleus was the stock reduced from 4% to 3% by Peltam's conversion in 1879, and £20,000,000 of consols new 3%, which dated from 1844. All the three stocks were, and had been for a considerable time, well over par. But for the past few years they had remained, in almost the stationary position, relatively to the upward movement shared by the government debentures, and the new 3% loan, of foreign governments, of British colonies and of the leading municipalities. It was clear that the anticipation of a conversion or redemption of anything of the kind had been never made. During this fact was afforded by the course of a new 3% stock, the local loans stock, which Mr Goschen had created in 1887. Thence bearing the same interest and resting upon the same ultimate security as consols, and being both convertible and redeemable after five years, rose at once to a higher level of price. The opportunity for a great scheme of conversion had evidently come. The risk to be incurred by government in undertaking the liability to pay off such an enormous body of stock, though less in comparison with the resources of the nation than that which Mr Goulburn had faced in 1844, was still very great, and it was rendered more formidable by the fact that the consols had already lost 3% of their value at the time to a year's notice before their stocks could be redeemed. If that right of notice were to be enforced as regards any large proportion of the stocks, no precaution could adequately guard against the inevitable democratic consequences by which any such act affecting the stockholders' rights would affect the market, or the large number of new mortgages and other security, before the year expired. Mr Goschen proposed to offer to the holders of each of the three stocks an exchange at par into a new stock bearing interest at 3% for the first year, at 2% for the next fourteen years and at 2 1/2 for twenty years thereafter, the stock to be irredeemable for the whole of that period, namely till 1923. Acceptance was made compulsory for holders of the new 3%, with the result that they had either paid or given notice; but it was made optional for the holders of the other two stocks, and a bonus of 5% was offered to them as an inducement to forego their right of notice. These provisions were duly enforced by the Act of 1884. It has, on the whole, been found that practically all the holders of the new 3% and by the great majority of the holders in consols and reduced 3%, the amount left outstanding being only £70,000,000 of consols, which are convertible and redeemable after five years, was passed providing for the compulsory redemption or conversion of the outstanding stock at the expiry of the statutory notice. The funds required for this further operation were raised by the issue of treasury bills and exchequer bonds, by temporary advances from the bank and from the national debt commissioners, and by the creation of an additional half-million of the new stock. In the result it was only necessary to find cash for paying off dissentients to the amount of £10,000,000. The final outcome of the whole operation was a saving in the annual charge of interest of £1,412,000, increasing to twice that amount after fourteen years.

The conversion of 1884, which was greatly facilitated by the exercise of a power, which the act conferred, to pay to recognized agents, such as stockbrokers, bankers and solicitors, a commission of 1 1/2% on stocks in respect of which they lodged their clients' assents. These agents were thus afforded an inducement to get their clients payment and advice, without which many of the fundholders would probably not have moved in the matter. The commission paid amounted to more than £34,000 representing stocks to the amount of £1,412,000. The government would not again be confronted with this difficulty of having to give long preliminary notice of the intention to convert or redeem the stock. In 1888, when the second part of the Conversion Act 1888 that the present consols should be redeemable after 1923 on such notice and in such manner as parliament might direct, was passed.

NATIONALITY, a somewhat vague term, used strictly in international law (see International Law, Private) for the status of membership in a nation or state (for the conditions of which see State, Aligiance, Naturalization, Aliens), and in a more extended sense in political discussion to denote an aggregation of persons claiming to represent a racial, territorial or economic interest by their mutual adherence to the same political entity. In this latter sense the word has often been applied to such people as the Irish, the Armenians and the Czechs. A "nationality" in this connexion represents a common feeling and an organized claim rather than distinct attributes which can be comprised in a strict definition.

NATIONAL WORKSHOPS (Fr. Ateliers Nationaux), the term applied to the workshops established to provide work for the unemployed by the French provisional government after the revolution of 1848. The political crisis which resulted in the abdication of Louis Philippe was naturally followed, in Paris, by an acute industrial crisis, and this, following upon the agricultural and commercial distress which had prevailed throughout 1847, rendered the problem of unemployment in Paris very acute. The provisional government under the influence of one of its members, Louis Blanc, and on the demand of a deputation claiming to represent the people passed a decree (Feb. 25, 1848) from which the following is an extract:—

The provisional government of the French Republic undertakes to provide work for the unemployed by work by work. It undertakes to guarantee work for every citizen.

For the carrying out of this decree, Louis Blanc wanted the formation of a ministry of labour, but this was shelled by his colleagues, who as a compromise appointed a government labour Commission under the presidency of Louis Blanc, with power of inquiry and consultation only. The carrying out of the decree of Feb. 25th was entrusted to the minister of public works, M. Marie, and various public works were immediately started. The earlier stages of the national workshops are sufficiently interesting to justify the following detailed account:—

"The workman first of all obtained a certificate from the landlord of his house, or furnished apartments, showing his address, whether in Paris or the department of the Seine. This certificate was issued and stamped by the police commissary of the district. The workman could only be employed in repairing or constructing public works, and in delivering this document, received in exchange a note of admission to the national works, bearing his name, residence and calling, and a note of recommendation to be kept in the workshops in which vacancies existed. All went well while the number of the unemployed was less than 6000, but as soon as that number was exceeded the workmen of each arrondissement, after having visited the workshops, returned to the mairie's offices tired, starving and discontented. The workmen had been promised bread when work was not to be had, which was reasonable and charitable; the great mistake was, however, that of giving them money, and distributing it in public at the offices of the maires instead of distributing assistance in kind, which might have been done so easily through the agency of the bureaux de bienfaisance. Each mairie's office was authorized to pay every unemployed workman 1-50 frs. per day on production of a ticket showing that there was no vacancy for him in the national works. The fixed sum of 2 francs was paid to any workman engaged on the works of the city, and a sum of 1 franc to any workman who returned to the city without result. The works opened by the minister of public works being far distant from each other, and the workmen not being able to visit them, the committee of the city of Paris, under the presidency of M. Wissocq, a member of the city council, divided them, two central bureaux were established, one at the Halle-aux-Veaux under M. Wissocq, the other near the mairie's office in the 

2 The term is also incorrectly applied to the proposed Ateliers sociaux of Louis Blanc (q.v.), state-supported co-operative productive societies.

3 Clearing the trench of Clamart and conveying the earth to Paris for the construction of a railway station on the chemin de fer de l'Ouest; construction of the Paris-Chartres railway; improvement of the navigation of the Oise; extension of the Seine railway to Vesly.
The mineral also often occurs in compact fibrous aggregates, the fibres having a divergent or radial arrangement (hence the name radiolite for one variety). From other fibrous zeolites, natrolite is readily distinguished by its optical characters: between crossed nicols the fibres exhibit parallel to their length, and they do not show an optic figure in convergent polarized light. Natrolite is usually white or colourless, but sometimes reddish or yellowish. The lustre is vitreous, or in finely fibrous specimens sometimes silky. The spec. grav. is 2-2, and the hardness 5-5. The mineral is readily fusible, melting in a candle-flame, to which it imparts a yellow colour owing to the presence of sodium. It is decomposed by hydrochloric acid with evolution of gaseous silicon fluoride.

Natrolite occurs with other zeolites in the amygdaloid cavities of basic igneous rocks. The best specimens are the diverging groups of white prismatic crystals found in compact basalt at the Puy-de-Marmuz, 230 m. de Doué, France. The largest crystals are from Brevig in Norway. The walls of cavities in the basalt of the Giant's Causeway, in Co. Antrim, are frequently encrusted with slender needles of natrolite, and similar material is found abundantly in the volcanic rocks (basalt and phonolite) of Salessel, Ausias and several other places in the north of Bohemia.

Several varieties of natrolite have been distinguished by special names. Fargite is a red natrolite from Glenfarg in Perthshire, Benjaminite or Spectophane is a specimen from Laraha, and Enrichite by the alteration of other minerals, chiefly sodalite, in the augite-eynite of southern Norway.

NATTIER, JEAN M Arc (1685-1760), French painter, was born in Paris in 1685. The son of Marc Nattier, a portrait painter, and of Marie Courtois, a miniaturist. He received his first instruction from his father, and having applied himself to copying pictures at the Luxembourg Gallery, he refused to proceed to the French Academy in Rome, though he had taken the first prize at the Paris Academy at the age of fifteen. In 1715 he went to Amsterdam, where Peter the Great was then staying, and painted portraits of the tsar and the empress Catherine, but declined an offer to go to Russia. Between 1715 and 1720 he devoted himself to compositions like the "Battle of Pultawa," which he painted for Peter the Great, and the "Petification of Phineas," of his countrymen, which he sold to the Academy. The financial collapse of 1720 caused by the schemes of Law all but ruined Nattier, who found himself forced to devote his whole energy to portraiture. He became the painter of the artificial ladies of Louis XV.'s court. The most notable examples of his straightforward portraiture are the "Marie Leczinska" at the Dijon Museum, and a group of the artist surrounded by his family, dated 1730. He died in Paris in 1766. Many of his pictures are in the public collections of France. Th us at the Louvre is his "Magdalen," and at Nantes the portrait of "La Camargue," a Lady of the Court of Louis XV. At Orleans a "Head of a Young Girl," at Marseilles a portrait of "Mme de Pompadour," at Perpignan a portrait of "Louis XV.," and at Valenciennes a portrait of "Le Duc de Boufflers." The Versailles Museum owns an important group of two ladies, and the Dresden Gallery a portrait of the "Maréchal de Saxe." At the Wallace collection Nattier is represented by "The Comtesse de Dillières," "The Bath (Mdlle de Clermont)," "Portrait of a Lady in Blue," "Marie Leczinska" and "A Prince of the House of France." In the collection of Mr Lionel Phillips are the duchess of Flavacourt as "Le Silence," and the duchess of Châteauroux as "Le Couronnement." In the Royal Library are two portraits of the "Comtesse de Neubourg and her Daughter" formed part of the Vaile Collection, and realized 4,500 gu. at the sale of this collection in 1903. Nattier's works have been engraved by Leroy, Tardieu, Lépicié, Audran, Dupin and many other noted craftsmen.

NATURAL BRIDGE, a small village of Rockbridge county, Virginia, in the western part of the state, 170 m. by rail W. of Richmond, and about 16 m. S.E. of Lexington, the county-seat. It is served by the Chesapeake & Ohio and the Norfolk & Western Railways. In the vicinity of the village, which is about 1500 ft.
natural gas—naturalism

above sea-level, is the great natural curiosity from which it derives its name—a bridge of natural rock 90 ft. long and from 50 to 150 ft. wide, which spans Cedar Creek at a height of 215 ft. above that stream. It consists of horizontal limestone strata, and is the remains of the roof of a cave or underground tunnel through which the stream once flowed. It is crossed by a public road. In the village are magnesite and lithia springs and a salt-petre cave, which was worked during the War of 1812 and the Civil War. A royal grant dated the 5th of July 1774 conveyed to Thomas Jefferson a tract of 157 acres, "including the Natural Bridge on Cedar Creek," and it did not pass from his estate until 1833.

natural gas, the name given to the inflammable gas occurring in petrolierous formations. It consists mainly of hydrocarbons of the paraffin series, principally marsh gas, which constitutes from 50 to 90% of the Pennsylvanian gas. Members of the olefine series are also present, especially in the gas of Baku. Varying amounts of carbon dioxide, sometimes as much as 10% or more, and small quantities of carbon monoxide, nitrogen, hydrogen and oxygen are also found. For particulars of the geological occurrence, and the collection and distribution, of natural gas, see PETROLEUM.

naturalism. "Nature" is a term of very uncertain extent, and the "natural" has accordingly several antitheses, often more or less conflicting, and only to be learnt from the context in which they occur. Thus, though Man and the World are often opposed as respectively subject and object, yet the word nature is applied to both: hence Naturalism is used in both terms and in both senses. In the subjective sense the natural, as the original or essential, is opposed to what is acquired, artificial, conventional or accidental. On this opposition the casuistry and paradoxes of the Sophists largely turned; it determined also, at least negatively, the conduct of the Cynics in their contempt for the customary duties and decencies; and it led the Stoics to seek positive rules of life in "conformity to nature." This deference for the "natural" generally, and distrust of traditional systems of thought and even of traditional institutions, has played a large part in modern philosophy, especially British philosophy. It was perhaps the inevitable outcome of the reaction, which began with the Renaissance, against the medieval domination of mere authority. "L'homme qui médite est un animal dépravé," said Rousseau; and again, "Tout est bien sortant des mains de l'auteur des choses, tout dégénère entre les mains de l'homme."

In psychology and epistemology, "no one," as Green has said, "is more emphatic than Locke in opposing what is real to what we 'make for ourselves'—the work of nature to the work of the mind. Simple ideas or sensations we certainly do not 'make for ourselves.' They therefore, and matter supposed to be the cause of them, are, according to Locke, real. But relations are neither simple ideas nor their material archetypes. They therefore, as Locke explicitly holds, fall under the head of the work of the mind, which is opposed to the real."

This opposition again led Hume, in the first place, to distinguish between natural and philosophical relations—the former determined simply by association, the latter by an abiotic union of two ideas, which we may think proper to compare—and then, in the next, to reduce identity and causality, the two chief "philosophical relations," to fictions resulting from "natural relations," that is to say, from associations of similarity and contiguity. Subjective naturalism thus tended to become, and in the end became, what is more commonly called Sensationalism or Associationism, thereby approximating towards that objective naturalism which reduces the external world to a mechanism describable in terms of matter and motion—a result already foreshadowed when Harteley connected ideas and their association with brain vibrations and vibratulences. In ethics, also, the striving to get back to the natural entailed a similar downward trend. From the Cambridge Platonists, from Locke and Clarke, we hear much of rational principles of conduct, comparable in respect of intelligibility with the truths of mathematics; but already we find that in Shaftesbury the centre of ethical interest is transferred from the Reason, conceived as apprehending either abstract moral distinctions or laws of divine legislation, to the "natural affections" that prompt to social duty; and when we reach Bentham, with pleasure and pain as "sovereign masters," and the Mills, who love of virtue is inspired by the laws of association, it all seems to be non-rational. There is much resemblance, as well as some historical connexion, between the naturalism of moralists such as Shaftesbury and Hutcheson and the Common-Sense metaphysics of Reid and his school. Hence Kant, distinguishing between a "naturalistic" and "scientific" or critical method in metaphysics, styles Reid and his followers "naturalists of pure reason," satirically comparing them to people who think they can settle the size and distance of the moon by direct eyesight better than by the roundabout calculations of mathematics.

So far we have seen the natural approximating to the non-rational. But when used in a subjective sense in opposition to the supernatural, it means the rational as opposed to what is above reason, or even contrary to reason. It is in this sense that the term Naturalism most frequently occurs; and it was so applied specially to the doctrines of the English Deists and the German Illuminati of the 17th and 18th centuries: those of them who held that human reason alone was capable of attaining to the knowledge of God were called theological naturalists or rationalists, while those who denied the possibility of revelation altogether were called philosophical naturalists or rationalists simply. In these controversies the term Naturalist was also sometimes used in an objective sense for those who identified God and Nature, but they were more frequently styled Spinozists, Pantheists or even Atheists. But it is at once obvious that dispute as to what is natural and what supernatural is vain and hopeless till the meanings of reason and nature are clearly defined. "The only distinct meaning of the word "natural," said Butler, "is stated, fixed or settled; since what is natural as much requires and presupposes an intelligent agent to render it so, i.e. to effect it continually, or at stated times, as what is supernatural or miraculous does to effect it once. And from hence it must follow that persons' notion of what is natural will be enlarged in proportion to their greater knowledge. ... Nor is there any absurdity in supposing that there may be beings in the universe, whose capacities ... may be so extensive, as that the whole Christian dispensation may to them appear natural, i.e. analogous or conformable to God's dealings with other parts of His creation; as natural as the visible known course of things appears to us." 9

The antithesis of natural to spiritual (or ideal) has mainly determined the use of the term Naturalism in the present book. It is in the sense of the antithesis of spiritual and rationalism, though these terms are often used synonymously, as by Hegel, Ueberweg and other historians of philosophy; nor yet pantheism, if by that is meant the immanence of all things in God. We know only material phenomena, it is said; matter is an abstract conception simply, not a substantial reality. It is therefore meaningless to describe mind as its effect. Moreover, mind also is but an abstract conception; and here again all our knowledge is confined to the phenomenal. To identify the two classes of phenomena is, however, impossible, and indeed absurd; nevertheless we find a constant concomitance of naturalism and rationalism in our psychology, the easier it becomes to correlate the

8 In aesthetics we find Naturalism used in a cognate sense: the Flemish painters, such writers as Flaubert or Zola, for example, being called naturalistic or realistic, in contrast to the Italian painters or writers like George Sand or the Brontës.
psychical and the physical as but "two aspects" of one and the same fact. It is therefore simplest and sufficient to assume an underlying, albeit unknown, unity connecting the two. A monism—so far neutral, neither materialistic nor spiritualistic—is thus a characteristic of the prevailing naturalism. But when the question arises how best to systematize experience as a whole, it is contended that we must begin from the physical side. Here we have precise conceptions, quantitative exactness and thoroughgoing continuity; every thought that has ever stirred the hearts of men, not less than every breeze that has ever rippled the face of the deep, has meant a perfectly definite redistribution of matter and motion. To the mechanical principles of this redistribution an ultimate analysis brings us down; and—beginning from these—the nebular hypothesis and the theory of natural selection will enable us to explain all subsequent synthesis. Life and mind now clearly take a secondary place; the cosmo-llogical mechanism determines them, while they are powerless to modify it. The spiritual becomes the "epiphenomenal," a merely incidental phosphorescence, so to say, that regularly accompanies physical processes of a certain type and complexity. (See also Psychology.)

This absolute naturalism, as we may call it, the union, that is, of psychological and cosmological naturalism, is in fact a species of Fatalism, as Kant indeed entitled it. It is the logical outcome of a sensationalist psychology, and of the epistemology which this entails. As long as association of ideas (or sensory reactions) is accepted as the predominant form of explanation, and conscience, so long may naturalism stand.

The naturalistic work of chief account at the present day is E. Haeckel's Die Weltreligionen, gemeinsamenstandige Studien über monistische Philosophie (5 th ed., 1900), of which an English translation has appeared. Effective refutations will be found in the works of two of Haeckel's colleagues, O. Liebmann, Zur Analyse der Wirklichkeit (3 rd ed., 1900); R. Eucken, Die Einheit des Geisteslebens in Beusswein und Thod der Menschheit (1888, Eng. trans.): Der Kampf um einen geistigen Lebensinhalt (1898). See also A. J. Balfour, Foundations of Belief (8 th ed., 1901); J. Ward, Naturalism and Agnosticism (1899). (J. W.*)

NATURALIZATION, the term given in law to the acquisition by an alien of the national character or citizenship of a certain state, always with the consent of that state and of himself, but not necessarily with the consent of the state to which he previously belonged, which may refuse to its subjects the right of renouncing its nationality, called "expatriation," or may allow the right only on conditions which have not been fulfilled in the particular case. Hence although nationality in direct theory is always single, as liege homage was and allegiance in its proper sense is, it often happens that two states claim the same person as their national or subject. This conflict arises not only from naturalization having, been granted without the corresponding expatriation having been permitted, but also from the fact that birth on one side becomes a matter of nationality by feudal law, and still is so by the laws of England and the United States (jus soli), while the nationality of the father is its leading determinant in those countries which have accepted Roman principles of jurisprudence (jus sanguinis). The conflict is usually solved for practical purposes by an understanding which is approximately general, namely that, in cases not provided for by treaty, no state shall protect those whom it claims as its nationals while residing in the territory of another state which claims them as its own nationals by any title, whether jus soli, jus sanguinis, naturalization, or the refusal to allow expatriation. On this footing the British foreign office, while it grants passports for travel to naturalized persons, will extend no protection to them against a claim of their former country, if they return to it, to exact military service due to it. The United States, asserting that expatriation is an inalienable right of man, maintains that, to lose his right to American protection, the emigrant who has been naturalized in the United States must have done that for which he might have been tried and punished at the moment of his departure; it claims to protect him against the exaction of what at that moment was merely a future liability to military service, and this doctrine has been practically accepted by France in her dealings with America. Germany also accepted it by the treaty of 1868 between the United States and the North German Confederation, now in force for the German empire, subject to provisions that the emigrant's fixing his domicile in the old country shall be deemed a renunciation of his naturalization in the new, and that his living in the old country for more than two years may be deemed to imply the absence of an intention to return to the new. Between the United States and Great Britain the convention of the 13 th of May 1870 provides that naturalization in either is to be valid for all purposes immediately on its completion, but that if the resident shall renew his residence in his old country he may be readmitted to his old nationality, on his application and on such conditions as the readmitting government may impose.

The Naturalization Act 1870, which now governs the matter for England, does not say that the person naturalized becomes thereby a British subject, to which, if it had been said, a proviso might have been added saving the above-mentioned policy of the foreign office as to not protecting him in his old country, although even without such a proviso the foreign office would have been free to follow that policy. The act in question (s. 7) gives him the rights and imposes on him the duties of a natural-born British subject in the United Kingdom, and provides that, when within the limits of his old country, he shall not be deemed a British subject unless he has ceased to be a subject of that domicile by a claim of nationality. In 1876 it has been maintained that British naturalization is not really naturalization at all; but leaves the naturalized person as he was with the addition of a certain quality within the United Kingdom; and on that ground it has been considered in France that a Frenchman, obtaining naturalization in England, does not fall within the French law (Code Civil, Art. 17) which pronounces the expatriation of citizens who cause themselves to be naturalized abroad. This is the Bourgeois Case, 41 Ch. D. 310, in which, when it came before the English courts, Mr Justice Kay inclined to the same view, but the court of appeal without giving an opinion on the point, Professor Dicey leans to the same view (5 Law Quarterly Review, 438); but Sir Thomas Barclay (4 L.Q.R. 226), Sir Malcolm McIlwraith (6 L.Q.R. 379), and Professor Westlake (International Law—Peace, 2nd ed. p. 234; Private International Law, 4th ed. p. 350) adopt the view that the Naturalization Act 1870 makes the naturalized person a full British subject, only to be treated in his old country in accordance with the international principles recognized by the British executive. And the foreign office, by granting passports to naturalized persons, acts on the same view. The point is important with reference to the question whether the naturalization of the father in the United Kingdom confers the character of British subjects on his children afterwards born abroad. (See Alien.)

An analogous question arises on the provision in the Naturalization Act 1870, sec. 16, that the legislature of any British possession may make laws "for imparting to any person the privileges of naturalization, to be enjoyed by such person within the limits of such possession." This, in accordance with the wider view of the effect of naturalization in the United Kingdom, may mean that naturalization in pursuance of a colonial law confers the character of a subject, or confers rights, including disabilities, such as that to hold land, under which the naturalized person may have lain as an alien in any other British possession. On that footing the foreign office grants passports to the holders of colonial certificates of naturalization, and protects them in all foreign countries but that of their origin; and the Merchant Shipping Act 1894, sec. 1, allows persons naturalized in British possessions to be owners of British ships. On the other hand, those who maintain the narrower view of the effect of naturalization in the United Kingdom naturally hold that colonial naturalization has no effect at all outside the British possession in which it is granted.

Naturalization in India is regulated by the British Indian Naturalization Act, No. 30 of 1852, under which it may be granted to subjects of the several princes and states in India
as well as to those who are entirely aliens to the British empire. The former, however, are treated for several purposes as British subjects even without being so naturalized.

In most countries a lengthened sojourn is a condition precedent to naturalization. In Belgium, the United Kingdom, North America and Russia the period of such sojourn is fixed at five years, in France, Greece and Sweden at three, in the Argentine Republic two, while in Portugal a residence of one year is sufficient. In Germany, Austria and Italy no period of residence is prescribed, while in Austria a ten years' residence confers *per se* the rights of citizenship. In the United States an alien desiring to be naturalized must declare on oath his intention to become a citizen of the United States; two years afterwards must declare on oath his intention to support the constitution of the United States and renounce allegiance to every foreign power, including that of which he was before a subject; must prove residence in the United States for five years, and in the state where his application is made for one year, as a good citizen; and must renounce any title of nobility. In France an alien desiring naturalization, if he has not resided continuously in the country for ten years, must obtain permission to establish his domicile in France; three years after (in special cases one year) he is entitled to apply for naturalization, which involves the renunciation of any existing allegiance.

**NAUCRATIA**

**NAUARCHIA**

—NAUCRATIS

and

as a people of Attica, which was the only area among the 500 tribes of the Athenian democracy that persisted without being amalgamated during the time of the empire. The word is derived either (1) from naux (a ship) and designates the duty imposed upon each naucracy, of providing one ship and two (or, more probably, ten) horsemen; or (2) from παύω (to dwell), in which case it has to do with a household census. The former is generally accepted in view of the fact that the naucrae were certainly the units on which the Athenian fleet was based. The view once held (on the strength of a fragment of Aristotle, quoted carelessly by Photius) that the naucracy was invented by Solon may now be regarded as obsolete (see the Aristotelian *Constitution*, viii. 3). Each of the four Athenian tribes was divided into three naucraei (thirds), each of which was subdivided into four naucraeis; there were thus 48 naucraeis. The earliest mention of them is in Herodotus (v. 71), where it is stated that the Cylonian conspiracy was put down by the "Prytaneis (chief men) of the Naucraeis." Although it is generally recognized that in this passage we can trace an attempt to shift the responsibility for the murder of the suppliants from the archon Megacles, it is highly improbable that the Prytaneis of the Naucraeis did not play a part in the tragedy. Thucydides is probably right, as against Herodotus, in assuming that the naucracy was formed by a process of amalgamation at this period. It may be conjectured, however, that the military forces of Athens were organized on the basis of the naucraeis, and that it was the duty of the presidents of these districts to raise the local levies. It is certainly remarkable that the Aristotelian *Constitution of Athens* does not connect the naucracy with the fleet or the army; from chapter viii. it would appear that its importance was chiefly in connexion with finance (ἀρχή ταταγμή πρὸς το ἀρκεῖον τῆς διαπερασμάτος). The naucracy consisted of a number of villages, and was, therefore, a local unit very much in the power of the naucrarioi, who was selected by means of wealth. The land of the naucracy was divided into "tributaries" ("thirds") and the "Prytaneis." The construction of, and afterwards captained, the ship, and also assessed and administered the taxes in his own area. In the reforms of Cleisthenes, the naucraeis gave place to the demes as the political unit. In accordance with the new decimal system, their number was increased to fifty. Whether they continued (and if so, how long) to supply one ship and two (or ten) horsemen each is not certainly known. Cheidemus in Photius asserts that they did, and his statement is to a certain extent corroborated by Herodotus (vi. 59) who records that, in the Athenian War before the Persian Invasion, the Athenian fleet numbered only fifty sail.

See *Photius* (s.e.), who is clearly using the *Ath. Pol.* (he quotes from it the last part of his article *tolidem verbis*); *Schenck, Antiq.* (p. 326, Eng. trans.)—quoted by J. E. Sandy (Ath. Pol. viii., 12)—refutes Gilbert, Greek Constitutional Antiquities (Eng. trans., 1895), and in *Jrh., Class. Phil. stud.* (ed. 1875) p. 9 seq.; A. H. J. Greenidge, *Handbook of Greek Const*, Hist. p. 134; history of Greece in general; for derivation of name, G. Meyer, *Curtius’ Studien* (vii. 75), where *Weckel, Geschichtliche Faktion* (J. M. M. —

**NAUCRATIS**

an ancient Greek settlement in Egypt. The site was discovered by Professor W. M. Flinders Petrie in 1884, on the eastern bank of a canal, about 10 m. W. of the present Rosetta branch of the Nile. In ancient times it was approached by the Canopic mouth, which was farther to the west. The identification of the site is placed beyond doubt by the discovery of inscriptions, with the name of the town, and of great masses of early Greek pottery, such as could not have existed anywhere else. The site was excavated in 1884–1885 by the Egypt Exploration Fund, and the report of the expedition appeared in *The British School at Athens* in 1899. A list of the temples of Naucratis is given by Herodotus (ii. 178); they were the Hellenion, common to all the colonizing cities, and those dedicated to *Cleisthenes* (1), *ad fin.*
by the Aeginetans to Zeus, by the Samians to Hera, and by the Milesians to Apollo. A temple of Aphrodite is also mentioned by Athenaeus. Traces of all these temples, except that of Zeus, or at least dedications coming from them, have been found in the excavations, and another has been added to them, the temple of the Dioscuri. The two chief sites to be cleared were the temples of Apollo and of Aphrodite, in both of which successive buildings of various date were found. Both were remarkable for the great mass of early painted pottery that was found; in the temple of Apollo this had been buried in a trench; in that of Aphrodite it was scattered over the whole surface in two distinct strata. A great deal of it was local ware, but there were also imported vases from various Greek sites. In addition to these temples, there was also found a great fortified enclosure, about 580 ft. by 750, in the south-eastern part of the town; within it was a square tower or fort; a portico of entrance and an arc of rows of sphinxes inlaid in t. Ptolemaic, as is shown by the foundation deposits found at the corners of the portico; these consisted of models of the tools and materials used in the buildings, models of instruments for sacrifice or ceremonies, and cartouches of King Ptolemy Philadelphus. Professor Petrie naturally supposed this great enclosure to be the Hellenion or common sanctuary of the Greeks, but Mr. Hogarth subsequently found traces of another great walled enclosure to the north-east of the town, together with pottery dedicated 70377. Εὐλαργός 666, and he claims with reason that this enclosure was in Greece, and the Mazarin, as he thought, of the early Greek antiquities have been found in the southern part of the town, which seems rather to have been a native settlement. The cemetery of the ancient town was found on two low mounds to the north, but was mostly of Ptolemaic date.

Apart from the historic interest of the site, as the only Greek colony in Egypt in early times, the chief importance of the excavations lies in the rich finds of early pottery and in the inscriptions upon them, which throw light on the early history of the alphabet. The most flourishing period of the town was from the accession of Amathus II. in 341 B.C. to the Persian invasion of 620 B.C., when the contents of the temples must have been destroyed. The earlier chronology has been much disputed. There are clear traces of a settlement going back to the 7th century, including a scarab factory, which yielded numerous scarabs, not of native Egyptian manufacture, bearing the names of the kings that preceded Amasis. Among these were fragments of early Greek pottery. It seems a fair inference that the makers of these were Greeks, and that they probably represent the early Milesian colony, settled here in the time of Psammethichus I., before the official assignment of the site by Amasis to the Greek colonists of various cities. The most important of the antiquities found are now in the British Museum.

See W. M. F. Petrie, &c., "Naukratis I.", third Memoir of the Egypt Exploration Fund (1886); E. A. Gardner, &c., "Naukratis II.", sixth Memoir of same (1889); D. G. Hogarth, &c., "Annual of the British School at Athens" (1896-1899). (E. Gr.)

NAUDÉ, GABRIEL (1600-1653), French librarian and scholar, was born in Paris on the 2nd of February 1600. He studied medicine at Paris and Padua, and became physician to Louis XIII. In 1629 he became librarian to Cardinal Bagni at Rome, and on Bagni's death in 1641 librarian to the Cardinal Barberini. At the desire of Richelieu he began a wearisome controversy with the Benedictines, denying Gerson's authorship of De Imitatione Christi. Richelieu intended to make Naudé his librarian, and on his death Naudé accepted a similar offer on the part of Mazarin, and for the next ten years devoted himself to bringing together from all parts of Europe the noble assemblage of books known as the Bibliothèque Mazarine. Mazarin's library was sold by the parlement of Paris during the troubles of the Fronde, and Queen Christina invited Naudé to Stockholm. He was not at all induced by this appeal that he should re-form his scattered library Naudé returned at once. But his health was broken, and he died on the journey at Abbeville on the 30th of July 1653. The friend of Gui Patin, of Pierre Gassendi and all the liberal thinkers of his time, Naudé was no mere bookworm; his books show traces of the critical spirit which made him a worthy colleague of the humorous and scholars who prepared the way for the better known writers of the siècle de Louis XIV.

Including works edited by him, a list of ninety-two pieces is given in the Nauadana. The chief are Le Marfore, ou discours contre les libelles (Paris, 1620), very rare, reprinted 1658; Instruction à la France sur la vérité de l'histoire des Frères de la Rose-Croix (1660), &c., disbelieving their impurities; Apologie pour tous les grands personnages faussement soupçonnés de magie (1625, 1629, 1669, 1712), Pythagoras, Socrates, Thomas Aquinas and Solomon are among those defended. Avis pour dresser une bibliothèque (1629), an essay on the arrangement of libraries; Naukratis (1639), full of sound and learned views on librarianship; Addition à l'histoire de Louis XIV. (1630), this includes an account of the origin of printing; Bibliographia polymaths, sive aenigmatica (1633, 1639, 1642), a mere catalogue of the bibliographical value; De studio liberali syntagma (1632, 1654), a practical treatise found in most collections of directions for studies; De studio militari syntagma (1657), esteemed in its day; Considerations politiques sur les coups d'état (Rome [Paris], 1639; first edition rare, augmented by Dumay, 1752), this contains an apology for the massacre of St Bartholomew; Biblioth. Cordesianae Catalogus (1643), classified, Jugement de tout ce qui a été imprimé contre le Cardinal Mazarin (1646), Naudé's best work, and one of the ablest defenses of Mazarin; it is written in the form of a dialogue between Saint-Angé and Mascaret, and is usually known under the name of the latter.

Mazarine (1868).

NAUGATUCK, a township and borough of New Haven county, Connecticut, U.S.A., on the Naugatuck river, 5 m. S. of Waterbury, with an area of 17 sq. m. in 1906. Pop. (1890) 6218, (1900) 10,541, of whom 3342 were foreign-born, (1910 census) 12,722. It is served by the New York, New Haven & Hartford railroad and by interurban electric railways. Among the principal public buildings are the Whittmore Memorial Public Library (1852), a fine high school and the large Salem school (part of the public school system), all given to the borough by John Howard Whittmore of Naugatuck, who in addition endowed the library and the high school. The town furnishes water-power. Among the manufactures are rubber goods, chemicals, iron castings, woollen goods, cutlery, &c. The value of the factory products increased from $8,886,676 in 1900 to $11,009,573 in 1905, or 23.9%. The prominence of the rubber industry here is due to Charles Goodyear (q.v.), who in 1821 entered into partnership with his father Amasa Goodyear for the manufacture of hardware. Vulcanized rubber overshoes were first made in Naugatuck, and in 1843 the Goodyear's Metallic Rubber Shoe Company was chartered by the Connecticut legislature. The town was formed from parts of Waterbury, Bethany and Oxford, and was incorporated in 1844; the borough was chartered in 1893; and the two were combined in 1895.

NAUHEIM, or BAD-NAUHEIM, a watering-place of Germany, in the grand-duchy of Hesse-Darmstadt, situated on the north-east slope of the Taunus Mountains, 23 m. by rail N. of Frankfurt-on-Main on the main line of railway to Cassel. Pop. (1905) 5054. It has three Evangelical, a Roman Catholic and an English church. Its thermal waters (84° to 95° F.), although known for centuries, were, prior to 1835, only employed for the treatment of hydrophobia and a few other diseases. The town has several parks, the largest being the Kurpark, 125 acres in extent, in which are the Kurhaus and the two chief springs. The waters, which are saline, strongly impregnated with carbonic acid, and to a less extent with iron, are principally used for bathing, and are specific in cases of gout and rheumatism, but especially for the treatment of heart affections. Three smaller springs, situated outside the Kurpark, supply water for drinking. In 1899-1900 a new spring (saline) was tapped at a depth of 682 ft. Another attraction of the place is the Johannisberg, a hill 773 ft. high, immediately adjoining the Kurpark, which was bestowed by Napoleon upon Marshal Davout, became a town in 1854. From 1815 to 1866 it belonged to the electorate of Hesse-Cassel, but in 1866 it was ceded to
The grand-duchy of Hesse-Darmstadt. It was the scene of fighting between the French and the Germans in 1752 and again in 1792.

See Grödel, Bad Nauheim, seine Kurmittel (9th ed., Friedberg, 1903); Credner, Die Kurmittel in Bad Nauheim (Leipzig, 1894); Bogd, Bad Nauheim, seine Kurmittel und Erfolge (Wiesbaden, 1889); and Seubner, Die Park- und Waldanlagen von Bad Nauheim (Nauheim, 1906).

NAUPELLE, a large cavelon on the left bank of the Lesse, which joins the Meuse above Dinant, Belgium. Here in 1866 Edouard Dupont discovered an imperfect human lower jaw, now in the Brussels Natural History Museum. It is of a very ape-like type in its extreme projection and that of the teeth such as have been known in fossils. He is distinguished for his Florilegium, which was now at Dinant in 1885.

NAUMACHIA, the Greek word denoting a naval battle (nau, ship, naukû, battle). These entertainments took place in the amphitheatre, which was flooded with water, or in specially constructed basins (also called naumachie). The first on record, representing an engagement between a Tyrian and an Egyptian fleet, was given by Julius Caesar (46 B.C.) on a lake which he constructed in the Campus Martius. In 2 B.C. Augustus, at the dedication of the temple of Mars Ultor, exhibited a naumachia between Athenians and Persians, in a basin probably in the Hortus Caesaris, where subsequently Titus gave a representation of a sea-fight between Corinth and Corea. In that given by Claudius (A.D. 52) on the latus Fucius, 19,000 men dressed as Rhodians and Sicilians manoeuvred and fought. The crews consisted of gladiators and condemned criminals; in later times, even of volunteers.

See L. Friedländer in J. Marquart, Römische Staatsverwaltung, iii. (1885) p. 558.

NAUMACHUS, a Greek gnomic poet. Of his poems 73 hexameters (in three fragments) are preserved by Stobaeus in his Florilegium; they deal mainly with the duty of a good wife. From the remarks on celibacy and the allusion to a mystic marriage it has been conjectured that the author was a Christian. The fragments, translated anonymously into English under the title of Advice to the Fair Sex (1730), are in Gaisford's Pòtæa minores Græci, iii. (1823).

NAUEN, GEORG AMADEUS CARL FRIEDRICH (1707–1783). German mineralogist and geologist, was born at Dresden on the 30th of May 1707, the son of a distinguished musician and amateur. He received his early education at Worms, studied at Freiberg under Werner, and afterwards at Leipzig and Jena. He graduated at Jena, and was occupied in 1823 in teaching in that town and in 1824 at Leipzig. In 1826 he succeeded Mohs as professor of crystallography, in 1835 he became professor also of geology at Freiberg; and in 1842 he was appointed professor of mineralogy and geology in the university of Leipzig. At Freiberg he was charged with the preparation of a geological map of Saxony, which he carried out with the aid of Bernhard von Cotta in 1846. He was a man of encyclopaedic knowledge, lucid and fluent as a teacher. Early in life (1811–1822) he travelled in Norway, and his observations on that country, and his subsequent publications on crystallography, mineralogy and geology established his reputation. He was awarded the Wollaston Medal by the Geological Society of London in 1868. He died at Leipzig on the 26th of November 1873.

He published Beiträge zur Kenntnis Norwegens (2 vols., 1824); Lehrbuch der Mineralogie (1828); Lehrbuch der reinen und angewandten Krystallographie (2 vols. and atlas, 1830); Elemente der Mineralogie (1845; ed. 9, 1874; the 10th ed. by F. Zirkel, 1877); Lehrbuch der Geognosie (2 vols. and atlas, 1849–1854, ed. 2, 1858–1877).

NAUMBURG, a town of Germany, in the province of Prussian Saxony, the seat of the provincial law courts and court of appeal for the province and the neighbouring districts. It is situated on the Saale, near its junction with the Unstrut, in the centre of an amphitheatre of vine-clad hills, 29 m. S.W. from Halle, on the railway to Weimar and Erfurt. Pop. (1905) 25,137.

The cathedral, an imposing building in the Romanesque Transition style (1207–1243), has a Gothic choir at each end, and contains some interesting medieval sculptures. It is remarkable for its large crypt and its towers, a fourth having been added in 1804, the gift of the emperor William II. There are also four other Protestant churches (of which the town church, dedicated to St Wenceslaus and restored in 1892–1894, possesses two pictures by Lucas Cranach the elder), a Roman Catholic church, a gymnasium, a modern school, an orphanage and three hospitals. A curious feature of the town is the custom, which has not yet died out, of labelling the houses with signs, such as the "swan," the "leopard" and the "lion." The industries of the place are the spinning of cotton and woollen fabrics, chemicals, combs, beer, vinegar and leather. On the hills to the north of the town, across the Unstrut, lies Schenkemburg, once the residence of the poet Gellert, and noticeable for the grotesque carvings in the sandstone rocks.

In the 10th century Naumburg was a stronghold of the margraves of Meissen, who in 1029 transferred to it the bishopric of Zeitz. In the history of Saxony it is memorable as the scene of various treaties; and in 1561 an assembly of Protestant princes was held there, which made a futile attempt to cement the divided Protestants. The city was seized and destroyed in 1613 by the last bishop died, and the bishopric fell to the elector of Saxony. In 1631 the town was taken by Tilly, and in 1632 by Gustavus Adolphus. It became Prussian in 1814. An annual festival, with a procession of children, which is still held, is referred to an apocryphal siege of the town by the Hussites in 1432, but is 'probably connected with an incident in the 'brothers' war (1447–51), between the elector Frederick II. of Saxony and his brother Duke William. Karl Peter Lepsius (1775–1853), the antiquary and his more distinguished son Richard the Egyptologist, were born at Naumburg.

See E. Borkowski, Die Geschichte der Stadt Naumburg an der Saale (Stuttgart, 1897); E. Hoffmann, Naumburg an der Saale im Zeitalter der Reformation (Leipzig, 1900); S. Braun, Naumburger Annalen vom Jahre 799 bis 1613 (Naumburg, 1892); Patrich, Naumburg an der Saale, sein Dom und andere allertümliche Bauwerke (Leipzig, 1841–1843); and Wispel, Entwicklungsgeschichte der Stadt Naumburg an der Saale (Naumburg, 1903).

NAUNTON, SIR ROBERT (1563–1635). English politician, the son of Henry Naunton of Aulterton, Suffolk, was educated at Trinity College, Cambridge, becoming a fellow of his college in 1585 and public orator of the university in 1594. Walter Devereux, earl of Essex, enabled him to spend some time abroad, sending information about European affairs. Having returned to England, he entered parliament in 1606 as member for Helston, and he sat in the five succeeding parliaments; in 1614 he was knighted, in 1616 he became master of requests and later surveyor of the court of wards. In 1618 his friend Buckingham procured for him the position of secretary of state. Naunton's strong Protestant opinions led him to favour more active intervention by England in the interests of Frederick V., and more vigorous application of the laws against Roman Catholics. Gondomar, the Spanish ambassador, complained to James, who censured his secretary. Consequently in 1623 Naunton resigned and was made master of the court of wards. He died at Letheringham, Suffolk, on the 27th of March 1635. Naunton's valuable account of Queen Elizabeth's reign was still in manuscript when he died. As Fragmenta regalia, written by Sir Robert Naunton, it was printed in 1641 and again in 1642, a revised edition, Fragmenta Regalia, or Observations on the late Queen Elizabeth, Times and Favourites, being issued in 1653. It was again published in 1832. He was a Fellow of the Society of Antiquaries, and died without issue in 1656. It has also been printed in several collections and has been translated into French and Italian. There are several manuscript copies extant, and some of Naunton's letters are in the British Museum and in other collections.

See Memoirs of Sir Robert Naunton (1814).

NAUPACTUS (Ital. Lepanto, mod. Gr. Epako). A town in the district of Acarnania and Aetolia, Greece, situated on a bay on the north side of the straits of Lepanto. The harbour, once the best on the northern coast of the Corinthis Gulf, is now
NAUPLIA—NAUTILUS

279

almost entirely choked up, and is accessible only to the smallest craft. Naupactus is an episcopal see; pop. about 2300. In Greek legend it appears as the place where the Heracleidae built a fleet to invade Peloponnese. In historical times it belonged to the Ozolian Locrians; but about 435 B.C., in spite of a partial resettlement with Locrians of Opus, it fell to the Athenians, who peopled it with Meanean refugees and made it their chief naval station in western Greece during the Peloponnesian war. In 404 it was restored to the Locrians, who subsequently lost it to the Achaenians, but recovered it through Epaminondas. Philip II of Macedon gave Naupactus to the Aetolians, who held it till 197, when it was captured by the Roman army. The mouth of the Gulf of Lepanto was the scene of the great sea-fight in which the naval army of Turkey was defeated. It was still flourishing about A.D. 170, but in Justinian's reign was destroyed by an earthquake. In the middle ages it fell into the hands of the Venetians, who fortified it so strongly that it was never taken and was captured in 1678 by the Venetians, and again in 1699, by the French. In the war of independence it finally became Greek once more (March 1829).

See Strabo ii. pp. 426-427; Pausanias x. 38. 10-13; Thucydides iii. passim; Livy, bk. xxxvi, passim; E. L. Hicks and G. F. Hill, Greek Hierarchical Inscriptions (Oxford, 1901), No. 25.

NAUPLIA, a town in the Peloponnese, at the head of the Argolic Gulf. In the early part of the war it was of no importance, and when Pausanias lived, about A.D. 150, it was deserted. At a very early time, however, it seems to have been of greater note, being the seaport of the plain in which Argos and Mycenae are situated, and several tombs of the Mycenaean age have been found. A hero Nauplius took part in the Argonautic expedition; another was king of Euboea. The mythic importance of the town revived in the middle ages, when it became one of the chief cities of the Morea. It was captured in 1211 by Godfrey Villehardouin with the help of Venetian ships; a French dynasty ruled in it for some time, and established the feudal system in the country. In 1386 it was Venetian; but after the fall of the Empire it passed into the hands of the Turks. It was captured by Venice in 1686, and Palamidi on the hill overlooking the town was made a great fortress. In 1715 it was taken by the Turks; in 1770 the Russians occupied it for a short time. The Greeks captured it during the War of Independence on the 12th of December 1822, and it was the seat of the Greek administration till 1833, when Athens became the capital of the country. It is the chief town of the department of Argolis (pop. in 1867 81,943); pop. about 6000.

NAUSEA, (from Gr. ναυαχία, a ship), sea-sickness, or generally any disposition to vomit; also used figuratively to denote feelings of strong aversion or dislike.

NAUSICAÆ, in Greek legend, daughter of Alcinous, king of the Phaeacians in the island of Scheria (Odyssey, vi. 15: 352; viii. 457.) When Odysseus (Ulysses) was swept in the sea from the raft on which he had left the home of Calypso, he swam ashore to Scheria, where he fell asleep on the bank of a river. Here he was found by Nausicaa, who supplied him with clothes and took him to her father's palace, where he was hospitably entertained. She said to him, "You are not the son of Telamon, who is the father of Telemachus." The incident of Odysseus and Nausicaa formed the subject of a lost play by Sophocles and was frequently represented in ancient art.

NAUTCH, (Hindostani nāch), an Indian ballet-dance. The nautch is performed by nautch-girls, who move their feet but little, and the dance consists of swaying the body and posturing with the arms.

NAUTULUS. The term nautilus, meaning simply "the sailor," was applied by the ancient Greeks to the genus of eight-armed cephalopods which is now known as the paper nautilus, and whose scientific name is Aragonia (see CEPHALOPODA).

This animal is not uncommon in the Mediterranean, and from its habit of floating at the surface attracted the attention of the fishermen and sailors of the Aegean Sea from the earliest times. The popular belief that the expanded arms are raised above the water to act as sails and that the other arms are used as oars was not based on any actual observation of the living animal, and it is now known that although the animal floats at the surface it does not sail, the expanded arms being applied to the exterior surface of the shell, which is secreted by them. The eggs are carried in the shell, and as this structure is entirely absent in the males, there is good reason to conclude that the habit of carrying the eggs and using one pair of arms for that purpose gave rise to the modification of those arms and the secretion of the shell by them. Huxley once expressed the truth of the matter with characteristic felicity in the remark that if the shell of the Argonaut is to be compared to anything of human invention or construction at all, it should be compared, not to a ship or boat, but to a perambulator.

The shell of Argonauta (see fig. 1) is spirally coiled and symmetrical, and thus bears a remarkable resemblance to the shell of the pearly nautilus and the extinct ammonites, especially as it is like that of the pearly nautilus coiled towards the dorsal or anterior surface of the animal. It is ornamented by ridges and furrows which pass in transverse curves from the inner to the outer margin of the coil. The outer margin or keel is somewhat flattened and the whole shell is compressed from side to side. It differs entirely from the shell of the pearly nautilus in the absence of internal septa and siphuncle and in the absence of any attachment between it and the body. It is in fact entirely different in origin and relations to the body from the typical molluscan shell secreted by the mantle in other Cephalopods and other types of Mollusca. It is a structure sui generis, unique in the whole phylum of Mollusca.

The only description of the living animal by a competent observer which we have is that of Lacaze-Duthiers, made on a single specimen on the Mediterranean coast of France, and published in 1892, and even this is in some respects incomplete. The specimen after capture was carried in a bucket, and became separated from its shell. When placed with the shell in a large aquarium tank the animal resumed possession of the shell and assumed the attitude shown in fig. 1. The shell floated at the surface, doubtless in consequence of the inclusion of some air in the cavity of the shell. It is not known with certainty that the animal is able in its natural state to descend below the surface; the specimen here considered never did so of its own accord, and when pushed down always rose again.

FIG. 1.—The Argonaut in life. (After Lacaze-Duthiers.)

Tr, Float; Br. a, ventral or posterior arms; Br. p, dorsal or anterior arms; V, the expanded portion of them, once called the sails; B, the beak; C, the shell; E, the funnel.
The siphon or funnel is unusually large and prominent, and is the chief or only organ of locomotion, the water which is expelled from it driving the animal backwards. The arms are usually turned backwards and carried inside the shell, to the inner surface of which the suckers adhere, but one or two arms are from time to time extended in front. This does not apply to the dorsal arms which are applied to the outside of the shell, and the expanded membrane of these arms covers the greater part of its surface. The dorsal arms are turned backwards, and each is twisted so that the oral surfaces face each other and the suckers are in contact with the shell. The membrane or velum is thin, and is really a great expansion of a dorsal membrane similar to that which is found along the median dorsal line of the two posterior arms. The suckers of the originally posterior series of each dorsal arm lie along the external border of the shell, and the arm with its two rows of suckers extends round the whole border of the membrane, the arm being curved into a complete loop, so that its extremity reaches almost to the origin of the membrane near the base of the arm, the extremity being continued on to the internal surface of the membrane. The external row of suckers, originally the posterior row, are united by membrane which is continuous with the velum. The smaller suckers on the more distal part of the arm, which extends along the edge of the shell-aperture, are quite sessile. In the figure of Lacaze-Duthiers (fig. 1) the suckers appear to be turned away from the shell, but this is erroneous. A figure showing the natural position is given in the Monograph of the Cephalopoda in the series of Monographs issued by the Zoological Station of Naples.

The animal described by Lacaze-Duthiers lived a fortnight in captivity, during which time it devoured with avidity small fishes that were presented to it, seizing them, not by throwing out all the ventral arms, but by means of the suckers near the mouth. Judging from these observations, Argonauta is a pelagic animal which lives and feeds near the surface of the ocean. Several species of Argonauta are known, distributed in the tropical parts of all the great oceans. The male is much smaller than the female, not exceeding an inch or so in length. It secretes no shell and its dorsal arms are not modified. The third arm on the left side, however, is modified in another way in connexion with reproduction. Argonauta is one of the Cephalopods in which the process known as hectocotylization of one arm is developed to its extreme degree, the arm affected becoming ultimately detached and left by the male in the mantle cavity of the female where it retains for some time its life and power of movement. The hectocotylus or copulatory arm in the Argonaut is developed at first in a closed cyst (fig. 2), which afterwards bursts, allowing the arm to uncloil; the remains of the cyst form a sac on the back of the arm which serves to contain the spermatozoa.

The animal known as the Pearly Nautilus was unknown to the ancient Greeks, since its habitat is the seas of the far East, but in the middle ages, when its shell became known in Europe, it was called, from its superficial similarity to that of the original nautilus, by the same name. It was Linnaeus who, in order to distinguish the two animals, took the name "nautilus" from the animal to which it originally belonged and bestowed it upon the very different East Indian Mollusc, giving to the original nautilus the new name Argonauta. Zoological nomenclature dates from Linnaeus, and thus the nautilus is now the name of the only living genus of Tetrabranchiate Cephalopods. A detailed description of this animal is given in the article Cephalopoda (p. 8); it is only necessary to add here a brief account of its mode of life and habits.

Four species are known from the Indian and Pacific oceans; they are gregarious and nocturnal animals living at some depth and appearing only after dark. The greatest interest attaches to the great Nautilus pompilius, the largest marine animal as represented by Dr Willey with the oral surface downwards, the tentacles spread out, and the shell vertical. The chambers of the shell have no communication with one another nor with the siphon; the nautilus is therefore always the same age, but grows by the addition of new large chambers. These are filled with a nitrogenous gas. This necessarily very much reduces the specific gravity of the animal, but it is still heavier than the water and does not seem capable of rising to the surface any more than an octopus. Nautilus pompilius is the largest animal at present known in the East Indian Archipelago, for example at Amboyna in the Moluccas. In 1901-1902 Dr Arthur Willey of Cambridge University spent some time in that region for the purpose of investigating the reproduction and development of the animal. He stationed himself at New Britain, known to the Germans as Neu Pommer, an island of the Bismarck Archipelago off the coast of Papua. The natives of this island use the nautilus for food, capturing them by means of a large fish-trap similar in construction to the cylindrical lobster-traps used by British fishermen. Fish is used for bait. Dr Willey found the males more numerous than the females; of a hundred specimens captured on one occasion only two were females. He kept specimens alive both in vessels on shore and in large baskets moored at the bottom of the sea. He found that when they were placed in a vessel of sea-water, a small pump of fresh water was used to suck for the mantle cavity. Some of the females laid eggs in captivity, but these were found not to be fertilized; they were about 3.5 centimetres long and attached singly by a broad base to the sides of the cagliari, in which the animals could be kept for some time.

NAUVOO, a city of Hancock county, Illinois, U.S.A., on the Mississippi river at the head of the lower rapids and about 50 m. above Quincy. Pop. (1900) 13,521; (1910) 10,200. On the opposite bank of the river is Montrose, Iowa (pop. in 1910, 708), served by the Chicago, Burlington & Quincy railway. Nauvoo is the seat of St Mary’s Academy and Spalding Institute (1907), two institutions of the Benevolent Sisters. “Commerce City” was laid out here in 1834 by Connecticut speculators; but the first settlement of importance was made by the Mormons in 1839-1840; they named it Nauvoo,1 in obedience to a "revelation" made to Joseph Smith, and secured a city charter in 1840. Four years later its population was about 15,000, and a large Mormon temple had been built, but internal dissensions arose, “gentile” hostility was aroused, the charter of Nauvoo was revoked in 1845, two of the leaders, Joseph Smith and his brother Hyrum, were killed at Carthage, the county-seat, by a mob, and in 1846 the sect was driven from the state. Traces of Mormonism, however, still remain in the ruins of the temple and the names of several of the streets. Three years after the expulsion of the Mormons Nauvoo was occupied by the remnant (some 250) of a colony of French communists, the Icarians, who had come out under the leadership of Etienne Cabet (q.v.). For a few years the colony prospered, and by 1855 its membership had doubled. It was governed under a constitution, drafted by Cabet, which vested the legislative authority in a general assembly composed of all the males twenty years of age or over and the administrative authority in a board of six directors, three of whom were elected every six months for a term of one year. Each family owned its own home, but property was held in common, all ate at the common table, and the children were taught in the community school. In December 1855 Cabet proposed a revision of the constitution to give him greater authority. This resulted in rending the colony into two irreconcilable factions, and in October 1856 Cabet with the minority (172) withdrew to St Louis, Mo., where he died on the 8th of November. In May 1858 the surviving members of his faction took a few fresh arrivals from France established a new

1 The Mormons said the name was of Hebrew origin and meant "beautiful place"; Hebrew "naveh" means "pleasant."
NAVAHO—NAVARRE

281

Icarian colony at Cheltenham near St Louis, but this survived only for a brief period. Nauvoo was never intended to be more than a temporary home for the Icarians. Soon after the schism of 1856 those who had rebelled against Cabet began to prepare a permanent home in Adams county, Iowa. There too in 1879 the community split into two factions, the Young Party and the Old Party. Some time before this separation a few members of the colony removed to the vicinity of Cloverdale, Sonoma county, California, and here most of the members of the Young Party joined them early in 1884 in forming the Icaria-Speranza Community. This society tried a government quite different from that first adopted at Nauvoo, but it ceased to exist after about three years. The Old Party also adopted a new constitution, but it too was dissolved in 1895.

See Albert Shaw, Icaria: A Chapter in the History of Communism (New York, 1884); Jules Frondhommeaux, Icaria et son fondateur Etienne Cabet (Paris, 1907); and H. Lux, Etienne Cabet et der Ikarische Kommunismus (Stuttgart, 1894).

NAVAHO, or Navajo, a tribe of North American Indians of Athabaskan stock. They inhabit the northern part of Arizona and New Mexico. The majority live by breeding horses, sheep and goats. They are well known for their beautiful blanket weaving. (See INDIANS, NORTH AMERICAN.)

NAVAN, a market town of county Meath, Ireland, situated at the confluence of the Blackwater with the Boyne. Pop. (1901) 3839. It is a railway junction of some importance, where the southern and Kildare branches of the Dublin and Waterford railway cross the Drogheda and Oldcastle branch of the Great Northern. By the former it is 30 m. N.W. of Dublin. Navan is the principal town of county Meath (though Trim is the county town), and has considerable trade in corn and flour, some manufacture of woollens and of agricultural implements, and a tannery. Navan was a barony of the patrimony of Meath, was walled and fortified, and was incorporated by charter of Edward IV. It suffered in the civil wars of 1641, and returned two members to the Irish parliament until the Union in 1800. It is governed by an urban district council, and is a favourite centre for rod-fishing for trout and salmon.

NAVARINO, BATTLE OF, fought on the 20th of October 1827, the decisive event which established the independence of Greece. By the treaty signed in London on the 6th of July 1827 (see GREECE, HISTORY), England, France and Russia agreed to demand an armistice, as preliminary to a settlement. Sir Edward Codrington, then commander-in-chief in the Mediterranean, received the treaty and his instructions on the 10th/11th of August at Smyrna, and proceeded at once to Nauplia to communicate them to the Greeks. His instructions were to demand and an armistice, to intercept all supplies coming to the Turkish forces in the Morea from Africa or Turkey in general, and to look for directions to Straitford Canning (Lord Straitford de Redcliffe), the British ambassador at Constantinople. The ambassador's instructions reached Codrington on the 7th of September. He was accompanied to Nauplia by his French colleague, Rear-Admiral de Rigny. The Greek government agreed to accept the armistice. Admiral de Rigny left for a cruise in the Levant, and Sir Edward Codrington, hearing that an Egyptian armament was on its way from Alexandria, and believing that it was bound for Hydra, steered for that island, which he reached on the 19th of September, but on the 20th of September found the Egyptians at anchor with a Turkish squadron at Navarino. The Turkish government refused to accept the armistice. On the 19th of September, seeing a movement among the Egyptian and Turkish ships in the bay, Codrington informed the Ottoman admiral, Tahir Pasha, that he had orders to prevent hostile movements against the Greeks. Admiral de Rigny joined him immediately afterwards, and a joint note was sent by them on the 22nd of September to Ibrahim Pasha, who held the supreme command for the sultan. On the 25th an interview took place, in which there gave a verbal engagement not to act against the Greeks, pending orders from the sultan. The allies, who were in want of stores, now separated, Codrington going on to Zante and de Rigny to Cervi, where his store ships were.

Frigates were left to watch Navarino. The British admiral had barely anchored at Zante before he was informed that the sultan's forces were putting to sea. On the 29th of September a Greek naval force, commanded by an English Philhelene, Captain Frank Abney Hastings, had destroyed some Turkish vessels in Salamis; on the north side of the Gulf of Corinth, off the 3rd to the 5th of October Codrington, who had with him only his flagship the "Asia" (84) and some smaller vessels, was engaged in turning back the Egyptian and Turkish vessels, a task in which he was aided by a violent gale. He resumed his watch off Navarino, and on the 13th was joined by de Rigny and the Russian rear-admiral Heiden with his squadron. By general agreement among the powers the command was entrusted to Codrington, and the allied force consisted of three British, four French and four Russian sail of the line, if the French admiral's flagship the "Sirène" (60), which was technically "a double banked frigate," be included. There were four British, one French and four Russian frigates, and six British and French brigs and schooners. The Egyptians and Turks had only three line of battleships and fifteen large frigates, together with a swarm of small craft which raised their total number to eighty and upwards. Ibrahim Pasha, though unable to operate at sea, considered himself at liberty to carry on the war by land. His men were actively employed in burning the Greek villages, and reducing the inhabitants to slavery. The flames and smoke of the destroyed villages were clearly seen from the fleet. On the 17th of October, an expostulation was sent in to Ibrahim Pasha, but was returned with the manifestly false answer that he had left Navarino, and that his officers did not know where he was. The admirals, therefore, decided to stand into the bay and anchor among the Egyptian and Turkish ships. A French officer in the Egyptian service, of the name of Letellier, had anchored the vessels of Ibrahim and the Turkish admiral in a horseshoe formation, of which the points touched the entrance to the bay, and there were forts on the lands at both sides of the entry. The allies entered in two lines—one formed of the French and British led by Codrington in the "Asia," the other of the Turks and Russians. After the expostulation was sent in, Ibrahim Pasha anchored in the free water in the midst of Ibrahim's fleet. The officer commanding the British frigate "Dartmouth" (42), Captain Fellowes, seeing a Turkish fireship close to windward of him, sent a boat with a demand that she should be removed. The Turks fired, killing Lieutenant G. W. H. Fitzroy, who brought the message, and several of the boat's crew. The "Dartmouth" then opened "a defensive fire," and the action became general at once. The allies, who were all closely engaged, were anchored among their enemies, and the result was obtained by their heavier artillery; and their better gunnery. These four days of Turkish and Egyptian vessels were sunk by the assailsants, or fired by their own crews. On the allied side the British squadron lost 73 killed and 197 wounded; the French 43 killed and 183 wounded; the Russians 59 killed and 139 wounded. In the British squadron Captain Walter Bathurst of the "Ganoa" (74) was slain. The loss of the Turks and Egyptians was never accurately reported, but it was certainly very great.

In its effects on the international situation Navarino may be reckoned one of the decisive battles of the world. It not only made the efforts of the Turks to suppress the Greek revolt hopeless, but it made a much difficult to heal the traditional friendship between Great Britain and Turkey, which had its effect during the critical period of the struggle between Mehemet Ali and the Porte (1831-1841). It precipitated the Russo-Turkish war of 1828-1829, and, by annihilating the Ottoman navy, weakened the resisting power of Turkey to Russia and later to Mehemet Ali.

NAVARRE (Span. Navarro), an inland province of northern Spain, and formerly a kingdom which included part of France. The province is bounded on the N. by France (Basses Pyrénées) and Guipúzcoa, E. by Huesca and Saragossa, S. by Saragossa.
and Logroño and W. by Álava. It is traversed from east to west by the Pyrenees and the Cantabrian Mountains, and almost the whole of the province is overrun by the ramifications of these ranges. From Navarre there are only three practicable roads for carriages into France—those by the Puerta de Vera, the Puerta de Maya and Roncesvalles. The highest summit in the province is the Monte Adi (4031 ft.). The chief river flowing towards the Atlantic is the Bidasoa, which rises near the Puerta de Maya, and after flowing southwards through the valley of Baxtán takes a north-easterly course, and for a short distance above its outset at Fuenterribiana constitutes the frontier between France and Spain (Güipúzcoa); by far the larger portion of Navarre is drained by rivers which flow towards the western Pyrenean stock. Game, both large and small, is plentiful in the mountains, and the streams abound with trout and other fish. Gypsum, limestone, freestone and marble are quarried; there are also mines of copper, lead, iron, zinc and rock salt. Mineral and thermal springs are numerous, but none is of more than local fame. The other industries include manufactures of arms, paper, chocolate, candles, alcohol, leather, coarse linens and cloth. The exports both by rail and by the passes in the Pyrenees consist of live stock, oil, wine, wool, leather and paper. As the Basques and Gascons, who occupied the southern slope of the western Pyrenees, crossed the border and skirts the western frontier, sends out a branch line from Castejón to Pamplona and Alsasua junction, where it connects with the Northern railways from Madrid to France. Narrow-gauge railways convey timber and ore from the mountains to these main lines. Pamplona, the capital (pop., 1900, 28,886), and Tudela (9449) are described in separate articles. The only other towns with more than 5000 inhabitants are Baxtán (9234), Corella (6793), Estella (5736) and Tafalla (5490).

History.—The kingdom of Navarre was formed out of a part of the territory occupied by the Vascones, i.e. the Basques and Gascons, who crossed the border and occupied the southern slope of the eastern Pyrenees, and part of the shore of the Bay of Biscay. In the course of the 6th century there was a considerable emigration of Basques to the north of the Pyrenees. The cause is supposed to have been the pressure put upon them by the attacks of the Visigoth kings in Spain. Yet the Basques maintained their independence. The name of Navarre is derived by etymologists from „navar” a flat valley surrounded by hills (a commonplace name in Spain; cf. Navas de Tolosa to the south of the Sierra Morena) and „erri” a region or country. It began to appear as the name of part of Vascobobo Valley the end of the Visigoth epochs in Spain in the 9th century. Its early history is more obscure than usual. In recent times ingenious attempts have been made to trace the descent of the first historic king of Navarre from one Semen Lupus, duke of Aquitaine in the 6th century. The reader may consult La Vasconie by Jean de Jaurgain (Paris, 1898) for the latest example of this reconstruction of ancient history from fragmentary and dubious materials. Jaurgain has been subjected to very damaging criticism by L. Barray-Dhíengo (Revue Hispanique, t. vili. 141). The first historic king of Navarre was Sancho Garcia, who ruled at Pamplona in the early years of the 8th century. Under him and his immediate successors Navarre reached the height of its power and its extension (see Spain: History, for the reign of Sancho El Mayor, and the establishment of the Navarrese line as kings of Castile and Leon, and of Aragon). When the kingdom was at its height it included all the modern province of the name; the northern slope of the western Pyrenees called by the Spaniards the „Ultra-pueblos” or country beyond the passes, and now known as French Navarre; the Basque provinces; the Bureba, the valley between the Basque Mountains and the peak of Monte Bucorg; the Rioja and Taranza in the upper valley of the Ebro. In the 13th century the kings of Castile gradually annexed the Rioja and Álava. While Navarre was reunited to Aragon—1076-1114—(see Spain: History) it was saved from aggression on the east, but did not recover the territory taken by Castile. About the year 1200 Alfonso VIII of Castile annexed the other two Basque provinces, Biscay (Vizcaya) and Guipúzcoa. Taranza remained in possession of Aragon. After 1234 Navarre, though the crown was claimed by the kings of Aragon, passed by marriage to the line of the French kings. In 1316 Spanish Navarre was finally annexed by Ferdinand and the Catholic Kings. Navarre as a state survived as an independent little kingdom till it was united to the crown of France by Henry IV. founder of the Bourbon dynasty. From 1510 until 1833, when it was fully incorporated with Spain, Navarre was a viceroyalty.

As originally organized, Navarre was divided into Merindades, or districts, governed by a Merino (mayorino) as representative of the king. This system was replaced in the 16th century by the feudal system, in which the head of the household was called the vassal. In 1629 the district of Biscay was added to Navarre; this was afterwards taken from the crown of France and united to the Spanish territory of the kingdom of Biscay, which was separated from the rest of the kingdom to prevent the latter from falling into the hands of the French.

See Historia Compendiosa de Navarra by Don J. M. Yanguas, (San Sebastian, 1832).

NAVARRETE, JUAN FERNANDEZ (1526-1570), surname El Mudo (The Mute), Spanish painter of the Madrid school, was born at Logroño in 1526. An illness in infancy deprived him of vocal faculty, but he began to express his wants by sketching objects with a piece of charcoal. He received his first instructions in art from Fray Vicente de Santo Domingo, a Hieronymite monk at Estella, and afterwards he visited Naples, Rome, Florence and Milan. According to the ordinary account he was for a considerable time the pupil of Titian at Venice. In 1568 Philip II summoned him to Madrid with the title of king’s painter and a salary, and employed him to execute pictures for the Escorial. The most celebrated of the works he there produced were a Nativity (in which, as in the well-known work on the same subject by Correggio, the light emanates from the Infant Saviour), a “Baptism of Christ” now in the Madrid Picture Gallery, and “Abraham Receiving the Three Angels” (one of his last performances, dated 1570). He executed many other altarpieces, all characterized by boldness and freedom in design, and by the rich warm colouring which has acquired for him the surname of “the Spanish Titian.” He died at Toledo in February 1570.

NAVARRETE, MARTIN FERNANDEZ DE (1675-1844), Spanish historian, was born at Abalos on the 9th of November 1705, and entered the navy in 1758. He was engaged in the service of the fleet and the operations of the army in the war of the Austrian Succession. In 1774 he wrote a history of the suppression of Algerine pirates. Ill-health compelled him for a time to withdraw from active service, but he devoted this forced leisure to historical research, and in 1789 he was appointed by the crown to examine the national archives relating to the maritime history of Spain. Rejoining the navy in 1793, he was present at the siege of Toulon, and afterwards received command of a frigate. From 1797 to 1805 he held in succession various
important posts in the ministry of marine. In 1808 the French invasion led to his withdrawal to Andalusia, and the rest of his life was entirely devoted to literature. In 1819 appeared, as an appendix to the Academy's edition of Don Quijote, his Vida de Cervantes, and in 1825 the first two volumes of the Colección de los Viajes y Descubrimientos que hicieron por Mar los Españoles desde fines del Siglo XV. (3rd vol., 1829; 4th vol., 1837). In 1837 he was made a senator and director of the academy of history. At the time of his death, on the 8th of October 1844, he was assisting in the preparation of the Colección de Documentos Inéditos para la Historia de España. His Disertacion sobre la Historia de la Nautica (1846) and Biblioteca Maritima Española (1851), were published posthumously.

NAVARRO, PEDRO (c. 1460–1528), Spanish military engineer and general, of obscure parentage, was born probably about 1460. He began life as a sailor; and was employed later as mazo de espuela, or running footman, by the Cardinal Juan de Aragon; on the death of his employer in 1485 he enlisted as a mercenary in a war between Florence and Genoa; and was subsequently engaged for some years in the warfare between the Genoese corsairs and the Mahommedans of Northern Africa. Navarro was not more scrupulous than others, for in 1490 he was at Civitavecchia, recovering from a gunshot wound in the hip received in a piratical attack on a Portuguese trading ship. When Gonzalo de Córdoba was sent to Sicily, to take part with the French in the partition of Naples, Navarro enlisted under his command. There was some talk of appointing him from Cephalonia in 1500 he helped by laying mines to breach the walls, though not at first with much success. The Spanish commander gave him a captain's commission. During the campaigns of 1502 and 1503 he came to the front among the Spanish officers by the defence of Canosa and of Taranto, by his activity in partisan warfare on the French lines of communication, and by the part he took in winning the battle of Cerinola. But his great reputation among the soldiers of the time was founded on the vigour and success of his mining operations against the castles of Naples held by French garrisons, in 1502, and he was undoubtedly recognized as the first military engineer of his age. When the French were expelled from Naples he received from Gonzalo a grant of land and the title of count of Olivetto. In 1506 he was in Spain, and for several years he was employed in wars on the north coast of Africa. In 1508 he took Velez de Gomera, largely by means of a species of floating battery which he invented. In 1509 he accompanied Ximenez in the conquest of Oran, and did excellent service. Till 1511 he continued in service in Africa, and took Bougie and Tripoli in 1510. The disasters at Gerba and Kerkena did not materially affect his reputation. There was some talk of appointing him to command the army of the league formed against the French in 1512; but his humble birth was thought to disqualify him. He was, however, sent as subordinate general. At the battle of Ravenna he covered the orderly retreat of the Spanish foot, and was struck from his horse by a shot which failed to pierce his armour. Being taken prisoner by the French, he was sent to the Castle of Loches. Ferdinand, whom the soldiers called an Aragonese skilful, would not pay his ransom, and after three years of imprisonment he entered the service of Francis I. In a peace. The death of Francis Milan is said to have saved him. Generalized, in the battle of Marignano, by the taking of the citadel of Milan, and in the long siege of Brescia. He was at the battle of Pavia, and in 1512 was taken prisoner at Genoa by his own countrymen. He was confined at Naples till the peace of 1526, but beyond the confiscation of his estate at Oliveto no punishment was inflicted for his treason. His last service was in the disastrous expedition of Lautrec to Naples in 1527, which was ruined by the plague. He died near the end of 1528.

A life of Navarro by Don Martin de los Heros, is published in the Documéntos inéditos para la Historia de España, vol. xxv. (Madrid, 1854).

NAVE, ecclesiastically considered, that part of a church appropriated to the laity as distinguished from the chancel, the choir or the presbytery, reserved for the clergy. In a 14th-century letter (quoted in Gasquet's Parish Life in Medieval England, 1906, p. 43) from a bishop of Coventry and Lichfield to one of his clergy, the reason for this appropriation is given. "Now the decreet of the holy fathers but the approved existing customs of the Church order that, when the clerks sing and serve God according to their offices be divided by screens from that in which the laity devoutly pray. In this way the nave of the church ... is alone to be open to lay people, in order that, in the time of divine service, clerics be not mixed up with lay people, and more especially with women, nor have communication with them, for in this way devotion may be easily diminished." The word " nave" has been generally derived from Lat. navis, ship. Du Cange (Glossarium, s. v. "Navis") quotes from the Chronicon Moriniacense, of the 12th century, as to the popular origin of the name, Eustesius, etiam tabernaculum, quod ecclesiae navis a populo vocatur ... Salmassius in his commentary on Solinus (1629) finds the origin in the resemblance of the vaulted roof to the keel of a ship, and refers to Sallust (Jugurtha, 18, 8) where is noticed a similar resemblance in the huts (maspálic) of the Numidians. The use of the word navis may, however, be due to the early adoption of the "ship" as a symbol of the church (see Skeat's note on Piers Plowman, xl. 32). The Greek ναός, Attic νόος (nous, to dwell), the inner shrine of a Greek temple, the cela, has also been suggested as the real origin of the word. This derivative was taken by the Greeks to mean a Latinized corruption into navis; for the early application of the word for ship to this part of a church building is undoubted.

Architecturally considered the nave is the central and principal part of a church, extending from the main front to the transepts, or to the choir or chancel in the absence of transepts. When the nave is flanked by aisles, light is admitted to the church through clerestory windows, some of the most ancient examples being the basilica at Bethlehem and the church of St Elias, at Thessalonica, both of the 4th century; numerous churches in Rome, dating from the 6th century, the two great basilicas at Ravenna; in all these cases the sills of the clerestory windows were raised sufficiently to allow of a sloping roof over the side aisles. When, however, a gallery was carried above the side aisles, another division was required, which is known as the triforium, and this subdivision was retained in the nave even when it formed a passage only in the thickness of the wall. In Late Gothic work in England, the triforium was suppressed altogether to give more space for the clerestory windows, and roofs of low pitch were provided over the side aisles.

The longest nave in England is that of St Albans (300 ft.), in which there are thirteen nave arches, thirty bays; at Florence which is 230 ft. long, but as there are no transepts this dimension includes nave and choir. Cluny was 250 ft. with eleven bays; Reims is 235 ft. with ten bays; Paris 170 ft. with nine bays; Amiens 160 with ten bays; and St Ouen, Rouen, 200 ft. with ten bays. In Germany the nave of Cologne cathedral is only 190 ft., including the two bays between the towers. The cathedral at Seville in Spain is 200 ft. long, with only five bays. In Italy the nave of the cathedral at Bologna is 400 ft. long, with nine bays, and the church of St Peter's in Rome 300 ft. long with four bays. On the other hand, the vaults in the nave of the continental cathedrals are far higher than those in England, that of Westminster Abbey being only 103 ft. high, while the choir of Beauvais is 150 ft. The result is that the naves of the English cathedrals not only are longer in actual dimensions, but appear much longer in their apparent height.

1 Vessels resembling boats or ships are familiar in medieval art and later. Thus "Incense-boats" (naretas) somewhat of this ship, 12th-century, of a 9th-century, or 11th-century form; they approximated still more closely to a model of a ship. A large vessel, also in the shape of a boat or ship, and known as a nef, was used at that table of princes and great personages, as in the knights' tables, spoons, &c. Some very elaborate examples of these survive, such as the 15th-century nef of St Ursula in the treasure of the cathedral at Reims, and that of Charles V. of France in the Musee Cluny. A very fine nef, of the 13th century, is in the hands of the Department of Antiquities of England; in the British Museum. (See DRINKING VESSELS.)
NAVEL—NAVIGATION

The then backward state of navigation is best understood from a sketch of the few rude appliances which the mariner had, and even these were only imperfectly understood or used. The accurate knowledge of finding the longitude proved unattainable for many years after the time of the Armada, and the very inaccurate knowledge existing of the positions of the heavily bodies themselves fully explains the mariner's exaggeration of his position and his great repute, at the time, where the writer observes, "Now there be some that are very inquisitive to have a way to get the longitude, but that is too tedious for seamen, since it requireth the deep knowledge of astronomy and distance of the sun, moon, and stars."

NAVIGATION (from Lat. navigo, to navigate, and aeger, to move), the science or art of conducting a ship across the seas. The term is also popularly used by analogy of boats on rivers, &c., and of flying-machines or similar methods of locomotion. Navigation, as an art applied properly to ships, is technically used in the restricted sense dealt with below, and has therefore to be distinguished from "seamanship" (q.v.), or the general methods of rigging a ship (see RIGGING), or the management of sails, rudder, &c.

History.

The early history of the rise and progress of the art of navigation is very obscure, and it is more easy to trace the gradual advance of geographical knowledge by its means than the growth of the practical methods by which this advance was attained. Among Western nations before the introduction of the mariner's compass the only practical means of navigating ships was to keep in sight of land, or occasionally, for short distances, to direct the ship's course by referring to it the sun or stars; this very rough mode of procedure failed in cloudy weather, and even in short voyages in the Mediterranean in such circumstances the navigator generally became hopelessly bewildered as to his position.

Over the China Sea and Indian Ocean the steadiness in direction of the monsoons was very soon observed, and by running directly before the wind vessels in those localities are able to "traverse long distances out of sight of land in opposite directions at different seasons of the year, aided in some cases by a rough compass (q.v.). But it is surprising when we read of the progress made among the ancients in fixing positions on shore by practical astronomy that so many years should have passed without its application to solving exactly the same problems at sea, but this is probably to be explained by the difficulty of devising instruments for use on the unsteady platform of a ship, coupled with the lack of scientific education among those who would have used them.

The association of commercial activity and nautical progress shown by the Portuguese in the early part of the 15th century marked an epoch of distinct progress in the methods of practical navigation, and initiated that steady improvement which in the 20th century has raised the art of navigation almost to the position of an exact science. Up to the time of the Portuguese exploring expeditions, sent out by Prince Henry, generally known as the "Navigator," which led to the discovery of the Azores in 1419, the rediscovery of the Cape Verde Islands in 1447 and of Sierra Leone in 1456, navigation had been conducted in the most rude, uncertain and dangerous manner, and it is possible to conceive. Many years had passed without the least improvement being introduced, except the application of the magnetic needle about the beginning of the 14th century (see COMPASS and MAGNETISM). Prince Henry did all in his power to bring together and systematize the knowledge then obtained upon nautical affairs, and also established an observatory at Sagres (near Cape St Vincent) in order to obtain more accurate tables of the declination of the sun. John II., who ascended the throne of Portugal in 1481, followed up the good work. He employed Roque de Viga in his physico-mathematical mission to the Cape Verde Islands, and sent him, from Fayal, to act as a committee on navigation. They calculated tables of the sun's declination, and improved the astrolabe, recommending it as more convenient than the cross-staff. The Ordenanzas of the Spanish council of the Indies record the course of instruction prescribed at this time for pilots; it included the De Sphaera Mundi of Sacrobosco, the spherical triangles of Regiomontanus, the Almagest of Ptolemy, the use of the astrolabe and its mechanism, the adjustments of instruments, cartography and the methods of observing the movements of heavenly bodies.

Whether the property of the lodestone was independently discovered in Europe or introduced from the East, it does not appear to have been generally utilized in Europe earlier than about A.D. 1400 (see COMPASS). In Europe the card or 'field' appears to have been attached to the magnet from the first, and the whole suspended as now in gimbal-rings within the "bittacle," or, as we now spell the word, "binnacle." The direction of a ship's head by compass was termed how she "capes." From the description of the stores supplied to ships in 1588, they appear to have usually had two compasses, costing £3. 4d. each, which were kept in charge by the helmsman. The fact that the north point of true magnetic measurement in most places, point to the true pole but eastward or westward of it, by an amount which is termed by sailors "variation," appears to have been noticed at an early date; but that the amount of variation was accurately determined between different localities was not apparent to navigators before 1600. It was observed at sea either from Cape or Cabot about 1490, and we find it used to be the practice to ascertain this error when at sea either from a bearing of the pole star, or by taking a mean of the compass bearings of the sun at noon and rising and setting, the deviation of the compass in the ships of those days being too small a quantity to be generally noticed, though there is a very suggestive remark on the effect of moving the compass in the interior of a ship in the "Siue Aurea" of Cassiporus noted in "ludus de Navigatione," printed at Bristol in 1679. In order, partially to obviate the error of the compass (variation), the magnets, which usually consisted of two steel wires joined at both ends and opened out in the middle, were not always fastened to the nose of the ship, but with the ends about a point eastward of north and westward of south, the variation in London when first observed in 1580 being about 11°. That of the voyage year by year at the same base was first noted by Gellibrand in 1635.

The "cross-staff" appears to have been used by astronomers at a very early period, and subsequently by seamen for measuring
Navitation was one of the few instruments possessed by Columbus and Vasco da Gama. The old cross-staff, called by the Spaniards "ballestilla," consisted of two light battens. The part we may call the staff was about 1½ in. square and 3½ in. long. The cross was made to fit closely and to slide on the staff. It had the following angles; its length was a little over 26 in., so as to allow the "pinules" or sights to be placed exactly 26 in. apart. A sight was also fixed on the end of the staff for the eye to look through so as to see both those on the cross and the objects whose distances were to be measured. It was made by describing the angles on a table, and laying the staff upon it (fig. 1). The scale of degrees was marked on the upper face. Afterward shorter crosses were introduced, so that smaller angles could be taken by the same instrument. These angles were marked on the sides of the staff.

To observe with this instrument a heavenly object, the cross staff was held vertically, the sun being taken by compass, to ascertain when it was near the meridian; then the end of the long staff was placed close to the observer's eye, and the transversary, or cross, moved until one spoke of the cross touched the horizon, and the other the sun's centre. This was continued until the sun was dipped, when the meridian altitude was observed.

Another primitive instrument in common use at the beginning of the 16th century was the astrolabe (fig. 2), which was more convenient than the cross-staff for taking altitudes. Fig. 2 represents an astrolabe as described by Martin Cortes, who was 60 in. in diameter, and was circular except at one place, where a projection was provided for a hole by which it was suspended. Weight was considered desirable in order to keep it steady when in use. The face of the metal having been well polished, a plum line from the point of suspension marked the vertical line, from which derived the horizontal and meridian line and centre. The upper left quadrant was divided into degrees. The second part was a pointer pt of the same metal and thickness as the circular plate, about ½ in. wide, and in length equal to the diameter of the circle. The centre was bored, and a line was drawn across it the full length, which was called the line of confidence. On the ends of that line were fixed plates, s, s, having each a small hole, both exactly over the line of confidence, as sights for the sun or stars. The center moved inside the circle the size of a goose quill. When the instrument was suspended the pointer was directed by hand to the object, and the line read on the one quadrant only. Some years later the opposite quadrant was also graduated, to give the benefit of a second reading. The astrolabe was used by Vasco da Gama with his flagship on his voyage round the Cape of Good Hope in 1497; but the movement of a ship rendered it very uncertain, and the habit of giving it was increased by the necessity for three observers. One held the instrument by a ring passed over the thumb, the second measured the altitude, and the third read it.

For finding latitude at night by altitude of the pole star taken by cross-staff or astrolabe, use was made of an auxiliary instrument called the "nocturnal." From the relative positions of the two stars in the constellation of the Little Bear, farthest from the pole (Polaris, or the Pole Star), and that of the pole star with regard to the pole could be inferred, and tables were drawn up termed the "Regiment of the Pole Star," showing for eight positions of the guards how much should be added or subtracted from the altitude of the pole star; thus, "when the guards are in the N.W. bearing from each other north and south add half a degree," &c. The bearings of the guards, and also roughly the hour of the night, were found by the nocturnal, first described by M. Coignet in 1551.

The nocturnal (fig. 3) consisted of two concentric circular plates, the outer being about 3 in. in diameter, and divided into twelve equal parts corresponding to the twelve months, the being divided into groups of five days. The inner circle was graduated into twenty-four equal parts, corresponding to the hours of the day, and again subdivided into quarters; the handle of the upper circle in such a way that the middle of it corresponded with the centre of the month on which the guards had the same right ascension as the sun—or, in other words, crossed the meridian at noon. From the common centre of the two circles extended a long index bar, which, together with the inner circle, turned freely and independently, about this centre, which was pierced with a round hole. To use the instrument, the projection at twelve hours on the inner plate was turned until it coincided with the day of the month of observation, and the instrument held with its plane roughly parallel to the equinoctial or celestial equator, the observer looking at the pole star through the hole in the centre, and turning the long central index bar until the guards were seen just touching its edge; the hour in which this edge coincided with the inner plate was, roughly, the time. Occasionally the nocturnal was constructed so as to find the time by observations of the pointers in the Great Bear.

The rough charts used by a few of the more expert navigators, as the time we refer to will be more fully described later (see also Map and Geography). Nautical maps or charts first appeared in Italy at the end of the 15th century, but it is said that the first seen in England was brought by Bartholomew Columbus in 1489.

Among the earliest authors who touched upon navigation was John Werner of Nuremberg, who in 1534, in his notes upon Ptolemy's geography, describes the cross-staff as a very ancient instrument, but says that it was only of recent beginning to be generally introduced among seamen. He recommends measuring the distance between the moon and a star as a means of ascertaining the longitude; but this (though developed many years after into the method technically known as "lunars") was of no practical use owing to the then imperfect knowledge of the true positions of the moon and stars and the non-existence of instrumental means by which such distances could be measured with the necessary accuracy.

Thirty-eight years after the discovery of America, when long voyages had become comparatively common, R. Gemma Frisius wrote upon astronomy and cosmography, with the use of the globes. His book comprised much valuable information to mariners of that day, and was translated into French fifty years later (1582) by Claude de Bosiere. The astronomical system adopted is that of Ptolemy. The following are some of the points of interest relating to navigation. There is a good description of the sphere and its circles; the obliquity of the ecliptic is given as 23° 30'. The distance between the meridians is to be measured on the equator, allowing 15° to an hour of time; longitude is to be found by eclipses of the moon and conjunctions, and reckoned from the Canary Islands (Azores). Latitude should be measured from the equator, with the use of "as Clarense says." The use of globes is very thoroughly and correctly explained. The scale for measuring distances was placed on the equator, and 15 German leagues, or 60 Italian leagues, were to be considered equal to one degree. The Italian league was 8 stadia, or 1000 paces, therefore the degree is taken much too small. We are told that, on plane charts, mariners drew lines from various centres (i.e. compass courses), which were very useful since the virtue of the lodestone had become recognized; it must be remembered that parallel rulers were unknown, and they invented the Mercators' and other maps are in the day. The confusion of lines has been continued upon sea charts till comparatively recently. Gemma gives rules for finding the course and distance correctly, except that he treats difference of longitude as departure. For instance, if the difference of latitude and difference of longitude are equal, the course prescribed is between the two principal winds—that is, 45°. He points out that the courses thus followed are not straight lines, but curves, because they do not follow the great circle, and that distances could be more correctly measured on the globe than on charts. The tide is to be reckoned with until high water being when it is on the meridian and 12 hours later. From a table of latitudes and longitudes a few examples are here selected, by which it appears that even latitude was much in error. The figures in brackets
represent the positions according to modern tables, counting the longitude from the western extremity of St. Michael. (Flores is 2° 8' farther west.)

The latitude of Cape Clear is given 34° in error, and the longitude 43°; the Scilly Islands are given with an error of one degree in latitude and 2° 20' in longitude; while Madeira is placed 3° 8' too far south and 4° 20' too far west, and Cape St. Vincent 3° 25' too far south and 6° too far west.

In 1534 Gemma produced an "astronomical ring," which he dedicated to the secretary of the king of Hungary. He admitted that it was not entirely his own invention, but asserted that it could accomplish all that had been said of quadrants, cylinders and astrolabes—also that it was a pretty ornament, worthy of a prince. As it displayed great ingenuity, and was followed by many similar contrivances during two centuries, a sketch with brief description is here given (fig. 4).

The outer and principal sustaining circle EPO represents the meridian, and is about 6 in. in diameter. The Pw are the poles. The upper quadrant is divided into degrees. It is suspended by fine cord or wire, placed at the supposed latitude. The second circle EQ is fixed at right angles to the first, and represents the equinoctial line. The upper side is divided into twenty-four parts, representing the hours from noon or midnight. The inner side of this circle are marked the months and weeks. The third ring CC is attached to the first at the poles, and revolves freely within it. On the interior are marked the months, and on another side the corresponding signs of the zodiac; another is graduated in degrees. It is fitted with a groove which carries two movable sights. On the fourth side are twenty-four unequal divisions (tangents) for measuring heights. Its use is illustrated by twenty problems showing the manner of doing roughly all that any instrument for taking angles can. Thus, to find the latitude, set the sights C, C to the place of the sun in the zodiac, and shut the circle till it corresponds with 12 o'clock. Look through the sights and after the point of suspension till the greatest elevation is attained; that time will be noon, and the point of suspension will be the latitude. The figure is represented as slung at lat. 40°, either north or south. To find the hour of the day, the latitude and declination being known: the sights C, C being set to the declination as before, and the suspension on the latitude, turn the ring CC freely till it points to the sun, when the index opposite the equinoctial circle will indicate the time, while the meridional circle will coincide with the meridian of the place.

There is in the museum attached to the Royal Naval College at Greenwich an instrument described as Sir Francis Drake's astrolabe. It is not an astrolabe, but may be a combination of astronomical rings as invented by Gemma with additions, probably of a later date. It has the appearance of a large gold watch, about 21 in. in diameter, and contains several parts which fall back on hinges. One is a sun-dial, the gnomon being in connexion with a graduated quadrant, by which it could be set to the latitude of the place. There are a small compass and an hour circle. It is very neat, but too small for actual use, and may be simply an ornament representing a larger instrument. There is a small brass case inside one lid; that given for London is 51° 34', about 3 m. too much.

Though clocks are mentioned in 1484 as recent inventions, watches were unknown till about 1530, when Gemma seized the idea of using them for the purpose of ascertaining the difference of longitude between two places by a comparison between their local times at the same instant. They were too inaccurate, however, to be of practical use, and their advocate proposed to correct them by water-clocks or sand-clocks. For rough purposes of keeping time on board ship sand glasses were employed, and is curious to note that hour-glasses were used for this purpose in the British Navy until 1839. The outer margin of the compass card was early divided into twenty-four equal parts numbered as hours until the error of thus determining time by the bearings of the sun was pointed out by Davis in 1607.

In 1537 Pedro Nunez (Nonius), cosmographer to the king of Portugal, published a work on astronomy, charts and some points of navigation. He recognized the errors in plane charts, and tried to rectify them. Among many astronomical problems given is one for finding the latitude of a place by knowing the sun's declination and altitude when on two bearings, not less than 40° apart. Gemma did a similar thing with two stars; therefore the problem now known as a "double altitude" is a very old one. It could be mechanically solved on a large globe within a degree. To Nunez has been erroneously attributed the present mode of reading the exact angle on a sextant, the scale of a barometer, &c., the credit of which is due, however, to Vernier nearly a hundred years later. The mode of dividing the scale which Nunez published in 1542 was the following. The arc of a large quadrant was furnished with forty divisions, or scales. Those graduated to 90°, the others to 89, 88, 87, &c., divisions. As the fine edge of the pointer attached to the sights passed among those numerous divisions it touched one of them, suppose the fifteenth division on the sixth scale, then the angle was \( \frac{1}{2} \) of 90° = 15° 32'. This was a laborious method; Tycho Brahe tried it, but abandoned it in favour of the diagonal lines then in common use, and still found on all scales of equal parts.

In 1545 Pedro de Medina published Arde de navigar at Valla-dolid, dedicated to Don Philipo, prince of Spain. This appears to be the first book ever published professedly on navigation. It was soon translated into French and Italian, and many years after into English by John Frampton. Though this pretentious work came out two years after the death of Copernicus, the astronomy is still that of Ptolemy. The general appearance of the chart given of the Mediterranean, Atlantic, and part of the Pacific is in its favour, but examination shows it to be very incorrect. A scale of equal parts, near the centre of the chart, extends from the equator to what is intended to represent 75° of latitude; by this scale London would be in 55° instead of 51°, Lisbon in 37° instead of 38° 42'. The equator is made to pass along the coast of Guinea, instead of being over four degrees farther south. The Gulf of Guinea extends 15° too far east, and Mexico is much too far west. Though there are many vertical lines on the chart at unequal distances they do not represent meridians; and there is no indication of longitude. A scale of 600 leagues is given (German leagues, fifteen to a degree). By this scale the distance between Lisbon and the city of Mexico is 1740 leagues, or 6900 miles; by the vertical scale of degrees it would be about the same; whereas the actual distance is 4820 miles. Here two great wants become apparent—a knowledge of the actual length of any arc, and the means of representing the surface of the globe on flat paper. There is a table of the sun's declination to minutes; on June 12th and December 11th (o.s.) it was given as 23° 33'. The directions for finding the latitude by the pole star and pointers appear good. For general astronomical information the book is inferior to that of Gemma.

In 1556 Martin Cortes published at Sevilla Arte de navigar. He gives a good drawing of the cross-staff and astrolabe, also a table of the sun's declination for four years (the greatest value being 25° 33'), and a page of astronomical tables. The motions of the heavens are described according to the notions then prevalent, the earth being considered as fixed. He recommends
the altitude of the pole being found frequently, as the estimated distance run was imperfect. He devised an instrument whereby to tell the hour, the direction of the ship's head, and where the sun would set. A very correct table is given of the distances between the meridians at every degree of latitude, whereby that became to reduce the difference of longitude to departure. In the rules for finding the latitude by the pole star, that star is supposed to be 3° from the pole. Martin Cortes attributes the tides entirely to the influence of the moon, and gives instructions for finding the time of high water at Cadiz, when by means of a card with the moon's age on it, revolving within a circle showing the hours and minutes, the time of high water at any other place for which it was set would be indicated. Directions are given for making a compass similar to those then in common use, also for ascertaining and allowing for the variation. The east is here spoken of as the principal point, and marked by a cross.

The third part of Martin Cortes's work is upon charts; he laments that wise men do not produce some that are correct, and that pilots and mariners will use plane charts which are not true. In the Mediterranean and "Channel of Flanders" the want of good charts is (he says) less inconvenient, as they do not navigate by the altitude of the pole.

As some subsequent writers have attributed to Cortes the credit of first thinking of the enlargement of the degrees of latitude on Mercator's principle, it is proper here to premise that in the first edition of Mercator's work, Bore's latitude was divided into 24 divisions, and Coignet recommended Richard to very earnestly divide it into 30. A table of the meridians was accordingly given: it is divided into 15 parts from 15° to 105°; and the meridian from 0° to 15° is 21', from 15° to 30° 41', from 30° to 45° 61', and so on to 105°, which he left unmeasured, in order "that no one" might measure it in 3° steps. He recommended the use of the small meridian, which with other improvements, he called the "true Mercator's projection," as against the "false Mercator's projection," used by the same authors in a former edition, which he divided into only 11 divisions. He introduced a new table for finding the position of a ship, and another for finding the distance of a ship from the land. He also divided the world into 14 parts, the sea being divided into 20 parts.

William Cunnigham published in 1559 a book called his Astronomical Glass, in which he teaches the making of charts by a central meridional line divided into equal parts, with other meridians on each side, distant at top and bottom in proportion to the departure at the highest and lowest latitude, for which purpose a table of departures is given very correctly to the third place of sexagesimals. The chart would be excellent were it not that the parallels are drawn straight instead of being curved. In another example, which shows the position of a ship on the earth, he assumes the meridians and parallels to be all curved; it would be better if it were not that the former are too long. The hemisphere is also shown upon a projection approaching the stereographic; but the eighteen meridians cut the equator at equal distances apart instead of being nearer together towards the primitive. He gives the drawing of an instrument like an astrolabe placed horizontally, divided into 32 points and 360 degrees, and carrying a small magnetic needle to be used as a prismatic compass, or even as a theodolite.

In 1581 Michael Colgnet of Antwerp published a sea chart, and also a small treatise in French, wherein he exposes the errors of Medina, and was probably the first who said that rhumb lines form spirals round the pole. He published also tables of declination of the sun and observed the gradual decrease in the obliquity of the ecliptic. He described a cross-staff with three transverse pieces, which was then in common use at sea. Colgnet died in 1623.

The Dutch published charts made up as atlases as early as 1585, with a treatise on navigation as an introduction.

In 1585 Roderico Zamorane, who was then lecturer at the naval college at Seville, published a concise and clearly-written compendium of navigation; he follows Cortes in the desire to obtain better charts. Andres Garcia de Cespedes, the successor of Zamorano at Seville, published a treatise on navigation at Madrid in 1606. In 1592 Petrus Plancius published his universal map, containing the discoveries in the East and West Indies and towards the north pole. It possessed no particular merit; the degrees of latitude are equal, but the distances between the meridians are varied. He made London appear in 51° 32' N. and long. 2°, by which his first meridian shall have been more than 3° east of St Michael.

For Mercator's great improvements in charts at about this date see Map; from facsimiles of his early charts in Jomard, Les Monuments de la géographie, the following measurements have been made. A general chart in 1569 of North America, from lat. 25° to lat. 70°, is 2 ft. long north and south, and 20 in. wide. Another of the same date, from the equator to 60° south lat. is 15° 8 in. long. The charts agree with each other, a slight allowance being made for remeasuring. As compared with Jammes's table of meridional parts, the spaces between the parallels are all too small. Between 6° and 10° the error is 8'; at 20° it is 5'; at 30°, 16'; at 40°, 39'; at 50°, 61'; at 60°, 104'; at 70°, 158'; and at 70°, 182—that is, over three degrees upon the whole chart. As the measures are always less than the truth it is possible that Mercator was afraid to give the whole.

In a chart of Sicily by Romoldus Mercator in 1580, on which two equal degrees of latitude, 36° to 38°, extend 93 in., the degree of longitude is quite correct at one-fourth from the top; the lower part is 1 in. too long. One of the north of Scotland, published in 1595, by Romoldus, measures 103 in. from 58° to 61°; the divisions are quite equal and the lines parallel; it is correct at the centre only. A map of Norway, 1595, lat. 60° to 70° = 93 in., has the parallels curved and equidistant, the meridians straight converging lines; the spaces between the meridians at 60° and 70° are quite correct.

In 1594 Blundeville published a description of Mercator's charts and globes; he confesses to not having known upon what rule the meridians were separated by Mercator, unless upon such a table as that given by Wright, whose table of meridional parts is published in the same book, also an excellent table of sines, tangents and secants—the former to seven figures, the latter to eight. These tables are now used in all navigation in making the principles of such sailing were not unknown at an earlier date; indeed it is said that S. Cabot projected a voyage across the North Atlantic on the arc of a great circle in 1405.
The list of instruments given by Davis as necessary to a skilful seaman comprises the sea compass, cross-staff, chart, quadrant, astrolabe, an "instrument magnetic" for finding the variation of the compass, and a plane table and cross-staff for use in lieu of a compass. The first three are said to be sufficient for use at sea, the astrolabe and quadrant being uncertain for sea observations. The importance of knowing the times of the tides when approaching tidal or creek waters, and the compass being only partially pointed by the magnetic needle governing them by the moon's age. A table of the sun's declination is given for noon each day during years 1593-1597, from the ephemerides of Flamsteed. He lays down that given for the latitude of 28° Christmas, Brazil, we read, "the compass varied 9°, the south point westward. He states that the first meridian passed through St Michael, because there is no variation at that place, and therefore that this meridian passed through the magnetic pole as well as the pole of the earth. He makes no mention of Mercator's chart by name nor of Cortes or other writers on navigation. Rules are given for finding the latitude by two altitudes of the sun and intermediate azimuth, also by two fixed stars, using a globe. There is a drawing of a quadrant, with a plumb line, for measuring the zenith distance, and one of a modification of a cross-staff using which the observer stands with his back to the sun and places his horizon on a right line through the staff, while the shadow of the top of a movable projection, falls on the right; this, known as the back-staff, was an improvement on the compass for use on land. He also says that he had the rough idea of the principle of the quadrant and sextant. This remained in use till superseded in 1731 by Hadley's quadrant. The eighth edition of Davis's work was printed in 1657. Edward Wright, of Caius College, Cambridge, published in 1599 a valuable work entitled Certain Errors in Navigation Detected and Corrected. One part is a translation from Roderico Zamberti's Latin work, the other was composed for the use of English seamen, there considered to be the chief navigations which had then recently come in use "could hardly be amended," as they were growing to "perfection"—especially the sea chart and the compass, though he expresses a hope that the latter may be "free'd from that rude and gross manner of handling in the making." He gives a table of magnetic declinations (variation) and explains its geometrical construction. He states that Medina utterly denied the existence of variation, and that it was not to be learned by the seamen, but it was the same as the "true observation". He expresses a hope that a right understanding of the dip of the needle would lead to a knowledge of the latitude, "as the variation did of the longitude." He gives a table of declination of the horizon at noon, by English seamen at London, the greatest given being 23° 31' 30". The latitude of London he made 51° 32'. For these determinations a quadrant over 6 ft. in radius was used. He also includes tables of the times of the sun's elevation, refraction, parallax and the sun's motions. With all this knowledge the earth is still considered as stationary—although Wright alludes to Copernicus, and says that he omitted to allow for parallaxes. Wright ascertained the declinations of thirty-two stars, and made many improvements or additions to the art of navigation, considering that all the problems could be performed trigonometrically, without globe or chart. He devised sea rings for taking observations, and a sea chart, as the result of two years' work, which is in some respects similar to that by Davis. While portraying the neglected state which navigation had been in, he rejoices that the worshipful society at the Trinity House (truly well established in 1514), under the patronage of the king (Henry VIII.), had removed many gross and dangerous errors. He joins the brethren of the Trinity House in the desire that a lecturership should be established on navigation, as at Seville and Cadiz; also that a grand pilot should be appointed, as Sebastian Cabot had been in Spain, to examine pilots (i.e. mates) and navigators. Wright's desire was partially fulfilled in 1645, when an Act of Parliament was passed for the establishment of a college of masters and mates of ship's masters; but such was the opposition by shipowners that it was even then left voluntary for a few years. England was in this respect more than a century behind Holland. It was not till the reign of George I, in 1717, that a college of the first class was established at Trinity House. The great mark which Wright made was the discovery of a correct and uniform method of dividing the meridional line and making charts which are still called after the name of Mercator. He considered such charts as true as the globe itself; and so they were for all practical purposes. He commenced by dividing a meridional line, in the proportion of the sectants of the latitude, for every ten minutes of arc, and in the edition of his work published in 1610 his calculations are for every minute. His method was based upon the fact that the radius bears the same proportion to the sectant of the latitude as the difference of longitude does to the meridional difference of latitude—a rule strictly correct for small arcs only. One minute is taken as the unit of time, and the arc of a degree is divided into sixty minutes, the second of arc becomes 20,000, 3' = 30,000, &c., increasing uniformly till 90', which is equal to 400,000; 3° is 600,012. The sectant of 20° is 12,251,102, and for 20° 1' it will be 12,251,102+1,642—practically the same as that used in modern tables. The principle is simply explained by fig. 5, where b is the pole and of the meridian. At any point a a minute of longitude: a min. lat.: ea (the semi-diameter of the parallel): k' (the radius). Again ea,: k': k': ki : radius: sec. lat. The disc on which the projection is made is divided in parallel circles, each parallel increasing successively from the equator towards either pole until it is of equal diameter to the cylinder, and consequently the meridians widening apart until they are everywhere as distant from each other as the equator is from the latitude of that circle. Such a spherical surface is thus by extension made cylindrical, and consequently a plane parallelodromic surface, since the surface of a cylinder is nothing else but a plane parallelodromic surface wound round it. Such a cylinder on being opened into a flat surface will have upon it a representation of a Mercator's chart of the world." This great improvement in the principle of constructing charts was adopted slowly by seamen, who, putting it as they supposed to a practical test, found good reason to be disappointed. The positions of most places in the world had been originally laid down erroneously, by very rough courses and estimated distances upon the plane chart, and from this they were transferred to the projection. The parallels and distances, really due to erroneous positions, were wrongly attributed to the new and accurate form of chart. When Napier's Canon Mirrorius appeared in 1614, Wright at once recognized the value of logarithms as an aid to navigation, and undertook a translation of the book, which he did not live to publish (see Napier). Gunter's tables (1620) made the application of the new discovery to navigation possible, and this was done by Addison in his Arithmetical Navigation (1623), as well as by Gunter in his tables of 1624 and 1636, which gave logarithmic sines and tangents, to a radius of 1,000,000, with directions for their use and application to astronomy and navigation, and also logarithms of numbers from 1 to 10,000. Several editions followed, and the work retained its reputation over a century. Gunter invented the sector, and introduced the meridional line upon it, in the just proportion of Mercator's projection. The means of taking observations correctly, either at sea or on shore, was about this time greatly assisted by the invention bearing the name of Pierre Vernier, the description of which was published at Brussels in 1631. As Vernier's quadrant was divided into half degrees only, the author, he called it, spread over 14° 2′ degrees, amounting that space carried thirty equal divisions, numbered from 0 to 30. As each division of the sector contained 29 min. of arc, the vernier could be read to minutes. The verniers now commonly adapted to sextants can be read to 10 secs. Shortly after the invention it was recommended for use by P. Bouguer and Jorge Juan, who describe it in a treatise entitled La Construction, &c., du quadrant Nouveau. About this period Gascoigne applied the telescope to the quadrant as used on shore; and Hevelius invented the tangent screw, to give slow and steady motion when near the desired position. These
practical improvements were not applied to the rougher nautical instruments until the invention of the sextant in 1731.

In 1635 Henry Cellibrand published his discovery of the annual change in variation of the needle, which was effected by comparing the results of his own observations with those of W. Borough and Edmund Gunter. The latter was his predecessor at Gresham College.

In 1637 Richard Norwood, a sailor, and reader in mathematics, published an account of his most laudable exertions to remove one of the greatest stumbling-blocks in the way of correct navigation, that of not knowing the true length of a degree or nautical mile, in a pamphlet styled The Seaman's Practises. Norwood ascertained the latitude of a position near the Tower of London in June 1633, and of a place in the centre of York in June 1635, with a sextant of more than 5 ft. radius, and, having carefully corrected the declination of the sun and allowed for refraction and parallax, made the difference of latitude 2° 26'. He then measured the distance with a chain, taking horizontal angles of all windings, and then made it on a tape four feet long, correcting elevations and depressions. A few places which he was unable to measure he paced. His conclusion was that a degree contained 367,176 English feet; this gives 2040 yds. to a nautical mile—only about 12 yds. too much. Norwood's work went through numerous editions, and retained its popularity over a hundred years. In a late edition he says that, as there is no means of discovering the longitude, a seaman must trust to his reckoning. He recommends the knots on the log-line to be placed 51 ft. apart, as the just proportion to a mile when used with the half-minute glass. To Norwood is also attributed the discovery of the "dip" of the magnetic needle in 1576.

The progress of the art of navigation was and is still of course inseparably connected with that of map and chart drawing and the correct astronomical determinations of positions on land. While we as have seen at an early period simple practical astronomical means of finding the latitude at sea were known and in use, no mode could be devised of finding longitude except by the rough method of estimating the run of the ship, so that the only mode of arriving at a port of destination was to steer so as to get into the latitude of such a port either to the eastward or westward of its supposed position, and then approach it on that parallel of its latitude. The success of this method would of course greatly depend upon the accuracy with which the longitude of such a port was known. Even with the larger and more accurate instruments used in astronomical observatories on shore the means of ascertaining latitude were far in advance of those by which longitude could be obtained, and this equally applied to the various heavenly bodies themselves upon which the terrestrial positions depended, the astronomical element of declination (corresponding to latitude) being far more accurately determined than that of right ascension (corresponding to longitude).

Almanacs were first published on the continent of Europe in 1457, but the earliest printed work of that kind in England is dated 1497. The only portions of their contents of use to seamen were tables of the declination of the sun, rough elements of the positions of a few stars, and tables for finding latitude by the pole star.

No accurate predictions of the positions of the moon, stars and planets could, however, be made until the laws governing their movements were known, such laws of course involving a knowledge of their actual positions at different widely separated epochs.

In 1699 Edmund Halley (subsequently astronomer royal), in command of the "Paramour," undertook a voyage to improve the knowledge of longitude and of the variation of the compass. The results of his voyage were the construction of a number of lighthouses, and the perfection of the longitude of stars. As a result of this voyage, and proposals for finding the longitude by observations of fixed stars.

The necessity for having more correct charts being equally by the pressing need of obtaining the longitude by some simple and correct means available to seamen, many plans had already been thought of for this purpose. At one time it was hoped that the longitude might be directly discovered by observing the variation of the compass and comparing it with that laid down on charts. In 1674 Charles II. actually appointed a commission to investigate the possibility of making such a discovery of a scientific kind; the proposal was adopted by Henry Bond, and the same idea appears as late as 1777 in S. Du Châtel's "Pélerinage." Nor did the only accurate method of ascertaining the longitude be known by the difference of time at the same instant at the meridian of the observer and Greenwich. The invention of the chronometer and the perfecting of chronometers this could only be done by finding at two such places the apparent time of the same celestial phenomenon.

A class of phenomena whose comparative frequency would give them a helpful clue, viz., the sun's eclipses, became known through Galileo's discovery of these bodies (1610). Tables for such eclipses were published by Domini Cassini in 1668, and in 1699 they were published at Paris by his son, who was followed by J. Pount, J. Bradley, W. Wargentin, and many other astronomers. But this method, though useful on land, is not suited to mariners; when W. Whiston, for example, in 1737, recommended its use for the purpose of observing a reflecting telescope, he did not sufficiently consider the difficulty of using a telescope at sea.

Another method proposed was that of comparing the local time of the moon's crossing the meridian of the observer with the predicted time of the same event at Greenwich, the difference of the two depending upon the moon's motion during the time represented by the longitude; thus Heron's Longitude Unmeiled (1588), proposes to find the time of the moon's meridian passage at sea by equal altitudes with the cross-staff, and then compare apparent time at ship with London time. The accuracy of this, as in the case of lunar problems, would depend upon the perfect knowledge of the laws of the moon's motion than that existed.

The celebrated problem of finding longitude by lunars (or by measurement of "lunar distances") occupied the attention of those who, like Clavius and Galileo, were interested in the more simple and accurate method by the use of chronometers, and was the principal reason for establishing the Royal Observatory at Greenwich. The subsequent publication of the Nautical Almanac was the simple determination, the distances of the moon from those at any instant of time at Greenwich would be obtained by finding that if such predictions were published in advance, an observer at any instant of time by simply measuring such distances, could accurately determine the Greenwich time, a comparison of which with the local time (which in clear weather can be frequently and simply determined) would give the longitude. This, as previously mentioned, was foreseen by J. Werner as early as 1514, but very great difficulties attended its practical application for many years. Until the establishment of the astronomical observatory at Greenwich in 1675, it was impracticable to make the vast number of observations necessary to fulfill the astronomical conditions, and until the invention of the sextant no instrument was devised which would be accurately suited to the necessity, while the accuracy of the predictions required with the necessary accuracy, while even up to the time when the problem had attained its greatest practical accuracy the calculations involved were far too intricate for general use among those for whom it was chiefly intended. The very Imperfectness of the movements of the moon were unknown before Newton's time, when the lunar problem begins to have a chief place in the history of navigation; the places of stars were formerly derived from various and widely discrepant sources.

The study of the lunar problem was stimulated by the reward of 1000 crowns offered by Philip III. of Spain in 1598 for the discovery of a method of finding longitude at sea; the States-General followed with an offer of 10,000 florins. But for a long time nothing practical came of this; a proposal by J. B. Morin, submitted to Richelieu in 1633, was pronounced by commissioners appointed to investigate the question to be impracticable through the expense of the necessary tables, and the same objection applied when the question was raised in England in 1674 by a proposal of St Pierre to find the longitude by using the altitudes of the moon and two stars to find the time each observed, and the meridian of the ship's place calculated by the king's astronomers, John Moore, Sir J. Moore and Sir C. Wren to establish an observatory for the benefit of navigation, and especially that the moon's exact position might be calculated a year in advance. Flamsted gave his judgment that the lunar tables then in use were quite useless, and the positions of the stars erroneous. The result was that the king decided upon establishing an observatory in Greenwich Park, and Flamsted was appointed astronomer royal, and of the salaries of £200 a year, which was a considerable sum in those days. The moon's movement is $200 a year, for which also he was to instruct two boys from Christ's Hospital. While the small building in the Park was in course of erection he resided in the Queen's House at the central point of Greenwich Hospital School, and removed to the house on the hill on the 10th of July 1767, which came to be known as "Flamsted House." The institution was placed under the surveyor-general of ordnance,—perhaps because that office was then held by Sir John Moore, himself an eminent mathematician. Though this was not the first observatory in Europe, it was destined to become the most useful, and has amply fulfilled the important duties for which it was
designed. It was established to meet the exigencies of navigation, as was clearly stated on the appointment of Flamsteed, and on several subsequent occasions; we see now what an excellent foster-mother it has been to the higher branches of that science. This has been shared by many other navigators. In England originally the most suitable man in the kingdom was placed in charge, it was so starved and neglected as to be almost useless during many years. The government did not provide a single large mural arc which a proved a failure. Seven years after another mural arc was erected at a cost of £120, with which he set to work in earnest to verify the latitude, and to determine the position of the equinox and to ascertain the right ascensions and declinations of the stars; he obtained the positions of 2883 which appeared in the "British catalogue" in 1723 (see Flamsteed).

Flamsteed died in 1719, and was succeeded by Halley, who paid particular attention to the motions of the moon with a view to the longitude problem. A paper which he published in the Phil. Trans. (1729) contains observations that were made by him (Halley) in 1683-1684 for ascertaining the moon's motion, which he thought to be the only practical method of that. He himself had at that time made some observations, but not better than those before his time as well as those of Tycho, Kepler, Bullialdus and Horrox, were uncertain; sometimes the errors would compensate one another; at others they fell the same way, and it was right leading to an error on being corrected. He hopes that the tables will be so amended that an error may scarce exceed 3 minutes of arc (equal to 1° of longitude). Sir Isaac Newton's tables, corrected by himself (Halley) and others up to 1713, would admit of errors of 5 minutes, when the moon was in the third and fourth quarters. He blames Flamsteed for neglecting that portion of astronomical work, as he was at the observatory more than at the board. He had and should have been, during the whole period of the moon's apogee—less than nine years—during which he observed the right ascensions at her transit, with great exactness, almost fifteen hundred times, or as often as Tycho Brahe, in about 1590, with his instruments and tables, to be able to compute the moon's position within 2 minutes of arc with certainty, which would reduce errors of position to 20 leagues at the equator and 15 in the Channel; he thought Hadley's quadrant might be applied to determine lunar distance at sea with the desired accuracy.

The rise of modern navigation may be fairly dated from the invention of the sextant in 1731 and of the chronometer in 1735; the former a complete nautical observatory in itself, and the latter an instrument which in its modern development has become an almost perfect time-keeper. It was a curious coincidence that these two invaluable instruments were invented at so nearly the same time. Until 1731 all instruments in use at sea for measuring angles either depended on a plumb line or required the observer to look in two directions at once.

True imperfections are clearly pointed out in a paper by Pierre Bouguer (1729) which received the prize of the Paris Academy of Sciences for the best method of taking the altitude of stars at sea. Bouguer himself proposes a modification of what he calls the English quadrant, probably the one suggested by Wright and improved by Davis. Fig. 6 represents the instrument as proposed, capable of measuring fully 90° from E to N. A fixed pinacle was recommended to be used in the same, which a ray from the sun would make upon the sight C. The sight F was movable. The observer, standing with his back to the sun would look through F and C at the horizon, shifting the sight F up or down till the ray from the sun coincided with the horizon. The distance E to F would represent the altitude, and the remaining part of F to N the zenith distance. The English quadrant which this was to supersede differed in having about half the arc from E towards N, and, instead of the pinacle being fixed at E, it was on a smaller arc represented by the dotted line e8, and movable. It was placed on an even number of degrees, considerably less than the altitude; the remainder was measured on the larger arc, as described.

Fig. 6. Halley's observations were published posthumously in 1742, and in 1741, Commissioners of Longitude paid his daughter £400 for M.S. supposed to be useful to navigation. As the moon passes the stars lying in her course through the heavens at the mean rate of 33° in one minute of time, it is obvious that an error to that amount in measuring from a star a minute of time will produce a difference of one degree in longitude. As the moon's motion with regard to the sun is nearly one degree a day less, a similar error in the distance would produce still more effect.

Hadley's instrument, on the other hand, described to the Royal Society in May 1731 (Phil. Trans.) embodies Newton's idea of bringing the reflection of one object to coincide with the direct image of the other. He calls it an octant, as the arc is actually 45°, or the eighth part of a circle; but, in consequence of the angles of incidence and reflection both being changed by a movement of the index, it measures an angle of 90°, and is graduated accordingly; the same instrument has therefore been called a quadrant. It was very slowly adopted, and no doubt there were numerous mechanical difficulties of centring, graduating, &c., to be overcome before it reached perfection. In August 1732, in pursuance of an order from the Admiralty, observations were made with Hadley's quadrant on the East India Company's yacht of 60 tons, sheeress, in rough weather, by persons—except the master attendant—an unaccustomed to the motion; still the results were very satisfactory. A year later Halley published (Phil. Trans., 1733) the description of an instrument for taking altitudes when the horizon is not visible. The sketch represents a curved tube or spirit-level, attached to the radius of the quadrant, since which time many attempts have been unsuccessfully made to construct some form of artificial horizon adapted to use at sea on board ship, a discovery which would greatly facilitate observations at night and at the many times when the natural or sea horizon is imperfectly visible.

From the year 1714 the history of navigation in England is closely associated with that of the "Commissioners for the discovery of longitude at sea," a body constituted in that year with power to grant annually sums not exceeding £2000 to assist experiments and reward minor discoveries, and also to judge on applications for much greater rewards which were from time to time offered to open competition. For a method of determining the longitude within 60 geographical miles, to be used by a vessel of 100 tons, the sum of £10,000 was offered; within 40 m., £5,000; within 30 m., £3,000. £10,000 was also to be given for a method that would determine longitude within 80 m. near the shores of greatest danger. No action seems to have been taken before 1737; the first grant made was in that year, and the last in 1815, but the board continued to exist till 1828, having disbursed in the course of its existence £101,000 in all. In the interval a number of other acts had been passed either dealing with the powers, constitution and funds of the commissioners or encouraging nautical discovery; thus the act 18 George II. (1745) offered £20,000 for the discovery by a British ship of the North-West Passage, and the act 16 George III. (1775) offered the same reward for a passage to the Pacific either north-west or north-east, and £5000 to any one who should approach by sea within one degree of the North Pole. All these acts were swept away in 1828, when the longitude problem had ceased to attract competitors, and voyages of discovery were nearly over.

The suggestions and applications sent in to the commissioners were naturally very numerous and often very trifling; but they sometimes furnish useful illustrations of the state of navigation. Thus, in a memorial by Captain H. Lanoue (1736), he records a number of recent casualties, which shows how desperately the largest ships were then navigated. Several men-of-war off Plymouth in 1691 were

1 This total comprises the large sums awarded to Harrison and to the widow of Mayer, the cost of surveys and expeditions in various parts of the globe, large outlays on the Nautical Almanac and on subsidiary calculations and tables, rewards for new methods and solutions of problems, and many minor grants to watchmakers or for improvements in instruments. Thus Jesse Ramsden received in 1775 and later about £1600 for his improvements in graduation (q.v.), and E. Massey in 1804 got £200 for his log (see Log).
NAVIGATION

wrecked through mistaking the Deadman for Berry Head. Admiral Wheler's squadron in 1694, leaving the Mediterranean, ran on Griffin Rock after they thought they were the South Seas. Cloudesley Shaw's squadron, in 1707, was lost on the rocks off Scilly, by erring in their latitude. Several transports, in 1711, were lost near the river St Lawrence, having erred 15 leagues in the reckoning. The lead in the Lizard, the ship, the Lizard, on the 17th of November 1721, the same day on which he sailed from Plymouth.

Many rewards were paid by the commissioners for methods by which it was proved that calculations involved in “clearing the lunar distance” could be abbreviated; thus Israel Lyons (1730-1775) received £10 for his solution of this problem from the commissioners in 1760; and in 1772 he and Richard Duth rivals, each obtained £50. George Whitchell, master of the Royal Naval Academy, Portsmouth, conceived a plan whereby the correction could be taken from a table by inspection. In October 1765 the commissioners awarded him £100 for this work. He gives his own plan of taking and printing 1000 copies of his table. On the following April he gave him £200 more. The work was continued on the same plan by Antony Shepherd, the Plimton professor of astronomy, Cambridge, with some additions by the astronomer-roial. The total cost of the ponderous 4 to volume up to the time of publication in June 1772 was £3100, after which £500 more was paid to the Rev. Thomas Parkinson and Israel Lyons for examining the results. It was a very large and expensive volume—ill-adapted for ship's use. Considerable sums were paid by the commissioners from time to time for other tables to facilitate navigation—not always in judicious arrangement of lofty tables. Michael Taylor and those of Mendoza, published in 1815. The proposals submitted to the board to find the longitude by the time of the transit of Venus were of every number.

One of the first points to which the attention of the commissioners was directed was the survey of the coasts of Great Britain, which was pressed on them by Whiston in 1737. He was appointed surveyor of coasts and headlands, and in 1741 received a grant for instruments. An act passed in 1740 enabled the commissioners to spend money on the survey of the coasts of Great Britain and the “plantations.” At a later date they bore part of the expenses of Cook's scientific voyages, and of the publication of their results. Indeed it is to them that Cook's own survey of the south coast of Africa is due. He gives his own plan of taking and printing 1000 copies of his table. On the following April he gave him £200 more. The work was continued on the same plan by Antony Shepherd, the Plimton professor of astronomy, Cambridge, with some additions by the astronomer-roial. The total cost of the ponderous 4 to volume up to the time of publication in June 1772 was £3100, after which £500 more was paid to the Rev. Thomas Parkinson and Israel Lyons for examining the results. It was a very large and expensive volume—ill-adapted for ship's use. Considerable sums were paid by the commissioners from time to time for other tables to facilitate navigation—not always in judicious arrangement of lofty tables. Michael Taylor and those of Mendoza, published in 1815. The proposals submitted to the board to find the longitude by the time of the transit of Venus were of every number.

Before we pass on to these two important topics we may with advantage take a view of the state of practical navigation in the middle of the 18th century as shown in two of the principal treatises then current. When Roberton's Elements of Navigation passed through six editions between 1755 and 1796. It contains good teaching on arithmetic, geometry, spherical trigonometry, astronomy, geography, winds and weather. There are two good traverse tables, one to quarter points, the other to every 15 minutes of arc; the distance to each is 120 m. There is a table of meridional parts to minutes, which is more minute than customary. Book iv, upon what is now called "the day's work" or dead-reckoning, appears to embrace all that is necessary. A great many methods, we are told, were then used for measuring a ship's range of latitude: the late Captain Henry showed that the half-minute glass were generally used. Bouger and La Caselle proposed a log with a diver to avoid the drift motion (1753 and 1760). Robertson's rule of computing the equation of equal altitudes is as good as any. It is well established that time it is a proper instrument of an equal-altitude instrument, having three horizontal wires, probably such as was used at Portsmouth for testing Harrison's timekeepers. The mechanical difficulties must have been great in preserving a perpendicular stem and a truly horizontal sweep for the time between the equal altitudes of the sun—all good, as is also the remark that "the greater the moon's meridian altitude the greater generally the tides will be." He states that Lacaille recommends equal altitudes being observed and worked separately, in order to find the time from noon, and the mean of the results taken as the truth. There is a sound article on chronology, the ancient and modern modes of reckoning time. A long list of latitudes, longitudes and distances, with their sources and references, is given. The second volume was published by the author to treat of navigation mechanical and theoretical; by the former he means seamanship. He gives instructions for all kinds of vessels. In particular, the treatment of the Dead Reckoning is good. There are two good traverse tables, one to quarter points, the other to every 15 minutes of arc; the distance to each is 120 m. two at Greenwich Observatory, to be 3° 54' 20" west of Greenwich. In February 1705 the commissioners of longitude expressed an opinion that the trial was satisfactory, but required the principles to be disclosed and other watches made. Half the great reward was paid to him at once. A few years later, this year 1767, he gave up everything to them within six months. The second half was not paid till 1773, after trials had been made with five watches. The watch was made at Greenwich by Maskelyne, who, as we shall see, was a great advocate of lunars, and was not ready to admit more than a subsidiary value to the watch. A bitter controversy arose, and Harrison in 1767 published a book in which he championed Maskelyne with exposing his watch to undue criticism. The feud between the astronomer-royal and the watchmakers continued long after this date.

Even after Harrison had received his £20,000, doubts were felt as to the certainty of his achievement, and fresh rewards were offered in 1774 both for timekeepers and for improved lunar tables or other methods. But the tests proposed for timekeepers were very discouraging, and the watchmakers complained that this was due to Maskelyne. A fierce attack on the astronomer's treatment of himself and other watchmakers was made by Thomas Mudge in 1792, in A Narrative of Facts, addressed to the first lord of the Admiralty, and it is not surprising that the complaint did not meet with much justice. Harrison at this date still says that he would prefer an occultation of a bright star by the moon and a number of correspondent observations of transits of the moon calculated to the moon centre, and that the best way would be by two parallel and remote places, to any timekeeper. The details of these controversies, and of subsequent improvements in timekeepers, need not detain us here. The names of J. R. Dollond and T. F. Rother, who, as watchmakers are prominent, each of whom received, up to 1805, £2000 reward from the commissioners of longitude. It was Arnold who introduced the name chronometer. The French emulated the English efforts for the production of good timekeepers, and favourable trials were made between 1768 and 1772 with watches by Le Roy and F. Berthoud.

The marvellous accuracy with which the modern chronometer is constructed is doubtless greatly stimulated by the annual competition at Greenwich, from which the Admiralty purchase for the British navy. These chronometers are all fitted with secondary compensation balances, and it is therefore unusual in the navy to apply any temperature correction to the rate. The perfection obtainable in compensation may be illustrated by the performance of a chronometer at the Royal Observatory in 1886, which at a mean temperature of 50° F. had a weekly rate of 1-6 secs. losing; and on being further tested at a mean temperature of 92° F., it only changed its weekly rate to 2-9 secs. losing. In the mercantile marine cheaper chronometers without secondary compensation are more commonly used, and temperature corrections applied, calculated from a formula originally proposed by Hartnup, formerly of the Liverpool Observatory. Great attention has been paid to this mode of compensation, as illustrated by the following facts. From the discussion of the records of performance of the chronometers of the Pacific Steam Navigation Company during twenty-six voyages from London to Valparaiso and back, by giving equal weight to each of the three chronometers carried by each ship, the mean error of longitude for an average voyage of 101 days was less than three minutes of arc. As a single instance, in the s.s. Orelana, on applying temperature rates during a voyage of 63 days, the mean accumulated error of all three chronometers was only 2-3 sec. of time.

While we were thus rapidly approaching their present perfection the steady progress of astronomy both by the multiplication and increased accuracy of observations, and by corresponding advances in the theory, had made it possible to construct greatly improved tables. In observations of the moon Greenwich still took the lead; and it was here that Halley's successor Bradley made his two grand discoveries of aberration and nutation which have added so much to the precision of modern astronomy. Kepler's Rudolphine tables of 1627 and Street's tables of 1661, which had held their ground for almost a century, were rendered obsolete by the observations of Halley and his successors. At length, in 1753, in the second volume of the Commentarii of the Academy of Göttingen, Thaddeus Mayer printed his new solar and lunar tables, which were to have so great an influence on the history of navigation. Mayer afterwards constructed and submitted to the English government in 1755 improved MS. tables. Bradley found that the moon's place by these tables was generally correct within 1', so that the error in a longitude found by lunar would not be much more than half a degree if the necessary observations could be taken accurately at sea. Thus the lunar problem seemed to have at length become a practical one for mariners, and in England it was to the prime of its development. The father of all lunar navigation—"the father," as he has been called, "of lunar observations."

In 1761 Maskelyne was sent to St Helena to observe the transit of Venus. On his voyage out and home he used Mayer's printed tables for lunar determinations of the longitude, and from St Helena he wrote a letter to the Royal Society (Phil. Trans., 1762), in which he described his observations made with Hadley's quadrant of 20 in. radius, constructed by John Bird, and the glasses ground by Dollond. He took the observations both ways to avoid errors. The arc and index were of brass, the latter made of mahogany, and so adjusted as to divide into minutes. The telescope was 6 in. long, magnified four times the ordinary magnification. Very few seamen in that day possessed so good an instrument. He considered that his ship's time should be ascertained within twelve hours before or after observing the lunar distance, as a good common watch will scarcely vary above a minute in that time. This shows that he must have intended the altitudes to be calculated—which would lead to new errors. He considered that his observations would give the longitude within 15 degrees. On the 11th of February he took ten observations; the extremes were a little over one degree apart.

On his return to England Maskelyne prepared the British Mariner's Guide (1763), in which he undertakes to furnish complete and easy instructions for finding the longitude at sea or on shore, within a degree, by observing the distance between the moon and sun, or a star, by Hadley's quadrant. How far that promise was fulfilled, and the practicality of the instructions are points worth consideration, as the book took a prominent place for some years. The errors which he said were inseparable from the dead-reckoning, "even in the hands of the ablest and most skilful navigators," amounting at times to 15 degrees, appear to be overestimated in this book. He attempted to determine the moon's position at time of observation from Mayer's tables, would, he believed, always determine the longitude within a degree, and generally to half a degree, if applied to careful observations. He recommends the two altitudes and distance being taken simultaneously when practicable. The probable error of observation in a meridian altitude he estimated at one or two minutes, and in a lunar distance at two minutes. He then gave clear rules for finding the moon's position and distance by ten equations, too laborious for seamen to undertake. Admitting the requisite calculations for finding the moon's place to be difficult, he desired to see the moon's longitude and latitude computed for every twelve hours, and hence her distance from the sun and from a proper star on each side of her carefully calculated for every six hours, and published beforehand.

In 1765 Maskelyne became astronomer-royal, and was able to give effect to his own suggestion by organizing the publication of the Nautical Almanac. The same act of 1765 which gave Harrison his £5,000 gave the commissioners authority to publish tables of corrections for the longitudes of the HMS. The improvements up to his death in 1762, were bought from his widow for £3000; £500 was granted to the mathematician L. Euler, on whose theory of the moon Mayer's later tables were formed; and the first Nautical Almanac, that for 1767, was published in the previous year, at the cost and under the authority of the commissioners of longitude. In 1766 the French nautical almanac for the following year appeared, an improvement on what had been before issued by private persons, but it did not
attempt to give lunar distances. 1 In the English Nautical Almanac for 1767 we find everything necessary to render it worthy of confidence, and to satisfy every requirement at sea. The great achievement was that of giving the distance from the moon's centre to the sun, when suitable, and to about seven fixed stars, every three hours. The mariner has only to find the apparent time at ship, and clear his own measured lunar distance from under letter patent from the king dated 24th March 1679, then laid by the editor of the book are the methods of Lyons and Dunthorne, and then by simple proportions, or proportional logarithms, find the time at Greenwich. The calculations respecting the sun and moon were made from Mayer's last manuscript tables under the inspection of Maskelyne, and were so continued till 1804. 2 The calculations respecting the planets are from Halley's tables, and those of Jupiter's satellites from tables made by Wargentin and published by Lalande in 1739 (except those for the fourth satellite). The original Nautical Almanac contained all the principal points of information which the seaman required, but the great value of such an authentic publication to the whole astronomical world led soon to a considerable increase to its contents. As much of this was unnecessary for the ordinary requirements of navigation, since 1903 it has been issued in two forms, the larger for observatory purposes, the smaller for the class for whom it was originally intended.

Various useful rules and tables were added to early volumes of the Almanac. Thus that for 1771 contains a method and table for determining the position of the sun's parallactic altitude at any time, published by Cornelis Donnes of Amsterdam in 1740. At the end of the Almanac for 1772 Maskelyne and Whewell gave three special tables for clearing the lunar distance; still their rule is not exact, and improvement Dunthorne's solution is also given. In the edition for 1773 a new table for equations of equal altitude was given by W. Wales. In those for 1779 and 1800 tables were added by John Brinkley for rendering the observations for double altitudes easier. The plan of the Nautical Almanac was soon imitated by other nations. In France the Académie Royale de Marine had all the lunar distances translated from the British Nautical Almanac for 1773 and following years. As for China, the British Almanac for 1792 is the last seen, and ten thousand copies were soon sold. A second edition, prepared by Wales, appeared in 1781, an octavo of 237 pages, in the preface of which it is stated that it contains everything necessary for computing the latitude and longitude by observation. There are in all twenty-three tables, the traverse table and table of meridional parts alone being deficient as compared with modern works of the kind; dead-reckoning Maskelyne did not touch. He gave practical methods for working several problems; that for computing the lunar

especially an improvement on those by Lyons and Dunthorne, and a rule given for clearing the distance, called Dunthorne's improved parallactic altitude. Remarkably, short was Maskelyne's rule for finding the latitudes by two altitudes and the elapsed time also is good. The third edition of the Tables was issued in 1802.

The publication of the Requiæ Tables met a great want, and the existence of such accurate and conveniently arranged methods of tables for the special purposes of nautical calculations led to the more general use of many refinements which had been previously neglected. They form the original of many subsequent and greatly extended collections, of which those by J. W. Norie are the more generally used in modern times in the mercantile marine, and the very accurate and comprehensive tables by James Inman (originally published in 1823) are now largely used in the Royal Navy.

Until the middle of the 17th century mariners generally employed small collections of Dutch charts, known as "waggoners" from Wagener, the name of a celebrated Dutch hydrographer in 1684. In 1671 appeared the English Pilot by John Scoles, who is styled the "Hydrographer Royal." It forms a collection of rude sketches of the coasts of England, the North Sea, France and Spain, with sailing directions, and on its appearance the importation of Dutch charts was prohibited. Private enterprise, for many years after that, supplied both the British navy and the British mercantile marine with constantly improving charts, especially latterly, under the powerful patronage of the East India Company, whose hydrographer (Alexander Dalrymple), in 1795, was selected as the first hydrographer of the Admiralty. This post has since been occupied by a succession of distinguished naval officers under whom have grown up the School of Hydrography surviving for the safe navigation of the ship," while on the completion of a voyage of discovery it was customary for the results to be published for the benefit of the public.

The establishment of the Admiralty Hydrographical Office in 1795 marked a great step in the advancement of the art of navigation. On the 12th of August of that year an order in council placed all such nautical documents as were then in the possession of the Admiralty in charge of Dalrymple, whose catalogue, compiled for the use of the East India Company in 1786, contained 347 charts between England, the Cape, India and China; thus the germ of the present hydrographical department was established. The expense was then limited to £50 a year. The first official catalogue of Admiralty charts was issued in 1830, the total number being then 962. In close of the war devastating in 1815 both trade and science revived, and several governments besides that of Great Britain saw the necessity of surveying the coasts in various parts of the globe; the greater portion of the work fell to the English hydrographical department, which took under its charge nearly every place where the inhabitants were not able to do it for themselves. Since that time its carefulness has steadily developed, and it not merely undertakes the constant improvement of the charts of the whole world, but periodically issues for the use of the seafaring community a vast amount of most accurate and practical nautical information on the various closely allied subjects of navigation, tides, compass adjustment and ocean meteorology.

A knowledge of the times and heights of high and low water and the directions of the tidal streams due to those phenomena are in many parts of the world (especially round our own coasts) of great importance. The tide tables have been laid down by Newton and Laplace, and in Phil. Trans., 1683, there is an account of Flamsteed's tide table for London Bridge, which gave the times of each high tide on every day in the year. For a long subsequent period empirical tide tables for a few places in England were published by private individuals, but in 1832 the researches of Dr W. Whewell and Sir J. W. Lubbock enabled official tide tables to be issued for Liverpool and Grimsby. They were advanced in detail and accuracy, being now in many cases based on continuous tidal observations for a whole lunar period of 18½ years, and represent the practical epitome of our knowledge of the tides and currents. The formule and tables on which these predictions are based are given in the introduction to each annual volume (see Tide).

Modern Navigation

Having thus sketched the progress of the art of navigation from an early period to the present time, we will now describe the modern methods by which it is brought into practical use,
referred to in more technical information to the professional text-books enumerated at the end of this article. The great development in both speed and size of modern ships enormously increases the responsibilities of those who command and navigate them, and has led to a careful examination of the existing modes of determining a ship's position at all times by day or night, both when in sight of land and on the open ocean. An examination of the present text-books on the subject of navigation shows how problems and methods which were formerly considered chiefly as theoretical exercises have now, from the altered conditions of the navigation of very fast ships, become methods of frequent practice, while corresponding improvements have been made in instruments of observation and chronometers, by the aid of which more satisfactory results are now attained. Much has also been done to advance the study of this and its numerous allied subjects by the development of the Royal Naval College at Greenwich and the United Service Institution; also by the establishment of shipmasters' societies (of which the well-known society in London is typical), where during the year valuable papers are read and useful discussions take place among those actually carrying out the practice of navigation.

In coming out in advance a long ocean voyage the experienced navigator would first, by laying down the track from port to port on a great circle chart, ascertain the shortest route between them, remembering that the greatest saving in distance over other routes is when the ports are far apart in longitude and both in high latitudes of the same name. On examining such a track in conjunction with the wind and current charts it will be seen what modifications the intervention of land, unfavourable currents or winds, ice or unduly high latitude render necessary, and such modified route would be finally adopted subject to possible change as the voyage progressed. The judgment forming the basis of this course laid down for the voyage can be shown by the remarks in the volumes of Sailing directions or "Pilots" relating to the region about to be traversed, while among the many excellent modern publications of the Hydrographic Office of the Admiralty perhaps the Ocean Passage Book is one of the most generally useful, since, when used in combination with the admirable charts of suggested full-powered and auxiliary tracks, it very greatly assists all navigators in planning out a successful voyage. Finally the intended route would be transferred from the great circle chart to one on Mercator's projection, which is more convenient for purposes of navigation since in constructing the former for the sake of simplicity a projection of the coast's surface is adopted on which great circles are correctly shown as straight lines (gnomonic), while for practical purposes in navigation such a representation on which a ship's track when steering a continuous course (technically termed a rhumb line) is truly shown as a straight line (Mercator) is the most convenient, although in high latitudes giving a very distorted representation of the surface depicted. It is well to remember that on great circle charts rhumb lines become curves and great circles straight lines, and, vice versa, on Mercator charts, the rhumb line of one projection being that nearer to the equator, all meridians and the equator on both projections are shown as straight lines.

Ships rarely steer on great circles, which would generally theoretically involve continually altering course, but a series of chords of such circles are described of lengths such as involve a practical change of course of one or two degrees on the completion of each.

Great circle charts are very useful for drawing what is known as a composite track where if the great circle route would lead into too high a latitude the shortest route to and from the highest desirable parallel is readily laid down, the intervening track being pursued on that parallel.

A method of drawing approximate great circles directly on Mercator charts was proposed by Airy in 1858, and is sometimes very useful. The excellent idea, originally suggested by M. F. Maury, of establishing steam "lanes" in localities where there is much ocean traffic, so as to minimize the risks of collision between outward and homeward bound ships, has been successfully carried out in the North Atlantic. The leading transatlantic steamship companies now agree to follow great circle routes from the Irish coast to points on the Banks of Newfoundland, which vary somewhat in position with the season of the year, but are published in advance. These "lanes" being avoided by sailing vessels, risks of collision are materially lessened.

Having thus planned the most desirable general track to pursue, three methods are employed to ascertain the position of the ship at any time during such voyage: these are (1) projecting the track on charts; (2) simple trigonometrical calculation of the port of arrival where the ship then is, the course steered and distance run; and (3) astronomical observations, which form an entirely independent method.

Of these the first is the least trustworthy, owing to the usual difficulties attending accurate graphic methods and the small scales on which ocean charts are necessarily drawn. When near the land the larger scale coast charts are used, and in the approaches to harbours still larger scale plans give increasing accuracy to this record of a ship's position. Index charts of all parts of the world are provided, by referring to which the navigator ascertains where the chart begins to employ, always preferably using that on the largest scale.

On leaving harbour, and while near the coast, the position is not found by calculation but by frequently observing (when a variety of objects is in sight) (1) simultaneous sextant angles between suitably situated objects subsequently laid down on the chart by a station pointer; (2) simultaneous compass bearings of two or more objects (technically known as cross bearings); or (3) a combination of both methods by employing one bearing and one angle. All such methods are capable of considerable accuracy if the observations are made simultaneously. Frequent observation of objects, or sometimes only one, be visible (as frequently occurs at night) other and rougher methods are practised, depending upon the change of bearing of an object while a certain distance in a certain direction is traversed by the ship, such knowledge being based in many cases on an estimate of the action of the tide. When a ship is steaming at the rate of 20 knots the navigator remembers that a mile is passed over in three minutes, and that if in sight of land and fixing positions by objects on shore, it is essential to adopt some rapid method; otherwise when laid down on the chart the position shows where the ship was, and not where she is. This difficulty has led to the more general use of methods of obtaining positions by angles instead of bearings, and laying them down on the chart by the aid of the station pointer. Many advantages accrue from this, as the observer is not restricted in position on board, as is the case when using the compass, and especially if a double sextant (having two index glasses and one horizon glass) is employed two angles can be measured simultaneously, the result on the chart being very rapidly arrived at. An ingenious combination of sextant and station pointer in one has been proposed, and most simply carried out by attaching vertical sights to the legs of a station pointer, which is put on a suitable horizontal stand, and the legs moved until the sights are in line with the objects observed. To assist the navigator in the choice of suitable objects between which to measure the angles, a very useful pamphlet is issued by the Admiralty, from the diagrams in which it can be seen at a glance which combination of objects in sight gives the most favourable result, always remembering as a broad principle that nearer objects are more suitable than distant ones, and that the accuracy of position determined depends on the relative distances of the objects as well as on the magnitude of the angles between them.

In these circumstances, which render these rougher methods those only available, and especially in hazy weather in many known localities (such as the English Channel), a continuous line of deep sea soundings at fairly even distances apart affords an additional verification of position, remembering that only an occasional sounding might prove very misleading.

The chronicle of progress in the art of navigation would be very
incomplete without reference to the extended use of Lord Kelvin's sounding machines, either in the original form, where the increased pressure at different depths is recorded by dis-coloration of chemical tubes, or in the later form known as the "depth recorder," where similar results are obtained by the automatic record of the position of a piston forced upwards in a tube by this increased pressure. Very satisfactory results can be obtained at speeds of 15 or 16 knots, enabling that great safeguard of navigation in many places, viz. a continuous line of soundings, to be accurately and rapidly obtained. In connexion with this should be mentioned a most ingenious invention known as the "submarine sentry," which on being set for any desired depth and towed overboard remains at that depth whatever the speed of the ship may be. On striking bottom it at once floats to the surface and rings a warning bell. Such an instrument is of obvious value in ships where, owing to the small number of available men, it is difficult to maintain a continuous line of soundings. To avoid an unnecessarily wide détour in rounding points and shoals, extensive use is now made of both horizontal and vertical danger angles; the former is the angle on the arc of a horizontal circle passing through a point at the rector to the horizontal diameter and the latter to the vertical diameter through two previously selected, easily recognized, fixed objects. Should circumstances enable the selection to be made of an angle of about 90°, the ship by continually measuring the angle may be steered on the arc of such a circle with great precision, and may even be safely taken through a channel between two dangers. The vertical danger angle enables similar results to be attained by measuring the vertical angle subtended by a known height; but except where the selected object is one whose height is well determined, such as a lighthouse, this method is not so trustworthy as the former.

Before losing sight of land the latitude and longitude of the last well-determined position found by the methods referred to is taken from the coast chart, transferred to the ocean or small scale chart, and considered to be the "departure" or starting-point of the ocean voyage, and from that point the course and distance run by the ship is laid down, being rectified on every occasion when the position is more accurately determined by astronomical means. To obviate the inevitable inaccuracies attending this graphic method and as a corroboration of the ship's position, the changes of latitude and longitude involved in each alteration of course are daily calculated by plane trigonometry and the results are reduced to the same scale, are then the basis of the Traverse Table, which is a tabulated expression of the solutions of right-angled plane triangles.

The foregoing modes of keeping account of a ship's position are technically known as "dead reckoning." The general introduction of compasses with short needles and slow periods of vibration has done very much towards improving the accuracy with which a ship's "dead reckoning" is kept. The original model of these was that patented by Lord Kelvin in 1876, and since adopted in the British navy as the standard. In this instrument we have a compass specially designed to enable the principles of compensation or correction proposed by Sir G. B. Airy in 1837 to be accurately carried out, while its slow period of swing renders it in all circumstances extremely steady.

The record of distance run is always obtained from the patent log, usually in the form of the Cherub or Taffrail log introduced in 1878. The common or hand log has ceased to be regarded as anything but the very roughest of guides, and the patent log in its original form, in which it recorded the revolutions of a small screw ship, does not give satisfactory results at great speeds, nor can anything more favourable be said of those forms where pressure on known areas is employed. The revolutions of the engines, with due allowance made for the condition of the ship's bottom, afford now perhaps the best means of estimating speed (see Log).

Astronomical observations afford the most accurate means of ascertaining positions at sea, other methods (dead reckoning) being only relied upon when the weather does not admit of the practice of these, though by utilizing twilight and night observations of moon, stars and planets, the navigator in most parts of the world need seldom proceed far without the means of astronomically rectifying his position either in latitude, longitude or both at the same time.

The practical problems involved are precisely those employed at astronomical observatories, but it is not possible to attain similar accuracy of results, for though the sextant (the instrument always employed at sea in making such observations) is capable of marvellous accuracy, yet, as practically all such observations depend directly upon altitudes measured above the ocean surface, and consequently on the height of the ship above the Great Sea Level, the results of this, due to the changing effects of refraction, much affect observations made at any one time. This error in practice is greatly reduced by methods of combining several observations made at different times and using their mean or average result.

A notable feature of the progress of the art of modern navigation is the greatly increased practice of star navigation, and many of the supposed difficulties of night observations are found to be removed by experience. Determinations of positions at sea by twilight observations, when the brighter stars become visible while the horizon is still well defined, are probably the most practicable. By combining altitude and distance, the position of the ship may be determined. For purposes of combining for latitude stars passing north and south of the zenith, and for longitude those near the prime vertical both east and west, can generally depend upon a good result, especially if suitable stars can be found for each pair at about the same altitudes. For these purposes the armillary sphere is extremely useful: this is a small celestial globe on which are depicted the principal stars visible to the naked eye. On elevating the pole to the approximate latitude of the observer, and turning the sphere until the sidereal time is under the fixed meridian, a correct representation of the heavens at the time of observation is obtained; the stars are then easily identified by their bearings and altitudes. This valuable instrument is not merely useful when at twilight, only a few of the brighter stars being visible, the constellations to which they belong are difficult of recognition, but it enables arrangement to be made in advance for such observations as are desired to be taken during the night. By marking in pencil on the globe the positions of the planets in right ascension and declination, the same sphere is also available for their identification. The heavenly bodies commonly observed at sea are: The Sun, Moon, Venus, Mars, Jupiter, Saturn, the stars, and the planets. The chief astronomical observations made at sea are those for ascertaining (1) latitude, (2) time and thence longitude, (3) error of compass, and (4) latitude and longitude simultaneously.

The chief latitude observations made at sea are those for determining (1) latitude, (2) time and thence longitude, (3) error of compass, and (4) latitude and longitude simultaneously. For astronomical latitude observations made at sea are those for determining (1) latitude, (2) time and thence longitude, (3) error of compass, and (4) latitude and longitude simultaneously.
observations of it can be taken at any time when it is visible, and from a convenient table given in the Nautical Almanac the altitude of the sun at any place, with the exception of the time interval for sunrise or sunset, may be assumed in all well found modern ships that on applying the known errors and accumulated rates to the times shown by the chronometers taken at the time of departure, the longitude may be ascertained as accurately known, and as the distance east or west of any place is merely the difference between the two local times at any instant expressed in degrees, so also is the distance east or west of Greenwich [longitude] obtained by the difference between the time at place and the time at Greenwich at any instant. The connexion between time and degrees depends upon the complete rotation of the earth in twenty-four hours, causing meridians 15° apart to pass under the same fixed point in the heavens at intervals of one hour. In the calculations, those errors and differences are considered as small quantities, and those west later, resulting in local time being in advance of Greenwich time in east longitude and vice versa in west longitude.

The navigator gains or loses the same number of seconds as the rate of the chronometer referred to are known from observations made on shore prior to the beginning of the voyage with a sextant and artificial horizon, and these observations are capable of almost as great accuracy as those taken at sea, an essential element of the navigator's position. The error of the chronometer is absolutely an essential opportunity is taken at each principal port visited of either repeating such observations or obtaining the information from time balls dropped from observatories on shore at the Greenwich meridian, and thus in the The calculation of the longitude can only be found with fair accuracy from calculations based on altitudes of heavenly bodies, when they are nearly east or west of the observer or any place at which they are approximately seen from the azimuth diagrams or from tables of true bearings of heavenly bodies, and the error involved by using such to the position of the horizon can be greatly obliterated in twilight or at periods of observation when nearest the meridian of the ship's course during the voyage. The observations of bodies bearing east and west. In the usual case of determining time by observations of the sun the results arising from morning observations are compared with those similarly obtained by the observer at noon. If the time taken for this observation as made by any unallowed-for error in the chronometer exist it will affect the determining longitude by its full amount.

In considering the foregoing methods of astronomical fixing a ship's position, there are the twain, when the two elements of latitude and longitude are determined at different times, and generally, as we shall presently see, when they are determined together (though usually for a shorter period the navigator has to depend for some time on the accuracy of the course steered and estimated distance run; also when cloudy weather prevails he has to depend entirely on those elements for a knowledge of the ship's position. The frequent astronomical observation of the error of the compass is therefore a most important and fortunately simple duty. In practice the error is found by a comparison between the compass bearing of a heavenly body and its true bearing, obtained either by calculation, or more accurately by the use of directographic diagrams of azimuths and bearing tables from which at practically any time when above the horizon the true bearings of the principal heavenly bodies are taken by inspection of the Mercurius chart involving total errors thereby. The ship observed when the body observed is bearing nearly east or west true if not too high, but if clouds prevent observations at such times, fairly good results can be obtained by observing the compass bearing when the object observed is the meridian (if too high) and therefore lying north or south true.

The causes of the changing errors of a compass in an iron ship are described elsewhere (see COMPASS), but by making comparisons as above the navigator can at once ascertain what is termed the "total" error, and if he takes from that the portion of error due to the earth, or what is termed variation (known from a chart of such elements), the remaining error is what is called deviation. The latter method of procedure has the great advantage of enabling the navigator to ascertain during a voyage whatever magnetic changes in the ship are taking place other than that arising from the earth's magnetic field, and the error is the total error that is applied to compass courses. Deviations greater than a few degrees are not merely inconvenient but in modern compasses produce unsteadiness or oscillation of the compass cards and necessitate the use of compensating magnets which reduces such errors by adjusting the compensating magnets when favourable occasions offer. Recognizing the great value of a sound knowledge of the compass and its measurement, the subject has been included among the compulsory subjects of examination for the rank of master, thus following the example of the navy, where all navigating officers have to attend a practical course of study on the subject.

The practical problem of finding both latitude and longitude at the same time is the most important of all in modern navigation, and is rapidly superseding other modes of ascertaining a ship's position. The principle involved depends upon the fact that every heavenly body is at each particular instant of time directly overhead or in the zenith of some place on the earth. Thus, if we take the sun as an instance, it is noon at all places on the meridian of 60° W. when it is exactly 12 noon at Greenwich, and at the one spot on that meridian where the sun's rays are most perpendicular to the earth's surface at the instant the sun's altitude must equal the sum's declination and its longitude in time equal the time since noon at Greenwich. Now at a distance of 60 m. in every direction on the sun's meridian we have a point at which the sun will have an altitude of 89° and in all directions at a distance of 1200 m. its altitude will be 70° (≈90° − 20°), so that on this globe, by marking the position where at a certain instant the sun is vertical and taking the position at noon, the concentric circles may be drawn, on all points of each of which the sun's altitude will be the same. When, therefore, at sea we measure with a sextant at any time the altitude of the sun (say 60°10') we at once know we are somewhere on the arc of a great circle joining the position at noon and the position at that instant, and for radius distance equal to 1790° (≈90°−60°10'). Such information, combined with the best and most recent knowledge we have of the ship's latitude at the time, will of itself afford valuable information as to the position, but by making two such observations, separated by a sufficiently long interval for the position of the sun vertical to have moved considerably (owing to the rotation of the earth), we are able to determine with certainty that we must be at one or other of the widely separated intersections of two such circles, the movement of the ship in the interval between the two observations being duly allowed for. The dead reckoning affords information as to the position of the ship, and hence the two observations, when noted, will determine the ship's position, or using a Mercator chart involves two suppositions: (i) that the concentric circles we have referred to will be correctly represented as circles on a Mercator chart (ii) that the sun's altitude at noon is, say 100 m. of arc may be considered to be a straight line coincident with the tangent to the circle and therefore at right angles to the direction of the sun. Except in high latitudes (above 60°) Mercator's projection fulfills the first condition sufficiently well for practical purposes, and, except when the altitude is greater than 70°, the second condition is also approximately true since the radii of such circles will exceed 1000°.

Now even on a large globe it would be practically impossible to obtain very accurate results from this problem by drawing such circles, but on a large scale chart (or ordinary squared paper) much greater accuracy may be obtained by the use here of a Mercator chart and the construction of concentric circles, which may be used on the chart either as base or side. The Mercator chart involves two suppositions: (i) that the concentric circles we have referred to will be correctly represented as circles on a Mercator chart (ii) that the sun's altitude at noon is, say 100 m. of arc may be considered to be a straight line coincident with the tangent to the circle and therefore at right angles to the direction of the sun. Except in high latitudes (above 60°) Mercator's projection fulfills the first condition sufficiently well for practical purposes, and, except when the altitude is greater than 70°, the second condition is also approximately true since the radii of such circles will exceed 1000°.

If we suppose the latitude of the ship to be right the position will be at B, if not correct it must still be on the line ab, and if near land or any danger the direction of this line, even if no subsequent observation in the same manner be made, will give a trustworthy indication of the direction of the ship. A line cd drawn through C parallel to ab will represent an arc on which the position lies when it is probable that C is correct, and the position at this instant (in 60°) is the position of the ship. If another observation of the sun for longitude is now made and the resulting position is D (lying of course in the same latitude as C), on drawing through D a line ef at right angles to the bearing of the ship, the intersection of the two arcs will be somewhere on an arc as is represented by this line. Hence the intersection of the two arcs on which the position lies and the distance of the ship from the arc where the last observation was taken at the supposed position D, the discrepancies being entirely due to the original unknown error in the assumed latitude of A, for had that been accurate the position on the original line ab would have been off the course and distance from that position C would have coincided with E.

Errors in the assumed latitude of as much in many cases as 30 m. will often be found to produce no practical difference in a majority of cases, but the error in the longitude is often dependent upon the chronometer, and in such cases as arise when the intersecting arcs make a small angle with each other great accuracy...
NAVIGATION

is required in the course and distance run between the times of observation.
This method of finding both latitude and longitude at the same time is commonly known as "Sumner's" method from the publication given to the public by Sumner in 1847. It is subject to an error and is not generally considered as a good method, but it is the only one which has been developed by the American mercantile marine, although in a modified form it was practised at a much earlier date in the British navy under the name of "cross bearings of the sun." This method, in its original form, was more lengthy and troublesome, the work being practically doubled.

We have taken an illustration from observations of the sun, but the method is obviously applicable to all heavenly bodies provided they are so situated that the arcs drawn will intersect at a great angle; this is true at night or at night-time is readily done by selecting two heavenly bodies whose positions do not coincide at the same time. In these cases the small complication of allowing for the run of the ship is often obviated by making the observations simultaneously.

The armillary sphere or star globe is useful in selecting objects suitably situated.

The principle of Sumner's method has of recent years received a very important and valuable development under the name of "new navigation." In this method, originally proposed by M. Hilaire, a comparison is made between the altitude of a heavenly body as actually observed and that calculated from the supposed position of the ship. For instance, the position of an observer at the instant the body is vertically overhead is given by the equation of 45°, and if the body is observed at an angle of 30°, the position of the ship is just somewhere on a portion of the circumference of a circle (usually of such size that the portion considered may be represented on a chart by a straight line) having its centre in latitude equal to the sun's degree and in longitude equal to the meridian of the place at which the observation was made. The altitude of the body is considered to be the radius of such a circle, and the point aloft considered to be the radius of such a circle, and the point halfway up the arc. It is evident that a greater altitude means the ship is nearer to the centre of the circle (above the horizon) and a smaller altitude means the ship is farther from the centre of the circle (below the horizon) than at the instant of observation. This is used when there are two heavenly bodies whose positions do not coincide at the same time.

A careful record of everything pertaining to the navigation of the ship, with the results of all observations and calculated positions, is kept in the ship's log, an official book of great importance, a rough draft of which is usually kept in some convenient place in the ship as an event of the time of their occurrence. A copy of the headings of a page of this as transferred into the official log is here given:

<table>
<thead>
<tr>
<th>Course</th>
<th>Wind</th>
<th>Latitude</th>
<th>Longitude</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Direction</td>
<td>Force</td>
<td>Temperature</td>
</tr>
</tbody>
</table>

The course entered here is that which would be indicated by the "standard" compass of the ship (placed in the most favourable magnetic position on the vessel); that actually steered by the officer in charge is the "true" one. When the true course is entered in the log, the position on the chart is plotted. When the officer in charge observes that the "true" course is considerably different from the "standard" course, it is necessary to correct the compass for deviation. This is done by the use of a magnetic compass and weather glass, and the method is described in "Practical Navigation," published by the English government. The log contains also the time, the wind direction and force, the barometer reading, and other matters of importance. The log is usually kept by the ship's master, and the entries are made by his watch-officer, who is responsible for the correctness of the observations.

The course and distance made good each day are calculated by trigonometry between the best determined positions. If two successive noons, such positions in fine weather being always those of the given time, are utilised for this purpose, the latitude is calculated between the two lines of position, and the longitude is calculated by the difference in the positions of the ship at the time of noon. This method is used for the dead reckoning since the previous noon; such differences, however, obviously include the errors of all kinds. The latitude and longitude found by dead reckoning are entered under that heading (D.R.). The next column is usually the "observations," and the "true" or "obs." or "by observation" are seldom both determined at noon, but are carried up or back to that instant by calculation from the intervening dead reckoning. The variation is taken from the published variation chart, on which the latest results of such observations are embodied at intervals of about ten years with the annual changes (as far as known) in different localities, thus enabling the master to obtain the correct variation for the position at which the course and distance are calculated from the position of the ship at noon to the port of destination or some prominent position or danger near which the vessel must pass. This is entered under the heading of "true bearing observed."

AUTHORITIES.—The following list of some of the writers on navigation whose works have not been already mentioned may be found useful to refer to: Thomas Addison, Arithmetic Navigation (1625)—he was the first to apply logarithms; Antonio de Naja (Lisbon, 1628) follows Nuñez and Cespedes, but corrects the declination of the sun and stars; Sir R. Dudley, L'arzo de maro (1630-1645, 2nd ed., Florence, 1771)—too technical to be considered; E. H. Sumner (1681)—one of the best books of the period; William Jones (1702)—a most important treatise containing trigonometry applied to the various rules, the use of tables, and other matters of importance; P. F. S. de la Trinité (Paris, 1676)—too large; M. Pimental, L'Art de naviger (Lisbon, 1712); P. Bouguer, jun., Nouveau traité de navigation (1753)—without tables, published at the time of the last change, improved, and shortened in 1769 under the supervision of the French Academy of Sciences; Nathaniel Colson, The Mariner's New Calendar (1735)—a good book; Seller, Practical Navigation—a book very popular in its time (there was an edition as late as 1739); Samuel Dunn published good star charts and tables of latitude and longitude (1732), and framed concise rules for many problems on navigation (published by the board of longitude); John H. Moore, The Practical Navigator and Seaman's New Daily Assistant (1732)—very popular, and generally used in the British navy—the 18th and 19th editions (1810, 1814) were improved by J. Deiss; W. Wilson (Edinburgh, 1775)—a treatise on navigation—very useful; E. S. B. Kersley, Practical Navigation, or Guide to the Indian Seas (1777)—for the longitude he depends chiefly on a variation chart from observations made by East Indiamen, and he still makes no mention of the Nautical Almanac or of parallel rulers; Samuel Dunn (probably a son of the last named, 1781) is the last writer who gives instructions for the use of the astrolobe; he also wrote on "lunars" (1783, 1793), a name which was generally adopted about this time, and published an excellent treatise on the "lunars" (1796, 4th ed., 1813)—clear and simple; N. Bowditch, Practical Navigator (1800)—passed through many editions and is now (in a revised form) the standard of all who deal with the subject; John J. Kelly, Spherical Trigonometry and Nautical Astronomy (1795, 4th ed., 1813)—clear and simple; N. Bowditch, Practical Navigator (1800)—passed through many editions and is now (in a revised form) the standard of all who deal with the subject; John J. Kelly, Epitome of Navigation (1803, 21st ed. 1878)—still a favourite in the mercantile marine from its simplicity, and because navigation can be learned from it without a teacher; T. Kergin, The Young Navigator's Guide to Nautical Astronomy (1821); Inman, Epitome of Navigation (1821)—with an excellent volume of tables, formerly
NAVIGATION LAWS.

The laws grouped under this title are a branch rather of municipal law than of the general maritime law. They are based upon the right of a state to regulate the navigation of its own waters and to protect its own commerce.

One of the most curious early books on the subject is Captain G. St Lo, England’s Safetie or a Bridele to the French King, proposing a sure Method for encouraging Navigation (London, 2nd ed. 1693). Navigation laws may be divided into two classes. The first class includes all laws designed to secure a commercial monopoly to the state which enacted them. In Great Britain the Acts of 1840, 1843, and 1850 were of this description, and the powers of the Merchant Shipping Acts 1862; the rules at present in force are those contained in the order of the 27th of November 1896, L.G. No. 1892, as amended by subsequent orders in council. The second class includes all laws designed to secure to the ships of most foreign countries, with a special provision as to China. In the case of a state which has not assented to them, the only rules that apply are those of the sea, gradually ascertained by individual cases before courts of admiralty.

1. Of the navigation of its tidal waters—as far as they are territorial—a state may legislate without the assent of other states. An example of such legislation is afforded by the Territorial Waters Jurisdiction Act 1878, a measure passed in consequence of the celebrated case of R. v. Keyn, L.R. 2 Ex. D., 126 (the “Franconia” case), in 1876. Under the head of territorial waters would fall the “narrow seas” (as the Bristol Channel, Great Belt or Straits of Messina), bays and harbours, estuaries and arms of the sea, navigable tidal rivers, and the sea for the distance of a marine league from the shore. Such waters being res publicae though not res communes, as are the water-bodies below, subject to the same law as the state. In England the soil under such waters, or at least under all but the last kind, is prima facie vested in the crown, subject to the public rights of fishery and anchorage. For the distance of a marine league from the shore the law of admiralty is applicable. As to revenue purposes, this is a rule of general international law. It may be noted that the Institut de Droit International proposed to double this limit. See Hall, International Law (1920), 381, p. 154. In England the navigation of most of the principal tidal waters is governed by rules contained in acts of parliament and orders in council, the latter for the most part promulgated under the authority given by the Merchant Shipping Act 1852. For instance, there are numerous orders relating to the Thames, Mersey, Tees and other important rivers.

2. The navigation of non-tidal waters, even though navigable, are in Great Britain practically dealt with as a matter of internal public law, and do not exist as a public franchise, but can only be acquired by prescription founded on a presumed grant by an owner. In Roman law and in the Code Napoléon it is otherwise. Navigable rivers in those systems are publica, subject to public control, and a navigable river is a navigable river by definition, however differently it may be described in private law. In England, navigation of non-tidal waters in the United Kingdom, whether natural or artificial, is now almost entirely regulated by various Navigation and Conservancy Acts, e.g. the Thames Conservancy Acts, the Shannon, Tees, Tweed, etc. Acts, and the Canal Acts, especially the Manchester Ship Canal Act 1885. It may be noticed that the crown is empowered by the Merchant Shipping Act 1862 to make such rules in respect of the internal navigation of the whole country as may be found expedient on the application of the proprietors. Examples of such rules are the orders in council regulating the Mersey and Irwell navigation and the Bridgewater navigation, 18th May 1870. Such waters being private property as a public utility, the permission for the rules by the proprietors is required in the order in council.

The distinction drawn in the United States between navigable and boatable rivers seems to be peculiar to that country, unless indeed it would be possible to lend itself to such navigable or flottable "waters" of the Code Napoléon, § 538. It is at least unknown in Great Britain.

Remedies for Obstruction and Pollution.—These may be either criminal or civil—the criminal by indictment or information, the civil by action for damages or for an injunction, in addition to the criminal remedy, where special damage has been sustained. Pollution is expressly provided for by the Rivers Pollution Prevention Acts, which gives jurisdiction to county courts in cases within the act.

International Law.—The international law as to the navigation of the high seas has been sketched above. Reference should also be made to the late book by Dr. Martin, The Territorial Sea and its Legal Problems.

The leading case is The Immune (1799). 2 C. Robison’s Rep. 186. Regulations for the coasting trade may be made by the government of India under the powers of the Customs Consolidation Act 1894, and the Act of 1896 by which commissioners were appointed for the possession under the Merchant Shipping Act 1894, § 736. As to territorial waters, it is the general rule that no universal opinion of jurists that the state to which the territorial waters belong has a right to regulate their use. The look of the navigation laws is in many cases has often been the subject of treaties, almost necessarily so, where a river is the boundary between two states. In such a case if a state were to maintain the strict letter of its rights, navigation is subject to the middle line of the bed of the river, the medium flumina aequum or thalweg.
NAVIUS—NAVY AND NAVIES

299

By the treaty of Vienna in 1815 it was provided that the navigation of the Mississippi should be open to all the vessels of all the nations, subject to a uniform system of police and tolls. The treaty of Paris, 1836, extended this principle to the Danube. In America the case of the Mississippi is vested exclusively in the State of Louisiana, the treaty of Versailles, 1783, it was provided that "the navigation of the Mississippi shall for ever remain free and open to the subjects of Great-Britain and the citizens of the United States." But the United States afterwards acquired Louisiana and Florida; and, the stipulation as to British subjects not being renewed in the treaty of Ghent, 1814, the United States maintains that the right of naviga-
ing the river is vested exclusively in the United States. The Panama Canal, which is subject to peculiar engagements by treaty or convention. The former depends on the Convention of Con-
stantinople, 1855; the latter—as far as regards the United Kingdom and the United States—on the Hay-Pauncefote Treaty, 18th of November 1901. But as a rule it may be said that in peace the territorial waters of a state are open to foreigners for commercial purposes, subject to observance of any rules as to police, pilotage, &c., imposed by the state. Tolls may be imposed by the state upon foreigners. This right is expressly recognized in most commercial treaties. A notable instance was the claim of Denmark to a monopoly of freight on the Baltic, which Sir Robert Peel in the St. Elsiure, though the Sound was not strictly her territorial water. The right was not universally recognized, though it had prescription in Great-Britain. The Sound was still, in its origin, a Royal right, and has been, and is, subject to various engagements. The Sound was abolished, and compensation paid to Denmark for the loss of her alleged right.

NAVIIUS, ATTUS, in Roman legendary history, a famous augur during the reign of Tarquinius Priscus. When the latter desired to double the number of the equestrian centuries, Navius opposed him, declaring that it must not be done unless the omen were propitious, and, as a proof of his powers of divination, cut through a whetstone with a razor. Navius's statue with veiled head was afterwards shown in the comitium; the whet-
stone and razor were buried in the same place, and a putel placed over them. Hard by was a sacred fig-tree, called after him the Navian fig-tree. It was reported that Navius was subse-
quently put to death by Tarquinius. According to Schwegler, the putel originally indicated that the place had been struck by lightning, and the story is a reminiscence of the early struggle between the state and ecclesiasticism.

See Livy i. 65; Dion. Halic. iii. 54; Aurelius Victor, De viris illustribus, 6; Schwegler, Römische Geschichte, bk. xv. 16.

NAVY, a labourer employed in the digging and excavating of earth, &c., in the construction of railways, docks, canals or other engineering operations. The word is a shortened form of "navigator," applied during the 18th and early part of the 19th centuries to a labourer at work on canals, to which the name "navigation" is often applied. Power-machines (excavators) for performing such work are consequently known as "steam-
navies."

NAVY and NAVIES. The navy of a country was in its original meaning the total body of its shipping, whether used for war, for oversea and coasting traffic, or for fishing—the total in fact of its ships (Lat. navis). By custom, however, the word has come to be used only of that part of the whole which is set aside for purposes of war and police. Every navy consists of a material part (see SHIP), i.e., the vessels, with their means of propulsion and their armament, and of a human organization, namely the crews of all ranks, by which the vessels are handled. Ships and men are combined in divisions, and are ruled by an organ of the government to which they belong (see ADMIRALTY ADMINISTRATION).

PERSONNEL

The personnel of the British navy is composed of two different bodies of men, the seamen and the marines, each of which has its appropriate officers. The marines are the subject of a separate article.

The officers of the navy are classed as follows in the order of their rank: flag-officers (see ADMIRAL), commodores, captains, staff captains, commanders, staff commanders, lieutenants, sub-lieutenants, chief gunners, chief boatswains, chief carpenters, gunners, boatswains, carpenters, midshipmen, naval cadets.

Flag-officers are divided into three ranks, viz. rear-admiral, vice-
admiral, admiral. There is also the rank of "admiral of the fleet": such a ship could in theory uniform all the ships of the fleet. All flag-officers, commanders-in-chief, are considered as responsible for the conduct of the fleet or squadron under their command. They are bound to keep them in perfect condition for service; to exercise the regular inspection of the design of the officers, and in performing all such evolutions as may occur in the presence of an enemy; to direct the commanders of squadrons and divisions to inspect the state of each ship under their command; to see that the regulations for the discipline of the men are properly observed; and occasionally to inquire into these and other matters themselves. They are required to correspond with the secretary of the admiralty, and to send a report.

Every flag-officer serving in a fleet, but not commanding it, is required to superintend all the ships of the squadron or division placed under his orders—to see that their crews are properly managed and supplied, and that they are ready for action. Seamen, as above stated, are provided, in time of peace, with provisions and water, and, in the case of these stores, the ships are exclusively responsible for the food of the seamen, is normal. The admiral is supposed to have every reason to believe the ship will do his duty, and, if he is not satisfied, he may order her to be shifted, or the crew may be transferred to the next ship. But the ship is responsible for the colour of the flag.
NAVY AND NAVIES

Reports of the Secretary of the Navy in the United States, and the Reports of the Budget Committee of the French-Chamber contain masses of information. The Naval Annual, founded by Lord Brassey at 1869, is a model of publication which we believe the every country which possesses a navy. Mr. F. T. Jane's All the World's Fighting ships is a survey of the materiel of navies since 1898.

History of Navies

Every navy was at its beginning formed of the fighting men of the tribe, or city, serving in the ship or large boat, which was used differently for fishing, trade, war or piracy. The development of the warship as a special type, and the formation of organized bodies of men set aside for military service on the sea, was the work of the Peloponnesian War. We must follow the process of development, particularly in the case of the naval powers of the dark and middle ages, the Norsemen, the Venetians, the French, the English fleet and others. But centuries, and indeed millenniums, before the modern world emerged from darkness the nations of antiquity who lived on the shores of the Mediterranean had formed navies and had seen them culminate and decline. The adventures of the Argonauts and of Ulysses give a legendary and poetical picture of an "age of the Vikings" which was coming to an end two thousand years before the Norsemen first vexed the west of Europe. At a period anterior to written history?" is a matter of pure speculation and conjecture. In the years 650-600 B.C., the Persian empire was starting on the eastern route, the Greek was starting on the western route, and the Phoenician was starting on the northern. Long ships built for speed (μακροπόδες, naves longae) as distinguished from round ships for burden (στοργυρίδαι νῆρα, naves omerariae) are of extreme antiquity (see Siren). Greek tradition credited the Corinthians with the invention, but it is probable that the Hellenic peoples, in this as in other respects, had a Phoenician model before them. So little is known of the other early navies, whether Hellenic or non-Hellenic, that we must be content to take the Athenian as our example of them all, with a constant recognition of the fact that it was the most highly developed, and that we cannot safely argue from it to the rest.

The Athenian navy began with the provision of warships by the state, because private citizens could not supply them in sufficient numbers. The approach of the Persian attack in 483 B.C. drove Athens to raise its establishment from 50 to 100 long ships, which were paid for out of the profits of the mines of Morocca (see Themistocles). The Persian danger compelled the Greeks to form a league for their common naval defence. The League had its first headquarters at Peloponnesus and there were several quite independent, and the Hellenotamiai, or trustees of the public fund. Her superiority in maritime strength gave Athens a predominance over the other members of the League like that which Holland enjoyed for the same reason in the Seven United Provinces. The Hellenotamiai were chosen from among her citizens, and Pericles transferred the fund to Athens, which became the mistress of the League. The allies sank in fact to subjects, and their contributions, aided by the produce of the mines, went to the support of the Athenian navy. The hundred long ships of the Persian War grew to three hundred by the end of the 5th century B.C. (see Peloponnesian War, and a century later period (when, however, the quality of ships and men alike had sunk) to three hundred and sixty. The ancient world did not attain to the formation of a civil service— at least until the time of the Roman Empire—and Athens had no admiralty or navy office. In peace the war-vessels were kept on ships under cover in sheaths. In war a stratēgos was appointed to the general command, and he chose the trierarch, whose duty it was to commission them partly at their own expense, under supervision of the state exercised by special inspectors (ἀρκονομίτες). The hulls, or rigging, of all the vessels were navigated by the state, but it is certain that heavy charges fell upon the trierarch, who had to fit the ships for sea and return them in good condition. The burden became so heavy that the trierarchies were divided, first between two citizens in the Peloponnesian War, and then among groups (συντελείαι) consisting of five to sixteen persons. Individual Athenians who were wealthy and patriotic or ambitious might fit out ships or spend freely on

the crime has been committed, which must be specified in the warrant ordering the punishment. He may delegate this authority to a limited extent to certain officers. All the officers and the whole ship are to be present at every punishment, which must be inserted in the log-book, and an abstract sent to the admiral every quarter.

The commander has the chief command in small vessels. In larger vessels he is chief of the staff to the captain, and assist him in maintaining discipline, and in sailing and fighting the ship.

The lieutenants take the watch by turns, and are at such times captains of the ship. They take the wheel of the ship, and control her. The one on duty is to inform the captain of all important occurrences which take place during his watch. He is to see that the whole of the duties of the ship are carried on with the same punctuality, with the same degree of intelligence and in the same order. While the captain, the commander or senior executive officer is responsible for everything done on board.

The navigating officer receives his orders from the captain or the second officer. He is entrusted, under the command of the captain, with the charge of navigating the ship, bringing her to anchor, ascertaining the latitude and longitude of her place at sea, surveying harbours, and making such nautical remarks and observations as may be useful in navigation in general.

The warrant-officers of the navy may be compared with the non-commissioned officers of the army. They take rank as follows, viz. gunner, boatswain, topman, coppersmith, gunner's assistant, and midshipmen. They take rank after sub-lieutenants and before midshipmen.

The midshipmen are the principal subordinate officers, but have no specific duties assigned to them. In the smaller vessels some of the seamen are allowed to serve in the rigging, and in the larger ships, the engineers, who had entered at different ages, had been trained in separate schools, and had formed three co-operating but independent lines.

For instance, Joseph Hill wrote, [October 16], 1892, from the desire to give a more scientific character to naval education, and to achieve complete unity among all classes of officers, it was decided to replace the triple by a single system of entry, and to coalesce all classes of officers, apart from the purely civil lines—surgents and paymasters (formerly "pursers"—"persons")—into one. Lads were in future to be entered together, and at one training establishment at Osborne in the Isle of Wight, on the distinct understanding that it was to be at the discretion of the admiral to assign them to executive, marine or engine duties at a later period. After a period of training at Osborne, and at the Naval College at Dartmouth, they were transferred through the different branches, and later by the same examination for lieutenant. When in the intermediate position of sub-lieutenant, they were to be assigned to their respective branches as executive officer, marine or engineer. The engineers under the same conditions were to continue as a civil branch, as they had been before, and become known as lieutenant, commander, captain or rear-admiral (Engineer).

The station officer consists of leading seamen, able seamen, ordinary seamen, engine-room artificers, other artificers, leading stokers, stokers, coal-trimmers, boys and marines. The artificers and stokers and the marines are always entered voluntarily, the latter in the same manner as soldiers, by enlisting into the corps, the former at some rendezvous or on board particular ships. The supply of boys for the navy, from whom the seamen class of men and petty officers is recruited, is also obtained by voluntary entry.

Men are assigned to the naval reserve, receive an annual payment by way of retainer, perform drill on board His Majesty's ships, and are engaged to serve in the navy in case of war or emergency.

There are two schemes for forming reserves. The Royal Naval Reserve scheme draws men from the mercantile marine and fishing population of the United Kingdom. The Royal Fleet Reserve scheme includes the reserve of all sailors who have entered into the reserve, to the pensioners, was mainly designed to obtain the services in war of the men who had quitted the navy after the expiration of their two years' service.

So far as other countries are concerned, the staff of officers does not differ materially from one navy to another. In all it consists of admirals, captains, lieutenants, midshipmen and cadets receiving their early training in staff schools. In the United States, the United States, all the important naval forces of the world are raised by conscription.

The strength and general condition of navies of any given time must be learnt from the official publications of the various powers, and from privately composed books founded on them. The yearly statements of the First Lord of the Admiralty in Great Britain, the
their command. But these voluntary gifts were insufficient to maintain a great navy. The necessity which compelled modern nations to form permanent state navies, instead of relying on a levy of ships from the ports, and such vessels as English nobles and gentlemen sent to fight the Armada, prevailed in Athens also. The organization of the crews bore a close resemblance in the general lines to that of the English navy as it was till the 16th and even the 17th century. The hierarchy, either the citizen named to discharge the duty, or some one whom he paid to replace him, answered to the captain. There was a sailing master (μαρτυρων), a body of petty officers, mariners and oarsmen (σπουδαστηρες), with the soldiers or marines (κουβαρας). As the ancient warship was a galley, the number of rowers required was immense. A hundred triremes would require twenty thousand men in all, or more than the total number of crews of the twenty-seven British line of battleships which fought at Trafalgar. And yet this would not have been a great fleet, as compared with the Roman and Carthaginian forces, which consisted with hundreds of vessels and multitudes of men, numbering one hundred and fifty thousand or so, on each side, in the first Punic War.

Until the use of broadside artillery and the sail became universal at the end of the 16th century, all navies were forcibly organized on much the same lines as the Athenian, even in the western seas. In the Mediterranean the differences were in names and in details. The war fleets of the successors of Alexander, of Carthage, of Rome, of Byzantium, of the Italian republics, of the Arabs and of Aragon, were galleys relying on the power of the ram. The triremes of the Roman and the Byzantine, elements—a chief who is a general, captains who were soldiers, or knights, sailing masters and deck hands who navigate and tend the few sails used, marines and rowers. A few words may, however, be said of Rome, which transmitted the tradition of the ancient world to Constantinople, and of the Constantinopolitan or Byzantine navy, which in turn transmitted the tradition to the Italian cities, and had one peculiar point of interest.

As a trading city Rome was early concerned in the struggle for predominance in the western Mediterranean between the Etruscans, the Greek colonies and the Carthaginians. The Romans of the 2nd century B.C. called for the services of navy commissioners as early as 311 B.C. (Duumiri latae). In the first Punic War it had to raise great fleets from its own resources, or from the dependent Greek colonies of southern Italy. After the fall of Carthage it had no opponent who was able to force it to the same efforts. The prevalence of piracy in the 1st century B.C. again compelled it to attend to its navy (see Pompey). The obligation to keep the peace on sea as well as on land required the emperors to maintain a navy for police purposes. The organization was very complete. Two main fleets, called the Praetorian, guarded the coasts of Italy at Ravenna and Misenum (classes Praetoriarum), other squadrons were stationed at Forum Iulii (Fréjus), Seleucia at the mouth of the Orontes (Nahr-el-Aasy), called the classis Syriaca, at Alexandria (classis Augusta Alexandrina), at Carpathos (Scarpanto, between Crete and Rhodes), Aquileia (the classis Veneta at the head of the Adriatic), the Black Sea (classis Pontica), and Britain (classis Britannica). River flotillas were maintained on the Rhine (classis Germanica), on the Danube (classis Pannonica and Maeciana) and in later days at least on the Euphrates. All these squadrons did not exist at the same time. The station at Forum Iulii was given up soon after the reign of Augustus, and the classis Veneta was formed later. But an organized navy always existed. A body of soldiers, the classici, was assigned for its service. The commander was the Praefectus Classis.

When Constantine founded his New Rome on the site of Byzantium, the navy of the Eastern Empire may be said to have begun. Its history is obscure and it suffered several eclipses. While the Vandal kingdom of Carthage lasted (425–534), the eastern emperors were compelled to attend to their fleet. After its fall their navy fell into neglect till the rise of the Mahommedan power at the end of the 7th century again compelled them to guard their coasts. The eastern caliphs had fleets for purposes of conquest, and so had the emirs and caliphs of Cordova. The Byzantine navy reached its highest point under the able sovereigns of the Macedonian dynasty (867–1056). It was divided into the imperial fleet, commanded by the Great Drungarios, the first recorded lord high admiral, and the provincial or thematic squadrons, under their strategoi. Of these there were three, the Cithyraeotic (Cyprus and Rhodes), the Samian and the Aegean. The thematic squadrons were maintained permanently for police purposes. The imperial fleet, which was more powerful when in commission than all three, was kept for war. A peculiar feature of the Byzantine navy was the presence in it of a corps answering to the seaman gunners and gunnery officers of modern navies. These were the siphonarioi, who worked the siphons (σιφώνες) used for discharging the "Greek fire." When the Turkish invasions disorganized the Eastern Empire in the 12th century, the Byzantine navy withered, and the emperors were driven to rely on the help of the Venetians. The Italian republics of the middle ages, and the monarchical states bordering on the Mediterranean, always possessed fleets which did not differ in essential particulars from that of Athens. There is, however, one fact which must not be overlooked. It is that the seamen of some of them, and more especially of Genoa, served the powers of western Europe from a very early date. Diego Gelmi, the first bishop of Santiago in Galicia, employed Genoese to construct a dockyard and build a squadron at Vigo in the 15th century.

Edward III. of England employed Genoese, and others were employed to create a dockyard for the French kings at Rouen. By them the naval science of the Mediterranean was carried to the nations on the shores of the Atlantic. The Mediterranean navies made their last great appearance in history at the battle of Lepanto (1571). Thenceforth the main scene of naval activity was on the ocean, with very different ships, other armaments and organizations.

The great navies of modern history may best be discussed by taking first certain specially important national navies in their earlier evolution, and then considering those which are of present day interest in their relations to one another.

The British Navy.

The Royal Navy of Great Britain stands at the head of the navies of the modern world, not only by virtue of its strength, but because it has the longest and the most consistent historical development. The Norse invasions of the 9th century forced the English people to provide for their defence against attack from overseas. Though their efforts were but partially successful, and great Norse settlements were made on the eastern side of the island, a national organization was formed. Every shire was called upon to supply ships "in proportion to the number of hundreds and from the produce of what had been the folkland contained in it" (Stubbs, Const. Hist. i. 116). Alfred and his successors had also ships of their own, maintained out of the royal revenue which they had complete control. Before the Conquest the system of contribution by the shires had largely broken down. Yet in its main lines the method of providing a navy adopted by Alfred and his immediate successors remained in existence. There were the people's ships which represented the naval side of the fyrd—i.e. the general obligation to defend the realm; and there were the king's own vessels which were his property. By the 12th century a third source of supply had been found. This was the feudal array. Towns on the sea coast were endowed with privileges and franchises, and rendered definite services in return.

The Norman Conquest introduced no fundamental difference. In the 12th century the kings of the Angevin dynasty made the military resources of their kingdom available in three ways; the feudal array, the national militia and the mercenaries. Dover, Sandwich, Romney, and the other towns on the southeast coast which formed the Cinque Ports represented the naval part of the feudal array. In the reign of Henry III. (1216–1272) their service was fixed at 57 ships, with 1,197 men and boys, for
fifteen days in any year, to count from the time when they weighed anchor. During these fifteen days they served at the expense of the towns. Beyond that date they were maintained by the king. The Cinque Ports Squadron has been spoken of as the foundation of the Royal Navy. But a feudal array is wholly alien in character to a national force. The Cinque Ports, after playing a prominent part in the 13th century, sank into insignificance. They were always inclined to piracy at the expense of other English towns. In 1297, during one of the expeditions to Flanders, they attacked and burnt twenty vessels belonging to Yarmouth under the eyes of Edward I. (1272-1307). The national militia had a longer life. The obligation of the coast towns and counties to provide ships and men for the defence of the realm was enforced till the 17th century. Nor did the method of enforcing that obligation differ materially. In the reign of King John (1109-1216), when the records began to be regularly kept, but when there was no radical change in system, the reeves and bailiffs of the seaports were bound to ascertain by a jury the name, size and quality of all ships belonging to the port. When the ships were required for the king, the bailiff was to assemble them, and the king's ships were embarked. The local authorities were then bound to see that they were properly equipped and manned. It was the duty of the reeves and bailiffs to arrange that they should reach the place named by the king as rendezvous at the time fixed by him. These embargoes inflicted heavy loss even when they were honestly imposed, and loud complaints were heard in Parliament from the later years of Edward III. (1327-1377) that they afforded the king's officers many openings for oppression and corruption.

The ancestors of the modern navy must be sought in the third element of the navy of the middle ages—the king's ships and his "mercenaries." Under King John we find the full record of a regular organization of a Royal Navy as apart from the feudal array of the Cinque Ports or the fyrd. In 1205 he had in all 50 "galleys"—long ships for war—distributed in various ports. William of Wrotham, archdeacon of Taunton, one of the king's "clerks," or ecclesiastical persons who formed his civil service, is named, sometimes in combination with others, as "keeper of the king's ships," "keeper of the king's galleys" and "keeper of the king's seaports." The royal vessels cannot have differed from the private war ships of the Cinque Ports, and at first his navy was preferable to the feudal array, or the levy from the counties, mainly because it was more fully under his own control. They were indeed so wholly his that he could hire them out to the counties, and at a much later period the ships of Henry V. (1413-1422) were sold to pay his personal debts after his death. Yet though the process by which the king's ships became the national navy was slow, the affiliation is direct from them to the fleet of to-day, while the permanent officials at Whitehall are no less the direct descendants of William of Wrotham and the king's clerks of the 13th century. When on active service the command was exercised by representatives of the king, who were not required to be bred to the sea or even always to be laymen. In the crusade of 1190 the fleet of Richard the Lion Hearted (1189-1199), drawn partly from England and partly from his continental possessions, was governed by a body of which two of the members were churchmen. They and their lay colleagues were described as the ductores et gubernatores totius nauigraph Regis. The first commanders of squadrons were known as justiciariss nauigraph Regis, ductores et constabularii Regis.

The crusade of 1190 doubtless made Englishmen acquainted with the title of "admiral"; but it was not till much later that the word became, first as "admiral and captain," then as "admiral" alone, the title of an officer commanding a squadron. The first admirals of all England was Sir John Beauchamp, appointed for a year in 1360. The permanent appointment of a lord admiral dates from 1406, when John Beaufort, natural son of John of Gaunt, and marques of Somerset and Dorset, was named to the post. The crews consisted of the two elements which, in varying proportions and under different names, have been and are common to all navies—the mariners whose business it was to navigate the ship, and the soldiers who were put in to fight. Until the vessel had been developed and the epoch of ocean voyages began, the first were few and subordinate. As the seas of Britain were ill adapted for the use of the galley in the proper sense, though the French employed them, English ships relied mainly on the sail. They used the oar indeed but never as a main resource, and had therefore no use for the "tarma" (ciurma in Italian, choume in French, and chusma in Spanish) of rowers formed in the Mediterranean craft. Crews were obtained partly by enlistment, it is also to a great extent, by the press (see IMPRESSION). The code of naval discipline was the laws of Oleron (see SEA LAWS), which embodied the general "custom of the sea." By the reign of Edward III. (1327-1377) the duties and jurisdiction of the admirals were fixed. He controlled the returns of the ships made by the reeves, selected them for service, and chose his officers, who had their commission from him. A rudimentary code of signals by lights or flags was in use.

The history of the middle ages bears testimony to the general efficiency and economy of the navy. Under weak kings, and at certain periods, for instance in the latter years of Edward III. and the reign of his grandson Richard II. (1377-1399), it fell into decay, and the coast was ravaged by the French and their allies the Basque seamen, who manned the navy of Castile. Henry IV. (1399-1413), though an astute and vigorous ruler, was driven to make a contract with the merchants, mariners and shipowners, to take over the duty of guarding the coast in 1406-1407. Their admirals Richard Citheron and Nicholas Blackburne were appointed, and exercised their commands. But the experiment was not a success, and was not renewed. Apart from these periods of eclipse, the navy as an element, feudal, national and royal, was more than a match for its enemies. The destruction of the fleet prepared by Philip Augustus, the French king, for the invasion of England in 1213 at Damme, the defeat of Eustace the Monk in 1217 off Dover, the victory over the French fleet at Sluys in 1340, and the defeat of the Spaniards off Winchelsea in 1530, were triumphs never quite counterbalanced by any equivalent overthrown. Still better proofs of the ability of any navy to discharge its duties were the long retention of Calais, and the constant success of the fleet of England in their invasions of France. The claim to the sovereignty of the seas has been attributed on insufficient evidence to King John, but it was enforced by Edward III.

Under the sovereigns of the Tudor dynasty (1485-1603) the development of the navy was steady. Though Henry VII. (1483-1509) made little use of his fleet in war, he built ships. His son Henry VIII. (1509-1547) took a keen interest in his navy. Shipbuilding was improved by the importation of Italian workmen. The large resources he obtained by the plunder of the Church enabled Henry VIII. to spend on a scale which had been impossible for his predecessors, and was to be impossible for his successors without the aid of grants from Parliament. But the most vital service which he rendered to the navy was the formation of, or rather the organization of existing officials into, the navy office. This measure was taken at the very end of his reign, when the board was constituted by letters patent dated 24th of April 1546. It consisted of a lieutenant of the admiralty, a treasurer, a comptroller, a surveyor, a clerk of the ships, and two officials without special title. A master of the ordinance for the ships was also appointed. Henry's board, corresponding to the modern board of admiralty, was, with some periods of suspension, and with the addition of different departments—the Victualling board, the transport board, the pay office, &c., added at various times—to be the administrative machinery of the navy till 1832. They were all theoretically subject to the authority of the lord high admiral, or the commissioners for discharging his office, who had the military and political control of the navy and issued all commissions to its officers. In practice the boards were very independent. The double government of the navy, though it lasted long, was undoubtedly the cause of much waste—partly by the creation
of superfluous officials, but more by the opening it provided for corruption.

The 16th century in England as elsewhere saw a great development in the size and capacity of ships, in the length of voyages, and consequently in the sciences of navigation and seamanship, which brought with them the predominance of the seaman element hitherto subordinate. In the reign of Henry VIII., when a squadron was commissioned in 1512, out of a total of 3,000 men, 1,730 were soldiers. By the end of the reign of his daughter Mary (1553-1558) it was calculated that of the 8,546 men required to man her fleet 5534 were seamen, 804 were gunners, and only 2008 were soldiers. In the early years of his reign Henry VIII. equipped his squadrons on a system which bears some resemblance to the Athenian triarchies. He made a contract with his admiral Sir Edward Howard (1477-1513), by which the king supplied ships, guns and a sum of money. The admiral, who had full power to "press," named the officers and collected the crews. Among them are named contingents from particular towns—the representatives of the fiefs. With the exception of the captain, who received eighteen pence a month, all were paid at the same rate, 5s. wages and 5s. for rations per month. Extra sums called "dead shares," the wages of so many imaginary men, and rewards, were provided for the master and warrant officers. Until the regular returns known as the "weekly progress of the dockyards" and the "monthly lists of ships in sea pay" were established in 1773, no constant strict account of the strength of the navy was kept. The figure must therefore be accepted as subject to correction, but King Henry's navy is estimated to have consisted of 53 vessels of 11,268 tons, carrying 557 brass guns and 1548 of iron. It sank without leaving the agitated hearts of his successors Edward VI. (1547-1553) and Mary (1553-1558). By Elizabeth it was well restored. In mere numbers her navy never equalled her father's. At the end of her reign it was composed of 42 vessels, but they were of 17,025 tons, and therefore on the average much larger. The military services rendered by the great queen's fleet were brilliant. No organic change was introduced, and fleets continued to be made up by including vessels belonging to the different ports.

The two most notable advances in organization were the establishment of a graduated scale of pay by rank in 1582, and the formation of a fund for the relief of sick and wounded seamen. This was not a grant from the state but a species of compulsory insurance. All men employed by the navy, including shipwrights, were subject to a small deduction from their pay. The amount was kept in the chest at Chatham, from which the fund took its name, and was managed by a committee of five, each of whom had a key, and of whom four were elected by the contributors. The commissioner of the dockyard presided.

It was between the accession and the fall of the House of Stuart (1603-1688) that the navy became a truly national force, maintained out of the revenue voted by parliament, and acting without the co-operation of temporary levies of trading ships. The reign of James I. (1603-1625) is a period of great importance in its history. The policy of the king was peaceful, and he only once sent out a strong fleet—in 1620 when an expedition was despatched against the Barbary pirates. He took, however, a lively interest in shipbuilding, and supported his master shipwright Phineas Pett (1507-1647) against the rivals whom he offended by disregarding their rules of thumb. Under the lax administration of the lord high admiral Nottingham, better known as Lord Howard of Effingham, many abuses crept into the navy. Though more money was spent on it than in the reign of the queen, it had sunk to a very low level of effective strength in 1618. In 1619 the old lord admirals was persuaded to retire, and was succeeded by George Villiers, duke of Buckingham, the king's favourite. Nottingham's retirement was made compulsory by the report of a committee appointed to inquire into the condition of the navy in 1618. They reported that while numbers of new offices had been created at a cost treble the whole expense of the permanent staff of Queen Elizabeth's time, the dockyards had become nests of pillaging and corruption.

Ships were rotting, and money was yearly drawn for vessels which had ceased to exist. The committee undertook to meet the whole ordinary and extraordinary charges of the navy (upkeep and new building) for £30,000 a year. The ships in commission at that time during peace were confined to the diminutive winter and summer guards, whose duty was to transport ambassadors and fru across the Channel and to hunt the pirates who still swarmed on the coast. Buckingham left the admiralty of the navy in the hands of the commissioners, who by dismissing superfluous officers and paying better salaries had by 1624 fulfilled their promise to restore the fleet. The establishment they proposed was only of 30 ships, but they were larger in aggregate tonnage by 3050 tons than Queen Elizabeth's.

Charles I. (1625-1649) carried on the work of his father as far as his limited resources allowed. The pay of the sailors, fixed in 1585 at 10s., was increased to 15s. A captain received from £4, 6s. 8d. a month of 28 days (the standard of the navy) to £14, according to the size of his ship. Lieutenants, who were only carried in 16 larger ships, received from £2 16s. to £3 12s. 6d. The sailing-master from £3, 6s. 8d. to £4 13s. 9d., and the warrant officers from £1, 3s. to £2 4s. The rating of ships by the number of men carried was introduced in this reign. Vessels of good quality were built for the king, and he showed a real understanding of the necessity for maintaining a strong fleet.

But the time was coming when the hereditary royal revenue was no longer adequate to meet the expense of a navy. By the middle of the 17th century a costly warship, far larger than the trading-ship in size and much more strongly built, had been developed. The great size of British commerce called for protection which an establishment of 40 to 50 vessels could not give. When the Great Rebellion broke out in 1641 the navy of King Charles consisted of only 42 vessels of 22,411 tons. At the Restoration (1660) it had grown to 254 ships for sea service, of 57,463 tons. Such a force could only be maintained out of taxes granted by the parliament. The efforts of King Charles to obtain funds for his navy had a large influence in provoking the rebellion (see Ship Money). The government of the navy during this reign remained in the hands of the committee of 1618, under the lord high admiral Buckingham, till he was murdered in 1628. It was then entrusted to a special commission appointed by the king; who were to have held it till the king's second son James, duke of York, was of age. In 1638 the king restored the office of lord high admiral "during pleasure" in favour of Algernon Percy, 10th earl of Northumberland, by whom the fleet was handed over to the parliament.

During the Great Rebellion and the Protectorate the navy was governed by parliamentary committees, or by a committee named by the Council of State, or by Cromwell. The need, first for cutting the king off from foreign support, and then for conducting successive struggles in Ireland, or with the French, depended on the size of the fleet. Both admirals and officers were to have held it till the king's second son James, duke of York, was of age. In 1638 the king restored the office of lord high admiral "during pleasure" in favour of Algernon Percy, 10th earl of Northumberland, by whom the fleet was handed over to the parliament.
With the restoration of Charles II. (1660-1685) the modern period in the history of the navy began. The first steps were taken to form a corps of officers. Lads of gentle birth were sent on board ships in commission with a letter of service—from which came their popular name of "king's letter boys"—to the captain, in whose service they were to be trained and made officers. The pay was fixed by the admiralty. Promotion from them to flag rank was not at first limited by strict rules, but it tended to be by seniority. During the war of the Austrian Succession, in 1747, a regular system was introduced by which when a captain was promoted for active service—to hoist his flag, as the phrase went—he was made rear-admiral of the Blue squadron. Captains senior to him were promoted rear-admiral in general terms, and were placed on the retired list. They were familiarly called "yellow admirals," and to be promoted in this way was to be "yelowed." Promotion to lieutenant's commission could, obtained by officers who had served, or whose name had been on the books of a seagoing ship, for five years. Whether he entered with a king's letter of service or from the naval academy at Portsmouth, as a sailor or as a ship's boy, he was equally qualified to hold a commission if he had fulfilled the necessary conditions and could pass an examining board of captains, a test which in the case of lads who had interest was generally a pure formality. He was supposed to show that he knew some navigation, and was a practical seaman who could handle, reef and steer. As captains were a retinue of privy councilors, a custom arose by which they put the pay of absent captains to the charge of the men who served under them, and drew the pay allowance for them. It was quite illegal, and constituted the offence known as "false masters," punishable by dismissal from the service. But this regulation was even less punctually observed than the rule which forbade the carrying of women. Till the beginning of the 19th century many distinguished officers were borne on a ship's books for two or three years before they went to sea. The navigation was entrusted to the sailing-master and his mates. He had often been a merchant captain or sailor. The captains and lieutenants were supposed to understand navigation, but it was notorious that many of them had forgotten the little they had learnt in order to pass their qualifying examination. As the navy was cut down to the quick in peace, the supply of officers was insufficient at the beginning of a war, and it was found necessary to give commissions to men who were illiterate but were good practical seamen. Officers who had not begun as gentlemen "on the quarter deck" were said to have come in "through the hawse hole"—the hole by which the cable runs out at the bow. Some among them rose to distinction. The accountant's boy, who had to call himself "boy," and in bad times was said to be often in league with the mariners to extort both from the merchants and the crew. The medical service in the navy during the 18th century was bad. The position of the surgeons who were appointed by the navy office was not an enviable one, and the medical staff of the navy was much recruited from licentiates of Edinburgh, or Apothecaries Hall. Finally it is to be observed that when a ship was paid off only the commissioned officers, masters and surgeons were entitled to half-pay, or had any further necessary connexion with the navy.

The crews were formed partly by free enlistment and partly by being "brought together" in the "commonality" of the navy. By this method men who had served and were "leaders" of the commonality, or "lads," were allowed to volunteer or were drafted from the jails. The Patriotic Society, formed at the beginning of the Seven Years' War, educated boys for the navy. During the Revolutionary and Napoleonic Wars the counties were called upon to supply quotas, which they commonly secured from the debtors' prison or the workhouse. A ship was supposed to be well manned when she had one-fifth of her crew of marines, and one-third of men bred to the sea. This proportion of seamen was rarely reached. As the navy did not train its men from boyhood in peace, but the navy commanders were known as "prime seamen" and "sailormen," who were the skilled artificers of the time, had to be sought for among those who had served their apprenticeship in the merchant service. They never enlisted voluntarily, for they disliked the discipline of the navy, and the pay was indicating only the seniority of the flag-officers. It was the intention of parliament to confine the flag list to these nine officers, but as the navy grew this was found to be impossible. The rank of admiral of the fleet remained a solitary distinction. The captains, commanders and lieutenants were the commissioned officers who received their commissions from the admiralty. Promotion from them to flag rank was not at first limited by strict rules, but it tended to be by seniority. During the war of the Austrian Succession, in 1747, a regular system was introduced by which when a captain was promoted for active service—to hoist his flag, as the phrase went—he was made rear-admiral of the Blue squadron. Captains senior to him were promoted rear-admiral in general terms, and were placed on the retired list. They were familiarly called "yellow admirals," and to be promoted in this way was to be "yelowed." Promotion to lieutenant's commission could, obtained by officers who had served, or whose name had been on the books of a seagoing ship, for five years. Whether he entered with a king's letter of service or from the naval academy at Portsmouth, as a sailor or as a ship's boy, he was equally qualified to hold a commission if he had fulfilled the necessary conditions and could pass an examining board of captains, a test which in the case of lads who had interest was generally a pure formality. He was supposed to show that he knew some navigation, and was a practical seaman who could handle, reef and steer. As captains were a retinue of privy councilors, a custom arose by which they put the pay of absent captains to the charge of the men who served under them, and drew the pay allowance for them. It was quite illegal, and constituted the offence known as "false masters," punishable by dismissal from the service. But this regulation was even less punctually observed than the rule which forbade the carrying of women. Till the beginning of the 19th century many distinguished officers were borne on a ship's books for two or three years before they went to sea. The navigation was entrusted to the sailing-master and his mates. He had often been a merchant captain or sailor. The captains and lieutenants were supposed to understand navigation, but it was notorious that many of them had forgotten the little they had learnt in order to pass their qualifying examination. As the navy was cut down to the quick in peace, the supply of officers was insufficient at the beginning of a war, and it was found necessary to give commissions to men who were illiterate but were good practical seamen. Officers who had not begun as gentlemen "on the quarter deck" were said to have come in "through the hawse hole"—the hole by which the cable runs out at the bow. Some among them rose to distinction. The accountant's boy, who had to call himself "boy," and in bad times was said to be often in league with the mariners to extort both from the merchants and the crew. The medical service in the navy during the 18th century was bad. The position of the surgeons who were appointed by the navy office was not an enviable one, and the medical staff of the navy was much recruited from licentiates of Edinburgh, or Apothecaries Hall. Finally it is to be observed that when a ship was paid off only the commissioned officers, masters and surgeons were entitled to half-pay, or had any further necessary connexion with the navy.

The crews were formed partly by free enlistment and partly by being "brought together" in the "commonality" of the navy. By this method men who had served and were "leaders" of the commonality, or "lads," were allowed to volunteer or were drafted from the jails. The Patriotic Society, formed at the beginning of the Seven Years' War, educated boys for the navy. During the Revolutionary and Napoleonic Wars the counties were called upon to supply quotas, which they commonly secured from the debtors' prison or the workhouse. As the navy did not train its men from boyhood in peace, but the navy commanders were known as "prime seamen" and "sailormen," who were the skilled artificers of the time, had to be sought for among those who had served their apprenticeship in the merchant service. They never enlisted voluntarily, for they disliked the discipline of the navy, and the pay was
Navy and Navies

both bad and given in an oppressive way. The pay of a seaman was 22s. 6d. a month for able seamen, the rate fixed in the reign of Charles II., and at 10s. for ordinary seamen. This sum was not paid at fixed dates, but at first only at the end of a commission, and after 1758 whenever a ship which had been a year in commission returned home—up to months before the date of her arrival, the balance being kept as a security against desertion, which was then incessant and enormous. As men were often turned over from ship to ship they had a sheaf of pay notes to present to their next ship. The task of working up accounts was slow, and the men were often driven to sell their pay notes to low class speculators at a heavy discount. Discipline was mainly enforced by the lash, and the abuse of their power by captains was often gross.

These grievances led to a long series of single ship mutinies, which culminated in the great mutiny of 1797. The fleets at Spithead, the Nore, Plymouth, the South of Ireland and Cape of Good Hope mutinied one after another. The government had aggravated the danger by drafting numbers of the United Irish into the fleet, and the demands from the irate sailors became menacing in consequence. These crisis which seemed to threaten the country with ruin passed away. Concessions were made to the just claims of the men. When political agitators endeavoured to make use of the discontent of the sailors for treasonable ends, the government stood firm, and the patriotism of the great bulk of the men enabled it to restore discipline. The "breeze at Spithead," as the mutiny was nicknamed in the navy, was the beginning of the reforms which made the service as popular as it was once hateful.

The administration of the navy throughout the 18th century, as in a large degree after 1756 up to 1812, was in many respects slowly, and was generally corrupt. The different branches, military and civil, were scattered and worked in practical independence, though the board of admiralty was supposed to have absolute authority over all. The admiralty was at Whitehall, the navy office in Seething Lane near the Tower, and after 1780 at Somerset House. The victualling office was on Tower Hill, the pay office in Broad Street, where also was the Sick and Hurt office. In 1749, when the state of the navy excited just discontent, the admiralty first established regular visitations of the dockyards which in a time of general laxity became nests of corruption. These visits were, however, not regularly made. By the end of the century, and in spite of sporadic efforts at reform, the evil had become so generally recognized that Earl St Vincent, then first lord, persuaded parliament in 1802 to appoint a parliamentary commission of inquiry. Its reports, thirteen in number, were given between 1804 and 1806. They revealed much waste, bad management and corruption. The tenth report showed that money voted for the navy was used by the then treasurer, Henry Dundas (Lord Melville), for purposes which he refused to reveal. In 1806 another commission was appointed to revise and digest the civil affairs of the navy, and a considerable improvement was effected. Much remained to be done. There was no strict appropriation of money. Accounts were kept in complicated, old-fashioned ways which made it impossible to strike a balance.

In 1832 Sir James Graham, first lord in Earl Grey's administration, obtained the support of parliament for his policy of sweeping away the double administration of the navy, by admiralty and navy office, and combining them into one divided into five departments. With this great organic change the navy entered on its modern stage.

Subject to the warning that for the reason given above, the figures do not deserve absolute confidence, the material strength of the British navy from the death of Queen Anne to the fall of Napoleon was:

The figures for 1783, and for 1816, are swollen by prizes and worn out ships. All the figures include vessels unfit for service, or useful only for harbour work, or ordered to be built, but not actually in existence. The number of men varied enormously from a peace to war establishment. Thus in 1755 on the eve of the Seven Years' War the navy was for war for voters of 70,000 men, including 19,061 marines—the corps having been created in the interval. In 1775, on the eve of the American War of Independence, the vote was for 18,000 men for the sea service, including 4354 marines. At the close of the war in 1783 the vote was for 110,000 men, including 25,291 marines, from which it fell in 1784 to 26,000 (marines 4495 included) and in 1786 to 18,000 men, of whom 3860 were marines. In 1812, when the navy was at the highest level of strength it reached, the vote was for 113,000 seamen and 31,400 marines. From this level it fell in 1816 to 24,000 seamen and 9000 marines. These figures represent paper strength. Owing to the prevalence of desertion, and the difficulty of obtaining men, the actual strength was always appreciably lower.

The French Navy.

Before the French monarchy could possess a fleet, its early kings, whose rule was effective only in the centre of the country, had first to conquer their sea coast from their great vassals. Philip Augustus (1180-1223) began by expelling King John of England from Normandy and Poitou. The process was not completed until Louis XII. (1468-1515) had assumed the crown by his marriage with the duchess Anne. Long before the centralization of authority had been completed the French kings possessed a fleet, or rather two fleets of very distinct character. Her geographical position has always compelled France to draw her navy from two widely different sources—from the Channel and the coast of the Atlantic on the north and west and on the south from the Mediterranean. This separation has imposed on her the difficult task of concentrating her forces at times of crisis, and the concentration has always been hazardous. Like their English rivals, the French had a long tradition of the mutual hatred of their naval forces from the feudal array, the national levy and their own ships. But the proportion of the elements was not the same. Many of the great vassals owed the service of ships, and their obedience was always less certain than that of the Cinque Ports. The trading towns were less able, and commonly less willing, than the English to supply the king with ships. He was thus driven to trust mainly to his own vessels—and they were drawn at first exclusively, and always to a great extent, from the Mediterranean seaboard. His own territories in the south were insufficiently provided with seamen, and the French king had to hire them at Rouen, again by buying the services of Brittany, Lancashire, or by subsidies from Genoa, or in a less degree from Aragon.

When Saint Louis (1226-1270) sailed on his first crusade in 1249, he formed the first French royal fleet, and created the first French dockyard at Aigues Mortes. Ships and dockyard were bought from, or were built by, the Genoese at the king's expense. His admirals, the first appointed by the French crown, Ugo Lercari and Jacobo di Levante, were Genoese. Saint Louis created the office of admiral of France. When in later times Aigues Mortes was cut off from the sea by the encroachment of the land, Narbonne and Marseilles were used as ports of war. This fleet was purely Mediterranean in character. It consisted of galleys, and though the sail was used it was dependent on the oar, and therefore on the "tarma" (chiarome) of rowers, who in earlier times were hired men, but from the middle of the 15th century began to be composed of galley slaves—prisoners of war, slaves purchased in Africa, criminals and vagabonds condemned by the magistrate to the chain and the oar. Philip IV. le Bel (1285-1314) was led by his rivalry with Edward I. of England to create a naval establishment on the Channel. He found his materials in the existing Mediterranean fleet. A dockyard was built for them at Marseilles, and French ships bought or by subsidies from Genoa. These ships were purchased by the Tartaro and Albierino Spinola. It was officially known as the Tersental or Dorstenaal, but was commonly called the cloods de galéres or galley yard, and it existed from 1294 to 1419. The French navy has always suffered from alternations of attention and neglect. In times of disastrous wars on land it has fallen into confusion and obscurity. Except when Francis I. (1515-1547) made a vigorous attempt to revive it at the very close of his reign, the French navy languished till the 17th century. Its very unity of administration disappeared in the 15th century, when
the jurisdiction of the admiral of France was invaded and defied by the admiralties of Guyenne, Brittany, and the Levant. These local admiralties were suppressed by Francis I.

Richelieu, the great minister of Louis XIII., found the navy extinct. He was reduced to seeking the help of English ships against the Huguenots. From him dates the creation of the modern French navy. In 1626 he abolished the office of admiral of France, which had long been more than a lucrative place held by a noble who was too great a man to obey orders. He himself assumed the title of grand maître et surintendant de la navigation, and the military command was entrusted to the admirals du Ponant, i.e., of the west or Atlantic and Channel, and du Levant, i.e., of the Mediterranean. But Richelieu's establishment soon decayed. It was revived by the pride and policy of Louis XIV. (1643-1715). Under him a direction a numerous and strongly organized navy was created. A very full code of laws—the ordonnance—was framed by Colbert and Lyonne with the advice of the ablest officers, and was promulgated on the 5th of April 1689. Though modified by other ordonnances in 1705, 1722, 1776, and 1786, in the main lines it governed the French navy till the Revolution.

By this code the French navy was based on the inscription maritime, a very severe law of compulsory service, affecting the inhabitants of the coast and of the valleys of rivers as far up as their sources. It was the raison d'être of the whole body of officers and officers was divided into the civil branch known as la plume, and the military branch called l'épée. The first had the entire control of the finances, and the dockyards of Toulon, Brest and Rochfort, with an intendant de la marine at the head of each. The general chief was the sous secrétaire au département de la marine, the title of the French minister of marine till the Revolution. Under Louis XIV. a civil officer, the intendant des armées navales, who ranked as an admiral, sat on councils of war and reported on the conduct of the naval officers. He must not be confused with the intendant de la marine. The military branch had at its head the admiral of France, the office being re-created in 1669 by Louis XIV. in favour of his natural son the duc de Vermandois. In theory the admiral was the administrative military and judicial head of the admiralty. In practice the admirals were princes of the blood, who drew pay and fees, but who never went to sea, with the one exception of the count of Toulouse, another natural son of Louis XIV. Two vice-admirals of France du Ponant and du Levant commanded in the Mediterranean and on the ocean. A third office of vice-admiral of France was created for Suffren. The lieutenant général (vice-admiral) came next, and below him the chef d'escadre (rear-admiral), capitaine de vaisseau (post captain), capitaine de brilol (freships) or de frégate (commander), and the major, a chief of the staff on board who commanded all landing parties. There was no permanent body of marines in the French navy, the infanterie de la marine being troops for service in the colonies, which were administratively connected with the navy and governed by naval officers. The lieutenant needs no explanation, and the enseigne was a sub-lieutenant. The corps of officers was recruited from les gardes de la marine, answering more or less to the English men-of-war. It received a careful professional education and were required to be of noble birth. Besides the grand corps de la marine there was a fleet of galleys with a general at its head, and a staff of officers also of noble birth. It was suppressed in 1748 as being a useless expense. Officers not belonging to the grand corps were sometimes taken in from the merchant service. They were known as officiers bleus, because their uniform was all blue, and not, as in the case of the noble corps, blue and red.

On paper the organization of the French royal navy was very thorough. In reality it worked ill; the severity of the inscription maritime made it odious, and owing to the prevailing financial embarrassment of the crown after 1692 the sailors were ill-paid, ill-fed and defrauded of the pensions promised them. They fled abroad, or went inland and took up other trades. The military and civic branches were always in a state of hostility to one another, and their pay also was commonly in arrears. The noble corps was tenacious of its privileges, and extremely insolent towards the officiers bleus. By Louis XV. (1715-1774) the navy was neglected till the last years of his reign, when it was revived by the duc de Choiseul. Under Louis XVI. (1774-1792) when the Revolution broke out the long accumulated hatred felt for the mariners only made the free play. Louis XVI. had indeed relaxed the rule imposing the presentation of proofs not only of all naval officers, but the change was made only in 1786 and it came too late. The majority of the noble officers were massacred by the Jacobins or driven into exile.

The Revolution subjected the French navy to a series of disorganizations and reorganizations by which all tradition and discipline were destroyed. Old privileges and the office of Grand Admiral were suppressed. The attempt to revive the navy in the face of the superior power of England was hopeless. Neither the Republic nor the Empire was able to create an effective navy. They had no opportunity to form a new body of officers out of the lads they educated.

The strength of the French Royal Navy is difficult to estimate, since for long periods of the 18th century it was rotting in harbour and its ships were rarely commissioned. Louis XIV. is credited with 95 ships of the line and 29 frigates, together with many smaller vessels, in 1692. At the close of the Seven Years' War it had sunk to 44 ships of the line and 9 frigates. By 1778 the French navy had risen to 78 of the line with frigates and smaller vessels which brought the total to 264. In 1793 on the outbreak of the revolutionary war, it was estimated to consist of 82 ships of the line, mostly line vessels, and of frigates with lesser craft which brought it to a total of 250. Under Napoleon the mere number was very much more impressive, but the ships had comparatively little size, but they were largely constructed of green timber, were meant merely to force England to maintain blockades, and were never sent to sea.

Spanish Navy.

The administrative history of the Spanish navy is singularly confused and broken. It might almost be said that the country had no navy in the full sense of the word—that is to say, no regularly organized military sea arm. Of its origin we are not accurately informed. Some writers maintain that the state for warlike purposes only—until one was created on the French model by the sovereigns of the Bourbon dynasty i.e. after 1700. Yet the kings of the Spanish peninsula, whether they wore the crown of Castile and Leon or of Aragon, had fleets, formed, like all the others of the middle ages, partly of ships supplied by the coast towns and populations, partly of the royal vessels. Aragon was a purely Mediterranean power. Its fleets, which were chiefly supported by Barcelona, a flourishing commercial city, were composed of galleys. With the union of the crown in 1479 Aragon fell into the background, and its navy continued to be represented only by a few galleys, for service in the Mediterranean against the pirates. The dominions of Castile stretched from the Bay of Biscay to the Mediterranean. Its kings, therefore, had need both of ships (naos) and galleys. The first beginnings of the Castilian navy were not due to the king, but to the foresight and enterprise of Diego Gelmiere, bishop and afterwards first archbishop of Santiago in Galicia. In or about 1280 he employed the Genoese Oczillo to form a dockyard at Aria, and to build vessels. The naval activity of the coast of the Bay of Biscay developed so rapidly that in 1147 a squadron from the northern ports took part in the conquest of Andros by Alfons VII. (1120-1148) in alliance with the Pisans. A century later (1248) another squadron constructed at the expense of the king Fernando III. El Santo (1217-1252), and commanded by Count Ramon Bonifaz of Burgos, the first admiral of Castile, took a decisive part in the conquest of Seville. The annexation of Andalusia and the necessity for guarding against invasions from Africa called for a great extension of the navy of Castile. Alfonso X. El Sabio (1252-1284) founded the great galley dockyards of Seville—the arenal. It was also the work of Genoese builders and administrators. In the course of the 13th century the towns of the northern coast formed one of the associations so common in Spanish history, and known as hermandades (brotherhoods). The first meeting of its delegates took place at Castoridales near Bilbao in 1296, when the towns of Santander, Laredo, Bermeo, Guetaria, San Sebastian and Vitoria were represented. The hermandad de la marisma (of the seafarers)
NAVIES AND NAVY

of Castile supplied the squadrons which took an active part in the wars of the 14th and 15th centuries between France and England as allies of the French. Its history is obscure, and it came to an end with the establishment of the full authority of the crown by the Catholic sovereigns Ferdinand and Isabel.

The discovery of America, the acquisition by marriage or conquest of Sicily, Naples and Flanders, gave the kings of Spain a yet stronger motive for maintaining a powerful navy. The maxim that their ships were the bridges which joined their wealth and power and were defended against rivals through the power they conveyed by them and their servants. But neither the Catholic sovereigns nor the Habsburgs who held the throne till 1700, made any attempt to organize a common navy. The sources from which the naval armaments of Spain were drawn during the greatness and decline of the country were these. Galleys were maintained in the Mediterranean, but they were mainly found by Sicily and Naples, or by the contracts which the kings of Spain made with the Genoese house of Doria. On the ocean the chief object of the Spanish government was to conduct and protect the severely regulated trade with America. Thus it was mainly concerned to keep to obtain the outward and inward commerce with the Spanish colonies. For "galleons," first designed by Alvaro de Bazan, marquess of Santa Cruz, which were rather armed traders than real warships. The crown did not build its own ships, but contracted for them with its admirals. The American convoys sailed from and returned to the Bay of Cadiz. One squadron, the fleta, carried the trade, was navigated by the admiral, with whom was associated a general, who commanded the few warships proper, and was answerable for the protection of the whole. Another squadron, called of Cantabria, was maintained on the north coast, and was employed to see the convoy on its way and meet it on its return home. It had its own admiral and general. The ships were always treated as if they were transports for carrying soldiers. The seamen element was neglected. The command was divided between the capitan de mar (sea captain) who was responsible for the navigation and the capitan de guerra (soldier captain) who fought the ship. The same division went through all ranks. The soldiers would neither help to work the ship nor fight the guns. They used musketry only, or relied on a chance to board with sword and pike. Properly speaking there was no class of naval officers, and the overworked and deeply laden vessels with their crews was the main element of general naval administration existed. The office of admiral of Castile became purely ornamental and hereditary in the family of Henriquez. It was not replaced by a navy office. One of the innumerable juntas or boards, through which the Spanish kings governed, looked after the making of contracts, and co-operated with the council of the Indies which was specially concerned with the American convoys. After the disasters of the later years of Philip II. (see AMERICA) some efforts at improvement were made. Better ships were built, and something was done to raise the condition of the seamen. But no thorough-going organization was ever created, and in the utter decadence of the 17th century the Spanish navy and seafaring population alike practically disappeared.

Under the Bourbon dynasty which attained the throne in 1700 the Spanish navy was revived, or rather a navy was created on the French model. Don Jose Patiño, a very able man, was named intendente de la marina in 1715, and in 1717 he drew up a draft naval organization and code, founded on the French ordonnance of 1669. Patiño's draft was the basis of the ordenanzas generales (general code) issued in 1748. The Spanish navies even set up a scheme of galleys with a separate staff of officers, also on the French model, which was, however, suppressed in the year of the issue of the ordenanzas generales. Fine arsenals were organized at Ferrol and Cartagena. The navy thus created produced some distinguished officers, and fought some brilliant single ship actions. But the embarrassments of the treasury, the tendency of several of the kings to sacrifice their navy to political schemes requiring mainly the employment of troops and the ruin of the seafaring population during the 17th century, prevented it from ever attaining to a high level of efficiency. During the Peninsular War the new navy all but disappeared as the old had done. The want of pecuniary resources and internal instability have prevented its revival on any considerable scale.

The navy created by Patiño consisted in 1737 of 56 ships in all, of which 28 were of the line, of from 50 to 80 guns, with one of 114 guns. In 1746 the number of ships of the line had increased to 37. In 1759 the list of line of battle ships was 50,—of which the majority, if not all, had been constructed by English shipbuilders, in the service of the Spanish government. In 1776, when at the height of its power, it contained 62 ships of the line.

Dutch Navy.

The Dutch fleet arose out of the great struggle with Spain in the 16th century. The Netherlanders had been a maritime people from the earliest antiquity. Under their medieval rulers, the counts of Holland and of Flanders and the House of Burgundy, they had rendered service at sea. The freemen owed the service known as the rembrandt (pennies, an oat). An admiralty office was established in 1597. But during the revolt against Philip II. of Spain, new navy services were formed which, after the fall of the Southern Netherlands, became the corps of states-general. The governments established in the different states which afterwards formed the Seven Provinces took possession of the jurisdiction and the dues of the medieval admiralty. The naval part of the war with Spain was for long conducted by the adventurers known as the "beggars of the sea," and was mainly confined to the coasts and rivers. In 1597, when the Confederation was formed and had provided itself with a common government in the states-general, the need for a regularly organized sea-going fleet was felt. In that year the banner of the states-general was raised. The admiral, with the arrows in its paw, was first hoisted during the expedition to Cadiz in alliance with England. On the 13th of August 1597 the states-general issued the decree (Instructie) which regulated the naval administration of the Republic until 1795. The attachment of the Netherlanders to their local franchises was too strong to permit of the establishment of a central authority with absolute powers. It was therefore necessary to make a compromise by which some measure of unity was secured while the freedom of the various confederate states was effectually guarded. Five boards of admiralty (Admiraltiteits collegien) were recognized. They were: South Holland and West Friesland; South Holland, and Amsterdam; West Friesland (the western side of the Zuyder Zee), at Hoorn or Enkhuizen on alternate years; Zealand at Middelburg; and Friesland at Dokhum, or after 1645 at Harlingen. These bodies enjoyed all the rights of the admiralty and collected the port dues, out of which they provided for the current expenses of their respective squadrons. Extraordinary charges for war were met by grants from the province to which each board belonged. Some measure of unity was secured among these five independent authorities by three devices. Each board consisted of seven persons, of whom four were named by the province and required confirmation by the states-general, while three were chosen from other provinces to secure a representation of the commonwealth. The members of the boards took an oath of fealty to the states-general. The stadholder was admiral-general. He presided at the board, and commanded the squadron. In his absence his place was taken by his lieutenant admiral-general. An oath of fealty was also taken to him, and all armed ships whether men-of-war or privateers sailed with his commission. He chose the captains from two candidates presented to him by the board. Delegates were sent to the admiralty at Amsterdam, and the Hamburg, or Amsterdam, or the Medimnavy, save in far more than ever was the case in former times. The admiralty was suspended in 1659, when the powers of the admiral-general were absorbed by the high mightinesses (Huene Hogen Mogen) of the states-general. The staff of officers began with the lieutenant admiral-general and descended through the vice-admiral, the quinny named Schout-bij-nacht, who was and is the rear-admiral, and whose title means "commander by night." These flag officers were named by the admiral-general or states-general. The captain (Zeecapitain) was selected from the provincial list. The lieutenants
were appointed by the local boards. No regular method of recruiting the corps of officers existed.

This compromise was in itself a bad system. With the exception of the board of North Holland, which was supported by the wealth of Amsterdam, the admiralties were commonly distressed for money. Unity of action was difficult to obtain. Much of the work of convoy which the state squadrons should have performed was thrown in the 17th century on directorates (Directorien) of merchants who fitted out privateers at their own expense. When there was no statholder, the local governing bodies trenched on the authority of the states-general, and indulged in a great deal of favouritism. In one respect the navy of the Dutch共和国 departed eight hundred years as rapidly as any of its neighbours. The feeding of the crews was contracted for by the captains, who were required to enter into securities for the execution of the contract, and who had a reputation for probity. The Dutch crews, being better fed and looked after than the English, suffered less from disease. The clumsy organization of the Dutch navy put it at a disadvantage in its wars with England, but the seamanship of the crews, their good gunnery, and the great ability of many of their admirals made them at all times formidable enemies. No organic change was made till 1795, when the victories of the French revolution's armies led to the formation of the Batavian republic. The five admiralties were then swept away and replaced by a committee for the direction of naval affairs, with a unified administration, organized by Pieter Paulus, a former official of the board of the Maas. As Holland was now swept into the general convulsion of the French Revolution, it followed the fortunes of France.

Its navy, after belonging to the Batavian republic, passed to the epemeral kingdom of Holland, created by Napoleon in favour of his brother Louis in 1806 and annexed to France in 1810. The Dutch navy then became absorbed in the French. After the fall of Napoleon a navy was created for the kingdom of the Netherlands out of the Dutch fragments of the Imperial force.

- The United States.

The American navy came into existence shortly after the Declaration of Independence. As early as October 1775 Congress authorized the construction of two national cruisers, and, at the same time, appointed a marine committee to administer naval affairs. The first force, consisting of purchased vessels, was bottled and built, and insufficiently equipped and manned, embraced two ships of 24 guns each, six brigs carrying from 10 to 12 guns, two schooners each with 8 guns, and four sloops, three of 10 guns and one of 4 guns. On December 22d a personnel of officers was selected, one of the lieutenants being the well-known Paul Jones. Esek Hopkins was made commander-in-chief, but, having incurred the censure of Congress, he was dismissed early in 1777, and since then the title has never been revived except in the person of the president. In November 1776 the grades of admiral, vice-admiral, rear-admiral and commodore were assimilated in rank and precedence to relative army titles, but they were never created by law until 1862. During the war a number of spirited engagements occurred, but there was a great lack of efficient material at home, and agents abroad were not able to enlist the active sympathies of nations or rulers. Benjamin Franklin did manage to equip one good squadron, but this was rendered almost useless by internal dissensions, and it required the victory of Paul Jones in the "Bon Homme Richard" over the "Saratoff" to bring about any tangible result for the risk taken. During the war 800 vessels of all classes were purchased, but the navy lost by capture 11 vessels of war and a little squadron of gunboats on the lakes; and, with 13 ships destroyed to avoid capture by the British, 5 condemned, and 3 wrecked at sea, the country was practically without a naval force between 1780 and 1785.

Owing to the depredations upon commerce of the Barbary powers, Congress in 1794 ordered the construction of six frigates, prescribing that four of them should be armed with 44 guns and two with 36 guns; but, the Berbers having made peace, the number of vessels was reduced one-half, and no additions were made until 1797, when the "Constitution," "United States" and "Constellation" were built. The navy was at first placed under the war department, but a navy department with a secretary of its own was created in 1798. From 1815 to 1842 the secretary was aided by a board of commissioners chosen from among the naval officers, but in the latter year the department was reorganized into five bureaus, which were increased to eight in 1862. Each has a naval officer at its head. They deal with navigation, ordnance, equipment, navy yards, medicines, provisions, steam engineering and construction. Of the 46 vessels of the navy, 10 were built on the Potomac by the then secretary of the navy, G. Bancroft. The war college for officers at Coasters Harbor, Newport, R.I., dates from 1884.

The Balance of Navies in History.

The five navies above discussed claim special notice on various grounds: the British, Dutch and French because they have been leaders and models; the Spanish because it has been closely associated with the others; the American because it was the first of the extra-European sea forces. But these great examples may no means exhaust the list of navies, old and new, which have played or now play a part. Every state which has a coast has also desired to possess forces on the sea. Even the papacy maintained a fighting force of galleys which took part in the naval transactions of the Mediterranean for centuries. The Turkish sultans have fitted out fleets which once were a menace to southern Europe. But in a survey of general naval history it is not necessary to give all these navies special mention, even though some of them have a certain intrinsic interest. Some, the Scandinavian navies for instance, have been confined to narrow limits, and have had little influence either by their organization or, save locally, by action. Others again have been the purely artificial creation of governments. Instances of these on a small scale are the navies of the grand duchy of Tuscany, or of the Bourbon kings of Naples.

A much greater instance is the navy of Russia. Founded by Peter the Great (1689-1725), it has been mainly organized and has been most successfully led by foreigners. When the Russian government has desired for political reasons to make a show of naval strength, it has been numerous. In 1770, during the reign of Catherine II. (1762-1796), a Russian squadron was especially formed by the empress's favourite Orloff, but in reality directed by two former officers of the British navy, John Elphinstone (1722-1785) and Samuel Greig (1735-1788), gained some successes against the Turks in the Levant. But when opposed to formidable enemies, as in the Crimean War, it has either remained in port, or has, as in the case of the war with Japan (1904-1905), proved that its vitality was not in proportion to its size.

The innumerable navies of South American republics are small copies of older forces.

The 19th century did indeed see the rise of three navies, which are of a very different character—the Italian, which was the result of the unification of Italy, the German, which followed the creation of the German Empire, and the Japanese. But all three are contemporary in their origin, and have inevitably been modelled on older forces—the British and the French. With them must go the Austrian navy, excellent but unavoidably small.

If we look at the relations which the navies of the modern world have had to one another, it will be seen that the great discoveries of the later 15th century shifted the seat of naval power from the Mediterranean to the Atlantic. In the first place they imposed on all who wished to sail the wider seas opened to European enterprise by Vasco da Gama and Columbus the obligation to use a vessel which could carry water and provisions sufficient for a large crew during a long voyage. The Mediterranean states and their seamen were not prepared by resources or habit to meet the call. But there was a second and equally effective reason. The powers which had an Atlantic coast were incomparably better placed
than the Italian states, or the cities of the Baltic, to take advantage of the maritime discoveries of the great epoch which stretches from 1492 to 1526. In the natural course the leadership fell to Portugal and Spain. Both owed much to Italian science and capital, and the profit fell inevitably to them. The reasons why Spain failed to found a permanent naval power have been given, and they apply equally to Portugal. Neither achieved the formation of a solid navy. The claim of both to retain a monopoly of the right to settle in, or trade with, the New World and Asia was in due course contested by neighbouring nations. France was torn by internal dissensions (the Wars of Religion and the Fronde) and colonized the territories of the English and Dutch. England and Holland were able to prove the essential weakness of the Spaniards at sea before the end of the 16th century. In the 17th century the late allies against Spain now fought against one another. Her insular position, her security against having to bear the immense burden of a war on a land frontier, and the superiority of her naval organization over the divided administration of Holland, gave the victory to Great Britain. She was materially helped by the fact that the French monarch attacked Holland on land, and exhausted its resources. Great Britain and France now became the competitors of Spain, and so remained from 1659 till the fall of Napoleon in 1815.

During this period and a quarter Great Britain again had the most material advantage: that her enemy was not only contending with her at sea, but was engaged in endeavouring to establish and maintain a military preponderance over her neighbours on the continent of Europe. Hence the necessity for her to support great and costly armies, which led to the sacrifice of her fleet, and drove Holland into alliance with Great Britain (Wars of the League of Augsburg, of the Spanish Succession, of the Austrian Succession and the Seven Years War). During the War of American Independence France was in alliance with Spain and Holland, and at peace on land. She and her allies were able to impose terms of peace by which Great Britain surrendered positions gained in former wars. But the strength of the British navy was not broken, and in quality it was shown to be essentially superior.

The French Revolution undid all that the government of France had gained between 1778 and 1793 by attention to its navy and abstinence from wars on land. The result of the upheaval was first to launch her into schemes of universal conquest. Other nations were driven to fight for existence with the help of Great Britain. In that long struggle all the navies of Europe disappeared except the French, which was broken by defeat and rendered inept by inaction, and the victorious British navy. When Napoleon fell, the navy of Great Britain was not merely the first in the world; it was the only powerful navy in existence.

The pre-eminent position which the disappearance of possible rivals had given to Great Britain lasted for several years unchallenged. But it was too much the consequence of a combination of circumstances which could neither recur nor endure. The French navy was vigorously revived under the Restoration and the government of Louis Philippe (the periods from 1815 to 1830 and 1830 to 1848). The emperor Nicholas I. of Russia (1825-1855) built ships in considerable numbers. As early as 1838 the fear that the naval superiority of Great Britain would be destroyed had already begun to agitate some observers. The "extremely reduced state" of the British navy, and the danger that an overwhelming force would be suddenly thrown on the English coast, were vehemently set forth by Commander W. H. Craufurd, and by an anonymous flag-officer. The peril to be feared, it was argued, was an alliance between France and Russia. In 1838 the British navy contained, built and building, 90 ships of the line, 93 frigates and 12 war steamers; the French, 49 of the line, 60 frigates and 37 war steamers, including armed packets; Russia, 50 of the line, 25 frigates and 8 steamers; the United States, 15 of the line, 35 frigates and 16 war steamers. The agitation of 1838 passed away, and the Crimean War, entailing as it did the destruction of a great part of the Russian fleet at Sebastopol, and proving the weakness of the Baltic fleet, and having, moreover, been conducted by an alliance of France and Great Britain against Russia, would seem to have shown that the anxieties of 1838 were exaggerated. But the rivalry which is inherent in the very position of states possessing sea coasts and maritime interests could not cease. The French imperial government was anxious to develop its navy. By the construction of the armoured floating batteries employed in bombardment of Kinburn in October 1855, and by the launch of the first seagoing ironclad "La Gloire" in 1859, it began a new race for superiority at sea, which has shown no sign of abatement. This was the stage of high tension in the political events in Europe which brought forward new competitors, while great navies were developed in America and Asia.

The year 1871 was the beginning of a vast growth of naval armaments. It saw the completion of the unity of Italy and the formation of the German empire, two powers which could not dispense with strong fleets. But for some years the Italian and German navies, though already in existence, were still in a youthful stage. The rapid growth of the United States navy dates from about 1825. For a long time the Japanese, the Dutch, the French, Russia and Great Britain, in answer to them, began the race in which the efforts of each had a stimulating effect on the others. Though the alliance between France and Russia was not formed till later, their common interests had marked them out as allies from the first, and it will be no less convenient than accurate to treat Great Britain and the partners in the Dual Alliance as for some time opposed to one another.

In the general reorganization of her armaments undertaken by France after the war of 1870-1, her navy was not neglected. Large schemes of construction were taken in hand. The instability of French ministries, and the differences of principle which divided the authorities who favoured the construction of battleships from those who were partisans of cruisers and torpedo-vessels, militated against a coherent policy. Yet the French navy grew in strength, and Russia began to build strong vessels. As early as 1874 the approaching launch of a coast-defence ironclad at Kronstadt (the "Peter the Great" designed by the English constructor Sir E. J. Reed) caused one of the successive "naval scares" which recurred frequently in the coming years. It was, however, a more lasting result of the Crimean War, and the lessons of the Turkish conflict of that year, that the production of warships was ordered. In 1878 the prospect of a war arising out of the Russian and Turkish conflict of that year, again stirred doubts as to the sufficiency of her naval armaments in England. Yet it was not till about 1885 that an agitation for the increase of the British fleet was begun in a consistent and continuous way. The controversy of the succeeding years was boundless, and was perhaps the more heated because the controversialists were not controlled by the necessity for using terms of definite meaning, and because the lists published for the purpose of making comparisons were inevitably of doubtful value; when ships built, building and ordered to be built, but not begun, were counted together, or as not infrequently happened, were all added on one side, but not on the other. The belief that the British navy was not so strong as it should be, in view of the dependence of the British empire on strength at sea, spread steadily. Measures were first taken to improve the opportunities for practice allowed to the fleet by the establishment of yearly naval manoeuvres in 1885, and the lessons they afforded were utilized to enforce the necessity for an increase of the British fleet. In 1888 a committee of three admirals (Sir W. Dowell, Sir Vesey Hamilton and Sir R. Richards), appointed to report on the manoeuvres of that year, gave it as their opinion that "no time should be lost in placing the British navy beyond comparison with that of any two powers." This verdict met a ready acceptance by the nation, and in 1889 Lord George Hamilton, then first lord of the admiralty, introduced the Naval Defence Act, which provided for the addition to the navy within four and a half years of 70 vessels of 316,000 tons at a cost of £21,500,000. The object was to obviate the risk of sudden reductions for reasons of economy in the building vote.
Later experience proved that the practice of fixing the amount to be spent for a period of years operated to restrict the freedom of government to make additions, for which the necessity had not been foreseen when the money was voted. But the act of 1889 on which Britain was less in 1904 than she was in 1889, while as inevitable it stimulated other powers to increased efforts.

The rivalry between Great Britain and the states composing the Dual Alliance may be said to have lasted till 1904, when the course of the war in the Far East removed Russia from the field. It must be borne in mind that during the latter part of these twenty years Russia was largely influenced by the desire to arm against the growing navy of Japan. Comparisons between the additions to the fleets made on either side, even when supported by a great display of figures, are of uncertain value. Number is not the test of strength when taken apart from the quality, distribution, the command of coaling stations—which are of extreme value to a modern fleet—and other considerations.

But the respective lists of battleships supply a rough and ready standard, and when taken with the number of men employed and the size of the budgets (both subject to qualifications to be mentioned) does enable us to see with some approximation to accuracy how far the rivals have attained their desired aims. In 1889, before the passing of the Naval Defence Act, the British navy contained 37 battleships of 262,540 tons. The united French and Russian fleets had 29 of 356,653 tons: of these 27 were French, 7 British vessels, France and Russia having been divided with iron and therefore of no value when exposed to the fire of modern explosives. This is but one of many examples which may be given of the fallacious character of mere lists of figures. In 1894, when the Naval Defence Act had produced its effect, the comparative figures were: for Great Britain, 46 ironclads (or battleships) of 441,440 tons, and for the Dual Alliance 35 of 279,953—in which, however, the seven wooden vessels were still included. France and Russia had then large schemes of new construction—60,500 tons of ships over 10,000 tons for France, and 78,000 tons for Russia. The British figure was 7,000 tons. But the French and Russian list included mere names of vessels, of which the plans were not then drafted.

The rivalry in building went on as eagerly after 1894 as before. At the beginning of 1904 Great Britain had 67 battleships of 895,370 tons, as against 57 of 635,500 belonging to the powers of the Dual Alliance. The difference in favour of Great Britain was therefore 10 battleships, and 259,870 tons. Vessels not ready for service were included in the list, which therefore includes potential as well as actual strength. The balance in favour of Great Britain was 190,650 tons. In 1904 there were 17 British, 7 French, 7 British vessels, and 108,000 tons of them 70,000 tons. During this period the naval budget of Great Britain had risen from £12,000,000 in 1885 to £34,437,500 in 1903-1904. The number of men employed had grown from 57,000 to 127,000. The figures for the Dual Alliance cannot be given with equal confidence. France had transferred the troupes de la marine or colonial troops from the navy to the army, which introduced a confusing element into the comparison, and the figures for Russian expenditure are very questionable. The total credit demanded for the French navy in 1890, the year after the passing of the British Naval Defence Act, was frs. 217,147,462. By 1904, before the passing of the revised scheme, it was frs. 577,855,126. But the figures of the French credit for 1890 are not attainable, but her budget for 1903 was frs. 11,067,889 sterling. A comparison in numbers of men available is wholly misleading, since the British navy contains a large number of voluntarily enlisted men who serve for many years, and a small voluntary reserve, while France and Russia include all who are liable to be called out for compulsory service during a short period. There is no equality between them and the highly trained men of the British navy. The immense increase in its staff represents an addition to real power to which there is nothing to correspond in the case of continental states.

While this vast growth of naval power was going on in Great Britain, France and Russia, other rivals were entering into the lists with various fortunes. Italy may be said to have been the first comer. Her national navy, formed out of the existing squadrons of Sardinia, Tuscany and Naples, had stood the strain of war in 1866 very ill. The conditions in which the unity of the country had been achieved during the Franco-Prussian War of 1870-71, together with the obvious need for a navy in the case of a nation with a very extended sea coast, animated the Italians to give their scheme of naval construction, and efforts. Their policy was controlled by the knowledge that they could not hope to rival France in numbers, and they therefore aimed at obtaining individual vessels of a high level of strength. Italy may be said to have set the example of building monster ships, armed with monster guns. But she was unable to maintain her position in the race. The too hopeful finance in which she had indulged in the first enthusiasm of complete political unification led to serious embarrassment in 1894. Her naval budget sank from £4,650,000 in 1891 to £3,776,655 in 1897-1898, and Italy voted only £5,610,652 in 1895-1906. As a candidate in the race for naval strength she necessarily held a subordinate place, though always to be ranked among the important sea powers. In 1903, when the rivalry of Great Britain and the Dual Alliance was at its height, her strength in battleships was 18, of 226,630 tons. In number, therefore, they did more than cover the balance in favour of Great Britain as against the Dual Alliance, but not in tonnage, in which the difference in favour of Great Britain was 329,870.

The history of the German navy is one of foresight, calculation, consistency and therefore steady growth. The small naval force maintained by Prussia before the German Federation after the war of 1866, and the Imperial navy after 1871. Until 1853 it had been wholly dependent on the war office. In that year an admiralty was created in favour of Prince Albrecht, but this office was abolished in 1861, and the navy was again placed under the war office. The first ministers of the navy under the North German Federation were generals; so was the first imperial minister, General Stosch (1871). Admiral Tirpitz, appointed in 1887, was the first minister who was bred a seaman. His predecessor, General Stosch, had been an excellent organizer, and had done much for the improvement of the service. It has been the rule of the German government, both before and since the foundation of the empire, to advance by carefully framed plans, without adhesion to them pedantically when circumstances called for a modification of their lines. As early as 1867 a scheme had been formed for the construction of a navy of 16 ironclads and 50 smaller vessels, at a cost of £5,395,533. It was not sufficiently advanced in execution to allow Germany to make any efforts at sea in the war of 1870-71. In 1872 a supplementary grant of £3,791,666 was made for construction in view of the increased cost of armour and armament. In 1882 there were 201 men and 102 officers still under the construction of 100 vessels, and it was completed in 1888 by another which provided for the construction of 28 vessels, of which 4 should be battleships of the largest size, within the next six years. In 1894 and for some years afterwards the Reichstag showed itself hostile to a heavy expenditure on the navy, and refused many votes asked for by the government. Under the pressure of ambition and of the real needs of a nation with an extensive and growing maritime commerce, the expenditure grew in spite of the opposition of the Reichstag. Between 1874 and 1882 the number of vessels under construction had increased from 20 to 28. In the following year to £3,500,000, from which figure it advanced by 1888 to £5,756,135. Another building scheme was framed in that year, but it was swept aside in 1900, under the combined influence of the exhortations of the emperor William II, and of the anger caused in Germany through the arrest by a British cruiser of a German steamer (the "Breslau") on the coast of Africa on a charge of carrying contraband of war to the Boers. The emperor was now able to obtain the consent of the Reichstag to an extended Naval Defence Act. By the terms of this measure it was proposed to spend £7,000,000 on construction, and £10,000,000 on the dockyards. With this money, by the year 1917 Germany was to be provided with a fleet of 38 battleships, together with a proportionate number of cruisers and other smaller vessels. Rapid progress was made not only with the programme itself but with the equipment of German dockyards.
and other establishments for providing the material of a great navy. In the spring of 1896 the serious menace to British supremacy at sea, represented by the growth of the new German fleet of battleships, led in England to a "scare" which recalled that of 1888, and to an energetic campaign for additional expenditure on the British navy.

During the years following on the American Civil War (1862–66) the United States paid small attention to the navy. In 1881 a board was appointed to advise on the needs of the navy, and in 1890, the board recommended the formation of a fleet of 100 vessels of which 20 should be battleships of the largest class. The reviving interest in the navy was further stimulated by the diplomatic difference with Great Britain which arose over the frontier question between her and the republic of Venezuela in 1896. Resolutions were passed in congress approving of an increase of the navy. The war with Spain in 1898 completed the revival of American interest in the navy. The acquisition of Porto Rico, and the protectorate of Cuba in the West Indies, together with the annexation of the Philippines, and the visible approach of the time when the relations of the powers interested in the Pacific would call for regulation, confirmed the conviction that a powerful fleet must be maintained. In 1889 the United States possessed no modern battleship. The 1860s were devoted to the building of these. At the close of 1893 there were built and building 27 of 35,380 tons, only two of them being of less than 10,000 tons. From $5,119,850 in 1890 the expenditure grew to $16,355,380 in 1903.

The navy of Japan, the last comer among the great naval forces of the world, may be said to date from 1895, from, in fact, the eve of the war with China. As an insular power with a large seafaring population, Japan is called upon to possess a fleet. Even in the days of its voluntary isolation it had a known capacity for maritime warfare. Its capacity for harnessing the ideas and mastering the mechanical skill of Europe have been in no respect better shown than in naval matters. From the moment it was compelled to open its ports it began not only to acquire steamers but to apply itself under European guidance to learning how to make and use them. A navy on the western model was already organized by 1895, but it was still of trifling proportions. In 1896 the Japanese navy had become an object of serious attention to the world. A plan was drafted in that year, and confirmed in the next, by which Japan arranged to supply itself, mainly by purchase in Europe, with a fleet containing 4 of the most powerful battleships, the scheme were a built and 8 building in 1898, when the decision was taken to increase the tonnage of the vessels. A little later additions were arranged for, and vessels building for South America states in English ports were purchased. The British model was carefully followed in naval organization, the alliance with England giving special facilities for this. And by 1904, when the war with Russia began, the unknown Japanese fleet proved its competence by victories at sea which put the seal on her position as a naval power.

Conclusion.—When we look over the whole period from the end of the Napoleon wars, one great fact is patent to our view. It is that this was an epoch of revival or development in the naval power of the whole world, in the course of which the position held by Great Britain in 1816 was almost entirely lost by the growth of other powers. The situation in this year was by its very nature temporary, and a quotation of the respective numbers of warships then possessed by the world would have no value. An instructive comparison can, however, be made between the year 1838, when Great Britain began to be seriously concerned with the rise of possible enemies at sea, and the year of the war between Russia and Japan. Battleships may again be taken as the test of strength, since nothing happened in the Russo-Japanese War to show that they do not still form the most vital element of naval power. We may also leave aside the many small vessels which cannot act collectively, and which individually do not weigh in the balance. The figures for 1838 are given above, but may be repeated for comparison. In that year Great Britain possessed, built and building, 90 ships of the line; France 49; Russia 56; the United States 15. In 1903 the number of vessels recognized as battleships, possessed by the great powers, was for Great Britain 67; for France 39; for Russia 18; for the United States 27; for Germany 27; for Italy 18; for Japan 5. At the first date the British fleet was among great powers as 90 to 114. At the latter it was as 67 to 134.

Such comparisons, however, as these become much more complicated in later years, when the importance of the preponderance of "Dreadnoughts"—the new type of battleship—(see SHIP and SHIPBUILDING)—was realized. By the invention of this type Great Britain appeared to obtain a new lead; and in 1907, when it was calculated that by 1910 there would be ten British "Dreadnoughts" actually in commission while neither in Europe nor America would a single similar ship have been completed by any foreign power, the situation seemed to be entirely in favour of complete supremacy at sea for the British fleet. But the progress of German and American construction, and particularly the experience gained of German ability to build and equip much more rapidly than had been supposed, showed by 1909 that, so far as "Dreadnoughts" were concerned at all events, the lead of Great Britain could only be maintained by exceptional effort and exceptional expenditure. It was admitted by the prime minister, Lord Esher, that a new race thus began, of which it is impossible here to indicate more than the start. It was no longer a question of completed ships, but one still more of programmes for building and of the rate at which these programmes could be accomplished. At the beginning of 1910, while Great Britain had her ten "Dreadnoughts," it was not the case that other powers had none; Germany already had four and the United States two; and a knowledge of the naval programmes of both these countries, to speak of no others, showed that, unless either their policy was altered, or the British shipbuilding programme was modified so as to keep up with their progress, it would not take many years before the theory of the equality of the British fleet in "capital ships" to those of the next two naval powers would have to be abandoned. In England this situation created a profound sensation in 1909, since it was common ground that her fleet was her all in all, on which her empire depended; and the result was seen, not only in a considerable increase in the Naval Estimates of 1910–11, but also in the beginning of a serious attempt to organize their fleets on the part of the British colonial dominions, which should co-operate with the mother country.

The British Admiralty figures for the state of the principal fleets as on March 31st, 1910, are summarized below. The letters at the heads of the columns have the following significations: E., England; F., France; R., Russia; G., Germany; I., Italy; U., United States; and J., Japan:

BIBLIOGRAPHY.—Ancient and Contemporary Accounts of the naval organizations of the ancient world, and of the sea-fighting of the time are to be found in the histories of Greece and Rome: Signor G. Corazzini has written a Storia della marina militare antica (Livorno, 1880). The Great British navy and of the Byzantine navy will be found in Professor Bury’s appendices to his edition of Gibbon’s Decline and Fall, vol. i. apx. 5, and vol. vi. apx. 5. General histories of the naval powers of the world written to be little more than jargon reviews of the dates, and results of battles. This is certainly the case with the great folio of the English writer Josiah Burchett, A Complete History of the most remarkable transactions at sea, from the earliest accounts of time to the conclusion of the last war with France, wherein is given an account of the most considerable Naval Expeditions, Sea Fights, Stratagems, Discoveries and other Maritime Occurrences that have happened, and also of all navigation and seamen’s stories; and in a more particular manner of Great Britain from the time of the Revolution in 1688 to the oyslaird period (1750). The later part is however valuable, for Burchett, who was a naval officer himself, had command of the admiralty, had authority for his time, and had served as sea secretary to Russell, Lord Orford. There is an Histoire de la marine de tous les peuples, by M. A. du Sein (Paris, 1879) which is of no more value than the previous work. Menu, C. J. Keary, The Vikings of Western Christendom (1891). The medieval period of Western navies are treated in their respective naval histories.

Medieval:—As regards the medieval navies the first place may be allowed to the Italians. A general bibliography of Italian naval literature, Saggio de una bibliografia marittima italiana, occupying fifty-eight pages, drawn up by Signor Emilio Cestaro, will be found in the Revista marittima, supplement for 1894 (Rome). The histories of the different Republics of the middle ages record their maritime enterprises. Of excellent books, which give much of the details and promises, is the Storia della marina pontificia de A. Guglielmotti, G.P.T., in 10 volumes published at different times, and in two editions, at Florence 1856, &c. The general maritime history of the Mediterraneans in the middle ages is well done by E. Badenie, La marine commerce y artes de Barcelona (1779-1792) by Don A. Capmany. The naval enterprises of the Norsemen are dealt with in a scholarly fashion by M. G. B. Deppe. Histoire des expéditions maritimes des Normands (1841), and with newer knowledge by C. F. Keary, The Vikings of Western Christendom (1891). The medieval period of Western navies are treated in their respective naval histories.

Great Britain:—The History of the Royal Navy to the French Revolution, by Sir N. Harris Nicolas (1847), is unfortunately incomplete. It ends at the year 1422, but is the work of a most laborious writer, and one who had wide experience in the navy. The administrative history of the British navy until 1660 is the subject of the History of the Administration of the Navy and of Merchant Ships, the first edition to 1660, by John Tinctoris (1735). The British Historical society—a valuable collection of materials. The campaigns and battles of the navy are told, generally from the public letters of the admirals, and with no great measure of criticism in several compilations. The Naval History of England (1735) by Mr T. Ledard, is copious and useful. The Naval Chronicle, or an Historical Summary of Naval and Maritime Events from the Time of the Romans to the Treaty of Peace 1802, by Captain Isaac Schomberg (1802), contains a mass of valuable information, lists of ships, dates of construction, &c., and some administrative details. Less comprehensive, but still useful, is such a compilation as The General History of the Late War (that is, the Seven Years War), by Dr John Entick, and other materials (1765). A much better book is The Naval and Military Memoirs of Great Britain 1727 to 1783 (1804) by Mr R. Beatson, a very careful and well-informed writer who had seen some service as a marine officer. The Life of the British Admirals, consists of a more accurate Naval History from the earliest periods, by Dr J. Campbell (1779), may be profitably consulted, with caution, for it by no means justifies its claim to novelty and accuracy in all parts. A History of the British Navy, from the time of King George IV., by Mr W. James (1827), republished with a continuation by Captain Chamber in 1837, is a standard authority. A far less useful work, which is not to be recommended, is The Naval History of Great Britain by Captain W. P. Brenton, first published in 1823, and republished in 1836. The Field of Mars, a compilation in dictionary form published in 1781, with an enormous title-page, is a valuable volume for the history of navies during the 18th century. The History of the British Navy from the Earliest Period to the Present Time (1863) by Dr C. D. Yonge, contains some original matter for the naval transactions of the 19th century. The Royal Navy, in 7 large volumes (1897-1903), edited and partly written by Sir W. L. Clowes, is a compilation of unequal value. Some of

Naval Strategy and Tactics

Sir W. L. Clowes’s coadjutors, notably Captain Mahan and Sir C. R. Markham, are of high standing and authority. The book is copiously illustrated. The Naval Chronicle, 1799–1818, a magazine, contains masses of useful matter, for the Revolutionary and Napoleonic Wars. The Royal Naval Biography of Captain John Marshall, giving the lives of all officers on the list in 1823 or promoted later (1824–1835), with a supplement (1827–1830), may be consulted, but is too unorthodox and too uniformly laudatory. The Naval Biographical Dictionary of William H. Davis, a limited number of copies being issued, and unsigned, the contents are rather meagre. W. R. O’Byrne, is a solid book of reference. The publications of the Naval Record Society (1854 and subsequent years) contain large and important questions of naval strategy, by authorities matched by similar authorities, such as Sir W. Monson’s Tracts, which were difficult of access. See also A Short History of the Royal Navy, by David Hanay.

Naval Strategy and Tactics

The naval history of France has been much written about since 1840. Not many of the books published have been of considerable value. The Histoire maritime de la France of M. Léon Guérin (1844), was meant to meet a popular demand. The writer was a naval officer, and is of more value, but is somewhat wanting in criticism. The Précis historique de la marine française of M. Chassarion (1843); the Histoire générale de la marine (1853); the Histoire de la marine française de M. le Saint (1877); and the Histoire de la marine française of M. Sartorius, are compilations of M. Troussel are compilations. La Marine de guerre, ses institutions militaires depuis son origine jusqu’à nos jours, by Capts. Gougeard (1877); and La marine de guerre du royaume de France by M. Lambert de Sainte Croix (1892); and the excellent little book of M. Lorrain La Marine royale, 1789 (n.d.), may be consulted with pleasure and profit. The three books of M. de Saint-Yves, of the Academy of Sciences, Histoire et philosophie des navires, and Abraham du Queude la marine de son temps (1827) are all of high value. Les Batailles navales de la France de Capts. Troude (1867), is a carefully written account of naval actions. The Histoire de la marine française, pendant la guerre de l’indépendance américaine (1877); Sous la première république (1886); Sous le consulat et l’empire (1886); De 1815 à 1870 (1900); and La marine française et la guerre de la Indes (1859) are works of a more popular character, though and critical. M. G. Lacour-Gayet, Professor at l’École supérieure de la Marine, has published two books of serious research, but marked by some national prejudice, La Marine militaire de la France sous la révolution de Juillet (1880), and La Marine militaire de la France sous le régime de Louis XVI. (1905). The Recherches sur l’ancien clos des galères de Rouen (1864) of M. C. de Robillard de Beaurieux, and the life of Jean de Vienne by the Marquis Terrier de Lézay (1834), is a valuable monograph and on the valor of early French naval history. The Projets et tentatives de débarquement aux Iles britanniques by Capts. Desbrière (1900 seq.) is a most valuable authority. A very valuable book is L’Histoire de la marine française was born in 1890 by M. C. de la Roncière.

Miscellaneous:—The standard authorities for Spanish naval history are, La Marina de Castilla (1832), and La Armada Española desde la unión de Castilla y Aragón hasta la era de la Infanta Isabel de Braganza y don Juan de Orléans-Duro. The Geschiedenis van het Nederlandsche Zeemacht by Mr J. C. de Jonghe (1858), is an admirable and exhaustive history of the Dutch navy, The History of the Mariner’s Data by Mr M. R. hij (1876). The History of the Sea by Hugh Chalmers Hasted by Mr J. Mitchell for the Oriental Translation Fund (1831). may be read with curiosity and some profit. There are two general histories of the navy of the United States, by Captain Posthumus (1851) and by Mr E. M. Clay (1840); the second is the fuller, and the more critical. Captain Mahan’s Influence of Sea Power on History 1660–1783 (1890), and his Influence of Sea Power upon the French Revolution and Empire 1793–1812 (1892), must be classed apart as studies of the general inter-action of navies on one another and on international relations. The long series of readable monographs by Admiral Junier de la Gravière, covering the whole field of naval warfare in the American War to his own time, contain much information and sound criticism.

Naval Strategy and Tactics

Historical Evolution.—That the methods of conducting war at sea have been conditioned by the capacity of the ships and their armament, and that capacity and armament have interacted upon one another, may appear to be platitude. We have done the indication in our other remarks and are therefore in mind when we are considering the history of naval strategy, that is, of the large movements by which a commander secures the advantage of fighting at a place convenient to himself, or of tactics—which are the movements he makes in battle. Throughout antiquity and the middle ages till the 16th century, the weapons relied on were (1) the ship itself, used as a ram, (2) the swords of the crew, (3) such missile weapons as bolts from heavy crossbows.
The yard gangway time to follow the trade of Syracusean too, vessels at A.D. 1571 questioned, the strategy and fixed found to not run battle. Therefore, while fleets depended on the methods of battle at close quarters, two conditions were imposed on the warship. She must be small and light, so that her crew could row her with effect, and she must carry a numerous crew to work her oars and board or repel boarders. Sails were used by the triremes and other classes of warship, ancient and medieval, when going from point to point—to relieve the rowers from absolutely exhausting toil. They were lowered in action, and when the combatant had a secure port at hand, they were left ashore before battle. These conditions applied alike to Phormio, the Athenian admiral of the 5th century B.C., to the Norse king Olaf Tryggveson of the 10th century A.D., and to the chiefs of the Christian and Turkish fleets which fought the battle of Lepanto in A.D. 1571. There might be, and were, differences of degree in the man of war and sail respectively. Outside the Mediterranean, the sea was unfavourable to the long, narrow and light galleys of 120 ft. long and 20 ft. of beam. But the Norse ship found at Gokstad, though her beam is a third of her length, and she is well adapted for rough seas, is also a light and shallow craft, to be easily rowed or hauled up on a beach. Some medieval vessels were of considerable size, but these were the exception; they were awkward, and were rather transports than warships.

Given a warship which is of moderate size and crowded with men, it follows that prolonged cruises, and blockade in the full sense of the word, were beyond the power of the sea commanders of antiquity and the middle ages. Thucydides used the trade which with a favourable wind could rely on making six knots an hour—that is to say, twice the average speed attained by Captain Cook in his voyages of exploration. But a war fleet could not provide the cover, or carry the water and food, needed to keep the crews efficient during a long cruise. So long as galleys were used, that is to say, till the middle of the 18th century, they were kept in port as much as possible, and a tent was rigged over the deck to house the rowers. The fleet was compelled to hug the shore in order to find supplies. It always endeavoured to secure a basis on shore to store provisions and rest the crews. Therefore the wider operations were slowly made. Therefore too, when the enemy was to be waited for, or a port watched, some point on shore was secured and the ships were drawn up. It was by holding such a point that the Corinthian allies of the Syracusans were able to pin in the Athenians. The Romans watched Lillybeum in the same way, and Hannibal the Rhodian could run the blockade before they were launched and ready to stop him. The Norsemen hauled their ships on shore, stockaded them and marched inland. The Greeks of Homer had done the same and could do nothing else. Roger di Lauria, in A.D. 1285, waited at the Hormigas with his galleys on the beach till the French were seen to be coming past him. Edward III. in A.D. 1350, stayed at Winchester till the Spaniards were sighted. The allies at Lepanto remained at anchor near Dragonella till the last moment.

Given again that the fighting was at close quarters with ram, stroke of sword, crossbow bolt, arrow, pigs of iron or lead and wild fire blown through tubes, it follows that the formations and tactics were equally imposed on the combatants. The formation was inevitably the line abreast—the ships going side by side—for the object was to bring all the rams, or all the boarders into action at once. It was quite as necessary to strike with the prow when boarding as when ramming. If the vessels were laid side by side the oars would have prevented them from touching. It may be added that this rule prevailed equally with the sailing ship of later times, since they were built with what is technically called "a tumble home," that is to say, their sides sloped inwards from the water line, and the space from the top of the bulwarks of one to the other was too great to be traversed. The extent to which ramming or boarding would be used respectively would depend on the skill of the rowers. The highly trained Athenian crews of the early Peloponnesian War relied mainly on the ram. They aimed at dashing through an enemy's line, and shaving off the oars from one side of an opponent. When successfully practised, this manœuvre would be equivalent to the dismasting of a sailing line of battle ship. It was the δικτυα, and it enabled the assailant to turn, and ram his crippled enemy in the stern (ρήσανας). But an attack with the ram might be exceedingly dangerous to the assailant, if he were not very solidly built. His ram might be broken off in the shock. The Athenians found this a very real peril, and were compelled to construct their triremes with stronger bows, to contend with the more heavily built Peloponnesian vessels—whereby they lost much of their mobility. In fact success in ramming depended so much on a combination of skill and good fortune that it played a somewhat subordinate part in most ancient sea fights. The Romans baffled the ramming tactics of the Carthaginians by the invention of the corvo or crow, which grappled the prow of the rammer, and provided a gangway for boarders. After the introduction of artillery in the 14th century, when guns were carried in the bows of the galley, it was considered bad management to fire them until the prow was actually touching the enemy. If they were discharged before the shock there was always a risk that they would be fired too soon, and the guns of the time could not be rapidly reloaded. The officer-like course was to keep the fire for the last moment, and use it to clear the way for the boarders. As a defence against boarding, the ships of a weaker fleet were sometimes tied side to one another, in the middle ages, and a barrier made with oars and spars. But this defensive arrangement, which was adopted by Olaf Tryggveson of Norway at A.D. 1000, and by the French at A.D. 1340, could be turned by an enemy who attacked on the flank. To meet the shock of ramming and to ram, medieval ships were sometimes "bearded," i.e. fortified with iron bands across the bows.

The principles of naval warfare known to the ancient world descended through Byzantium to the Italian Republics and from them to the West. With the growth of ships, the development of artillery, and the beginning of the great sailing fleets capable of keeping the sea for long periods together, came the need for a new adaptation of old principles. A ship which depended on the wind for its motive power could not hope to ram. It could still board, and the Spaniards did for long make it their main object to run their bow over an enemy's sides, and invade his deck. In order to carry out this kind of attack they would naturally try to get to windward and then bear down before the wind in line abreast ship upon ship. But an opponent to leeward could always baffle this attack by edging away, and in the meantime fire with his broadside to cripple his opponent's spars. Experience soon showed the more intelligent sea officers of all nations, that a ship which relied on broadside fire, must present her broadside to the enemy; it was also soon seen that in order to give full play to the guns of the fleet, the ships must follow one another. Thus there arose the practice of arranging ships in the line ahead, one behind the other. For a time sea-officers were inclined to doubt whether order could be maintained among vessels subject to the forces of wind and tide. But in the very first years of the 16th century, a Spanish writer of the name of Alonso de Chaves argued with force that even an approach to order is superior to none—and that, given the accidents of
wind and tide, the advantage would rest with him who took
his precautions. The truth was so obvious that it could not but
be universally accepted. The line ahead then became
"Line of battle." This term has a double mean-
ing. It may mean the formation, but it may also
mean the ships which are fit to form parts of the line in action.
The practice of sorting out ships, so as to class those fit to be
in a line of battle apart from others, dates from the second
half of the 17th century. Its advantages had been seen before,
but the classification was not made universal till then. The
excess number of ships connected in those naval wars, their
variety in size, and the presence in the fleets of a large proportion
of pressed or hired merchant ships had led to much bad execu-
tion. But in the final battles of the first war between England
and the Dutch Republic (1652–53), the Parliamentary admiral
enforced the formation of the line by strong measures. On the
conclusion of the war, they drew up the first published code of
fighting instructions. These give the basis of the whole tactical
system of the 17th and 18th centuries in naval warfare. The
treaties of Peace of Westphalia, 1648, and Peace of Nijmegen,
1678, laid down a system of combat by line, with advanced
squadrons on either side of the line of battle, to cover the
flank of the line and give a deceptive impression of greater
strength.

"The governing principles were simple and were essentially sound.
The ships were arranged in a line, in order that each
should have her broadside free to fire into the enemy
without running the risk of firing into her own friends.
In order to remove the danger that they would
attack each other, a competent space, to allow for a
change of course in case of need, was left between them. It
was fixed at two cables—about 200 fathoms, or 100 yds.

The fleets would fight "on the wind"—that is, with the wind on the side,
because they were then under better control. With the wind
blowing from behind they would take the course of the
other's sails. When the course had to be altered, the ships
were turned by the wind, together, or by wearing—
that is, stern to wind, either together or in succession. To tack
or wear a large fleet in succession was a very lengthy operation.

The second ship did not tack, or wear, till it had reached the
place where the first had turned, and so on, down the whole line.

B. By tacking or wearing together the order of a fleet was reversed,
the van becoming the rear, and the rear the van. It must be
remembered that a fleet was divided into van, centre and rear,
which kept their names even when the order was reversed.

Orders were given by signals from the flag-ship, but as they
could not be seen by the ships in a line with her, frigates were
stationed on the side of the line opposite to that facing the
enemy "to repeat signals."

A main object which the admirals who drafted the orders
had before them was to obviate the risk that the enemy would
double on one end of the line and put it between two fires.
It is obvious that if two fleets, A and B, were sailing, both
with the wind on the right side, and the leading ship of A comes
into action with the wind more than a quarter, or even a third of B's line will be free to turn and surround the
head of A's line. This did actually happen at the battle of
Beachy Head. Therefore, the orders enjoin on the admiral the
strict obligation to come into action in such a way that his leading
ship shall steer with the leading ship of the enemy, and his rear
with the rear. The familiar expression of the British navy was
"to take every man his bird."

The regular method of fighting battles was thus set up. In
itself it was founded on sound principles. As it was framed when
the enemies kept in view were the Dutch, who in seamanship
and gunnery were fully equal to the British, its authors were
justified in prescribing the safe course. Unhappily they added
the direction that a British admiral was to keep his fleet, through-
out the battle, in the order in which it was begun. Therefore
he could take no advantage of any disorder which might occur
in the enemy's lines. When therefore the conflict came to be
between the British and the French in the 18th century, battles
between equal or approximately equal forces were for long
inconclusive. The French, who had fewer ships than the British,
were anxious to fight at the least possible cost, lest their fleet
should be worn out by severe action, leaving Great Britain
with an untouched balance. Therefore, they preferred to engage
to leeward, a position which left them free to retreat before the
wind. They allowed the British fleet to get to windward, and,
when it was parallel with them and bore up before the wind to
attack, they moved onwards. The attacking fleet had then to
advance, not directly before the wind with its ships moving
along lines perpendicular to the line attacked, but in slanting
or curving lines. The assailants would be thrown into "a bow
and quarter line"—that is to say with the bow of the second
fleet on the after part of the first and in gunnery and to end.

In the case of a number of ships of various powers of sailing,
it was a difficult formation to maintain. The result was that
the ships of the assailant line which were steering to attack
the enemy's van came into action first and were liable to be crippled
in the rigging. If the same formation was to be maintained,
the others were now limited to the speed of the injured vessels,
and the enemy to leeward slipped away. At all times a fleet
advancing from windward was liable to injury in spars, even if
the leeward fleet did not deliberately aim at them. The leeward
ships should be worn away from the wind, and their shot would
always have a tendency to fly high. So long as the assailant
remained to windward, the ships to leeward could always slip
off.

The inconclusive results of so many battles at sea excited
the attentions of a Scottish gentleman, Mr Clerk of Eldin (1728–
1812), in the middle of the 18th century. He began a
series of speculations and calculations, which he em-
bodyed in pamphlets and distributed among naval
officers. They were finally published in book form in 1790 and
1797. The hypothesis which governs all Clerk's demonstrations
is that the British navy and its gunnery and seaman-
ship to their enemy, it was their interest to produce a mêlée.

He advanced various ingenious suggestions for concentrating
superior forces on parts of the enemy's line—by preference on
the rear, since the van must lose time in turning to its support.
They are all open to the criticism that an expert opponent could
find an answer to each of them. But that must be always the
case, and victory is never the fruit of a skilful movement alone,
but of that superiority of skill or of moral strength which enables
one combatant to forestall or to crush another by more rapid
movement or greater force of blow. Clerk's theories had at
least this merit that they might infallibly tend to make battles
decisive by throwing the combatants into a furious mangled
strife.

The unsatisfactory character of the accepted method of
fighting battles at sea had begun to be obvious to naval officers,
both French and English, who were Clerk's contemporaries.
The great French admiral Suffren condemned naval tactics as
being little better than so many excuses for avoiding a real
fight. He endeavoured to find a better method, by concentrating
superior forces on parts of his opponent's line in some of his
actions with the British fleet in the East Indies in 1782 and in the
West Indies in 1783.

But his orders were ill obeyed, and the quality of his fleet was
not superior to the British. Rodney, in his first battle in the
West Indies in 1780, endeavoured to concentrate a superior
force on part of his enemy's line by throwing a greater number
of British ships on the rear of the French line. But his directions
were misunderstood and not properly executed. Moreover he
did not then go beyond trying to place a larger number of ships
in action to windward against a smaller number to leeward by
arranging them at a less distance than two-cables length. But

314  NAVY AND NAVIES  STRATEGY AND TACTICS

CRICK's theories.
an enemy who took the simple and obvious course of closing his line could battle the attack, and while the retreat to leeward remained open could still slip away. On the 12th of April 1782 (battle of Dominica) Rodney was induced, by the disorder in the French line, to break his own formation and pass through the enemy. He took the French flag-ship and five other vessels. The favourable result of this departure from the old practice of keeping the formation intact throughout the battle ruined the French system of tactics. In the French war which began in 1793 Lord Howe (battle of 1st of June) ordered his fleet to steer through the enemy, and to put themselves on his line only as a means of bringing his fleet into action, and then played to produce a mêlée in which the individual superiority of his vessels would have free play. Throughout the war, which lasted, with a brief interval of peace, from 1793 to 1815, British admirals grew constantly bolder in the methods they adopted for producing the desired mêlée (battles of St Vincent, Camperdown, Trafalgar). It has sometimes been argued that their line of attack was rash and would have proved disastrous if tried against more skilful opponents. But this is one of those criticisms which are of value only against those who think that there can be a magic efficacy in any particular attack, which makes its success infallible. That the tactics of British admirals of the great wars of 1793-1815 had in themselves no such virtue was amply demonstrated at the engagement off Lissa in 1811. They were justified because the reliance of admirals on the quality of their fleets was well founded. It should be borne in mind that a vessel while bearing down on an enemy's line could not be exposed to the fire of three enemies at once when at a lesser distance than 350 yards, because the guns could not be trained to converge on a nearer point. The whole range of effective fire was only a thousand yards or a very little over. The chance that a ship would be dismasted and stopped before reaching the enemy's line was small.

Influence of improved ship-building. The improvements in the construction of ships, which had so much influence on the development of tactics, had its effect also on strategy. The great aims of a fleet in war must be to keep the coast of its own country free from attack, to secure the freedom of its trade, and to destroy the enemy's fleet or confine it to port. The first and second of these purposes can be attained by the successful achievement of the third—the destruction or paralysis of the hostile fleet. But till after the end of the 17th century it was thought impossible, or at least very rash, to keep the great ships out of port between September and May or June. Therefore continuous watch on an enemy by blockading his ports was beyond the power of any navy. Therefore too, as the opponent might be at sea before he could be stopped, the movements of fleets were much subordinated to the need for providing convoy to the trade. It was not till the middle of the 18th century that the continuous blockade first carried out by Lord Hawke in 1758-59, and then brought to perfection by Earl St Vincent and other British admirals between 1793 and 1815, became possible.

Modern Times. The interval of ninety years between 1815 and 1904 (the opening of the Russo-Japanese conflict) was marked by no naval war. There was fighting at sea, and there were prolonged blockades, but there were no encounters between large and well-appointed navies. During this period an entire revolution took place in the means of propulsion, armament and material of construction of ships. Steam was applied to war-ships, and also a new form of armament was developed in the 19th century. The Crimean War gave a great stimulus to the development of the guns. It also brought about the application of iron to ships as a cuirass. Very soon metal was adopted as the material out of which ships were made. The extended use of shells, by immensely increasing the danger of fire, rendered so inflammable a substance as wood too dangerous for employment in a war-ship. France has the honour of having set the example of employing iron as a cuirass, while England was the first to take it as the sole material. Changes so sweeping as these could not take place without affecting all the established ideas as to the conduct of war at sea. The time of revolution in means of propulsion, armament and construction was also a time of much speculation. Doubts and obscurities remained unsolved because they had never been brought to the test of actual fighting on an adequate scale. As the 19th century drew to a close, another element of uncertainty was introduced by the development of the torpedo. A weapon which is a floating and moving mine, capable up to a certain point of being directed on its course invisible or very hard to trace, and able to deliver its blow beneath the water-line, was so complete a novelty that its action was hard indeed to foresee and therefore particularly liable to be exaggerated. From the torpedo sprang too the submarine vessel, which aims at striking below the surface, where it itself is, like its weapon, invisible, or nearly so.

How to solve the problems which science has set has been the task of thoughtful naval officers—and of the governments which the military seaman serves. The questions to be solved may be stated in the following order. What would be the effect: 1st, of the employment of a steam, or of any substitute for steam, more rapid than the wind or the oar; 2nd, of the development of the gun; 3rd, of the use of metal as a material of construction; 4th, of the use of a weapon and a vessel acting below the surface of the water, and if not wholly invisible at least very much hidden? The belief that steam had given the lesser fleet an advantage over the greater—that it had, in a phrase once popular among Englishmen, "bridged the Channel"—need only be touched on for its historical interest. It was an intelligible, perhaps pardonable, example of the confusion produced by a novelty of improved capacity on the minds of those who were not prepared to consider it in its bearings. A more thoughtful judgment, if it have shown that where both sides had the command of steam, the proportion between them would remain what it was before; the only exception would be that the fleet which was steering in a direction already laid down would have a somewhat greater advantage than of old, over another which was endeavouring to detect its presence and course. Its movements would be more rapid, and it could steam through a fog by which it would be hidden in a way impossible for a sailing ship. On the other hand, such a fleet could be much more rapidly pursued and intercepted when on its course was known. The influence of the speed and certainty of movement conferred by steam would have on the powers of fleets and ships presented a problem less easy to dispose of. Against the advantage they conferred was to be set the limitation they imposed. The necessity for replacing indispensable fuel was a restriction unknown to the sailing ship, which needed only to renew its provisions and water—stores more easily obtained all the world over than coal. Hence doubts naturally arose as to how far a state which did not possess coaling stations in all parts of the world could conduct extensive operations over great distances. The events of the recent Russo-Japanese War lead to the conclusion that the obligation to obtain coal has not materially limited the freedom of movement of fleets. By carrying store vessels with him, by coaling at sea, and taking advantage of the friendly neutrality of certain ports on his route, the Russian admiral, Rojdestvensky, reached the Far East in 1905 in less time and with less difficulty than he could have done in days when he would have been liable to delay by calms, contrary winds and loss of spars in gales. The amount of skill on the part of the crews required to carry a fleet a long distance would even appear to be less than it was of old. From this it would seem to follow that modern fleets possess no less capacity than the old sailing fleets for the great operations of war at a distance, or for maintaining blockades. Advantage and disadvantage counterbalance one another, and the proportion remains the same. Blockade is only another name for the maintenance of a watch on an enemy's squadron in port by a force capable of fighting him if he comes out. Admiral Togo blockaded the Russian squadron at Port Arthur in 1904 as effectually as any admiral has done the work in the past. The mobility given to the blockaded fleet by steam has been exactly counterbalanced by the increased mobility of the watch. The proportions remain the same.
But if the power to undertake far-ranging operations, and to
confine an enemy to port by keeping him under observation,
and driving him back when he comes out remains the same, the
strategy of war at sea cannot have undergone any material altera-
tion. The possession of ports where stores can be accumulated and
repairs effected is an advantage as it always was. But a
powerful fleet when operating far from its own country can supply
itself with a store-house (a base) of enemy's fight, or can be
served at sea by store-ships, old and new. If beaten, it will gather
from the want of places of refuge as it always did.

Among the speculations of recent years, a good deal has been
heard of the "fleet in being." If this phrase is only used to
mean that, so long as any part of an enemy's navy is capable of acting with effect, its existence cannot be
ignored with the certainty of safety, then the words
convey a truth which applies to all war whether by land or
sea. If it means, as it was at least sometimes clearly intended
to mean, that no such operation as the transport of troops
oversea can be undertaken with success, so long as the naval
forces of an opponent are not wholly destroyed, it is con-
tary to ancient experience. The Japanese in the beginning of
1904 began transporting troops to Korea before they had beaten
the Russians, and they continued to send them in spite of the
risk of interruption by the Vladivostok squadron. There was a
risk, but risk is inseparable from war. The degree which can be
incurred with safety depends on the stake at issue, the nature of
the circumstances and the capacity of the persons, which vary
infinitely and must be separately judged.

The war of 1904–05 may also be said to have shown that the
vast change in the construction of ships, together with the develop-
ment of old and the invention of new weapons, has
done far less to alter the course of battles at sea than had been thought likely. Two calculations have been successively
made and have been supported with plausibility. The first was
that steam would enable the ship herself to be used as a projectile
and that the use of the ram would again become common.
The sinking of the "Re d'Italia," by the Austrian ironclad
Ferdinand Max at the battle of Lissa in 1866 seemed to give
force to this supposition. Accidental collisions such as those
between the British war-ships "Vanguard" and "Iron Duke,
"Victoria," and "Camerondown" have also shown how fatal a
wound may be given by the ram of a modern ship. But the sinking
of the "Re d'Italia" was largely an accident. As
between vessels both under full control, a collision is easily
avoided where there is space to move. In a mêlée, or pell-mell
battle, to employ Nelson's phrase, opportunities would occur for
the use of the ram. But the activity of science has developed
one weapon to counterbalance another. The torpedo has made
it very dangerous to keep a fleet in one line, and it cannot fire
torpedoes ahead, and when charging home
Torpedoed, at an opponent presenting his broadside would be liable
to be struck by one. The torpedo may be said therefore to have
excluded the pell-mell battle and the use of the ram except
on rare occasions. But then arose the question whether the
torpedo itself would not become the decisive weapon in naval
warfare. It is undoubtedly capable of producing a great effect
when its power can be fully exerted. A school arose, having
its most convinced partisans in France, which argued that, as a
small vessel could with a torpedo destroy a great battle-ship, the
first would drive the second off the sea. The battle-ship was
to give place to the torpedo-boat or torpedo-boat-destroyer which
was itself only a torpedo-boat of a larger growth. But the
torpedo is subject to close restrictions. It cannot be used with
effect at more than two thousand yards. It passes through a
resisting medium, which renders its course uncertain and
comparatively slow, so that a moving opponent can avoid it.
The vessel built to use it can be easily sunk by gun-fire. By
night the risk from gun-fire is less, but science has nullified
what she had done. The invention of the search-light has made
it possible to keep the waters round a ship under observation
all night. In the war between Russia and Japan the torpedo
was at first used with success, but the injury it produced fell
below expectations, even when allowance is made for the fact that
the Russian squadron at Port Arthur had the means of repair close
at hand. In the sea fights of the war it was of subordinate use,
and indeed was not employed except to give the final stroke to,
or force the surrender of, an already crippled ship. This war
(which and as much may be said for the war between the United States
and Spain) confirmed an old experience. A resolute attempt
can be made by the Americans to destroy the "modem"
phrase to "bottle-up") the entrance to Santiago de Cuba by
sinking a ship in it. The Japanese renewed the attempt on
a great scale, and with the utmost intrepidity, at Port Arthur;
but though a steamer can move with a speed and precision im-
possible to a sailing ship, and can therefore be sunk more surely
at a chosen spot, the experiment failed. Neither Americans
nor Japanese succeeded in preventing their enemy from coming
out when he wished to come.

Since neither ram nor torpedo has established the claim made
for them, the cannon remains "the heart of the battle-ship." It
may still deliver its blows at the greatest distance, and
in the greatest variety of circumstances. The change
has been in the method in which its power is applied. Now,
as in former times, the aim of a skillful officer is to concentrate
a superior force on a part of his opponent's formation. When
the range of effective fire was a thousand or twelve hundred
yards, and when guns could only be trained over a small segment
of a circle because they were fired out of ports, concentration
could only be effected by bringing a larger number of ships into
close action with a smaller one. To-day when gun-fire is effective even
at a thousand thousand yards, and when ships are fired from the main
barbettes have a far wider sweep, concentration can be effected
from a distance. The power to effect it must be sought by a
judicious choice of position. It is true that greater rapidity
and precision of fire produce concentration in one way. If of
two forces engaged one can bring forty guns to bear on a chosen
point of its opponent's formations, while that opponent can
bring fifty guns to bear on a part of it, the superiority
would seem to be with the larger number. But this is by no means
necessary to the case. The smaller number of guns may give
the greater number of blows if fired with greater speed and
accuracy. Yet no commander has a right to rely on such
a superiority as this till it has been demonstrated, as it had been
in the case of the British fleet by the time that Trafalgar was
fought. Therefore an able chief will always play for position.
He will do so all the more because an advantage of position adds
to any other which he may possess. He may dispense with it
for a particular reason at a given moment and in reliance on
other sources of strength, but he will not throw it away.

Position is to be secured the first condition to be thought
of. Torpedo or gun, the latter in another guise, cannot
be used in the same way. The word "line abreast" was
imposed on the sailing fleets by the peremptory order
"need for bringing, or at least retaining the power to
bring, all their broadsides into action. Experiments made during
manoeuvres by modern navies, together with the experience
gained in the war of 1904–05 in the Far East, have combined to
show that no material change has taken place in this respect.
It is still as necessary as ever that all the guns should be so placed
as to be capable of being brought to bear, and it is still a condition
imposed by the physical necessities of the case that this freedom
can only be obtained when ships follow one another in a line.
When in pursuit or flight, or when steaming on the look-out for
a still unseen enemy, a fleet may be arranged in the "line
abreast." A pursuing fleet would have to run the risk of being
struck by torpedoes dropped by a retreating enemy.
But it would have the advantage of being able to bring all its guns
which can fire ahead to bear on the rear-ship of the enemy.
When an opponent is prepared to give battle, and turns his broad-
side so as to bring the maximum of his gun-fire to bear, he
must be answered by a similar display of force—in other words,
the line ahead must be formed to meet the line ahead.

Both fleets being in this formation, how is the concentration
of a superior force to be effected? If the opponents are equal
in number, speed, armament, gunnery and the leadership of the
chefs, accident alone can confer an advantage on either of them. Where equal weights are tried on accurate scales one cannot force up the other, but this evenness of power is rarely met in war by land or sea. The knowledge that it existed would probably prevent an appeal to arms between nations, since no decisive result could be hoped for. It is needless to insist that superior numbers make the task of concentrating comparatively easy, unless counterbalanced by a great inferiority in speed. Speed is the quality which an admiral will wish his fleet to possess, in order that he may have the power to choose his point of attack. The swifter of two forces, otherwise equal, can always get ahead of its opponent, and then by turning inwards bring the leading ship of the force it is attacking into a curve of fire. The leader of the slower fleet can avoid the danger by also turning inwards. By so doing he will keep the assailant on his beam, opposite his side. Then the two fleets will tend to swing round in two circles having a common center, the added speed going round the outermost ring, and the slower round the inner. As the difference in length of these two lines would be always great and perhaps immense, the less speedy fleet could easily avoid the risk of being headed. On the other hand the outer fleet will be in a concave formation, and therefore able to bring all its guns to bear on the same point, while the inner fleet will be in a convex line, so that it will be unable to bring the guns of both van and rear to bear on the same mark. The advantage is obvious, but it may perhaps be easily exaggerated. The swifter fleet on the larger circle can in theory concentrate all its fire on one point, but all its ships would not be able to do it already going at its maximum rate, and the slower round the inner. In actual battle very much will depend on the respective skill of the gunners. The swifter ship would of course neutralise by the crippling of two or three of its leading ships. In such an action as this it would be, if not impossible, at least exceedingly difficult to give orders by signal. An admiral will therefore have to direct by example, which he cannot do except by placing his flag-ship at the head of the line. In that case he will be marked out as a target for the enemy's concentrated fire. He may indeed decide to direct the battle by signal from outside the line. Yet the difficulty he will find in seeing what is happening, as well as the difficulty the captains will find in seeing the signals, will always be so great, that in all probability the admirals of the future, will, like Nelson, be content to lay down the general principles on which the battle is to be fought, and trust the captains to apply them as circumstances arise. A large measure of independence must needs be allowed to the captains in the actual stress of battle. Ships must be placed at such a distance apart as will allow them room to manoeuvre so as to avoid collision with their own friends. The interval cannot be less than 800 yds. When the length of the vessels themselves is added, it will be seen that the battle will stretch six miles. Modern powder is nominally smokeless, and it certainly does not create the dense bank of smoke produced by the old explosives. Yet it does create a sufficient haze to obscure the view from the van to the rear of an extended line. The movements must be rapid, and there will be little time indeed in which to take decisions. The torpedo may not be used during the actual battle. Its part will be to complete the destruction or enforce the surrender of a beaten enemy, and to cover retreats.

The s-ecantine and submergible vessel were brought into prominence by France in the hope that by diminishing the value of battleships they would reduce the superiority of the British navy. The example of France was followed by other powers, and particularly by Great Britain; but their value as weapons of war is necessarily a matter of speculation.

BIBLIOGRAPHY.—Naval strategy can hardly be said to have been dealt with until the publication of Sir Charles Price's Manual of naval Power on History. The tactics of the ancient world are only very briefly dealt with in the De re Militari of Vegetius, in book iv. Vegetius was much copied and read in the middle ages, and was translated into French in 1584 by Jean de Moung, one of the authors of the Roman de la Rose. His translation is printed, together with the verse paraphrase of Priorats, in the Anciens Textes frangais. Naval tactics were dealt with by Jacques-Francois de Meurmis' Opera Omnia, vol. vi. They were emperors of the Maccononian dynasty. The tactics of the medieval galleys are described, with the advantages to be derived from both the galley and the galley-boat, Pontistica, and by Admiral Jurien de la Gravere in Les Derniers jours de la marine a rames (1885). The chief writers on the tactics of the sailing fleets were French. At the head of them, in time and in merit, must be put Paul Hoste, whose folio on Naval Evolutions appeared in 1607. Hoste was a Jesuit who was secretary to the Court of Tourville. Hoste's treatise was translated into English and published in Edinburgh in 1834 with numerous and excellent illustrations by Captain J. D. Boswell. A Treatise on Naval Tactics. Captain Boswell also made use of the passages relating to naval tactics in the History of the Art of War by J. G. Hoyer, an officer in the Prussian army, published 1805. Of particular note was the Manuver a de Bourde de Villeheut (1765), translated into English in 1788 under the title of The Manuverer, or Skilful Seaman. Particular attention is due to the Essay on Naval Tactics by Mr Clerk of the Naval Office, published for the society of arts (8vo). The work of the Frenchman, Vicomte de Meung, was Manuver de Bourde de Villeheut (1765), translated into English in 1788 under the title of The Manuverer, or Skilful Seaman. Particular attention is due to the Essay on Naval Tactics by Mr Clerk of the Naval Office, published for the society of arts (8vo). The work of the Frenchman, Vicomte de Meung, was Manuver de Bourde de Villeheut (1765), translated into English in 1788 under the title of The Manuverer, or Skilful Seaman. Particular attention is due to the Essay on Naval Tactics by Mr Clerk of the Naval Office, published for the society of arts (8vo).

NAWAB—NAWANAGAR

NAWAB, a Mahomedan title for a native ruler in India, answering to the Hindu raja. Nawab originally means a deputy, being the honorific plural of the Arabic naib, and it was applied to the representative of the Great Mogul, e.g., the nawab of Oudh. From this use it became a title of rank, without office, and is now sometimes conferred by the British government on Mahomedan gentlemen for distinguished service.

NAWABGANJ, the name of three towns of British India. (1) The most important is the headquarters of Bara Banki district in the United Provinces, on the Oudh and Rohilkund railway, 17 m. E. of Lucknow; pop. (1901) 14,478. It has a considerable trade in sugar and cotton goods. It was the scene of a victory by Sir Hope Grant during the Mutiny. (2) A town in Malda district, Eastern Bengal and Assam, on the Mahananda near its junction with the Ganges, a centre of river trade; pop. (1901) 17,016. (3) A town in Gonda district, United Provinces, on the Bengal and North-Western railway; pop. (1901) 7047.

NAWANAGAR, or JAMNAGAR, a native state of India, in Kathiawar, within the Gujarat division of Bombay, situated on the south of the Gulf of Cutch. Area, 3,791 sq. m. Pop. (1901) 356,779, showing a decrease of 11% in the decade due to famine. Estimated revenue, £710,000; tribute, £800. The title is that of Nawab. It was annexed by Sir B. L. Metcalfe as the rao of Cutch. Prince Ranjitsinhji (b. 1872), well known in England as a cricketer, was educated at the Rajkumar College,
Rajkot, and Trinity College, Cambridge. He had been adopted by his uncle, the Jam Shri Vihbajii, but the adoption was set aside, with British sanction, in favour of a son by a Mahomedan mother. This son succeeded, but died in 1906 aged twenty-four, and Ranjitsinjhi obtained the throne in March 1907. A branch railway, constructed at the expense of the state, was opened in 1898 from Rajkot to Nawanagar town.

The town of Nawanagar is about 5 m. from the seaport of Bedi. Pop. (1901) 53,844. Founded by Jam Rawal in 1540, it was built of stone and has manufactures of silk and gold embroidery, and perfumed oils and red powder for ceremonial purposes. Its water is supplied from a reservoir covering 600 acres and an aqueduct 8 m. long.

**Nawayi** [Abd Zakariyya bin Sharaf un-Nawayi] (1233-1278), Arabiwi writer, was born at Naway near Damascus. In the latter city he studied from his eighteenth year, and there, after making the pilgrimage in 1253, he settled as a private scholar until 1267, when he succeeded Abu Shams as professor of tradition at the Ashrafiyah school. He died at Naway from overwork.

His manual of Moslem law according to the Shar'iate school has been edited with French translation by van den Bergh, 2 vols., Batavia (1882-1884), and published at Cairo (1888). The *Takadhil al-Asma* has been edited as the *Biographical Dictionary of Illustrious Men of Egypt and the Maghrib*. It was published in 4 vols., translated into English by M. Marchand (Leipzig, 1847). The *Takrib wa Taisir*, an introduction to the study of tradition, was published at Cairo, 1890, with Suyuti's commentary. It has been in part translated into French by M. Marchand (Vienne, 1897). The *Journal asiatique*, series ix., vols. 16-18 (1909-1901). Nawayi's collection of the forty (actually forty-two) chief traditions has been frequently published with commentaries in Cairo. For other works see C. Brockelmann, *Geich der arabischen Literatur*, vol. ii. (Weimar, 1898), pp. 395-397.

**Naxos**, the largest of the Cyclades (about 22 m. by 16 m.), a fertile island in the Aegean Sea, east of Faros, with which, and adjacent smaller islands, it forms an *eparchia*. In ancient times it was also called Dia or Strongyle. It was rich in vines and famous for its wine, and a centre of the worship of Bacchus. The god found Ariadne asleep on its shore, when she was deserted by Theseus. The sculptors of Naxos formed an important school of early Greek art; several unfinished colossal statues are still to be seen in the quarries, notably one in Aplollonia Bay, to the N.E. of the island. A tyrant Lygdamis ruled Naxos in alliance with Peisistratus of Athens during the 6th century B.C. In 490 it was captured and treated with great severity. Four Naxian ships took part in the expedition of Xerxes, but deserted and fought on the Greek side at Salamis in 480. Naxos was a member of the Delian League (478); it revolted in 471, was captured by Athens, and remained in her possession till her empire was destroyed. In later times the most remarkable event was its capture, in A.D. 1297, by the Venetian Marco Sanudo, who founded the duchy of Naxos, which flourished till the Turks took the island in 1566. Since the War of Independence it has belonged to the Greek kingdom. The only ancient remains of any importance are those of a temple (Palatii), supposed to be that of Dionysus, on an island just off the town. Naxos is still rich in fruit trees, and also exports corn, wine and oil, as well as emery, its richest and most important mineral product. Pop. (1907) 23,185 (province), 2064 (commune).

**Naxos** the earliest Greek colony in Sicily, was founded by Thoecles from Chalcis in 735 B.C., on the E. coast, in Tauromenium (mod. Tarormina), in a low-lying situation just N. of the mouth of the river Alcantara, where the castle of Schio now stands. The adoption of the name of Naxos, the island in the Aegean Sea, seems to indicate that there were Naxians among its founders. Within a few years it became strong enough to found Leontini and Catana. Naxos was the warmest ally of Athens in the Sicilian expedition. In 403 B.C. it was destroyed by Dionysius and handed over to the Sicels, but was never reoccupied. Its place was supplied in 358 by Tauromenium. Scanty traces of its walls are to be seen, and irregular blocks of lava, especially on the south, parallel to the river (E. A. Freeman, *Hist. of Sic. i. 323*). Without the city stood the altar of Apollo Archegetes, at which all sacred embassies that left Sicily sacrificed before their departure (Thuc. vi. 3).

**Nay**, or Nevi, the long flute of the ancient Egyptians, held obliquely and played by directing the breath, as in the pipes of the syrinx, across the open end, which had no embouchure of any kind. Performers on the nay are represented on many of the frescoes which decorated the tombs at Thebes, their flutes reaching nearly to the ground while they are in the familiar half-kneeling posture. The acoustic principles involved in the nay are similar to those of the fipple-flute, and the narrowness of the bore in proportion to the length would facilitate the production of harmonics and so give the nay an extended compass. Victor Loret 1 has compiled a list of all the real pipes of ancient Egypt which have survived, having for the most part been preserved in mummy cases. The nay was not restricted to ancient Egypt, but has remained in general use in various parts of the East until the present day.

**Nayagarh**, a native state in India, in the Orissa division of Bengal. Area, 538 sq. m.; pop. (1901) 140,779; revenue, 1862, he joined the parliament as an officer, and remained in the same post till 1898), a revolt of the hill tribes of Kalinga against the raja required the intervention of British military police. Nayagarh village (pop. 3340) is connected by road with Khurda in Puri district.

**Nayar**, or Naik, a caste or tribe on the W. coast of S. India, who form the dominant race in Malabar. Traditionally they are soldiers, but many have taken to professions, and one was in 1810 a judge of the high court at Madras. Their total number in all India in 1901 was just over one million. Their most peculiar customs are: (1) marumakkal buwayam - a descent through sister's children, or the name of the female line; and (2) sanbandham, a loose form of union, taking the place of marriage, without any responsibility of the husband towards either wife or children. In 1866 an act of the Madras legislature enabled a sanbandham to be registered, and have the force of a legal marriage. Little advantage has been taken of this act, while it is alleged that the sanbandham now usually lasts for a lifetime.

See Malabar District Gazetteer (Madras, 1908).

**Nayler** (or Naylor), James (1618-1660), English Puritan, was born at Andersloe or Ardsley, in Yorkshire, in 1618. In 1622 he joined the parliament as a soldier, and served as quartermaster in John Lambert's horse. In 1637 he adopted Quakerism and gradually arrived at the conviction that he was a new incarnation of Christ. He gathered round him a small band of disciples, who followed him from place to place. At Appleby in 1653 and again at Exeter in 1655 he suffered terms of imprisonment. In October 1655, in imitation of Christ's procession into Jerusalem, he entered Bristol on horseback riding single—a rawboned nude figure, with lank hair reaching below his cheeks—attended by seven followers, some on horseback, some on foot, he in silence and they singing "Hosanna! Holy, holy! Lord God of Sabaoth!" At the High Cross he and his followers were arrested. His trial occupied the second parliament of Cromwell for several days, and on the 16th of December 1656 he was convicted of blasphemy and sentenced to be whipped from the Palace Yard to the Old Exchange, to be branded in the forehead with "B" (for blasphemer), to have his tongue bored with a red-hot iron, to be whipped through the streets of Bristol, and to suffer imprisonment with hard labour for two years. On his release he was readmitted into the communion of the Quakers, and spent some time in Westmorland with George Whitehead. In 1664 he published a long and obscure work set out to visit his long-forsaken family in Yorkshire, but died en route in Huntingdonshire.

A collected edition of the *Tracts* of Nayler appeared in 1716. See A Relation of the Life, Conversion, Examination, Confession, and Death of James Nayler, a Popular Preacher, in 1643, under the Title, *Trial, and Sufferings of James Nayler* (1710); and a Refutation of some of the more Modern Misrepresentations of the Society of Friends commonly called Quakers, with a Life of James Nayler, by Joseph Conyers Bevan (1800).

NAZARENES—NEAGH

NAZARENES (NAζαρεῖον), an obscure Jewish-Christian sect, existing at the time of Epiphanius (fl. A.D. 370) in Coele-Syria, Decapolis (Pella) and Basanitis (Cochae). According to that authority (Panarion, xxix. 7) they dated their settlement in Pella from the time of the flight of the Jewish Christians from Jerusalem, immediately before the siege in A.D. 70; he characterizes them as neither more nor less than Jews pure and simple, but adds that they recognized the new covenant as well as the old, and believed in the resurrection, and in the one God and His Son Jesus Christ. He cannot say whether their chirological views were identical with those of Cerinthus and his school, or whether they differed at all from his own. But Jerome (Ep. 79, to Augustine) says that they believed in Christ the Son of God, born of the Virgin Mary, who suffered under Pontius Pilate, and rose again, but adds that, "desiring to be both Jews and Christians, they are neither the one nor the other." They used the Anamalistic recension of the Gospel according to Matthew, which they called the Gospel to the Hebrews, but, while adhering as far as possible to the Mosaic economy as regards circumcision, sabbaths, foods and the like, they did not refuse to recognize the apostolicity of Paul or the rights of heathen Christians (Jer., Comm. in Isa., ix. 1). These facts, taken along with the name (cf. Acts xxiv. 5) and geographical position of the sect, lead to the conclusion that the Nazarenes of the 4th century are, in spite of Epiphanius's distinction, to be identified with the Ebionites (q.v.).

NAZARETH (mod. en-Naṣrā), a town in Galilee, in a hollow of hills on the southern border of the plain of Esdraelon. It first appears as a village (John i. 46) in which Joseph and Mary lived (Luke i. 26) and to which they returned from Egypt (Matt. ii. 23). Here the unrecorded years of Christ's boyhood were spent. From the name of the town comes naṣārā (i.e. "Nazarenes"), the ordinary Oriental word for "Christians." There was here a synagogue (Matt. xiii. 54) in which Christ preached the sermon that led to his rejection by his fellow towns- men. The growth of legends and traditional identifications can be traced in the writings of the pilgrims who have visited the town from Jerome's time till our own. For none of these can anything be said, save that it is probable that the village spring (called "St. Mary's Well") is the same as that used in the time of Christ. A large basilica stood here about A.D. 600: the crusaders transferred here the bishopric of Sycophylus. It was taken by Saladin in 1187. In 1517 it was captured by the Turks. The population is now estimated at about 3500 Moslems and 6500 Christians; there are numerous schools, hospitals, &c., conducted by Greeks, Latins and Protestants. Visitors are shown the "Church of the Annunciation" with caves (including a fragment of a pillar hanging from the ceiling, and said to be miraculously simple, which is described as the scene of the announcement, the "workshop of Joseph," the "synagogue," and a stone table, said to have been used by Christ.

NAZARITE, or rather Nazarite, the name given by the Hebrews to a peculiar kind of devotee. The characteristic marks of a Nazarite were unshorn locks and abstinence from wine (Judges xiii. 5; 1 Sam. i. 11; Amos ii. 11 seq.); but full regulations for the legal observance of the Nazarite vow are given in Num. vi., where every product of the grape-vine is forbidden, and the Nazarite is enjoined not to approach a dead body, even that of his nearest relative. The law in question is in its present form post-exilic, and is mainly directed to the regulation of a known usage. It contemplates the assumption of the vow for a limited period only, and gives particular details as to the atoning ceremonies at the sanctuary by which the vow must be recommenced if broken by accidental defilement, and the closing sacrifice, at which the Nazarite on the expiry of his vow cuts off his hair and burns it on the altar, thus returning to ordinary life. Among the later Jews the Nazarite vow, of course, corresponded with the legal ordinance, which was further developed by the scribes in their usual manner (Mishna, tractate Nazir). These are neither more nor less than Jews pure and simple, but...
streams, the river Bann alone carries off its waters, flowing northward. The principal feeders are the Main and the north, the Crumlin (whose waters have petrifying powers) on the east, the Bann and Blackwater on the south, and the Ballinderry and Moyola on the west. Antrim and Toome, at the N. E. and N.W. respectively, are the only towns immediately on the shores. The islands are few and near the shore; namely, Skiddy Island (with a castellated tower) on the coast, Ready and Coney Islands on the southwest. The loughs abound in fish, including gillaroo trout, char and pulleen or fresh-water herring. A tradition that the lough rose suddenly from a fountain, inundating a populous district, and that remains of buildings may be seen below the waters, finds place in "saps Moore's ballad Let Erin remember."

NEAL, DANIEL (1678-1743), English historian, born in London on the 14th of December 1678, was educated at the Merchant Taylors' School, and at the universities of Utrecht and Leiden. In 1704 he became assistant minister, and in 1706 sole minister, of an independent congregation worshipping in Aldersgate Street, and afterwards in Jewin Street, London, where he remained almost until his death on the 4th of April 1743. He married Elizabeth Lardner (d. 1748), by whom he had one son, Nathanael, and two daughters. In 1720 Neal published his History of New England, which obtained for its author the honorary degree of M.A. from Harvard college. He also undertook to assist Dr John Evans in writing a history of Nonconformity. For Evans he prepared a great many papers for the period before 1640. Neal wrote the whole of the work himself. This History of the Puritans deals with the time between the Reformation and 1689; the first volume appearing in 1732, and the fourth and last in 1738. The first volume was attacked in 1733 for unfairness and inaccuracy by Isaac Maddox, afterwards bishop of St Asaph and of Worcester, to whom Neal replied in a pamphlet, A Review of the principal facts objected to in the first volume of the History of the Puritans; and the remaining volumes by Zachary Grey (1688-1760), to whom the author made no reply.

The History of the Puritans was edited, in five volumes, by Dr Joshua Toulmin (1740-1815), who assisted a life of Neal in 1797. This was reprinted in 1822, and an edition in two volumes was published in New York in 1844.

NEAL, DAVID DALHOFF (1838— ), American artist, was born at Lowell, Massachusetts, on the 26th of October 1838. He was a pupil of the Royal Academy, Munich, under Max. E. Ainmiller, whose daughter he subsequently married. Later he entered the studio of Piloty, with whom he remained from 1860 to 1876. His picture, "The First Meeting of Mary Stuart and Rizzino," was accepted by the Gallery of the Royal Bavarian Academy of Art. Besides portraits his canvases include "James Watt," a large historical composition shown at the Royal Academy, 1874, "Chapel of the Kings at Westminster" (collection of F. Cutting, Boston) and "Cromwell visiting Milton" (Hurlbut collection, Cleveland, Ohio).

NEALE, EDWARD VANSITTART (1810-1892), English co-operator and Christian Socialist, was born at Bath on the 2nd of April 1810, the son of a Buckinghamshire clergyman. After receiving his earlier education at home he went to Oriel College, Oxford. In 1837 he was elected a fellow of the college. He became a member of the Christian Socialists in 1850 and also joined the council of the Society for Promoting Working Men's Associations. His wealth enabled him to carry out experiments in co-operation on a larger scale than had been previously attempted. He founded the first co-operative store in London, and advanced the capital for two builders' associations, both of which failed. In 1851, though strongly opposed by other members of the promoting "Council," he started on his own initiative the Central Co-operative Agency, similar in many respects to the Co-operative Wholesale Society of a later day. The failure of this scheme, together with that of the operatives' cause in the engineering lock-out of 1852 is said to have cost him £40,000. It is certain that until in later life he inherited the estate of Bishop Abbey in Berkshire he was, comparatively speaking, a poor man. He was closely associated with the movement which resulted in the Industrial and Provident Societies Act of 1876, and the passing of the Consolidation Act of 1882 was almost entirely due to his efforts. Besides publishing pamphlets on co-operation he served on the executive committee which afterwards developed into the Central Co-operative Board, and took an active part in the formation of the North of England Co-operative Wholesale Society in 1863. One of the founders of the Co-operative Wholesale Society in 1866, and the Agricultural and Horticultural Association in 1867, he also promoted the annual co-operative congress, afterwards becoming general secretary of the Central Board. He was also a director of the Co-operative Insurance Company and a member of the Co-operative Newspaper Society for many years. He visited America in 1875 with a deputation whose object was to open up a direct trade between the farmers of the western states and the English co-operative stores. After resigning the post of secretary to the congress board in 1891, he became a member of the Oxford University branch of the Christian Social Union. He died on the 16th of September 1892.

NEALE, JOHN MASON (1818-1886), English divine and scholar, was born in London on the 24th of January 1818, and was educated at Trinity College, Cambridge. Here he was affected by the Oxford movement, and helped to found the Camden (afterwards the Ecclesiological) Society. Though he took orders in 1841, ill-health prevented his settling in England and he went to America to receive a degree of D.D. at the Unitarian College at Philadelphia. There he died on the 12th of August 1886.

Neale was strongly high-church in his sympathies, and had to endure a good deal of opposition, including a fourteen years' inhibition by his bishop. In 1853 he founded a nursing sisterhood named St Margaret's. He occupies a high place as a hymnologist, but principally as a translator of ancient and medieval hymns, the best known being probably "Brief life is here our portion." "To thee, O dear, dear country," and "Jerusalem, the golden," which are included in the poems of Bernard of Clonfert, De Contemptu Mundi, translated by him in full. He also published An Introduction to the History of the Holy Eastern Church (1859, 2 vols.); History of the so-called Jansenist Church of Holland (1853); Essays on Liturgiology and Church History (1863); and many other works.

See Life by his daughter, Mrs Charles Toole (1907); the Memoir by his friend, R. F. Littlehead; and the Letters of John Mason Neale (1910), selected and edited by his daughter. For a complete list of Neale's works see article in Dict. Nat. Bio., xl. 145.

NEAMTZU (Neamț), town in Rumania, situated among the lower slopes of the Căpâlna Mountains, and on the left bank of the river Neamțu, an affluent of the Moldova. Pop. (1900) 8578, about half being Jews. Neamțu gives its name to the department of which Pîntea is the capital. Lying 15 m. S. by E. of Falticeni, the nearest railway station, it has little trade. Near it is the ruined fortress of Neamțu, constructed early in the 13th century by the Teutonic knights of Andrew II., king of Hungary, in order to repel the incursions of the Cumans. An hour's drive to the west of the town is the monastery of Neamțu, founded in the 14th century, and containing the tomb of Ioan, a warrior and a saint. Before the secularization of the monastic lands in 1864, it was one of the richest and most important of the Rumanian monasteries. Baltazateli, 10 m. W. by S. of Neamțu, is locally famous for its mineral springs and baths.

NEANDER, JOACHIM (1560-1680), German hymnwriter, was born at Bremen. The family name, originally Neumann, had, according to the prevailing fashion a century earlier, been Graecized as Neander. After studying at Heidelberg and Frankfort, where he formed friendships with Friedrich Spanheim (1652-1700) and Petäpp Jakob Spezer (1635-1703), he settled at Düsseldorf as rector of the Latin school in connexion with the Reformed Church. In 1676 he incurred church censure for abstaining and inducing others to abstain from joining in the celebration of the communion. It was during the term of
Neander, Johann August Wilhelm (1759-1850), German theologian and church historian, was born at Göttingen on the 17th of January 1759. His father, Emmanuel Mendel, is said to have been a Jewish pedlar, but August adopted the name of Neander on his baptism as a Christian. While still very young, he removed with his mother to Hamburg. There, as throughout life, the simplicity of his personal appearance and the oddity of his manners attracted notice, but still more, his great industry and mental power. From the grammar-school (Johanneum) he passed to the gymnasium, where the study of Plato appears especially to have engrossed him. Considerable interest attaches to his early companionship with Wilhelm Neumann and certain others, among whom were the writer Karl August Varnhagen von Ense and the poet Adelbert von Chamisso.

Baptized on the 29th of February 1806, in the same year Neander went to Halle to study divinity. Here Schleiermacher was then lecturing. Neander found in him the very impulse which he needed, while Schleiermacher found a pupil of thoroughly congenial feeling, and one destined to carry out his views in a higher and more effective Christian form than he himself was capable of imparting to them. But before the year had closed the events of the Franco-Prussian War compelled his removal to Göttingen. There he continued his studies with ardour, made himself yet more master of Plato and Plutarch, and became especially advanced in theology under the venerable G. J. Baur. The impulsive communicative character of Schleiermacher was confirmed by Planck, and he seems now to have realized that the original investigation of Christian history was to form the great work of his life.

Having finished his university course, he returned to Hamburg, and passed his examination for the Christian ministry. After an interval of about eighteen months, however, he definitely betook himself to an academic career, "habilitating" in Heidelberg, where two vacancies had occurred in the theological faculty of the university. He entered upon his work here as a theological teacher in 1811; and in 1812 he became a professor. In the same year (1812) he first appeared as an author by the publication of his monograph Über den Kaiser Julianus und sein Zeitalter. The fresh insight into the history of the church evinced by this work at once drew attention to its author, and even before he had terminated the first year of his academical labours at Heidelberg, he was called to Berlin, where he was appointed professor of theology.

In the year following his appointment he published a second monograph Der Heilige Bernhard und sein Zeitalter (Berlin, 1813), and then in 1818 his work on Gnosticism (Genetische Entwicklung der spätesten christlichen Gnostischen Systeme). A still more extended and elaborated monograph than either of the preceding followed in 1822, Der Heilige Johannes Chrysostomus und die Kirche, besonders des Orients in dessen Zeitalter, and again, in 1824, another on Tertullian (Antignostikus). He had in the meantime, however, begun his great work, to which these several efforts were only preparatory studies. The first volume of his Allgemeine Geschichte der christlichen Religion und Kirche embracing the history of the first three centuries, made its appearance in 1825. The others followed at intervals—the fifth, which appeared in 1839, bringing down the narrative to the pontificate of Boniface VIII. Aanthropological volume, edited by C. F. T. Schneider in 1852, carried it on to the period of the council of Basel. Besides this great work he published in 1832 his Geschichte der Pflanzung und Leitung der christlichen Kirche, and in 1837 his Das Leben Jesu Christi, in seinem geschichtlichen Zusammenhang und seiner geschichtlichen Entwickelung, called forth by the famous Life of David Strauss. In addition to all these he published Denkwürdigkeiten aus der geschichtlichen Erinnerung an die Christiane Religion (1816, 1820, 1824, 1846); Das Eine und Mannigfaltige des christlichen Lebens (1849); papers on Plotinus, Thomas Aquinas, Theobald Thamer, Blaise Pascal, J. H. Newman, Blanco White and T. Arnold, and other occasional pieces (Kleine Gelegenheitsschriften, 1829), mainly of a practical, exegetical and historical character. He died on the 14th of July 1850, worn out and nearly blind with incessant study. After his death a succession of volumes, representing his various courses of lectures, appeared (1856-1864), in addition to the Lectures on the History of Dogma (Theologische Vorlesungen), admirable in spirit and execution, which were edited by J. L. Jacoby in 1857.

Neander's theological position can only be explained in connexion with Schleiermacher's, and the manner in which he adopted and modified and carried out the principles of his master. Characteristically meditative, he rested with a secure footing on the great central truths of Christianity, and recognized strongly their essential bearing on life and history. In these he claimed the claims of philosophy; he was not less strongly asserted the rights of Christian feeling. "Without it," he emphatically says, "there can be no theology; it can only thrive in the necessity of a system; and the historian must explain his favourite motto: "Pectus est quod theologiam facit."" His Church History (Allgemeine Geschichte der christlichen Religion und Kirche) remains the greatest monument of his genius. In this he was chief among the writers of his time, and has made the individual in history. In the principal figures of ecclesiastical history he tried to depict the representative tendencies of each age, and also the types of the essential tendencies of human nature generally. His guiding principle in treating both of the history and of the present condition of the church was—that Christianity has room for the various tendencies of human nature, and aims at perpetuating and glorifying them. He showed that these various tendencies are to occur successively and simultaneously and to counterbalance each other, so that the freedom and variety of the development of the spiritual life ought not to be forced into a single dogmatic form ("E. Pflüger, Development of Theology, p. 280"). Several of his books have passed into new and revised editions and have been translated into English. Among these English versions may be mentioned General History of the Christian Religion and Church, by J. J. Torrey (1830-1836); History of the Planting and Training of the Church by the Apostle, by J. E. Ryland (1851); Julian and his Generation, by G. V. Cox (1850); Life of Jesus, by J. M'Clnstock and C. E. Blumenthal (1838); and the History of the Church in its General Memorial of the Christian Church during the Early and Middle Ages, by J. E. Ryland (1852).

See O. C. Kraube, August Neander (1881) and a paper by C. F. Krumeich in Studi e Ricerche storiche di j. L. Spina erinnerungen an August Neander (1882); Philipp Schaff, Erinnerungen an Neander (1886); Adolph Harnack, Rede and August Neander (1895); J. Weigand, Geschichte der Bekenntnisse (1886); W. Neander (1890); and K. T. Schneider, August Neander (1894). Cf. Herzog-Hauck, Realencyklopädie, and P. Schaff, Germany: its Universities and Theology (1852).

Neandertal, a ravine near the village of Hochdall between Düsseldorf and Elberfeld, Renish Prussia. Here in 1856 were discovered in a Quaternary bed in the Feldhohnen Cave human remains which have been referred to a type commonly called Neandertal Man. The bones found were a brain-cap, two femora, two humeri and other fragments, now in the Fuhlrott Collection, Elberfeld. The cranium, pronounced by Huxley to be the most ape-like yet discovered, was remarkable for its enormous superciliary ridges. Professor Virchow and others contended that the remarkable shape was pathological or caused by disease during the lifetime of the individual. The subsequent discovery of two other skulls, almost identical in form, at Spy in Belgium, has helped to prove its typical character. The now generally accepted view is that the Neandertal skull represents the oldest known dolichocephalic race of Europe.

Nep, a word only used of tides in which the high-water mark is at its lowest, there being the least difference in level between high and low water (tides); or, that are "springing" (See Tide). From Greek neptos, and only once alone in the expression fortganges nept, "without power of advancing." It may possibly be connected with "nip," in the sense of "pinched," "scanty."
NEARCHUS, one of the officers in the army of Alexander the Great. A native of Crete, he settled at Amphipolis in Macedonia. In 325, when Alexander descended the Indus to the sea, he ordered Nearchus to conduct the fleet to the head of the Persian Gulf. The success with which Nearchus accomplished this arduous enterprise led to his selection by Alexander for the more difficult task of circumnavigating Arabia from the mouth of the Euphrates to the Isthmus of Suez. But this project was cut short by a storm, in a length of voyage of 301 days and 11 nights. On that followed Nearchus attached himself to Antigonus, under whom he held the government of his old provinces of Lycia and Pamphylia, and probably therefore shared in the downfall (301) of that monarch.

He wrote a detailed narrative of his expedition, of which a full abstract was embodied by Arrian in his *Indica*—one of the most interesting geographical treatises of antiquity.

NEATH (Welsh, *Casll-Nedd*), a municipal and contributory parliamentary borough, seaport and market-town of Glamorgan-shire, south Wales, pretty situated near the mouth of the Neath or Nedd, on the Great Western and the Rhondda and Swansea Bay railways, 73 m. N.E. of Swansea, and 138 m. by rail from London, via Badminton. The main line of the Neath and the Brecon railway has a terminus in the town. Pop. (1901) 13,720. The principal buildings are the parish church of St Thomas (restored 1874), the church of St David (1866), a Roman Catholic church, and Baptist, Calvinistic, Methodist, Congregational and Wesleyan chapels; the intermediate and technical schools (1895), Davies's endowed (elementary) school (1786), the Gwyn Hall (1883), the town hall, with corn exchange in the basement storey, and the market-house. According to tradition Iestyn-ap-Gwrgan, the last prince of Glamorgan, had a residence somewhere near the present town, but Fibaer, son of his successor, of Glamorgan, gave the district between the Neath and the Tawe to Richard de Granville (ancestor of the Granvilles, marquesses of Bath), who built on the west banks of the Neath first a castle and then in 1129 a Cistercian abbey, to whose monks he later gave all his possessions in the district. All traces of this castle have disappeared. Another castle, built in the same century, on the east bank, was held direct by the lords of Glamorgan, as the westernmost outpost of their lordship. It was frequently attacked by the Welsh, notably in 1231 when it was taken, and the town demolished by Llewelyn ab Iorwerth. The portcullis gate and a tower are all that remain of it; of the abbey which was at one time the finest in Wales, there still exist the external walls, with parts of the chapel, vaulted chapter-house, refectory and abbot's house. This abbey was the spot where Edward II. found shelter after his escape from Caerphilly. At the dissolution the abbey and the manor of Cadocstown (part of its possessions) were sold to Sir Richard Williams or Cromwell. Its cartulary has been lost. Copper smelting has been carried on in or near the town since 1384 when the Mines Royal Society set up works at Neath Abbey; the industry attained huge proportions a century later under Sir Humphrey Mackworth, who from 1695 carried on copper and lead smelting at Melincrhydan. Besides its copper works the town at present possesses extensive tinplate, steel and galvanized sheet works as well as iron and brass foundries, steam-engine factories, brick and tile works, engineering works, flannel factories and chemical works. In the neighbourhood there are numerous large collieries, and coal is shipped from wharves on the riverside, vessels of 300 or 600 tons being able to reach the quays at high tide. The Neath Canal, from the upper part of the Vale of Neath to Britton Ferry (13 m.) passes through the town, which is also connected with Swansea by another canal. There is a large export trade in coal, copper, iron and tin, mostly shipped from neighbouring ports, while the principal imports are timber and general merchandise. Neath is included in the Swansea parliamentary district of boroughs.

The town perhaps occupies the site of the ancient Nidus or Nidum of the Romans on the Julia Martima from which a vicinal road branched off here for Brecon. No traces of Roman antiquities, however, have been found. Neath is a borough by ancient charter, 7th March 1247, and a town of 12th century from William, earl of Gloucester, who granted its burgesses the same customs as those of Cardiff. Other charters were granted to it by successive lords of Glamorgan in 1290, 1340, 1359, 1397, 1421 and 1473. By the first of these (1290) the town was granted a fair on St Margaret's Day (July 22) and as the abbey had extensive sheep walks the trade in wool was considerable. In 1685 James II. granted a charter, which, however, was not acted upon except for a short time.

NEBO, or *Nabu* ("the proclaimer"), the name of one of the chief gods of the Babylonian pantheon, the main sect of whose worship was at Borsippa—opposite the city of Babylon. It is due to the close association of Borsippa with Babylon after the period when Babylon became the centre of the Babylonian empire that the cult of Nebo retained a prominence only some degrees less than that of Marduk. The amicable relationship between the two was expressed by making Nebo the son of Marduk. In this case the expression of the relationship in this form was intended to symbolize the superiority of Marduk, different, therefore, from the view involved in making Marduk the son of Ea (see above), which meant that the prerogatives of Ea were transferred to Marduk by the priests of Babylon, in the midst of the 12th century from William, earl of Gloucester, who granted its burgesses the same customs as those of Cardiff. Other charters were granted to it by successive lords of Glamorgan in 1290, 1340, 1359, 1397, 1421 and 1473. By the first of these (1290) the town was granted a fair on St Margaret's Day (July 22) and as the abbey had extensive sheep walks the trade in wool was considerable. In 1685 James II. granted a charter, which, however, was not acted upon except for a short time.

Borsippa became in the course of time so completely a mere adjunct to Babylon that one might fairly have expected the Nebo cult to have been entirely absorbed by that of Marduk. Since that did not happen, the legitimate inference is that other deterrent factors were at play. One of these factors was the position that Nebo had acquired as the "god of wisdom" to whom more particularly the introduction of writing was ascribed. He takes his place, therefore, by the side of Ea as a cultural deity. The wisdom associated with him had largely to do with the interpretation of the movements in the heavens, and the priests of Nebo, at an early age, must have acquired widespread fame as astrologers. Assuming now, for which there is a reasonable amount of confirmatory evidence, that the priestly school of Nebo had acquired a commanding position before Babylon rose to political importance we can understand why the worshippers of Marduk persisted in paying homage to Nebo, and found a means of doing so without lowering the dignity and standing of their own god. If Assur-bani-pal, the king of Assyria (668-626 B.C.), in the subscriptions to the copies of the Babylonian literary tablets invokes as he invariably does Nebo and his consort Tashmît as the gods of writing to whom all wisdom is traced, it is fair to assume that in so doing he was following ancient tradition and that the priests of Marduk likewise were dependent upon the school at Borsippa for their knowledge and wisdom.

Nebo is therefore an older god than Marduk in the sense that his specific prerogative as the god of wisdom was too firmly recognized when Marduk became the head of the Babylonian pantheon to be set aside.

The temple school at Borsippa continued to flourish until the end of the neo-Babylonian empire, and school texts of various contents, dated in the reigns of Artaxerxes, Cambyses and Darius, furnish the evidence that the school survived even the conquest of Babylonia by Cyrus (538 B.C.). The original character of Nebo can no longer be determined with any degree of definiteness. He may have been a solar deity, but there are also decided indications which point to his being a water-deity—like Ea. It may be, therefore, that if he shows the traits of a solar deity, this may be due to the influence of the neighbouring Marduk cult, just as in return Marduk takes on attributes that belong to the city of Babylon. Thus, as the god of writing, Nebo has charge of the tables of fate on which he inscribes the names
of men and decides what their lot is to be. If in the systematized religious system, Marduk appears as the arbiter of human fates, the conclusion is warranted that Marduk is here imbued with the authority which originally was in the hands of his son. A reconciliation between the rival claims was effected by continuing Nebo in the rôle of scribe, but as writing at the dictation of the gods, thus recording what the divine assembly, gathered in the "chamber of fates" (known as Ushb Khinakku) within the precincts of E-Saggila, Marduk's temple at Babylon—under the presidency of Marduk, had decided.

Nebo also does homage to his father by paying him an annual visit during the New Year celebration, when the god was solemnly carried across to Babylon, and in return Marduk accompanied his son part way back to his shrine at Borsippa. Within E-Saggila, Nebo had a sanctuary known, as was his chief temple at Borsippa, as E-Zida, "the legitimate (or 'firm') house," and the close bond existing between father and son was emphasized by providing for Marduk within the precinct of E-Zida, a sanctuary which bore the same name, E-Saggila, "the lofty house," as Marduk's temple at Babylon. The kings, and more particularly those of the neo-Babylonian dynasty, devote themselves assiduously to the worship and embellishment of both E-Saggila and E-Zida. In their inscriptions Marduk and Nebo are invoked together and the names of the two temples constantly placed side by side. The symbols of the two gods are similarly combined. On boundary stones and cylinders, when Marduk's symbol—the lance—is depicted, Nebo's symbol—the stylus—is generally found adjacent. The dragon, though of right belonging to Marduk (q.v.), as the conqueror of Tiamat, also becomes the attribute of Nebo, and similarly in other respects the two forms a close partnership. Such is the relation between the two that occasionally, as in the official reports of astrologers and in official letters, Nebo is even mentioned before Marduk without fear of thereby offending the pride of the priests of Marduk.

In Assyria the Nebo cult likewise enjoyed great popularity, and there is a record of one Assyrian ruler who made Nebo his specific deity and called upon his subjects to put their whole trust in him. One may discern, indeed, a tendency in Assyria to take advantage of the almost equal plane on which Nebo stands with Marduk in Babylonia, to play off Nebo as it were against Marduk. The Assyrian king, in this way by glorifying at times Nebo at the expense of Marduk, paid their debt of homage to the south without any risk of lowering the grade of their own chief deity Assur. Marduk was in a measure Assur's rival. This was not the case, however, with Nebo, and they accordingly showed a desire to regard Nebo rather than Marduk as the characteristic representative of the southern pantheon. In the astral-theological system Nebo was identified with the planet Mercury. His consort, known as Tashmit, plays no independent part, and is rarely invoked except in connexion with Nebo.

See also BABYLON, BORSIPPAA BABYLONIAN AND ASSYRIAN RELIGION.

NEBRASKA, a state just N. of the centre of the U.S.A., lying approximately between 40° and 43° N. and between 100° and 108° W., and 25° W. from Washington. It is bounded on the N. by South Dakota, on the E. by Iowa and a corner of Missouri, on the S. by Kansas, on the S. and W. by a corner of Colorado, and on the W. by Wyoming. The Missouri river extends along the eastern half of the north-eastern border. The extreme length of the state is about 430 m., and extreme breadth about 210 m. The area is 77,520 sq. m., of which 712 are water-surface.

Physical Features.—The state lies partly in the physiographic province of the Great Plains (covering more than four-fifths of its area) and partly in that of the Prairie Plains, and slopes gently from the eastern highland to the western lowland. The principal watercourses are as follows: Rulo, in the S.E. corner of the state, 842 ft.; Dakota city, in the N.E., 1102 ft.; Benkelman, in the S.W. in Dundy county, 2056 ft.; Kimball, in the N.W. in Kimball county, 4697 ft.; Harrison, in the N.W. corner, 4590 ft. There are three physiographic sub-divisions: the foot-hills (and Bad Lands), the sand-hills and the plains. Each of these three forms a portion of the three corresponding regions of the Great Plains.

The western portion of the state lies in the foot-hills of the Rocky Mountain system, and is much rougher than western Nebraska. The surface of western Nebraska is characterized by high, barren table-lands, broken by canyons, dotted with buttes, and dominated by some bold and lofty ridges. Pine Ridge, a picturesque escarpment of the Great Plains, cuts across the N.W. corner of Nebraska from the South Dakota and South Dakota counties to the Platte river, precipitous, marked by buttes and deeply cut in places by canyons, is the most striking surface feature of the state. The altitude in this region varies from 3500 ft. to 5000 ft. In the fork of the North and South Platte rivers, the Wild Cat Mountains rise to 5300 ft., in wild White Cat Mountain, long reported as the highest point in the state, attains 5038 ft., Hogback Mountain 5002 ft., and Big Butte, in northeastern Platte county, 5022 ft. The Carlsbad and Green River basins rise to 5500 ft. in the extreme N.W. in the White river and Flat Creek have carved canyons in deep lacustrine deposits, creating huge mesas and buttes of sandstone and gneiss, and highly precipitous, and baked by the sun. The buttes—bary, pyramidal or conical, flat-topped, precipitous hills, and often fantastic, towering rather than grand in their isolation—are never more than 600 to 1000 ft. above the surrounding country. Nature is not grand in any part of Nebraska, but the Bad Lands are imposing, and in the wooded foot-hills there is an abundance of bold and attractive scenery, particularly in Sioux county, and in Cherry county around Valentine and on the canyon of the Snake river. East of the Bad Lands is the sand-hill region, which includes a area of possibly 20,000 sq. m. The sand-hills proper are a portion of the Great Plains, and are marked by the occurrence of prairie fires and the increase of settlement, they have become well grazed over and stable; although sand-draws, and even occasional low-outflows scoured by the winds in the summits or sides of the hills are still characteristic of the prairie. The sand-hills and sand-hill and sand-region are the prairies, which include three-fourths of the state. They are sometimes characteristically flat over wide areas, and are usually gently rolling. The sand-hills form the base of the high plains and the sand-hills are the conspicuous modifying feature of the prairie region; but in general, owing to the gentle slope of the streams and the great breadth of the plains, erosion has been slight; and indeed the streams have broaded their channels and the valleys are deep and narrow. The water-partings are characteristically level uplands, often with shallow depressions, once lakes, and some of them are dotted with shallow lakes of various extent. The valley floor of the North Platte in the foot-hills, the flood-plain of an older river, is in places 700 ft. or more below the bounding tableland, and 10 to 15 m. wide; the present flood-plain being from 1 to 4 m. in width. Hundreds of small tributaries to the greater streams (especially along the Republican and the Logan) complicate and beautify the landscape. No farming country is richer in quiet and diversified scenic charm than the prairies of the eastern half of the state. The Missouri river has long been the fittest boundary which border it almost continuously on at least one side. In the foot-hills there are typical canyons, as along the Platte forks, and in the south part of the state. One of the most striking forms are large, the largest, those of the Bad Lands are the most peculiar; and the Niobrara tributary system is the most developed.

Rivers.—The Missouri skirts the eastern border for perhaps 500 m. It is not navigated, and save at Sioux City and Omaha serves practically no economic purposes, irrigation being unnecessary in the counties on which it borders. Its bluffs, cut for the most part in the loess but at places in the rock, are frequently from 200 to 200 ft. At Vermilion, South Dakota, its alluvial plain, 1131 ft. above the sea, is 330 ft. above the mouth of the Nemaha. The current is always rapid and heavily loaded with sediment, and its axis is shifting constantly. The Missouri, which drains a large area, and from which the Platte river is derived, is deeply incised, and which border it almost continuously on at least one side. In the foot-hills there are typical canyons, as along the Platte forks, and in the south part of the state. One of the most striking forms are large, the largest, those of the Bad Lands are the most peculiar; and the Niobrara tributary system is the most developed.

1 About 62 grains per gallon at low water, 404 at high.
2 The North Platte falls 3700 ft. in 510 m, the South, 7200 ft. in 427 m, above their junction; the latter falling 2602 ft. in 308 m, after leaving its canyon in the Rockies.
surface flow in volume. The Loup system is remarkable for the even drift, and somewhat sandy, which, however, is buried, until the latter banked up its deposits across the mouths of their more sluggish currents. The Republican and South Platte—the former an intermittent system—suffer in their flow from the drain made upon the Colorado. The westward current of the Niobrara above the Keya Paha is in a narrow gorge. Its immediate bluffs and the shores of some of its tributaries, notably the west bank of the Niobrara, are laid bare by cutting away the top clays and some sandy deposit from among Nebraska streams for a number of pretty water-falls. The White river, heading on Pine Ridge, falls 1100 ft. in 20 m. Some streams wholly dry up in the dry seasons, and in the foot-hills and sand-hills, the scanty surface drainage is an important force with the basis of the valleys. The 324 Underground Water.—Swamps and bogs, apart from purely temporary pondage, are confined to a few restricted regions of the Missouri river bottoms and the central part. There the water-table, if cupped or hollowed along the Missouri, and many lakes originate such as are scattered along the Platte, Elkhorn, Big Blue and other rivers. Scores of lakes are scattered about the heads of streams rising in the N.E. to the Colorado river. Some of these lakes are fresh and some alkaline. Springs also are numerous in the sandhills, where they form considerable streams. They often flow with force and are known locally from this peculiarity as artesian springs, or sometimes, from this and their large size, as "mound" springs. The state fish-hatchery is on springs at South Bend; at Long Pine springs of large flow supply the town and railway shops with water for the telegraph wires. Establishments at Chadron, South Dakota, have similar works; and at San Jose, in the Indiana hills, drinking water is available in many parts of the state. At Niobrara, in Knox county, a well 665 ft. deep, drilled in 1896, yielded for a time 2500 gallons per minute at 95-lb pressure (in 1903 1900 gallons at 65 lb.) The Uralla, also near the Missouri, has 383,916, and 54,227 of sand and gravel. The state, however, is particularly rich in good clays, which are probably its greatest mineral resource. Caleite of excellent quality is the commonest mineral. Gravel is of value in most parts, and sand is found in inexhaustible quantities, and is an important article of export. Flint (valuable for railway ballast) occurs in immense quantities in the N.E. regions. The磷酸盐-enriched sands are now promised on the 383,916 of good clays, which are industrially good, where otherwise of excellent quality, and are needed for the production of many of the building stones limestones are the most abundant and important, the best comes from the Benton beds and when "green" can be sawn into blocks. The Dakota formation, though of especial value to industry, are in general coarse or otherwise inferior, yields some of splendid quality. Its clays, which are of all colours, are the most valuable of the state. The finest building stone is a beautiful green quartzite rock of dense, fine texture and lasting quality. It is related to the Ogallala beds and occurs only in small areas. The quarries and clay pits of the state are mainly in the Carboniferous region of the S.E. In the Sand Hills region of the N.E., and peat more widely. The Carboniferous formations carry peat, a commercial coal, never thicker than about 2 ft., and rarely ready available, and they can never be of more small and merely local importance.

Minerals.—Mineral resources are decidedly limited; the total value of the mineral output (excluding coal) in 1907 was $1,383,916, of which $1,352,916 was in coal, 3,724,000 lbs. of salt, and $54,227 of sand and gravel. The state, however, is particularly rich in good clays, which are probably its greatest mineral resource. Caleite of excellent quality is the commonest mineral. Gravel is of value in most parts, and sand is found in inexhaustible quantities, and is an important article of export. Flint (valuable for railway ballast) occurs in immense quantities in the N.E. regions. The phosphate-enriched sands are now promised on the 383,916 of good clays, which are industrially good, where otherwise of excellent quality, and are needed for the production of many of the building stones limestones are the most abundant and important, the best comes from the Benton beds and when "green" can be sawn into blocks. The Dakota formation, though of especial value to industry, are in general coarse or otherwise inferior, yields some of splendid quality. Its clays, which are of all colours, are the most valuable of the state. The finest building stone is a beautiful green quartzite rock of dense, fine texture and lasting quality. It is related to the Ogallala beds and occurs only in small areas. The quarries and clay pits of the state are mainly in the Carboniferous region of the S.E. In the Sand Hills region of the N.E., and peat more widely. The Carboniferous formations carry peat, a commercial coal, never thicker than about 2 ft., and rarely ready available, and they can never be of more small and merely local importance.

Flora. Nebraska lies partly in the arid, or Upper Sonoran, and partly in the humid, or Carolinian, area of the Upper Austral lifezone; the climatic and climatic divisions being placed by the United States Biological Survey in the last-named region. The flora of Nebraska is characterized by its goodly representation of coniferous species to be found in most parts of the Middle West. Native coniferous species include nine pine species (the most important being the juniper), and nine fir or spruce species. The prairies of Nebraska, especially in the S.E. and farther east, are "profoundly" (C. E. Bessey) of the vegetation of the state. There are at least 64 trees and at least 77 shrubs growing native in the state; but of their joint number a considerable number are very rare, and have never been systematically described. The larger trees include the pinons, and the hickory and walnut woods of broad-leaf trees (and red cedars) grow very generally along all the water-courses of the state; and coniferous species grow along the Sandhills and the Wild Cat Mountains, are largely represented in the Sandhills and the Wild Cat Mountains, are largely represented. The barberry, the honeysuckle, the Russian olive, and the Russian mulberry are found in the Sandhills and the Wild Cat Mountains, are largely represented. The prairie dog is a common and widespread species, being one of the best-known groups of the state. There are at least 64 trees and at least 77 shrubs growing native in the state; but of their joint number a considerable number are very rare, and have never been systematically described. The larger trees include the pinons, and the hickory and walnut woods of broad-leaf trees (and red cedars) grow very generally along all the water-courses of the state; and coniferous species grow along the Sandhills and the Wild Cat Mountains, are largely represented in the Sandhills and the Wild Cat Mountains, are largely represented. The barberry, the honeysuckle, the Russian olive, and the Russian mulberry are found in the Sandhills and the Wild Cat Mountains, are largely represented.
wreath, dry of its moisture and so hot that in a day or two it shrivels and turns the crops to ash. Such summers are uncommon, and the belief that Nebraska is often visited by tornadoes is erroneous.

The mean annual temperature of the state is about 48° F, and the normals for the six approximately equal weather sections into which the state is divided by the National Weather Service are respectively about 48°, 50°-52°, 48°-50°, 47°-49°, and 46°-48° F. This is not as uniform as that of the Prairie States. The state is large enough to have a considerable variation in the average temperatures, especially in the central and northeastern districts. But there is a considerable difference in the averages for different months—the normal means of January and July through 30 years being 20° and 74° F, and the means of spring, summer, autumn and winter more or less 72°, 83°, 70°, and 22° F respectively. But for any particular locality a wide range in absolute temperature through the year, which averages for the state probably about 120° F, is not uncommon. Sometimes the temperatures are very high in the higher altitudes, where the nights are almost invariably cool and refreshing after even the hottest day. The number of continuous days with a mean temperature above 90° F, averages probably not more than 15. The length of the snow-fall season is, however, not so great. Temperature is of course lower as one moves to the N. and N.W., the initial planting and harvesting of each crop progressing wave-like across the state in from one to two weeks. Especially in the W. and N.W. there are in some winters occasional anti-cyclical or high-pressure storms known as blizzards—wind-storms preceded or accompanied by snow-fall—which are very severe. These storms are usually accompanied by very low temperature. They are the cause of great loss to the cattle owners. Such storms are, however, rare. In the S.E. portion of the state the winters are characteristically mild and open. The winters are most severe in the southeastern part of the state and the same may be said of temperatures above 95° in summer.

The normal mean annual precipitation for the whole state is about 23". The rainfall and snowfall of the actual yearly fall varying through years between 13-30 and 35-65. The rainfall in Nebraska does not seem inadequate for an agricultural country: moreover, the eastern half of the state is more favored than the western, which becomes, indeed, to the semi-arid Great Plains on which Nebraska belongs. The Service of the United States Government is active. But aridity is a matter of the efficiency rather than of the mere quantity of rainfall, and in this regard Nebraska is very fortunately situated. Rain in Nebraska is the critical moment—a characteristic of the state. Some centimeters of all precipitation falls in the growing season, giving the state, especially in the east, a greater amount at this time than many other states, whose aggregate yearly rainfall is greater; so that Nebraska has not abundance for the safest cultivation. Moreover, nine-tenths of the rainfall is absorbed by the loess and sandy soils, only one-tenth being "run-off." It is a widely spread but unfounded belief in Nebraska that the rainfall has been increasing since the settlement of the state. That its storage has very greatly increased as cultivation has been extended (the prairie sod sheds water like a roof) is true; moreover, the spread of scientific principles of farming has increased the advantages derived from the rainfall. This has increased rainfall has thus been greatly increased. Intermittent streamlets may well become perennial, and many are probably, as reported, in the process of returning to the streams. These may affect the seasonal distribution of precipitation; and that an advantageous alteration has in fact resulted is believed by many.

The climate of Nebraska is exceptionally healthy. Its beneficial qualities are the state's year-round growing season and pure air, constant winds and splendid drainage, to which its even slope and peculiar soil alike contribute. In some people, however, frost-hardiness is indulged. The sandhills, in particular, often have this effect. Autumn is perhaps the finest season; the fields are green into the winter, the air is pure and fresh, though dry and warm, and the long season is delightfully mild and beautiful. The arid climate, as compared with the eastern portion, of the state has alike the advantages and disadvantages of a climate more sharply characterized.

Soil.—Geologically Nebraska is one of the most typical agricultural states of the Union; although in the present distribution of interests agriculture is by no means so predominant as in some southern states. The basis of the soils is sands (coarse, fine or silt); clay beds, though economically important, are in quantity relatively scant. In the eastern half silt, and in the western fine sand, form the bulk of the soil. There are five well-defined soil regions corresponding to the geologic-topographic divisions already indicated of drift areas: 1. Beach or sand; 2. Glacial or moraine; 3. Fluvial or river; 4. Sandy loam with a large percentage of sand or silt, and considerable calcareous matter, and usually a small amount of clay. It contains considerable humic matter, discoloring rapidly in the air (when exposed to the air). The local term for it is "brown," and it is rich in fertility, and its great depth (in Lincoln and Dawson counties bluffs 200 ft. thick are found) is a guarantee of almost inextinguishable reserve. The sand is useful directly from its being of small amount (rare boulders, and some gravel). The superficial soil over most of the state, and everywhere in the E. except rarely where the loess or drift is bare, is a rich, black vegetable mould, 1 or 2 ft. thick, on the gray sandy drift. The loess and drift are not firm fertile; the soil never bakes, is always receptive of moisture,

"
"
gumbo soil; they are due to the Pierre shale, are poorly drained
and characteristically alkaline. Small alkaline areas also occur about
lakes in the sand-hills. Where surface water is adequate the regions
of the Pierre shale make splendid grazing lands; but in general they
are not very useful for agriculture. Salt lands occur about Salt Creek
notably around Lincoln. The stream bottoms of alluvium are modified by loess and humic deposits, and are of course very fertile;
but hardly more so than the loess of the uplands.
Agriculture is not only the chief industry but is
Agriculture.
also the foundation of the commerce and manufactures of the state.
In 1900, of the total area 60-8% was reported as included in farms,
and 37-5% as actually improved. The rank of the state in the
Union was I3th in value of farm property, and loth in value of farm
products. The farm value was $747,950,057, an increase since 1890
an
of 46-1%; while the total product-value was $162,696,386
in the same period. A greater
increase (partly factitious) of 143-4
part of the state was reported improved in 1890 than in 1900; the
change was due to the increase of stock-raising in the West. Simifrom 156-9 acres in 1880
larly, the size of the average farm increased
to 190-1 in 1890, and 246-1 in 1900, although in eastern Nebraska

permits entire sections instead of quarter sections (160 acres) to be
homesteaded, this movement has been fostered. In the years 1880
1900 the number of farms operated by cash tenants rose from 3-1 to
9-6%; of share tenants from 14-9 to 27-3% of the total. There is
no appreciable tendency toward management for absentee owners.
The census of 1900 showed that not less than two-fifths of the total
net income came from live stock or from hay, grain and forage on
farms representing together 96% of the farm- value of the state
live stock being a trifle more important; dairying was similarly
predominant for 1-6%, and beet-sugar for o-l %. Other crops were
unimportant sources of revenue. Sugar-beet culture has developed
since about 1889; it is localized largely in Lincoln county, near
North Platte, though beets are raised over a large part (especially the
western part) of the state. In 1907 about 11,000 acres were planted
to sugar beets. The principal factory for the slicing of the beets

interest is rapidly growing, but is still exceeded in other states.
Omaha is a great dairy market. Nebraska ranks very high in the
production of cattle and hogs. A fourth of all animal products are
represented by milk, butter and cheese, eggs and poultry; the rest
by animals killed on the farm or sold for slaughter, most of them
going to supply the meat-packing industry of South Omaha. Wild,
salt and prairie grasses make up the bulk of the forage acreage, but
the cultivated crops especially millet and Hungarian grasses and

are more important.
alfalfa
and Sheridan county in the foot-hills, produce more than half the
hay-crop of the state. Alfalfa can be grown with more or less success
in every county of the state, not excepting areas where clay or sand
form the sub-soil but on the uplands of the central part of the state
it is produced with the greatest success and in the greatest quantities.
In 1908, according to the reports of the state Board of Agriculture,
the crop of Custer, Dawson and Buffalo counties was about 15% of
the total crop (1,846,703 tons) of the state. The product was
quintupled between 1899 and 1905, and between 1905 and 1908 the
increase was about 40 %. It has been a great aid to western Nebraska
as to other portions of the Great Plains. Sorghum and kafir corn are
also excellent, and broom-corn fairly good, as drought-resistant
crops; the last, which is of lessening importance, is localized in Cass,
Saunders and Polk counties. Cereals are by far the most important
of farmed land and
crops, representing in 1899 four-fifths
crop
"
off years," but speaking with
values.
Allowing for variations in
as much exactness as is possible, Nebraska has established her
position since about 1900 in the'third, fourth and fifth rank respectively among the states of the Union, in the production of Indian
corn, wheat and oats. Of these, Indian corn is by far the most important, representing normally about two-thirds of the total crop
value; while wheat and oats each represented in 1906 about oneseventh of the total crop, and rye, barley, kafir-corn and buckwheat
make up the small remainder. Indian corn is grown to some extent
all over the state, except in the north-west, but the great bulk of the
crop is produced east of the 99th meridian. It is rarely cut, but is
left to mature and dry on the stalk in the field.
The yearly yield in
the decade 1895-1904, according to the most conservative state
statistics, varied from 298,599,638 to 72,445,227 bushels, and the
average was 178,941,084 bushels, or 190,773,957, omitting the failure
of 1901 the yield per acre being similarly 26-35 or 2 7'9 bushels
;

%

;

in 1906 the crop was 249,782.500 bushels, and
(12-4 in 1901)
the average yield per acre 34-1 bushels; in 1907 the crop was
179,328,000 bushels, and the average yield only 24 bushels per acre.
According to the report of the state Board of Agriculture, Custer,
Lancaster and Saunders counties produced the largest amounts
(each more than 5,000,000 bushels) of Indian corn in 1908. Since
1900 Nebraska has become one of the foremost winter wheat states,
second only to Kansas. Little spring wheat is now sown except in
the northern counties, the state being on the northern edge of the
winter wheat belt. From 1880 to 1890 the acreage devoted to wheat
greatly diminished, because the spring variety was not relatively
remunerative, but the acreage trebled in the next decade as autumn
planting increased. The winter varieties have the advantages of
-,

larger yield, earlier ripening and lesser loss from insects, and afford
protection to the soil. The growth of durum (macaroni) wheat is
also increasing, but is hampered by the uncertainty of market, which
The wheat crops of the decade 1895is for the most part foreign.

1904 averaged 33,208,805 bushels a year; or ranged from a

delusion that climate is changing and adapting itself to agriculture,
thus relieving the farmer of accommodating his methods to the
climate, has considerably handicapped him in progress. Systematic
experiments in dry-farming throughout the Great Plains were provided for on a great scale by Congress in 1906. By attention to crop
rotation, soil physics and world-wide search for plants adapted to the
Great Plains (such as the U.S. Department of Agriculture has long
been conducting), a very great deal can be accomplished no one
can say how much; but certainly the Western must long remain at
a great disadvantage in comparison with the Eastern portion of the
state as regards the growth of cereals.
Water for the western part of the state is a resource

Irrigated. As compared with the streams of Colorado, where irrigation is much more advanced, Nebraska has been less favored by the supply-capacities of the Arkansas and Poudre in Colorado, and the Loup and North Platte in Nebraska being about as 1,000, 1,193, 3,347 and 4,532 respectively, according to the last United States Census, the German (1901-1902, vol. iii. p. 144). An irrigation law was first passed by Nebraska in 1885. One of the greatest improvement projects undertaken by the national Reclamation Service is one on the North Platte River, where 97 miles in Wyoming of sufficient capacity to store all the surplus waters of that stream, about 600 m. of canals, and the reclamation of 107,000 acres in Nebraska; it was 74% completed in 1905. The work of the United States Government in the development of Nebraska agriculture was begun in 1862. Some farmers on the uplands between the valleys in western Nebraska irrigate by means of wind-mills, and although the underground water is 175 ft. or more below the surface on wind-mill supplies sufficient water to irrigate ten acres. The extent of irrigated acreage increased about thirteen-fold from 1889 to 1899. In the latter year there were 1701 m. of ditch costing about $75.00 per m., irrigating 448,503 acres, which yielded crops averaging $6 per acre value. The greatest part of the irrigated area is in the valley of the North Platte and the Upper Platte—probably nine-tenths in 1896—in Scotts Bluff, Lincoln, Cheyenne, Dawson, Keith and Deuel counties. There, however, a large district of Platte County—the farthest E. of any large ditch in the country; and though agriculture is normally quite "successful" here without irrigation, nevertheless it is more profitable. In Scotts Bluff County, there was about a quarter of the irrigated acreage lay E. of the section classed as arid.

Manufactures.—The rank of Nebraska among the states of the Union in 1900 in population, in value of agricultural products, and in value of manufactures, was twelfth. Among the leading products are clothing, flour, oats, barley, and meat-packing. In 1900 the value of the manufactures was $2,624,461, compared with $2,024,201 in 1895. Of this the clothing, flour-milling, and meat-packing establishments constitute 92% of the total value of the manufactures. The clothing manufacturers in 1900 were 287, employing 4,282 persons, producing clothing valued at $7,704,130, and yielding nearly one-half the total value of the manufactures of the state ($71,018,339 in 1900; $69,243,468 in 1905). The value of the clothing manufactured in 1900 was $1,433,501, and in 1905 $1,653,788. Nebraska wheat, like that of Kansas, combines for milling the splendid qualities of winter wheat with those characteristic of grain grown on the edge of the semi-arid West; flour and grist-mill products were valued at $7,704,130 in 1900 and at $12,190,303 in 1905. The first creamery in Nebraska was established in 1881. A creamery at Lincoln is said to be the largest in the United States. Many co-operative dairies have persisted since the early days of farmers' granges. The value of cheese, butter and other dairy products was $2,253,593 in 1900 and $3,306,931 in 1905. The relative dependence upon agriculture perhaps the most promising is that of brick and tile products (valued at $289,685 in 1900 and at $1,314,913 in 1905), and the largest is 1905 was the manufacture and repair of steam railway cars (valued at $384,104 in 1900 and $524,294 in 1905). The value of ordinary railway earnings amounted to $4,865,681 in 1905.

Communications.—There is no longer any river navigation. There were 6,101-5 m. of railway in the state at the end of 1907; the great period of railway building was 1870-1890, the mileage in 1870 being 705, in 1880, 1,053, and in 1890, 2,662. There is much better coverage by railways than the western. Six great east and west trunk-lines connecting the Rocky Mountain region and Chicago have 3,175 m. of track (g.e.), and to others, giving rather than an outlet southward, enter the state, so that the cattle paths of the state. In 1896 all but 5 counties out of 90 had railway outlets. A marked tendency toward north and south railway lines is of great importance, especially the eastern side of the state. Omaha and Lincoln are the principal centers of population, and 1,193,214, 1900 16-6% were foreign-born, and 43.3% natives of other states than Nebraska. The latter came mainly from the north-central states. Of the foreigners, Germans, Scandinavians and British (including English Canadians) made up four-fifths of the total. The most numerous individual races were German (55,506), Swedes (44,354), Irish (16,138), Dames (12,313), Irish (11,177), English (9,757), Russians (8,063) and English Canadians (8,010). In 1900 three cities had a population above 25,000—Omaha, 102,555; Lincoln, 40,169; South Omaha, 26,001—and seven others had a population between 5000 and 8000—Beatrice, Grand Island, Nebraska City, Fremont, Hastings, Kearney and York. The population of Nebraska was 28,841 in 1860, 122,993 in 1870, 452,402 in 1880 and 1,062,656 in 1890. The increases of population by decades following 1860 were 326-5, 267-8, 134-1, 0-3, and 11-8%. From 1880-1890 the absolute increase was exceeded in only four states, and was greater than in any state of the Mississippi except the enormous state of Texas; from 1890-1900 it was less than in any state of the Union except Nevada (whose population decreased). In this decade 35 counties out of 98 in the state showed a decrease; the shrinkage was mainly in the first half of the decade, and was due to the cumulative effects of national hard times, a reaction from an enormously inflated land “boom” of the late ’eighties, and a remarkable succession of drought years, and consequent crop failures in the West. Between 1885 and 1893 Kansas and Colorado went through much the same experiences, and a rapid settlement of their arid areas before the conditions of successful agriculture were properly understood. Many homes, and even small settlements in Nebraska—though not to the same extent as in Colorado and Kansas—were abandoned. Urban population (the population in places having 4000 or more inhabitants) also fell, constituting 25-8% in 1890, and in 1900 only 20-9% of the total population of the state.

In the case of some cities that showed a great decrease (e.g., Lincoln 27.2%, and Omaha 27%) notoriously “packed” censuses in 1900 were in part responsible for the bad showing ten years later.

In 1906 there were in the state 345,803 communicants of various religious denominations; of these 100,763 were Roman Catholics, 64,512 Methodists, 59,485 Lutherans, 23,862 Presbyterians, 19,121 Disciples of Christ, 17,939 Baptists and 15,247 Congregationalists. In 1890 there were in the state 2853 untaxed and 3338 taxed Indians, the latter being citizens; in 1900 there were 3,122 altogether, all of them taxed; and in 1908 there were 3720, of whom 1270 were Omaha, 1116 Santee Sioux, 1060 Winnebago, 295 Ponca.

Among the Indians who occupied Nebraska immediately before the advent of the whites and thereafter, the only families of much importance in the state's history were the Caddoan and the Siouan. The Caddoan land was repudiated, there was in 1868 an Indian Removal Advisory Committee; the Siouan family by its Dakota, Tchega, Chwero and Winnebago branches. Included in the Dakota branch were the Santee and Teton tribes, the latter comprising the Brulé, Blackfeet and Oglala Indians; in the Tchega branch were the Omaha and Ponca tribes; and in the Chwero branch, the Iowa, Oto and the Missouri tribes. Other tribes were of less importance; and of these other families—with the exception of the Cheyennes and Arapahoes of the Algonquian family, whose permanent hunting grounds embraced the foot-hill country of the West—were of negligible importance, being only roamers within the borders of the state. The Pawnees contested the plains against the Sioux with undying enmity. Before the Civil War there were no very great troubles between Indians and whites, despite constant frontier difficulties, except the bloody “Pawnee War” of 1859-60, but in 1863-4 the Pawnees rose rather generally along the frontier, and many settlers were killed. In 1890-91 there was another war—with the Sioux—marked by the battle of Wounded Knee, just across the line from Nebraska. The Indians were defeated, and the route of the Peru to the north of the state was substantially abandoned. The only road in Nebraska the usual discernible features of administration. The maltreatment of the Poncas, a fine and peaceful tribe, was peculiarly and inexcusably harsh. Segregation on reservations was generally abolished in 1879, and in 1890 the federal government took over for Omahas and Winnebagos in Thurston county and for the Sioux in Sheridan county, and an agency for the Santees and Poncas near the mouth of the Niobrara; and at Genoa, where the Pawnee agency was located. The Nebraska Indians remained under the Department of the Interior maintained by the United States government with 350 boarding.
pupils. In 1908, however, almost all the tribal lands had been distributed in several ways: the Niobrara Reservation (under the Santee agency) was surrendered to the Omaha School; the Ponca Reservation had only 1,130.7 acres reserved for agency, school and mission purposes; the Ponca Reservation (under the same school) had only 160 acres reserved for agency and school building; the Omaha Reservation (under the Omaha School) had 12,423 acres unallotted; the Sioux Reservation (under the Pine Ridge Agency) for Oglala Sioux had 640 acres; and the Winnebago Reservation (under the Winnebago Agency) was unallotted.

Government.—The present constitution, adopted in 1875, replaced one adopted in 1856. In 1871 a convention framed a constitution that was rejected by the people. It provided for compulsory education, and for the taxation of church property; prohibited the grant by counties or cities of financial aid to railway or other corporations, and enjoined that railways should have an easement only in their right of way. The last two provisions were mainly responsible for the defeat of the constitution. The adoption of 1875 presents a few variations from the normal type, and under it a few interesting problems have arisen. The constitution provides two methods for amendment. A convention for revising or amending the constitution is to be held in case a recommendation to that effect made by the legislature (a three-fifths vote of all the members of each house being required) is accepted by a majority of the electors voting at the next election for members of the legislature, but no amendment agreed upon by the convention is to take effect until approved by a majority of electors voting on it. Without convention, however, if by a majority of members of both houses of the legislature (a three-fifths vote of all the members of each house, adopt an amendment, which is to come into effect only if approved by a majority of electors voting at the next election of senators and representatives—the publication of the proposed amendment in some newspaper in each county once a week for three months before the election being required. This has been interpreted by the courts as requiring a majority of the votes actually cast for senators and representatives. As there is less interest in amendments than in the election of members of the legislature, only two out of a large number of amendments proposed from time to time by three-fifths of the members elected to each house have been adopted. The first of these, increasing the pay per day to the members of the legislature and providing for longer sessions, was declared lost by the official canvassers, but when (1886) the ballots had been recounted by the legislature it was declared adopted. The second (1906), creating a railway commission, was endorsed by a political party in state convention, was printed on the same ballot-paper with the names of the party candidates for office in order to secure it all "straight" party votes, and by this procedure, which was upheld by the state supreme court in 1907, it was adopted. All male persons of the United States who are citizens of the United States or have declared their intention to become such at least thirty days before an election must have the right of suffrage provided they have attained the age of twenty-one years, have resided in the state six months, are not of unsound mind, and have not been convicted of treason or felony. Women who have either children or taxable property may vote on questions relating to schools. The general election of state and local officers is held annually on the first Tuesday succeeding the first Monday in November, but municipal and school officers are elected in other times, as provided by law. The use of the voting machines was authorized in 1890; and the nomination of candidates by primaries was made mandatory in 1907. By a provision unique in 1875, the constitution authorized the legislature to provide that the electors might express their preferences for United States senators; but this was not treated as mandatory on the legislature, and though votes were at times taken (1856, 1894), they were not officially canvassed, nor were any senatorial elections materially affected by them. In 1907, under a direct primary law, the nomination of candidates for United States senator was transferred from the party convention directly to the people; and in 1909 the "Oregon plan" was adopted, whereby each candidate for the legislature must go on record as promising, or not, always to vote for the people's choice. If the legislature takes any action which nullifies the promise of any candidate for the legislature there appears a statement that he "promises," or that he "will not promise," to vote for the "people's choice." In the same year the state enacted a law providing for the non-partisan nomination of all judges, of all superintendents of public instruction and of regents of the state university; nominations are by petition, and there is a separate "official non-partisan ballot" bearing the names and addresses of the nominees and the titles of the office for which they are nominated. The legislature of 1906 also provided for open election primaries and for the framing of state party platforms by convention before the time of the primary.

The governor is the chief executive officer of the state, but quite independent of him are a lieutenant-governor, a secretary of state, an auditor of public accounts, a treasurer, a superintendent of public instruction, an attorney-general and a commissioner of public lands. The governor, lieutenant-governor, secretary of state, auditor of public accounts and treasurer, as well as that of the judges of the supreme and district courts, to $2500 each and that of other important officers (including the secretary of state, the attorney-general and the superintendent of public instruction) to $2000. This economy has somewhat hampered the growing state. Salaries have been too low to attract the ablest men; and as the constitution forbade the fixing of new salaries when the funds were insufficient, the proceeds of sales of state lands could not be secured, resort was had to the creation of additional "secretaries" and of boards constituted of existing state officials or their secretaries.

The legislature consists of a Senate of 33 members and a House of Representatives of 100 members, and meets in regular session on the first Tuesday in January of every odd-numbered year at Lincoln, the capital. Both senators and representatives are apportioned accordingly, with the exception of the drugged districts. Each November of each even-numbered year for a term of two years. The salary of the governor is the rate of five dollars a day during 60 days of a regular session and not exceeding 100 days during their entire term. No bill or joint resolution may be passed on the first day of the regular session after its fourth day, except at the request of the governor. Special legislation of various kinds is expressly prohibited, and in the bill of rights it is declared that "all powers not herein delegate reman granted to the people." This clause would seem to leave the state government with no powers not expressly granted, and to make the rule for interpreting the Nebraska constitution similar to that for interpreting the Federal constitution; but it has been little influenced by it, and it is chiefly of historical interest.

The administration of justice is vested in a supreme court, 15 district courts, county courts and courts of justices of the peace and municipal courts. The supreme court consists of three judges elected for a term of six years, one retiring every two years; each district court consists of one to seven judges elected for a term of four years, and each county court consists of one judge elected for a term of two years. The constitution provides for the condemnation in the probate of wills and the administration of estates, concurrent jurisdiction with the district courts in civil suits for sums not exceeding $1000, and that the constitution may be amended in the present constitution of North Carolina as amended in 1876.

\[1\] The amendment increased the pay of members from three dollars to five dollars a day, making their compensation more. than the bare expenses of the legislature; it provided that a senator should last at least sixty days, and that members should not receive pay "for more than sixty days at any one sitting"; the original constitution had provided that they should not receive pay for more than forty days at any one session and had prescribed no minimum length for a session.

\[2\] An almost identical clause was inserted in the Ohio constitution of 1851, and one in exactly the same language appears in the present (1851) constitution of Alabama; and in the constitutions of 1855, 1858 and 1859 (present), in the Nebraska constitution of 1866, in the North Carolina and South Carolina constitutions adopted in 1876, and in the present constitution of North Carolina as amended in 1876.
relating to appeals; it appears in the bill of rights and reads as follows: "The right to be heard in all civil cases in the court of last resort, by appeal, error or otherwise, shall not be denied." Regardless of this provision, however, the civil code denies the right of an appeal to any person who has been found guilty or, in which the amount claimed does not exceed $20, and the courts have decided that this denial is not in conflict with the constitution; but in at least one case an appeal was allowed here, and the constitutional guaranty, and that guaranty has doubtless had much influence on judicial legislation.

County government exists under both the district-commissioner system and under the county commission system. In the latter, the board of county commissioners is the executive body; in the former, the county government is becoming largely the body of supervisors. The cities are governed in accordance with local ordinance. Except in Omaha there is no great field for social economic legislation; but the record of the state has been normally good in this respect. The constitution, in 1855, declared that in and of itself the position has been a burning political question since 1876, the constitution making it the duty of the legislature to "correct abuses and provide adequate compensation for all illegal exactions and extortions in all charge of express, telegraph and railroad companies" within the state. The influence of the railways has been very great, and a constant drag on just taxation and other legislative reforms. In 1885, 1887 and 1897 the legislature created a Board of Transportation consisting of existing state executive officers or their secretaries, but this could do little except gather statistics, investigate alleged abuses, and advise the legislature, upon which the passage of rates remained mandated.

The Board of Commissioners for the state was held unconstitutional by the state supreme court. In 1893 a maximum freight-rate Act was passed, but the rates thus fixed were declared by the supreme court to be unreasonable. In 1898 the "Equal Amendment," being "unreasonable," The right of the state to fix" reasonable" rates remained unquestioned, but American experience has found such laws to be harmful. In 1906 all political parties endorsed the state's right to regulate railroad rates, passenger and freight; and a constitutional amendment creating a railway commission was adopted in the manner described above. A railway commission was established in 1907 for the regulation of railways. The legislature framed a stringent anti-pass law, reduced passenger fares and express and freight charges, provided for equitable local taxation of railway property, and required railways to pay on the railroad franchise taxes. The constitution makes the railroads responsible for the death or injury of their employes, and gave to the newly-created railway commission complete jurisdiction over all steam-railways in the state, over the street railways, and over the local railway companies, telephone companies and all other common carriers.

In 1909 provision was made for an annual corporation licence tax and for the physical valuation of railways. In the same year, the following the example of Oklahoma, Nebraska passed a law guaranteeing bank deposits from a fund created by an assessment on the basis of total deposits. Useful child-labour and pure-food laws were enacted in 1888, but the institutions heavily embraced in the establishment in the Territory in 1855, but liquor licences were introduced in 1839; in 1909 the licence fee was fixed at $1000. A law enacted in 1907 made it illegal for breweries to own retail liquor houses, and restricted the number of such houses to one in each town or railroad city. In 1909 the legislature made an additional provision for the appointment of county clerks, with the next term of the legislature to be 7 A.M. A homestead law exempts from judgment liens and forced sale a homestead not exceeding $2000 in value and consisting of either 160 acres of land, a substantial dwelling house on lots in a city or village; the exemption, however, does not extend to mechanics', labourers' or vendors' liens upon said homestead or to a mortgage upon that has been signed by both husband and wife or by an unmarried woman and some discriminatory licensing is referred to marriage, except that it becomes liable for payment of debt contracted for necessaries to the family when a judgment against the husband for the payment of the same cannot be satisfied. The rights of dower and courtesy have been abolished, and husband and wife have instead equal rights to inherit property from the other; but the portion of the property of a deceased spouse that descends to the surviving spouse from the intestate's estate is one-half of the property, and each of the children, the grounds for a divorce are adultery, incompetency of the marriage, sentence to imprisonment for a term of three years or more, abandonment without cause, or wanton separation for two years, cruelty, and refusal or neglect of the husband to provide a suitable maintenance for his wife. The period of residence in the state required to secure a divorce was formerly six months, but in 1909 it was made two years.

Finance.—The constitution limited the debt that the state might contract to meet casual deficits to $100,000, unless in time of war, and provided for an interest of 5% on the bonded debt. In the 1890s the floating debt was deposited with the state treasurer; the interest was 3%, and the carrying charge at a rate of 5%.

The provisions were construed to mean not more than $100,000 of debt could be contracted in addition to appropriations made by the legislature. There was from the beginning a constitutional guaranty that the state would not contract any bonded debt. These warrants when issued and presented for payment were paid by the state treasurer, sold to the permanent school fund, and drew 3% interest until cancelled from the general fund. The floating debt which was paid by the state treasurer, sold to the permanent school fund, and drew 4% interest until canceled from the general fund. The floating debt which was paid by the state treasurer, sold to the permanent school fund, and drew 4% interest until canceled from the general fund.

In 1903 the assessed valuation of property was $188,458,479; in 1905, $304,479,951; in 1906, $306,147,627; in 1907, $307,598,987; in 1908, $308,967,578, and in 1909, $310,337,498. The increase was due largely to a new revenue law of 1903 ordering property to be assessed at one-fifth of its actual value. The average effective for the year is about 63 mills in 1905, 1906 and 1907; and in 1908, 68 mills. Education.—The public schools have been endowed by the United States, beginning in 1854, and by the state; in 1909 the permanent educational fund founded by the United States amounted to $8,450,557, invested in state securities, county, school district and municipal bonds. The percentage of illiterate population (i.e. population unable to write) above 10 years of age was in 1880 and 1890 in the state, and it was 2.5% (for native whites, foreign whites and negroes respectively 0.8, 6.8 and 11.8), was smaller than in any other state except Iowa (whose percentage was also 2.5); the percentage for males voting age (2.5%) being the least in the Union. There are four state normal schools—one at Peru (opened 1867), one at Kearney (1893), one at Wayne (originally private; purchased by the state in 1909) and one, provided for by the legislature of 1909, situated in the north-western part of the state. The university of Nebraska at Lincoln was established in 1869 by an act of the state legislature, and was opened in 1871. The university is governed by a board of regents. The board consists of three members appointed by the legislature for three-year terms. In 1907, two members were appointed by the governor for six-year terms. In 1910, two members were appointed by the governor for six-year terms. The university of Nebraska at Lincoln was established in 1869 by an act of the state legislature, and was opened in 1871. The university is governed by a board of regents. The board consists of three members appointed by the legislature for three-year terms. In 1907, two members were appointed by the governor for six-year terms. In 1910, two members were appointed by the governor for six-year terms.
History.—Local pride has prompted some Nebraskans to begin the history of the white race in their state with the march of Coronado, in 1541, across the buffalo plains to “Quivira,” N. of the Arkansas river in Kansas; but the claiming interests of the evidence of the early days is shown by the existence, in the early days, of the Platte from hearsey in 1673; French explorers followed it to the Forks, in 1729; and, after Nebraska passed to the United States in 1803 as part of the Louisiana Purchase, successive American exploring expeditions left traces in its history. Major Stephen H. Long, in particular, followed the Platte and South Platte across the state in 1819, and his desiring of the semi-arid buffalo plains—whence arose the myth of the Great American Desert—finely contrasts with the later history and latter-day optimism of dry-farming and irrigation. Meanwhile, fur traders who drew their goods from the country of the Platte had long been active on the Missouri. Trading posts were probably established in Nebraska in 1795, 1802, 1807 and 1812; the last two near the present towns of Ft. Calhoun (about 20 m. N. by W. from Omaha) and Bellevue. Manuel de Lisa, a noted Cuban trader and plainsman, was probably the first white settler (1807). In 1824 Bellevue became an Indian agency, and in 1849 the first United States post-office in Nebraska. Ft. Atkinson was maintained near the present town of Ft. Calhoun in 1819-1827; in 1825 the government acquired the first Indian lands, and in 1829 the Missouri river route, and the coming interests of the thirty years of the 19th century missionaries began to settle among the tribes; the first Ft. Kearney was maintained where Nebraska City now stands in 1847-1848, and in the latter year was re-established on the Platte, some 175 m. inland from the Missouri. Meanwhile there had begun the passage of the Mormons across the state (1845-1857), marked by important temporary settlements near Omaha (q.v.) and elsewhere, the travel to Oregon, and to California, for which depots of supplies were established at Bellevue, Plattsmouth, Nebraska City and Old Ft. Kearney, or Doby Town. Thus the country was well and favourably known, and the first organized settlement, called by the Mormons, was made in 1854.

 Movements in Congress for the creation of a new Territory on the Platte began in 1844, several attempts at organization failing in the preceding decade. In 1852-1853 Iowans and Missourians along the border of what are now Kansas and Nebraska held elections W. of the Missouri and sent delegates to Congress. A provisional Territorial government formed by Wyandot Indians and licensed white residents on Indian lands in Kansas (q.v.) forced Congress to take action. With what followed, the rivalry of the Platte and Kansas river valleys for the Pacific railroad route, and the coming events, the thirty years of the century missionaries began to settle among the tribes; the first Ft. Kearney was maintained where Nebraska City now stands in 1847-1848, and in the latter year was re-established on the Platte, some 175 m. inland from the Missouri. by a feverish activity in railroad construction (the mileage in the state being increased from 1953 to 5417 m. in the ten years), together an extraordinary rise in land values, urban and rural. Farm-land prices were raised to a basis of maximum productiveness when the best interests, especially of the western section, demanded steady growth based on average crop results under average conditions. The early 'nineties were marked by an economic collapse of false values, and succeeding years by a painful recovery of stable conditions.

The Democratic and Republican parties were first effectively organized in opposition, as parts of national bodies, in the territorial campaigns of 1858. Till then there were practically only Democratic factional rifts. After 1861 the Republicans held the state seat over generally speaking in the People's party.

The governors of Nebraska have been as follows:

Nebraska was one of the states in which the collapse of the cooperative enterprises of the Grange again was particularly severe. The Farmers' Alliance was organized for the state in 1887, became a secret organization in 1889, and, as in other states, was a power by 1890. The membership of Grange, Alliance and Knights of Labor had increased greatly in the previous year.

NEBRASKA CITY, a city and the county-seat of Otoe county, Nebraska, U.S.A., situated on the high W. bank of the Missouri river, about 40 m. below Omaha. Pop. (1880) 4183; (1890) 11,494; (1900) 7380 (882 foreign-born); (1910) 5488. It is served by the Chicago, Burlington & Quincy, and the Missouri Pacific railway systems. A railway and wagon bridge spans the Missouri river at this point. The city was the seat of the state Institute for the Blind (1873), and has three public parks and a public library. The city is a distributing centre for a farming and grazing region, the trade in grain being especially large. In 1900 Nebraska City ranked third among the manufacturing cities of the state, the manufactures including canned fruits and vegetables, packed pork, flour, oatmeal, hominy, grits, meal, starch, cider-vinegar, agricultural implements, windmills, paving bricks, concrete, sewer pipe, beer, overalls and shirts. It is one of the oldest settlements of the state.

The central part of the city was settled by the State of Nebraska in 1854, but the city was incorporated under Nebraska law in 1859. The first Fort Kearney was established on the site of Nebraska City in 1824, and was abandoned in 1848, and the fort was re-established farther W. on the Platte river (see Kearney). Otoe county was organized in 1855, and the original Nebraska City was incorporated and made the county-seat in the same year. This city, together with Kearney City, incorporated in 1855—adjacent to the first "old" Fort Kearney—and South Nebraska City, were consolidated by the legislature into the present Nebraska City in 1858. (Twelve other city "additions" and so-called "towns," all within or closely adjacent to the present city, were in existence in 1871.) Nebraska City was for some years the largest city of the state. In 1858 it became the headquarters of a great freighting-firm that distributed supplies for the United States government among the army posts between the Missouri river and the Rocky Mountains; in seven months in 1859 this one firm employed 602 men, used 517 wagons, 568 oxen, and 75 miles, and shipped 2,782,258 lb. of freight. Nebraska City was the initial point of several roads, parts at one time or another of the "Oregon," "Old California," and "Great Salt Lake" trails. (See Nebraska (State): History.) Nebraska City became a city of the second class in 1871 and a city of the first class in 1893.

The Nebuchadrezzar King of Babylon, the Ñaboukôðôpôpôs of the Greeks. The first and last are nearer to the original name as it is found on the cuneiform monuments, viz. Nabu-kudurri-šušer, "Nebo, defend the landmark." Nebuchadrezzar seems to have been of Chaldean origin. He married Amuha, daughter of the Median king, according to Abydenus, and in 605 B.C. defeated Necho at Carchemish, driving the Egyptians out of Asia and annexing Syria to the Babylonian empire. In the following year he succeeded his father Nabopolassar on the Babylonian throne.
and continued the restoration of Babylon, which he made one of the wonders of the world. His " new palace," the temple that was built in fifteen days; temples were erected to the gods; the great walls of the city were constructed with a moat surrounding them, the Euphrates was lined with brick and a strong fortress erected. Canals were dug throughout the country and a great reservoir excavated near the capital. Only a fragment of his annals has been preserved, recording his campaign against Amasis (Amonis) of Egypt in his thirty-seventh year (396 B.C.) when he defeated the soldiers of "Phut of the Ionians." Tyre revolted in the seventh year of his reign, and was besieged for thirteen years; a contract-table dated in his fortieth year shows that it was still in ruins. When Persia was conquered, the investment of Tyre Nebuchadrezzar marched against Jerusalem, put Jehoiakim to death and placed Jechoniah on the throne. Three months later Jechoniah was deposed and Zedekiah made king in his place. Zedekiah's revolt in 588 B.C. led to another siege of Jerusalem, which was taken and destroyed in 586 B.C. (see JESUS and JERUSALEM). To this period probably belong an inscription of Nebuchadrezzar on the north bank of the Nahr el-Kilb near Beirut, and another in the Wadi Brissa in the Lebanon. From his inscriptions we learn that Nebuchadrezzar was a man of religious character. A younger brother of his is called Nabo-sum-lisir.

See Josephus, Cont. Apion, i. 19; Eusebius, Praep. Evangel. x.

NEBULA (Lat. for "cloud," connected with the Gr. νεφέλη, mist or cloud), in astronomy, the name given to certain luminous cloudy patches in the heavens. They resemble the stars in that they retain the same relative positions, and thus may be distinguished from the comets which appear to wander across the stars. When examined with sufficient telescopic power, a great many of these luminous patches are perceived to be composed of clusters of little stars, which in a smaller telescope are invisible separately, but whose rays of light blend together so as to produce a confused luminous appearance. Others, however, cannot be resolved into individual stars even with the best telescopes, and in many cases the spectroscope gives direct evidence that the nebula has a constitution altogether different from that of a star-cluster. We thus distinguish between the nebulae proper and the star-clusters; but owing to the difficulty of deciding the nature in any particular case, and especially owing to the fact that some of the earlier observers believed it probable that all nebulae would with sufficient telescopic power become resolvable into stars, the term nebula is often used to cover both star-clusters and the true nebulae.

An enumeration of nebulae was made by Charles Messier in Paris in 1771, who recorded 193; Sir William Herschel increased the number known to over 2500; whilst Sir John Herschel between 1825 and 1847 catalogued and described 3926 nebulae (including 1700 observed at the Cape of Good Hope). About 1848 the earl of Ross with his famous six-foot reflector at Parsonstown began his examination of the nebulae, which added greatly to our knowledge of their forms and structure. In more modern times the development of photography has enabled the features of the nebulae to be ascertained and recorded with a certainty, which, unfortunately, the older visual observations and drawings cannot claim to possess. In this connexion the photographic work of Isaac Roberts, A. A. Common, E. E. Barnard and J. E. Keeler in particular must be mentioned. The total number of known nebulae has, too, been enormously increased; Perrin estimates that the number within the power of the Crossley reflector at Lick is not less than half a million.

Nebulae may be conveniently classified according to their telescopic appearance; we enumerate below some of the principal forms that have been recognized, but it must be observed that this classification is rather superficial, and that the differentiation is often one of appearance only and not of real structure. The types are: (1) Irregular nebulae, examples: the great nebula of Orion (M. 42), the "key-hole" nebula near ζ Argus, the "Omega" nebula (M. 17); (2) Annular nebulae, example: M. 37 in Lyra; (3) Double nebulae, example: the dumb-bell nebula (M. 27) in Vulpecula; (4) Planetary nebulae, examples: the "owl" nebula (M. 97) in Ursa Major, M. 1 in Taurus; (5) Elliptical nebulae, example: the great nebula of Andromeda (M. 31); (6) Spiral nebulae, example: M. 51 in Canes Venatici; (7) Nebulous stars; (8) Diffused nebuleis. Most of these names require little explanation. The first class have ill-defined irregular boundaries; their forms often suggest the appearance of curled liquid or wreaths of smoke. The annular nebulae have a ringed appearance, the centre being much darker than the outer parts, though it is filled with faintly luminous matter. Double nebulae belong to the class of condensation. The planetary nebulae are nearly uniformly illuminated compact patches of light generally circular or elliptical in shape; they were so called because they appeared to possess disks like planets. Elliptical nebulae are usually nebulae of some flat type (such as annular or spiral) seen rather edgewise, so that the structure is not readily recognizable. The typical spiral nebulae are in the form of a double spiral, the two branches of which proceed from diametrically opposite points of a bright nucleus and wind round it in the same sense; the whole is generally studied by the aid of a spiral reflector. The structure of spiral nebulae includes the abandoned small nebulae which shine with a white light (in contrast with the blue-green light of the planetary and irregular nebulae—see below Spectra of nebulae), are generally classed as spiral nebulae. The spiral structure has been shown to exist in a few of them, but for the remainder it is only inferred. Nebulous stars are true stars surrounded by an atmosphere or aureole of nebulous light. Diffused nebuleis are very faint nebulae of enormous extent, sometimes forming the background of a whole constellation. We proceed to describe some of the more famous nebulae.

One of the most remarkable nebulae is that which is situated in the sword-handle of Orion and about the multiple star θ Orionis; it is faintly visible to the naked eye. It seems to have been first noticed by Huygens in 1656, who described and figured it in his Systema Saturniwm. It has now been found that nebulous streamers connected with the bright nucleus wind through the whole constellation of Orion. It is well known that all the brighter stars of the constellation except Betelgeuse appear to be related to one another by their similarity both of spectra and of proper motion; it seems probable that they are all situated in the nebula and in some way connected with it.

The only other nebula which can be seen with the naked eye is the elliptical nebula in Andromeda. Modern photographs show very clearly that its structure is spiral. The nucleus is large and appears circular, but the spirals proceeding from it lie in a plane inclined at a rather sharp angle to the line of sight, and this gives to the nebula its elliptical appearance. Two small dense nebulae accompany it, and appear to belong to the system.

The finest example of a ring nebula is M. 57 between β and γ Lyrae. The ring is slightly elliptical, its dimensions being 85" by 64". At the ends of the major axis the ring becomes very faint, so that the form of the bright part may justly be compared to a pair of marks of parenthesis ( ). The centre is marked by a star which appears to be intimately associated with the ring, for the whole space within the ring is filled with a very faint nebulosity. According to Schaeberle, there is evidence of a spiral structure in this nebula also. It must, however, clearly be of an essentially different character from that of any other ordinary spiral nebula. The great majority of the nebula reveals a fundamental difference between the annular and spiral nebulae.

The "dumb-bell" nebula in Vulpecula consists of two almost separated fan-shaped patches of light. It exhibits a close resemblance to the annular nebula; for we have only to assume a continuation of the thinning out along the longest diameter and a slight filling in of the centre of the Lyra nebula to obtain the dumb-bell form.
NEBULAR THEORY

333

Of planetary nebulae, one of the best known is the "owl nebula" in the Great Bear about midway between "the pointers." As seen with Lord Rosse's reflector, it presented a startling appearance, resembling the face of a goblin; two faint stars shone in the centres of the two dark circles which represented the saucer-eyes of the creature. Some change has certainly taken place since then, for the two stars no longer could be supposed to represent the pupils of the eyes; the cause may, however, be merely the proper motion of the stars or of the nebula.

The discovery of great regions having a faint nebulous background is one of the most remarkable results of modern work. Particularly interesting is the fact that, whilst the large telescopes are necessary to reveal the regions, smaller telescopes are able to photograph them, they are revealed by what at first sight seems an abnormally simple apparatus. For the study of the ordinary nebulae large reflecting telescopes (preferably of short focal length) are used, the great light-gathering power being all important; but for photographing these diffused nebulosities portrait lenses of very small aperture and focal length are most successful. Thus the great extension of the Orion nebula was photographed by W. H. Pickering in 1890 with a lens 2-6 in. in aperture and of 8-6 in. focal length; the exposure was rather more than six hours. Other extensive nebulous regions of a similar character have been found by Barnard in the constellations Ophiuchus, Scorpio and Taurus.

Spectra of Nebulae.—Owing to the feebleness of their light the study of the spectra of nebulae is one of particular difficulty. Two varieties of spectra are recognized; the one consists of a few narrow bright lines with sometimes a faint continuous spectrum for a background; the other consists of a continuous spectrum crossed by dark lines and is indistinguishable from that of ordinary stars. The former variety unmistakably shows that the light proceeds from diffuse incandescent vapour; nebulae show that a spectrum is being radiated, and it is possible to form a nebula, annular and planetary nebulae are of this nature. The visual spectrum is marked by three bright lines in the blue and green of wave-lengths 5007, 4959 and 4861. Of these the last is the line H β of the hydrogen series; the other two are of unknown origin, and as they are always found together and have always the same relative intensity, they have both been attributed to the same unknown element, which has been named "nebulium." Usually there are no other conspicuous lines in the visual spectrum, but in the ultra-violet region many can be photographed, including most of the hydrogen series. The yellow line (D2) of helium can be detected in many nebulae. The great majority of the nebulae, however, show the second variety of spectrum, and are thus indistinguishable spectroscopically from irresolvable star-clusters. The great nebula of Andromeda and the spiral nebulae are of this kind. It is not necessary to conclude that they, therefore, are star-clusters whose components are, owing to their remoteness from us, too faint and close together to be separately distinguishable. A gaseous mass only gives a bright line spectrum when it is so rarefied as to be transparent through and through. If the density and thickness are such that a ray of light cannot pass through it the spectrum will, in general, be continuous like that of a solid body.

The inquiry into the physical state and constitution of the nebulae raises problems of great difficulty. In the case of "gaseous" nebulae it is very hard to understand how such extremely tenuous masses are maintained in a state of incandescence. Only one theory has been put forward which at all accounts for this fact, and unfortunately, it is not altogether satisfactory in all respects. This is Sir Norman Lockyer's "Meteoritic Hypothesis," which attributes the light to collisions between numbers of small discrete solid particles, these being vaporized and made luminous owing to the heat developed by their impacts. Formidable difficulties, however, prevent the entire acceptance of this suggestion.

The spiral nebulae are not distributed at random over the sky, nor are they condensed along the galactic plane like the clusters which they spectroscopically resemble. There is a well-marked centre of aggregation of the northern nebulae near the north galactic pole. In the southern hemisphere they are more evenly distributed, but the avoidance of the galactic plane is marked. The remarkable Nebuliclae or Magellanic Clouds in the southern hemisphere, which look like detached portions of the Milky Way, are found on telescopic examination to consist, not of stars alone, like the Milky Way, but of stars and nebulae clustering together. In the greater cloud Sir John Herschel counted 286 nebulae; in the lesser cloud they are rather less numerous:

REMARKS.—The characters of nebulae receive treatment in all textbooks on descriptive astronomy; mention may be made of Miss A. M. Clerke, The System of the Stars (2nd ed., 1905), which contains a full account of these objects, illustrated by many photographs; the same work is replete with references to original papers. Of recent catalogues of nebula, we notice J. L. E. Dreyer, "A new general catalogue of nebula and clusters of stars," Memoirs R.A.S. (1888), published separately in 1890; and "Index Catalogue of Nebulae (1888-1894)." Mem. R.A.S. (1895). Excellent photographs of the more famous nebulae are given in Sir R. Ball's Popular Guide to the Heavens (1905); a more comprehensive collection is given in Isaac Roberts, Photographs of Stars, Star Clusters and Nebulae (2 vols., 1878-1881; in press). A. S. E.

NEBULAR THEORY, a theory advanced to account for the origin of the solar system. It is emphatically a nebular hypothesis; it cannot be demonstrated by observation or established by mathematical calculation. Yet the boldness and the splendour of the nebular theory have always given it a dignity not usually attached to a doctrine which from the very nature of the case can have but little direct evidence in its favour.

There are very remarkable features in the solar system which point unmistakably to some common origin of many of the different bodies which it contains. We may at once put the comets out of view. It does not appear that they bear any testimony on either side of the question. We do not know whether or not they were once satellites of the sun, or whether they may not be merely imported into the system from the depths of space. Even if the comets be indigenous to the system, they may, as many suppose, be merely ejections from the sun. In any case the orbits of comets are exposed to such tremendous perturbations from the planets that it is unsafe from the present orbit of a comet to conjecture what that orbit may have been in remote antiquity. On these grounds we discuss the nebular theory without much reference to comets. But even after the omission of all cometary objects we can still count in the solar system upwards of five thousand bodies, almost every one of which pronounces distinctly, though with varying emphasis, in favour of the nebular theory.

The first great fact to be noticed is that the planets revolve around the sun in the same direction. This is true not only of the major planets Mercury, Venus, the Earth, Mars, Jupiter, Saturn, Uranus and Neptune; it is also true of the host of more than five hundred minor planets. It is also remarkable that all the great planets and many of the small ones have their orbits very nearly in the same plane, and nearly circular in form. Viewed as a question in probabilities, we calculate the chance that five hundred bodies revolving round the sun shall all be moving in the same direction. The improbability of such an arrangement is enormously great. It is represented by the ratio of a number containing about a hundred and sixty figures to unity, and so we are at once forced to the conclusion that this remarkable feature of the planetary motions must have some physical explanation. In a minor degree this conclusion is strengthened by observing the satellites. Discarding those of Uranus, in which the orbits of the satellites are highly inclined to the ecliptic, and in which manifestly some exceptional influence has been at work, we find that the satellites revolve around the primaries also in the same direction;1 while, to make the argument complete, the planets, so far as they can be observed, rotate on their axes in the same manner.

The nebular theory offers an explanation of this most remarkable uniformity. Laplace supposed the existence of a primitive

1 Exceptions are Saturn ix. (Phoebe), Jupiter vii. (?) and viii., and the satellite of Neptune.
nebula which extended so far out as to fill all the space at present occupied by the planets. This gigantic nebulous mass, of which the sun was only the central and somewhat more condensed portion, is supposed to have a movement of rotation on its axis. There is no difficulty in conceiving how a nebula, quite independently of any internal motion of its parts, shall also have had as a whole a movement of rotation. In fact a little consideration of the theory of probabilities will show it to be infinitely probable that such an object should really have some movement of rotation, no matter by what causes the nebula may have originated. As this vast mass cooled it must by the laws of heat have contracted towards the centre, and as it contracted it must, according to a law of dynamics, rotate more rapidly. The time would then come when the centrifugal force on the outer parts of the mass would more than counterbalance the attraction of the centre, and thus we would have the outer parts left as a ring. The inner portion will still continue to contract, the same process will be repeated, and thus a second ring will be formed. We have thus grounds for believing that the original nebula will separate into a series of rings all revolving in the same direction with a central nebulous mass in the interior. The materials of each ring would continue to cool and to contract until they passed from the gaseous to the liquid condition. If the consolidation took place with comparative uniformity we might then anticipate the formation of a vast multitude of small planets such as those we actually do find in the region between the orbit of Mars and that of Jupiter. More usually, however, the ring might be expected not to be uniform, and, therefore, to condense in some parts more rapidly than in others. The effect of such contraction would be to draw the materials of the ring into a single mass, and thus we would have a planet formed, while the satellites of that planet would be developed from the still nascent planet in the same way as the planet itself originated from the sun. In this way we account most simply for the uniformity in the direction in which the planets revolve, and for the mutual proximity of the planes in which their orbits are contained.

Such was the nebular theory as it was originally sketched. At the present day when the nebulae that are spiral in form have been shown to be so numerous, next to the fixed stars themselves, our view of the nebular theory has been somewhat modified. It now seems probable that the spiral nebula is the fittest illustration of the transformation of a diffused nebula into a system of sun and planets. The rotation of the planets on their axes is also explained as a consequence of the nebular theory, for at the time of the first formation of the planet it must have participated in the revolution of the whole nebula, and by the subsequent contraction of the planet the speed with which the rotation was performed must have been accelerated.

There is quite a different method of considering the nebular origin of our system, which leads in a very striking manner to conclusions practically identical with those we have just sketched. We may commence by dealing with the sun as we find it at the present moment, and thence inferring what must have been the progress of events in the earlier epochs of the history of our system.

The supply of heat from the sun at the present time suggests a profound argument in support of the nebular theory. The amount of the sun's heat has been estimated, but we receive on the earth less than one two-thousand-millionth part of the whole radiation. It would seem that the greater part of the rest flows away to be lost in space. Now what supplies this heat? We might at first suppose that the sun was really an intensely heated body radiating out its heat as does white-hot iron, but this explanation cannot be admitted, for there is no historical evidence that the sun is growing colder. We have not the slightest reason to think that the radiation from the sun is measurably weaker now than it was a couple of thousand years ago, yet it can be shown that, if the sun were merely radiating heat as simply a hot body, then it would cool some degrees every year, and must have cooled many thousands of degrees within the time covered by historical records. We, therefore, conclude that the sun has some other source of heat than that due simply to incandescence. It might, for example, be suggested that the heat of the sun was supplied by chemical combination analogous to combustion. It would take 20 tons of coal a day burned on each square foot of the sun's surface to supply the daily radiation. Even if the sun were made of one mass of fuel as efficient as coal, that mass must be entirely expended in a few thousand years if the present rate of radiation was to be sustained. We cannot, therefore, admit that the source of the heat in the sun is to be found in any chemical combination taking place in its mass. Where then can we find an adequate supply of heat? Only one external source can be named: the falling of meteors into the sun must yield some heat just as a shooting star yields some heat to our atmosphere, but the question is whether the quantity of heat obtainable from the shooting stars is at all adequate for the purpose. It can be shown that unless a quantity of meteors in collective mass equal to our moon were to plunge into the sun every year the supply of heat could not be sustained from this source. Now there is no reason to believe that meteors in anything like this quantity can be supplied to the sun, and, therefore, we must reject this source as also inadequate.

The truth about the sun's heat appears to be that the sun is really an incandescent body losing heat, but that the operation of cooling is immensely retarded owing to a curious circumstance due jointly to the enormous mass of the sun and to a remarkable law of heat. It is well known that if energy disappears in one form it reappears in another, and this principle applied to the sun will explain the famous difficulty.

As the sun loses heat it contracts, and every pair of particles in the sun are nearer to each other after the contraction than they were before. The energy due to their separation is thus less in the contracted state than in the original state, and as that energy cannot be lost it must reappear in heat. The sun is thus slowly contracting; but as it contracts it gains heat by the operation of the law just referred to, and thus the further cooling and further contraction of the sun is PROVEN until the additional heat obtained is radiated away. In this way we can reconcile the fact that the sun is certainly losing heat with the fact that the change in temperature has not been large enough to be perceived within historic times.

It has been estimated that the sun is at present contracting so that its diameter diminishes 10 m. every century; there is, however, now reason to think that the rate of contraction is by no means so rapid as this would indicate. This is an inappreciable distance when compared with the diameter of the sun, but if it be a true estimate of our present purpose depends upon the fact that this contraction is always taking place. Assuming the accuracy of the estimate just made, we see that a thousand years ago the sun must have had a diameter 100 m. greater than at present, ten thousand years ago that diameter must have been 1000 m. more than it is now, and so on. We cannot perhaps assert that the same rate is to be continued for very many centuries, but it is plain that the further we look back into the past time the greater must the sun have been.

Dealing then simply with the laws of nature as we know them, we can see no limit to the increasing size of the sun as we look back. We must conceive a time when the sun was swollen to such an extent that it filled up the entire space girdled by the orbit of Mercury. Earlier still the sun must have reached to the earth. Earlier still the sun must have reached to where Neptune now revolves on the confines of our system, but the mass of the sun could not undergo an expansion so prodigious without being made vastly more rarefied than at present, and hence we are led by this mode of reasoning to the conception of the primeval nebula from which our system has originated.

Considering that our sun is but a star, or but one of the millions of stars, it is of interest to see whether any other systems present indication of a nebulous origin analogous to that which Laplace
NECESSITAS—NECK

proposed for the solar system. In one of his papers, Sir W. Herschel marshals the evidence which can be collected on this point. He arranges a selection from his observations on the nebulae in such a way as to give great plausibility to his view of the gradual transmutation of nebulae into stars. Herschel begins by showing us that there are regions in the heavens where a faint diffused nebulousness is all that can be detected by the telescope. There are other regions in which a nebula can be just discerned, others again in which the nucleus is easily seen, and still others where the nucleus is a brilliant star-like point. The transition from an object of this kind to a nebulous star is very natural, while the nebulous stars pass into the ordinary stars by a few graduated stages. It is thus possible to exhibit a series of objects beginning at one end with the most diffused nebulousness and ending at the other with an ordinary fixed star or group of stars. Each object in the series differs but slightly from the object just before it and the object just after it. It seemed to Herschel that he was thus able to view the actual changes by which masses of phosphorescent or glowing vapour became actually condensed down into stars. The condensation of a nebula could be followed in the same manner as we can study the growth of the trees in the forest, by comparing the trees of various ages which the forest contains at the same time. In attempting to pronounce on the evidence with regard to Herschel’s theory, we must at once admit that the transmutation of a nebula into a star has never been seen. It is indeed very doubtful whether any changes of a nebula have ever been seen which are of the same character as the changes Herschel’s theory would suggest. It seems, however, most likely that the periods of time required for such changes are immense and that the changes accomplished in only a century or two are absolutely inappreciable.

The nebular theory is a noble speculation supported by plausible argument, and the verdict of science on the whole subject cannot be better expressed than in the words of S. Newcomb: “At the present time we can only say that the nebular hypothesis is indicated by the general tendencies of the laws of nature, that it has not been proved to be inconsistent with any fact, that it is almost a necessary consequence of the only theory by which we can account for the origin and conservation of the sun’s heat, but that it rests on the assumption that this conservation is to be explained by the laws of nature as we now see them in operation. Should any one be sceptical as to the sufficiency of these laws to account for the present state of things, science can furnish no evidence strong enough to overthrow his doubts until the sun shall be found growing smaller by actual measurement, or the nebula be actually seen to condense into stars and systems.”

NECESSITAS (Gr. Ἀρέστα), in Orphic theology, the personification of absolute necessity. She appears as the mother of the Moeræ (Fates), as the wife of Demiurgus (Fashioner of the World) and mother of Hellmarmenē (Destiny). Her power is irresistible, even greater than that of the gods; to her was due the strife (battles with Titans, Giants) that raged amongst them of old, before the rule of love began; the world revolves round the spindle, which she holds in her lap. According to the Egyptian theory, she is one of the four deities present at the birth of every human being, her companions being the Daimon (guardian spirit), Tyche (Fortune) and Eros. On the citadel of Corinth there was a temple sacred to her and Bia (Violence), which none were permitted to enter. The Roman Necessitas is represented in the well-known ode of Horace (i. 33) as the forerunner and companion of Fortuna, holding in her brazen hand huge nails, a clamp and molten lead, symbolical of fixedness and tenacity.

See Plato, Rep. 616 c, Symph. 195 c, 197 b; Macrobios, Saturnalia, i 19; Pausanias ii. 4. 6.

NECESSITY (Lat. necessitas), a term used technically in philosophy for the quality of inevitable happening; for example, hot air necessarily rises. Thus it corresponds in the sphere of action to certainty in the sphere of knowledge. That the sun will rise to-morrow is a necessary event; and men anticipate the rising with certainty. In ordinary language the conception of necessity is rendered meaningless by being referred to the contingent. There are other conditions in which a man can be just discerned, others again in which the nucleus is easily seen, and still others where the nucleus is a brilliant star-like point. The transition from an object of this kind to a nebulous star is very natural, while the nebulous stars pass into the ordinary stars by a few graduated stages. It is thus possible to exhibit a series of objects beginning at one end with the most diffused nebulousness and ending at the other with an ordinary fixed star or group of stars. Each object in the series differs but slightly from the object just before it and the object just after it. It seemed to Herschel that he was thus able to view the actual changes by which masses of phosphorescent or glowing vapour became actually condensed down into stars. The condensation of a nebula could be followed in the same manner as we can study the growth of the trees in the forest, by comparing the trees of various ages which the forest contains at the same time. In attempting to pronounce on the evidence with regard to Herschel’s theory, we must at once admit that the transmutation of a nebula into a star has never been seen. It is indeed very doubtful whether any changes of a nebula have ever been seen which are of the same character as the changes Herschel’s theory would suggest. It seems, however, most likely that the periods of time required for such changes are immense and that the changes accomplished in only a century or two are absolutely inappreciable.

The nebular theory is a noble speculation supported by plausible argument, and the verdict of science on the whole subject cannot be better expressed than in the words of S. Newcomb: “At the present time we can only say that the nebular hypothesis is indicated by the general tendencies of the laws of nature, that it has not been proved to be inconsistent with any fact, that it is almost a necessary consequence of the only theory by which we can account for the origin and conservation of the sun’s heat, but that it rests on the assumption that this conservation is to be explained by the laws of nature as we now see them in operation. Should any one be sceptical as to the sufficiency of these laws to account for the present state of things, science can furnish no evidence strong enough to overthrow his doubts until the sun shall be found growing smaller by actual measurement, or the nebula be actually seen to condense into stars and systems.”

NECK (O. Eng. necca; the word appears in many Teutonic languages; cf. Dutch nek, Ger. Nacken; in O. E. the common word was wouls; cf. Ger. Hals), that part of the body which connects the head with the trunk (see ANATOMY: Superficial and Artistic). The word is transferred to many objects resembling this part of the body in shape or function; it is thus applied to an isthmus, or to the narrowest portion of a promontory, to the narrow part of a musical stringed instrument connecting the head and body, as in the violin, or to a narrow pass between mountains, which in the Dutch form nek, appears in place-names in South Africa. In architecture, the “neck” is that part of the capital just above the “astragal,” and the term “necking” is applied to the annulet or round, or series of horizontal mouldings, which separates the capital of a column from the plain part or a shaft. In Romanesque work this is sometimes corded.

In Geology, the term “neck” is given to the denuded stump of an extinct volcano. Beneath every volcano there are passages of communication between the volcanic regions and the world above. The volcanic activity has been levelled by denudation there is always a more or less circular pipe which marks the site of the crater. This pipe, which is filled with consolidated ashes or with crystalline lava, is the characteristic of a volcanic neck. Active volcanoes often stand on the sea-bottom and when the eruption comes to an end the volcano is slowly buried under layers of sediment. In tropical seas the coral animals cover the submarine volcanoes which rise nearly to the surface and form great reefs of limestone around them. Should elevation take place after long ages the removal of the overlying strata will bring the volcanic mass to light, and in the normal course of things this will suffuse the region examined with volcanic products. The necks of these are furnished by the geological history of the British Isles. In Carboniferous times, for example, before the Coal-measures were deposited, there were shallow seas over the southern part of Scotland and the north of England. Volcanic activity took place on the seabed-bottom, and many volcanic cones, both small and large, were produced. These have long since been uplifted and the superjacent geology has been worn away. Where the necks have been removed.

In Derbyshire, Fife, the Lothians and the Glasgow district the remains of Carboniferous volcanoes occur in every state of preservation. Some have the conical hills of lavas and ashes well preserved (e.g. Largs, Glasgow); others (e.g. Fintry and Crossford) occur only in a small part of the original volcanic pile (e.g. Arthur’s Seat, Edinburgh; the Binn of Burtston) and of the larger number nothing remains but the neck of the volcano which shows that it was there.

In regions of former volcanic activity necks are the most persistent of all volcanic structures, because the active volcanic magma is located deep within the earth’s crust, and the pipe by which it rises to the surface is of great length and traverses a great thickness of
strata. Many volcanic necks stand on lines of fault. In others there are groups of necks lying in a straight or sinuous line, which may indicate the position of a fracture or at least of a line of least resistance. In many cases their bases are nearly circular in cross section. This pipe was usually vertical, and nearly uniform in diameter for great depths; the material occupying it, when it is extruded, is still, and in a vertical direction, as shown in vertical section (or elevation) in a cliff is a pillar-shaped mass crossing the bedding planes of the strata nearly at right angles. It terminates upwards in the remains of the volcanic cone and downwards in a conical depression, which is usually filled with sediments and is sometimes emplaced, represented in most cases, where it has been exposed, by a large irregular mass (a batholith or boss) of coarsely crystalline igneous rock. The site of such a neck is generally indicated by a low cone, which is a remnant of a hollow or hollows of conical or igneous strata of a different kind. The low cone is generally a point to the greater hardness and strength of the volcanic materials and is not connected with the original shape of the volcano. Such hills are common in some parts of Scotland and well-known examples are Arthur’s Seat and the Castle Rock (Edinburgh), North Berwick Law, the Bass Rock; they occur also in the Peak district of Derbyshire, where the base of the depression is situated, and in a more splendid sugar-loaf cones known as the Pits of St Lucia in the West Indies, rising from the sea with almost vertical sides to a height of nearly 300 ft. These volcanic cones are found in California, Arizona, and many of the western states of North America geologists have observed conical volcanic hills having all the features which belong to necks.

However, the necks are soon and easily disintegrated they may be reduced more rapidly than the strata around them and the position of a neck may be indicated by a cup-shaped hollow; this is the case with some of the diamond-bearing pipes of South Africa, which have been encountered in underground mining operations; in the coal-field of Fife, for instance, the coals are sometimes replaced by a circular mass of volcanic rock, a quarter of an inch thick, which seems to have been formed in a hollow. Better examples are the Kimberley diamond mines. The blue-ground (or serpentine breccia) occupies great pipes or funnels, circular in outline with nearly vertical sides, extending downwards to underground levels, and filled with breccia of a kind of hard rock which is cut from the crater’s walls ultimately filled up the cavity. Nancies occur in Fifeshire and in Shetland, and among the recent volcanoes of the Eiffel there are some which have thrown out more slate and sandstone than consisting of volcanic rock, surrou volca by neck.

In Arran, for example, there is a large neck which contains lumps of Cretaceous rocks nowhere else known to occur on the island; they have fallen down from strata once occupying part of the walls of the crater but now removed by denudation.

The lava which rises and flows out from the crater leaves its trace usually in a vast sheet, but sometimes in a small area along the margin of the crater and surrounded by a rising conical depression, which is composed of solid crystalline rock representing the last part of the magma which ascended from the underground focus and congealed within the crater. In Mount Pelee, for instance, the last stage of the eruptions of 1902 to 1905 was the protrusion of a great column of solidified lava which rose at one time to a height of 900 ft. above the lip of the crater, but has since crumbled down. The Castle Rock of California, a conspicuous feature of the plum of crystalline basalt, is of this kind weather down very slowly and tend to form prominent hills.

After the eruptions terminate gases or hot solutions given out by deep parts of molten rock may find a passage upward through the materials occupying the crater, greatly modifying their mineral nature and laying down fresh deposits. A good example of secondary deposits within a volcanic neck is provided by the Cripple Creek mining district of Colorado. The ore-bearing veins are connected with volcanic rocks and part of these occupy a vertical circular pipe which is a typical volcanic neck. A phylodic breccia, greatly altered, is the principal rock, and is cut by dikes of phylodic dolerite, &c. The country rock is mostly granite and gneiss, and blocks of these are common in the breccia. A large volcano was built up at the same time the granite plateau, and has since been almost entirely removed by denudation. The pipes of crystalline basalt are cut by currents of hot water derived from the volcanic magma and were deposited along cracks and fissures in the materials which occupied the crater, and also in the surrounding rocks (see VOLCANIC NECK). (J. S. F.)

NECKAM, ALEXANDER (1157–1217), English schoolman and man of science, was born at St Albans in September 1157, on the same night as King Richard I. Neckam’s mother nursed the prince with her own son, who thus became Richard’s foster-brother. He was educated at St Albans Abbey school, and began to teach as schoolmaster of Dunstable, dependent on St Albans Abbey. Later he resided several years in Paris, where by 1180 he had become one of the leading men of St. Stephen’s (as it was then called) and was appointed a distinguished lecturer of the university. By 1186 he was head of the school of theology and of the college of the schoolmaster at Dunstable. He is said to have visited Italy with the bishop of Worcester, but this statement has been doubted; the assertion that he was ever prior of St Nicolas, Exeter, seems a mistake: on the other hand, he was certainly much at court during some part of his life. Having become an Augustinian canon, he was appointed abbot of Cirencester in 1213. He died at Kempsey in Worcestershire in 1217, and was buried at Worcester. Besides theology he was interested in the study of grammar and natural history, but his name is chiefly associated with his studies in magnetism: he wrote on De natura rerum and De uteusilbus (the former of which, at any rate, had become well known at the end of the 12th century, and was probably written about 1180) Neckam has preserved as the earliest European notices of the magnet as a guide to seamen—outside China, indeed, these seem to be the earliest notices of this mystery of nature that have survived in any country or civilization. It was probably in Paris, the chief intellectual centre of his time, that Neckam heard how a ship, among its other stores, must have a needle placed above a magnet (the term uteusilbus was that used to designate such a needle, which would revolve until its point looked north, and thus guide sailors in murky weather or on starless nights. It is noteworthy that Neckam has no air of imparting a startling novelty: he merely records what had apparently become the regular practice of at least some seamen of the Catholic world.

See Thomas Wright’s edition of Neckam’s De naturis rerum and De farsibus divinorum sapientiae in the Rolls Series (1863), and of his De uteusilbus in his Volume of Vocabulary. Neckam and his works are included in the Corpus Polygraphiae Protestantiae published by a treatise on grammatical criticism; a translation of Aesop into Latin elegiacs (six fables from this version, as given in a Paris MS., are printed in Robert’s Pales (indiciis); commentaries, still unprinted, on portions of Aristotle, Martianus Capella and Ovid’s Metamorphoses, and other works. Of all these the De natur rerius, a sort of manual of the scientific knowledge of the 12th century, is much the most important; the magnet passage herein is in book ii. of the De variis, p. 183 of Wright’s edition. The corresponding section in the De viusilbus, is on p. 114 of the Vol. of Vocabs.
NECKAR—NECKER

Roger Bacon's reference to Neckam as a grammatical writer (in *multis veris et utilis scriptis: sed... inter auctores non potest... numerati*) may be found in Brewer's (*Rolls Series*) edition of Bacon's *Opera Inedita*, p. 457. See also Thomas Wright, *Biographies Britannica Literaria, Anglo-Norman Period*, pp. 449-459 (1846: some points in this are modified in the 1863 edition of *De nat. rer.*); C. Raymond Beazley, *Dawn of Modern Geography*, iii. 56-60 (C. R. B.).

**NECKAR**

A river, and a right-bank tributary of the Rhine, rises between the Black Forest and the Swabian Alb, near Schwenningen, in Württemberg, at an altitude of 2287 ft. As far as Rottweil only a mountain stream, it here attains the volume of a river, flows N. as far as Horb, thence in a north-easterly direction, and with rapid current it passes Rottenburg and the university town of Tübingen, taking then a generally northerly course. From Esslingen the Neckar becomes broadened, deeply wooded, and is navigable and after passing Cannstatt, from which point it is navigable for small craft, it flows through vine-clad hills by the pleasant village of Marbach, Schiller's birthplace, receives at Besigheim the waters of its most considerable tributary, the Enz, swims down by Laufen, and enters the beautiful vale of Heilbronn. Hence, between hills crowned by frequent feudal castles, it runs by Wimpfen and by Hornberg, where Götz von Berlichingen lived, to Eberbach, where it enters the sandstone formation of the Odenwald. It now takes a tortuous westerly course, and the scenery on its banks becomes more romantic. Windng downward by Neuenstein and Neckargemünd, its wooded heights, it sweeps beneath the Königstuhl (1900 ft.) which, wades the walls of Heidelberg, and now quitting the valley enters the plain of the Rhine and falls into that river from the right at Mannheim. Its length is 247 m., and its drainage area 4790 sq. m. Its most important tributaries are the Enz, Eischach and Glatt (left), and the Fils, Rems, Kocher and Jagst (right). It is navigable for small steamboats up to Heilbronn, for boats up to Cannstatt, and for rafts from Rottweil. It is the principal waterway of Württemberg, and is greatly used for floating down the home produce from Rottweil to Mannheim, which is an important port where every house is surrounded by vineyards. Up to Frankfort it has been deepened and the channel otherwise improved. A committee, chiefly promoted by the Württemberg government and the Stuttgart chamber of commerce, reported in 1901 that it was both desirable and practicable to dredge the river and to canalize it, from Esslingen down to Mannheim, and that the cost would probably be between 2 and 3 million sterling.

**NECKARGEMÜND**, a town and climatic health resort of Germany, in the grand duchy of Baden, situated amid densely wooded hills, on the left bank of the Neckar, 6 m. E. from Heidelberg by the railway to La Würzbourg, and at the junction of a line to Jagstfeld. Pop. (1901) 2500. It has an important trade in wine. The other industries are quarrying, tanning and shipbuilding, and there are electrical works. Neckargemünd, one of the favourite tourist resorts in the Neckar valley, was founded in the 10th century and became a free town in 1286. In 1393 it passed to the elector palatine and, together with the surrounding district, was apportioned to Baden in 1814.

**NECKER, JACQUES** (1732-1804), French statesman, finance minister of Louis XVI, was born at Geneva in Switzerland. His father was a native of Cüstrin in Pomerania, and had, after the publication of some works on international law, been elected as professor of public law at Geneva, of which he became a citizen. Jacques Necker had been sent to Paris in 1747 to become a clerk in the bank of a friend of his father, M. Vernet. He soon afterwards established, with another Genevese, the famous bank of Thelusson & Necker. Thelusson superseded the bank in London (his grandson was made a peer as Lord Rendlesham), while Necker was managing partner in Paris. Both partners became very rich by loans to the treasury and speculations in grain. In 1763 Necker fell in love with Madame de Vermont, but the widow of a French officer. But while en route to Geneva, Madame de Vermont met Suzanne Curchod, the daughter of a pastor near Lausanne, to whom Gibson had been engaged, and brought her back as her companion to Paris in 1764. There Necker, transferring his love from the widow to the poor Swiss girl, married Suzanne before the end of the year. She encouraged her husband to try and make himself a public position. He accordingly became a syndic or director of the French East India Company, and, after showing his financial ability in its management, defended it in an able memoir against the attacks of A. Morelet in 1769. Meanwhile he had made interest with the French government that by a royal edict he was appointed resident at Paris by the republic of Geneva. Madame Necker entertained the chief leaders of the political, financial and literary worlds of Paris, and her Fridays became as greatly frequented as the Mondays of Madame Geoffrin, or the Tuesdays of Madame Helvetius. In 1773 Necker won the prize of the Académie Française for an *éloge* on Colbert, and in 1775 published his *Essai sur la législation et le commerce des grains*, in which he attacked the free-trade policy of Turgot. His wife now believed he could get into office as a great financier, and made him give up his share in the bank, which he transferred to his brother Louis. In October 1776 Necker was made finance minister of France, though with the title only of director of the treasury, which, however, he changed in 1777 for that of director-general of the finances. He did great good in regulating the finances by attempting to divide the taille or poll tax more equally, by abolishing the "vingtième d'industrie," and establishing *monts de piété* (establishments for loaning money on security). But his greatest financial measures were his attempt to fund the French debt and his establishment of annuities under the guarantee of the state. The operation of funding was too difficult to be suddenly accomplished, and Necker rather pointed out the right line to be followed than completed the operation. In all this he treated French finance rather as a banker than as a profound political economist, and thus fell far short of Turgot, who was the very greatest economist of his day. Politically he did not do much to stave off the coming Revolution, and his establishment of provincial assemblies was only a timid application of Turgot's great scheme for the administrative reorganization of France. In 1781 he published his famous *Compte rendu*, in which he drew the balance sheet of France, and was dismissed from his office. Yet his dismissal was not really due to his book, but to the influence of Marie Antoinette, whose schemes for benefitting theduc de Guises he had thwarted. In retirement he occupied himself with literature, and with his only child, his daughter, who in 1786 married the ambassador of Sweden and became Madame de Staël (q.v.). But neither Necker nor his wife cared to remain out of office, and in 1787 Necker was banished by "lettre de cachet" 40 leagues from Paris for attacking Calonne. In 1788 the country, which had at the bidding of the literary guests of Madame Necker come to believe that Necker was the only minister who possessed the heart and soul of the people, as they said, demanded Necker's recall, and in September 1788 he became once more director-general of the finances. Throughout the momentous months which followed the biography of Necker is part of the history of the French Revolution (q.v.). Necker put a stop to the rebellion in Dauphiné by legalizing its assembly, and then set to work to arrange for the summons of the states general. Throughout the early months of 1789 he was regarded as the saviour of France, but his conduct at the meeting of the states general showed that he regarded it merely as an assembly which should grant money, not organize reform. But as he had advised the calling of the call for the national, and the double representation of the third estate, and then permitted the orders to deliberate and vote in common, he was regarded as the cause of the Revolution by the court, and on July 11 was ordered to leave France at once. Necker's dismissal brought about the taking of the Bastille, which induced the king to recall him. He was received with joy in every city he traversed, but at Paris he again proved to be no statesman. Believing that he could save France alone, he refused to act with the National Assembly, and caused the king's acceptance of the suspensive veto, by which he sacrificed his chief prerogative in September, and destroyed all chance of a strong executive
NECROLOGY

NECROLOGY (from Med. Lat. necrologium, Gr. νεκρός, corpse, the termination being formed from λύγης, λέγειν to read, in the sense of list, register; cf. ־ martyrlogio), a register in a monastery or other ecclesiastical establishment of the names of the dead, with the dates of their deaths. The prayers for the dead were said at that hour, but the prayers of the living were not. NECHOMANCY (Gr. νεκρομαντεία, or νεκρομαντία, from νεκρός or νέκας, corpse, and μαντεία, divination), properly divination by communicating with the dead. The Latinized form of the Greek word was corrupted into nigromantia, connecting the word with nigfer, black, and so was applied to the "black art," "black magic," in the sense of witchcraft, sorcery. This corrupted form is common in English to the 17th century (see MAGIC and WITCHCRAFT).

NECROPOLIS, a cemetery (q.v.) or burying-place, literally a "city of the dead" (Gr. νεκρός, corpse, and πόλις, city). Apart from the occasional application of the word to modern cemeteries outside large towns, the term is chiefly used of burial-grounds near the sites of the centres of ancient civilizations.

NECROSIS (Gr. νεκρός, corpse), a term restricted in surgery to death of bone. A severe inflammation, caused by a violent blow, by cold, or by the absorption of various poisons, as mercury and copper, produces a general or local necrosis. The latter part, analogous to the slough in the soft parts, is followed a sequester or exfoliation. At first it is firmly attached to the living bone around; gradually, however, the dead portion is separated from the living tissue. The process of separation is a slow one. New bone is formed around the sequester, which often renders its removal difficult. As a rule the surgeon waits until the dead part is loose, and then cuts down through the new case and removes the sequester. The cavity in which it lay gradually closes, and a useful limb is the result.

NECTAR, in ancient mythology generally coupled with ambrosia, the nourishment of the gods in Homer and in Greek literature generally. Probably the two terms were not originally distinguished; but usually both in Homer and in later writers nectar is the drink and ambrosia the food. On the other hand, in Alcman nectar is the food, and in Sappho and Anaxandrides ambrosia the drink. Each is used in Homer as an unguent (IIiad, xiv. 170; xix. 35). Both are fragrant, and may be used as perfume. According to W. H. Roscher (Nektor und Ambrosia, 1883; see also his article in Roscher's Lexikon der Mythologie) nectar and ambrosia were originally only different forms of the same substance—honey, regarded as a dew, like manna, brought down from heaven, or the honey which was used both as food and drink. (See also AMBROSI)

NEED-FIRE, or WILD-FIRE (Ger. Nofeußer, O. Ger. nodfyr), a term used in folklore to denote a curious superstition which survived in the Highlands of Scotland until a recent date. Like the fire-churning still customary in India for kindling the sacrificial fire, the need- or wild-fire is made by the friction of one piece of wood on another, or of a rope upon a stake. Need-fire is a practice of sheep shepherds to ward off disease from their herds and flocks. It is kindled on occasions by witches, or spirits of the dead, and driven through the town. Its efficacy is believed to depend on all other fires being extinguished. The kindling of the need-fire in a village near Quedlinburg was impeded by a night light burning in the parsonage (Pröhle, Harz-Bilder, Leipzig, 1853). According to one account, in the Highlands of Scotland the rule that all common fires must be previously extinguished applied only to the houses situated between the two nearest running streams (Kelly, Curiosities of Indo-European Tradition and Folklore, p. 53 seq.). In Bulgaria even smoking during need-fire is forbidden. Two naked men produce the fire by rubbing dry branches together in the forest, and with the flame they light two fires, one on each side of a cross-road haunted by wolves. The cattle are then driven between the two fires, from which glowing embers are taken to rekindle the cold hearths in the houses (A. Strausz, Die Bulgaren, p. 198). In Caithness the men who kindled the need-fire had previously to divest themselves of all metal. In some of the Hebrides the men who made the fire had to be eighty-one in number and all married. In the Halberstadt district in Germany, the rope which was wound round the stake, must be pulled by two chaste, virgins; while at Wolfenhüttel, contrary to usual custom, it is said that the need-fire had to be struck out of the cold anvil by the smith. In England the need-fire is said to have been lit at Birley within the last half-century. The superstition had its origin in the early ideas of the purifying nature of flame.

NEEDLE (O. Eng. nedd), the word appears in various forms in Teutonic languages, Ger. Nadel, Dutch naald, the root being ne-, to sew, cf. Ger. nähen, and probably Lat. nāre, to spin, Gr. νιῆσα, spinning), an instrument adapted for passing a thread through fabrics in sewing, consisting of a thin rod of steel, having a pointed end and pierced with a hole or "eye" to carry the thread. The term is also applied to various other objects that more or less resemble a sewing needle in form, though differing in function, such as the magnetized piece of steel that points north and south in the mariner's compass, the pointer or indicator of certain forms of electric telegraph instruments, the small slender tube, which the contents of a hypodermic syringe are injected beneath the skin, a sharp-pointed mountain peak or isolated mass of rock, &c.

Sewing needles have been in use from prehistoric times. Originally they were made of fishbone, bone or ivory, and their first form was probably a rude bodkin having a hook instead of an eye, though bone needles with an eye, sometimes at the end and sometimes in the middle, have been found in cave deposits in Great Britain and France and in the Swiss lakes. Bone
needles continue to be used by uncivilized tribes, but since the discovery of bronze metal needles have been employed in civilized communities. Steel needles were introduced into Europe by the Moors, and it is on record that they were being made at Nuremberg in 1370. In England their manufacture was estab-
lished about 1550. Made in England is also a rival substitute comparatively known as Needlemade. They are made in Warwickshire, with several other small towns in Warwick. Originally the industry was domestic in its character, but is now mainly in factories where mechanical appliances have to a great extent supplanted handwork. Large quantities of needles are also manufactured on the Continent of Europe, Aix-la-Chapelle being an important centre of their production. In the United States ordinary sewing needles are not made, though there is a large output of the special forms used in sewing machines.

The raw material of needle-manufacture consists of Sheffield crucible steel drawn down into wire of suitable gauge. The wire is supplied in coils of definite weight and diameter, and the first operation is to cut the coils into lengths, each sufficient for two needles. These lengths are next straightened. For this purpose a bundle containing several thousand lengths is packed within two strong wooden angles, and the pressure is applied by a pair of heavy wooden rollers. The wire is then placed sideways to the iron rings run over. Over this plate the bundle is worked backward and forward by the pressure of an oblong slightly curved iron tool having two longitudinal slits through which the wire is passed. The rings run on the right hand, lower the rings on the left, and slightly revolving them with his right, was able to point about 100,000 needles a day, the number depending, however, to some extent on the skill of the workman. This process was, however, soon superseded by machinery, which is still more expeditious. The wires are fed out from a hopper to a revolving wheel, on the periphery of which they are held by an India-rubber band. This wheel revolves at right angles to one having a similar action and so each wire is brought up to the stone in rapid succession and pointed at one end, the process being repeated for the other end. The next operations are to stamp the grooves which are to be found at the head of a needle and to polish them by being rubbed between the rings already mentioned. Each wire now forms two needles attached head to head by a broad thin scarf of steel. The operation of separating them is largely performed by machines which pass the double blanks over the face of an emery wheel, but an older method is to split them on two flattened wires, clamp them tightly in a frame, file away the scar and break the blanks in halves, so that two lots of single needles are obtained, each by each step, after the heads have been filed smooth, is to harden and temper the needles, which are heated to redness, plunged into cold oil, and then gently heated by being placed on a continuous band passing over a series of gas flames. After the tempering process the wires are then smoothed and polished so that they will not cut the thread. For this purpose the heads are softened by heating them, and the needles are then formed by a machine which may allow a smooth wire to be bent and the ends be pushed down on the shank, while in another the same end is left free for providing them with a minute latch. Another special class is constituted by the numerous varieties of needles used by surgeons for suturing wounds, &c. (see Surgical Instruments).

NEEDLE-GUN (Zündnadelgewehr), a military breeching-loading rifle, famous as the arm of the Prussians in 1866 and of the Germans in 1870-1871. It was the invention of the gunsmith Johann Nicholas von Dreyse (1787-1867), who, beginning in 1824, had made many experiments, and in 1836 produced the complete needle-gun. From 1841 onwards the new arm was gradually introduced into the Prussian service, and later into the military forces of many other German States. Dreyse was enabled to manufacture at an equipment. The principal details of the arm (pattern 1841) are as follows:

- Breech
- Calibre
- Weight without bayonet
- Charge (black powder)
- Bullet (lead)
- Muzzle velocity
- Sighted to

NEEDLEWORK. This subject may be considered under the two headings of (1) Plain Needlework, used for purely utilitarian purposes, and (2) Art Needlework for decorative purposes. Plain needlework requires no such further explanation as may be given in the case of art needlework, under which title are included (a) embroidery, and (b) other methods of decorative needlework, such as applied or appliqué work, ornamental quilting, patchwork and couching. In these last-mentioned methods the needlework is subservient to the decorative effect, which depends almost wholly upon the materials selected for the purpose; whereas in embroidery the needlework itself constitutes and is the visible decoration. The aim of this article is to indicate briefly different stitches of plain needlework and then to show that these stitches are also used in the domain of art needlework.

The more necessary stitches in plain needlework for making clothes are tacking, running, hemming, feather-stitching or herring-boning (all of which are practically of the same type), and button-holing in which the thread is looped as each stitch is made, and buttonhole is allied to another looped stitch, namely chain-stitching, which though frequently used in embroidery is rarely if ever used in plain needlework. For repairs of clothes and household linen, &c., the principal stitch is darning; grafting, however, is a substitute for it, and varies with the character of the stuff to be repaired, e.g. knitted stockings, damask linen, cloth, &c. Darning is allied to running, and grafting to patchwork. Patchwork as a form of decorative needlework is exemplified in sumptuous canopies and seat covers made several centuries B.C. by Egyptians, and rich hangings made by Italian and Flemish embroiders. Long and short stitches, kindred in principle to the running stitch in plain needlework, are perhaps the most frequent stitches used in embroidery, and are especially appropriate when the blending of tints with a flat even surface is the effect to be aimed at. Much medieval work of this character, as well as that done with chain stitch and its allied split stitch, is regarded as typical of opus anglicanum. Chain stitch produces a comparatively broken surface in decided contrast with the smooth one of long and short stitch, split stitch and satin stitch embroidery. Satin stitch is well adapted to express, with even flat surface in design, for colour effects, each mottled or dotted mass which is to be of one tint. In this respect, therefore, satin stitch serves a purpose in contrast to that of long and short stitch. A characteristic of satin-stitching is the sheen effect produced, on both
NEEMUCH—NEER, VAN DER

sides of the material embroidered, by parallel stitches taken closely together. Buttonhole stitch in relation to art needlework prevails to a great extent in cut linen and drawn-thread work (often called Greek lace), and predominates in the making of needlepoint lace (see Lace). In much of the Persian drawn-thread work, however, it is superseded by whipping or tightly and closely twisting a thread round the undrawn threads of the linen. Whipping has been put to another use in certain 16th-century art needlework for ecclesiastical purposes, where round the gold threads are worked as the ground of a design coloured silks are dexterously whipped, closely and openly, producing gradations of tint suffused with a corresponding variation of golden shimmer. Another important branch of art needlework with gold and silver threads is couching. When the metallic threads, arranged so as to lie closely together, are simply stitched flatly to the foundation material, the work is called flat couching or laying, a kind of treatment more frequent in Chinese and Japanese than in European art needlework. Flat couching is also carried out with floss silks. When a design for couching includes effects in relief, stout strings or cords as required by the design are first fastened to the foundation materials, and over them the metallic threads or in some cases coloured gimps are laid, and so stitched as to have an appearance in miniature of varieties of willow-twisting or basket work. The principle of relief couching is carried much further in certain English art needlework, having cumbersome and grotesque peculiarities, which was done during the reigns of the Stuarts. Crude compositions were wrought in partial relief with padded work, of costumed figures of kings and queens and scriptural persons with a medley of disproportionate animals, insects and trees, &c., in which foliage, wings, &c., were of coloured silk needlepoint lace—the whole being set as often as not in a background of tent or cross-stitch work on canvas. But tent and cross-stitch work (in French point compté) was also used by itself for cushion covers and later for upholstery. In its earlier phases it seems to have come under the medieval classification of opus pulvinarum. The reticulations of the canvas or those apparent in finer material governed the stitching and imparted a stiff formal effect to the designs so carried out, a characteristic equally strong in the lacis work, or darning on square mesh net (see Lace).

Appliqué or applied work belongs as much as patchwork to the medieval category of opus consuimum, or stitching stuffs together according to a decorative design, the greater part of which was cut out of material different in colour, and generally in texture, from that of the ground to which it was applied and stitched. Irish art needlework, called Carrickmacross lace, is the most part of cambric supplied or applied to net.

Quilting is also a branch of art needlework rather than embroidery. Indians and Persians using a short running stitch have excelled in it in past times. Some good quilting was done in England in the 18th century with chain-stitching which lay on the inner side of the stuff, the outer displaying the design in 'short stitches. In the account of his voyage to the East Indies, published in 1655, Edward Terry (1590–1665) writes of the Indians "making excellent quilts of satin lined with taffeta betwixt which they put cotton wool and worked them together with short running or bulky quilting, cords have been used; and elaborate designs for quilted lining of waistcoats were well done in the 18th century, with fine short stitches that held the cords between the inner and outer materials. A large number of names have been given to the many modifications of the limited number of essentially different stitches used in plain and art needlework, and on the whole are fanciful rather than real in technical or practical terms. Much information about them, with an abundance of capital illustrations, is given in the Dictionary of Needlework, by J. F. Caulfield and Emelie Saward (London, 1903).

NEEMUCH, or NEER, a town of Central India, with a British military cantonment, within the state of Gwalior, on the border of Rajputana, with a station on the Rajputana railway, 170 m. N. of Mhow. Pop. (1901) 21,588. In 1857 it was the most southerly place to which the Mutiny extended. The brigade of native troops of the Bengal army, which was stationed there, mutinied and marched to Delhi, the European officers taking refuge in the fort, where they were besieged by a rebel force from Mandasor, and defended themselves gallantly until relieved by the Malwa field force. Since 1895 it has been the headquarters of the political agent in Malwa.

NEENAH, a city of Winnebago county, Wisconsin, U.S.A., on the N.W. shore of Lake Winnebago, 82 m. N. by E. of Milwaukee. Pop. (1890) 9083; (1900) 9524, of whom 1559 were foreign-born; (1905) 6047; (1910) 5734. It is served by the Chicago & North-Western, the Chicago, Milwaukee & St Paul, and the Milwaukee, St Paul & Sault Ste Marie railways, by two interurban electric railways, and by steamboat lines on the lake and on the Fox river, which flows out of Lake Winnebago at this point. Several bridges connect it with Menasha, on the opposite side of the river, and the two cities form one industrial community. Doty Island, at the mouth of the river, belongs partly to Neenah and partly to Menasha. Neenah is a trade centre of the surrounding agricultural region, in which dairying, especially cheese-making, is carried on extensively. The Fox river (with a fall of 12 ft.) furnishes good water-power for the manufactories. There was a trading post at or near the site of Neenah during the French régime in Wisconsin, but there was no actual settlement until well into the 19th century. Neenah was chartered as a city in 1873; its name is derived from an Indian word meaning "running water" or "raptids."

NEER, VAN DER. Aernout and Eglon van der Neer, father and son, were Dutch painters whose lives filled almost the whole of the 17th century.

Aernout van der Neer (1603–1677), commonly called Aert or Artus, was the contemporary of Albert Cuyp and Hobbema, and so far like the latter that he lived and died in comparative obscurity. Aernout was born at Gorkum and died at Amsterdam. Houbraken's statement that Aernout had been a steward to a Dutch nobleman, and an amateur painter, before he settled in Amsterdam and acquired skill with his brush, would account for the absence of any pictures dating from his early years. He died in abject poverty, and his art was so little esteemed that the pictures left by him were valued at about five shillings apiece. Even as early as 1659 he found it necessary to supplement his income by keeping a wine tavern. The earliest pictures in which Aernout coupled his monogram of A. V. and D. N. interlaced with a date are a winter landscape in the Rijks Museum at Amsterdam (dated 1639), and another in the Martins collection at Kiel (1642)—immature works both, of poor quality. Far better is the "Winter Landscape" (1643) in Lady Wantage's collection, and the "Winter Scene on the Dam" in the d'Aguesseau collection in Brussels. In 1652 Aernout witnessed the fire which consumed the old town-hall of Amsterdam. He made this accident the subject for two or three pictures, now in the galleries of Berlin and Copenhagen. Though Amsterdam appears to have been constantly van der Neer's domicile, his pictures tell that he was well acquainted with the canals and woods about Haarlem and Leiden, and with the reaches of the Maes and Rhine. Dort, the home of Albert Cuyp, is sometimes found in his pictures, and substantial evidence exists that there was friendship between the two men. At some period of their lives they laid their hands to the same canvases, on each of which they left their joint mark. On some it was the signature of the name, on others the more convincing signature of style. There are landscapes in the collections of the dukes of Bedford and Westminster, in which Cuyp has represented either the frozen Maes with fishermen packing herring, or the moon reflecting its light on the river's placid waters. These are models after which van der Neer appears to have worked. The same feeling and similar subjects are found in Cuyp and van der Neer, before and after their partnership. But Cuyp was the leading genius. Van der Neer got assistance from him; Cuyp expected nothing from van der Neer. He carefully enlivened his friend's pictures, when asked to do so, with figures and cattle. It is in pictures jointly produced by them that we discover van der Neer's presence at Dort. We are near
Dort in the landscape sunset of the Louvre, in which Cuyp evidently painted the foreground and cows. In the National Gallery picture Cuyp signs his name on the tail of a milkmaid, whose figure and red skirt he has painted with light effectiveness near the edge of van der Neer's landscape. Again, a couple of fishermen with a dog, and a sportsman creeping up to surprise some ducks, are Cuyp's in a capital van der Neer at the Staedel Institute in Frankfort.

Van der Neer's favourite subjects were the rivers and watercourses of his native country either at sunset or after dark. His peculiar skill is shown in realizing transparency which allows objects—even distant—to appear in the darkness with varieties of tone, but without solid masses. The look of his paintings is veiled with frozen water, and his daylight icescapes with golfers, sleighers, and fishermen are as numerous as his moonlights. But he always avoids the impression of frostiness, which is one of his great gifts. His pictures are not scarce. They are less valuable in the market than those of Cuyp or Hobbema; but, possessing a charm peculiarly their own, they are much sought after by collectors. Out of about one hundred and fifty pictures accessible to the public, the choicest selection is in the Hermitage at St Petersburg. In England paintings from his brush are to be found in the National Gallery and Wallace Collection, and, amongst others, in the collections of the marquess of Bute and Colonel Holford.

2. EGLON VAN DER NEER (1643-1703) was born at Amsterdam, and died at Düsseldorf on the 3rd of May 1703. He was first taught by his father, and then took lessons from Jacob van Loo, whose chief business then consisted in painting figures in the landscapes of Wynants and Hobbema. When van Loo went to Paris in 1663 to join the school from which Boucher afterwards emerged, he was accompanied or followed by Eglon. But, leaving Paris about 1666, he settled at Rotterdam, where he dwelt for many years. Later on he took up his residence at Brussels, and finally went to Düsseldorf, where he entered the service of the elector-palatine Johann Wilhelm von der Pfalz. In each of the places where he stopped Eglon married, and having had three wives became the father of twenty-five children. A portrait of the princess of Neuberg led to his appointment as painter to the king of Spain.

Eglon van der Neer has painted landscapes imitating those of his father, of Berchem, and of Adam Elsheimer. He frequently put the figures into the town views of Jan van der Heyden, and sometimes with Berchem and Adrian van der Velde. His best works are portraits, in which he occasionally came near Ter Borch or Metsu in delicacy of touch, de Hooch in effectiveness of lighting, or Mieris in polish of surface. One of his earliest pieces in which the influence of Ter Borch is apparent is the "Lady with the Book," of 1665, which was sold with the Bredel collection in 1875. A young woman in white and red satin at Rotterdam, of 1669, recalls Mieris, whose style also reappears in Eglon's "Cleopatra" at Buckingham Palace. Two landscapes with "Tobit and the Angel," dated 1685 and 1694, in the museums of Berlin and Amsterdam, illustrate his fashion of setting Scripture scenes in Dutch backgrounds. The most important of his sacred compositions is the "Esther and Ahasuerus," of 1666, in the Uffizi at Florence. But Eglon varied his practice also with arrangements of hunting and hawking parties, pastures and fords, and cavalry skirmishes.

The latest of his panels is a mountain landscape of 1703 in the gallery of Augsburg.

NEERWINDEN, a village of Belgium in the province of Liège, five miles E. by S. of Tирelle, which gives its name to two great battles, the first fought in 1693 between the Anglo-Allied army under William III. of England and the French under the duke of Luxemburg, and the second in 1793 between the Austrians under Prince Josias of Coburg and the French under General Dumouriez.

Battle of Neerwinden or Landen, 1693 (see Grand Alliance, War of the).—Luxemburg, having by feints induced William to detach portions of his army, rapidly drew together superior numbers in face of the Allied camps, which lay in a rough semicircle from Elissem on the right to Neerlanden, and thence along the Landen brook on the left (July 18-28, 1693). William had no mind to retire over the Geete river, and entrenched a strong line from Laer through Neerwinden to Neerlanden. On the right section of this line (Laer to Neerwinden) the ground was much intersected and gave plenty of cover for both sides, and this section, being regarded as the key of the position, was strongly garrisoned; in the centre the open ground between Neerwinden and Neerlanden was solidly entrenched, and in front of it Rumsdorp was held as an advanced post. The left at Neerlanden rested upon the Landen brook and was difficult of access. William's right, as his line of retreat lay over the Geete, was his dangerous flank, and Luxemburg was aware that, the front of the Allies being somewhat long for the numbers defending it, the intervention of troops drawn from one wing to reinforce the other would almost certainly be too late. Under these conditions Luxemburg's general plan was to throw the weight of his attack on the Laer-Neerwinden section, and specially on Neerwinden itself, and to economize his forces—as "economy of force" was understood before Napoleon's time—elsewhere, delivering holding attacks or demonstrations as might be necessary, and thus preventing the Allied centre and left from assisting the right. Luxemburg had about 80,000 men to William's 50,000. Opposite the entrenchments of the centre he drew up nearly the whole of his cavalry in six lines, with two lines of infantry intercalated. A corps of infantry and dragoons was held off for the attack of Neerlanden and Rumsdorp, and the troops destined for the main attack, 28,000 of all arms, formed up in heavy masses opposite Neerwinden. This proportion of about one-third of the whole force to be employed in the decisive attack in the event proved insufficient. The troops opposite the Allied centre and left had to act with the greatest energy to fulfil their containing mission, and at Laer-Neerwinden the eventual success of the attack was bought only at the price of the utter exhaustion of the troops.

After a long cannonade the French columns moved to the attack, converging on Neerwinden; a smaller force assaulted Laer. The edge of the villages was carried, but in the interior a murderous struggle began, every foot of ground being contested, and after a time William himself, leading a heavy counter-attack, expelled the assailants from both villages. A second attack, pushed with the same energy, was met with the same determination, and meanwhile the French in other parts of the field had pressed their demonstrations home. Even the six lines of cavalry in the centre, after enduring the fire of the Allies for many hours, trotted over the open and up to the entrenchments to meet with certain defeat, and at Neerlanden and Rumsdorp there was
severe hand to hand fighting. But, meantime, the two intact lines of infantry in the French centre had been moved to their left and formed the nucleus for the last great assault on Neerwinden, which proved too much for the exhausted defenders. They fell back slowly and steadily, defying pursuit, and the British Coldstream Guards even captured a colour. But at this crisis the initiative of a subordinate general, the famous military writer Feuquières (q.v.), converted the hard-won local success into a brilliant victory. William had begun to move troops from his centre and left to the right in order to meet the great assault; but the French and Neerlandish cavalry of the French centre once again straight at the entrencheds. This time the French squadrons, surprising the Allies in the act of manoeuvring, rode over every body of troops they met, and nothing remained for the Allies but a hurried retreat over the Geete. A stubborn rearguard of British troops led by William himself alone saved the Allied army, of which all but the left wing was fought out and in disorder. Luxemburg had won his greatest victory, thanks in a measure to Feuquières' exploit; but had the assaults on Neerwinden been made— as Napoleon would have made them—Neerlandish and Neerwinden were not in the first third of his forces instead of one-third, the victory would have been decisive, and Feuquières would have won his laurels, not in forcing the decision at the cost of using up his cavalry, but in annihilating the remnants of the Allied army in the pursuit. The material results of the battle were twelve thousand Allies (as against eight thousand French) killed, wounded and prisoners, and eighty guns and a great number of standards and colours taken by the French.

The battle of the 18th March 1793 marked the end of Dumouriez's attempt to overthrow the Low Countries, and the beginning of the Allies' invasion of France. The Austrians under Coburg, advancing from Maastricht in the direction of Brussels, encountered the heads of the hurriedly assembling French army at Treilmont on the 13th of May. He was in possession of Utrecht, and Neerwinden and Neerlandish. On the 18th, however, after a little preliminary fighting Coburg drew back a short distance and rearranged his army on a more extended front between Racour and Dormael, thus parrying the enveloping movement begun by the French from Treilmont. Dumouriez was consequently compelled to fight after all on parallel fronts, and though in the villages themselves the individuality and enthusiasm of the French soldier compensated for his inadequate training and indiscipline, the greater part of the front of contact was open ground, where the superiority of the veteran Austrian regulars was unchallengeable. In these conditions an attempt to win a second Jemmapes with numerical odds of 11 to 10 instead of 2 to 1 in favour of the attack was foredoomed to disaster, and the repulse of the Revolutionary Army was the signal for its almost complete dissolution. Neerwinden was a great disaster, but not a great battle. Its loss, however, was the immediate and decisive calamity of the century system with ill-trained troops. The methods by which such troops could compass victory, the way to fight a "sans culotte" battle, were not evolved until later.

NEES VON ESSENBECK, CHRISTIAN GOTTFRIED (1776-1858), German botanist and entomologist, was born at Erbach on the 14th of February 1776, and was educated at Darmstadt and at Jena, where he took the degree of M.D. After spending some time in medical practice he was appointed professor of botany in Erlangen in 1816. Three years later he became professor of natural history in Bonn, and in 1831 he was appointed to the chair of botany in the university of Breslau. In 1848 he entered political life and made himself so obnoxious to the government that in 1837 he was deprived of his professorship, and in consequence the latter years of his life were spent in great poverty. He died in Breslau on the 16th of March 1858.

For about forty years he edited the Nova acta of the "Acad. Leopold-Carolina," in which several of his own papers were published. His earliest memoirs dealt with the ichneumons, and he published a Monographie der Ichneumone in 2 vols. in 1828, and Hymenopterorum Ichneumonidarum Systematisatis; 2 vols. in 1832. In 1835 he published a work on the Anatidae. Of his other separate works include: Die Algen des süßen Wasses nach ihren Entwicklungsstufen dargestellt (1814); Das System der Pflanze und Schimmels (1815); Die Naturgeschichte der europäischen Lehmnose, in 4 vols. (1833-1838); "Agrostologia Brasiliensis," in the Florae Brasiliensis; and a Systema Larinæarum (1836). He also wrote numerous monographs in Flora, in Linneae and in other scientific German magazines, either alone or along with other well-known botanists. His best-known works are those that deal with the Pungi, the Hepaticae and the Glumiferae, in all which groups he made valuable additions to knowledge.

The other Travels in South America of Ludw. NEES VON ESSENBECK (1827-1837), inspector of the botanic gardens at Leiden, and afterwards professor of pharmacy at Bonn, also wrote numerous papers on botanical subjects, dealing more particularly with medicinal plants and their products.

NEEFF, FELIX (1758-1839), Swiss Protestant divine and philanthropist, was born at Geneve on the 8th of October 1758. Originally a sergeant of artillery, he decided in 1819 to devote himself to religious work. He was ordained to the ministry in 1822, and soon afterwards settled in the valley of Freisinyiès, where he laboured in the manner of J. F. Oberlin, being at one and the same time pastor, schoolmaster, engineer and agriculturist. He was so successful that he changed the character of the district and its inhabitants. In 1827, worn out by his labours, he was obliged to return to his native place, where he died two years later.

NEGAPATAM, a seaport of British India, in the Tanjore district of Madras, forming one municipality with Nagore, a town in the N. of the district of the Vettar river. Pop. (1901) 57,190. It carries on a brisk trade with the Straits Settlements and Ceylon, steamers running once a week to Colombo. The chief export is rice. Negapatam is the terminus of a branch of the South Indian railway, and contains large railway workshops. It is also a depot for coffee emigration. Negapatam was one of the earliest settlements of the Protugueses on the Coromandel coast. It was taken by the Dutch in 1666, becoming their chief possession in India, and by the English in 1781. From 1799 to 1845 it was the headquarters of Tanjore district. There was a further connection of Labbios, Mahomedans of mixed Arab descent, who are keen traders. Jesuit and Wesleyan missions are carried on.

NEGATIVE, a city of Marquette county, Michigan, U.S.A., about 12 m. W. by S. of Marquette and 3 m. E. of Ishpeming, in the N. part of the upper peninsula. Pop. (1904) 6707; (1910) 8460. It is served by the Chicago & North-Western, the Duluth, South Shore & Atlantic, and the Lake Superior & Ishpeming railways. It is built on a ridge called Iron Mountain, 1564 ft. above sea-level, and under and near it are some of the most productive iron-ore deposits in the state, the mining of which is the principal industry of the city. The settlement of Negative began about 1870, and the city was chartered in 1873. The name is a Chippewa word meaning "first" or "he goes before," and is said to have been chosen at the request of the Pioneer Iron Company as an equivalent for "Pioneer."

NEGLECT (Lat. negligentia, from negligentere, to neglect, literally "not to pick up"), a ground of civil law liability, and in criminal law an element in several offences, the most conspicuous of which is manslaughter by negligence. In order to establish civil liability on the ground of negligence, three things must be proved—a duty to take care, the absence of due care, and actual damage caused directly by the absence of due care. Mere carelessness gives no right of action unless the person injured can show that there was a legal duty to take care. The duty may be to the public in general, on the ground that any person who does anything which may involve risk to the public is bound to take due care to avoid the risk. For instance, in the words of Lord Blackburn, "those who go personally or bring property where they know that they or it may come into collision with the persons or property of others have by law a duty cast upon them to use reasonable care and skill to avoid such a collision."

Where a special duty to an individual is alleged, the duty must rest on a contract or undertaking or some similar specific ground. Thus, where a surveyor has carelessly given incorrect progress certificates, and a mortgagee who has had no contractual relation with the surveyor has advanced money on the faith of the certificate, the surveyor is not liable to the mortgagee in an action of negligence; because he owed no duty to the mortgagee to be careful. When a duty to take care is established, the degree of care required is now determined by a well-ascertained standard. This standard is the amount of care which would be exercised.
NEGOTIABLE INSTRUMENT—NEGRI TOS

in the circumstances by an "average reasonable man." This objective standard excludes consideration of the capacity or state of mind of the particular individual. It also gets rid of the old distinctions between "gross," "ordinary" and "slight" negligence, though no doubt the degree of care required varies with the circumstances of the case. The application of such a standard is a task for which a jury is a very appropriate tribunal. In fact the decision of the question whether there has been a want of due care is left almost unreservedly to the jury. There is this amount of control, that if the judge is of opinion that the evidence, if believed, could probably be regarded as showing a want of due care, or in technical language that there is "no evidence of negligence," it is his duty to withdraw the case from the jury and give judgment for the defendant. Unless the judge decides that there is no duty to take care, or that there is no evidence of want of care, the question of negligence or no negligence is wholly for the jury.

Ordinarily a man is responsible only for his own negligence and for that of his servants and agents acting within the scope of their authority. For the acts or defaults of the servants of an independent contractor he is not liable. But in certain cases a defendant was imposed on a defendant of premises is under a duty to all persons who go there on business which concerns him to see that the premises are in a reasonably safe condition so far as reasonable care and skill can make them so. Thus he cannot release himself by employing an independent contractor to maintain the premises. The effect of this doctrine is that the occupier may be liable if it can be shown that the independent contractor or his servant has been guilty of a want of due care. A similar obligation has been enforced in the case of a wreck stranded in a navigable river, and the owner was held liable for damage caused by the carelessness of the servant of an independent contractor who had undertaken to light the wreck. So too any person who undertakes a work likely to cause danger if due care is not taken is liable for damage caused by the carelessness of the servant of an independent contractor, so long as the carelessness is not casual or collateral to the servant's employment.

In an action of negligence a familiar defence is "contributory negligence." This is a rather misleading expression. It is not a sufficient defence to show that the plaintiff was negligent, and that his negligence contributed to the harm complained of. The plaintiff's negligence will not disentitle him to recover unless it is such that without it the misfortune would not have happened, nor if the defendant might by the exercise of reasonable care on his part have avoided the consequences of the plaintiff's negligence. The shortest and plainest way of expressing this rule is, that the plaintiff's negligence is no defence unless it was the proximate or decisive cause of the injury. There was an attempt in recent times to extend this doctrine so as to make the contributory negligence of a third person a defence, in cases where the plaintiff, though not negligent himself, was travelling in a vehicle or vessel managed by a negligent servant, or was otherwise under his control. In such circumstances it was said that the plaintiff was "identified" with the third person. (Watte v. North-Eastern Ry. Co., 1858, E. B. & E., 719.) This case, in the Exchequer Chamber, was an action on behalf of an infant by his next friend. The infant, which was five years of age, was with his grandmother, who took a ticket for the child and a ticket for herself to travel by the defendants' line; as they were crossing the railway to be ready for the train the child was injured by a passing train. The jury found that the defendants were negligent, and that the grandmother was guilty of negligence which contributed to the accident, while there was no negligence of the infant plaintiff. A verdict was entered for the plaintiff, but in the Queen's Bench the verdict was entered for the defendants, without calling on them to argue, on the ground that the infant was identified with its grandmother. But the case of the "Bernina," decided in 1888, where a passenger and an engineer on board the "Bushire" were killed in a collision between the "Bernina" and the "Bushire" caused by fault in both ships, but without fault on the part of the deceased, exploded this supposed doctrine, and made it clear that the defence of contributory negligence holds good only when the defendant contends and proves that the plaintiff was injured by his own carelessness.

The American law of negligence is founded on the English common law; but the decisions in different states have occasionally contradicted English decisions, and also one another.

NEGOTIABLE INSTRUMENT, in law, a document or other instrument purporting to represent so much money, and the property in which passes, like money, by mere delivery. Negotiable instruments arise in either of two ways: (1) by statute, (2) by custom of merchants. The most commonly recognized negotiable instruments are bills of exchange, promissory notes, bills of lading, foreign bonds and debentures payable to bearer. Negotiable instruments constitute an exception to the general rule that a man cannot give a better title than he has himself (see BILL OF EXCHANGE).

The NEGRITOS (Span. for "little negroes"), the name originally given by the Spaniards to the aborigines of the Philippine Islands. They are physical weaklings, of low, almost dwarf stature, with very dark skin, closely curling hair, flat noses, thick lips and large clumsy feet. The term has, however, been more generally applied to one of the great ethnic groups into which the population of the East Indies is divided, and to an apparently kindred race in Africa (see NEGRO). A. de Quatrefages suggests that from the parent negroid stem were thrown off two negrito branches to the west and east, the Indo-Oceanie and African, and that the Akkas, Wochuas, Batwas and Bushmen of the Dark Continent are kinsmen of the Andaman Islanders, the Sakais of the Malay Peninsula and the Aetas of the Philippines. The result of Quatrefages's theory would be to place the negro races closest to the primitive human type, a conclusion apparently justified by their physical characteristics. The true negroes are always of little stature (the majority under 5 ft.), have rounded forms and their skull is brachycephalic or subbrachycephalic, that is to say, it is relatively short and broad and of little height. Their skin is dark brown or black, sometimes somewhat yellowish, their hair woolly (scanty on face and body), and they have the flat nose and thick lips and other physical features of the negroes. Among the people undoubtedly negro are those of the Andaman Islands (q.v.), the Malay Peninsula (q.v.) and some of the Philippines (q.v.), the best types being the Sakais (q.v.), Micronesians and Aetas. The question of the so-called negro races of India, the Oraons, Gonds, &c., is in much dispute, Quatrefages believing the Indian aborigines to have been negroats, while other ethnologists find the primitive people of Hindustan in the Dravidian races. Some authorities have placed the Veddahs of Ceylon among the negroats, but their hair and woolly and dolichocephalic skulls are sufficient arguments against their inclusion. The negro is often confounded with the Pigmy; but the latter, though possessing the same woolly hair and being of the same colour, is a large, often muscular man, with a long, high skull.

See A. de Quatrefages, Les Pygmées (Paris, 1887; Eng. trans. 1895); E. H. Man, The Aborigines of the Andaman Islands (London, 1888); Gigiolo, Nuove notizie sui popoli negroidi dell' Asia e specialmente sui Negriti (Florence, 1879); Meyer, Album von Philipps und Typhens (Dresden, 1883); Blumenstritt, Ethnographie der Philippinen (Gotha, 1892); A. B. Meyer, Die Negritos (Dresden, 1899); A. H. Keane, Ethnology; A. C. Haddon in Nature for September 1899.
NEGRO (from Lat. niger, black), in anthroplogy, the designation of the distinctly dark-skinned, as opposed to the fair, yellow, and brown variations of mankind. In its widest sense it embraces all the dark races, whose original home is the intertropical and sub-tropical regions of the eastern hemisphere, stretching roughly from Senegambia, West Africa, to the Fijian Islands in the Pacific, between the extreme parallels of the Philippines and Tasmania. It is most convenient, however, to refer to the dark-skinned inhabitants of this zone by the collective term of Negroes, and to reserve the word Negro for the tribes which are considered to exhibit in the highest degree the characteristics taken as typical of the variety.

These tribes are found in Africa; their home being south of the Sahara and north of a not very well-defined line running roughly from the Gulf of Guinea to a south-easterly trend across the equator to the mouth of the Tana. In this tract are found the true negroes; and their nearest relatives, the Bantu-negroid peoples, are found to the south of the last-mentioned line. The relation of the yellowish-brown Bushman and Hottentot peoples of the southern extremity of Africa to the negro is uncertain; they possess certain negroid characteristics, the tightly curled hair, the broad nose, the tendency towards prognathism; but their colour and a number of psychological and cultural differences would seem to show that the relation is not close. Between the two a certain affinity seems to exist, and the Hottentot is probably the product of an early intermixture of the first Hamito-Bantu immigrants with the Bushman aborigines (see AFRICA: Ethnology). The relation of the negroes of Africa to those of Asia (southern India and Malaysia) and Australasia cannot be discussed with profit owing to the lack of evidence; still less the theories which have been put forward to account for the wide dispersal from what seems to be a single stock. It will be sufficient to say that the two groups have in common a number of well-defined characteristics of which the following are the chief: A dark skin, varying from dark brown, yellowish brown, to nearly black; dark tightly curled hair, flat in transverse section, 1 of the "woolly" or the "frizzly" type; a greater or less tendency to prognathism; eyes dark brown with yellowish cornea; nose more or less broad and flat; and large teeth.

Sharing these characteristics, but distinguished by short stature and brachycephaly, is a group to which the name Negrito (q.v.) has been given; with this exception the tendency among the negroes appears to be towards tall stature and dolichocephaly in proportion as they approach the pure negro type. As between the two a certain affinity seems to exist, and in Africa, the Asiatic and Australasian negroids may be dismissed with this introduction. The negro and negroid population of America, the descendants of the slaves imported from West Africa, and in a less degree, from the Mozambique coast, before the abolition of the slave-trade, are treated separately below.

In Africa three races have intermingled to a certain extent with the negro; the Libyans (Berbers: q.v.) in the Western Sudan; and the Hamitic races (q.v.) and Arabs (q.v.) in the east. The identity of the people who have amalgamated with the negro to form the Bantu-speaking peoples in the southern portion of the continent, and the Hamitic to the north, is not clear; but as the latter appear to approach the Hamites in those characteristics in which they differ from the true negroes, it seems probable that they are infused with a proportion of Hamitic blood. The true negroes show great similarity of physical characteristics; besides those already mentioned they are distinguished by length of arm, especially of fore arm, length of leg, smallness of calf and projection of heel; characteristics which frequently fail to appear to the same degree among the Bantu, who are also as a rule less tall, less prognathous, less platyrhine and less dark. A few tribes in the heart of the negro domain (the Welle district of Belgian Congo) show a tendency to round head, shorter stature and fairer complexion; but it seems reasonable to suppose that the negro has RECEIVED an infusion of Libyan (or less probably Hamitic) or Negro-Negrito blood.

The colour of the skin, which is also distinguished by a velvety surface and a characteristic odour, is due not to the presence of any special pigment, but to the greater abundance of the colouring matter in the Malpighian mucous membrane between the inner or true skin and the epidermis or scar skin. This colouring matter is not distributed equally over the body, and does not reach its fullest development until some weeks after birth; so that new-born babies are a reddish chocolate or copper colour. But excess pigmentation is doubtless confined to the negro skin; the white pigment are often found in some of the internal organs, such as the liver, spleen, &c. Other characteristics appear to be a hypertrophy of the organs of excretion, a more developed venous system, and a less voluminous brain, as compared with the white races.

In certain of the characteristics mentioned above the negro would appear to stand on a lower evolutionary plane than the white man, and to be more closely related to the highest anthropoids. The characteristics are length of arm, prognathism, and by the same time his environment has not been such as would tend to produce in him the restless energy which has led to the progress of the white race; and the easy conditions of tropical life and the fertility of the soil have reduced the struggle for existence to a minimum. But though the mental inferiority of the negro to the white or yellow races is a fact, it has often been exaggerated; the negro is largely the creature of his environment.

1 It is also noteworthy that the dark colour seems to depend neither on geographical position, the isothermal's of greatest heat, nor even altogether on racial purity. The extremes of the chromatic scale are found in juxtaposition throughout the whole negro domain, in Sene-Gambia, in Gabun, and most of the negroes of the Mozambique. In the last region M de Frobrveldt determined the presence of thirty-one different shades from dusky yellow to sooty black. Some of the sub-negroid and mixed races, such as many Abyssinians, Gall, Jolof and Mandingo, are quite as black as the darkest full-blood negro. A general similarity in the outward conditions of soil, atmosphere, climate, food charged with an excess of ox and other undetermined causes have tended to develop a tendency towards dark shades everywhere in the negro domain apart from the basis mainly due to an original stain of black blood. Perhaps the most satisfactory theory explains the excessive pigmentation in the dark-skinned races as a natural protection against the ultra-violet rays in which tropical light is so rich and which are destructive of protoplasm &c. (see E. Woodruff, Tropical Light, London, 1905). The expression "[e Col. Bongo, the coloured races of Africa, &c. Turin, (1864), p. 20."

2 La Raza Negra nel suo stato attuale, &c. (Turin, 1864), p. 20.
and it is not fair to judge of his mental capacity by tests taken directly from the environment of the white man, as for instance tests in mental arithmetic; skill in reckoning is necessary to the white race, and it has cultivated this faculty; but it is not necessary to the negro.

On the other hand negroes far surpass white men in acuteness of vision, hearing, sense of direction and topography. A native who has once visited a particular locality will rarely fail to recognize it again. For the rest, the mental constitution of the negro is very similar to that of a child, normally good-natured and cheerful, but subject to sudden fits of emotion and passion during which he is capable of performing acts of singular atrocity, impudence, and wantonness, and often deceiving and injuring a servant a dog-like fidelity which has stood the supreme test. Given suitable training, the negro is capable of becoming a craftsman of considerable skill, particularly in metal work, carpentry and carving. The bronze castings by the *ciré perdue* process, and the cups and horns of ivory elaborately carved, which were produced by the natives of Guinea after their intercourse with the Portuguese of the 16th century, bear ample witness to this. But the rapid decline and practical evanescence of both industries, when that intercourse was interrupted, shows that the native craftsman was raised for the moment above his normal standards by foreign influences, and is not capable of sustaining the high quality of his work when that inspiration failed.

In speaking of the form or forms of culture found among negro and negroid tribes, the dependence of the native upon his environment must be kept in mind, particularly in Africa, where interchange of customs is continually taking place among neighbours.

Thus the forest regions are distinguished by a particular form of culture which differs from that prevailing in the more open country (see *Africa: Ethnology*). But it may be said generally that the negro is first and foremost an agriculturist. The negroes are on a lower cultural plane; they are nomadic hunters who do no cultivation whatever. Next in importance to agriculture come hunting and fishing and, locally, cattle-keeping. The last is not strictly typical of negro culture at all; nearly all the tribes by whom it is practised are of mixed origin, and their devotion to cattle seems to vary inversely with the purity of race. The most striking exception to this statement is the Dinka of the upper Nile, the whole of whose existence centres round the cattle pen. Of the other tribes where pastoral habits obtain to a greater or lesser degree, the Masai have a large percentage of Hamitic blood, the eastern and southern Bantu-speaking negroids are also of mixed descent, &c.

The social conditions are usually primitive, especially among the negroes proper, being based on the village community ruled by a chief. Where the country is open, or where the forest is not so thick as to present any great obstacle to communication, it has often happened that a chief has extended his rule over several villages and has ultimately built up a kingdom administered by sub-chiefs of various grades, and, has even established a court with a regular hierarchy of officials. Benin and Dahomey are instances of this. But the region where this “empire-building” has reached its greatest proportions lies to the south of the forest belt in the territory of the Bantu negroids, where arose the states of Lunda, Cazembe, &c.

The domestic life of the negro is based upon polygamy, and marriage is almost always by purchase. So vital is polygamy to the native social system that the attempts made by missionaries to abolish plurality of wives would, if successful (a contingency unthinkable under present conditions), result in the most serious social disorder. Not only would an enormous section of the population be deprived of all means of support, but the native wife would be infinitely harder worked; agriculture, the task of the women, would be at a standstill; and infanticide would probably assume dangerous proportions.

Descent in the negro world is on the whole more often reckoned through the female, though many tribes with a patriarchal system are found. Traces of totemism are found sporadically, but are rare.

Of the highest importance socially are the secret societies, which are found in their highest development among the negroes of the west coast, and to a less significant extent among some of the Bantu negroids of the western forest district. In their highest form these societies transcend the tribal divisions, and the tie which binds the individual to the society takes precedence of all others. But the secret society cannot be called a definitely negro institution, since it is found in the west only.

As an agriculturist the negro is principally a vegetarian, but this form of diet is not the result of direct choice; meat is everywhere regarded as a great delicacy, and no opportunity of obtaining it is ever neglected, with one exception—that the cattle-keeping tribes rarely slaughter for food, because cattle are a form of currency. Fish is also an important article of diet in the neighbourhood of large rivers, especially the Nile and Congo. It is worthy of note that the two cultivated plants which form the mainstay of native life, manioc in the west and centre and mealleys in the south and east, are neither of African origin.

Cannibalism is found in its simplest form in Africa. In that continent the majority of cannibal tribes eat human flesh because they like it, and not from any magical motive or from lack of other animal food. In fact it is noticeable that the tribes most commonly classified as cannibals usually live in districts in which meat is most plentiful. Among the true negroes it is confined mainly to the Welle and Ubangi districts, though found sporadically (and due to magical motives) on the west coast, and among the Bantu negroids in the south-western part of Belgian Congo and the Gabun.

With regard to crafts the most important and typical is that of iron smelting and working. No negro tribe has been found of which the culture is typical of the Stone age; or, indeed, which makes any use of stone implements except to crush ore and hammer metals. These use are rough pieces of stone of convenient size, not shaped in any way by chipping or grinding. Doubtless the richness of the African soil in metal ores rendered the Stone age in Africa a period of very short duration (see *Africa: Ethnology*). A good deal of aptitude is shown in the forging of iron, considering the primitive nature of the tools. Considerable skill in carving is also found in the west and among the Bantu negroids, especially of Belgian Congo south of the Congo. Weaving is practiced to a large extent in the west; the true native material being palm-leaf fibre. The cultivation of the west coast, which has brought such fame to West African art, is often combined with an exotic material and has been subjected to foreign influences. Among the Bantu of the Kasai district the art of weaving palm-cloth reaches its highest level, and in the east cotton-weaving is again found. Pottery-making is almost universal, though nowhere has it reached a very advanced stage; the wheel is unknown, though an appliance used on the lower Congo displays the principle in very rudimentary form. The production of fire by means of friction was universal, the method known as “twirling” being in vogue, *i.e.* the rapid rotation between the palms of a piece of hard wood upon a piece of soft wood. The lighting is practised either by direct heating or through the medium of rude forms of currency which vary according to locality. Value is reckoned among the tribes with pastoral tendencies in cattle and goats; among the eastern negroes by hoe-and spear-blades and salt blocks; in the west by cowries, brass rods, and bronze armlets (manillas); in Belgian Congo variously by *olivella* shells, brass rods, salt, goats and fowls, copper ingots and iron spear-blades, &c.

As regards religion, the question of environment is again important; in the western forests where communities are small the negro is a fetishist, though his fetishism is often combined more or less with nature worship. Where communication is easier the nature worship becomes more systematic, and definite supernatural agencies are recognized, presiding over definite spheres of human life. Where feudal kingdoms have been formed, ancestor-worship begins to appear and often assumes paramount

---

*The three volumes by Colonel Ellis mentioned in the bibliography form an excellent study of the development of negro religion.*
importance. In fact this form of religion is typical of all the eastern and southern portion of the continent (see Africa: Ethnology). With the negro, as with most primitive peoples, it is the malignant powers which receive attention from man, with a view to propitiation or coercion. Beneficent agencies require no attention, since, from their very nature, they must continue to do good. The negro attitude towards the supernatural is based frankly on fear; gratitude plays no part in it. A characteristic feature of the culture area, among both negro and Bantu negro tribes, is the belief that any form of death except by violence must be due to evil magic exercised by, or through the agency of, some human individual; to discover the guilty party the poison ordeal is freely used. A similar form of ordeal is found in British Central Africa to discover magicians, and the wholesale "smelling-out" of "witches," often practised for political reasons, is a well-known feature of the culture of the Zulu-Xosa tribes. Everywhere magic, both sympathetic and imitative, is practised, both by the ordinary man and by professional magicians, and most magical treatment is based on this, although the magician is usually a herbalist of some skill. Where the rainfall is uncertain, the production of rain by magical means is one of the chief duties of the magician, a duty which becomes paramount in the eastern plains among negroes and Bantu negro tribes alike. But the negroes and Bantu negroes have been considerably influenced by exotic religions, chiefly by Mahomedanism along the whole extent of country bordering the Sahara and in the east. Christianity has made less progress, and the reason is not far to seek. Islam is simple, categorical and easily comprehended; it tends far less to upset the native social system, especially in the matter of polygyny, and at the same time discourages indulgence in strong drink. Moreover the number of native missionaries is considerable. Christianity has none of these advantages, but possesses two great drawbacks as far as the negro is concerned. It is not sufficiently categorical, but leaves too much to the individual, and it discountsenance polygyny. The fact that it is divided into sects, more or less competitive among themselves, is another disadvantage which can hardly be overrated. This division has not, it is true, as yet had much influence upon the negroes of Africa, since the various missions have mostly restricted themselves each to a particular sphere; still, it is a defect in Christianity, as compared with Islam, which will probably make itself felt in Africa as it has in Asia.

As regards language, the Bantu negroes all speak dialects of one tongue (see Bantu Languages). Among the negroes the most extraordinary linguistic confusion prevails, half a dozen neighbouring villages in a small area often speaking each a separate language. All are of the agglutinative order. No absolutely indigenous form of script exists; though the Hausa tongue has been reduced to writing without European assistance.1

Negroes in the United States.

After the migration of the African-fined races in large numbers to other parts of the earth occupied by people of darker colour, the adjustment of relations between the different races developed a whole series of problems almost unknown to the ancient world or to the life of modern Europe. The wider the diversity of physique and especially of skin colour, the greater the danger of friction. The more serious the effort to secure individual autonomy and co-operation in natural institutions, the graver have become the difficulties. They have been and are perhaps more acute in the United States than elsewhere, because there the lightest and the darkest races have conmingled, because of the theory on which the government of the country nominally rests, that each freeman should be given an equal chance to improve his industrial position and an equal voice in deciding political questions, and because of the almost irreconcilable differences in the public opinion of the two great sections to only one of which do the problems come home as everyday matters. These were not solved by the Civil War and its aftermath, but their settlement has occupied the heads of the other system of slavery nor the governmental theory during the radical reconstruction period that race differences should be ignored has proved workable, and the trend is now towards some modus vivendi between these extremes.

The only definition of negro having any statutory basis in the United States is that given in the legislation of many Southern states prohibiting intermarriage between a white person and "a person who has one-eighth or more of African blood." Census enumerators in their counts of the American people have distinguished the two main races of whites and negroes, but in so doing they have never been given a definition or criterion of race. Consequently they followed the judgment of the community enumerated, which usually classes as negro all persons known or believed to have in their veins any admixture of negro blood. It is probable that this line, the so-called "colour line," which is emphasized in regions where negroes are numerous by many legal, economic and social discriminations between the races, is drawn with substantial accuracy. Far different has been the result of governmental efforts to draw another line within the group of negroes as thus defined, that between the negroes of "pure negro blood" and the mixed of negro and white blood. This distinction has no legal significance, for negroes of pure blood and negroes of mixed blood are subject to the same provisions of law, and at least for the whites it has little social or economic significance.

An attempt to draw it was made at each census between 1850 and 1890 inclusive, and the results, so far as they were published, indicate that between one-sixth and one-ninth of the negroes in the United States have some admixture of white blood. The figures were reached through thousands of census enumerators, nearly all of whom were white. Of recent years an effort has been made on the part of negro investigators to get an answer to the same question by the careful study of communities selected as typical.

The classification of about 39,000 coloured people, most of them in different parts of Georgia, with a study of the other available data and inferences from a somewhat wide observation, led Dr Dubois to the conclusion that "at least one-third of the negroes of the United States have recognizable traces of white blood." Perhaps we may believe with some confidence that the information from white sources understates, and that from negro sources overstates, the true proportion, and that the true proportion of mulattoes in the United States is between one-sixth and onethird of all negroes. To infer that the true proportion in 1850, 1860, 1870 and 1890, the dates to which the census figures relate, was much less than the true proportion in 1895 to 1900, to which the unofficial figures relate, is contrary to the general trend of the evidence. As the law and the social opinion of the Southern whites make little or nothing of this distinction between negroes of pure blood and mulattoes, it is often regarded as less important than it really is. The recognized leaders of the race are almost invariably persons of mixed blood, and the qualities which have made them leaders are derived certainly in part and perhaps mainly from their white ancestry. Wherever large numbers of full-blooded negroes and of persons of mixed central or north European and negro blood have lived in the same community for some generations, there is a strong and growing tendency to establish a social line between them.

The difficulty of ascertaining the number of mulattoes in the United States and the tendency of the testimony to be modified by the opinion or desire of the race from which it comes are typical. There is hardly any important aspect of the subject upon which the testimony of seemingly competent and impartial witnesses is not materially affected by the influence of the race.
NEGRO

to which the witnesses belong. Under these circumstances it
seems necessary to assume that the testimony of the official
documents of the federal government is correct, unless clear
evidence, internal or external, refutes it. The following state-
ments of fact rest mainly on those sources.

The number of negroes living in the (continental) United
States in 1808 was about nine and three-quarter millions, and
if those in Porto Rico and Cuba be included it reached ten
and two-thousand millions. This number is greater than the total
population of the United States, the negroes being nearly as
great as the population of Norway, Sweden and Denmark.

During the colonial period, and down to the changes initiated
by the invention of the cotton gin, negroes were distributed
with some evenness along the Atlantic coast. Between the date
of that invention and the Civil War, and largely as a result of
the changes the cotton gin set in motion, the tendency was to-
ward a concentration of the negroes in the great cotton-growing
area of the country. In 1700, for example, one-ninth of the
population of the colony of New York was negro; in 1900 only
one-seventh of the population of the empire state belonged
to that race. The division line between the Northern and
Southern states adopted by the Census Office in 1850, and em-
ployed since that date in its publications, is Mason and Dixon's
line, or the southern boundary of Pennsylvania, the Ohio river
from Pennsylvania to its mouth and the southern boundary of
Missouri and Kansas. In the states north of that line, the
Northern states, in all of which but Missouri negro slavery either
never existed or else was abolished before the Civil War, the
white population increased tenfold and the negro population
only fourfold between 1790 and 1860. In the states south of
that line, the Southern states, the negro population in the same
period increased sixfold and the white population not so fast.
It was a widespread opinion shortly after the Civil
War that the emancipated slaves would speedily disperse through
the country, and that this process would greatly simplify the
problems arising from the contact of the two races. This expec-
tation has not been entirely falsified by the result. Between
1860 and 1900 the negroes in the Northern states increased
somewhat more rapidly than the northern whites, and those
in the Southern states much less rapidly than the Southern
whites. As a result, one-tenth of the negroes living in 1908 in the
Northern states, a larger proportion than at any
time during the 19th century. But this process of dispersion
is so slow as not materially to affect the prospects for the
immediate future, and it is still almost as true as at any earlier
date that the region in which cotton is a staple crop coincides
in the main with the region in which negroes are more than one-
half of the total population.

This appears if a comparison is made between the northern
boundary of the so-called Antitrirarian zone of plant and animal
life in the United States, that is the zone of the cotton plant,
sugar cane, rice, pecan and peanut, and the northern boundary
of the "black belt" or region in which the negroes are a majority
of the population. The coincidence of the two is very close,
and was much closer in 1900 than in 1860. It appears yet more
clearly by a comparison between a map showing the counties
in which at least 5% of the area was planted to cotton in 1890
and another map showing the "black belt" counties in 1900.
The black belt stretches north through eastern Virginia beyond
the cotton belt, and the cotton belt stretches south-west through
eastern central Texas beyond the black belt, but between these
two extremes there is a close agreement in the boundaries of the
two areas.
The question "Have the American negroes progressed, materi-
ally and morally, since emancipation?" is generally answered
in the affirmative. But even on this question entire unanimity
is lacking. A considerable body of men could still be found
in 1910, mainly among Southern whites, who held that the con-
dition of the race was worse than it was in the days of slavery.
Probably all competent students would admit, however, that
the race has differentiated since 1865, that the distance separating
the highest tenth from the lowest tenth has become wider, that
the highest tenth is far better and far better off than formerly,
and the lowest tenth is worse and perhaps also worse off than
in slavery. Under such circumstances there are no adequate
objective tests of progress. The pessimist points to the alleged
increase of idleness and crime, the melodist to a demonstrated
decrease of illiteracy and to considerable accumulations of
property. The large majority of competent students believe that
the American negroes have progressed, materially and morally,
since emancipation, that the central or average point is higher than in 1865, although such persons differ widely among themselves regarding the amount of that
progress.

It would be generally but not universally held, also, that the
negroes in the United States progressed under slavery, that they
were far better qualified for incorporation as a vital and
contributing element of the country's civilization at the
time of their emancipation than they were on arrival or than
an equal number of their African kindred would have been.
But probably the rate of progress has been more rapid under
freedom than it was under slavery.
The evidence regarding the progress of the American negro may be grouped under the following heads: numbers, birth-rate, health, wealth, education, occupations, morals,
citizenship.

Numbers.—The dictum of Adam Smith, "The most decisive mark
of the prosperity of any country is the increase of the number of its
inhabitants," may perhaps be adapted by the Southern
"decissive" to "obvious," to the negro population of the United
States. The negro population of Africa is probably not increasing
at all. But during the 19th century the negroes in the United States
increased nearly ninefold. They are now much the most thriving
offshoot of the race and the most civilized and progressive group
of negroes in the world. Under a slavery system not permitting
the importation of new supplies a high rate of increase by excess
of births over deaths is an advantage to the master class. During
the slavery period and until about 1880 the increase of southern
whites and of southern negroes proceeded at about the same rate.
But after the last score of years the century increase of negroes
was much less rapid, the rate being only about three-fifths of that
prevailing among southern whites.

Birth-rate.—As the increase of negro population is slackening, as
the immigration and emigration of negroes are insignificant in
amount, and as the death-rate is about stationary, it is reasonable
to infer that the birth-rate is dwindling. This cannot be stated with
certainty, for there are no registration records giving the number
of births for any large and representative group of American
negroes. A good index to the birth-rate, however, may be derived
from the proportion of children under 5 years of age to women 15 to
49 years of age. In the returns negroes are not distinguished from Indians
and Mongolians. To minimize this slight source of error and at the
same time to secure a more representative and homogeneous popu-
lation group, the following figures are confined to the Southern or
former slave states:

<table>
<thead>
<tr>
<th>Date</th>
<th>Negroes</th>
<th>Whites</th>
</tr>
</thead>
<tbody>
<tr>
<td>1850</td>
<td>705</td>
<td>695</td>
</tr>
<tr>
<td>1860</td>
<td>688</td>
<td>682</td>
</tr>
<tr>
<td>1870</td>
<td>661</td>
<td>601</td>
</tr>
<tr>
<td>1880</td>
<td>641</td>
<td>561</td>
</tr>
<tr>
<td>1890</td>
<td>604</td>
<td>580</td>
</tr>
<tr>
<td>1900</td>
<td>577</td>
<td>581</td>
</tr>
</tbody>
</table>

These figures indicate that the proportion of children to child-
bearing women, and hence probably the birth-rate, changed in the
same direction during each decade between 1850 and 1890. Between
1850 and 1860 the proportion of negro children decreased about 6% and
that of white children about 4%. Between 1860 and 1880 the proportion
of negro children increased about 12% and that of white children about
9%; between 1880 and 1890 the proportion of negro children decreased
about 18% and that of white children about 12%; between 1890 and 1900 the
proportion of negro children decreased about 4% and that of white children
remained practically the same. Before the war the proportion of living children to potential mothers
was about the same for the two races. At the South, for the first three
censuses after the war the proportion of negro children was much
greater than that of white children, but by 1900 that proportion was
less, and the movement during the decade suggests that the proportions
may have begun to change in opposite directions.
Some light upon the influences at work may be derived from the comparison between city and country at the south.

<table>
<thead>
<tr>
<th>Date</th>
<th>Cities having at least 25,000 Inhabitants.</th>
<th>Smaller Cities and Country Districts.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1890</td>
<td>319</td>
<td>301</td>
</tr>
<tr>
<td>1900</td>
<td>271</td>
<td>374</td>
</tr>
</tbody>
</table>

The noteworthy inference from these figures is that the proportion of Negroes in southern cities was very low and decreasing. In 1890 it was about five-sixths, and in 1900 less than three-fourths of the proportion of children among whites in these cities. The differences in northern cities are equally marked. City life appears to exercise a powerful and increasing influence in reducing the birth rate among the Negroes.

Health.—The prosperity and progress of a population group are indicated, not merely by growth in numbers but also by the longevity of its members. This vitality is roughly measured by the death rate. Other things being equal, a low and sinking death rate is evidence of a high and increasing average duration of life. In the United States, vital statistics are in charge of several states and cities, and are often defective or entirely lacking. In 1890 and 1900 the Federal government compiled what were of importance, and in 1884 an official compilation was made of death-rates of Negroes before the war. The results are worth consideration.

</tbody>
</table>

These figures indicate that the death-rate of each race decreased during the half century, but that the Negro among Negroes was much less rapid than among whites. The Negro death-rate at the earliest period exceeded that of the whites by 8-0 per thousand, or three-tenths of the smaller rate. But these figures speak for Negroes living mainly in cities where the proportion of children and elderly persons is small and that of Negroes at the healthy ages is large. After making a proper allowance for these differences in sex and age composition, it is found that the true death-rate of Negroes in the registration area is about twice as high as that of a white population of like sex and age structure. Whether the difference between the two races is due to the greater number of Negroes in the southern cities and the different incidence of diseases in the two regions, and partly by probable differences in the accuracy of diagnosis of disease in the two sections and by physicians attending the two races.

The leading causes of death among Negroes in the registration area are arranged in the order of importance are stated below. The cause of the corresponding death-rate among whites is added, but the differences are affected partly by the greater proportion of Negroes in the southern cities and the different incidence of diseases in the two regions, and partly by probable differences in the accuracy of diagnosis in the two sections and by physicians attending the two races.

</tbody>
</table>

These figures bring out in a striking way the very high mortality, absolute, and relative, of the American Negro from consumption.
deserves careful attention. Enumerations of negroes affording comparable results were made in 1880, 1890 and 1904.

<table>
<thead>
<tr>
<th>Date</th>
<th>Negro Prisoners Number per 100,000 Pop.</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>1890</td>
<td>24,727</td>
</tr>
<tr>
<td>1904</td>
<td>26,087</td>
</tr>
</tbody>
</table>

These figures show a rapid increase between 1880 and 1890 in the number and proportion of negro prisoners, and between 1890 and 1904 a slow increase in the number and a notable decrease in the proportion.

But in order to make the figures for 1890 and 1904 comparable, it is necessary to exclude from those for the earlier date 4473 negro prisoners mainly belonging to two classes, persons in confinement prior to sentence and persons of indeterminate age, who by reason of their inability to pay a fine, but all belonging to classes which were excluded from the enumeration for 1904. This gives the following result:

<table>
<thead>
<tr>
<th>Date</th>
<th>Negro Prisoners Number per 100,000 Pop.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1880</td>

</tbody>
</table>

The proportion of negro prisoners to population increased rapidly between 1880 and 1890 and slightly between 1890 and 1904, the increase for the first period being mostly attributable to the first set of figures and that for the second period by the second set of figures. It is noteworthy also that the proportion of white prisoners to population increased during the same period, but perhaps a more significant comparison is that between the proportion of prisoners of each race to the population of that race in the northern states and the southern states respectively, the distribution of population and the systems of penal legislation and administration being widely different in the two sections. It is impossible to make the correction just referred to except for the United States as a whole, but it must be remembered that the figures for 1890 are not comparable with those for 1904, and that the true figures for that year would be decidedly less.

Number of Prisoners to each 100,000 People.

<table>
<thead>
<tr>
<th>Date</th>
<th>Southern States. Northern States.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1890</td>
<td>157</td>
</tr>
<tr>
<td>1904</td>
<td>221</td>
</tr>
</tbody>
</table>

These figures indicate that in the southern states in 1890 there were about four and a half times as many negro prisoners to population as white prisoners, and in 1904 about five and a half times as many; that in the northern states in 1890 there were about six times as many white prisoners to population as negroes, and in 1904 about nine times as many. They throw no light whatever upon a point they are often quoted as establishing, the comparative criminality of the northern and southern negroes. Those residing in the north include persons of a more adult age, and of a larger population, influences all tending to increase the proportion of prisoners. It seems likely that if the figures for the south in 1890 could be made strictly comparable with those for the same region in 1904 the apparent decrease of 22% in the proportion of negro prisoners to population would about almost but not quite disappear. The evidence regarding crime indicates a continued but slow and slackening increase in the proportion of negro prisoners to negro population in the country as a whole and in its two main sections, an increase in the proportion of white prisoners to white population during the first interval and a decrease during the second, and a growing difference between the two races in the proportion of negro prisoners.

CITIZENSHIP. When the Fourteenth and Fifteenth Amendments to the Federal Constitution were adopted, the former conferring United States citizenship on all native negroes and the latter providing that the right of such citizens to vote should be abridged by any state on account of race, color or previous condition of servitude, it was not the practice in northern states to allow negroes to vote. The northern states were, however, the first to have negroes in the state legislature; the negroes of the southern states were not even regarded as taxable or as voters. Six states in Connecticut, Wisconsin, Minnesota and Colorado, and in each state they were rejected. In all states containing a large proportion of negroes the results of the Federal policy of reconstruction were disastrous, and negroes, perhaps, contributed more than the Civil War itself to estrange the two sections. Since the withdrawal of Federal troops in 1877 the prevailing and persisting jurisdiction of southern whites regarding the laws and the policy to be adopted upon the negro question have been accepted as taking and more weight in determining the action of the states and the Federal government. The number of negroes voting or entitled to vote has been reduced at first by intimidation or fraud, later by legislation or provisions of the state constitutions. If such enactments are not directed against any race but against certain characteristics which may appear mainly in the race, such as illiteracy, inability to pay a fine, or any other act, they are not directed against negroes at all.
NEHEMIAH (Heb. for "Yahweh comforts"), governor of Judaea under Assarhaddons (apparently A. Longinianus, 465-434 B.C.). The book of Nehemiah is really part of the same work with the book of Ezra, though it embodies certain memoirs of Nehemiah in which he writes in the first person. Apart from what is related in this book we possess little information about Nehemiah. The hymn of praise by Ben Sira (Ecclesiasticus xlix. 13) extols his fame for rebuilding the desolate city of Jerusalem and for raising up fresh homes for the downtrodden people. According to other traditions he restored the temple-service and founded a collection of historical documents (2 Mac. i. 18-36, ii. 13). See further Ezra and Nehemiah (Books), J.B. Pusey, History of the Jewish People (2 vols., 1853) and 1857.

NEIGHBOUR (O. Eng. nækegbær, from næka, "nigh," "near") and gebær, "beot," literally "dweller," "husbandman"; cf. Dan. and Swed. nabo, Ger. Nachbar), properly one who lives in a house close to one, hence any one of a number of persons living in the same locality. From Biblical associations (Luke x. 27) the word is used widely of one's fellow-men.

NEILE, RICHARD (1562-1640), English divine, was educated at Westminster school and at St John's College, Cambridge. His first important preferment was as dean of Westminster (1630). In 1631 he held the living of Rochester (1628), Lichfield (1610), Lincoln (1614), Durham (1617) and Winchester (1628), and the archbishopric of York (1631). When at Rochester he appointed William Laud as his chaplain and gave him several valuable preferences. His political activity while bishop of Durham was rewarded with a privy councilship in 1627. Neile sat regularly in the courts of star-chamber and high commission. His correspondence with Laud and with Sir Dudley Carleton and Sir Francis Windebank (Charles I.'s secretaries of state) are valuable sources for the history of the time.

NEILL, JAMES GEORGE SMITH (1810-1857), British soldier, was born near Ayr, Scotland, on the 26th of May 1810, and educated at Glasgow University. Entering the service of the East India Company in 1827, he received his lieutenant's commission a year later. From 1828 to 1832 he was mainly employed in duty with his regiment, the 1st Madras Europeans (of which he wrote a Historical Record), but gained some experience on the general and the personal staffs as D.A.A.G. and as aide-de-camp. In 1830 he received his majority, and two years later set out for the Burmese War. He served throughout the war with distinction, became second-in-command to Cheape, and took part in the minor operations which followed, receiving the brevet of lieutenant-colonel. In June 1834 he was appointed second-in-command to Sir Robert Vivian to organize the Turkish contingent for the Crimean War. Early in 1837 he returned to India. Six weeks after his arrival came the news that all northern India was aflame with revolt. Neill acted promptly; he left Madras with his regiment at a moment's notice, and proceeded to Benares. The day after his arrival he completely and ruthlessly crushed the mutineers (4th June 1857). He next turned his attention to Allahabad, where a handful of Europeans still held out in the fort against the rebels. From the 6th to the 19th of June his men forced their way under conditions of heat and of opposition that would have appalled any but a real leader of men, and the place, "the most precious in India at that moment," as Lord Canning wrote, was saved. Neill received his reward in an army colonelcy and appointment of aide-de-camp to the queen. Allahabad was soon made the concentration of Havelock's column. The officers, through a mutual regard for each other and their respective instructions, disagreed, and when Havelock went on to Cawnpore (where Neill had reoccupied shortly before) he left his subordinate there to command the lines of communication. At Cawnpore, while the traces of the massacre were yet fresh, Neill inflicted the death penalty on all his prisoners with the most merciless rigour. Meanwhile, Havelock, in spite of a succession of victories, had been compelled to fall back for lack of men; and Neill criticized his superior's action with a total want of restraint. A second expedition had the same fate, and Neill himself was now attacked, though by his own exertions and Havelock's victory at Bithor (16th August) the tension on the communications was ended. Havelock's men returned to Cawnpore, and choler broke out there, whereupon Neill again committed himself to criticisms, this time addressed to the commander-in-chief and to Outram, who was on the way with reinforcements. In spite of these very grave acts of insubordination, Havelock gave his rival a brigade command in the final advance. The famous march from Cawnpore to Lucknow began on September 19th; on the 21st there was a sharp fight, on the 22nd incessant rain, on the 23rd intense heat. On the 23rd the fighting opened with the assault on the Allah Bagh, Neill in command in person of the leading European regiment, less recklessly commanded. Neill was hit heavily engaged, and on the 29th he led the great attack on Lucknow itself. The Fury of his assault carried everything before it, and his men were entering the city when a bullet killed their commander. Strict as he was, he was loved not less than feared, and throughout the British dominions he had established a name as a skilful and extraordinarily energetic commander. The rank and precedence of the wife of a K.C.B. was given to his widow, and memorials have been erected in India and at Ayr. See J. W. Kaye, Lives of Indian Officers (1889); and J. C. Marshman, History of the Indian Mutiny (1865).

NEILSON, ADELAIDE (1846-1886), English actress, whose real name was Elizabeth Ann Brown, was born in Leeds, the daughter of an actress, and her childhood and early youth were passed in poverty and menial work. In 1865 she appeared in Margate as Julia in The Hunchback, a character with which her name was long to be associated. For the next few years she played at several London and provincial theatres in various parts, including Rosalind, Amy Robsart and Rebecca (in Ivanhoe), Beatrice, Viola and Isabella (in Measure for Measure). In 1872 she visited America, where her beauty and talent made her a great favourite, and she returned year after year. She died on the 15th of August 1880. Miss Neilson was married to Philip Henry Lee, but was divorced in 1877.

NEISSE, three rivers of Germany. (1) The Glatzer Neisse rises on the Schneegengebirge, at an altitude of 1,400 ft., flows north past Glatz, turns east and pierces the Eulengebirge in the Wartha pass, then continues east as far as the town of Neisse, and after that flows north-east until at an altitude of 453 ft. it joins the Oder between Oppeln and Briesen. Owing to its terrigenous character the greater part of its course is only used for floating down timber. It abounds in fish, and its total length is 212 m. (2) The Lasauritzer or Görlitzer Neisse rises near Reichenberg in Bohemia, on the south side of the Riesengebirge, at an altitude of 1190 ft., flows north west near Reichenberg, Görlitz, Forst and Guben, and enters the Oder above Fürstenberg at an altitude of 105 ft. Its length is 140 m., of which less than 40 m. are navigable. (3) The Wüterende Neisse is a tributary of the Kätzbach.

NEISEN, a town and fortress of Germany, in the province of Prussian Silesia, at the junction of the Neisse and the Biala, 32 m. by rail S.W. of Oppeln. Pop. (1903) 25,734 (mostly Roman Catholics) including a garrison of about 5000. It consists of the town proper, on the right bank of the Neisse, and the Friedrichstadt on the left. The Roman Catholic parish church of St. James (Jakobikirche) dates mainly from the 13th century, but was finished in 1430. The chief secular buildings are the old episcopal residence, the new town hall, the old Rathaus, with a tower 205 ft. in height (1499), the beautiful Renaissance Kämmererei (exchequer) with a high gabled roof ornamented with frescoes, and the theatre. A considerable trade is carried on in agricultural products.

Neise, one of the oldest towns in Silesia, is said to have been founded in the 10th century, and afterwards became the capital of a principality of its own name, which was incorporated with the bishopric of Breslaw about 1200. Its first walls were erected in 1350, and enabled it to repel an attack of the Hussites in 1424. It was thrice besieged during the 'Thirty Years' War. The end of the first Silesian War left Neise in the hands of Frederick the Great, who laid the foundations of its modern fortifications.
The town was taken by the French in 1807. Neisse can, at the will of the garrison, be protected by a system of inundation.

**NEJD**, a central province of Arabia, bounded N. by the Nafud desert, E. by El Hasa, S. by the Dhahe desert and W. by Asir and Hejžá. It lies between 20° and 28° N. and 41° and 48° E., extends nearly 550 m. from north to south, 450 from east to west, and covers approximately 180,000 sq. m. The name Nejd implies an upland, and this is the distinctive character of the province as compared with the adjoining coastal districts of Hejžá and El Hasa. Its general elevation varies from 2,000 ft. on its western border to 2,500 in Kasim in the north-east, and somewhat less in Yemáma in the south-east. In the north the double range of Jebel Shammar, and in the east the ranges of J. Tuwék and J. 'Arid rise about 1,500 ft. above the general level, but on the whole it may be described as an open steppe, sloping very gradually from S.W. to N.E. of which the western and southern portion is desert, or at best pasture land only capable of supporting a nomad population; while in the north and east, owing to greater abundance of water, numerous fertile oases are found with a large settled population. The principal physical features are described in the article ARABIA.

The main divisions of Nejd are the following: Jebel Shammar, Kasim, Sudēr, Wushman, 'Arid, Asfāj, Harf, Yemáma and Wadi Dawsár. J. Shammar is the most northerly: its principal settlements are situated in the valley some 70 m. long, between the two hills which entirely surround it on the north and south. Its western outer flanks. Jauf, Téma and Khairab, though dependencies of the Shammar principality, lie beyond the limits of Nejd. The capital, Hall, has been visited by several Europeans, by W. G. Palgrave in 1862, when Tálāl was emir, and by Mr Willfrid and Lady Anne Blunt, Charles Dougherty, C. Huber, T. Euting and Baron E. Nolde during the reign of Mohammad b. Rashid, who from 1892 till his death in 1897 was emir of all Nejd. Its well ordered and thriving appearance is commented on by all these travellers. The town is surrounded by a wall and dominated by the emir’s palace, a stately, if somewhat gloomy building, the walls of which are quite 25 ft. high, with six towers, the whole giving the idea of an old French or Spanish donjon.

Hall lies at the northern end of the valley, 2 m. S.E. of J. Aja, at an altitude of about 3,000 ft. The highest point of J. Aja, the western and higher of the twin ranges, is according to Huber 4,600 ft. above sea-level. The valley is about 20 m. in width and is intersected with dry ravines and dotted with low ridges generally of volcanic origin. Wells and springs are the only source of water supply, both for drinking and for irrigation. The principal crops are dates, wheat and barley and garden produce; forage and firewood are very abundant, and the total population was estimated by Nolde in 1893 at 10,000 to 15,000.

Among the other settlements of J. Shammar are Jaféfá and Mukák at the northern foot of J. Aja, Kasr and Kafár at its southern foot, Rauda, Mustajidda and Féd at the foot of J. Selma, all large villages of 3,000 to 5,000 inhabitants. 'Akdá is a small valley in the heart of J. Aja, an hour’s ride from Hall; it was the oldest possession of the Ibn Rashid, since 1835 the ruling family of J. Shammar, and is a place of great natural strength. Kasim lies E. of J. Shammar in the valley of the W. Rumma the great wadi of northern Nejd; the chief towns Burēdá and 'Anežá are situated about 70 m. apart, on the north and south sides of the wadi respectively. Doughty described 'Anežá in 1879 as clean and well built with walls of sun-dried brick, with well supplied shops. Many inhabitants live in distant houses in gardens outside the town walls. 'Anežá and Burēdá each contain some 12,000 inhabitants. The dry bed of the Wadi Rumma in lower Kasim is about 2 m. across, fringed in places with palm plantations; water is found at 6 or 8 ft. in the dry season and in winter the wells overflow. The staple of cultivation is the date-palm, the fruit ripening in August or September. Fruit trees and fields of wheat, millet or millet surround the villages, but the extent of cultivation is limited by the necessity of artificial irrigation. Kaháfa, Kusába and Kuwárá are the principal villages of upper Kasim; and 'Anežá and Burēdá, Madnáb, Ayun and Ras of lower Kasim.

Doughty’s and Huber’s explorations did not extend east of Kasim, and for all details regarding eastern and southern Nejd Palgrave is the only authority. According to him, a long desert march leads from Madnab to Zulfā the first settlement in Sūdér, where the land rises steadily to the high calcareous tableland of J. Tuwék. The entire plateau is intersected by a maze of valleys, generally with steep banks, as if artificially cut out of the limestone. In these countless hollows is concentrated the fertility and population of Nejd; gardens and houses, cultivation and villages lie hidden from view among the depths while one journeys over the dry flats, till one comes suddenly on a mass of emerald green beneath.

Sūdér forms the northern end of the plateau, 'Arid the southern, while Wushman appears to lie on its west, and Asfāj and el Harf below it and to the south and south-west respectively. The principal town is Majma the former capital of Sūdér, a walled town situated on an eminence in a broad shallow valley surrounded by luxuriant gardens and trees. Tawém, Jalajil and Hula are also described by Palgrave as considerable towns.

'Arid is entered at Sedūs, on the W. Hanía, a broad valley bottom with precipitous sides, here 2 or 3 m. wide, full of trees and brushwood. Along its course lie the villages of Ayāna, and Deraíya the former Wahhābí capital, destroyed by Ibrahim Paša in 1817; and a few miles farther E. the new capital of the reigning Emir is sited by the emir. They were visited by Palgrave in 1863, and by Pelly two years later. It was then, and still is, a large town of perhaps 20,000 inhabitants with thirty or more mosques, well-stocked bāzārs, and like the towns of Kasim, surrounded by well-watered gardens and palm groves. To the south the valley opens out into the great plains of Yemáma, dotted with groves and villages, among which Manfuha is scarcely inferior in size to Riád itself. Still farther to the south-east lies the district of Harik, with its capital Hauta, the last in that direction of the settled districts of Nejd, and on the borders of the southern desert.

Palgrave visited El Kharfa the chief place of the Alaj district some 80 m. S.W. of Riád. This district seems to be scantily peopled as compared with Sūdér or Yemáma, and a large proportion of the inhabitants are of mixed negro origin. While there, he made inquiries about the adjoining district of W. Dawāsir. Its length was stated to be ten days’ journey or 200 m.; scattered villages consisting of palm-leaf huts lie along the way, which leads in a south or south-westerly direction to the highlands of Asir and Yemen.

The Beduín who occupy the remainder of Nejd consist in the main of the four great tribes of the Shammar, Harb, 'Atēba and Mutēr. The first-named represent that part of the great Shammar tribe which has remained in its ancestral home on the southern edge of the Nafud (the northern branch long ago emigrated to Mesopotamia); many of its members have settled down to town life, but the tribe still retains its Bedouin character, and its late chief, the emir Mahommed Ibn Rashid, the most powerful prince in Nejd, used to live a great part of his year in the desert with his tribesmen. The Harb are probably the largest of the Bedouin tribes in the peninsula; they are divided into a number of sections, several of which have settled in the oases of Hejžá, while others remain nomadic. Their territory is the steppe between Kasim and Medina, and across the pilgrim road between Medina and Mecca, for the protection of which they receive considerable subsidies from the Turks. The 'Atēba circuits extend from the Hejžá border near Mecca along the road leading thence to Kasim. The Mutēr occupy the desert from Kasim northwards towards Kuwēt.

Nejd became nominally a dependency of the Turkish empire in 1871 when Mīhad Pasha established a small garrison in El Hasa, and created a new civil district under the government of Baura, under the title of Nejd, with headquarters at Hofuf. Its real independence was not, however, affected, and the emirs,
Mohammed Ibn Rashid at Hall, and Abdullah Ibn Sa‘ud at Riadh, ruled in western and eastern Nejd respectively, until 1893, when the former by his victory at ‘Anţaza became emir of all Nejd. His successor, Abdul Aziz Ibn Rashid, was, however, unable to hold his position, and in spite of Turkish support sustained a severe defeat in 1905 at the hands of Ibn Sa‘ud which for the time, at any rate, restored the supremacy to Riadh.

No data exist for an accurate estimate of the population; it probably exceeds 1,000,000, of which two-thirds may be settled, and one-third nomad or Bedouin. Palgrave in 1864, perhaps unduly exaggerating the importance of the town population, placed it at nearly double this figure. The revenue of the emir Mohammed Ibn Rashid of Hall, who died in 1897, was estimated by Blunt in 1879 at £60,000, and his expenditure at £57,000 a year. Outside the visited Hall in 1893 after the emir’s conquest of the Wakahabi state, believed that his surplus income then amounted to £60,000 a year, and his accumulated treasure to £1,500,000.

NEJEF, or Meshed ‘Ali, a town of Asiatike Turkey, in the pass of Baghdad, 30 m. S. of Kerbelah and 5 or 6 m. W. of the ruins of ancient Ka‘fa, out of the bricks of which it is chiefly built. It stands on the eastern edge of the Syrian desert, on the north-eastern shore of a deep depression, formerly a sea, the Assyrion Stagnum of the old geographers, but in latter years drained and turned into gardens for the town. It is a fairly prosperous city, supplied with admirable water by an underground aqueduct from the Hindeh canal, a few miles to the north, which also serves to water the gardens in the deep dry bed of the former lake. The town is enclosed by nearly square brick walls, flanked by massive round towers, dating from the time of the caliphs, but now falling into decay. Outside the walls, over the sterile sand plateau, stretch great fields of tombs and graves, for Nejef is so holy that he who is buried here will surely enter paradise. In the centre of the town stands Meshed (strictly Meshedh) ‘Ali, the shrine of ‘Ali, containing the reputed tomb of that caliph, which is regarded by the Shi‘ite Moslems as being no less holy than the Ka‘ba itself, although it should be said that it is at least very doubtful whether ‘Ali was actually buried there. The dome of the shrine is plated with gold, and within the walls and roof are covered with polished silver, glass and coloured tiles. The resting-place of ‘Ali is represented by a large square stone, on which small windows are graced with double bars, and a door with a great silver lock. Inside this is a smaller tomb of damascened ironwork. In the court before the dome rise two minarets, plated, like the dome, with finely beaten gold from the height of a man and upward. While the population of Nejef is estimated at from 20,000 to 30,000, there is in addition a very large floating population of pilgrims, who are constantly arriving, bringing corpses in all stages of decomposition and accompanied at times by sick and aged persons, who have come to Nejef to die. At special seasons the number of pilgrims exceeds many thousands. The tomb of ‘Ali is the point of departure from which Persian pilgrims start on the journey to Mecca. No Jews or Christians are allowed to reside there. The accumulated treasures of Meshed ‘Ali were carried off by the Wahhabites early in the 19th century, and in 1843 the town was deprived of many of its former liberties and compelled to submit to Turkish law; but it is again enormously wealthy, for what is given to the shrine may never be sold or used for any outside purpose, but constantly accumulates. Moreover, the hierarchy derives a vast revenue from the fees for burials in the sacred edifices.

NELEUS, in Greek legend, son of Poseidon and Tyro, brother of Pelias. The two children were exposed by their mother, who afterwards married Cretheus, king of Iolcus in Thessaly. After the death of Cretheus, the boys, who had been brought up by herdsmen, quarrelled for the possession of Iolcus. Pelias expelled Neleus, who migrated to Messenia, where he became king of Pylos (Apollodorus I. 6; Dion. Sic. IV. 68) and the founder of a royal family called the Neleidae. Thus Neleus may be traced as the old ruling family in some of the Ionian states in Asia Minor. Their presence is explained by the legend, that when the Dorians conquered Peloponnesus, the Neleidae were driven out and took refuge in Attica, whence they led colonies to the eastern shores of the Aegean. By Chloris, daughter of Amphion, Neleus was the father of twelve sons (of whom Nestor was the most famous) and a daughter Pero. Through the contest for his daughter’s hand (see Melampus) he is connected with the legends of the prophetic race of the Melampodidae, who found the mysteries and expatiatory rites of Dionysus in Argolis. According to Pausanius (i. 2. 2, v. 8. 2) Neleus restored the Olympian games and died at Corinth, where he was buried on the isthmus.

NELLORE, a town and district of India, in the Madras presidency. The town is on the right bank of the Penner river, and has a station on the East Coast railway, 109 m. N. of Madras city. Pop. (1901) 32,040. There are United Free Church, American Baptist and Catholic missions.

The District of Nellore has an area of 9761 m. It consists of a large tract of low-lying land extending from the base of the Eastern Ghats to the sea. Its general aspect is forbidding: the coast-line is a fringe of blown sand through which the waves occasionally break, spreading a salt sterility over the fields. Farther inland the country begins to rise, but the soil is not naturally fertile, nor are means of irrigation readily at hand. About one-half of the total area is cultivated; the rest is either rocky waste or is covered with low scrub jungle. The chief rivers are the Pennar, Suvarnamukhi and Gundlakam.

They are not navigable, but are utilized for irrigation purposes, the chief irrigation work being the anicut across the Pennar. Nellore, however, is subject both to droughts and to floods. Copper was discovered in the western hills in 1805, but several attempts by European capitalists to work the ore proved unremunerative, and the enterprise has been abandoned since 1840. Iron ore is smelted by indigenous methods in many places, but the most important mining industry is that of mica. Salt is largely manufactured along the sea-coast. Nellore, with the other districts of the Carnatic, passed under direct British administration in 1801. The population in 1901 was 1,496,687 showing an increase of 2·3% in the decade. In 1904 a portion of the district was transferred to the newly formed district of Guntur, reducing the remaining area to 7965 sq. m., with a population of 1,272,815. The principal crops are millets, rice, other food grains, indigo and oil-seeds. The breed of cattle is celebrated. The East Coast railway, running through the length of the district, was opened throughout for traffic in 1899. The section from Nellore town to Gudur, formerly on the metre gauge, has been converted to the standard gauge. Previously the chief means of communication with Madras was by the Buckingham canal. The sea-borne trade is insignificant.

NELSON, HORATIO NELSON, VISCOUNT (1758-1805), duke of Bronte in Sicily, British admiral, was born in 1758, the son of the wealthy linen-draper house of Burnham Thorpe, in Norfolk, on the 20th of September 1758. His father, Edmund Nelson (1722-1800), who came of a clerical family, was rector of the parish. His mother, whose maiden name was Catherine Suckling (1724-1767), was a grandson of Sir Robert Walpole (1st earl of Orford). This connexion proved of little or no value to the future admiral, who, in a letter to his brother, the Rev. William Nelson, written in 1784, speaks of the Walpoles as “the merest set of cyphers that ever existed—in public affairs I mean.” His introduction to the navy came from his maternal uncle, Captain Maurice Suckling (1725-1778), an officer of some reputation who at his death held the important post of comptroller of the navy. Horatio, who had received a summary, and broken, education at Norwich, Downham and North Walsham, was entered on the “Raisable” when Captain Suckling was appointed to her in 1770 on an alarm
of war with Spain. The dispute was settled, and Captain Suckling was transferred to the "Triumph," the guardship at Chatham, whither he took his nephew. In order that the lad might have more practice than could be obtained on a harbour ship, his uncle sent him to the West Indies in a merchant vessel, and on his return gave him constant employment in boat work on the river. In a brief sketch of his life, which he drew up in 1799, Nelson says that in this way he became a good pilot for small vessels from Chatham to the Tower of London, down the Swin, and the North Foreland; and confident of myself among rocks and sands, which has many times since been of great comfort to me. Between April and October of 1772 he served as Captain Lutwidge in the "Cromer," one of the vessels which went on a not otherwise notable voyage to the Arctic seas with Captain Phips, better known by his Irish title of Baron Mulgrave. On his return from the north he was sent to the East Indies in the "Seahorse," in which vessel he made the acquaintance of his lifelong friend Thomas Troubridge. At the end of two years he was invalided home. In after times he spoke of the depression under which he laboured during the return voyage, till "after a long and gloomy reverie, in which I almost wished myself overboard, a sudden glow of patriotism was kindled in my heart, and presented my king and my country as my patron. My mind exulted in the idea. 'Well then, I exclaimed, 'I will be a hero, and, confiding in Providence, I will brave every danger.' " He spoke to friends of the "radiant orb" which from that hour hung ever before him, and "urged him onward to renown." On his return home he served during a short cruise in the "Worchester" frigate, passed his examination as lieutenant on the 9th April 1777, and was confirmed in the rank next day. He went to the West Indies with Captain Locker in the "Lowestoft" frigate, was transferred to the flagship by the admiral commanding on the station, Sir Peter Parker (1721-1813), and was then by him placed in rank to the command of the "Badger" brig, and the "Hinchinbrook" frigate. By this appointment, which he received in 1779, he was placed in the rank of post captain (from which promotion to flag rank was by seniority), at the very early age of twenty. His connexion with Captain Suckling may, no doubt, have been of use to him, but in the main he owed his rapid rise to his power of winning the affection of all those he met, whether as comrades or superiors. Sir Peter Parker and Lady Parker remained his friends all through his life. In 1780 he saw his first active service in the navy, when, a midshipman in the "San Juan" sloop, he was rendered deadly by the climate. He was brought to death's door by fever, and invalided home once more. In 1781 he was appointed to the "Albemarle" frigate, and after some convoy service in the North Sea and the Sound was sent to Newfoundland and thence to the North American station. "Fair Canada," as he records in one of his letters, gave him the good health he had so far never enjoyed. At Quebec he formed one of those passionate attachments to women which marked his career. He now made the personal acquaintance of Sir Samuel Hood, Lord Hood. In the autobiographical sketch already quoted, he mentions the high opinion formed of him by the admiral who presented him to Prince William, duke of Clarence, afterwards King William IV., as an officer well qualified to instruct him in "naval tactics," by which we must perhaps understand seamanship. Prince William has left a brief but singularly vivid account of their first meeting. He appeared, says the Prince, "to be the merest boy of a captain I ever beheld; and his dress was worthy of attention. He had on a full-fledged uniform; his lack unpowdered hair was tied in a stiff Hessian tail of an extraordinary length; the old-fashioned flaps of his waistcoat added to the general quaintness of his figure, and produced an appearance which particularly attracted my notice; for I had never seen anything like it before, nor could I imagine who he was or what he came about. My doubts were, however, removed when Lord Hood introduced me to him. There was something irresistibly pleasing in his address and conversation; and an enthusiasm, when speaking on professional subjects, that showed he was no common being." The slight oddity of appearance, the power to arouse affection, and the glow indicating the fire within, are noted by all who ever looked Nelson in the face.

In March 1783, at the very end of the American War, he saw his second piece of active service. He was repulsed in an attempt to retake Turk's Island from the French. The peace gave him leisure to pay a visit to France, for which country and all its ways he entertained a dislike and contempt characteristic of his time. In France he formed another attachment, and went so far as to apply to a maternal uncle for an allowance to eke out his half-pay. It came to nothing, presumably by refusal on the lady's part. And now when the navy was cut down to the quick on the peace establishment, and the vast majority of naval officers were condemned to idleness on shore, he had the extraordinary good fortune to be appointed to the command of the "Boreas" frigate, for service in the West Indies. Nelson found in this commission an opportunity for the display of his readiness to assume responsibility. He signalized his arrival in the West Indies by refusing to obey an order of the admiral which required him to acknowledge a half-pay officer acting as commissioner of the dockyard at Antigua as his superior. He insisted on enforcing the Navigation Laws against the Americans, who by the time independent had become foreigners. He called the attention of the government to the corruption prevailing in the dockyard of Antigua. His line was in all cases correct, but it impressed the admiralty as somewhat assuming, and his strong measures against the interfering trade brought on him many lawsuits, which, though he was defended at the expense of the government, caused him much trouble for years. In the West Indies on the 12th of March 1787 he married Frances Nisbet (1761-1831), the widow of a doctor in Nevis, whose favour he first gained by being found romping on all fours with her little boy under the drawing-room table. The marriage was one of affection and respect, rather than of love.

Though Nelson had as yet seen little active service, and that little had not been specially distinguished, he had already gained that reputation within his own service which commonly precedes public recognition. His character had been fully developed, and his capacity proved. His horizon was narrow, being strictly confined to his profession. He had all the convictions of the typical John Bull of his generation. The loyalty of a devoted subject was strong in him. He burned to win affection, admiration, distinction. He was a man to do whatever there was to be done. An instrument of the first excellence. A most magnificent instrument for use in the great Revolutionary struggle now close at hand could not have been forged.

War having broken out, he was appointed captain of the "Agamemnon" (64) on the 30th of November 1793, and joined his ship on the 7th of February. From this date till June 1800, rather more than seven years, he was engaged on continual active service, with the exception of a few months when he was invalided home. This period is the most varied, the busiest, the most glorious and the most debated of a very full career. It subdivides naturally into three sections; (1) From the date of his appointment as captain of the "Agamemnon" till he was disabled by the loss of his arm in the unsuccessful attack on Santa Cruz de Tenerife on the 24th of July 1797 he served as captain, or commodore, under Hood, Itham and Jervis, successive commanders-in-chief in the Mediterranean. (2) After an interval of nine months spent at home in recovering from his wound, and from the effects of a badly performed operation, he returned to the Mediterranean, and was at once sent in pursuit of the great French armament which sailed from Toulon under the command of Napoleon for the conquest of Egypt. His victory of the Nile on the 1st of August 1798 placed him at once in the foremost rank among the warriors of a warlike time, and made him a national hero. With his return to Naples on the 22nd of September the second period ends. (3) From now till he landed at Leghorn on the 26th of July 1800, on his return home across Europe, he was entangled at Naples in political transactions and intrigues, which he was ill prepared to deal with by either nature or training, and was plunged into the absorbing passion,
which did increase his popularity with the mob, but cost him many friends.

The first of these three passages in his life is full of events which must, however, be told briefly. In May he sailed for the Mediterranean with Hood, and was engaged under his orders in the occupation of Toulon by the allied British and Spanish forces. In August 1793 he was despatched to Naples to convoy the troops which the Neapolitan government had undertaken to contribute towards the garrison of Toulon. It was on this occasion that he made the acquaintance of Emma Hamilton (q.v.), the wife of Sir William Hamilton, minister at the Court of Naples. References to Lady Hamilton begin to appear in his letters to his wife, but, as might be expected, they indicate little beyond respectful admiration, and he makes a good deal of her kindness to his stepson, Josiah Nisbet, whom he had taken to sea. Young Nisbet was afterwards promoted to post captain, and was put in command of a frigate at an improperly early age by Nelson's interest. He proved quite unworthy, and in the end died mad.

After the allies had been driven from Toulon by Napoleon, Nelson was employed throughout 1794 in the operations connected with the occupation of Corsica. In April and May he was engaged in the capture of Bastia, and June and July he was employed in Calvi. Both the British squadrons were suffering from a lack of stores, but the naval brigades under Nelson's personal direction were conspicuously active, and their energy was favourably contrasted with the alleged formalities of the troops. During the operations at Calvi, Nelson's right eye was destroyed by gravel driven into it by a cannon shot which struck the ground close to him. From the date of the occupation of Corsica till the island was evacuated, that is to say, from the end of 1794 till the middle of 1795, he was incessantly active. He served under Hotham, who undertook the command when Hood returned to England, and was engaged in the indecisive actions fought by him in the Gulf of Lyons in May 1795. The easy-going ways of the new admiral fretted the eager spirit of Nelson, and Hotham's placid satisfaction with the trifling result of his encounters with the French provoked his subordinate into declaring that, for his part, he would never think that the British fleet had done very well if a single ship of the enemy got off while there was a possibility of taking her. His zeal found more satisfaction when he was detached to the Riviera of Genoa, where, first as captain, and then as commodore, he had an opportunity to prove his qualities for independent command, but harrowing with Jervis, who was connected with the French, and co-operating with the Austrians. In Sir John Jervis, who superseded Hotham, he found a leader after his own heart.

When Spain, after first making peace with France at Basel, declared war on England, and the fleet under Jervis withdrew from the Mediterranean, Nelson was despatched to Elba on a hazardous mission to bring off the small garrison and the naval stores. He sailed in the "Minerve" frigate, having another with him. After a smart action with two Spanish frigates which he took off Carthage on the 20th of December, and a narrow escape from a squadron of Spanish line of battle ships, he fulfilled his mission, and rejoined the flag of Jervis off the eave of the great battle off Cape St Vincent on the 14th of February 1797 (see ST VINCENT, BATTLE OF). The judgment, independence and promptitude he showed in this famous engagement, were rewarded by the conspicuous part he had in the victory, and revealed him to the nation as one of the heroes of the navy. Nelson receiving the swords of the Spanish officers on the deck of the "San Josef" became at once a popular figure.

A few days after the victory he became rear-admiral by seniority. He had already been made a peer under the title of Earl St Vincent. Nelson's own services were recognized by the grant of the knighthood of the Bath. During the trying months in which the fleet was menaced by the sedition then rife in the navy, which came to a head in the mutinies at Spithead and the Nore, he remained with the flag, and in the blockade of Cadiz. In July 1797 he was sent on a desperate mission to Santa Cruz de Tenerife. It was believed that a Spanish Manilla ship carrying treasure had anchored at that place, and Lord St Vincent was desirous of depriving the enemy of this resource. The enterprise was, in fact, rash in the last degree, for the soldiers from the garrisons of Elba and Corsica having gone home, no troops were available for the service, and a fortified town was to be taken by man-of-war boats alone. Nelson's well-established character for daring marked him out for a duty which could only succeed by dash and surprise, if it was to succeed at all. But the Spaniards were on the alert, and the attack, made with the utmost daring on the night of the 24th of July, was repulsed with heavy loss. Some of the boats missed the mole in the dark and were stove in by the surf, others which found the mole were shattered by the fire of the Spaniards. Nelson's right elbow was shot through, and he fell back into the boat from which he was directing the attack. The amputation of his arm was badly performed in the hurry and the dark. He was invalided home, and spent months of extreme pain in London and at Bath. On the 10th of April 1798 he came back to the fleet off Cadiz as rear-admiral, with his flag in the "Vanguard" (74).

He was now one of the most distinguished officers in the navy. Within the next six months he was to raise himself far above the heads of all his contemporaries. It was notorious that a great armament was preparing at Toulon for some unknown destination. To discover its purpose, and to defeat it, the British government resolved to send their naval forces again into the Mediterranean, and Nelson was chosen for the command by Jervis, with whom the immediate decision lay, but also by ministers.

Having joined the flag of Lord St Vincent outside of the straits of Gibraltar on the 30th of April, Nelson was detached on the 2nd of May into the Mediterranean, with three line-of-battle ships and five frigates, to discover the aim of the Toulon armament. Napoleon had, however, enforced rigid secrecy, and Nelson, on obtaining the information that Jervis had been despatched to St Vincent, was directed to return to Toulon for more information. In the meantime the French squadron made its appearance, but Nelson, contrary to the advice of Jervis, insisted on staying in the Mediterranean rather than the British at concealing their plans. Beyond the fact that a powerful combined force was collected in the French port he could learn nothing. On the 20th of May the "Vanguard" was dismasted in a gale. Nelson bore the check in a highly characteristic manner. "I ought not," he wrote, "to call what has happened by the cold name of accident; but I believe firmly that it was the Almighty's goodness to check my consummate vanity." The "Vanguard" was saved from going on shore by the seamanship of the French flagship's captain, and Nelson, who had hitherto been under the impression that he had hitherto a peculiar regard. The "Vanguard" was refitted by the exertions of her own crew under cover of the little island of San Pietro on the southern coast of Sardinia. In the meantime the frigates attached to his command had returned to Gibraltar, in the erroneous belief that the liners would be taken there to make good the damage suffered in the gale. "I thought Hope would have known me better," said Nelson. On the 30th of April he was off Toulon again, only to find that the French were gone, and that he could not learn whither they were steering. Racked by anxiety and deprived of his best ship, he obtained the armament by the disappearance of his frigates, he remained cruising till he was joined, on the 7th of June, by Troubridge with ten sail of the line. And now he started on his fierce pursuit of the enemy, seeking him in the dark, for there were no scouts at hand; exasperated at being left without the eyes of his fleet; half maddened at the thought he might, by no fault of his own, miss the renown towards which his prophetic imagination had seemed to guide him; knowing that St Vincent would be blamed for choosing so young an admiral; but resolved to follow the enemy to the antipodes if necessary. From the coast of Sardinia to Naples, from Naples to Messina, from Messina to Alexandria, from Alexandria, where he found the roadstead empty, back to Sicily, and then when at last a ray of light came to him, back to Alexandria—he swept the central and eastern Mediterranean. At no time in his life were the noble qualities of his nature displayed more entirely free from all alloy. He was an embodied flame of resolution, and as yet he showed no sign of the vulgar bluster which was to appear
later. In the midst of his anxieties his kindness of heart shone forth without a trace of the tendency of sentimental gush so irritatingly obvious in after days. Unlike most admirals of his time, he did not live apart from his captains, but saw much of them, and freely discussed his plans with them. He had his reward in their devotion and perfect comprehension of what he wished them to do. At the same time he acquired an absolute confidence in the efficiency of his squadron, the magnificent force which had been formed by years of successful war, and by the careful training of his predecessors. The captains were the band of brothers he himself had made them.

The great victory of the 1st of August 1796 (see Nile, BATTLE 09) brought Nelson yet another wound. He was struck on the forehead by a largegrid shot, and had for a time to lie below. It is to be lamented in the interest of his fame that the wound was not severe enough to compel him to return home. After providing for the blockade of what remained of the French fleet in Alexandria, he sailed for Naples, and arrived there on the 22nd of September. There was no rear-admiral of any standing in the navy who could not have done what remained to be done in the Mediterranean, under the supervision of St Vincent, as well as he. For him Naples was a pitfall. There awaited him there precisely the influences to folly which he was least able to resist. He loved being loved, and was the man to think the gift a deception, but the advantage and praise of these weaknesses of character which caused Lord Minto, who yet never ceased to regard him with sincere friendship, to say that he was in some respects a "baby," he was disarmed in the presence of the two women who now made a determined attempt to capture him. Emma Hamilton, who could not help endeavouring to conquer every man she met, was naturally eager to dominate one who had filled Europe with his fame. Emma Hamilton was the queen of Naples, Maria Carolina, a woman who had a share of the ability of her mother Maria Theresa without any of her fine moral qualities. Maria Carolina was all her life trying to fight the power of revolutionary France, with no better resources than were afforded her by the insignificant kingdom of Naples, and a husband who was the embodiment of all the faults of the Italian Bourbons. She had made use of the English minister's wife as an instrument of political intrigue, and now she employed her to manage Nelson. We have the repeated assertions of Nelson himself in all his ample correspondence from September 1798 to July of 1800, and indeed later, to prove that he was, in his own tell-tale phrase, persuaded to "Sicily" his conscience—in other words to turn his squadron into an instrument of the rival influence and power of Maria Carolina, the "Dear Queen" of his letters to Emma Hamilton. It is highly probable that he was secretly influenced by acquaintance at the pedantry of the British government, which only gave him a barony for the splendid victory of the Nile, on the ridiculous ground that no higher title could be given to an officer who was not a commander-in-chief. All doubt as to the character of his relations with Lady Hamilton has been laid at rest by the Morrison papers. None ought ever to have existed, for, if Nelson did not love this woman in the fullest possible sense of the word, his conduct would be inexplicable on any other hypothesis than that which commands us to believe that the avowed affection to lead him about "like a bear," and to drag him into gambling, which he naturally hated. For her sake he offended old friends, and quarrelled with his wife in circumstances of vulgar brutality. That he believed she had borne him a child can no longer be disputed, and he carried on with her a correspondence under the name of Thompson which was apparently meant to deceive her husband, but is varied by grotesque explosions which destroy the illusion, such as it was.

In the hands of these two women, and in the intoxication produced on him by flattering, which should not be too copious or gross for his taste, Nelson speedily became a Neapolitan royalist of far greater sincerity than was to be found among the king's subjects except in the ranks of the Lazzaroni. He gratified the headlong queen by egging her torpid husband into an exceedingly foolish attack on the French garrisons then occupying the so-called Roman republic. The collapse of the Neapolitan forces was instant and ignominious. The court fled to Palermo in December, under the protection of the British fleet. At Palermo Nelson was directing the operations of the ships engaged in blockading Malta, then held by the garrison placed in it by Napoleon when he took it on his way to Egypt, and sinking continually deeper into his slavery to Lady Hamilton, till the spring of the following year. He was then aroused by a double call. A royalist army led by the king's vicar-general, Fabrizio Ruffo (q.v.), had succeeded in recovering the greater part of the kingdom of Naples from the government set up by the French, and called, in the pedantic style of the revolutionary epoch, the Parthenopian republic. A French fleet commanded by Admiral Jervis crossed the Mediterranean. News of the appearance of Bruix reached Nelson just as he was about to sail for Naples with the heir apparent to co-operate with Ruffo and his "Christian Army." He immediately took steps to concentrate his ships, which had been reinforced by a small Portuguese squadron, at Marittimo on the western coast of Sicily, where he would be conveniently placed to meet the French, if they came, or to unite with the ships of Lord St Vincent. He was, however, half distraught between his sense of what was required by his duty to his own service and the obligations he had assumed towards the sovereigns of Naples. In the end he resolved to sail for Naples for this time without the crown prince, in order to carry out a mission entrusted to him by the king.

The story of Nelson's visit to Naples in the June of 1799 will probably remain a subject for perpetual discussion. His reputation for humanity and probity is considered to depend on the view we take of his actions there and at this period. It is true that the relative importance of these episodes has been much diminished by the publication of the Morrison Papers, and that it has at all times been exaggerated. From the Morrison Papers we know that, when his passions were concerned, he was not incapable of stratagems to deceive his old friend William Hamilton. It is the less incredible that he should have been willing to use deceit against persons whom he hated so fiercely as he did the Neapolitan Jacobins, in his double quality of English Tory and Neapolitan Royalist. But apart from his laxity in the course of a double adultery, his letters, written to many different people during his stay on the coasts of Naples, contain more than sufficient evidence to show that he was utterly unhinged by excitement, and was unable to estimate the real character of many of his own words and deeds. He considered himself as owing an equal allegiance to Ferdinand of Naples, and his feelings towards the Jacobin subjects of his Italian king are expressed in terms which bear a remarkable likeness to the rhetoric of the Jacobins of France when they were most vigorously engaged in ridding their country of aristocrats. To Troubridge he writes: "Send me word some proper heads are taken off, this alone will comfort me." To St Vincent he reports that "Our friend Troubridge had a present made him the other day of the head of a Jacobin, and makes an apology to me, the weather being very hot, for not sending it here." Some allowance may be made for a rude taste in these reminiscences, but it is not easy to make the scream of fury in Nelson's letters, imitated from the style of Lady Hamilton, who in these things was the syrophant of the queen, a man who allowed his thoughts to dwell in an atmosphere of hysterical ferocity, and was above all a man of action, was well on the way to interpret his words into deeds. It was while he was in this heated state that he was sent to preside over the fall of the Parthenopian republic at the end of June 1799.

King Ferdinand had not been unwilling to offer terms to those of his subjects who had joined with the French to establish the republic, so long as he was under the influence of fear. But when the French had been defeated in northern Italy and had left the Republicans to their own resources, he became more anxious to make an example. In the early parts of June he heard that Ruffo was inclined to clemency, and grew very eager to prevent any such mistake. No more effectual way of
enforcing just could be imagined than to put the control of events entirely in the hands of Nelson, whose sentiments were well known, who was notoriously under the influence of Emma Hamilton, that is to say, of the queen, and who, as a stranger, would have no family or social attachments with the republicans, no changes of fortune nor future revenges to fear. That he asked Nelson to go to Naples, giving him large powers, may be considered certain. A commission in the full sense he could not give without the consent of the king of Great Britain, and that was not even asked for. But Nelson had general instructions from home to support the Neapolitan government, and through the only means he could rely on, an ally and again the common enemy, he understood it in a much wider sense, while he considered himself as being bound to Ferdinand in the relation of subject to sovereign by the grant of the duky of Bronté in Sicily, which he had just received. He therefore sailed to Naples resolved to act in the double capacity of English and Neapolitan admiral, of English opponent of the Jacobins, and of Neapolitan royalist. The general cause of Europe and the particular revenge of the king and queen were of equal importance to him. When he entered the Bay of Naples on 24th July he found that a capitulation had been agreed upon some thirty-six hours earlier, between Ruffo, acting as vicar-general, with the consent of Captain Foote (1767–1833) of the "Seahorse," the senior British naval officer present, on the one side, and the Neapolitan republicans on the other. The republicans had been reduced to the possession of the castles of Uovo and Nuovo, and had been glad to secure terms which allowed them to go into exile in France. Nelson denounced an arrangement which would have precluded all cutting off of heads as "infamous." He ordered the white flag to be hauled down on the "Seahorse," and told Ruffo that he would not allow the capitulation to be carried out. The same warning was given to the republicans in the forts. There is a question whether the capitulation had been in part already carried into effect. Sir William Hamilton, who, together with his wife, had accompanied Nelson from Palermo, asserts that it had, in an official despatch to Lord Grenville dated on the 14th July. But this letter, written only a fortnight after the transaction, contains many inaccuracies, and can be held to prove only that Hamilton would have seen nothing discreditable in violating a capitulation, or that he was in his dotage, and did not know what he was doing. Ruffo refused to be a party to a breach of faith. On the afternoon of the 25th he had an interview with Nelson on board the flagship the "Foudroyant," which was conducted through the Hamiltons and was of a very heated character. Next morning, as Ruffo showed a determination to stand aside and throw on Nelson the responsibility of provoking a renewal of hostilities, messages were sent to him both by the admiral and by Hamilton that there would be no interference with the "armistice." This assurance put a stop to the dispute between them. The republicans came out of the forts and were transferred to feluccas under the guard of British marines, where they were kept till the king's pleasure was known. As a matter of course it was that they should be mostly hanged or shot. Whether Nelson meant to deceive Ruffo into thinking that he had accepted the capitulation when he named the armistice,—whether the vicar-general was deceived, and then misled the garrisons in good faith—or whether he knew perfectly well that the capitulation was not included, and took the opportunity afforded him by these two English gentlemen to deceive his own countrymen, are points much discussed. The republicans in the forts did claim that they were covered by the capitulation, and that it had been violated. It is difficult to see in what way the service of King George was forwarded by Nelson's zeal for King Ferdinand. Such discredit as fell on him would have been avoided if he had kept to his duty as British admiral, and had not thought it incumbent on him to prove himself a good Neapolitan royalist. On the 29th of June Francesco Caracciolo (q.v.), a Neapolitan naval officer who had joined the republicans, was brought to Nelson as a prisoner. Out of his desire to make an example of a proper head, and in the full knowledge that Caracciolo's death would be pleasing to the queen, Nelson, in virtue, seemingly, of his supposed commission as Neapolitan admiral (which he did not possess), ordered a court martial of Italian officers to sit, on an English ship, to try the prisoner. The court could only find him guilty, and Caracciolo was hanged. The sentence was just, but the procedure was indecent, and Nelson's intervention cannot be justified.

At this period of his life it is indeed difficult to represent Nelson's actions in a favourable light. In July he disobeyed the order of Lord Keith to send some of his ships to Minorca, on a rumour that they were needed for the defence of Naples. The influence of the queen, exercised through Emma Hamilton was partly responsible for his willfulness, but a great deal must be put down to his annoyance at finding that Keith, and not he himself, was to succeed St Vincent as commander-in-chief in the Mediterranean. After the victory of the Nile he became, in fact, incapable of acting as a subordinate. Until he left for home in June 1800, except during the short interval when he acted as commander-in-chief in the absence of Keith, he was captious, querulous and avoided leaving Palermo as much as he could, and far more than he ought. When forced out he made his health an excuse for going back. He began a quarrel with Troubridge which ripened into complete estrangement. He wearied out his friends at the Admiralty, and finally extorted leave to return. As Keith would not allow him to take a line ofattleship for his journey home with the Hamiltons, and indeed said plainly that Lady Hamilton had commanded the Mediterranean station long enough, he returned across Europe with his friends. Accounts of the figure they cut, and the sensation they created at Vienna and at Dresden, can be found in the Minto correspondence, and in the reminiscences of Mrs St George, afterwards Mrs Trench (1768–1827). He reached home in November.

In England he was received with the utmost popular enthusiasm, but with coldness by the king, the Admiralty, and by the great official and social world. His erratic and self-willed conduct towards Lord Keith sufficiently explains the distrust shown by My Lords of the Admiralty. Their uneasiness was not diminished by their knowledge that his renown made it quite impossible to lay him aside at a crisis. The king, a man of strict domestic habits and strong religious convictions, was undoubtedly offended by the scandals of Nelson's life at Naples, and he cannot but have been displeased by the admiral's openly avowed readiness to devote himself to King Ferdinand. English society as represented by the First Lord, Lord Spencer, and his wife, may not have shared the moral indignation of the pious king; but their taste was offended, and so was their self-respect, when Nelson insisted on forcing Lady Hamilton on them, and would go nowhere where she was not received. When it was discovered that he insisted on making his wife live in the same house as his mistress, he was considered to have infringed the accepted standard of good manners. After enduring insult at once cruel and cowardly, to the verge of poorness of spirit, Lady Nelson rebelled. A complete separation took place, and husband and wife never met again.

On the 1st of January 1801 Nelson became vice-admiral by seniority. The alliance of the Northern powers of which the Tsar Paul was the inspiring spirit, made it necessary for the British government to take vigorous measures in its own defence. A fleet had to be sent on a very difficult and dangerous mission to the Baltic. The Admiralty would have been unpardonable, and would not have been excused by public opinion if, when it had at its disposal such an admirable weapon as the conqueror of the Nile, it had failed to employ him. Nelson was chosen to go as a matter of course, but unfortunately, it was thought proper to put him under the command of Sir Hyde Parker (q.v.) an officer of no experience, and, as the Admiralty ought to have known, of commonplace, not to say indolent, character. Nelson bore the subordination with many bitter complaints, but on the whole with patience and tact. Sir Hyde Parker began by keeping his formidable second in command at arm's length, but Nelson handled him with considerable diplomacy. Knowing
his superior to be fond of good living he caused a turbot to be caught for him on the Dogger Bank, and sent it to him with a complimentary message. Sir Hyde was insensible to the attention, and thowed notably. We have the good fortune to possess a letter written by Colonel Stewart (1774-1827), a military officer who did duty with Nelson as a marine. Colonel Stewart has put on record many stories of Nelson which have a high biographical value. He saw the hero when his character was displayed in all its strength and its weakness. Nelson was at once burning for honour, ardently desirous to serve his country at a great crisis, and yet longing for rest and for the company of Emma Hamilton. His passion had, if possible, been increased by the birth of the child Horatio, whom he believed to be his own, and his jealousy was excited by fears that Emma would become an object of attention to the Prince of Wales (afterwards George IV.). His health, as Colonel Stewart justly observed, was always affected by anxiety, and during the Baltic campaign he complained incessantly of his sufferings. Nervous irritation provoked him into odd explosions of excitement, as when, for instance, he suddenly interfered with the working of his flagship while the officer of the watch was tacking her on the south coast of England, and so threw her into disorder. When he saw the consequences of his untimely intrusion he sharply appealed to the officer to tell him what was to be done next, and when the embarrassed lieutenant hesitated to recall the battle, exclaimed: "If you do not know, I am sure I don't," and then went into his cabin. His subordinates learnt to take these manifestations as matters of course, knowing that they were wholly without malignity. To them he was always kind, even when they were at fault, taking, as his own phrase has it, a penknife where Lord St Vincent would have taken a hatchet. Colonel Stewart tells how he was wont to invite the midshipmen of the middle watch to breakfast, and romp with them as if he had been the youngest of the party. The playfulness of his nature came out, in combination with his heroism, when he admitted his refusal to obey Sir Hyde's weak order to recall in the middle of the battle, which would have been disastrous if it had been acted on, by putting his telescope to his blind eye and declaring that he could not see the order to retire. At such moments all could see his agitation; but, as the surgeon of the "Elephant," whose bire flag at Copenhagen, says, they could also see that "it was not the agitation of indecision, but of ardent animated patriotism panting for glory." When Sir Hyde Parker was recalled in May, Nelson assumed the command in the Baltic; but the dissolution of the Northern Confederation left the battle of Trafalgar only the last act in the drama of the war. The British ships were dispersed on the northern latitudes, and in June he obtained leave to come home. His services were grudgingly recognized by the title of viscount. During the brief interval before the peace he was put in command of a flotilla to combat Napoleon's futile threat of invasion. In the hope of quieting public anxiety rather than in any serious expectation of success, an attack was made on a French flotilla strongly protected by its position, at Boulogne, which was disastrously repulsed. Nelson was not in command on the spot, and if he had been would in all probability have renewed his experience at Santa Cruz. He could not do the impossible more than once. But in the words in which he acknowledged the fatal stroke, he lingered for a very few hours of anguish in the fetid cockpit of the "Victory," amid the horrors of darkness relieved only by the dim light of lanterns, and surrounded by men groaning, or raving with unbearable pain. The shock of the broadsides made the whole frame of the "Victory" tremble, and extorted a moan from the dying admiral. When Captain Hardy came down to report the progress of the battle, his inherent love for full triumph drew from him the declaration that less than twenty prizes would not satisfy him. He clung to his authority to the end. The suggestion that Collingwood would have to decide on the course to be taken was answered with the eager claim, "Not while I live." But the last recorded words were of affection and of duty. He begged Hardy for a kiss, and he ended with the proud and yet humble claim, "I have done my duty, thank God for that."
NELSON

His body was brought home in his flagship and laid to rest in St Paul’s. He is commemorated in London by the monument in Trafalgar Square, completed in 1849 with a colossal statue by E. H. Baily, and surrounded by Landseer’s bronzed lions, added in 1856.

In the character of Nelson, and his achievements, there are some elements which must be allowed for more fully than has always been the case. He was, to begin with, the least English of great Englishmen. He had the excitability, the vanity, the desire for approbation without much delicacy as to the quarter from which it came, which the average Englishman of Nelson’s time, his judgment obscured by the effects of centuries of racial rivalry culminating in the Napoleonic wars, was wont to attribute to Frenchmen. Where there is vanity there is the capacity for spite and envy. Nor was Nelson altogether free from these unpleasant faults. But in the main his desire to be liked combined with a natural kindness of disposition to make him appeal frankly to the goodwill of those about him. He won to a very great extent the affection he valued, and that from men so widely different in character as Lord Minto and the simple-hearted seamen among whom he passed the best part of his life. He could be cruel when his emotions were aroused by evil influences, with the downright cruelty he displayed at Naples, or the more subtle forms of persecution, which were, perhaps, the most degrading to him, and to her, in the way of his love for Emma Hamilton. But they were few to whom the evil side of his nature was shown, while the captains and seamen for whom he did much to make a hard duty more tolerable were to be counted by the thousand.

As a commander he belonged to the race of Pyrrhus and the prince of Condé—the fighters of battles. His victories were won at the head of a force which had been brought to a high level of efficiency by three generations of predecesors, against enemies who had been, as in the case of the French, disorganized by revolution, and in whose day the French themselves were inexperienced as the Danes were, or who, as in the case of the Spaniards, were sunk in a moral and intellectual decadence. But he estimated the vices of his opponents with full insight. Wielding a fine instrument, and confronted by inferior enemies, he was entitled to dare much, and it is a proof of his sagacity that he saw how far he could dare, caring but little for the bulk of the force in front of him, and looking to the spirit. Above all, he had the power to inspire the enthusiasm he felt, and to make men act above themselves because he was there, and because they saw him pressing him. Among all the warriors of his generation Napoleon alone was a greater master of the souls of men, and Blücher alone came near him.

Nelson had no children by his wife. His daughter Horatia, by Lady Hamilton, became the wife of the Rev. Philip Ward, and died in 1831. In November 1805, in recognition of Nelson’s great services to his country, his brother William (1757–1835) was created Earl Nelson of Trafalgar, an annuity of £5000 being attached to the title. When William died without sons in February 1853, his only daughter Charlotte Mary (1787–1873), wife of Samuel Hood, 2nd Baron Bridport (1758–1868), became Duchess of Bronté, while, according to the remainder, his English titles passed to his nephew Thomas Bolton (1786–1835), who became 2nd Earl Nelson. Bolton, who took the name of Nelson, was succeeded as 3rd Earl Nelson in November 1835 by his son Horatio (b. 1823). The duchy of Bronté was in 1910 held by Baroness Bridport’s grandson, Arthur Wellington Nelson Hood, 2nd Viscount Bridport (b. 1839).

Again, much has been written about Nelson. A large part of the total mass consists of hasty work done to meet an immediate demand, or of repetition not justified by the critical faculty or literary skill of the writers. The valuable portion may be divided into original authorities, such as his correspondence, and the testimony of eyewitnesses; and the narratives or criticisms of students who tell with original power, and judge with knowledge and insight, with the backing of original authorities, the first place is taken by The Dispatches and Letters of Sir Edward Hamilton, Vice-Admiral Lord Nelson, with notes by Sir N. H. Nicolas (7 vols., 1844–1846). Nicolas spared no pains to make his collection complete and to illustrate it from all trustworthy sources. Thus he includes Sir Edward Berry’s Account of the Battle of the Nile, Colonel Stewart’s Notes on the Copen-
1715, in which year was published his Address to Persons of Quality and Estate, containing suggestions for the establishment of special hospitals, schools and theological colleges, many of his proposals being afterwards carried into effect. Nelson married a Roman Catholic, Lady Theophila Lucy, daughter of the earl of Berkeley, and widow of Sir Kingsmill Lucy of Broxbourne.

See Charles F. Secretan, Memoirs of the Life and Times of the Pious Robert Nelson (1860); Thomas Birch, Life of Villiaston (2nd ed., 1753); Thomas Lathbury, History of the Nonjurons (1845).

NELSON, a river of Kootenay district, Canada, discharging the waters of Lake Winnipeg in a north-easterly direction into Hudson Bay. It drains an area of 360,000 sq. m. and, including its tributary the Saskatchewan, is 1450 m. long. It is navigable for small steamers for a distance of about 80 m., after which it is unnavigable except for canoes. It has a total fall between the lake and sea of 710 ft. Here its chief tributary is the Burntwood.

Norway House at its source and York Factory at its mouth are important stations of the Hudson's Bay Company.

NELSON, a town of British Columbia, situated on the west arm of Kootenay lake. Pop. (1906) about 5000. It is the commercial and railroad centre of the east and west Kootenay districts. It is the northern terminus of a branch of the Great Northern railway and is also connected by road and steamboat with the main line of the Canadian Pacific railway at Revelstoke and with the Crow's Nest line of the same system at Kootenay landing. It has direct railway communication with Rossland, Grand Forks and Greenwood.

NELSON, a municipal borough in the Clitheroe parliamentary division of Lancashire, England, 342 m. N. from Manchester by the Lancashire & Yorkshire railway. Pop. (1891) 22,754, (1901) 32,816. It is of modern growth, with market hall, free library, technical school, pleasant park and recreation grounds, and an extensive system of electric tramways and light railways, connecting with Burnley and Colne. Its chief manufacture is cotton. It was incorporated in 1890, and the corporation consists of a mayor, 6 aldermen and 18 councillors. Area, 3466 acres.

NELSON, a seaport of New Zealand, the seat of a bishop and capital of a provincial district of the same name; at the head of Blind Bay on the northern coast of the South Island. Pop. (1906) 8164. The woods and fields in the neighbourhood abound with English sent-birds, and the streams with trout; while the orchards in the town and suburbs are famous for English kinds of fruit, and hops are extensively cultivated. The town possesses a small museum and art gallery, literary institute, government buildings, and boys' and girls' schools of high repute.

The cathedral (Christ Church) is finely placed on a mound which was originally intended as a place of refuge from hostile natives. It is built of wood, the various native timbers being happily combined. Railways connect the harbour with the town, and the town with Motupiko, &c. The harbour, with extensive wharves, is protected by the long and remarkable Boulder Bank, whose southern portion forms the natural breakwater to that anchorage. The settlement was planted by the New Zealand Company in 1842. The borough returns one member to the house of representatives, and its local affairs are administered by a mayor and council.

NELSONVILLE, a city of Athens county, Ohio, U.S.A., on the Hocking river, 62 m. S.E. of Columbus. Pop. (1890) 4538, (1900) 5421, including 326 foreign-born and 209 negroes; (1910) 6828. Nelsonville is served by the Hocking Valley railway. The city is in one of the most productive coal sections of the state; there are large quantities of clay in the vicinity; and the principal industries are the mining and shipping of coal and the manufacture of fire-clay products. Nelsonville was settled in 1818 and was incorporated in 1838; it was named in honour of Elisha Nelson, who built the first house here.

NEMATODA, in zoology, a group of worms. The name Nematoda (Gr. νηματοδα, thread, and ελλος, form) was first introduced by Rudolph, but the group had been previously recognized as distinct by Zeder under the name Ascarides. They are now by many systematists united with the Acanthocephala and the Nematomorpha to form the group Nemathelmithes.

The Nematoda possess an elongated thread-like form (see fig. 1), varying in length from a few lines up to several feet. The body is covered externally by a chitinous cuticle which is a product of the subjacent epidermic layer in which no cell limits can be detected though nuclei are scattered through it. The cuticle is frequently prolonged into spines and papillae, which are especially developed at the anterior end of the body. The mouth opens at one extremity of the body and the anus at or near the other. Beneath the exoskeleton is a longitudinal layer of muscle-fibres which are separated into four distinct groups by the dorsal, ventral and lateral areas; these are occupied by a continuation of the epidermic layer; in the lateral areas run two thin-walled tubes with clear contents, which unite in the anterior part of the body and open by a pore situated on the ventral surface usually about a quarter or a third of the body length from the anterior end. These tubes are the nervous excretory organs. The body-cavity is largely occupied by processes from the large muscle cells of the skin. These processes stretch across the body cavity to be inserted in the dorsal and ventral middle lines.

The body-cavity also contains the so-called phagocytic organs. These consist of enormous cells with nuclei so large as to be in some cases just visible to the naked eye. These cells are disposed in pairs, though the members of each pair are not always at the same level. The number of cells is not large (some 2 to 8), and as a rule they lie along the lateral lines. In some species (Ascarius decipiens) the giant cell is replaced by an irregular mass of protoplasm containing a number of small nuclei. Such a plasmodium bears, on its periphery, groups of rounded projections of protoplasm termed end-organs. Similarly the giant cells are produced at their periphery into a number of branching processes which bear similar end-organs on their surface and in some cases terminate in them. These end-organs are the active agents in taking up foreign granules, or bacteria, which may have found their way into the fluid of the body-cavity. From the shape and position of the phagocytic organs it is obvious that they form admissible strainers through which the fluid of the body-cavity filters (figs. 2, 3).

The alimentary tract consists of a straight tube running from the mouth to the anus without any convolutions; it is separable into three divisions: (1) a muscular oesophagus, which is often provided with cuticular teeth; (2) a cellular intestine; and (3) a short terminal rectum surrounded by muscular fibres. Neither here nor elsewhere are cilia found at any period of development.

A nervous system has been shown to exist in many species, and consists of a pericerebral gang ring giving off usually six nerves which run forwards and backwards along the lateral and median lines; these are connected by numerous fine, circular threads in the sub-cuticle. Some of the free-living forms possess eye spacks. The sexes are distinct (with the exception of a few forms that are hermaphroditic), and the male is always smaller than the female. The generative organs consist of one or two tubes, in the upper
portion of which the ova or spermatozoa are developed, the lower portion serving as an oviduct or vas deferens; the female generative organs open at the middle of the body, the male close to the posterior extremity into the terminal portion of the alimentary canal; from this cloaca a diverticulum is given off in which are developed one to three chitinous spicules that subserve the function of copulation. The spermatozoa differ from those of other animals in having the form of cells which sometimes perform amoeboid movements. Most remarkable sexual conditions are found to occur in the free-living genera *Rhabetis* and *Nematodes* are parasites, there are many that are never at any period of their life parasitic. These free-living forms are found everywhere—in salt and fresh water, in damp earth and moss, and among decaying substances; they are always minute in size, and like many other lower forms of life, are capable of retaining their vitality for a long period even when dried, which accounts for their wide distribution; this faculty is also possessed by certain of the parasitic *Nematodes*, especially by those which lead a free existence during a part of their life-cycle. The free-living differ from the majority of the parasitic forms in undergoing no metamorphosis; they also possess certain structural peculiarities which led Bastian (Trans. Linn. Soc., 1865) to separate them into a distinct family, the *Anguillulidae*. It is impossible, however, to draw a strict line of demarcation between the free and parasitic species, since—(1) many of the so-called free *Nematoda* live in the slime of molluscs (Villo), and are therefore really parasitic; (2) while certain species belonging to the free-living genus *Anguillula* are normally parasitic (e.g. *A. tritici*, which lives encysted in ears of wheat), other species occasionally adopt the parasitic mode of existence, and become encysted in slugs, snails, &c.; (3) it has been experimentally proved that many normally parasitic genera are capable of leading a free existence; (4) transitional forms exist which are free at one period of their life and parasitic at another.

*Nematodes* include by far the greatest number of the known genera; they are found in nearly all the orders of the animal kingdom, but more especially among the *Vertebrata*, and of these the *Mammalia* are infested by a greater variety than any of the other groups. Some two dozen distinct species have been described as occurring in man. The *Nematode* parasites of the *Invertebrata* are usually immature forms which attain their full development in the body of some vertebrate; but there are a number of species which in the sexually adult condition are peculiar to the *Invertebrata*.

The *Nematoda* contain about as many parasitic species as all the other groups of internal parasites taken together; they are found in almost all the organs of the body, and by their presence, especially when encysted in the tissues and during their migration from one part of the body to another, give rise to various pathological conditions. Although some attain their full development in the body of a single host—in this respect differing from all other *Entozoa*—the majority do not become sexually mature until after their transference from an "intermediate" to a "definitive" host. This migration is usually accompanied by a more or less complete metamorphosis, which is, however, not so conspicuous as in most other parasites, e.g. the *Trematoda*. In some cases (many species of *Ascaris*) the metamorphosis is reduced to a simple process of growth.

The parasitic and free-living *Nematodes* are connected by transitional forms which are free at one stage of their existence and parasitic at another; they may be divided into two classes—those that are parasitic in the larval state but free when adult, and those that are free in the larval state but parasitic when adult.

(1) To the first class belong the so-called "hairworm", *Mermis*, not to be confused with the Gordian worms. 1 The adult forms of *M. nigrescens* live in damp earth and may be seen after storms or early in the morning picking up the stalks of plants, a fact which causes people to talk about showers of worms. The eggs are laid on

---

1 Ercoli successfully cultivated *Oxyurus curvula*, *Strongylus armatus* and other species in damp earth; the free generation was found to differ from the parasitic by its small size, and by the females being ovoviviparous instead of oviparous. To this phenomenon he gave the name of dimorphosis.

2 The genera *Ascaris*, *Flaria*, *Trichosoma* are found throughout the *Vertebrata*; *Cucullanus* of the fish and *Cystidium* of *Anguilla*, which is a free-swimming larva; *Bailey* and *Amphibia* in the gastropods, *Ankylostoma*, *Trichocephalus*, *Trichina* and *Pseudolus* live only in the *Mammalia*, the last-mentioned genus being confined to the order *Cetacea*; *Strongylus* and *Physalodora* are peculiar to mammals, birds and reptiles, while *Diplogaster*, *Syngamus* and *Hystrixides* are confined to birds. *Mermis* (in the larval state) is confined to the *Invertebrata* and *Sphaerularia* to bees. *Oxyurus*, though chiefly parasitic in the *Mammalia*, occurs also in reptiles, *Amphibia* and one or two insects. *Dactilis* and *Ichthyomyia* are only found in fishes.

3 See *Nematomorpha*.

1. Mouth. 2. Anterior end of alimentary canal. 3. Posterior end of alimentary canal. 4. Ovary. 5. 6 and 7, Anterior middle and posterior pairs of phagocytic organs.

*Disphragaster*. While some of the species are bisexual, others are protandrous, self-fertilizing hermaphrodites. In cultures of the latter there occur very rare supplemental males which appear in no sense degenerate but as fit for reproduction as the males of the bisexual species. Though possessing a complete copulatory apparatus and producing large quantities of spermatozoa, they have lost their sexual instinct and play no part in the economy of the species. These "psychically decadent" individuals appear to represent the entire male sex of a bisexual species, and become unnecessary owing to the grafting of hermaphroditism on the female sex.

Mode of Life and Metamorphoses.—While the majority of the

---

---
the ground and the young larvae make their way into grasshoppers, in whose bodies they pass most of their larval life. (3) To the second class belong **Ancylostoma**, Strongylus and many species of Ascaris; the embryo on leaving the egg lives free in water or damp earth, and resembles very closely the free-living genus *Rhabditis*. After a longer or shorter period it enters the alimentary canal of its proper host with drinking-water, or is conveyed to it by the intermediate host, where it reaches the alimentary canal, and is so conveyed through the body, in which it becomes sexually mature. *Rhabditis nigrovenosa* has a developmental history which has been elucidated by F. Fedschenko, passing through two sexual transitions which regularly alternate. The worm inhabits the lung of the frog and toad, and is hermaphroditic (Schneider) or parthenogenetic (Leuckart); the embryos hatched from the eggs find their way through the cuticle of the embryo and enter the exterior; in a few days they develop into a sexual larva, called a *Rhabditis* form larva, in which the sexes are distinct; the eggs remain within the uterus, and the young when hatched break through the walls. Similarly found in the alligator, mother snakes, containing the organs of the body until only the outer cuticle is left; this eventually breaks and sets free the young, which have no teeth, and therefore have lost the typical Rhabditis form. They live for some time in water or mud, occasionally entering the bodies of water snails, but undergo no change until they reach the lung of a frog, when the cycle begins anew. Although several species belonging to the second class occasionally enter the bodies of water snails and other animals before reaching their definitive host, they undergo no alteration of form in this intermediate host; the case is different, however, in *Filaria mediensis* and other forms, which, when the larva has developed to the adult form in its different hosts, all the changes being accompanied by a metamorphosis. *Filaria mediensis*—the Guinea worm—is parasitic in the subcutaneous connective tissue of many mammalian species. It has been found in the tropical parts of Asia and Africa, but has also been met with in South Carolina and several of the West Indian islands. The adult worm in the female sometimes reaches a length of 6 ft. The males have only about a third as much length as the females. The female is parasitic, and the young, which, unlike the parent, are provided with a long tail, live free in water; it was formerly believed from the frequency with which the legs and feet were sucked back by the parasite that the embryo entered the skin directly from the water, but it has been shown by Fedschenko, and confirmed by Manson, Leiper and others, that the larva bores its way into the body of a Cyclops or a mosquito, and there undergoes its development. The parasite is then transferred to the alimentary canal of man by means of drinking-water, and thence makes its way to the subcutaneous connective tissue. The *Nematoda* which are parasitic during their whole life may similarly be divided into two classes—those which undergo their development in a single host, and those which undergo their development in the bodies of two distinct hosts.

1. In the former class the eggs are extruded with the feces, and the young becoming free larvae, which the larval hosts follow, are liberated by the solvent action of the gastric juice and complete their development. This simple type of life-history has been experimentally proved by Leuckart to be characteristic of *Ollulanus* and *Ambigua* and other species. 2. (a) The life-history of *Ollulanus tricuspis* is an example of the second class. *Ollulanus tricuspis* is found in the adult state in the alimentary canal of the cat; the young worms are hatched in the alimentary canal, and often wander into the body of their host and become encysted in the lungs, liver and other organs; during the encystment the worm degenerates and loses all trace of structure. This wandering appears to be accidental, and to have no influence on the further development of the animal which takes place in those embryos which are voided with the excrement. Leuckart proved experimentally that these young forms become mature in muscles of male and female animals, the cycle is completed after the mouse is devoured by a cat. The well-known *Trichinella spiralis* (fig. 5) has a life-history closely resembling that of *Ollulanus*. The adult worm, which is of extremely minute size, the male being only 0.057 and the female 3/4 of an inch in length, is transmitted to the alimentary canal of many other carnivorous mammals; the young bore their way into the tissues and become encysted in skeletal muscles—within the muscle-bundles, according to Leuckart, but in skeletal muscle-fibres, according to Chatin and others. The co-existence of the acellular encysted form and the sexually mature adult in the same host, experimentally proved by both Bancroft and Leuckart, is the rule in *Trichinella*; many of the embryos, however, are extruded with the feces, and complete the life cycle by reaching the alimentary canal of rats and swine which frequently devour human ordure.

Swine become infected with *Trichinella* in this way and also by eating the dead bodies of rats, and the parasite is conveyed to the body of the pig along with the larvæ of *Trichina spiralis*. The life-history of this phase is similar in many respects to that of the other Nematoda which have been described, except that the blood-vessels and not the alimentary canal is the direct route of entry, and the chances of survival are much better.

**Importance in Pathology.—** Among recent advances having medical import in our knowledge of the Nematoda, the chief importance are those dealing with the parasites of the blood. *F. bancrofti* is known to live in the lymphatic glands, and its embryos *Microfilaria bancrofti* is known to be transmitted by *M. fatigans* to the human body, and the larvae of this parasite are conveyed through the blood-vessels and circulate in the blood. Manson showed in 1881 that the larvae (*Microfilariae*) were not at all times present in the blood, but that their appearance had a certain periodicity, and the larvae of *F. bancrofti* *Microfilaria bancrofti* are transmitted in the blood of the human being from the peripheral circulation during the day, hiding away in the large vessels at the base of the lungs and of the heart. Ten years later Manson discovered a second species, *Filaria perstans*, whose larvae live in the blood. They, however, show no periodicity, and are found continuously both by day and by night; and their larval forms are termed *Microfilaria perstans*. The adult stages are found in the sub-peritoneal connective tissue. A third form, *Microfilaria diurna*, is found in the larval stage in blood, but only in the daytime. The adult stage of this form is the same as that found in the other species. The presence of these parasites seems at times to have little effect on the host, and men in whose system it is calculated there are some 40-50 million larvae have shown no signs of disease. In other cases very serious disorders of the lymphatic system are brought about, of which the most marked is perhaps Elephantiasis. Manson and Bancroft suggested that the second host of the parasite is the mosquito or gnat, and for a long time it was thought that they were conveyed to man by the mosquito dying after laying her eggs in water, the larval nematodes escaping from her body and being swallowed by man. It is now held that the parasite enters the blood of man through the piercing mouth-parts at the time of biting. When first sucked up by the insect from an infected man it passes into its stomach, and thence makes its way into the thoracic muscles, and there for some time it grows. Next the larvae make their way into the connective tissue in the pro-thorax, and ultimately bore a channel into the base of the piercing apparatus and come to rest between the hypopharynx and the labium. Usually two are found in this position lying side by side; it would be interesting to know if these are male and female. From their position in the middle of the body it is evident that they cannot pass on to the next generation. The life-history of the male seems to be more prolonged than that of the female, and the male produces thousands of larvae, which circulate in the blood, and show a certain periodicity in their appearance, being much more numerous in the blood at night than during the day.

**Importance as Pests.—** Agriculturists now pay increased attention to the nematodes that destroy their crops. A good example of a fairly typical case is afforded by *Heteroder a schachtii*, which attacks beetroot and causes great loss to the Continental sugar manufacturers. The young larvae, nourished by the yolk
which remains over from the egg and by the remains of the mother which they have taken into their alimentary canal, make their way through the earth, and ultimately coming across the root of a beet, begin to bore into it. This they do by means of a spine which can be protruded from the mouth. Once within the root, they absorb the cell sap of the parenchyma and begin to swell until their body projects from the surface of the root in the form of a tubercle (fig. 6). The reproductive organs do not begin to appear until the larva has twice cast its skin. After this a marked sexual dimorphism sets in. The female, hitherto indistinguishable from the male, continues to swell until she attains the outlines of a lemon. Doing this she bursts the epidermis of the rootlet, and her body projects into the surrounding earth. The male has a different life-history (fig. 7). After the second larval moult, he passes through a passive stage comparable to the pupa-stadium of an insect, and during this stage, which occurs inside the root, the reproductive organs are perfected. The male then casts his cuticle, and by means of his spine bores through the tissues of the root and escapes into the earth. Here he seeks a female, pairs, and soon afterwards dies. The eggs of the female give rise to embryos within the body of the mother; her other organs undergo a retrogressive change and serve as food for the young, until the body-wall only of the mother remains as a brown capsule. From this the young escape and make their way through the earth to new roots. The whole life-history extends over a period of some 4-5 weeks (fig. 7), so that some 6-7 generations are born during the warmer months. If we assume that each female produces 300 embryos, and that half of these are females, the number of descendants would be, after six generations, some 22,788 milliards (A. Strubell, Bibl. Zool., 1888-1890). Other species which have been recorded in the United Kingdom are *Tylenchus devastatrix* (Kuhn), on oats, rye and clover roots; *T. tritici*, causing the ear-cockle of wheat; *Cephalobus rigidus* (Schm.), on oats; *Heterodera radicicola* (Greel), on the roots of tomatoes, cucumbers, potatoes, turnips, peach-trees, vines and lettuce, and many other plants.

**NEMATOMORPHA**

This zoological group includes Gordian worms which are found swimming in an undulatory manner or coiling round water-weeds in ponds and puddles, or knotted together in an apparently inextricable coil. They may be several inches in length and are no thicker than a piece of whip-cord.

The male is distinguishable from the female by the presence of a fork at the posterior end of the body. The body is covered by a cuticle which is sculptured and the various markings are of systematic importance: it is secreted by a hypodermis which also includes nerve-cells and some gland-cells. In the adult aquatic stage the alimentary canal shows signs of degeneration, and it seems probable that in this stage Gordian worms take no food. The mouth is terminal or subterminal; there is a weak sucking pharynx situated behind the brain, and a long intestine lying along the medio-ventral body-cavity; it ends in a cloaca which receives the vasa deferentia in the male. There is a single unsegmented nerve-cord which runs along the ventral middle line and enlarges posteriorly into a caudal ganglion and anteriorly in a ganglion, the brain, which is not supra-oesophageal. The peripheral nervous system is minutely described by T. H. Montgomery. There is a median eye on the head.
The Nematomorpha are nearly solid,—quite so at each end, and only in the middle region of the body are there any body-cavities, the space within the body being usually filled up with parenchyma. There are four closed spaces of the nature of body-cavities, two lateral and a dorso-median and a ventro-median. Into the former the ovaries project, though the lumen of the lateral body-cavity is quite shut off from the lumina of the ovaries or uterus. In the adult male the lateral body-cavities are absent. A curious duct with lateral branches termed the supra-intestinal organs lies above the intestine in the female. There are two series of ovaries extending through a large part of the body and accompanied by two uterus; the latter open by two oviducts which debouch into an atrium which also receives the intestine and a single receptaculum seminis, and is continued backward as the cloaca; the ovaries posteriorly. The ovaries are epithelial sacs which open into the uterus. The paired testes extend through the greater part of the body and end in two vascular diverticula which unite with the intestine to form a cloaca.

The eggs are laid in the spring as a rule, and after about a week they give rise to a minute, ringed larva with a protrusible boring apparatus consisting of three chitinous rods. Ily the aid of this the larva makes its way into the soft body of some insect larva, Ephemerides, Chironomids, or even of Molluscs, and encysts in the muscles or fat body. The insect, which may have become an image into which the Gordion larva has penetrated, is then eaten by a carnivorous insect or by a fish, and the contained Gordion larva becomes elongate and mature in its second host. After a year or more this larva emerges into the water and commences to reproduce.

The unexpected occurrence of these worms in pools and puddles, often in great numbers, has given rise to myths about showers of worms. They occasionally make their way into the human stomach with the drinking-water and are vomited; but this is a case of pseudo-parasitism—they are not true parasite of man.

There are a considerable number of species divided among the four genera: Gordius, Paragordius, Chordodes and Parachordodes; the last, a genus of Camerano’s, is looked upon with some doubt by Montgomery. A free swimming marine form with longitudinal rows of bristles, known as Metanema A. E. Verrill, may also come here, but at present its history is unknown. The Nematomorpha form an isolated group; at first sight they seem to be connected with the Nematoda, but in reality their only common feature is the tubular genitalia opening into a cloaca, and it seems at present impossible to connect them with the Annelida. Until more is known it seems wisest to look upon them as an isolated assemblage of animals with no near affinities to any of the great phyla.

**NEMERTINA,** or **NEMERTEANS (Nemertes),** a subdivision of worms, characterized by the ciliation of the skin, the presence of a retractile proboscis, the simple arrangement of the generative apparatus, and in certain cases by a peculiar pelagic larval stage to which the name “plidium” has been given. Many of them are long thread-shaped or ribbon-shaped animals, more or less cylindrical in transverse section. Even the comparatively shortest species and genera can always be termed elongate, the broadest and shortest of all being the parasitic Malacobedella and the pelagic Pelagonermetes. There are no exterior appendages of any kind. The colours are often very bright and varied.

Nemertines live in the sea, some being common amongst the coralline algae, others hiding in the muddy or sandy bottom, and secreting gelatinous tubes which ensheath the body along its whole length. Formerly, they were generally arranged amongst the Platyelmintes as a sub-order in the order of the Turbellarians, but with the advance of our knowledge of the lower worms it has been found desirable to separate them from the Turbellarians and to look upon the Nemertina as a separate phylum.

O. Bürger classifies Nemertines into four orders: 1. Protonemertini, in which there are two layers of dermal muscles, external circular and internal longitudinal; the nervous system lies external to the circular muscles; the mouth lies behind the level of the brain; the proboscis has no stylet; there is no caecum to the intestine. Families, Carinellidae, Hubrechtidae.

2. Mesonemertini, in which the nervous system has passed into the dermal muscles and lies amongst them; other characters as in Protonemertini. Family, Cephalothricidae.

3. Metanemertini, in which the nervous system lies inside the dermal muscles in the parenchyma; the mouth lies in front of the level of the brain; the proboscis as a rule bears stylets; the intestine nearly always has a caecum. Families, Eoonemertidae, Oxytelonemertidae, Prokrohocomidae, Amphiporidae, Tetrastemmatidae, Nectonemertidae, Pelagonemertidae, Malacodellidae.

This order represents the Holonemertini of Hubrecht.

4. Heteronemertini, in which the dermal musculature is in three layers, an external longitudinal, a middle circular, an internal longitudinal; the nervous system lies between the first and second of these layers; the outer layer of longitudinal muscles is a new development; there is no intestinal caecum; no stylets on the proboscis and the mouth is behind the level of the brain. Families, Eupolididae, Lineidae.

Nemertes was a sea nymph, daughter of Nereus and Doris. One of the genera was named *Nemertes* by Cuvier.
This order represents the Schizonomertini of Hubrecht and the family Eupolidae.

The first three orders, which have a double muscular layer, external circular and internal longitudinal, are sometimes grouped together as the Dimayria; the Heteromertini, in which a third coat of longitudinal muscles arises outside the circular layer, are then placed in a second branch, the Trimayria.

The following families and genera are represented on the British coast: Carinellidae, Carinella; Cephalothricidae, Cephalothrix, Carinoma; Eunemertidae, Eunemertes; Ottonyphelines, Ottonypheline; Oxytomidae, Amphiporus, the Amphinophorus; Tetrastemmidae, Tetrastema, Prosorhachmus; Malacocellidae, Malacocella; Eupolidae, Eupola, Valencina, Oxypodia; Lineidae, Lineus, Euboralias, Micrura, Cerabeatius, Miscella.

Anatomy.—Proboscis and Proboscidian Skelet.—The organ most characteristic of a Nemertine is without doubt the proboscis. With very few exceptions (Malacocella, Akrostomum, where it has fused

through the central opening, the proboscis is largely provided with nematocysts, and capable of protrusion through the sutured mouth which has reached its maximum eversion. It adds a decidedly aggressive character to an organ of the original significance of which, as we have seen, was tactile. This aggressive character has a different aspect in the proboscis of central stylet, but in which the surface that is turned upwards upon eversion of the proboscis is largely provided with nematocysts, and capable in the rhynchocoel, in which the proboscis moves about. This rhynchocoel is formed by a split which appears in the mesenterial fold just before the proboscis emerges from the body and (fig. 2) is attached to the wall of the space, forming an eversion.

There is reason to suppose that, when a wound is inflicted by the central stylet, it is environments by the fluid secreted in the posterior proboscidian region being at the same time expelled. A reservoir, duct and muscular bulb in the region (fig. 4) where the stylet is styled serve for this purpose. There is reason to suppose that, when a wound is inflicted by the central stylet, it is environments by the fluid secreted in the posterior proboscidian region being at the same time expelled. A reservoir, duct and muscular bulb in the region (fig. 4) where the stylet is styled serve for this purpose. shape, and in Cerebratulus articus they are deep red, possibly from the presence of haemoglobin. They are usually larger than the body cells. Internally, the muscular layers are lined by an epithelium. In the posterior portion this epithelium in certain Heteronematina has a more glandular appearance, and sometimes the interior cavity is obliterated by cell-division in this region. Superiorly the sheath either closely adheres to the muscular body-wall, with which it may even be partly interwoven, or it hangs freely in the connective tissue which fills the space between the interior body-wall and the exterior. In all cases the connective tissue bundles as they are united into denser and definite layers, and this is especially marked in those forms (Akrostomum) where the density of the muscular body-wall has considerably diminished, and the connective tissue layers are correspondingly developed. It can then at the same time be observed, too, that the compact mass of connective tissue ("reclitum," Barrois) which lies between the muscular body-wall and the intestine is directly continuous with that in which the connective tissue layers are everywhere present. The omnipresence of this connective tissue tends to exclude the formation of any perivisceral body cavity in Nematina.

The connective tissue of the integument and basement membrane is incomparably thicker than the muscular bundles as they are united into denser and definite layers, and this is especially marked in those forms (Akrostomum) where the density of the muscular body-wall has considerably diminished, and the connective tissue layers are correspondingly developed. It can then at the same time be observed, too, that the compact mass of connective tissue ("reclitum," Barrois) which lies between the muscular body-wall and the intestine is directly continuous with that in which the connective tissue layers are everywhere present. The omnipresence of this connective tissue tends to exclude the formation of any perivisceral body cavity in Nematina.

Muscular and Connective Tissue.—The muscular layers by which the body-wall is constituted have so very different properties to some extent confusingly described by the successive authors on Nematina anatomy. There is sufficient reason for this confusion. The fact is that not only have the larger subdivisions a different arrangement and even number of the muscular layers, but even within the same genus, nay, in the same species, well-marked differences occur.

Fig. 7.—The layers of the body-wall in Carinella (fig. 7), the Metanematina (fig. 8) and the Heteronematina (fig. 9). a, Cellular tissue of the integument; Bm, basement membrane; c1, outer circular, and long, longitudinal layer of muscular tissue; c2, long, 1, additional circular and longitudinal layers of the same; n, connective tissue layer.

Increase in size appears sometimes to be accompanied by the development of a new layer of fibres, whereas a difference in the method of preparation may give to a layer which appeared homogeneous in one specimen a decidedly fibrous aspect in another. Nevertheless there are certain principal types under which the different modifications can be arranged. One of them is found in the two most primitive organized genera, Ceratella and Cephalothrix, i.e. an outer circular, a longitudinal and a circular layer of muscular fibres (fig. 7). The second is common to all the Heteronematina, as well as to Polia and Valencia, and also comprehends three layers of which, however, two are longitudinal, viz. the external and the internal, one being a longitudinal and the other a circular layer. The third type all the Metanematina correspond; their muscular layers are only two, an external circular and an internal longitudinal one (fig. 8).

The Heteronematina thus appear to have developed an extra layer of longitudinal fibres internally to those which they inherited from more primitive ancestors, whereas the Metanematina are no longer in possession of the internal circular layer, but have on the contrary largely developed the external circular one, which has dwindled away in the Heteronematina. The situation of the lateral nerves-stems in the different genera with respect to the muscular layers lies, however, to become fairly biventricular in the Heteronematina, and forms the basis of Burger's classification. In Carinella, Cephalothrix and Polia, as well as in all Metanematina, the basement membrane of the skin already alluded to is particularly strong and interconnected with the connective tissue layers. In the Heteronematina there is a layer in which the cutaneous elements are largely represented below the thin basement membrane, there being nothing like this plexus in the whole of the muscles. The difference in the appearance of the basement membrane—sometimes wholly homogeneous, sometimes eminently fibrous—can more especially be observed in differently preserved specimens of the genus Polia.
nerves for the proboscis, those for the sense organs in the head and the strong nerve pair (n. organus) for the oesophagus. At the same time it renders more intelligible the extreme sensibility of the body-wall of the Nematines, a local and Instantaneous irritation often responsible for the extraordinary quickness of the proboscis extrusion.

In the Metanemertini, where the longitudinal stems lie inside the muscular body-wall, definite and metamerically placed nerve branches spring from them and transmit the nervous impulses in this way virtually situated above the intestine. In others there is an approximation of the lateral stems towards the median ventral line with a similar organization of the peripheral rami, thus this lateral nerve system may be considered as having grown into one. Two lateral outgrowths of the most posterior portion of the oesophagus, afterwards becoming constricted off, as well as two ingrowths from the sides of the head, also may be considered as having grown in this way. The lateral nerves, as in both Meta- and Heteronemertines are concerned. As to the Mesonemertini, in the most primitive genus, Carinella, we do not find any lateral organs answering to the description above given. What we do find is a slight transverse furrow on each side of the head close to the tip, but the most careful examination of sections made through the tissues of the head and brain shows the absence of any further apparatus comparable to that described above. Only in one species, Carinella spatulata, a delicate tactile sense has been found, otherwise the external organs are so far as in connexion with the furrow just mentioned, which is here also somewhat more complicated in its arrangement, a ciliated tuft of tactile hairs, in the fore-portion of the body by which the animal feels its way. No other intermediate stages have as yet been noticed between this arrangement and that of the Heteronemertini, in which a separate posterior brain-lobe receives a similar ciliated canal, and in which the oesophageal outgrowths have their appearance and are coalesced with the nerve-tissue in the organ of the adult animal. The histological elements of this portion remain distinct both by transmitted light and in actual sections.

These posterior brain-lobes, which in all Heteronemertines are in direct continuity with the brain, and in each of the principal lobes cease to have this intimate connexion in the Metanemertini; and, although the brain is of but little surface, and is situated comparatively far from the front of the head, it is not composed of cells differentiated in the same manner as those of the proboscis. Small tufts of tactile hairs or papillae are sometimes observed in small number at the tip of the head; sometimes longer hairs, apparently rather stiff, are seen on the surface, very sparingly distributed between the cilia, and hitherto only in a very limited number of small specimens. They may perhaps be considered as sensory.

**Digestive System.—** The anterior opening, the mouth, is situated ventrally, close to the tip of the head and in front of the brain in the Metanemertini, somewhat more backward and behind the brain in the other Nematines. In most Heteronemertines it is found to be an indentation in the upper surface of the head. When the proboscis is retracted, it is smaller and rounded; in Malacodella and Abrostomum it, moreover, serves for the extrusion of the proboscis, which emerges by a separate dorsal opening just inside the mouth. The oesophagus is homogeneous, ciliated throughout and continues for some distance longitudinally, comparatively thick and provided with longitudinal muscular fibres. The two layers are specially obvious in its walls—the inner layer bordering the lumen being composed of smaller, more closely set, the outer thicker one containing numerous granular cells and having a more glandular character. Outside the wall of the oesophagus a vascular space has been detected which is in direct continuity with the longitudinal blood-vessels. In certain cases, however, the walls of the oesophagus appear to be very closely applied to the muscular body-wall and this vascular space thereby considerably reduced.

The posterior portion of the intestine is specially characterized by the appearance of the intestinal diverticula horizontally and symmetrically placed right and left and opposite to each other. In the Metanemertini the posterior part of the intestine is formed of the line of rectum, which extends transversely, and is divided longitudinally, into two laterals which lie on the side of the body about the level of the hinder end of the proboscis in the same species of the genus Carinella, which are termed side-organs. The posterior part of the intestine is thus of a transverse form, and is divided into two lateral columns, which are provided with a constant supply, with the necessary oxygen. Such could hardly be obtained in any other way by those worms that have no special respiratory apparatus, and that live in mud and under stones where the natural supply of freshly oxygenated sea-water is practically limited. Whether in the Metanemertines, where the blood fluid is often provided with haemoglobiniferous disks, the chief functions of the side organs may not rather be a sensory one needs further investigation.

The exterior opening of the duct has been several times alluded to. In the Metanemertini it is generally situated towards the middle of the aorta and the external opening of the intestine is thus disposed of in the way of the head, as was noticed for Caryellina, and as is also present in Polia. Generally a row of shorter grooves perpendicularly to the first, and similarly situated, being in the middle of the cilia, enlarges the surface of these grooves (fig. 14). In *Valencia* there is nothing but a clear opening, without furrows, and in *Heteronemertini* there is on each side of the head a longitudinal slit of varying length but generally considerable depth, in the lower space of the eye. Besides these more or less plainly visible by transparency. These slits are continued into the ciliated duct, being at the same time themselves very strongly ciliated. In life they are commonly rhythmically opened and shut by a wave movement. They are the head slits (cesophageal furrows) of Koppen's character of this subdivision (figs. 10 and 13).

With respect to the sense organs of the Nematines, we find that the eyes are of rather constant occurrence, although many hetero- nemertines and all metanemertines lack them. The simple organized species have often very numerous eyes (Aphthedora, *Drepanophorus*), which are provided with a spherical refracting apparatus, consisting of a central disc, two lateral and a delicate radially arranged rods, with an outer sheath of dark pigment, and with a separate nerve-twig each, springing from a common or double pair of branches which leave the brain as *n. optici*, for the innervation of the eyes. Besides these more or less primitive organs of vision, more primitive eyes are present in others down to simple stellate pigment specks without any refracting apparatus.

Organs of hearing in the form of capsules containing ootests have been very rarely observed, apparently only in *Metanemertini*.

As to the organ of touch, the great sensibility of the body has already been noticed, and there is no reason to believe that the organs of the proboscis. Small tufts of tactile hairs or papillae are sometimes observed in small number at the tip of the head; sometimes longer hairs, apparently rather stiff, are seen on the surface, very sparingly distributed between the cilia, and hitherto only in a very limited number of small specimens. They may perhaps be considered as sensory.

Aided by the obvious direction of the proboscis the anterior portion of the intestine is specially characterized by the appearance of the intestinal diverticula horizontally and symmetrically placed right and left and opposite to each other. In the Metanemertini the posterior part of the intestine is formed of the line of rectum, which extends transversely, and is divided longitudinally, into two laterals which lie on the side of the body about the level of the hinder end of the proboscis in the same species of the genus *Carinella*, which are termed side-organs. The posterior part of the intestine is thus of a transverse form, and is divided into two lateral columns, which are provided with a constant supply, with the necessary oxygen. Such could hardly be obtained in any other way by those worms that have no special respiratory apparatus, and that live in mud and under stones where the

---

caeca are always eminently regular. So they are throughout the whole body in most of the Metanemertines. In Carinella they are generally deficient and the intestine straight; in young specimens of this species, however, they occur, though less regular and more in the form of incipient foldings by which the inner surface is increased. The inner surface of the intestinal caeca is ciliated, the caeca themselves are sometimes, especially in the hindermost portion of the body—of a considerably smaller lumen than the transverse or longitudinal ones. At times, however, the reverse is the case, and in both cases it is the smaller lumen which appears to be the connecting tube, between and suspended by the transverse fibres consisting of the muscular blood-vessels above mentioned.

The anus is situated terminally, the muscular body-wall of the intestine must find its way outwards probably acting in this region the part of a sphincter. The transverse vessels mostly terminate on both sides in closest proximity to the anus; and certain species, however, they interpose by a transverse connexion above the anus. The transversal muscular blood-vessels do the same.

Circulatory Apparatus.—The chief vessels are three longitudinal, a median and two lateral ones. They are in direct connection with each other both at the posterior and at the anterior end of the body. At the posterior end they communicate together to form a T-shaped connexion in a simple and uniform way. Anteriorly there is a certain amount of difference in the arrangement. Whereas in the Metanemertines an arrangement prevails as represented in fig. 18, in the Heteronemertines the lateral stems, while entirely unconnected with others by the posterior portion of the body, no longer individually exist in the oesophageal region, but are dissolving themselves into a network of vascular spaces surrounding this portion of the digestive tract. The median dorsal vessel, however, remains distinct, but instead of continuing its course beneath the proboscis sheath it is first enclosed by the ventral musculature of the body, and then forwards it even bulges out longitudinally into the posterior portion of the body, so that it communicates with the caeca just mentioned, which surround the oesophagus, bathe the posterior lobes of the brain, pass through the nerve ring together with the proboscis sheath, and are generally continued in front of the brain as a lacunar space in the muscular tissue, one on each side.

Special mention must be made of the delicate transverse vessels regularly connecting the longitudinal and the lateral ones. They are metamerically placed, and belong to the metameric sheath as digestive caeca, thus alternating with the generative sacs. The blood fluid does not flow in any definite direction; its movements are largely influenced by those of the muscular body-wall itself, and the colour of the blood is not uniform, being more delicate in some and more yellow in others. There are, however, cases where the longitudinal vessels are well marked and contain definite vessels, the two lateral longitudinal lacunae form, so to say, the forerunners of the lateral vessels. A median longitudinal vessel and transverse connecting trunks have not yet been detected. There are large lacunae in the head in front of the ganglia.

The vascular system is entirely closed. It contains a colourless fluid, with flat, oval, nucleated corpuscles, as a rule colourless, but in some cases tinged with yellow or red haemoglobin. It consists of a characteristic network of minute blood-vessels, on which are called 'flame-cells.' So well known in the excretory apparatus of the Platyhelminthes and larval Annelids (fig. 19). There is no communication between the nephridia on one side and the other, but in Eupodia there are ducts opening into the alimentary canal as well as the exterior, a condition of things which is generally described in ciliated organs of this type. As a rule these organs are more or less conical in a lateral direction; even in the larger Heteronemertines the nephridia can be shown to be generally situated in the region limited by the inner wall of the body, the lateral muscles, the sheath, (2) the upper wall of the intestine, (3) the muscular body-wall. No trace of the nephridia is found posterior to the oesophagus.

Generative System.—In the Nemertines the sexes are separate, with only very few exceptions (Tetrastemma herma phrodotica, Marion). The reproductive system of the lateral vessel of Drepanosphinctus spectabilis (Magnified about 750), 1. The beginning of the lateral vessel: (1) a large sagittal canal lined with an epithelium, the proliferation of which gives rise to the ovary; (2) an opening in the wall of the ovary, in which the ova are contained; (3) the generative apparatus in the wall of the ovary. Each pouch pushes the epithelial wall outward, with its epithelial wall and its contained genital cells, arises ultimately from some of the parenchymatous cells of the body. The walls and contents in some forms are smooth and in others they are smooth and their lining then proliferates. It has been pointed out that the cavity of the sacs corresponds in many particulars with the coelom of higher animals, and in Lebiksky's observations on the nemertines the most support to the view that a coelom exists. Montgomery has also described certain spaces which may be coelomic lying between the alimentary canal and the inner longitudinal layer of muscles in the Heteronemertes. The ovapath.
spermatozoa, when mature, present no peculiarities. As the ova are in many species deposited in a gelatinous tube secreted by the body-walls, in which they are arranged (three or more together) in flask-shaped cavities, impregnation must probably take place either before or at the very moment of their being deposited. The exact mode has not yet been noticed.

**Prosrhocrinus claperdii** is a viviparous form.

**Development.**—The embryology of the Nemertines offers some very remarkable peculiarities. Our knowledge of the development of the most primitive forms is scanty. Both *Hetero* and *Metanemertini* have been more exhaustively studied than the other two groups, the first, as was noticed above, being characterized by peculiar larval forms, the second developing without metamorphosis.

The larva of *Cerebratulus* is called the plidium. It is a small, minute, elongated form, which is the first stage of the adult nemertine. It encloses the primitive alimentary tract. Two pairs of invaginations of the skin, which originate are called the prostomial and metatormal disks, grow round the intestine, finally fuse together, and form the skin and muscular body-wall of the future nemertine, which afterwards becomes ciliated, frees itself from the plidium in the interior of the larva, and develops into the adult worm without further metamorphosis.

The eggs of these species are not enveloped by such massive gelatinous strings as are those of the genus *Lineus*. In the latter we find the young Nemertines crawling about after a period of from six to eight weeks, and probably feeding upon a portion of this gelatinous substance, which is found to diminish in bulk. In accordance with the metamorphic tendencies of the species, the larval stages in the development of the nemertine have generally been given under the name *Cerebratulus*, and the young worm is known as the plidium. In the *Metanemertini*, as far as they have been investigated, a direct development without metamorphosis has been observed. It appears probable that this is one of the further simplifications of the more complicated metamorphosis described above.

As to the development of the different organs, there is still much that remains doubtful. The hypoblast in some forms originates by invagination, in others by delamination. The proctoblastic cell appears to have undergone a closer-fitting exterior layer of cells, which is stripped off after the definite body-wall of the Nemertines has similarly originated out of four ingrowths from the primary epiblast. To this reduced and sedentary plidium the name of "larva of Desor" has been given.

In the *Metanemertini*, as far as they have been investigated, a direct development without metamorphosis has been observed. It appears probable that this is one of the further simplifications of the more complicated metamorphosis described above.

**Affinities.**—The position of the Nemertines in the animal kingdom is now looked upon as more isolated than was formerly thought, and recent workers have been inclined to treat them as a separate phylum. Whether this view be adopted or not, and whether the Turbellaria be regarded as nearly related or only remotely connected, there can be little doubt that the Nemertines resemble the Turbellaria more nearly than they do any other group of animals. Bürger even goes so far as to homologize the proctoblastic with the Turbellarian pharynx, and he sums up their relationship to the Annelids by the statement that to a certain extent the Nemertines represent Turbellaria which in the course of time have copied certain features of an Annellid character.

NEMESIS—NEMORS, LORDS AND DUKES OF

Podtis Latinis Minores, iii. (1881); Cynegistica: ed. M. Haupt (with Ovôl's Halieutica et Grattius Fallicus) 1838, and R. Steen, with G. Grazia (1832); Italian translation with notes by L. F. Valtirighi (184). The four eclogues are printed with those of Calpurnius in the editions of H. Schenkl (1885) and E. H. Keene (1887); see L. Cistori, Studio sulle Elogogie di N. (1895) and Dell' imitazione nelle Elogogie di N. (1896); and M. Haupt, "Caracallus Buocolicus Calpurnii et N. (1882)."

NEMESIS, the personification of divine justice. This is the only sense in which the word is used in Homer, while Hesiod (Theog. 223) makes Nemesis a goddess, the daughter of Night (some, however, regard the passage as an interpolation); she appears in a still more concrete form in a fragment of the Cypria.

The word Nemesis originally meant the distributor (Gr. νῆμεσ) of fortune, whether good or bad, in due proportion to each man according to his deserts; then, the resentment caused by any disturbance of this proportion, the sense of justice that could not allow it to pass unpunished. Grouppe and others prefer to connect the name with τῆμαι, τῆμος ("to feel just resentment"). In the Iliad of the drizzling ground (ναες καμπέται) as the avenger of crime and the punisher of arrogance, and as such is akin to Ate and the Erinyes. She was sometimes called Astraelia, probably meaning "one from whom there is no escape"; the epithet is specially applied to the Phrygian Cybele, with whom, as with Aphrodite and Artemis, her cult shows certain affinities. She was specially honoured in the district of Rhamnus in Attica, where she was perhaps originally an ancient Artemis, partly confused with Aphrodite. A festival called Nemeseia (by some identified with the Genesis) was held at Athens (800). Its object was to avoid the nemesis of the dead, who were supposed to have the power of punishing the living, if their cult had been in any way neglected (Sophocles, Electra, 792; E. Rohde, Psyche, 1907, i, 236, note 1). At Smyrna there were two divinities of the name, more akin to Aphrodite than to Artemis. The reason for this duality is hard to explain; it is suggested that they represent two aspects of the goddess, the kindly and the malignant, or the goddesses of the old and the new city. Nemesis was also worshipped at Rome by victorious generals, and in imperial times was the patroness of gladiators and venatores (fighters with wild beasts) in the arena and one of the tutelary deities of the drizzling ground (ναες καμπέται). In the 3rd century A.D. there is evidence of the belief in an all-powerful Nemesis-Fortuna. She was worshipped by a society called Nemесiaci. In early times the representations of Nemesis resembled Aphrodite, who herself sometimes bears the epithet Nemesis. Later, as the goddess of proportion and the avenger of crime, she has as attributes a measuring rod, a bridle, a sword and a scourge, and rides in a chariot drawn by griffins.

See C. Walz, De Nemesti Graecorum (Tbingen, 1852); E. Tournefort, Nomenclature botanique, 3 vols. (1712-1713); and Adolf Decker, Brechser philologische Abhandlungen, v. heft 2 (1890), both exhaustive monographs; an essay, "Nemesis, or the Divine Envy," by F. E. More, in The New World (N. Y., Dec. 1890); L. R. Farnell, Cults of the Greek States, ii.; and A. Legrand in Darmenc and Saglio's Dictionnaire des antiquités. For the Roman Nemesis, see G. Wissowa, Religion und Kultur der Rômer (Munchen, 1902).

NEMESIUS (fl. C. A.D. 390), a Christian philosopher, author of a treatise περί φύσεως ανθρώπων (On Human Nature), was, according to the title of his book, bishop of Emesa (in Syria); of his life nothing further is known, and even his date is uncertain, but internal evidence points to a date after the Apollinarian controversy and before the strife connected with the names of Eutyches and Nemesius, or about the middle of the 5th century. His book is an interesting attempt to compile a system of anthropology from the standpoint of the Christian philosophy. Moses and Paul are put side by side with Aristotle and Menander, and there is a clear inclination to Platonic doctrines of pre-existence and metempsychosis. In physiological matters he is in advance of Aristotle and Galen, though we can hardly assert—as has sometimes been thought—that he anticipated Harvey's discovery of the circulation of the blood. The treatise is conclusive evidence as to the mutual influence of Christianity and Hellenism in the 5th century. John of Damascus and the schoolmen, including Albertus Magnus and Thomas Aquinas, held Nemesis in high esteem, believing his book to be the work of Gregory of Nyssa, with whom he has much in common.

NEMORENSIS LACUS (mod. Nemi), a lake in the Alban Hills, in an extinct subsidiary crater in the outer ring of the ancient Alban crater, E. of the Lake of Albano. It is about 3½ m. in diameter and some 110 ft. deep; the precipitous slopes of its basin are over 300 ft. high, and on the side towards the modern village a good deal more, and are mainly cultivated. It is now remarkable for its picturesque beauty. In ancient times it was included in the territory of Aricia, and bore the name of Mirror of Diana. The worship of Diana here was very ancient, and, as among the Scythians, was originally, so it was said, celebrated with human sacrifices; even in imperial times the priest of Diana was a man of low condition, a gladiator or a fugitive slave, who won his position by slaying his predecessor in fight, having first plucked a mistletoe bough from the sacred grove, and who, notwithstanding, bore the title of rex (king). It is curious that in none of the inscriptions that have been found is the priest of Diana mentioned; and it has indeed been believed by Morpurgo and Frazer that the rex was not the priest of Diana at all, but, according to the former, the priest of Virbius, or, according to the latter, of Diana, the spirit of the forest. The temple itself was one of the most splendid in Latium; Octavian borrowed money from it in 31 B.C., and it is frequently mentioned by ancient writers. Its remains are situated a little above the level of the lake, and to the N.E. of it. They consist of a large platform, the back of which is formed by a wall of concrete faced with opus reticulatum, with niches, resting against the cliffs which form the sides of the crater. Excavations in the 17th and the last quarter of the 19th centuries (now covered in again), and also in 1905, led to the discovery of the temple itself, a rectangular edifice, 48 ft. by 42 ft., and of various inscriptions, a rich frieze in gilt bronze, many statuettes (ex-votos) from the favissae of the temple in terra-cotta and bronze, a large number of coins, &c. None of the objects seem to go back beyond the 4th century B.C. A road descended to it from the Via Appia from the S.W., passing through the modern village of Genzano. The lake is drained by a tunnel of about 2 m. long of Roman date. On the W. side of the lake remains of two ships (really floating palaces moored to the shore) have been found, one belonging to the time of Caligula (as is indicated by an inscription on a lead pipe), and measuring 27 ft. long by 8 ft. wide. The finest is decorated with marbles and mosaics, and with some very fine bronze headbands, with heads of wolves and lions having rings for hawisers in their mouths (and one of a Medusa), now in the Museo delle Terme at Rome, with remains of the woodwork, &c., &c. Various attempts have been made to raise the first ship, from the middle of the 15th century onwards, by which much had a villa constructed there, but destroyed again almost at once as the more it did not remain. See F. Barnabei, Notizia degli scavi (1895), 261, 451; (1896), 188; V. Malfatti, Notizia degli scavi (1895), 471; (1896), 393; Risolta marittima (1896), 379; (1897), 293; J. G. Frazer, The Golden Bough (London, 1900); L. Morpurgo in Monumenti dei Lincei, x. (1903), 197-209.

NEMORS, LORDS AND DUKES OF. In the 12th and 13th centuries the lordship of Nemours, in Gâtinais, France, was in possession of the house of Villeboeuf, a member of which, Gautier, was marshal of France in the middle of the 13th century. The lordship was sold to King Philip III. in 1274 and 1276 by Jean and Philippe de Nemours, and was then made a county and given to Jean de Grailly, capitain de Bouch in 1364. In 1404 Charles VI. of France gave it to Charles III. of Evreux, king of Navarre, and erected it into a duchy in the peerage of France (ducé-pairie). Charles III.'s daughter, Beatrix, brought the
duchy to her husband Jacques de Bourbon, count of La Marche, and by the marriage of their daughter, Eleanor, to Bernard of Armagnac, count of Pardiac, passed to the house of Armagnac. After being co-seated and restored several times, the duchy reverted to the French crown in 1505, after the extinction of the house of Armagnac-Pardiac. In 1507 it was given by Louis XII. to his nephew, Gaston de Foix, who was killed at Ravaeni in 1512. The duchy then returned to the royal domain, and was detached from it successively for Giuliano de Medicis and his wife Philiberta of Savoy in 1515, for Louise of Savoy in 1524, and for Philip of Savoy, count of Genevois, in 1528. The descendants of the last-mentioned duke possessed the duchy until its sale to Louis XIV.

In 1572 Louis gave it to his brother Philippe, duke of Orleans, who resided at the court for a few years, and finally presented it to the House of Bourbon. The title of duc de Nemours was afterwards given to Louis Charles, son of King Louis Philippe, who is dealt with separately.

The following are the most noteworthy of the earlier dukes of Nemours.

**JAMES DE ARMAGNAC**

Duke of Nemours (c. 1433-1477), was the son of Bernard d'Armagnac, count of Pardiac, and Eleanor of Bourbon-La Marche. As comte de Castres, he served under Charles VII. in Normandy in 1444 and 1450, and afterwards in Guienne. In 1503, under Louis XI. the king loaded him with honours, married him to his god-daughter, Louise of Anjou, and recognized his title to the duchy of Nemours in 1462. Sent by Louis to pacify Roussillon, Nemours felt that he had been insufficiently rewarded for the rapid success of this expedition, and joined the League of the Public Weal in 1465. He subsequently became reconciled with Louis, but soon resumed his intrigues. After twice pardoning him, the king's patience became exhausted, and he besieged the duke's château of Carlat and took him prisoner. Nemours was treated with the utmost rigour, being shut up in a cage; and was finally condemned to death by the parliament and beheaded on the 4th of August 1477.

**PHILIP DE SAVOY**

Duke of Nemours (1490-1533), was a son of Philip, duke of Savoy, and brother of Louise of Savoy, mother of Francis I. of France. Originally destined for the priesthood, he was given the bishopric of Geneva at the age of five, but resigned it in 1519, when he was made count of Genevois. He served under Louis XII., with whom he was present at the battle of Agnadello (1509), under the Emperor Charles V. in 1520, and finally under his nephew, Francis I. In 1528 Francis gave him the duchy of Nemours and married him to Charlotte of Orléans-Longueville. He died on the 25th of November 1553.

His son, **JAMES** (1531-1588), became duke of Nemours in 1553. He distinguished himself at the sieges of Lens and Metz (1552-1553), at the battle of Kenty (1554) and in the campaign of Parment (1553). He was a supporter of the Guises, and had to retire for some time into Savoy in consequence of a plot. On his return to France he fought the Huguenots, and signalized himself by his successes in Dauphiné and Lyonnais. In 1567 he induced the court to return from Meaux to Paris, took part in the battle of St. Denis, protested against the peace of Longjumeau, and repulsed the invasion of Wolfgang, count palatine of Zweibrücken. He devoted his last years to letters and art, and died at Annecy on the 15th of June 1585.

By his wife Anne of Este, the widow of Francis, duke of Guise, the duke left a son, Charles Emmanuel (1567-1595), who in his youth was called prince of Genevois. Involved in political intrigues by his relationship with the Guises, he was implicated in the assassinations of Henry IV., duke of Navarre, and his brother the cardinal of Lorraine in 1588, but contrived to escape. He fought at Ivry and Arques, and was governor of Paris when it was besieged by Henry IV. After quarrelling with his half-brother Charles of Lorraine, duke of Mayenne, he withdrew to his government of Lyonnais, where he endeavoured to make himself independent. He was imprisoned, however, in the château of Pierre-Encise by the archbishop of Lyons. After his escape he attacked Lyons, but was defeated owing to the intervention of the constable de Montmorency. He died at Annecy in July 1595.
1838 he held the Tailieries long enough to cover the king's retreat, but refrained from initiating active measures against the mob. He followed his sister-in-law, the duchess of Orléans, and her two sons to the chamber of deputies, but was separated from them by the rioters, and only escaped finally by disguising himself in the uniform of a national guard. He embarked for England, where he settled with his parents at Claremont. His chief aim during his exile, especially after his father's death, was a reconciliation between the two branches of the house of Bourbon, as indispensable to the re-establishment of the French monarchy in any form as those wishes were frustrated on the one hand by the attitude of the comte de Chambord, and on the other by the determination of the duchess of Orléans to maintain the pretensions of the count of Paris. Nemours was prepared to go further than the other princes of his family in accepting the principles of the legitimists, but lengthy negotiations ended in 1837 with a letter, written by Nemours, as he subsequently explained, at the dictation of his brother, François, prince de Joinville, in which he insisted that Chambord should express his adherence to the tricolour flag and to the principles of constitutional government. In 1871 the Orleans princes received the Countess of Castiglione, the destinies of France, in the house of the house, but they were not consulted when the count of Chambord came to Paris in 1873, and their political differences remained until his death in 1883.

Nemours had lived at Bushey House after the death of Queen Marie Amélie in 1866. In 1871 the exile imposed on the French princes was withdrawn, but he only transferred his establishment to Paris after their disabilities were also removed. In March 1872 he was restored to his rank in the army as general of division, and placed in the first section of the general staff. After his retirement from the active list he continued to act as president of the Red Cross Society until 1881, when new decrees against the princes of the blood led to his withdrawal from the Parisian society. During the presidency of Marshal MacMahon, he appeared from time to time at the Élysée. He died at Versailles on the 26th of June 1896, the duchess having died at Claremont on the 10th of November 1837. Their children were Louis Philippe Marie Ferdinand Gaston, comte d’Eu (b. 1842), who married Isabella, eldest daughter of Don Pedro II. of Brazil; Ferdinand Philippe Marie, duc d’Arlon (b. 1844), who married Sophie of Bavaria (1847–1897), sister of the empress Elizabeth of Austria; Margaret (1846–1893), who married Prince Ladislas of Czartoryski; and Blanche (b. 1837).

See R. Bazin, _Le Duc de Nemours_ (1907); Paul Thuere-Dangin, _Histoire de la monarchie de jullet_ (4 vols., 1884, &c.).

**NEMOURS**, a town of northern France, in the department of Seine-et-Marne, on the Loing and its canal, 26 m. S. of Melun, on the Paris-Lyon railway, _Pop._ (1906) 4814. The church, which dates mainly from the 16th century, has a handsome wooden spire, and there is a feudal castle. A statue of the mathematician Bésout (d. 1785), a native of the town, was erected in 1885. In the vicinity is a group of fine sandstone rocks, and sand is extensively quarried. Nemours is supposed to derive its name from the woods (nemora) in the midst of which it formerly stood, and discoveries of Gallo-Roman remains indicate its early origin. It was captured by the English in 1420, but derives its historical importance rather from the lordship (afterwards duchy) to which it gave its name. In 1585 a treaty revoking previous concessions to the Protestants was concluded at Nemours between Catherine de Medici and the Guises.

**NENADOVICH, MATeya** (1777–1854), Servian patriot, was born in 1777. He is generally called Prota Mateja, since as a boy of sixteen he was made a priest, and a few years later became archpriest (Prota) of Valyevo. His father, Alexa Nenadovich, Knez (chief magistrate) of the district of Valyevo, was one of the most popular and respected public men among the Servians at the beginning of the 19th century. When the four leaders of the Janissaries of the Belgrade Pashalic (the so-called Dabias) thought that the only way to prevent a general rising of the Servians was to intimidate them by murdering all their principal men, Alexa Nenadovich was one of the first victims. The policy of the Dahis, instead of preventing, did actually and immediately provoke a general insurrection of the Servians against the Turks. Prota Mateja became the deputy-commander of the insurgents of the Valleyvo district (1804), but did not hold the post for long, as Karageorge sent him in 1805 on a secret mission to St Petersburg, and afterwards employed him almost constantly as Servia’s diplomatic envoy to Russia, Austria, Bucharest and Constantinople. After the fall of Karageorge (1813), the new leader of the Servians, Milosh Obrenovich, sent Prota Mateja as representative of Servia to the Congress of Vienna (1814–1815), where he pleaded the Servian cause indefatigably. During that mission he often saw Lord Castlereagh, and for the first time the Servian national interests were brought to the knowledge of British statesmen.

Prota Mateja’s memoirs are the most valuable authority for the history of the first and second Servian insurrections against the Turks. The best edition of the _Memoiri Profe Mateya Nenadovica_ was published by the Servian Literary Association in Belgrade in 1893.

**NENAGH, a market town of Co. Tipperary, Ireland, finely situated in a rich though hilly country near the river Nenagh, 66½ m. S.W. from Dublin by the Ballyhropy and Limerick line. In 1872 it had 5243 inhabitants, and was extensively worked for iron. In the midst of the town was built the Nenagh Round, dating from the time of King John, there still exists the circular donjon or keep. There are no remains of the hospital founded in 1200 for Austin canons, nor of the Franciscan friary, founded in the reign of Henry III. and one of the richest religious houses in Ireland. The town is governed by an urban district council. It was one of the ancient manors of the Butlers, who received for it the grant of a fair from Henry VIII. In 1539 the town and friary were burned by O’Carroll. In 1649 the town was taken by Owen Roe O’Neill, and shortly afterwards it was recaptured by Lord Inchiquin. It surrendered to Ireton in 1651, and was burned by Sarsfield in 1668.

**NENNIUS (fl. 760), a Welsh writer to whom we owe the _Historia Britonum_, lived and wrote in Brecknock or Radnor. His work is known to us through thirty manuscripts; but the earliest of these cannot be dated much earlier than the year 1000; and all are defaced by interpolations which give to the work so confused a character that critics were long disposed to treat it as an unskilful forgery. A new turn was given to the controversy by Heinrich Zimmer, who, in his _Nennius vindicatus_ (1895), took the view that Nennius compiled the _Mirabilia_ manuscripts with the 11th-century translation of the Irish scholar, Gilla Coemgím (d. 1072), succeeding in stripping off the later accretions from the original nucleus of the _Historia_. Zimmer follows previous critics in rejecting the _Prologus maior_ (§§ 1, 2), the _Capitula_, or table of contents, and part of the _Mirabilia_ which form the concluding section. But he proves that Nennius should be regarded as the compiler of the _Historia_ proper (§§ 7–65). Zimmer’s conclusions are of more interest to literary critics than to historians. The only part of the _Historia_ which deserves to be treated as a historical document is the section known as the _Genalogiae Saxonicum_ (§§ 57–65). This is merely a recursion of a work which was composed about 679 by a Briton of Strathclyde. The author’s name is unknown; but he is, after Gildas, our earliest authority for the facts of the English conquest of England. Nennius himself gives us the oldest legends relating to the victories of King Arthur; the value of the _Historia_ from this point of view is admitted by the severest critics. The chief authorities whom Nennius followed were Gildas’ _De excidio Britonum_, Eusebius, _Vita Patricii_ of Murich Macev Machi, _The Collectanea of Tichern_ and _The Liber ascensionis_ (an Irish work on the settlement of Ireland), the _Liber de exaditus mundi_, the chronicle of Prosper of Aquitaine, the _Liber boati Germani_. The sources from which he derived his notices of King Arthur (§ 56) have not been determined.

NEO-CAESAREA, SYNOD OF, NEOPLATONISM

NEO-CAESAREA, SYNOD OF, a synod held shortly after that of Ancyra, probably about 314 or 315 (although Hefele inclines to put it somewhat later). Its principal work was the adoption of fifteen disciplinary canons, which were subsequently accepted as ecumenical by the Council of Chalcedon, 451, and of which the most important are the following: i. degrading priests who marry after ordination; vii. forbidding a priest to be present at the second marriage of any one; viii. refusing ordination to the husband of an adulteress; xi. fixing thirty years as the age below which a presbyter might not be ordained (because Christ bestowed His public ministry at the age of thirty); xiii. according to city priests the precedence over country priests; xiv. permitting Choripiscopi to celebrate the sacraments; xv. requiring that there be seven deacons in every city.

NEOCOMIAN, in geology, the name given to the lowest stage of the Cretaceous system. It was introduced by J. Thurmann in 1835 on account of the development of these rocks at Neuchâtel (Neocomium), Switzerland. It is divided by some into two sub-stages: one, Barremian, or the lower Cretaceous, comprising the barremian rocks in the Wealden beds of southern England; the other, Aptian, or the upper Cretaceous, comprising the Aptian rocks. The Neocomian includes the barremian and aptian sub-stages; Sir A. Geikie (Text Book of Geology, 4th ed., 1903) regards "Neocomian" as synonymous with Lower Cretaceous, and he, like Renvie, closes this portion of the system at the top of the Lower Greensand (Aptian). Other British geologists (A. J. Jukes-Browne, &c.) restrict the Neocomian to the marine beds of Speeton and Tealby, and their estuarine equivalents, the Weald Clay and Hastings Sands (Wealden). Much confusion would be avoided by dropping the term Neocomian entirely and employing instead, for the type area, the subdivision immediately above, the Barremian, or barremian, and below, the Hauterivian, or Hauterive, sub-stage, so that this becomes the more obvious when it is pointed out that the Barremian type is limited to Dauphine; the Valanginian has not a much wider range; and the Hauterivian does not extend north of the Paris basin.

Characteristic fossils of the Barremian are Hoplitus euthymi, H. octocarinus; of the Valanginian, Naica levilhian, Belenmites pestilentialis; of the Hauterivian, Hoplitus radiatus, Crioceras capricornus, Exogyra Couloni and Tectiros complanatus. The marine equivalents of these rocks in England are the lower Speeton Clays of Yorkshire and the Tealby beds of Lincolnshire. The Wealden beds of southern England represent approximately an estuarine phase of deposit of the same age. The Hils clay of Germany and Wealden of Hanover; the limestone and shales of Teschen; the Aptophyes and Pygopses diphyodes marks of Spain, and the Pitchnormian formation of Russia are equivalents of the Neocomian in its narrower sense.

See Cretaceous, WEALDEN, SPEETON BEDS. (J. A. H.)

NEOCRATE, a rank or dignity granted by the Senate under the Roman Empire to certain cities of Asia, which had built temples for the worship of the emperors or had established cults of members of the imperial family. The Greek word νεώτερος meant literally a temple-sweeper (νεώτερος, temple, κοσμεῖν, to adorn), and was hence used both of a temple attendant and of a priestly holder of high rank who was in charge of a temple.

NEOLITHIC, or LATER STONE AGE (Gr. νεώτερος, new, and ἄλθος, stone), a term employed first by Lord Avebury and since generally accepted, for the period of highly finished and polished stone implements, in contrast with the rude workmanship of those of the earlier Stone Age (Paleolithic). Knowledge of Neolithic times is derived principally from four sources, Tumuli or ancient burial-mounds, the Lake-dwellings of Switzerland, the Kitchen-middens of Denmark and the Bone-Caves. No trace of metal is found, except gold, which seems to have been sometimes used for ornaments. Agriculture, pottery, weaving, the domestication of animals, the burying of the dead in dolmens, and the rearing of megalithic monuments are the typical developments of man during this stage.

See ARCHAEOLOGY; also Lord Avebury, Prehistoric Times (1900); Sir John Evans, Ancient Stone Implements of Great Britain (1897); J. F. Prestwich, Geology (1886-1890).

NEOPHYTE (Gr. νεώτερος, from νεώς, new, φυτόν, a plant, "newly planted"), a word used in the Eleusinian and other mysteries to designate the newly initiated, and in the early church applied to newly baptized persons. These usually wore the white garments which they received at their admission to the church (see BAPTISM) for eight days, from Easter eve till the Sunday after Easter (hence called Dominica in albis), but were subject to strict supervision for some time longer and, on the authority of 1 Tim. iii. 6, were generally held ineligible for election as bishops, a rule to which, however, history shows some notable exceptions, as in the cases of St Ambrose at Milan, 374 and Bishop Nectarius of Cyrene at Ptolemais in 409, who were chosen bishops before they were even baptized. By the council of Nicaea (325) this rule was extended to the priesthood. The ancient discipline is still maintained in the Roman Church, and applies to converts from Christian sects as well as to those from heathenism. The period, however, is determined by circumstances. The term "neophyte" is also sometimes applied in the Roman Church to newly ordained priests, and even—though rarely—to novices of a religious order. In a transferred sense the word is also given to one beginning to learn any new subject.

See Bergier, Dict. de théologie, s. v.; Martigny, Dict. des antiquités, pp. 433-435; Siegel, Christliche Alterthümer, ii. 17 seqq.; Riddle, Christi. Antiquitates, pp. 313, 522; Walcott, Sacred Archaeology, s. v.

NEOPLATONISM, the name given specially to the last school of pagan philosophy, which grew up mainly among the Greeks of Alexandria from the 3rd century onwards. The term has also been applied to the Italian humanists of the Renaissance, and in modern times, somewhat vaguely, to thinkers who have based their speculations on the Platonic metaphysics or on Plotinus, and incorporated with it a tendency towards a mystical explanation of ultimate Systems of Cyrene at Ptolemais in 409.

Historical Position and Significance.—The political history of the ancient world ends with the formation, under Diocletian and Constantine, of a universal state bearing the name of the East as well as the Roman civilization. The history of ancient philosophy ends in like manner with a universal philosophy which assimilated elements of almost all the earlier systems, and worked up the results of Eastern and Western culture. Just as the Later Roman empire was at once the supreme effort of the old world and the outcome of its exhaustion, so Neoplatonism is in one aspect the consummation, in another the collapse, of ancient philosophy. Never before in Greek or in Roman speculation had the consciousness of man's dignity and superiority to nature found such adequate expression; never before had real science and pure knowledge been so undervalued and despised by the leaders of culture as they were by the Neoplatonists. Judged from the standpoint of empirical science, philosophy passed its meridian in Plato and Aristotle, declined in the post-Aristotelian systems, and set in the darkness of Neoplatonism. But, from the religious and moral point of view, it must be admitted that the ethical "mood" which Neoplatonism endeavored to create and maintain is the highest and purest ever reached by antiquity.

It is a proof of the strength of the moral instincts of mankind that the only phase of culture which we can survey in all its stages from beginning to end culminated not in materialism, but in the boldest idealism. This idealism, however, is also in its way a mark of intellectual bankruptcy. Contempt for reason and science leads in the end to barbarism—its necessary consequence being the rudest superstition. As a matter of fact, barbarism did break out after the flower had fallen from Neoplatonism. The philosophers themselves, no doubt, still lived
NEOPATONISM

373

on the knowledge they repudiated; but the masses were trained to a superstition with which the Christian church, as the executor of Neoplatonism, had to reckon and contend. By a fortunate coincidence, at the very moment when this bankruptcy of the old culture must have become apparent, the stage of history was occupied by barbaric peoples. This has obscured the fact that the inner history of antiquity, ending as it did in despair of this world, must in any event have seen a recurrence of barbarism. The present world was a thing that men would neither enjoy nor master nor study. A new world was discovered, for the sake of which all previous was discarded. First, it stands in the line of post-Aristotelian systems; it is, in fact, as a subjective philosophy, their logical completion. Secondly, it is founded on scepticism; for it has neither interest in, nor reliance upon, empirical knowledge. Thirdly, it can justly claim the honour of Plato’s name, since it expressly goes back to him for its metaphysics, directly combating those of the Stoics. Yet even on this point it learned something from the Stoics; the Neoplatonic conception of the action of the Deity on the world and of the essence and origin of matter can only be explained by reference to the dynamic pantheism of the Stoics. Fourthly, the study of Aristotle also exercised an influence on Neoplatonism. This appears not only in its philosophical method, but also—though less prominently—in its metaphysics. And, fifthly, Neoplatonism adopted the ethics of Stoicism; although it was found necessary to supplement them by a still higher conception of the functions of the spirit.

Thus, with the exception of Epicureanism—which was always treated by Neoplatonism as its mortal enemy—there is no outstanding earlier system which did not contribute something to the new philosophy. And yet Neoplatonism cannot be described as an eclectic system, in the ordinary sense of the word. First, in the first place, it is dominated by one all-pervading interest—the religious; and in the second place, it introduced a new first principle into philosophy, viz. the supra-rational, that which lies beyond reason and beyond reality. This principle is not to be identified with the “idea” of Plato or with the “form” of Aristotle. Neoplatonism perceived that neither sense perception nor rational cognition is a sufficient basis or justification for religious ethics; consequently it broke away from rationalistic ethics as decidedly as from utilitarian morality. It had therefore to find out a new world and a new spiritual function, in order first to establish the existence of what it desiderated, and then to realize and describe what it had proved to exist. Man, however, cannot transcend his psychological endowment. If he will not allow his thought to be determined by experience, he falls a victim to his imagination. In other words, thought, which will not stop, takes to mythology; and in the place of reason we have superstition. Still, as we cannot allow every fancy of the subjective reason to assert itself, we require some new and potent principle to keep the imagination within bounds. This is found

in the authority of a sound tradition. Such authority must be superhuman, otherwise it can have no claim on our respect; it must, therefore, be divine. The highest sphere of knowledge—the supra-rational—as well as the very possibility of knowledge, must depend on divine communications—that is, on revelations. In short, philosophy as represented by Neoplatonism, its sole interest being a religious interest, and its highest object the supra-rational, must be a philosophy of revelation.

This is not a prominent feature in Plotinus or his immediate disciples, who still exhibit full confidence in the subjective pre
ing of the essences of their philosophy. But the later adherents of the school did not possess that confidence; they based their philosophy on revelations of the Deity, and they found these in the religious traditions and rites of all nations. The Stoics had taught them to overslip the political boundaries of states and nationalities, and rise from the Hellenic to a universal human consciousness. Through all history the spirit of God has breathed; everywhere we discover the traces of His revelation. The older any religious tradition or mode of worship is, the more venerable is it, the richer in divine ideas. Hence the ancient religions of the East had a peculiar interest for the Neoplatonist. In the inter
there of the Stoic myths Neoplatonism found its vehicle, as practised especially by the Stoic philosophers. They interpreted the myths and were done with them; the later Neoplatonists treated them as the proper material and the secure foundation of philosophy. Neoplatonism claimed to be not merely the absolute philosophy, the keystone of all previous systems, but also the absolute religion, reinvigorating and transforming all previous religions. It contemplated a restoration of all the religions of antiquity, by allowing each to retain its traditional forms, and at the same time making each a vehicle for the religious attitude and the religious truth embraced in Neoplatonism; while every form of ritual was to become a stepping-stone to a high morality worthy of mankind. In short, Neoplatonism seizes on the aspiration of the human soul after a higher life, and treats this psychological fact as the key to the interpretation of the universe. Hence the existing religions, after being refined and spiritualized, were made the basis of philosophy.

Neoplatonism thus represents a stage in the history of religion; indeed it is precisely when its historical importance lies in the progress of science and enlightenment it has no positive significance, except as a necessary transition which the race had to make in order to get rid of nature-religion, and that under
valuing of the spiritual life which formed an insuperable obstacle to the advance of human knowledge. Neoplatonism, however, failed as signally in its religious enterprise as it did in its philo
sophical. While seeking to perfect ancient philosophy, it really extinguished it; and in like manner its attempted reconstruction of ancient religions only resulted in their destruction. For in requiring these religions to impart certain prescribed religious truths, and to inculcate the highest moral tone, it burdened them with problems to which they were unequal. And further, by inviting them to loosen, though not exactly to dissolve, their political allegiance—the very thing that gave them stability—it removed the foundation on which they rested. But might it not then have placed them on a broader and firmer foundation? Was not the universal empire of Rome ready at hand, and might not the new religion have stood to it in the same relation of dependence which the earlier religions had held to the smaller nations and states? This was no longer possible. It is true that the political and spiritual histories of the peoples on the Mediter
ranian run in parallel lines, the one leading up to the universal monarchy of Rome, the other leading up to monotheism and universal human morality. But the spiritual development had shot far ahead of the political; even the Stoic occupied a height far beyond the reach of anything in the political sphere. It is also true that Neoplatonism sought to come to an understanding

1 Porphyry wrote a book, περὶ τῆς ἐκ λαὸς ψεύδων, but this was before he became a pupil of Plotinus; as a philosopher he was independent of the λόγον.
with the Byzantine Roman empire; Julian perished in the pursuit of this project. But even before his day the shrewder Neoplatonists had seen that their lofty religious philosophy could not stoop to an alliance with the despotic world-empire, because it could not come in contact with the world at all. To Neoplatonism political affairs are at bottom as indifferent as all other earthly things. The idealism of the new philosophy was too heavenly to be naturalized in the Byzantine empire, which stood more in need of police officials than of philosophers. Important and instructive, therefore, as are the attempts made from time to time by the state and by individual philosophers to unite Neoplatonism and the universal monarchy, their failure was a foregone conclusion.

There is one other question which we are called upon to raise here. Why did not Neoplatonism set up an independent religious community? Why did it not provide for its mixed multitude of divinities by founding a universal church, in which all the gods of all nations might be worshipped along with the one ineffable Deity? The answer to this question involves the answer to another—Why was Neoplatonism defeated by Christianity? Three essentials of a permanent religious foundation were wanting in Neoplatonism; they were an external cult, a visible religion, and a regular system of morals. First, and chiefly, it lacked a religious founder; second, it could not tell how the state of inward peace and blessedness could become permanent; third, it had no means to win those who were not endowed with the speculative faculty. The philosophical discipline which it recommended for the attainment of the highest good was beyond the reach of the masses; and the way by which the masses could attain the highest good was a secret unknown to Neoplatonism. Thus it remained a school for the "wise and prudent"; and when Julian tried to enlist the sympathies of the common rude man for the doctrines and worship of this school, he was met with scorn and ridicule.

It is not as a philosophy, then, nor as a new religion, that Neoplatonism became a decisive factor in history, but, if one may use the expression, as a "mood." The instinctive certainty that there is a supreme good, lying beyond empirical experience, and yet not an intellectual good—this feeling, and the accompanying conviction of the utter vanity of all earthly things, were produced and sustained by Neoplatonism. Only it could not describe the nature of this highest good; and therefore it had to abandon itself to imaginative and aesthetic impressions. It changed thought into an emotional dream; it plunged into the ocean of sentiment; it treated the old world of fable as the reflection of a higher reality, and transformed reality into poetry; and after all these expedients, to borrow a phrase of Augustine's, it only saw afar off the land of its desire.

Yet the influence of Neoplatonism on the history of our ethical culture is immeasurable, above all because it begot the consciousness that the only blessedness which can satisfy the heart must be sought higher even than the sphere of reason. That man shall not live by bread alone, the world had learned before Neoplatonism; but Neoplatonism enforced the deeper truth—a truth which the older philosophy had missed—that man shall not live by knowledge alone. And, besides the prodigious importance which thus belongs to it, another fact has to be taken into account in estimating the influence of Neoplatonism. It is to this day the nursery of that whole type of devotion which affects renunciation of the world, which strives after an ideal, without the strength to rise above aesthetic impressions, and is never able to form a clear conception of the object of its own aspiration.

Origin.—As forerunners of Neoplatonism we may regard, on the one hand, those Stoics who accepted the Platonic distinction between the sensible world and the intelligible, and, on the other hand, the so-called Neopythagoreans and religious philosophers like Plutarch of Chaeronea and especially Numerius of Apamea. But these cannot be considered the actual progenitors of Neoplatonism; their philosophic method is quite elementary as compared with the Neoplatonic, their fundamental principles are uncertain, and unbounded deference is still paid to the authority of Plato. The Jewish and Christian thinkers of the first two centuries approach considerably nearer than Numenius to the later Neoplatonism.1 Here we have Philo, to begin with. Philo, who translated the Old Testament religion into the terms of Hellenic thought, holds as an inference from his theory of revelation that the divine Supreme Being is "superrational," that he can be reached only through "ecstasy," and that the oracles of God supply the material of moral and religious knowledge. The religious ethics of Philo—a compound of Stoic, Platonic and Neopythagorean elements—already showed the peculiar character of the later Neoplatonism. While the system assigns the supremacy to God, it is possible over the national religion of Israel, it exacts from the former, as a sort of tribute to the latter, the recognition of the elevation of God above the province of reason. The claim of positive religion to be something more than the intellectual apprehension of the reason in the universe is thus acknowledged. Religious syncretism is also a feature of Philo's system, but it differs essentially from what we find in later Neoplatonism. For Philo pays no respect to any cultus except the Jewish; and he builds the method of reconciliation of the Gnostics in thinking out the

1 The resemblance would probably be still more apparent if we thoroughly understood the development of Christianity at Alexandria in the 2nd century; but unfortunately we have only very meagre fragments to guide us here.
NEOPATONISM

The original Being first of all throws out the Nous, which is a perfect image of the One and the archetype of all existing things. It is at the same time the ground of all existence, the source of all being or generation. This Nous is the perfect image of the One and is from all time, for the Nous is the limit of the mode or the perfect image of the One. Thus in Nous we have the beginning of the sensible world and the supreme intelligible Being. All that is and all that is possible is derived from them.

An acquaintance with Judaism and Christianity. But if we search Plotinus for evidence of any actual influence of Jewish and Christian philosophy, we search in vain; and the existence of any such influence is the more unlikely because it is the only later Neoplatonism that offers striking and deep-rooted parallels of the early Christian and Jewish philosophies. Plotinus's Neoplatonic philosophies thus appear to be merely an historical anticipation of the Neoplatonic, without any real connexion. Nor is there anything mysterious in such an anticipation. It simply means that a certain religious and philosophical tendency, which grew up slowly on Greek soil, was already implanted in those who occupied the vantage-ground of a revealed religion of redemption. We have to come down to Iamblichus and his school before we find complete correspondence with the Christian Gnosticism of the 2nd century; that is to say, it is only in the 4th century that Greek philosophy in its further development reaches the stage at which certain Greek philosophers who had embraced Christianity had arrived in the 2nd century. The influence of Christianity—whether Gnostic or Catholic—on Neoplatonism was at no time very considerable, although individual Neoplatonists, after Amelius, used Christian texts as oracles, and put on record their admiration for Christ.

HISTORY AND DOCTRINES. — The founder of the Neoplatonic school in Alexandria is supposed to have been Ammonius Saccas (q.v.). But the Enneads of his pupil Plotinus are the primary and classical document of Neoplatonism. The doctrine of Plotinus is most accurately and liked mysticism its self-contented, and its ramification is divided into two main divisions. The first or theoretical part deals with the high origin of the human soul, and shows how it has departed from its first estate. In the second or practical part the way is pointed out by which the soul may again return to the Eternal and Supreme. Since the soul in its longings reaches back beyond all sensible things, beyond the world of ideas even, it follows that the highest being must be something supra-rational. The system thus embraces three heads—(1) the primeval Being, (2) the ideal world and the soul, (3) the phenomenal world. We may also, however, in accordance with the views of Plotinus, divide thus: (A) the invisible world—(1) the primeval Being, (2) the ideal world, (3) the soul; (B) the phenomenal world.

The primeval Being is, as opposed to the many, the One; as opposed to the finite, the Infinite, the unlimited. It is the source of all life, and therefore absolute causality and the only real existence. It is, moreover, the Good, in so far as all finite things have their purpose in it, and ought to flow back to it. But one cannot attach moral attributes to the original Being itself, any more than to a single point of the infinite. It has an active quality of any kind; it is being without magnitude, without life, without thought; in strict propriety, indeed, we ought not to speak of it as existing; it is "above existence," "above goodness." It is also active force without a substratum; as active force the primeval Being is perpetually producing something else, without alteration, or motion, or diminution of itself. This production is not a physical process, but an emission of force; and, since the product has real existence only in virtue of the original existence working in it, Neoplatonism may be described as a species of dynamic pantheism, either directly or indirectly, equivalence being reached by the "One." In its broadest sense it is as far as they have being, are divine, and God is all in all. Derived existence, however, is not like the original Being itself, but is subject to a law of diminishing completeness. It is indeed an image and reflection of the first Being; but the further the line of successive projections is prolonged the smaller is its share in the true existence. The totality of being may thus be conceived as a series of concentric circles, fading away towards the verge of non-existence, the force of the original Being in the outermost circle being a vanishing quantity. Each lower stage of being is united with the "One" by all the higher stages, and receives its share of reality only by transmission through them. All derived existence, however, has a drift towards, a longing for, the higher, and bends towards it so far as its nature will permit.

The image and product of the motionless nous is the soul, which, according to Plotinus is, like the nous, immaterial. Its relation to the Nous follows from the same hypothesis, and the same kind of relationship. The Nous is the immediate sphere between the nous and the phenomenal world, is permeated and illuminated by the former, but is also in contact with the latter. When they would harmonize, individuation is at an end and remain in the nous, but at the same time it has the power of uniting with the corporeal world and thus being disintegrated. It therefore occupies an intermediate position. As a single soul (world-soul) it represents that universe or harmony of the Nous, which is also embraces innumerable individual souls; and these can either submit to be ruled by the nous, or turn aside to the sensual and lose themselves in the finite.

Then the soul, a moving essence, generates the corporeal or phenomenal world. This world ought to be so pervaded by the soul that its various parts should remain in perfect harmony. Plotinus is no more a Christian Gnostic; he admires the beauty and splendour of the world. So long as idea governs matter, or the soul governs the body, the world is fair and good. It is an image—though a shadowy image—of the upper world, and the degrees of being are placed in a horse in its harmonious development. But in the actual phenomenal world unity and harmony are replaced by strife and discord; the result is a conflict, a becoming and vanishing, an illusive existence. And the reason for this state of things is the presence of the body: the body is the soul's wedge against the fabric of the universe; the Nous is the basework of each (ro Blyra krdwv q 6ba); it is the dark principle, the indeterminate, that which has no qualities, the μη δο. Destitute of form in itself, it is formless, and is matter. The human souls which have descended into corporeality are those which have allowed themselves to be ensnared by sensuality and overpowered by lust. They now seek to cut themselves loose from their true being; and, striving after independence, they assume a false existence. They must turn back from this; and, since they have not lost their freedom, a conversion is still possible.

Here, then, we enter upon the practical philosophy. Along the same line of thought, and which is the same road back to the supreme Good. It must first of all return to itself. This is accomplished by the practice of virtue, which aims at likeness to God, and leads up to God. In the ethics of Plotinus all the several schemes of virtue are taken over and arranged in a graduated series. The lowest stage is that of the civil virtues, then follow the purifying, and last of all the divine virtues. The civil virtues merely adorn the life, without elevating the soul. That is the office of the pure and divine virtues, by which the soul is freed from sensuality and led back to itself, and thence to the Nous. By means of ascetic observances the man is made conscious of his inward, spiritual nature.

But there is still a higher attainment: it is not enough to be "God." This is reached through contemplation of the primeval Being, the One—in other words, through an endless reminder of the One. But the Oneness reaches only to the nous, and is itself a kind of motion. It is only in a state of perfect passivity and repose that the soul can recognize and touch the primeval Being. Hence the soul must first pass through the spiritual stage, and become the Niagara from which the corporeal things in their multiplicity and harmony, it then reverts upon itself and withdraws into the depths of its own being, rising thence to the nous, the world of ideas. But even there it does not find the Highest, the One; it still hears a voice saying, "not we have made ourselves." The last stage is reached when, in the highest tension and concentration, beholding in silence and utter forgetfulness of all things, it is able as it were to lose itself. Then it may see God, the fountain of life, the source of being, the origin of all good, the root of the soul. In that moment it enjoys the highest indescribable bliss: it is as it were swallowed up of divinity, bathed in the light of eternity.

Such is the religious philosophy of Plotinus, and for himself personally it sufficed, without the aid of the popular religion or worship. Nevertheless he sought for points of support in these. God is certainly in the truest sense nothing but the primeval Being; but He reveals Himself in a variety of names and attributes. The idea of God is manifested in the idea of the μονοτρόπον, the μαντηρατον, which are wrapped up in it are gods, the stars are gods, and so on. A rigid monotheism appeared to Plotinus a miserable conception. He gave a meaning to the myths of the popular religions, and he had something to say even for magic, sooth-saying and prayer. In support of image-worship he advanced

1 Porphyry tells us that on four occasions during the six years of their intercourse Plotinus attained to this ecstatic union with God.
arguments which were afterwards adopted by the Christian image-worshippers. Still, as compared with the later Neoplatonists, he is comparatively free from crass superstition and wild fanaticism. He is not to be classed amongst the "deceived deceivers," and the restoration of the worship of the old gods was by no means his chief object.

Amongst his pupils, Ameliaus and Porphyry are the most eminent. Under the direction of the teaching of Plotinus on certain points; and he also put some value on the prologue to the Gospel of John. To Porphyry (q.v.) belongs the credit of having recast and popularized the system of his master Plotinus. He was not an original thinker, but a diligent student, distinguished by great learning, by a turn for historical and philosophical criticism, and by an earnest purpose to uphold false teaching—especially Christianity, to enable men and train them to goodness. The system of Porphyry is more emphatically practical and religious than that of Plotinus. The object of philosophy, according to Porphyry, is the salvation of the soul. The origin and the blame of evil are not in the body, but in the desires of the soul. Hence the strictest asceticism (abstinence from flesh, and wine, and sexual intercourse) is demanded, as well as the knowledge of God. As he advanced in life, Porphyry protested more and more earnestly against the rude faith of the common people and their immoral worship. But, outspoken as he was in his criticism of the popular religions, he had no wish to give them up. He stood up for a pure worship of the many gods, and maintained the cause of every old national religion and the ceremonial duties of its worship. Against the Christians was directed, not against Christ, nor even against what he believed to be Christ's teaching, but against the Christians of his own day and their sacred books, which, according to Porphyry, were the works of deceivers and ignorant people. In his trenchant criticism of the origin of what passed for Christianity in his time, he spoke bitter and severe truths, which have gained for him the reputation of the most rabid and wicked of all the enemies of Christianity. His work was destroyed, but the copious extracts which we find in Lactantius, Augustine, Jerome, Macarius Magnus and others show how profoundly he had studied the Christian writings, and how great was his talent for real historical research.

Porphyry marks the transition to a new phase of Neoplatonism, in which it becomes completely subservient to polytheism, and seeks before everything else to protect the Greek and Oriental religions from the formidable assault of Christianity. In the hands of Iamblichus (q.v.), the pupil of Porphyry, Neoplatonism is changed "from a philosophical theory to a theological doctrine." The distinctive tenets of Iamblichus cannot be accounted for from scientific but only from religious considerations. In order to justify superstition and the ancient forms of worship, philosophy becomes in his hands a theurgy, a knowledge of mysteries, a sort of spiritualism.

To this period also belongs a set of "philosophers," with regard to whom it is impossible to say whether they are dupes or impostors—the "decepti deceptores" of whom Augustine speaks. In this philosophy the mystical properties of numbers are a leading feature; absurd and mechanical notions are glossed over with the sheen of sacramental mystery; myths are explained by pious fancies and fine-sounding pietistic reflections; miracles, even of the most abominable sort, are belied in, and miracles are wrought. The "philosopher" has become a priest of magic and philosophy a method of incantation. Moreover, in the unbridled exercise of speculation, the number of divine beings was increased indefinitely; and these fantastic accessions to Olympus in the system of Iamblichus show that Greek philosophy is returning to mythology, and that nature-religion is still a power in the world. And yet it is undeniable that the very noblest and choicest minds of the 4th century are to be found in the ranks of the Neoplatonists. So great was the general decline that this Neoplatonistic philosophy offered a welcome shelter to many earnest and influential men, in spite of the charlatans and hypocrites who were gathered under the same roof. On certain points of doctrine, too, the dogmatic of Iamblichus indicates a real advance. Thus his emphatic assertion of the truth that the seat of evil is in the will is noteworthy; and so also is his repudiation of Plotinus's theory of the divinity of the soul.

The numerous followers of Iamblichus—Aedesius, Chrysanthus, Eusebius, Priscus, Sopater, Sallust, and, most famous of all, Maximus (q.v.), rendered little service to speculation. Some of them (Themistius in particular) are known as commentators on the older philosophers, and others as the missionaries of mysticism. The work De mysteriis Aegyptiorum is the best sample of the views and aims of these philosophers. Their hopes rose high when Julian ascended the imperial throne (361—363). But the emperor himself lived long enough to see that his romantic policy of restoration was to leave no results; and after his early death all hope of extinguishing Christianity was abandoned.

But undoubtedly the victory of Christianity in the age of Valentinian and Theodosius had a purifying influence on Neoplatonism. During the struggle for supremacy, the philosophers had been driven to make common cause with everything that was hostile to Christianity. But now Neoplatonism was thrust from the great stage of history. The church and church theology, to whose guidance the masses now surrendered themselves, took in along with them their superstition, their polytheism, their magic, their myths, their systems of philosophy, and their machinery. The church made all this settled and established itself—certainly not without opposition—in the church the purer did Neoplatonism become. While maintaining intact its religious attitude and its theory of knowledge, it returned with new zest to scientific studies, especially the study of the old philosophers. If Plato still remains the divine philosopher, yet we can perceive that after the year 400 the writings of Aristotle are increasingly read and valued. In the chief cities of the empire Neoplatonic schools flourished till the beginning of the 5th century; during this period, indeed, they were the training-schools of Christian theologians. At Alexandria the noble Hypatia (q.v.) taught, to whose memory her impassioned disciple Synesius, afterwards a bishop, reared a splendid monument. But after the beginning of the 5th century the fanaticism of the church could no longer endure the presence of "heathenism." The murder of Hypatia was the death of philosophy in Alexandria, although the school there maintained a lingering existence till the middle of the 6th century. But there was one city of the East which, lying apart from the crowded highways of the world, had sunk to a mere provincial town, and yet possessed associations which the church of the 5th century felt itself powerless to eradicate. In Athens a Neoplatonic school still flourished. There, under the monuments of its glorious past, Hellenism found its last retreat. The school of Athens returned to a stricter philosophical method and the cultivation of scholarship. Still holding by a religious philosophy, it undertook to reduce the whole Greek tradition, as seen in the light of Plotinus, to a comprehensive and closely knit system. Hence the philosophy which arose at Athens was what may fairly be termed scholasticism. For every philosophy is scholastic whose subject-matter is imaginative and mystical, and which has itself powerless to eradicate. In Athens a Neoplatonic school still flourished. Out of these they drew the material of their philosophy, which they then proceeded to elaborate with the appliances of dialectic.

The most distinguished teachers at Athens were Plutarch (q.v.), his disciple Syrusian (who did important work as a commentator on Plato and Aristotle, and who deserves more mention for his vigorous defence of the freedom of the will), but above all Proclus (411—485). Proclus is the great schoolman of Neoplatonism. It was he who, combining religious
ardour with formal acuteness, connected the whole mass of traditional lore into a huge system, making good defects, and smoothing away contradictions by means of distinctions and speculations. "It was reserved for Proclus," says Zeller, "to bring the Neoplatonic philosophy to its formal conclusion by the rigorous consistency of his dialectic, and, keeping in view all the modifications which it had undergone in the course of two centuries, to give it that form in which it was transferred to Christianity and Mahometanism in the middle ages." Forty years after the death of Proclus the school of Alexandria (q.v.) had already fulfilled its mission in the work of Proclus. The works of Proclus, as the last testament of Hellenism to the church and the middle ages, exerted an inculcative influence on the next thousand years. They not only formed one of the bridges by which the medieval thinkers got back to Plato and Aristotle; they determined the scientific method of thirty generations, and they partly created and partly nourished the Christian mysticism of the middle ages.

The disciples of Proclus are not eminent (Marinus, Asclepiodotus, Ammonius, Zenodotus, Isidorus, Hegias, Damascius), the highest of them was Damascius (q.v.). When Justinian issued the edict for the suppression of the school, Damascius along with Simplicius (the painstaking commentator on Aristotle) and five other Neoplatonists set out to make a home in Persia. They found the conditions were unfavourable and were allowed to return (see CHOSROES I.).

At the beginning of the 6th century Neoplatonism had ceased to exist in the East as an independent philosophy. Almost at the same time, however—and the coincidence is not accidental—it made new conquests in the church theology through the writings of the pseudo-Dionysius. It began to bear fruit in Christian mysticism, and diffuse a new magical leaven through the worship of the church.

In the West, where philosophical efforts of any kind had been very rare since the 2nd century, and where mystical contemplation did not meet with the necessary conditions, Neoplatonism found a congenial soil only in isolated individuals. C. Marius Victorinus (q.v.) translated certain works of Plotinus, and thus had a decisive influence on the spiritual history of Augustine (Confess. vii. 9, viii. 2). It may be said that Neoplatonism influenced the West only through the medium of the church; for the most part it was a system of expounding, and disputing, Neoplatonism. So Boethius (it may now be considered certain) was a Catholic Christian, although his whole mode of thought was certainly Neoplatonic (see BOETHIUS). His violent death in the year 525 marks the end of independent philosophy in the West. But indeed this last of the Roman philosophers stood quite alone in his century, and the philosophy for which he lived was neither original, nor well-grounded, nor methodically developed.

**Neoplatonism and the Theology of the Church.**—The question as to the influence of Neoplatonism on the development of Christianity is not easily answered, because it is scarcely possible to get a complete view of their mutual relations. The answer will depend, in the first instance, upon how much is included under the term "Neoplatonism." If Neoplatonism is understood in the widest sense, as the highest and finest expression of the religious movements in the Graeco-Roman empire from the 2nd to the 5th century, then it may be regarded as the twin-sister of the church dogmatism, which grew up during the same period; the younger sister was brought up by the elder, then rebelled against her and at last transfigured over her. The Neoplatonists themselves characterized the theologians of the church as intruders, who had appropriated the Greek philosophy and spoiled it by the admixture of strange fables. Thus Porphyry says of Origen (Euseb. H.E. vi. 19), "The outer life of Origen was that of a Christian and contrary to law; but, as far as his views of things and of God are concerned, he thought like the Neoplatonists; he regarded the soul as immortal, and the body as accidental. This verdict of Porphyry's is at all events more just and apt than that of the theologians on the Greek philosophers, when they accused them of having borrowed all their really valuable doctrines from the ancients, and then adding to them so little that the relationship was acknowledged on both sides. Now, in so far as both Neoplatonism and the church dogmatism set out from the felt need of redemption, in so far as both sought to deliver the soul from sensuality and recognized man's inability without divine aid—without a revelation—to attain salvation and a sure knowledge of the truth, they are at once most intimately related and at the same time mutually independent. It must be confessed that when Christianity began to project a theology it was already deeply impregnated by Hellenic influences. But the influence is to be traced not so much to basic Neoplatonism as to the whole set of conditions under which spiritual life was manifested. When Neoplatonism appeared, the Christian church had already laid down enough of a Christian position to make it possible for them out of Neoplatonism—those are not a mere accident—but still independently. It was only by identifying itself with the whole history of Greek philosophy, or by figuring as pure Platonism restrained, that Neoplatonism may be regarded as a development of Alexandria—a plagiarism from itself. These assumptions, however, were fanciful. Although our sources are unfortunately very imperfect, the theology of the church does not appear to have learned much from Neoplatonism; the vein of dogmatism is almost purely Oriental. The latter had not yet reached the form in which its doctrines could be accepted by the church dogmatism, and partly because theology was in the same way a question of faith, partly because it settled firmly on its own territory, to make good her position and clear away old and objectionable opinions. Origen was quite as independent a thinker as Plotinus; only, they both drew on the same tradition. From the 4th century downwards, however, the influence of Neoplatonism on the Oriental theologians was of the utmost importance. The church gradually expressed her most peculiar conceptions, which were formulated by philosophical means, but were irreconcilable with Neoplatonism (the Christological dogmas); and the further this process went the more unrestrainedly did theologians resign themselves to the influence of Neoplatonism on their doctrine. The question is, the doctrinal and the political. The function of the incarnation, the reconstruction of the flesh and the creation of the world in time marked the boundary line between the church's dogmatic and Neoplatonism; in every other respect, theologians and Neoplatonists drew so closely together that many of their most complicated and at first sight so strange considerations are, in reality, almost the same. It is easy to see that the doctrines attributed to Neoplatonism by the church were the conclusions of St. Augustine. If we con- sider the historical position of Neoplatonism finally for some time, we may often discover whether the writer is a Christian or a Neoplatonist. In ethical precepts, in directions for right living (that is, asceticism), the two systems appear more and more closely. But it was here that Neoplatonism finally achieved its greatest triumph. It indoctrinated the church with all its mysticism, its mystic exercises and even its magical cultus as taught by Iamblichus. The works of the pseudo-Dionysius are therefore in part the writings of Iamblichus and Proclus, the church's theology is turned into a scholastic mysticism with directions on matters of practice and ritual. And as these writings were attributed to Dionysius, the disciple of the apostles, the scholastic mysticism which they unfolded was regarded as an apostolic, not to say a divine, science. The influence exercised by these writings, first on the East, and then on the West (or 12th century)—on the West, cannot be overestimated. It is impossible to enlarge upon it here; suffice it to say that the mystical and pietistic devotion of our own day, even in the Protestant churches, is nourished and fed through these works by a series of intermediate links, to the writings of the pseudo-Areopagit.

In the ancient world there was only one Western theologian who came under the influence of the writings of Augustine, the most important of them all. It was through Neoplatonism that Augustine got rid of scepticism and the last dogma, Manichaeism. In the seventh book of his Confessions he has recorded how much he owed to the perusal of Neoplatonic works. On all the cardinal doctrines—God, matter, the relation of God to the world, freedom and evil—Augustine retained the impress of Neoplatonism; at the same time he is the theologian of antiquity who most clearly perceived and most fully stated wherein Neoplatonism and Christianity differ. The best ever written by any church father on this subject is to be found in chaps. xx-xxvi. of the seventh book of the Confessions.

Why Neoplatonism succumbed in the conflict with Christianity is a question which the historians have never satisfactorily answered. As a rule, the problem is not even stated correctly. We have nothing to do with the question of whether it is right to substitute the symbols of grace and justice in the place of the Neoplatonic the doctrine, and what share must be assigned to the organization of the church.

In medieval theology and philosophy mysticism appears as the powerful opponent of rationalistic dogmatism. The empirical science of the Renaissance and the two following centuries was itself a new development of Platonism and Neoplatonism, as opposed to rationalistic and dogmatic rationalism. But astrology and alchemy—all this outgrowth of Neoplatonism—gave the first effective stimulus to the observation of nature, and consequently to natural science, and consequently to finally extinguished barren
rationalism. Thus in the history of science Neoplatonism has played a part and rendered services of which Plotinus or Iamblichus or Proclus never dreamed. So true is it that sober history is often stranger and more capricious than all the marvels of legend and romance.

NEOPLEOMUS (also called PYRHRUS), in Greek legend, the son of Achilles and Deidamia. He was brought up by his grandfather Lycomedes in the island of Scyros, and taken to Troy in the last year of the war by Odyssey, since Helenus had declared that the city could not be captured without the aid of a descendant of Aeneus. Neopolus was famed for his beauty, eloquence and bravery. He was one of the warriors in the wooden horse and slew Priam at the sack of Troy (Odyssey, xi. 508-526; Aeneid, ii. 527). Apart from these Trojan tales, Neopolus is a prominent figure in the legends of Euphras and of Delphi. He was the ancestor of the Molossian kings, who therefore claimed to be of pure Hellenic stock. He was murdered at Delphi, where he was buried, and a festival was held in his honour every eighth year.

NEOPYTHAGOREANISM, a Graeco-Alexandrian school of philosophy, which became prominent in the 1st century A.D. Very little is known about the members of this school, and there has been much discussion as to whether the Pythagorean literature which was widely published at the time in Alexandria was the original work of 1st-century writers or merely reproductions of and commentaries on the older Pythagorean writings. The only well-known members of the school were Apollonius of Tyana and Moderatus of Gades. In the previous century Cicero's learned friend P. Nigidius Figulus (d. 45 B.C.) had made an attempt to revive Pythagorean doctrines, but he cannot be described as a member of the school. Further, it is necessary to distinguish from the Neopythagoreans a number of Eclectic Platonists, who, during the 1st century of our era, maintained views which had a similar tendency (e.g. Apuleius of Madaura, Plutarch of Chaeronea and, later, Numenius of Apamea).

Neopythagoreanism was the first product of an age in which abstract philosophy had begun to pall. The Stoics discovered that their "perfect man" was not to be found in the luxurious, often morbid society of the Graeco-Roman world; that some kind of theosophic and dialectic ethics was needed to reawaken a sense of responsibility. A degenerate society cared nothing for syllogisms grown threadbare by repetition. Neopythagoreanism was an attempt to introduce a religious element into pagan philosophy in place of what had come to be regarded as an absurd formalism. The founders of the school sought to invest their doctrines with the halo of tradition by ascribing them to Pythagoras and Plato, and there is no reason to accuse them of insincerity. They went back to the later period of Plato's thought, the period when Plato endeavoured to combine his doctrine of Ideas with the Pythagorean number-theory, and identified the Good with the One, the source of the duality of the Infinite and the Measured (τό διαμέτρου και περίοδος) with the resultant scale of realities from the One down to the objects of the material world. They emphasized the fundamental distinction between the Soul and the Body. God must be worshipped spiritually by prayer and the will to be good, not in outward action. The soul must be freed from its material surrounding, the "muddy vesture of decay," by an ascetic habit of life. Bodily pleasures and all sensuous impulses must be abandoned as detrimental to the spiritual purity of the soul. God is the principle of good; Matter (όξων) the groundwork of Evil. In this system we distinguish not only the asceticism of Pythagoras and the later mysticism of Plato but also the influence of the Orphic mysteries and of Oriental philosophy. The Ideas of Plato are no longer self-subsistent entities; they are the elements which constitute the content of spiritual activity. The soul is no longer an appanage of oivos, it is oivos itself: the non-material universe is regarded as the sphere of mind or spirit.

Thus Neopythagoreanism is a link in the chain between the old and the new in pagan philosophy. It connects the teaching of Plato with the doctrines of Neoplatonism and brings it into line with the later Stoicism and with the ascetic system of the Essenes. Neopythagoreanism was a thing of the East, and the Neopythagoreans shows a parallel so striking as to warrant the theory that the Essenes were profoundly influenced by Neopythagoreanism. Lastly Neopythagoreanism furnished Neoplatonism with the weapons with which pagan philosophy made its last stand against Christianity.

See PYTHAGORAS, NEOPLATONISM, ESSENES; and Zeller's PHILOSOPHY OF THE GREEKS, where fuller details are to be found. For more references to the history of the school see APOLLONIUS OF TYANA and MODERATUS OF GADES.

NEPAL, NEPAUL or NEPAL, an independent state, situated on the north-eastern frontier of India, lying between 80° 15' and 88° 10' E., and 26° 20' and 30° 10' N.; area, 54,000 sq. m. Its extreme length is about 525 m., and its breadth varies from 90 to 140 m. It is bounded on the N. by Tibet; on the E. by Sikkim; on the S. by Bengal and the United Provinces; and on the W. by Kumaon, from which it is separated by the Kali river. Its population is estimated by the natives at about 5,000,000, the common phrase used by the rulers in speaking of popular opinion being, "but what will the Bāwan (or fifty-two) Lakḥ say to this."

Nepal physically consists of two distinct territories: (1) the tarai, or strip of level, cultivated and forest land lying along the southern frontier; and (2) the hill-country, consisting of the hills (in the lower range) and of the high mountains (in the higher range) running northwards to Tibet. Along the northern frontier stand many of the highest peaks of the Himalayan range, such as Dhaulagiri (26,837 ft.), Māsūrpatra, Garshrīlak and Yāsā (24,000), Gosaín Thān (22,500), Mākhan (21,000), Kangchhenggo (21,500), Kinchinjunga (21,450), and numerous peaks varying from 20,000 to 24,000 ft. In clear weather this magnificent snowy range may be seen in an almost continuous line from the top of some of the higher ranges near Katmandu. South of these are numerous parallel peaks running up, ranging from 16,000 to 6000 ft. in height, which are broken up at intervals by cross ranges, thus forming a series of glens with a few hill-villages interspersed.

These mountain ranges determine the course of the rivers, which are divided by the cross ranges into four groups. The first of these extends from Kumaon eastward as far as Dhaulagiri, and consists of the affluent of the Ganges and Brahmaputra. The second group, known to the Nepalese as the Kālāpūrī or Kang chen gang. The third group consists of two branches, eastward running, the Dāhuālgiri and Gosaín Thān, and unite at Trebeni Ghat to form the Gandak. The third is a group of smaller rivers draining the great valley of Nepal, the valleys of Chitāng, Benepa, and Panouiri, and portions of the tarai around the Churiaitagi range of hills. There are the various branches of the Bara Gandak, the lesser Rapti, the Bagmati and Kumla. East of this again is the fourth group, known to the Nepalese as the Sapt Kosi, rising from the peaks between Gosaín Thān and Kinchinjunga, and uniting to form the Sapt Kosi, which falls into the Ganges.

There is thus a natural division of the country into four portions. The northern consists of the Kālāpūrī or Kangchenjunga range, and contains the towns of Jumla, Doti and Sulliana. The second is the country of the Chaubisi (or twenty-four) rajas, and contains the towns of Malembum, Pulpa, Gorkha and Noakote. The third is the country of the eighteenth of the Bāwan, consisting of the hill capital and many large towns to be mentioned afterwards. The fourth is the eastern portion of Nepal, comprising the country of the Kiratis, and many small towns, such as Dhanokota, Ham and Bijapur.
**Route into Nepal**—The portion of Nepal, exclusive of the tarai, which is the least developed part of the country, is one of the least inhabited parts of the capital of the country, and a few adjacent smaller valleys. There is only one means of access open to Europeans, and this indeed is in general resorted to by the natives, as the other routes are usually impassable during the rainy season. The modern highway, which runs nearly north from Segauli, passing through the tarai and sal forests, to Bhikhkhori; then through the beds of mountain streams, and along the Churighati range, another road runs to Butotam, and a third good road to Bhiphmendi at the foot of the Sisgarhi range of hills. So far the route is practicable for carts and baggage animals, but from this point onward it leads through the forests, which until the Chitlong valley and the Chandragiri range. The distance from Segauli to Katmandu is 90 m.

The valley in extreme length from east to west is about 26 m., and in breadth from north to south, about 10 m. The surface of the hills vary in height from 600 to 9720 ft., the level of the valley being about 4500 ft. above the sea. Tradition has it that Nepal was once lake-like, and appearances are in favor of this view. It is crossed from east to west by a low limestone range, through which the rivers have gradually forced a passage, and in like manner the collected rivers have escaped at the south-eastern corner of the valley.

There are three principal streams, the Bagmati, the Vishnumati, and Manohara, besides many small tributaries of these. All the rivers rise within the valley, except the Bagmati, which springs from the northern part of the tarai; the remainder of the tarai is broken up into ravine at the north-eastern corner. They all unite and pass through a long narrow gorge in the limestone range, already mentioned, at Chisopani, near the frontier of the Kothal."}

**Climate**—In and around the Nepal valley, as in India, the year may be divided into three seasons. The rains fall in June and last till October, but the fall is not so heavy or constant as in the higher Himalayan districts. The second season, from the middle of October to the middle of April. During these months the climate is delicious. Heat-frost and thin ice are common in the mornings, and the thermometer sometimes falls as low as 25° Fahr., and is bright and clear. From Christmas to the end of February there are occasional showers of rain; and snow falls on the surrounding low ranges, but is very rarely seen in the valley itself. In April, the rains are over, but the thermometer seldom reaches 85° in the shade. The result of observations extending over many years gives an average mean temperature of 60° Fahr., and an annual rainfall of about 60 in. Violent thunderstorms are common, and occasionally severe earthquakes occur, as in 1833 and 1866.

**Flora and Fauna.**—In a country possessing such a range of altitudes the flora and fauna are of course very varied. For descriptive purposes, Nepal may again be divided into three zones. These are—(1) the tarai and lower ranges of hills up to 4000 ft. in height; (2) the central ranges and high-lying valleys, up to 10,000 ft.; and (3) the alpine region, from 10,000 to 20,000 ft. in height. Each zone is clearly sharply defined, as the climate varies according to the latitude, the height of intermediate ranges, and the depth of the valleys; so that tropical plants and animals are sometimes found near the summits, and alpine species descend nearly along the loftier spurs into the southern zones.

The low alluvial land of the tarai is well adapted for cultivation, and is, so to speak, the granary of Nepal; but owing to scantiness of water and the absence of water-trees, large swamps and lakes are not found. There are, however, numerous small swamps, jungles and forests. Considerable stretches of land are, however, being reclaimed from year to year. The productions here are those of British India—cotton, rice, wheat, pulse, sugar-cane, tobacco, opium, indigo, and the fruits and vegetables familiar in the plains of India. The forests yield a magnificent supply of sal, sidi, and other valuable forest trees; and the jungles abound with acacias, mimosa, cotton tree (Bombax), dák (Rhus Jacquemontiana), large bamboos, rattans, palms, and numerous ferns and orchids. On the Churighati range the common Pinus longifolia grows freely. Tea can be grown at a height of from 2000 to 4000 ft. The middle range supports several species of rhododendrons, and the lower slopes are covered with potatoes, Cucurbitaceae, pineapples, and many varieties of European fruits, vegetables and flowers. The forests contain tree rhododendrons, Pinus longifolia, and more shrubs, nuts, walnuts, maples, hickory, bamboo, wild cherry, pear, allies of the Himalayan plum, peach (Daphne), roses, and many other inhabitants of temperate climes, with various orchids, ferns and wild flowers. In the alpine zone evergreen conifers, such as the spruce, fir, box, hollies, birch, dwarf rhododendrons and the usual alpine flora.

The wild animals follow a similar distribution, and the following typical species may be mentioned. In the lowest zone are found the tiger, leopard, sambar, wild cat, and wild bear; in the middle zone, the elephant and rhinoceros, the gaur (Gaurus gaurus), gyal (Gaurus frontalis), wild buffalo or auro, many species of deer, and the black bear (Ursus labiatus). Among the birds are the eagle, vulture (Gyps philocetus), the jungle fowl, and the smaller vultures, &c. In the middle zone there are also the leopard, the Himalayan black bear (Ursus tibetanus), the wild dog, cats of many sorts, squirrels, hares, porcupines, the pangolin, and some species of deer and antelope. Among the birds are the larger vultures and eagles, pheasants (Gallus philocetus), chukor, hill partridges, &c., the eagle the true red and golden eagle (Aquila chrysaetos), &c. Among the birds are the eagle- vulture (Gyps philocetus), the blood pheasant (Pheasant philocetus), snow pheasant (Tetragallus himalaicus), and the blue pheasant (Cortinnis sanya), crestless pheasant (Coturnix walli), &c. Geese, ducks, waders of all sorts, and other migratory birds are found in abundance, among the two most common being the teal and the drake.

Minerals.—The lowest zone in some directions abounds in fossils; and deposits of lignite, and even of true coal, are met with, the latter notably at a spot south of Palpa. The middle zone is rich in limestone and marble. They rest also on minerals, such as iron, copper, zinc, lead and sulphur. Copper is found near the surface in many places, and there are remains of mines both at Markhu and in the great valley of Nepal. Mineral springs, both hot and cold, are of frequent occurrence in this zone. The races of silver, and also of gold, have been found in the alpine zone.

**People.**—The races occupying Nepal are of mixed Mongol appearance, being generally short and robust, and having flat or oblique eyes, yellow complexes, black hair, and comparatively hairless faces. The Newars, according to the Vamcavali or native history, trace their descent from the races of southern India, but this is rendered more than doubtful by both their appearance and language. The Gurkhas (Gurkhas) or Gurkhas are descendants of the Brahmans and Rajputs who were driven out of Hindostan by the Moslems, and took refuge in the western hilly lands, where they ultimately became dominant, and where they have become much mixed with the other races by intermarriage.

**Religion.**—The Bhutias, Newars, Limbus, Keratis, and Lepchas are all Buddhists, but their religion has become so mixed up with Hindutism that it is now hardly recognizable. The Newars have entirely abandoned the monastic institutions of Buddhism, and in the measurement of time they often make 24 hours equal to a day, this is particularly the case in the higher and more northern districts, known as Kamhas, Tharsus, Manjus, &c., but generally classed together by the Nepalese as Aoulias, or dwellers in the malarious or aul districts. These are probable descendants of immigrants from the lower castes of Hindus, occupying the borderlands of the tarai. Among the forests of the lower eastern region are also to be found some small savage tribes, known as Chepangs and Kusundas.

All the races except the Aoulias are of a decidedly Mongolian appearance, being generally short and robust, and having flat or oblique eyes, yellow complexes, black hair, and comparatively hairless faces. The Newars, according to the Vamcavali or native history, trace their descent from the races of southern India, but this is rendered more than doubtful by both their appearance and language. The Gurkhas (Gurkhas) or Gurkhas are descendants of the Brahmans and Rajputs who were driven out of Hindostan by the Moslems, and took refuge in the western hilly lands, where they ultimately became dominant, and where they have become much mixed with the other races by intermarriage.

**Education.**—There is a central educational institution at Katmandu with sixteen branches, or schools, over the valley of Nepal. This central institution has three departments, English, Sanskrit and Persian—or more correctly perhaps Urdu. Education is provided
free by the state, and is encouraged by grants of scholarships and prizes. Boys passing out well are sent at government expense to the schools of the west, and there is a free education for the poor, education, and some have lately been sent to Japan. The evil effects of higher education, as taught in the Indian colleges, on the youth of Bengal, &c., has, however, been strongly denounced. It is not unlikely that education in Nepal may receive a set-back in consequence. Some of the upper classes speak English fluently, but the bulk of the labouring classes is quite illiterate.

Katmandu is a perfect storehouse of ancient Sanskrit literature, and some of the oldest MSS. in that language as yet known to scholars have been found there. There is also a fair English library.

Calendar.—There are three principal eras in Nepal. The Samvat of Vikramaditya begins fifty-seven years before the Christian era. That of the Bhadra, which is the date of the Nepalese era, and the Nepalese Samvat dates from October A.D. 880. The Sri-Harsha and Kaliagata eras are also sometimes used. Day is considered to begin when the tiles on a house can be counted, or when one can read in the sky against the sun. Sixty bispals = 1 pala; 60 pala = 1 ghari or 24 minutes; 60 ghari = 1 day of 24 hours.

Health.—All families of good position have at least one badi, or medical man, in constant attendance, and there are also many general practitioners. There is a large central hospital at Katmandu, and some thirteen other smaller hospitals are distributed over the country, with similar physicians and surgical officers. There is also a small hospital attached to the British Residency.

The disease most prevalent in the country are rheumatism, chronic dyspepsia, skin diseases, syphilis, gout, smallpox, cholera and leprosy. The prevailing diseases are malaria, typhus fever, and diarrhea, and dysentery are met with. Fever of a severe typhoid type is common in the crowded lanes and dirty villages. Vaccination is not extensively practised.

The health of the inhabitants of the principal cities in the valley has greatly improved since the introduction of fresh water, which has been brought in by pipes from mountain springs.

Trade.—There are three large towns in the Nepal valley, Katmandu, the capital, said to contain approximately 50,000 inhabitants, Patan and Bhatagaon about 30,000 each. The houses are from two to four storeys in height, built of brick and tile. The windows and balconies are numerous and sometimes beautifully carved. There are numerous handsome temples in all the towns, the majority of which are pagoda-shaped and built of brick, with roofs of copper, which is sometimes gilt. The streets are narrow, and they, as well as the squares, are all paved with brick or stone. In front of the temples generally stand monoliths surmounted by figures of Garuda, or of the founder, made of brass gilt, or sometimes of black stone. Besides these three large towns, there are at least twenty smaller towns and numerous villages in the valley, all of which possess temples. Some of these, as for instance those of Pashupati, Bhaktapur and Bhaktapur, near Katha, are considered of great sanctity. Many thousands of pilgrims travel annually to the shrines of Pashupati, Pashupati, and it is there that the dying are brought to be immersed in the Bagmati, and the dead are burned on its banks.

The Gurkhas are noted for their military abilities, and the agriculture of the valley is carried on by the Newars. The soil is varied in character, from light micaceous sand to dense ferruginous clay. The whole valley is cultivated and irrigated by the numerous streams which slope down from the mountains so that there is little grazing ground, and few sheep or cattle are kept. There are some milch cows and buffaloes, which are either slain or reared for consumption and sacrifice are all imported, and are consumed as fast as they are brought in. In the cold season the Bhutias bring large flocks of sheep and goats laden with bags of borax, salt and salt petre. These are sold for consumption, except a few that are retained to carry back the bags. These droves are generally accompanied by ponies and some of the large Tibetan dogs; the latter are very cheerful, fierce, shaggy animals, about the size of a small Newfoundland. There are also hawks, hares and some game such as pheasants and ducks, the eggs of which are in great demand even among the orthodox Hindus. The crops grown in the valley consist of rice, both the transplanted and the dry-sown or ghaiya varieties, wheat, pulse, murwah, maize, buckwheat, chillies, radishes, mustard, garlic, onions, ginger, turmeric, sugar-cane, potatoes, ground nuts, many species of cucumbers and pumpkins, &c. Nothing but artichokes, radishes and some vegetables are grown. Large cardamoms are extensively grown in the eastern hills, and form an important article of trade with India. The hemp plant (Cannabis indica) grows wild, and is used both for manufacturing purposes and for producing the resinous extract and other ingredients which are used for making opium. Some opium is planted and grown, but timber, such as madder or manjist, are grown in some places; and drugs, such as chirata, are collected and exported. The better class of soils yields a return of about Rs. 180 per khat, and the poorest about Rs. 90 per khat. From some of the finer soils as many as three crops of various sorts are obtained annually. The land measures in use are different in different parts of the country. Thus a small plot of nearly 2 acres in Kathmandu district is worth Rs. 120, while in the western tarai it is only 15x15 yds. In the hills the unit of land measurement is called rupni, which is about twice the size of an English acre. The area of Nepal is approximately 116,000 square miles.

Land Taxes.—The tarai lands pay from two to nine rupees (British) per Nepali bigha according to quality of land. In the hills taxes range from one to ten rupees per Nepali bigha. There is also a stall-fed tax, payable by all owners of stall-fed, bullock, one bullock without plough about 10 annas; one sapat 63 annas. These taxes are termed Hol, Patay and Kodaley.

Agriculture.—The Newars are the principal agriculturists. Many European fruits, flowers and vegetables have been introduced and grow freely. The country is famed for its oranges and pineapples. Flowers are grown and sold for religious purposes, and even wild flowers are collected and distributed by the Newar women in adornning their hair, as well as for offerings at the shrines. Many wild fruits are collected and sold in the markets. Apples and pears, English stock, thrive well; apricots and plums are good; peaches and grapes grow freely and are of large size, but they seldom ripen before the rains begin, when they rot.

Manufactures.—All the trade and manufactures of the country are in the hands of the Newars, and a few Kashmiris and natives of Hindustan. The trade in European goods is chiefly carried on by the latter, whilst the Newars deal in corn, oil, salt, tobacco and articles of daily consumption. The Newars are noted for their shoddy and coarse textiles. The white sari, which are woven on cotton looms, are the same as those of the Sikhs. They are manufactured in the villages, and the women are generally engaged in the work. The manufacture of incense is a peculiar trade of the Newars, who are also celebrated for the manufacture of silk and worsted goods. Some small quantities of cotton, hemp, and jute are manufactured. The Newars are also noted for the manufacture of woolen cloths, and are the principal manufacturers of woollen cloth for export to British India. The Newars are also noted for the manufacture of paper, and the making of armorials, and ornaments of silver.

Manufactures.—The Newars are skillful workmen. Their bricks are excellent, and so also is their pottery, which certain towns are famous, such as Themi and Nokote. As carpenters they excel, though the use of the large saw is still unknown, and planks are cut with chisel and mallet. Some of the wood carvings on the temples and large houses are most artistic in design and bold in execution, though unfortunately they are sometimes of a most obscene character. The manufactures are few, consisting chiefly of coarse cotton cloths, paper made of the inner bark of the paper-plants (Dioon), cloths, bags and burlaps, worsteds, wools, and ornaments of gold and silver.

Coinage.—At one time Nepal supplied Tibet with its silver coinage, but this was abandoned on account of the adulterations introduced by the Nepalese. The ancient coins, specimens of which are still to be met with, were made by hand. The modern coinage is struck by machinery, a regular mint having been established by Sir Jung Bahadur Rana after his return from London in 1859.

Government.—The Nepalese have relations with China, and occasionally send an embassy with presents to Peking. The British too have considerable influence with the government in regard to their foreign relations, and a British resident is stationed at Katmandu. But in all matters of domestic policy the Nepalese brook no interference, and they are most jealous of anything that has a tendency to encroach on their independence. Theoretically the government of Nepal is a pure despotism, and the maharajah is paramount. Practically, all
real power has long been in the hands of the prime minister, and much of the modern history of the country consists of accounts of the struggles of one faction or another to gain ascendancy. Under the prime minister there is a council, consisting of the relations of the king, the raj guru, the generals, and a few other officials known as kajis and sirdars and bhardars, which is consulted on all important business, and which forms a court of appeal for disputed cases from the courts of law. There are separate civil and criminal courts, but the distinction is not always observed, as difficult cases are often transferred from one to the other.

Law and Justice.—The old savage code with its ordinances by fire and water, and its punishments by mutilation and torture was abandoned by Sir Henry Yule and his colleagues in 1851. Treason, rebellion and desertion in war-time are punished by death. Bribery and peculation by public servants are punished by dismissal from office, and a fine and imprisonment, the latter of which can be compounded by payments at various rates, according to the nature of the offence. Murder and the killing of cows are capital offences. Manslaughter and maiming cows are punished by imprisonment for life and other offenses against the person or property by imprisonment or fine. Brahmanas and women are exempted from capital punishment. Offences against caste are heavily punished by fine and imprisonment. In some cases indeed all the members of a caste are punished, and in such cases, as the land can be sold as slaves. Bankruptcy laws have been recently introduced. The marriage laws are somewhat peculiar. Among the Gurkhas the laws resemble those of other Hindus as regards the marriage of widows and remarriage of those of the same rank. An every girl who is not married with ceremony to a boi fruit, which is then thrown into some sacred stream. As the fate of the fruit is unknown, the parents are considered to be atoning for a wanton age of puberty a husband is selected, but the woman can at any moment divorce herself by placing a betel-nut under her husband's pillow and taking her departure. Adultery is punished by the imprisonment of both the adulteress and her paramour. Sati has been abolished in Nepal by law.

Goals.—There are three large prisons in the Nepal valley, one for males and two for females; there are also a considerable number of jails in the country. The convicts are kept in them, and employed in public works of various sorts. They are allowed six pice a day for subsistence at the capital, and five pice in other places. Their relatives are allowed to minister to their creature comforts.

Slavery is an institution of the country, and all families of rank possess many slaves, who are employed in domestic and field work. They are generally treated well, and are carefully protected by law. The price of slaves ranges from Rs. 100 to Rs. 200. Revenues.—The revenue of Nepal is about one hundred and fifty lakhs of rupees, i.e. £1,000,000. The chief sources of it are the land revenue and the customs duties. About 10% of the total lands, and 20% of the hill lands, are private property. Some lands were assigned by the Gurkha kings to Brahmanas, some to the Thakurs, and others to the Bhandars. Where these are not the gifts of the old Newar kings, pay from 4 to 8 annas per bigha. All such grants of land, however, are subject to a heavy fine on the coronation of a new raja. Land which does not produce rice is lightly rated, but in the valley of Nepal, and wherever there are rice crops, the government tax or rent is one half of the produce of the land. Waste lands, when brought into cultivation, are rent free for ten years, after which for five years the tax is only 4 annas per bigha, and the cultivator receives one-tenth of the cleared land rent free for his life. A considerable revenue in the shape of royalty is obtained from mines of copper, iron, &c. The taxes on merchandise amount to from 12 to 14% on the value of the goods carried to and from British India, and from 5 to 6% on goods exported to Tibet.

Army.—Much attention is devoted by the Gurkhas to military matters, and the bulk of that race may be said to be soldiers. The standing army consists of about 50,000 men, in a fair state of efficiency. Besides this force there is a reserve, consisting of men who have served for a few years and taken their discharge, but in case of necessity can be called on again to enter the ranks. These would probably raise the strength to between 70,000 and 80,000 men. The regiments are formed on the European system, and similarly divided into companies, and supplied with supplies of gunpowder and military stores. There are workshops where cannon are cast, and rifles and ammunition of all sorts turned out in large quantities, but only for the use of the army.

In addition to its own army, Nepal supplies to the British army in India a large force of splendid soldiers, who were raised under the following circumstances. In 1815 the British enlisted three battalions of Gurkhas from amongst the soldiers of that race who were thrown out of employment, owing to the termination of the first phase of the war with Nepal. These regiments were styled the 1st, 2nd and 3rd Gurkhas, and were soon employed on active service. The 1st and 2nd behaved with much gallantry at the siege and storming of Bharatpur, and in the First Sikh War, while the 2nd and 3rd won a great name for loyalty and courage during the Mutiny of 1857—58, especially at the siege of Delhi. This induced the British to 1856 two more battalions, which they numbered the 4th and 5th, and the whole Gurkha force has since proved its usefulness and loyalty on many occasions, particularly during the Afghan War of 1878—80, and on many frontier expeditions. Batallions have been sent on service to Burma, Egypt, China and Tibet. The Gurkhas in the British service now consist of ten regiments of riflemen of two battalions each, and number about 20,000 men.

History.—Nepal and the somewhat similar country of Kashmir are peculiar among the Hindu states of India in possessing an historical literature. The Nepalese Vamśavālī professes to start from a very early period in the Satya Yuga, when the present valley was still a lake. The earlier portion of it is devoted to the Satya and Treta Yugas, and contains mythological tales and traditions having reference to various sacred localities in the country. During these two Yugas, and also the Dwapur and Kali, the Vamśavālī deals in round numbers of thousands of years.

In the beginning of the Kali Yuga, the Gupta dynasty is said to have been founded by Ne-Muni, from whom the country takes its name of Nepal. Lists are then given of the various dynasties, with the lengths of the reigns of the rajas. The dynasties mentioned are the Gupta, Ahir, Kirāti, Somavanshi, Suryavanshi, Thakuri or first Rajput, Vaishya Thakuri, second Rajput and Karnakati dynasties. The country was then invaded by Mukundasena, and after his expulsion various Vaishya Thakur dynasties are said to have held the throne for a period of 225 years. The chronology of the Vamśavālī up to this period is very confused and inaccurate; and, though the accounts of the various invasions and internal struggles, mixed up as they are with grotesque legends and tales, may be interesting and amusing, they can hardly be considered authentic. Some of the names of the rajas, and the dates of their reigns, have been determined by coins, the colophons of old MSS., and certain inscriptions on the temples and ancient buildings. For instance, Ançuvarma, of the Thakuri dynasty, reigned about A.D. 633, as he is mentioned by the Chinese traveller Hsuan Tsang, who visited Nepal. His name too is found in the chronology of the country in a manuscript. In this manner it is ascertained from MSS. that Rudra-deva-Varma was reigning in 1068; Lakshmikama-deva from 1015 to 1040; Padma-deva, of the Vaishya Thakuri dynasty, in 1065; Mana-deva, of the second Rajput dynasty, in 1139; Ananta-Malla, 1286-1302; Harisinha-deva, 1324; Jayastithi-Malla, 1385-1391. Much information as to the chronology of the various dynasties can be obtained from the catalogue of the Cambridge MSS. compiled by Cecil Bendall, and also from his papers on the ancient coins of the country. Inscriptions too have been edited by Professor Bühler in the Indian Antiquary, vol. iv. Detailed lists of the rajas are to be found in Kirkpatrick's Account of Nepal, in Hodgson's Essays, Prinsep's papers in the Asiatic Society's Journal and Wright's History of Nepal.

The records begin to be more accurate from the time of the invasion and conquest of the country by Harisinha-deva, the raja of Simraun, 1324. This raja was driven from Simraun by Tughlah Shah of Delhi, but seems to have found little difficulty in the conquest of Nepal. There were only four rajas of this Ayodhya dynasty, and then the throne was occupied by Jaya-bhadrā-Malla, a descendant of Ahbha-yā-Malla, who reigned practically until the 13th century. There were eight rajas of this dynasty. The seventh, Jayastiti-Malla, who reigned for forty-three years (1386—1429), has appeared to have done much in forming codes of laws, and introducing caste and its rules among the Newars. In the reign of the eighth raja, Yakesha-Malla, the kingdom was divided into four separate states—namely, Banega, Bhatgaon or Bhaktapur, Kantipur or Katmandu, and Lalitapur or Patan. There was only one raja of Banega, who died without issue. The Malla dynasty in the other
three branches continued in power up to the conquest of the country by the Gurkhas in 1768.

The Gurkhas claim descent from the Rajputs of Chitor, in Rajputana. They were driven out of their own country by the victorious Mughals, and took refuge in the hilly districts about Kumaon, whence they gradually pushed their way eastwards to Lamjung, Gurkha, Noakot and ultimately to the valley of Nepal, which under Raja Prithwi Narayan they finally captured. In the struggle which took place at Bhatgaon, Jaya-prakasa (the raja of Katmandu) was wounded, and shortly afterwards he died at Pashupati. Ranjit-Malla, the aged raja of Bhatgaon, was allowed to retire to Benares, where he ended his days. Tej Narasinha, the raja of Patan, was kept in confinement till his death. During the latter years of the war Jaya-prakasa applied to the British for assistance, and a small force, under Captain Kinloch, was sent into the tarai in 1765, but it was repulsed by the Gurkhas.

Prithwi Narayana died in 1774. He left two sons, Pratap-sinha Sah and Bahadur Sah. The former succeeded his father, but died in 1777, leaving an infant son, Rana Bahadur Sah. On the death of Pratap-sinha, his brother, who had been in exile, returned to Nepal and became regent. The mother of the infant king, however, was opposed to him, and he had again to flee to Betta, in British territory, where he remained till the death of the rani, when he again became regent, and continued in possession of the throne. During this time the Gurkhas were busily annexing all the neighboring petty states, so that in 1790 their territories extended from Bhutan to the Sutlej river, and from Tibet to the British provinces. At length, in 1790, they invaded Tibet, and were at first successful; but they were thus brought into contact with the Chinese, who in 1791 sent a large force to invade Nepal. In 1792 the Chinese advanced as far as Noakot, and there dictated terms to the Nepalese.

In 1791 the Gurkhas had entered into a commercial treaty with Britain. When driven hard pressed, they applied for assistance against the Chinese to Lord Cornwallis. In consequence of this Kirkpatrick was despatched to Nepal, and reached Noakot in the spring of 1792, but not till after peace had been concluded. One result of this embassy was the ratification of another commercial treaty on the 1st of March 1792. In 1795 Rana Bahadur removed his uncle, Bahadur Sah, from the regency, and two years subsequently put him to death. From this time up to 1799 the king, who seems to have been insane, perpetrated the most barbarous outrages, till at length his conduct became so intolerable that he was forced to abdicate in favour of his son, Girvan-yuddha Vikrama Sah, who was still an infant. Rana Bahadur once again recovered the throne in 1804, but was assassinated in 1805.

In October 1801 another treaty was signed by the British and Nepalese authorities, and a British resident was sent to the Nepalese court, but was withdrawn in 1805, owing to the conduct of the Nepalese. From this time the Nepalese carried on a system of encroachment and outrage on the frontier, which led to a declaration of war by the British in November 1814. At first the British attacks were directed against the western portion of the Nepalese territory, and under Generals Marly, Wood and Gillespie several disasters were met with. General Gillespie himself was killed while leading an assault on a small fort called Kalunga. General Ochterlony was more successful, and the Gurkhas were driven eastward beyond the Kali river, and began to negotiate for peace. Arms, however, were soon taken up again, and Ochterlony, who was put in command, in January 1816, advanced directly on the capital in the line of the route that is now in use. He soon fetched his way as far as Mukwanpur, and the Nepalese sued for peace. A treaty was concluded in March, by which the Nepalese relinquished much of their newly acquired territory, and agreed to allow a British residency to be established at Katmandu. In November the raja died, and was succeeded by his infant son, Surendra Bikran Sah, the reins of government being held by General Bhimsena Thapa.

From this time the records for many years furnish little of interest except a history of struggles for office between the Thapa and Pandy factions, and futile attempts at forming combinations with other states in Hindustan against the British.

In 1839 Bhimsena's enemies succeeded in driving him from power, and he committed suicide, or was murdered, in prison. The Kala Pandy faction then came into power, and there were frequent grave disputes with the British. War, however, was averted by the exertions of the resident, Mr Brian Hodgson.

In 1843 Matabar Singh, the nephew of Bhimsena, returned from exile, soon got into favour at court, and speedily effected the destruction of his old enemies the Kala Pandyrs, who were seized and executed in May 1843. At this time mention begins to be made of a nephew of Matabar Singh, Jung Bahadur, the eldest of a band of seven brothers, sons of a kaji or state official. He rose rapidly in the army and in favour at the court, especially with one of the rani, who was of a most intriguing disposition. In 1844 he was a colonel, and on the 18th of May 1845 killed his uncle, and immediately, with the aid of the rani, took a prominent part in the government. After a short but turbulent interval of intrigue, he got rid of his enemies at one fell swoop, by what is known as the Kot massacre, on the 15th of September 1846. From that time till the day of his death Jung Bahadur was in reality the ruler of Nepal. His old friend, the rani, was banished, and all posts of any consequence in the state were filled by Jung, his brothers and other relatives. In 1850, finding himself securely seated in power, Jung Bahadur paid a visit to England, which made a great impression on his acute intellect, and ever after he professed and proved himself to be a stanch friend of the British. On his return in 1851 he at once devoted himself to reforming the administration of the country, and, whatever may have been the means by which he gained power, it must be allowed that he exercised it so as to prove himself the greatest benefactor his country has ever possessed. In 1853 a treaty for the extradition of criminals was proposed, but it was not ratified till February 1855. In 1854 the Nepalese entered into a war with Bhutan, a war which lasted with varying success nearly forty years, and it was not till the end of 1859 that they were finally swept out of the country. The Nana was said to have died of fever in the tarai, and it is probable that this was the case. His wives and a few attendants resided for many years near Katmandu.

In return for the aid afforded to the British, Jung Bahadur was well rewarded. He was created a G.C.B., and in 1853 a G.C.S.I., honours of which he was not a little proud. The troops employed received food and pay from the day of leaving Katmandu; handsome donations were given to those severely wounded, and to the relatives of the killed; great quantities of muskets and rifles were presented to the Nepalese government; and, to crown all, a large portion of the tarai was restored to Nepal. This ground contains most valuable sal and sisu forests, and yields a revenue of several lakhs of rupees yearly.

From the termination of the mutiny Nepalese history has been uneventful. The country has been prosperous, and the relations with the British have continued to be most friendly. Nevertheless the restrictions on commerce, and the prohibitions against Europeans entering the country, or travelling beyond certain narrow limits, are as rigidly enforced as they were a hundred years ago. Sir Jung Bahadur died suddenly in the tarai in 1877. In spite of all the exertions he had made to bring about a better state of things, three of his wives were allowed to immolate themselves on his funeral pyre. His brother, Sir Ranadip Singh Bahadur, G.C.S.I., succeeded him as prime minister. Shortly after his accession to power a plot was formed against him, but nearly forty of the conspirators were seized and executed, while
Nephelinites—Nepheline-Syenite

383

others escaped into exile. He was, however, murdered in 1883 and was succeeded by his nephew Sir Shamsher Jung, G.C.S.I., who died in 1901 and was succeeded by his brother Deb Shamsher Jung. But in June of that year a palace revolution placed another brother, Chandra Shamsher Jung, in power, whilst Deb Shamsher fled to India. Maharajah Chandra Shamsher has ruled Nepal with much ability. He gave effective aid to the British during the Tibet war of 1904, and the relations with the government of India became more cordial after his accession to power. In 1906 Chandra Shamsher was created a G.C.S.I., and in 1908 he visited England as a guest of the government, when he was invested with the G.C.B. by King Edward VII. He was also made a major-general in the British army, and honorary colonel of the 4th Gurkha Rifles.

For authorities see Dr. Daniel Wright, History of Nepal (1877); Colonel Kirkpatrick, Account of Nepal; British Houghton Hodgeson’s essays; Dr. H. A. Oldfield’s sketches; Sir C. M. Aitchison, Treatises and Essays; Sir Joseph Hooker’s writings; and Sir Richard Temple, Hydrobad and Nepal (1887). (D. Wr.; H. Wy.)

Nephelinites (Gr. νηφέλης, χ. φάρμακον, a drug that takes away grief, from νηθ- privative, and χέω, 'grief'), an Egyptian drug spoken of by Homer in the Odyssey (iv. 221). Others held that "nephelinite" is the name given to any drug having a like property, and also occasionally to herb or plant from which such a drug is produced. It is also applied to a special genus of plants, chiefly East Indian, known as the "pitcher-plants," on account of the formation of the leaves.

Nepheline, a rock-forming mineral consisting of sodium, potassium and aluminium silicate, Na₆K₆Al₂Si₆O₁₈. Its crystals belong to the hexagonal system, and usually have the form of a short six-sided prism terminated by the basal plane. The unsymmetrical etched figures produced artificially on the prism faces indicate, however, that the crystals are hemimorphic and tetraedrical, the only element of symmetry being a polar hexad axis. The hardness is 5½. The specific gravity (2-6), the low index of refraction and the feeble double refraction are nearly the same as in quartz; but since in nepheline the sign of the double refraction is negative, whilst in quartz it is positive, the two minerals are readily distinguished under the microscope.

An important determinative character of nepheline is the ease with which it is decomposed by hydrochloric acid, with separation of gelatinous silica (which may be readily stained by colouring matters) and cubes of salt. A clear crystal of nepheline which has been decomposed in this way is found to contain, as the name nepheline, proposed by R. B. Hailly in 1801, from Gr. νηφέλης, a cloud.

Although in naturally occurring nepheline sodium and potassium are always present in approximately the atomic ratio 3:1, artificially prepared crystals have the composition NaAlSi₆O₁₈; the corresponding potassium compound, KAl₂Si₆O₁₈, which is the mineral kaliophilithe, has also been prepared artificially. It has therefore been suggested that the orthosilicate formula, (NaK)Al₂Si₆O₁₈, represents the true composition of nepheline.

The mineral is one specially liable to alteration and in the laboratory various substitution products of nepheline have been prepared. In nature it is frequently altered to zeolites (especially natrolite), sodalite, kaolin, or compact muscovite. Giesekite and lihenerite are pseudomorphs.

Two varieties of nepheline are distinguished, differing in their external appearance and in their mode of occurrence, being analogous in these respects to sanidine or glassy orthoclase and common orthoclase respectively. "Glassy nepheline" has the form of small, colourless, transparent crystals and grains with a vitreous lustre. It is characteristic of the later volcanic rocks like phonolite and trachyte; hornblende-basalt, &c., and also of certain dikes-rocks, such as tinguita. The best crystals are those which occur with mica, sanidine, garnet, &c., in the crystal-lined cavities of the ejected blocks of Monte Somma, Vesuvius.

The other variety, known as eucolite, occurs as large, rough crystals, or more often as irregular masses, which have a greasy lustre and are opaque, or at most translucent, with a reddish, greenish, brownish or grey colour. It forms an essential constituent of certain alkaline plutonic rocks of the nepheline-syenite series, which are typically developed in southern Norway.

The colour and grey lustre of eucolite (a name given by M. H. Klaproth in 1809, from Gr. χελαινος, oil, and μονος, stone; Ger. Pettitstein) are due to the presence of numerous microscopic enclosures of other minerals, possibly augite or hornblende. These enclosures sometimes give rise to a chatoyant effect like that of cat’s-eye and cymophane; and eucolite when of a good green or red colour and showing a distinct band of light is sometimes cut as a gem-stone with a convex surface.

Closely allied to nepheline, and occurring with it in some nepheline-syenites, is the species crenanite, which has the composition H₄Na₆Ca(Na₄CO₃)₂Al₆(SiO₆)₆. It is frequently of a bright yellow colour, and has sometimes been cut as a gemstone.

Nepheline-Syenite, or Elaolitite-Syenite, a holocrystalline plutonic rock which consists largely of nepheline and alkali felspar. The rocks are mostly pale coloured, grey or pink, and in general appearance they are not unlike granites, but dark grey varieties are also known. They do not contain micas as that mineral and nepheline are mutually exclusive. From ordinary syenites they are distinguished not only by the presence of nepheline but also by the occurrence of many other minerals rich in alkalis or in rare earths. Orthoclase and albite are the principal felspar; usually they are intergrown to form perthite. In some rocks the potash felspar, in others the soda felspar predominates. Soda-lime felspars such as oligoclase and andesine are rare or entirely absent. Fresh clear microcline is very characteristic of some types of nepheline-syenite. Sodalite, colourless and transparent in the slides, but frequently pale blue in thin specimens, is the principal felspathoid mineral in addition to nepheline. As a rule these two crystalize before felspar, but they may occur in perthitic intergrowth with it. The commonest ferro-magnesian mineral is pale green augite, which may be surrounded by rims of dark-green, pleochroic soda-augite (aegirine). The latter forms long flat prisms or bundles of radiating needles. A dark reddish-brown biotite is very common in some of these rocks and a white mica, probably not muscovite but lepidolite, is occasionally present. The hornblende may be brown, brownish-green, blue or blue-black, belonging as a rule to the blue hornblende, which occurs with the pyroxene or enclosed in it. The dark-brown triclinic hornblende aenigmatite occurs also in these rocks. Olivine is rare, but may be found in some basic forms of nepheline-syenite.

The commonest accessaries are sapphire, zircon, iron ores and apatite. Crenanite occurs in several nepheline-syenites; in others there is fluor-spar or melanie garnet. A great number of interesting and rare minerals have been recorded from nepheline-syenites and the pegmatitic veins which intersect them. Among these we may mention cudialyte, eukolite, mesandrite, rinkite, johnstrapite, laevnite, biotelite, parakolomphylie and lamprophyllite. Many of these contain fluorine and the rare earths.

Nepheline-syenites are rare rocks; there is only one occurrence in Great Britain and one in France and Portugal. They are known also in Bohemia and in several places in Norway, Sweden and Finland. In America these rocks have been found in Texas, Arkansas and Massachusetts, also in Ontario, British Columbia and Brazil. South Africa, Madagascar, India, Tasmania, Timor and Turkestan are other localities for the rocks of this series. They exhibit also a remarkable individuality as each occurrence has its own special features moreover a variety of types characterizes each occurrence, as these rocks are very variable. For these reasons, together with the numerous rare minerals they contain, they have attracted a great deal of attention from petrographers.

Many types of nepheline-syenite have received designations derived from the localities in which they were discovered. The laurdalites (from Lardal in Norway) are grey or pinkish, and in many ways closely resemble the lauvrjolithes of southern Norway with which they occur. They contain anorthoclase felspars of lozenge-shaped forms, biotite or greenish augite, much apatite and sometimes olivine. Some of these rocks are porphyritic. The
Nephelinites—Nepheleites

Nephelinites include the greater number of known nepheline-syenites and are called after Foya in the Serra de Monchique (southwestern Portugal), from which they were first described. They are grey, green, or reddish, and mostly of massive structure with preponderantly interstitial nepheline. In some cases (variable amounts of feldspar) one finds altered nepheline (often in blackish foyaites) or felspars in nepheline-syenites, and in some aegirine as the abundant mineral. The foyaites have been described from the basaltic rocks of the Azores, Cape Verde Islands, and Fernando Noronha. In Germany they are represented among the Tertiary eruptive rocks of the Rhine district and Thuringia, at the extinct craters of the Eifel and at the Kaiserstuhl. In central Bohemia there are many occurrences of nepheline-terphites, basanites and basalts which though fine grained contain all their minerals in excellent preservation. The nepheline of Katanzschuleck in the Odenwald is well known. Contrasted with the nepheline and leucophytes these rocks are scarce in Italy and the Mediterranean province, but leucite-bearing nepheline-terphites occur at Monte Vulture and nepheline-basalts in Southern Spain, Madagascar, and the U.S.A. In the Southern Hemisphere they are found in the Transvaal, Madagascar, and the Cape Province. The English Eifel, at the Kaiserstuhl, contains a variety known as the Eifel nepheline-syenite.

The nephelinites are a group of effusive rocks which contains nepheline with plagioclase felspar as a constituent and, in some cases, aegirine as the constituent. The nephelinites are generally fine-grained with an abundance of feldspar and aegirine. They occur in the North Atlantic and in the eastern Pacific Ocean. The nepheline-syenites are a group of rocks which contains nepheline with plagioclase felspar as a constituent and, in some cases, aegirine as the constituent. The nepheline-syenites are generally fine-grained with an abundance of feldspar and aegirine. They occur in the North Atlantic and in the eastern Pacific Ocean.

deflections.S. Elia, founded about A.D. 1000, with frescoes of the period. It contains a pulpit of the time of Pope Gregory IV. (827–844), the sculptures of which are scattered about the church (F. Mazzanti in Nuovo Bollettino d’Archeologia Cristiana, 1896, 34).

Nepet had become Roman before 386 B.C., when Livy speaks of it and Strutium as the keys of Etruria. In that year it was surrendered to the Etruscans and recovered by the Romans, who beheaded the authors of its surrender. It became a colony in 283 B.C. It was among the twelve Latin colonies that refused further submission to Rome (1879), mainly, it is believed, because of a municipium. It is hardly mentioned in imperial times, except, as a station on the road (Via Amerina) which diverged from the Via Cassia near the modern Settevane and ran to Amelia and Tuder. In the 8th century A.D. it was for a short while the seat of a dukedom.

See G. Dennis, Cities and Cemeteries of Etruria (London, 1883, i. 85) and T. As.

NEPOMUK (or Pomuk), JOHN OF, the national saint of Bohemia. It is necessary to distinguish between the John of Nepomuk of history and the legendary one. In 1303 a dispute arose between King Wenceslaus IV. of Bohemia and the archbishop of Prague, John of Jenzenstcin. Wenceslaus, wishing to found a new bishopric in south-western Bohemia, determined to seize the revenues of the abbey of Kladrub as soon as the aged abbot Raček should die. The archbishop opposed this plan, and, by his orders his vicar-general, John of Pomuk—son of a German named Wälél, a citizen of Pomuk—advised the monks to select a new abbot immediately after Raček’s death. This greatly increased the king, who summoned the abbot and some of his clergy—among whom was Pomuk—to appear before him. He ordered them to be immediately arrested, and though the archbishop escaped his four companions—among them Pomuk—were seized and subjected to cruel tortures. They were ordered to abandon the archbishop. Three of them consented, but Pomuk, who refused to submit and was already on the point of death, was carried to the bridge of Prague and thrown into the Vltava. It is difficult to connect this historical event with the legend of St John of Nepomuk, who was canonized by the church of Rome in 1729, mainly, by the influence of John von Nepomuk, who hoped that this new cult would obliterate the memory of Hus. The Austrian chronicler Thomas Ebendorffer of Haselbach, who lived two generations later, first states that it was reported that King Wenceslaus had ordered that the confessor of his queen—an office that John of Pomuk never held—should be thrown into the Vltava because he would not reveal the secret of confession. The story is afterwards told in greater detail by the untrustworthy Bohemian historian Wenceslas Hajek. It appears certain that the person canonized in 1729 was not the historical John of Pomuk or Nepomuk.

See A. H. Wratilaslaw, Life, Legend and Canonisation of St John Nepomuk (1873), a valuable work founded on the best Bohemian authorities; also A. Frid, Der geschichtliche Heilige Johann von Nepomuk (1861); O. Abel, Die Legende vom heiligen Johann von Nepomuk (1855); and particularly vol. iii. of W. W. Tomek’s History of the Town of Prague (Czech) (12 vols., Prague, 1885-1901).

NEPOMUS, CORNELIUS (c. 99–24 B.C.), Roman historian, friend of Catullus, Cicero and Atticus, was born in Upper Italy (perhaps at Verona or Ticinum). He wrote: Chronicus, an epitome of universal history; Exempla, a collection of anecdotes after the style of Valerius Maximus; letters to Cicero; lives of Catol the elder and Cicero; and De viris illustribus, parallel lives of distinguished Romans and foreigners, in sixteen books. One section of this voluminous work (De excellentiis ducibus exterorum gentium, more commonly known as Vitae excellentium imperatorum) and the biographies of Cato and Atticus from another (De Latinis historicis) have been preserved. Erotic poems and a geographical treatise are also attributed to him. Nepos is not altogether happy in the subjects of his biographies, and he writes rather as a panegyrist than as a biographer, although he can rebuke his own countrymen on occasion. The Liber contains many errors (especially in chronology), but supply information not found elsewhere. The language is as rule simple and easy. The lives were formerly attributed to Aurelius Probus of the 4th century A.D.; but the view maintained by Lambinus (in his famous edition, 1560)—that they are all the work of Nepos—is now generally accepted. A dedicatory epigram written by Probus to the emperor Theodosius and inserted after the life of Hannibal, was the origin of the mistake. This dedication, if genuine, would only prove that Probus copied (and perhaps modified and abridged) the work. In modern times G. F. Unger (Der sogenannnte C. N., 1881) has attempted to prove that the author was Hyginus, but his theory has not been favourably received. Evidence to show that the Liber (especially selections) are extremely unreliable—text by E. O. Winstedt (Oxford, 1904), C. L. Roth (1881), C. G. Cobet (1881), C. Halm and A. Fleckesen (1889), with lexicon for school; with notes, O. Browning and W. R. Inge (1888), J. C. Rolfe (U.S. 1904), A. Weidner and J. Schmidt (1905), C. Erbe (1892), C. Nipperley and B. Lupus (ed. maj., 1879, school ed., 1895), J. Siebelis and O. Stange (1897).

NEPOS, JULIUS, the last but one of the Roman emperors of the West (474–475). He was a nephew of Marcellinus, prince of Dalmatia, whom he succeeded in his principality. After the death of Olybrius the throne of the West remained vacant for some months, during which Italy was abandoned to barbarians. Being connected by marriage with Leo I, emperor of the East, he was selected by him to succeed Olybrius on the Western throne, and proclaimed at Ravenna. After capturing his rival Glycerius, who had been nominated by the army in 473, at the mouth of the Tiber, he was recognized as emperor in Rome, Italy and Gaul. The only event of the reign of Nepos was the inglorious cession to the Visigoths of the province of Auvergne. In 475 Orestes, father of Augustus, afterwards the last emperor of the West, raised the standard of revolt and marched against Nepos at Ravenna. The emperor fled into Dalmatia, and continued to reside at Salona until his assassination by two of his own officers in 480, possibly at the instigation of Glycerius, who had been compelled to enter the church and had been appointed bishop of Salona.

See Tillemont, Hist. des emperors, vi.; Gibbon, Decline and Fall, ch. 36.

NEPTUNE (Lat. NEPTUNUS), an Italian god, of unknown origin and meaning, paired with Salacia, possibly the goddess of the salt water. At an early date (590 B.C.) he was identified with the Greek Poseidon (g.v.), when the Sibylline books ordered a lecisternium in his honour (Livy v. 13). His festival, Nepturnalia, at which tents were made from the branches of trees, was celebrated on the 23rd of July, and his temple, containing a famous marine group by Scopas, stood near the Circus Flaminius. In earlier times it was the god Fortunus who was thanked for naval victories. Sextus Propertius called himself son of Neptune, and Agrippa dedicated to Neptune a temple (Basilica Neptuni) in the Campus Martius in honour of the naval victory of Actium.

NEPTUNE, in astronomy, the outermost known planet of our solar system; its symbol is Ψ. Its distance from the sun is a little more than 30 astronomical units, i.e. 30 times the mean distance of the earth from the sun, or about 2,796,000,000 m. It deviates greatly from Bode’s law, which would give a distance of nearly 30. Its orbit is more nearly circular than that of any other major planet, Venus excepted. Its time of revolution is 16.6 years. The 8th satellite, of the 8th magnitude it is invisible to the naked eye. In a small telescope it cannot be distinguished from a fixed star, but in a large one it is seen to have a disk about 2-3” in diameter, of a pale bluish hue. No features and no change of appearance can be detected upon it, so that observation can give no indication of its rotation. Both its optical aspect and the study of its spectrum seem to show that it resembles Uranus. Its spectrum shows marked absorption-bands in the red and yellow, indicating an atmosphere of great depth of which hydrogen would seem to be a constituent. (See PLANET.) Only a single satellite of Neptune is yet known. This was discovered by William Le Verrier soon after the discovery of the planet. Its period of revolution is 5d. 21 h. Its motion is retrograde, in a plane making an angle of about 35° with the orbit of the planet. This was the first case of retrograde motion found in any of the

XIX. 13
planets or satellites of the solar system. The most noteworthy feature connected with the satellite is a secular change which is going on in the position of its orbital plane. Were the planet spherical in form, no such change could occur, except an extremely slow one produced by the action of the sun. The change is therefore attributed to a considerable ellipticity of the planet, which is thus inferred to be in rapid rotation. It will ultimately be possible to determine from this motion the position of the axis of rotation of Neptune with much greater precision than it could possibly be directly observed. The elements of the satellite were determined by H. Struve from all the observations available up to 1892.

### Varying Elements of Neptune's Satellite.

- Inclination to earth's equator: \( 119.35^\circ = 10^h 16^m 3^s (1-1860) \)
- R.A. of node on earth's equator: \( 185.15^\circ + 0^h 14^m 8^s (1-1860) \)
- Distance from node to epoch: \( 234.42 \)
- Mean daily motion: \( 61.5754^\circ \)
- Mean distance at \( \log \Delta = 1.47814 \): \( 16.271^\circ \)
- Epoch, 1890, Jan. 0, Greenwich mean noon

The eccentricity, if any, is too small to be certainly determined. From the above mean distance is derived as the mass of Neptune to be \( 1.2 \). The motion of Uranus gives a mass \( 1.5\times 10^{-3} \).

### Discovery of Neptune.

The detection of Neptune through its action upon Uranus before its existence had been made known by observation is a striking example of the precision reached by the theory of the celestial motions. So many agencies were concerned in the final discovery that the whole forms one of the most extraordinary chapters in the history of astronomy. The planet was, before its actual discovery by Sir William Herschel in 1781, had been observed as a fixed star on at least 17 other occasions, beginning with Flamsteed in 1690. In 1820 Alexis Bouvard of Paris constructed tables of the motion of Jupiter, Saturn and Uranus, based on a discussion of observations up to that year. Using the mutual perturbations of these planets as developed by Laplace in the Mécanique Céleste, he was enabled satisfactorily to represent the observed positions of Jupiter and Saturn; but the case was entirely different with Uranus. It was found impossible to represent all the observations within admissible limits of error, the outstanding differences between theory and observation exceeding \( 1^\circ \). In these circumstances one of two courses had to be adopted, either to obtain the best general representation of all the observations, which would result in the tables being certainly erroneous, or to reject the older observations which might be affected with errors, and base the tables only on those made since the discovery by Herschel. A few years of observation showed that Uranus was deviating from the new tables to an extent greater than could be attributed to legitimate errors of theory of observation, and the question of the cause became of growing interest. Among the investigators of the question was F. W. Bessel, who tried to reconcile the difficulty by an increase of the mass of Saturn, but found that he could do so only by assigning a mass not otherwise admissible. Although the idea that the deviations were probably due to the action of an ultra-Uranian planet was entertained by Bouvard, Bessel and doubtless others, it would seem that the first clear statement of a conviction that such was the case, and that it was advisable to reach some conclusion as to the position of the disturbing body, was expressed by the Rev. T. J. Hussey, an English amateur astronomer, in a letter to Sir John Herschel in February 1841. Airy's views of the subject, and offered to search for the planet with his own equatorial if the required estimate of its position could be supplied. Airy expressed himself as not fully satisfied that the deviation might not arise from errors in the perturbations. He therefore was not certain of any extraneous action; but even if there was, he doubted the possibility of determining the place of a planet which might produce it. In 1837 Bouvard, in conjunction with his nephew Eugène, was again working on the problem; but it does not seem that they went farther than to collect observations and to compare the results with Bouvard's tables.

In 1835 F. B. G. Nicolai, director of the observatory at Mannheim, in discussing the motion of Halley's comet, considered the possibility that it was acted upon by an ultra-

NERAC

The longitude of the actual planet was 32° 57' on 3rd of October 1846.

The close agreement of these elements led Airy to suggest to Challis, on the 5th of July 1846, a search for the planet with the Northumberland telescope. He proposed an examination of a part of the heavens 30° long in the direction of the ecliptic and 10° broad, and estimated the number of hours' work likely to be employed in this sweep. The proposed sweeps were commenced by Challis on the 29th of July. The plan required each region to be swept through twice, and the positions of all the known stars found to be compared, in order that the position of each sweep might be verified. On the 7th of August Leverrier's concluding paper was presented to the French Academy, and on the 18th of September he wrote to John G. Galle (1812-1910), then chief assistant at the Berlin observatory, suggesting that he should search for the computed planet, with the hope of detecting it by its disk, which was probably more than 3' in diameter. This letter, probably received on the 23rd of September, was communicated to J. F. Encke, the director of the observatory, who approved of the search. H. L. d'Arrest, a student living at the observatory, expressed a wish to assist. In the first instance it was intended that it would be given to the planet; but this proved impossible to detect any planet by its disk. Star charts were at the time being prepared at the observatory under the auspices of the Berlin Academy of Sciences. It was suggested by d'Arrest that this region might be covered by one of the charts. Referring to the chart, which was lying in a drawer, it was found that such was the case. Comparing the stars on the chart one by one with the heavens it was found that an eighth magnitude star now visible was not on the chart. This object was observed until after midnight, but no certain motion was detected. On the following evening the object was again looked for, and found to have actually moved. "The effect of the planet was at last established. It was afterwards found that Challis in his sweeps had observed the planet on the 4th of August, but, not having compared his observations with those made subsequently, had failed to detect it.

The question whether Leverrier should receive the sole credit of the discovery was warmly discussed. Arago took the extreme ground that actual publication alone should be considered, rejecting Adams' communications to Airy and Challis as quite unworthy of consideration. He also suggested that the name of Leverrier should be given to the planet; but this proposal was received with so little favour outside of France that he speedily withdrew it, proposing that of Neptune instead.

The observations at the first opposition showed that the planet was moving in a nearly circular orbit, and was at a mean distance from the sun much less than that set by Leverrier as the smallest possible. The latter had in fact committed the error of determining the limits by considering the variations of the elements one at a time, assuming in the case of each that while it varied the others remained constant. But a simultaneous variation of all the elements would have shown that the representation of the observations of Uranus would be improved by a simultaneous diminution of both the eccentricity and the mean distance, the orbit becoming more nearly circular and the planet being brought nearer to the sun. But this was not at first clearly seen, and Benjamin Peirce of Harvard University went so far as to maintain that there was a discontinuity between the solution of Adams and Leverrier and the solution offered by the planet itself, and that the coincidence in direction of the actual and computed planet was an accident. But this view was not well founded, and the only explanation needed was to be found in Leverrier's faulty method of determining the limits within which the planet must be situated. As a matter of fact the actual motion of the planet during the century preceding, as derived from Leverrier's elements, was much nearer the truth than the elements themselves were. This arose from the fact that his very elliptic orbit, by its large eccentricity, brought the planet near to the sun, and therefore near to its true position, during the period from 1780 to 1845, when the action on Uranus was at its greatest.

The observations of the first opposition enabled Sears Cook Walker of the National Observatory, Washington, in February 1847 to compute the past positions of the planet and identify it with a star observed by Lalande at Paris in May 1795. This being communicated to the Paris observatory, an examination of Lalande's manuscript showed that he had made two observations of the planet, on the 8th and 10th of May, and finding them discordant had rejected one as probably in error, and marked the other as questionable. A mere re-examination of the region to see which observation was in error would have led him to the discovery of the planet more than half a century earlier and actually recognized. The identity of Lalande's star with Neptune was independently demonstrated by the observers of Altona, before any word of Walker's work had reached him.

BIBLIOGRAPHY.—The principal sources for the history of the discovery of Neptune are the Astronomische Nachrichten, vols. xxv., xxvi., xxvii., and xxxiv. 1846; and E. Le Verrier's paper in the Ergänzungshefte to this publication, pp. 1-31 (Altona, 1845). In the Memoirs of the Royal Astronomical Society, vol. xvi. Airy gave a detailed history of the circumstances connected with the discovery, so far as he was cognizant of them. Documents pertaining to the subject are found in the Monthly Notices of the Royal Astronomical Society, vol. iv. 1847; Report to the Smithsonian Institution on the History of the Discovery of Neptune, published by the Smithsonian Institution (Washington, 1848); the most complete and detailed history of all the circumstances connected with the discovery, and negotiations on the orbit of the planet, that has been published. Leverrier's investigation was published in extenso as an addition to the Connaissance des Temps, as an Appendix to the Almanac of 1851. Peirce's discussions, so far as published at all, are found in the Proceedings of the American Academy of Arts and Sciences. The first computations of the orbit after the discovery were made by Sears Cook Walker, and published by the Smithsonian Institution (1845-1856). General tables of the motion of Neptune are in Kowalski's Tables du mouvement de la planète Neptune; Newcomb's Tables of the motion of Neptune, Washington, Smithsonian Institution (1856); Leverrier's Annuaire de l'Observatoire de Paris, Memoirs, vol. xiv. (1877), and lastly Newcomb's "Tables" in Astron. Papers of the American Ephemeris, vol. vii., part iv. Tables of the planet are found in Newcomb, The Uranian Systems; appendix to the Washington observations of 1873.

NERAC, a town of south-western France, capital of an arrondissement in the department of Lot-et-Garonne, 16 m. W.S.W. of Agen by road. Pop. (1906) town, 4018; commune, 6318. The town, once the capital of the dukes of Albret, is divided by the Baise into two parts, Grand-Nérac on the left bank and Petit-Nérac on the right. The river rises near the town, amid the ruins of the 16th century, called the Pont Vieux, and by the Pont Neuf, of modern construction. Narrow winding streets often bordered by old houses ascend from the narrow quays on both banks. From the left bank a staircase leads to the Rue Henri Quatre, where stands a wing of the castle in which Henry IV. lived. A statue of the king stands in one of the squares. The former palace of the Chambre des Comptes is now occupied by the tribunal of commerce, the library and the museum. The church of Grand-Nérac of the 18th century and the church of Petit-Nérac of the 13th century offer no remarkable features. On the left bank of the Baise, above Grand-Nérac, market gardens have taken the place of the old gardens of the Sires d'Albret, but remains of the Palais des Mariannes and of the Pavillon des Bains du Roi de Navarre, both of Renaissance architecture, are left. The famous promenade de La Garenne laid out by Antoine de Bourbon, king of Navarre, stretches for more than a mile along the opposite bank of the river. The remains of a Roman villa, including a fragment of mosaic, have been found there. A road leads from the south end of La Garenne to the ruins of the feudal castle of Nazareth. The river Baise is navigable to the town which is within a short distance of Nérac. The town has a sub-prefecture, and the industries include brewing and cork-working.

Nérac appears at the beginning of the 11th century as a possession of the monks of St. Pierre de Condom. The lords of Albret gradually deprived them of their authority over the town, and at the beginning of the 14th century founded a castle on the left bank of the Baise. In the 16th century the castle was the residence of Henry IV. during much of his youth and of
NERBUDA—NERGAL

Marguerite de Valois, sister of Francis I., of Jeanne d’Albret, and of the second Marguerite de Valois, wife of Henry IV., who held a brilliant court there. Néerac, the inhabitants of which had adopted the Reformed religion, was seized by the Catholics in 1568, 1578, and 1588, but restored to the protestants by the Edict of Nantes in 1587.

NERBUDA, or NARBADA, a river of India. It is traditionally regarded as the boundary between Hindustan proper and the Deccan. It rises on the summit of Amarkantak hill in Rewa state, and for the first 200 m. of its course winds among the Mandla hills, which form the head of the Satpura range; then at Jubbulpore, passing through the “Marble Rocks,” it enters its proper valley between the Vindhyan and Satpura ranges, and pursues a direct westerly course to the Gulf of Cambay. Its total course through the Central Provinces and Gujarat amounts to 683 m. above sea level, and it falls into the sea in the Borne district of Broach. It receives the drainage of the northern slopes of the Satpuras, but not that of the Vindhyan tableland, the streams from which flow into the Ganges and Jumna. After leaving the Central Provinces, the river widens out in the fertile district of Broach, with an average breadth of 1/2 m. to 1 m. Below Broach city it forms an estuary which is 13 m. broad where it enters the Gulf of Cambay. The Nerbuda is nowhere utilized for irrigation, and navigation is confined to the lower section. In the rainy season boats of considerable size sail about 60 m. above Broach city. Sea-going vessels of about 70 tons frequent the port of Broach, but they are entirely dependent on the tide. In sanctity the Nerbuda ranks only second to the Ganges among the rivers of India, and along its whole course are special places of pilgrimage. The most meritorious act that a pilgrim can perform is to walk from the sea to the source of the river and back along the opposite bank. This pilgrimage takes from one to two years to accomplish.

The Nerbuda has given its name to a division of the Central Provinces, comprising the five districts of Narsinghpur, Hanshagad, Nimar, Betul and Chhindwara. Area, 18,382 sq. m.; pop. 1,001,071.

NERCHINSK, a town of Eastern Siberia, in the government of Transbaikal, 183 m. by rail E. of Chita, on the left bank of the Nercha, 2/4 m. above its confluence with the Shilka. Pop. (1897) 6713. It is badly built of wood, and its lower parts frequently suffer from inundations. It has a small museum. The inhabitants support themselves mainly by agriculture, tobacco-growing and cattle-breeding; a few merchants trade in furs and cattle, in brick-tee from China, and manufactured wares from Russia.

The fort of Nerkhinsk dates from 1654, and the town was founded in 1658 by Pashkov, who in that year opened direct communication between the Russian settlements in Transbaikal and those on the Amur which had been founded by Cossacks and fur-traders coming from the Yakutsk region. In 1689 was signed between Russia and China the treaty of Nerkhinsk, which stopped for two centuries the farther advance of the Russians into the basin of the Amur. After that Nerkhinsk became the chief centre for the trade with China. The opening of the western route through Mongolia, by Urga, and the establishment of a custom-house at Khalkha in 1728 diverted this trade into a new channel. But Nerkhinsk acquired fresh importance from the influx of immigrants, mostly exiles, into Eastern Transbaikal, the discovery of rich mines and the arrival of great numbers of convicts, and ultimately it became the chief town of Transbaikal. In 1821 it was transferred from the banks of the Shilka to its present site, on account of the floods. Since the foundation, in 1851, of Chita, the present capital of Transbaikal, Nerkhinsk has been falling into decay.

NERCHINSK (in full NERCHINSKII ZAVOD), a town and silver-mine of East Siberia, in the government of Transbaikal, 150 m. E.S.E. of another Nerkhinsk (q.v.) (with which it is often confused), on a small affluent of the Argun. Pop. (1897) 3000. It lies in a narrow valley between barren mountains, and is much better built than any of the district towns of East Siberia. It has a chemical laboratory for mining purposes, and a meteorological observatory (31° 18' N., 119° 37' E., 2200 ft. above sea-level), where meteorological and magnetic observations have been made every hour since 1842. The average yearly temperature is 25° F., with extremes of 97° and -52°.

Nerchinsk Mining District extends over an area of 1,450 sq. m., and includes all the silver-mines and gold-fields between the Shilka and the Argun, together with a few on the left bank of the Shilka. It is traversed by several parallel chains of mountains which rise to 4500 ft., and are intersected by a complicated system of deep, narrow valleys, densely wooded, with a few expansions along the larger rivers, where the inhabitants with difficulty raise some rye and wheat. The population (75,625 in 1897) consists of Russians, Buryats and Tunguses. Included in this number were some 2300 convicts. The mountains, so far as they have been geologically explored, consist of crystalline rocks, with quartzites and slate, deeply intersected with veins of silver intermixed with granite, syenite and diorite; they contain rich ores of silver, lead, tin and iron, while the diluvial and alluvial valley formations contain productive auriferous sands.

The Nerchinsk silver mines began to be worked in 1704, and during the first half of the 18th century their yearly production did not exceed 800 oz., and the total amount for the first 150 years (1704-1854) amounted to 11,540,000 oz. The lead was mostly neglected on account of the difficulties of transport, but its production is at present on the increase. Gold was first discovered in 1850, and between 1853 and 1855 260,000 oz. of gold dust were obtained. In 1864 a large number of auriferous deposits were discovered. Until 1863 all the labour was performed by serfs, the property of the emperor, and by convicts, numbering usually nearly four thousand.

NEREUS, in Greek mythology, the eldest son of Pontus and Gaea, and father of the fifty Nereids. He is a beneficent and venerable old man of the sea, full of wisdom and skilled in prophecy, but, like Proteus, he will only reveal what he knows under compulsion. Thus Hermes seized him when asleep, and, although he attempted to escape by assuming various forms, compelled him to reveal the whereabouts of the apples of the Hesperides (Apollodorus ii. 5). His favourite dwelling-place is a cave beneath the depths of the ocean (Athenaeus iii. 149, 218). The Nereids, the Nereids, are personifications of the smiling, quiet sea. Of these, Thetis and Amphitrite rule the sea according to the legend of different localities; Galatea is a Sicilian figure, who plays with and deludes her rustic lover of the shore, Polyphemus. Nereus is represented with the sceptre and trident; the Nereids are depicted as graceful maidens, lightly clad or naked, riding on tritons and dolphins. The name has nothing to do with the modern Greek νερό (really νεάρον, "fresh" [water]): it is probably a short form of νηρός.

NERGAL, the name of a solar deity in Babylonia, the main seat of whose cult was the city of Nergal or Nergal, represented by the mound of Tell- Ibrahim. The importance of Nergal as a religious and at one time also as a political centre led to his surviving the tendency to concentrate the various sun-cults of Babylonia in Shamash (q.v.). He becomes, however, the representative of a certain phase only of the sun and not of the sun as a whole. Portrayed in hymns and myths as a god of war and pestilence, there can be little doubt that Nergal represents the sun of noon-time and of the summer solstice which brings destruction to mankind. It is a logical consequence that Nergal is pictured also as the deity who presides over the probably Upper-Sumerian, and stands at the head of the special pantheon assigned to the government of the dead, who are supposed to be gathered in a large subterranean cave known as Aralu or Ikalla. In this capacity there is associated with him a goddess Allatu, though there are indications that at one time Allatu was regarded as the sole mistress of Aralu, ruling...
NERI, PHILIP

389

in her own person. Ordinarily the consort of Nergal is Laz. Nergal was pictured as a lion and on boundary-stone monuments his symbol is a mace surmounted by the head of a lion.

As in the case of Ninib, Nergal appears to have absorbed a number of minor solar deities, which accounts for the various names or designations under which he appears, such as Lugaligira, Sharrapu ("the burner," perhaps a mere epithet), Ira, Gibil (though this name more properly belongs to Nusku, q.v.) and Sibitti. A certain confusion exists in cuneiform literature between Ninib and Nergal, perhaps due to the traces of two different conceptions regarding these two solar deities. Nergal is called the "raging king," the "furious one," and the "Lion," and by a play upon his name—separated into three elements Ne-uru-gal ("lord of the great dwelling")—his position at the heart of the nether-world pantheon is indicated. In the astral-theological system he is the planet Mars, while in ecclesiastical art the great lion-headed colossal serving as guardians to the temples and palaces seem to be a symbol of Nergal, just as the bull-headed colossal are probably intended to typify Ninib.

The name of his chief temple at Kutha was E-shid-lam, from which the god receives the designation of Shidlamtia, "the one whose weapon is Eshid-lam." At this temple the temple of Ninib does not appear to have been as widespread as that of Ninib. He is frequently invoked in hymns and in votive and other inscriptions of Babylonian and Assyrian rulers, but we do not learn of many temples to him outside of Kutha. Sennacherib speaks of one at Taribusi to the north of Nineveh, but it is significant that although Nebuchadrezzar II. (606-566 B.C.), the great temple-builder of the neo-Babylonian monarchy, alludes to his operations at E-shid-lam in Kutha, he makes no mention of a sanctuary to Nergal in Babylon. Local associations with his original seat—Kutha—and the conception formed of him as a god of the dead in act of making him feared rather than actively worshipped.

(M. JA.)

NERI, PHILIP (FILIPPO DE) (1515-1555), Italian churchman, was born at Florence on the 21st of July 1515. He was the youngest child of Francesco Neri, a lawyer of that city, and his wife Lucrezia Soldi, a woman of noble birth, whose family had long served the state. He was carefully brought up, and received his early teaching from the friars at San Marco, the famous Dominican monastery in Florence. He was accustomed in after life to ascribe most of his progress to the teaching of two amongst them, Zenobio de' Medici and Servanzio Mini. When he was about sixteen years old, a fire destroyed nearly all his father's property. Philip was sent to his father's childless brother Romolo, a merchant at San Germano, a Neapolitan town near the base of Monte Cassino, to assist him in his business, and with the hope that he might inherit his possessions. So far as gaining Romolo's confidence and affection, the plan was entirely successful, but it was thwarted by Philip's own resolve to take holy orders. In 1533 he left San Germano, and went to Rome, where he became tutor in the house of a Florentine gentleman named Galeotto Caccia. Here he was able to pursue his own studies under the guidance of the Augustinians, and to begin those labours amongst the sick and poor which gained him in later life the title of "Apostle of Rome," besides paying nightly visits for prayer and meditations to the churches of the city and the catacombs. In 1538 he entered on that course of home mission work which was the distinguishing characteristic of his life; somewhat in the manner of Socrates he traversed the city, seizing opportunities of entering into conversation with persons of all ranks, and of leading them on, with patient irony, with searching questions, with words of wise and kindly counsel, to consider the topics he desired to set before them.

In 1548 he founded the celebrated confraternity of the Santissima Trinità de' Pellegrini e de' Convalescenti, whose primary object is to minister to the needs of the thousands of poor pilgrims who flock to Rome, especially in years of jubilee, and also to relieve the patients discharged from hospitals, but still too weak for labour. In 1551 he passed through all the minor orders, and was ordained deacon, and finally priest on the 23rd of May. He had some thought of going to India as a missionary, but was dissuaded by his friends who saw that there was abundant work to be done in Rome, and that he was the man to do it. Accordingly he settled down, with some companions, at the hospital of San Girolamo della Carità, and while there tentatively began, in 1556, the institute with which his name is more especially connected, that of the Oratory. The scheme at first was no more than a series of evening meetings in a hall (the Oratory), at which there were prayers, hymns, readings from Scripture, from the fathers, and from the Martyrology, followed by a lecture, or by discussion of some religious question proposed by the individual who presided (as a rule a canon of the church). These gatherings (from sacred history) were called oratorias. The scheme was developed, and the members of the society undertook various kinds of mission work throughout Rome, notably the preaching of sermons in different churches every evening, a wholly novel agency at that time. In 1564 the Florentines requested him to leave San Girolamo, and to take the oversight of their church in Rome, San Giovanni de' Fiorentini, then newly built. He was at first reluctant, but by consent of Pius IV. he accepted, while retaining the charge of San Girolamo, where the exercises were resumed in the same style. At this time the new society included amongst its members Caesar Baronius, the ecclesiastical historian, Francesco Maria Tarugi, afterwards archbishop of Avignon, and Paravicini, all three subsequently cardinals, and also Gallonius, author of a well-known work on the Sufferings of the Martyrs, Ancina, Bordoni, and other men of ability and distinction.

The Florentines, however, built in 1574 a large oratory or mission-room for the society contiguous to San Giovanni, in order to save them the fatigue of the daily journey to and from San Girolamo, and to provide a more convenient place for assembly, and the headquarters were transferred thither. As the community grew, and its mission work extended, the need of having a church entirely its own, and not subject to other claims, as were San Girolamo and San Giovanni, made itself felt, and the offer of the small parish church of Santa Maria in Vallicella, conveniently situated in the middle of Rome, was made and accepted. The building, however, as not large enough for their purpose, was pulled down, and a splendid church erected on the site. It was immediately after taking possession of their new quarters that Neri formally organized, under permission of a bull dated July 25, 1575, the Congregation of the Oratory, and the headquarters were transferred thither. As the community grew, and its mission work extended, the need of having a church entirely its own, and not subject to other claims, as were San Girolamo and San Giovanni, made itself felt, and the offer of the small parish church of Santa Maria in Vallicella, conveniently situated in the middle of Rome, was made and accepted. The building, however, as not large enough for their purpose, was pulled down, and a splendid church erected on the site.
timely and political intervention. Neri continued in the government of the Oratory until his death, which took place on the 26th of May 1595 at Rome. He was succeeded by Baronius.

There are many anecdotes told of him which attest his possession of a playful humor, united with a shrill mother-wit. He considered a cheerful temper to be more Christian than a melancholy one, and carried this spirit into his whole life. This is the true secret of his popularity and of his place in the folklore of the Roman poor. Many miracles were attributed to him alive and dead, and it is said that when his body was dissected it was found that two of his ribs had been broken by the constant pressure of his heart's desire, which was very fervent in the catacombs about the year 1545. This phenomenon is in the same category as the stigmata of St Francis of Assisi. Neri was beatified by Paul V, in 1600, and canonized by Gregory XV. in 1622.

"Practical commonplaceness," says Frederick William Faber in his panegyric of Neri, was the special mark which distinguishes his form of ascetic piety from the types accredited before his day.

"He looked like other men... he was emphatically a modern gentleman, of scrupulous courtesy, sportive gaiety, acquainted with what was going on in the world, taking a real interest in it, and getting into it, managing it. He had a strong sense of that society has always 1.1. to him, in a modern room with modern furniture, plain, it is true, but with no marks of poverty about it—in a word, with all the ease, the graceful, the polish of a modern great man. His elevation of character was certainly out of all proportion to his birth. He was the active promoter of vernacular services, frequent and popular grace, devotional prayer, and unsanctioned, albeit fervent, private devotion.

Neri was not a reformer, save in the sense that in the active discharge of pastoral work he laboured to reform individuals. He had no one of the tricks of the trade of the character in being in truth an ardent Ultramontanist in doctrine, as was all but inevitable in his time and circumstances, and his great merit was the instinctive tact which showed him that the system of monasticism could never be the leaven of secular life, but that something more homely, simple, and everyday in character was needed for the new time.

Accordingly, the congregation he founded is of the least conventional nature, rather resembling a residential clerical club than a monastery of the older type, and its rules (never written by Neri, but approved by Paul V, in 1612) would have appeared incredibly lax to the other members of the religious order. Harding, Francis or Dominic. It admits only priests aged at least thirty-six, or ecclesiastics who have completed their studies and are ready for ordination. The members live in community, and each pays his own expenses during the time of his probation. This was a startling innovation on the monastic vow of poverty. They have indeed a common table, but it is kept up precisely as a regimental mess. The contributions from every member are divided by the society except the bare lodging, and the fees of a visiting physician. Everything else—clothing, books, furniture, medicines—must be defrayed at the private charges of each member.

There are no vows, and every member of the society is at liberty to withdraw when he pleases, and to take his property with him. The government, strikingly unlike the Jesuit autocracy, is of a republican form; and the superior, though first in honour, has to take his turn in discharging all the duties which come to each priest of the society in the order of his seniority, including that of watching at table, which is not entrusted to the Oratory to lay brothers, according to the practice in most other communities. Four deputies assist the superior in the government, and all public acts are decided by a majority of votes of the whole congregation, in which the superior himself has also casting voice. To be chosen superior, fifteen years of membership are requisite as a qualification, and the office is tenable, as all the others, for but three years at a time. No one can vote till he has been three years in the society; the deliberative vote of the superior is of course the deciding factor. The elections of the classes of members—novices, triennials and decennials. Each house can call its superior to account, can depose, and can restore him, without appeal to any external authority, although the bishop of the diocese in which the house of the Oratory is established has ordinary and immediate superior, though without power to interfere with the rule. Their churches are non-parochial, and they can perform private offices, but no public, except, on the death of the parish priest, who is entitled to receive all fees due in respect of these ministrations. The Oratory chiefly spread in Italy and in France, where in 1760 there were 38 houses all under the government of a superior-general. Malebranche, Thomassin, Mascaron and Masillon were members of the famous branch established in Paris in 1611 by Bérulle (after cardinal), which had a great success and a distinguished history. It fell in the crash of the Revolution, but was re-established by the Oratory of St Peter in 1825. They are the "Oratory of Jesus and the Immaculate Mary"; the Church of the Oratory near the Louvre belongs to the Reformed Church. An English house, founded in 1847 at Birmingham, is celebrated as the home of converts (at least pamphlet converts) of the "New Religion"; never though a few houses have been founded there, in Munich and Vienna.

NERO (35–68), Roman emperor 54–68, was born at Antium on the 17th of December 35. He was the son of Gnaeus Domitius Ahenobarbus and Agrippina the younger, and his name was originally L. Domitius Ahenobarbus. His father died when Nero was scarcely three years old. In the previous year (39) his mother had been banished by order of her brother Caligula (Gaius) the emperor, who detested her. In 41 Nero had become emperor of his own age, his father having been deprived of both parents, found shelter in the house of his aunt Domitia, where two slaves, a barber and a dancer, began his training. The emperor Claudius recalled Agrippina, who spent the next thirteen years in the determined struggle to win for Nero the throne which had been predicted for him. Her first decisive success was gained in 48 by the disgrace and execution of Messalina (g.n.), wife of Claudius. In 49 followed her own marriage with Claudius, and her recognition as his consort in the government. The Roman populace already looked with favour on Nero, as the grandson of Germanicus, but in 50 his claims obtained formal recognition from Claudius, who adopted him under the title of Nero Claudius Caesar Drusus Germanicus. Agrippina’s next step was to provide a suitable training for her son. The scholar L. Annaeus Seneca was recalled from exile and appointed his tutor. On the 17th of December 51 Nero completed his fourteenth year, and Agrippina, in view of Claudius’s failing health, determined to delay no longer his adoption of the toga virilis. The occasion was celebrated in a manner which seemed to place Nero’s prospects of succession beyond doubt. He was introduced to the senate by Claudius himself on a charge of treasurability, and the title of princeps juven- tatis was conferred upon him. He was specially admitted as an extraordinary member of the great priestly colleges; his name was included by the Arval Brethren in their prayers for the safety of the emperor and his house; at the games in the circus his appearance in triumphal dress contrasted significantly with the simple toga praetexta worn by Britannicus. During the next two years Agrippina followed this up with energy. Britannicus’s leading partisans were banished or put to death, and the all-important command of the praetorian guard was transferred from him to Burrus, who had been the trusted agent first of Livia and then of Tiberius and Claudius. Nero himself was put prominently forward. The petitions addressed to the senate by the town of Bononia and by the communities of Rhodes and Ilium were gracefully supported by him in Latin and Greek speeches, and during Claudius’s absence in 52 at the Latin festival it was Nero who, as prefect of the city, administered justice in the forum. Early in 53 his marriage with 1 Tac. Ann. xii. 26, 36; see also Schiller, Nero, 67.

2 Tac. Ann. xii. 26; Zonaras xi. 10.

3 Tac. Ann. xii. 41.
Claudius's daughter Octavia drew still closer the ties which connected him with the imperial house. Agrippina determined to hasten the death of Claudius, and the absence, through illness, of the emperor's trusted freedman Narcissus, favoured her schemes. On the 13th of October 54 Claudius died, poisoned, as all our authorities declare, by her orders, and Nero was presented to the soldiers on guard as their new sovereign. From the steps of the palace he proceeded to the praetorian camp to receive the salutations of the troops, and thence to the senate-house, where he was promptly invested with all the honours, titles and powers of emperor.

Agrippina's bold stroke had been completely successful. Only a few voices were raised for Britannicus; nor is there any doubt that Rome was prepared to welcome the new emperor with genuine enthusiasm. His prestige and his good qualities, carefully fostered by Seneca, made him popular, while his childish vanity, unGovernable selfishness and savage temper were as yet unsuspected. His first acts confirmed this favourable impression. He modestly declined the title of *pater patriae*; the memory of Claudius, and that of his own father Domitius were duly honoured. The senate listened with delight to his promises to rule according to the maxims of Augustus, and to avoid the errors which had rendered unpopularity the rule of his predecessor, while his unfailing clemency, liberality and affability were the talk of Rome. Much no doubt of the credit of all this is due to Seneca and Burrus. Seneca had seen from the first that the real danger with Nero lay in the savage vehemence of his passions, and he made it his chief aim to stave off by every means in his power the dreaded outbreak. The policy of indulging his tastes and helping him to enjoy the sweets of popularity without the actual burdens of government succeeded for the time. During the first five years of his reign, the golden *quinquennium Neronis*, little occurred to damp the popular enthusiasm. Nero's easy-going and undemanding nature, his impetuosity and his want of patience in the pursuit of objects, were fully fulfilled, and the senate found itself free to discuss and even to decide important administrative questions. Abuses were remedied, the provincials protected from oppression, and the burdens of taxation lightened. On the frontiers, thanks chiefly to Corbulo's energy and skill, no disaster occurred serious enough to shake the general confidence, and even the murder of Britannicus seems to have been accepted as a necessary measure of self-defence. But Seneca's fear lest Nero's sleeping passions should once be roused were fully verified, and he seems to have seen all along that the danger which had rendered his predecessor unpopular would continue to exist, and that his own influence was not likely to be sufficient to avert the danger. He, therefore, with Seneca's advice, and in the name of the senate and the people, consulted the legions, who rose against Nero, adopted Burrus as their chief, and divorced, confirmed, and annexed the new title of Caesar, which was translated into the Roman tongue as emperor. The legions and the praetorian guard, who had been disfrocked by Claudius with the utmost rigor, were restored to their ancient positions and privileges.

In the court of the year 61 Rome was startled by the news of a disaster in Britain. At the time of the Claudian invasion of Britain in A.D. 43 Prasutagus, the king of the Iceni, had concluded a treaty with Claudius, by which, without recognizing the sovereignty of Rome, he was himself enrolled among "the allies and friends of the Roman people." The alliance was of value to Claudius, for the territory of the Iceni (Norfolk, Suffolk, and Cambridgeshire) lay immediately north of the new province and its capital Colchester, and Prasutagus had loyally kept faith with Rome. But in A.D. 61 he died, leaving no male heir. His kingdom therefore lapsed to the legions. By a stroke of good fortune, the kingdom was divided in an orderly way, divided his accumulated wealth between his two daughters and the emperor. His plan failed, for the local Roman officials acted as though the kingdom had been conquered and annexed; they seized on the property of the late king and his chief allies and insulted his family. Fearing that worse might follow when the kingdom should be annexed, and encouraged by the absence of the legate and his legions, the Iceni, led by Prasutagus's daughter Boudicca (Boadicea) rose in revolt and were joined by the Trinovantes in Essex, who had been long subject to Rome and had their own grievances to redress. Colchester, since A.D. 50 a Roman colony, was sacked. The ninth legion which had hurried from Lincoln was cut to pieces, and the insurgents prepared to march on London. The news of the outbreak found the legate Suetonius Paulinus engaged in attacking Anglesey. His resolution was at once taken. He left his garrison on the island and made haste along the Watling Street, leaving orders for the legions to follow. Though the tribes along the road were rising, Suetonius succeeded in reaching London, only however to find himself too late to hold the city. He marched back along the road by which he had come. London first, and then Verulamium, were abandoned to the Britons. At last at some undefined point on the Watling Street his legions joined him. Thus reinforced he turned to face the enemy. The engagement was severe but the Roman victory was decisive, and Roman authority was restored throughout central and southern Britain.

The profound impression produced in Rome by the "British disaster" was not confined two years later in A.D. 65 by the partial destruction of Pompeii by an earthquake, and the news of the evacuation of Armenia by the Roman legions. A far deeper and more lasting impression was produced by the great fire in Rome.

The fire broke out on the night of the 18th of July, 64, among the wooden booths at the south-east end of the Circus Maximus. Thence in one direction it rapidly spread over the Palatine and
Nero

Velia up to the low cliffs of the Esquiline, and in another it laid waste the Aventine, the Forum Boarium and Velabrum till it reached the Tiber and the solid barrier of the Servian wall. After burning five thousand houses, many of which were the first discovery of a fire, he then destroyed the buildings in the north-eastern quarter of the city and desolated the regions of the Circus Flaminius and the Via Lata, and by the time that it was finally quenched only four of the fourteen regions remained untouched; three had been utterly destroyed and seven reduced to ruins. The conflagration is said by all authorities later than Tacitus to have been deliberately caused by Nero himself.1 But Tacitus, though he mentions the rumours, declares that its origin was uncertain, and in spite of such works as Profumo's Le fonti ed i tempi dell'incendio Neroniano (1963), there is no proof of guilt.2 3

Nero's command replaced the Caudo Matronia were utilized to give shelter to the homeless. Crowns, provisions were brought from Ostia and the price of corn lowered. In rebuilding the city every precaution was taken against the recurrence of such a calamity. 

Regular streets replaced the narrow winding alleys. The new houses were limited in height, partly built on hard stone and protected by open spaces and colonnades. The water-supply, lastly, was carefully regulated.

There is, however, no doubt that this great disaster told against Nero in the popular mind. It was regarded as a direct manifestation of the wrath of the gods, even by those who did not suspect the emperor. This impression no religious ceremonies nor even the execution of a number of Christians, as convenient scapegoats, could altogether dispel. But Nero proceeded with the congenial work of repairing the damage. In addition to the rebuilding of the streets, he erected a splendid palace, the "golden house,"4 for himself. The wonders of his Domus aurea were remembered and talked of long after its partial demolition by Vesuvius. It stretched from the Palatine across the low ground, afterwards occupied by the Colosseum, to the Esquiline. Gold was lavished on the Greek workmen, and Greek art was admirably reproduced in the most marvellous of all the grounds in which it stood, with their meadows and lakes, their shady woods and their distant views. To defray the enormous cost, Italy and the provinces, says Tacitus, were ransacked, and in Asia and Africa also the imperial treasures were recalled. The days of Mummium and of Sulla.5 It was the first occasion on which the provincials had suffered from Nero's rule, and the discontent it caused helped to weaken his hold over them at the very moment when the growing dissatisfaction in Rome was gathering to a head. Early in 65 Nero was panic-stricken by the discovery of a formidable conspiracy involving such men as Faenius Rufus, Tigitellinus's colleague in the prefecture of the praetorian guards, Plautius Lateranus, one of the consuls elect, the poet Lucan, and, lastly, not a few of the tribunes and centurions of the praetorian guard itself. Their chosen leader, whom they destined to succeed Nero, was C. Calpurnius Piso (q.v.), a handsome, wealthy and popular noble, and a boon companion of Nero himself. The plan to murder Nero was frustrated by a freedman, Milichus, who, in the hope of a large reward, disclosed the whole plot. Piso, Faenius Rufus, Lucan and many of their less prominent accomplices, and even Seneca himself (though there seems to have been no evidence of his complicity) were executed.

But, though largesses and thanksgivings celebrated the suppression of the conspiracy, and the round of games and shows was renewed with even increased splendour, the effects of the shock were visible in the long list of victims who during the next few months were sacrificed to his restless fears and resentment. Consipuous among them was Paetus Thrasea, who, by the rendering virtue had long made him distasteful to Nero, and who was now suspected, possibly with reason, of sympathy with the conspirators. The death of Poppaea in the autumn of 65 was probably not lamented by any one but her husband, but the general gloom was deepened by a pestilence, caused, it seems, by the overcrowding at the time of the fire. The emperor now appears to have passed some time in the country where, according to Tacitus, he visited the Parthian prince Tiridates. This event was a conspicuous tribute to the ability both as soldier and statesman of Cn. Domitius Corbulo. As long ago as 54 the news reached Rome that the Parthian king Vologaeses had expelled the king recognized by Rome from Armenia and installed in his place his own brother Tiridates. Orders were at once issued to concentrate all available forces on the Cappadocian frontier under Corbulo, the first soldier of his day. After some time spent in making his army efficient, Corbulo invaded Armenia and swept victorious through the country. Armenia was rescued and Corbulo proposed that Tiridates should become king of Armenia on condition of his receiving his crown as a gift from Nero. But the government in Rome had a plan of its own, and a certain Tigranes, long resident in Rome but a stranger to the Armenians, was sent out, and Corbulo was obliged reluctantly to seat him on the Armenian throne. Tigranes's position, always insecure, soon became untenable, and it became necessary for Rome to intervene once more. A Roman force under Caesennius Paetus was sent to restore Tigranes and re-establish Roman predominance. Paetus, however, was defeated, and Corbulo, nowlegate of Syria, was obliged to come to his assistance. The result was the final triumph of Corbulo's policy. Tiridates agreed to accept the crown of Armenia from the hands of Nero. In royal state he travelled to Italy, and the ceremony of investiture was performed at Rome with the utmost splendour. Delighted with this tribute to his greatness, Nero for a moment dreamt of rivalling Alexander. Expeditions were talked of to the Caspian Sea and Ethiopia, but Nero was no soldier and quickly turned to a more congenial field. He had already, in 64, appeared on the stage before the half-Greek public of Naples. But his mind was less interested in the glory of the empire than in the arts, and he was a hearty admirer of the beauties of the ancient home of art. Towards the end of 66 he arrived in Greece with a retinue of soldiers, courtiers, musicians and dancers. The spectacle presented by Nero's visit was unique.6 He went professedly as an enthusiastic worshipper of Greek art and a humble candidate for the suffrages of Greek judges. At each of the great festivals, which to please him were for once crowded into a single year, he entered in regular form for the various competitions, scrupulously conforming to the tradition and rules of the arena, and awaited in nervous suspense the verdict of the umpires. The more the Greeks humoured him to the top of his bent. Everywhere the imperial competitor was victorious, and crowded audiences importuned him to display his talents. The emperor protested that only the Greeks were fit to hear him, and rewarded them when he left by the bestowal of immunity from the land tax on the whole province, and by the gift of the Roman franchise; he also planned and actually commenced the cutting of a canal through the Isthmus of Corinth. If we may believe report, Nero found time in the intervals of his artistic triumphs for more vicious excesses. The stories of his mock marriage with Sophas, his execution of wealthy Greeks for the sake of their money, and his wholesale plundering of the temples were evidently part of the accepted tradition about him in the time of Suetonius, and are at least credible. Far more certainly true is his ungrateful treatment of Domitius Corbulo, who, when he landed at Cenchrea, fresh from his successes in Armenia, was met by an order for his instant execution and at once put an end to his life.

Meanwhile the general dissatisfaction was coming to a head, as we may infer from the urgency with which the imperial freedman Helius insisted upon Nero's return to Italy. More serious was the dissatisfaction which now showed itself in the rich and warlike provinces of the west. In northern Gaul, early in 68, the standard of revolt was raised by Julius Vindex, governor of Gallia Lugdunensis, and himself the head of an ancient and noble Celtic family. South of the Pyrenees, P. Sulpicius Galba, governor of Hispania Tarraconensis, and Poppaea's former

2 This work is a reply to C. Pascal's L' Incendio di Roma e i primi Calamitari (Milan, 1900), which throws the guilt on the Christians.
5 Sumptuous and splendid
6 This is an inquiry into the matter of the fire, and the steps taken by the emperor to repair the damage.
husband, Marcus Salvius Otho, governor of Lusitania, followed Vindex's example. At first, however, fortune seemed to favour Nero. It is very probable that Vindex had other aims in view than the deposition of Nero and the substitution of a fresh emperor in his place, and that the liberation of northern Gaul from Roman rule was part of his plan. If this was so, it is easy to understand both the enthusiasm with which the chiefs of northern Gaul rallied to the standard of a leader belonging to their own race, and the opposition which Vindex encountered from the Roman colony of Lugdunum and the legions on the Rhine. For it is certain that the latter at any rate were not animated by loyalty to Nero. Though they defeated Vindex and his Celtic levies at Vesontio (Besançon), their next step was to break the statues of Nero and offer the imperial purple to their own commander Virginius Rufus. He declined their offer, but appealed to them to declare for the senate and people of Rome. Meanwhile in Spain Galba had been saluted emperor by his legions, had accepted the title, and was already on his march towards Italy. On the road the news met him that Vindex had been crushed by the army of the Rhine, and for the moment he resolved to abandon his attempt. Meanwhile, Nero had reluctantly left Greece, but returned to Italy only to renew his realms. When on the 19th of March the news reached him at Naples of the rising in Gaul, he allowed a week to elapse before he could tear himself away from his pleasures, and then contented himself with proscribing Vindex, and setting a price on his head. The revolts in Spain and Germany terrified him a century later. The belief that he had not really died, but would return again to confound his foes, was long prevalent, not only in the remoter provinces, but even in Rome itself, and more than one pretender was able to collect a following by assuming the name of the last of the race of Augustus. More lasting still was the imachable hatred of those who had suffered from his cruelties. Roman literature, faithfully reflecting the sentiments of the aristocratic salons of the capital, while it almost canonized those who had been his victims, fully avenged their wrongs by painting Nero as a monster of wickedness. In Christian tradition he even appears as the mystic Antichrist, who was destined to come once again to trouble the saloons. Even in the middle ages, Nero was still the very incarnation of splendid iniquity, while the belief lingered obstinately that he had only disappeared for a time, and as late as the 17th century his restless spirit was supposed to haunt the slopes of the Pincian Hill.

The chief ancient authorities for Nero's life and reign are Tacitus (Annals, xiii.-xvi., ed. Furneaux), Suetonius, Dio Cassius (Epit. li., lii., liii.), and Zonaras (Ann. xxi.). The most important modern work is the Life and Passions of the Emperor Nero (London, 1903); see an important notice in Class. Rev. vol. xviii. p. 57), which contains complete bibliography of ancient and modern writers; see also H. Schiller's Nero, and Gellius, Kaisers; Lehmann, Claudius und Nero; Treasures of Rome in general. (H. F. P.)

NERVA, MARCUS COCEIUS, Roman emperor from the 18th of September 96 to the 25th of January 68, was born at Narina in Umbria on the 8th of November, probably in the 3rd. He belonged to a senatorial family, which had attained considerable distinction under the emperors, his father and grandfather having been well-known jurists. A single inscription (C.I.L. vi. 31997) gives the name of his mother as Sergia Plautilla, daughter of Laenas. In his early manhood he had been on friendly terms with Nero, by whom he was decorated in 65 (Tacitus, Annals, xv. 72) with the triumphal insignia after the suppression of the Pisonian conspiracy (further valuable information as to his career is given in an inscription from Sassoferato, C.I.L. xi. 5743).

He was praetor (66) and twice consul, in 71 with the emperor Vespasian for colleague, and again in 90 with Domitian. Towards the close of the latter's reign (93) he is said to have excited suspicion and to have been banished to Tarentum on a charge of conspiracy (Dio Cass. lxvii. 15; Philostr. Apoll. Tyan. vii. 8). On the murder of Domitian in September 96 Nerva was declared emperor by the people and the soldiers. He is described as a quiet, kindly, dignified man, honest of purpose, but unfitted by his advanced age and temperament, as well as by feeble health, to bear the weight of empire. Nevertheless, his selection, in spite of occasional exhibitions of weakness, was probably the best choice. His accession brought a welcome relief from the terrible storm of the last few years. The new emperor recalled those who had been exiled by Domitian; what remained of their confiscated property was restored to them, and a stop was put to the vexatious prosecutions which Domitian had encouraged. But the popular feeling demanded more than this. The countless informers of all classes who had thriven under the previous régime now found themselves swept away, to borrow Pliny's metaphor (Pliny, Paneg. 35), by a hurricane of revengful fury, which threatened to become as dangerous in its indiscriminate ravages as the system it attacked. It was finally checked by Nerva, who was stung into action by the sarcasticremark of the consul Titus Caesius Caesar Fronto that, "bad as it was to have an emperor who allowed no one to do anything, it was worse to have one who allowed everyone to do everything" (Dio Cass. lxviii. 1).

Nerva seems to have followed the custom of announcing the general lines of his future policy. Domitian had been arbitrary and high-handed, and had heaped favours on the soldiery while humiliating the senate; Nerva showed himself anxious to restore the traditional privileges of the senate, and such maxims of constitutional government as still survived. He appears, however, to have set himself honestly to carry out reforms. The economical condition of Italy evidently excited his alarm and sympathy. The last mention of a lex agraria in Roman history is connected with his name, though how far the measure was strictly speaking a law is uncertain. Under the provisions of this lex, large tracts of land were bought up and allotted to poor citizens. The cost was defrayed partly from the imperial treasury, but partly also from Nero's private resources, and the execution of the scheme was entrusted to commissioners (Dig. xlvi. 21, 3; Dio Cass. lxvii. 2; Pliny, Ep. vii. 31; Corp. Inscrip. Lat. vi. 1548). He also founded or restored colonies at Verulam, Scylacium and Sitis in Mauretania. The agrarian
law was probably as short-lived in its effects as preceding ones had been, but a more lasting reform was the maintenance at the public cost of the children of poor parents in the towns of Italy (Aur. Vict. Ep. 24), the provision being presumably secured by a yearly charge on state and municipal lands. Private individuals were also encouraged to follow the imperial example. In the hands of Trajan, Hadrian and the Antonines, Nerva's example bore fruit in the institution of the alimentaiones, the most genuinely charitable institution of the pagan world. These measures Nerva supplemented by others which aimed at lightening the financial burdens on the declining industry of Italy. The burden of maintaining the imperial household was transferred to the foedus; from the same source apparently money was found for repairing the public roads and aqueducts; and, lastly, the lucrative but unpopular tax of 5% on all legacies or inheritances (vicesima hereditatium), was so readjusted as to remove the grosser abuses connected with it (Pliny, Paneg. 37). At the same time Nerva did his best to reduce the overgrown expenditure of the state (Pliny, Ep. ii. 1). A commission was appointed to consider the best modes of retrenchment, and the outlay on shows and games was cut down to the lowest possible point. Nerva seems nevertheless to have soon wearied of the unceasing task of settling disputes, and, finding that the dignity of the office was endangered by the execution of Domitian's murderers, the chamberlain, Iain Parthenius and Petronius Secundus, Aelianus's colleague, Nerva vainly strove to save, even at the risk of his own life, the men who had raised him to power, but the soldiers brutally murdered the unfortunate men, and forced him to propose a vote of thanks for the deed (Dio Cass. Epit. lxviii. 4; Aur. Vict. Ep. 24). This humiliation convinced Nerva of the necessity of placing the government in stronger hands than his own. Following the precedent set by Augustus, Galba and Vespasian, he resolved to adopt as his colleague and destined successor, M. Ulpius Trajanus, a distinguished soldier, at the time in command of the legions on the Rhine. In October 97, in the temple of Jupiter on the Capitol, Trajan was formally adopted as his son and declared his colleague in the government of the empire (Pliny, Paneg. 8). For three months Nerva ruled jointly with Trajan (Aur. Vict. Ep. 24); but on the 25th (according to others, the 27th) of January 98 he died somewhat suddenly. He was buried in the sepulchre of Augustus, and divine honours were paid him by his successors. The verdict of history upon his reign is best expressed in his own words— "I have done nothing which should prevent me from laying down my power, and living in safety as a private man." The history of Nerva is of a character to serve the ruined temple in the Via Alessandrina (il Colonacce) which marks the site of the former seat of Domitian, but which Nerva completed and dedicated (Suet. Dom. 5; Aur. Vict. 12).

NERVAL, GÉRARD DE (1808-1859), the adopted name of Gérard Labrunie, French man of letters, born in Paris on the 22nd of May 1808. His father was an army doctor, and the child was left with an uncle in the country, while Mme Labrunie accompanied her husband in his campaigns. She died in Silesia. In 1811 his father returned, and beside Greek and Latin taught the boy modern languages and the elements of Arabic and Persian. Gérard found his favourite reading in old books on mysticism and the occult sciences. He distinguished himself by his successes at the Collège Charlemagne, however, and his first work, La France guerrière, élégies nationales, was published while he was still a student. In 1828 he published a translation of Goethe's Faust, the choruses of which were afterwards used by Berlioz for his legend-symphony, The Damnation of Faust. A number of poetical pieces and three comedies combined to acquire for him, at the age of twenty-one, a considerable literary reputation, and led to his being associated with Théophile Gautier. The first of these little comedies was Le Jeune Pasteur, the first of the series of feuilletons for the Presse. He conceived a violent passion for the actress Jessica Colon, in whom he thought he recognized a certain Adrienne, who had fired his childish imagination. Her marriage and her death in 1842 were blows from which his nervous temperament never really recovered. He travelled in Germany with Alexandre Dumas, and alone in various parts of Europe, leading a very irregular and eccentric life. In 1843 he visited Constantinople and Syria, where, among other adventures, he nearly married the daughter of a Druse sheik. He contributed accounts of his travels to the Colon, the Revue des Deux Mondes and other periodicals. After his return to Paris in 1844 he resolved for a short time his feuilleton for the Presse, but his eccentricities increased and he committed suicide by hanging, on the 25th of January 1855. The literary style of Gérard is simple and unaffected, and he has a peculiar faculty of giving to his imaginative creations an air of naturalness and reality. In a series of novelettes, afterwards published under the name of Les Illuminés, ou les précurseurs du socialisme (1852), containing studies on Rétif de la Bretonne, Cagliostro and others, he gave a sort of analysis of the feelings which followed his third attack of insanity. Among his other works the principal are Les Filles du feu (1854), which contains his masterpiece, the semi-autobiographical romance of La Promesse; Scènes de la vie orientale (1848-1850); Contes et folies (1852); La Bohème galante (1856); and L'Alchimiste, a drama in five acts, the joint composition of Gérard and Alexandre Dumas. His Poésies completes were published in 1877.

There are many accounts of Gérard de Nerval's unhappy life. Among them may be mentioned notices by his friend Théophile Gautier and by Arène Housaye, prefixed to the posthumous Le Rêve et la vie (1855); Maurice Tourneux's sketch in his Age du romantisme (1887); and a sympathetic study of temperament in the Nervés (1896) of Mme Arvède Barine. See also G. Ferrières, Gérard de Nerval (1906).

NERVE (Lat. nervus, Gr. ἁρδέος, a bowstring, originally a sinew or tendon (and still so used in the phrase "to strain every nerve"), but now a term practically confined to the fibres of the nervous system in anatomy, though consequently employed as a general psychical term in the sense of courage or firmness, and sometimes (but more usually "nervousness") in the opposite sense. In the present article the anatomy of the nerves is dealt with; see also Nervous System, Muscle and Nerve, Neuropathology, &c.

I. CRANIAL

The cranial nerves are those which arise directly from the brain, and for the most part are concerned with the supply of the head. With one exception they all contain medullated fibres (see Nervous System). Twelve pairs of these nerves are recognized, and they are spoken of as often by their numbers as by their names. The following is a list:

1. (1) Olfactory; (2) Optic; (3) Oculo-motor or Motor ocul.; (4) Trochlearis or Patheticus; (5) Trigeminal or Trifacial; (6) Abducens; (7) Facial; (8) Auditory; (9) Glossato-phyngeal; (10) Vagus or Pneumogastric; (11) Spinal accessory; (12) Hypoglossal.

The first, or olfactory nerve, consists of the olfactory bulb and tract, which are a modified lobe of the brain and lie beneath the sulus rectus on the frontal lobe of the brain (see fig. 1). At its posterior end the tract divides to become continuous with the two extremities of the limbic lobe (see Basal), while at its anterior end it is the tab from which some twenty small non-medullated nerves pass through the cribiform plate of the ethmoid to supply the sensory organs in the olfactory mucous membrane (see Olfactory Organ).
The second or optic nerve consists of the optic tract, the optic commissure or chiasma, and the optic nerve proper. The optic tract begins at the lower visual centres or internal and external geniculate bodies, the superior quadrigenral body and the pulvinar (see fig. 1), but these again are connected with the higher visual centre in the occipital lobe by the optic radiations (see fig. 2). In the chiasma some of the fibres cross and some do not, so that the right optic tract forms the right half of both the right and left optic nerves. In addition to this the fibres coming from the internal geniculate body of one side cross in the chiasma to the same body of the opposite side, forming Gowers's commissure. The optic nerve passes through the optic foramen in the skull into the orbit, where it is penetrated by the central artery of the retina, and eventually pierces the sclerotic just internal to the posterior pole of the eyeball. Its final distribution is treated in the article Eye.

The third or oculomotor nerve arises from a nucleus in the floor of the aqueduct of Sylvius (see Brain, fig. 8), and comes to the surface pass into a small compartment of the dura mater, in front of the apex of the petrous bone, known as Meckel's cave; here the large crescentic Gasserian ganglion is formed upon the sensory root, and from this the three branches commonly named the ophthalmic, maxillary and mandibular nerves arise. The first of these divisions is the opthalmic, the second the maxillary, and the third the mandibular, while the motor root of the oculomotor leaves the pons as the third root of trigeminal. The first three branches combine in the foramen rotundum, and then runs across the roof of the sphenoidal fossa and divides into sphenopalatine or Meckel's ganglion, which lies in the outer part of the orbit, and through which, as well as through its own long ciliary branches, it supplies the muscles of the pupil with sensation. It leaves the orbit through the anterior ethmoid canal, and lies for a short distance on the cribriform plate of the ethmoid; then it enters the nasal cavity and becomes the naso-lacrimal duct of the posterior ethmoid, and finally disappears, the lacrimal duct of the nasal fossa.

The fourth or trigeminal nerve consists of the mandibular, maxillary and ophthalmic divisions, which arise from the trigeminal ganglion, one of the sensory ganglia of the cranial nerves. The maxillary and ophthalmic divisions together form the first division of the trigeminal, which is the general sensory nerve of the head, supplying all the structures of the face below the eyes and the nose, and the mucous and skin covering of the head and neck. The mandibular division of the trigeminal is the motor nerve of the masticatory muscles, and is supplied to the muscles of the face, neck and teeth.

The fifth or trigeminal nerve consists of motor and sensory roots. The motor root rises from a nucleus in the upper lateral part of the floor of the fourth ventricle, as well as from a descending (mesencephalic) tract from the neighbourhood of the Sylvian aqueduct (see fig. 3). The large sensory root goes to a sensory nucleus a little external to the motor one, and also, by a spinal or descending root, to the substantia gelatinosa Rolandi as low as the second spinal nerve (see fig. 3). The superficial origin of the fifth nerve is from the side of the pons (see fig. 1), and the two roots at once

From D. J. Cunningham, in Cunningham's Text-book of Anatomy.

Fig. 1.—View of the Under Surface of the Brain, with the lower portion of the temporal and occipital lobes, and the cerebellum on the left side removed, to show the origins of the cranial nerves.

in a groove on the inner side of the crus cerebri (fig. 1); it soon pierces the dura mater, and lies in the outer wall of the cavernous sinus, where it divides into an upper and lower branch. Both these enter the orbit through the sphenoidal fissure, the upper branch supplying the superior rectus and levator palpebrae superioris muscles, the lower the inferior and internal rectus and the inferior oblique, as to that it supplies five of the seven orbital muscles.

The fourth or trigeminal nerve is very small, and comes from a nucleus a little lower than that of the third nerve. It is specially remarkable that it crosses to the opposite side in the substance of the valve of Viesseens of the fourth ventricle, after which it winds round the outer side of the crus cerebri (fig. 1) and enters the outer wall of the cavernous sinus to reach the orbit through the sphenoidal fissure. Here it enters the superior oblique muscle on its orbital surface.

The fifth or trigeminal nerve consists of motor and sensory roots. The motor root rises from a nucleus in the upper lateral part of the floor of the fourth ventricle, as well as from a descending (mesencephalic) tract from the neighbourhood of the Sylvian aqueduct (see fig. 3). The large sensory root goes to a sensory nucleus a little external to the motor one, and also, by a spinal or descending root, to the substantia gelatinosa Rolandi as low as the second spinal nerve (see fig. 3). The superficial origin of the fifth nerve is from the side of the pons (see fig. 1), and the two roots at once motor branch to the mylohyoid and posterior belly of the digastic muscles, and then enters a canal in the lower jaw, where it gives off twigs to all the lower teeth. A motor branch also runs through the mental foramen to supply the skin of the chin. The auriculo-temporal nerve rises by two roots, which embrace the middle meningeal artery, and runs backward and then upward close to the lower jaw joint to supply the parotid gland, the outer side of the ear, and the side of the scalp. At its beginning it communicates with the otic ganglion, which lies just internal to it below the foramen ovale, and also receives a communication from the nerve to the internal pterygoid muscle.

The sixth or abducens nerve rises from a nucleus in the floor of the fourth ventricle deep to the eminentia teres (see fig. 3). It appears in the lower part of the infratemporal fossa, and runs to the middle line (see fig. 1), soon after which it pierces the dura mater and runs in the floor of the cavernous sinus to the sphenoidal fissure. Entering the orbit through this, it quickly supplies the external rectus and inferior oblique.

The seventh or facial nerve begins in a nucleus which is about the same level as that for the sixth, but much deeper from the floor of the fourth ventricle as well as from the roof of the cranial fossa (fig. 3). The fibres of the facial loop round the nucleus of the sixth, and then emerge in the triangular interval between the medulla, pons and cerebellum, close to the eighth nerve, and having the paras
intermedia between (see fig. 1). Entering the internal auditory meatus with these structures the facial nerve soon passes into a canal in the petrous bone known as the aquaductus Fallopian, and in this it makes a sudden bend and forms the geniculate ganglion, from which the great superficial petrosal branch to Meckel's ganglion is given off. The canal of the stylo-mastoid foramen on the base of the skull, and from the nerve enters the parotid gland, in which it forms a plexus called the plexus tympanicum. From this, branches pass to all the muscles of the face except those of mastication. In the aquaduct the pars intermedia joins the seventh, and beyond the geniculate ganglion, leaves it as the chorda tympani, which runs through the tympanum (see ear) to join the lingual branch of the fifth. It is probable that the pars intermedia, geniculate ganglion and chorda tympani, represent the sensory root of the facial nerve. Just outside the stylo-mastoid foramen the facial nerve gives off the posterior auricular branch to the occipitalis and posterior auricular muscles, as well as a branch to the stylohyoid and posterior belly of the digastric muscles.

The eighth or auditory nerve is in two bundles, cochlear and vestibular. The former comes from the cochlear nuclei which lie deep to the acoustic tubercle in the floor of the fourth ventricle (fig. 3), while the latter rises from the dorsal nucleus, nucleus of Deiters and the nucleus of the descending root, which are more deeply placed. The nucleus of Deiters is connected with the cerebellum, and is concerned in maintaining the equilibrium (p.n.) of the body, while, as is pointed out in the article COCHLEA, the cochlear nuclei are connected with the inferior quadrigeminal body by the lateral fillet as well as with the internal geniculate body, while this body again is connected with the higher auditory centre in the grey cortex of the temporo-sphenoidal lobe by the auditory radiations. The vestibular root passes in front of the restiform body (fig. 3), and the cochlear behind that body. Together they enter the internal auditory meatus, and, at the end of it, pierce the lamina cribrosa, the vestibular nerve supplying the utricle and superior and external semicircular canals, the cochlear nerve the posterior canal, the saccule and the cochlea (see Ear).

The ninth or glossopharyngeal nerve is chiefly, if not entirely, sensory, and its deep termination in the brain is the solitary bundle (see fig. 2, and Brain, fig. 4). It appears on the surface between the olive and restiform body (see fig. 1), and leaves the skull through the posterior lacerated foramen; as it does so two ganglia, the jugular and petrosus, are formed on it, after which it runs downward and forward, between the internal and external carotid arteries, and eventually reaches the back of the tongue (see Tongue). On its way it supplies the tympanum, the stylopharyngeus muscle, though there is grave doubt as to whether these fibres are not really derived from the facial nerve. The contributions to the pharyngeal plexus, the tonsil and part of the epiglottis.

The tenth or vagus has sensory and motor fibres; the former go to the solitary bundle mentioned in the description of the glossopharyngeal nerve (see fig. 3). While the latter come from the dorsal nucleus and nucleus ambiguus, both of which are found deep to the lower half of the fourth ventricle. The nerve appears on the superior surface of the brain, then passes through the olive and restiform body and just below the ninth (see fig. 1). It leaves the skull through the posterior lacerated foramen, and, like the glossopharyngeal, has two ganglia developed on it; the upper of these is the ganglion of the root, and the lower the ganglion of the trunk (see fig. 4). From the former the auricular branch or Arnold's nerve (see Ear) comes off, while from the latter are given off the pharyngeal branches to the pharyngeal plexus (fig. 4, Ph.) and the superior laryngeal branch which is the sensory nerve of the larynx (fig. 4, S.L.). Between the two ganglia the accessory part of the eleventh nerve joins the tenth, and it is from this communication that the motor twigs to the pharynx, larynx, alimentary and respiratory tracts are derived, as well as the inhibitory fibres of the heart. In the neck the vagus accompanies the carotid artery and internal jugular vein, and here it gives off superior and inferior cardiac branches. The left inferior cardiac branch passes to the superficial, while the three others go to the deep cardiac plexus. The nerve now enters the thorax, passing between the subclavian artery and vein. On the right side its recurrent laryngeal branch loops under the subclavian artery (fig. 4, R.), and runs up to supply all the muscles of the larynx except one (see Respiratory System). In the thorax the left vagus passes in front of the arch of the aorta, under which the left recurrent laryngeal loops, and on both sides a thoracic cardiac branch is given to the deep cardiac plexus. Both vagi pass behind the root of their own lung, and break up to form the posterior pulmonary plexus after giving off some branches for the much smaller anterior pulmonary plexus; they then reach the oesophagus, where they again break up into an oesophageal plexus or plexus gulae. As the diaphragm is approached the two nerves become distinct again, but the left one now lies in front and the right behind the food tube, so that, when the stomach is reached, the left vagus supplies the front of the organ and communicates with the hepatic plexus, while the right goes to the back and communicates with the coeliac, splenic and renal plexuses.

The eleventh or spinal accessory nerve is entirely motor, and consists of a spinal and an accessory part. The former rises from the upper cervical nerves, and is distributed to the muscles of the back and neck; the accessory part arises from the first and second cervical nerves, and to the sternomastoid muscle and runs obliquely downward.
NERVE

From A. M. Paterson, in Cunningham's Text-Book of Anatomy.

Fig. 4.—The Distribution of the Pneumogastric Nerve.

III. Spinal

The spinal nerves are those which arise from each side of the spinal cord and are distributed to the trunk and limbs, though some of the upper ones supply the lower parts of the head and face. As is shown in the article Nervous System, the division between cranial and spinal nerves is rather one of convenience than of real scientific difference. There are generally thirty-one pairs of these nerves, which are subdivided according to the part of the vertebral column through which they pass out; thus there are eight cervical (abbreviated C.), twelve thoracic (Th.)—formerly called dorsal,—five lumbar (L.), five sacral (S.) and one coccygeal (Coc.). As the thoracic nerves are the simplest and most generalized in their arrangement, a typical one of these, say the fourth or fifth, will be first described.

The nerve is attached to the spinal cord by two roots, of which the ventral is purely efferent or motor and the dorsal purely afferent or sensory. On the dorsal root is a fusiform ganglion which lies in the foramen between the vertebrae through which the nerve passes. The two roots then join together to form a mixed nerve (see fig. 5), but very soon divide once more into anterior (ventral) and posterior (dorsal) primary divisions. These, however, each contain sensory and motor fibres. Just before it divides in this way the mixed nerve gives and receives its rami communicantes with the sympathetic (see Nervous System).

The anterior primary division runs round the trunk, between the ribs, forming an intercostal nerve and giving off a lateral cutaneous branch, when the side of the body is reached, which divides into anterior and posterior secondary branches. The rest of the division runs forward, supplying the intercostal muscles, as far as the edge of the sternum, when it ends in an anterior cutaneous branch to the front of the chest. The dorsal primary division divides into an external (lateral) and internal

and backward across the posterior triangle of the neck to enter the trapezius; both these muscles are in part supplied by the nerve.

The twelfth or hypoglossal nerve is motor, and rises from a nucleus in the mesencephalon, floor of the fourth ventricle dorsal to the trigonum hypoglossi (see Brain, fig. 3). It emerges from the brain between the anterior pyramid and the olive (see fig. 1), and leaves the skull in two bundles through the anterior condylar foramen. Soon after this it is closely bound to the vagus, and, in front of the atlas, receives an important contribution from the loop between the first and second cervical nerves. The nerve then passes downward until it reaches the origin of the occipital artery, round which it loops, and then runs forward on the surface of the hypo-glossus to the muscles of the tongue. As it bends round the occipital artery it gives off its descendens hypoglossi branch, which derives its fibres from the communications with the first cervical already mentioned. This branch runs down and forms a loop with the communicantes cervicis branch from the second and third cervical nerves, and from this loop (ansa hypoglossi) many of the depressor muscles of the hyoid bone and larynx are supplied. Farther forward special branches are given off to the thyro-hyoid and genio-hyoid muscles, and these, like the descendens hypoglossi, are derived from the first and second cervical loop, thus leaving all the true muscles of the tongue to be supplied by the medullary part of the nerve.

For the embryology and comparative anatomy of the cranial nerves, see Nervous System.

From A. M. Paterson, in Cunningham's Text-Book of Anatomy.

Fig. 5.—Scheme of the Distribution of a Typical Spinal Nerve.
nerve. Its anterior primary division joins those of the second, third and fourth cervical nerves to form the cervical plexus, from which the skin of the side of the neck and lower part of the head and face are supplied by means of the small occipital, great auricular, superficial cervical, suprasternal, supraventricular and supracleavicular nerves (see fig. 7), as well as those muscles of the neck which are not supplied by the cranial nerves. The phrenic nerve, which comes chiefly from the fourth cervical, deserves special notice because it runs down, through the thorax, to supply the greater part of the diaphragm. The explanation of this long course (see Diagram) is that the diaphragm is formed in the neck region of the embryo. The posterior primary division of the second cervical nerve is very large, and its inner (mesial) branch is called the great occipital and supplies most of the back of the scalp (fig. 7). The fifth, sixth, seventh and eighth anterior primary divisions of the cervical nerves as well as a large part of that of the first thoracic are prolonged into the arm, and in the lower part of the neck and arm it communicates with one another to form the brachial plexus. As a general rule underlies the composition of the limb plexuses it will be worth while to study the structure and distribution of this one with some care. It will be seen from the accompanying diagram (fig. 8) that each component nerve with the exception of the first thoracic divides into an anterior (ventral) and a posterior (dorsal) division which are best spoken of as secondary divisions in order to prevent any confusion with the anterior and posterior primary divisions which all the spinal nerves undergo. In the diagram the anterior secondary divisions are white, while the posterior are shaded. It has been suggested by A. M. Paterson that the posterior secondary branches correspond with the lateral branches of the thoracic nerves already mentioned, but there are still certain difficulties to be explained before altogether accepting this. Later on in the plexus three cords are formed of which the posterior is altogether made up of the posterior secondary divisions, while the anterior secondary divisions of the fifth, sixth and seventh cervical nerves form the external cord, and those of the eighth cervical and first thoracic the inner. As a general rule the nerves which rise from the ventral secondary divisions of the limb plexuses run only to that surface of the limb which was ventral in the embryo, while the dorsal secondary divisions are confined to the original dorsal area, but, in order to apply this to the human adult, it must be realized that the limbs
are at one time flattened buds coming off at right angles from the side of the body and having dorsal and ventral surfaces, one (pre-axial) border toward the head of the embryo, and one (postaxial) toward the tail. If a person lies prone upon the floor with the arms outstretched and the palms downward the embryological position of the forelimb is to some extent restored, and it will now be easily understood that the more preaxial part of the limb will be supplied by those nerves which enter it from nearer the head, while the postaxial part draws its nerve supply from lower down the spinal cord. To use Herringham's words (10) (A) of two spots on the skin, that nearer the preaxial border tends to be supplied by the higher nerve. (B) Of two spots in the preaxial area the lower tends to be supplied by the lower nerve, and of two spots in the postaxial area the lower tends to be supplied by the higher nerve. Other points of general importance in regard to cutaneous nerve supply are, firstly, that the area of skin supplied by one spinal nerve is not sharply marked off from that of the next, but the two are separated.

From A. M. Paterson, in Cunningham's Text-book of Anatomy.

FIG. 7.—The Triangles of the Neck (Nerves).

by an overlapping region; and, secondly, that the area supplied by any one spinal nerve is liable to variation in different individuals within moderate limits. This variation may affect the whole plexus, and the term 'prefixed plexus' has been devised by C. S. Sherrington to indicate one in which the spinal nerves entering into its formation are rather higher than usual, while, when the opposite is the case, the plexus is spoken of as 'postfixed.'

With regard to the muscular supply of a limb the general rule is that each muscle is supplied by fibres derived from more than one spinal nerve; this, of course, is made possible by the redistribution of fibres in the plexuses. Moreover, the muscular supply does not necessarily correspond to that of the overlying skin, because (see Muscular System) some of the primitive muscles have been suppressed, others have fused together, while others have shifted their position to a considerable distance. Bearing the foregoing facts in mind, the main distribution of the nerves of the brachial plexus may be surveyed, though the exact details must be sought in the human anatomy textbooks. The outer cord of the plexus gives off the external anterior thoracic nerve (C. 5? 6, 7) to the pectoralis major, the brachial nerve (C. 5 6, 7) to the muscles of the front of the arm, and to the skin of the outer side of the forearm and the posterior thoracic nerve (C. 5 6, 7) supplies most of the flexor muscles of the hand. The median nerve (C. 5 6, 7, 8) supplies the skin of the outer side of the palm including the outer three digits and half the fourth. From the inner cord come the inner head of the median just mentioned, the ulnar nerve (C. 8, Th. 1) which supplies the flexor carpi ulnarsi, the hypoglossal (C. 5, 6, 7, 8) which runs to the anterior and descending hypoglossal nerves (C. 5 6, 7, 8) which supplies the deltoid and teres minor muscles, and the skin over the lower part of the deltoid, and the musculo-spiral nerve (C. 5, 6, 7, 8) which is the largest branch of the brachial plexus and gives off cutaneous twigs to the outer side and back of the arm, and to the forearm as well as the inner digital and a half on the palm and digital aspects. Other branches of the inner cord are the internal cutaneous (C. 8, Th. 1) supplying the inner side of the forearm, the lesser ulnar cutaneous (C. 7, Th. 1) which comes from junction of external and internal cutaneous nerves, and the intercosto-humeral (C. 5, 6, 7, 8) supplies the skin on the inner side of the upper arm, and the internal anterior thoracic nerve (C. 8, Th. 1) to the pectoralis minor and major.

Side of the thigh, through its middle and internal cutaneous branches, and the skin of the inner side of the leg and foot through the internal saphenous branch. At first sight it is difficult to understand how the anterior cutaneous nerve, which supplies the skin of the front of the thigh, is a posterior secondary division of the lumbar plexus, but the explanation is that the front of the human thigh was originally the dorsal surface of the limb bud, and the distribution of the nerve is quite easily understood if the position of the hind limb of a lizard or crocodile is glanced at. The fourth lumbar nerve is sometimes called the nervus furcalis, because, dividing, it partly goes to the lumbar, and partly to the sacral plexus (fig. 8), though, when the plexus is prefixed, the third lumbar may be the nervus furcalis, or, when it is postfixed, the fifth lumbar. Under ordinary conditions the descending branch of the fourth lumbar nerve joins the fifth, and together they make the lumbo-sacral cord, which, with the first three sacral nerves, forms the sacral plexus. This plexus, like the others, contains anterior and posterior secondary divisions of its spinal nerves, and it resembles the brachial plexus in that the lowest nerve to enter it contributes no dorsal secondary division.

All the constituent nerves of the plexus run into one huge nerve, the great sciatic, which runs down the back of the thigh and, before reaching the knee, divides into external and internal popliteal nerves. These two nerves are sometimes separate from their first formation in the plexus, and may always be separated easily by the handle of a scalpel, since they are only bound together by loose connective tissue to form the great sciatic nerve. When they are separated in this way it is seen that the external popliteal is made up entirely of posterior (dorsal) secondary divisions (see fig. 9), and is derived from the fourth and fifth lumbar and first and second sacral nerves, while the internal popliteal is formed by the anterior (ventral) secondary divisions of the fourth and fifth lumbar and first, second, and third sacral nerves. The external popliteal nerve supplies the short head of the biceps femoris (see Muscular System), and, just below the knee, divides into anterior tibial and musculo-cutaneous branches, which both supply the dorsal surface of the leg and foot. The anterior tibial nerve is chiefly muscular, innervating the muscles in front of the tibia and fibula as well as the extensor brevis digitorum pedis on the dorsum of the foot, though it gives one small cutaneous branch to the cleft between the first and second toes. The musculo-cutaneous nerve supplies the peroneus longus and brevis muscles, and the rest of the skin of the dorsum, of the foot, and lower part of the leg, while the skin of the upper part of the dorsum of the leg, below the knee, is supplied by the external popliteal before its division. The internal popliteal nerve, after supplying the hamstring, is continued into the calf of the leg as the posterior tibial and innervates all the muscles of the calf, the plantar surface. Behind the inner ankle it divides into the external and internal plantar nerves, from which the muscles and skin of the sole are supplied. A little above this the posterior tibial nerve gives off a contribution to help form the external or short saphenous nerve. That from the internal popliteal is called the cutaneous saphenous nerve, while that from the external popliteal is the communicans plantaris. These join about the middle of the back of the leg, and the short saphenous nerve runs down behind the outer ankle to supply the outer side of the foot. Sometimes it encroaches on the dorsum of the foot, replacing part of the musculo-cutaneous, though, when this is the case, its dorsal contribution from the external popliteal (communicans plantaris) is always more than usual.

To return to the sacral plexus: branches are given off from the anterior secondary divisions to the short external rectus muscles (see Muscular System), the small saphenous nerve (S.1, 2, 3) is partly dorsal and partly ventral in its origin and distribution; it supplies the skin of the perineum, buttock and the back of the thigh. The pudic nerve (S.2, 3, 4) helps to supply the skin and muscles of the perineum and genital organs.

The visceral branches form the pelvic stream of white rami communicantes (see Nervous System); they run from the second and third and fourth sacral to the pelvic plexuses of the superior, middle, and inferior hemorrhoidal nerves.

The sciatic nerve (S.2, 3) pierces the great sacro-sciatic ligament and supplies the skin over the lower internal part of the buttock. The muscular branches (S.3, 4) supply the external sphincter, levator ani and coccygeus.

The sacro-coccygeal nerve (S.4, 5, Coc.1) runs down on each side of the coccyx to supply the adventitious skin, and represents the ventral-lateral nerve of the tail of lower mammals.

NERVI, a coast town of Liguria, Italy, in the province of Genoa, from which it is 7½ m. S.E. by rail (also electric tramway), 82 ft. above sea-level. Pop. (1901) 3480 (town); 6317 (community). It is much frequented as a health resort for invalids, invalids, otolaryngologists, and lepers, and its villas have beautiful gardens. It is moister and less dusty than the western Riviera, and is especially in favour with those who suffer from lung complaints. At Quarto, 2½ m. N.W., 1000 Garibaldians (1 mile) embarked for Marsala in 1860.

NERVOUS SYSTEM. The nervous system forms an extremely complicated set of links between different parts of the body, and is divided into (A) the central nervous system, composed of (1) the brain, and (2) spinal cord; (B) the peripheral nervous system, consisting of (1) the cranial nerves, (2) the spinal nerves, (3) the various sense organs such as the eye, ear, olfactory organ, taste organ and tactile organs, and (4) the motor end plates; (C) the sympathetic system. The anatomy and physiology of many of these parts are treated in separate articles (see Brain, Spinal Cord, Nerve, Eye, Ear, Olfactory Organ, Taste, Touch, Muscle and Nerve, Sympathetic Nervous System). The object here is to deal with anatomical points which are
common to the whole system, or for which a place does not conveniently occur elsewhere.

Histology of the Nervous System.

Three kinds of tissue are found in the nervous system, nerve fibres, nerve cells, and a supporting tissue called neuroglia. Nerve fibres may be myelinated or non-myelinated, but, whichever they are, they consist of the long process or axon of a nerve cell; in a non-myelinated nerve this process is either naked or enclosed in a delicate membrane called the primitive sheath or neurilemma, but in a myelinated nerve the process or axis cylinder is ensheathed by a white fatty substance called myelin, and so the term "myelinated" is often used instead of "medullated" for these nerves (see fig. 1). Outside this white sheath the neurilemma is present in most nerves, but is lost when they are massed to form the white matter of the central nervous system and in the optic nerve. At regular intervals the myelin is interrupted by some substance which stains deeply with silver nitrate, and these breaks are known as nodes of Ranvier. They do not, however, affect the axis cylinder. In a large nerve, such as the median, the nerve fibres are collected into small bundles called fasciculi, ensheathed in a connective tissue sheath, the perineurium, and separated from it by a lymph space. From this sheath delicate processes penetrate among the fibres, and these are known as the endoneurium. The fasciculi are collected into bundles called funiculi, and the whole nerve consists of a variable number of fasciculi surrounded by a dense fibrous sheath, the epineurium. The various bundles do not remain distinct, but break up and rearrange themselves, so that following them up with the scalpel is a difficult and tedious work. The nerve fibres, however, never join one another and are often several feet in length.

Nerve cells are unipolar, bipolar or multipolar. Unipolar cells are found in the ganglia on the posterior roots of the spinal nerves, and only give off an axon or axis cylinder process; this, however, soon divides in a T-shaped manner, and all these cells were originally bipolar, though the cell has grown away from its two axons (or, as they are often regarded, axon and dendrite), leaving a stalk joining it to them at right angles. Bipolar cells are found as an embryonic stage of unipolar, though in fish they persist in the spinal ganglia throughout life. They are also sometimes found in the sympathetic ganglia. Multipolar cells are found in the brain and cord, and are best studied in the anterior horns of the grey matter of the latter, where they are nearly whole in the naked eye (see fig. 2). Of their many processes only one is an axon, and it becomes the axis cylinder of a motor spinal nerve. The other processes are called dendrites, and break up into delicate branches some of which surround, but, it is generally believed, are not actually continuous with, neighbouring cells or their processes. It is known that the axons are made up of delicate fibrils, and it is thought by some observers that there is actual continuity between some of these and those of an adjacent neuron, as the combination of a nerve cell, its axon and dendrites, is called. The cells of Purkinje in the cerebellum show a particularly rich arborization of dendrites (see Brain, fig. 7). Nerve cells have generally a large clear nucleus.

The Neuroglia is the delicate connective tissue which supports and binds together the nervous elements of the central nervous system. One part of it, which lines the central canal of the cord and vessels of the brain, is formed of columnar cells, and is called ependyma, while the rest consists of small cells with numerous processes which sometimes branch and sometimes do not. These fibres interlace with one another to form a delicate felt-work which is unimixed with nervous elements on the surface of the grey matter of the brain (see Brain, figs. 7 and 15), though elsewhere it is interwoven with them.

Nerve Endings.—Sensory nerves end by breaking up into filiform or by various tactile organs. In the former case the minute fibrils, of which it has been shown that the axons or nerve fibres consist, separate and end among epithelial cells of the mucous membrane or skin. In the latter case the nerve fibres lose their coating of myelin and end in one of the seven following organs:

1. End bulbs of Krause (fig. 3, A), oval bulbs composed of elongated cells among which the nerve fibrils end in knobs or coils; each is surrounded by a sheath of neurilemma, and the organs are found in the lips, tongue, conjunctiva, epineurium of nerves, synovial membranes of joints, and in the glans penis et clitoritis, where they have a mulberry-like appearance.

2. Pacini corpuscles (fig. 3, B) are large enough to be seen by the naked eye, and are oval bodies made up of a series of concentric capsules of connective tissue rather resembling the structure of an onion; in the centre of this is a structureless core, at the distal extremity of which the nerve fibre ends in one or more knobs. These bodies are found in the palm and sole, in the mesentery, the genital organs and in joints.

3. Tactile corpuscles of Meissner and Wagner (fig. 3, C) are oval bodies found in certain of the skin papillae and mucous membrane, especially of very sensitive parts like the hand and foot, lips, tongue and nipple. They are oval and made of a connective tissue capsule composed of a wall which septa enter the interior. The nerve fibre generally takes a spiral course through them, loses its myelin sheath, and ends by breaking up into its fibrils, which eventually become bulbous.

4. Tactile corpuscles of Gravely are found in the skin of those parts devoid of hair, and consist of a capsule containing two or more large cells, between which the nerve fibre ends in the so-called tactile discs.

5. Ruffini's endings are flattened oval bodies with a thick connective tissue capsule, in which the nerve fibre divides into many
branches which have a varicose appearance, form a rich plexus, and end in knobs. These organs are found between the true skin and subcutaneous tissue of the fingers.

6. Organs of Gaits are found in tendons. Nerve fibres penetrate the tendon bundles and divide in a tree-like manner to end in little disks and varicosities.

7. Neuro-muscular spindles are small fusiform bundles of embryonic muscle fibres among which the nerve fibres end by encircling them and forming flattened disks. These are sensory endings, and must not be confused with the motor end plates. They are found in most of the striated muscles of the body.

Motor nerves end in striped muscle by motor end plates. These are formed by a nerve fibre approaching a muscle fibre and suddenly losing its myelin sheath while its neurilemma becomes continuous with the sarcolemma of the muscle fibre. The axis cylinder divides, and its ramifications are surrounded by a disk of granular matter containing many clear nuclei. In very long muscle fibres more than one of these end plates are sometimes found. Involuntary motor endings are usually found in sympathetic nerves going to unstripped muscle. The fibres form minute plexuses, as of union of which small triangular ganglion cells are found. After this the separate fibrils of the nerve divide, and each ends opposite the nucleus of an unstripped muscle cell.

The Sympathetic System

This system is made up of two gangulated cords running down one on each side of the vertebral column and ending below in the median vertebral. In addition to these cords there are numerous ganglia and plexuses through which the sympathetic nerves pass on their way to or from the viscera and blood-vessels.

A typical ganglion of the sympathetic chain is connected with its corresponding spinal nerve by two branches called rami communicantes, one of which is grey and the other white (see fig. 4). The white consist of medullated fibres belonging to the central nervous system, and these are splanchnic afferent or centripetal and efferent or centrifugal. The efferent fibres lie in the anterior ramus of the spinal nerves, and, like all the fibres there, are either motor or secretory cells with an axon and motor paths for the unstripped muscle of the vessels and viscera, and the secretory paths for the cells of the viscera.

In the course of each fibre from the nerve cell in the spinal cord, of which it is an axon, to the vessel or viscus it supplies, there is always a break where it arborises round a ganglion cell, and this may be in its own ganglion of the sympathetic chain, in a neighbouring ganglion above or below, or in one of the so-called collateral ganglia interposed between the sympathetic chain and the viscera. In addition to these there are a certain number of vasodilator and visceroinhibitory fibres, which run without any central connexions from the spinal or cranial nerves to the viscera. The splanchnic afferent or centripetal fibres are the sensory nerves from the viscera, and have no cell connexions until they reach the spinal ganglia on the posterior roots of the spinal nerves, which they do by traversing the ganglial cord of the sympathetic. The fibres of the white rami communicantes are remarkable for their small diameter, and the efferent fibres, at all events, are found only in two regions, one of which is called the thoraco-lumbar stream and extends from the first or second thoracic to the second or third lumbar nerve, while the pelvic stream is found from the second to the fourth sacral nerves.

The grey rami communicantes are found in connexion with all the spinal nerves, though they are irregular in the paths by which they reach the sympathetic ganglia from the cells of which they come or their fibres are mainly non-medullated, and pass in both roots of the spinal nerves and also into the anterior and posterior primary divisions of those nerves. In this way they reach the body wall and limbs, and are somatic vaso-motor, secretory and pilo-motor nerves, supplying the vessels, glands and hair muscles of the skin and its glands. The sympathetic ganglia, from which these nerves come, contain multipolar nerve cells, with long axons and several dendrites as well as a number of medullated fibres passing through, and much connective tissue.

---

Fig. 4.—Scheme of the Constitution and Connexions of the Gangulated Cord of the Sympathetic. The gangulated cord is indicated on the right, with the arrangement of the fibres arising from the ganglion cells. On the left the roots and trunks of spinal nerves are shown, with the arrangement of the white ramus communicans above and of the gray ramus below.

coccygeal ganglion (g. impar). In the neck the cords lie in front of the anterior tubercles of the transverse processes of the cervical vertebrae, in the thorax, in front of the heads of the ribs, while in the abdomen they lie in front of the sides of the bodies of the

---

NERVOUS SYSTEM

Some of the axons of these cells pass in the connectives to ganglia above and below, while others pass with the splanchnic efferent nerves to the viscera.

The above sketch will give the general scheme of the sympathetic system, but its exact topographical details in man must be sought in the modern text-books such as those of Gray, Quain or Cunningham. Here only the larger and more important details can be given. In the ganglionic chain there is a ganglion corresponding to nearly each spinal nerve, except in the neck, where only three are found; of these the superior cervical ganglion is more than an inch long, and is connected with the first four spinal nerves as well as (ansa Vieuusseni) joining it to the middle cervical ganglion in front of that vessel. It communicates with the seventh and eighth spinal nerves, and gives branches of distribution to the heart and to the subclavian artery and the vertebral vessels. The last and lowest thoracic part of the sympathetic cord has usually eleven ganglia, which receive both white and grey rami communicantes from the spinal nerves (fig. 6) of the former the upper ones run up in the vertebral canal in the form of a plexus, and the lower ones form the three abdominal splanchnics which pass through the diaphragm (q.v.) and join the abdominal plexuses.

The great splanchnic (fig. 6, SL) comes from the sixth to the ninth ganglia, and ends in the semi-lunar ganglion of the solar plexus (fig. 6, SL). The small splanchnic (fig. 6, S2) comes from the ninth and tenth, or tenth and eleventh ganglia, and ends in the aortico-renale plexus. The second smallest splanchnic (fig. 6, S3) comes from the last thoracic ganglion, whether it be the tenth or eleventh, and ends in the renal plexus.

In the lumbar region the gangliated cord is very irregular; there may be four or more ganglia, and these are often fused. Grey rami communicantes are given to all the lumbar spinal nerves, and white ones are received from the first two. Most of the branches of distribution pass to the aortic plexus. The sacral ganglial cord runs down just internal to the anterior sacral foramina; it usually has four small ganglia, and the two cords end by joining the coccygeal ganglion or ganglion impar, though the two-fourth sacral ganglia are united by transverse communicating fibres. The intermammary rami communicantes, already mentioned as the pelvic stream, from the second to the fourth sacral spinal nerves, do not enter the ganglia but pass directly to the pelvic plexuses (fig. 6, V).

Sympathetic Plexuses.—The branches from the thoracic nerves are the thoracic splanchnics, from the last thoracic to the first lumbar nerves, the lumbar splanchnics, and the sacral splanchnics. The thoracic splanchnics communicate with the renal nerve and ganglion. The lumbar splanchnic nerves communicate with both the aorta and the inferior mesenteric ganglion, while the sacral splanchnics communicate with the sympathetic ganglion of the abdomen.

In the abdomen the solar plexus is by far the most important. It lies behind the stomach and surrounds the superior mesentric artery, and is situated the semi-lunar, aortico-renal and superior mesentric ganglia, and from it are prolonged subsidiary plexuses along the main arteries, so that the sympathetic ganglia, paravertebral, renal, splanchnic, superior mesentric, anterior, posterior, and inferior mesentric plexuses, as these are named, are recognized. The hypogastric plexus is the continuation downward of the aortic, and lies just below the bifurcation of the aorta (see fig. 6, IH); it divides into two branches, which communicate the internal iliac arteries and are joined by the pelvic stream of white rami communicantes from the sacral spinal nerves and some twigs from the ganglia of the sacral sympathetic to form the pelvic plexuses. These are prolonged to the mesentery. The anterior branch of the internal iliac artery, so that haemorrhoidal, vesical, prostatic, vaginal and uterine plexuses are found. By the side of the neck of the uterus in the last-named plexus several small ganglia are seen.

(Estration of the sympathetic system, see Quain’s Anatomy, London, 1895.)

EMBRYOLOGY OF NERVOUS SYSTEM

The development of the brain, spinal cord and organs of special sense (ear, tongue) will be found in articles on that of the cranial and spinal nerves and the sympathetic system is dealt with. The thoracic spinal nerves are the most typical, and one of them is the best way to begin with. In fig. 7, A the ganglion on the dorsal root (DR) is seen growing out from the neural crest, and the cells or neuroblasts of which it is composed become fusiform and grow in two directions as the ganglion recedes from the cord. Those which run toward the spinal cord are the axons, while those growing into the mesoderm are probably the efferent fibres. The ventral roots (VR) rise as the axons of the large cells in the ventral horn of the grey matter, and meet the fibres of the dorsal root on the distal side of the ganglion (fig. 7. A). As the two roots join each other fibres enter an anterior (ventral) and a posterior (dorsal) primary division (fig. 7, D), the latter growing into the dorsal segment of its muscle plate and the skin of the back. The anterior primary division grows down to the right of the cardinal vein and finally forms a rootlet into a somatic branch to the body wall (fig. 7, C, So), and a splanchic or visceral branch (fig. 7, C, VY) which joins the sympathetic and forms the white ramus communicantes. The motor fibres grow to this rootlet and give off branches (fig. 7, E). In the limb regions the anterior primary divisions of the nerves divide into anterior and posterior secondary divisions, which probably correspond to the anterior and posterior roots of the thoracolumbar plexus (fig. 7, F). These unite with neighbouring nerves to form plexuses, and divide again, but the anterior nerves keep to the ventral side of the limb and the posterior to the dorsal.

The cranial nerves are developed in the same way as the spinal, so far as concerns the facts that the motor fibres are the axons of cells situated in the basal lamina of the mesencephalon and
rhombencephalon (see Brain), and the sensory are the axons and dendrites of cells situated in ganglia which have budded off from the brain. The evidence of comparative anatomy, however, shows that there are two ventral roots to one dorsal. In the fishes and higher vertebrates the dorsal and ventral roots unite, though in saurichians and echinoderms (shark) embryos the development of the brain and spinal cord is similar. The posterior B. supplied the dorsal root to the developed trunk. In Amphioxus, the cranial nerves are formed of at least five components: (1) Ventral motor, (2) Lateral motor, (3) Somatic sensory, (4) Visceral sensory, (5) Lateral line nerves.

The cranial nerves are only represented by two pairs in Amphioxus. In the Cyclostomata, fishes and Amphibia, ten pairs of nerves are found, which in their distribution do not always agree with those of man. In the Amniota or reptiles, birds and mammals, the seventh and twelfth nerves have been added. The researches of W. H. Gaskell and J. M. Strong have shown that the cranial nerves are formed of at least five components: (1) Ventral motor, (2) Lateral motor, (3) Somatic sensory, (4) Visceral sensory, (5) Lateral line nerves.

The cranial nerves are formed of at least five components: (1) Ventral motor, (2) Lateral motor, (3) Somatic sensory, (4) Visceral sensory, (5) Lateral line nerves.

From A. M. Paterson, in Cunningham's Text-book of Anatomy.

the cranial nerves cannot be directly homologized with the spinal, nor can the fact of there being twelve of them justify us in assuming that the head contains the rudiments of twelve fused or unsegmented somites. To this we will return later. The case of the optic nerve is different to that of any of the others. A. Robinson (Journ. Anat. and Phys., vol. 30, p. 319) has shown that most of its fibres are the axons of ganglion cells in the retina, and, as the retina is part of the optic vesicle and an outgrowth from the brain, the so-called optic nerve is only comparable to a tract of fibres within the brain.

The twelfth or hypoglossal nerve is regarded as a fusion of the motor roots of three spinal nerves, and embryology bears this out, for Froiep has described a small and transitory ganglion corresponding to the posterior root ganglion of this nerve. Another link in the chain of reasoning is that the first spinal or sub-occipital nerve often has its posterior root suppressed.

The sympathetic system is developed from the posterior root ganglia of the spinal nerves, by cells which in man migrate a few at a time. A. M. Paterson, however, believes that the sympathetic is developed, independently of the cerebro-splanic system, in the mesoderm (Phil. Trans. clxxxii. pt. B. p. 139). In embryos of 14.5 mm. there are found masses of cells on each side of the abdominal aorta, permeated with blood vessels, and having the same structure as the carotid and coccgeal bodies. They are known as the organs of Zuckerkandl, and disappear soon after birth.

**Comparative Anatomy**

The comparative anatomy of the brain and spinal cord is dealt with in the separate articles devoted to them.

**Splanic Nerves.**—In Amphioxus the dorsal and ventral roots do not unite with one another but alternate, a dorsal root on one side being opposite a ventral on the other. The dorsal roots are both sensory and motor, the ventral only motor. In the Cyclostomata (Petromyzon) the arrangement is nearly the same, but in some regions as well as in the lobus trigemini and lobus vagi (fig. 8, Nuc. X.). They are formed in the fifth, seventh, ninth, tenth and eleventh nerves, and supply visceral surfaces. In mammals the lingual and palatine

**FIG. 8.—Brain (A) and Choroid Plexuses (B) of Lamprey.**

branches of the fifth, the chorda tympani and great superficial petrosal (8) of the seventh, and all the sensory fibres of the ninth and tenth except Arnold's nerve, represent these. In fishes and Amphibians the palate is supplied by the seventh nerve instead of

**NERVOUS SYSTEM**
the fifth, but the explanation given for this difference is that in these lower forms the Gasserian and geniculate ganglia are not distinct, and so fibres from the compound ganglion may pass into either nerve. These sensory components of the cranial nerves evidently correspond to the branches which have already been mentioned as the splanchnic afferent fibres of the sympathetic.

The system of the lateral line or acustico-lateralis component is sometimes regarded merely as a subdivision of the somatic sensory. It is best developed in the fish, and may be divided into pre- and post-auditory, and auditory. The pre-auditory part comprises the pit and canal end organs supplied by the seventh, and also probably the olfactory organ supplied by the first nerve. The auditory apparatus, supplied by the eighth nerve, is, according to modern opinion, undoubtedly a part of this system, while the tenth nerve sends a large branch along the lateral line supplying the special end organs of the post-auditory part. All these components of the lateral line pass to the tuberculum acusticum in the fourth ventricle, as well as to the cerebellum, which J. B. Johnston (Zool. Bull. 1, 5, p. 221, Boston) regards as a derivative of the rostral (anterior) end of the acusticum. In mammals no doubt the olfactory and auditory apparatus and nerves have the same morphological significance as in fishes, but the seventh does not supply any cutaneous sense organs on the head or face, and the only vestige of the post-auditory supply of the tenth nerve to the lateral line is the small auricular branch of the vague, often called Arnold's nerve.

The following table, slightly modified from the one drawn up by J. McMurrich, gives a fair idea of the present state of our knowledge of the nerve components of the Mammalia.

1 A tract of the brain.

For further details and literature of the nervous system see Quain's *Anatomy* (latest edition); R. Wiedenheims *Comp. Anat. of Vertebrates* (Lond. 1907); Bronn's *Classes and Ordnungen des Thierreichs*; C. S. Minot's *Human Embryology* (1897); J. McMurrich's *Development of the Human Body* (London, 1906). For the theory of nerve components see Onéra Merritt, *Journ. Anat. and Phys.*, vol. 39, p. 199. And for the anatomy and morphology of limb plexuses will be found in Miss C. W. Saberton's paper on the "Nerve Plexuses of Troglohydes Niger" *Studies in Anatomy*, University of Manchester, vol. iii. (1906), p. 165. She refers to most of the literature on the subject, but the papers of H. Braus, Jena Zeitschr. v. 31 (1898), p. 239 on fish, of M. Davidoff, *Morph. Jabr.* v. 5 (1879), p. 450 on the pelvic plexuses of fish, and of M. Fürbringer, *Gegenb. Zeitschr.* v. 3 (1897), on the spino-occipital nerves and brachial plexus of fish, are also very important.

NESFIELD, WILLIAM EDEN (1835-1888), British architect, one of the leaders of the Gothic revival in England, was born in Bath on the 2nd of April 1835. His father, Major William Andrew Nesfield, a well-known landscape gardener, laid out Regent's Park and St James's Park, and remodelled Kew. Educated at Eton, Nesfield was articled first to Mr Burn, a classicist, and then to his uncle, Anthony Salvin, who took the Gothic side in "the battle of the styles." Nesfield travelled for study in France, Italy and Greece, afterwards publishing a volume, *Sketches from France and Italy* (London, 1862), which became one of the text-books of the Gothic revival. In 1859 Nesfield settled down in London. His first important commission was to build a new wing to Combe Abbey for Lord Craven. In 1862 began a nominal partnership with Norman Shaw, the fruits of which have been exaggerated; they shared rooms in Argyle Street for some years, but never collaborated. It was in Argyle Street that the principal work of Nesfield's life was conceived—Combe Abbey, Cloversley Hall and Kinnell Park. Here he showed a mastery of planning and construction, a conscientious regard for detail, an eye for the picturesque, an unfailing regard for dignity, which make his achievements landmarks in the history of his art. He built the lodge in Regent's Park (1864) and that in Kew Gardens (1866). Combe Abbey and Cloverley are somewhat "early French" in style, but as Nesfield developed he adopted a purely English manner, and presented his newer ideas in Loughton Hall and Kimmel Park. The gate lodge at Kimmel Park, Abergale, is entirely "English Renaissance"; Cloverley Hall (1864), planned when he was twenty-nine, with its great hall, fine approaches to the staircase, and the staircase itself, is already half English, and Eastlake, in his *History of Gothic Revival*, praises it on that very ground. The full development of the revived classic taste in Nesfield came with his addition to Kimmel Park—red brick, stone dressings, grey-green slated roofs—which elevated that originally unpertinient 15th-century building into a small Renaissance palace. For contrast in style, harmonious as they are in artistic expression, Cloverley and Kimball are the typical examples of the artist's style. Other works are Farnham Royal House near Slough, Lea Wood, Loughton Hall and Westcombe Park. His more notable urban works are the bank at Saffron Walden (1873), and the Rose and Crown, Hotel; the latter was another contrast, the former being medieval and the latter what is called "Queen Anne." Though he built no new important church, Nesfield rebuilt the Early Decorated St Mary's, Farnham Royal, near Slough, mainly on the old lines. He restored King's Walden church, Herts (1868), and Radwinter church, Essex (1871), and Cord church near Whitchurch, Salop; but no great public building came from him. Nesfield's career was a comparatively short one. On the 3rd of September 1883 he married Mary Annette, eldest daughter of John Sebastian Guild and granddaughter of Joseph Guild, and he retired from practice some years before his death at Brighton on the 27th of March 1888. He left behind him a valuable series of sketches and measured drawings, most of which are now in the library of the Royal Institute of British Architects. (J. M. By.)

NESLE, the name of a place in France (dep. of Somme), which gave its name to an old feudal family. This family became extinct at the beginning of the 13th century, and the heiress brought the lordship to the family of Clermont in Beauvaisis. Simon de Clermont, seigneur de Nesle, was regent of the kingdom of France during the second crusade of St Louis. Raoul de Nesle, his grandson, was the child of the grand next gout (d. 1352) de Clermont, both marshals of France, were members of the family. The lordship of Nesle was erected into a countship for Charles de Sainte-Maure in 1497 and into a marquisate for Louis de Sainte-Maure in 1546. It was acquired in 1666 by Louis Charles de Mailly. His grandson, Louis de Mailly, had five daughters, of whom four (the countess of Mailly, the duchess of Lauragais, the countess of Vintimille, and the marquise de la Tourne, afterwards duchess of Chateauroux) were successively, or simultaneously, mistresses of Louis XV.

NESSELRODE, KARL ROBERT, Count (1780-1862), Russian diplomatist and statesman, was born on the 14th of December 1780 at Lisbon, where his father (d. 1810) was Russian ambassador. In deference to his mother's Protestantism he was baptized in the chapel of the Russian embassy, thus becoming a member of the Church of England. The Nesselrodes were of Westphalian origin, but had long been settled in Livonia. Nesselrode's German origin was emphasized by his education in a Berlin gymnasia, his father having been appointed ambassador to the Prussian court about 1787. When he was sixteen he entered the Russian navy, and his father's influence procured for him the position of naval aide-de-camp to the emperor Paul. He presently exchanged into the army, obtained a further court appointment, and entered the diplomatic service. Nesselrode was attached to the Russian embassy at Berlin, and transferred thence to the Hague. In August 1806 he received a commission to travel in South Germany to report on the French troops; he was then attached as diplomatic secretary to Generals Kamenski, Buxhoeveden and Bennigsen in succession. He was present at the battle of Eylau in January 1807, and assisted at the negotiation of the peace of Tilsit. Immediately afterwards
NESTOR

he was sent to Paris to join the embassy of Count Peter Tolstoy, whom he accompanied in the spring of the next year to the meeting of the two emperors at Erfurt. After his return to Paris he strengthened the understanding between Alexander I. and Talleyrand consequent on the Erfurt meeting, and acted as intermediary between the two. On the appointment of a successor to Count Tolstoy he retired to St Petersburg, but returned to Paris early in 1810 charged with a commission from Speranski to Talleyrand and the marquis de Caulaincourt, formerly ambassador in St Petersburg, both of whom were hostile to Napoleon's policy of aggression, and the breach of diplomatic relations with Russia in 1811, Nesselrode returned to St Petersburg by way of Vienna in order to exchange views with Metternich. He sought to persuade Alexander to open negotiations with Napoleon, if only to throw the onus of breaking the peace entirely on the French side. He joined the tsar's headquarters at Vilna in March 1812 and, though Rumiantzov was still foreign minister, it was Nesselrode who directed the foreign policy of Russia from this time forward. He was present at the battle of Leipzig, and accompanied the invading army to Paris. He remained at the capital throughout the lifetime of Mortier at Clechy, and signed the treaty of Chaumont on the 1st of March 1814. His former relations with Talleyrand facilitated negotiations in Paris, and his great influence with the emperor was used in favour of the restoration of the Bourbons, and, after Waterloo, against the imposition of a ruinous war indemnity on France. At the congress of Vienna he was associated with Count Capo d'Istria, and when, in August 1816, Alexander made him secretary of state for foreign affairs in succession to Rumiantzov, it was again in conjunction with the Greek statesman, Nesselrode, the contemporary of Talleyrand, both of whom had opposed Napoleon's policy of aggression. The emperor Alexander I., however, was apt to keep the direction of affairs in his own hands and so long as Alexander inclined to Liberalism Capo d'Istria was the interpreter of his will, but as the emperor veered towards Metternich's system Nesselrode became his mouthpiece. After Alexander's final "conversion" to reactionary principles, Capo d'Istria was dismissed (1822) and Nesselrode definitely took his place. He had consistently advocated Alexander's project of a "universal union," symbolized by the Holy Alliance, in contradistinction to the narrower system of the alliance of the great powers; and, when the Greek insurrection broke out, he did much to determine the tsar to sacrifice his sympathy with the Orthodox Greeks to his dream of the European confederation (see Alexander I., emperor of Russia).

After Alexander's death in 1825 Nesselrode retained office under Nicholas I. He was responsible for the change of policy of Russia towards the Ottoman empire after 1829, viz. that of abandoning the traditional idea of conquering Constantinople in favour of keeping the Ottoman power weak and dependent on the tsar. This was his policy during the revolt of Mehmet Ali (q.v.), and it was Nesselrode who inspired the terms of the famous treaty of Unkiar Skessi (1833). Nicholas I. was, however, even less inclined than his brother to place himself in the hands of a minister; and Nesselrode showed himself amenable, though when his views differed from those of the emperor he stated them with great frankness. He conducted the negotiations which led to the shelving of the treaty of Unkiar Skessi and to the alliance between Russia and Great Britain which, issuing ultimately in the Straits Convention of 1841—40 to which France also was a party—sealed the breach which had so long divided the powers of eastern and western Europe.

In 1849 it was Nesselrode who suggested the intervention of Russia in Hungary in favour of the Austrian government, although he restrained the tsar from active intervention in France then as in 1830. During the crisis of 1853 he prolonged negotiation in the hope of averting war. The last of his important political acts, the signing of the treaty of Paris in 1856, undid the results of his patient efforts to establish Russian preponderance in the Balkan peninsula. He then retired from the foreign office, retaining the chancellorship, which he had held since 1844. He died at St Petersburg on the 23rd of March 1862.

See Lettres et papiers du chancelier comte de Nesselrode 1760-1850, the first volume of which was issued by his grandson Count Anatole Nesselrode at Paris in 1904. This work includes letters of the chancellor's father, Count William, Nesselrode's correspondences, and important state papers. In vol. ii. is a fragment of an autobiography (to 1814), which Count Nesselrode did not live to complete. See also Correspondance diplomatique du comte Pozzo di Borgo et du comte de Nesselrode, edited by Charles Pozzo di Borgo (Paris, 2 vols., 1890—1897).

NESTOR, the place where a bird lays its eggs, hatches them out, and shelters them until they are fledged. The word is used by analogy of other animals than birds, insects, &c. It appears in much the same form in Teutonic languages; related to it are Irish nesad, and Lat. nidus, whence Fr. nid. It has been referred to the Gr. νηστος, return home, but it is now established that it represents a form nida- for nista- from nida- down; cf. "nether," and sed-, to sit. Sanskrit has nīda. The Lat. nidus has given the scientific term for nest-building, nidification (q.v.).

NESTOR, in Greek legend, son of Neleus and Chloris, king of Pylos in Messenia. When all his brothers were slain by Heracles, in consequence of the refusal of Neleus to purify him for the murder of Iphitus, Nester alone escaped, being absent at Gerenia—hence his epithet Gerenios in Homer (Apollodorus i. 9). He is the old warrior of the Iliad and the wise counsellor of the Greeks before Troy. After the fall of the city he returned to Pylos, where Telemachus visited him to obtain news of his father. In his earlier years he took part in the battle of the Centaurs and Lapithae, the Calydonian boar hunt, and the Argonautic expedition. The name is used in modern times for any old man of ripe experience, or the oldest member of a class or corporation.

NESTOR (c. 1050—1114), the reputed author of the earliest Russian chronicle, was a monk of the Pechersky cloister of Kiev from 1073. The only other fact of his life is that he was commissioned with two other monks to find the relics of St Theodore as a means of assertion of the right to rule in Russia. The chronicle begins with the deluge, as those of most chroniclers of the time did. The compiler appears to have been acquainted with the Byzantine historians; he makes use especially of John Malalas and George Hamartolus. He also had in all probability other Slavonic chronicles to compile from, which are now lost. Many legends are mixed up with Nester's Chronicle; the style is occasionally so poetical that perhaps he incorporated bilini which are now lost. The early part is rich in these stories, among which are the arrival of the three Varangian brothers, the founding of Kiev, the murder of Askold and Dir, the death of Oleg which was kept secret by Rostislav, the murder of his father. In his earlier years he took part in the battle of the Centaurs and Lapithae, the Calydonian boar hunt, and the Argonautic expedition. The name is used in modern times for any old man of ripe experience, or the oldest member of a class or corporation.

The latest theory about Nestor is that the Chronicle is a patchwork of many fragments of chronicles, and that the name of Nestor was attached to it because he wrote the greater part or perhaps because he put the fragments together. The name of a certain Sylvestre, an iugen, is affixed to several of the manuscripts as the author. The Chronicle has come down to us in several manuscripts, but unless this was in the number which sent the north of Russia, Pechora, and other places, and Jan, a man ninety years of age, who died in 1106, and was son of Vishata the voivode of Yaroslavl and grandson of Ostomir the Posadnik, for whom the Codex was written. Many of the ethnological details given by Nestor of the various races of the Slavs are of the highest value.
has had many additions made to it from previous and contemporary chronicles, such as those of Volinias and Novgorod. Soloviev, the Russian historian, remarks that Nestor is called the ‘first Russian chronicler,’ but he is the first writer who took a national point of view in his history, the others being merely local writers. The language of his work, as shown in the earliest manuscripts just mentioned, is undeniably Russian, though doubtless it is not without its homely echoes of the lives of Boris and Gleb, the martyrs, and of the life of St Theodosius, because they contradict many passages in the Chronicle. The work is of primary importance for early Russian history, and, although deprived of literary merit, is not without its amusing episodes of an Herodotean character. The reputed body of the ancient chronicler may be seen among the relics preserved in the Pechersky monastery at Kiev. See also Hegel’s Chronique dite de Nestor (Paris, 1884); Bestuzhev Riumin, On the Composition of the Russian Chronicles till the end of the 14th century (in Russian), (St. Petersburg, 1860).

W. R. M.

NESTOR, the name of a small but remarkable group of parrots peculiar to the New Zealand sub-region of which it forms part, is the Ptilocrus meridionalis of Gmelin, founded on a species described by J. Latham (Gen. Synopsis i. 264), and subsequently termed by him P. nestor, in allusion to its hoary head, but now usually known as Nestor meridionalis, the “Kaka” of the Maories and English settlers in New Zealand, in some parts of which it was very abundant, though its nesting is not frequent. Forster, who accompanied Cook in his second voyage; described it in his MSS. in 1773, naming it P. hypopolius, and found it in both the principal islands. The general colour of the head and neck is not unlike that of the ear-coverts in being purplish-brown, and the rump and abdomen a more or less deep crimson-red; but much variation is presented in the extent and tinge of the last colour, which often becomes orange and sometimes bright yellow. The kaka is about the size of a crow, but a larger species, generally resembling it, though with plumage mostly dull olive-green, the Nestor notabilis of J. Gould, was discovered in 1836 by Walter Mantell, in the higher mountain ranges of the Middle Island. This is the “Kee” of the Maories, and incurred the enmity of colonists by developing the extraordinary habit of assaulting sheep, picking holes with its powerful beak in their side, wounding the intestines, and so causing death. The bird is admittedly an eater of carrion in addition to its ordinary food, which, like that of the kaka, consists of fruits, seeds and the grubs of wood-destroying insects, the last being obtained by stripping the bark from trees infested by them. The amount of injury the kea inflicts on flock-masters has doubtless been much exaggerated, for Dr Menzies states that on one visit, “where the loss was unusually large, the proportion of sheep attacked was about one in three hundred, and that those pasturing below the elevation of 2000 ft. are seldom disturbed.

On the discovery of Norfolk Island (October 10 1774) a parrot, thought by Forster to be specifically identical with the kahā (as he wrote the name) of New Zealand—though his son (Voyage, ii. 446) remarked that it was “infinitely brighter coloured”—was found in its hitherto un trodden woods. Among the drawings of Bauer, the artist who accompanied Robert Brown and Flinders, is one of a Nestor marked “Nestoric Isl. 19 Jan. 1803,” on which Herr von Pelseln in 1860 founded his t. norfolkislandensis. Meanwhile Latham in 1835 had described, as distinct species, two specimens evidently of the genus Nestor, one said, but doubtless erroneously, to inhabit New South Wales, and the other from Norfolk Island. In 1836 Gould described an example, without any locality, in the museum of the Zoological Society, as Platychoerus productus, and in 1838 some time after he was in Australia, he found that the home of this species, which he then recognized as a Nestor, was Phillip Island, a very small adjunct of Norfolk Island, and not more than 5 m. distant from it. Whether the birds of the two islands were specifically distinct, or not we shall perhaps never know, since they are all extinct, and no specimen undoubtedly from Norfolk Island seems to have been preserved. The Phillip-Island Nestor may be distinguished from both of the New-Zealand species by its somewhat smaller size, orange throat, straw-coloured breast, and the generally lighter shade of its tints.

The position of the genus Nestor in the order Psittacae must be regarded as uncertain, but it is now usually placed in the sub-family Nestoridae of the Psittacidae (see PARROT). Further knowledge of this very interesting form may be facilitated by the following references to the Transactions and Proceedings of the New Zealand Institute, ii. 64, 65, 387; iii. 45-52, 81-90, v. 207, vi. 114, 120, ix. 340, x. 192, xi. 317; and to Sir W. Buller’s Bird-life of New Zealand (A. N. Z. J. 1893).

NESTORIANS. § 1. The Early Nestorians.—Among those who had been present at Ephesus in support of Nestorius (q.v.) was Tba., presbyter and head of the theological school of Edessa. In 435 he became bishop of Edessa and under his influence the Nestorian teaching made considerable progress. On the accusation of the orthodox he was deposed by the “Robber Synod” of Ephesus, but at Chalcedon in 451 was pardoned on condition of renouncing Nestorius and Eutyches and acknowledging the Tome of Leo. He had not, however, changed his views, and this was generally recognized. Meanwhile one of his pupils, Barsumas, had settled at Nisibis in Persian territory where he became bishop in 453 and established a Nestorian school. And when the emperor suppressed the school of Edessa ("the Athen of Syria") in 489, and expelled its members, they travelled far afield as eager and successful missionaries of the Gospel. In Persia their numbers and their zeal stimulated the old churches into vigour and led to the founding of new ones. And as they succeeded in converting the Nestorians of Western Asia, the Byzantine Church the Persian government welcomed them as a political ally, though the religious opposition of the Magi was still largely retained. In their new environment the Nestorians abandoned some of the rigour of Catholic asceticism, and at a synod held in 499 abolished clerical celibacy even for bishops and went so far as to permit repeated marriages, in striking contrast not only to orthodox custom but to the practice of Aphraates at Edessa who had advocated celibacy as a condition of baptism. The liberty here granted to bishops was enjoyed as late as the 12th century, but since then the Nestorian Church in Persia was divided into two separate Chelsea: from the diocese of Edessa to the Greek Church. That the ascetic ideal was by no means wholly extinct is evident from the Book of Governors written by Thomas, bishop of Marga, in 840 which bears witness to a Syrian monasticism founded by one Awin of Egyptian descent, who settled in Nisibis about 350, and lasting uninterruptedly until the time of Thomas, though it had long been absorbed in the great Nestorian movement that had annexed the church in Mesopotamia.

The Nestorian Church in Eastern Syria and Persia was under the jurisdiction of an archbishop (catholothos), who in 498 assumed the title of Patriarch of the East, and in 516 another called Cresiphon, a fast field and a fitting centre for the great area over which the evangelizing activity of the Nestorians now extended. The church traced its doctrines to Theodore of Mopsuestia rather than to Nestorius, whose name at first they repudiated, not regarding themselves as having been proselytized to any new teaching.

§ 2. The Later Nestorians.—In 608 Migail influence was so strong in Persia that the Christians were persecuted and the office of catholothos was vacant for 20 years, being filled again by Iau-Jabu, during whose patriarchate the Mahomedan invasion overran Persia. The patriarch was able to secure from the caliph permission for the Christians to practice their religion in return for tribute money and this was afterwards remitted. Ibn Ali Talib, anxious to perpetuate their severed from the orthodox church and the Byzantine empire, confirmed these privileges by charter and in 762 the patriarchate was removed to Bagdad. For five centuries the Nestorians were a recognized institution within the territory of Islam, though their treatment varied from kindly to harsh. Birūnī, a Mahomedan writer, who lived at Khiva c. A.D. 1000, speaks of them as comprising the bulk of the population of Syria, Irak and Khorasun, and as superior to the orthodox in intellectual ability.
NESTORIANS

They agreed with Byzantines in observing Lent, Christmas and Epiphany, but differed from them in the observance of all other feasts and fasts. The Latin church tried in vain during the Crusades to secure their adhesion to Rome. The barbaric invasions of the 13th and 14th centuries fell with crushing force on the Nestorians. In 1258-60, and eventook Baghdad, and about 1400 Timur again seized and sacked the city. Though the Nestorians were numerous, their moral influence and their church life had greatly deteriorated. Those who escaped capture by Timur fled to the mountains of Kurdistan, and the community that had played so large a part in Mesopotamian history for a thousand years was thus shattered. In 1532 they were further weakened by a large secession known as “the Chaldeans” arising out of a dispute about the succession to the patriarchate. The discontented appealed to Rome, and the pope (Julius III.) consecrated the Chaldean catholicks. The Chaldeans are now chiefly found in rural districts east of the Tigris. They have a see at Bagdad, a monastery (Rabban Hormuz) at Elkoosh, and are called by those Syrian Christians who have resisted the papal overtures, Maghlabin (“the conquered”). Other attempts during the 16th century to promote union between the Nestorians and Rome proved fruitless, but the Roman Church has never ceased in its efforts to absorb this ancient community. The history of the Jacobites or Syrian Monophysites who, like the Nestorians, diverged from the Byzantine Church, but in an exactly opposite direction, is treated in a separate section (see Jacobites, CHURCH, &c.). Like the Nestorians they were great missionaries, and up to the 7th century, and again in the 12th and 13th, produced the bulk of Syriac literature (q.v.). The chief Nestorian authors were (a) in the 7th, 8th and 9th centuries, Babbayi the elder and Isho-yabith of Gedhala, commentators; Sahdona, who wrote on the monastic life; Abraham the Lame, a devotional and penitential writer; Dionysius of Tell Mahre (see Dionysius Telmaharenesis), whose Annals are important; and Thomas (q.v.) of Marga; (b) in the 14th century, Abd-isho bar Berika (d. 1343), the author of a theological treatise Marganiya (“the Pearl”), 1346, and the Paradise of Eden, a collection of 50 theological poems.

§ 3. The Nestorian Missionary Enterprise.—The combined hostility of the orthodox church and the Byzantine empire drove the Nestorians into exile, but they went much further than was needed simply to secure immunity from persecution. They showed a zeal for evangelization which resulted in the establishment of their influence throughout Asia, as is seen from the bishops founded not only in Syria, Armenia, Arabia and Persia, but also in the East Indies. Media, Merv in Khorasan, Herat, Tabriz, Bukhara, Bokhara, Khokand, Samarkand, Bulbul, Kish, Kasis, Kandahar, Chagri, (Pekin) and Singan fu Hsien fu in China, and Kaljana and Khangareh in India. In 1265 they numbered 25 Asiatic provinces and over 70 dioceses. Mongolian invasions and Mahomedan tyranny have, of course, long since swept away all traces of many of these. The 400,000 Syrian Christians (“Christians of St Thomas,” see Thomas, 67) who live in Malabar do not owe their origin to Nestorian missionaries, the stories of the evangelization of India by the Apostles Thomas and Bartholomew having no real historical foundation, and the Indian state of the Syrian church is a matter of doctrine, not history, for the period of its history on which it is based, the early Church, was not evangelized. They were not Nestorians, in whatever part of India it may have been exercised. The theology of the Indian Syrian Christians is of a Nestorian type, and Cosmas Indicopleustes (6th century) puts us on the right track when he says that the Christians whom he found in Ceylon and Malabar had come from Persia (probably as refugees from persecution, like the Huguenots in England and the Pilgrim Fathers in America). Pahlavi inscriptions found on crosses at St Thomas’s Mount near Madras and at Kottayam in Travancore afford evidence both of the antiquity of Christianity in these places (7th or 8th century), and for the semi-patri-passionism (the apparent identification of all three persons of the Trinity in the sufferer on the cross) which marked the Nestorian teaching. In 745 Thomas of Kana brought a new

1 “In punishment by the cross (was) the suffering of this One; He who is the true Christ, and God alone, and Guide ever pure.”

band of emigrants from Bagdad and Nineveh, and possibly the name “Christians of St Thomas” arose from confusion between this man and the apostle. Other reinforcements came from Persia in 822, but the Malabar church never developed any intellectual vigour or missionary zeal. They had their own kings, lived in the favour and protection of the sultans of Malabar, in caste regulations of food and avoidance of pollution. In 1330 Pope John XXII. issued a bull appointing Jordanus, a French Dominican, bishop of Quilon, and inviting the Nestorians to enter “the Christian Church.” The invitation was declined, but in the 16th century the Syrian Christians sought the help of the Portuguese settlers against Musulman oppression, only to find that before long they were subjected to the fiercer perils of Jesuit antagonism and the Inquisition. The Syriacs submitted to Rome at the synod of Dampier in 1599, but it was a forced submission, and in 1632 when the Portuguese arrested the new bishop just sent out by the catholics of Babylon, the rebellion broke out. The renunciation was not quite thorough, one party adhering to the Roman Church as Romo-Syrians, the others reverting wholly to Syrian usages and forming 10-day about three-fourths of the whole community. In 1665 a curious thing happened. Gregory, the Jacobite metropolitan of Jerusalem, visited Malabar, and, as the people had no consecrated bishop at the time, he consecrated Mar Thomas, who had been filling the office at the people’s request, and remained in the country jointly ordering with the Roman Church, which he had been converted to. Thus the Nestorian Church in India, voluntarily and with perfect indifference to theological dogmas, passed under Jacobite rule, and when early in the 18th century, Mar Gabriel, a Nestorian bishop, came to Malabar, he had a cool reception, and could only detach a small following of Syrians whom he brought back to the old Nestorianism. The approaches of the Anglican Church through the Church Missionary Society in the first part of the 19th century were politely repelled. On the death of the bishop Mar Athanasius Matthew in 1871, litigation began as to his successor, but lastly the occupation of the Church by Thomas, who came from Judea in 636. For two generations the little cause prospered, and again after persecutions in 699 and 813. Later on a second mission arrived, many churches were built and several emperors patronized the faith. This evidence is confirmed by (a) the canon of Theodore of Edessa (800) allowing metropolitans of China, India and other distant lands to send their reports to the catholicks every six years; (b) the edict of Wu Tsang destroying Buddhist monasteries and ordering 300 foreign priests to return to the secular life that the customs of the church were not to be spoken of; (c) the decree of the Chinese, one of whom, Ibn Wahhab, discussed the contents of the Bible with the emperor; (d) the discovery in 1725 of a Syrian MS. containing hymns and a portion of the Old Testament.

In the 10th century the Nestorians introduced Christianity into Tartary proper; in 1274 Marco Polo saw two of their churches. The legend of Prester John is based on the idea of the conversion of a Mongol tribe, the Karith, whose chieftain Uung Khan at baptism received the title Malek Juchana (King John). And there has lately come to light a MS. of the 9th or 10th century in Sogdianese, an Indo-Iranian language spoken in the north-east of Asia, which shows that the Nestorians had translated the New Testament into that tongue and had taught the natives the alphabet and the doctrine. Their activity may well be said to have covered the continent. Their campaign was one of deliberate conquest, one of the greatest ever planned by
Christian missionaries. Marco Polo is witness that there were Nestorian churches all along the trade routes from Bagdad to Pekin. (A. J. G.)

§ 4. The Modern Nestorians.—The Nestorians or East Syrians (Suryoyi) of Turkey and Persia now inhabit a district bounded by Lake Urmia, or Urumbia, on the east, stretching westwards into Kurdistan, to Mosul on the south, and nearly as far as Van on the north. They are divided into the Persian Nestorians of the plain of Azerbaijan, and the Turkish Nestorians, inhabiting chiefly the sanjak of Hakkari in the vilayet of Van, who are subdivided into the Euchearist, or Assyrian, and the Syrian or Persian. The latter being semi-independent in their mountain fastnesses. Forming at once a church and a nation, they now hold allegiance to their hereditary patriarch, Mar Shimun, Catholicos of the East, who resides at Qudshias, a village about 7000 ft. above the sea-level, near the Kurdish town of Julamerk. It is only of late years, under the influence of the different missions, that education, ruined by centuries of persecution, has revived amongst the Nestorians; and even now the mountainers, cut off from the outer world, are as a rule destitute of learning, and greatly resemble the Jews of the Persia of the time of Alexander the Great. They are, however, extraordinarily tenacious of their ancient customs, and, almost totally isolated from the rest of Christendom since the 5th century, they afford an interesting study to the ecclesiastical student. Their churches are rude buildings, dimly lighted and destitute of pictures or images, save that of the Cross, which is treated with the deepest veneration. The qankh, or sanctuary, is divided from the nave, by a solid wall, pierced by a single doorway; it contains the altar, or madhib kha (literary, the sacrificing place), and may be entered only by persons in holy orders who are fasting. Here is celebrated the Eucharist (Qurbana, or the offering; cf. “Corban”), by the priest (gasha), attended by his deacon (shamashka). Vestments are only worn at the ministration of the sacraments; incense is used invariably at the Eucharist and at other ceremonies. There are three liturgies—of the Holy Apostles, of Theodore and of Nestorius. The first is quite free from Nestorian influence, dates from some remote period, perhaps prior to 431, and is certainly the most ancient of those now in use in Christendom; the other two, though early, are undoubtedly of later date. The Nestorian canon of Scripture seems never to have been fully determined, the wildest and most fantastic mental system rigidly defined. Nestorian writers, however, generally reckon the mysteries as seven, i.e. Priesthood, Oyl of Unction, the offering of the Body and Blood of Christ, Absolution, The Holy Vealens, the Signation of the life-giving Cross. The “Holy Vealens” is regarded as the original blessing of the first Eucharist, brought by Addai and Mari and maintained ever since in the Church; it is used in the consecration of the Eucharistic wafers, which are rather thicker than those used in the Western Church. Communion is given in both kinds, as throughout the East; likewise, confirmation is administered directly after baptism. The sacramental confession is enjoined, but has recently become obsolete; prayers for the departed and invocation of saints form part of the service. The bishops are always celibates and are chosen from episcopal families. The service-books were wholly in MS., until the press of the archbishop of Canterbury’s mission at Urmia issued the Tekhtha (containing the liturgies, baptismal office, &c.) and several other liturgical texts.

The Nestorians commemorate Nestorius as a saint, and invoke his aid and that of his companions. They reject the Third Ecumenical Council, and though showing the greatest devotion to the Blessed Virgin, deny her the title of Theotokos, i.e. the mother or bearer of God. Their theological teaching is mystic and perplexing; their earliest writings contain no error, and the hymns of their great St Ephrem, still sung in their services, are positively antagonistic to “Nestorianism”; their theology dating from the schism is not so satisfactory. They attribute two Kian, two Qumni and one Parsa in

\[1\] The legendary founders of the Syrian Church. Addai was supposed to be one of the Seventy of Luke x. 1, and Mari his disciple.

Christ to (see J. F. Bethune-Baker's Nestorius and his Teaching). To say that the modern Nestorians are not definitely and firmly orthodox is perhaps fairer than to charge them with being distinctly heretical.

§ 5. Missions amongst the Nestorians.—The peculiar circumstances, both ecclesiastical and temporal, of the Nestorians have attracted much attention in western Christendom, and various missionary enterprises amongst them have resulted.

1. The Monastery of Bethunia, or Hor Monastery, at Bitlis, is the monastery of the Catholicos of the Oriental Church, who holds the title of Catholicos of all the Orient (see under Chaldeans). It is the seat of the metropolitans of the Nestorian Church, and is situated on a height, 1750 ft. above the sea-level, near the Kur river, about 3 miles from the town of Bitlis.

2. The Eastern Missionary Society, established in 1834-1835 by the Rev. Richard D. Brown, and supported by the Church of England, has been in operation ever since. The object of the society is to advance the knowledge of the Nestorians, and from its foundation has spent in the work of instruction and charity more than $125,000. The society has two classes of missionaries: the first, the educational, constitutes a society in itself. It seeks the foundation of schools and the training of Nestorian clergy, and is under the care of the Rev. Richard D. Brown, D.D. The second, the medical, consists of English medical men, whose residence is in the town of Bitlis. The society has a station in London, and is supported by the Society for the Propagation of the Gospel, the Royal Asiatic Society, the Asiatic Society, and private subscribers. The society has been very successful, and has already founded a college at Bethunia, and a seminary at Bitlis.

3. The Nestorians are a separate and distinct Church, divided into two provinces, the upper and lower. The upper province is divided into two sub-provinces, the upper and lower, and is governed by a Catholicos, who is also the head of the Church of the East. The lower province is divided into two sub-provinces, the upper and lower, and is governed by a Catholicos, who is also the head of the Church of the East.

4. The Nestorians are a separate and distinct Church, divided into two provinces, the upper and lower. The upper province is divided into two sub-provinces, the upper and lower, and is governed by a Catholicos, who is also the head of the Church of the East. The lower province is divided into two sub-provinces, the upper and lower, and is governed by a Catholicos, who is also the head of the Church of the East.

5. The Nestorians are a separate and distinct Church, divided into two provinces, the upper and lower. The upper province is divided into two sub-provinces, the upper and lower, and is governed by a Catholicos, who is also the head of the Church of the East. The lower province is divided into two sub-provinces, the upper and lower, and is governed by a Catholicos, who is also the head of the Church of the East.
said to have been his first patriarchal sermon, Nestorius exorted the emperor in the famous words—"Purge me, O Caesar, the earth of heretics, and I in return will give thee heaven. Stand by me in putting down the heretics and I will stand by thee in putting down the Persians." In the spirit of this utterance, steps were taken within a few days by the new prelate to suppress the assemblies of the Arians; these, by a bold stroke of policy, anticipated his action by themselves setting fire to their meeting-house. Nestorius being with him nicknamed "the incendiary." The Novatians and the Quarto-decimans were the next objects of his authority. In his legal views, the decisions of the councils were not infrequently nullified by the decisions of the emperor; and in his teaching, Dorylaeum, which was attributed to Jesus. In the school of Antioch the importunity of the expression had long before been pointed out, by Theodore of Mopsuestia, among others, in terms precisely similar to those afterwards attributed to Nestorius. From Antioch Nestorius had brought along with him to Constantinople a co-presbyter named Anastasius, who enjoyed his confidence and is called by Theophanes his "syneculus." This Anastasius, in a pulpit oration which the patriarch himself is said to have prepared for him, caused great scandal to the partisans of the Marian cultus then beginning by saying, "Let no one call Mary the mother of God, for Mary was a human being; and that God should be born of a human being is impossible." The opposition, which was led by one Eusebius, a "scholasticus" or pleader who afterwards became bishop of Dorylaeum, chose to construe this utterance as a denial of the divinity of Christ, and the sentence which it became to pronounce it necessary to silence the remonstrants by force. The situation went from bad to worse, and the dispute not only grew in intensity but reached the outer world. Matters were soon ripe for foreign intervention, and the new situation in Constantinople and the antagonism between the Alexandrian and Antiochene schools of theology, as well as the jealousy between the patriarchate of St Mark and that of Constantinople, found a determined and unscrupulous exponent, did not fail to make use of the opportunity. He stirred up his own clergy, he wrote to encourage the dissidents at Constantinople, he addressed himself to the sister and wife of the emperor (Theodosius himself being known to be still favour- able to Nestorius), and he begged the clergy of his own diocese to find bribes for the officials of the court. He also sent to Rome a careful selection of Nestorius's sayings and sermons. Nestorius himself, on the other hand, having occasion to write to Pope Celestine I. about the Pelagians (whom he was not inclined to regard as heretical), gave from his own point of view an account of the disputes which had recently arisen within his patriarchate. While ordinarily Rome might have been expected to hold the balance between the contrasted schools of thought, as Leo was able later to do, it is not surprising that this implied appeal proved unsuccessful, for Celestine naturally resented any questioning of the Roman decision concerning the Pelagians and was jealous of the growing power of Alexandria, in whom the Romish Church of the East. He was not slow to use the opportunity of gaining what was at once an official triumph and a personal satisfaction. In a synod which met in 430, he decided in favour of the epithet Ἐστάρκος, and had Nestorius retract his erroneous teaching, on pain of instant excommunication, at the same time entrusting the execution of this decision to the patriarch of Alexandria. On hearing from Rome, Cyril at once held a synod and drew up a doctrinal formula for Nestorius to sign, and also twelve anathemas covering the various points of the Nestorian dogmatism. Nestorius, instead of yielding to the combined pressure of his two great rivals, merely replied by a counter excommunication. In this situation of affairs the demand for a general council became irresistible, and accordingly Theodosius and Valentinian II. addressed letters to the metropolitans of the church to meet at Ephesus at Whitsuntide 431, each bringing with him someable suffragans. Nestorius, with sixteen bishops and a large following of armed men, was among the first to arrive; soon afterwards came Cyril with fifty bishops. Juvenal of Jerusalem and Flavian of Thessalonica were some days late. It was then announced that John of Antioch had been delayed on his journey and could not appear for some days; he, however, is stated to have written politely requesting that the opening of the synod should not be delayed on his account. Cyril and his friends accordingly assembled in the church of the Theotokos in Chalcedon, and at last yielding to the sense of the enormous majority, he gave a decision in favour of the "orthodox," and the council of Ephesus was dissolved. Maximian, one of the Constantinopolitan clergy, a native of Rome, was promoted to the vacant see, and Nestorius was henceforward represented in the city of his former patriarchate only by one small congregation, which also a short time afterwards became extinct. The commotion which had been thus raised did not so easily subside in the more eastern section of the church; the Antiochenes continued to maintain for a considerable time an attitude.
of antagonism towards Cyril and his creed, and were not pacified until an understanding was reached in 433 on the basis of a new formula involving some material concessions by him. The union even then met with resistance from a number of bishops, who rather than accede to it, submitted to deposition and expulsion from their sees; and it was not until these had all died out that, as the result of stringent imperial edicts, Nestorianism may be said to have become extinct throughout the Roman empire. The Nestorians themselves, however, continued to exist in private life in their old monastries of Euprepios, Antioch, until 435, when the emperor ordered his banishment to Petra in Arabia. A second decree, it would seem, sent him to Oasiss, probably the city of the Great Oasis, in Upper Egypt, where he was still living in 459, at the time when Socrates wrote his Church History. He was taken prisoner by the Blemmyes, a nomad tribe that gave much trouble to the empire in Africa, and when they set him free in the Thebaid near Panopolis (Akhmim) c. 450, they exposed him to further persecution from Shenute the great hero of the Egyptian monks. There is some evidence that he was summoned to the Council of Chalcedon, though he could not attend it, and the concluding portion of his book known as The Bassaor of Heracleides not only gives a full account of the “Rober Synod” of Ephesus 449, but knows that Theodosius is dead (July 450) and seems aware of the proceedings of Chalcedon and the flight of Dioscurus the unscrupulous successor of Cyril at Alexandria. Nestorius was already old and ailing and must have died very soon after.

The Nestorian Heresy.—What is technically and accurately meant in dogmatic theology by “the Nestorian heresy” must now be noticed. As Eutychianism is the doctrine that the God-man has only one nature, so Nestorianism is the doctrine that He has two concurrent natures. For this reason many of the Nestorians have been called Eutychian. This accords quite well with the modern theory that in the two hypostases or natures approaches Eutychianism. It must be remembered that Nestorius was as orthodox at all events as a Christian. Even the definition of Arianism and Apollinarism, and was perfectly correct in his assertion that the Godhead can neither be born nor suffer; all that he can allege against him is that “the fear of the communicatio idiomatum, instead of the communicatio substantiarum, that was raised by Nestorius was not one as to the communicatio idiomatum, but simply as to the proprieties of language. I cannot speak of God,” he said, “as being two or three months old,” a remark which was much cited by the Aviarmenians.” He did not mean that Mary was the mother of Christ, but that he thought it improper to speak of her as the mother of God, and Leo in the Letter to Flavian which was endorsed at Chalcedon uses the term “Mother of the Lord” which was exactly what Nestorius wished. And there is at least this to be said for him that even the most zealous desire to frustrate the Arian had never made it a part of orthodoxy to speak of David as thebêthvew or of James as thebêthivon. The secret of the enthusiasm of the masses for the analogical expression Theokotos is to be sought not so much in the Nicene doctrine of the incarnation as in the recent growth of the cult of the Virgin, rather than to the theology of the Virgin, which were entirely unheard of (except in heretical circles) for nearly three centuries of the Christian era. That the Virgin should be given a title that was quasi-divine mattered little. The danger was that under cover of such a title an unhistorical conception of the facts of the Gospel should grow up, and a false doctrine of the relations between the human and the Divine be encouraged, as the doctrine of a human soul in Christ was destined to be. Hence, even though they happened to be against me personally,” His aim, he tells us, had been to maintain the distinct continuance of the two persons, not only in Christ, but in the whole of creation. “In the Person the nature’s use their properties mutually. The manhood is the person of the Godhead and the Godhead is the person of the manhood.” The ultimate union of these two natures, he said, is not a fusion of soul and body, but rather will and mind in the union of the natures, so that both should will or not will exactly the same things. The natures have, moreover, a

3 Syriac, išgērāt, lit. “merchandise.” The Greek word may have been iστρόφων. Nothing is certainly known of any such Heracledes.
mutual will, since the person of this is the person of that, and the person of that the person of this." The manner in which this union is realized is thus stated by Nestorius: "The Word also passed, through Blessed Mary inasmuch as He did not receive a beginning by birth from her, as is the case with the body which was born of her. For this reason I said that God the Word passed and was not born. For He did not receive a beginning from her. But the two natures being united are one Christ. And He who was born of the Father as to the Divinity, and from the Holy Virgin as to the humanity is and is styled one; for of the two natures there was a union." It may truly be said that the ideas for which Nestorius and the Antiochene school strove "won the day as regards the doctrinal definitions of the church. The manhood of Christ was safeguarded, as distinct from the Godhead: the union was left an mystery.

NESZLER, VICTOR (1841-1890), German musical composer, was born on the 28th of January 1841 at Baldenheim, near Schletstadt. At Strassburg he began his university career with the study of theology, but he concluded it with the production of a light opera entitled Fleurette (1864). To complete his knowledge of composition he went to study under Humann, his opera Der Trompeter von Säckingen, based on Scheffel's poem, was composed and performed in 1884. Besides a number of other operas, Neszler wrote many songs and choral works; but it is with the Trompeter von Säckingen that his name is associated. He died at Strassburg on the 28th of May 1890.

In 1895 a monument to him by Marzolf was erected there.

NET, a fabric of thread, cord, or wire, the intersections of which are knotted so as to form a mesh. The art of netting is most widely related to weaving, knitting, plaiting, and lace-making, from all of which, however, it is distinguished by the knotting of the intersections of the cord. It is one of the most ancient and universal of arts, having been practised among the most primitive tribes, to whom the net is of great importance in hunting and fishing.

Net-making, as a modern industry, is principally concerned with the manufacture of the numerous forms of net used in fisheries, but netting is also largely employed for many other purposes, as for catching birds, for the temporary division of fields and gardens, for screening a variety of other furniture purposes, for ladies' hair, bags, appliances used in various games, &c. Since the early part of the 19th century numerous machines have been invented for netting, and several of these have attained commercial success. Fishing nets were formerly made principally from hemp fibre—technically called "twine"; but since the adaptation of machinery to net-making cotton has been increasingly used, such nets being more flexible and lighter, and more easily handled and stowed.

The forms of fishing nets vary according to the manner in which they are intended to act. This is either by entangling the fish in their complicated folds, as in the trammel; receiving them into pockets, as in the trawl; suspending them by the body in the meshes, as in the mackerel-net; imprisoning them within their labyrinth-like chambers, as in the stake-net; or drawing them to shore, as in the seine. The parts of a net are the head or upper margin, along which the cords are strung upon a rope called the head-ropé; the foot is the opposite or lower margin, which carries the foot-ropé, on which in many cases leaden plummetts are made fast. The meshes are the squares composing the net, the length of a net is measured in chains, e.g. a day-net is three fathoms long and one over or wide. The lever is the first row of a net. There are also accurrs, false meshes or quarterings, which are loops inserted in any given row, by which the number of meshes is increased. To breathe a net is to make a net. Dead netting is a piece without either accrues or stole (stolen) meshes, which last means that a mesh is taken away by netting into two meshes of the preceding row at once.

Hand-Netting.—The tools used in hand-netting are the needle, an instrument for holding and netting the material; it is made with an eye E, a tongue T, and a fork F (fig. 1). The twine is wound on it by being passed alternately between the fork and round the tongue, so that the turns of the string lie parallel to the length of the needle, and are kept by the tongue and fork. A spool or mesh-pin is a piece of round or flat wood on which the loops are formed, the perimeter of the spool determining the size of the loops. Each loop contains two sides of the square mesh; therefore, supposing that it be required to make a mesh 1 in. square—that is, measuring 1 in. from knot to knot, an spool 2 in. in circumference must be used. Large meshes may be made, but two or more rounds turn the spool, as occasion may require; or the spool may be made flat, and of a sufficient width. The method of making the hand-knot in nets known as the fisherman's knot is more easily acquired by example than described in writing. Fig. 2 shows the course of the twine in forming a single knot. From the last moved knot the twine passes over the front of the mesh-pin B, and is caught behind by the little finger of the left hand, forming the loop 4, thence it passes to the front and is caught at d by the left thumb, then through the loops and as in fig. 3, where a pin is released by the thumb and the knot is drawn "taut" or tight. Fig. 3 is a bend knot used for uniting two ends of a net.

Machine-Netting.—In 1778 a netting-machine was patented by William Horten, William Ross, Thomas Davies and John Golby. In 1802 the French government offered a prize of 10,000 francs to the person who should invent an automatic machine for net-making. Jacquard submitted a model of a machine which was brought under the notice of Napoleon I. and Carnot, and he was summoned to Paris by the emperor who asked—"Are you the man who pretends to do what God Almighty cannot—tie a knot in a stretched string?" Jacquard's model, which is incomplete, was deposited in the Conservatoire des Arts et Métiers; it was awarded a prize of 1000 francs for an appointment in the Conservatoire, where he perfected his famous attachment to the com- mon loom. In the Kingdom of the Netherlands, the first to succeed in inventing an efficient machine and in establishing the industry of machine net-making was James Paterson of Musselburgh. Paterson, originally a cooper, served the army during the Peninsular War, and was discharged after the battle of Waterloo. He established a net factory in Musselburgh about 1820; but the early form of machine was imperfect, the knots it formed slipped readily, and, there being much prejudice against machine nets, the demand was small. Walter Ritchie, native of Musselburgh, devised a method for forming the ordinary hand-knot on the machine nets, and the machine, patented in July 1835, became the foundation of an extensive and flourishing industry. The Paterson machine is very complex. It consists of an arrangement of hooks, needles and sinkers, one of each being required for every mesh in the breadth being made. The needles hold the meshes, while the hooks, by the means of each and twist it into a loop. Through the series of loops so formed a steel wire is shot, carrying with it twine for the next range of loops. This twine the sinkers successfully catch and depress sufficiently to form the two sides and loop of the next mesh to be formed. The knot formed by threading the loops is now tightened up, the last formed mesh is freed from the sinkers and transferred to the hooks, and the process of threading the loops is repeated.

Another form of net-loom, working on a principle distinct from that of Paterson, was invented and patented in France by Onésiphore Pecqueur in 1840, and again in France and in the United Kingdom in 1849. This machine was improved by many subsequent

1 This is a common Teut. word, of which the origin is unknown; it is not to be connected with "knit" or "knot." The term "net," i.e. remaining after all deductions, charges, &c., have been made, as in "net profit," is a variant of "neat," tidy, clean, Lat. nitidus, shining.
The geographical features of the countries formerly known collectively as the Netherlands or Low Countries are dealt with under the modern English names of HOLLAND and BELGIUM. Here we are concerned only with their earlier history, which is put for convenience under this heading in order to separate the account of the period when they formed practically a single area for historical purposes from that of the time when Holland and Belgium became distinct administrative units.

The sources of our knowledge of the country down to the 5th century are Caesar’s De Bello Gallico, the history of Velleius Paterculus, ii. 105, the works of Tacitus, the Historia Francorum (i.iii) of Gregory of Tours, the Frédegar’s Chronica (for the last two of which see D. Bouquet’s Recueil des historiens des Gaules et de la France, 1738-1870). The Netherlands first became known to the Romans through the campaigns of Julius Caesar. He found the country peopled partly by tribes of Gallo-Celtic, partly by tribes of Germanic stock, the river Rhine forming roughly the line of demarcation between the races. Several of the tribes along the borderland, however, were undoubtedly of mixed blood. The Gallo-Celtic tribes bore the general appellation of Belgae, and among these the Nervii, inhabiting the district between the Scheldt and the Sambre were at the date of Caesar’s invasion, 57 B.C., the most warlike and important. To the north of the Meuse, and more especially in the low-lying ground enclosed between the Waal and the Rhine (insula Batavorum) lived the Batavi, a clan of the great Germanic tribe, the Chatti. Beyond these were found the Frisians (q.v.), a people of German origin, who gave their name to the territory between the Rhine and the Ems. Of the other tribes the best known are the Caninefates, Chauci, Usipetes, Scambri, Eburones, Menapii, Morini and Aduatuci.

Julius Caesar, after a severe struggle with the Nervii and their confederates, was successful in bringing the Belgic tribes into submission to Rome. Under Augustus, 15 B.C., the conquered territory was formed into an imperial province, Gallia Belgica, and the frontier line, the Rhine, was strongly held by a series of fortified camps.

With regard to the region north of the Rhine we first obtain information from the accounts of the campaigns of Nero, Claudius, Drusus and Tiberius. The Batavians were first brought under Roman rule in the governorship of Drusus, a.d. 13. They were not incorporated in the empire, but were ranked as allies, socii or auxilia. Their land became a recruiting ground for the Roman armies, and a base for expeditions across the Rhine. The Batavians served with fidelity and distinction in all parts of the empire, and from the days of Augustus onwards formed a considerable part of the Praetorian guard. The Frisians struggled against Roman over-lordship somewhat longer, and it was not until a.d. 47 that they finally submitted to the victorious arms of Domitius Corbulo. The Frisian auxiliaries were likewise regarded as excellent troops.

In the confusion of the disputed succession to the imperial throne after the death of Nero, the Batavians (a.d. 60-70) under the influence of a great leader, known only by his Roman name, Claudius Civilis, rose in revolt. Civilis had seen much service in the Roman armies, and was a man of statesmanlike ability. In revenge for his own imprisonment, and the death of his brother by order of Nero, he took advantage of the disorder in the empire not only in the province but in the fellow-countrymen of his independence, but to persuade a large number of German and Belgic tribes to join forces with them. A narrative of the revolt is given in detail by Tacitus. At first success attended Civilis and the Romans were driven out of the greater part of the Belgic province. Even the great fortress of Castra Vetera (Xanten) was starved into submission and the garrison massacred. But dissensions arose between the German and Celtic elements of Civilis’s following. The Romans, under an able general, Cerialis, took advantage of this, and Civilis, beaten in fight, retired to the island of the Batavians. But both sides were exhausted, and it was arranged that Cerialis and Civilis should meet on a broken bridge over the Nabelia (Yssel) to discuss terms of peace. At this point the narrative of Tacitus breaks off, but it would appear that easy conditions were offered, for the Batavians returned to their position of socii, and were henceforth faithful in their steady allegiance to Rome. The insula Batavorum, lined with forts, became for a long period the bulwark of the empire against the inroads of the Germans from the north.

Of this period scarcely any record remains, but when at the end of the 3rd century the Franks (q.v.) began to swarm over the Rhineland into the Roman lands the name of the old tribes had disappeared. The peoples within the frontier had been transformed into Romanized provincials; outside, the various tribes had become merged in the common appellation of Frisians. The branch of the Franks—\(\text{The Franks.}\) who were a confederacy, not a people—which gradually over spread Gallia Belgica, bore the name of the Salian Franks. Nominaly they were taken under the protection of the empire, in reality they were its masters and defenders. In the days of their great king Hodwig or Clovis (451-511) they were in possession of the whole of the southern and central Netherlands. The strip of coast from the mouth of the Scheldt to that of the Ems remained, however, in the hands of the free Frisians (q.v.), in alliance with whom against the Franks were the Saxons (q.v.), who, pressing forward from the east, had occupied a portion of the districts known later as Gelderland, Overysel and Drente. Saxo

Saxon was at this period the common title of all the north German tribes; there was but little difference between Frisians and Saxons either in race or language, and they were closely united for some four centuries in common resistance to the encroachments of the Frankish tribes. The conversion of Clovis and his rude followers to Christianity tended gradually to civilize the Franks, and to facilitate the fusion which soon took place between them and the Gallo-Roman population. It tended also to accentuate the enmity to the Franks of the heathen Frisians and Saxons. In the south (of the Netherlands) Christianity was spread by the labours of devoted missionaries, foremost amongst whom were St Amandus, St Bavon and St Eligius, and bishoprics were set up at Cambrai, Tournai, Arras, Thérouanne and Liége. In the north progress was much slower, and...
though a church was erected at Utrecht by Dagobert I. about A.D. 630, it was destroyed by the Frisians, who remained obstinately heathen. The first successful attempt to convert them was made, under the powerful protection of Pippin of Heristal, by Wilhtboord, a Northumbrian monk, who became, A.D. 695, the first bishop of Utrecht (see Utrech). His labours were continued with even more striking results by another Englishman, Winfrid, better known as St Boniface, the Apostle of the Germans. Winfrid's missionary labours were the prelude of a new, widespread movement of religious influence which, for the next three centuries, was to affect the whole of the subsequent history of the Low Countries. It was a part of this mighty movement that led to the conversion of the Frisians. The conversion of the Frisians was a part of the same movement that led to the conversion of the Frisians. The complete conversion, however, in the end due rather to the arms of the Carolingian kings than to the unaided efforts of the missionaries. Towards the end of the century, Charlemagne, himself a Netherlander by descent and ancestral possessions, after a severe struggle, thoroughly subdued the Frisians and Saxons, and compelled them to embrace Christianity.

In the triple partition of the Carolingian empire at Verdun in 843, the central portion was assigned to the emperor Lothaire, separating the kingdoms of East Francia (the later Germany) from West Francia (the later France). This middle kingdom formed a long strip stretching across Europe from the North Sea to Naples, and embraced the whole of the later Netherlands with the exception of the portion on the left bank of the Scheldt, which river was made the boundary of West Francia. On the death of the emperor, his son Lothaire II. received the northern part of his father's domain, known as Lothari or Hlutharil Regnum, corrupted later into Lotharingia or Lorraine. Lothaire had no heir, and in 870 by the treaty of Meersen his territory was divided between the kings of East and West Francia. In 875 the duchy of East Francia acquired the whole; from 912 to 924 it formed part of West Francia. Finally in 924 Lorraine passed in the reign of Henry the Fowler under German (East Frankish) overlordship. Henry's son, Otto the Great, owing to the disordered state of the country, placed it in 953 in the hands of his able brother, Bruno, archbishop of Cologne, for pacification. Bruno, who kept for himself the title of archduke, divided the territory into the two duchies of Upper and Lower Lorraine. Godfrey of Verdun was invested by him with the government of Lower Lorraine (Nieder-Löthringen). The history of the Netherlands from this time forward—with the exception of Flanders, which continued to be a fief of the French kings—is the history of the various feudal states into which the duchy of Lower Lorraine was gradually broken up.

It is a melancholy history, telling of the invasion of the Northmen, and of the dynastic struggles between the petty feudal sovereigns who carved out counties and lordships for themselves during the dark centuries which followed the fall of the Carolingian empire. It was a time of oppression too, for many of the people, in the agitation, during which the country remained chiefly swamp and tangled woodland, with little communication save up and down the rivers and along the old Roman roads. Its remoteness from the control of the authority of the German and French kings, together with its inaccessibility, gave special facilities in Lower Lorraine to the growth of a number of practically independent feudal states forming a group or system apart. Chief among these states were the duchy of Brabant, the counties of Flanders, Hainault, Holland, Gelderland, Limburg and Luxembourg, and the bishoprics of Utrecht and Liége. For their separate local histories and their dynasties and political relations with one another and with neighbouring countries, reference must be made to the separate articles Flanders, Holland, Brabant, Gelderland, Limburg, Luxembourg, Utrecht, Liége.

During the 9th and 10th centuries the Netherlands suffered cruelly from the attacks of the Northmen, who ravaged the shores and at times penetrated far inland. In 834 Utrecht and Dorestad were sacked, and a few years later, Utrecht and Friesland was in their hands. Year after year the raiders went on under a succession of leaders—Herald, Roruk, Rolf, Godfrey—and far and wide there was pillaging, burning, murder and slavery. In 873 Rolf seized Walcheren, and became the scourge of the surrounding districts. In 880 the invaders took Nijmegen, erected a permanent camp at Elsloo and pushed on to the Rhine. Liége, Aix-la-Chapelle, Cologne and Bonn fell into their hands. The emperor, Charles the Fat, was roused to collect a large army, with which he surrounded the main body of the Northmen under their leader Godfrey in the camp at Elsloo. But Charles pre- ferred to pay the tribute demanded by the Northmen. Godfrey received a large sum of money, was confirmed in the possession of Friesland, and on being converted to Christianity in 882, received in marriage Gisela, daughter of Lothaire II. Three years later, however, Godfrey was murdered, and although the raids of the Northmen did not entirely cease for upwards of another century, no further attempt was made to establish a permanent dynasty in the land.

At the close of the 11th century the system of feudal states had been firmly established in the Netherlands under stable dynasties—hereditary or episcopal, and, despite the continual wars between them, civilization had begun to develop, orderly government to be carried on, and the general condition of the people to be less hopeless and miserable. It was at this time that the voice of Peter the Hermit roused the whole of western Europe to enthusiasm by his preaching of the first crusade. Nowhere was the call responded to with greater zeal than in the Netherlands, and nowhere had the spirit of adventure and the stimulus to enterprise, which was one of the chief fruits of the crusades, more permanent effects for good. The foremost heroes of the first crusade were Netherlands. Godfrey of Bouillon, the leader of the expedition and the first king of Jerusalem, was duke of Lower Lorraine, and the names of his brothers Baldwin of Edessa and Eustace of Boulogne, and of Count Robert II. of Flanders are only less famous. The third crusade numbered among its chiefs Floris III. of Holland, Philip of Flanders, Otto I. of Gelderland and Henry I. of Brabant. The so-called Latin crusade of 1203 placed the imperial crown of Constantinople on the head of Baldwin of Flanders. At the siege and capture of Damietta (1218) it was the contingent of North-Netherlanders (Hollanders and Frisians under Count William I. of Holland) who bore the brunt of the fighting and specially distinguished themselves. To the Netherlands, as to the rest of western Europe, the result of the crusades was in the main advantageous. They broke down the intense narrowness of the life of those feudal times, enlarged men's conceptions and introduced new ideas into their minds. They first brought the products and arts of the Orient into western Europe; and in the Netherlands, by the impulse that they gave to commerce, they were one of the primary causes of the rise of the chartered towns. Little is known about the Netherlands towns before the 12th century. In the course of that period. No place was reckoned to be a town unless it had received a charter from its sovereign or its local lord. The charters were of the nature of a treaty between the city and its feudal lord, and they differed much in character according to the importance of the place and the pressure it was able to put upon its sovereign. The extent of the rights which the charter conceded determined whether the town was a free town (wille staed—ville franca) or a commune (gemeente—communa). In the case of a commune the concessions included generally the right of inheritance, justice, taxation, use of wood, war &c. The town's representative, entitled "justiciary" (schout) of "bailiff" (boljav), presided over the administration of justice and took the command of the town levies in war. The commune—consisting only of those bound by the communal oath for mutual help and defence—elected their own magistrates. These electors were often a small proportion of the whole body of inhabitants: sometimes a few influential families alone had the right, and it became hereditary. This governing oligarchy was known as the patricians. The magistrates bore the name of schabint (schappen) or "schepenen).
citizens to assist them a body of sworn councillors (geworrenen or juüts), whose presidents, styled "burgomasters," had the supervision of the communal finances. Thus grew up a number of municipalities—practically self-governing republics—semi-independent feudatories in the feudal state.

The most powerful and flourishing of all were those of Flanders—Ghent, Bruges and Ypres. In the 13th century these towns had become the seat of large industrial populations (varying according to different estimates from 100,000 to 200,000 inhabitants), employed upon the weaving of cloth with its dependent industries, and closely bound up by trade interests with England, from whence they obtained the wool for their looms. Bruges, at that time connected by the sea with the river Zwijn and with Sluis as its port, was the central mart and exchange of the world's commerce. In these Flemish cities the early oligarchic form of municipal government speedily gave way to a democratic. The great mass of the townsmen organized in trade guilds—weepers, fullers, dyers, smiths, leather-workers, brewers, butchers, bakers and others, of which by far the most powerful was that of the weavers—as soon as they became conscious of their strength rebelled against the rule of their guild masters, and compelled them to hand over the power. The patricians (hence called leiaertsa) relied upon the support of the French crown, but the fatal battle of Courtrai (1302), in which the handicraftsmen (clauwaert) laid low the chivalry of France, secured the triumph of the democracy. The power of the Flemish cities rose to its height during the ascendancy of Jacques van Artevelde (1285-1343), the famous citizen-statesman of Ghent, but after his fall the mutual jealousies of the cities undermined their strength, and with the crushing defeat of Roosebeke (1382) in which Philip van Artevelde perished, the political greatness of the municipalities had entered upon its decline.

In Brabant—Antwerp, Louvain, Brussels, Malines ( Mechlin)—and in the episcopal territory of Liège—Liège, Huy, Dinant—there was a feebler repetition of the Flemish conditions. Flourishing communities were likewise to be found in Hainault, Namur, Cambrai and the other southern districts of the Netherlands, but nowhere else the vigorous independence of Ghent, Bruges and Ypres, nor the splendour of their civic life. In the north also the 13th century was rich in municipal charters. Dordrecht, Leiden, Haslem, Delmen, Rotterdam in Holland, and Middelburg and Zierikzee in Zeeland, repeated with modifications the characteristics of the communes of Flanders and Brabant. But the growth and development of the northern communal movement, though strong and instinct with life, was slower and less tempestuous than the Flemish. In the bishopric of Utrecht, in Gelderland and Friesland, the privileges accorded to Utrecht, Groningen, Zutphen, Stavoren, Leeuwarden rather than the model of those of the Rhenish "free cities" than of the Franco-Flemish commune. In the northern Netherlands generally up to the end of the 14th century the towns had no great political weight; their importance depended upon their river commerce and their markets. Thus at the close of the 14th century, despite the constant wars between the feudal sovereigns who held sway in the Netherlands, the vigorous municipal life had fostered industry and commerce, and had caused Flanders in particular to become the richest possession in the world.

It was precisely at this time that Flanders, and gradually the other feudal states of the Netherlands, by marriage, purchase, treachery or force, fell under the dominion of the house of Burgundy. The foundation of the Burgundian rule in the Netherlands was laid by the succession of Philip the Bold to the counties of Flanders and Artois in 1384 in right of his wife Margaret de Maule. In 1404 Antony, Philip's second son (killed at Agincourt 1415), became duke of Brabant by bequest of his great-aunt Joan. The consolidation of the Burgundian power was effected by Philip the Good, grandson of Philip the Bold, in his long and successful reign of 48 years, 1419-1467. He inherited Flanders and Artois, purchased the county of Namur (1427) and compelled his cousin Jacqueline, the heiress of Holland, Zeeland, Hainault and Friesland, to surrender her possessions to him, 1428. On the death in 1430 of his cousin Philip, duke of Brabant, he took possession of Brabant and Limburg; the duchy of Luxembourg he acquired by purchase, 1443. He made his bastard son David bishop of Utrecht, and from 1456 onwards that see continued under Burgundian influence. Two other bastards were placed on the episcopal throne of Liège, an illegitimate brother on that of Cambrai. Philip did not live to see Gelderland and Liège pass definitively under his rule; it was reserved for his son, Charles the Bold, to push the independent communes of Liège (1468) and to incorporate Gelderland in his dominions (1473).

This extension of dominion on the part of the dukes of Burgundy implied the establishment of a strong monarchical authority. They had united under their sway a number of provinces with different histories and institutions and speaking different languages, and their aim was to centralize the government. The nobility and clergy were on the side of the ducal authority; its opponents were the municipalities, especially those of Flanders. Their strength had been severely menaced by the overthrow of Roosebeke, but Philip had made his accession found under his son once more advancing them in power and prosperity. He was quite aware that the industrial wealth of the great Flemish communes was financially the mainstay of his power, but their very prosperity made them the chief obstacle to his schemes of unifying into a solid dominion the loose aggregate of states over which he was the ruler. On this matter Philip would brook no opposition. Bruges was forced after strenuous resistance to submit to the loss of its most cherished privileges in 1438, and the revolt of Ghent was quenched in the "red sea" (as it was styled) of Gavere in 1452. The splendour and luxury of the court of Philip surpassed that of any contemporary sovereign. A permanent memorial of it remains in the famous Order of the Golden Fleece, which was instituted by the duke at Bruges in 1430 on the occasion of his marriage with Isabel of Portugal, a descendant of John of Gaunt, and was so named from the English wool, the raw material used in the Flemish looms, for which Bruges was the chief mart. The reign of Philip, though marred by many acts of tyranny and harshness, was politically great. Had his successor been as prudent and able, he might have made a unified Netherlands the nucleus of a mighty middle kingdom, interposing between France and Germany, and a revival of that of the Carolingian Lothaire.

Before the accession of Charles, the only son of Philip, two steps had been taken of great importance in the direction of unification. The first was the appointment of a grand council with supreme judicial and financial functions, whose seat was finally fixed at Malines (Mechlin) in 1473; the other the summoning of deputies of all the provincial "states" of the Netherlands to a states-general at Brussels in 1465. But Charles, rightly surmamed the Bold or Headstrong, did not possess the qualities of a builder of states. Impatient of control and hasty in action, he was no match for his crafty and plotting adversary, Louis XI, of France. His ambition, however, was boundless, and he set himself to realize the dream of his father—a Burgundian kingdom stretching from the North Sea to the Mediterranean. At first all went well with him. By his ruthless suppression of revolts at Dinant and Liège he made his authority undisputed throughout the Netherlands. His campaigns against the French king were conducted with success. His creation of a formidable standing army, the first of its kind in that age of transition from feudal conditions, gave to the Burgundian power all the outward semblance of stability and permanence. But Charles, though a brave soldier and good military organizer, was neither a capable statesman nor a skillful general. He squandered the resources left to him by his father, and made himself hateful to all classes of his subjects by his exactions and tyranny. When at the very height of power, all his schemes of aggrandisement came to sudden ruin through a succession of disastrous defeats at the hands of the Swiss at Grandson (March 2, 1476), at Morat (June 22, 1476).
and at Nancy (January 5, 1477). At Nancy Charles was himself among the slain, leaving his only daughter Mary of Burgundy, then in her twentieth year, sole heir to his possessions.

The catastrophe of Nancy threatened the loosely-knit Burgundian dominion with dissolution. Louis XI. claimed the reversion of the French fiefs, and seized Burgundy, Franche Comté and Artois. But the Netherlands provinces, though not loving the Burgundian dynasty, had no desire to see French master. Deputies representing Gelders, Brabant, Hainault and Holland met at Ghent, where Mary was detained almost as a prisoner, and compelled her (February 10, 1477) to sign the "Great Privilege." This charter provided that no war could be declared nor marriage concluded by the sovereign, nor taxes raised without the assent of the states, that natives were alone eligible for high office, and that the national language should be used in public documents. The central court of justice at Malines was abolished, but the Grand Council was reorganized and made thoroughly representative. The Great Privileges supplemented by the so-called "Royal Privileges of the Flemish Privilege granted (February 10), the Great Privilege of Holland and Zeeland (February 17), the Great Privilege of Namur and the Joyeuse Entrée of Brabant, both in May, thus largely curtailting the sovereign's power of interference with local liberties. On these conditions Mary obtained the hearty support of the states against France, but her humiliations were not yet at an end; two of her privy councillors, accused of traitorous intercourse with the enemy, were, despite her entreaties, seized, tried, and beheaded (April 3). Her marriage, for months later to Maximilian of Austria was the beginning of the long domination of the house of Habsburg. The next fifteen years were for Maximilian a stormy and difficult period. The duchess Mary died from the effects of a fall from her horse (March 1482), and Maximilian became regent (mamour) for his son. The peace of Arras with France (March 1483) freed him to deal with the discord in the Netherlands provinces, and more especially with the turbulent opposition in the Flemish cities. With the submission of Ghent (June 1483) the contest was decided in favour of the archduke, who in 1494, on his election as emperor, was able to hand over the country to his son Philip in a comparatively tranquil and secure state. Philip, surnamed the Fair, was fifteen years of age, and his accession was welcomed by the Netherlanders with whom Maximilian had never been popular. Gelderland, however, which had revolted after Nancy, had Charles of Egmont for its duke, and the two bishoprics of Liége and Utrecht were no longer subject to Burgundian authority. In 1496 Philip married Joanna of Aragon, who in 1500 became heiress apparent to Castile and Aragon. That same year she gave birth at Ghent to a son, afterwards the emperor Charles V. Philip's reign in the Netherlands was chiefly noteworthy for his efforts for the revival of trade with England. On the death of Queen Isabel, Philip and Joanna succeeded to the crown of Castile and took up their residence in their new kingdom (January 1506). A few months later Philip unexpectedly died at Burgos (September 25th). His Burgundian lands passed without opposition to his son Charles, then six years of age.

The claim of the emperor Maximilian to be regent during the minority of his grandson was recognized by the states-general. Maximilian nominated his daughter Margaret, widow of Philippe, duke of Savoy, to act as governor-general, and she filled the difficult post for eight years with great ability, courage and tact; and when Charles at the age of fifteen assumed the government he found the Netherlands thriving and prosperous. In the following year, by the death of Ferdinand of Aragon, his maternal grandfather, and the incapacity of his mother Joanna, who had become hopelessly insane, he succeeded to the crowns of Castile and Aragon, which came to him with their large possessions and the whole dominion of the New World of America. In 1519 Maximilian died, and the following year his grandson, now the head of the house of Austria, was elected emperor. Charles V. had been born and brought up in the Netherlands, and retained a strong predilection for his native country, but necessarily he had to pass the larger part of his life, at that great crisis of the world's history, in other lands. During his frequent absences he entrusted the government of the Netherlands to the tried hands of his aunt, Margaret, who retained his confidence until her death (November 1530), and secured the affermation of all Netherlanders. Margaret was assisted by a permanent council of regency, which was specially charged with the administration of the finances, sometimes under the name of superintendent of the finances, sometimes under the title of treasurer-general and controller-general. The duties of this minister were of special importance, for it was to the Netherlands that Charles looked for much of the resources wherewith to carry on his many wars. During this time Charles consolidated his dominion over the Netherlands. In 1524 he became lord of Friesland by purchase, and in 1528 he acquired the temporalities of Utrecht. He now ruled over seventeen provinces—i.e. Castile, and Aragon, Guelders, Brabant, Gelderland, Limburg and Luxemburg, Zeelant and Zutphen; the magistrature of Antwerp; and five lordships—Friesland, Meclin, Utrecht, Overysel, and Groningen with its dependent districts.

After the death of Margaret, Charles appointed his sister Mary, the widowed queen of Hungary, to the regency, and for twenty years she retained her post, until the abdication in fact of Charles V. in 1555. She too governed ably, though in entire subservience to her nephew, but was not of such intimate touch with the native peculiarities of the Netherlanders as her predecessor. At the time of her accession to office Charles changed the form of administration by the creation of three separate councils, those of State, of Finance, and the Privy Council. The regent was president of the council of state, of which the knights of the Golden Fleece were members. The policy of Charles towards the Netherlands was for many years one of studied moderation. He redressed many grievances, regulated the administration of justice, encouraged commerce, reformed the coinage, but as time went on he was compelled to demand larger subsidies and to take severer measures against heretical opinions. Mary was forced to impose taxation which met with violent resistance, especially in 1539 from the stiff-necked town of Ghent. The emperor himself was obliged to intervene. On the 14th of February 1540 he entered Ghent at the head of a large army and visited the city with severe punishment. All its charters were annulled, its privileges and those of its guilds swept away, and a heavy fine imposed. It was a lesson intended to teach the Netherlanders the utter futility of opposition to the will of their lord. The struggle, however, with the Protestant princes of Germany not only led to continual demands of Charles for men and money from his Netherlands dominions, but to his determination to prevent the spread of Protestant opinions; and a series of edicts was passed, the most severe of which (that of 1550) was carried out with extreme rigour. Its preamble stated that its object was "to extirpate the root and ground of this pest." By its enactments, men holding heretical opinions were condemned to the stake, women to be buried alive. Yet despite the efforts of the government the Reformation made progress in the land. In 1548 Charles laid before the states a scheme for making the Netherlands an integral part of the empire under the name of the Circle of Burgundy; but the refusal of the German Electors to make his only son Philip king of the Romans led him to abandon the project, which was never renewed. Already the emperor was beginning to feel weary of the heavy burdens which the government of so many realms had imposed upon him, and in 1549 he presented Philip to the states of the Netherlands, that they might take the oath of allegiance to him, and Philip swore to maintain all ancient rights, privileges and customs. The abdication of Charles V. took place on the 29th of October 1555 in the great hall of the palace at Brussels, and Philip II. entered upon his long and eventful reign. His external policy
was at first successful. Chiefly through the valour of Lamoral, count of Egmont, two great victories were won over the French at St Quentin (August 10, 1557) and at Gravelines (July 13, 1558). The terms of the treaty of Cateau-
Cambrésis (February 1559) were entirely favourable to Philip. Internal difficulties, however, confronted him. His proposal to impose a tax of 1½% on real property and of 2½% on movable property was rejected by all the larger provinces. As a thorough
Sutherlanders the number and the language of his Netherland subjects Philip was from the first distrusted and his acts regarding them with suspicion. He himself never felt at home at Brussels, and in August 1559 he set sail for Spain, never again to revisit the Netherlands.

He appointed as regent, Margaret, duchess of Parma, a natural
daughter of Charles V, by a Flemish mother, and like the other
women of the House a strong and capable ruler. She was nominally assisted by the members of the three councils—the Council of State, the Privy Council and the Council of Finance, but in reality all power was placed by Philip in the hands of three confidential councillors styled
the Consulta—Barlaymont, president of the Council of Finance, Viglius, president of the Privy Council, and Antony
Perrenot, bishop of Arras, better known by his later title as Cardinal Granvelle. This extremely able man, a Burgundian
by birth, was the son of one of Charles V’s most trusted
councillors, and it was largely to him that the government
of the Netherlands was confined. Two burning questions at
the outset confronted Margaret and Granvelle—the question
of the new bishoprics and the question of the presence of
Spanish troops in the Netherlands. The proposal to
reorganize the bishoprics of the Netherlands was not a new
one, but was the carrying out of a long-planned project of
Charles V. In 1555 there were but three dioceses in the Netherlands—those of Tournay, Arras and Utrecht—all of unwieldy size and under the jurisdiction of foreign metropolitan. It was proposed now to
establish a more numerous hierarchy, self-contained within
the limits of Burgundian rule, with three archbishops and fifteen
dioceses. The primatial see was placed at Malines (Mechlin),
having under it Antwerp, Hertogenbosch, Roermond, Ghent,
Bruges, and Ypres constituting the Flemish province; the
second archbishopric was at Cambray, with Tournay, Arras, St
Omer, and Namur,—the Walloon province; the third at
Utrecht, with Haarlem, Middleburg, Leeuwarden, Groningen
and Deventer,—the northern (Dutch) province. All these with
the exception of Cambray and St Omer were within the boundaries
of the Netherlands. The scheme aroused almost universal
distrust and opposition. It was believed that its object was
the introduction of the dreaded form of the Inquisition established in
Spain, and in any case more systematic and stringent measures for the suppression of heresy. To the clamours of the Consulta it excited also to be alarmed
of the nobles jealous of their privileges, and of the monasteries,
which were called upon to furnish the revenues for the new sees.
Granvelle was made first archbishop of Malines, and all the
odium attaching to the increase of the episcopate was laid at
his door, though he was in reality opposed to it. The continued
presence of the Spanish troops caused also great dissatisfaction.
The Netherlanders detested the Spaniards and everything
Spanish, and this foreign mercenary force, together with the
new bishops, was looked upon as part of a general plan for the
gradual overthrow of their rights and liberties. So loud was the outcry that Margaret and Granvelle on their own responsibility
sent away the Spanish regiments from the country (January
1561). The most serious difficulty with which Margaret had to
deal arose from the attitude of the great nobles, and among these
especially of William (the "Silent") of Nassau, prince of Orange,
Lamoral, count of Egmont, and Philip de Montmorency, count
of Hoorn. These great magnates, all of them Knights of the
Fleece and men of peculiar weight and authority in the country,
were disposed to find that, though nominally councillors of state, their advice was never asked, and that all power was placed in the hands of the Consulta. They began to be alarmed
by the severity with which the edicts against heresy were being

The Tridestine decrees.

The Beggars.

The iconoclasts.
any interference on the part of the magistracy to wreak their
will upon its spendid and priceless contents.

The effect of the outbreak was in every way disastrous. The
regent was alienated from the popular leaders, and was no longer
disposed to help William of Orange, Egmont, and Hoorn to secure
a mitigation of religious persecution; and the heart of Philip
was hardened in its resolve to exterminate heresy in the Nether-
lands. He disseminated until such time as he could despatchet
his greatest general, the duke of Alva, to Brussels at the head of a
picket force to crush all opposition.

William of Orange was not deceived by the specious temporiz-
ing of the machinists. He was the coming storm, and he did his
 utmost to induce Egmont, Hoorn and other prominent
members of the patriotic party to unite with him in
taking measures for meeting the approaching danger.

Egmont and Hoorn refused to do anything that might be con-
structed into disloyalty; in these circumstances William felt that
the time had come to provide for his personal safety. He with-
drew (April 1567) first to his residence at Breda, and then to
the ancestral seat of his family at Dillenburg in Nassau.

Margaret of Parma meanwhile, with the aid of a considerable
body of mercenaries, began to round up the unruly, paralyzing
punishment upon the iconoclasts and Calvinist sectaries.

A body of some 2000 men drawn principally from
Antwerp were cut to pieces at Austerweel (March 13,
1567), and their leader John de Marnix, lord of Thou-
seule, slain. Valenciennes, the chief centre of disturbance in
the south, was besieged and taken by Philip de Noircarmes,
governor of Hainault, who inflicted a savage vengeance (April
1567). The regent therefore represented to her brother that the
disorders were entirely put down and that the time had come to
show mercy. But Philip's preparations were now complete, and
Alva set out from Italy at the head of a force of some 10,000
veteran troops, Spaniards and Italians, afterwards increased by
a body of Germans, with which, after marching through Bur-
gundy, Lorraine and Luxemburg, he reached the Netherlands
(August 8), and made his entry into Brussels a fortnight
later.

The powers conferred on Alva were those of military dictator.
The title of regent was left to the duchess Margaret, but she
speedily sent in her resignation, which was accepted
(October 6). Before this took place events had been
moving fast. On the 9th of September Egmont and
Hoorn were arrested as they left a council at the duke's
residence and were confined in the castle of Ghent. At the same
time Orange's friend, the powerful burgomaster of Antwerp,
Anthony van Stralen, was seized. The next step of Alva was
to create a special tribunal which was officially known as the
"Council of Troubles," but was popularly branded with the name
of the "Council of Blood," and as such it has passed down to
history. As a tribunal it had no legal status. The duke himself
was president and all sentences were submitted to him. Two
members only, Vargas and del Rio, both Spaniards, had votes.
A swarm of commissioners ransacked the provinces in search of
delinquents, and the council sat daily for hours, condemning the
accused, almost without a hearing, in batches together.

The executioners were ceaselessly at work with stake, sword
and gibbet. Crowds of fugitives crossed the frontier to
seek refuge in Germany and England. The prince of
Orange was publicly declared an outlaw and his
property confiscated (January 24, 1568). A few weeks later his
eldest son, Philip William, count of Buren, a student at the university
of Louvain, was kidnapped and carried off to Madrid.
William had meanwhile succeeded in raising a force in Germany
with which his brother Louis invaded Friesland. He gained a
victory at Heiligerlee (May 23) over a Spanish force under Count
Aremberg. Aremberg himself was killed, as was Adolphus of
Nassau, a younger brother of William and Louis. But Alva
himself took the field, and at Jemmingen (July 21) completely
annihilated the force of Louis, who himself narrowly escaped
with his life. One result of the victory of Heiligerlee
was the determination of Alva that Egmont and Hoorn
should die before he left Brussels for the campaign in
Friesland. They were pronounced by the Council of
Blood to be guilty of high treason (June 2, 1568).

On the 6th of June they were beheaded before the
Broodhuis at Brussels.

A few months after the disaster of Jemmingen, Orange, who
had now become a Lutheran, himself led a large army into
Brabant. He was met by Alva with cautious tactics.
The Spaniards skillfully avoided a battle, and in
November the invaders were compelled to withdraw
across the French frontier through lack of resources,
which had been disbanded. Alva was triumphant; but though
Alva's master had supplied him with an invincible army, he was
unable to furnish him with the funds to pay for it.
Money had to be raised by taxation, and at a meeting of the states-general
(March 20, 1569) the governor-general proposed (1) an immediate
tax of 1% on all property, (2) a tax of 5% on all transfers of
real estate, (3) a tax of 10% on the sale of all articles of commerce,
the last two taxes to be granted in perpetuity. Everywhere the
proposal met with uncompromising resistance. After a pro-
longed struggle, Alva succeeded in obtaining a subsidy of
9000 pieces of eight for the expenses of his state.

The Dutch Council of Blood went on, as did the exodus of thousands upon
thousands of industrious and well-to-do citizens, and with
each year the devastation felt for Alva and his rule steadily
increased.

All this time William and Louis were indefatigably making
preparations for a new campaign, and striving by their agents
to rouse the people to active resistance. The first
successes were however to be not on land, but on the
sea. In 1569 William in his capacity as sovereign
of Orange issued letters-of-marque to a number of vessels to prey upon the Spanish commerce in the
northern seas. These corsairs, for such they were, were known by the
name of Sea-Beggars (Guerreros de Mar). Under the command of the
lord of Lumbres, the lord of Treslong, and William de la Marck
(lord of Lume) they spread terror and alarm along the coast,
seized much plunder, and in revenge for Alva's cruelty com-
mitted acts of terrible barbarity upon the priests and monks
and catholic officials, as well as upon the crews of the vessels that fell
into their hands. Their difficulty lay in the lack of ports in
which to take refuge. At last by a sudden retreat the
work of the Blood Council was abandoned, and a body of Sea-Beggars seized the town of Brill at the mouth of
the Maas (April 1, 1572). Encouraged by this success they
next attacked and took Flushing, the port of
Zeeland, which commanded the approach to Antwerp; and the
inhabitants were compelled to take the oath to the prince
of Orange, as stadtholder of the king. They next mastered Delfs-
haven and Scheldam. These striking successes caused a wave of
revolt to spread through Holland, Zeeland, Gelderland,
Utrecht and Friesland. The principal towns gave in
their submission to the prince of Orange, and acknow-
ledged him as their lawful stadtholder. Within three
months of the capture of Brill, Amsterdam was the only town in
Holland in the hands of the Spaniards.

This revolt of the northern provinces was facilitated by the
fact that Alva had withdrawn many of the garrisons, and was
moving to oppose an invasion from the south. Louis
of Nassau, with a small force raised in France with the
connivance of Charles IX., made a sudden dash into
Hainault (May 1572) and captured Valenciennes and
Mons. Here he was shut in by a superior force of Spaniards, and
which to take refuge. At last by a sudden retreat the
army which Orange was collecting on the eastern frontier. On the
9th of July William crossed the Rhine, and captured Malines,
Ternode and Oudenarde, and was advancing southwards
when the news reached him of the massacre of St Bartholomew,
which deprived him of the promised aid of Coligny and his army of
12,000 men. He made an attempt, however, to relieve Mons,
but his camp at Harmignies was surprised by a night attack, and
William himself narrowly escaped capture. The next morning
he retreated, and six days later Mons surrendered.
Orange however did not despair, and resolved to throw in his lot for good and all with the rebel province of the north. Already at his summons the states of Holland had met at Dort (July 15) under the presidency of Philip de Marigny, lord of Sainte Aldegonde, and they had unanimously recognized William as their lawful stadtholder and had voted a large grant of supplies. The prince now took up his permanent residence at Delft, and a regular government was established, in which he exercised almost dictatorial authority.

Alva was now free to deal with rebellion in the north. Malines, which had surrendered to William, was given over for three days to the mercy of a brutal soldier. Then the army under Alva’s son, Don Frederick of Toledo, marched northwards, and the sack of Zutphen and the inhuman butchery of Naarden are among the blackest records of history. But the very horrors of Don Frederick’s advance roused a spirit of indomitable resistance in Holland.

The famous defence of Haarlem, lasting through the winter of 1572 to July 1573, cost the besiegers 12,000 lives, and gave the insurgent provinces time to breathe. The example of Haarlem was followed by Alkmaar, and with better success. The assault of the Spaniards was repulsed, the dykes were cut, and Don Frederick, fearing for his communications, beat a hasty retreat (August). A few weeks later (Oct. 11) the fleet of Alva on the Zuyder Zee was completely defeated by the Sea-Beggars and its admiral taken prisoner. Disgusted by these reverses, in bad odour with the king, and with his soldiers mutinying for lack of pay, the governor-general resigned. On the 18th of December 1573 Alva, who to the end had persisted in his policy of pitiless severity, left Brussels, carrying with him the curses of the people over whom he had tyrannized for six terrible years of misery and oppression.

Philip sent the grand commander, Don Luis Requesens, as governor-general in his place, and after some futile attempts at negotiation the war went on. The prince of Orange, who had now formally entered the Calvinist communion, was inexcusable in laying down three conditions as indispensable: (1) Freedom of worship and liberty to preach the gospel according to the Word of God; (2) the restoration and maintenance of all the ancient charters, privileges, and liberties of the land; (3) the removal of all Spaniards and other foreigners from all posts and employments civil and military.

In February 1574 the Spaniards by the fall of Middleburg lost their last hold upon Walcheren and Zeeland. This triumph was however far more than counterbalanced by the complete defeat of the army, led by Count Louis of Nassau, at Moorheide near Nijmegen (14th March). The gallant Louis and his younger brother Henry both lost their lives. This was a grievous blow to William, but his courage did not fail. The Spaniards laid siege to Leiden, and though stricken down by a fever at Delft the prince spared no exertion to save the town. The dykes were cut, the land flooded, but again and again a relieving force was baulked in its attempts to reach the place, which for more than four months bravely defended itself. But when at the last extremity through famine, a tempestuous flood enabled the vessels of Orange to reach Leiden, and the investing force was driven to retreat (October 3, 1574). This was the turning-point of the first stage in the struggle for Dutch independence. In honour of this great deliverance, the state of Holland founded the university, which was speedily to make the name of Leiden illustrious throughout Europe.

In the spring of 1575 conferences with a view to peace were held at Breda, and on their failure Orange, in the face of Spanish successes in Zeeland, was forced to seek foreign succour. He sought at first in vain. The sovereignty of Holland and Zeeland was offered to the queen of England, but she, though promising secret support, declined. The situation was, however, relieved through the sudden death of Requesens (March 1576). The stadtholder summoned a meeting of the states of Holland and Zeeland to Delft, and on the 25th of April an act of federation between the two provinces was executed. By this compact the prince was invested with all the prerogatives belonging to the sovereign. He was made commander-in-chief of both the military and naval forces with supreme authority, and in his hands was placed the final appointment of all the provincial official posts and to vacant city magistracies. He was required to maintain the Protestant reformed religion and to suppress “all religion at variance with the gospel.” He also had authority to confer the protectorate of the federated provinces upon a foreign prince.

In June 1576 the long siege of Zierikzee, the capital of Schouwen, ended in its surrender to the Spanish general Mon-dragon, after the failure of a gallant attempt by Admiral Boisot to break the leaguer, in which he lost his life. Things looked ill for the patriots, and Zeeland would be next when at the mercy of the conquering army had not the success been followed by a great mutiny of the Spanish and Walloon troops, to whom long arrears of pay were due. They chose their leader (dietto), marched into Brabant, and established themselves at Alost, where they were joined by other bands of mutineers. The principal fortresses of the country were in the hands of Spanish garrisons, who refused obedience to the council. William seized his opportunity, and with a body of picked troops advanced into Flanders, occupied Ghent, and entered into negotiations with the leader of the state-general at Brussels, for a union of all the provinces on the basis of exclusion of foreigners and non-interference with religious belief. The overtures were favourably received, the council at Brussels was forcibly dissolved, and a congress met at Ghent on the 9th of October to consider what measures must be taken for the pacification of the country. In the midst of their deliberations the news arrived that the mutineers had marched from Alost on Antwerp, overpowered the troops of Champagney, and sacked the town with terrible barbarities (Nov. 3). This tragedy, known as “the Spanish Fury,” silenced all disputes and differences among the representatives of the provinces. A treaty establishing a firm alliance between the provinces, represented by the states-general, assembled at Brussels on the one part, and on the other by the prince of Orange, and the states of Holland and Zeeland, was agreed upon and ratified under the title of the “Pacification of Ghent.” It was received with great enthusiasm. The provinces agreed first to eject the foreigner, then to meet in states-general and regulate all matters of religion and defence. It was stipulated that there was to be toleration for both Catholics and Protestants; that the Spanish king should be recognized as de jure sovereign, and the prince of Orange as governor with full powers in Holland and Zeeland.

Meanwhile Philip had appointed his natural brother, Don John of Austria, to be governor-general in the place of Requesens. After many delays he reached Luxemburg on the 4th of November (the date of the Spanish Fury at Antwerp) and notified his arrival to the council of state. His letter met with a cold reception. On the advice of the prince of Orange the states-general refused to receive him as governor-general unless he accepted the “Pacification of Ghent.” Negotiations were entered into, but a deadlock ensued. At this crisis the hands of Orange and the patriotic party were greatly strengthened by a new compact entitled “The Union of Brussels,” which was extensively signed, especially in the southern Netherlands. This document (Jan. 1577) engaged all its signatories to help in ejecting the foreign soldiery, in carrying out the “Pacification,” in recognizing Philip’s sovereignty, and at the same time in maintaining the charters and constitutions which that king on his accession had sworn to observe. The popular support given to the Union of Brussels forced Don John to yield.

The Pacification of Ghent.

Don John of Austria becomes Governor-General.
He promised to accept the "Pacification of Ghent," and finally an agreement was drawn up, styled the "Perpetual Edict," which was signed by Don John (February 10th) and by Archduke Matthias. The statesman general undertook to accept Don John as governor-general and to uphold the Catholic religion, while Don John, in the name of the king, agreed to carry out the provisions of the "Pacification." The authority conferred upon Orange as stadtholder by the provinces of Holland and Zeeland was thus ratified, but that astute statesman had no confidence that Philip intended to observe the treaty any longer than it suited his convenience. He therefore refused, with the approval of the representatives of these provinces, to allow the publication of the "Perpetual Edict" in Holland and Zeeland. As events were to prove, he was right in the right.

Don John made his state entry into Brussels on the 1st of May, but only to find that he had no real authority. "The prince of Orange," he informed the king, "has bewitched the minds of all men. They keep him informed of everything, and take no resolution without consulting him." In vain the young soldier strove to break loose from the shackles which hampered him. He was, to quote the words of a contemporary, "like an apprentice defying his master." Irritated and alarmed, the governor suddenly left Brussels in the middle of July with some Walloon troops and went to Namur. It was a virtual act of abdication. The eyes of all men turned to the prince of Orange. Through his exertions the Spanish troops had not only been expelled from Holland and Zeeland, but also from the citadels of Antwerp and Ghent, which were now in the hands of the patriots. He was invited to come to Brussels, and after some hesitation, and not without having first obtained the approval of the states of Holland and Zeeland, he assented. William made his triumphal entry into the capital (September 23), which he had quitted as an outlawed fugitive four years before. In a brief period he was the acclaimed leader of the entire Netherlands people.

But it was not to last. The jealousy of Catholic against Protestant, of south against north, was too deeply rooted.

Archduke Matthias.

Two distinctive nationalities, Belgian and Dutch, were already in course of formation, and not even the tactful and conciliatory policy of the most consummate statesman of his time could unite those whom the whole trend of events was year by year putting farther asunder. On the 6th of October, at the secret invitation of the Catholic nobles headed by the duke of Parma, the archduke Matthias, brother of the emperor, arrived in Brussels to assume the sovereignty of the Netherlands. He was but twenty years of age, and his sudden intrusion was as embarrassing to the prince of Orange as to Don John. William, however, whose position had been strengthened by his nomination to the post of ruwbaar of Brabant, determined to welcome Matthias and use him for his own purposes. Matthias was to be the nominal ruler, he himself with the title of lieutenant-general to hold the reins of power.

But Philip had now become thoroughly alarmed, and he despatched Alexander Farnese, son of the duchess of Parma, to join his uncle Don John with a veteran force of 20,000 troops. Strengthened by this powerful reinforcement, Don John fell upon the patriot army at Gemblours near Namur on the 31st of January 1578, and with scarcely any loss completely routed the Netherlands. All was now terror and confusion. The "malcontent" Catholics now turned for help from Matthias to the duke of Anjou, who had invaded the Netherlands with a French army and seized Mons. At the same time John Casimir, brother of the elector palatine, at the invitation of the Calvinist party and with the secret and financial aid of Queen Elizabeth, entered the country at the head of a body of German mercenaries from the east. Never did the diplomatic talents of the prince of Orange shine brighter than at this critical crisis. The duke of Anjou at his earnest instigation accepted the title of "Defender of the liberties of the Netherlands," and promised, if the provinces would raise an army of 10,000 foot and 2000 horse, to come to their assistance with a like force. At the same time negotiations were successfully carried on with John Casimir, with Elizabeth and with Henry of Navarre, and their help secured for the national cause. Meanwhile Don John had aroused the distrust of his governor-general, and under his armed protection a fierce and intolerant Catholic reign supreme in that important city.

Farnese at once set to work with subtle skill to win over to the royalist cause the Catholic nobles of the south. The moment therefore arrived when the"Pacification of Ghent" and the "Pacification of Autriche" had fallen into the hands of John Casimir, and under his armed protection a fierce and intolerant Catholic reign supreme in that important city.

To the "Malcontents" (as the Catholic party was styled) the domination of heretical sectaries appeared less tolerable than the evils attendant upon alien rule. This feeling was widespread throughout the Walloon provinces, and found expression in the League of Arma (5th of January 1579). By this instrument the deputies of Hainault, Artois and Doany formed themselves into a league for the defence of the Catholic religion, and for the punishment of heretics. The political stipulations of the Union of Brussels, professed loyal allegiance to the king. The Protestant response was not long in coming. The Union of Utrecht was signed on the 29th of January by the representatives of Holland, Zeeland, Utrecht, Gelderland and Zutphen. By it the northern provinces bound themselves together "as if they were one province." to maintain their rights and liberties "with life-blood and goods" against foreign tyranny, and to grant complete freedom of worship and of religious opinion throughout the kingdom. This cultural and political achievement of the "League of Arma" was not to last. The League of Arma.

The death of Don John.

As the result of an intrigue, in which M. de Kerlerec had an active part, Don John was assassinated at his table on the 10th of January 1584. The news of his death was greeted with deep sorrow and regret throughout the whole of the Netherlands. The news of his death was greeted with deep sorrow and regret throughout the whole of the Netherlands.

NETHESOLE, OLGA (1863- ), English actress, of Spanish descent, was born in London, and made her stage début at Brighton in 1887. From 1888 she played important parts in London, at first under John Hare at the Garrick, and in 1894 took the Court Theatre on her own account. She also toured in Australia and America, playing leading parts in modern plays, notably "John Barleycorn" (1896) and "The Fatal Flower." Her combination of these parts was such (cf. Ezr. 18:16), it was said, that she had an aptitude for the role of "Nathan." She is the author of the "Social Drama," which began with "Nathan." The book has also the singular form—"Nathan." In all, 613 Nethinim came back from the Exile and were lodged near the "House of the Nethinim" at Ophel, towards the east wall of Jerusalem so as to be near the Temple, where they served under the Levites and were free of all tolls, from which they must have been supported. It is mentioned that they had been ordered by David and the princes to serve the Levites (Ezr. viii. 20).

Notwithstanding their sacred service, the Nethinim were regarded by later Jewish tradition as especially degraded, being placed in tables of precedence below bastards (Talm. Jer. Hor. iii. 5, I. J. 29, 1). They were "given" or "dedicated," i.e. to the temple. The latter has also the singular form—"Nathin." (Jeb. 29-35), that the prohibition against intermarriage with the Moabites, Ammonites, Egyptians and Edomites, though given in the Bible, only applied for a certain number of generations and did not apply at all to their daughters, but, it is added, "Bastards and Nethinim are prohibited (to marry Israelites), and this prohibition is perpetual and applies both to males and females." To explain this combination of sacred service and exceptional degradation, it has been suggested by Joseph Jacobs that the Nethinim were the descendants of the Kedidim, i.e., women dedicated to the worship of Astarte and attached to the Temple before the Exile. There is evidence of these practices from the time of Solomon (I Kings xi. 4) down to Josiah (2 Kings xii. 4-6), and even as late as Ezekiel (Ezek. xxiii. 36-48), giving rise to the command of Deuteronomy xxiii. 17.

An examination of the name lists given in duplicate in Ezra ii. 43-48, Neh. vii. 46-59, together with the additional names in the Greek Esdras (v. 29-35), shows that the Nethinim were in charge of the rings and hooks connected with the temple service; they sheared the sheep offered for sacrifice in the temple and poured the libations. Some of them were derived from the wars which the temple was involved in and plagued the city of Jerusalem. There is mention of them in 1883—Damascus. One of the names given in 1 Esdras v. 34, was Solomon, ed. Fritzsche, Θωδης, ed. Swete, would seem to throw light on the puzzling reading θωδης (A.V. "Sabeans," R.V. "Drunkards") of Ezek. xxiii. 42, and if so would directly connect the list of the Nethinim with the degraded worship of Astarte in the Temple.

A large majority of the names of the parents mentioned seem to be feminine in form or meaning, and suggest that the Nethinim could not trace back to any definite pedigree; and this is confirmed by the fact that the lists are followed by the enumeration of those who could not "show their father's house" (Ezra ii. 60; Neh. vii. 62). The Greek versions, as well as Josephus, refer to them as ἱεροθεοῦχοι, which can mean one thing only.

The Talmudic authorities have an abstract term, Nethinuth, indicating the status of a Nethin (Tos. Kidd. v. 1 ed. Zuckermandel, p. 341), and corresponding to the abstract Mammith, "bastard." The existence of this degraded class up to the Exile throws considerable light upon the phraseology of the prophets in referring to licentious and the scenes connected with it as prostitution. Their continued existence as a pariah class after the Exile would be a perpetual reminder of the dangers and degradation of the most popular Syrian creed.

These unfortunate creatures had no alternative but to accept the provisions made for them out of the Temple treasury, but after the fall of the Temple they would naturally disappear by intermarriage with similar degraded classes (Mishna Kidd. viii. 3). In the Code of Khammurabi §§ 191, 192, they could be adopted by outsiders.

The above explanation of the special degradation of the Nethinim, though they were connected with the Temple service, seems to be the only way of explaining the Talmudic reference to their tabooed position, and is an interesting example of the light that can be reflected on Biblical research by the Talmud.

See Joseph Jacobs, Studies in Biblical Archaeology (1894), 104-122; W. Baudissin, Geschichte des Alterstumsmärchens Pfisterluthern, 142 seq. (This view, however, is not accepted by Cheyne, Encyclopaedia Biblica.)

NETLEY, a village in the Fareham parliamentary division of Hampshire, England, 3 m. S.E. of Southampton on the east shore of Southampton Water, and on a branch of the London & South Western railway. Here a Cistercian abbey was founded in 1237 by Henry III., and its ruins are extensive, including a great part of the cruciform church, abbot's house, chapter house and domestic buildings. The style is Early English and Decorated, and many beautiful details are preserved. The gateway was transformed into a fort in the time of Henry VIII.

Netley Hospital for wounded soldiers (1 m. S.E. of the abbey), was built in 1586 after the Crimean War. It is a vast pile giving accommodation for upwards of a thousand patients, and is the principal military hospital in Great Britain.

NETSCHER, GASPAR (1639-1684), German portrait and genre painter, was born at Heidelberg in 1639. His father died when he was two years of age, and his mother, fleeing from the dangers of a civil war, carried him to Arnheim, where he was adopted by a physician named Tullekens. At first he was destined for the profession of his patron, but owing to his great aptitude for painting he was placed under an artist named Koster, and, having also studied under Ter Borch, he set out for Italy to complete his education there. Marrying, however, at Liège, he settled at Bordeaux, and toiled hard to earn a livelihood by painting those small cabinet pictures which are now so highly valued on account of their exquisite finish. After removing to The Hague, he turned his attention to portrait-painting, and in this branch of his art was more successful. He was patronized by William III., and his earnings soon enabled him to gratify his own taste by depicting musical and conversational pieces. It was in these that Netscher's genius was fully displayed. The choice of these subjects, and the habit of introducing female figures, dressed in glossy satins, were imitated from Ter Borch; they possess easy yet delicate pencilling, brilliant and correct colouring, and many animated and graceful attitudes; but frequently their refinement passes into weakness. The painter was gaining both fame and wealth when he died prematurely in 1684. His sons Constantyn (1668-1722), and Theodorus (1661-1732), were also painters after their father's style, but inferior in merit.

NETTE (O. Eng. netfel, cf. Ger. Nessel), the English equivalent of Lat. Urtica, a genus of plants which gives its name to the natural order Urticaceae. It contains about thirty species in the temperate parts of both east and west hemispheres. They are herbs covered with stingy hairs, and with unisexual flowers on the same or on different plants. The male flowers consist of a
perianth of four greenish segments enclosing as many stamens, which latter, when freed from the restraint exercised upon them by the perianth-segments while still in the bud, suddenly uncoil themselves, and in so doing liberate the pollen. The female perianth is similar, but encloses only a single seed-vessel with a solitary seed. The stinging hairs consist of a bulbous reservoir filled with acrid fluid, prolonged into a long slender tube, the extremity of which is finely pointed. By this point the hair penetrates the skin and discharges its irritant contents beneath the surface. Nettle tops, or the very young shoots of the nettle, may be used as a vegetable like spinach; but an animal is made by eight crystalline (cystoliths) they contain are apt to be gritty, though esteemed for their antiscorbutic properties, which they do not possess in any exceptional degree. The fibre furnished by the stems of several species is used for cordage or paper-making.

Three species of nettle are wild in the British Isles: *Urtica dioica,* the common stinging nettle, which is a hairy perennial with staminate and pistillate flowers in distinct plants; *U. urens,* which is annual and, except for the stinging hairs, glabrous, and has staminate and pistillate flowers in the same plant; *U. phuliferus* (Roman nettle), an annual, is staminate with pistillate flowers in rounded heads, which occurs in waste places in the east of England, chiefly near the sea—the more virulent of the British species. From their general presence in the neighbourhood of houses, or in spots where house refuse is deposited, it has been suggested that the nettles are not really natives, a supposition that to some extent receives countenance from the circumstance that the young shoots are very sensitive to frost. In any case they follow man in his migrations, and by their presence usually indicate a soil rich in nitrogen. The trailing subterranean rootstock renders the common nettle somewhat difficult of eradication.

**NETTLERASH,** or *Urticaria,* a disorder of the skin characterized by an eruption resembling the effect produced by the sting of a nettle, namely, raised red or red and white patches occurring in parts or over the whole of the surface of the body and attended with great irritation. It may be acute or chronic. In the former variety the attack often comes on after indulgence in certain articles of diet, particularly various kinds of fruit, shell-fish, cheese, pastry, &c., also occasionally from the use of certain drugs, such as hembane, copaiba, cubebis, turpentine, &c. There is sometimes considerable feverishness and constitutional disturbance, together with sickness and faintness, which either precede or accompany the appearance of the rash. The eruption may appear on any part of the body, but is most common on the face and trunk. The attack may pass off in a few hours, or may last for several days, the eruption continuing to come out in successive patches. The chronic variety lasts with intermissions for a length of time often extending to months or years. This form of the disease occurs independently of errors in diet, and is not attended with the feverish symptoms characterizing the acute attack. As regards treatment, the acute variety generally yields quickly to a purgative and the use of some antacid, such as magnesia or liquor potassae. The local irritation is allayed by sponging with a warm alkaline solution (soda, potash or ammonia), or a solution of acetate of lead, and a lotion of ichthyol has been found useful. Chronic cases have been known to benefit from the administration of creosote or salol.

**NETTLESHIP, HENRY** (1839-1893), English classical scholar, was born at Kettering on the 5th of May 1839. He was educated at Lancing, Durham and Charterhouse schools, and Corpus Christi College, Oxford. In 1867 he was elected to a fellowship at Lincoln, which he vacated on his marriage in 1870. In 1868 he became an assistant master at Harrow, but in 1873 he returned to Oxford, and was elected to a fellowship at Corpus. In 1878 he was appointed to succeed Edwin Palmer in the professorship of Latin, which post he held till his death at Oxford on the 10th of July 1893. NettleShip had been from the first attracted to the study of Virgil, and a good deal of his time was devoted to his favourite poet. After Conington's death in 1869, he saw his edition of Virgil through the press, and revised and corrected subsequent editions of the work. In 1873 he had undertaken to compile a new Latin lexicon for the Clarendon Press, but the work proved more than he could accomplish, and in 1887 he published some of the results of twelve years' labour in a volume entitled *Contributions to Latin Lexicography,* a genuine piece of original work. In conjunction with J. E. Sandys, NettleShip revised and edited Seys-Sert's Dictionary of Classical Antiquities, and he contributed to a volume entitled *Essays on the Endowments of Research,* an article on "The Present Relations between Classical Research and Classical Education in England," in which he pointed out the great value of the preparatory school. In the *Lectures and Essays* which he compiled in 1889 for the Clarendon Press, in *Lectures and Essays on Subjects connected with Latin Literature and Scholarship,* NettleShip revised and republished some of his previous publications. A second series of these, published in 1895, and edited by F. Haverfield, contains a memoir by Mrs M. NettleShip, with full bibliography.

**NETTELY, RICHARD LEWIS** (1846-1898), English philosopher, youngest brother of Henry NettleShip, was born on the 17th of December 1846, and educated at Uppingham and Balliol College, Oxford, where he held a scholarship. He won the Hertford scholarship, the Ireland, the Gaisford Greek verse prize, a Craven scholarship and the Arnold prize, but took only a second class in Litterae Humaniores. He became fellow and tutor of his college and succeeded to the work of T. H. Green, whose writings he edited with a memoir (London, 1886). He left an unfinished work on Plato, part of which was published after his death, together with his lectures on logic and some essays. His thought was idealistic and Hegelian. His literary style was excellent; but, though he had considerable personal influence on his generation at Oxford, a certain nebulosity of view prevented his making any permanent contribution to philosophy. He was fond of music and outdoor sports, and rowed in his college boat. He died on the 25th of August 1892, from the effects of exposure on Mont Blanc, and was buried at Chamounix.

**NETTE TREE,** the name applied to certain trees of the genus *Celtis,* belonging to the family or natural order Ulmaceae. The best-known species have usually obliquely ovate, or lanceolate leaves, serrate at the edge, and marked by three prominent nerves. The flowers are inconspicuous, usually hermaphrodite, with a 4- or 5-parted perianth, as many stamens, a hairy disk and a 1-celled ovary with a 2-parted style. The fruit is succulent like a little drupe, a character which serves to separate the genus *Celtis* from the nettles and the elms, to both of which it is allied. *Celtis australis* is a common tree, both wild and planted, throughout the Mediterranean region extending to Afghanistan and the Himalayas; it is also cultivated in Great Britain. It is a rapidly growing tree, from 30 to 40 ft. high, with a remarkably sweet fruit, recalling a small black cherry, and was one of the plants to which the term "lotus" was applied by Dioscorides and the older authors. The wood, which is compact and hard and takes a high polish, is used for a variety of purposes. *C. occidentalis,* a North American species, is the hackberry (q.v.).

**NETTUNO,** a fishing village of the province of Rome, Italy, 2 m. E.N.E. of Anzio by rail, and 90 m. S.S.E. of Rome, 36 ft. above sea-level. Pop. (1901) 3406 (town), 5072 (commune). It has a picturesque castle built by Alexander VI. from the ruins of one formerly belonging to the Montalto family. It is said to have been a Saracen settlement. The picturesque costume of the women is now worn only at festivals. To the E. on the sandy coast on the way to Astur is a military camp and a range for the trial of field artillery.

**NETZE,** a river of Germany, having a small portion of its upper course in Poland. It is a right-bank tributary of the Warthe, and rises in the low-lying lake district, through which the Russo-German frontier runs, to the south of Inowrazlaw. The frontier crosses Lake Gopolke, which is not far from the source of the Netze, which on leaving it (in Prussian territory), flows
north-west to the Tralger lake, and continues thereafter in the same general direction, but with wide fluctuations, to Nakel. Here it joins the Bromberg canal, which gives access to the river Brate and so to the Vistula. The Netze then turns west-south-west and waters the moorland (much of which, however, has been brought under cultivation) known as the Netzbruch. It joins the Warthe at Zantoch, after a course of 273 m. It is navigable for 1130 m. up to the Bromberg canal and the Boiten for smaller boats for 40 m. up to Pakosch on the Tralger lake. Its drainage area is 5,400 sq. m. From 1772 to 1807 that part of Poland which was given to Prussia at the first partition was known as the Netze District, as it extended along the Netze. It was almost all given back to Russia at the peace of Tilsit, but was restored to Prussia in 1815 under the treaty of Vienna.

**NEU-BRANDENBURG.** A town of Germany, in the grand duchy of Mecklenburg-Strelitz, is situated on a small lake called the Tollense See, 58 m. N.W. of Stettin by rail. Pop. (1905) 31,443. It is still partly surrounded with walls, and possesses four interesting old Gothic gates, dating from about 1300. The principal buildings are the Marienkirche, a Gothic building of the 13th century, the Johannis kirche, the town-hall and the grand ducal palace. It possesses a bronze statue of Fritz Reuter (1803); a monument to Bismarck (1895); another commemorating the war of 1870-1 (1895); a small museum of antiquities; and an art collection. On the other side of the lake is the grand-ducal palace, Belvedere. Iron-founding, machine-making, wool-spinning and the making of paper, tobacco and musical instruments, and the trade in wool and agricultural products is considerable. The horse fair is also important. Neu-Brandenburg was founded in 1248, and has belonged to Mecklenburg since 1202.

See Boll, Chronik der Vorderstadt Neubrandenb (1875).

**NEUBREISACH.** A town and fortress of Germany in the imperial province of Alsace-Lorraine, situated on the Rhine-Rhone canal, 12 m. E. from Colmar by the railway to Freiburg-im-Breisgau. Pop. (1905—excluding a garrison of 2300 men) 3520. It is built in the form of a hexagon, and together with Fort Mortier, which lies on an arm of the Rhine-opposite, forms a place of great strategic strength. It contains an Evangelical (garrison) church, a Roman Catholic church and a non-commissioned officers' school. There are electrical works in the town.

Neubreisach was founded by Louis XIV. In 1699 and fortified by Vauban, the Neubreisacher canal being constructed to transport the necessary materials. In the Franco-German War, it was bombarded by the Germans from the 2nd to the 10th of November 1870, when it capitulated.

See Wolff, Geschichte des Bombardements von Schlettstadt und Neubreisach (Berlin, 1871); and von Neuburg, Die Erinnerung von Schlettstadt und Neubreisach im Jahre 1870 (Berlin, 1876).

**NEUBURG,** a town of Germany, in the kingdom of Bavaria, is pleasantly situated on the Danube, 12 m. W. of Ingolstadt, on the railway to Neuoffingen. Pop. (1905) 8332. It is a place of ancient origin, but is chiefly noteworthy because formerly for two centuries it was the capital of the princedom of Pfalz-Neuburg. Its most important building is the old residence of its princes, the handsomest part of which is in the Renaissance style of the 16th century. The town also contains an Evangelical and seven Roman Catholic churches, a town hall, several schools and convents, a theatre, and an historical museum with a valuable library. It has electrical works and breweries, while fruit and vegetables are cultivated in the neighborhood, a considerable trade in these products being carried on by the Danube.

Neuburg was originally an episcopal see. In the 10th century it passed to the counts of Scheyern, and through them to Bavaria, being ceded to the Rhenish Palatinate at the close of a war in 1507. From 1557 to 1742 it was the capital of a small principality ruled as a hereditary branch of the family of the elector palatine of the Rhine. This principality of Pfalz-Neuburg had an area of about 1000 sq. m. and about 100,000 inhabitants. In 1742 it was united again with the Rhenish Palatinate, with which it passed in 1777 to Bavaria.

See Gremmel, Geschichte des Herzogthums Neuburg (Neuburg, 1872); Führer durch die Stadt Neuburg und deren Umgebung (Neuburg, 1904).

**NEUCHÂTEL** (Ger. *Neuenburg*), one of the cantons of western Switzerland, on the frontier towards France. It is the only Swiss canton that is situated entirely in the Jura, of which it occupies the central portion (its loftiest summit is the Mont Racine, 4731 ft. in the Tête de Rang range). The canton has a total area of 311-8 sq. m., of which 267-1 sq. m. are reckoned "productive" (forests occupying 88-6 sq. m. and vineyards 44.4 sq. m.). It consists, for the most part, of the longitudinal ridges and valleys characteristic of the Jura range, while its drainage is very unequally divided between the Thiére or Zihl, and the Doubs, which forms part of the north-west boundary of the canton, and receives only the streams flowing from the Le Locle and La Chaux de Fonds valley. Three regions make up the territory. That stretching along the shore of the lake is called *Le Vignoble* (from its vineyards) and extends from about 1500 ft. to 2300 ft. above the sea-level. An intermediate region is named *Les Vallées*, for it consists of the two principal valleys of the canton (the Val de Ruz, watered by the Seyon, and the Val de Travers, watered by the Areuse) which lie to a height of about 2300 ft. to 3000 ft. above the sea-level. The highest region is known as *Les Montagnes*, and is mainly composed of the long valley in which stand the industrial centres of La Chaux de Fonds (q.v.), and Le Locle (q.v.) to which must be added those of La Sarthe, Les Ponts, and Les Verrières.

In 1571 the population numbered 126,270 souls according to the federal census (a cantonal census of 1906 makes the figure at that date 134,014), of whom 104,551 were French-speaking, 17,629 German-speaking and 566 Italian-speaking, while 107,201 were Protestants, 17,731 Romanists or Old Catholics, and 1020 Jews. There are three "established and state-endowed" churches, the National Evangelical (in 1907 a proposal to disestablish it was rejected by a huge majority), the Roman Catholic, and the Old Catholic (this sect in La Chaux de Fonds only), while the pastors of the Free Evangelical church and of the Jews (mostly in La Chaux de Fonds) are so far recognized as by the state as to be exempt from military service.

Besides the capital, Neuchâtel (q.v.), the chief towns are La Chaux de Fonds (the most populous of all), Le Locle and Fleurier (3740), the principal village in the Val de Travers. The most valuable mineral product is asphalt, of which there is a large and rich deposit in the Val de Travers, belonging to the state but worked by an English company. The wine of the Vignoble region (both sparkling and still) is plentiful and has a good reputation, the red wines of Neuchâtel, Boudry and Cornizol being largely exported, though the petit vin blanc of Neuchâtel is all but wholly consumed within the canton. Als Initiene is largely manufactured in the Val de Travers, but lace is no longer made there as of old. The well-known manufacturer of Suchard's chocolate is at Serrières, practically a suburb of the town of Neuchâtel, while in the canton there are also cement factories and stone quarries. The most characteristic industry is that of watch-making and the making of gold watch cases, which is chiefly carried on (since the early 18th century) in the highland valleys of La Chaux de Fonds and of Le Locle, as well as at Fleurier in the Val de Travers. At Courbet, also in the Val de Travers, there is a large factory of screws and knitting machines.

The canton is divided into 6 administrative districts, which
comprise 63 communes. The cantonal constitution dates in its main features from 1838, but has been modified in several important respects. The legislature or Grand Conseil consists of members elected (since 1893) in the proportion of one to every 1200 (or fraction over 600) of the population, and holds office for three years, while since 1906 the principles of proportional representation and minority representation obtain in these elections. Since 1906 the executive of 5 members (since 1882) or Conseil d'Etat is elected by a popular vote. The 2 members of the federal Conseil des États are named by the Grand Conseil, but the 6 members of the federal Conseil National are chosen by a popular vote. In 1876 the citizens have the right of "free referendum" as to all laws and important decrees, while since 1882 the same number have the right of initiative as to all legislative projects, this right as to the partial revision of the cantonal constitution dating as far back as 1848, the number in the case of a total revision having been raised in 1906 to 5000. We first hear of the novum castellum, regalisissimam sedem in the will (1011) of Rudolf III., the last king of Burgundy, on whose death (1032) that kingdom reverted to the empire. About 1034 the emperor Conrad II. gave this castle to the lord of seven castle towns. It was, however, only in 1070, under Frederic I. (or in his succum of establishing the domain permanently there in the 12th century and then taking the title of "count." In 1288 the reigning count resigned his domains to the emperor Rudolf, who gave them to the lord of Châlon-sur-Saône, by whom they were restored to the count of Neuchâtel on his doing homage for them. This act decided the future history of Neuchâtel, for in 1303 the house of Châlon succeeded to the principality of Orange by virtue of a marriage contracted in 1288. The counts gradually increased their dominions, so that by 1373 they held practically all of the present canton, with the exception of the lordship of Valangin (the Val de Ruz and Les Montagnes, this last region only colonized in the early 14th century), which was held by a cadet line of the house till bought in 1592.

In 1395 the first house ended in an heiress, who brought Neuchâtel to the count of Freiburg im Breisgau. As early as 1290 the reigning count had made an alliance with the Swiss Fribourg, in 1308 with Bern, and about 1324 with Soleure, but it was not till 1406 that an "everlasting alliance" was made with Bern (later in 1495 with Fribourg, and in 1501 with Lucerne). This alliance resulted in bringing the county into the Swiss confederation four decades later, while it also won for it a surname helping the Confederates from the battle of St Jakob (1444) onwards right down into the early 18th century. In 1457, through another heiress, the county passed to the house of the marquises of Baden-Hoehberg, and in 1504 similarly to that of Orleáns-Longueville (a bastard line of the royal house of France). From 1512 to 1529 the Swiss occupied it as the count was fighting for France and so against them. In 1532 the title of "prince" was taken, while by the treaty of Westphalia (1648) the principality became sovereign and independent of the empire. In 1539 (the very year Farel introduced the Reformation at Neuchâtel) the overlordship enjoyed by the house of Châlon-Orange passed by virtue of a marriage contracted in 1515, to that of Nassau-Orange, the direct line of which ended in 1702 in the person of William III., king of England. In 1707 the Longueville house of Neuchâtel also became extinct, and a great struggle arose as to the succession. Finally the parliament (states) of Neuchâtel decided in favour of Frederic I., the first king of Prussia, whose mother was the elder paternal aunt of William III., and so heiress of the rights (given in 1208) of the house of Châlon, to which the title had reverted on the extinction of the line of the counts of Neuchâtel. Thus the act of 1288 determined the fate of the principality, partly because Frederic I. was a Protestant, while the other claimants were Romanists. The nominal rule of the Prussian king (for the country enjoyed practical independence) lasted till 1857, with a brief interval from 1806 to 1814, when the principality was held by Marshal Berthier, by virtue of a grant from Napoleon. In 1814 its admission into the Swiss confederation was proposed and was effected in 1815, the new canton being the only non-republican member, just as the hereditary rulers of Neuchâtel were the last to maintain their position in Switzerland. This anomaly led in 1848 to the establishment (attempted in 1831) of a republican form of government, brought about by a peaceful revolution led by A. M. Piaget. A royalist attempt to regain power in 1856 was defeated, and finally, after long negotiations, the king of Prussia renounced his claims to sovereignty, though retaining the right (no longer exercised) to bear the title of "prince of Neuchâtel." Thus in 1857 Neuchâtel became a full republican member of the Swiss confederation.

Mattile, Monuments de l'histoire de Neuchâtel (3 vols., Neuchâtel, 1844-1848); and Histoire de la seigneurie de Valangin jusqu'a sa réunion à la directe, 1592 (Neuchâtel, 1892); Musée Neuchâtelois (published by the Cantonial Historical Society), from 1864; Le Patois neuchâtelois et ancien nariophone (Neuchâtel, 1895); A. Pfieghart, Die schweizerische Uhrenkunde (Lausanne, 1900); Histoire historique et monographique des communes du canton de Neuchâtel (Neuchâtel, 1897-1904).

NEUCHâTEL, capital of the above Swiss canton, situated near the north-east corner of the lake of Neuchâtel. It is the meeting-place of several important railway lines, from Bern past Kerzers (27 m.), from Bienne (19 m.), from La Chaux de Fonds (19 m.), from Pontarlier (in France), by the Val de Travers, 33 m., and from Yverdon 23 m. The railway station (1575 ft.) at the top of the town is connected by an electric tramway with the shore of the lake some 150 ft. lower. The older portion of the town is built on the steep slope of the Chaumont, and originally the waters of the lake bathed the foot of the hill on which it stood. But the gradual growth of alluvial deposits, and more recently the artificial embankment of the shore of the lake, have added much dry ground, and on this site the finest modern buildings have been erected. The 16th-century castle and the 13th-century collegiate church of Notre Dame (now Protestant) stand close together and were founded in the 13th century. Those who have visited the picturesque Scenic Railway, which winds through the town, to which they granted a charter of liberties in 1214. Among the buildings on the quays are the Musée des Beaux Arts (modern Swiss paintings and also various historical collections, including that of Desor relating to the Lake Dwellings), the Gymnase or Collège Latin (in which is also the museum of natural history and the town library), the university (refounded in 1866 and raised from the rank of an academy to that of a university in 1909), the École de Commerce and the post office. The town owes much to the gifts of citizens. Thus David de Pury (1750-1806) founded the town hospital and built the town hall, while James de Pury bequeathed to the town the villa in which the ethnographical museum has been installed (1904). In 1811 J. L. de Pourtalés (1722-1814) founded the hospital which bears his name, while in 1844 A. de Meuron (1780-1852) constructed the lunatic asylum at Préfargier, a few miles from the town. Among natives of the town are the theologians J. F. Ostervald (1663-1747) and Frédéric Godet (1812-1900), the geologist E. Desor (1851-1882), the local historian G. A. Matile (1807-1881) and the politicians A. M. Piaget (1802-1879) and C. de Plancy (1833-1900). Neuchâtel, by far the most cosmopolitan town in Switzerland, particularly because over 50% of the French is spoken there) attracts many foreign students, while the town is a literary centre. In 1900 Neuchâtel numbered 20,843 inhabitants (in 1850 only 7277 and in 1870, 12,683), 15,277 being French-speaking and 4553 German-speaking; there were 17,237 Protestants, 3450 Romanists and 80 Jews. (W. A. B. C.)

NEUCHâTEL, LAKE OF. This lake, in W. Switzerland, is with the neighbouring lakes of Biécon and Morat (both connected with it by canals), the modern representative of the large body of water which at one time seems to have filled the whole of the lower valley of the Aar. It is now the most considerable sheet
of water which is wholly within Switzerland (since parts of those of Geneva and Constance belong to foreign countries), though it does not belong entirely to any one—of its total area of 928 sq. m., 364 sq. m. are in the Canton of Neuchâtel and rather over 33 sq. m. of that in Vaud, while Fribourg claims 283 sq. m. and Berne 2 sq. m. It is about 2135 m. in length, varies from 33 to 5 m. in width, and has a maximum depth of 303 ft., while its average is 143 ft. above sea level. It is mainly fed by the Thélle or Zihl river, which enters it at its southwestern end and issues from it at its north-eastern extremity, but it also receives, near its north-west end, the Areuse (flowing through the Val de Travers) and the Seyon (which traverses the Val de Vierne), as well as near its north-east end, the Broye (that flows through a canal from the Lake of Morat). Successive drainages have brought to light the remains of many lake dwellings, of which there is a good collection in the natural history museum at Neuchâtel. The scenery of the lake, though pleasing, cannot compare with that of the other Swiss lakes, despite the fact that from it the giants of the Alps, Blanc and Berthe, and of the Oberland ranges are clearly seen. The first steamer was placed on the lake in 1827. On the south-eastern shore the picturesque and historical little town of Estavayer is the chief place. At the south-western extremity of the lake is Yverdon (the Ébarvon of the Romans and the residence of the educationalist Pestalozzi, 1866-1825). Far more populated is the north-western shore, where, from S.W. to N.E., we find Grandson (famous for the battle of 1476 wherein Charles the Bold, duke of Burgundy, was defeated by the Swiss), Cortaillod (producing excellent sparkling wine), Serrieres (of which order the St. Benedictine monks claim to have made the first wine in Switzerland), and Neuchâtel itself. On the norther shore is La Tène, famous for the remarkable relics of the Iron Age that have been discovered there. (W. A. B. C.)

NEUENHAR, a spa of Germany, in the Prussian Rhine province, situated at the foot of a basalt peak, in the pleasant valley of the Ahr, 10 m. N.W. of Remagen on the Rhine by the railway to Adenau. Pop. (1909) 3388. It is well laid out, has an Evangelical and two Roman Catholic churches, and carries on a considerable trade in the red wines of the district. There are five alkaline springs with temperatures from 69° to 101° F., the waters of which are said to have medicinal properties. The use of the respiratory organs, gout, rheumatism and diabetes. In the immediate vicinity lies the Apollinaris spring. See Schmitz, Erfahrungen über Bad Neuenahr (5th ed., Ahreweiler, 1887); and Schwenke, Die Kurmitteil des Bades Neuenahr (Halle, 1900).

NEUENDORF, a village of Germany, in the province of Brandenburg, 2 m. E. from Potsdam, on the Nuthe, with a station on the railway from Berlin to Potsdam. Pop. (1905) 6877. The place has considerable industries, chief among which are carpenter-works, jute spinning and the manufacture of railway plant. Within its area lies the colony of Nowawes laid out by Frederick the Great in 1754.

NEUCHÂTLE, a town of eastern France, in the department of Vosges at the confluence of the Meuse and the Mosoun, 49 m. W.N.W. of Épinal by rail. Pop. (1906) 3924. The churches of St. Christopher (13th and 14th centuries) and St. Nicholas, the latter combining the Romanesque and Gothic styles and built above a Romanesque crypt, are of interest. A sub-prefecture, a tribunal of first instance and communal colleges are among the public institutions. Neuchâtel carries on wool-spinning and the manufacture of embroidery, naps and chains. The town, which is said to occupy the site of the Roman Neomagus, belonged in the middle ages to the dukes of Lorraine, ruins of whose castle are still to be seen. In 1641 it passed to France.

NUHALSCHILDEN, a town of Germany, in the province of Prussian Saxony on the Ohre, situated 18 m. N.W. from Magdeburg by the railway to Osbelefe and at the junction of a line to Eisleben. Pop. (1905) 10,421. It has an Evangelical church, a monument of a knight and a equestrian statue of Henry the Lion and a gymnasium. There are several active industries, notably the manufacture of majolica and terra-cotta wares, machinery, gloves, beer, malt, cheese and sugar, while large pig markets are held here.

See Behrends, Chronik der Stadt Neuhaldensleben (new ed., 1903).

NEUHOFF, THEODORE STEPHEN, Baron von (c. 1600-1756), German adventurer and for a short time nominal king of Corsica, was a son of a Westphalian nobleman and was born at Metz. Educated at the court of France, he served first in the French army and then with the Swedish army and the Dutch army and the Hanoverian army. Baron de Goeritz, minister to Charles XII., realizing Neuhoff's capacity for intrigue, sent him to England and Spain to negotiate with Cardinal Alberoni. Having failed in this mission he returned to Sweden and then went to Spain, where he was made colonel and married one of the queen's ladies-in-waiting. Deserting his wife soon afterwards he repaired to France and became mixed up in law's financial affairs; then he wandered about Portugal, Holland and Italy, and at Genoa he made the acquaintance of some Corsican prisoners and exiles, whom he persuaded that he could free their country from Genoese tyranny if they made him king of the island. He was made the king of the island in March 1736, but the Genoese having put a price on his head and published an account of his antecedents, he left Corsica in November 1736, ostensibly seeking foreign assistance. After trying in vain to raise a fleet of ships from the English government, he started off on his wanderings once more until he was arrested for debt in Amsterdam. On regaining his freedom he sent his nephew to Corsica with a supply of arms; he himself returned to the island in 1738, 1739 and 1743, but the combined Genoese and French forces and the growing strength of the party opposed to him again drove him to wandering about Europe. Arrested for debt in London he regained his freedom by mortgaging his "kingdom" of Corsica, and subsisted on the charity of Horace Walpole and some other friends until his death in London on the 11th of December 1756. His only son, Frederick (c. 1725-1797), entered the army of Provence and Great Britain, and afterwards acted as agent in London for the grand-duke of Württemberg.

Frederick wrote an account of his father's life, Mémoires pour servir à l'histoire de la Corse, and also an English translation, both published in London in 1769. In 1795 he published a Description of Corsica with an account of its union to the crown of Great Britain. See also Fitzgerald, King Theodore of Corsica (London, 1890).

NEUILLY-SUR-SEINE, a town of northern France, in the department of Seine, 33 m. N.W. of the centre of Paris, of which it is a suburb, between the fortifications and the inner city walls. Pop. (1901) 39,222. A castle at Neuilly, built by the count of Argenson in the 18th century, ultimately became the property and favourite residence of the duke of Orleans (Louis Philippe), the birthplace of nearly all his children, and the scene of the offer of the crown in 1830. The buildings were pillaged and burned by the mob in 1848. The park, which extended from the fortifications to the river, as well as the neighbouring park of Villiers (also belonging to the princes of Orleans), was broken up into building lots, and is occupied by many small middle-class houses and a few fine villas. Within the line of the fortifications, but on Neuilly soil, stands the chapel of St. Ferdinand, on the spot where the duke of Orleans died in 1842 from the results of a carriage accident. The stained-glass windows were made at Sèvres after designs by Ingres; the ducal cenotaph, designed by Ary Scheffer, was sculptured by de Triqueti; and the chapel also contains a "Descent from the Cross," by the last-named artist, and an angel executed in Carrara marble by the princess Marie d'Orléans, sister of the duke. The fine bridge, designed in the 18th century by Perronet, is noteworthy as the first level bridge constructed in France. The Galilani Institution, founded by the brothers Galilani for aged book-sellers, printers and others, has a commendation for its residents. The manufactures
include perfumery, chocolate, colours, varnish, automobiles, carpets, &c.

**NEUMANN, F. E.—NEUQUEN**

at Heidelberg, where he graduated Ph.D. After some experience in field-geology under C. W. von Glümbel he joined the Austrian Geodetical survey in 1864. Four years later he returned to Heidelberg but in 1873 he was appointed paleontologist in Vienna, and occupied this post until his death on the 29th of January 1890. His more detailed researches related to the Jurassic and Cretaceous Ammonites and to the Tertiary freshwater mollusca; and in these studies he sought to trace the descent of the species. He dealt also with the zones of climate during the Jurassic and Cretaceous periods, and endeavoured to show that the equatorial marine fauna differed from that of the two temperate zones, and the latter from that of the arctic zone, much as the faunas of similar zones differ from each other in the present day; see his "Über klimatische Zonen während der Jura und Kreidezeit" (Denkschr. K. Akad. Wiss. Wien, 1883); he was also author of Erdgeschichte (2 vols., 1887); and Die Sämmtle des Thierreiches (vol. 1 only, 1889).

**NEUMÜNZER, a town of Germany, in the Prussian province of Schleswig-Holstein, lies on both banks of the small river Schwale, in the basin of the Stör, 40 m. N. of Altona-Hamburg by rail, and at the junction of lines to Kiel, Varntrup (Denmark) and Lübeck-Rostock. It was occupied in 1793. It has an Evangelical and a Roman Catholic church, and several schools. It is situated near Altona, the most important industrial town in the province, and contains extensive cloth-factories, besides manufactories of leather, cotton, wadding, carpets, paper, machinery, beer and sweetmeats. Its trade is also brisk. The name, which was originally Wipendorp, is derived from an Augustine monastery, founded in 1130 by Vicelin, the abbot of Holstel, and is mentioned as “novum monasterium” in a document of 1346. Its industrial importance began in the 17th century, when the cloth-weavers of Segeberg, a town to the south-east, migrated to it. It became a town in 1836.

See Kirmis, Geschichte der Stadt Neumünster (1900); and Dittmann, Aus dem alten Neumünster (1879).

**NEUNKIRCHEN, or OBEN-NEUNKIRCHEN, a town of Germany, in the Prussian Rhine province, on the Blies, 12 m. N.W. of Saarbrücken by rail. Pop. (1905) 32,358, consisting almost equally of Protestants and Roman Catholics. It contains two Gothic Evangelical and a Romanesque Roman Catholic church, several schools, and a monument to Freiherr von Stumrn (d.1901), a former owner of the iron-works here. The principal industrial establishment is a large iron foundry, employing upwards of 4,500 hands, and producing about 3,250,000 tons of pig-iron per annum; and there are boiler-works, saw-mills, soap manufactories and a brewery. Around the town are important coal mines from which about 2½ million tons of coal are raised annually. The castle built in 1570 was destroyed in 1797, and is now a ruin. The town is first mentioned in 1280, and became important industrially during the 18th century.

**NEUQUEN, an inland territory of Argentina on the Chilian frontier, between the Colorado and Limay rivers, with the province of Mendoza on the N. and the territory of Rio Negro on the E. and S. Area, 42° 34' 59' S. Pop. (1890) 14,517; (1904, estimate) 18,022. The greater part of the territory is mountainous, with fertile, well-watered valleys and valuable forests. The eastern part, however, contains large barren plains, showing some stunted vegetation, and having numerous saline deposits. Long drouths prevail in this region and there is no inducement for settlement, the nomadic Indians visiting it only on their hunting expeditions. Guanacos and Argentine hares are found in abundance in Neuquen, and to a lesser degree the chinchilla and American opossum. The Neuquen, which unites with the Limay near the 68th meridian to form the Rio Negro, is the principal river of the territory. The largest of a group of beautiful lakes in the higher Andean valleys is the celebrated Nahuel-Huapi (Lion Grass), which is nearly 50 m. long from E. to W. and about 20 m. from N. to S. at its widest part, and which lies partly in the S.W. angle of the territory, partly in Rio Negro, and partly in the republic of Chile. It is the source of the Rio
Limay and receives the overflow from two smaller neighbouring lakes. The temperature of the Andean region is cold even in summer, but on the lower plains it is hot in summer, and only moderately cold in winter. The principal industry is the raising of stock for the Chilean markets, as there is little cultivation. Cereals, forage crops, vegetables and fruits of the cold temperate zone can be produced easily, but distance from markets and lack of transport have restricted their production to local needs. The principal means of transport is by a light-draft river steamer which ascends the Rio Negro to Fort Roca at the confluence of the Limay and Neuquen, and by a branch of the Great Southern railway from Bahia Blanca to the same point. The population is concentrated in a few small towns on the rivers and in some colonies, established by the national government to check Chilean invasions, in the fertile districts of the Andes. A majority of the population, however, is of Chilean origin. The capital is Chos Malal, a small town on the upper Neuquen, in the mountainous district in the northern part of the territory.

NEURALGIA (Gr. νευρα, nerve, and άγων, pain) denotes strictly the existence of pain in some portion or throughout the whole of the distribution of a nerve without any distinctly recognizable structural change in the nerve or nerve centres. This strict definition, if adhered to, however, would not be applicable to a large number of cases of neuralgia; for in not a few instances the pain is connected with some source of irritation, by pressure or otherwise, in the course of the affected nerve; and hence the word is generally used to indicate pain affecting a particular nerve or its branches from any cause. There are few ailments which give rise to greater distress than this condition of pain usually between a depressed or enfeebled state of health. It is often found to affect the hereditarily rheumatic or gouty. In weakened conditions of the system from improper or insufficient food, or as a result of any drain upon the body, or in anaemia from any cause, and in such diseases as syphilis or malaria, neuralgia is a frequent concomitant. Any strain upon the nervous system, such as mental overwork or anxiety, is a potent cause; or exposure to cold and damp, which seems to excite irritation in a nerve already predisposed to suffer. But irritation may be produced by numerous other causes besides this—such as decayed teeth, disease of bone, local inflammations in which nerves are implicated, by some source of pressure upon a nerve trunk, or by swelling of its sheath in its passage through a bony canal or at its exit upon the surface.

The pain is generally localized, but may come to extend beyond the immediate area of its first occurrence. It is usually of paroxysmal character, and not infrequently periodic, occurring at a certain time of the day or night. It varies in intensity, being often of the most agonizing character, or less severe and more of a tingling kind. Various forms of perennial nerve function may be found co-existing with or following neuralgia. Thus there may be hyperaesthesia, anaesthesia, paralysis, or alterations of nutrition, such as wasting of muscles, whitening of the hair, &c.

The forms in which neuralgia most commonly shows itself are facial neuralgia or tic douloureux, migraine (hemiplegia or brow ague), intercostal neuralgia and sciatica.

Facial neuralgia, or tic douloureux, affects the great nerve of sensation of the face (fifth nerve), and may occur in one or more of the three divisions in which the nerve is distributed. It is usually confined to one side. When the first or upper division of the nerve is involved the pain is mostly felt in the forehead and side of the head. It is usually of an intensely sharp, cutting or burning character, either constant or with exacerbations, and often periodic, returning at a certain hour each day while the attack continues. The skin over the affected part is often red and swollen, and, even after the attack has abated, feels stiff and tender to the touch. In this, as in all forms of neuralgia, there are certain localities where the pain is more intense, these "painful points," as they are called, being for the most part in those places where the branches of the nerves emerge from bony canals or pierce the fascia to ramify in the skin. Hence, in this form, the greater severity of the pain above the eyebrow and along the side of the nose. There is also pain in the eyelid, redness of the eye, and flow of tears. When the second division of the nerve is affected the pain is chiefly in the cheek and upper jaw, the painful points being immediately below the lower eyelid, over the cheek bone, and about the upper lip. When the third division of the nerve suffers the pain affects the lower jaw, and the chief painful points are in front of the ear and about the chin.

Hemianopia, migraine, brow-ague and sick headache are various terms employed to describe what by some is considered to be another form of neuralgia. An attack may come on suddenly, but, in general, begins by a dull aching pain in the brow or temple, which steadily increases in severity and extent, but remains usually limited to one side of the head. It attains at times an extreme degree of violence, and is apt to be aggravated by movement, loud noises or bright light. Accompanying the pain there is more or less of nausea, and when the attack reaches its height vomiting may occur, after which relief comes, especially if the head is massaged. An attack of this kind may last for a few hours or for a whole day, and after it is over the patient feels comparatively well. It may recur periodically, or, as is more common, at irregular intervals. During the paroxysms, or even preceding them, certain sensory disturbances may be experienced, more especially affections of vision, such as ocular spectras, hemiopia, diplopia, &c. Gout, eyestrain and intestinal toxanmia have been put forward as causes of migraine, and Sir W. Gowers regards it as the equivalent of a true epileptic attack.

Intercostal neuralgia is pain affecting the nerves which emerge from the spinal cord and as they emerge the spaces between the ribs. The pain is felt along the front of the body. This form of neuralgia affects the left side more than the right, is much more common in women than in men, and occurs generally in enfeebled states of health. It might be mistaken for pleurisy or some inflammatory affection of the lungs; but the absence of any chest symptoms, its occurrence independently of the acts of respiration, and other considerations well establish the distinction. The specially painful points are chiefly at the commencement of the nerve as it issues from the spinal canal, and at the extremities towards the front of the body, where it breaks up into filaments which ramify in the skin. This form of neuralgia is occasionally the precursor of an attack of a shingles (Herpes zoster) as well as a result of it.

Sciatica is another of the more common forms of neuralgia. It affects the great sciatic nerve which emerges from the pelvis and runs down the leg to the foot. It is in most instances traceable to exposure to cold or damp, to overuse of the limbs in walking, &c. Any source of pressure upon the nerve within the pelvis, such as may be produced by a tumour or even by constipation of the bowels, may excite an attack of sciatica. It is often connected with a rheumatic or gouty constitution. In general the nerve of one side only is affected. The pain which is felt: at first a little behind the hip-joint steadily increases in severity and extends along the course of the nerve and its branches in many instances as far as the toes. The specially painful points are about the knee and ankle joints; besides which a feeling of numbness is experienced throughout the whole limb. In severe cases all movement of the limb aggravates the pain, and the patient is obliged to remain in bed. In prolonged attacks the limb may waste and be drawn up and fixed in one position. Attacks of sciatica are often attended with great sufferings, and are apt to be very intractable to treatment. In the treatment of all forms of neuralgia it is of first importance to ascertain if possible whether any constitutional morbid condition is associated with the malady. When the attack is periodic the administration of a large dose of quinine two or three hours previous to the usual time of the seizure will often mitigate, and may even prevent the paroxysm. Many topical applications are of great efficacy. Liniments containing opium, belladonna or aconite rubbed into the affected part will often soothe the most severe local pain. And antipyrin, phenacetin, aspirin and similar analgetics are commonly taken. The plan at one time resorted to of dividing or excising a portion of the affected nerve is now seldom employed, but the operation
of nerve-stretching in some forms of neuralgia, notably sciatica, is sometimes successful. It consists in cutting down upon and exposing the nerve, and in seizing hold and drawing upon it so as to stretch it. Such an operation is obviously justifiable only in cases where other less severe measures have failed to give relief. The employment of electricity, in long continued and intractable forms of neuralgia, proves in many instances eminently serviceable. In the severest forms of tic doloreux complete relief has followed the extirpation of the Gasserian ganglion.

NEURASTHENIA (Gr. νευρατος, nerve, and ασθεσις, weakness), the general medical term for a condition of weakness or nervous ferment.

The symptoms may present themselves as follows: (1) general feeling of malaise, combined with a mixed state of excitement and depression; (2) headache, sometimes with the addition of vertigo, deafness and a transitory clouding of consciousness simulating petit mal or migraine; (3) disturbed and restless, unrefreshing sleep, often troubled with dreams; (4) weakness of memory, especially for recent events; (5) blurring of sight, noises or ringing in the ears; (6) variable disturbances of sensibility, especially scattered anaesthesia (partial or complete loss of the sense of touch) in the hands especially, and in women the breasts; (7) various troubles of sympathetic origin, notably localized coldness, particularly in the extremities, morbid heats, flushings and sweats; (8) various phenomena of nervous depression associated with functional disturbances of organs, e.g. muscular weakness, lack of tone, and sense of fatigue upon effort, dyspepsia and gastric atony with dilatation of the stomach and gastralgia; pseudo-anginal attacks and palpitation of the heart; loss of sexual power with nocturnal pollutions and premature ejaculations leading to apprehension of oncoming impotence. Objective signs met with in organic disease are absent, but the knee-jerks are usually exaggerated.

According to the complexity of symptoms, the neurasthenia is more particularly defined as cerebral, spinal, gastric and sexual. The cerebral form is sometimes termed psychasthenia, and is liable to present morbid fears or phobias, e.g. agoraphobia (fright in crowds), monophobia (fright of being alone), claustrophobia (fright of being in a confined place), anthropophobia (fright of society), batophobia (fright of things falling), siderodromophobia (fright of railway travelling). There may also be motoric ruminations, in which there is something connective from the above connected ideas from which there is, no breaking away, often most insistent at night and leading to insomnia. Sometimes there is arthromania (an imperative idea to count). Such cases often exhibit a marked emotionalism and readily manifest joy or sorrow; they may be cynical, pessimistic, introspective and self-centred, only able to talk about themselves or matters of personal interest, yet they frequently possess great intellectual ability, and although there may be mental depression, there is an absence of the insane ideas characteristic of melancholia.

Traumatic neurasthenia is the neurasthenia following shock from injury; it is sometimes termed "railway spine," "railway brain," from the frequency with which it occurs after railway accidents, especially in people of a nervous temperament. The physical injury at the time may be slight, so that the patient is able to resume work, but symptoms develop later which may simulate serious organic disease. As in all forms of neurasthenia, the subjective symptoms may be numerous and varied, whereas the objective signs are but few and slight. Many difficulties, therefore, present themselves in arriving at a sound opinion as to the future in such cases. It is desirable not only to study the case carefully, but to obtain some knowledge of the previous history of an individual who is claiming damages on account of traumatic neurasthenia.

NEUROTI, an ancient tribe placed by Herodotus (iv. 105) to the north-east of Scythia. He says of it that it is not Scythian, but has Scythian customs. Every member of it, being a wizard, becomes a wolf once a year. The position assigned to their district appears to be about the head waters of the Dniester and Bug (Bugh) and the central course of the Dnieper just the region which, on general grounds, place-names, recorded migra-

tions and modern distribution, appears to be the original location of the Slavs (q.v.). The wolf story again recalls the tales of werewolves so common among Slavonic peoples, and there's much probability in Schafarik's conjecture that the Neuri are nothing but the ancestors of the Slavs.

( E. H. M.)

NEURITIS (Gr. νευρως, nerve, and νηρις, bundle of nerve fibres), a term applied to the inflammation of one or more bundles of nerve fibres. Two varieties are known, the localized and the multiple. The localized form frequently follows on exposure to cold and may attack a single nerve. Facial paralysis (Bell's palsy) is commonly seen following a neuritis of the facial nerve. Neuritis may follow blows and is a nervous feature of severe or long continued pressure such as may occur in a dislocation of the elbow joint, or the nerve may share in the extension of a neighbouring inflammation. The first symptom of a localized neuritis is pain of a boring character along the course of a nerve and its distribution, the part being sensitive to pressure. There may be slight redness and oedema along the course of the nerve, movement becomes painful in the muscles to which the nerve is distributed, numbness may follow and the tactile sense be impaired, finally the muscles atrophy, and degenerative changes appear in the nerve cell. In time the pain may disappear, the feeling cold or injury may pass off in a few days, while severe cases such as those following the pressure of an unreduced dislocation may last for months.

Multiple neuritis or polyneuritis is a disease which may affect many of the peripheral nerves symmetrically and at the same time. For the pathological changes see NEUROPATHOLOGY. The difference in these changes is due mostly to the difference in the aetiology of the neuritis. The causes may be divided as follows:

1. The toxins of acute infective diseases, such as diphtheria, meningitis, typhoid fever, smallpox, scarlet fever and septicemia.
2. Acute or chronic poisoning by lead, arsenic, mercury, copper and phosphorus.
4. The local action of leprosy and syphilis.
6. Alcohol, the most common.

Alcoholic neuritis occurs as a result of constant steady drinking, particularly in those who drink beer rather than spirit. The earliest symptom is numbness of the feet and later of the hands, then painful cramps in the legs appear and there is pain on moving the limbs, or the patient complains of deafness, tingling and burning in the hands and feet, and superficial tenderness is occasionally present. In other varieties of the disease the earliest symptoms are weakness of the legs or internal organs, and the patient has a feeling of giving way, or marked inco-ordination of movement may occur and the gait become ataxic. Trophic changes soon appear, in some cases early and rapid muscular wasting occurs, the skin becomes dry and cold, and the nails become yellow. In time bony acro-structures takes place, the hip and knee-joints become flexed and the foot dropped at the ankle. In cases that recover there may be permanent deformity of the cases, the calves may become bedridden and powerless, and degenerative mental changes may take place, loss of memory, irritability of temper and emotional instability. Various complications such as bronchitis, fatty changes in the heart, albuminuria and a liability to pulmonary tuberculosis, tend to carry off the victim of chronic alcoholic neuritis. Cases seen early in the progress of the disease, who can be placed under supervision, may recover under treatment, but those in whom the disease has been neglected a great number of cases in whom there is mental impairment rarely make a complete recovery. The treatment consists in putting the patient to bed, with the administration of sedatives. The hypodermic syringe becomes the hypodermic syringe is the key to the position of the limbs so as to avoid the development of contractures. Cradles being used, the limbs kept in the correct positions by sand-bags, and gentle massage being employed as soon as possible. Should contractures have already formed some mechanical device adapted to stretch the contracted muscle must be resorted to. Biers' hyper-aeremic suction apparatus is very useful in the painless stretching of the limbs. To prevent adhesions, of course. Should adhesions have to be broken down under an anaesthetic, extension apparatus may have to be worn. In the later treatment the galvanic and faradic currents combined with massage are useful in helping to restore the wasted muscles. Cold hots, air baths and warm applications are appreciated. Arsenical neuritis mostly affects the lower extremities, as contrasted with lead, which mainly paralyses the fingers and wrists; recovery is even slower than in alcoholic neuritis, the treatment being of the same line, with the removal of the cause of the disease. In the neuritis of chronic lead poisoning a fine tremor of the hands is an early symptom and sensory symptoms are usually absent; the muscles affected are the extensors of the wrists, thumb and fingers.
The course of the disease is long, and an attempt should be made to eliminate the lead from the system by purgatives and the administration of potassium iodide.

The diabetic neuritis paraesthesia is slight, and the legs are chiefly affected. Paresthesia and ataxia may be present. Soreness on the soles are of frequent occurrence in this variety. The treatment is that of the disease.

Post-diphtheritic neuritis occurs in about 10% of all cases of diphtheria and is fatal in 30%; it is unilateral in the earliest stage, and this may be the only one, or the pharynx may be affected. The limbs are affected much later, usually about the 5th or 6th week. Atrophy of the muscles is frequently rapid. If the respiratory muscles are unaffected the prognosis is good, but the paralysis of the limbs may last for several months. The treatment is complete rest, good food and the administration of strychnine.

A neurologic symptom, ataxia, and motor weakness has been noted after influenza, together with slight muscular wasting and electrical degeneration. Later, loss of sensation in the peripheral portion of the limbs is complained of, and the motor weakness may affect the muscles of the trunk and face. Such cases tend towards complete recovery.

**NEUROPATHOLOGY**, the general name for the science concerned with diseases of the nervous system. As regards the anatomy and physiology, see the articles Nerve, Nervous System, Brain, Spinal Cord, and Sympathetic System. The morbid processes affecting the nervous system are numerous and variously modified by diseases extending into the nervous system, whether (1) organic disease, (2) functional disturbance. Such a classification depends upon whether or not symptoms observed during life can be associated with recognizable changes of the nervous system, gross or microscopical, after death. Sometimes this is the morbid process itself, sometimes only the ultimate result of the process. It must be remarked, however, that many diseases which we now look upon as functional may be found due to recognizable changes when suitable methods of investigation shall have been discovered. The paroxysmal neurones and psychoses may be considered a priori to be due to temporary morbid functional conditions. Our knowledge of the first group has naturally much more advanced than of the latter, for, given certain symptoms during life, we are able, as a rule, to predict not only the nature of the morbid process, but its particular locality.

The histological elements which make up the nervous system may also be divided into two groups: (1) the neurones or neurons, (2) the supporting, protecting and nutrient tissues. Organic diseases may start primarily in the nervous units or neurones and cause their degeneration; such are true diseases of the nervous system. But the nervous units may be affected secondarily by diseases existing in the supporting, protecting and nutrient tissues of the nervous system; such are essentially diseases within the nervous system, and include diseases of the blood-vessels, lymphatics, membranes and the special nervous connective tissue, neuroglia (a residue of the embryonal structure from which the nervous system was developed). Tumours and new growths must also be included.

The modern conception of the “neuron” as an independent complex cell with branching processes, in physiological rather than anatomical association with other neurones, has modified our ideas of the morbid processes affecting the nervous system, especially as regards degenerations of systems, communities or collections of neurones subserving special functions. It was formerly believed, and generally taught, that the primary systemic degenerations were due to a sclerosis; thus locomotor ataxy was believed to be caused by an overgrowth of the supporting glia tissue of the posterior column of the spinal cord, which caused a secondary atrophy of the nervous tissue. We now know that this overgrowth of glia tissue is secondary to the atrophy of the nervous elements, and the only true primary overgrowth of glia tissue is really of the nature of the new growth (glio). But even in this case it is doubtful if the mere proliferation of the glia tissue elements could destroy the nervous elements, if it were not for the fact that it leads to changes in the vessel walls and to ischaemorrhages.

The symptoms manifested during life depend upon the nature of the morbid process and the portion of the nervous system affected. A correct understanding of neuropathology involves the study of (1) the causes which give rise to morbid conditions, which are often complex and due to various combinations of causative factors within the body, and (2) the changes in the structure and function of the nervous system brought about by intrinsic and extrinsic causes.

The causes of pathological processes occurring in the nervous units (neurones) may be divided into internal and external, and it may be remarked that in all cases except direct injury the two groups are generally more or less combined.

**A. Internal Causes.**—Of all the causes of nervous disease hereditary predisposition stands pre-eminently first; it may be congenital, paternal, maternal; from grandparents or even remote ancestors. Moreover, no study of heredity is complete if it does not consider the rôle of the family, or the fact that both the diseases, and the predisposition to them, are of interest inasmuch as they affect members of a family, the same disease frequently commencing in each individual at about the same time. These are termed family diseases, and include hereditary ataxia (Friedreich's disease), hereditary (Huntingdon's) chorea, amaurotic idiocy and various forms of idiopathic muscular atrophy. Alcoholism, tuberculous, syphilitic, and in general all diseases in which there may be constitutional alteration in the body or nervous system, may produce a morbid condition of the nervous system, especially those which are latent and of neuritic symptoms. Such sympathetic changes in the nervous system have been observed in many diseases, and it is essential that these symptoms should be recognized, for it is necessary to change the general administration of the patient, and the habits of life. Many diseases, e.g. epilepsy, migraine, hysteria and neurotism; and to psychoses, e.g. delusional insanity, mania and melancholia, manic-depressive, recurrent or periodic insanity and dementia-precox or adolescent insanity.

In 70% of 150 cases of idiocy or imbecility in the London county asylums, Dr Tredgold found that the presence or absence, a hereditary condition, had some bearing on the intellectual condition of the patient, and that the inheritance of this condition was more than one. Strictly speaking, it is the tendency to nervous disease rather than the disease itself that is inherited, and this is frequently spoken of as a neuropathic or psychopathic taint. There are, however, a fair number of diseases which are hereditary, rare, are of interest inasmuch as they affect members of a family, the same disease frequently commencing in each individual at about the same time. These are termed family diseases, and include hereditary ataxia (Friedreich's disease), hereditary (Huntingdon's) chorea, amaurotic idiocy and various forms of idiopathic muscular atrophy. Alcoholism, tuberculous, syphilitic, and in general all diseases in which there may be constitutional alteration in the body or nervous system, may produce a morbid condition of the nervous system, especially those which are latent and of neuritic symptoms. Such sympathetic changes in the nervous system have been observed in many diseases, and it is essential that these symptoms should be recognized, for it is necessary to change the general administration of the patient, and the habits of life. Many diseases, e.g. epilepsy, migraine, hysteria and neurotism; and to psychoses, e.g. delusional insanity, mania and melancholia, manic-depressive, recurrent or periodic insanity and dementia-precox or adolescent insanity.
B. The external causes producing morbid changes in the nervous elements are: I. Abnormal conditions of the blood and lymph, by which the neurones are poisoned and their metabolism morbidly affected. II. Excess or deficiency of normal stimulation, or existence of abnormal stimulation. III. Injury or diseases of supporting, enclosing or vascular tissues.

I. Abnormal Conditions of the Blood and Lymph.—The immediate environment of all the cellular elements of the body is lymph; and in the central nervous system there is a special form of lymph, the cerebro-spinal fluid, which is secreted by the choroid plexus in the ventricles and the habenular like other cerebro-spinal nerves, are bathed in the lymph, and extract from it the materials necessary for their growth and vital activities, casting out the waste products incidental to the biochemical changes which are continually taking place. The lymph, therefore, serves as a medium of exchange between the blood and the tissues, consequently the essential causes of change in environment of the nervous elements (neurones) are: (1) Deficiency or absence of blood-supply to the nervous system in general (as after severe haemorrhage), or to some particular portion, owing to local vascular disturbance or occlusion. (2) Alterations in the composition of the blood and lymph, e.g. (a) absence of certain essential constituents, (b) excess of certain normal constituents, (c) the presence of certain abnormal constituents produced within the body, or entering it from without.

1. Quantity of Blood Supply.—Syncope or fainting occurs when the blood supply suddenly fails to reach the higher centres of the brain; this usually arises from sudden reflex arrest of the heart’s action. If the brain is deprived of oxygen it suffers. The effect of an insufficient blood supply by emboletic plugging or by clotting of the blood in a vessel with diseased walls, the portion of the brain substance thus deprived of blood undergoes softening, the nervous elements are destroyed and the sympathetic nerve fibres, which have had their trophic and genetic centres in the area destroyed, undergo secondary degeneration. Clotting of the blood in the veins may also give rise to destructive softening of the brain, and similar secondary degeneration.

2. Quality of Blood Supply.—(a) Insufficiency of oxygen, due to poverty of the colouring matter or of the number of the red corpuscles, which constitutes the various forms of anaemia, leads to functional depression, lassitude and mental fatigue. Impoverishment of the blood in women by frequent pregnancies and excessive lactation causes neuralgia, nervous exhaustion and, in the neuropath, hysteria, neurasthenia, neuritis and mental derangement. In the male the tendency that the various neurones and psychoses have to occur and recur at the time of the menstrual and climacteric periods in women, suggest the possibility of an alteration in the composition of the blood at these times. One such alteration is the condition known as “minimal deficiency,” as the probable contributory factor of the mental disturbance. It may be remarked that eclampsia, prepartum and postpartum, the relative compounding of insanity in women; although sometimes of septic origin, they more frequently are occasioned by some morbid metabolism as yet little understood. The most striking examples we have, however, of the effect of absence or “sub-minimal” deficiency of a necessary constituent of the blood upon the development and functions of the nervous system are afforded by cretinous idiots, who are born without thyroid glands, and whose brains never develop in consequence; and by those people who suffer from the disease known as myxedema, occasioned by the absence of iodinoid, a product of the internal secretion of the thyroid gland. The proof of this is shown by the disappearance of the symptoms of the disease with restoration of the gland, and a partial restoration of the mental faculties, e.g., after a preparation of the gland has been continuously administered by the mouth. Even cretinous idiots when subjected in early life to thyroid treatment improve considerably. The removal of the thyroid and the substitution of its action in the body by injection of thyrosin or animal extracts of the gland is the basis of thyroid therapy, which has been shown to be of value in the treatment of organic mental disease in children and adults. The most striking indication of the effect of this pathological condition is shown in the improvement of the general nervous temperament; for probably there is an internal secretion of this gland in the male, as of the ovary in the female, which has some influence upon the functional activity of the nervous system. The secretion of this gland may have some relation to a series of phosphorus-containing substances, which, lost to the body by sexual excess or onanism, have to be replaced by the blood; the necessity of these substances with respect to the brain is shown by the fact that, when specific compounds, is thereby robbed, and neuroasthenia ensues. Brown-Squard’s testicular injection treatment for many nervous complaints, based upon this idea, has not, however, met with much success.

(b) Excess of certain Normal Constituents in the Blood.—Excess of carbonic acid causes drowsiness, and probably in asphyxia is one of the causes of the convulsions. All the series of the nitrogenous waste products—the most highly oxidized, most soluble and least harmful of which is urea—are normal constituents of the blood; but should the oxidation process be incomplete, owing to functional or organic disease of the liver, or should these substances accumulate in the blood, owing to inadequate function of the kidneys, a toxic condition is produced under which the nervous manifestations which are headache, drowsiness, unconsciousness and convulsions, and sometimes symptoms of pyloric or uremic fever. Again, in Graves’s disease, nervous phenomena, in the form of exophthalmos, myxedema, and polyuria, polydipsia, and in particular, the calamine authorities have been explained by the excess of thyroid internal secretion, to the enlargement and increased functional activity of the gland. The successful treatment of Graves’s disease by the ablation of the thyroid gland and the introduction of thyroid extract (goats), which had the thyroid glands removed, supports this theory.

(c) The presence of abnormal constituents in the blood is a most interesting cause of nervous phenomena, every therapist might consider the subject under the following headings: Poisons produced within the body (a) by perverted function of organs or tissues, auto-intoxication; (b) by the action of micro-organisms, protozoa and higher organisms upon the living fluids and tissue; (c) poisons introduced into the body from without, in the food and drink, or by inhalation.

(a) Poisons resulting from perverted Function of the Organs.—In the process of digestion a number of poisonous substances, e.g. albumoses, &c., are produced, which, although absorbed in the alimentary canal, are prevented by the living epithelium, and possibly other barriers, from entering the blood. Fatigue products, e.g. sarcolactic acid in prolonged muscular effort lead to auto-intoxication. Excess of uric acid in the blood is associated with high arterial pressure, deposits of lithates in the urine, headache and renal and vascular disturbances. Excess of albumoses in the blood, resulting from obstructive jaundice, may be attended by stupor and psychical depression; and the term melancholia, signifying “black melancholy,” is applied to the condition of the patient as the liver is an organ the derangement of which causes nervous depression. The rapidly fatal results attending acute yellow atrophy of the liver, namely, the profound changes in the urine, the jaundice and the secondary complications, point out the danger of such cases. In the condition of coma, demonstrate the important part this organ plays in preserving the normal quality of the blood. The delirium and coma which sometimes supervene in diabetes, heralded by acetonuria, proves that the fundamental disease is one of the functions of the liver, due to the saturation of the sodium salts of the blood by aceto-acetic and oxo-butyric acids, products of imperfect proteid metabolism. The effect of this would be an interference with the elimination of the protein acid in the processes of tissue and pulmonic respiration. Again, in pernicious and certain grave anaemias, the degenerative changes in the spinal cord found in some cases is due, not so much to the destruction of the nerves, but to the deposits of oxalic acid, which probably arises from imperfect metabolism or absorption from the alimentary canal. In this question of auto-intoxication, it must be remarked that all the tissues of the body are mutually interdependent, and many diseases are secondary to the fundamental morbid condition, and is thereby apt to establish a vicious circle which is constantly enlarging; therefore nervous symptoms manifesting themselves in the course of the disease may be but symptoms of the primary condition.

(b) Poisons produced by Infective Micro-organisms.—Some of these poisons have a general devitalizing influence, by an alteration of the blood and the production of fever. In the course of the acute process, symptoms of phthisis, typhoid, scarlet fever, measles, influenza, also tuberculosis and septicaemia, delirium is a frequent complication; it may be the result of high fever or prolonged fever, or directly due to the poison, or the two combined. In severe cases stupor and coma may occur, and it has been shown that in this extreme stage the nerve cells undergo an acute morbid biochemical change. These particular poisons have no selective toxic action upon the nervous system, and the nervous symptoms are slow to develop, but, after the acute illness are liable to supervene, especially in a neuropathic individual. Thus many cases of neurasthenia, insanity, neuritis, also neuritis, date their origin from an acute infectious disease. In pneumonia, in which the lung and corresponding spinal cord, namely, locomotor ataxy, and the other affecting especially the frontal and central convolutions of the cerebral hemispheres, namely, general paralysis of the insane. A striking instance of the relation of organic disease of the nervous system to infection is in persons affected with acquired or inherited syphilis is a symptom known as Argyll-Robertson pupil found; this is the absence of the pupil reflex contraction to light, while that for accommodation, in the two diseases mentioned, it strengthens the presumption.
FIG. 1. Left hemisphere, case of delusional insanity; this in all respects might pass for a normal brain.

FIG. 2. Brain of a micro-cephalic idiot, which weighed only eight ounces although its possessor was an adult woman. The striking lack of development of the hemispheres is shown in their small size, whereby the cerebellum is almost entirely uncovered; moreover the convolutional pattern is simpler than that of an anthropoid ape's brain.

FIG. 3. Left hemisphere, case of abscess of the frontal lobe; the convolutions and sulci are obliterated and the membranes thickened, so that the fore part of the brain presents the appearance of a membranous bag; this contained a large amount of pus.

FIG. 4. Right hemisphere of a woman who for 11 years suffered with Motor aphasia paralysis of the lower half of the right side of the face, deviation of the tongue to the right and some weakness in the right leg and arm.

FIG. 5. Left hemisphere of a woman who for many years was the subject of sensory aphasia. The left hemisphere showed a similar lesion to the right but rather more extensive.

FIG. 6. Brain from a case of apoplexy: the tops of the hemispheres have been sliced off to show the hemorrhage (dark patch) in the right centrum ovale, which has ruptured the fibres proceeding from the motor area of the brain, situated between the basal ganglia.

FIG. 7. Left hemisphere: a case of advanced dementia, showing atrophy of the convolutions, with deep and wide sulci intervening.

FIG. 8. The brain of an adult congenital imbecile. There is a very simple convolutional pattern in comparison with the other brains shown in the figures. The convolutions are small, the secondary gyri are deficient in numbers. The sylvian fissure turns obliquely upwards and there is an obvious deficiency in the superior and inferior parietal lobes.

FIG. 9. Right hemisphere of a woman who for many years was the subject of sensory aphasia. The left hemisphere showed a similar lesion to the right but rather more extensive.

FIG. 10. Left hemisphere and cerebellum of a case of porencephaly. A local atrophy of the convolutions, owing to a vascular lesion before birth, is seen in the parietal lobe.
Fig. 1.—Trypanosoma gambiense in the blood from a case of sleeping sickness in a European. The undulatory membrane is clearly seen; the head of the organism with its micronucleus is in contact with a red blood corpuscle. Magnification 2000 diameters.

Fig. 2.—A. and B. The spirochaete pallidum. A shows the organisms seen in a section of mucous tubercle stained by Levaditi's silver method; the lowest with 8 equal spirals and a pointed end is the most typical. Magnification 1200. B. Spirochetes in a smear preparation stained by Leishman. Magnification 2260.

Fig. 3.—Section of the brain of a European who died of sleeping sickness, showing an enormous increase of large branching neuroglia cells around a small vessel of the cortex. Magnification 450.

Fig. 4.—Very marked syphilitic arteritis, showing great diminution of the lumen, mainly caused by an inflammatory thickening of the inner coat. Magnification 5.

Fig. 5.—Section of the base of the brain of a monkey that died of experimental sleeping sickness caused by inoculation of the Trypanosoma gambiense. Magnification 250.

Fig. 6.—Longitudinal section of a perivascular sheath of the cortex of a monkey that died of experimental sleeping sickness. The large branching neuroglia cells are seen undergoing proliferation. Magnification 600.

Fig. 7.—Longitudinal section of a small vessel of the cortex from a case of well-marked general paralysis of the insane. Magnification 250.

Fig. 8.—Transverse section of a small vessel of the cortex from a case of sleeping sickness, showing the perivascular cell infiltration of lymphocytes and plasma cells. Magnification 250.

Fig. 9.—Transverse section of a small vessel of the cerebral cortex from a case of syphilitic gummatous meningitis, showing the same perivascular cell infiltration of lymphocytes and plasma cells as seen in figs. 7 and 8. Magnification 250.
and syphilis. These changes were proliferation of the interstitial connective tissue cells forming the ganglion and hyperplasia of the lymphatic endothelial cells forming the capsule containing the nerve cells.

The diagram here given (fig. 1) after Volpino explains the supposed developmental cycle of the protozoan which is presumed to be the cause of rabies. The weak link in the chain is the assumed sporozoit which is so small as to be capable of passing through a Berkfeld filter. It has taken twenty years to lead to the complete knowledge of the life history of the malarial parasite and its relation to the disease, and all we can say is that there is now a certain amount of evidence forthcoming which tends to show that rabies is due to a protozoan, which Calkins, who discovered a similar body in the epithelial cells of variolas, places among the rhizopods.

There are certain chronic trypanosome infections in which the nevrosis becomes a specific feature of the disease, notably sleeping sickness (see Plate II, fig. 1) and a disease affecting horses, termed mal de coit or dourine.

The chronic trypanosome affections resemble in many respects syphilis; they are characterized by local infection, enlargement of the nearest lymphatic glands, a general polyadenitis and successive eruptions, accompanied by fever. The tissue changes are the same whether we examine the primary seat of infection, popular eruptions on the mucous membrane or the skin, or the lymphatic glands.

When the nervous system is affected a local or general chronic meningo-encephalitis is set up, characterized by a meningial and perivascular infiltration with lymphocytes and plasma cells, occasioned by a chronic irritative process, presumably caused in the case of sleeping sickness by the presence of trypanosomes in the cerebro-spinal fluid (see fig. 8, Plate II.). The same perivascular and meningeal infiltration with plasma cells and lymphocytes is found in syphilitic and parasplastic diseases of the nervous system (see Plate II., figs. 7 and 9).

The significance of pathological changes in the cerebro-spinal fluid has recently become of great importance in the diagnosis of nervous diseases, and a short account of the subject in this article will therefore not be out of place. The cerebro-spinal fluid is clear like water; it has a specific gravity of 1006 and resembles in its composition the blood with its corpuscular and albuminaceous constituents. It is secreted by the choroid plexus, and if any cause, such as tumour or meningitis, should interfere with its escape from the ventricles it gives rise by pressure to internal hydrocephalus and cerebral anaemia which may occasion epileptic convulsions and various degrees of drowsy stupor, lethargy, unconsciousness and even coma. Withdrawal of the fluid by lumbar puncture and by tapping the ventricles of the brain has been employed in treatment, but without very satisfactory results. If, however, lumbar puncture has proved of but little use in treatment, it has proved of inestimable service in the diagnosis of various kinds of diseases of the central nervous system. The fluid withdrawn may be examined in various ways which are complementary to one another.

It should be centrifuged and the deposit examined microscopically if necessary after staining by suitable methods; the existence of cells based on experience, that the syphilitic poison is the cause of these diseases of the majority of instances. Among syphilis, when it attacks the supporting, enclosing and nutrient vascular tissues, shows a predilection to affect structures about the base of the brain, and paralyses the third and fifth nerve of this character. Rabies, through the whole nervous system is charged with the poison, the medulla oblongata (as shown by the symptoms) is especially affected. Again, in tetanus the bacilli are only found in the muscles which have been destroyed by the animal's jerks; but they elaborate a virulent poison, which affects particular groups of neurons. The fact that lockjaw nearly always occurs first, shows that the poison selects the motor nucleus of the fifth nerve; but it is remarkable that experiment has shown that the tetanus toxin, if mixed with an emulsion of nervous matter before injection into an animal, loses its toxicity. This fact indicates its affinity for nervous matter, and also a power of absorption of the poison by some nervous matter, similar to that found by different procedures, is offered by diphtheria. A neuro-toxin is produced by the local action of the bacilli, for they do not become freely generalized in the blood and tissues. Whether the poison is a direct production of the bacilli themselves, or is an auto-toxin created in the body itself, by an influence exerted on the living fluids and tissues by a ferment-like product of the bacilli, is not determined. But whatever may be the source of the toxin, its effects upon the nervous system, as shown by the sufferings of the patients—paralysis of the soft palate, with nasal speech and regurgitation of fluids through the nose when swallowing is attempted; inability to read—owing to the paralysis of the visual and motor portion of accommodation; weakness of the supporting structure of the limbs, which may amount to paralysis; absence of the kneecaps; and often skin anaesthesia.

The remarkable to the existence of widespread diseases affecting men and animals is becoming yearly of greater importance and interest. Certain hitherto obscure diseases in which the nervous system is profoundly affected are now explained by the invasion of the tissues of the body by these lowly organisms, for example, Sleeping Sickness, the cause of which has been definitely proved to be the Trypanosoma gambiense (see Plate II., fig. 1).

The discovery by Schaudinn of the presence of the Spirochaetae Pallida (see Plate II., fig. 2) in the primary and secondary lesions of several diseases, and the general acceptance of this organism as the cause of the disease, taken together with the fact that in many respects it simulates the trypanosome in its mode of division and other characters, tend to prove that syphilis is also a protozoal disease.

The bacterial invasion of tissues is generally characterized by a migration of polymorpho-nuclear leucocytes, but protozoal invasion is characterized by a formative hyperplasia of the fixed cell tissues, endothelial, epithelial, and connective, and there is a close similarity in the defensive reaction of the tissues to all forms of protozoal invasion (see Plate II. with explanatory text).}

**Protozoa and diseases of the nervous system.**

Fig. 1. The discovery by Schaudinn of the presence of the Spirochaetae Pallida (see Plate II., fig. 2) in the primary and secondary lesions of several diseases, and the general acceptance of this organism as the cause of the disease, taken together with the fact that in many respects it simulates the trypanosome in its mode of division and other characters, tend to prove that syphilis is also a protozoal disease.

Only a short time has elapsed since Negri showed that in cases ofabies, whether experimental or otherwise, curious bodies measuring from 1 to 20μ could be constantly found in the nerve cells, and that these bodies were not found in the nerve cells in any other disease so that even if the theory advanced that they are cellular forms of protozoa prove not true, yet the discovery affords a valuable and expedient means of determining whether a suspected animal suffered with rabies or not. It is known that the salivary glands and saliva contain the virus, even before the animal shows symptoms. It is known too that the central nervous system contains the virus and that it multiplies there. Experimental inoculation can be made either from the saliva or an emulsion of the central nervous system of an animal suffering with rabies. Moreover, the virus can pass through a Berkfeld filter; if the filtrate is to be injected into a rabbit, the fluid which will distill through the filter will exhibit the Negri bodies. There are only two conclusions to be drawn from these observations: (1) If it be a protozoal disease, the organism at one period of its developmental cycle must be so small as to be able to pass through the pores of the Berkfeld filter. (2) Negri bodies are the result of intra-cellular degenerative changes caused by an elective affinity of the virus for the protoplasm of the nerve cell. This discovery is of course, of the greatest importance in the diagnosis of rabies.

In a case of rabies, the diagnosis of rabies was made by microscopic examination of the spinal and sympathetic ganglia, particularly the ganglia of the vagus and fifth nerves. Changes were found similar to those met with in other protozoal diseases, namely, sleeping sickness, dourine...
in a fluid which normally contains no cellular elements indicates disease of the central nervous system. In general paralysis, syphilis of the nervous system and tabes dorsalis even in early stages of these diseases is usually characterized by a turbid fluid. Some evidence of the progress of the disease and the effect of treatment may be obtained by counting the number of cells at different periods. In tuberculous meningitis, for instance, the abundance of bacilli in the tuberculous fluid cannot readily be found, but bacilli are present, for injection of the fluid into a guinea pig is a certain means of determining whether it is tuberculous meningitis or not. Tubercular meningitis is not the only cerebro-spinal meningitis and the cells in the deposit are polymorpho-nuclear leucocytes, and in the leucocytes can be seen the specific organism Diplococcus intracellularis with its characteristic staining and rapid multiplication. However, this becomes blurred metalic grains. This may also invade the central nervous system giving rise to meningitis, and in these cases the deposit will be polymorpho-nuclear leucocytes, and the organisms are difficult to find. But if the disease is of the meningitic type; but if not, they can be obtained by cultural methods. In all operations of this kind antiseptic precautions must be adopted both for the safety of the patient and the reliability of the findings, otherwise organisms in the skin may contaminate the fluid withdrawn.

Other formed elements which may be found are large cells, macrophages containing blood pigment; these cells indicate that some haemorrhage has occurred. One of the most important uses of turbid centrifuged fluid is the discovery of the causation of the sickness. The fluid withdrawn and centrifuged contains, as one would expect from the lesions in the brain and spinal cord, large numbers of macrophages, white blood cells, lymphocytes, and, besides, the actively moving organisms (Trypanosoma gambiense) (see Plate II. fig. 1) which are the essential cause of the disease. It has been remarked that the normal cerebro-spinal fluid is devoid of protein, but if present in large quantities it is a sign of disease. In the cerebro-spinal fluid in sleeping sickness led to the belief that the specific organism of syphilis, Spirochaeta pallida, might be found in the cerebro-spinal fluid in syphilitic diseases of the nervous system, but although in a few instances successful inoculation of animals with syphilis by injection of the cerebro-spinal fluid has been effected, yet the organism has only once been found in the fluid withdrawn by lumbar puncture. It has long been a puzzle why only certain individuals, about 5%–8% of those infected with syphilis, should subsequently suffer with diseases of the nervous system. The skin and mucous orifices are the most common sites of the early appearance of the primary lesion, and irritation takes place in the central nervous tissues, but no tissue or structure in the body is exempt. It is probable that the virus attacks tissues when in a low state of resistance, alcohol and other stimulants being the most frequent agents. This also indicates that there is a specific reaction of the tissues to the living virus and the parasypilhics, an apparent cause, and the paralytic affections, which cause a feature, the former may be more successfully treated with mercury, which has the power of devitalizing the specific virus and preventing its multiplication, the same as atoxyl prevents the multiplication of the trypanosomes. Iodide of potassium favours the absorption of the degenerative products of the cells, and syphilus tumors may rapidly resolve with mercury under the influence of these drugs. Nervous symptoms even so severe as to threaten a rapidly fatal termination may disappear with energetic treatment when they are due to the syphilus tumors, and not to an inflammatory reaction of the tissues; not so, however, when the symptoms are slow, insidious and progressive, due to a primary decay of the nerves, e.g., the parasypilhics affectations tabes dorsalis and syphilis paralytica, the syphilus meningitis accompanying syphilus disease of the same cause. We can understand that it may be a chance whether a man suffers with true brain or spinal cord syphilis, because it may be a chance whether the virus is caused there by the blood-vessels and lymphatics, and if carried there finds a suitable nidus to develop. But the parasypilhics affects appear to be due to a premature primary decay of the neural elements owing to blood-poisoning and other sympathetic influences from the syphilus virus. There are a great many facts now forthcoming which show that the subjects of parasypilhics present mild symptoms of syphilis, and as the disease is so long it is not until ten years later that they develop nervous symptoms, and then in the middle of the tongue or the back of the mouth or tongue. Such subjects are immune to a second attack of syphilis, and the examination of the fluid and cerebro-spinal fluid by the Wassermann test will show absence of syphilus infection. It is in fact that there is a biochemical change; the presence of this reaction may be correlated with the fact that these fluids contain lipoid substances and a globulin in excess. The cerebro-spinal fluid contains these lipidoid substances and globulin in proportion to the degree of decay of the neural structure; they arise from the destructive metabolism of the neural elements. Lipoid, though produced only in the blood of syphilus individuals, consequently it must be supposed that in general paralysis and tabes certain groups and systems of neurenes undergo decay from exposure of some kind to syphilus venereum. (1) a biochemical stimulus, the syphilus poison, (2) excessive physiological stress, which in non-syphilus individuals would only lead to cerebral or spinal neurasthenia.

Terrified by a progressive lethargy, paresis, tremors and the signs and symptoms of neural exhaustion without neural destruction; it comes on slowly and insidiously often years after infection and eventually terminates fatally by the sensorial decay of the central nerve system. The symptoms of the central nervous system explains the fatal lethargy; the perivascular and meningeal lymphatics are filled with lymphocytes, and in these organs there is a considerable development of secondarily affected cells have undergone a rapid formative proliferation (Plate II. figs. 3 and 5). The effect of this morbid process is to deprive the neural elements of oxygen and nutrition; the neurenes in consequence, although not destroyed, are nevertheless unable to function for more than a few years.

(2) Poisons introduced into the Body.—The most widespread and pernicious of all medical diseases is the abuse of alcoholic stimulants. At least 20% of the natives of the asylums of London are admitted with a history of alcoholism. In not more than 10% is alcohol the efficient cause of the mental disease; in many it is only a contributory cause. Alcohol is a stimulant of the nervous system, and intemperance is the first sign of the mental breakdown. Most of the patients admitted inherit the neuropathic tendency, and it is a rare thing, among such, to find cirrhosis of the liver with ascites, a condition peculiar to male persons. A great Irish writer, from a very large experience as pathologist to the asylums of London, only remembers one such case, and that was in a notorious drunkard who was certified insane and was killed within four years. Neurasthenia, before she could be certified as of unsound mind, a fact which indicates that she inherited a very stable nervous constitution. To people with unstable nervous systems a relatively small quantity of alcohol is sufficient to act as a poison. This epitheloid, imbeciles, criminals, potential lunatics, hysteric, neuroexpression and the subjects of head injury are liable to become anti-social and dangerous to themselves and others by indulgence in quantities of alcohol which would have no effect on the stable nervous system. Alcohol may produce acute delirium, with fine tremors, and, generally, visual hallucinations of a horrible nature, indicating acute toxic influence upon the brain. This apparently acute form of alcohol poisoning is met with in chronic inebriates especially; it is much commoner in men than in women, and it is remarkable how a severe injury or illness, such as pneumonia, will bring out delirium tremens in about 4% of cases. If the patient has enough alcoholic in the system, the effect on the nervous system of chronic tipping may be dementia, a very characteristic manifestation of the mental degeneration being absence of knowledge of time and place, personal illusions and loss of memory of recent events, indicating a failure of receptivity and of the formation of memory-features of the higher centers, mental confusion, delusions of persecution, and especially a morbid jealousy with suspicions of fidelity of the husband by the wife or of the wife by the husband. A certain amount of improvement may occur, the dementia is a marked disorder. Apathy and proper control generally ends in recovery, but such cases so frequently relapse that it is fairly certain that alcohol is an exciting factor to a morbid or insane temperament. Besides mental symptoms of chronic alcoholic poisoning, there is frequently paralysis, affecting especially the lower limbs (structures suffer more where vitality is least), although the chronic alcoholic does not suffer from the acute symptoms of severe cases. The patient, usually of the female sex, becomes helpless and bedridden, and death frequently occurs from heart failure. Characteristic features of this affection are great tendingness on the part of the patient to the action of alcohol; this consists in a variable degree of skin anaesthesia, wasting of muscles and alteration of the normal electrical reactions, and frequently pyrexia. There is also a great tendency of the central nervous system to develop primary neuritis, muscular atrophy and marked dementia. This "complex of symptoms" points to a peripheral neuritis, although frequently changes occur also in the ganglion cells, from which the axis cylinders of the nerves have their...
NEUROPATHOLOGY

Alcoholic polyneuritic psychosis affecting women in many ways resembles delirium tremens; the fact that neuritis occurs much more frequently in women is probably associated with a greater liability to the influence of microbial toxins by absorption from the organs of men.

Fig. 2. Consciously not the imperfect origin (vide figs. 2, 3, 4, and 5). Alcoholic polyneuritic psychosis affecting women in many ways resembles delirium tremens; the fact that neuritis occurs much more frequently in women is probably associated with a greater liability to the influence of microbial toxins by absorption from the organs of men. Thus into the system produces progressive degenerative changes in the brain and spinal cord, which are manifested by psychical disturbances, such as slowness of thought, weakness of memory, dulness of perception, sometimes delirium and incoherence; other symptoms are blunted sensibility, dilated pupils, muscular spasms, perhaps even epileptiform fits, and ataxia, and, lastly, stupor deepening into coma. Sausage disease, due to eat- ing the meat and fish infected with Bacillus botu-linus, is associated with symptoms which: of a nature to terminate fatally, and it has been shown that the symptoms are due to a poison which has a toxic destructive effect upon the nerve cells (fig. 6).

II. Normal and Abnormal Stimulation.—The nervous system, in order to develop and manifest functional activity, requires suitable stimulation from without. Structural function and responses are mutually reciprocal and interdependent; for a structure which is not used will gradually lose its function, while its nutrition will also suffer, and in time atrophy may occur. Consciously and unconsciously, a continuous stream of impulses is pouring into the nervous system from without by the sensory channels, which are the avenues of experience and intelligence, and our somatic and psychical life depends upon the existence of such stimuli. The nervous system in the form of systems, groups and communities of neuromere, each with special functions, yet all woven together in one harmonious whole, develops in a particular way in consequence of the awakening influence of these stimuli from without. Consequently nervous structures which are not used are liable to undergo regressive metamorphosis and atrophy; thus amputation of a limb in early life causes atrophy of the nervous structures which presided over the sensation and movement of the part. This is seen both in the grey and white matter of the spinal cord; there is also an atrophy of the physio-motor neurones of the brain presiding over the movements of the limb.

A healthful physical, intellectual and moral environment of the individual is an essential factor in the prevention and cure of psychoses and neuroses, because it tends to develop and strengthen body and mind, deliberation, judgment and the higher controlling functions of the brain. A function not used will gradually disappear, and become more and more difficult to evoke. This fact is of importance in functional neuroses and psychoses, e.g. hysterical paralysis, melancholia and delusional insanity, because the longer mental or bodily function is left in abeyance, the more likely is the defect to become permanently installed. The converse is also true; the longer a perverted function exists, the more unlikely it is to disappear. Thus auditory hallucinations, a very important and frequent symptom of insanity, from the tones of which the mentally sick are followed by “voices,” which eventually become so distinct and real that the greater part of the patient’s psychological existence is centered upon, and determined by, this abnormal stimulus from within, indicating progressive strengthening and fixation of the perverted functions of the mind, and progressive weakening and dissolution of the normal functions.

Mental pain in the form of grief, worry, anxiety, fright, shock, violent emotions (pleasurable or painful), disappointed love, sexual excesses or perversions, and excessive brain work, frequently precede and determine, in persons with the insane or neuropathic taint, (a) attacks of delirium, e.g. mania, melancholia, delusional insanity; (b) of neuroses, e.g. hysteric, epilepsy, hysteria, hystero-epilepsy; (c) organic brain disease, e.g. apoplexy, thrombosis, general paralysis.

Vascular reflex irritation affords many examples of neuroses and psychoses, the symptoms of which are set up by irritation of the viscera, e.g. intestinal worms. Teething and indigestible food are often the exciting cause in infants and young children of convulsive spasms of the glottis and tetany. Various functional and organic
diseases of the female reproductive organs act as exciting causes in the production of hysteria, hystero-epilepsy, melancholia and mania; menstrual disturbances caused by the monthly and annual changes, however, do not always occur at the menstrual period or menopause. The irritation of a curious tooth may produce spasmodic tic and trigeminal neuralgia. Wax in the ear may occasion vertigo and tinnitus; and eczema or of the feet, which often even tend to excite epileptic fits in a person suffering from epilepsy. Numerous other examples of peripheral disturbance could be mentioned as exciting causes of nervous affection in neurotic individuals. Irritation of the terminals of the vagus in any part of its widespread visceral distribution may lead to vomiting. The characteristic pain of angina pectoris, which radiates down the inner side of the left arm, is explained by the fact that the cardiac branches of the sympathetic arise from the same segments of the spinal cord as the sensory branches of the ulnar nerve; consequently the pain is referred to the corresponding skin area supplied by this nerve. This is a typical example of referred pain.

III. Injury or disease of enclosing or supporting structures may lead to paralytic or irritative lesions of the nervous system, or the two may be combined. Blows or wounds of the head and spine may damage or destroy the nervous structures by shock or direct injury. Concussion of the brain or spinal cord may occur, as a result of injury, without any recognizable serious damage of the enclosing structures or even the central nervous system. Shock, due to concussion, can only be explained by a molecular or bio-chemical change in the nervous structures. Direct injury or a fall fracturing the skull, driving the fragment of bone into the cavity of the brain, is one of the most common causes of interruption of the function of the tissue; but wounds and diseases of the enclosing and supporting structures, if producing simple non-infective inflammation, give rise only to such symptoms as accord with the nerve structure irritated or destroyed. Should, however, the wound or diseased structure become infected with micro-organisms, the disease spreads and becomes generalized likewise the symptoms. Of all the causes of infective inflammation, middle-ear disease, on account of its frequency and insidious onset, is the most important. It is very liable, when neglected, to be followed by a secondary lymphatic infection, which abscesses and frequent seat of which is in the adjacent temporal lobe, but it may be in other parts of the brain, e.g., the cerebellum and frontal lobe (Plate I. fig. 3). The peripheral nerves may be destroyed or irritated by direct injury, disease or new growth in adjacent tissues, or they may be involved in the cellus thrown out round the seat of a fracture.

Diseases of the blood-vessels are among the most frequent causes of organic brain disease. Arteries or veins—more frequently the former—may become blocked or ruptured from various causes. The immediate effect is a disturbance or loss of consciousness, leading to a stroke of the brain (cerebral apoplexy) and never regain consciousness (see Coma). Should the individual recover consciousness more or less permanent loss or disturbance of function will be the result. Paralysis of some form, especially hemiplegia, is the commonest result, but the loss or disturbance of function will depend upon the extent of the injury.

The cerebral arteries may be occluded by embolism; a portion of a clot or vegetation from a diseased valve of the left side of the heart may be detached, and escape into the circulation; and this is carried into the large blood-vessels of the brain, usually the internal carotid; the blood-vessels on the inner side of the right side of the brain, and the blood-vessels on the inner side of the left side of the right brain. The area of brain tissue supplied by that artery is deprived of blood, and undergoes softening in consequence, resulting in infarction or death of the opposite half of the brain (hemiplegia) associated with aphasia when the paralysis affects the right side in a right-handed person (Plate I. figs. 5 and 9). When the embolus is infective, as it frequently is in ulcerative endocarditis, its lodgment in an artery of the brain, not only blocks the vessel but leads to an infective inflammation and softening of its walls, with the formation of an abscess. The aneurysm may suddenly rupture into the substance of the brain and produce apoplexy. In fact the majority of cases of apoplexy from cerebral hemorrhage occurring in young people are due to this cause. Softening may also arise from coagulation of the blood (thrombosis) in the arteries or veins. There are many cases which generate combine or conspire together to produce thrombosis, viz., a weak acting heart, heart altered conditions of the blood, and sometimes independently of vascular disease spontaneous coagulation in a vessel of the brain may occur. It is sometimes met with in the cachexia of certain grave diseases, viz., in phthisis and cancer, in typhus and pneumonia, after paraparitis and in marasmus at all periods of life, but especially in the very young and very old. But thickening, roughening and a degenerated condition of the cerebral arteries known as arteriosclerosis, associated with a weak acting heart is especially liable to give rise to thrombosis and softening, and this is a very common cause of apoplexy, paralysia and dementia in people who have passed middle life. General disease of the arteries of the body, associated especially with acute Bright's disease and high arterial pressure, is frequently attended with the formation of minute aneurysms upon the cerebral arteries, which may rupture and cause apoplexy. Hemorrhage into the brain from this cause is especially liable to occur in certain situations; one vessel in particular, supplying the basal ganglia, most frequently gives way, the effused blood tearing through the most superficial layers of brain, proceeding from the cerebral cortex in the shape of a funnel, become aggregated together to form the neck between the two masses of grey matter—the optic thalamus and the corpus striatum (Plate II, fig. 6). The result is hemiplegia of the opposite side of the body. Apoplexy of the spinal cord and nervous system, occurring in a person under forty, is generally due to syphilis, the virus of which produces an inflammation of the coats of the vessel, especially the inner (see Plate II. figs. 4, 9, 10). The thickening and narrowing of the lumen with loss of elasticity of the arteries of the brain generally, may suddenly or gradually set up conditions of cerebral anemia and give rise to semi-comatose and comatose or even apoplectic states. Occlusion by the inflammatory proliferation or by the sudden clotting of blood in the diseased vessel may occur, the immediate effect of which may be an epileptic or apoplectic fit; the result is softening; and seeing that any or all the branches of the involved vessel are affected, or affected at random, the symptoms may be manifold. They may be general or local, and not uncommonly are associated with inflammation of the meninges or of the dura mater and membranes about the brain, or at the opposite side of the body, may manifest themselves, showing that the disease has attacked a fresh set of arteries. Disseminated sclerosis (insular) is another random morbid area, occurring especially the white matter, with certain characteristic symptoms of a progressive character, the pathology of which is not understood fully, but is probably due to some toxic cause. Islands of nervous tissue undergo a morbid change, commencing in

FIG. 7.—Diagram of left cerebral hemisphere, showing localization of function. The motor region is situated in front of the central sulcus, and is arranged in a series from the "toe to larynx" downward, corresponding in an inverse manner to the spinal series. Irritation of any part of this area will cause localized convulsive spasms, which may spread in a definite march to the whole motor area, as in Jacksonian epilepsy. Destructive lesions will cause paralysis. The centre for "taste and smell" is represented at the tip of the uncinate convolution. The "motor speech center" or "language center" is only in small part represented, for the larger part is on the mesial surface. "Hearing" is represented occupying the posterior half of the first temporal convolution, but only a small part of the centre is seen, for the greater part lies above within the fissure of Sylvius. Included in this area, but in the left hemisphere only, is the centre for "auditory word memory"; destruction of this causes inability to understand the meaning of written words uttered, although the patient is able to read. Behind this, in the angular gyrus, is the centre for "visual word memory"; destruction of this causes loss of power of understanding of written or printed words—therefore inability to read. In front of the motor area is the "motor convolution", the centre of "motor speech"; destruction of this produces motor aphasia, or inability to articulate words. Above this is a centre which is connected with written speech. The centres concerned with verbal and written language are connected to "command", local, fibres, and destruction of these produces language leads to various defects in verbal and written language. It will be understood from this diagram that diseases of the left hemisphere in right-handed persons are associated with results of more significance than similar affections of the right hemisphere.
the myelin sheath and ending in an increase of the supporting neuroglia tissue at the expense of the true nervous tissue.

Tumours and new growths in the central and peripheral nervous systems may be primary or secondary: the former arise in the supporting, enclosing or nutrient tissue elements; the latter are metastatic deposits from tumours originating elsewhere. Tumours may be single or multiple, the special symptoms occasioned depending upon the seat of the tumour and whether it destroys or only irritates the adjacent nervous tissue. Tumours situated within the cranial cavity cause general symptoms, namely, optic neuritis, severe head-ache and vomiting; these symptoms, which are caused by increased intracranial pressure, are more severe in rapidly-growing vascular tumours, even though small, than in large slow-growing tumours.

Fig. 8.—Diagram of section of the spinal cord in the upper cervical region, showing recent degeneration of the crossed pyramidal tract of the right side and direct pyramidal tract of the left side. The black dots indicate the degenerated fibres stained by the Marchi method. This degeneration is secondary to haemorrhage into the internal capsule of the left hemisphere, and it will be observed by the number of degenerated fibres that the greater bulk have crossed over to the right side of the spinal cord, thus agreeing with the fact that the paralysis is of the right half of the body.

Fig. 9.—A diagram to indicate afferent, efferent and association systems of neurones. It will be observed that there are three nervous circles indicated by the arrows—spinal, cerebellar and cerebral. In every perfect co-ordinate movement impulses properly adjusted are flowing along these three systems of neurones. In systemic degenerations one or more of these systems may be affected, and the symptoms will depend partly upon the function which is lost or disturbed, and partly upon the disturbance of equilibrium of the three co-ordinated systems.

Fig. 10.—Diagram of spinal cord, fifth lumbar segment, from a case of advanced tabes dorsalis. The posterior column is shrunken, and but faintly stained, except in the anterior part; the shrinking and the loss of stainability are due to the absence of fibres of the posterior roots, which normally form the greater part of this region of the cord. The fibres which are seen in the anterior part of the posterior column are derived from cells within the spinal cord, and belong to spinal association neurones.

Fig. 11.—Diagram illustrating the relative number and wealth of cells and fibres in the cerebral cortex in the normal brain, in amentia and dementia. The horizontal systems of fibres are association systems, and it will be observed that these are especially diminished in amentia, and still more in dementia, whereas the radial fibres are less affected. In the normal, there are five layers of cells arranged in columns (Meynert's); in the pathological conditions it will be observed that the pyramidal-shaped cells no longer have their apical processes pointing vertically upwards. The processes are broken off, the cells are distorted in shape and diminished in numbers, and the degree of dementia in a wasted brain is proportional to the atrophy and destruction of the small and medium-sized pyramids of the whole cerebral cortex, and the disappearance of the superficial layers of fibres. This is specially manifested in paralytic dementia and the dementia of chronic insanity.
Some tumours are highly vascular and a large thin-walled vessel may suddenly rupture and cause an apoplectic fit. If the growth is situated in a portion of the cortex having some special localizing function, e.g. the motor area (vide fig. 7), it may give rise to epileptiform convulsions, starting in a limb or definite group of muscles; but the irritation usually spreads to the whole motor area of the same side, and even extends to the opposite hemisphere, by an overflow of the discharge through the corpus callosum. In such case there is a loss of consciousness. If, however, the tumour destroys the cerebral cortex of a particular region, it may give rise to a paralytic lesion, e.g. paralysis of the arm (vide Plate 1., fig. 4).

Organic diseases of the blood-vessels, or of supporting and enclosing tissues, produce secondary degenerations of the nervous system. The symptoms, like the lesion, are obvious, coarse and obtrusive; frequently arising suddenly, they may in a short time terminate fatally, or tend towards partial or complete recovery. Various forms of motor and sensory loss and disturbance of function may arise, indicating destruction or disturbance of particular regions of the central nervous system; and degenerations in certain tracts and systems of fibres arise, corresponding to histological features with those observed when a nerve fibre is separated from its cell of origin by section (secondary degeneration of Waller and Türck) (vide fig. 8, with explanation). This form of degeneration must be distinguished from primary degeneration, which is due to an inherent nutritional defect of the nerve cell and all its processes (the neurone), in which a regressive metamorphosis occurs; it starts in the structures of the neurone latest developed (namely, the myelin sheath and the fine terminal twigs of the axis cylinder and dendrons), and proceeds back to the main branches and trunk, eventually destroying the trophic and genetic centre itself, the nerve cell. These primary degeneration processes are insidious in origin, progressive in character, and nearly always fatal in termination; they affect definite systems, groups and communities of neurones in a progressive manner, and, therefore, are associated with a progressive evolution of symptoms, related to the structures affected (vide figs. 9 and 10).

To cite some examples: (1) Locomotor ataxy, on the one hand, is a primary degeneration affecting the afferent system of neurones; it is characterized by muscular incoordination without wasting, inability to stand with the eyes shut, painful or aching in the limbs, absent knee-jerks, Argyll-Robertson pupils, and other symptoms pointing to a morbid process affecting especially the afferent sensory system of neurones. (2) Progressive muscular atrophy, on the other hand, is a disease of the efferent motor system of neurones of the brain and spinal cord, characterized by progressive wasting of groups of muscles innervated by groups of neurones which are undergoing degeneration. A far more chronic form of this disease frequently arises from affection of the medulla oblongata, causing what is known as bulbar paralysis. Infantile paralysis is an acute inflammation of the anterior horns of the spinal cord, causing destruction of the spinal motor neurones of the anterior horn. It differs from the above chronic disease in its sudden onset and non-progressive character; it resembles it in producing paralysis of muscles without sensory disturbance of the general kind. (3) General atrophy of all the neurones of the central nervous system is a degeneration which begins in the association system of neurones of the cerebral cortex, but which may be, and frequently is, associated with degeneration of the afferent or efferent systems (fig. 9).

Neurones and psychoses have not hitherto been satisfactorily explained by definite morphological changes in the brain (Plate I., fig. 1). We know little or nothing accurately about the morbid histology of insanity, except as regards the morphological changes met with in cases of amentia and dementia. The conditions of amentia, namely, idiocy and imbecility, are associated with arrest of development of the brain, as a whole or in part, the naked-eye evidence of which may be afforded by small size and simplicity of convolutions of the brain as a whole or in part (Plate I., figs. 2, 8 and 10); and the microscopical evidence by arrest of development, or imperfect development, of structures connected with the higher functions of the mind, namely, the association neurones in the superficial layers of the cerebral cortex (fig. 11). Conditions of dementia, primary or secondary, are associated with progressive decay and atrophy of the superficial layers of the grey matter of the cortex, and naked-eye evidence thereof is afforded by partial or general wasting of the cerebral hemispheres, accompanied with thickening of the pia-arachnoid membrane, atrophy of the convolutions, and with deepening and widening of the intervening sulci (Plate I., fig. 7).

The cerebro-spinal fluid fills up the space in the cranial cavity caused by the atrophy of the brain; consequently there is a great

FIG. 13.

FIG. 14.

Motor Cells, drawn from Microphotographs of Preparations stained by Nissl method to show Microchemical Changes produced by various diseases.

FIG. 12.—Normal motor cell from cerebral cortex, showing a mosaic pattern of the cytoplasm due to a substance stainable by basic aniline dyes; this stainable substance exists also on the dendrons. By comparing the appearances of this cell with the other figures a just idea can be obtained of the morbid changes which result in various pathological conditions.

FIG. 13.—Cell from a case of hyperpyrexia—disappearance of the mosaic pattern, substance uniformly stained; absence of the chromatic elements on the dendrons, due to a precipitation of all globulin by the heat.

FIG. 14.—Cell in an advanced stage of coagulation necrosis, complete absence of mosaic pattern; diffusé fine dust-like stain; breaking off of the processes; all caused by softening of the brain from vascular obstruction.

FIG. 15.—Another specimen from the same brain in a still more advanced stage of destruction, and showing a phagocyte attached to the cell and devouring the decayed structure.

FIG. 16.—A cell with enormously swollen nucleus, the result of hydration due to absorption of fluid after ligature of cerebral vessels. Such a cell will probably recover. 

excess of this fluid. Before general paralysis was recognized as a disease some of the cases which died suddenly in a fit were doubtless termed serious apoplectic. This wasting so characteristic of general paralysis is especially due to atrophy of the cells and fibres of the superficial grey matter of the cortex, sections of which, examined microscopically, after suitable methods of staining have been employed, show great poverty, or complete loss, of three sets of delicate myelinated fibres, namely, tangential, super-radial and the inter-radial corresponding to the line of Baillarger. This degeneration
of the superficial association fibres of the cerebral cortex affects especially the frontal and central convolutions, and is the earliest and most constant microscopical change in progressive paralytic dementia; it is accompanied usually by meningeal and vascular changes, atrophy of the nerve cells, and proliferation of the neuroglia (fig. 11); especially characteristic is the perivascular infiltration with lymphocytes and plasma cells (see Plate II, fig. 7). It was indeed thought that this condition of the vessels was pathognomonic of general paralysis; it certainly is not, for it is found throughout the central nervous system in sleeping sickness and cerebro-spinal syphilis (Plate II., figs. 8 and 9). It sometimes occurs in the neighbourhood of cerebral tumours but it is not found in uræmia or lead encephalitis. Possibly new methods may enable us to show changes of structure in diseases such as epilepsy and delusional insanity, in which hitherto no naked eye or microscopical structural defects accounting for the symptoms have been certainly demonstrated.

In conditions of acute mania there is usually considerable vascular engorgement. The histological changes, however, probably be more correct in assuming that insanity (especially those forms in which there is neither amentia or dementia) is due to alterations in the quality

![Diagram](image-url)

**Fig. 17.—Diagram to illustrate various stages in degeneration and regeneration of medullated nerve fibres.**

1. Normal medullated nerve with node of Ranvier.
2. Degenerated nerve, ten days after section, showing degenerated myelin stained black; disappearance of axis-cylinder.
3. Central end of cut nerve, showing at the top an axis-cylinder budding out, proliferated neurilemmal cells, and still some degenerated myelin in sheath.
4. Peripheral cut end of same, showing proliferated neurilemmal cells, still some degenerated myelin.
5. Complete absorption of degenerated myelin, proto-plasmic basis of new fibre formed out of neurilemmal cells.
6. A new fibre, with axis-cylinder.
7. Central end of cut nerve at junction, showing an axis-cylinder sprouting and forming a number of axis-cylinder processes, which grow into the central end to form new channels of conduction.
8. Is a new regenerated fibre resembling a sympathetic fibre in having as yet no myelin sheath; as the nerve becomes excitable and stimulus passes, a myelin sheath is formed.

rather than the quantity of blood in the brain. The primary dementia of adolescence, which in 80% of the cases occurs before the age of 25, in which hereditary taint is most common, and which frequently is accompanied by, or terminates in, tuberculosis, can be explained by the effect of toxaemic conditions of the blood on cerebral neurones with an inborn low specific energy and metabolic activity. The histological changes found in the brain do not serve to explain the symptoms, and we must look to bio-chemical changes in the body acting upon an innately unstable brain to explain the problems of the disordered mind in this disease.

**NEUROPATHOLOGY**

**Microscopical Changes in Degeneration of the Neurone.—** About 1850, Waller demonstrated that a nerve fibre underwent degeneration to its termination when separated from its cell of origin; hence the term "Wallerian degeneration." Embryological researches by Professor His showed that the axis-cylinder process (the essential conducting portion of the nerve fibre) is an outgrowth of the nerve cell. The cell, therefore, is the trophic and genetical centre of the nerve fibre. Acute alterations and death of the nerve cells may occur from toxic conditions of the blood; from high fever (107°-110° F.); arrest of the blood supply, as in thrombosis and embolism; or actual destruction by injury, haemorrhage or inflammation. These morbid processes produce, as a rule, bio-chemical as well as morphological changes in the nerve cell and its processes. Space will not allow of a full description, but some of these changes are indicated in figs. 18-22, with explanatory text. When a nerve cell dies, the nerve fibre undergoes secondary degeneration and death; that is to say, the whole neurone dies, and regeneration, at any rate in the higher vertebrates, does not take place. Restoration, or partial restoration, of function is due to other structures taking on the function, and the more specialized that function is, the less likely is restoration to take place. If, however, a peripheral nerve is divided, its component fibres are merely severed from their cells of origin. All that portion of the nerve which is in connexion with the nerve cells of origin practically undergoes no change. The peripheral portion undergoes degeneration, but from the central end of the nerve new axis cylinders again grow out and a new nerve is formed. With this regeneration comes restoration of function, which may be hastened by suturing the ends of the cut nerve. A similar regeneration, however, does not occur after section of fibres of the white matter of the central nervous system, and this may be due to the fact that the nerve fibres of the white matter of the cerebro-spinal axis possess no nucleated sheath of Schwann, which, by the light of recent investigations, is shown to play an important part in regeneration; in the writer's opinion, the neurilemmal sheath of the old fibre forms a new protoplasmic basis, into which the axis-cylinder from above grows, the passage of stimulus determining its function. Fig. 17, Nos. 1-8, with explanatory text, shows the changes which occur in degeneration and regeneration of a peripheral nerve after section, with loss of function; and subsequent union, with restoration of function. The writer, in conjunction with Professor Halliburton, has shown that the characteristic microscopical changes in the myelin sheath which occur in the process of regeneration are due to a splitting up of the complex phosphoretted substance "protagon" into glycerophosphoric acid, choline and oleic acid by a process of hydration. The Marchi reaction, which has been found so useful for demonstrating degeneration of the central and peripheral nervous systems, is dependent upon the fact that the myelin sheath, after hardening in a solution of bichromate of potash, does not turn black when acted upon by osmic acid, whereas the simpler non-phosphoretted fatty product of degeneration is stained black. When the Marchi reaction of degeneration is fully developed, it has been ascertained that the nerve yields no phosphorus. The degeneration resulting from section of a nerve is termed secondary, to distinguish it from another, primary, due to slow
NEUROPTERA

and progressive decay of the whole neurone, beginning usually at the terminal twigs and proceeding back to the cell body with its contained nucleus. There is primary degeneration of systems of neurones, correlated by function rather than by anatomical situation. Examples are afforded by locomotor ataxy and progressive muscular atrophy, the former being a degeneration of the afferent sensory system of neurones, the latter of the motor efferent system. The cause of primary degenerations is probably a defect inherited or acquired in the "vita propria" of the neurones affected. They slowly atrophy and disappear, and their place is filled up by an overgrowth of the supporting neuroglia tissue (figs. 10 and 18). This overgrowth of dense tissue is termed sclerosis, and was erroneously considered to be the cause, instead of the effect, of the atrophy of the nervous tissue.

For further information the reader may consult the Croonian Lectures on the Degeneration of the Neurilemma, by F. W. Mott, published in the Lancet (1900); and the same writer's "Introduction to Neuropathology." In Allbutt's System of Medicine. Also Gower's Handbook of the Nervous System, von Monakow's Gehirn Pathologie, Ford-Robertson's Pathology of Mental Diseases and Mott's Archives of Neurology, vols. 1, 2, 3 and 4. (F. W. M.)

NEUROPTERA (Gr. νευρόν, a nerve, and πτερόν, a wing), a term used in zoological classification for an order of the class Hexapoda. The name (from the class Hexapoda) in the original sense has had many varying meanings given to it by different authors. As first used by Linnaeus (1735) it included all insects with mandibulate jaws and two pairs of net-veined wings—dragon-flies, May-flies, stone-flies, lacewing-flies and caddis-flies—and it has been employed in the same wide sense by D. Sharp (Cambridge Nat. Hist. vol. v., 1895). But detailed study of these various groups of insects shows that beneath their common superficial resemblances lie important distinctions in structure, and essential differences in the course of the life-history. Some of the families—the stone-flies, for example—have the young insect in a larval stage, the adult, growing its wings visibly outside the thoracic segments, and active at all stages of its life. The dragon-flies and May-flies are also active throughout their lives and possess external wing rudiments, though the young insects differ rather strikingly from their parents. All such families—falling into the group Exopterygota as defined in the classification of the Hexapoda—were separated from the Neuroptera by W. E. Erichson (1839) and united with the Orthoptera, with which order some entomologists still associate them under the name of "Pseudo-orthoptera." The other groups of the old Linnean order (such as lacewing-flies and caddis-flies)—which are hatched as larvae markedly unlike the parent, develop wing-rudiments hidden under the larval cuticle, and only show the wings externally in a resting pupal stage, passing thus through a "complete" metamorphosis and falling into the sub-class Endopterygota were retained in the order Neuroptera, which thus became much restricted in its extent. More recently the subdivision of the Linnean Neuroptera has been carried still further by the separation of the caddis-flies and scorpion-flies as distinct orders (Plecoptera and Mecoptera respectively), and by the withdrawal of the "Pseudo-orthoptera" from the Orthoptera—with whose typical families they have little in common—and their division into a number of small orders. Altogether, eight orders are recognized in the classification adopted here, the first five of these belonging to the sub-class Exopterygota and the last three to the Endopterygota (see HEXAPODA).

The multiplication of orders is attended with practical difficulties, and the distinctions between the various groups of the Linnean Neuroptera are without doubt less obvious than those between the Coleoptera (beetles) and the Diptera (two-winged flies) for example. But if classification is to have practical usefulness it is impossible to associate in the same order families whose kinship to insects of other orders is nearer than their kinship to each other. And no student can doubt that the stone-flies are akin to Orthoptera and the caddis-flies to the Lepidoptera, while dragon-flies and May-flies stand in an isolated position with regard to all other insects. In the present article, for the sake of convenience, all the insects which have been regarded by Linnaeus and others as "Neuroptera" are included, but they are distributed into the orders agreed upon by the majority of modern observers, and short characters of these orders and their principal families are given. For further details the reader should consult the special articles on these groups, to which cross-references will be found.

Sub-class EXOPTERYGOTA

Order Plecoptera.

This order was founded (1869) by F. Brauer—the name having been long previously suggested by H. Burmeister (1832)—to include the single family of the Perlidae or stone-flies. They resemble the Orthoptera more nearly than any other group of the Linnean Neuroptera, having the anal area of the hind-wings folding fanwise beneath the costal area and the whole hind-wing covered by the fore-wing when the insect is at rest, though the fore-wing is not firmer in texture than the hind-wing, as is the case in the Orthoptera. In the opinion of J. H. Comstock and J. G. Needham the wing-neuration in this order is the most primitive to be found in the Hexapoda. The tenth abdominal segment carries a pair of jointed cerci which are often elongate, and the feelers are always long, while the jaws are usually feeble and membranous, though the typical parts of a mandibulate mouth are present—mandibles, maxillae with inner and outer lobes and palps, and second maxillae (labium) whose lacinia are not fused to form a ligula. Both head and trunk are somewhat flattened dorso-ventrally, giving the insects a very distinct and characteristic aspect. The stone-flies further resemble the Orthoptera in their numerous Malpighian excretory tubes, which vary in number from twenty to sixty. The reproductive organs, both ovaries and testes, become fused together in the middle of the body. A remarkable point in the Plecoptera is the presence in some forms (Pteronarca) of small branching gills on the three thoracic and the front abdominal segments. These organs appear, however, from the observations of H. A. Hagen not to be functional in the adult insect—though they may only survive from the aquatic nymphal stage.

Life-history and Habits.—The nymphs of the Perlidae are closely like their parents and breathe dissolved air by means of tracheal gills on the thoracic segments, for they all live in the water of streams. They feed upon weaker aquatic creatures, such as the larvae of May-flies.

The perfect insects, whose flight is feeble, are never found far from the water, a curious feature among them is the frequent reduction of the wings in the males of certain species, contrary to the usual condition among the Hexapoda, where if the sexes differ in the development of their wings, it is the female which has them reduced. The Plecoptera are world-wide in their range and fossils referable to them have been described from rocks of Eocene, Miocene and Jurassic age, while C. Bronniart states that allied forms lived in the Carboniferous Period.

Order Isoptera.

The two families included in this order agree with the Plecoptera in the young insect resembling the parent, but they are all terrestrial.
NEUROPTERA

G. Enderlein. The eleventh abdominal segment which carries the short jointed cerci (fig. 1, b, c) may remain in a reduced condition distinct from the tenth. There are only six or eight Malphigian tubes—contrasting with the large number of these excretory organs found in the Orthoptera and Plecoptera.

The Embididae are feeble, somewhat soft-skinned insects with the prothorax small and the mesothorax and metathorax elongate. The feelers are long and simple, and the wings are very narrow, each with a sub-costal, a radial, a median and a cubital nervure. The branches of the median and the cubital, however, as well as the radial nervures, are vestigial, and there are a few short cross-bars between the radial and the median. Some Embididae are entirely wingless in the adult state, and it has been suggested that this is always the condition in the juvenile state. Recent investigations of K. W. Verhoeoff, the family contains only thirteen known species. The Embididae live in warm countries, and are very retiring in their habits, hiding under stones where they spin webs formed of silk produced by a gland of the fore-feet.

The Termitidae (so-called “white ants”) are the other family of Isoperta. They are relatively shorter and broader insects than the Embididae with large prothorax and long wings, which have a transverse line of weakness at the base and are usually shed after the nuptial flight. The Termitidae are numerous in species in warm countries. The vast majority of individuals in a community consist of wingless forms—“workers” and “soldiers,” which are well developed members of either sex. Their economy is fully described in a special article on Termites.

Order Corrodentia.

The insects included in this order differ from those of the two preceding orders in their more condensed abdomens which bear no cerci, while the number of Malphigian tubes is reduced to four. In the absence of cerci the Corrodentia are more specialized than the Isoperta and Plecoptera, but some of them show a more primitive character in the retention of vestigial maxillulae—the minute pair of jaws that are found behind the mandibles in the Ants (fig. c). A large proportion of the Corrodentia are wingless. When wings are present the front pair are much larger than the hind pair, and the neuromere is remarkable for the concrescence of the median with the which have wings of the type described above, are further characterized by the presence of minute but distinct maxillulae, while the inner lobe (lacinia) of the first maxilla is an elongate, hard structure (the “pick,” fig. 3, c) and the outer lobe is convex and soft. The labial (second maxillary) palps are reduced to small, rounded prominences, which are vestigial, and the abdominal extremities consist of a great number of small sacs, resembling the lobes (fig. 3, c). The feelers of these insects are elongate and thread-like, consisting of from a dozen to nearly thirty segments.

The Book-louse are familiar wingless insects, often found in houses running about among old papers and neglected biological collections. They belong to the family Psocidae which has a few score species—most of them winged—living out of doors on the bark of trees and among vegetable refuse. In some Psocidae the wings are in a vestigial state, and the fully winged species rarely if ever fly. H. A. Hagen observed that some genera possess wing-like outgrowths on the prothorax, comparable to those seen in certain insects of the Carboniferous Period. The Psocidae themselves have not been traced back beyond the Oligocene, in the amber of which period their remains are fairly numerous.

Mallophaga.—This term was first applied by C. L. Nitzsch (1818) to the degraded wingless parasites (fig. 4) commonly known as bird-lobe biting-lice, differing from the true lice (see Hemiptera, Lousia) by their jaws adapted for biting (not for piercing or sucking). By their structure they are evidently allied to the Copeognatha. They are abundantly distinct, however, through the short feelers (not only three to five segments and the conspicuous prothorax. The head is relatively large, but the eyes are degraded and often absent. A remarkable feature is the frequent occurrence of vestigial outgrowths on the body and in some cases, even their fusion with the anterior abdominal segments. The legs are stout and spiny, and well adapted for clinging to the hair of the host and for clinging to the hair of the animal. It is usual to divide the Mallophaga into two families—the Lioheidae, possessing labial palps and two claw-like outgrowths, which are capable, on the death of their host, of seeking another, and the Philopteridae, without labial palps and with a single claw-like outgrowth. This claw is modified for clasping (fig. 4) which never leaves the host and perish themselves soon after its death.

Order Ephemeroptera.

This order includes the single family of the Ephemeridae or May-flies. The name, although quite recently proposed by A. E. Shipton, should be used rather than A. S. Packard’s older term Pteroptera on, c. Magnified 30-50 times.

Fig. 4.—Biting-louse (Trichodectes scutalis) of cattle. Magnified 50-150 times.

Order Odonata.

The distinctiveness of the dragon-flies from other insects included in Linnaeus’s Neuroptera was long ago recognized by J. C. Fabricius, also proposed for the order the common name of Odonata (5). They resemble the May-flies in their “hemimetabolous” life-history; the young insects are markedly unlike their parents, inhabiting fresh water and breathing dissolved air, either through gills or outgrowths at the tips of the antennæ, or through air-tubes on the walls of the rectum into which water is periodically admitted. The winged insects resemble the May-flies in their short fore-wings and in the form of their tubular or Malphigian tubes, but are most strikingly from those insects in their strong well-armoured bodies, their powerful jaws adapted for a predaceous manner of life, and the close similarity of the hind-wings to the fore-wings. The wings of the glassy appearance, and very complex in their neuromere; a remarkable and unique feature is that a branch of the radius (the radial sector) crosses the median nervure, while, by the development of multitudinous cross-nervures, the wing-area becomes divided into an indefinitely large number of segments. The tenth abdominal segment carries strong, unjointed cerci, while the presence of reproductive armature on the second abdominal segment.

All the insects of this order are of small size and the cuticle is imperfectly ciliated, so that the body is as whole is soft. The name Corrodentia was first used by H. Burmeister (1832) and has reference to the biting habits of the insects. Originally, however, the Corrodentia included the order which Enderlein has recently separated as Isoperta (see above). As at present restricted, the Corrodentia include two distinct sub-orders.

Copeognatha.—This sub-ordinal name has been applied by Enderlein to the “book-llice.” These frail insects, the majority of

of the male is a character found in no other order of the Hexapoda. See special DRAGON-FLY.

Sub-class ENDOPTERYGOTA

Order Neuroptera

The insects retained in the order Neuroptera as restricted by modern systematists are distinguished from the preceding orders by the perfection of the maxillo-maxillary joint, the "complete metamorphosis" is undergone. Structurally the Neuroptera are distinguished by elongate feelers, a large, free prothorax, a labium with the former lobes of the maxillae fused together to form a median ligula, membranous, net-veined wings without hairy covering, those of the two pairs being usually alike, the absence of abdominal cerci, and the presence of six or eight Malpighian tubules. The Apodemata, as well as the Neuroptera, have 8 segments of the "campodeiform" type, but destitute of cerci; they are preaceous in habit, usually with slender, sickle-shaped mandibles, whereby they pierce various insects so as to suck their juices. The order contains mainly families, and the eruciform larva of the neuroptera are insects in the geographical distribution. Fossil Neuroptera occur in the Lias and even in the Trias if the relationships of certain larvae have been correctly surmised.
Roman Catholics. The chief industries are tanning, dyeing, and the manufacture of damask, linen, woolen stuffs, leather and beer.

In 1745, 1760 and 1779 engagements between the Austrians and Prussians took place near Neustadt, on which the last occasion was bombarded and set on fire.

See Weltzel, Geschichte der Stadt Neustadt (Neustadt, 1870).

NEUSTADT-AN-DER-HAARDT, a town of Germany, in the Bavarian Palatinate, picturesquely situated under the eastern slope of the Haardt Mountains and at the mouth of the valley of the Speyerbach, 14 m. W. of Spires, and at the junction of railway lines to Worms, Weissenburg and Monsheim. Pop. (1905) 18,575. It has four churches, two Evangelical and two Roman Catholic. The Protestant abbey church, a fine Gothic edifice dating from the 14th century, contains the tombs of several of the counts palatine of the Rhine. The Roman Catholic Ludwigskirche is a modern Gothic structure. The chief industries of the town are cloth, paper, furniture, soap, starch and hats. It has also breweries and distilleries.

A brisk trade is carried on in wood, grain, fruit and wine, all of which are extensively produced in the vicinity. Neustadt, which became a town in 1275, is one of the centres of the Rhenish "grape-cure," and thus attracts numerous visitors.

NEU-STETTIN, a town of Germany, in the Prussian province of Pomerania, on the small Strelitz lake, 90 m. by rail N.E. of Königsberg, the gateway to the N. of Neudorf, Posen and Stolpimünde. Pop. (1905) 10,785. Its industries are iron-founding, dyeing, brewing and the manufacture of machinery, soap and matches. There is a considerable trade in cattle, grain and other agricultural produce, and in timber and spirits.

Neu-Stettin was founded in 1313 by Wratlaisla, duke of Pomerania, on the model of Stettin.

See Willecke, Chronik der Stadt Neu-Stettin (Neu-Stettin, 1862); and W. Kaisski, Beschreibung der vorherrschender Alterthümer in Neu-Stettin (Danzig, 1881).

NEU-STRELITZ, a town of Germany, capital of the grand-duchy of Mecklenburg-Strelitz, situated between two small lakes, the Zierer See and the Glamecker See, 60 m. N. of Berlin, on the railway to Stralsund, at the junction of lines to Warnemünde and Buschoff. Pop. (1905) 11,656. It is built in the form of a star, the eight rays converging on a market-place adorned with a statue of the grand-duke George (d. 1866). The ducal residence is a handsome edifice in a pseudo-classical style, with a library of 75,000 volumes, and collections of coins and antiques.

Other buildings are the churches (two Evangelical and one Roman Catholic), the Carmelitum (a large hospital), the town hall, the market-place, the post-office, and the post-station, which are iron-ware, machinery, pottery, beer and mineral waters. Its trade, chiefly in corn, meal and timber, is facilitated by the Zierer See and by a canal connecting the town with the Havel and the Elde.

About 15 m. to the south lies Alt-Strelitz, the former capital of the duchy, a small town the inhabitants of which are employed in the manufacture of tobacco, leather and wax candles. Neu-Strelitz was not founded till 1776. In the vicinity is the château of Hohen-Zellert, where Queen Louise of Prussia died in 1810.

NEUSTADT-AN-DER-HARZ, a town of Germany, is a principal station of the western kingdom of the Franks, as opposed to the eastern kingdom, Austrasia (q.v.). The most ancient form of the word is Nistur, from niust, which would make the word signify the "most recent" conquests of the Franks. The word Neustria does not appear as early as the Historia Francorum of Gregory of Tours, but is found for the first time in Fredegarius. The kingdom of Chilperic was retrospectively given this name, and in contemporary usage it was given to the kingdom of Clovis II., as opposed to that of Sigebert III., the two sons of Dagobert; and after that, the principality of Stitar was the western part of the realm of Neustria, and those reigning in the East, kings of Austrasia. Under the new Carolingian dynasty, Pippin and Charles Martel restored the unity of the Frankish realm, and then the word Neustria was restricted to the district between the Loire and the Seine, together with part of the diocese of Rouen north of the Seine; while Austrasia comprised only the Frankish dominions beyond the Rhine, perhaps with the addition of the three cities of Mainz, Worms and Speirs on the left bank. The districts between Neustria and Austrasia were called Media Francia or simply Francia. In 843 both the duchies were united under the name of Neustria. The capital was later transferred to the city of Rouen.

At the time of Charlemagne, Lombardy was divided into five provinces: Neustria, Austrasia, Aemilia, Littoraria maris and Tuscia. Austrasia was the name given to eastern Lombardy, and Neustria that given to western Lombardy, the last part occupied by the Lombards.

NEUTITSCHEN (Czech Nový Jičín), a town of Austria, in Moravia, 75 m. N.E. of Brunn by rail. Pop. (1900) 11,801, chiefly German. It is situated on a spur of the Carpathians, and on the banks of the Tisch, an affluent of the Oder. It is the chief place of what was until 1862 a separate administrative unit. The principal industries are the manufacture of woolen cloth, flannel, hats, carriages and tobacco are carried on; and it is also the centre of a brisk trade. The town was founded in 1311. The town became the headquarters of the Austrian field-marshall Loudon, who died here in the same year and is buried in the parish church.

NEUTRALITY, the state or condition of being neutral (Lat. neuter, neither of two), of not being on or inclined to one side or another, particularly, in international law, the condition of a state not participating in a dispute between other states. Neutrality is the most progressive branch of modern International Law. It is also that branch of International Law in which the practice of self-restraint takes the place of the direct sanctions of domestic law most effectively. The rapid changes it is undergoing are in fact bringing the state-system of the modern world nearer to the realization of the dream of many great writers and thinkers, of a community of nations just as much governed by legal methods as any community of civilized men. While the right of war was simply the right of the stronger, there was no room for neutral rights, for, without place in the law, a neutral's rights are nothing but survivals of the right of brute strength. No nation or community down to comparatively recent times was treated as having a right to what it could not keep. It is the growth of a law of neutrality, through the modern possibility of concerted action among neutral states, which is bringing about improvement, and, though the signs of our times are not always reassuring, we have taken a long stride forward since Molloy, in his De Jure maritimo et navalis (1680), wrote: "As a neuter neither purchases friends nor frees himself from them, he refrains from taking a part in a dispute between other states. Neutrality is held more advantageous than to remain in a state wherein he is in all probability of being ruined by the one or the other."

It was the great commercial communities, the Hansa in the north and Venice and the Mediterranean maritime republics in the south, which were first able to insist on some sort of regulation of the usages of war for their own protection. With the growth of intercourse among nations a further advance was made, by treaty stipulations entered into in time of peace, to provide rules for their guidance in the event of war, but it is only in our own time that the idea of a substantive neutral right has obtained legal recognition. To our own time belongs the final acceptance of the principle that the neutral flag protects an enemy's goods except contraband, the conception of neutralization of territory, the abolition of fictitious blockades, the practice of declarations of
neutrality, the detachment from the high sea and neutralization of the zone called territorial waters, and the Areopagus of nations called the European Concert, in which the right of neutrals is asserted as a brake upon the operation of the still venerated right of conquest. The rights of neutrals have received their most recent affirmation in several of the decisions of the Hague Peace Conferences.

International trade and intercourse have become so intricate that war can no longer be waged without causing the most serious loss to neutral nations, which, moreover, suffer from it without any of the possible contingent advantages it may procure for them. This is so, that most great powers have found it necessary for their self-protection to enter into defensive alliances with others, the direct object of which is the preservation of European peace by the threat of making war so gigantic a venture that no state will again embark on it "with a light heart." The next step will probably be alliances between states which, by their nature or by their having reached the limit of their expansion, have nothing further to gain by war with each other, for the purpose of securing perpetual peace as between themselves.

Differences have been made to define neutrality, but the word defines itself, so far as a succinct definition serves any purpose. The subject covers too wide and varied an area of matter to be condensed into a short statement of any kind. Neutrality entails rights and duties on both the belligerent and the neutral sides. Theoretically, neutrality, to be complete, would require the neutral to abstain from everything which could even remotely be of assistance to either belligerent. To this obligation would theoretically correspond that the belligerent should carry on the war without doing anything which could even remotely disturb or interfere with the neutral state or the free activity of its citizens. Neither the one nor the other is found to be practicable. It is not easy for the belligerent to observe absolutely the duty of doing no direct injury to neutral territory. A battle may be fought to the very edge of the neutral frontier, and shells may explode in any neutral town within the firing range of modern artillery. The present respect paid by belligerents to territorial waters is a palliative in the case of a seaboard frontier; but even the three-mile limit acknowledged by most countries would permit belligerents with present range of artillery to fire landwards far into neutral territory. Compensation—it is true—would be due for any damage done, but this does not alter the fact that acts of war can produce direct consequences on neutral territory which have the character of carrying war into a neutral state. The neutral state, moreover, is obliged to incur heavy expenditure to protect its frontier from being traversed by either belligerent, and thus avoid itself being exposed to claims for compensation for an act which it would otherwise be powerless to prevent. In the case of a maritime war, the neutral state is also bound to exercise strict supervision to prevent its ports from being used by either belligerent for the purpose of increasing its military strength. In short, war cannot be carried on without heavy expense and inconvenience to neighbouring neutral states. The inconvenience to the intercourse of neutral citizens is still greater. Their ships are liable to be taken out of their course, and their cargoes to be discharged to the bottom of the hold in search of articles which are contraband according to circumstances over which they have no control, and they may be confiscated without recourse by judges appointed by one of the interested parties. Even their whole trade with specific ports of the one belligerent may be stopped by the ships of the other belligerent without indemnity. On the other hand, a great deal of vital assistance can be given by neutral citizens to the one or the other belligerent in money, or by supplies of arms, ammunition, food and other commodities, which it is not at present the duty of neutral states to interfere with.

The respective rights and duties of belligerent neutrals in current practice may be subdivided as follows:

1. Belligerent duty to respect neutral territory and neutral territorial waters.

2. Neutral right of official representation and mediation of intercourse of neutral citizens with citizens of either belligerent of convoy, &c.

3. Belligerent right of blockade, angry, visit and search, capture and confiscation of contraband of war.

4. Neutral duties: (absolute) of abstention from any direct corporate assistance to either belligerent, of enforcement of respect by both belligerents for neutral territory; (relative) of prevention of any recruiting for either belligerent, or arming or equipping of vessels for their service; and (contingent) of all the above rights and duties of the belligerent without distinction, and of granting impartially to one or the other belligerent any rights, advantages or privileges, which, according to the usages recognized among nations, are not considered as an intervention in the struggle.

This subdivision, we believe, covers the whole ground of neutrality. We shall follow it in this article. Belligerent Duty.—It is now universally recognized among European states that a belligerent army must make no use of its strength in the field to carry its operations into the territory and into the ports of another belligerent. Belligerent forces entering neutral territory are by the practice of nations bound to surrender their arms to the neutral state, and remain hors de combat till the close of the war. (Compare arts. 11 and 12 of the Hague Convention relating to the "Rights and Duties of Neutral Powers and persons in case of war on land" 18th of October 1907.) Through territorial waters belligerent vessels are allowed to pass freely as in time of peace. Nor does the usage of nations forbid a belligerent vessel from entering a neutral port. Motives of humanity have sanctioned this distinction; between territorial and maritime warfare. The Admiralty Instructions (1893) set out the rights of belligerents as Great Britain views them as follows: "Subject to any limit which the neutral authorities may place upon the number of belligerent cruisers to be admitted into any one of their ports at the same time, the captain, by the comity of nations, may enter a neutral port with his ship for the purpose of taking shelter from the enemy or from the weather, or of obtaining provisions or repairs that may be pressingly necessary (I. section 592). He is bound to submit to any regulations which the local authorities may make respecting the place of anchorage, the limitation of the length of stay in the port, the interval to elapse after a hostile cruiser has left the port before his ship may leave in pursuit, &c. (I. section 593). He must abstain from any acts of hostility towards the subjects, cruisers, vessels or other property of the enemy which he may find in the neutral port (section 594). He must also abstain from increasing the number of his guns, from procuring military stores, and from augmenting his crew even by the enrolment of British subjects" (section 595).

Nor may the commander of a British warship take a capture into a neutral port against the will of the local authorities (Holland, Manual of Naval Prize Law, 1888, section 299). This subject was one of those dealt with at the Hague Conference of 1907. (See art. 18 of the "Convention relating to the rights and duties of neutral powers in naval war."")

Neutral Rights.—Neutral powers have the right to remain, as far as possible, unaffected by the war operations, and, therefore, continue their diplomatic relations with the belligerent states. The immunities and extraterritoriality of their diplomatic agents attach to them as in time of peace, subject only to necessity of war, which may entitle a belligerent to place restrictions on this intercourse. Thus, during the Franco-German War, on the surrounding of Paris, foreign diplomats in the besieged city were refused by the German authorities all possibility of corresponding with their governments, except by letters left open for their inspection. Neutral legations may also undertake the representation of private interests of subjects of the one belligerent on the territory of the other. Thus in the Franco-German War of 1871 the Germans in France were placed under the protection of the United States legation, and the French in
Germany under that of the British legation; in the war of 1866 between the United States and Spain, American interests in Spain were committed to the care of the British legation, and those of Spaniards in the United States to that of the Austro-Hungarian legation. By legations are understood both diplomatic and consular authorities. The protection granted is in the nature of mere mediation. It confers no rights on the belligerent subjects in question, nor does it give the neutral legation any right to protect a belligerent subject or his property against any ordinary rights of war.

Good offices, properly speaking, are a mild form of mediation or tentative mediation, i.e., mediation before it has been accepted by the parties. Article 3 of the Hague Convention of 1899 for the pacific settlement of international disputes (3oth March 1899), provides that "powers strangers to the dispute, have the right to offer good offices or mediation, even during the course of hostilities," and that "the exercise of this right can never be regarded by one or other of the parties in conflict as an unfriendly act." The Hague Convention puts an end to the doubt whether a neutral power can mediate without involving itself in some way with the one or the other side in the dispute. Mediation had already been provided for in several existing treaties, such as the Treaty of Paris (30th March 1856), which provides that "any cession should arise between the Sublime Porte and one or more of the other signatory powers and threaten the maintenance of their good relations, the Sublime Porte and each of these powers before resorting to force shall give an opportunity to the other contracting parties in order to prevent such extreme measures" (article 8); the Treaty of Yedo between the United States and Japan (29th July 1858) stipulating that in the case of difference between Japan or any other state, "the president of the United States, at the request of the Japanese government, will act as a friendly mediator in such matters of difference as may arise between the government of Japan and any other European power," (article 2); and the General Act of Berlin relating to West Africa (1885), which provides that "in the case of a serious disension having arisen on the subject of, or within the territories" in question, between the signatory powers, they undertake, before taking up arms, to have recourse to the mediation of one or more of the friendly powers (article 12).

In the Venezuela-Guiana boundary question, the mediation of the United States government was declined by Great Britain, but its good offices were accepted. In the difficulty which arose between Germany and Spain in connexion with the hoisting of the German flag on one of the Caroline Islands, Spain did not consider arbitration consistent with the sovereign power she claimed to exercise over the island in question, but she accepted the mediation of the pope, and the matter was settled by protocols, signed at Rome (17th December 1885). These incidents show the uses of variety and gradation in the methods of diplomacy.

Neutral subjects have the right to carry on trade and intercourse with belligerent subjects in so far as they do not interfere with the operations or necessities of war, and it is no abuse of a belligerent subject, or of any foreign ship in belligerent soil, to state in the neutral character that this trade or intercourse is of benefit to either side. This is subject always to the belligerent right to capture and confiscate contraband of war (see below). On the other hand, the property of subjects and citizens of neutral states follows the fortune of the belligerent state within whose territorial jurisdiction it is situated. It is liable to the same charges as that of native subjects and citizens, and in case of military contributions neutral subjects on belligerent soil can claim no protection or exemption (see below, Angery). They have also the same rights to all indemnities for loss as are granted to native subjects and citizens.

The position of neutral public ships and the relative assimilation to them of mail steamers has been the subject of some controversy. A public ship is a ship having an official character. It includes not only warships, but also any ships affected to any specific and exclusive government purpose. Public ships in this sense are invested with an extra-territorial character, and the state to which they belong is directly responsible for any breaches of the law. This is not the case with mail steamers. The ships are therefore not liable to visit and search for contraband of war, are exempt from territorial jurisdiction even in belligerent waters. As regards vessels which are engaged partly in private traffic and partly on public service, such as mail steamers and government packets, the position is necessarily different. Under the Japanese Prize Law, adopted in view of the Chino-Japanese campaign, any vessel carrying contraband of war, whose destination is hostile, may be detained, without exception being made for mail steamers. The United States proclamation of April 1856 in connexion with the Spanish War stated that mail steamers would not be stopped in search of contraband of war, and that the passengers and crew would not be arrested. Under the Chinese prize law, some interesting decisions have been handed down, and the Chinese admiral had directed that British ships under his orders should afford protection to such merchant vessels, and not to allow them to be molested in any way. Professor Takahashi, in his 'International Law of the China-Japanese War,' relates that the Japanese admiral replied that "as the matters demanded by the British admiral belonged to the sphere of international diplomacy, and consequently were outside his official responsibility, they should be communicated to the proper authorities of the government of the British admiral," observes Professor Takahashi, "seemed to be not only to claim a right of convoy, which has never been recognized..."
NEUTRALITY

in treaties with Mexico (5th April 1831), Venezuela (20th January 1836), Peru (6th Sept. 1870), Salvador (6th December 1876) and Italy (26th February 1871), have agreed to accept the commander's declaration as provided in the Japanese Prize Law. Wharton quotes in his International Law Digest a passage from a despatch of Mr Secretary Forsyth (18th May 1837) in which he states that "it is an ordinary duty of the naval force of a neutral during civil or foreign wars to convoy merchant vessels of the nation to which it belongs to the ports of the belligerents. This, however, has not always been done in exact accordance with such rights as defined by the law of nations or by treaty." The Spanish Naval Instructions (24th April 1809) in the war with the United States granted unconditional exemption to convoyed neutral ships (article 11). The subject has now been dealt with by the Declaration of London (1908-1909), which requires the commander of a convoy to give a statement in writing as to the character of the vessels and cargoes (see CONVOY). A neutral merchant ship, travelling under enemy's convoy, places itself, with the assistance of the belligerent force, beyond the application of the belligerent right of visit and search, and thus commits a breach of war if it does not proceed to the neutral port.

Belligerent Rights.—Since the declaration of Paris providing that blockades in order to be binding must be effective, that is to say, must be maintained by a force sufficient really to prevent access to the enemy's coast, the tendency has been to give a precise form to all the obligations of the blockading belligerent. Thus it is now generally agreed that notification to the neutral should be sufficiently detailed to enable neutral vessels to estimate, with practical accuracy, the extent of their risks. French writers consider a general notification, though desirable, as insufficient, and hold an individual notification to each neutral ship which presents itself at the line of blockade as requisite. This theory was applied by France in the Franco-German War, and earlier by the Northern States in the American Civil War. The new Japanese Prize Law (1894) does not attempt to prescribe any such notification to each ship, but sets out that notice of blockade to each ship is either actual or constructive. "Actual" it describes as being when the master is shown to have had knowledge of the blockade, in whatever way he may have acquired such knowledge, whether by direct warning from a Japanese warship or from any other source; "constructive," when a notification of its existence has been made to the proper authorities of the state to which the vessel belongs, and sufficient time has elapsed for such authorities to communicate the notification to the subjects of that nation, whether or not they have in fact communicated it. No blockade, however, was attempted by the Japanese government, and the application of the rules was not put to the test.

In the war with Spain the United States proclamation of the investment of Cuba stated that an efficient force would be posted, so as to prevent the entrance and exit of vessels from the blockaded ports, and that any neutral vessel approaching or attempting to leave any of them, "without notice or knowledge" of the establishment of the blockade, would be duly warned by the commander of the blockading forces, who would endorse on her register the fact and date of such warning, and where such endorsement was made. The words "without notice or knowledge" were explained fully in the instructions to blockading vessels (20th June 1898). "Neutral vessels," said these instructions, "are entitled to notification of a blockade before they can be made prize for its attempted violation."

"The character of this notification is not material. It may be actual, as by a vessel of the blockading force, or constructive, as by a proclamation of the government maintaining the blockade, or by common notoriety. If a neutral vessel can be shown to have notice of the blockade in any way, by British prize courts, but also to extend it over all waters of the Far East, where British warships were not actually engaging in combat, the Japanese government made no difficulty. On 11th August the under-Secretary of the Japanese Foreign Office received a letter from the British Minister in Tokyo stating that there must be some misunderstanding, and that the British government would never try to interfere with belligerent right."

she is good prize and should be sent in for adjudication; but should the formal notice not have been given, the rule of constructive knowledge arising from notoriety should be construed in a manner liberal to the neutral." Thus the United States government abandoned the system of individual notification inserted in the proclamation of 10th April 1861, which was only found practicable in the case of vessels which had presumably sailed without knowledge. In such cases it was provided by the more recent instructions that they should be boarded by an officer, who should enter the notice that an attempt had been made to include the name of the blockading vessel giving notice, the extent of the blockade, and the date and place, verified by his official signature. The vessel was then to be set free, with a warning that, should she again attempt to enter the same or any other blockaded port, she would be good prize. The Declaration of London (1908-1909) exhaustively treats of this subject and has regulated it with a leaning towards continental views (see BLOCKADE).

Angry, or Droit d'Angerie, is a contingent belligerent right, without any apparent military necessity. Ordinary private neutral property on belligerent soil, it must be remembered, follows the fate of private property generally. The only distinction between the right of angry and the right of assimilating private neutral property to private property generally on belligerent soil which seems based on reason is that, whereas private property of neutrals generally which has remained on belligerent soil is sedentary, or, so to speak, domiciled there, neutral vessels are mere visitors with a distinct external domicile. The writer thinks the assimilation of neutral railway carriages to neutral vessels in this respect not unreasonable.²

A neutral state in its corporate capacity, we have seen, must abstain from acts which can be of assistance to either belligerent, and it is bound to exercise reasonable diligence to prevent its territory being used as a base for belligerent operations. The duties of a neutral state as a state go no further. Commercial acts of its citizens, even the export of arms and munitions of war to a belligerent country, do not, in the present state of international usage, so long as both belligerents are free to profit by such acts alike, involve liability on the part of the neutral state. But relief from the obligation of repressing breaches of neutrality by contraband traffic of subjects has its counterpart in the right granted to belligerent warships of visit and search of neutral merchant vessels, and in the possible condemnation, according to circumstances, of the ship and confiscation of goods held to be contraband.

Footnotes:

1. Angaria (from אנגיא, a messenger), a post station. The French word Angaria, as the ship is, is probably of the same origin.
2. Treaties between the Zollverein and Spain (30th March 1868) and between Germany and Portugal (2nd March 1872) contain special provisions for the fixing of indemnities in case of any forced utilization by either state of private property of the citizens of the other.
Contraband is of two kinds—absolute contraband, such as arms of all kinds, machinery for manufacturing arms, ammunition, and any materials which are of direct application in naval or military armaments; and conditional contraband, consisting of articles which are fit for, but not necessarily of direct, application to hostile uses. The British Admiralty Manual of Prize Law (1888), following this distinction, enumerates as absolutely contraband: arms of all kinds and machinery for manufacturing arms; ammunition and materials for ammunition, including lead, sulphate of potash, muriate of potash, chlorate of potash and nitrate of soda; gunpowder and its materials, saltpetre and brimstone; also guncotton; military equipments and clothing; military stores, naval stores, such as masts, spars, rudders, anchors, cable, hemp and cordage, sailcloth, pitch and tar, copper fit for sheathing vessels, marine engines and the component parts thereof, including screw propellers, paddle wheels, cylinders, cranks, shafts, boilers, tubes for boilers, boiler plates and fire-bars, marine-cement and the material used in the manufacture thereof, blue lias and Portland cements; iron in any of the following forms—anchors, rivet iron, angle iron, round bars of iron of from $\frac{3}{8}$ to $\frac{3}{4}$ of an inch diameter, rivets, strips of iron, sheets, plate iron exceeding $\frac{3}{8}$ of an inch, and Low Moor and Bowling plates; and as conditionally contraband: provisions for food, such as rice, potatoes, beans, flour, oils, lard, hemp and cordage, salt, fish, salted meat, lard, salt, tea, coffee, tobacco, and other foodstuffs of various kinds, with the exception of provisions for the manufacture of arms; arms and ammunition, in a condition such as to be useful for military purposes; mineral fuels, such as coal, lignite and lignite coal, wood, coal-tar, wood-oil, pitch, tar, copper, and iron; materials for the construction of vessels, such as teak, eucalyptus, mahogany, iron, in the form of planks, rails, beams and bolts; and materials used for the construction of boilers, engines, and machinery. The above-mentioned goods are contraband when they are on board a vessel which either has a hostile destination or calls at any port of the enemy. (2) Provisions and liquors, money, telegraphic materials, such as wire, platinum, sulphuric acid and zinc, porous cups, materials for the construction of a railway, as iron bars, sleepers, &c., coal, timber and so forth; the above-mentioned goods are contraband in a condition such as to be useful for the construction of a railway or a hostile port, used exclusively or mainly for naval or military equipment. When it is clearly known that, though goods detailed in the above sections 1 and 2 are found on board a vessel, they are merely for her own use, they cannot be deemed contraband goods.

The clashing of coal as conditional contraband has given rise to much controversy. Great Britain has consistently held it to be so. During the war of 1870 the French and German warships were only allowed to take at English ports enough to return to a French or German port respectively. In 1883, during the Franco-Italian campaign, after protest by the Chinese government, Great Britain applied the same rule at Hong-Kong and Singapore. During the Spanish-American War neither belligerent seems to have treated coal as contraband. In the case of the coal-ships which were prevented from landing their cargoes at Cuba, the prevention seems to have been connected with the blockade only. At the West African conference of 1884 Russia declared that she would "categorically refuse her consent to any articles in any treaty, convention or instrument whatever which would imply the recognition of coal as contraband of war (Parliamentary Papers, Africa, No. 4, 1883)." Coal is a harmful article, so far as its nature itself is concerned, that it is impossible to avoid classing it as conditional contraband, so long as such contraband is recognized. The alternative, of course, would be to allow both belligerents freely to supply themselves at neutral ports, and neutral vessels freely to supply belligerent coaling stations.

During the Franco-Chinese campaign of 1885 and the South African War there was controversy as to the legality of treating foodstuffs as conditional contraband. During the former the subject-matter was rice, and the circumstances were exceptional. The hostilities being at the outset reprisals, and not actual war, France at first exercised no right of search over British merchant ships. Great Britain, on her side, for the same reason did not object to French war vessels coaling, victualling and repairing at British ports. On China protesting against this indulgence to France, Great Britain, as above stated, put in force her practice of treating coal as contraband, and thereupon France exercised her corresponding belligerent right of searching British vessels. The closing of British coaling stations in French warships for use by serious inconvenience to France, and she proclaimed "that in the circumstances in which war was being carried on" the cargoes of rice which were being shipped to the northern Chinese ports were contraband. By depriving the Chinese government of part of the annual tribute sent from the southern provinces in the form of rice she hoped to bring pressure on the Peking government. This was a manifest stretching of the sense of conditional contraband. Besides, no distinction was made as to destination. The British government protested, but no case was brought into the French prize courts, and the legality of the measure has never been judicially examined.

The controversy during the South African War was confined to theory. In practice no stoppage of food-stuffs seems to have taken place, though the fact that the whole able-bodied population of the enemy states formed the fighting force opposed to Great Britain made it clear that the free import of food supplies from abroad helped the farmer-soldiers to carry on warfare without the immediate care of raising food crops.

The two cases cited show the great difficulty of fixing the character of conditional contraband. Besides, the cases referred to are instances of contraband seizures. During the Russo-Japanese War (1904-1905) there was a warm controversy between the British and Russian governments on the scope of the belligerent right to declare certain articles contraband. The Conference of London (1906-8), by enumerating the articles which are absolute contraband, limiting those which may be declared contraband, and fixing certain articles which can in no case be declared contraband, has endeavoured to meet the difficulties which arise in practice (see Contraband).

Trade between neutrals has a prima facie right to go on, in spite of war, without molestation. But if the ultimate destination of goods, though shipped first to a neutral port, is enemy's territory, then, according to the "doctrine of continuous voyages," the goods may be treated as if they had been shipped to the enemy's territory direct. This doctrine, though Anglo-Saxon in its origin and development, has been put in force by an Italian court in the case of the *Dodslevi*, a Dutch vessel which was adjudged good prize on the ground that, although bound for Jibouti, a French colonial port, it was laden with a provision of arms—a model which had been left behind there, and which might be used in the future by the Abyssinians, with whom Italy was at war. The subject has been fully discussed by the Institute of International Law, by whom the following rule has been adopted: "Destination to the enemy is presumed where the shipment is to one of the enemy's ports, or to a neutral port, if it is unquestionably proved by the facts that the neutral port was only a stage (etape) towards the enemy as the final destination of a single commercial operation."

The question of the legality of the doctrine was raised by Chancellor von Böllow during the South African War in connexion with the stopping of German ships bound for Delagoa Bay, a neutral port. He contended that such vessels were, "The only person in that eminent assemblage who raised an objection to the principle of the doctrine was the distinguished French writer on maritime law, M. Desjardins, who declined to acknowledge that any theory of continuous voyages was, or could be, consistent with the existing law of neutrality, juridically known to International Law. He admitted, at the same time, that penalties of contraband would be incurred if the shipping to a neutral port were effected purely in order to deceive the belligerent as to the real destination of the cargo. This was the French ruling in the *Frau Houswina* case (26th May 1853). He proposed to restrict the operation of the principle, and was opposed by three Italian professors of international law, Professors Fusinato, Catellani and Buzzati, on the ground that it would exclude, as it obviously would do, the contingency of goods shipped to a neutral port, not for the purpose of deceiving the belligerent, but for that of being ultimately delivered to a belligerent not in possession of a seaport. The article as quoted in the text was also supported by the greatest German authority on International Maritime Law, Director Perels of the German admiralty.
NEUTRALITY

at all times, outside belligerent jurisdiction, and that only the authorities of the neutral port were entitled to stop contraband on its way to a belligerent force. He did not, however, press the point, and only reserved the right of raising it at a future date. It was fully discussed at the London Conference of 1908-1909. In order to effect a compromise between conflicting theories and practice, a distinction was made in the declaration between actionable contraband, the transmission of intelligence and the doctrine of continuous voyages not being applicable to conditional contraband when documented to be discharged at a neutral port, except where the enemy country has no seaport (Declaration of London, arts. 30 to 36).

Unneutral Service.—Under this heading the London Conference of 1908-1909, concerning the laws of naval war, dealt with analogues of contraband, and neutral vessels assisting or in the service of the enemy. The articles adopted are as follows:

A neutral vessel will be condemned and will, in a general way, receive the same treatment as a neutral vessel liable to condemnation for carriage of contraband: (1) If she is on a voyage specially under taken with a view to the transport of individual passengers who are enemy nationals or at the instigation of or in the service of the enemy. (2) If, to the knowledge of either the owner, the charterer, or the master, she is transporting a military detachment of the enemy, or one or more persons in the course of the voyage, directly assist the operations of the enemy.

In the cases specified under the above heads, goods belonging to the owner of the vessel are likewise liable to condemnation.

The provisions of the present article do not apply if the vessel is encountered at sea while unaware of the outbreak of hostilities, or if the master, after becoming aware of the outbreak of hostilities, has had no opportunity of discharging the contraband goods to the authorities. This means that a neutral vessel thereby deemed to be aware of the existence of a state of war if she left an enemy port subsequently to the outbreak of hostilities, or a neutral port subsequently to the notification of the outbreak of hostilities to the power to which such port belongs, provided that such notification was made in sufficient time.

A neutral vessel will be condemned and, in a general way, receive the same treatment as a neutral vessel liable to condemnation for carriage of contraband: (1) If she takes part in hostilities, (2) If she is under the orders or control of an agent placed on board by the enemy government, (3) If she is in the exclusive employment of the enemy government, (4) If she is exclusively engaged at the time either in the transport of enemy troops or in the transmission of intelligence in the interest of the enemy.

Any individual emboldened in the armed forces of the enemy who is found on board a neutral merchant vessel may be made a prisoner of war, the thing there be no ground for the capture of the vessel.

The procedure employed to ascertain whether a neutral vessel carries contraband or not is called Visit and Search (see Search), a belligerent right universally recognized and justified by the considerations that merchant ships of the enemy might evade capture by hoisting a neutral flag, if the belligerent had not the right of ascertaining the real character of the ship, and that private neutral vessels might carry contraband goods and generally help the enemy, if the belligerent had not the right of examining their cargo. All neutral private vessels in time of war are liable to visit by belligerents on their courses whatever their destination, or even if the ship is immediately disarmed. The visiting officer has the right to inspect any lockers, stores or boxes, and in case of refusal to open them he is justified in using such coercive measure as the case warrants. If after the visit and search the commander has reason to entertain suspicion he gives the master an opportunity of explanation, and if the explanation is unsatisfactory he detains the vessel. If the seizure turns out after all not to have been justified, the ship and cargo are immediately released and compensation is due for the loss through the detention. In the case of the stoppage and search of German vessels during the South African War, the German government proposed the appointment of arbitrators to decide upon the claims for compensation but this was an innovation to which the British government did not assent.

Resistance to search entails consequences which Art. 63 of the Declaration of London (1908-1909) has expressed as follows:—

Forcible resistance to the legitimate exercise of the right of stoppage, search and capture involves in all cases the condemnation of the vessel. The cargo is liable to the same treatment as the cargo of enemy vessels. No claims belonging to the master or owner of the vessel are treated as enemy goods.

The consequence of carrying contraband are capture, trial by a belligerent prize court, and possible confiscation of the ship and cargo, or of the cargo alone or of a part of the cargo, according to the facts of the case. All are agreed as to articles which are absolute contraband, being liable to capture. As regards conditional contraband, British law, in so far, at least, as concerns naval and victualling stores, is less severe, the Lords of the Admiralty being entitled to purchase such stores without condemnation in a prize court. In practice such purchases are made at the market value of the goods, with an additional 10% for loss of profit. This proceeding is known in International Law as the right of pre-emption. It is not, however, as yet officially recognized on the continent of Europe, though the need of some palliative for confiscation, in certain cases, is felt, and some continental jurists, moved by the same desire to distinguish unmistakable from so to speak constructive contraband, and protect trade against the vexation of uncertainty, have tried to argue conditional contraband away altogether.

The right of compensation of continental authorities is seen in the rule drawn up in 1805, after several years of discussion, by the Institute of International Law, a body composed exclusively of international jurists of acknowledged standing. The majority which adopted it represents authoritative opinion in Germany, Denmark, Italy, Holland and France, showing that the old antagonism between the British and continental views on conditional contraband has ceased to exist. To prevent confusion the Institute declares conditional contraband abolished, and then adds that "nevertimel, the belligerent has, at his option and on condition of paying an equitable indemnity, a right of sequestration or pre-emption as to articles (objets) which, on their way to a part of the enemy, may serve equally for use in war or in peace." The proposed rules goes beyond the directions of the British Prize Act, and it could only come into operation under a verbal alteration of the Declaration of Paris, under which "contraband" alone is excepted from the protection of the neutral flag, a fact which seems to have escaped the notice of the Institute. British prize law is at present governed by the Prize Act of 1864. This act must be overhauled to meet the requirements of the new international law of the subject; the creation of an International Court of Appeal and the new rules adopted by the conferences of the Hague and London will make many changes necessary.

Absolute Duties of Neutrals.—The very sense of neutrality obviously implies abstention from direct corporate assistance. The duty of neutral states to enforce respect for their territory has become a very serious one. A belligerent cannot be allowed to cross the neutral frontier or carry on war operations in neutral waters, without the same right being granted to the other belligerent. Pursuit of one force by the other would amount to waging war on the neutral territory. It is agreed among nations that the avoidance of such a contingency is in the interest of them all. During the Franco-German War both France and Germany,

2 The Naval Prize Act 1864, sect. 38.
as belligerents, and Belgium and England, as neutrals, rigorously observed their duties and enforced their rights, and no difficulty occurred. It is, nevertheless, conceivable that, under pressure of military necessity, or on account of an overwhelming interest, a power might decide to violate the territory of a weak neutral state and leave the consequences to diplomacy. The South African War was exceptional, in that the Portuguese government exposed itself to no international difficulty through allowing a belligerent, whose final victory was certain, and of necessity entailed total suppression of the conquered belligerent, to cross its colonial territory. At the same time it is an unfortunate precedent of taking advantage of the practical powerlessness of neighbouring neutral states to commit a violation of the law of nations, respect for which it is a primary duty of every self-respecting state to encourage. In other words, if belligerent soldiers pass the frontier, they have to be turned back. If they claim the

Refugees. 

droit d'asile, they are arrested, disarmed, and kept in such a manner as to render it impossible for them to take any further part in the hostilities. In the case of territorial waters, as has already been pointed out, the neutral state is not in the same position as on land, all ships without distinction having a right of innocent passage through them. Belligerent ships also have the right to enter neutral ports, but the neutral authority is bound to take precautions to prevent any favour being shown to the one party or the other.1

1 The right of way claimed and accorded to under the Anglo-

Portuguese Treaty of 11th June 1891 was a mere right of transit for merchandise, and could not in any way be construed as diminishing the exclusive obligation to a belligerent who was no party to the treaty.

2 The rules laid down on this subject by the British authorities during the Spanish-American War were as follows:

Refugees. 

1. In the case of the belligerent state of war all warships of either belligerent are prohibited from making use of any port or roadstead in the United Kingdom, the Isle of Man or the Channel Islands, or of any of Her Majesty's colonies or foreign possessions. This is subject to a number of exceptions relating to the jurisdiction of the British crown, as a station or place of resort for any warlike purpose, or for the purpose of obtaining any facilities for warlike equipment; and no ship of war of either belligerent shall hereafter be permitted to leave such port, roadstead or waters from which any vessel of the other belligerent (whether the same shall be a ship of war or a merchant ship) shall have previously departed until after the expiration of at least twenty-four hours from the departure of such last-mentioned vessel beyond the territorial jurisdiction of Her Majesty.

Rule 2.—If there is now in any such port, roadstead or waters such ship as above described, the belligerent shall take over such ship of war of either belligerent, such ship shall leave such port, roadstead, or waters within such time, not less than twenty-four hours, as shall be reasonable, having regard to all the circumstances and the condition of the case of the ship of war of the United States of the Alabama. The British Government, with the idea of strict neutrality, there is no movement to alter the usages to the disadvantage of neutral interests. That the Geneva Arbitral Tribunal found in favour of the United States in the case of the Alabama, but that the International Law had undergone any change. The tribunal was bound by the antecedent fixation of the Washington rules, and laid down no new principle. On the other hand, the magnitude of the Geneva award was not likely to promote change in the direction of increasing neutral duties, except as part of a general regulation of neutral and belligerent rights. The whole subject was laid before the Hague Conference of 1907, which adopted the main principles of the rules enunciated in the Treaty of Washington (see Art. 8 of the Convention relating to the rights and duties of neutral states in maritime war).

Rule 3.—No ship of war of either belligerent shall hereafter be permitted to enter any such port, roadstead or waters subject to the territorial jurisdiction of Her Majesty, to take in any supplies, except such provisions and such other things as may be requisite for the sub-

Relative Duties of Neutrals.—Relative duties embrace those duties which citizens are bound to observe and for which states incur a relative responsibility. It was the non-observance of these relative duties that led to difficulties between Great Britain and the United States at the close of the American Civil War and which brought the two countries themselves to the verge of conflict. The Treaty of Washington (5th May 1871) referring these difficulties to arbitration defined the scope of the duties in question for all future purposes between the two peoples (see below, "Proclamations of Neutrality"). Under this treaty the parties bind themselves to use "due diligence," where they have "reasonable ground" to believe that any acts have a belligerent character, in "preventing" them. They are bound to prevent—

(1) Fitting out, arming, or equipping any vessel;

(2) Departure from their jurisdiction of any vessel, having been specially adapted in whole or in part within such jurisdiction to warlike uses;

(3) The making use by a belligerent of their ports or waters as a base of naval operations against the other;

(4) The making use thereof for the purpose of the renewal or augmenting of military supplies or arms;

(5) The making use thereof for the recruitment of men.

The contracting states undertook to bring the rules they adopted on this subject to the knowledge of other maritime nations, and to follow in their practice the rules accepted by a majority of them. It is not a duty to make the rules recognized by us, and after they shall have been so recognized, the rules shall not be disregarded.

There was evident reluctance among foreign states to commit themselves to the obligation of exercising "due diligence." It is clear that the duty of a state to forbear from committing any act which may be of assistance to either belligerent can never be formulated as an absolute one in regard to the acts of private persons, merchants, or neutral vessels, within the neutral jurisdiction. In recent times it has certainly become possible for states to exercise a more effective control than formerly over these acts; but at the present moment, though a much greater degree of control is possible, there are certain cases in which the idea of strict neutrality, there is no movement to alter the usages to the disadvantage of neutral interests. That the Geneva Arbitral Tribunal found in favour of the United States in the case of the Alabama, but that the International Law had undergone any change. The tribunal was bound by the antecedent fixation of the Washington rules, and laid down no new principle. On the other hand, the magnitude of the Geneva award was not likely to promote change in the direction of increasing neutral duties, except as part of a general regulation of neutral and belligerent rights. The whole subject was laid before the Hague Conference of 1907, which adopted the main principles of the rules enunciated in the Treaty of Washington (see Art. 8 of the Convention relating to the rights and duties of neutral states in maritime war).

Rule 3.—No ship of war of either belligerent shall hereafter be permitted to enter any such port, roadstead or waters subject to the territorial jurisdiction of Her Majesty, to take in any supplies, except such provisions and such other things as may be requisite for the sub-

Rule 4.—Armed ships of either belligerent are interdicted from carrying prizes made by them into the ports, harbours, roadsteads or waterways of the neutral state, unless the ship of war of the other belligerent shall have been captured or seized within the territorial jurisdiction of Her Majesty, without special permission, until after the expiration of three months from the time when such coal may have been last supplied to her within British waters as aforesaid.

Rule 5.—If, in any case, it be necessary that any such ship of war shall be prevented from proceeding, without stopping, and without making use of the port or roadstead, the competent authorities of the Neutral State shall not, except in such cases, when it may be shown that such a step is absolutely requisite for the protection of the Neutral State, prevent the ship taking in a supply of water, provisions, or other necessaries of life, necessary for the continuance of the voyage of the ship; the port or roadstead may not hindrance in the least degree, the provisions of this article.
To some extent the difficulty of determining the extent of relative neutral duty is overcome by the issue of proclamations of neutrality; but neutrality and its rights and duties are in no respect dependent on their being proclaimed by the neutral power. Germany issues no proclamation; at least the German empire has issued none in connexion with the different wars which have taken place since 1870. The Austro-Hungarian government during the same period only has been the case of the war of 1870 itself, and in 1877, issued proclamations, and these probably had objects outside the ordinary purposes of proclamations of neutrality, and its usual practice is the same as that of Germany. France usually issues a short general proclamation, and Great Britain a more detailed one, which must be as old as the "ancient custom" of its being publicly read from the steps of the Royal Exchange by the sergeant-at-arms and common crier of the City of London. The British proclamation practically recites the Foreign Enlistment Act 1870 (an act to regulate the conduct of His Majesty's subjects during the existence of hostilities between foreign states, with which His Majesty is at peace), admonishes all persons entitled to British protection to observe and respect the exercise of those belligerent rights which "We and Our Royal Predecessors have always claimed to exercise," and warns them that any such persons "breaking, or endeavouring to break, any blockade lawfully and actually established" by either belligerent, "or carrying officers, soldiers, despatches, arms, ammunition, military stores, or materials, or article or articles, considered and deemed to be contraband of war, according to the law or modern usages of nations, for the use or service of either belligerent," rightfully incurs the penalty of the law, and the penalties denounced by the law of nations in that behalf." During the South African War no proclamation of neutrality was issued by any country.

Proclamations of neutrality may be made to serve the twofold purpose of warning the belligerent of the length to which the neutral government considers neutral duty to extend, and neutral subjects of the exceptional measures to which a foreign war exposes them. They may also be used to give effect to any modification of neutral right or duty which the neutral state may consider warranted by special or altered circumstances.

No purely mercantile transactions are considered a violation of neutrality. Six years before the American Civil War, President Pierce, in his message to the Thirty-fourth Congress, first session, made the following statement:—"The laws of the United States do not forbid their citizens to sell to either of the belligerent powers articles of contraband of war, or to take munitions of war or soldiers on board their private ships for transportation; and although in so doing the individual exposes his person or property to some of the hazards of war, his acts do not involve a breach of the national neutrality, nor of themselves implicate the government." This statement of international practice has been confirmed by art. 7 of the Hague Convention of October 18, 1907, on the Rights and Duties of Neutral States and Persons on Land (see below).

During the Franco-German War there was correspondence between the Prussian diplomatic representatives in London and at Washington and the British and United States foreign secretaries concerning shipments of arms and ammunition to the French armies, in which the Prussian government contemplated that it was incompatible with strict neutrality that French agents should be permitted to buy up neutral countries under the eyes and with the cognizance of the neutral government, "many thousands of breech-loaders, revolvers, and pistols, with the requisite ammunition, in order to arm there-with the French people, and make the formation of fresh army corps possible after the regular armies of France had been defeated and surrounded." Nothing, however, was done to prevent the departure of these supplies. Both the British and United States governments claimed entire liberty for the traffic in question.

1 The Times, 26th April 1898.
again take part in the hostilities. This neutral state shall discharge the same duties if it be entrusted with the wounded or sick of the other party.

Art. 15.—The Geneva Convention applies to sick and wounded interned on neutral territory (see Geneva Convention).

Art. 16.—The natives of a state not taking part in the hostilities are entitled to the same treatment as the nationals of the other belligerent state.

Art. 17.—A neutral person cannot take advantage of his neutrality:
(a) If he commits hostile acts against a belligerent;
(b) If he commits acts in favour of a belligerent, for instance, if he voluntarily takes service in the ranks of the army of one of the parties.

In each case the neutral shall not be treated with more severity by the belligerent against whom he has acted in contravention of his neutrality than a native of the other belligerent state would be for the same acts.

Art. 18.—The following shall not be considered as acts committed in favor of one of the belligerents, in the sense of Art. 17 (b):
(a) Supplies or loans made to one of the belligerents provided the purveyor or the lender inhabits neither the territory of the other party nor territory occupied by it, and provided the supplies do not come from these territories;
(b) Services rendered in matters of police or civil administration.

An ART. 19.—The rights of neutral powers may be exercised by such states, whether it belongs to these states or to companies or to private persons, and recognizable as such, cannot be requisitioned or utilized by a belligerent, except in such cases and in such a manner as the rights of neutrality are exercised. Such property shall be returned to its country of origin as soon as possible.

The neutral state can, in case of necessity, keep and utilize to that extent property coming from the territory of a belligerent state. An account shall be kept, proportioned to the amount of the property utilized and the duration of utilization.

The clauses of the Convention relating exclusively to neutrality in naval war, which are still fuller, are:

Convention of 1899 on neutralities in naval war.

Art. 1.—Belligerents are bound to respect the sovereign rights of neutral powers and to abstain, either on the territory or in neutral waters, from acts which might constitute in the part of the powers permitting them a non-observance of their neutrality.

Art. 2.—Selection of means of capture, including and the exercise of the right of visit and search, by belligerent ships of war in the territorial waters of a neutral power, constitute a breach of neutrality and are strictly forbidden.

Art. 3.—When a vessel has been captured in the territorial waters of a neutral power, this shall, if the prize is still within its jurisdiction, use all means in its power to effect the release of the prize and its officers and crew, and that the crew placed on board by the captor shall be interned. If the prize is out of the jurisdiction of the neutral power, the capturing government shall, on the request of the former, release the prize with its officers and crew.

Art. 4.—Belligerents are forbidden to make neutral ports and waters the base of naval operations against their adversaries, except in case of self-defense, the equipping or arming of any vessel, which may serve as means of communication with belligerent forces on sea or on land.

Art. 5.—The supply, under any ground whatsoever, either directly or indirectly, by neutral power to a belligerent power, of ships of war, or of munitions or of material of war in any kind, is forbidden.

Art. 6.—A neutral power is not bound to prevent the exportation or transit, for the account of either belligerent, of armaments, munitions of war, or in general, of anything which may be useful to an army or a fleet.

Art. 7.—A neutral government is bound to use the means at its disposal to prevent, when it has reason to believe, the equipping or arming of any vessel, which it has any reasonable suspicion of being destined to act as a cruiser or to join in hostile operations against a power with which it is at peace.

It shall be bound to exercise the same surveillance to prevent the departure out of its jurisdiction of any vessel intending to act as a cruiser or take part in hostile operations, and which, within the said jurisdiction, may have been adapted either wholly or in part for warlike purposes.

Art. 8.—A neutral power must apply equally to the two belligerents the restrictions, conditions and interdictions specified by it relating to adaptation of vessels, equipment, or arming of any vessel, which it has any reasonable suspicion of being destined to act as a cruiser or to join in hostile operations against a power with which it is at peace.

A neutral power may, however, forbid access to its ports and roadsteads, to any belligerent vessel which may have neglected to comply with the orders and directions issued by it or may have committed a breach of neutrality.

Art. 10.—The neutrality of a power is not compromised by the passage through its territorial waters of belligerent ships of war and of their neutral crew.

Art. 11.—A neutral power may allow ships of war of belligerents to make use of its licensed pilots.
ports or roadsteads and in its waters any violation of the preceding provisions.

Art. 26.—The exercise by a neutral power of the rights defined by the present Convention can never be considered as an unfriendly act by either belligerent who has accepted the articles relating thereto.

Art. 27.—The contracting powers will communicate to each other, as soon as feasible, all the laws, ordinances and other provisions which within their jurisdiction govern belligerent ships of war in their ports and waters, by means of a notification addressed to the government of the Netherlands and immediately transmitted by the latter to the other contracting powers.

Art. 28.—The provisions of the present Convention are only applicable as between contracting powers, and only if the belligerents are all parties thereto.

Other reforms may be expected from the Conference of 1915. Germany in the course of the South African War and Great Britain in that of the Russo-Japanese War showed great irritation at the stoppage of certain of their merchant vessels, and Great Britain in the one case had to consent to and in the other to demand a modification of belligerent right under International Law—a modification which, be it said, is a perfectly justifiable one, viz. that the right of search for contraband of war be restricted to a specified area. It is probable that, in future wars, powerful neutral states will show, in similar cases, quite as much irritation as did Germany and Great Britain. (T. BA.)

**NEUILLIVE, ALPHONSE MARIE DE** (1836-1885), French painter, was born, the son of wealthy parents, at Saint-Omer, France, on the 31st of May 1836. From school he went to college, where he took his degree in bachelier ès lettres. In spite of a broken leg, he learnt to paint as a boy. He entered the naval school at Lorient, and it was here, in 1856, that his artistic instincts first declared themselves. After being discouraged by several painters of repute, he was admitted to work in Ficot's studio. He did not remain there long, and he was painting by himself when he produced his first picture, "The Fifth Battalion of Chasseurs at the Gervais Battery (Malakov)." In 1860 de Neuville painted an "Episode of the taking of Naples by Garibaldi" for the Artists' Club in the Rue de Provence, and sent to the Salon in 1861: "The Light Horse Guards in the Trenches of the Mamelon Vert." He also illustrated Le Peuple du monde and Guizot's History of France. At the same time he painted a number of remarkable pictures: "The Attack in the Streets of Magenta by Zouaves and the Light Horse" (1864), "A Zouave Sentinel" (1865), "The Battle of San Lorenzo" (1867), and "Dismounted Cavalry crossing the Tchernaia" (1869). In these he showed peculiar insight into military life, but his full power was not reached till after the war of 1870. He then aimed at depicting in his works the episodes of that war, and began by representing the Bivouac before Le Bourget (1872). His fame spread rapidly, and was increased by the Last Cartridges (1873), in which it is easy to discern the vast difference between the conventional treatment of military subjects, as practised by Horace Vernet, and that of a man who had lived through the life he painted. In 1874 the "Fight on a Railroad" was not successful, and was followed by the "Attack on a House at Villerssexel" (1875) and the "Railway Bridge at Stiring" (1877). In 1878 the painter exhibited (not at the Great Exhibition) "Le Bourget," the "Surprise at Daybreak," "The Intercepted Despatch-bearer," and a considerable number of drawings. He also exhibited in London some episodes of the Zulu War. In 1880 he was made an officer of the Legion of Honour for "The Cemetery of Saint-Privat" and "The Despatch-bearer." During these years de Neuville was at work with Détaille on an important though less artistic work, "The Panorama of Rézonville." De Neuville died in Paris on the 18th of May 1885. At the sale of his works the state purchased for the Luxembourg the "Bourget" and the "Attack on a Barricaded House," with a water-colour "The Parley," and a drawing of a "Turco in Fighting Trim."

**NEUWILLER,** a town of Germany, in the imperial province of Alsace-Lorraine, situated under the Voges Mountains, 6 m. N. from Zabern by the railway to Rastatt. Pop. (1905) 1906.

It is an interesting medieval town, still surrounded by walls. The Romanesque Evangelical church dates from the 12th century; there are also a Romanesque Roman Catholic church, which was restored in 1832, a synagogue, and an old town-hall. The town has a considerable trade in hops and wine. Above it rise the ruins of the fortress of Herrenstein, and of the castle of Huneburg.

See Fischer, Geschichte der Abtei und Stadt Neuwied (Zabern, 1876).

**NEUWIED,** a town of Germany, in the Prussian Rhine province, the capital of the mediatized countship of Wied, is situated on the right bank of the Rhine, 8 m. below Coblenz, on the railway from Frankfort-on-Main to Cologne. Pop. (1905) 18,177. The principal edifice is the château of the princes of Wied. This is situated in a fine park, and contains a collection of Roman antiquities. The town has an Evangelical and a Roman Catholic church. Its chief products are starch, sugar, tobacco, cigars, chcolate, buttons and enamelled goods. Here are large rolling-mills, and in the vicinity are several large iron-foundries. The schools of Neuwied enjoy a high reputation.

Neuwied was founded by Count Frederick of Wied in 1662, on the site of the village of Langendorf, which was destroyed during the Thirty Years' War, and it rapidly increased owing to the toleration accorded to all religious sects. Among those who sought refuge here was a colony of Moravian Brethren; they still occupy a separate quarter of the town, where they carry on manufactures of porcelain stoves and dercskin gloves. Near Neuwied one of the largest Roman castra on the Rhine has been discovered. In 1807 the French, under General Hoche, defeated the Austrians near Neuwied, this being their first decisive success in the revolutionary wars. Legenhau, in the neighbourhood, is one of the residences of the princes of Wied.

See Wirgten and Bleneke, Neuwied und seine Umgebung (Neuwied, 1901).

**NEVA,** a river of Russia, which carries off into the Gulf of Finland the waters of Lakes Ladoga, Onega, Ilmen and many smaller basins. It issues from the south-west corner of Lake Ladoga in two channels, which are obstructed by sandstone reefs, so that the latter of the two has a depth of only 7 ft. to 15 ft. A little farther down it becomes completely navigable, and attains a breadth of 4200 ft.; but between the village of Ostrovki and that of Ust-Tosna it passes over a limestone bed, which produces a series of rapids, and reduces the width of the river from 1050 to 840 and that of the navigable passage from 350 to 175 ft. Nine or ten miles before reaching its outfall the river enters St Petersburg, and 5 or 6 m. lower down breaks up into the Great Neva (850 to 1700 ft. wide), the Little Neva (945 to 1365), and the Great Nevka (280 to 1250), this last, 2 m. farther on, sending off the Little Nevka (470 to 1130 ft.). Its total length is only 40 m. In front of the delta are sandbanks and rocks which prevent the passage of vessels except by a canal, 18 m. long, 124 to 226 ft. wide, and admitting vessels with a draught of 83 ft., from Kronstadt to St Petersburg. Most of its alluvial burden being deposited in the lakes, the Neva takes a long time to alter its channels or extend its delta. The ordinary rise and fall of the river is comparatively slight, but when the west wind blows steadily for a long time, or when Lake Ladoga sends down its vast accumulations of block-ice, inundations of a dangerous kind occur, as in 1777, 1824, 1879 and 1903.

According to observations extending from 1706 to 1899, the mean daily of the freezing of the Neva is November 25th, the earliest October 28th, the latest January 9th, and the latest December 26th. The mean day of opening is April 21st, the earliest March 18th, and the latest May 12th. The mean number of days open is 218, the least 172, the greatest 279.

**NEVADA** (a Spanish word meaning "snow-clad" or "snowy land," originally applied to a snow-capped mountain range on the Pacific slope), one of the far western states of the American Union, lying between 33° and 49° N. and 114° 1' 34" and 120° 34' W. (37° and 45° W. of Washington). It is bounded N. by Utah, S. and Idaho, E. by Utah and Arizona, the Colorado River separating it in part from the latter state, and S. and W. by California. Nevada ranks sixth in size among the states of the Union. Of its total area of 110,690 sq. m., 869 sq. m. are
NEVADA

water surface. Its extreme length, N. and S., is 483 m., and its extreme width, E. and W., is 321 m. (For map, see CALIFORNIA.)

Physiography.—With the exception of its N.E. and S.E. corners, the state lies wholly within the Great Basin, the floor of which is really a vast table-land between 4000 and 5000 ft. above the sea. This plateau, however, is not a plain, but contains many buttes and mesa and isolated mountain ranges rising from 1000 to 8000 ft. above its surface. In the N.E. an unnamed range of highlands, with an E. and W. trend, forms the water-park of the Humboldt streams and boundary of the Humboldt river in Nevada and those that flow into the Snake river through Idaho and Oregon and thence to the Pacific Ocean. This range is very broken and ill-defined, with peaks often reaching altitudes of from 9000 to 12,000 ft., and with numerous spurs diverging N. and S. from the main divide. Between this ridge and the valley of the Colorado river lies all that portion of the Great Basin included within the state. The surface of this table-land is very rugged, and frequently broken by mountain ranges running N. and S. and from 5 to 20 m. wide at their bases. Intersecting the mountains in places.

Between these ranges lie valleys of about the same width as the bases of the mountains. These valleys are generally-level,

floored, but at their borders gradually slope upward, and are filled, often to a depth of several thousand feet, with the detritus of gravel, sand and silt from the neighbouring hills. This is a

region of innumerable faulted crust blocks, the elevated ones creating the N. and S. mountain ranges, and the depressed ones the valleys that lie between. It is for this reason that the mountain slopes are generally more abrupt on one side than on the other. Several valleys often unite into a large elevated plain, broken only by scattered buttes and spurs. The combined areas of the valleys and the area occupied by the mountains are about equal.

The mean elevation of the state is 5500 ft. There are 5400 sq. m. between 2000 and 3000 ft. above the sea; 11,100 sq. m. between 3000 and 4000 ft.; 23,700 sq. m. between 4000 and 6000 ft.; 29,800 sq. m. between 5000 and 6000 ft.; 30,100 sq. m. between 6000 and 7000 ft.; 7800 sq. m. between 7000 and 8000 ft.; and 2800 sq. m. between 8000 and 9000 ft. The highest point is Wheeler Peak, near the centre of the eastern boundary, with an elevation of 13,507 ft.; the lowest points are along the Colorado river, where the altitudes range from 700 to 800 ft. With the exception of this dip in the S.E. corner, the entire state lies above the 2000 ft. line.

The Sierra Nevada range, which forms the western rim of the basin, sends into the state a single lofty spur, the Washoe Mountains. At the foot of this range there is, relatively speaking, a depression, with few if any streams in it, and their full extent the drainage of the eastern slopes of the Sierra and what little drainage there is in the northern half of Nevada. From this depression eastward the general level of the plateau gradually rises to an elevation of 6000 ft. near the eastern borders of the state. The mountains also increase in height and importance as far as the East Humboldt range, a lofty mass about 60 m. W. of the Utah boundary. This range is the water-parting for nearly all the westward-flowing streams of the state, and is by far the steepest and most rugged within Nevada; a number of its peaks attaining a height of 11,000 or 12,000 ft. On its eastern slope the waters soon disappear within the sand of the desert to the eastward, and the only permanent rivers are those cold springs that form the source of the Ruby and Franklin lakes; on its western side the descent is more gentle, and the waters form the South Fork of the Humboldt. Below the centre of the state lie the Toiyabe Mountains, with several peaks from 10,000 to 12,000 ft. in height. The waters on the eastern on the eastern slope flow into the Smoky Valley; those on the other side assist the nephis of the Bear and Carson rivers, the former of which flows N. toward the Humboldt, but seldom has sufficient volume to enable it to reach that stream. Above 100 m. E. of the Carson river is a third important range, the Humboldt Mountains, whose highest peak, Mount Jefferson, rises 9275 ft. above the sea. Owing to their great height these three ranges receive heavier rainfall than the surrounding country and are fedier to the northern valley than any other region of the state. Many of the block mountains of the Great Basin are of complicated internal structure, showing rocks of all ages—state, limestone, dolomite, granite, multi-coloured volcanic rocks, and large areas of lava over.

From the valley of the Humboldt river southward the plateau gradually rises until the divide between this stream and the Colorado river, in the vicinity of the White Pine Mountains, is reached. From this point there is a fall, which is gradual as far as the 38th parallel, and then more abrupt. Thus at Pioche the altitude is 6225 ft.; near Winnemucca 3880 ft. The eastward drainage of the region of the Humboldt is toward the Colorado river, which reach the sea, but either terminate in lakes having no outlet or else vanish in sloughs or "sinks." Small streams often sink from sight in their beds of gravel, and after flowing some distance underground reappear as springs. Of the many springs in Nevada the Humboldt is most important. Rising in the N.E., it flows in a tortuous channel in a general S.W. direction for 300 m. and drains 7000 sq. m. The upper streams empty into the Humboldt lake, the overflow from which goes into the Colorado river at no part of its course is a large river, and near its mouth its waters are sub-alkaline. The Truckee river flows with more vigour, having its source in Lake Tahoe, in California, at an altitude of 6225 ft., and entering the Carson river through an irrigation canal completed in 1905; before this date it flowed into Pyramid Lake and Lake Winnemucca in the depression at the foot of the Sierra Nevada. A few streams from the west of the Humboldt range and Walker rivers, receive their waters from the eastern slope of this range and empty into lakes bearing their names. Of this group of lakes the largest is Pyramid Lake, 80 miles long. Lake Winnemucca is the largest, being 33 m. long and 14 m. wide. Fed by the same streams as its western neighbour, Lake Winnemucca, a much smaller lake. The waters of these two lakes are only moderately saline and may be used for irrigation. The Truckee is formed by the waters of Walker lake, 33 m. long and 6 or 7 m. wide, whose waters are strongly saline. On the western boundary, and partly included within the limits of Nevada, is Lake Tahoe, 20 m. long and 10 m. wide, which is 6553 ft. deep at its centre and whose waters have never been known to freeze, notwithstanding the lake's elevation. The topography and the climate of Nevada have led to the formation of two principal kinds of vegetation, the desert and the perennial. The perennial lakes, such as those just described, hold their waters for years and perhaps centuries; but the ephemeral lakes usually evaporate in the course of the summer. The latter class is formed by waters that can find no outlet. The barrens and deserts are covered by the growth forming in the valleys shallow bodies of water yellow with the mud held in suspension. The largest of these occurs in the Black Rock Desert, in the N.W., and at times is from 450 to 500 m. in length and only a few inches deep. Such bodies of water become nothing but vast sheets of liquid mud, and are called "mud lakes," a term most frequently applied to the sloughs led by Quinn's river. When the waters evaporate in the summer they leave a clay bed of remarkable hardness, which is sometimes encrusted with saline matter of a snowy whiteness and dazzles the eyes of the traveller. When such is the case the beds are called "alkali flats." During the glacial period much of the Great Basin was covered with glaciers and these 1600 years ago, and the glaciers left behind them uniting to form the ancient "Lake Lahontan," in northwestern Nevada. As these lakes shrank after the return of an arid climate, they left elevated beaches and deposits of various minerals, which are now rich in silver, lead, zinc and copper. The Mammoth hot springs are numerous, with temperatures ranging from 50° to 204° F.

In the S.E. corner of the state is the third drainage system. In the Washoe Mountains, as in the rest of the Sierra Nevada range of Arizona and flows S.W. for 60 m. until it joins the Colorado river. The latter stream flows for 150 m. along the S.E. boundary towards the Gulf of California.

Plants and Flora.—Of native animals the varieties are few and the numbers of individuals small. In the arid valleys coyotes (prairie wolves), rabbits and badgers are found. Large animals, such as the black and the grizzly bear, and deer are found on the slopes of the mountains, and small species of antelope and the black-tailed gazelle are found in the northernmost valleys in the winter. At rare intervals antelope appear in the southern deserts. Here also are found the sage thrasher, Le Conte's rooster, and the black antelope. Certain species of grouse are common high in the timbered mountains. Several varieties of water-fowl, especially curlews, pelicans, gulls, ducks, terns, geese and snipe, are found in the winter. The Spring Valley is noted for the size and number of its springs. The "black mouse" or Carson field mouse (Microtus montanus) is found throughout Nevada, as well as in Utah, north-eastern California, and eastern Oregon; it multiplies rapidly under favourable conditions. The ephedra (Ephedra viridis) causes serious injury to the grazing sheep. The flora of Nevada, although scanty, varies greatly according to its location. With the exception of the alkaliflats, no portion of the desert is devoid of vegetation, even in the driest seasons. In the Washoe Mountains, as in the rest of the Sierra Nevada range there is a heavy growth of conifers, extending down to the very valleys; but in many places these mountains have been almost
NEVADA

deforested to provide timbers for the mines.
on other mountains there are scattered trees the pinon (nut
pine) and the juniper at an altitude between 5000 and 7000 ft.
on all but the lowest ranges, the trees rarely reaching a height of
over 15 ft.; and the stunted mountain mahogany on the principal
ranges at an altitude of 6800 ft. Several varieties of poplar are
found in the upper canyons, and trees of the willow-leaved species in
the Humboldt Mountains often attain a height of 60 ft. But except
for these infrequent wooded strips, the mountains are even more
bare than the valleys, because their shrubs are dwarfed from exposure. The trees, except in the Washoe Mountains, are of very
slow growth and therefore knotty and ill-adapted for timber. As a
rule, the elevation of the timber line on the mountains increases as
the latitude decreases. On the foothills are found phlox and lupine,
and in the N. much bunch grass, which is valuable for grazing purThe valleys are covered with typical desert shrubs; greaseposes.
wood (sarcobatus vermiculatus) creosote bushes (larrea tridentata) and
sage-brush (artemisia tridentata); the first-named plant is abundant,
chiefly in the N. This vegetation, covering plains, mesas, and even
extending up the sides of the mountains, gives the entire landscape
the greyish or dull olive colour characteristic of the Great Basin.
To the southward, as the valleys become increasingly sandy and
saline, even the sage-brush disappears, and little vegetation besides
the cactus and the yucca is to be seen. The valleys are treeless,
except in the vicinity of the Truckee river, where considerable
quantities of the cotton wood and a small amount of willow, birch,
and wild cherry are found. The mesquite grows some distance
from water, and is especially common near the Colorado river. In
January 1910 there were seven national forests in the state, created
since July 1908 and chiefly in 1909, containing 7983-76 sq. m.
As the lofty range of mountains on the W. deprives the
Climate.
winds from the Pacific of nearly all their moisture before they reach
the Great Basin, the climate of Nevada is characterized by an exThe skies are clear nearly every day in the year.
cessive dryness.
The mean annual precipitation varies from 3 in. in the S.W. (Esmeralda county) to 12 in. in the E. (White Pine county). In the
central, north-eastern and north-western sections, embracing the
counties of Nye. Elko and Humboldt, the average annual rainfall
varies from 7 to 8 in. ; in the west-central section, at the foot of the
"
"
so-called
Sierra, the average is about 10 in.
rainy season
lasts from October to April, but the precipitation is chiefly in the
form of snow on the mountains. Except at great altitudes snow lies
on the ground only a few days each year. The melting of the
mountain snow-caps in the spring causes severe freshets, which in
turn are followed by long seasons of drought at a time when water
is most needed for agricultural purposes.
Fogs and hail are rare,
but, as in all treeless countries, the rain comes in unequal quantities,
and cloudbursts are not unknown. The mean annual temperature
for the state is 49 F., but varies from 54 in the S.W. to 46 in the
N. The daily and annual variation is very great, and is intensified
toward the E., where the altitudes are greater. At Elko, Elko
county, in the N.E., the mean temperature for the year is 46 F.
for the winter (December, January and February) it is 26
with
extremes reported of 73 and -42 , the mean temperature for the
summer (June, July and August) is 69, with extremes of 108 and
20. At Hawthorne, Esmeralda county, in the S.W., the mean
temperature for the year is 54; for the winter it is 36, with extremes of 69 and -6; the mean temperature for the summer is
72, with extremes of 102 and 32. At the head of the Humboldt
river frosts are of almost nightly occurrence, and in the Carson
Valley damaging frosts often occur in June. In the extreme S. the
isothermal lins run almost due E. and W. but farther northward
they take a N.W. and S.E. direction. The annual range of temperature is about 124; the highest temperature ever recorded being
119, and the lowest -42. In spite of the high temperatures of
summer, however, the low humidity prevents the heat from being
oppressive, and cases of sunstroke are unknown. While the western
mountains keep out the moisture, they do not ward off the winds
which pour dowa the steep slopes in the winter and spring and
raise clouds of dust.
Early-sown grain is often injured by flying
sand and gravel. In the summer and autumn the winds are light.

which irrigation is practicable are along the Humboldt river, in the
plains watered by the Carson, Truckee and Walker rivers, and at
the foot of the mountains along the western edge of the state.
There are various places also near the mouths of desert canyons,
where_ small amounts of water are obtainable for irrigation purposes
from intermittent streams. The total number of acres irrigated in
1899 was 504,168, an increase of 124-7% in the decade. In 1902
the total irrigated acreage was 570,001, an increase of 13-1% in
three years.
In 1902 Congress provided for the beginning of extensive irrigation works in the arid West, and Nevada (where preliminary reconnaissances had been made in 1889-1890) was the
first state to profit from this

A system of reservoirs (the main reservoir
Lake Tahoe with an area of 193 sq. m.), distributing canals, and
drain ditches was also projected, making it possible to reclaim
231,300 acres of the desert. It was estimated that the works would

at a cost of $1,250,000.
is

require nine years for their completion, at a total cost of $9,000,000,
although the first 200,000 acres could be reclaimed at a cost of
$2,700,000. The works were to be operated by the government for
ten years, and the cost assessed against the holders of the land. 1
At the conclusion of this period the system was to pass into the control
of the landholders, with no further charge by the government.
The soil when reclaimed is well adapted for forage crops, cereals,
vegetables and deciduous fruits. Nevada is a great ranching state,
and stock-raising has shown a rapid extension. In 1900, 88-9%
of its farm acreage was devoted to hay and forage crops, being
more than doubled in the decade. Fifty-one per cent, of the improved lands in 1899 were devoted to the cultivation of these crops.
With the growing of grasses as the chief agricultural product,
farming in Nevada is necessarily extensive rather than intensive.
In 1899 the average size of the farms was 1174 acres. 1 The value
of the different kinds of agricultural products for 1899 was as follows
:

live stock, $4,373.973;

hay and

grain, $1,535,914; dairy produce,

It thus appears
$385,220; vegetables, $216,600; fruits, $20,900.
that the live stock industry is one of the most important in the
state; the value of its product in 1899 excee ded its output of gold
and silver, which had then reached its lowest point, by over one
million dollars.* About 64% of the value of the live stock was
represented by neat cattle; 19% by sheep; 10% by horses, and
the remainder by mules, swine, asses, burros and goats.
In spite of the predominating interest in stock-raising, intensive
cultivation of the soil is practicable where the water supply is
sufficient. Nevada, for example, ranked third in 1909 in the amount
of wheat produced to the acre (28-7 bushels), 4 but in the total amount
produced (1,033,000 bushels) ranked only thirty-eighth, and furnished only 0-145% of the crop of the United States. In 1909 in
the amount of barley per acre (38 bushels) Nevada ranked third,
and in the average farm price per bushel ($0-75) ranked first among
the barley-producing states of the country, but in the total amount
produced (304,000 bushels) held only the twenty-second place and
in the same year the average yield of potatoes per acre in Nevada
was 1 80 bushels, exceeded in two states the average for the
entire country was 106-8 bushels per acre but the total crop in
Nevada (540,000 bushels) was smaller than in any state or Territory
of the Union, except New Mexico.
The prevailing soils are sand and gravel loams, but other varieties
are numerous, ranging from rich alluvial beds of extinct lakes, as
in

That conditions are favourable to the animal industry is shown
by the fact that in 1897 the valleys of northern Nevada were so
overrun with wild horses, to the detriment of the grazing grounds
for cattle, that the legislature authorized the killing of such animals.
For a time this was a profitable pursuit, as the horse hides brought
good prices.

Agriculture.
in census years there are sometimes great discrepancies. According
to the Year Book of the Department of Agriculture in 1909 a crop
of 165,000 bushels of oats was grown in Nevada on 7000 acres;
there was no crop reported of Indian corn or of rye.

Agriculture.


NEVADA

Nevada, and thence past the Colorado river into Arizona, is one of the richest mineral belts in the world. Gold was found in Gold Canyon near Dayton, Nevada, as early as July 1849. In 1859 the discovery of silver at Fairview, near Virginia City, caused a rush to that locality and to the building of Virginia City, a prosperous community on the side of a mountain where human beings under ordinary conditions would not have settled. In 1860 there was a new gold excitement. The mines of this one district had produced, up to 1902, $371,248,288, of which $148,145,385 was in gold, $204,653,040 in silver, and the remainder in uncalled tins. For the years 1898 to 1902 the production of the state was $11,000,000; in the second period of great productivity (1873-1878), the output of the lead (by John W. Mackay and his partners, Flood, Fair and O'Brien) in the Comstock Lode of the Great Bonanza mines of Nevada, the maximum annual output for the mines was attained, being $36,301,527. For the three years 1875-1877 the production of gold and silver in Nevada was $20,000,000, and was considerably more than the annual output of the other American states and Territories. After this last year the output of the Comstock mines declined on account of the exhaustion of the ore supply, the increased expense of mining at great depths, and the decrease in the price of silver. The yield reached its lowest point in 1899, but subsequently increased through the application of improved machinery, although the old diggings were treated by the cyanide process with profitable results. In 1899 the mines were worked only for their gold; the lead, silver, and zinc of the miners threw away the “black stuff” which was really valuable silver ore with an assay value four times as great as that of their base metal. By 1902 the output of lead was about equal to the unproductive silver. But the fall in the price of silver led to a reaction, and from 1893 the gold output predominated. The gold production of 1907 was valued at $12,099,435; the silver production at $1,464,470.

In connexion with the operation of the Comstock mines was built (in 1869-1879) the Sutro Tunnel, named in honour of its engineer, Adolph Sutro (1830-1898), piercing the mountain horizontally far below the mouth of the Comstock Lode, and at a distance of nearly 4 miles, striking the shafts of the Comstock Lode, securing ventilation and cool air for the miners, draining the mines above its level, and obstructing floods and hoisting water. Two or three tunnels were also constructed, making the total length 61 miles. Another mining region that attained importance in the early period was the Eureka District, in Eureka county, about 90 miles from Virginia City. During the first years of its operations it was worked by the Sutro Tunnel Company, which had been formed in 1864, but it was five years before the mines became productive. By 1882 they had produced $60,000,000 of precious metals.

With the working out of the deposits in the Comstock region, the mining industry declined, and between 1879 and 1902 there was a period of great depression, in which Nevada fell from first to sixth place among the silver-producing states and Territories. In May 1900, however, very rich deposits of gold and silver were discovered in Nye county, near the summit of the San Antonio Mountains, and a new era began in Nevada’s mining industry. The village of Tonopah sprang into existence as soon as the rush of newcomers to that region had overcome their first difficulties. In two years $7,000,000 worth of gold and silver had been taken from the Tonopah mines and it was asserted that they would prove as rich as the mines of the Comstock Lode. The Tonopah ores were richer in silver than the Comstock ore, and in 1903 there were using being approximately in the proportion of three to one. This discovery gave a new impetus to prospecting in south-western Nevada, and the variations of temperature that the district was not an isolated mining region but was in the heart of a great mineral belt. Tonopah is at the outcropping of a number of ledges which continue for several hundred feet below the surface for an unknown distance. In 1902, in Esmeralda county, 24 m. S. of Tonopah, rich ores were found in the Goldfield District, and within three years there were 8000 people in this region. During 1903 the town of Goldfield had a period of mushroom growth, then quieted, and finally became a thriving little city. Lead and zinc were also worked in this region. The production of the Goldfield District in 1904 amounted to $3,341,079. This discovery was followed in 1904 by that of the Bullfrog District, in Nye county, 60 miles south-west from the Eureka District; and the town of Bullfrog, although 100 m. from a railway, had an electric lighting plant, an ice plant and a hotel. In 1905 gold was discovered in Nye county, 29 m. N.E. of Tonopah, in what became known as the Goldfield District. At the time the population of New York City was 5,775,000, while the population of Manhattan was a mile in length and contained 3000 inhabitants.

After 1902 the production of gold and silver steadily increased, being worth $1,984,675 in 1903, $2,724,745 in 1906, and $4,747,700 in 1907. By far the larger portion of these metals came from the southern part of the state. In production of gold in 1907 Esmeralda county ranked first with $8,533,617 (nearly 70% of the total); Nye county, second, with $2,724,745; and Storey county’s a little more than $250,000. In the production of silver county ranked first in 1907 ($3,667,973, of which $3,541,788 was from Tonopah), Churchill county second ($342,617, from Ruby City); and Esmeralda county, third ($282,370), the lead silver ores) and Storey county were third and fourth respectively. Copper, lead and zinc are produced in small quantities, being found notably in the Eureka district and in the Goldfield district. The production of copper in 1907 was 1,278,571 lb. valued at $356,514. The output of lead in 1907 was 6,271,341 lb. (valued at $322,381). The output of zinc was 2,168,783 lb. (valued at $127,958).

Other important minerals extracted in Nevada are: coal, gravel, silica, and clay. Salt deposits are extensive and commercially important in Washoe and Churchill counties. After 1900 the production of salt rapidly increased up to 1906, when it was 11,249 bbls.; in 1907 it was only 6457 bbls., all graded as commercial coarse salt. Salt deposits are found chiefly in Washoe county; chalcedony (ore containing quicksilver) in Esmeralda county; cinabari (ore containing quicksilver) in Washoe county; haematite in Elko and Churchill counties; cerasite (iron sulphide) in Pershing county; and argentiferous galena (ore of tungsten) at Round Mountain, White Pine county. In 1903 and 1907 Nevada ranked second among the American states in the production of sulphur, but its output is very small in comparison with that of Louisiana.

Manufactures.—The manufacturing interests of Nevada are not important. Of the manufacturing establishments in the state in 1900, 10, or 47.8% were situated in Reno, Carson City and Virginia City, named in the order of their importance. These places employed 35.9% of the labour engaged in manufacturing, and the value of their products was 38.8% of the total for the state. Manufacturing establishments on the products of mines and quarries (clay, glass, stone and metal works) constituted about one-fifth of the whole product. Car construction and general shop work of steam railways was the leading manufacturing industry in 1903; next in importance came the manufacture of newspapers and journals, printing and publishing of newspapers and periodicals. Such statistics of the special census of manufactures (under the factory system) of 1903 as are comparable with those of 1900 show 99 factories in 1900 and 115 in 1903, an increase of 16.2%. Their capital in 1900 was $1,251,208 and in 1903 $2,891,997, an increase of 134.1%. The value of their products in 1900 was $1,261,005, and in 1903 $3,096,274, an increase of 145.5%.

Transportation.—In its industrial development Nevada has always been hampered by lack of transportation facilities. There are no navigable waterways, and the railway mileage is small. There were 460 miles of railways in the state in 1907, of which 213 were in the district; 42 miles were lines of less than 10 miles in length, and wagon trains were the only means of transporting the products of the mines across the desert. An unsuccessful attempt was made, beginning in 1886, to build a railway from this point; for this purpose the railway mileage in 1880 was 739 m., in 1900 148 m., and in the following decade railway building was at a standstill. Since 1900, however, there has been considerable development, and the total mileage on these lines in January 1908 was 922 m. The line is from east and west by three main lines of railway, parts of the great transcontinental systems, the Southern Pacific and the Western Pacific in the northern part of the state and the San Pedro, Los Angeles & Salt Lake in the southern. The oldest of these trunk lines, the Southern Pacific (formerly the Central Pacific), follows the course of the Humboldt and Truckee rivers. It is met at several points by lines which serve the rich mining districts in the south; at Cobre by the Nevada Northern from Ely in White Pine county, on the Robinson copper mining district; at Palisade by the Eureka & Palisade, a narrow-gauge railway, connecting with the lead and silver and coal mining of the district; and at Winnemucca by the Nevada Central, also of narrow gauge, from Austin; at Hazen by the Nevada & California (controlled by the Southern Pacific) which runs to the California line, connecting in that state with other parts of the great Southern Pacific system. Nevada, with the Tonopah & Goldfield, which runs to Tonopah and thence to Goldfield, thus giving these mining regions access to the Southern Pacific’s transcontinental lines; the Truckee & Palisade, a narrow-gauge line, close to the boundary, by the Virginia & Truckee, connecting with Carson City; and the South Pass and Humboldt, which runs from the Carson Valley, and Virginia City, in the Comstock District, and by the Nevada-California-Oregon, projected to run through northern California, to be one of the transcontinental lines of the Western Pacific railway, completed in 1910, extending from Salt Lake City to San Francisco, and running entirely east to west.

It is interesting to note that in 1875 the Nevada legislature passed an act forbidding camels to run at large. This law remained on the statute books until 1908, when it was formally repealed.
across the state of Nevada, is parallel with the Southern Pacific for some distance in the eastern part of the state, and crosses the mountains at Beckwith Pass 20 m. north of Reno. The San Pedro, Los Angeles & Salt Lake railway, also an important factor in east and west, is a new article in the nation's growth. As has been of special value in the development of the southern part of the state, it crosses a section that is mostly desert, but is connected with the Bullfrog District by the Las Vegas & Tonopah, which runs from Goldfield through Beatty and Rhynolet, and meets the San Pedro, Los Angeles & Salt Lake at Las Vegas. The Goldfield and Bullfrog districts have a further outlet to the south through a second railway, the Nevada Short Line (Bullfrog-Goldfield & Tonopah & Tidewater railways) which connects with the Atchison, Topeka & Santa Fe at Ludlow in California.

Population.—Nevada is the most sparsely settled state of the Union. Its population in 1860 was 68,573; in 1870, 42,491 in 1880, 63,766; in 1890, 45,761; in 1900, 43,335; and in 1910, 81,875 (6.7 per sq. m.). In 1900, 10,036 were foreign-born (mostly English, Irish, Germans, Italians and Chinese in almost equal proportions); and there were 35,405 white persons, 5216 Indians, 1520 Chinese, 228 Japanese and 134 negroes. There were then only three towns of importance: Reno, Virginia City and Carson City, the capital.

The Indian population consists of Paiute, Shoshoni and the remnants of a few other tribes of Shoshonean stock. On the Duck Valley reservation (488 sq. m.), established in 1877, in Elko county, between the forks of the Owyhee river and lying partly in Nevada and partly in Idaho, and of the western Shoshoni (boarding school), 55 pupils, in 1880, were found in Paiute, 238 Shoshoni and 1 Hopi in 1908; on the Pyramid Lake reservation (503 sq. m.), established in 1874, in Washoe county, on the borders of the lake from which it is named, 486 Paiute; on the Walker river reservation (70-37 sq. m.), established in 1874 (partly opened to settlement in 1906) along Walker river and Walker Lake, 466 Paiute; on the Moapa river reserve (15-6 sq. m.), in the south-eastern part of the state, 117 Paiute.

In 1906, of the 14,044 members of religious denominations, 9,070 were Roman Catholics, 1,270 Protestant Episcopalians, 1,105 Latter-Day Saints (Mormons), 615 Methodist and 220 Presbyterians.

Administration.—Nevada is governed under the original constitution of 1864, with the amendments adopted in 1880, 1889, 1904 and 1906. The constitution as adopted limited the suffrage to adult white males, but this provision was annulled by the fifteenth amendment to the Federal constitution; and in 1880 amendments to the state constitution were adopted striking out the word "white" from the suffrage clause and adding a new article granting rights under the law to persons without regard to race, colour or previous condition of servitude. A residence in the state of six months and in the district or county of thirty days preceding the election is required of all voters. Persons guilty of treason or felony in any state or Territory and not restored to civil rights, idiots and insane persons, are excluded from the suffrage. An unusual provision in the constitution, a result of its adoption in the midst of the Civil War, gives soldiers and sailors in the service of the United States the right to vote, but only their votes to be applied to the township and county in which they were enlisted and the power to vote is limited to 15 years after the date of discharge. The legislature has the right to make the payment of the poll tax a requirement for voting, but no such provision is in force.2 A law passed in 1887, requiring all voters to take an oath against polygamy, with the object of disfavouring Mormons, was declared unconstitutional by the State Supreme Court.

A governor, lieutenant-governor, secretary of state, attorney-general, controller, treasurer, superintendent of public instruction and survey general are chosen by popular vote every four years. Their functions are similar to those of the administrative officers of other states, but the fact remains that the governor does not possess the usual pardoning power but that the governor himself is a member of the pardoning board. The governor and lieutenant-governor must each be at least twenty-five years old at the time of election to office. The legislative department consists of a Senate, with members chosen every four years, about half of whom retire every two years; and an Assembly, whose members are chosen biennially. The constitution requires that the number of senators shall not be less than one-third nor more than one-half the number of the members of the Assembly, and that the total membership of both shall not exceed seventy. Bills of any character may originate in either house. The legislative sessions are biennial and are limited to fifteen days; special sessions are limited to twenty days. The judicial department consists of a supreme court with a chief justice and two associate justices, chosen for six years, and district courts, with judges chosen for four years.

The state is divided into fifteen counties, each of which is governed in local matters by a board of county commissioners, and is divided for purposes of taxation into townships. The constitution requires that township and county governments shall be uniform throughout the state. For each township there is a justice of the peace, chosen biennially by its voters. The homestead exemption extends only to the land actually occupied and cultivated by a person who is not a legal resident of the state, for a value not exceeding $6000; but no exemption is granted against a process to enforce the payment of purchase-money, or for improvements, or for legal taxes, or of a mortgage to which both the husband and wife were consents. The exemption can be obtained by a husband or wife only with the wife's consent, if the wife is at the time a resident of the state. The exemption is not affected by the death of the husband or wife, but inures to the benefits of the surviving members of the family. For divorce a residence in the state of six months is necessary; the grounds for divorce are desertion or neglect to provide for one year, conviction of felony, habitual drunkenness, cruelty or physical incapacity.

There are a number of unusual provisions in the constitution of Nevada. The assertion in the "Declaration of Rights" that "no power exists in the people of this or any other state of the Federal Union to dissolve their connexion therewith or perform any act tending to impair, subvert, or resist the supreme authority of the government of the United States," is a result of the drafting of the instrument during the Civil War. There is also a provision that the jurors for criminal trial be selected by the returned veterans of the war. There is a provision that no law be enacted which provides that whenever 10% of the voters of the state, as shown by the votes of the last preceding election, express a wish that any law or resolution of the legislature shall be submitted to the people, the Act or Resolve shall be voted on at the next election of the state or county officers, and if a majority of the voters approve the measure it shall stand; otherwise, it shall become void.

Nevada thus became the fourth American state to adopt the referendum.

Institutions.—The state maintains a penitentiary at Carson City and an insane asylum at Reno. The dead, dumb and blind are cared for in the state asylum for the disabled. The University of Nevada.

The State University, established at Elko in 1874 and removed to Reno in 1887, is supported by the income from a Federal grant of two townships (72 sq. m.) of public land and an additional grant, under the Morrill Act, of 8760 acres of 8760 acres of which is to be used for the support of an Agricultural and Mechanical College. An agricultural experiment station and a normal school are conducted in connexion with the university. The constitution provides that no institution in aid of religion is to be supported by public funds. At Virginia City is a school of mines, established by the state in 1903. The Federal government maintains three boarding schools for Indians in the state.

The public school system of Nevada is supported by a Federal grant of 2,000,000 acres of public land (given in lieu of the usual sixteenth and thirty-sixth sections) supplemented by state and local taxation. The constitution provides that a special state tax shall be levied for the support of the schools, and that there shall be provided for school purposes. All fines collected under the penal laws, all escheats and 2% of the receipts of toll roads and bridges go into the school fund, which is invested in state and Federal securities and the
NEVADA

interest apportioned among the counties according to their school population. The administration of the school system is in the hands of a superintendent of public instruction.

American party. The reason of the leave on the 31st of December 1908 amounted to $550,000, of which the state held an irredeemable bond for $350,000; the actual redeemable bonded debt of $170,000 was due to the investment of the school and university funds. From this bond the state is limited by its constitution to $300,000, except for the extraordinary purpose of repelling invasion or suppressing insurrection. Practically all the revenue is derived from the taxation of real and personal property. Mines and mining claims are exempt from taxation, but a quarterly tax is levied on the net proceeds of mines, and is not to be paid a second time so long as the products remain in the hands of the original producer. The rate for state purposes is fixed by the legislature, and for county purposes by the board of county commissioners. A poll tax is required of all males between the ages of 21 and 50 years, one half of which goes to the county in which it is collected and the rest to the state. At the close of 1908 the state receipts for the year amounted to $1,004,041, and expenditures to $875,541.

History.—The first recorded person of European descent to enter the limits of Nevada was Francisco Garés (1738-1781), of the Order of St. Francis, who set out from Sonora in 1775 and passed through, as is now the "extramural" portion of Clark county on his way to California. Half a century later a party of trappers of the Hudson's Bay Company entered Nevada and plied their trade along the Humboldt river. American trappers came at the same time. Emigrants to California followed the trappers, and many crossed Nevada in the early forties of the 19th century. During 1843-1845 John C. Frémont made a series of explorations in this region. By the treaty of Guadalupe Hidalgo, negotiated in 1848, at the close of the war with Mexico, Nevada became United States territory. It was then a part of California. Thereafter, its mines and resources were explored; the first silver mine was discovered in 1851. Nevada produced $300,000 in 1852, $550,000 in 1853, $1,000,000 in 1854, $3,000,000 in 1855, $5,184,000 in 1856, and $10,000,000 in 1857. The annual value of gold and silver produced from 1860 to 1864 was one of rapid development accompanied by the wildest speculation. This was followed by a reaction and a general collapse of inflated values until 1873, when the discovery of the Great Bonanza mine brought about a revival of industry and of speculation. A second period of decline followed the working out of this mine and lasted until 1900, when the discovery of a new mineral belt in southern Nevada brought renewed prosperity. Until 1870 the state was regularly Republican, but in this year the Democrats gained most of the offices, including the seat in the national House of Representatives. The Republicans, however, secured 3 electoral votes of Nevada in 1872 and in 1876, and in 1878 were again in full control, only to suffer defeat in 1880. Not until the silver currency question became a political issue did Nevada take a prominent part in national politics. In 1883, the Nevada Silver Association was formed for the purpose of advocating the free and unlimited coinage of silver. Both parties in the state in 1888 declared in favour of free coinage, and in 1892 instructed their delegates to the national conventions to oppose any candidate who did not favour this policy. As a means of asserting their views effectively, the citizens, irrespective of party, organized local silver clubs, and these eventually led to the formation of the Silver party of Nevada, which drafted a "platform" and nominated a state ticket and presidential electors who were instructed to support the Populist national ticket. The Republicans in the state divided, and the majority of them went over to the Silver party. At the national election in this year the Silver ticket received in Nevada 7264 votes; the Republican 2813; the Democrat 714; and the Prohibitionist 86. In the state election of 1894 the Silver party was again victorious, and not a Democrat was returned to the legislature. In the election of 1896 all the parties in the state declared in favour of the free and unlimited coinage of silver at the ratio of 16 1. The Democratic and Silver parties united, with the result that the state's electoral vote went to Bryan and Sewall, the Democratic nominees, while the Silver party retained most of the state offices. In the presidential election of 1900 the Nevada Republicans pursued a non-committal policy with regard to the silver question, declaring in favour of "the largest use of silver as a money metal in all matters compatible with the best interests of our government." The Democratic and the Silver parties again
NEVADA—NEVERS

united, and subsequently dominated the politics of the state.

NEVADA, a city and the county-seat of Vernon county, Missouri, U.S.A., in the south-western part of the state, about 90 m. S.by E. of Kansas City. Pop. (1900) 7461, of whom 235 were foreign-born and 168 negroes; (1910) 7176. It is served by the Missouri Pacific and the Missouri, Kansas & Texas railway systems. The principal public buildings are the county court house, the federal building and the high school. Nevada is the seat of Cottey College for girls (Methodist-Episcopal, South, 1884) and of a state hospital for the insane, and there is a state camp ground for the National Guard of Missouri. There are three parks, one of which, Lake Park, is a pleasure and health resort, with a lake and chalybeate and sulphur springs. The smelting of lead and zinc and the manufacture of paper, lumber, sheet metal and bricks are among the city’s industries. Nevada is a trading centre for the surrounding country, and an agricultural market, in which Indian corn, oats, wheat, clover, Timothy and blue-grass are grown; coal is mined in the vicinity. The city’s water-supply is drawn from artesian wells. Nevada (“Nevada City” until 1869) was platted in 1855, was burned down in 1865 during the occupancy by the state militia in war time, was incorporated as a town in 1869, was entered by the first railway in 1870, and was chartered as a city in 1880.

NEVADA CITY, a township and the county-seat of Nevada county, Missouri, U.S.A., about 130 m. N.E. of San Francisco. Pop. (1890) 2524; (1900) 3250 (764 foreign-born); (1910) 2680. It is the terminus of the Nevada County Narrow Gauge railway, which connects with the Southern Pacific railway at Colfax, 23 m. S. An electric line extends to Grass Valley (pop. in 1900, 4710), 4 m. S.W. Situated in a hilly and picturesque region, 2580 ft. above the sea, Nevada City is frequented as a health and summer resort (annual mean temperature, about 53° F., mean summer temperature, about 66°). Gold-mining and quartz-mining are its principal industries, and in 1907 Nevada county’s output of gold ($1,000 76 oz. worth $2,278,840 in California; the county is the leading producer

¹ Died the 21st of September, 1890, and Frank Bell became governor by virtue of his office as lieutenant-governor.
² Died the 10th of April 1895, and R. Sadler became governor by virtue of his office as lieutenant-governor.

from quartz mines. Among the manufactures of the township are carriages and products of planing mills, foundries and machine shops; and grapes and fruits are raised in the surrounding country. Gold was first discovered within what is now Nevada City, on Deer Creek, in the summer of 1848, by James W. Marshall, who, in January of the same year, had found the metal near what is now Coloma, Eldorado county. The first settlement was made here in 1849; rich deposits of gold were soon afterwards found on or near the surface, and the settlement had the characteristic growth of a western mining town; its output of gold reached its maximum in 1850—1851. Nevada City was first incorporated in 1851 under a special act of the legislature (repealed in 1852); it was reincorporated in 1856 and again in 1878.

NÉVÉ, or FIRN, the name given to the partly consolidated masses of snow and ice which form in the hollows on the sides of mountains below the belt of freshly fallen snow and just above the compact glacier-ice. The névé, which generally consists of broad sheets of great beauty, is formed from the freshly fallen snow during a series of alternate thaws and frosts. These processes are accompanied by a gradual descent down the mountain side during the winter, and the névé finally consolidates, until it becomes compact glacier-ice. The névé is the feeding ground of the glacier (q.v.). The word névé (Lat. nivis, snow) is adopted from the French dialect of the French Alps; nivis is German, meaning “last year’s snow.”

NEVERS, a town of central France, capital of the department of Nièvre, 159 m. S.S.E. of Paris by the Paris-Lyons-Méditerranée railway to Nîmes. Pop. (1900) 23,502. Nevers is situated on the slope of a hill on the right bank of the Loire at its confluence with the Nièvre. Narrow winding streets lead from the quay through the town where there are numerous old houses of the 14th to the 17th centuries. Among the ecclesiastical buildings the most important is the cathedral of St. Cyr, which is a combination of two buildings, and possesses two apses. The apse and transept at the west end are the remains of a Romanesque church, while the nave and eastern apse are in the Gothic style and belong to the 14th century. There is no transept at the eastern end. The lateral portal on the south side belongs to the late 17th century; the massive and elaborately decorated tower which rises beside it to the early 16th century. The church of St. Étienne is a specimen of the Romanesque style. In that part of the church which is accompanied by the apse and from which the three radiating chapels is characteristic. It was consecrated at the close of the 11th century, and belonged to a priory affiliated to Cluny. The ducal palace at Nevers (now occupied by the courts of justice and an important ceramic museum) was built in the 15th and 16th centuries and is one of the principal feudal edifices in central France. The façade is flanked at each end by a turret and a round tower. A middle tower containing the great staircase has its windows adorned by sculptures relating to the history of the house of Clèves by the members of which the greater part of the palace was built. In front of the palace lies a wide open space with a fine view over the valley of the Loire. The Porte du Croux, a square tower, with corner turrets, dating from the end of the 14th century, is among the remnants of the old fortifications; it now contains a collection of sculptures and Roman antiquities. A triumphal arch of the 18th century, commemorating the victory of Fontenoy and the hôtel de ville, a modern building which contains the library, are of some interest. The Loire is crossed by a modern stone bridge, and by an iron railway bridge. Nevers is the seat of a bishopric of tribal character and of a departmental court of assizes and has a chamber of commerce and a branch of the Bank of France. Its educational institutions include a lycée, a training college for female teachers, ecclesiastical seminaries and a school of art. The town manufactures porcelain, agricultural implements, chemical manures, glue, boilers and iron goods, boots and shoes and fur garments, and has distilleries, tanneries and dye-works. Its trade is in iron and steel, wood, wine, grain, live-stock, &c. Hydraulic lime, kaolin and clay for the manufacture of faience are worked in the vicinity.
NEVILLE

Neviodunum, the early name of Nevers was in later times altered to Nevirnum. The quantities of medals and other Roman antiquities found on the site indicate the importance of the place at the time when Caesar chose it as a military depot for corn, money and hostages. In 52 B.C. it was the first place seized by the revolting Aedui. It became the seat of a bishopric at the end of the 5th century. The countship (see below) dates at least from the beginning of the 10th century. The citizens of Nevers obtained charters in 1194 and in 1231. For a short time in the 13th century the town was a university, transferred from Orleans, to which it was restored.

COUNTS AND DUKES OF NEVERS. Having formed part of the duchy of Burgundy, the county of Nevers (Nevirnais) was given by Duke Henry I. in 987 to his stepson, Otto William, afterwards count of Mâcon, who five years later handed it over to his son-in-law Landri. The first house of the hereditary counts of Nevers originated in this Landri, and was brought to an end in 1192 by the death of Agnes, countess of Nevers, wife of Pierre de Courtenay (d. 1217). The county subsequently passed by successful marriages into the houses of Donzy,Chartillon et Bourbe; Maubu de Bousescus (d. 1214), lord of the county of Nevers, together with those of Auxerre and Tonnerre, to her husband Odo (Eudes), son of Hugh IV., duke of Burgundy, in 1248. Her eldest daughter, Yoland, received the county of Nevers as her dowry when in 1265 she married Jean Tristan, son of King Louis IX. She became a widow in 1270, and in 1272 married Robert de Dampierre, who became count of Flanders. Her descendant by her second marriage, Marguerite, daughter and heiress of Louis II. de Male, count of Flanders, married successively two dukes of Burgundy, Philip I. de Bourbon and Philip II. the Bold. Philip (d. 1415), the third son of Philip the Bold, received the counties of Nevers and of Rethel and the barony of Donzy; his last male descendant, John, died in 1491. The house of Cleves then inherited the Nivernais, which was erected into a duchy by King Francis I. for Francis of Cleves in 1539. In 1565 Louis de Gonzaga (d. 1592), son of Frederick II., duke of Mantua, married Henrietta of Cleves, duchess of Nevers, and one of his descendants, Charles (d. 1669), sold the Nivernais to Cardinal Mazarin in 1659. The cardinal devised it to his nephew Philippe Jules Mancini, whose descendants possessed it until the French Revolution. The last issue of this house was the marriage of Louis IV. of Nivernais, Louis Jules Barbon Mancini Mazarini, died in 1798.

NEVILLE, or NEVILL, the family name of a famous English noble house, descended from Dolwin son of Uchtred, who had a grant from the prior of Durham in 1131 of "Staindropshire," co. Durham, a territory which remained in the hands of his descendants for over four centuries, and in which stood Raby castle, their chief seat. His grandson, Robert, son of Meldred, married the heiress of Geoffrey de Neville (d. 1192-1193), who inherited from her mother the Bulmer lordship of Brancepeth near Durham. Henceforth Brancepeth castle became the other seat of the house, of which the bull's head crest commemorates the Bulmers; but it adopted the Norman surname of Neville (Neville). Robert's grandson, another Robert (d. 1283), held high position in Northumbria, and sided with Henry III. in the Barons' War, as did his younger brother Geoffrey (d. 1283), ancestor of the Nevills of Horby. This Robert's son Robert (d. 1271) extended the great possessions of the family into Yorkshire by his marriage with the heiress of Middleham, of which the powerful Norman castle still stands. The summons of their son Ranulf (d. 1351) to parliament as a baron (1294) did not recognize the position of the Nevills as a barony in the north country. Ralph (d. 1357) the second baron—whose elder brother "the Peacock of the North" was slain by the Douglas in 1318—was employed by Edward III. as a commander against the Scots and had a leading part in the victory of Neville's Cross (1346), where David Bruce was captured, and by which Durham was saved. His active career as head of his house (1331-1367) did much to advance its fortunes and to make the name of Neville a power on the Scottish march. Of his younger sons, Alexander became archbishop of York (1374-1388) and was a prominent supporter of Richard II., attending him closely and encouraging his absolutist policy; in consequence of which he was one of those "appealed of treason" by the opposition in 1388 and being found guilty was outlawed, and died abroad in 1392. His younger brother William, a naval commander, took the opposite side, was a leading Lollard and a friend of Wiclif, and in 1388-1389 acted with the lords appellant.

John, the 3rd baron (d. 1388), a warden of the Scottish marches and lieutenant of Aquitaine, a follower of John of Gaunt and a famous soldier in the French wars of Edward III., conducted the royal policy in the west strengthening the family's position by marriage; his sisters and daughters became the wives of great northern lords; his first wife was a Percy, and his second Lord Latimer's heiress; and his younger son, Thomas, became Lord Furnival in right of his wife, while his son by his second wife became Lord Latimer. His eldest son Ralph (1364-1425), 1st earl of Westmorland (see WESTMORLAND, EARLS OF), carried the policy further, marrying for his second wife a daughter of John of Gaunt and securing heriresses for five of his sons, four of the younger ones becoming peers, while a fifth, Robert, was made bishop of Durham (1458-1457). Among his daughters married the Duchesses of Cleves (Richard iv. and Richard iii.) and an abbess of Barking. The Nevills were thus closely connected with the houses of Lancaster and York, and had themselves become the most important family in the realm. Of the earl's sons by his second marriage, Richard, earl of Salisbury (and three of his sons) and William, earl of Kent, are the subjects of separate notices.

The greatness of the Nevills centred in the "kingmaker" (Richard's son) and the heads of his house, after the 1st earl remaining, sprung from George and Edward, sons of his second marriage. George, who was Lord Latimer, was father of Sir Henry, slain at Edgcote fight, and grandfather of Richard, 2nd lord (1469-1530), a soldier who distinguished himself in the north, especially at Flodden Field. His grandson (d. 1577) was the last lord, but there were male descendants of his younger sons, one of whom, Edmund, claimed the barony, and after 1601 the earldom of Westmorland, but vainly, owing to its attainder. In this line may still exist a male heir of this mighty house.

The heirs male of Edward, Lord "Bergavenny" (now "Abergavenny" co. Monmouth), who died in 1476, have retained their place in the peerage under that style to the present day by a special and anomalous deviation. His wife, the only child of Richard (Beauchamp), earl of Worcester (d. 1422), brought him the great estates which had come to her line with Fitz Alan and Despencer heiresses, and in 1450 he was summoned as Lord Bergavenny, though not seized of that castle. Their grandson, George (c. 1471-1535) the 3rd lord, was in favour with Henry vii. and Henry viii., and recovered from the latter in 1512 the castle and lands of Abergavenny. He was prominent in the French campaigns of 1513-14 and 1523. On the death of his son, Henry, the 4th lord, in 1587, a long-famous contest ensued between his daughter, Lady Fane, and his heir male, Edward Neville, which was eventually ended by James I., in 1604, assigning the barony of Abergavenny to Edward's son and that of Despencer to Lady Fane. The former subsequently descended (on uncertain grounds) to the heirs-male with the old Beauchamp estates under special entails. In 1784 the Lord Abergavenny received an earldom, and the next lord erected at Eridge, Sussex, the present seat of the family, on which the marquises of Abergavenny and earldoms of Lewes were conferred in 1876. Its Sussex estates are mainly derived through the Beauchamps, from the Fitz Alan, heirs of the Warennes. The Nevills of Billingeard, Berks, were a junior line, of whom
was Sir Henry Nevill (d. 1615), courtier and diplomatist, who became a leading figure in parliament under James I. His grandson, another Sir Henry (d. 1664), was an author of some note and a Republican opponent of Cromwell, by whom he was beheaded from London. Archbishop Nevill took the oath of allegiance in 1740, and in 1762 Richard Aldworth (1717-1793), on inheriting Bilingbear, took the name of Nevill. From him descend the Lords Braybrooke.

Neville is a common French name, and it is not clear whether all the Nevills who occur in the 12th and 13th centuries were of the same stock as the lords of Raby. The baronial line of Nevill of "Essex" was founded by the marriage, temp. Richard 1., of a Hugh de Neville to the heiress of Henry de Cornhill, a wealthy Londoner. He went on crusade with Richard I. and was afterwards an active supporter of John, who named him to the Greek Charter (1215). His descendant, Hugh de Neville, was summoned as a baron in 1311, as was his son John, who served in the French and Flemish campaigns, and died, the last of his line, in 1358.

See Rowland's Historical and Genealogical Account of the Family of Nevill (1830); Drummond's Noble British Families (1846); Swallow's De Novo Castellis (1745); Bagot's sketch in The Anecdote, No. 175; also Du Cauvynel's Complete Peerage; J. H. Round's Feudal England; and for the Nevill castles Mackenzie's Castles of England. For the Kingmaker, see Oman's monograph (1885).

NEVILLE, GEORGE (c. 1432-1476), archbishop of York and chancellor of England, was the youngest son of Richard Neville, earl of Salisbury, and brother of Richard Neville, earl of Warwick, known as the "Kingmaker." He was educated at Balliol College, Oxford, and was from his childhood destined for the clerical profession, in which through the great influence of his family he obtained rapid advancement, becoming bishop of Exeter in 1458. From this time forward Neville took a prominent part in the troubled politics of the period. He was present with his brother Warwick at the battle of Northampton in July 1460, immediately after which the great seal was committed to his keeping. He took part in the coronation of Edward of York as king, who confirmed his appointment as chancellor. In 1463 he was employed on a diplomatic mission in France; and in 1464, after taking part in negotiation with the Scots, Neville became archbishop of York. During the next few years he as well as his brothers fell into disfavour with Edward IV.; and in 1469, after a successful rising in Yorkshire secretly fermented by Warwick, the king fell into the hands of the archbishop, by whom, after a short imprisonment, he was permitted to escape. When Warwick was in turn defeated by the king's forces at Stamford Bridge, Neville took the oath of allegiance to Edward, but during the short Lancastrian restoration which compelled Edward to cross to Holland, Neville acted as chancellor to Henry VI.; and when the tide once more turned he again trimmed his sails to the favouring breeze, making his peace with Edward, now again triumphant, by surrendering Henry into his hands. The archbishop for a short time shared Henry's captivity in the Tower. Having been pardoned in April 1471, he was re-arrested a year later on a charge of treason and secretly conveyed to France, where he remained a prisoner till 1475, when he returned to England. Bishop Neville died in the Tower on the 8th of June 1476. Archbishop Neville was a respectable scholar; and he was a considerable benefactor of the university of Oxford and especially of Balliol College.

NEVILLE, RALPH (d. 1244), bishop of Chichester and chancellor of England, was a member of the great Neville family, but of illegitimate birth. In 1214 he became dean of Lichfield, and obtained several rich livings; and in 1224 he was consecrated bishop of Chichester. In 1226 he was appointed chancellor by the council governing during the minority of Henry III.; and when the king in 1236 demanded the return of the great seal, Neville refused to surrender it, on the ground that only the authority that had appointed him to the office had power to deprive him of it. In 1231 he was chosen archbishop by the monks of Canterbury, but the election was not ratified by the papacy. He died in the castle of Lincoln in 1244. Neville’s residence in London was a palace in the street opposite the Temple, which from this association obtained the name of Chancery Lane, by which it is still known; while the palace itself, after passing into the hands of Henry de Lacy, earl of Lincoln, was called Lincoln’s Inn after that nobleman when it became the abode of students of law. Neville bequeathed this property to the see of Chichester, and the memory of his connexion with the locality is perpetuated in the name of a passage leading from Chancery Lane to Lincoln’s Inn which still bears the name of Chichester Rents.

NEVIN, JOHN WILLIAMSON (1803-1886), American theologian and educationalist, was born on Herron’s Branch, near Shippensburg, Franklin county, Pennsylvania, on the 20th of February 1803. He was a descendant of Hugh Williamson of North Carolina, and was of Scotch blood and Presbyterian training. He graduated at Union College in 1821; studied theology at Princeton Theological Seminary in 1823-1828, being in 1826-1828 in charge of the classes of Charles Hodge; was licensed to preach by the Carlisle Presbytery in 1828; and in 1830-1840 was professor of Biblical literature in the newly founded Western Theological Seminary of Allegheny, Penn., whence he removed to the Theological Seminary of Mercersburg, Pa., and thus passed from the Presbyterian Church into the German Reformed. He soon became prominent; first by his contributions to its organ the Messenger; then by The Anxious Bench—A Tract for the Times (1843), attacking the vicious excesses of revivalistic methods; and by his defence of the Inauguration address, The Principle of Protestantism, delivered by his colleague Philip Schaff, which aroused a storm of protest by its suggestion that Presbyterianism was not the last word in the development of the church but that a Johannine Christianity was to be its outgrowth, and by its recognition of Petrine Romanism as a stage in ecclesiastical development. To Dr Schaff’s 122 theses of The Principle of Protestantism Nevin added his own theory of the mystical union between Christ and believers, and both Schaff and Nevin were accused of a "Romanizing tendency." Nevin characterized his critics as pseudo-Protestants, urged (with Dr Charles Hodge, and against the Presbyterian General Assembly) the revival of Roman Catholic baptism, and defended the doctrine of the "spiritual real presence" of Christ in the Lord’s Supper, notably in The Mystical Presence: A Vindication of the Reformed or Calvinistic Doctrine of the Holy Eucharist (1846); to this the reply from the point of view of rationalistic puritanism was made by Charles Hodge in the Princeton Review of 1848. In 1849 the Mercersburg Review was founded as the organ of Nevin and the "Mercersburg Theology"; and to it he contributed from 1849 to 1853. In 1851 he resigned from the Mercersburg Seminary in order that its running expenses might be lightened; and from 1847 to 1853 he was president of Marshall College, and vice-president of Mercersburg College. With Dr Schaff and others he was on the committee which prepared the liturgy of the German Reformed Church, which appeared in provisional form in 1857 and as An Order of Worship in 1866. In 1861-1866 he was instructor of history at Franklin and Marshall College (in which Marshall College had been merged), of which he was president in 1866-1876. He died at Lancaster, Penn., on the 6th of June 1886.

See Theodore Appel, The Life and Work of John Williamson Nevin (Philadelphia, 1889), containing Nevin’s Life and Work (1879). Nevis, an island in the British West Indies, forming with St Kitts one of the five presidencies in the colony of the Leeward Islands. Pop. (1901) 12,774. It lies in 17° 14’ N. and 63° 33’ W., and is separated from St Kitts by a shallow channel 2 m. wide at its narrowest point. In form it is almost round, and from the sea has the appearance of a perfect cone, rising gradually to the height of 3200 ft. Its total area is 50 sq. m. Although the
island is subject to severe storms, the climate is healthy, the average temperature being 82° F. Sugar, rum and molasses are exported, and corn, yams, coffee and fruit are grown. There are medicinal springs and large deposits of sulphur. The chief town, Charlestown, lies on a wide bay on the S.W. The legislative council of St Kitts-Nevis meets at Basseterre, the capital of St Kitts. Nevis was discovered by Columbus in 1498 and first colonized in 1628 by the English from St Kitts. During the period of the slave trade it was a leading mart for slaves in the West Indies.

NEVYANSK, NEVYANSKY or NEVINSKY ZAVOD, a town of Russia, in the government of Perm, 57 m. by rail N.N.W. of Ekaterinburg, on the eastern slope of the Ural mountains, in the populous mountain valley of the Neyva, in a district very rich in iron and auriferous sands. Pop. (1881) 13,980; (1897) about 16,000, all Great-Russians and mostly Nonconformists, who are employed, partly at the iron-works, partly in various small industries, such as the manufacture of boxes, widely sold in Siberia, iron wares and boots, and partly in agriculture. The iron-works at Nevans are the oldest in Russia, having been founded in 1699. In 1702 Peter the Great presented them to Demidov, with 3,000,000 acres of land. Several other iron-works are situated within a short distance, the chief being Verkhne-Nevinsky, 18 m. S.; Neyvo-Rudinsky, 8 m. S.; Petrokamensk, 32 m. N.E.; Neyvo-Shaltansk, 20 m. lower down the Neyva; and Neyvo-Alapayevsk, 64 m. N.E. of Neviansky.

NEW ABBEY, a parish and village of Kirkcudbrightshire, Scotland. Pop. of parish (1901) 937. The hill of Criffel and Loch Kindar are situated within the parish boundaries. The lake contains 12 islands, of which one was a crannog, and the other the site of an ancient kirk. The village, which lies 6 m. S. of Maxwelltown, is famous for the ruin of Sweetheart Abbey, a Cistercian house built in 1275 by Devorguila in memory of her husband John de Bally, who had died at Barnard Castle in 1269. His heart, embalmed and enshrined in a coffin of ebony and silver, which she always kept beside her, was, at her death in 1290, buried with her in the precincts of the abbey, which thus acquired its name (Abbacia Dulcis Cordis, or Douxquer). The building afterwards became known as the New Abbey, to distinguish it from the older foundation at Dunieden, which had been erected in 1142 by Eugeus of Galloway. The remaining part of the abbey chiefly consist of the shell of the beautiful Cruciform church, with a central saddleback tower rising from the transepts to a height of over 90 ft., and a graceful rose window at the west end of the nave. Most of the work is Early English with Decorated additions. The abbott’s tower, a stately relic, stands about ½ m. N.E. of the abbey.

NEW ALBANY, a city and the county-seat of Floyd county, Indiana, U.S.A., on the N. bank of the Ohio river, at the head of low water navigation, nearly opposite Louisville, Kentucky, with which it is connected by three railway bridges, and 156 m. below Cincinnati, Ohio. Pop. (1860) 21,059; (1900) 20,628, of whom 1563 were foreign-born and 1905 negroes; (1910) 20,629. It is served by the Baltimore & Ohio South-western, the Chicago, Indianapolis & Louisville, the Pittsburg, Cincinnati, Chicago & St Louis and the Southern railways, by electric railways to Louisville, Indianapolis, &c., and by steamboats on the Ohio; it is connected by a belt line with the Louisville & Nashville, the Chesapeake & Ohio, the Illinois Central and other railways. The city is situated on an elevated plateau above the river, in an amphitheatre of wooded hills. It has a good public library, a well-organized public school system and several private schools and academies. Within the city limits is a national cemetery. The manufactures include leather, iron, foundry and machine shop products, furniture and veneer, lumber, cotton goods and hosiery, distilled liquors and stores. The value of the factory products in 1905 was $4,110,700, 13% more than in 1900. Originally settled about the beginning of the 19th century. New Albany was platted in 1813 and was chartered as a city in 1839. The city owed much of its early industrial importance to the plate-glass works successfully established here by Washington Charles de Pauw (1822–1887), who endowed the De Pauw College for Young Women (opened as the Indiana Asbury Female College in 1852). The glass works left the city because of the superior and cheaper fuel supplied by natural gas in central Indiana. The De Pauw College for Young Women was relatively unimportant after the endowment of Indiana Asbury University (now De Pauw University) by W. C. de Pauw in 1883, but it continued to give instruction until 1903.

NEW AMSTERDAM, a town of British Guiana, situated in 6° 20' N. and 99° 15' W. on the east bank of the Berbice river, about 4 m. from the mouth. Formerly the capital of the colony of Berbice, it is now the capital of the county of that name. It is a picturesque little town composed almost entirely of wooden houses, having a population estimated in 1904 at 7450. The Colony House, standing in handsome grounds beside the small but pretty botanical gardens, was formerly the residence of the governor and the seat of the legislature, and now contains the treasury and supreme courts. The town is lighted by municipally owned electric works, and contains various government institutions, a town hall and market. The local government is Scottland was the county town, the revenue (a little less $12,000 annually) being mainly raised by a direct rate on house property. The expenditure is principally on streets, street lighting, fire brigade, water supply and drainage. New Amsterdam is connected by ferry and rail with Georgetown, to which there is also a bi-weekly steamer service.

NEWARK, DAVID LESLIE, LORD (1601–1682), Scottish general, was born in 1601, the fifth son of Sir Patrick Leslie of Pitcairny, Fife-shire, commissary of Lindores, and Lady Jean Stuart, daughter of the 1st earl of Orkney. In his early life he served in the Army of James Louis, where he rose to the rank of colonel of cavalry. In 1640 he returned to his native country to take part in the impending war for the Covenant. In 1643, when a Scottish army was formed to intervene in the English Civil War (see Great Rebellion) and placed under the command of Alexander Leslie, earl of Leven, the foremost living Scottish soldier, Leslie was selected as Leven’s major-general. This army engaged the Royalists under Prince Rupert at Marston Moor, and Leslie bore a particularly distinguished part in the battle. He was then sent into the north-western counties, and besieged and took Carlisle. When, after the battle of Killiecrankie, Leslie was recalled from England in 1645, and made lieutenant-general of horse. In September he surprised and routed Montrose at Philiphaugh near Selkirk, and was rewarded by the committee of estates with a present of 50,000 merks and a gold chain; but his victory was marred by the captured Irish—men, women and children—to whom quarter had been given. He was then declared lieutenant-general of the forces, and, in addition to his pay as colonel, had a pension settled on him. Leslie returned to England and was present at the siege of Newark. On his return to Scotland he reduced several of the Highland clans that supported the cause of the king. In 1648 he refused to take part in the English expedition of the “engagers,” the enterprise not having the sanction of the Kirk. In 1649 he purchased the lands of Abercrombie and St Monance, Fife-shire. In 1650 he was sent against Montrose, who was defeated and captured by Major Strachan, Leslie’s advanced guard commander; and later in the year, all parties having for the moment combined to support Charles II., Leslie was appointed to the chief command of the new army levied for the purpose on behalf of Charles II. The result, though disastrous, abundantly demonstrated the ability of Leslie’s arm and it is said that a claim was made for him that Cromwell and the English regulars proved no match for him until his movements were interfered with and his army reduced to indiscipline by the representatives of the Kirk party that accompanied his headquarters. After Dunbar Leslie fought a stubborn defensive campaign up to the crossing of the Forth by Cromwell, and then accompanied Charles to Worcester, where he was lieutenant-general under the king, who commanded in person. On the defeat of the royal army Leslie, intercepted in his retreat through Yorkshire, was committed to the Tower, where he remained till the Restoration.
in 1660. He was fined £4000 by Cromwell’s “Act of Grace” in 1654. In 1661 he was created Lord Newark, and received a pension of £500 per annum. He died in 1682. The title became extinct in 1790.

NEWARK (NEWARK-UPON-TRENT), a market town and municipal borough in the Newark parliamentary division of Nottinghamshire, England. Pop. (1901) 14,992. It lies in a flat, fertile lowland near the junction of the river Devon with the Trent, but actually on the Devon. By means of a canal 23 m. in length it is connected with the Trent navigation. It is 13 m. N. N.W. from London by the Great Northern railway, and is on the Melton Mowbray joint branch of that company and the London & North-Western, and on the Nottingham & Lincoln branch of the Midland railway. The church of St Mary Magdalene, one of the largest and finest parish churches of England, is specially notable for the beauty of the tower and of the octagonal spire (223 ft. high) by which it is surmounted. The central pier of the old church, dating from the 12th or 13th century, remain, and the lower part of the tower is a fine example of Early English when at its best. The upper parts of the tower and nave are Decorated, completed about 1350; the spire, from between 1384 and 1393, and the chancel from 1480. The sanctuary is bounded on the south and north by two chantry chapels, the upper of which has on one of its panels a remarkable painting of the “Dance of Death.” There are a few old monuments, and an exceedingly fine brass of the 14th century. The castle, supposed to have been founded by Egbert, king of the West Saxons, was partly rebuilt and greatly extended by Alexander, consecrated bishop of Lincoln in 1122, who established it as a mint. It rises picturesquely from the river, and from its position and great strength was for a long time known as the “key of the North.” Of the original Norman stronghold the most important remains are the gate-house, a crypt and the lofty rectangular tower at the south-west angle. The building seems to have been reconstructed in the early part of the 13th century. In the reign of Edward III. it was used as a state prison. During the Great Rebellion it was garrisoned for Charles I., and endured three sieges. Its dismantling was begun in 1649, immediately after the surrender of the king. There is a very beautiful and interesting cross (the “Beaumont” cross) of the latter part of the 13th century in good preservation in the town. A pair of tall piers was added in the reign of Henry VIII., and endowed by Archdeacon Magnus, and there are other considerable charities. The other principal public buildings are the town-hall in the Grecian style (erected in 1774), the corn exchange (1848), the Stock library and Middleton newsroom (1828), the mechanics’ institution (1836), a free library and a fine hospital (1881). There is a large trade in malt, coal, corn and cattle. There are iron and brass foundries, boiler-works, agricultural implement manufactories and breweries. Gypsum and limestone are obtained in the neighbourhood, and plaster of Paris is extensively manufactured. The town is governed by a mayor, 6 aldermen and 18 councillors. Area 1931 acres.

Newark (Newerca, Nowerk) owed its origin, possibly in Roman times, to its position on the great road called the Fosse Way, in the valley of the Trent. In a document which purports to be a charter of 664 Newark is mentioned as having been granted to the abbey of Peterborough by Wulfhere. In the reign of Edward the Confessor it belonged to Godiva, who granted it to the monastery of Stow, and it remained in the hands of the bishops of Lincoln until the reign of Edward VI. The castle was erected by Bishop Alexander in 1122, and the bridge about the same time. Under Stephen a mint was established. There were burgesses in Newark at the time of the Domesday Survey, and in the reign of Edward III. there is evidence that it had long been a borough by prescription. It was incorporated under an alderman and twelve assistants in 1540, and the charter was confirmed and extended by Elizabeth. Charles I., owing to the increasing commercial prosperity of the town, reincorporated it under a mayor and aldermen, and this charter, except for a temporary surrender under James II., has continued the governing charter of the corporation. Newark returned two representatives to parliament from 1673 until 1855. A weekly market on Wednesdays, and a fair on the eve, day and morrow of the Invention of the Holy Cross, granted to the bishop of Lincoln by John, are still held; another fair at St Mary Magdalene and the four preceding days was granted by Henry III., and is probably represented by the fair now held on the 14th of May. A market for corn and cattle is still held on Wednesdays, and another on Tuesdays for fat stock has been added.

NEWARK, the largest city of New Jersey, U.S.A., a port of entry, and the county-seat of Essex county, on the Passaic River, about 8 m. W. of New York City. Pop. (1890) 181,830; (1900) 246,970, of whom 71,363 were foreign-born, and 6604 were negroes; (1910 census), 347,469. Of the total foreign-born population in 1900 (45,329 of whom had been in the United States at least ten years), 25,130 were from Germany, 12,792 from Ireland, 8537 from Italy, 5874 from England, 5512 from Russia and 4074 from Austria. Of the total population, 143,306 were of foreign parentage on both sides, 56,404 German, 52,261 Irish, 13,668 Italian, 8561 English and 8531 Russian. Newark is served by the Pennsylvania, the Baltimore and Ohio, the Erie, the Delaware, Lackawanna & Western and the Central of New Jersey railways, and by steamboats engaged in coastwise and river commerce. By electric lines it is connected with most of the cities and towns within a radius of 20 m., including Jersey City, Paterson and the residential suburbs, among which are the Oranges, Montclair, Bloomfield, Glen Ridge, Belleville and Nutley. It has a frontage on the river and bay of 10½ m., and a total area of 23:4 sq. m. The site is generally level, but the ground rises toward the western part. Broad Street, 120 ft., and Market Street, 90 ft. wide, the principal thoroughfares, intersect. The most prominent public buildings are the City Hall, completed in 1906; County Court-House, designed by Cass Gilbert (b. 1859), with sculpture by Andrew O’Connor and decorations by Howard Pyle, Will H. Low, Kenyon Cox, H. O. Walker, C. Y. Turner, F. D. Millet, George W. Maynard and Edwin H. Blashfield; United States Government Building; Public Library, finished in 1901, and City Hospital. There is a Roman Catholic Cathedral, and the city is the see of a Roman Catholic and of a Protestant Episcopal bishop. The Prudential Life Insurance Company and the Mutual Benefit Life Insurance Company have fine office buildings. Many of the tanneries and other manufacturing concern have been cleaned up or near the city. In Military Park is a monument to Major-General Philip Kearny (1815-1862), and in Washington Park is a monument to Seth Boyden (1785-1870), a Newark inventor of malleable iron, of machinery for making nails, and of improvements in the steam-loomotive. Newark has also a monument to Frederick Theodore Frelinghuyzen (1817-1855), secretary of state in the cabinet of President Chester A. Arthur, and to Abraham Coles (1813-1881), a poet and physician, both of whom lived here. On the banks of the Passaic is a house having as a part of its walls the old walls of Cockfost Church, in which Washington Irving frequently sojourned, and of which he gave a charming description in Salmagundi. In the vicinity are the remains of Peterborough, the home of Colonel Peter Schuyler (1710-1762), who served against the French in 1746-48 and in the French and Indian War. At the corner of Broad and William streets stood until 1835 the parsonage in which Aaron Burr was born.

In 1910 Newark had 658 acres in public parks, of which 637 acres were under the administration of the Essex County Park Commission. To Washington, Military and Lincoln parks, the older ones next the heart of the city, there have been added Branch Brook (277 acres), Weequahic (265-8 acres), West Side (23 acres), and East Side (12-5 acres) parks. The principal cemeteries are Mount Pleasant, overlooking the Passaic in the northern part of the city, and Fairmount in the western part; about 1891 the remains of the early settlers were removed from the Old churchyard. 1

1 The river channel before improvement had a navigable depth of 7 ft. at mean low water; the depth was increased to about 10 ft. by the Federal government before 1902; in 1907 further improvement was authorized by Congress, the channel to be made 300 ft. wide and 16 ft. deep.
NEWARK

Burying Ground to Fairmount Cemetery and placed in a large vault marked by a monument.

As parts of its public school system the city maintains twelve summer, winter and evening schools, a normal and training school for the education of teachers, a school of drawing, and a technical school, the last for evening classes. The Newark Academy, founded in 1792, is the leading private school; and there are various Roman Catholic academies. In the township of Verona (pop. in 1905, 2,576), about 7 m. N. W. of Newark, is the City Home for boys, in which farming, printing and other trades are taught. The Public Library (opened in 1889) contained about 166,000 volumes in 1910, and the library of the New Jersey Historical Society about 26,000 books, about 21,000 of which are permanent. The Newark, New Jersey, Fire Insurance Company has a law library of about 20,000 volumes; and the Essex County Lawyers' Club has one of 5000 volumes or more. Among the charitable institutions are the City Hospital, Saint Michael's Hospital, Saint Barnabas Hospital, Saint James Hospital, the German Hospital, a Babies' Hospital, an Eye and Ear Infirmary, a City Dispensary, the Newark Orphan Asylum, a Home for Crippled Children, a Home for Aged Women and three day nurseries. The municipality owns and operates the water-works, and the water is brought from reservoirs in the Passaic Valley and to the north and north-west of the city.

The city charter (1857) provides for government by a mayor, elected biennially, and a unicameral council, elected by popular vote. By popular vote, also, the board of street and water commissioners is chosen. The council chooses the city clerk, treasurer and tax receiver, and the mayor appoints the city attorney, police justices, the board of education, the trustees of the public library, and the excise and assessment commissioners, and, subject to the ratification of his choice by the council, the comptroller, auditor and the tax, police, health and fire commissioners.

Newark has long been one of the leading manufacturing cities of the country. The manufacture of shoes and other leather products, particularly patent leather, became an important industry early in the 19th century; in 1770 there was one tannery here; in 1792 there were three; a large one, still in operation, was built in 1827; in 1837 there were 155 curriers and patent leather makers in the city, which then had an annual product of leather valued at $590,300; in 1905 the value of the leather, tanned, curried and finished was $13,577,719. The manufacture of felt hats (product, 1905, $4,586,040, Newark ranking third in the country), the manufacture of daguerreotypes, of the city of the United States), carriages, chairs and jewelry (an industry established about 1830; product, 1905, $8,238,095), developed rapidly early in the 19th century, and there are extensive manufactures of malleable irons (product, 1905, $10,017,003), and of clothing (product, 1905, $9,037,188), ironworks and machine shops (product, 1905, $6,254,153), and large establishments for smelting and refining lead and copper, the product of the lead smelters and refining establishments being in 1905 the most valuable in the city. Among the other important manufactures in 1905 were: chemicals, valued at $5,906,726; slaughtering and meat packing, $2,923,877; varnish, $2,89,305; porcelain ware, $2,686,760; enumerated goods, $2,613,350; boots and shoes, $2,838,251; reduction of gold and silver, not from ore, $2,436,150; corrsets, $2,081,761; paints, $1,812,663; silverware and silver-smithing, $1,780,966; tobacco, cigars and cigarettes, $1,742,682; hardware, $1,615,755; buttons, $1,281,258, and saddlery hardware, $1,151,780. In 1905 an art pottery was established for making "crystal patina" and "'robin's egg blue" wares, in imitation, to a certain extent, of old oriental pottery, and Clifton India was in imitation of pottery made by the American Indians. The total value of Newark's factory products increased from $112,738,045 in 1900 to $150,055,227 in 1905, or 33.1%. In 1905 the value of the city's factory product was almost one-fifth of that for the whole state, and Newark ranked tenth among the manufacturing cities of the entire country. In the same year Newark manufactured more than one-half (by value) of all the jewelry, leather and malt liquors produced in the state.

Insurance is another important business, for here are the headquarters of the Prudential, the Mutual Benefit Life and the American Fire, the Finkleman's and the Newark Fire Insurance companies. The city's foreign trade is of very little value; its imports was $850,442 in 1907; of its exports $664,525, but its river traffic is heavy, amounting to about 3,000,000 tons annually, and being chiefly in general merchandise (including food-stuffs, machinery and manufactured products), ores and metals, chemicals and colours, stone and sand and brick.

Newark was settled in 1666 by about thirty Puritans from Milford, Connecticut, who were followed in the next year by about the same number of their sect from Branford and Guilford. Because of the union of the towns of the New Haven Jurisdiction by an act of the General Court of Connecticut in 1711, and again by an act of the General Assembly of the Province of New York in 1777, the city may be considered as belonging rather to church than to civil rights, these Puritans resolved to remove and found a new town, in which, as originally in the New Haven towns, only church members should have a voice in the government. They bought practically all of what is now Essex county from the Indians for "fifty double bands of powder, one hundred bars of lead, twenty axes, twenty coats, ten guns, twenty pistols, ten kettles, ten swords, four blankets, four barrels of beer, ten pairs of breeches, fifty knives, twenty horses, eighteen hundred and fifty fathoms of wampum, six ankers of liquor (or brandy) of the value of four dollars each, and twenty sickles." The church was in Broad Street, nearly opposite the present First Presbyterian Church, with cupola and flanks from which "watchers" and "wards" might discover the approach of hostile Indians, and as an honour to their pastor, Rev. Abraham Piers, (1668-1768), who came from Newark-on-Trent, they gave the town its present name, having called it Milford upon their first settlement. The town was governed largely after the Mosaic law and continued essentially Puritan for fifty years or more; about 1730 Presbyterianism superseded Congregationalism, and in 1734 Colonel Josiah Ogden, having caused a schism in the preceding year, by the purchase of wheat one dry Sunday in a wet season, founded with several followers the first Episcopal or Church of England Society in Newark—Trinity Church. Partly because of its Puritanic genesis and partly because of its independent manufacturing interests, Newark has kept, in spite of its nearness to New York City, a distinct character of its own. The College of New Jersey, now Princeton University, was situated here from 1747 to 1756, for all but the first few months under the presidency of the Rev. Aaron Burr, who published in 1752 the well-known Newark Grammar, long used in Princeton and originally prepared for the reading of very successful boys' school in Newark. The city received large additions to its foreign-born population immediately after the revolution of 1838, when many Germans settled here—a German daily newspaper was established in 1837. Newark was incorporated as a township in 1693, was chartered as a city in 1836 and received another charter in 1837; from it the township of Orange was formed in 1806 and the township of Bloomfield in 1812.

See H. L. Thowell, Historical Sketch of the City of Newark, New Jersey (Newark, 1902); F. J. Urquhart, Newark, The Story of its Early Days (Newark, 1904); and J. Atkinson, The History of Newark, New Jersey (Newark, 1878).

NEWARK, a city and the county-seat of Licking county, Ohio, U.S.A., at the confluence of three forks of the Licking river, on the Ohio Canal, and 33 m. E. by N. of Columbus. Pop. (1800) 14,270; (1900) 18,157, of whom 1342 were foreign-born and 300 were negroes; (1910 census) 25,404. Newark is served by the Baltimore & Ohio, and the Pittsburg, Cincinnati, Chicago & St. Louis railways, and by inter-urban electric lines. It lies on a level plain, but is surrounded by hills. Along two of the forks of the Licking there are some of the most extensive earthworks of the "mound builders"; they occupy a central area of 3 sq. m., and have a great variety of forms: parallel walls, circles, semicircles, a parallelogram, an octagon, &c. About 10 m. S.W. and connected with Newark by electric line is Buckeye Lake, an artificial body of water about 8 m. long and 1 m. wide, frequented as a summer resort. Among the city's attractive features are Idlewilde Park and a beautiful auditorium, built
as a memorial to the soldiers and sailors of the Civil War. Newark is the trade centre of an agricultural region, which also abounds in natural gas and coal; natural gas is piped as far as Cincinnati. The city has electric car and steam car shops and various manufactories, including stores and furnaces (the most important), bottles, table glass-ware, cigars, rope halters, machine furniture and bent wood. The total factory product in 1905 was valued at $5,253,596, an increase of 9.49% over the latter of 1900. Newark was laid out about 1801 and was incorporated in 1834.

For an account of the earthworks see Gerard Fowke, *Archaeological History of Ohio* (Columbus, 1902).

NEW BEDFORD, a city and port of entry, and one of the county-seats of Bristol county, Massachusetts, U.S.A., 56 m. S. of Boston, at the mouth of the Acushnet river, and at the head of New Bedford Harbor, an arm of Buzzard's Bay. Pop. (1890) 40,733; (1900) 62,442, of whom 25,529 were foreign-born, including 8,559 French Canadians, 5,889 English, 4,802 Portuguese and 3,030 Irish; (1910 census) 66,651. New Bedford is the terminus of two divisions of the New York, New Haven & Hartford railroad, and is connected with Taunton (the other county-seat), Fall River, Brockton and other cities by interurban electric railways. Passenger steamboat lines connect with Martha's Vineyard, Nantucket and Buzzard's Bay points; a freight line and, in summer, daily passenger service to New York are maintained; the Insular Navigation Co. (Empreza Insulana de Navegação) runs passengers and freight steamers from New Bedford to Lisbon, and to the Azores; and there is a regular sailing packet service between New Bedford and the Cape Verde Islands. Two bridges connect New Bedford with the township of Fairhaven, on the E. side of the harbour; one, a steel bridge, is almost 1 m. in length and cost $1,500,000. New Bedford is attractively situated, and, commercially, occupies a particularly favourable position. It covers about 20 sq. m., and extends along the W. side of the river and harbour for several miles. Unusual dockage facilities are thus provided. The harbour was improved by the Federal government, between 1840 and 1906, the channel from Buzzard's Bay through the harbour being 18 ft. deep and 200 ft. wide; under a project of 1907 it was contemplated to increase the depth of the channel 66 ft. and the width to 300 ft. There is a broad highway along the shore of the harbour to Clark's Point at the entrance, where during the Civil War the United States government erected a stone fort, Fort Rodman, in which a garrison of artillery is still maintained; New Bedford was one of the 26 places reported by the U.S. Chief of Engineers in 1909 as having "permanent seacoast defences." Among the principal buildings and institutions are the post office and custom house, the city hall, the county court house, the registry of deeds building, the masonic building, the merchants' national bank, the New Bedford merchants' national bank, and St. Luke's hospitals, the Swain free school, St Mary's (Roman Catholic) school, the Friends' academy, a state textile school, a state armory and St Mary's home. The public library, established as a private society library in 1802, taken over by the city in 1853, and housed in the refitted old city hall building, was one of the first free public libraries in the United States; it contains about 100,000 volumes, and has notable collections relating to the whaling industry and to the Quakers. The Sailors' Bethel, built in 1851, and containing memorial tablets reminiscent of the whaling days, is of interest. The Old Dartmouth Historical Society was organized in 1903. A fine park system, aggregating 555 acres, includes the Common, and Brook- lawn, Buttonwood, Hazelwood, Grove and Triangle Parks. The city owns and operates a fine water-supply system.

When whale-oil was a widely used illuminant, New Bedford was long the principal port of the world's whaling industry; and in point of tonnage owned it is perhaps still so, as many New Bedford vessels now sail from San Francisco. As early as the middle of the 19th century vessels sailed on whaling voyages from the mouth of the Acushnet river, but it was not until 1765, when Joseph Rotch, a Nantucket merchant, bought a tract of land on the W. side of the river and constructed wharves and warehouses, that the industry became established here. At first the whales were obtained principally off the Virginia and Carolina coasts, but by the outbreak of the War of Independence, the New Bedford whalers sought their prey as far as West Indian and even South American waters. The War of Independence temporarily ruined the industry, but it was soon re-established, and the field of operations was much extended, after 1791 many ships regularly rounding Cape Horn into the Pacific Ocean. By 1824 there were 59 whaling vessels registered from New Bedford. The unsettled commercial conditions of the early years of the 19th century and the Embargo combined to ruin the business once more, but the close of the War of 1812 ushered in the greatest era of prosperity for the industry. By 1845 only New York, Boston and New Orleans of American ports exceeded New Bedford in tonnage. The production was greatest in that year, New Bedford whalers importing 158,000 blls. of sperm oil, 272,000 blls. of whale oil and 3,000,000 lb. of whalebone. The beginning of Arctic whaling in 1848 marked a new step in the industry, and the tonnage was much increased. The highest point in total, tonnage and vessels was reached in 1857, when New Bedford possessed 329 registered whaling ships, representing an investment of $17,000,000 and employing almost all 10,000 hands. From a succession of causes, of which the introduction of petroleum into general use as an illuminant was the chief, the industry began to decline from this time. The Civil War was a great blow to the whalers; 25 vessels were sunk by Confederate cruisers, entailing a loss of $1,650,000, and many more were bought by the government to be sunk at the entrances of southern harbours, or to be used as colliers or store ships. In 1871 and 1875 the vessels were lost in the Arctic ice, involving losses of several millions. Still the industry survives on a comparatively small scale; in January 1900 there were 13 steamers and barns, 1 brig and 4 schooners, with an aggregate tonnage of 4710, employed, chiefly in sperm whaling, and the whalebone product of 1908 was valued at about $350,000.

The prosperity that New Bedford lost with the decline of the whaling industry has been more than made up by the growth of the cotton spinning industry. In 1895 New Bedford ranked second among the cities of the United States in the manufacture of cotton goods (including cotton small wares), producing 5% of the total for the country; the specialty of the mills is the finer cotton goods. The first cotton mill, a five-storey stone structure, was built by Joseph Grinnell (1789–1883) and his associates in 1847, and began operations in the following year with 15,000 spindles and 200 looms. This was the beginning of the Wamsutta Mills, in 1907 comprising 8 buildings, 228,000 spindles and 4500 looms. In 1900 the city had some 50 mills, with a total of over 2,137,000 spindles. The value of cotton goods manufactured in 1905 was $22,411,936, or 76.1% of all manufactured products of the city, and the total value of this, and the exports at the city, was $8,185,286; in 1900 $16,748,783. Among the city's other manufactures are tools, cordage and twine, boots and shoes, glass, oils, lubricants (notably black-fish oil, a lubricant for watches and clocks, of which almost the entire supply is manufactured here), mechanical toys, beer, ale, woolen and silk goods, and paints. The total value of all factory products was $23,397,491 in 1900 and $29,469,349 in 1905. There is an extensive commerce in coal, raw cotton, lumber and fish; the direct foreign trade is comparatively small—in 1900 the imports were valued at $44,005, and the exports at $44,473.

The site of New Bedford was visited in 1602 by the English navigator, Bartholomew Gosnold, who traded with the Indians at the mouth of the Acushnet or Acosnet. It was originally part of the town of Dartmouth, which was occupied by settlers from Plymouth, who in 1632 purchased the land from Massasoit, Sachem of the Narragansets, and his son Wamsutta (called Alexander by the whites). About 1665 there was a considerable influx of Quakers, and members of this sect have always formed a large proportion of the population. The town was incorporated in 1667.
an important and influential element in the population. There were few settlers on the site of Newbern until the middle of the 18th century, and there was no village, properly speaking, until 1760. The town was first called Bedford after Joseph Russell, one of the founders, whose family name was the same as that of the dukes of Bedford; and it was later called Newbern to distinguish it from Bedford in Middlesex county.

During the War of Independence the harbour became a rendezvous for American privateers; this led to an attack, on the 5th of September 1778, by a fleet and armed force under Earl Grey, which burned many ships and almost destroyed the town. In 1782 Newbern was set off from Dartmouth and separately incorporated as a township; in 1812 the township of Fairhaven was separated from it. Newbern was chartered as a city in 1847. Its first newspaper, the Marine Journal, was established in 1792. The Mercury, founded in 1807, now one of the oldest newspapers in continuous publication in the country, was for some time edited by William Ellery Channing (1815–1901). There are Portuguese and French weekly newspapers.

Ellis, History of New Bedford and its Vicinity 1602–1892 (Syracuse, N.Y., 1892); W. S. Tower, A History of the American Whale Fishery (Philadelphia, 1907); and The Old Dartmouth Historical Sketches (1903 seq.), published by the Old Dartmouth Historical Society.

NEWBERRY, a city, port of entry and the county-seat of Craven county, North Carolina, U.S.A., near the head of the estuary of the Neuse river and at the mouth of the Trent river, about 90 m. N.E. of Wilmington. Pop. (1890) 7843; (1900) 9900, of whom 587 were negroes; (1910 census) 9671. Newbern is served by the Atlantic Coast Line and the Norfolk & Southern railways. The Federal government has improved both the Neuse and the Trent rivers for navigation; the Neuse has a channel of 8 ft. at low water to Newbern and one of 4 ft. from Newbern to Kinston, and the Trent a channel of 3 ft. from Newbern to Trenton. The Trent and the Neuse are both spanned here by railway and county bridges. The "Waterway between Newbern and Beaufort," projected in 1884, had in 1908 a controlling depth at mean low water of only 2 to 2½ ft.; it was decided to abandon this waterway on the completion of an inland waterway about 18 m. long with a channel 10 ft. deep at low water. The Federal surveyors have extended this waterway by about 2000 ft. along the shore, which would give Newbern an outlet to the ocean at Beaufort.

The remains of Tryon Palace, the residence of the royal governor and the meeting-place of the legislature, which was built by William Tryon (q.v.) in 1765–1770, and was said to be the finest building of its time in the colonies, are of historic interest, and among the principal buildings are the United States government building, the county court house, the county jail and the county house. At Newbern is one of the national cemeteries of the Federal government, containing many fine monuments.

The most important industries are the manufacture of lumber (especially pine) and trucking. The total value of factory products in 1895 was $5,343,184. In 1897 about 1000 men, mostly negroes, were employed in the saw-mills, whose annual product averages about 175,000,000 ft. Among the manufactures are fertilizers, cotton seed oil and carriages; repair shops of the Norfolk & Southern railway are here; the fisheries are of considerable importance; and the city ships quantities of fish, cotton and market-garden produce—much of the last being forced under canvas with steam heat. It is the port of entry of the Pamlico custom district; in 1908 its imports were valued at $71,421.

Newbern was settled in 1710 by a company of Swiss and Germans under the leadership of Baron Emanuel de Graffenried (d. 1735) and was named for Bern, Switzerland. It was incorporated as a city in 1723, but its present charter dates from 1890 with amendments adopted in 1907. For several years it was the capital of the province and for a long time was the chief seaport of the state. Although strongly fortified early in the Civil War, Newbern was captured by a Union force under General A. E. Burnside on the 14th of March 1862 after an engagement near the city in which the loss to the Confederates, who were under the command of General Lawrence O'Brien Branch, was about 578 killed, wounded, captured and missing, and the loss of the Union force was 90 killed and 380 wounded. Unsuccessful attempts to recapture the city were made by the Confederates on the 14th of March 1863, and on the 1st of February and the 5th of May 1864.

NEWBERRY, JOHN STRONG (1832–1892), American geologist, was born at Windsor, Connecticut, on the 22nd of December 1832, and received a medical education at Cleveland, Ohio, taking the degree of M.D. in 1848. He completed his medical studies in Paris. He was employed in 1846 by collecting coal-measure plants from mines that had been opened by his father, and an acquaintance with Professor James Hall established his interest in the science. Hence while in Paris he studied botany under A. T. Brongniart. In 1851 he settled in practice at Cleveland, but in 1855 he was appointed surgeon and geologist to an exploring party in northern California and Oregon, and in 1857 his reports on the geology, botany and zoology were published. Between then and 1861 he was employed on similar work in the region of the Colorado river under Lieutenants Ingersoll and Matthews, and published on that subject in 1861. In the following year he was employed by the government in a large area of previously unknown country in Utah, Arizona and New Mexico, the further results being published in 1876. During the Civil War he did important work as a member of the U.S. Sanitary Commission, his organizing capacity being specially marked during the operations in the Mississippi Valley. In 1866 he was appointed professor of geology and paleontology at the Columbia School of Mines, New York, where he commenced the formation of a magnificent collection of specimens; in 1869 he was made state geologist of Ohio and director of the (second) Geological Survey there, and in 1884 palaeontologist to the U.S. Geological Survey. Four volumes of the geology of Ohio were published while he was director of the survey, his own reports being confined to the surface geology and to the coal-measures and their fossil plants. He devoted much labour to the study of Triassic, Cretaceous and Tertiary plants, and in particular to those of the Laramie stage. He also carried on researches on the Palaeozoic and Triassic fishes of North America. Among his other publications may be mentioned The Origin and Classification of Ore Deposits (1880). His work throughout was characterized by great care and conscientious study, and it was under Lieutenant Ingersoll that most of the extended surveys of America and the Old World. He received the Murchison medal of the Geological Society of London in 1888, and was president of the American Association for the Advancement of Science (1897), of the New York Academy of Sciences (1897–1897), and of the International Congress of Geologists (1891). He died at New Haven, Conn., on the 7th of December 1892.

Memoir (with portrait) by J. J. Stevenson, American Geologist (July 1893).

NEWBOLT, HENRY JOHN (1869– ), English author, was born on the 6th of June 1862, the son of H. F. Newbolt, vicar of St Mary's, Bilston. He was educated at Clifton College, where he was head of the school in 1881 and edited the school magazine, and at Corpus Christi College, Oxford. He was called to the bar at Lincoln's Inn in 1887 and practised until 1899. His first book was a story, Taken from the Enemy (1892), and in 1893 he published a tragedy, Mordred; but it was the publication of his ballads, Admirals All (1897), that created his literary reputation. These were followed by other volumes of stirring verse, The Island Race (1898), The Sailing of the Long-ships (1902), Songs of the Sea (1904). From 1900 to 1905 he was the editor of the Monthly Review. Among his later books his novels The Old Country (1906) and The New Men (1909) attracted considerable attention.

NEW BRIGHTON, formerly a village (coextensive with the town of Castleton) of Richmond county, New York, U.S.A., but since the 1st of January 1898 the first ward of the borough of Richmond, New York City. It is at the north-eastern end of Staten Island, about 6 m. S.W. of the borough of Manhattan, with which it is connected by ferry. Pop. (1890) 16,423; (1900)
NEW BRIGHTON—NEW BRUNSWICK

21,441, of whom 6575 were foreign-born and 1295 negroes; (1905 state census) 23,650. At New Brighton is the Sailors' Snug Harbor, founded under the will of Robert Richard Randall (c. 1740–1801), who in 1771 became a member of the Marine Society of New York (an organization for the relief of indigent masters of vessels and their families), and in 1790 bought from Baron Poelnitz the "Minto farm," about 21 acres of land in what is now the Fifteenth Ward of the Borough of Manhattan. This tract, with four lots in what is now the First Ward of Manhattan, and cash and stocks to the value of about $20,000 Randall (who, himself seems to have followed the sea for a time, and was called "Captain") bequeathed to a board of trustees, directing that the income should be used "for the purpose of maintaining and supporting aged, decrepit and worn-out sailors," who had served at least five years under the American flag, and that the institution established for this purpose should be called "the Sailors' Snug Harbor." The will was bitterly contested by relatives, but finally was fully upheld in 1830 by the United States Supreme Court. The Sailors' Snug Harbor was incorporated in 1836, and was chartered in 1839, and named in 1846. Randall's body was removed to the grounds in 1834, and buried under a marble monument, and in 1884, a life-size bronze statue of him, by Augustus Saint Gaudens, was placed in front of the main building. In 1900 the institution comprised the main building, a hospital, a chapel, a parsonage, residences for the officials, and several other buildings. The grounds were about 10 acres, but employ themselves at simple trades, or at work about the grounds; the use of intoxicating liquors is strictly prohibited, but the men are furnished with plenty of tobacco, and are well cared for. The present immense value of the land bequeathed by Randall makes Snug Harbor one of the most liberally endowed charitable institutions in New York City. At New Brighton are also a Home for Destitute Children of Seamen, founded in 1846 at Stapleton, Staten Island, removed to a new building on the Snug Harbor property in 1854, and maintained by contributions and gifts; and the Samuel R. Smith Infirmary, founded in 1861 by the Medical Society of the Richmond county, and named in honour of a Staten Island physician. At New Brighton there are dry docks, paper and plaster mills, and silk-dyeing and printing works. The village as incorporated in 1866 included the northern half of the township of Castleton, and as incorporated in 1872 included all of that township.

NEW BRIGHTON, a borough of Beaver county, Pennsylvania, U.S.A., on Beaver river, 2 m. from its confluence with the Ohio and 28 m. N.W. of Pittsburg. Pop. (1890) 3616, (1900) 6820 (487 foreign-born and 179 negroes); (1910) 8326. It is served by the Pennsylvania railway, and is connected by bridge with Beaver Falls. The borough has a public art gallery, a public park and a general hospital. Coal and fireclay abound in the vicinity, the Beaver river furnishes good water power, and the borough has various manufactures. New Brighton was laid out as a town in 1815 and was incorporated as a borough in 1838.

NEW BRITAIN, a city of Hartford county, Connecticut, U.S.A., near the centre of the state, about 9 m. S.W. of the city of Hartford; land area 33-00 sq. m. in 1906. Pop. (1890) of the township, including the city, 19,007; of the city, 16,519; (1900) of the township, including the city, 28,202; of the city, 25,998, of whom 9203 were foreign-born, including 1860 Irish and 1811 Swedes, who have a weekly published here; (1910 census) 43,016. It is served by the New York, New Haven & Hartford railway, and by several inter-urban electric railways. The city is the seat of a state normal school, and has a free public library, formerly the New Britain Institute, and a public park of about 100 acres. New Britain is an important manufacturing centre; its principal products are hardware, cutlery and table-goods, boots, shoes, and foundry and machine shop products. In 1905 the capital invested in manufacturing was $10,079,717 (an increase of 45.1% since 1900) and the value of the factory products was $14,959,543 (an increase of 34.8%). More than one-half of the product-value was in hardware ($7,537,652). New Britain, which was settled in 1687, was originally a part of the township of Farmington. On account of ecclesiastical difficulties the "New Britain Society"—a parish—was organized in 1754. New Britain became a part of Berlin when that township was established in 1785. In 1830 the township of New Britain was incorporated, and in 1871 the city was chartered. A part of the state in 1905 the township of New Britain and the city of New Britain were co; the first election under the new charter was in April 1906. The city was one of the first in the country to build a municipal subway for electric light, telephone and telegraph wires.

See D. N. Camp's History of New Britain (New Britain, 1889).

NEW BRUNSWICK, a province of the Dominion of Canada, lying between 45° 2' and 48° 3' N. and 63° 46' and 60° 3' W. Its length from N. to S. is 230 m., its greatest breadth 190 m., and it has a seaboard of about 350 m.

Physical Features.—The surface is generally undulating, but in the 65 m. farther, nearest over the rainy season holds up to 2000 to 2000 ft. in height, rising in Bald Mountain to 2400 ft. These elevations are an extension of the Appalachian Mountains and traverse the province from the state of Maine. This whole section of the province is densely wooded. The southern region embraces the district along the Bay of Fundy. Its coast is rocky and bold and interrupted by ravines. Inland the numerous rivers, flowing through the soft sandstone and conglomerate rocks, have cut broad valleys, the soil of which is extremely rich and fertile. Along the shores of the east coast, the rivers separate into several streams, and are composed of mosses and marshes, but beyond that distance, it rises into gently sloping hills, which extend as far as St John.

New Brunswick is a network of rivers, bays and lakes, several of which are navigable for vessels of large tonnage. The principal rivers are the St John, Miramichi, Restigouche, Saint Croix, Petitcodiac, Richibucto and Nipisiguit. The St John, which is famous for its scenery, rises in the state of Maine and is over 350 m. in length. It is navigable for vessels of moderate tonnage from St John on the Bay of Fundy to Fredericton, a distance of about 88 m., but steamers of light draught ply as far as Woodstock, on the New Brunswick and Nova Scotia railways. The Richibucto and Nipisiguit are the two main branches of the St John, with a total length of 140 m., and which, with the Grand Falls, and the Petitcodiac, forms one of the most important systems of navigation in the province. The Nipisiguit and Tobique (a tributary of the St John) in the N. are in much repute among anglers.

The coast-line of New Brunswick is indented with numerous fine bays and harbours. The Bay of Fundy is an arm of the sea separating New Brunswick from Nova Scotia and terminating in two smaller bays, Chignecto Bay and the Basin of Minas. Its length up to Chignecto Bay is 140 m. and its extreme breadth 43 m. It is noted for its high tides, which rise about 30 ft. at St John and over 50 ft. at the head of Chignecto Bay. At Bay Verte, 14 m. distant, on the opposite side of the Inlet of Chignecto, the tide rises little more than 4 or 5 ft. The Bay of
Chaleur, which has several excellent harbours, is over 90 m. in
length and from 20 to 25 m. in breadth. The other inlets of
consequence on the east coast are Miramichi, Richibucto,
Buctouche, Cocagne and Shediac Bays; on the south coast are
Fassinaquddy Bay, St John Harbour and Chignecto Bay.

At the mouths of the rivers are in nearly every case excellent
harbours. To the province belong the islands of Campobello
and Grand Manan, at the entrance of the Bay of Fundy, from
both of which important fisheries are carried on.

Geology.—Along the Bay of Fundy, for about 30 m. inland, is
a band of hard Cambrian and Cambro-Silurian rocks, with
smaller areas of Devonian, Huronian and Laurentian. The city of St
John is built upon very hard Cambrian slates, in which interesting fossils are found. North of this belt grey sandstones and con-
glomerates of Carboniferous age occupy a triangular area, the apex
of which is near Oromocto Lake, the south side extending to Nova
Scotia and the north-west side to Bathurst. Along the western border this area is 400 to 600 ft. high, but near the coast it is low
and flat. The Carboniferous area of New Brunswick is continuous
across the isthmus of Chignecto with that of Nova Scotia, so that
from Miscou on the Bay of Chaleur to Sydney on the Atlantic coast
of Cape Breton, the whole coast of the Gulf of St Lawrence is
bordered by coal-bearing rocks.” (S. E. Dawson, North America,
London, 1861.) Northward of the Carboniferous are 40 to 50
m. wide is occupied by Ordovician and pre-Cambrian formations,
with large masses of intrusive granite. The Ordovician is composed
of schistose, micaeous, and foliated slates and quartzites, in places
highly altered and disturbed. The pre-Cambrian rocks consist of
very hard crystalline reddish felsite, chloritic quartzites, and fels-
laphic and micaceous schists. The whole of this region is rugged
and broken into numerous ranges of hills. The remainder of the
province to the north-western boundary is occupied by Silurian
rocks, mostly calcareous slates and shales associated with beds of
limestone. The whole province has been mantled with ice in the
Pleistocene period, and boulder-clay and later modified deposits
occupy the surface. Marine clay and sand containing fossil shells
are found along the coast.

Climate.—The climate, though subject to extremes, is healthy.
The average mean temperature in summer is 66° F., and in winter
19° F. The average rainfall for thirty years (1875 to 1905 in-
clusive) was 32.6 in., whereas in the neighbouring province of
Nova Scotia, with its larger coast-line, it was 39.6. The winters are
severe, and snow falls to a great depth, but the harbour of St John
is open throughout the winter. During the years 1892-1893 the
average yearly snowfall was 97.5 in., 20 in. more than in Nova
Scotia. The autumn is delightful, especially during the “Indian
summer,” after the first frost, but before the weather has broken.

Area and Population.—Including the islands, the total area of the
province is 27,985 sq. m., of which 74 are water. It thus occupies an area rather larger
than that of the mainland of Scotland. The population of 1801 was 30,000; with occasional
stationary, there being little or no immigration, and a steady exodus to the United States and
to the western provinces of the Dominion. The number of males slightly exceeds that of females.
The bulk of the people are of English descent, the remainder Irish and French. The Scots,
so numerous in nearly all the other districts of the Dominion, are here less conspicuous. Of
the original Indian inhabitants of the province, who were of Algonquian stock and divided into
twelve tribes, twelve of which are known, between 1700 and 1750, many of whom have a greater or
lesser proportion of white blood.

The capital is Fredericton, on the St John (pop. in 1901, 7117). The chief shipping
and commercial centre is St John (pop. in 1901, 49,711). Moncton is a large railway centre (pop.
in 1901, 2030). None of the other towns exceeds 5000 inhabitants. Owing to the large Irish and
French element over one-third of the population belongs to the Roman Catholic Church.
Campbellton (pop. 5000), a northern port on Chaleur Bay, with an important lumber trade,
was destroyed by fire in July, 1910.

Education.—There is a good system of primary and secondary schools under provincial
control. When in 1871 the system of free denominational
primary schools was supported by the pro-
vince was introduced, feeling rose so high among
the Roman Catholics that rioting broke out and
life was lost. In view of the provisions in the
area under protection, the Roman Catholics sought to have the new system declared unconstitutional, but the case, after being carried to the judicial committee of the imperial privy council, was decided against them. In the case of the Education Bill, practical though not theoretical satisfaction is given to that church. Renewed rioting broke out among the French Roman Catholics in 1890, but after some years the compromise of 1875 was confirmed. At Fredericton an office of education is maintained, and a school for the deaf and dumb. The Lazenarro for lepers at Tracadie and the marine hospital at St John are supported by the Dominion. At Fredericton is a small provincial university, founded in 1800 and re-established in 1859, at Sackville is the university of Mount Allison College under Methodist control, and at Memmecook one, working chiefly among the French, is owned by the Roman Catholics. In all these an adequate training is given in law, theology and the literary subjects, but for science, whether pure or applied, most of the provincial students go either to the United States or to the universities of Upper Canada.

Either owing to the excellence of its education New Brunswick has produced a school of poetry,
headed by Charles Roberts, which is unique in the Dominion.

Agriculture.—The great predominance of the lumber industry has tended to keep agriculture in the background. There is also a steady flow of the most active young men to the greater opportunities
offered by the Canadian and American west. Thus the area under crop declined from 6000 sq. m. in 1875 to about 1500 and about 700 for pasture, the rest being for the most part still covered with forest. In all the river valleys, and especially on the fertile alluvial lands along the coast, and where the climate
is mild and prosperous farms are scattered with a size from 100 to 240
acres, and good crops of wheat, oats, buckwheat and all the staple
grains and roots are raised. Fruits, dairy and poultry raising, and the production of cheese and butter, are becoming industries of importance. A dairy school is maintained by the provincial government
at Sussex (King’s county). Though no great development of agriculture is possible, a quiet, equable prosperity is attained by
NEW BRUNSWICK—NEWBURGH

hundreds of farmers. Much crown land still remains unoccupied, and is sold by the provincial government on easy terms to bona fide settlers.

1924—Its great forests, through which flow numerous rivers with excellent harbours at or near their mouths, have long made New Brunswick a centre of lumbering. This industry has affected the whole development of the province, and the wilder and more unpromising parts of the land have been settled, and the population of the province has spread from the Bay of Fundy on the south to the borders of Ontario or of the west. The most valuable and most widely-spread tree is the black spruce (Abies nigra), from which is made a yearly increasing quantity of wood-pulp for paper-making. The hemlock (Abies balsamea), the cedar, birch, bough, oak, ash and many other valuable trees, are also widely spread. The chief ports for shipping are St John, at the mouth of the St John river, and Chatham, at the mouth of the Miramichi.

Though much remains, much has been destroyed by forest fires. To this day traces may be seen of the fire which in 1825 utterly destroyed hundreds of square miles of timber along the river Miramichi.

The same forests are also a paradise for sportsmen. The game laws are being made increasingly strict, and the province draws a large revenue from the sale of licences, extra fees being imposed on sportsmen from other countries. Moose (Cerus alces), caribou and deer may only be shot during about two months in the autumn, and the number allowed to each gun is strictly limited. In 1902 the provincial and federal government set aside 1,400,000 acres of the lands adjoining the sources of the Tobique, Nipisiquit and Miramichi rivers for a national park and game preserve.

1926—The mineral wealth of the province is small. Copper, lead, zinc and plumbago have been worked on a small scale at various times. Coal seams are numerous, but are worked solely for local consumption. Albite, a species of coal found in Albert county and giving a very hot flame in the furnace, is the most widely sought for. Limestone and gypsum are extensively quarried near St John and in Albert county.

The fisheries, on the other hand, are extensive, though less so than those of Nova Scotia. This industry centres in the counties of Charlotte and Gloucester, herring, salmon, lobsters, sardines and cod forming the chief catch. The Restigouche and other rivers near the northern border are much frequented by anglers in search of trout and salmon.

Manufactures.—The chief manufactures, apart from the shipping of St John, are connected with lumbering and with agriculture. The manufacturing of lumber is of course growing in importance. Co-operation in the manufacture of butter and cheese has produced excellent results, and numerous cheese and butter factories are scattered through the province. In no sense, however, does New Brunswick play an important part in the manufactures of the Dominion.

Communications.—The rivers are still the main arteries of the province. The roads, though improving, are as a rule bad. The main road system has since 1876 been that of the International, owned and operated by the federal government, by which the province is linked to Nova Scotia on the east and to the rest of Canada on the west. The Pacific Coast Traction Company runs through the province, and by the Canadian Pacific and the Maine Central it has communication with the United States. Various lines of steamers run, chiefly from St John, to American and other eastern ports.

History.—Until 1784 New Brunswick formed part, first of the French province of Acadia, later of the British province of Nova Scotia. The first settlement within its borders was made in 1604 by Pierre de Guast, seigneur de Monts, with whom was Samuel de Champlain. Their colony at the mouth of the St Croix river was soon abandoned, but throughout the French régime the district was frequented by bands of fur-traders. In 1762 the first English settlement was made at Maugerville on the St John river, and in 1764 a body of Scottish farmers and labourers took up land along the Miramichi. On the 18th of May 1783 a convention of the loyalists settled at the mouth of the St John. Thousands more followed, and in 1784 New Brunswick was declared a separate province. At first governed by a representative assembly and an irresponsible council, it obtained responsible government in 1847—1848, after a constitutional struggle in which no little ability was shown. In 1867 it entered without reluctance but without enthusiasm into the Canadian Federation. Its economic and educational history, both more important than its political, have been indicated in earlier parts of this article. (For the boundary dispute, see MAINE.)

1897—The Acadian Geology (edit. of 1891), is the most easily accessible work on the geological history of New Brunswick. Numerous studies have been published, chiefly by the Geological Survey of Canada, by L. W. Bailey, R. W. Ellis, A. P. Low, and G. F. Matthew. Valuable papers on various provincial subjects have been published in the Transactions of the Royal Society of Canada by W. F. Ganong. The provincial government issues a yearly volume of sessional papers; Acadianism, a magazine published in St John, should also be consulted. The earliest account of New Brunswick is given by Nicholas Denys, Description géographique (published Paris, 1672; republished by W. F. Ganong with notes and introduction, 1903); there is no good modern history; but by G. E. Fenety, Political Notes (1867); James Hannay, History of Acadia (1879), and Lives of Wilmoit and Tilley (1907) may be consulted.

NEW BRUNSWICK, a city and the county-seat of Middlesex county, New Jersey, U.S.A., on the Raritan river, at the junction of the Delaware & Raritan canal, about 23 m. S.W. of Newark. Pop. (1890) 18,603, (1900), 20,006, of whom 325 were foreign-born and 755 were negroes; (1910 census) 23,388. It is served by the Pennsylvania and the Raritan River railways, and by daily steamboats to New York. There is a fine stone bridge across the Raritan. In the city are the Wells Memorial Hospital, St Peter's General Hospital, a Carnegie library, a Federal building and a Soldiers' Monument. New Brunswick is the seat of the Theological Seminary of the Reformed Church in America, and of the oldest theological school in the United States; founded in 1784 in New York City, situated at Flatbush, Long Island, in 1796-1810, and removed to New Brunswick in 1810, and of Rutgers College (originally Dutch Reformed, now non-sectarian), which was founded in 1766 as Queen's College, was rechartered in 1770 as a college for "the education of youth in the learned languages, liberal and useful arts and sciences and especially in divinity," was first opened for instruction in 1775, was closed during 1785-1807 and 1816-1825, and was renamed in 1825 in honour of Colonel Henry Rutgers (1745-1839), of New York City, a liberal benefactor. The college embraces two schools: the classical school and the scientific school, which in 1864, in pursuance of the Morrill Act of 1862, was constituted by the state legislature as the state college for the benefit of agriculture and the mechanic arts; a preparatory school is also controlled by its trustees. An agricultural experimental station is maintained in connexion with the college. In 1908-1909 there were 306 students. In 1908 the library of Rutgers College contained 57,000 volumes, and that of the Theological Seminary 48,000 volumes. The city has a variety of manufactures, and the total value of factory products in 1903 was $8,916,983, 54% manufactures, and 46% others.

A settlement was made here in 1681, and for a time the place was known as Prigmore's Swamp; later, after John Inian had established a ferry across the river, it was called Inian's Ferry; the present name was adopted in honour of the house of Brunswick. New Brunswick received a city charter from the royal governor in 1730, and was chartered as a city by the state legislature in 1784. During the War of Independence, General Washington and his army entered New Brunswick on the 28th of November 1776, but on the approach of the enemy evacuated it, and from the 3rd of December 1776 to the 13th of April 1777 it was occupied by the British under Lord Howe. Cornelius Vanderbilt was for several years the proprietor of the Bellona Hotel of New Brunswick, now a tenement house.

NEWBURGH, or Newburg, a city of Orange county, New York, U.S.A., on the W. bank of the Hudson river, about 57 m. N. of New York City. Pop. (1890) 23,687, (1900) 24,943, of whom 4346 were foreign-born and 538 negroes; (1910 census) 27,895. It is served by the Erie, the West Shore, and—by ferries across the Hudson—the Central New England and the New York Central & Hudson River railways. Across Newburgh Bar, as it is called, is the village of Fishkill, and an electric line connects with the village of Walden (pop. in 1910, 4004), about 12 m. N.W., which has various manufactures, the most important being pocket-knives. The city occupies a commanding position on terraces rising abruptly from the river, and on the flat plateau above, whence a view may be obtained of the Catskill Mountains to the N.W., of the Highlands of the Hudson to the S. and of the Hudson river for many miles in both directions. Orange Bridge, between Newburgh and Walden, is known for its ice
NEWBURGH—NEWBURY

yachting and skating races. Washington Park is in the central part of the city. Downing Park, named in honour of the horticulturist and landscape gardener Andrew Jackson Downing, (1815-1852), a native of Newbury, lies on a high plateau overlooking the city and the surrounding country. Among Newbury's institutions are a public library, St Luke's Hospital, a Children's Home, Mount St Mary's Academy (Roman Catholic) and a business college. In Colden Square there is a statue of Governor George Clinton. Cotton, woolen and silk goods, laces, paper, plaster, plush, felt and felted hats, carpets, engines and boilers, and mill and farm machinery are manufactured, and there are ship and brick yards. In 1903 factory products were valued at $7,142,327, an increase of 33.3% over their value for 1900. Newbury was first settled in 1709 by a colony of Germans from the Rhenish Palatinate under their minister, Joshua Rockethal (d. 1719), and was known as "the Palatine Parish of Quassicus." Toward the middle of the century many of the Germans removed to Pennsylvania, and Scottish and English settlers took up their abandoned lands. In 1752 the place was renamed Newbury, after the town of that name in Scotland, whence many of the new settlers had come. From the spring of 1782 until August 1783 Washington made his headquarters here, occupying the Hasbrouck House (built by Jonathan Hasbrouck between 1750 and 1770), which is still standing in Washington Park, and was bought by the state in 1840. It long contained a collection of historical relics, for which the state has erected a brick building in Washington Park. In 1865, he wrote his famous letter of rebuke to Colonel Lewis Nicola (1717-1807), who had written to him on behalf of a coterie of army officers, it is said, suggesting that he assume the title of king. Here, also, Washington made his reply to the so-called "Newbury Addresses," written by John Armstrong, and calling for action on the part of the army to force Congress to redress its grievances. Here the arrangements were completed for the disembarkation of the Continental Army, and the centenary of the disembarkation was celebrated here on the 18th of October 1883. In commemoration of the disembarkation also a monument known as the "Tower of Victory." (53 ft. high, with a life-sized statue of Washington), was erected in Washington Park by Federal and State authorities. Newbury was incorporated as a village in 1800 and chartered as a city in 1865. The U.S. Geographic Board spells the name Newbury, but the spelling Newbury is adopted locally and by the U.S. Post Office.

See E. M. Ruttenber, History of the Town of Newbury (Newbury, 1859) and History of Orange County (Newbury, 1872).

NEWBURY, a royal and police burgh of Fifeshire, Scotland. Pop. 2,061. It is on the N.W. of Ladybank Junction by the North British Railway. Its industries chiefly consist of the making of linen and floorcloth, matting and quarrying, and there are fisheries, especially of salmon. The harbour is used for the transhipment of the cargoes of Perth-bound vessels of over 200 tons. On high ground, about 1 m. S.W., stands the remains (only the pedestal) of Macduff's Cross, which marks the spot where the clan Macduff—in return for the chief's services against Macbeth—was granted rights of sanctuary and composition for murder done in hot blood. Denmylin castle, about 1 1/2 m. S.E. of Newbury, was the home for more than 250 years of the Balfour family, of which the two brothers, Sir James (1600-1657), the annalist and Lyon King, and Sir Andrew (1630-1664), founder of the Botanic Garden in Edinburgh, were the most distinguished members. Lindores abbey, the gem of the district, is situated on the Tay, close to Newbury, and 1 1/2 m. N. of the village of Lindores. Of the Benedectine abbey, founded in 1178 by David, earl of Huntingdon, brother of William the Lion, there only remain the groin arch of the principal entrance, a portion of the west tower and other Early English fragments, but the ground plan of the whole structure can still be traced. The church had the deanery of Newbury, and their orchards famous. At Blackearnside, a forest of alders, to the east of the village, Wallace defeated the earl of Pembroke in 1298.

NEWBURN, an urban district in the Tyneside parliamentary division of Northumberland, England, on the Tyne, 53 m. W. of Newcastle by a branch of the North Eastern railway. Pop. (1901) 12,500. It has collieries, and iron, steel, engineering, tool and fire-clay works, and there is a large industrial population. Newburn is of considerable antiquity. Roman remains have been discovered in proximity to cultural trade, and a church hither was destroyed by fire in 1572 in the course of a dispute between two claimants of the earldom of Northumberland. Here in 1640 the Scottish Covenanters planted guns to protect them while fording the river, after which they defeated the English on the Durham side at Stellaheugh, and subsequently occupied Newcastle. The name of Scotswood, one of the manufacturing villages between Newburn and the city, commemorates one of their positions. The district has many associations with the famous engineer George Stephenson, born at Wylam, 3 m. W.

NEWY, a market town and municipal borough in the Newbury parliamentary division of Berkshire, England, 53 m. W. by S. of Reading by the Great Western railway. Pop. (1901) 11,061. It is beautifully situated in the narrow well-wooded valley of the Kennet, which is followed by the Kennet and Avon canal. The town has north and south communications by the Didcot, Newbury & Southampton railway (worked by the Great Western company), and is the terminus of the Lambourn Valley light railway. The church of St. Nicholas is a large Perpendicular building of the beginning of the 16th century. The chief's dwelling house, built at the charge of John Winchcombe or Smales, father-in-law of John II. of Scotswood, a clothier, who, according to the brass to his memory, died in February 1550. A few picturesque old buildings remain in the town, including part of Winchcombe's house and the Jacobean cloth hall, now a public museum. The almshouses called King John's Court are supported by a foundation known as St Bartholomew's Hospital, to which in 1215 King John granted by charter (rewound in 1596 to the corporation) the profits of a fair on St Bartholomew's day (24th of August). Shaw House, on the outskirts of the town to the north-east, is an Elizabethan mansion of brick, dating from 1581; to the north of Donnington castle, retaining a Perpendicular gateway and other fragments. The suburb of Speenhamland was formerly an important posting station on the Bath road. At Sandleford Priory, to the south of Newbury, the site and part of the buildings of an Augustinian priory (c. 1200) were utilized in the erection of a mansion, in 1781, for Mrs Elizabeth Montague. The householders of Newbury have the right to elect boys and girls to the educational foundation of Chriss's Hospital. The cloth industry is long extinct in Newbury, but large wool fairs are held annually; there are numerous warehouses, there are Looms, and numerous clothiers. A racecourse was opened in the vicinity of the town in 1905, and six meetings are held annually. The borough is under a mayor, 6 aldermen and 18 councillors. Area, 1,828 acres.

Newbury (Neubiri, Neubir) possibly owes its origin to the village of Speen on the other side of the Kennet, which probably marks the site of the Roman station Spinae. The name Newbury (new town or borough) is first mentioned by Odericus Vitalis; it is probable, however, that the manor of Ulteritone, entered in Domesday as held by Ernulf of Hesdine and containing fifty-five houses, was the present town, which was from the twelfth century upwards the manor seat of the baron's of Newbury. The manor was subsequently held by the Marshalls, and later by the Mortimers, through whom it passed to the house of York and the crown. It formed part of the dowry of several queens-consort, and was held by Elizabeth before her accession. In 1627 it was granted by Charles I. at a fee-farm to her corporation. Newbury was a borough by prescription; in 1857 its inhabitants are called "burgesses" and a document of the time of Edward I. speaks of it as "burgus." It was incorporated by a charter of Elizabeth (1566) which was confirmed by Charles I. and renewed by Charles II. in 1665. Newbury sent two representatives to the parliament of 1672 and delegates to a council held in the reign of Edward III.

Newbury early became a centre of the woolen industry,
NEWBURYPORT

NEWBURYPORT, a city and port of entry and one of the county-seats of Essex county, Massachusetts, U.S.A., on the S. bank of the Merrimac river, about 3 m. above its mouth, and about 18 m. N. W. of Boston (1850, 13,947; 1900, 14,478), of whom 2863 were foreign-born; (1900 census) 14,949. Area, about 12-85 sq. m. The city is served by two divisions of the Boston & Maine railroad, and by coast and river freight steamers. There are many houses dating back to the 17th century; of these the stone "garrison" house (in Newbury), with walls 4 ft. thick and built in the form of a cross, is an interesting example. Other private houses worthy of mention are the former homes of "Lord" Timothy Dexter and Caleb Cushing, the birthplace of William Lloyd Garrison, and 33 m. from Newburyport in the township of West Newbury Indian Hill Farm, the birthplace of the journalist Ben Perley Poore (1820-1887), author of Perley's Reminiscences of Sixty Years in the National Metropolis (1886). Among the public buildings and institutions are the Marine Museum, the Public Library (founded in 1834 by Josiah Little and containing about 45,000 volumes), the old Tracy mansion (built in 1771 or 1772), which forms part of the Public Library building, the Anna Jacques and Homoeopathic hospitals, homes for aged women and men, a Home for Destitute Children, Old South Church, in which is the tomb of George Whitefield, and the Young Men's Christian Association building, which is a memorial to George Henry Corliss (1817-1888), the inventor, erected by his widow, a native of Newburyport. The General Charity Society is a benevolent association. The city has a good public school system. The Female High School was opened in 1843 and is said to be the first high school for girls to be established in the United States. The Putnam Free School, now part of the public school system, was endowed early in the 19th century by Oliver Putnam of Newburyport and afterwards of Hampstead, New Hampshire. Three parks, Washington, Cushing and Atkinson, are maintained by the city; and there are a statue of George Washington (1879), by J. Q. A. Ward, one of William Lloyd Garrison by D. C. French, and a memorial to the soldiers and sailors of the Civil War—a bronze statue, "The Volunteer"—by Mrs Theo (Ruggles) Kitson. A curious chain suspension bridge across the Merrimac, connecting Newburyport with Amesbury, was built in 1827, replacing a similar bridge built in 1819, which was one of the first suspension bridges in America.

Newburyport in the early part of the 18th century was one of the most prosperous commercial centres in New England. At that time fishing, whaling and shipbuilding were its principal industries, the clipper ships built here being among the fastest and best known on the seas. After the Civil War manufacturing became Newburyport's chief interest. In 1905 its factory product was valued at $6,800,979, an increase of 32.5% since 1900; 57.6% was in boots and shoes, and the manufactures of combs and silverware, silversmithing products, cotton goods and electrical supplies are also important.

Newburyport, including the site of the present Newburyport, was settled in 1635 by a company under the leadership of the Rev. Thomas Parker (1595-1677), who had taught in Newbury, England, in his youth. In 1639 a portion of the territory was set off to form the town of Rowley, and in 1764 about 647 acres were set off and incorporated as the town of Newburyport. In 1819 the town of Parsons (now West Newbury) was formed from Newburyport, with its area considerably enlarged, became a city in 1851. During the War of Independence and the War of 1812 it sent out many privates. In 1811 a fire destroyed 360 buildings, including the greater part of the business portion of the town.

See Caleb Cushing's History and Present State of the Town of Newburyport (Newburyport, 1826); Joshua Coffin, History of Newburyport, Newburyport, and West Newbury, 1635-1845 (Boston, 1845); Mrs E. V. Smith, History of Newburyport (Boston, 1854); D. H. Hurd, History of Essex County (Philadelphia, 1888); J. J. Bean, History of Newbury from the First Settlement of the Town to the Beginning of the Twentieth Century (Boston, 1902), History of Newburyport, 1764-1905 (Newburyport, 1906), and Oub3 Newbury, Historical and Biographical Sketches (1892).

NEW CALEDONIA (Fr. Nouvelle-Caledonie), an island in the western Pacific Ocean, belonging to France. (For map, see Pacific Ocean.) It is about 250 m. long, and has an extreme breadth of 35 m. and an area including adjacent islets of 6450 sq. m.; is situated at the southern extremity of Melanesia, between 20° 5' and 23° 10' S., and between 164° and 167° 30' E., and, like all the chief islands of that chain and the chain itself, lies north-west and south-east. An almost unbroken barrier reef skirts the west shore at about 5 m. distance, enclosing a navigable channel; on the east, which is more abrupt and rocky, it is a continuous reef. It is entirely surrounded by coral reefs, which continue, marking the former extension of the land, for about 100 m., ending with the Huon Islands. The Isle of Pines, so called from its araucarias (its native name is Kunie), geologically a continuation of New Caledonia, lies 30 m. from its south-east extremity. It formerly abounded in sandalwood, and consists of a central plateau surrounded by a belt of cultivation. At the two extremities of New Caledonia, parallel longitudinal ranges of mountains enclose valleys; for the rest the island consists essentially of confused masses and ranges of mountains, rising to an extreme elevation of 5387 ft., the plains being chiefly the deltas of rivers. The landscape is rich and beautiful, varied with grand rock scenery, the coast-line being broken by numerous small bays, into which flow streams rarely navigable even for short distances, but often skilfully utilized by the natives for irrigation; and sometimes flowing in subterranean channels. The larger rivers in the wet season form impassable morasses, especially in the S.E., where the mountains rise in isolated masses from flat plains.

Geology.—Speaking generally, New Caledonia may be described as a band of Palaeozoic and probably Lower Palaeozoic rocks, associated doubtless with some Archean beds; this band lies from north-west to south-east, through the whole length of the island. The second element in the composition of the island consists of Mesozoic beds, which occur in a broken band along most of the south-western coast. Most of the island is occupied by the band of the old rocks, which include mica, glauconite and sericite-chists and slates; there are small intrusions of granite, and numerous dikes and masses of basic eruptive rocks. The slates are interbedded with limestones containing fossil brachiopods, which have led to their determination as Silurian or Devonian; but L. Peletan classes all these limestones as Triassic. Triassic beds of the Pacific coastal type occur in a band along the south-western coast. They are covered by marine Jurassic beds and they in turn by Cretaceous coal-bearing, terrestrial deposits, resembling those of New Zealand. According to E. Glasser, the basic igneous rocks which are associated with the mineral deposits of New Caledonia were intrusive in Cenozoic times, at the severing of the connexion between New Caledonia and New Zealand. New Caledonia is part of the Austrasian Festoon, a great arc of islands, marginal cherts and limestones, and other strata of possible Mesozoic age. The main mineral deposits are the nickel ores, occurring as veins of garnierite, associated with peridotite dikes, in the ancient rocks of the eastern slope of the island.

**NEW CALEDONIA**

**Climate, Flora, Fauna.**—The hottest and wettest months are from November to March, but there is usually a fresh trade-wind blowing and the climate is healthful. Pineapples are the growth of the lowlands and the flora is of a less tropical character than farther north; it has some Polynesian and New Zealand affinities, and on the west coast a peculiar ‘wingless’ tree, found nowhere else, is common. The cocoa nut, maize, sugar-cane, coffee, cotton, rice and tobacco (which last does not suffer like other crops from the low temperatures in the night) are grown. Mammals are very few; they include the rat and *Pteropus* and other bats. The commonest birds are pigeons (the large *noumea* and other varieties), doves, parrots, kingfishers and ducks. The *Kagu* (*Rhynchochloa jubata*), a peculiar ‘wingless’ bird, is found here only. Turtle abound on the coast, and fish, of which some kinds are the tetrodons (*globe-fish*), are poisonous, especially at certain seasons. Land and marine molluscs are numerous, and include various edible haliotids.

**Population.**—At the census of 1901 the population of New Caledonia numbered 51,415, consisting of 12,295 free Europeans (colonists, soldiers, officials), 20,106 natives, 10,056 convicts. In 1868, however, the introduction of convicts into the island ceased. The centres of population are Nouméa (Noumea), the capital, on a fine harbour of the west coast near the southern extremity of the island, with 7000 inhabitants; Bourail, an agricultural penal colony (1800); La Foa, in the centre of the coffee plantations: Moindou, St Louis and St Vincent. The natives, whom the French call Kanakas (*Canuques*), a word meaning "man," applied indiscriminately to many Pacific peoples, live on reservations. They are Melanesians of mixed blood, the two fairly distinct types, one sub-Papuan and the other Polynesian. Of the first the physical characteristics are a small, thin-limbed body, hair black, short and woolly, projecting jaws, rounded, narrow, retreating forehead, long and narrow head, enormous eyebrow ridges, flat nose and dark skin. The second type is characterized by a lighter skin, sometimes of a reddish-yellow, longer, less woolly hair, body taller with better-proportioned limbs, and head broader. This is the prevailing type in the east and south of the island. There is nowhere a real defining line between the two (many New Caledonians having black skins and woolly hair with Polynesian suppositions of limb), but the Polynesian type is generally found among the chiefs and their kindred.

Both sexes among the natives pierce the lobes of the ear for ornaments. Tattooing is almost entirely confined to the women. Both sexes go naked, or with the scantiest loin-cloth. Their huts are usually beehive-shaped, with a single apartment, low narrow door, and floor of grass. Their chief customs are chieftainships, and a supreme chief recognized by all. In some other Pacific islands, when a son is born the chieftship passes to him, but the father continues to govern as regent. All property descends to the eldest son by birth or adoption, though custom demands that the younger members of the family should have a share. The people have to work on the chief's plantations and fisheries, and also work in parties for each other, breaking up new land, &c. This often ends in feasting and in dances (*plu pila*), which include allegorical representations of events or ideas. The supreme chief's authority is limited by the advice of a council of elders, whom he is obliged to summon in certain cases. Standards of morality is low; women are practically slaves, and infancy was formerly common.

The Kanakas are excellent agriculturists, being accounted superior in this respect to every other race of the Pacific. About the middle of the 19th century the indigenous population was 60,000. Returns for 1904 showed that this had fallen to rather less than half.

The languages of the different tribes are mutually unintelligible. They express the same peculiar character; on the highest mountains, for instance, there are several words for eating, each applied to a particular article of food. Their reckoning shows the same peculiarity. The numbers go up to five, and for living objects the word *bird* is added, for inanimate *yam*, *banana*, *bottle*; for bunches of bananas, bunches of sugarcanes, rows (planted) of yams, &c.; and sometimes things are counted by threes. Ten is a five fives, 15 three fives, 20 is a "man" (ten fingers and ten toes), 100 is 15 men, and so on.

**Administration and Industries.**—The colony is administered by a governor, who exercises military power through a marine infantry colonel, and civil power with the assistance of a privy council, a director of the interior, a judicial head, and a director of the penitentiary administration. There is also an elective general council. Nouméa is the seat of a superior tribunal, a tribunal of first instance, and a tribunal of commerce. There is also a permanent Fasti of the island, and the Fis of the Polynesian tribes.

Nouméa alone has (since 1879) a municipality, other localities being administered by commissioners. There are about 2000 inhabitants in the town, but the population is much lower in the country districts. The tobacco, rice, sugar-cane, maize, tobacco, sugar-cane, the vine, vegetables, potatoes, and some of the cereals are grown with success. Coffee was introduced about 1870, and has prospered well. Cheap agricultural labour is supplied by the convicts, by the liberated convicts, the Kanakas, and (to some extent) labourers from the New Hebrides. The soil is in three domains: that of the state, for the working of which concessions may be granted; that of the penitentiary administration; and that of the native reserve. Many horses, cattle and sheep have been imported, and the meat-preserving industry is prosecuted. Gold is found in the valley of the Dibot, as well as lead and copper at Bal Bay. Iron is found everywhere. The yearly output of nickel and chrome is considerable, and these minerals, with coal, constitute the characteristic wealth of the island. Coal has been worked near Nouméa, and kaolin is found in places. Gypsum and marble also deserve mention. The chief industrial establishments are smelting furnaces for cobalt, meat-preserving works at Uaou, sugar-works and distilleries at Nouméa and La Foa, tobacco, oil and soap factories at Nouméa. The commerce in 1888 amounted to £480,000, of which £200,000 represented tobacco, £90,000 the first crop of which £240,000 was for imports and £134,000 for exports, the share of France in that year having been 45% of imports and 47% of exports. The island imports wines, spirits, tobacco, coffee and tobacco, clothing and ironmongery; and exports ores, nickel, cobalt and chrome (which represent over three-quarters of the total exports in value), preserved meats and hides, coffee, copra and other colonial produce. There are about 150 m. of carriage roads, and in the mountainous regions there are many footpaths. A railway running north-westward from Nouméa to Dumbéa, &c., is designed to connect the capital with Bourail. The islands annexed to the colony of New Caledonia are Bal Bay, the Isle of Pines, used as a place of detention for habitual criminals; the Loyalty Islands (q.v.); E. of New Caledonia; the Huen Islands, a practically barren group; the Wallis Archipelago (q.v.); and Futuna and Alofa, S. of the Wallis group.

**History.**—New Caledonia was discovered by Captain Cook in 1774. He touched at the haven of Balade (the original name of the island) near the north-western extremity, as did d'Entrecasteaux in 1793, who closely explored the coast and surrounding seas. They subsequently became known to sealers and traders in sandalwood, who, however, established no friendly relations with the natives. In 1843 French missionaries arrived at the island, and it was claimed (for France, but on British representations the claim was renounced. In 1852 a landing party from a French vessel lying at Balade was attacked by the natives, and massacred with the exception of a single member. France was now determined on the annexation, and the flag was raised at the same spot in 1853, but simultaneously the commander of a British vessel was in negotiation with the native chief of the Isle of Pines, and the British flag was hoisted there. The chief, however, subsequently sided with the French, and the British flag was lowered and withdrawn. Nouméa was founded in 1854 (it was then called Port de France); in 1860 New Caledonia became a colony distinct from the French possessions in the Pacific at large; in 1864 the first penal settlement was made on Nou Island, off Nouméa. In 1878 there was a serious native insurrection, and another in 1888 was only put down after much bloodshed.

NEWCASTLE, DUkes OF

(Paris, 1893; Moncelon, Le Baye et la colonisation pénale à la Nouvelle-Caledonie (Paris, 1886); A. Bernard, L'Archipède de la Nouvelle-Caledonie (Paris, 1892); Nouvelle-Caledonie, ses riches, son avenir (Paris, 1901); In Unnatural Prison Land (London, 1901); Carol, La Nouvelle-Caledonie miniature et agricole (Paris, 1900); Vallet, La Colonisation française en Nouvelle-
Caledonie (Paris, 1903).

NEWCASTLE, DUkes OF. Within the space of a century there were no less than four successive creations of dukes of
Newcastle in the British peerage. William Cavendish (see below), nephew of the 1st earl of Devonshire, was raised to the

dignity of duke of Newcastle-upon-Tyne in 1665. His son and
successor Henry (1630-1691) died leaving daughters only, and
one of these married John Holles (1662-1711), earl of Clare, who
was created duke in 1694. This duke died also without male issue,
leaving his estates to his sister's son, Thomas Pelham (see below),
who, with other dainties, had the title of duke of Newcastle-
upon-Tyne conferred on him in 1715, and a second and
similar ducal title (that of Newcastle-under-Lyme) in 1756.
The first dukedom became extinct at the death of its second
title was granted him with remainder to Henry Fiennes Clinton,
earl of Lincoln, at once his nephew and nephew-in-law. From
his heir, who ranks as the 2nd duke, Henry Fiennes Clinton
(1720-1794), the dukedom passed through father and son from
Thomas Pelham Clinton (d. 1795), Henry Pelham Fiennes Pelham
Clinton (1785-1851), Henry Pelham Fiennes Pelham Clinton
(1811-1864), Henry Pelham Alexander (1834-1879), to the
7th duke, Henry Pelham Archibald Douglas Pelham Clinton
(b. 1864). The three principal dukedoms are more fully noticed
below.

1. WILLIAM CAvENDISH, duke of Newcastle (1592-1676),
eldest surviving son of Sir Charles Cavendish and of Catherine,
doughter of Cuthbert, Lord Ogle, and grandson of Sir William
Cavendish and "Bess of Hardwick," was born in 1592 and
educated at St John's College, Cambridge. On the occasion of
the creation of Prince Henry as prince of Wales in 1610 he was
made a knight of the Bath, subsequently travelled with Sir
Henry Wotton, then ambassador to the duke of Savoy, and on
his return married his first wife, Elizabeth, daughter of William
Basset of Blore, Staffordshire, and widow of Henry Howard,
3rd son of the earl of Suffolk. His fortune was immense, and he
several times entertained James I. and Charles I. with great
magnificence at Welbeck and Bolsover. On the 3rd of November
1620 he was created Viscount Mansfield, on the 7th of March
1628 earl of Newcastle, and in 1629 the barony of Ogle was
restored to his mother, this title, together with an estate of
£3,000 per annum, descending to him. In 1638 he was made
governor of the prince of Wales, and in 1639 a privy councillor.
When the Scottish war broke out he assisted the king with a
loan of £10,000 and a troop of volunteer horse, consisting of
120 knights and gentlemen. In 1641 he was implicated in the
Army Plot, and in consequence withdrew for a time from the
court. He was sent by Charles on the 11th of January 1642
to seize Hull, but was refused admittance. When the king
declared open war, Newcastle was given the command of the
four northern counties, and had the power conferred on him of
making knights. He maintained troops at his own expense,
and having occupied Newcastle kept open communications with
the queen, and despatched to the king his foreign supplies.
In November 1642 he advanced into Yorkshire, raised the siege
of York, and compelled Fairfax to retire after attacking him
at Tadcaster. Subsequently his plans were checked by the latter's
recapture of Leeds in January 1643, and he retired to York.
He escorted the queen, who returned from abroad in February,
to York, and subsequently captured Wakefield, Rotherham and
Sheffield, though failing at Leeds, but his successes were once
more ravished from him by Fairfax.
In June he advanced again,
defeated the Fairfax's at Adwalton Moor on the 30th of June,
and obtained possession of all Yorkshire except Hull and Wressel
Castle. It might now have joined the king against Essex, but
continued his march towards London, and then turned to attack
the eastern association, and taking Gainborough and Lincoln.
Thence he returned to besiege Hull, and in his absence
the force which he had left in Lincolnshire was defeated at
Winchby by Cromwell on the 11th of October 1643, which caused
the loss of the whole county. On the 27th of October 1643
he was created a marquis. Next year his position was further
threatened by the advance of the Scots. Against prevailing
numbers he could do little but harass and cut off supplies. He
retreated to York, where the three armies of the Scots, Fairfax
and Manchester surrounded him. On the 1st of July Rupert
raised the siege, but, on the next day threw away his success by
engaging the three armies in battle, contrary to Newcastle's
desire, at Marston Moor. After this disaster, notwithstanding
the entreaties of the king and the remonstrances of Rupert,
Newcastle immediately announced his intention of abandoning
the cause and of quitting England. He sailed from Scarborough
accompanied by a considerable following, including his two sons
and his brother, resided at Hamburg from July 1644 to February
1645, and removed in April to Paris, where he lived for three
years. There he married as his second wife Margaret (see below),
and had married Margaret (see below),

2. THOMAS PELHAM (1611-1700), 2nd duke of Newcastle-upon-
Tyne (d. 1672), son of the 1st duke, was born in London on
March 27, 1611, and educated at Trinity College, Cambridge.

At the Restoration Newcastle returned to England, and
succeeded in regaining the greater part of his estates, though
burdened with debts, his wife estimating his total losses in the
war at the enormous sum of £41,303. He was reinstated in the
offices he had filled under Charles I.; he was invested in 1661
with the Garter which had been bestowed upon him in 1650, and
was advanced to a dukedom on the 16th of March 1665. He
retired, however, from public life and occupied himself with his
estate and with his favourite pursuit of training horses. He
established a racecourse near Welbeck, and published another work on
horsemanship, A New Method and Extraordinary Invention to Dress
Horses and Work them according to Nature . . . (1667). He
wrote also several comedies, The Country Captain and The Varietie
(1659), The Humorous Lovers and The Triumphant Widow (1677).

Dryden's assistance he translated Molière's L'Étourdi as
Sir Martin Mar-All (1688). He contributed scenes to his wife's
plays, and poems of his composition are to be found among her
works; and he was the patron of Johnson, Shirley, Davenant,
Dryden, Shadwell and Fleetnoe, and of Hobbes, Gassendi and
Descartes. He died on the 25th of December 1676, and was
buried in Westminster Abbey. By his first wife he had
three children, of whom one son, Henry, survived him and became
2nd duke of Newcastle, dying in 1691 without male issue; the
title then became extinct and the estates passed to his third
daughter Margaret, wife of John Holles, earl of Clare, created
duke of Newcastle in 1694.

As a commander in the field Clarendon spoke contemptuously of
Newcastle as "a very lamentable man, and as fit to be a
general as a bishop."1 It can hardly be denied, however, that
his achievements in the north were of great military value to
the king's cause. For politics he had no taste, and adhered
to the king's cause merely from motives of personal loyalty, from
hatred of "whatsoever was like to disturb the public peace," and
doubtless the monarchy "was the foundation and support of
his own greatness." Even Clarendon concedes that he was
"a very fine gentleman," which is perhaps the best summary of
his character.

His second wife, Margaret, duchess of Newcastle (c. 1625-
1673), had been maid of honour to Henrietta Maria, and after
she married the duke in 1645 they continued to cherish a mutual
admiration of each other's character, each regarding the other
as endowed with transcendent merits both of person

NEWCASTLE

and mind. The duchess cultivated literary composition with equal wanton fervour, and kept a herd of maids of honour obliged to be ready at all hours "to register her Grace’s conceptions." Walpole speaks of her as a "fertile pedant" with an "unbounded passion for scribbling"; and, although giving evidence of learning, ingenuity and imagination, her writings are fatally marred by a deficiency in judgment and self-restraint. She is best known by the Life of her husband, originally printed by A. Maxwell at London in 1667. She also published Philosophical Fancies (1653); Poems and Fancies (1653); The World’s Ohio (1653); Nature’s Picture drawn by Fancie’s Pencil to the Life, which includes an autobiography (1656); Philosophical and Physical Opinions (1653); Orations (1653); Essays (1656); Sociable Letters (1664); Observations upon Experimental Philosophy (1666); Letters and Poems (1676).

The Life of William Cavendish, Duke of Newcastle, by Margaret, duchess of Newcastle, has been edited by C. H. Firth (1886); it was criticized by Pepys as "the ridiculous history of my Lord Newcastle writ by his wife, which shows her to be a mad, conceited, ridiculous woman, and he an ass to suffer her to write what she writes to him," but on the other hand eulogized by Charles Lamb as "the casket is rich enough, no case sufficiently durable to honour and keep soft such a stone also."

2. THOMAS PELHAM HOLLES, duke of Newcastle (1603-1678), whose official life extended throughout the Whig supremacy of the 18th century, was the elder son of Thomas, first Lord Pelham, by his second wife Lady Grace Holles, younger sister of John Holles, duke of Newcastle-on-Tyne, who died in 1711, and left the whole of his vast estates to him. In 1712 he also succeeded his father in his peerage and estates, and in 1714, when he came of age, was one of the greatest landowners in the kingdom. He vigorously supported the Whig party at Queen Anne’s death, and had much influence in making the Londons accept King George. His services were too great to be neglected, and in 1714 he was created earl of Clare, and in 1715 duke of Newcastle-on-Tyne. He also became lord-lieutenant of the counties of Middlesex and Nottingham and a knight of the Garter in 1718, in which year he increased his Whig connexion by marrying Lady Henrietta Godolphin, granddaughter of the great duke of Marlborough.

In 1717 he first held political office as lord chamberlain of the household, and in 1724 was chosen by Sir Robert Walpole to be secretary of state in place of Lord Carteret. This office he held continuously for thirty years (1724-1754), and only changed it in the premiership on his brother’s death. His industrial experience as office and his connexion with his inexhaustible wealth, and some praise must be given to his inhaustible activity and great powers of debate. He was a peculiarly muddle-headed man, and unhappy if he had not more to do than he could possibly manage, but at the same time he was a consummate master of parliamentary tactics, and knew how to manage the Houses of Lords and Commons alike. Lord Hervey (Memoirs) compares him with Walpole in 1735, and says: "We have one minister that does everything with the same seeming ease and tranquillity as if he were doing nothing; we have another that does nothing with the same seeming indifferency as if he did everything." He continued in office on Walpole’s fall in 1742, and became more powerful on his younger brother Henry becoming prime minister in 1743. On Henry Pelham’s death in March 1754, Newcastle succeeded him as premier; but people who had been accustomed to him as secretary of state would not stand him as premier, and in November 1756 he gave place to the duke of Devonshire. For his long services he was created duke of Newcastle-under-Lyme, with remainder to Henry Fiennes Clinton, 9th earl of Lincoln, who had married his eldest daughter of the same name.

In July 1757 he again became prime minister—for Pitt, though a great statesman, was a bad party leader—on the understanding, according to Horace Walpole, that "Mr Pitt does everything, the duke gives everything." Under this ministry England became famous abroad, but it gradually fell before the young king’s affection for Lord Bute, who, after supplanting Pitt, became prime minister in the room of Newcastle in May 1762. The duke went into strong opposition, and lost his two lord-lieutencies for opposing the peace of 1763. In 1765 he became lord privy seal for a few months, but his health was fast giving way, and he died in November 1768. The duke was certainly not a great man, but he was industrious and energetic, and to his credit be it said that the statesman who almost monopolized the patronage of office for half a century twice refused a pension, and finally left office £300,000 poorer than he entered it.

3. HENRY PELHAM FIENNES PELHAM CLINTON, 5th duke of Newcastle (1811-1864), the eldest son of Henry, the 4th duke, was educated at Eton and at Christ Church, Oxford, where he graduated in 1832. He was member of parliament for South Nottinghamshire from 1832 to 1846, when he became member for the Falkirk Burghs, retaining this seat until he became duke of Newcastle in January 1851. As earl of Lincoln he was first commissioner of woods and forests from 1842 to February 1846, when he was appointed chief secretary to the lord-lieutenant of Ireland, but the ministry fell in June of the same year. In 1852 Newcastle became secretary for war and the colonies under Lord Granville, and in 1854, when the outbreak of the Crimean War occurred, was made a peer and placed in charge of it. As secretary for war he was regarded as being largely responsible for the terrible hardships which befall the British troops in the Crimea in the winter of 1854, and as the result of a vote of censure he left office with his colleagues in January 1855. He was secretary for the colonies from 1859 to 1864, and died on the 18th of October 1864, being succeeded as 6th duke by his eldest son, Henry Pelham Alexander.

NEWCASTLE, a seaport of Northumberland county, New South Wales, Australia, at the mouth of the Hunter river, 102 m. by rail and 62 m. by sea N. by E. of Sydney, in 32° 55' S., 15° 49' E. Newcastle is the second city in New South Wales, the fourth port of Australia, and the seat of an Anglican bishop. The city rises steeply from the sea, and possesses numerous fine buildings, among which may be mentioned the railway station, post office, custom-house, the cathedral of Christ Church, the school of art with its large library, and the Victoria Theatre. There are also two state-subsidized hospitals, a college, a school of mines, a technological museum, several large and handsome churches, and numerous subsidized charitable institutions. Communication between the different parts is maintained by tramways, and steam ferry-boats ply between the city and its suburbs on the shores of the harbour. The industries include brewing, shipbuilding, copper and iron-founding, carriage-building and fellmongery; there are boot factories, engineering works, biscuit factories and smelting works at Cockle Creek. There is also a large trade in frozen meat. There are numerous coal mines in the vicinity, yielding coal of the finest quality. Newcastle has a fine harbour, with an area of 540 acres, protected by two breakwaters; the breadth of the channel at its entrance is 1,000 ft., and the depth at the bars is 25 ft. Vessels of the largest tonnage can enter and lie alongside of the wharves, which are 5 m. in extent, equipped with travelling cranes, hydraulic and steam cranes, lighted by electric light and connected with the Great Northern railway by a branch line. There is a floating dock to lift 2,000 tons, and at Stockton there is a patent slip to take large vessels for repair. The facilities for the shipment of coal are excellent, and Newcastle is the chief coal port in the southern hemisphere. The harbour is protected by two forts, Fort Scratchley, the strongest in Australia, and Shepherd’s Hill Fort. The city exports coal, wool, coke, horses, cattle, flour, meat, silver, lead, copper, tallow, hides and country produce. Newcastle returns three members to the legislative council and six members to the legislative assembly. Most of the suburbs are separate municipalities, namely, Stockton, Carrington, Wickham, Hamilton, Merewether, Adamstown, Waratah, New
NEW CASTLE—NEWCASTLE-UPON-TYNE

Lambton, Lambton, Wallsend and Blattsburg. The population of the municipality of Newcastle is 14,425; of the town and suburbs about 70,000. The mouth of the Hunter river (named after Governor John Hunter), now known as Newcastle Harbour, was discovered in 1797 by Lieutenant John Shortland, who accompanied Hunter to New South Wales. For many years after its discovery it was used as a convict station. It became a free settlement in 1821, and in 1859 was erected into a municipality. The centenary of the landing of Shortland was celebrated in 1897, when a monument commemorating the event was erected.

NEW CASTLE, a city of New Castle county, Delaware, U.S.A., in the northern part of the state, at the head of Delaware Bay, on a high point of land extending into the Delaware river, 6 m. south of Wilmington. Pop. (1900) 410; (1900) 3280 (315 foreign-born); (1910) 3351. It is served by the Philadelphia, Baltimore & Washington (Pennsylvania System), and (old Wilmington) the Baltimore & Ohio railways, and by steamship lines connecting with Baltimore, Philadelphia and other ports. The city, on land granted by the Swedes, is in New Castle county; and there is a public library, the Immanuel Protestant Episcopal Church (partly built in 1689), and several residences of Dutch and colonial types. The city has a good harbour and an excellent river front for manufacturing sites and for shipping; it is included in the customs district of Wilmington. Its industrial establishments include shipyards, rolling mills and steel works, flour-mills, and manufactories of cotton and woolen goods. The saltpetre fisheries are of some importance. In 1651 Governor Peter Stuyvesant of New Netherland established near the place Fort Casimir, as the first determined move in his aggressive policy against the Swedes, who had settled in this vicinity about 1640. The Swedes captured the fort in 1654, but this precipitated the crisis in which New Sweden (Delaware) was lost to the Dutch in 1655. Fort Casimir (renamed Fort Amstel) was made the seat of government of the local Dutch possessions, and in 1657 was placed under the jurisdiction of the City of Amsterdam, under which it remained, though prospering little—disease, famine and fears of English attack causing most of the inhabitants to leave in 1658 and 1659—until just before the English seized the settlements in Delaware in 1664. Under the English court house, possibly built by the Swedes, is in New Castle; and there is a public library, the Immanuel Protestant Episcopal Church (partly built in 1689), and several residences of Dutch and colonial types. The city has a good harbour and an excellent river front for manufacturing sites and for shipping; it is included in the customs district of Wilmington. Its industrial establishments include shipyards, rolling mills and steel works, flour-mills, and manufactories of cotton and woolen goods. The saltpetre fisheries are of some importance. after the union of Scotland and England. The castle, from which the town takes its name, stood on a slight elevation rising abruptly from the river, and was erected by Henry II. between 1177 and 1177 on the site of an older structure built in 1080 by Robert, eldest son of the Conqueror. It was originally the strongest fortress in the north of England, and its keep is now one of the finest specimens of the Norman stronghold remaining in the country. While it was still incomplete, William the Lion was led within its walls after his capture at Alnwick; and within its great hall Balliol, on the 26th of December 1292, died, homage for the crown of Scotland to Edward I. The area of the castle within its outer walls and fosse was 3 acres. Fragments of these walls, with the principal entrance or Black Gate (portions of which are, however, of later construction) and the Watergate or southern postern remain, but the inner wall surrounding the keep has been entirely removed. The massive keep, with walls 14 ft. thick, is in a state of good preservation, as is also the chapel, a beautiful specimen of late Norman style. The castle was purchased by the corporation in 1809, and is under the charge of the Newcastle Society of Antiquaries, which restored it as an appropriate museum of Newcastle. The castle is St. Nicholas church, forming the cathedral of the diocese of Newcastle, instituted in 1882. The diocese covers practically the whole of Northumberland, with a very small portion of Cumberland. The church, which is principally Decorated, consists of nave, aisles, chancel and transept, the total length of the interior from east to west being 245 ft., and the width at the transepts 128 ft. The principal feature of the church is the lantern tower, a later addition and a very fine specimen of early Perpendicular. Among other interesting old churches is St. Andrew's church, erected in the 14th century and retaining Norman characteristics, with a low square tower and a peal of six bells. During the siege by the Parliamentary army in 1644 it was greatly damaged. St. John's church is a building of the 14th century with an ancient front. Of the nine conventual buildings at one time existing in Newcastle or its immediate neighbourhood, a few fragments of the monastery of the Black Friars remain, and the chapel of the hospital of St. Mary at Jesmond forms a picturesque ruin. There are a number of quaint Elizabethan houses in the steep street called the Side, and in the Sandhill at its foot.

Some of the modern streets of Newcastle are spacious and handsome, the most noteworthy are Great Street, in which a complete scheme of Grecian architecture is followed, and Grainger Street. This thoroughfare is named after Richard Grainger (1789-1861), a wealthy local architect who devoted himself to the beautifying of his city with remarkable energy. Of numerous modern churches may be noted that of St. George, Jesmond, a landmark for a great distance and finely decorated within, and the Roman Catholic cathedral of the diocese of Hexham and Newcastle. The most important public buildings are the corporation buildings, including a large public hall, and a corn exchange; the guildhall, originally a hospital called the Maison de Dieu, and afterwards used as "the stately court of merchant adventurers," re-erected in 1658; the moot-hall (1810) for the meetings of assizes and sessions and the transaction of county business; the exchange (1860); the central newsroom and art gallery (1838); the Wood memorial hall (1870), used for the meetings of the North of England Institute of Engineers; and the custom-house. The Grey monument in Grey Street, an Ionic column surmounted by a statue of Earl Grey, was erected in 1836 to commemorate the passing of the Reform Bill; the Stephenson monument near the railway station was erected in 1861; a marble statue of Queen Victoria in front of the Royal Victoria Infirmary was unveiled in 1906, and a bronze statue of the queen in 1903 in the cathedral square.

Among educational establishments the chief are the colleges of medicine and of physical science of the university of Durham; the first granting degrees in medicine and surgery; the second, with which the school of art is incorporated, degrees in science and literature. The college of science, or Armstrong College as it is called in commemoration of the first Lord Armstrong, was founded in 1871; the north-east wing was opened in 1888; further parts of the building in 1894, and the west wing by King Edward in 1906. The royal free grammar school, founded in 1525, occupies modern buildings in Jesmond. There should be mentioned also Allan's endowed schools, founded in 1705, and reorganized by the charity commissioners in 1877; and Rutherford College and the Commercial Institute, providing technical and commercial education. The Laing Art Gallery was erected and presented to the city by Alexander Laing, and opened in 1904. Among clubs and similar institutions are the Literary and Philosophical Society, founded in 1793, the Newcastle Anti-quaries, founded in 1813, with a museum in the castle; the Natural History Society and museum; the Tyneside Geographical Society; the Tyneside Naturalists' Club, established in 1846; the Mechanics' Institution, 1824; the North of England Institute of Mining Engineers, 1852; the Fine Arts Society; the Farmers' Club; the Northern Counties' Club; the Union Club; and the University Club. Several clubs for working men form a note-worthy social feature. There is a public library and newsroom. The Royal Victoria Infirmary on the Castle Leazes is a memorial of the Diamond Jubilee of Queen Victoria, and was opened in 1906. The benevolent institutions also include: the dispensary (1777), fever house (1803), lying-in hospital (1760), eye infirmary (1822), children's hospital, Trinity almshouses (1492), hospital of the Holy Jesus (1682), hospital (1791) for keelmen, i.e. coal-barge men; and institutions for the blind, dumb and orphans.

Newcastle is well supplied with public parks and recreation grounds. To the N. of the city is the Castle Leazes ornamental park of 33 acres, and beyond this the Town Moor and racecourse, an extensive common, the survival of the pasture land of the township. Eastward from Town Moor is Brandling Park, and westward Nunn's Moor. The picturesque grounds of Armstrong Park N.E. of the city extend to about 50 acres, the larger half of which was presented by Sir W. G. Armstrong, who also presented the beautifully wooded grounds of Jesmond Dene. Elswick Park in the south-west of the city, extending to 83 acres, includes Elswick Hall. There are several others. Jesmond, N.E. of the city, is the chief residential suburb. It takes name from "Jesus Mount," and was formerly a place of pilgrimage, possessing a hospital dedicated to St. Mary the Virgin.

Both the Northumberland and Durham banks of the river are open, and open manufacturing towns or suburbs. Of these the most important is Gateshead (g.r.) immediately opposite Newcastle; while those adjacent to Newcastle on the same bank are Benwell and Fenham (pop. in 1901, 18,316) on the west, and Walker (13,330) on the east. The last-named two (formerly urban districts), together with part of Kenton, were incorporated with Newcastle in 1904. Newcastle is connected with the south bank of the Tyne by four bridges—two high-level bridges, an hydraulic swing bridge and a suspension bridge. The old high-level bridge carries the North-Eastern railway, with a road and footway beneath it. It was opened by Queen Victoria in 1849. The new high-level bridge, carrying the railway only, was opened by King Edward VII. in 1906; it consists of four steel spans on granite piers. The hydraulic swing bridge, on the low level, was built to replace a stone structure erected in 1781 on the site of a bridge dating from 1250, and destroyed by a flood in 1771. The Roman bridge, the Pons Aeli, is said to have spanned the river at the same point. The hydraulic bridge (1876) consists of one large centre pier, two midstream piers and two abutments; and its foundations are iron cylinders resting on the solid rock, 60 ft. below the bed of the river. Two spans, the swing, are simultaneously by machines impelled by two non-allow 103 ft. of waterway for vessels going up and down the river. About half a mile farther up the stream is the Redheugh bridge (1871). The central station of the North-Eastern railway is an extensive and handsome structure built on a sharp curve. An underground line connects it with the Blyth and Tyne station. The suburban line of the North-Eastern company from the central station to Jesmond, Gosforth and Benton was the first standard line to carry passengers by electric traction (1904).
NEWCOMB

Newcastle owes its prosperity to its convenient situation on a tidal river, and to the immense stores of coal in the neighbourhood, which, besides being largely exported, stimulate a great variety of industries which are dependent on their use. It began to export coal about the end of the 13th century, but the trade received a severe check by the act of Edward I. which made the burning of coal in London a capital offence. In the reign of Edward III. licence was granted to the inhabitants to dig coals and export them, and the export continued without intermission. The clay thereof in the place called the Castle Field and the Forth. The quay in front of the town, extending from the hydraulic bridge to the Ouseburn, forms a fine thoroughfare of about a mile in length; and by means of dredging a depth of water has been obtained at the shore permitting vessels of large tonnage to approach, although the berths of the ocean steamers are a little farther down the river. The quay is supplied with the most improved mechanical appliances, and has direct communication with the North-Eastern railway. There is a large grain warehouse at the E. end of the quay. Exports include coal, chemicals, pig-iron, iron-work, steel, iron bars, plates and castings, machinery, fire-clay goods and copper. The chief imports are fruits, wheat, maize, oats, barley, iron and steel, petroleum, sulphur ore, timber and wood hoops, iron ore and potatoes. Steamers carrying passengers serve the principal English ports, Cardiff, Leith, &c.; also Baltic ports and New York; while Newcastle is one of the chief ports for the extensive Norwegian tourist traffic, the ships of the combined Bergenske and Nordenfjeldske companies regularly staying Stavanger, Bergen, Trondhjem and intermediate ports. To the industries of Newcastle indicated by the exports may be added glass lead and iron; tallow, earthenware, tool, rope end ships' fitting manufactures, and most important of all, shipbuilding. The celebrated Elswick works, founded by Messrs Armstrong in 1837, and amalgamated with those of Mitchell & Co., are among the most important in the world. The construction of ships of all sorts, including the largest ironclads with all their armour and guns, is carried on. Elswick is the name of the western part of the borough of Newcastle. The borough returns two members to parliament. It is the largest undivided parliamentary constituency in the United Kingdom. The city is governed by a lord mayor (the title was conferred in 1606), 19 aldermen and 57 councillors.

Area, 8,453 acres.

History.—Newcastle owes its origin to its position on the great Roman wall and on the estuary of the river Tyne. Its Roman occupation is proved by existing remains, most important among which are the foundations of a bridge, attributed to the emperor Hadrian. Before the Conquest little is known of the town except that it was called Monkchester, and that it was destroyed in the 9th century by the Danes. After the defeat of Edgar Ætheling and Earl Waltheof on Gateshead Fell, it was again destroyed by William the Conqueror, but Robert of Normandy is said to have raised a castle there in 1080 on his return from an expedition against Malcolm, king of Scotland, and from that time the town was called Newcastle. Shortly afterwards it was fortified by Robert de Mowbray in his rebellion against William Rufus, but it was taken by the king in 1095. In the reign of Stephen it was seized by David, king of Scotland, and after its restoration to the English in 1157 Henry II. rebuilt the castle and established a mint. The walls surrounding the town are attributed to Edward I. During the 14th century Newcastle was three times defended successfully against the Scots, but in 1640 it was occupied for a year by the Scottish Covenanters under Leslie. It was then garrisoned by royalists, but again surrendered to the Scots in 1644 after a siege of about six weeks, and Charles I. was taken there in 1646 when he had yielded himself to the Scottish army. Theburgesses are said to have held the borough at a fee-farm rent under a grant from William Rufus. The title of mayor was conferred by Henry III., while Henry IV. in 1400 made the town a county of itself with a charter, and the burgesses power to elect 6 aldermen. Queen Elizabeth incorporated the town in 1589 under the title of mayor and burgesses, and Philip and Mary in 1596 granted 4 additional aldermen, while the charter of James I. in 1604 appointed 24 common councilmen.

NEWCOMB, SIMON (1835-1909), American astronomer, was born in Wallace, Nova Scotia, on the 12th of March 1835. He became a resident of the United States in 1853, and graduated at the Lawrence Scientific School of Harvard University in 1858, having paid special attention to mathematics and astronomy. He assisted in the preparation of the American Nautical Almanac for 1857. In 1861 he became professor of mathematics in the United States navy, and was put in charge of the great 26-in. equatorial erected at Washington Observatory in 1873. In 1877 he was appointed director of the American Nautical Almanac office, a post which he held until March 1897. In 1884 he became professor of mathematics and astronomy at the Johns Hopkins University, continuing, however, to reside at Washington. He was also editor of the American Journal of Mathematics for many years. In view of the wide extent and importance of his labours, the variety of subjects of which he treat, and the unity of purpose which guided him throughout, Simon Newcomb must be considered as one of the most distinguished astronomers of his time. A study of his works reveals an unusual combination of skill and originality in the mathematical treatment of many of the most difficult problems of astronomy, an unfailing patience and sagacity in dealing with immense masses of numerical results, and a talent for observation of the highest order. On assuming the directorship of the Nautical Almanac he became very strongly impressed with the diversity existing in the values of the elements and constants of astronomy adopted by different astronomers, and the injurious effect which it exercised on the precision and symmetry of much astronomical work. Accordingly he resolved to "devote all the force which he could spare to the work of deriving improved values of the fundamental elements and embodying them in new tables of the celestial motions." The formation of the tables of a planet has been described by Cayley as "the culminating achievement of astronomy," but the gigantic task which Newcomb laid out for himself, and which he carried on for more than twenty years, was the building up, on an absolutely homogeneous basis, of the theory and tables of the whole planetary system. The results of these investigations have, for the most part, appeared in the Astronomical Papers of the American Ephemeris, and have been more or less completely adopted for use in the nautical almanacs of all countries. A valuable summary of a considerable part of this work, containing an account of the methods adopted, the materials employed, and the resulting values of the various quantities involved, was published in 1895, as a supplement to the American Ephemeris for 1897, entitled "The Elements of the Four Inner Planets and the Fundamental Constants of Astronomy." In 1886 Newcomb had published an important memoir on the orbit of Neptune, which was followed in 1879 by a similar investigation of the orbit of Uranus. About twenty-five years later the tables of these planets were revised by him in view of all the observations which had accumulated in the meanwhile at Washington, Greenwich, Paris and Cambridge. In the meantime the theory of Jupiter and Saturn had been thoroughly worked out by G. W. Hill, Newcomb's distinguished collaborator in the Nautical Almanac office, and thus was
NEWCOMEN—NEWDIGATE

475

completed one important section of the work projected by Newcomb in 1877.

Among Newcomb's most notable achievements is his research in conjunction with the theory of the moon's motion. His first work on this abstruse subject, entitled Théorie des perturbations de la lune, qui sont dues à l'action des planètes, is remarkable for the boldness of its conception, and constitutes an important addition to celestial dynamics. For some years after the publication of Hansen's tables of the moon in 1857 it was generally believed that the theory of that body was at last complete, and that Newtonian prediction could be practically as accurate as that of the other heavenly bodies. Newcomb showed that this belief was unfounded, and that as a matter of fact the moon was falling rapidly behind the tabular positions. With the view of examining this question, he undertook the reduction of every observation made before 1750 which appeared to be worthy of confidence. In an elaborate memoir he showed that the ancient solar eclipses described by Herodotus, Thucydides, and others, which seemed to require an increased value of the secular acceleration of the moon's mean motion to bring them into line with modern views, were not really due to an ambiguity of the accounts in each case rendering uncertain either the totality of the eclipse or the place from which it was visible. In his investigation he employed the eclipses of the moon recorded in the Almagest, the Arabian eclipses between A.D. 800 and 1004, extracted from Caussin's translation of Ibn Junis, the eclipses and occultations of Buhlaldus, Gessendi, and Herelius, of the French astronomers at Paris and St Petersburg, and of Flamsteed at Greenwich, and deduced a secular acceleration of 0.89, agreeing well with the theoretical value.

On taking charge of the 26-in. equatorial at the United States Naval Observatory, Newcomb devoted it almost exclusively for the first two years to observations of the satellites of Uranus and Neptune, being of opinion that it was better to do one thing well than many things indifferently. The results of these skillfully conducted observations were published in a memoir on The Uranian and Neptunian Systems. From this research it appears that the orbits of all but four satellites of Uranus are sensibly circular, and although no special search was made, he concludes that none of Sir William Herschel's supposed outer satellites can have any real existence. From the motion of the satellites he finds that the mass of Uranus is, roughly, the weight of one half of the sun, while for the planet Neptune he finds a mass equal to \(1.4 \times 10^{27}\)th of the sun, agreeing with the view previously found by him from the perturbations of Uranus within \(10^{-29}\)th of its amount. As early as 1866 Newcomb communicated an important memoir to the American Academy, On the Secular Variations and Mutual Relation of the Orbits of the Asteroids, in which he discussed the two principal hypotheses to account for the origin of these bodies—one, that they are the shattered fragments of a single planet (Olbers' hypothesis), the other, that they have been formed by the breaking up of a revolving ring of nebulous matter.

In the Astronomical Papers of the American Ephemeris will be found a large number of contributions from Newcomb's pen on some fundamental and most important questions of astronomy. Among these are papers on The Recurrence of Solar Eclipses, A Transformation of Hansen's Lunar Theory, Development of the Perturbative Function and its Derivatives. His memoir On the Motion of Hyperion, a New Case in Celestial Mechanics, is in some respects one of his most original researches. He discussed the transits of Venus of 1761 and 1769, and those of Mercury from 1677 to 1884. At the International conference, which met at Paris in 1856 for the purpose of elaborating a common system of constants and fundamental stars to be employed in the various national ephemerides, Newcomb took a leading part, and at its suggestion undertook the task of determining a definite value of the constant of precession, and of compiling a new catalogue of standard stars. The results of these investigations were published in 1895, and have been in use since the beginning of 1901. In the intervals of these immense labours, on which his reputation as an astronomer rests, he found leisure for works of a lighter character, e.g. his Popular Astronomy (1878) which has been translated into German, Russian, Norwegian, Czech, Dutch and Japanese, his Astronomy for Schools and Colleges (1880), written in conjunction with Professor E. S. Holden, and Astronomy for Everybody (1905). After his retirement from official life he published an excellent popular treatise on the subject. More recondite work is his Compendium of Spherical Astronomy (1906). He also wrote on questions of finance and economy.

He received the honorary degrees of D.C.L., Oxford, and Sc. D., Cambridge and Dublin. In 1872 he was elected an associate of the Royal Astronomical Society, receiving its gold medal in 1874. In 1877 he was elected a foreign member of the Royal Society, which in 1890 awarded him the Copley medal. He also received the first Bruce medal of the Astronomical Society of the Pacific, awarded by the directors of the Berlin, Greenwich, Harvard, and Heidelberg Observatories. Of more recent date, Benjamin Franklin was the only American to become an Associate of the French Institute. He died at Washington on the 14th of July 1900, and was given a military funeral, having been made a rear-admiral by Act of Congress in 1906.

NEWCOMEN, MATTHEW (c. 1610-1669), English nonconformist divine, was born about 1610 and educated at St John's College, Cambridge, and was afterwards tutor at Emmanuel College, Cambridge, and lecturer at Dedham in Essex, and was the leader of the church reform party in that county. He assisted the elder Calamy in writing Smetymnuus (1641), and preached before parliament in 1643. He was a man of many gifts, excelling alike in preaching, in debate and in friendship, and declined many offers of more remunerative service. He protested against the extreme democratic proposals called "The Agreement of the People" (1647), and was one of the commissioners at the Savoy Synod of 1658. On the passing of the Act of Uniformity in 1662, Newcomen lost his fellowship at Oxford, but was invited to the pastorate at Lodi, where he was held in high esteem not only by his own people but by the university professors. He died of the plague in 1669.

NEWCOMEN, THOMAS (1663-1729), English engineer, one of the inventors of the steam-engine, was born at Dartmouth in 1663. While employed as an ironmonger in his native town, he corresponded with Robert Hooke about the previous investigations of Denis Papin and the marquis of Worcester as to the applicability of steam-power for the purpose of driving machinery, and in conjunction with John Calley (or Cassley), said to have been a grazier or glazier in Dartmouth, and Captain Thomas Savery (1650?-1715), a military engineer, he constructed in 1715 a "fire-engine," now known as the "atmospheric steam-engine." He died in 1729, probably in London. (See STEAM-ENGINE.)

NEWDIGATE, SIR ROGER (1719-1856), English antiquary, was born on the 30th of May 1719. He was the 5th baronet of Harfield (in Middlesex) and Arbury (in Warwickshire), and grandson of Sir Richard Newdigate, an English chief justice during the time of Richard Cromwell's protectorate. He was educated at University College, Oxford. From 1741 to 1747 he was M.P. for Middlesex, and from 1750 to 1758 M.P. for the University of Oxford. In 1752 he spoke in parliament on behalf of the repeal of the Plantation Act, and during the debates on the land tax in 1767 he opposed the duke of Grafton's administration and the proposed grant to the royal princes. Being the owner of extensive collieries near Bedworth in Warwickshire, he actively promoted the Coventry, Oxford and Grand Junction canal, cutting also a canal from his collieries to Coventry, and interesting himself in the construction of the turnpike road from

NEWEL—NEW ENGLAND

Coventry to Leicester. But it is as an antiquary and the founder of a prize at the Oxford university that he is chiefly remembered. His interest in old architecture dated from a tour in France and Italy which was undertaken while he was a young man. He filled two folio volumes with sketches of ancient buildings. His collection of antiquities included marbles, casts of statues and vases. Two marble candelabra found in Hadrian's villa at Rome have been preserved, and presented them be the Radcliffe Library at Oxford. Among his other generalities to the university were a chimney piece, for the hall of University College, and the sum of £2000 for the removal by Flaxman of the Arundel collection of marbles to the Radcliffe Library. The "Newdigate" prize of twenty-one guineas for English verse, which is open for competition each year to the undergraduates of Oxford University, was founded by him and was first awarded in the year of his death. He died at Arbury on the 23rd of November 1806. His portrait was painted by Kirkby for University College, Oxford, and at the age of sixty-three he also sat to Romney.

NEWEL (O. Fr. nouvel or, modern noyau, properly a kernel, from Lat. max, nut; other foreign equivalents are Ital. albero, Ger. Spindel), the term given in architecture to the central shaft of a semicircular or winding staircase, which is built up or consists of the narrow ends of the steps standing one over the other. In stone, both newel and steps are cut out of the same block; when in wood, the newel becomes a vertical post into which the steps are housed. The term is also given to the vertical post at the foot or the angles of a square staircase, into which the steps are housed or turned. In its usual application it is more than half the height of the staircase. The Newels, New England, a general name for the north-east section of the United States of America, embracing the states of Maine, New Hampshire, Vermont, Massachusetts, Rhode Island and Connecticut. It has an area of 66,424 sq. m. (4448 sq. m. being water); and in 1910 its population was 6,552,681, more than one-half of which was in Massachusetts, although that state contains less than one-eighth of the total area. The region is traversed by the broken mountain ranges which form the N.E. continuation of the Appalachian system; the soil is rather sterile, except in the river valleys; and the climate of the long winters is often severe. But the picturesque scenery and delightful summer climate have made New England a favourite resort. When the commerce of New England was interrupted as a consequence of the Napoleonic wars, the abundance of water power afforded by the rivers encouraged manufacturing, and the region rapidly acquired prominence in this industry, especially in the manufacture of textiles, of boots and shoes, and of paper and wood pulp; in 1905 the value of the textile products of New England (excluding flax, hemp and jute) alone was $522,821,440 (more than 45% of that of the entire country), the value of boots and shoes was $132,197,623 (more than one-quarter of the entire country), the value of paper and wood pulp was $99,813,133 (more than one-quarter of the entire country), and the value of all factory products amounted to $2,925,908,437 (nearly one-seventh of the total for the entire country).

Northmen very probably visited this region at the beginning of the 11th century. (See VINLAND). To Europeans who visited it in the 16th century it was included in "Norumbega," and some of the early explorers searched here for the mythical city of that name. Title to the territory was claimed by the English on the basis of its alleged exploration by the Cabots in 1498, and by the French on the basis of its exploration by Giovanni da Verrazzano in 1524. It was made favourably known to the English by the explorations of Bartholomew Gosnold in 1602, of Martin Pring in 1603 and of George Weymouth in 1605, and was at this time called North Virginia. In 1606 King James I. granted it to the Plymouth Company with a view to encouraging settlement, and in the next year a colony was planted at the mouth of the Sagadahoc (now Kennebec) river, but this was abandoned in 1608; the efforts of the French to establish settlements along the Maine coast were likewise unsuccessful. In 1624-1616 Captain John Smith traversed the coast as far east as the mouth of the Penobscot river and as far south as Cape Cod, gathered much information from the Indians, wrote an attractive descript-

of the country, prepared a map of it, suggested its present name, New England, and made another unsuccessful attempt to found a settlement. A new charter of 1626 conveyed to the New England Council, the successor of the Plymouth Company, all the territory in North America between latitudes 46° and 48° N., under the name of New England, and in the same year a permanent settlement was established at Plymouth by a band of dissenters, who, although they were defeated in their invasion of Virginia, were prevailed upon by the captain of their vessel to land in New England. During its existence of fifteen years the New England Council made numerous grants of territory, and from three of these grew three of the present states: Massachusetts, from a grant to the Massachusetts Bay Company in 1628; Maine, from the grant to Sir Ferdinando Gorges and John Mason (the two most influential members of the council) in 1622; and New Hampshire, from the grant to John Mason in 1629. The Council attempted to establish a general government over its entire domain, but the scheme was one of its many failures in supporting such a government with contributions from each member in return for an allotment of land was a failure, and although Robert Gorges, the second son of Sir Ferdinando Gorges, was sent over as governor-general in 1623, he accomplished nothing and returned in the next year in disgust. In 1635, when the Dutch were hemming in its domain on the west and the French on the north, the Council made a final allotment of its remaining territory among its members and surrendered its charter. Connecticut was founded in the same year by emigrants from Massachusetts without any other authority than that of the Council. New Haven was granted to John Davenport and 20 others under a charter from England, and it was settled at New Haven in 1638 by emigrants from England who had stayed for a time in Boston and other Massachusetts towns, but this was annexed to Connecticut in 1664 under the Connecticut charter of 1662. Rhode Island was founded in 1636 by exiles from Massachusetts who had no authority whatever from a superior government. Plymouth was a separate colony until its union with Massachusetts under the charter of 1691. New Hampshire was a part of Massachusetts from 1641-1643 to 1679. Maine, having passed under the jurisdiction of Massa-

chusetts in 1652, did not regain its independence until 1820. Vermont was settled largely by emigrants from New Hampshire, but New York claimed the territory and the dispute was not settled until the new state was erected in 1791.

Massachusetts, Plymouth, Connecticut and New Haven constituted in their early years a group of neighbouring colonies, substantially independent of the mother country, and possessing a unity of purpose and similar institutions but in need of mutual protection from the Indians, the Dutch and the French, and also needing an arbiter to whom they might refer their own disputes, especially those relating to boundaries and trade. To meet these needs they organized, under Articles of Confederation signed in 1643, the first form of colonial union in America; they called it The United Colonies of New England, but it is more commonly known as the New England Confederacy. The confederate authority was vested in a board of eight commissioners, two from each colony chosen annually by its General Court.

This board was to meet annually in September, two years of every five at Boston, one year of every five at Hartford, one at New Haven, and one at Plymouth; special meetings also might be called to consider questions relating to the four colonies. The commissioners chose their president at each meeting, but this officer had only the powers of a moderator. An agreement of six commissioners was necessary to pass any measure, but if there was an agreement of less than six the measure might be referred to the General Courts and become a law of the Confederacy if all of those courts approved. The most important powers of the Confederacy were those relating to the capture and destruction of hostile vessels, and the raising of an army of 100 men from Massachusetts and 45 men from each of the other colonies (or some other proportion which the commissioners might agree) to march out if so requested by three magnates, or any two magistrates of a town in distress. The experiment of a defensive war which the commissioners declared to be just were to be defrayed by the several colonies in proportion to their number of men and boys between the ages of sixteen and sixty. Other matters within the jurisdiction of the commissioners were such as related to disputes
between two or more colonies and the return of escaped servants, prisoners and fugitives from justice. As the commissioners had no means of enforcing their orders, their function was chiefly advisory, but occasionally of considerable importance on special occasions. Although the number of commissioners from each of the colonies was the same, those from Massachusetts exerted the dominant influence.

The commissioners met regularly until 1684—annually until New Haven submitted to Connecticut in 1664, and triennially from 1664 to 1684, when Massachusetts lost its first charter. Upon the restoration of Puritan government in the country (1660) numerous grievances were presented to King Charles II. against the Puritan governments of New England, among them Massachusetts' extension of its jurisdiction over the towns of Maine and New Hampshire, the persecution of the Quakers, and the denial of the right of appeal to the crown, and in 1604 a royal commission, consisting of Richard Nicolls, Samuel Maverick, Robert Carr and George Cartwright, was sent over to settle disputes and secure some measure of imperial control, but Massachusetts, the chief offender, successfully baffled all attempts at interference, and the mission was almost a complete failure. The grievances of English merchants arising from the violation of the navigation laws by the colonies continued, however, to receive the attention of the home government.

In 1676 the Lords of Trade and Plantations sent over Edward Randolph to investigate and gather information which would show the justice and expediency of imposing imperial control, and two years later Randolph was appointed Collector and Surveyor of Customs in New England. Randolph sent back many charges, especially against Massachusetts, with the effect that, in 1684, the charter of that colony was annulled by a decree in Chancery on a writ of quo warranto. This done, the home government set to work to organize the royal domain which should be known as New England, or the Dominion of New England, and its plan for this provided for the annulment of the charters of Rhode Island and Connecticut, and the inclusion in the Dominion of these colonies, and New Hampshire, Maine, New York and the Jerseys, thereby restoring to New England all the territory, with the exception of Pennsylvania, that was included in the grant to the New England Council in 1620. A temporary government was established at Boston in May 1686, with Joseph Dudley as president, and in December of the same year Edmund Andros arrived with a commission and instructions which were a copy of those to the governor of New York and made him governor of all New England except Rhode Island and Connecticut. Rhode Island offered no resistance to the writ against its charter and Andros extended his authority over it immediately after his arrival. Connecticut successfully baffled the royal servants for a time, but when threatened with a division of its territory agreed not to resist the royal purpose, and on the last day of October 1687 it passed under the general government of New England. Finally, a new commission to Andros, issued in April 1688, extended his jurisdiction over New York and the Jerseys, and the whole region over which he was made governor by this instrument was named "Our Territory and Dominion of New England in America." But the English Revolution of 1688 inspired a revolt in New England by which Andros was deposed in April 1689. Under William and Mary no attempt was made to preserve the Dominion of New England, but Rhode Island and Connecticut were permitted to resume government under their old charters, Massachusetts received a new one, and New Hampshire again became a separate royal province.

New England is prominent in American colonial history as the "Land of the Puritans" and the home of the corporate colony. The chief motive of its founders in coming to the New World was the establishment of a new Christian commonwealth, but subordinate to this there was from the first an economic motive. So long as the religious motive remained dominant, "blue laws" were a prominent feature of the administration, but by a slow transition the economic motive became the dominant one, and, as a consequence of this transition and of the corporate form of government, European institutions were transformed into American institutions and new political ideas were generated more rapidly in New England than in either the Middle or the Southern colonies. Owing to its geographical position, nearer to Canada than any other group of colonies, New England had to stand the brunt of the fighter during the wars between the English and the French (aided by their Indian allies) in America, terminating with the conquest of Canada by the English in 1759-1760, and a sense of common danger helped to create a certain solidarity, which made easier the unity of the colonies for common action against the mother country at the time of the War of American Independence. After that war, New England was long the most essentially commercial and industrial group of states, and was a stronghold of Federalism; and in the period immediately before and during the War of 1812, when its commercial interests suffered terribly, first from the restrictive measures of the general government and then from warfare, New England was a centre of that opposition to the policy of the National Administration (then Democratic), which culminated in the famous Hartford Convention in 1814-1815 (see HARTFORD).

NEW FOREST, one of the few woodland regions left in England covering about 93,000 acres in the south-west of Hampshire, between the Solent, Southampton Water and the river Avon. About two-thirds of it is crown property, and is preserved more or less in its natural condition as open woodland interspersed with bogs and heaths. The trees principally represented are oak and beech, with some newer plantations of Scotch fir. The trees were formerly felled for building the ships of the navy and for feeding the iron furnaces of Sussex and Hampshire. Pigs and a hardy breed of ponies find a good living in the forest; and in the woods of an early date for extermination or removal, a few red deer still survive. Foxes, squirrels, otters, snakes (smooth snake, grass snake and adder), butterflies (some of them peculiar to the district), and an occasional badger range the forest freely. The tract derives its name from the extensive aorestation carried through in this region by William the Conqueror in 1079; and the deaths of two of his sons within its confines—Richard killed by a stag, and William Rufus by an arrow—were regarded in their generation as a judgment of Heaven for the cruelty and injustice perpetrated by their father when appropriating the forest. Rufus's stone, near Lyndhurst, marks the supposed spot where the monarch fell. About one-fourth of the area is under cultivation by private owners and tenants. The principal village within the forest is Lyndhurst (pop. 2167 in 1901); its church contains a fresco by Lord Leighton, and here is held the verderers' court, which since 1887 has had charge of the crown portion of the forest. On the western outskirts lies the town of Ringwood (g.v.). Brockenhurst and Beaulieu are the villages next in importance. Beaulieu, at the head of the picturesque estuary of the Beaulieu river, which debouches into the Solent, is famous for the ruins of Beaulieu Abbey, founded by the king, for Carlton House, the gatehouse is restored as a residence, and the Early English refectory as a church. There are considerable remains of the cloisters, chapter house and domestic buildings. The New Forest gives name to a parliamentary division of the county.

The New Forest is one of the five forests mentioned in Domesday. It was a hunting-ground of the West Saxon kings, but, as already stated, was aforested by the Conqueror, whose cruelty in the matter is probably exaggerated by the traditional account. One of the chief sources of the wealth of the forest in early times was the herds of pigs fed there. The New Forest,
being under the forest laws, was affected by the forest clauses of Magna Carta and by the Forest Charter (1217), which mitigated their severity. The chief officer of this, as of other forests, was the justice in eyre who held the justice seat, the highest forest court and the only court of record capable of entering and executing judgments on offenders; the lower courts were the Swimwear and Wardenage, the former of which is still held in a modified form, in the Verderers' Hall of the King's House at Lyndhurst. The circuit of the justices in eyre, or their deputies, continued down to 1635; they were virtually ended by the Act for the Limitation of Forests (1640), though Charles II. attempted to revive them, and they were not legally abolished until 1817. The lower officers of the forest, who held merely local appointments, were the verderers, the warders (one of whose duties was that of seeing to the expediency of "great dogs"), the foresters, the woodwards and the agisters. There was also a lord warden, who was usually a gentleman having no judicial functions. The Deer Removal Act (1831) resulted in the almost total extinction of the forest deer. Under the act of 1877 the forest is administered rather as a national park than for the growing of timber on commercial principles.

NEWFOUNDLAND, a large island, forming a British colony, and occupying an important and commanding position off the eastern coast of North America, is not dissimilar to that occupied by Great Britain towards Europe. It is situated directly across the entrance of the Gulf of St. Lawrence, to which access is afforded at both the northern and the southern extremities of the island. In the south-west its distance from Cape Breton is less than 60 m., while only 1640 m. separate its most easterly point from the coast of Ireland. It is situated between 46° 36' 50" and 51° 39' N., and between 51° 37' and 39° 24' 30" W. The total area of the island is about 40,000 sq. m., or one-sixth larger than Ireland; its maximum length from Cape Race, Newfoundland, 7017 m., its maximum breadth from Cape Spear to Cape Anguillae, 5386 m. It consists of a triangular, three extensive peninsulas, which project from the north (Petit Nord) and south-east (Avalon), assisting the conformation, although the latter, the most populous region of the island, is joined by a very slender isthmus, at one place only 3 m. wide. A further division of the Avalon peninsula is wrought by the two bays of St. Mary's and Conception. St. John's, the capital, is situated on the eastern side of Avalon.

Physical Features.—VIEWED from the ocean the coasts of Newfoundland appear bleak, rocky and barren. The brown wall of rock, sometimes broken by high cliffs, and Rendered higher by the deep fjords and large bays running in some instances 80 to 90 m. inland, and throwing out smaller arms in all directions. For this reason the circumference of the island, which, measured from headland to headland, is about 1000 m., is actually doubled. The fjords resemble those of Norway; islands are numerous, some of them clad with vegetation; and picturesque scenery is not uncommon.

Near the coasts the surface of the country is of a hilly, rugged character, and diversified by ranges of low hills, valleys, woods, lakes, ponds and marshes. Much of this is a savanna country, giving sustenance to large herds of caribou. All the principal hills have a N.E. and S.S.W. trend, as have also the other great physical features of the island, such as the bays, larger lakes, rivers and valleys, a conformation doubtless shaped by glacial action during the ice period. The most important range of mountains is the Long Range, beginning at Cape Ray and extending along the western side of the island for some 200 m., and having peaks more than 2000 ft. high. Parallel to this but nearer the west coast is the Anguille Range, running from Cape Anguille to the north-east point of Bay of St. George. Some of the summits of the Blomidon Range, extending along the south shore of the Humber and Bay of Islands, attain a height of 2081 ft., most of the highest on the island. Avalon peninsula is also very hilly, being crossed by the extinct volcano of Conception Mountain, from which sixty-seven lakes are visible on a clear day. Over the interior are spread a number of detached sharply-pointed summits, springing abruptly from the great central plateau, bearing the local name of "tolls," and servicios as small islands.

In comparison with the island's size large rivers are few, owing to the broken, uneven character of most of the country, and the fact that the ponds and lakes find a convenient vent in the numerous two branching streams from the heart of the island to empty into three considerable streams, the Exploits, the Humber and the Gander. The first-named rises in the extreme S.W. angle of the island, close to the southern extremity of the Long Range, and after a course of about 80 miles into the sea at St. John's, forms the Gander River, a mile wide at its mouth; its channel is studded with islands, the largest being Thwart Island, 9 m. in length. Fourteen miles from St. John's, a succession of cascades known as Bishop's Falls, and farther inland, are the picturesque Grand Falls. The Exploits drains an area of between 3000 and 4000 m., much of it fertile land, and densely wooded with pine, spruce, birch and poplar. The Humber, rising on the west side of the island, is about 30 m. long, and at its mouth is at least 100 sq. m. wide. The Exploits flows, through which the Humber flows, is 15 m. After these Miché Sandy Lake, Victoria's, Terra Nova and George IV. The next in importance are the two large inlets where the railway and lumbering camps have invaded them the shores of these lakes are still primitive wilderness.

The coasts of the island, intersected by many great bays, have been successively opened to French, Spanish and English fishermen, and their small craft have been augmented into a host of fishing vessels. An extensive fishery results from the warm trades currents, which, after flowing south from the Gulf Stream, turn towards the coast of Newfoundland. The greatest part of the catch is salmon, which are usually caught with hand nets, the catches usually amounting to about 100,000 lbs. These fisheries are only of recent origin, being established in the early part of the 19th century. The fishing industry is now the largest in the world, and is carried on in a manner which results in the greatest loss of fish. The greater part of the fishery is carried on in the Gulf of St. Lawrence. In 1813 the whole fisheries of the island with the exception of the Grand Banks, were purchased by the British government, and the fisheries are now carried on under the direction of the government.

The islands of the Grand Banks, which extend from the island of Newfoundland to the Gulf of St. Lawrence, form a large area of shallow water, which is a great nursery, and provides a home for a large number of fish. The banks are occupied by fishermen from England, Ireland, Scotland and the United States, and are used for the fisheries of the Grand Banks. The catches of the fisheries are mainly salmon, cod, haddock, halibut, mackerel, herring and capelin. The fisheries are of great importance to the economy of the island, and the catches of fish are of great value as fish food, and as a source of employment for the fishermen and their families.
of the intermediary system have been ground down to the Laurentian gneiss, and, subsequently, the submarine valley thus formed has been filled up with a new set of sediments, the remains of which are still to be found skirting the shores of the bay and forming the islands in it.

Rocks of the Silurian age are most extensive on the peninsula of Cape St Mary, and around the head of Trinity Bay. These belong to the Primordial Silurian group. The Lower Silurian rocks have a large development, and in them the metallic ores occur which seem destined to render the island a great mining centre. The Lauzon division of the Quebec group, which is the true metalliferous zone of North America, has an immense spread in the island. It consists of serpentine rocks associated with dolomites, diorites, &c., and is well known throughout North America to be usually more or less metalliferous. The Newfoundland rocks are no exception, but give evidence of being rich in metallic ores. The Middle Silurian division of rocks is also widely spread; and the most fertile belts of land and the most valuable lands are nearly all situated on the country occupied by this formation. The great valley of the Exploits and Victoria rivers, the valley of the Gander and several smaller tracts belong to it.

The Carboniferous series occupies a large area on the western side of the island, in the neighborhood of Bay St George and Grand Lake. There is also a wider spread of the same series along the valley of the Humber and round the shores of Deer Lake and the eastern half of Grand Lake, and as far as Sandy Lake. "Coal," says Mr J. P. Howley, F.R.G.S., head of the survey, "is known to exist at several places in this series; and seams, apparently of workable thickness, judging from their out-crops, occur on the Middle Barachois and Robinson's Brook, in St George's Bay."

It will thus be seen that the Carboniferous series is confined to the western side, while the middle, eastern and southern portions are occupied by Silurian, Huronian and Laurentian formations. From the extent to which the Lauzon division of the Quebec group, the true metalliferous zone of North America, prevails in the island, its yet undeveloped mineral wealth must be very great.

Climate.—The climate is more temperate than that of most portions of the neighbouring continent. It is but rarely, and then only for a few hours, that the thermometer sinks below zero in winter, while the summer range rarely exceeds 80° F., and for the most part does not rise above 70°. The Arctic current exerts a chilling influence along the eastern coast, but as a compensation it brings with it the enormous wealth of commercial fishes and seals which has rendered the fisheries the most productive in the world. The Gulf Stream, while it creates fogs, modifies the cold. The salubrity of the climate is evidenced by the robust healthy appearance of the inhabitants.
Open fireplaces are sufficient to warm the houses, and free exercise in the open air is attainable at all seasons. The average mean temperature in January is 41 °F, in July it is 74 °F, and the minimum 37 °F. Of the minimum barometer is 29.37 in. The average rainfall is 58-30 in. Winter sets in, as a rule, in the beginning of December and lasts through the year, generally the first snow falling in the month of April, and the last not until early November. There is nothing in the climate to interfere with agriculture. Tornadoes are unknown, and thunderstorms are very rare. Fogs, of which so much is said in connexion with the coast line, are confined to the shores and bays of the south-eastern and southern coasts.

Flora.—Among the well-known wild animals indigenous to the colony are the caribou, black-throated blue warbler, kingfisher, and the great auk. The caribou are found in all the districts, and migrate regularly between the south-eastern and north-western portions of the island. The winter months are passed in the south, where "browse" is plentiful, and the snow is too deep to prevent them from reaching the lichens on the lower grounds. In March they begin their spring migration to the barrens and mountains of the north-west. In May or June they bring forth their young. As soon as the frost of October begins to nip the vegetation a turn south. September and October are the best months for stalking. In addition to the caribou, the wolf and black bear are found in the interior; the fox (black, silver, grey and red), beaver, otter, arctic hare, snowshoe hare, musquash or musk-rat are abundant. The famous Newfoundland dog is still to be met with, but good specimens are rare, and he appears to thrive better elsewhere. The common dogs are a degenerate race. There are very few inhabitants on the island, and many species of birds in the island, most of them being migratory. Among them may be enumerated the eagle, hawk, owl, woodpecker, swallow, kingfisher, finch, robin, thrush, partridge, snow-bunting, and warblers and swallows in great variety, finches, ravens, jays. The ptarmigan or willow grouse is very abundant, and is the finest game bird in the island. The rock ptarmigan is found in the highest and most barren mountain ridges. The American golden plover, various species of sandpipers and curlews, the brent goose, ducks, petrels, gulls and the great northern diver are met with everywhere. The great auk, now extinct, was once found in myriads around the island. The puffin and loon, and razor-beak auk are abundant. No venomous reptiles occur. Frogs have been introduced and thrive well. Of molluscan animals the common squid, a cephalopod about 6 or 7 in. in length, visits the coasts in immense shoals in August and September, and supplies a valuable bait. A gigantic species of cephalopod was discovered in 1873, which excited much interest among naturalists: the body varies from 7 to 15 ft. in length, with a circumference of 5 ft. to 10 ft.; the head, arms and tentacles (two) being from 24 to 40 ft. in length, and covered with suckers at their extremities; the other eight arms vary from 6 to 10 ft., and on the underside are entirely covered with suckers. Professor Vartholomew, of Trinity College, Dublin, has named this species—One he named Architeuthis Harveyi, after the discoverer, and the other Architeuthis monachus. Of the birds, juniper and larch of the forests of the interior furnish ample materials for a large timber trade as well as for shipbuilding purposes. The white pine grows to the height of 70 or 80 ft. in some places, and is 3 1/2 ft. in diameter. The yellow birch is found in the most remote parts, and in 1906–1907 a London company, with Lord Northcliffe (of the Daily Mail) at its head, acquired large tracts for this purpose, and operations were begun in 1910. The mountain ash, balsam, maple and aspen thrive well. Evergreens are in great variety. The berry-bearing plants cover large areas of the island. The maidenhair or capillare yields a saccharine matter which is luciscent sweet. Flowering plants and ferns are in vast varieties, and wild grasses and clover luxuriant. Garden vegetables of all kinds, and strawberries, raspberries, gooseberries, currants, &c., thrive well.

Population.—By the earliest computation made in 1654 the number of permanent inhabitants in the island was 1750. Twenty-six years later the resident population was stated to be 2580; in 1763, 7000; in 1804, 20,000. In 1832 the population had risen to 60,000; in 1836 to 75,004; in 1857, 124,288; and in 1874, 161,374. By the census of 1901 the total population of Newfoundland was 217,037, that of Labrador being 3947. The capital, St. John's, which contains a population of 5,000 in 1835, has in 1891 31,884. The rate of increase for the island for the ten years ending in 1901 is 3.7%, as compared with the rate of increase 1874–1884, which was 22.30%. Certain districts such as Carbonear, Harbour Grace and Ferryland, as well as Labrador, showed a steady decline, the largest increase being in St. George's district and on the west coast, where it is not less than 40%.
October, when the cod fishery closes. The cod are taken by the hand line, or herring, and are bought for the most part by the bulk. Newfoundland exports cod to Brazil, Spain, Portugal, Italy, Great Britain, Greece, the West Indies and the United States. Brazil and Spain are the largest consumers.

Cod are of great importance. The industry was begun about 1740, when the value of the seal oil exports was £1000. In 1904-1905 seal skins and seal oil to the value of £370,261 and £357,000 respectively were exported, and the price of cod at St. John’s £90 to £125. This shows a considerable falling off. The number of men employed is about 4000. Steamers were first used in 1863. They are from 350 to 500 tons burden, most of them carrying from 200 to 250 tons fish, and maintained by an English captain and his wife. In one instance 41,900 seals were brought in by a single steamer, the “Neptune,” the weight being 874 tons and the value £135,750. In bad years the catch may not exceed 200,000-in 1877 the catch was nil. On sealing voyage until the 12th of March, and no seal may be killed before the 1st of March. The young seals are born on the ice between the 1st and 15th of March, and become fit for slaughter about six weeks after they are born. If the weather is bad, they are killed as they are born. There is a well-known rule that “wherever the young seal appears, there the old seal will be found.”

There is a wealth of seals. After the bones and blubber have been removed, the seals are not valued by the natives. In 1904-1905 the value of seal blubber was £80,000, of seal oil £125,000, and of seal meat only £2000.

Of more recent origin is the lobster fishery, their packing for export having begun in 1873. By 1888 the value of the lobster export had risen to £358,007. 1904-1905, while the catch had somewhat diminished as compared with 1895, the value had increased to £512,662. A vigorous effort has been made to establish the herring fishery on a scale commensurate with the abundance of the fish in these waters. In 1885 the total quantity exported was 32,042 barrels, with a value of £91,357. In 1905 there were 175,633 barrels, valued at £722,329. The cod-fishing industry began in the Bay of Islands, Placentia, Bay St. George and Bay of Islands, and the whole coast of Labrador, which furnishes the finest kind of herring. Besides the herring exported, at least £150,000 worth is sold to the French and Americans at Baltimore.

The export of preserved salmon, of which the island has an abundant supply, does not form a large or important item, seldom reaching £50,000. Salmon is taken for the most part in nets in the coves and bays and at the mouths of rivers. The season for taking is brief, six or seven weeks, beginning at the end of May. The proper preservation of the salmon waters has been for generations neglected, and reckless practices had flagrantly to exterminate the fish.

In 1888, however, a fisheries commission was appointed, and river wardens were charged with the stringent enforcement of the new laws. The best salmon fisheries are in Bonavista Bay, Gander and St. John’s islands and in the west coast.

Mackerel formerly frequented the Newfoundland coasts, but disappeared about the middle of the 19th century; and few halibut or haddock are caught. Sea trout and brook trout, however, abound, and latterly Loch Leven and Californian rainbow trout have been introduced with success.

The most extraordinary increase concerns the whaling industry. Before 1734 the cod were the only fish caught. Thereafter the whale fishery was carried on, but it then suddenly ceased and has only recently been revived. The revival is due to the invention of a harpoon-gun which kills the whale effectually and with dispatch. The whaling industry had four factories at the first, and the present factory is the only one remaining in the province. The oil is distilled, the bone and oil. While in 1829 the value of the oil reached only £700 and the bone £100, a decade later the values were £384,062 and £34,835 respectively; and in 1905 the net value of the oil was £630,000, the bone £240,000, and the whale teeth £80,000, a sum representing the cost of manufacturing the carcases into a fine guano, and utilizes the by-products, thus adding £600,000 to the industry.

On the whole the aggregate value of the Newfoundland fisheries for 1900-1905 was nearly £2,000,000 sterling, including the fish consumed in the colony.

Agriculture.—Until recent years little attention has been paid to agriculture, the belief being current that the interior of the island was a desert. The reports of the geological survey dispelled this fiction, it being conclusively shown that out of the 28,000 sq. m. of dry land over one-sixth or 7000 sq. m. is available under suitable conditions for cultivation. The better lands are situated in the Codroy valley, which is rich in alluvial soil. That in the Bay St. George district is very fertile, and in the Humber valley, Exploits valley and elsewhere many thousands of farmers could be established if the British Government adopted a liberal policy in land cultivation. In 1901, 215,579 acres were occupied, of which 55,833 acres were actually under cultivation, producing chiefly hay, oats, potatoes and beans. There has been a notable increase, especially in sheep. Newfoundland seems especially adapted for a sheep-grazing country.

Mining.—Not until a comparatively recent date was Newfoundland known for its mineral deposits of value for general practical cultivation. In 1901, 215,579 acres were occupied, of which 55,833 acres were actually under cultivation, producing chiefly hay, oats, potatoes and beans. There has been a notable increase, especially in sheep. America in this period showed an increase of 128.5% and that with Canada 76.1%.

Rocks and Railways.—Railways play a unique part in the modern history of the island. Not until 1825 was the first road made; it was 9 m. in length, from St John’s to Portugal Cove. When representative government was established in 1853 an annual grant was voted for roads and bridges, and of late years not less than $100,000 per annum has been expended on this head. There are now over 2,500 m. of postal roads, and over 2000 of district roads. In 1880 after much agitation the legislature finally agreed to raise a loan of £1,000,000 for the construction of a railway from St John’s to Halls’s Bay, with branches to Brigus and Harbour Grace, the distance being estimated at 340 m. In November 1884 the line was completed for traffic as far as Harbour Grace. In the following year the construction of a line, 27 m. in length, from Whitbourne to Placentia, the old French capital, was begun and finished in 1888. Shortly afterwards it was decided to resume the line northwards from St John’s to Halls’s Bay (which, owing to the state of the contractors, had been discontinued) with a view ultimately to a transinsular railway. The tender of a well-known contractor, Mr R.G. Reid of Montreal, was accepted, and the work was begun in October 1890. But before the contractor had proceeded far with the Hall’s Bay line a new survey was made and another route determined for the proposed transinsular railway, westwards from the valley of the Exploits, which was regarded as much more favourable than the one originally contemplated. It traversed the Exploits and Humber valleys, passing through the most fertile parts of the island. The line of the Railway ran from St John’s to the west coast; hence it skirted Bay St George and the Codroy valley and terminated at Port-aux-Basques, a commodious harbour 93 m. distant from Sydney, Cape Breton. The new route was chosen, and a contract signed on the 16th of May 1893, whereby the contractor was to be paid $15,600 per mile in Newfoundland bonds, the whole line to be completed in three years. At the same time, in order to provide for the working of the line, it was agreed between the colonial government and Mr Reid that the latter should maintain and work it, as well as construct a system of telegraphs, for a period of ten years from the 1st of September 1893, at his own expense, in consideration of a “grant in fee simple to the contractor of 5000 acres of land for each one mile of mail line or branch railway to be operated.” Should the line, therefore, be 900 m. in length the land grant would be 2,500,000 acres, to be situated on each side of the railway in alternate sections of 1 or 2 m. in length with the railway, and 8 m. in depth, the colony also retaining an equal amount of land with the contractor along the route. Much hostile criticism was subsequently directed towards this arrangement. In 1898 a new proposal was made by Mr Reid, under the terms of which he undertook to work all the railways in the island for a period of fifty years, free of cost to the government, provided that, at the termination of the said period, the railways should become his own property. He was also to receive a further concession of land to the extent of 2,500,000 acres on terms similar to those contained in the former contract. Mr Reid agreed to build and run seven steamers, one in each of the large bays, and one to ply in Labrador in summer, to provide an electric street railway for St John’s, and also to pave a certain portion of the capital. The colony was to part with the telegraph system to the contractor, who was to acquire at a fixed price the government dry-dock at St John’s. On the other hand, to complete the bargain, $1,000,000 in cash was to be paid by the contractor to the government within a year after the signing of the contract. This remarkable covenant, which was afterwards characterized by Mr Chamberlin, secretary of state for the colonies, as a transaction “without parallel in the history of any country,” was nevertheless ratified by the legislature, and submitted to the governor, Sir Herbert Murray, for his approval. The governor declined to append his signature to the instrument, but upon its being referred to the imperial secretary of state, it was decided that the arrangement was one relating exclusively to the colony, and this being the case, that it would be an unwarrantable interference with the rights of a self-governing colony to disallow the measure. The Reid contract was therefore signed by Sir Herbert Murray before relinquishing his post early in 1898. Meanwhile considerable feeling had been manifested in the colony; numerous public meetings in support of the governor’s action were held; and several petitions were despatched to England; but it was not until the spring of 1899, when the colonists were forced to resign on account of the opposition which had been engendered. The general election brought a Liberal, Mr (afterwards Sir) Robert Bond, into power; and he had hardly assumed office when the contractor approached the ministry with further proposals to convert his property into a limited liability company with a capital of £5,000,000 sterling, for which proceeding the consent of the legislature was necessary, under the terms of 1898. Mr Bond refused unless a modification of the contract was agreed to. The modifications demanded were—that the telegraphs should revert to the government, and that the land grant, which included a large amount of private property, should be readjusted so as to conserve the rights of those whose holdings had been confiscated; also, that it should be optional for the colony to take over the railways at the end of fifty years by paying back the sum of $1,000,000 with interest, the amount paid by Mr Reid to the colony; and a sum to be arrived at by arbitration for all improvements that may have been made on the property within the fifty years. After considerable dispute these terms were substantially agreed to, and the conversion into a company took place.

The Discovery. John Cabot, sailing from Bristol in 1497, appears to have made landfall at Bonavista and claimed the whole country for Henry VII. Three years later Gaspar Corte-Real, ranging the North American coasts, discovered and named Conception Bay and Portugal Cove, and was appointed Portuguese governor of Terra Nova. The long series of annual trans-Atlantic expeditions followed upon the voyages of Cabot and Corte-Real, and their reports in England, Portugal and France concerning the multitude of fish in Newfoundland. For a long time it was supposed that the English fishermen did not avail themselves to any extent of these advantages until the middle of the 17th century, but this is now shown to be erroneous. Mr Prowse states that the trade during the first half of the century was both extensive and lucrative. In 1537 the little Devonshire fishing ships were unable to carry home their large catch, so “sack ships” (large merchant vessels) were employed to carry the salt cod to Spain and Portugal. An act of 1541 classifies the Newfoundland trade with the Irish, Shetland and Iceland fisheries. Hakluyt, writing in 1588, mentions that the number of vessels employed in the fishery was 400, of which only one-quarter were English, the rest being French and Spanish Basque. But in the same year, according to Anthony Parkhurst, “the English are commonly lords of the harbours where they fish and use all help in fishing if need require.” Shortly after England awoke to the importance of Cabot’s great discovery, and an attempt was made to plant a colony on the shores of the island. Sir Humphry Gilbert, provided with letters patent from Queen Elizabeth, landed in St John’s in August 1583, and formally took possession of the country in the queen’s name. The first attempt at colonizing was frustrated by the loss of Gilbert soon afterwards at sea. In 1610 James I, granted a patent to John Guy, an enterprising Bristol merchant, for a “plantation” in Newfoundland; but no marked success attended his efforts to found settlements. In 1615 Captain Richard Whithorne of Exmouth in Devonshire was despatched to Newfoundland by the British admiralty to establish order and correct abuses which had grown up among the fishermen. On his return in 1622 he wrote a “Discourse and Discovery of Newfoundland Trade,” which King James, by an order in council, caused to be distributed.
among the parishes of the kingdom "for the encouragement of adventures unto plantation there." A year after the departure of Whitbourne, Sir George Calvert, afterwards the first Lord Baltimore, obtained a patent conveying to him the lordship of the whole southern peninsula of Newfoundland, and the right of fishing in the surrounding waters. He planted a colony at Ferryland, 40 m. north of Cape Race, where he built a handsome mansion and resided with his family for many years. The French so harassed his settlement by incessant attacks that he at length abandoned it.

In 1650, or about a century and a half after its discovery, Newfoundland contained only 350 families, or less than 2000 individuals, distributed in fifteen small settlements, chiefly along the eastern shore. These constituted the resident population; but in addition there was a floating population of several thousands who frequented the shores during the summer for the sake of the fisheries, which had now attained very large dimensions. So early as 1626, 150 vessels were annually despatched from Devon and the shipowners and traders residing in the west of England sent out their ships and fishing crews early in summer to prosecute these lucrative fisheries. The fish caught were salted and dried on the shore; and on the approach of winter the fishermen re-embarked for England, carrying with them the products of their labour. Hence it became the interest of these traders and shipowners to discourage the settlement of the country. In order to retain the exclusive use of the harbours and fishing coves for their servants, and also a monopoly of the fisheries. They were also envious of the British government of the day in their project, and stringent laws were passed prohibiting settlement within 6 m. of the shore, forbidding fishermen to remain behind at the close of the fishing season, and rendering it illegal to build or repair a house without a special licence. The object of this short-sighted policy, which was persisted in for more than a century, was to preserve the island as a fishing station and the fisheries as nurseries for British seamen.

There was, however, another element which retarded the prosperity of the country. The French had early realized the immense value of the fisheries, and strove long and desperately to obtain possession of the asylum. Their constant attacks and encroachments harassed the few settlers, and rendered life and property insecure during the long wars between England and France. When at length, in 1713, the treaty of Utrecht ended hostilities, it did not deliver Newfoundland from the grasp of France, as it yielded to her the right of catching and drying fish on the western and northern sides of the island. Though no territorial rights were conferred on the French, and the sovereignty was secured to England, the practical effect was to exclude the inhabitants from the fairest half of the island.

In spite of the restrictive regulations, the number of the resident population continued to increase. The sturdy settlers clung to the soil, and combated the "adventurers" as the merchants were called, and after a lengthened conflict obtained freedom of settlement and relief from oppression. But the contest was severe and prolonged. The merchant-adventurers strenuously opposed the appointment of a governor; but at length, in 1728, the British government appointed Captain Henry Osborne first governor of Newfoundland, with a commission to establish a form of civil government. This constituted a new epoch in the history of the colony. In 1753 the fixed inhabitants had increased to 8000, while 5000 more were summer residents who returned home each winter. In 1765 the coast of Labrador, from Hudson's Strait to the river St John opposite the west end of the island of Anticosti, was attached to the government of Newfoundland. The population in 1785 had increased to 10,000. During the wars between England and France which followed the French Revolution, Newfoundland attained great prosperity, as all competitors in the fisheries were swept from the seas, and the markets of Europe were exclusively in the hands of the merchants of the country. The value of fish trebled, wages rose to a high figure, and in 1814 no less than 7000 emigrants arrived. The population now numbered 80,000. In 1832 representative government was granted to the colony, and provision was made for education. In 1846 a terrible fire destroyed three-fourths of St John's and with it an enormous amount of property; but the city rose from its ashes improved and beautified. In 1855 the system of responsible government was inaugurated. In 1856 the first Atlantic cable was landed by Bulloch.

Unproductive fisheries, causing a widespread destitution among the working classes, marked the first eight years of the decade between 1860 and 1870. A system of able-bodied pauper relief was initiated to meet the necessities of the case but was attended with the usual demoralizing results. The necessity of extending the cultivation of the soil in order to meet the wants of the growing population was felt more and more as the pressure arising from the failure of the fisheries showed their precarious nature more sensibly. In 1864 copper ore was discovered in the north, and mining opened there to be successfully initiated. In 1869 a series of successful fisheries began which enabled the government to terminate the injurious system of able-bodied pauper relief.

In 1871 the revenue rose to $831,160. In 1873 direct steam communication with England and America was established.

By the treaty of Utrecht of 1713 a right was reserved to French subjects to catch fish and to dry them on that part of Newfoundland which stretches from Cape Bonavista to the northern part of the island and from thence coming down by the western side reaches as far as Cape Ray. By the treaty of Versailles of 1783 France renounced the fishery from Bonavista to Cape St John on the east coast, receiving in return extended rights upon the west coast as far as Cape Ray. Neither treaty purported to grant exclusive right, but there was annexed to the treaty of Versailles a declaration to the effect that "His Britannic Majesty will take the most positive measures for preventing his subjects from interrupting in any manner by their competition the fishery of the French during the temporary exercise of it which is granted to them upon the coasts of the island of Newfoundland, and he will for this purpose cause the fixed settlements which shall be opened there to be removed." Upon this declaration the French founded a claim to exclusive fishing rights within the limits named. A convention was entered into with a view to defining these rights in 1854, but it remained inoperative, the consent of the Newfoundland legislature, to which it was made subject, having been refused. Meanwhile the French government granted a bounty to the French fishermen which enabled them to undersell the colonists.

In 1884 a convention which had been arranged between the British and French governments was submitted to the colonial administration by its promoters Sir Clare Ford and Mr E. B. Pennell, C.M.G., but without obtaining the support of the Newfoundland government. In the year following, on a change of ministry in the colony, the Ford-Pennell convention was again offered to the Newfoundland legislature in a slightly amended form, but the joint committee of the colonial house of assembly and the council absolutely refused to ratify the arrangement unless the French government would consent either to annul or to amend the system of bounties paid upon French-caught fish in Newfoundland waters. At the same time, to counteract the effect of these bounties, which pressed very hardly upon the British competition, a Bait Act was framed and carried in 1886, empowering the executive to prohibit the capture in Newfoundland waters for exportation or sale of bait fishes, except under special licence to be issued by the colonial government. The consequence of this measure, were its provisions properly enforced, would be to place an embargo upon the local supply of bait requisite to the French fishermen—the so-called "metropolitan fleet"—on the Grand Banks. Upon being apprized of this enactment, the French government immediately demanded that Great Britain should deny its sanction to this Newfoundland Bait Act, and pressed their objections with such persistence as to induce Lord Salisbury
to disallow the measure. Nevertheless, the despatch of the governor, Sir William des Voeux, to the colonial secretary, Sir H. Holland, was so entirely in favour of the principle of the bill that the Newfoundland authorities became imbued with a fixed determination to urge forward the measure for imperial acceptance. In 1887, therefore, a delegation, consisting of Sir Robert Thorburn, the premier, and Sir Ambrose Shea, visited England at a moment most propitious for obtaining the sympathy and support of the imperial government and the press and people of the mother country, it being the jubilee year of Queen Victoria’s accession to the throne. A conference of colonial premiers was one of the notable events distinguishing that happy period, and the subject was argued before the conference at considerable length. The claim set up by the senior colony “to control and legislate for her own fisheries” met with general approval, the single dissentient being the representative of Canada, who feared that Canadian fishermen would suffer under the bill. When an assurance was tendered that Canada’s fishermen would be placed upon the same footing with those of Newfoundland, the British government somewhat reluctantly sanctioned the Bait Act. The stipulation was made, however, that it should not be enforced until the spring following (1888). In the meantime the chargrin of the French Foreign Office at the failure of the Ford-Pennell negotiations, and the hostile attitude taken up by the Newfoundlanders in what they deemed to be the conservation of their interests, induced M. de Freycinet to devise retaliatory measures. Instructions were issued “to seize and confiscate all instruments of fishing belonging to foreigners resident or otherwise, who shall fish on that part of the coast which is reserved to our use.” Lord Rosebery, then foreign secretary, protested to the French ambassador against the spirit of these instructions, which he insisted were in direct contravention of the treaty, inasmuch as they ignored the concurrent as well as those sovereign rights of Great Britain which France solemnly undertook by the treaties never to question or dispute. Nor were other opportunities soon wanting to the French to revert severely upon the Newfoundland authorities for their passage of the Bait Act, as well as to repair in large measure the injury which that act promised to inflict upon the French industry. About 1874 a Nova Scotian named Rumkey had established the first factory for the canning of lobsters on the west coast of Newfoundland. This concern proved profitable, and others sprang up, until, at the close of the season of 1887, Captain Campbell, R.N., reported that twenty-six factories were at work, employing about 1,100 hands. It was at that time understood that this was an industry which, by the very nature of the process and the permanent shore structure it involved, the French were disqualified from pursuing. So clearly was this recognized that in 1886, when Commander Browne of H.M.S. “Mallard” reported the existence of a French lobster factory at Port-aux-Choix, a substantially-built structure, roofed with corrugated iron, the French authorities conceded that the establishment was in violation of the treaties, and issued orders for its removal. But this conciliatory policy was of brief duration. The year of the Bait Act’s first successful application was marked by the stoppage, by order of the French government, of Messrs Murphy and Andrew’s lobster factory, and by their contention that the lobster-canning industry formed a part of the privileges conceded under the treaties to the French, whose participation by the British fishermen would be forcibly resisted.

An exchange of notes took place between Lord Salisbury and M. Waddington, the French ambassador, in which the latter expressed an opinion which evoked a spirited protest on the part of the British Foreign Office. “France,” it was then declared, “preserved the exclusive right of fishing she always possessed. This right of France to the coast of Newfoundland reserved to her fishermen is only a part of her ancient sovereignty over the island which she retained in ceding the soil to England, and which she has never weakened or alienated.” This claim of the French to an exclusive fishery was held to be wholly untenable, and their classification of the lobster-canning and canning industry as amongst the “fishing” privileges granted them by the treaty was denounced as contrary to both letter and spirit of that instrument. Notwithstanding this, the French agents on the treaty shore clamoured for the removal of several of the British factories, which (it was declared) interfered with the exclusive fishing rights of the French. The French government also voted (1888) a special bounty for the establishment of lobster factories by their subjects on the treaty coast. Pending a settlement, the British foreign office deemed it expedient, therefore, to issue to their naval officers a modus vivendi, sanctioned by the French, which were in existence on the 1st of July 1889, were to continue for the present. Instantly the colony took alarm, and a deputation consisting of the island’s leading men was sent to England to protest against both the principle and practice of such an arrangement. On their return they learnt that it was the intention of the imperial government to re-enact verbatim et literatim the act for the enforcement of the treaties which had expired fifty-nine years previously. To prevent such an occurrence, delegates from both parties in Newfoundland visited London in April 1891, and, appearing at the bar of the House of Lords, protested that if the measure which was then on the eve of being introduced into that body were withdrawn, a temporary measure would be passed by the Newfoundland legislature which would answer the same purpose of enabling Great Britain to carry out her treaty obligations with France. The hope then generally entertained was that the whole question of French rights in the colony would soon be the subject of definite negotiations looking to their total extinguishment. That hope was, however, not speedily realized. For a number of years the Modus Vivendi Act was annually passed by the legislature, each year under protest, the conviction gaining strength in the colony that the imperial government was averse from renewing negotiations with France.

In 1898 the secretary of state, Mr Chamberlain, yielding to the urgent request of the senior colony, despatched a commission consisting of Sir J. Bramston and Sir James Erskine, with Lord Westmeath as secretary, on a tour of investigation along the treaty shore; and the report which the royal commissioners made (though not published) touched all points of the unhappy dispute. Again, in 1901, on a suggestion put forward by the colony, Mr Chamberlain summoned Sir Robert Bond, the Newfoundland premier, and a colleague, Sir E. P. Morris, to London, for a new conference on the French shore question, in which Lord Lansdowne, the foreign secretary, participated. Nothing coming of this, the Modus Vivendi Act continued to be passed annually. In 1909 a fresh attempt was made to effect a settlement, but the negotiations were again unsuccessful, as the colony declined to make concessions in regard to the sale of baih unless the French system of bounties on the sale of fish by their citizens were abandoned or at least modified in important
particulars. Later in the same year negotiations were begun between the British and French governments for a general treaty, in which all outstanding matters of dispute between the two countries should be for ever settled. As regards Newfoundland, the discussion of the French fishery question on the basis of arrangement in the matter of bate and bounties having proved unavailing, it was proposed not to persist further in it, but to put before the French government an arrangement which would terminate the rights of French fishermen to land and dry their fish on the shores of the island, but leave a concurrent right of fishery, the regulation and policing of which would be in the manner provided in the North Sea Fishery Convention of 1881 and the convention of 1887.

On the 8th of April 1904 the Lansdowne-Cambon Convention was signed, which effected a final settlement of the French shore question. For the total abandonment of the French rights compensation was clearly not only due to the individuals actually engaged in the fishing industry, but to the French nation at large. Territorial concessions were therefore made consisting of a modification of the Anglo-French fisheries in the Niger and Lake Chad district, and a re-arrangement of the Gambia-Senegambia line, giving Yarbatenda to Senegambia. The Los Islands opposite Konakry Island were likewise ceded to France. Provision was made for the reciprocal recognition, on the convention coming into force, of a British consul at St Pierre and a French consul at St John's. Claims for indemnity were duly submitted to an arbitral tribunal, composed of an officer of each nation; and at length what is known as the Lyttelton Award, was made as follows:

| General award for French rights | $255,750 |
| Loss of occupation | 226,813 |
| Effects left by the French on treaty coast | 28,936 |

So far as concerned the French, an end was thus put to a situation on the treaty shore, which for nearly two hundred years had given rise to difficulties and anxieties.

Scarce, however, had a year elapsed from the signing of the convention, when another international disagreement connected with the fisheries assumed grave importance. There had long been intense dissatisfaction in the colony over the attitude of the American government and American fishermen towards the British. The action of the American Senate in rejecting the Bond-Hay treaty negotiated in 1902 stirred the colonial government to retaliatory measures. By virtue of the treaty of 1818 American fishermen enjoyed the following rights: (1) to take fish of every kind on that part of the southern coast of Newfoundland which extends from Cape Ray to Ramea Islands; (2) to take fish of every kind on the western and northern coasts of Newfoundland from the said Cape Ray to the Quirpon Islands; and (3) to take fish of every kind on the coasts, bays, harbours and creeks from Mount Jolly to the southern coast of Labrador, to and through the straits of Belle Isle, and thence northward indefinitely as far as the coast. Subject to these limitations American fishermen have a right in common with British fishermen to prosecute their industry within those areas.

The foregoing embraces the whole of their fishing privileges. Every other right that they ever possessed they renounced under the treaty in the following language: "The United States hereby renounce for ever any liberty heretofore enjoyed or claimed by the inhabitants thereof, to take, dry or cure fish on or within the three marine miles of any of the coasts, bays, creeks or harbours of His Britannic Majesty's dominions in America, or the New-England coast, the coast of Maine, or any other coast of the New-England coast, however far extended, or of any other portion of the coast. This renunciation contained but one qualification: "that American fishermen shall be permitted to enter such bays or harbours for the purpose of shelter and of repairing damages therein, of purchasing wood, and of obtaining water and for no other purpose whatever."

Under the Newfoundland Foreign Fishing Vessels Act of 1893 the governor in council was authorized to issue licences to foreign fishing vessels, enabling them to enter any port on the coast of the island to purchase bait, ice, supplies and outfits for the fishery, and to ship crews. In 1905 this act was repealed and another passed by the colonial legislature imposing certain restrictions on American vessels, and a further more stringent act in 1906, preventing Newfoundlanders from joining American vessels. These acts were resisted by the American government, which, through Mr Secretary Root, called upon the British government to allow such interferences on the part of the Newfoundland legislature. Lord Elgin's reply was to suggest a modus vivendi, and during the following winter the two parties arrived at an agreement, which at the colony's energetic protest, a modus vivendi was agreed to in October 1906, whereby the Foreign Fishing Vessels Act of 1906 was held in abeyance, and the act of 1905 was held not to apply to American fishing vessels, and light dues were waived, while on the other hand American vessels were to report at the custom house on entry for clearance, and their fishermen were to comply with colonial fishery regulations. As regards Sunday fishing by the Americans, which was an important colonial grievance, the American government consented to waive it, if the use of purse seines was abated. All American vessels engaged on the coast were considered to be an interference with the internal affairs of the colony and great public indignation was aroused. Retaliatory measures were resolved upon, Newfoundland fishermen being declared liable to fine and imprisonment for selling bait to the Americans or for joining American vessels. The legislature voted an address to the imperial government, protesting against the modus vivendi, and this was carried to England in 1907 by Sir Robert Bond, the premier of the colony, but without avail. The matter was referred to the Hague tribunal for arbitration, and pending this the modus vivendi (agreed to in 1906) continued in force.

The tribunal gave its award in September 1908, the two main points at issue being decided as follows: (a) Great Britain had the right to make regulations as to the fisheries without the consent of the United States, subject to the provisions of the treaty of 1818. (b) The "three-mile limit" in bays (subject to special judgment in individual cases) was to be taken from a line across the bay at the point, nearest the entrance, where a width of ten miles is not exceeded. Among other provisions it was decided that American vessels might employ foreign hands (but these received no benefit under the treaty) so that the fishermen were required to report to customs houses if facilities to do so existed.

Commerce received a shock, but derived a salutary lesson from bank failures which occurred in December 1894. The Union and Commercial banks suspended payment, followed by the suspension of three other banks. The insolvency act was replaced by the Canadian Bank Act. The Union Bank was reorganized in 1895. Many persons lost money, but the financial panic soon passed. The colony was able to meet its obligations, and the financial condition was now so sound that the government was able to wisely to reduce the expenditure of the public service. A grant of $1,000,000 was received from the Imperial government in 1898, a deposit of $1,000,000 was secured from the Yukon, and the amount of debts was reduced to $2,000,000. The government was able to retire its first mortgage in 1902.

In politics, apart from the matters already alluded to, there occurred in 1893 the appointment of Mr. Dufresne as Minister of Finance in the Whiteway government. Mr. Dufresne was vigorous in his policy of economy, and in reducing the government's expenditure. The chief difficulty arose as to the acknowledgment of the Imperial Reserves Act under which they were enrolled. The colony was asked to bear the cost; its refusal was followed (1902) by the enactment of
NEW GLARUS—NEW GUINEA

NEW GRANDA (Span. Nueva Granada), the title under Spanish colonial administration of that part of South America now known as the republic of Colombia, which at one time was extended to include Venezuela and Ecuador. It also was for a time the title of the united territories of Panama and Colombia under republican auspices. The Bogotá plateau, then inhabited by a partly civilised Indian nation bonded to the Spaniards as "men", was invaded from the Caribbean coast and conquered in 1537 by Gonzalo Jiménez de Quesada, who, in honour of his native province, called it the "Nuevo Reino de Granada." The title at first applied only to the plateau regions of Colombia, as the coast provinces had been previously occupied and named. In 1550 an "audiencia real" under the viceroyalty of Peru was established at Santa Fé (Bogotá), but in 1564 this isolated group of Spanish settlements was transformed into a presidency. In 1718, owing to the unmanageable size of the viceroyalty of Peru, it was divided and a new viceroyalty was created from the various provinces lying in the north-western angle of the continent, extending from Tumbez northward to the northern limits of Panama, and eastward to the Orinoco, to which the name of Nueva Granada was given. The first viceroy was Pedro de Guzman y Guerrero, but his successor, Jorge Villalonga, resumed the title of president, and it was not until 1739 that the title of viceroy was definitely established. The new viceroyalty included the provinces of Tierra Firma (now the republic of Colombia, with the exception of Chibchas, or Mayas, and the Guayais, which were included in Venezuela); Cartagena, Santa Marta, Rio Hacha, Antioquia, Pamploa, Socorro, Tuna, Santa Fé, Neiva, Mariquita, Popayan and Pasto (now included in Colombia); and Quito, Cuenca and Guayaquil (now included in Ecuador). In 1777 the provinces of Maracaibo, Caracas, Cumana and Guayaquil were detached from the viceroyalty to form the captaincy-general of Caracas; otherwise it remained as above until the termination of Spanish rule in South America.

For the republic of Colombia (1819-1830), the republic of New Granada (1831-1861), the United States of Colombia (1861-1886), and the republic of Colombia (1886 to date), see COLOMBIA.

NEW GUINEA, the largest island (excluding Australia) in the world, lying between the equator and 15° S. and 150° 50' and 151° 30' E., separated from Australia by Torres Strait and having the Arafura Sea on the south-west. It is divided politically between Britain (south-east), Germany (north-east) and Holland (west), the Dutch territory occupying about 48.6% of the whole area, the German 26.5% and the British Territory of Papua 23.1%. The total area is estimated to be 312,325 sq. m. New Guinea was probably in Miocene times, if not later, united to the northern part of Queensland. The deeply indented shore of the Gulf of Papua forms the boundary of the subside area between the two countries, and from it the land stretches out for 200 to 300 m. north and west on both sides of the Fly river in vast plains, little elevated above sea-level. From Cape Buru westwards precipitous limestone cliffs, several hundred feet high, face the sea and rise into forest-clad mountains behind. The northern extremity of New Guinea is all but severed from the mainland by the deep MacCluer Inlet, running eastwards towards Goroka, and divided from the south-eastern coast by the Geelvink Bay. The south-east coast is more regular than the south-western. Off its coast-line, on the parallel of 6° S., lies the vast Biamarck Archipelago, of which New Pomerania (Neu Pommern) is the most important member; and, on the parallel of 10°, the d'Entrecasteaux Islands, with the Marshall Bennett group to their north-east; while stretching out from the south-east promontory of the mainland is the Louisiade Archipelago. The Great Barrier Reef of Australia can be traced more or less continuously round the Gulf of Papua and along the south-east coast to the extremity of the Louisiades. In a general way it may be said that on the west coast of New Guinea, from Cape Buru to the Louisiades, the sea is shallow, while on its steep eastern side the water close in-shore is often too deep
for safe anchorage. The islands on the southern margin of the Louisiade Archipelago are raised coral reefs, but the majority are mountainous, rarely, however, exceeding 3000 ft.; all of them are richly forested, but of little agricultural value. The volcanic d'Entrecasteaux Islands are mostly larger, more elevated (the highest being 3000 ft.), and stand in deeper water than the Louisiade group. To the east of Kiriwina (Trobriand) lies a small group of uniquely formed islets, each of which is completely surrounded by a steep forest-clad marginal rampart of coral 300 to 400 ft. high, concealing a depressed inhabited central plateau.

Starting in the southern extremity of New Guinea from an abrupt face some 3000 ft. high, and traversing its centre nearly parallel to both coasts, run high ranges of mountains, which, if not continuous, merge into each other in the same general direction. The Owen Stanley range—its highest summit, named by Huxley, in 1850, Mount Owen Stanley, 13,120 ft.—the Albert Victor Mountains, the Sir Arthur Gordon range, and the Bismarck Mountains form a backbone united probably with the Snelieu (Snowy) Mts., where perpetual snow was found by Dr. Lorentz in 1909 at 14,635 ft., and the height of Mt. Wilhelmina was fixed at 15,580 ft. This height may be exceeded by Mt. Carstensz. Other ranges, mostly of lower altitude, run parallel mainly to the east and west coasts. The most important and best-known rivers are the Amberno, in the north, discharging by a wide delta at Point d'Urville; the Kaiserin Augusta, which, rising in the Charles Louis range, and entering the Pacific near Cape della Torre, is navigable by ocean steamers for 180 m.; the Otilien, a river of great length, which discharges into the sea a short distance south of the last named; and the Mambare, navigable by steam-launch for 50 m. which drains the eastern aspect of Waggororo Mountains and enters the sea near the Anglo-German boundary. Below 8° S. the narrowness of the country precludes the existence of any very important rivers on either coast. The Purari, however, whose delta is 20 m. long by 20 broad, is navigable for 120 m. by steam-launch, while the Fly has been traversed by the same means for 500 and by a whale-boat for over 600 m. The latter drains an enormous tract of country, which is so little elevated above the sea-level that it can never be of any agricultural or commercial value. West of 142° E. the geographical features of the coast, except in the region of MacCluer Inlet and Geelvink Bay, are very little known, and those of the interior even less.

**Geology.**—The geology of British New Guinea is best known from the report of A. Gibb Mainland (Ann. Rep., British New Guinea, 1891–1893, Fort. Papers, Queensland, 1893, C.A. 1895, with 3 maps and 3 plates; bibliography, p. 85), which shows that the axis of the territory is a high range, composed of slates and schists of undetermined age, with intrusive plutonic rocks. The district around Port Glasgow, on the south coast of the eastern peninsula, are the Boirotor limestones, also of unknown age; they are lead-coloured, brecciated limestones with interbedded dolerites. Some Cretaceous or Upper Jurassic rocks occur in the basin of the Fly river. The Port Moresby beds are Cainozoic. They are highly inclined, and occupy a large range of country along the south coast, and include the Macgillivray Range, to the north-east of Beagle Bay. They are marine and probably Miocene; and range up to the height of 800 ft. above the sea, approximately the same limit as in Victoria. The Kevori griss, and the raised coral reefs are upper Cainozoic, and perhaps Pleistocene; but the reefs occur inland to a height of 2000 ft. and their range back in time has not been fixed. The volcanic series include the rhyolite of Nell Island, some obsidian, and the sheets of basalts which form the Cloudy Mountains, Mount Mountau and Mount Trafalgar (an active volcano), and also cover wide areas to the south and west of the Owen Stanley Range. Most of western British New Guinea consists of recent superficial deposits in the basin of the Fly river. The Louisiade and the d'Entrecasteaux Islands consist of the same slates and schists as form the main axis of the eastern peninsula, and they are auriferous. The geology of the rest of New Guinea is imperfectly known. It appears to consist in the main of a continuation of an axis of old schists and slates, with granite intrusions, and flanked by coastal plains with Cretaceous or Jurassic, and Miocene beds, with Pleistocene sands and clays and volcanic rocks. In the north-west coast deposits occur. Ferguson Island clearly shows remains of extinct craters, and possesses numerous hot springs, saline lakes and solfataries depositing sulphur and alum. In Murua (Woodlark I.) are quarries of the banded quartzite from which the best stone adzes found throughout south-east New Guinea are made. In Rossel Island (Roua or Arova) occur crystalline schistose and volcanic rocks; and in Misima (St. Aignan) limestones and laves in addition. Nearly all the rivers in New Guinea yield "colours" of gold, but only in the Louisiade Archipelago has enough been discovered to constitute the district a goldfield. No auriferous reefs have been found. Black magnetic iron sand covers the shore in Milne Bay. Coal has been observed in the Purari sandstones. In the Gia river the valuable alloy omiridium has been discovered. Earthquakes are rare on the mainland, but not infrequent in Bismarck and d'Entrecasteaux archipelagoes.

**Climate.**—Since the mountains as a rule traverse the island parallel to its coasts, the eastern shores have far less rain than the western. The amount which falls, chiefly at night, varies from 30 in. on some parts of the coast to 130 at others, and to a far greater but unknown amount in the mountains. Throughout the dry or cool season the wind blows steadily and almost uninterruptedly (except for an hour or so forenoon and afternoon) from the south-east. The temperature
has an extreme range of from 72° to 95° F., with a mean of about 89°. At an elevation of 3000 ft. the climate is pleasantly cool; at 1500 ft. there is a pleasant rapidity, with bright sunshine. The sun. No snow is known certainly to fall, though it is alleged to have been seen from the sea lying on the summits of the Charles Louis range. Fever is very prevalent on the coast, and is said, in some instances, to be incurable. Though generally a mild character, it is persistently recurrent, and slowly saps and wears out the constitution; too often it is virulent and rapidly fatal. The flora includes representatives of the Australian and New Guinea subtropical. Monotremes (2 species) and marsupials (4 families and 44 species) predominate, but are not abundant. Among the latter genera, Distichurus and Dorsopas are peculiarly abundant in the Papuan peninsula. The butterfly fauna (of which Chiruwony is a peculiar genus), a few squirls, and a considerable number of Chiroptera (bats) inhabit the country. The birds are also numerous, and characteristic; many of its birds. The most recent lists record over 500 species as found in the Papuan area, and of these between 50 and 60 genera are peculiar to it. The birds of paradise, which are confined to the sub-region, give special celebrity to its fauna. Between 70 and 80 species have already been described, many of them the most gorgeously adorned, and others, such as the Pteridophora alberris, the most wonderful of feathered creatures. They are absent from the Louisiades, but species occur in the D'Entrecasteaux Islands which have not been seen on the mainland opposite. The zoology of the Bismarck Archipelago is little known. The species of birds so far described from these islands, 73, 74 are peculiar to it, though closely allied to Papuan forms. It contains, however, no Paradisidae. The Amphibia, to which the sea is a barrier, are almost exclusively of Australian affinities. The natural flora, which is of European origin, consisting of the Fly river, a chelion peculiar to New Guinea, is remarkable in having its nearest affinities (as have the Papuan tortoises) with South American species. Of the lizards, 3 of the 6 species of Varanus, Geckonidae, 16, 10 Scincidae, etc., 18, and 8 out of the 11 Agamidae are peculiar. Salmonanders, toads and frogs are numerous, and crocodiles abound. Only 4 genera and 5 species of snakes are peculiar to New Guinea, but some, them poisonous, interfide. moths and bees are very abundant, the former being remarkable for their size and splendid coloration; but these groups have not been investigated exhaustively enough to afford a correct idea of their affinities. In the list of birds, the list of families is already known is long, it represents only a fraction of the species remaining to be discovered. The land molluscs show relationship with those of the other parts of the Malay Peninsula, the Malayans, and the Pacific islands.

Flora.—Most of the foreshores of New Guinea are eucalyptus dotted grasslands; in the interior dense forests prevail to a height of many thousand feet. Vast tracts of the country have been, however, deforested by fire, and these are covered by the tall ineradicable grass, Imperata arundinacea. So far the highest altitudes yet been reached, and it is likely that those will be by means of the mountains in Kaiser Wilhelms Land, but of the flora of the highest range of all—the Charles Louis mountains—nothing is known. There are many species of the tropical rain-forests of the large and many forms have here their centre, and have spread hence into Australia and the Pacific islands.

The New Guinea flora includes representatives of the Papuan, Australian and Polynesian forms. There are, according to Müller, twice as many palms known from New Guinea as from Australia and New Holland; besides 1500 species. The flora is characterized by its rhododendrons, pines (Araucaria and Libocedrus), and palm, by numerous superb species of Agave (Erichaeeae), and on the summits by an extraordinary association of species characteristically European (Rubus, Rhamnus, Centaurea, Aspidium), Himalayan, New Zealandian (Veronica), Antarctic and South American (Drymuss, Libocedrus). Good pasture grasses are numerous, but pasture lands are limited. The usual tropical food-plants are cultivated. Tobacco has been found growing in the interior, and may be indigenous, as in some districts the Kava pepper (Piper methysticum). At Darey a cotton plant (G. vitifolium) grows wild, and is a very important cultivated species.

Natives.—So large an area of New Guinea remains unexplored that it is impossible, except approximately, to state the number of its inhabitants, but probably 600,000 is under rather than over the mark. The New Guinea peoples show general differences, differing greatly in feature, colour and language. Ethnically they belong as a whole to the Melanesian division of the Indo-Pacific races. The New Guinea tribes range from the lowlands to the coast, and are found here in their greatest racial purity and occupy practically the whole island except its eastern extremity. The New Guinea tribes are usually of a negroid type with fine physique, but in the Arfak mountains in the north-west the races differ considerably. On the north coasts and adjacent islands, the very degraded and stunted Karons are found, with hardly the elements of social organization (primarily based on family and village life), and are practically aboriginalized, with foreign elements), and resembling the Aetas or Negritos of the Philippine Islands. In the interior of New Guinea the kindred tribes in the Malay Archipelago. On the banks of the Fly river d'Albertis observed at least two widely differing types, those on its upper course bearing some resemblance to the tribes of the eastern coast. Here, wedged in among the ruder Papuans, who reappear at the extremity of the peninsula, a very different-looking people, a high type, appears, neither aboriginalized nor mixed, arguing from appearance, language and customs, assert to be a branch of the fair Polynesian race. But they are obviously of mixed blood. On the west coast there is a smaller civilization due to intermarriage with Malays and Bugis, who have settled at various points, and carry in their trade the district, a mixture of the inhabitants, some of which, while the coast population is Malay or mixed, that of the interior is identical with that of the Papuans. The culture of the Papuans. The frequent hostility and mistrust of strangers are partly due to slave-hunting raids and ill-treatment by traders, but the different tribes vary in their wants, with the exception of the Manarines who are in the interior of New Guinea. At Humboldt Bay the people are ready to trade, as are the tribes at Astrolabe Bay; here the Russian Miklucho Maclay lived for some time, and was favourably impressed by the natives. Still further east, the plateau of the Finisterre ranges are highly cultivated and artificially irrigated by a comparatively fair people. In the east coast they have introduced the Papuan dog. The Marianne Strats tribes much wilder than those farther west, naked and painted, swarm like monkeys in the trees, the stems of which are submerged at high tide. But the Torres Straits islanders are eminently peaceful, and it is probably that they were the first in the list. It appears that the Kei and Aru Islands Papuans form ordely Christian communities. The people of the south-east peninsula are generally far from ferocious. Englishmen, wandering inland and losing their way, have been found and brought back to them. Their manners are more courteous, their women better treated, than is usual with Papuans, but they show perhaps less interest in European manners. Their children, in the mission schools, show much intelligence.

Exploration and Annexion.—Though probably sighted by Antonio d'Abreu, 1511, New Guinea was apparently first visited either by the Portuguese Don Jorge de Meneses, driven on his way from Goa to Ternate in 1526 to take shelter at "Isla Versaja" (which has been identified with Warsia, a place on the N.W. coast, but may possibly be the island of Waigiu), or by the Spanish Alvaro de Saavedra two years later. The name of "New Guinea" was probably given by Ortiz de Retes, or Roda, who in 1546 first laid down several points along the north coast. In the same and the two following centuries, though the coast was visited by Spanish, English, Dutch and French explorers, nothing was recorded until in 1641, 1662, 1667, and 1673, the coast was visited by English and Jacob Lemaire, Abel Tasman, William Dampier, L. v. de Torres, L. A. de Bougainville and James Cook, little additional knowledge was gained. This was due first to the difficulties of the navigation, next to the exclusiveness of the Dutch, who, holding the Spice Islands, prevented all access to places east of them, and lastly to the stream of enterprise being latterly diverted to the more temperate regions farther south. The Dutch barrier was broken down by the arrival of Dampier and other "interlopers" from the east, and of emigrants from the (English) East India Company in search of spice-bearing lands. The voyage of Thomas Forrest (1774) in the "Tartar galley" of 10 tons, and his account of New Guinea (Yvogue to New Guinea and the Moluccas, London, 1780), are still full of interest. New Guinea was actually annexed in 1793 by two commanders in the East India Company's service, and the island of Manavari in Geelvink Bay was kept for some months by its troops. After the peace of 1815 Dutch surveying expeditions to the west coast became numerous, and in later times scientific explorers penetrated many of the unknown parts of Dutch New Guinea, such as captured by 1884 the settlement of Mania (1875, and 1876), and Maria d'Alberta (1871-1878). Important expeditions were those of P. van der Crab, J. E. Teissmann, J. G. Coorengel, A. J. Langeveldt van Hemert and P. Swaan, undertaken for the Netherlands Indian government 1871-1872, 1875-1876 (reports published at The Hague in 1879); and of C. B. H. von Rosenberg in the Geelvink Bay districts in 1860-1870 (report published at The Hague in 1875). Subsequently to the visits of J. A. d'Entrecasteaux (1793) and Dumont d'Urville (1827-1840), the eastern coasts were surveyed by Captains F. P. Blackwood (1839),
Owen Stanley (1848), Charles B. Yule (1864), and other British officers, including J. Moresby (1874). Among other explorers in this period the following may be mentioned: Nicholas von Miklouho Maclay in 1870, 1877 and 1879-1881, in the Astrolabe Bay district, &c.; the missionary, Rev. S. Macfarlane (1875, Fly river, &c.); about 1876-1880 the north-east coasts and adjacent islands were explored by the Rev. G. Brown and by Wilfred Powell, and in 1882 Dr Otto Finsch, whose name is well known in connexion with scientific work in New Guinea, made valuable explorations in the neighbourhood of Port Moresby and the Loluki river.

The surveys and reports of Captain Moresby in 1874 brought home to Queensland (and Australia generally) the danger possible to her commerce were the coasts opposite to Torres Strait and the entrance to the splendid waterway inside the Barrier Reef to fall into the possession of a foreign power. By authority, therefore, of Queensland, the mainland of New Guinea, opposite her shores east of the 141st meridian, was annexed to that colony in 1883. But this action was disallowed by the British government as Yule’s and Moresby’s had been. Finally, however, in 1884 a British protectorate was authoritatively proclaimed by Commodore Erskine over the region “lying between the 141st meridian eastward as far as East Cape, with the several islands and archipelagoes extending southward to the meridian of 145° East.”

New Guinea was annexed on the 16th of November 1884, when the German flag was raised in Friedrich Wilhelmshafen and a trading company was established on the north-east coast, and in 1885 the two countries agreed to fix their boundaries through the then neutral areas of the country. The result of this was the assignation to Great Britain of the portion now known as the Territory of Papua (British New Guinea), lying between the extreme limits of 5° and 12° S. and 141° and 155° E. To Germany were assigned all the territory and islands to the north of the British, with the name of Kaiser Wilhelms Land, while all to the west of the 141st meridian remained under its old flag as Dutch New Guinea.

Since this period explorers and investigators have been almost constantly at work. There may be mentioned the work of the Rev. J. Chalmers on the coast of the Gulf of Papua (1893), and of officers of the German New Guinea Company in the ship “Yasabel” on the coasts and among the islands of the German territory; the expedition which crossed the southernmost peninsula from Huon Gulf of the New Guinea coast, to which both the leaders, O. Ehlers and M. Piering, lost their lives (1895); the work of Commodore von Lauterbach (1896), and the various explorations carried out by or at the instigation of Sir William MacGregor, including a crossing of the island from mouth of the Wilhelm river to the Victoria river, and the second crossing in the reverse direction (1897). Ethnographical researches have been prosecuted by Messrs C. G. Seligmann and W. Merk Strong, and others. The reports of travellers and of various missionary societies have thrown a great deal of light on the natural history of the island, on its resources, and the islanders.

British New Guinea

The British Territory of Papua has an area of about 90,540 sq. m. and a population estimated at 400,000, of whom about 600 are Europeans. The Protectorate, as declared in 1884, with its seat of government at Port Moresby, was subsidized by the three Australian colonies of Queensland, New South Wales and Victoria, and lasted, under the administration of two successive special commissioners (Major-General Sir Peter Scratchley and the Hon. John Douglas), till the 4th of September 1888, when it was proclaimed by the first Administrator—afterwards Lieutenant-Governor—Sir William MacGregor, a possession of Queen Victoria. Its constitution was that of a crown colony in association with Queensland; but in 1901 the federal government took control of the territory and in 1906 a proclamation by the governor-general of the commonwealth gave it the name of the Territory of Papua. The lieutenant-governor is elected by an executive and a legislative council, and advised by a native regulation board. Justice is administered by petty sessions in the six magisterial districts into which the possession is divided, with a central court at Port Moresby (which, however, sits elsewhere as necessary) having the jurisdiction of a supreme court, from which in certain cases an appeal lies to the supreme court of Queensland.

Order is maintained by an armed constabulary force, under a European officer, of about 150, almost all natives from different districts, whose members are found to be very efficient and trustworthy. The expenditure is about £8,000 annually, and the revenue, mainly derived from customs duties, is rapidly increasing. Only £5110 in 1895, it was £11,683 in 1900 and £19,197 in 1905.

Commerce and Trade.—The making of mats, fishing-nets, shell ornaments, decorated gourds, and stone implements, and the manufacture of pots, canoes, and so forth, constitute the chief native industries, which are the subject of barter between different regions. European industries include gold mining, in which 500 Deutscher Kolonisten, cornbes natives, are engaged (chiefly in the Louisiade and Belgian Archipelago), and the bêche de mer and pearl-shell fisheries, which were formerly more productive than at present. Copra is naturally largely prepared, as coco-nut palms are very numerous, and are sometimes cut and dried on the tree. The forest is still studded with herds of cattle. The rubber industry is, according to Sir W. MacGregor, “important and promising.” Species of Palmaquum, the genus from which, in the Indian Archipelago, the best gutta-percha is obtained, occur on the hills, and from their cultivation there might in time be obtained a large revenue independently of European labour. Timber of economic value is scarce. Red cedar (Cedrela) abounds in the surface flats, but the quality is poor and commercially valueless; and oak is plentiful, but the wood is coarse. Small quantities of ebony and sandal-wood are exported. “There can be no reasonable doubt that the sugar-cane, which is native and present in a few districts, when properly grown and prepared, will be found exceptionally fine quality, will eventually be valuable” (MacGregor).

The trade of British New Guinea is exclusively with the Australian colonies. Imports were valued at £72,286 in 1899-1900 (an increase of £7,540 in the year), and exports (including the gold mines) at £56,167, while in 1905 the figures were £75,188 for imports and £75,669 for exports, and in 1906 £79,671 and £80,290 respectively.

German New Guinea

The German protectorate of New Guinea, so called after the island which contributes the greatest area, comprehends, besides KaiserWilhelms Land, the islands which are now commonly called the Bismarck Archipelago—viz. New Pomerania, New Mecklenburg, with New Hanover and the Admiralty Islands and the Solomon Islands (Bougainville and Buka). There are besides nearly 200 smaller islands and islets scattered among their greater neighbours. In 1884 New Guinea was absolutely wild, not a single white man living on what is now the German part. On the islands New Pomerania and Miklo only two trading firms had their establishments; and on New Lauenburg (West New Guinea) the владелец derived his income from the fisheries, which in 1896, and after the annexation of a commercial enterprise set in at once, hand in hand with political administration. Now on the mainland and in the islands plantations have been established and tobacco and cotton have been successfully grown. Three German mission societies formed settlements on New Guinea, with a branch one on the Gazelle peninsula. The protectorate is included in the Universal Postal Union; each harbour has its post office, also a leading official with a number of assistants to control the natives and the revenue. It is divided into two districts with separate administrations, New Guinea and the Bismarck Archipelago; over both presides an imperial governor, the seat of government being Herbertshöhe in New Pomerania. A small police force of natives has been formed. In each district there is a registry of deeds and a court of law, and in New Guinea a court of appeal, of which the governor is president. A line of steamers plies between New Guinea, the Bismarck Archipelago and Singapore. A special silver coin of rupee value has been introduced. The area of Kaiser Wilhelms Land is approximately 70,000 sq. m. It is impossible to speak with any precision of the number of the native population, but the white population in 1906 was 140.

The revenue of German New Guinea is derived from taxes, duties and licences, and amounted on the 31st of March 1892 to about £3,000; on the same rate, 1901, to £7,750. The annual revenue is 60,000 rupees, and the expenditure, £2,400. The New Guinea Company was to receive £20,000 for transferring proprietorship to government, which took over the administration in 1899. In 1905 imports into Kaiser Wilhelms Land were valued at £33,316, and exports at £7,702, and the estimated expenditure for 1907-1908 of £76,000 included an imperial subvention of £57,656. The chief harbours are Friedrich Wilhelmshafen and Konstantinhaven.
**Dutch New Guinea**

Dutch New Guinea comprises all the western portion of the island. The boundary on the east, separating it from British New Guinea and German New Guinea, was finally settled in 1895. Starting from the south coast, it follows 141° 1' 48" E. up to the Fly river, which is mounts until 141° 1' is reached, when it once more follows the meridian up to the north coast. The area of the territory is 151,789 sq. m., and the inhabitants have been reckoned to number some 200,000. A few missionaries have established themselves, but otherwise the Dutch have scarcely occupied their possession, which at present merely forms part of the residency of Ternate in the Moluccas. Dutch New Guinea, however, has better natural advantages than either the British or German possessions in the island, and should eventually prove of real value to the Netherlands. The claims to superiority over New Guinea on the part of the rulers of some of the small neighbouring islands date at least from the spread of Islam to the Moluccas at the beginning of the 17th century, and were maintained by the Malay rulers both of Bachian and of Gebeh and afterwards by the sultan of Tidore. When the Dutch first came to these islands it was their policy to ally themselves with certain chiefs, and support their claims over various islands, so as to extend their own commercial monopoly; and they therefore supported the claims (admitted by Great Britain in 1814) of the sultan of Tidore over both the Raja Ampat (i.e. the four Papuan kingdoms, Waigeo, Salawatti, Misol and Waigmaima on Misol Island) and certain islands or points on the north-west coast of New Guinea. Namely the sultan of Tidore is still the suzerain of western New Guinea, but his authority is scarcely recognized, except on some few shores and adjacent islands, and practically Dutch New Guinea used to be administered partly from Ternate and partly from Timor, upon more peaceful lines than was the case when the rule of the Dutch in New Guinea largely consisted of the sending of a warship now and again to some distant island or bay to burn a kampong, to punish rebellious villagers, and thus assert or reassert Dutch authority, or that of the sultan, who is their vassal. In 1901, however, a more serious effort was made to establish some kind of government in the southern province of Dutch New Guinea, at Merawakay, where a small Dutch-Indian garrison was stationed with the professed object of preventing raids by bands of savages into the British territory near by. Such raids had been rather frequent, the invaders attacking the natives who live under British protection, burning their huts, murdering the men, carrying off the women and children as slaves, and returning to their haunts laden with booty. There is an assistant Resident at Merawakay, whose immediate chief is the Dutch Resident at Ternate, and who is the civil administrator of the province of southern Dutch New Guinea. Assistant Residencies have also been established at Manokvar in northern Dutch New Guinea, which has been formed into a province, under Ternate, and at Fakfak, in western Dutch New Guinea, likewise erected into a province, also under Ternate. By 1902, therefore, Dutch New Guinea formed a government, with its headquarters at Ternate, divided into the three provinces named. At regular intervals the steamers of the Dutch Royal Steam Packet Company call at Dorey and other points, while administrative posts have been established elsewhere in lieu of others previously attempted but abandoned.

A curious discussion arose in the Dutch states-general when the government was seeking legislative sanction for the above measures, with a provisional credit to cover the first establishment expenses. It was seriously contended in one part of the house that, as eminent men of geographical and ethnographical science had settled the question whether New Guinea belongs to Asia or Polynesia in favour of the latter, a New Guinea colonization scheme could not properly be proposed and decided upon in a section of the Dutch-Indian budget. This budget concerned only the Asiatic possessions of Holland, not the Polynesian ones, and Dutch New Guinea must, consequently, have its own budget. Finally, the majority of the states-general, backed by government, decided that New Guinea must still be reckoned to belong to Asia.

**NEW HAMPSHIRE,** a North Atlantic state of the United States, one of the New England group, and one of the Original Thirteen, lying between latitudes 42° 40' and 45° 18' 23" N., and between longitudes 70° 37' and 72° 37' W. It is bounded N. and NE. by Maine, E. by the Atlantic Ocean, S. by Massachusetts, and W. and N.W. by Vermont (from which it is separated by the Connecticut river—low water mark on the W. bank of the Connecticut is New Hampshire's W. boundary), and by Halls Stream which separates it from Quebec. The state has an area of 9341 sq. m., of which 310 sq. m. are water surface.

**Physical Features.**—The delightful scenery of mountains, lakes, streams and woodlands gives to the greater part of New Hampshire, which is in the New England physiographic province, the appearance of a companion state of New York. This is the favourite summer resort. In the N. central portion, the White Mountains, a continuation of the Appalachian system, rise very abruptly in several short ranges and in outlying mountain masses from a base level of 700-1500 ft. to generally rounded summits, the heights of several of which are nowhere exceeded in the eastern part of the United States except in the Black and the Unaka mountains of North Carolina; seventy-four rise more than 3000 ft. above the sea, twelve more than 5000 ft., and the highest, Mount Washington, attains an elevation of 6293 ft.

The widest ranges, the Presidential, the Franconia and the Carter-Moriah, have a north-eastern and south-western trend. The Presidential, in the north-eastern part of the region, is separated from the Franconia on the south-west by the Crawford, or White Mountain Notch, about 2000 ft. in depth, in which the Ammonoosuc and Saco rivers find a passage, and from the Carter-Moriah, parallel to it on the east, by the Glen-Ellis and Peabody rivers, the former of which has a beautiful fall of 100 ft. in height, about 20 m. in length, are Mount Washington and nine other peaks exceeding 5000 ft. in height: Mount Adams, 5805 ft; Mount Jefferson, 5725 ft; Mount Sam Adams, 5855 ft; Mount Clay, 5768 ft; Mount Notch, 5784 ft; Mount Adams Peak, 5384 ft; Mount Madison, 5380 ft; and Mount Franklin, 5028 ft. On the Franconia, a much shorter range, are Mount Lafayette, 5209 ft.; Mount Lincoln, 5092 ft.; and four others of less than 5000 ft. Mount Carrigain, in the White Mountains, is Carter Dome, 4860 ft., but seven others exceed 4000 ft. Lowest of the isolated mountains is Moosilake noted for its magnificent view-point 4810 ft. above the sea. Separating Franconia and Pemigewasset ranges is the romantic Franconia Notch, overlooking
which from the upper cliffs of Profile Mountain is a remarkable
human profile, The Great Stone Face, immortalized by Nathaniel
Hawthorne; here, too, is the Franconia Flume, a narrow uprift
fissure, similar to the Beeches. The Franconia, Long and
Mount Monadnock are the principal peaks of the White
Mountains. Mount Monadnock, 3,186 ft. high, near the S.W.
corner of the state and lenticular hills, or drumlins, but having a
general S.E. slope toward the sea, extends from the intervals of the Connecticut
river valley, and the sea is the only low surface in the state; a
considerable portion of this region is less than 500 ft. above the sea,
but some of the drumlins are ridges of considerable height and a
small drumlin. The seashore, about 18 m. in length, is for
the most part a sandy beach; here and there, however, especially
to the northward, it is somewhat rocky, and to the southward are
two bluffs. The only harbor is at Portsmouth near the mouth of
the Piscataqua. About 9 m. from the shore are the bleak and
nearly barren Isles of Shoals, nine in number, a part of which belong
to New Hampshire and a part to Maine.
The Merrimac, Winnipesaukee, and Cheshire, the S.W. corner
county, to the headwaters of the Connecticut river in the N.E.
corner is a water-parting, W. of which the state is drained southward
into the sea; the Connecticut, E. of which is drained south-eastward into the Atlantic
Ocean principally by the Merrimac in the S., the Saco and the headwaters
of the Merrimac in the White Mountain region, and the Androscoggin
in the western part of the state. The Salmon Falls, Lamprey and Exeter rivers.
The headwaters of the rivers are for the most part mountain streams or elevated lakes;
and on their swift and winding currents—flowing sometimes
between wide intervals, sometimes between rocky banks—are marked
by numerous falls and fed by lakes.
The lakes and ponds, numbering several hundred, were formed by
glacier action, and are the most notable of many in the state is Lake Winnipesaukee, which
is attractive than that of the mountains. The largest and most
widely known is Lake Winnipesaukee on the S. border of the White
Mountain region; this is about 20 m. long and from 1 to 8 m. wide, is
shaped like a crescent, is very clear, and in the center is a
rather level shore, back of which hills or mountains rise on all sides.
Among the more prominent of many others that are admired for
their beauty are Squam, Newfound, Sunapee and Ossipee, all
with a radius of a few miles from Winnipesaukee; Massabesic
farther S.; and Diamond Ponds, Umbagog and Connecticut lakes,
N. of the White Mountains. The rivers with their numerous falls and
the lakes with their high altitudes furnish a vast amount of
water power for manufacturing, the Merrimac, in particular, into
which many of the larger lakes, including Winnipesaukee, find an
outlet, is one of the greatest power-yielding streams of the world;
and the Merrimac is navigable for 100 m. The
Winnipesaukee, a larger mountain stream than the Merrimac was
originally an unbroken forest of which the principal trees were the white pine, hemlock, sugar maple, yellow birch, beech, red oak, and white oak in the S., red spruce, white
birch in the S.E., and spruce, hemlock, and red, white, and sugar maple, white spruce and white cedar in the other parts of the N. The
pine forests have nearly disappeared, but
much of the N. third of the state, many abandoned farms in the S. have become reforested with much the same trees, except that on
the lower levels in the N. yellow birch, sugar maple and beech have
to a considerable extent supplanted spruce, white pine and hemlock, and where forest fires have occurred is a
bird cherry, yellow birch and aspen. The butternut, hickory and
dehervines are common nut-bearing trees in the S. Among indigenous
fruit-bearing trees, shrubs and vines the state has the bird
cherry, blueberry, cranberry, raspberry, gooseberry, strawberry, grape and black currant; and conspicuous among a very great variety of shrubs and flowering plants are the
dogwood, rose, rhododendron, azalea, anemones, arbutus, violets, azaleas, eglantine, clove gents, orange lilies, orchids, asters and golden rod. The summits of some of the mountains are too high for trees and above belts of
hemlock and white birch, the woods are of cornel, oak, alders, willows, aspen, maple, moose, caribou, deer, wolf, bear, lynx, otter, beaver, fox, sable, mink, musk-rat, porcupine, wood-chuck, ruffed grouse and pigeon. These were rapidly reduced in number by the white man, the wild pigeons and woodchucks, and the ruffed grouse and the beaver have become rare, but, under the protection of laws enacted
since the latter part of the 19th century, deer and ruffed grouse are more plentiful. Rabbits, squirrels, skunks and quail are also abundant game. Many of the lakes and rivers have been stocked with trout and salmon or bass; some, with
smelt; the fresh waters of the state also contain pickerel, perch,
smelts, eels, suckers, dace, sunfish and shiners. In the S. half of the state there are many song birds belonging to the Allegheny
faunal area; in the N. part many others belonging to the Canadian
faunal area.
The climate is temperate and favorable for agriculture. The
wild flowers, bunting, warbler and wren are among the song birds of the forests.
Agriculture.—The winters are usually long and severe, and the summers
cool and salubrious, but the diversity of surface together with unequal
distances from the sea cause marked variations for the different
regions. The mean annual temperature ranges from about 42°F.
in the S.E. of the state to only 37°F. in the N.W. of the state, and
farther N. to 47°F. at low altitudes in the S.E. The greatest extremes of temperature occur in the deep mountain valleys where
it sometimes rises to 102°F. or above, in summer, and falls to 38°F. or below in winter; higher up on the mountains it is never
warm and along the sea-coast both extremes are considerably less.
The highest recorded winter mean is 25°F., at Nashua in the lower
valley of the Merrimac, and at Durham near the sea-coast; the
lowest recorded winter mean is 18°F. at Bethlehem 1470 ft. above
the sea in the White Mountain region; the highest recorded summer mean is 69°F. at Nashua, and the lowest recorded summer mean is 64°F. at Bethlehem. The mean annual precipitation for the entire
state is about 46 in.; it is 43 in. at Nashua, 45 in. at Durham, and
perhaps still more on the E. slopes of the mountain ranges, but
it is only 37 in. at Bethlehem in the N.W. part of the mountain
region, and only 35 in. at Stratford in the upper valley of the
Connecticut. The distribution is quite even throughout the year,
but summer and autumn are slightly more wet than winter and
spring. A fair estimate of the annual fall of snow is from 7 to 8 ft., but in the S.E. corner it is little more than one-half that amount. The prevailing winds are
generally N.W., but in the vicinity of the sea they are S.E. during summers.
increased from 23,746 acres to 25,694 acres (3000 acres in 1900), but that of the South from 26,533 acres to 27,264 acres (4000 acres in 1900). That of wheat decreased from 26,272 acres to 27,131 acres (none reported in 1900), and that of barley decreased from 4934 acres to 5566 acres (2000 acres in 1900), that of buckwheat decreased from 16,946 in 1890 to 15,333 in 1898 and 1908 (2000 acres in 1900). That of potatoes decreased from 460 acres in 1890 to 350 acres (none reported in 1900). With the exception of dairy cows and horses there was likewise a corresponding decrease in the number of livestock. The number of cattle decreased from 58,585 in 1890 to 56,970 in 1900 (51,000 in 1910); of sheep, from 211,825 in 1880 to 105,702 in 1900 (74,000 in 1910); and of neat cattle other than dairy cows, from 3,154 in 1890 to 1,626 in 1908. The number of horses increased from 52,458 in 1890 to 77,233 in 1900 (59,000 in 1910), and the number of dairy cows from 90,654 in 1890 to 115,036 in 1900 (122,000 in 1910). The value of the poultry and eggs increased from $1,747,000 in 1890 to $2,350,000 in 1900. This represented a significant increase in the relative value of the cereal grains in the state and nearly one-third of that of the hay and forage. The potato crop of the same year was grown on 19,422 acres and valued at $1,000,000. The wheat crop, which was sold, increased from $1,014,000 in 1890 to $3,265,000 in 1899 or 110.8%. Although the crop of orchard fruits was not greater in 1899 than in 1889 the number of apple trees increased during the decade from 7,144,779 to 8,034,958, the number of peach trees being, respectively, 10,877 and 9,155, and the number of cherry trees 10,151 to 18,137; in the number of pear trees and of cherry trees there was a slight decrease. The fruit crop of 1890 included 1,300,000 peaches, 1,640,000 plums, 10,345,000 cherries, 42,243 of peaches, 4942 bushels of plums, 1185 bushels of cherries, 487,900 lb. of grapes, 586,640 qts. of strawberries, 124,760 qts. of raspberries and 105,290 qts. of blackberries and dewberries. The valuation of the fruits was $32,575. The number of acres devoted to timber culture and fruits and dairy products. In the bottom lands of the Merrimack and of the Connecticut, south of the White Mountains, a large part of the Indian corn and potatoes grown here, however, are grown in large quantities north and west of the White Mountains and this district leads in the number of cattle and sheep, and in the production of all the cereals except Indian corn. Apples, pears and grapes are grown through the year in the southern parts of the state but peaches and cherries chiefly south of Lake Winnipesaukee. Hillsboro and Rockingham counties, in the south-east, lead in the production of poultry and eggs.

Manufactures.—The heavy precipitation on the elevated central and northern parts, and the hundreds of lakes and ponds which serve as reservoirs, give to the lower southern part of the state on the Merrimack and other rivers such an abundant and constant water-power that southern New Hampshire has become an important manufacturing district, and manufacturing has become the leading industry of the state. During the last two decades of the 19th century the number of inhabitants engaged in agricultural pursuits decreased from 45,122 to 38,782; and the number engaged in manufacturing increased from 57,283 to 75,945. Many farmers abandoned their sterile farms and made new homes in the West, where soil yielded larger returns for labour, and a foreign-born population, consisting largely of French Canadians, came to the cities in response to the demand for labour in factories.

From 1850 to 1860 the value of the manufactured products increased 62.3%; in the decade of the Civil War they further increased in value 80%; from 1890 to 1900 the increase was from $107,590,803 to $123,610,904, or 14.9%; and from 1900 to 1908 the value of the factory products increased from $107,590,803 to $123,610,904, or 14.9%. Textiles, and boots and shoes represented...
in 1905 more than one-half the total value. Cotton goods, the manufacture of which was introduced in 1804, increased in value only slightly during the last decade of the 19th century, from $2,018,310 in 1890 to $2,186,445 in 1900; but the value of boots and shoes was 21.8% in 1905; and in 1905 it was 18.7% of the total value of all factory products, and in no other state was the degree of specialization in this industry so great as in New Hampshire. Woolen goods, third in rank, decreased from $2,107,381 in 1890 to $1,960,041 in 1900, but the factory product increased in value from $7,524,622 in 1900 to $11,013,828, in 1905, or 45.5%. Paper and wood pulp, for the manufacture of paper, in both the state and New England, were third in value and increased, in value in $1,082,022 in 1890 to $7,244,733 in 1900, or 465.1%, and to $9,830,891 in 1905; and this industry rose from ninth in rank in 1890 to fifth in 1900 and to fourth in 1905. The manufacture of lumber and timber products, one of the oldest industries of the state, ranked fifth in 1905; these products had increased in value from $5,041,445 in 1890 to $2,218,310 in 1900, or 63.4%, but decreased to $7,510,431 in 1905, the decrease being largely due to the great lumber & paper mill at Atkinson and in the manufacture of paper and pulp mills. And machine shop products, hosiery and knit goods, wooden boxes, flour and grist mill products, and malt liquors were all important in manufacturing, their values increasing from $979,758 in 1900 to $2,565,612 in 1905, or 161.9%, and the value of hosiery and knit goods increased during the same period from $959,829 to $3,974,290, or 353%. As combatant in the manufacture of boots and shoes, the state of New Hampshire, ranked fifth in the manufacture of factory-made boots and shoes, and in woolen goods, sixth in cotton goods, and seventh in paper and wood pulp, in the state as a whole, in the domestic and finishing of textiles. In 1905 the value of the products in the eight cities of Manchester, Nashua, Concord, Dover, Rochester, Laconia, Keene, and Portsmouth, all of which are south of Lake Winnipesaukee, was 59.5% of that for the entire state. Moreover, the cotton goods were manufactured in Manchester. Boots and shoes were manufactured chiefly in cities near the southern border. Dover led in the manufacture of woolenens; Laconia in the manufacture of woolenens; Keene, in the manufacture of paper and wood pulp; and Manchester, in the manufacture of paper and wood pulp.

Transportation.—With the exception of a Grand Trunk line in the northern part of the state the several steam railways are owned or leased by the Boston & Maine. Up the steep slope of Mount Washington runs a cog railway. The first steps in railway building were taken in 1835, when the Boston & Maine, the Concord, and the Nashua & Lowell railways were incorporated. The Boston & Maine was opened from Boston, Mass., to Dover, N.H., in 1842. In 1850 there were in operation 487 m.; this mileage had increased to 1,677 m. in 1890. By 1905 the Portsmouth, the only port of entry, has a very small foreign trade, but there is a considerable traffic in coal and building materials here and on the Cochecho, which is navigable to Dover.

Population.—The population of the state was 334,188 in 1800; 68,746 in 1815; 141,184 in 1820; 269,238 in 1830; 284,754 in 1840; 317,976 in 1850; 326,973 in 1860; 318,300 in 1870; 346,091 in 1880; 376,630 in 1890; 411,588 in 1900; and 430,572 in 1910; the per cent of increase was 93.1 from 1800 to 1900 and 4.6 from 1900 to 1910. Of the total in 1900, 88,107 were foreign-born; 58,697, or 66.9%, were natives of Canada (44,426 French and 14,547 English), 13,547 of Ireland, 5100 of England, 2019 of Scotland, 2006 of Germany, and 2632 of Sweden. Of the 323,481 native-born, 86,435, or 27%, were born of other New England states. Of these, 50,213 were of those who were the children of other New England states, and 7502 were of foreign birth. At the same time there were 124,661 natives of New Hampshire numbered among the inhabitants of other states, principally Massachusetts, Vermont, Maine, New York, Illinois, Connecticut, Rhode Island, Minnesota, Iowa, Wisconsin, Michigan, Pennsylvania, Ohio, New Jersey, Kansas, and Nebraska, and to these latter to return for a holiday season to their native state the "Old Home Week" festival, now held throughout New England, was established in 1895 by Frank W. Rollins (b. 1850), who was the son of a merchant of Nashua. The New Hampshire Catholic church in 1906 had more members than any other religious denomination (115,863 out of 190,298 communicants of all denominations); in the same year there were 19,070 Congregationalists, 15,974 Baptists, 12,529 Methodist Episcopalians (North) and 4892 Protestant Episcopalians. Of the total population in 1800 the rural constituted 59.7% and the urban 37.6%; but in 1900 the rural constituted only 53.3% of the total and the urban 46.7%. The eleven cities having a population in 1900 of 5000 or more were: Manchester (56,987); Nashua (23,898); Concord (19,632); Dover (13,207); Portsmouth (16,657); Keene (9163); Berlin (8886); Rochester (8466); Laconia (8043); and Merrimack (7002). These eleven cities had 30.4% of the population of the state.

Administration.—New Hampshire was the first of the original thirteen states to establish a government wholly independent of Great Britain. This was designed to be only temporary, but was in operation from the 6th of January 1776 to the 2nd of June 1784. The constitution which then went into effect provided for a General Court consisting of a Senate and a House of Representatives and made the Council a body advisory to the state president; the 1784 instrument was much amended in 1792, when the title of president was changed to governor, but with the amendments adopted in that year it is in large measure the constitution of to-day. For sixty years there was no change whatever, and only three amendments, those of 1852 (removing the property qualifications of representatives, senators and the governor), were adopted until 1877, when twelve amendments were adopted,—the most important being those providing for biennial (instead of annual) state elections in November (instead of March), and those doing away with the previous requirement that representatives, senators and the governor "be of the Protestant religion." Five amendments were ratified in 1889 and four in 1902. New Hampshire is the only state in the Union in which amendments to the constitution may be proposed only by a constitutional convention, and once in seven years at the general election a popular vote is taken on the necessity of a revision of the constitution. A radical revision of the constitution is rendered especially difficult by a provision that no amendment proposed by a convention shall be adopted without the approval of two-thirds of the electors who vote on the subject when it is referred to them. Prior to 1902 every male inhabitant of a town who was twenty-one years of age or over, a citizen of the United States, and not a pauper or excused from paying taxes at his own request, had a right to vote, but an amendment adopted in this year made able to read English and to write additional qualifications, except in the case of those physically unable to read or to write, of those then having the franchise, and of persons 60 years of age or more on the 1st of January 1904. Various other amendments have been proposed from time to time, but have been defeated at the polls. By an act approved on the 9th of April 1909 provision was made for direct nominations of candidates at primaries conducted by regular elections.

There is a governor's council of five members, one from each county district, which has advisory duties and shares with the governor most of his powers. There is no lieutenant-governor. The governor and the councilors are elected for a term of two years, and a majority of the votes cast is necessary to a choice. Where no candidate receives such a majority the Senate and the House of Representatives by joint ballott choose one of the two having the greatest number. No person is eligible who at the time of his election is not at least thirty years of age and has been an inhabitant of the state for seven years next preceding; a councillor must be an inhabitant of the district from which he is chosen. The governor and council appoint all judicial

1 The constitution of 1776 provided that the Congress which framed it "assumed the name, power and authority of a House of Representatives", and that the "House of Representatives shall be a single and distinct branch of the legislature by the name of a Council"; that the Council appoint a president; that civil officers for the colony and for each county (except clerks of court, county treasurers and recorders) should be appointed by the taxed houses; and that "if the present unhappy dispute with Great Britain should continue longer than this present year, and the Continental Congress should require it, the Council be elected by the people of each respective county in such manner as the Council and House of Representatives shall order." 2 A constitution framed by a Convention which met in Concord on the 10th of June 1776 was rejected by the people in 1779.
officers, the attorney-general, auditor, important administrative boards, coroners and certain naval and military officers; they have power to pardon offences; and they may exercise some control over expenditures and the keeping of accounts of the treasury. In case of default or refusal to pay a warrant for drawing money from the treasury. The governor may veto within five days, besides Sunday, after it has been presented to him, any bill of resolution of which he disapproves, and within the same time. If the governor vetoes the bill, the houses are required to pass over his veto.

A Senate and a House of Representatives, which together constitute the General Court, meet at Concord on the first Wednesday in January, and are elected for one year. Each member is elected by the qualified electors in his district. The qualifications for persons from the county district, and these districts are formed so as to be approximately equal with respect to the number of inhabitants. The Senate consists of 390 representatives, which has the large membership of 390, representation is on the basis of population, but is so arranged to favor the rural districts; thus every town or ward of a city having 600 inhabitants is allowed one representative, but, although for every additional representative 1200 additional inhabitants are required, any town having less than 600 inhabitants is allowed a representative for such proportionate part of the inhabitants as the number of the town bears to 600. Senators and representatives are elected for a term of two years. A representative must have been an inhabitant of the state for at least two years preceding election. The right to be elected a senator or representative shall be in every case the right of the citizen of the town, parish or ward he is chosen to represent; a senator must be at least thirty years of age, must have been an inhabitant of the town for at least seven years preceding his election, and must have been a qualified elector in the town at least one year. The Constitution of New Hampshire places scarcely any restrictions on the powers of the legislature. By an amendment of 1877, however, it is forbidden to authorize any town to lend money or give credit for the benefit of any corporation whose object is profit. Although money bills may originate only in the House of Representatives the Senate may propose amendments. In 1909 the office of auditor was abolished.

For the administration of justice the state has a supreme court and a superior court, each county has a probate court, and some towns as well as the cities have a police court. The supreme court and the superior court each has jurisdiction throughout the state, and has the final jurisdiction in all civil and criminal cases, except as to admiralty jurisdiction. The superior court holds one general term each year at Concord and on the first Tuesday of every month except July and August sits to hear arguments, make orders and render decisions; the superior court holds one or two sessions a year in every county. Both of these courts have extensive jurisdiction. Each probate court, consisting of a single judge, has jurisdiction within its county of the probate of wills, of the granting of administration, in insolvency proceedings, and in relation to the adoption of children; it may appoint and remove guardians of minors, insane persons and spendthrifts, and, upon application, may change a person's name. The superior court has jurisdiction for misdemeanor cases, and may try cases where only the punishment is by fine not exceeding twenty dollars, or by imprisonment not exceeding six months, or by both, and in civil cases only where the title to real estate is not involved and the damages do not exceed two hundred dollars. The probate court has jurisdiction in all cases where such conviction, treatment seriously injuring the health or endangering the reason, willful desertion for three years, or joining a religious sect or society which professes to believe the relation of wife to husband unlawful, and conduct in accordance therewith for six months.

The surviving wife or husband and the minor children, if any, may occupy the homestead right of the deceased, and, if the surviving wife or husband is entitled to the right during the remainder of her or his lifetime.

Since 1854 to 1903 the liquor law was essentially prohibitory, but in the latter year an act licensing the traffic was passed. However, some option still remains with each town and city. Once every four years in cities and once in two years in towns the citizens of licensed and unlicensed places of public resort and of the electorate, and in a no-license town or city no bar-room or saloon is to be permitted; in such a town or city, however, malt liquor, cider and light wines may be sold at a railway station and an inn-keeper may serve liquors to his bona-fide registered guests.

Capital punishment for murder in the first degree is inflicted only upon men of the age of twenty-one years or above. The general superintendence of railways is vested in a board of three commissioners appointed by the governor and council for a term of three years, one each year. The board is specially directed to make an annual report, and to keep accounts, to examine these accounts from time to time, to examine the railways at least once a year, to investigate the cause of
all accidents and upon the petition of an interested party to fix rates
for the transportation of persons and freight. In 1909 an anti-pass
law was enacted.

Education.—New Hampshire formed a part of Massachusetts
when, in 1647, the General Court of that province passed the
famous order requiring every town in which there were fifty
householders to maintain a school for teaching reading and
writing, and every town in which there were one hundred house-
holders to maintain a grammar school with an instructor capable
of preparing young men for college. Although not much en-
forced, this, with some slight changes, continued to be the school
law until the close of the colonial era. The beginning of the new
era was marked by the founding of Phillips Exeter Academy
(1781), and later several other similar schools were opened.
Their excellence aroused a much greater interest in the common
schools, and in 1828 the General Court created a commissioners
for improving it were tried; among them were the
division of towns into districts, the appointment of county
school commissioners, and the establishment of a state board
of education. These, however, have been abandoned, and the
system is now administered chiefly by towns and a few special
districts under the general supervision of a state superintendent.

Each town is constituted a school district, and some special
districts are organized under special acts of the legislature. Some
of these are made up of a number of towns near by, and
have special purposes, such as the New Hampshire College of
Agriculture and Mechanics at Keene, the New Hampshire
College of Agriculture and Mechanic Arts, organized as a
department of Dartmouth College in 1866, but removed to Durham,

Strafford county, as a separate institution in 1891. The normal
schools are managed by a board of trustees consisting of the governor,
the superintendent of public instruction and five other
members appointed by the general court. Each school has a board
of managers, one member of which is appointed by the governor,
and one non-resident member is appointed by the general court.
The members of the board of managers are to hold office for
a term of years, and it is the duty of the board of managers to
hold and operate the school for the purpose of providing instruc-
tion in the several schools. The school is maintained by
the state, and is supported in part by tuition, and in part
by contributions from the state.

The state charitable and correctional institutions consist of
the New Hampshire School for Feeble-minded Children, at Laconia;
the New Hampshire School for the Blind, at Concord; the
Sanatorium, at Jackson; the New Hampshire Industrial School, at Manchester;
the New Hampshire Hospital for the Insane, and the State Prison, at Concord;
and the New Hampshire State Reformatory for convicts (1890) near Warren
Summit, about 75 m. north of Concord. The state also makes
annual appropriations for the care and education of blind and
dumb and deaf and dumb persons in institutions outside of the state. Each county
carries out the house and house of correction, and in addition there are
inmates of the state were entirely relieved of this care, and the insane
were removed to the state hospital. Within the state are also sixteen
facilities for the care and treatment of mental and physical disease, but
one of them is county, and one of them is city. Each of the state institutions
is under the management of an officer appointed by the governor, and in
1895 the legislature established a State Board of Charities and
Correction. This consists of five members appointed by the governor
and council for a term of five years, one each, and its duties
are to investigate the condition of the state and county charitable and correctional
institutions, except the state prison and the state hospital, to recommend such changes
to the state government as may seem desirable, and to have a special
jury in the several residential institutions whether in institutions or placed in
permanent homes.

Finance.—The income of the state, counties and towns is derived
mainly from property and personal taxes, but in the larger towns
the income includes also the town's share of the state of the
amount of twenty-one and seventy, on stock in public funds, on stock
in corporations or stock in benefit societies; this is subject
to the conditions of the schools, to make sug-
gestions and recommendations for improving them, to meet upon
the rights of trustees of educational institutions, and to
it is its duty to prescribe the form of register to be kept in the
schools, to investigate the condition of the schools, to make sug-
gestions and recommendations for improving them, to meet upon
the rights of trustees of educational institutions, and to

All children between the ages of eight and fourteen and those
between the ages of twenty-one and seventy are enrolled in a school;
for this purpose 5% of the legal voting age are required to attend either a public or an approved
private school for the full term unless excused by the school board on account of physical or mental infirmity. The schools are maintained
chiefly out of the proceeds of a district school tax, which must not
be less in any district than seventy and fifty dollars for every
dollar of public taxes apportioned to the town or district, a por-
tion which has gradually increased from five to one in 1879 and
from ninety to one in 1817. To this is added a "Literary Fund"
(designed originally for foundings a college) which is derived from
the proceeds of a state tax on the deposits, stock, &c. of savings
banks, obtained from the savers and associations and other similar corporations not residing in the state, and a portion of the proceeds of a dog tax, both of which are dis-
tributed among the several districts according to the number of
children between the ages of twenty years of age who have attended school at
least two weeks. The state also makes appropriations for the pay-
ment of a portion of the tuition in high schools and academies
distributing it among the districts in proportion to the rate of school
tax in each, appropriations for paying a portion of the salary of
school superintendents where two or more districts unite to form a
supervising district, and appropriations for general school pur-
poses. In 1879 the legislature authorized a number of teachers trained in normal schools and to average school attendance.

The plan of 1821 to use the Literary Fund for founding and main-
ung a state college for instruction in the higher branches of
science and literature was abandoned in 1828 and the only state
institutions of learning are the Plymouth Normal School (1870) at Plym-
outh, the Dane Normal School (1870) at Keene, and the New
Hamphire College of Agriculture and Mechanic Arts, organized as a
department of Dartmouth College in 1866, but removed to Durham.
NEW HAMPSHIRE

However, and by the beginning of the Civil War the state was almost free of debt. During that war the state incurred an indebtedness of about $4,236,000; but the reconstructed war debt of the towns and cities, making its total indebtedness again $4,138,124. On the 1st of September 1908 the funded debt of the state was $706,700.

History.—Martin Pring was at the mouth of the Piscataqua in 1603 and, returning to England in the same year, gave an account of the New England coast from Cape Race to Cape Cod Bay. Samuel de Champlain discovered the Isles of Shoals and sailed along the New Hampshire coast in 1605, and much more information concerning this part of the New World was gathered in 1614 by Captain John Smith, who in his Description of New England refers to the convenient harbour at the mouth of the Piscataqua and praises the country back from the rocky shore. Under the leadership of Sir Ferdinando Gorges there was formed in 1620 the Council for New England, which procured from King James I. a grant of all the country from sea to sea between 40° and 48° N. latitude, and which made the following grants: 

The 1628, short is 1623 1630. the house 1639, consisting of rivers November and Salem Maines. The 1629, of Long Island, New Hampshire, having been removed in 1614 to the Merrimac, had been founded for the purpose of debt. Ferdinando Mason, who had been a factor of New England, was the leader of the Puritan faction. Puritan Massachusetts was naturally hostile to the Antinomians at Exeter as well as to the Anglicans at Strawberry Banke. Although Exeter, in 1639, Dover, in 1640, and Strawberry Banke, not later than 1640, adopted a plantation covenant, these settlements were especially weak from lack of a superior tribunal, and appeals had been made to Massachusetts as early as 1633. Moreover, the grants of Massachusetts and Mariana were clearly in conflict. Under these conditions Massachusetts discovered a new claim for its northern boundary. The charter of 1648 stated that the river Merrimac flowed east for its entire course, but now an investigation was in progress which was to show that its source in Lake Winnipesaukee was several miles north of any of the four settlements in New Hampshire. Accordingly, Massachusetts resolved to make the most of the clause in the charter which described the northern boundary as three English miles north of the Merrimac river, “or to the northward of any and every part thereof,” to ignore the conflicting grants to Mason and to extend its jurisdiction over the offending settlements. Dover submitted in 1641, Strawberry Banke (Portsmouth) soon after, and Exeter in 1643.

The heirs of Mason protested, but little was done about the matter during the period of Puritan ascendancy in the mother country. Immediately after the resignation of Richard Cromwell, however, Robert Tufton Mason (a grandson of the original proprietor), who had become sole heir in 1655, began petitioning for a patent and later for title. The attorney-general, to whom the petition to the king was referred, reported that the petitioner had a “good and legal right and title to the lands.” The commission appointed by the king in 1664 to hear and determine complaints in New England decided that Mason’s lands were not within the jurisdiction of Massachusetts, and made an attempt to set up a government under which his claims could be tried, but this was a failure. In 1674 Mason offered to surrender his rights to the Crown in return for one-third of the customs, rents, fines, and other profits derived therefrom, but although the offer was at first favourably considered it was finally declined. Mason then petitioned again, and this time Massachusetts was requested to send agents to England to answer his complaints. They arrived in December 1676; and the case was tried before the Lords Chief Justices of the King’s Bench and Common Pleas in April 1677. Mason presented no claim to the right of government, and as to the title to the lands claimed by him the court decided that this was a question between him and the several tenants to be determined by the local court having jurisdiction in such matters. Thereupon Mason, in January 1679, petitioned the king to appoint a governor who should have jurisdiction over all the lands which he claimed, and on the 18th of September of this year New Hampshire was constituted a separate province with a government vested in a president and council appointed by the king and an assembly chosen by the people. This was the principal outcome of Mason’s persistent efforts to establish his rights to

mately a failure, the company sent over colonists who occupied the house left standing by Thomson, and, not far away, built “Mason Hall” or the “Great House” In what is now Portsmouth, a name (for the entire settlement) that replaced “Strawberry Banke” in 1653. Edward Hilton with a few associates appears to have established a settlement on Dover Point about the time of Thomson’s arrival at Little Harbor, and in the Hilton grant of 1630 it is stated that he had already built houses and planted there; as early as 1639 this settlement was named Dover. In 1638 the Rev. John Wheelwright, an Antinomian leader who had been banished from Massachusetts, founded Exeter on land claimed to have been bought by him from the Indians. In the same year Massachusetts encouraged friendly Puritans to settle Hampton on the same purchase, and about a year later this colony organized Hampton as a town with the right to send a deputy to the General Court. Serious dissensions had already arisen between Puritan and Anglican factions in Dover, and Captain John Underhill, another Antinomian, was at a time a leader of the Puritan faction. Puritan Massachusetts was naturally hostile to the Antinomians at Exeter as well as to the Anglicans at Strawberry Banke. Although Exeter, in 1639, Dover, in 1640, and Strawberry Banke, not later than 1640, adopted a plantation covenant, these settlements were especially weak from lack of a superior tribunal, and appeals had been made to Massachusetts as early as 1633. Moreover, the grants of Massachusetts and Mariana were clearly in conflict. Under these conditions Massachusetts discovered a new claim for its northern boundary. The charter of 1648 stated that the river Merrimac flowed east for its entire course, but now an investigation was in progress which was to show that its source in Lake Winnipesaukee was several miles north of any of the four settlements in New Hampshire. Accordingly, Massachusetts resolved to make the most of the clause in the charter which described the northern boundary as three English miles north of the Merrimac river, “or to the northward of any and every part thereof,” to ignore the conflicting grants to Mason and to extend its jurisdiction over the offending settlements. Dover submitted in 1641, Strawberry Banke (Portsmouth) soon after, and Exeter in 1643.

The heirs of Mason protested, but little was done about the matter during the period of Puritan ascendancy in the mother country. Immediately after the resignation of Richard Cromwell, however, Robert Tufton Mason (a grandson of the original proprietor), who had become sole heir in 1655, began petitioning for a patent and later for title. The attorney-general, to whom the petition to the king was referred, reported that the petitioner had a “good and legal right and title to the lands.” The commission appointed by the king in 1664 to hear and determine complaints in New England decided that Mason’s lands were not within the jurisdiction of Massachusetts, and made an attempt to set up a government under which his claims could be tried, but this was a failure. In 1674 Mason offered to surrender his rights to the Crown in return for one-third of the customs, rents, fines, and other profits derived therefrom, but although the offer was at first favourably considered it was finally declined. Mason then petitioned again, and this time Massachusetts was requested to send agents to England to answer his complaints. They arrived in December 1676; and the case was tried before the Lords Chief Justices of the King’s Bench and Common Pleas in April 1677. Mason presented no claim to the right of government, and as to the title to the lands claimed by him the court decided that this was a question between him and the several tenants to be determined by the local court having jurisdiction in such matters. Thereupon Mason, in January 1679, petitioned the king to appoint a governor who should have jurisdiction over all the lands which he claimed, and on the 18th of September of this year New Hampshire was constituted a separate province with a government vested in a president and council appointed by the king and an assembly chosen by the people. This was the principal outcome of Mason’s persistent efforts to establish his rights to
the land; for although he succeeded in procuring the appointment of officers who supported his claims, and although decrees were issued in his favour, the tenants, who contended that they had profited nothing from what his grandfather had done or that they were on lands which Wheelwright had bought from the Indians, resisted the enforcement of those decrees. The contest, however, especially for the waste lands, was continued by Mason, his heirs and assigns until near the close of the 18th century. From 1686 to 1689 New Hampshire formed a part of the Dominion of New England, which, after the first few months, was under Sir Edmund Andros as governor-general. There being no provincial authority in New Hampshire at the close of this period, a convention of the leading citizens of its four towns attempted to establish one. Upon the failure of this attempt, a temporary nominal union with Massachusetts was formed, but in 1692 Samuel Allen, the assign of Mason, caused a royal government to be established with his son-in-law, John Usher, as lieutenant-governor, and during the remainder of the colonial era New Hampshire was separate from Massachusetts except that from 1699 to 1741 the two had the same governor. The boundary between the two provinces was yet to be determined. Massachusetts proposed to confine New Hampshire to less than one-fourth its present area; that is, on the west to a line drawn 3 m. east of the south course of the Merrimac and on the north-east to a line drawn north-west from the source of the Salmon Falls river. New Hampshire claimed for its southern boundary a line drawn west from a point 3 m. north of the mouth of the Merrimac and for its upper eastern boundary a line drawn south-east by slightly west from the source of the Salmon Falls river. Both provinces granted townships within the disputed territory; Massachusetts arrested men there who refused to pay taxes to its officers, and sought to deprive the settlement of the dispute. New Hampshire, being on the more friendly terms with the home government, finally petitioned the king to decide the matter, and in 1737 a royal order referred it to a commission to be composed of councillors from New York, Nova Scotia and Rhode Island. This body agreed upon the present eastern boundary but evaded deciding the southern one. Both parties then appealed to the king, and in 1741 the king in council decided the division of the common from Megaloch to the eastern boundary and decided that the southern boundary should be a line corresponding to the course of the Merrimac from 3 m. north of its mouth to 3 m. north of Pawtucket Falls, at its most southerly bend, and thence due west to the next English province. This gave New Hampshire much more territory on the south than it had claimed. But the western boundary was not yet defined, and as early as 1749 a controversy over that arose with New York. New Hampshire asked for the territory west to within 20 m. of the Hudson river, or as far as the western boundaries of Massachusetts and Connecticut, while New York claimed east to the Connecticut river. Within a few years the governor of New Hampshire granted in the disputed territory 138 townships which were rapidly settled by those whom it was the duty of the province to protect. But there was a reluctance to incur the expense of a contest with so powerful a neighbour as New York, and in 1764 that province procured from the king in council a royal order declaring the western boundary of New Hampshire to be the western bank of the Connecticut river. The controversy, however, continued for some years thereafter (see VERMONT). From 1676 to 1759 New Hampshire suffered greatly from the Indians, and the fear of them, together with the boundary disputes and Mason's claims, retarded settlement. But where these troubles were removed the population increased rapidly, and at the outbreak of the War of Independence the province had about 80,000 inhabitants, the great majority of whom were with the patriot or Whig party during that struggle. By June 1775 the once popular governor, Sir John Wentworth, was a refugee; on the 5th of January 1776 the fifth Provincial Congress established a provisional government; on the 18th of the following June the first Assembly elected under that government declared for independence; and on the 16th of August 1777 the important victory at Bennington was won by New Hampshire and Vermont troops under the command of General John Stark, who had a commission from New Hampshire. Six states had ratified the Federal constitution when the New Hampshire convention met at Exeter on the 13th of February 1788, to accept or reject that instrument, and so great was the opposition to it among the delegates from the central part of the state that after a discussion of ten days the leaders in favour of ratification dared not risk a decisive vote, but procured an adjournment in order that certain delegates who had been instructed to vote against it might consult their constituents. Eight states had ratified when the convention reassembled at Concord on the 17th of June, and four days later, when a motion to ratify was carried by a vote of 57 to 47, adoption by the necessary nine states was assured. The War of Independence left the state greatly burdened with debt and many of its citizens threatened with a debtor's prison. As a means of relief a number of citizens demanded of the legislature the issue of paper, but the approach of the War of the Revolution made it necessary to renounce this plan. The state was left without a standing army, and the debt was incurred by the necessity of raising troops to serve in the army. At the close of the War the state was left with a debt of $1,200,000. 

National elections in New Hampshire were carried by the Federalists until 1816, except in 1804 when President Thomas Jefferson was returned by a small majority; he emerged, however, from the Federalist supremacy in national politics the Democrat-Republicans elected the governor from 1805 to 1812 inclusive except in 1809. In 1816 the Democrats won both state and national elections; and out of the transition from Federalist to Democrat control, which was effected under the leadership of William Plumer (1759-1830), a prominent politician in New Hampshire for half a century, a United States senator from 1802 to 1807 and governor of the state in 1812-1813 and 1816-1819, arose the famous Dartmouth College Case. As the trustees of this institution were Federalists with the right to fill vacancies in their number, the Democrats attempted to gain control by converting it into a state university and increasing the number of trustees, but when the case reached the Supreme Court of the United States that body pronounced (1819) the charter a contract which the Federal constitution forbade the state to violate. Heretofore the Federalist régime had taxed the people to support the Congregational Church, but now the Baptists, Methodists and Universalists joined the Democrats, and in 1819 this state support was abolished by the "Toleration Act." Because of Daniel Webster's arguments in the Dartmouth College Case, and because his party had favoured the support of the Congregational Church by public taxation, he became very unpopular in this his native state. Accordingly, his denunciation of President Andrew Jackson's bank policy added strength to the Jacksonian Democracy, and, later, his Whig connections were the greatest source of the Whig party's weakness in New Hampshire. John Quincy Adams was an intimate friend of William Plumer, the Democratic leader, and carried the state both in 1824 and 1828, but a Jackson man was elected governor in 1827, 1829, 1830 and 1831. The Whigs never won a national or state election, and often their vote was only about one-half that of the Democrats. But the Democrats broke into two factions in 1846 over the question of slavery (see HALE, JOHN PARKER); the American or "Know-Nothing" party elected a governor in 1855 and 1856; and then control of the state passed to the Republican party which has held it to the present. After 1890 the railway corporations were charged with a corrupt domination of the legislature and the courts, and in 1906 a "Lincoln Republican" movement was organized under the leadership of the well-known novelist Winston Churchill (b. 1874), with the object of freeing the state from this influence.
NEW HARMONY

The governors or presidents of the province and state have been:

Province.

John Cutt, president 1679-1681
Richard Waldron, president 1681-1682
Edward Cranfield, lieutenant-governor 1682-1685
Walter Barefoot, deputy-governor 1685-1686
Joseph Dudley, president of Council for New England 1686-1687
Edmund Andros, governor-general of New England 1687-1689
Without a government 1689-1690
Norman Chamberlain, governor 1690-1692
Samuel Allen, governor 1692-1693
Richard Coote, earl of Bellamont, governor 1693-1697
Joseph Dudley, governor 1697-1698
Samuel Stoughton, governor 1698-1700
John Wentworth, lieutenant-governor 1701-1705
William Burnett, governor 1705-1709
Jonathan Belcher, governor 1709-1710
Benning Wentworth, governor 1710-1714
John Wentworth, governor 1715-1717

Transition from Province to State.
Matthew Thornton, president of the Provincial Convention 1775

State Presidents.

Meshech Weare 1776-1785
John Langdon 1785-1786
John Langdon 1786-1789
Joseph Martin 1789-1790
Josiah Bartlett 1790-1792

State Governors.
Josiah Bartlett 1792-1794 Federalist
John Taylor Gilman 1794-1796 Federalist
John Langdon 1796-1799 Federalist
Jeremiah Smith 1799-1800 Federalist
John Langdon 1800-1802 Federalist
William Plumer 1802-1803 Federalist
John Taylor Gilman 1803-1816 Federalist
William Plumer 1816-1819 Federalist
Samuel Bell 1819-1823 Federalist

H. Dexter.)

NEW HARMONY, a village in Posey county, Indiana, U.S.A., on the Wabash river, about 22 m. N.W. of Evansville. Pop. (1900) 1341; (1910) 1229. It is served by the Illinois Central railway, and has regular steamboat connexion with the river cities. New Harmony had its beginning in 1814-1815, when a group of religious societies, known variously as the Harmonists, Harmonites and Rappites, founded in Germany towards the end of the 18th century by George Rapp (1757-1847), a native of Ipingen in Wiirttemberg. Rapp and his followers, who sought to form a community after the manner of the primitive Christian Church, were persecuted in Germany, and in 1803-1804 emigrated to Butler county, Pennsylvania. There they established in 1805 a community known as Harmony, consisting of some 600 persons, who held their property in common and in 1807 adopted celibacy. In 1814 Rapp sold most of his Pennsylvania land and bought about 24,735 acres (in the next ten years more than 14,000 acres in addition) on the Wabash river in Indiana Territory. In 1814-1815 Rapp and a thousand of his followers settled on the Indiana tract, their headquarters being established at New Harmony, or Harmonie as they called it. The settlers, mostly Germans, devoted themselves to agriculture, weaving and leather-working so industriously that they prospered from the start. Rapp, however, in 1825 disposed of his lands and property to Robert Owen, having returned with part of his followers to Pennsylvania, and founded a new community in the eastern part of the county, in Beaver county, where he died in 1847. Intent on founding a socialistic community, Owen went to the United States in 1824, and purchased Rapp's lands and live stock for $182,000. He interested several well-known scientists in his settlement, and with them came to New Harmony in the spring of 1826. Within six months the community numbered over 1000. Among its most notable members were Robert Owen's sons, Robert Dale Owen (1801-1877), a political leader and diplomat; David Dale Owen (1807-1860) and Richard Owen (1810-1896), both geologists; and William Maclure (1763-1817), founder of the Academy of Natural Sciences at Philadelphia; Thomas Say (1787-1834). "the father of American Zoology"; Charles Lesueur, a scientist and antiquarian; and Gerard Troost (1776-1850), a well-known geologist. The greater part of the settlers, however, were impractical theorists or adventurers. Constitution after constitution was adopted, and with the adoption of each new constitution and with each new religious discussion a group would secede and form a separate community—in 1825 there were ten—the best known and most successful being Maclura (like the others, occupying a part of W. Owen's land), named after William Maclure, who directed its founding. The whole organization broke up in 1827, and Owen left New Harmony in 1828. New Harmony has a Working Men's Institute Public Library, founded in 1838 by William Maclure,
and having in 1907 18,000 volumes; the collection is rich in works dealing with socialism.

NEW HAVEN, the largest city of Connecticut, U.S.A., the county-seat of New Haven and the seat of Yale University. It is co-extensive with the township of New Haven (though there is both a township and a city government), and lies in the south-western part of the state, about 4 miles from Long Sound, at the head of New Haven Bay, into which empty three small streams, the Quinnipiac, the Mill and the West rivers. Pop. (1890) 81,268; (1900) 108,027, of which 30,802 were foreign-born, including 10,491 Irish, 5262 Italians, 4743 Germans, 3193 Russians and 1376 Swedes; (1910 census) 133,605. Land area (1900) 17½ sq. m., of which more than one-half was annexed since 1900. New Haven is served by the main line and five branches of the New York, New Haven and Hartford railway, by three inter-urban electric lines and by two steamship lines connecting with foreign countries. The city is built on a sandy plain, in the rear of which is a line of hills terminating in two spurs, East Rock and West Rock, respectively 360 and 400 ft. high and 2 m. and 2½ m. distant from the Green. On East Rock is a monument to the Connecticut soldiers who fell in the War of Independence, the War of 1812, the Mexican War and the Civil War; on the West Rock is a cave, "Judges' Cave," in which the regicides William Goffe and Edward Whalley are said to have concealed themselves when sought for by royal officers in 1661. The central and older portion of the city is laid out in squares surrounding a public Green of 16 acres, which was in former days the centre of religious and social life. New Haven is popularly known as the "City of Elms," because of the number of these trees. Besides the Green there are 12 other parks, ranging from 6 to 300 acres in area, four of them being on the water front, along the harbour. On the west side of the city is Edgewood Park (120 acres); on the north is Beaver Pond Park (100 acres); and East and West Rocks, mentioned above, have been made into suburban parks.

Among the public buildings and places of interest are the three churches on the Green, built in 1814; Centre Church (Congregational), in the rear of which is the grave of John Dixwell (1685–1850), one of the regicides; United (formerly known as North Church (Congregational)), and Trinity Church, which belongs to one of the oldest Protestant Episcopal congregations in Connecticut. On the north-western side of the Green are the buildings of Yale University (q.v.); the "college" campus is the square enclosed by College, Chapel, High and Elm streets, with Battell Chapel at its eastern corner, Farnam, Lawrence, Phelps, Welch and Osborn halls on its south-eastern side, Vanderbilt Hall, Connecticut (or South Middle) Hall, the oldest of the Yale buildings (1750), and the Art School on the southern side, the Library, Dwight Hall and Alumni Hall on the north-western and Durfee Hall on the northern side; farther north of the Green are the Divinity School, the University Campus, on which are the Bicentennial Buildings and Memorial Hall, and, lying between Grove Street and Trumbull Street and Prospect Street and Hillhouse Avenue, the buildings of the Sheffield Scientific School. In the vicinage is the Grove Street Cemetery, in which are the graves of many famous Americans. Besides the University Library, there are a Public Library (1889), containing about 60,000 vol., the library of the Young Men's Institute (1826) and the collection of the New Haven Colony Historical Society. The city contains a State Normal School and a number of hospitals and charitable institutions.

Among the newspapers of New Haven are the Morning Journal and Courier (1832, Republican), whose weekly edition, the Connecticut Herald and Weekly Journal, was established as the New Haven Journal in 1766; the Palladium (Republican; daily, 1840; weekly, 1828); the Evening Register (Independent; daily, 1840; weekly, 1812); and the Union (1873), a Democratic evening paper. At New Haven also are published several weekly English, German and Italian papers, and a number of periodicals, including the American Journal of Science (1818), the Yale Law Journal (1890) and the Yale Review (1892), a quarterly.

In 1900 New Haven was the most important manufacturing centre in Connecticut, and in 1905 it was second only to Bridgeport in the value of its factory product. In 1903 its establishments numbered 490. The principal manufactures are hardware, foundry and machine shop products, ammunition and fire-arms (the Winchester Company), carriages and wagons, planes, doors, boxes and corsets. Meat packing is also an important industry. In 1905 the total capital invested in manufacturing was $71,412,715 and the total product $39,666,118 (a gain of 13.7% since 1900). Commercially, New Haven is primarily a distributing point for the Atlantic seaboard, but the city is a port of entry, and foreign commerce (almost exclusively importing) is carried on to some extent, the imports in 1906 being valued at $404,805. In 1906 the assessed valuation of real and personal property was $179,592,508, the net debt was $3,854,498 and the rate of taxation was 14 7½ mills on the dollar.

Under a charter of 1899, as amended afterwards, the city government, which has almost entirely superseded the town government, is in the hands of a mayor, who holds office for two years and appoints most of the administrative officers, except a board of aldermen (of whom each has a two-year term, six are chosen from the city at large and the others one each from each ward, the even-numbered wards electing their representatives one year and the odd-numbered the next), a city clerk, controller, sheriff, treasurer and tax collector, all chosen by popular vote, and an assistant clerk, appointed by the board of aldermen.

The first settlement in New Haven (called Quinipiac, its Indian name, until 1640) was made in the autumn of 1637 by a party of explorers in search of a site for colonization for a band of Puritans, led by Theophilus Eaton and the Rev. John Davenport, who had arrived at Boston, Massachusetts, from England in July 1637. In the following spring a permanent settlement was made. It was governed under a "plantation covenant" until the 4th of June 1639, when, at a general meeting, the "free planters" adopted the fundamental principles of a new government. They agreed that the Scriptures should be their guide in civil affairs, and that only approved church members should be admitted to the body politic; twelve men were appointed to choose seven men ("seven pillars") who should found the church and admit to its original membership such planters as they thought properly qualified. This having been done, the first General Court of which there is record met on the 25th of October. At this court the members of the new church, together with six members of other approved churches, were admitted to citizenship; a magistrate, four assistants, a secretary and a constable were chosen as the civil officers; annual elections and an annual session of the General Court in the last week of October were agreed upon; English statute and common law were expressly excluded; and the "word of God was adopted as the only rule to be attended unto in ordering the affaires of government in this plantation." As thus founded, New Haven was town and colony combined. In 1643–1644 the colony was expanded into the New Haven Jurisdiction, embracing the towns of New Haven, Guilford, Milford, Stamford and Branford in Connecticut, and, on Long Island, Southold; but this "Jurisdiction" was dissolved in 1664, and all these towns (except Southold) passed under the jurisdiction of Connecticut, according to the Connecticut charter of 1662. The government of the Jurisdiction was of the strictest Puritan type, and although the forty-five "blue laws" which the Rev. Samuel Peters, in his General History of Connecticut, ascribed to New Haven were much confused with the laws of the other New England colonies and some were mere inventions, yet many of them, and others equally "blue," were actually in operation as enactments or as court decisions in New Haven.
NEWHAVEN—NEW HEBRIDES

Among those in the Pater's list which are wholly or substantially true are the following: "The judges shall determine controversies without a jury." "Married persons must live together in harmony." "A wife shall be good evidence against her husband." "No minister shall keep school." "The selectmen, on finding children ignorant, may take them away from their parents and put them in the hands of the publicschools." "No person shall be a candidate in the same list which are wholly or in part spurious:" "No woman shall kiss her child on the Sabbath or fasting day," and "No one shall travel, cook victuails, make beds, sweep house, cut hay or do any work on the Sabbath day.

One of the most important events in the history of New Haven was the removal hither in October 1716 from Saybrook of the Collegiate School of Connecticut, which developed into Yale University. The period of greatest material prosperity of New Haven in the colonial period began about 1750, when a thriving commerce with other American ports and the West Indies developed. As a port it was notorious for its smuggling and illicit trade. New Haven also had extensive shipbuilding interests. All attempts to enforce the British commercial regulations were ineffectual. On the 22nd of February 1765 a town meeting of the citizens voted to purchase a vessel and arm her to refrain from importing from England hats, clothing, leather, gold and silver lace, buttons, cheese, liquors, &c. Two years later Jared Ingersoll (1722-1781), who had been sent to England to protest against the Stamp Act, but had accepted the office of Stamp Distributor on the advice of Benjamin Franklin, was forced to resign his office. In 1770 most of the merchants agreed not to import goods from England and transferred their trade with New York City, where Loyalist influence was strong, to Boston and Philadelphia. When news of the embryo of the Revolution first arrived at New Haven, a committee of correspondence was at once formed; and in the War of Independence the people enthusiastically supported the American cause. On the 5th of July 1779 the place was invaded by a British force under General William Tryon, who intended to burn the town, but met so strong a resistance that he withdrew before the next day. New Haven's commerce suffered severely during the war, but by the close of the first decade of the 19th century it had regained its former importance. When the War of 1812 opened there were fully 600 seamen in the city, practically all of whom were engaged in privateering or in the regular naval service of the United States. Among them was Capt. Isaac Hull. In 1815 the Fulton, the first steamboat on Long Island Sound, made its first trip to New Haven. The second quarter of the 19th century was the period of development of railways and manufactures. New Haven, and the Civil War has been marked by a diversification of industries. To that conflict New Haven contributed approximately $30,000,000, and 3900 men, 900 of whom were killed. From 1761 until 1833 New Haven was the joint capital (with Hartford) of Connecticut. New Haven was incorporated as a city in 1784; new charters were secured from the General Assembly of the state in 1860, 1881 and 1899. Fair Haven was annexed to New Haven in 1897. See Leonard Bacon, Thirteen Historical Discourses (New Haven, 1839); J. W. Barber, History and Antiquities of New Haven (3rd ed., New Haven, 1870); C. H. Levermore, Town and City Government of New Haven, and The Republic of New Haven (Baltimore, 1885); E. S. Bartlett, Historical Sketches of New Haven (New Haven, 1897); Edward E. Attwater, History of the Colony of New Haven in its Abstention from Colonization, New Haven, 1630-1784 (New Haven, 1876); History of New Haven Green (New Haven, 1898); Records of the Colony of New Haven 1638-1685 (2 vols., Hartford, 1857-1858), edited by C. H. Headly; and the Papers and other publications (1865 sq.) of New Haven Colony Historical Society.

NEWHAVEN, a seaport in the Eastbourne parliamentary division of Sussex, England, 56 m. S. from London by the London, Brighton & South Coast railway, on the English Channel at the mouth of the Ouse. Pop. of urban district (1901) 6772. The church of St Michael has a Norman square embattled tower surmounted by a spire, and an apsidal chancel. The port is protected by fortifications. A harbour was first granted to Newhaven in 1743, and during the early part of the 18th century it possessed a large shipping trade. This afterwards declined, but it is now one of the principal points of communication between England and France, the railway company maintaining a daily service of fast steamers to Dieppe in connexion with the Chemin de fer de l'Ouest. The tidal harbour, which is owned by a company, is enclosed by two piers and a breakwater, the area being about 30 acres, and the quayage 1400 yds. The roadstead is one of the finest on the coast of England. With France there is a large traffic in wines, spirits, silk, fruit, vegetables and general provisions. The. coasting trade consists chiefly of imports of coal and provisions, the exports being principally timber for saw-mills and fluting for the Staffordshire potteries. Some shipbuilding is carried on.

NEW HEBRIDES, a chain of islands in the western Pacific Ocean, between 166° and 171° E., and 15° and 21° S., included in Melanesia, and under the joint influence of Great Britain and France. (For map, see PACIFIC OCEAN.) From New Caledonia to the S.W. they are separated by a deep channel; but a comparatively shallow sea indicates their physical connexion with the Santa Cruz group (q.v.) to the N. The chain lies S.E. and N.W., but the main islands are arranged somewhat in the form of the letter Y. The south-easternmost island is Aneteau; N.W. from this the main islands are Tanna or Alipere, Eromanga, Efate,1 the Shepherd Islands and Api or Epi. At this point the arms of the Y divide, the western comprising the large islands of Malekula or Malicollo and Espiritu Santo,2 the eastern consisting of Ambrym, Arag and Maiwo or Aurora, with Aob or Leper Island between the two arms. Espiritu Santo, the largest island, has an area of 375 sq. m. Irregularly disposed to the N. of the Y are the lesser islands composing the Banks group—Gaua, Vanua Lava, Mota, Valua, &c., and the Torres Islands. With their rugged outline and rich vegetation, the islands as seen from the sea are very beautiful. Extending the small Torres group, which are low-lying and perched on reefs, but without lagoons, all the islands are of volcanic, not coral, formation, the larger ones lying on both sides of the line of volcanic activity. The coasts are almost free from reefs and the shores rise abruptly from deep water. Old coral is sometimes found elevated to a considerable height. The islands are formed chiefly of basalt and recent eruptive material; earthquakes and submarine eruptions are not infrequent; and some of the islands themselves have active craters. All have considerable elevations, the loftiest being the isolated cone of Lopevi, near the junction of the arms of the Y; its height is 3142 ft. The volcanic soil is very rich. Numerous clear streams water the islands, but some debouch upon flat ground towards the sea, and form unhealthy marshes there. Copper, iron and nickel are the most important minerals known in the group, and sulphur is of some commercial importance.

The climate is generally hot and damp, but there is a season (November to April) which is specially distinguished, as such, and is somewhat unhealthy. The trees—Casuarina, candle nut (Aleurites triolea), kauri pine (or Tanna), various species of Ficus, Myrtaceae and many others—are magnificent. The coco-nut is not confined to the coast, but grows high up the valleys on the hill-sides. Sandal-wood is also found. Besides the breadfruit, sago-palm, banana, sugar, yam, taro, arrowroot and several forest fruits, the orange, pine-apple and other imported species flourish; and European vegetables are exported to Sydney. Land mammals are scarce; they include bats, rats and pigs which have run wild. There are some lizards and turtles; birds include pigeons, parrots, ducks and swallows; locusts, grasshoppers, butterflies and hornets are numerous, and the sea abounds in fish, which, however, are generally inferior as food. The islands are inhabited by the Melanesian races.

The native population is estimated at 50,000; in 1904 the British population was 212, the French 401. The island of Efate contains the seat of the joint government, Vila or Port Vila (formerly Franceville), and the majority of the French population. There are several British and French trading companies, and a considerable area is cleared and worked by settlers. The chief exports are copra, coffee, maize, bananas, timber, &c.

1 Efate, Vaté, Paté, Efate or Sandwich island.
2 Abbreviated to Santo; native Martina.
The nature of the New Hebrides are Melanesian of mixed blood, and differ much in different islands. On Efate and some others Polynesian immigration has produced a taller, fairer and less savage people. In some parts, as on Aoba, isolated Polynesian communities exist. Melanesians in all parts are tall, with low, receding forehead, broad face, flat nose and thick lips. The natives decorate themselves with nose-rings and ear-rings and bracelets of shells. The men are constantly fighting; their weapons are bows and poisoned arrows, often beautifully designed, clubs of elaborate patterns and spears. Their houses are either round huts, or rectangular with pitched roofs resting on three parallel rows of posts. The villages are scrupulously clean and neat, ornamented with flowering shrubs, crotons and dracenas, and are often fortified with stone walls. In character the New Hebrideans are ferocious and treacherous, though most of their unhospitality is due to the fact that the trade of traders and labour agents. The women occupy a degraded position, and in some islands widows are buried alive with the bodies of their husbands. There is a great belief in sorceries and omens; but prayer and offerings (usually of shell money) are addressed mainly to the spirits of the (recently) dead, and there is another class of spirits, called Vai, who are appealed to when incorporeal in certain stones or animals; of one of two such the divinity is generally recognized. By the villages a shadow shaped as a great banyan tree is often set apart for dances and public meetings. A certain sanctity attaches also sometimes to the Casmarina and the Cyrtis theca, the Casmarina a very large house, in which are various grades, whereas a man's rank and influence mainly depend, his grade being recognized even if he goes to another island where his language is unintelligible. In like manner a division into two and French, a division depending on degrees of rank and in the New Hebrides; The subsequent visits of several explorers, the exploitation of the sandal-wood and other products by traders and the arrival of missionaries helped to open up the islands and to give them a certain commercial importance by the middle of the 19th century. Trade was mainly with New Caledonia, and France was thus indicated as the dominant power in the New Hebrides; even British planters pressed France to annex the islands in 1876, but in the following year some of the missionaries urged the same course on England. In 1878 the islands were declared neutral by Great Britain and France. The presence of British and French interests under a single administration was unsatisfactory administration, especially in regard to the settlement of civil actions and jurisdiction over the native population. As to the establishment of commercial supremacy, French interests clashed with Australian, and in 1882 M. John Higgison of New Caledonia (d. 1904) consolidated the former by founding the trading society which afterwards became the Société française des Nouvelles-Hébrides. In 1886 one of the most serious of many native outbreaks occurred, necessitating a French demonstration of force from New Caledonia. An Anglo-French convention of the 16th of November, 1891, provided for the surveillance of the islands (protection of life and property) by a mixed commission of naval officers. The Anglo-French agreement of 1904 had a clause providing for an arrangement as to proper jurisdiction over the natives and for the appointment of a commission to settle disputes between British and French landed proprietors. In this and the following year there was much unrest among the natives, and a joint punitive expedition was necessary. Strong feeling was aroused meanwhile in Australia owing to the disabilities suffered by British settlers in the islands. British annexation, or at least a division of the group into British and French spheres, was urged. But on the 20th of October 1906 a convention was signed in London, confirming a protocol of the preceding 27th of February, and providing that “the group of the New Hebrides, including the Banks and Torres Islands,” should form “a region of joint influence,” in which British and French subjects should have equal rights in all respects, and each power should retain jurisdiction over its own subjects or citizens. The claim of other powers to share the joint influence was excluded by the provision that their subjects resident on the islands must be under either British or French jurisdiction. A British and a French high commissioner were appointed, each assisted by a resident commissioner; provision was made for two police forces of equal strength, and the joint naval mission of 1887 was retained for the purpose of keeping order. The high commissioners were given authority over the native chiefs. A joint court was established, consisting of two judges, appointed respectively by Great Britain and France, and a third, to be president, and not a British subject or French citizen, appointed by the king of Spain. Its jurisdiction covers all sorts of cases (including breaches of contract) between non-British and non-French subjects, and all offenses against the provisions of the convention. The sale of arms and intoxicants to natives is forbidden; and the convention regulates the recruitment of native labour. Provision was made for community of interests in regard to public works, finance and the official use of the English and French languages. The creation of municipalities on the application of groups of not less than thirty non-native residents was provided for, municipal votes being given to both sexes. The convention provided against the establishment of a penal settlement and the immigration of prisoners. This convention was bitterly criticized in Australia on the ground that many of the provisions which nominally established equality between British and French would operate in practice to the advantage of the French; and there was no little dissatisfaction on the ground that the Australian government was neither represented at the preliminary conference, nor fully consulted during the negotiations.

NEW IBERIA—NEW JERSEY

501

See Parliamentary Papers, France, No. 1 (1888 and 1906), and "Colonial dependence relating to the Convention . . ." (Cd. 3288), (1907).

NEW IBERIA, a city of Louisiana, U.S.A., capital of Iberia parish, on the Bayou Teche, in the southern part of the state, about 125 m. W. of New Orleans. Pop. (1890) 3447; (1900) 6815 (3309 negroes); (1910) 7496. It is served by the Southern Pacific, the Franklin and Abbeville, and the New Iberia & Northern railways. Lumber, sugar, cotton and rice are produced in the neighbourhood. At the village of Avery Island, about 10 m. S.E., there are deposits of rock salt. The municipality owns and operates the waterworks and the electric lighting plant. New Iberia was laid out in 1835 and was chartered as a town in 1847.

NEW JERSEY, one of the Middle Atlantic states of the American Union, lying between 41° 21' 22°-6" and 38° 55' 40" N. lat., and 75° 35' and 73° 53' 39" W. long. It is bounded, N., by the state of New York; E., by the Hudson river, which separates the state from New York, and by the Atlantic Ocean; and S. and W. by the Delaware Bay and river, which separate New Jersey from Delaware and Pennsylvania. All the boundaries except the northern are natural. New Jersey has an extreme length, N. and S., of 166 m., an extreme width, E. and W., of 57 m., and a total area of 8224 sq. m., of which 710 sq. m. are water.

Physiography.—There are within the state four distinct topographic belts—the Appalachian, the Highlands, the Triassic Lowland and the Coastal Plain. The folded Appalachian belt crosses the N.W. corner of the state, and includes the Kittatinny Mountain and Valley. The mountain has a north-east-south-west trend, crossing the Delaware river at the Delaware Water Gap and continuing S. into Pennsylvania. In width the range varies from 1 to about 2 m. in the S. Its western foot lies along the Delaware river, which for some distance flows parallel with the range, and has an altitude of about 400 ft. above the sea level; while the Delaware, when it reaches the Water Gap, where it leaves it. Where the crest of the ridge enters the state its elevation is 1535 ft.; at High Point, its highest point, the ridge attains a height of 1803 ft., the highest point within the state. A large distance relating to the Delaware river is 40 m. N.W. of the state. At this point the width of the river, while it is 1570 ft. Beyond Culver's Gap the river narrows again to a ridge, and for a portion of its length it is double-crested. On the eastern side the slope is abrupt as to make ascent difficult and at places impossible, but the western slope, or account of a dip of the rock to the N.W., is more
NEW JERSEY

great. The eastern foot has a very uniform altitude of from 900 to 1000 ft. above the sea. The crest of the ridge is from 600 to 1200 ft. W. of the foot, and from 450 to 600 ft. above it. At the base of this ridge half a mile out through the Hudson is a gap, through which the river flows. This gap, 900 ft. wide at the base and 4500 ft. wide at the top, with sides rising abruptly to a height of 1200 ft. and more, is an impressive sight. The Kill van Kull, a branch of the river, extends about 40 m. long and 12 m. wide, and has an average elevation of 700 ft. Its western margin is from 900 to 1000 ft. above the sea, and its eastern border is from 400 to 500 ft. lower. The floor of the valley where the Hudson crosses the ridge is about 25 m. below sea-level, whose divides are from 700 to 900 ft. above the sea. South-east of the Kittatinny Valley, and parallel with it, lies the second topographic line of the ridge, an abrupt escarpment of 900 sq. m., having a length, N.E. and S.W., of 60 m., and a width varying from 9 to 18 m. It consists of an upland plateau now dissected by streams into a series of hills and ridges, and corresponds to lower waters, farther the S.W. and to the upland region of southern New England. The average elevation of the Highlands is about 1000 ft.; the highest point, between Canisteer and Vernon, in Sussex county, being 1496 ft. The third ridge, called the Triassic Lowland, occupies about one-fifth of the surface of the state. Its N.W. border is marked by a line drawn S.W. across the state through Pompton, Morristown, Lebanon and Highbridge to the Delaware; its S.E. corner is drawn from the highest point of the Highlands to the Hudson. Its surface is irregular, with altitudes ranging from above sea-level to 900 ft. A noteworthy feature of this area is the series of trap rock ridges, between which the Passaic river makes its irregular way through the valley. Along the bottom lastmentioned ridge, at Passaic, in the Hudson river for about 25 m. and is known as the Palisades Ridge, or simply the Palisades, because of the scenic effect produced by the long line of cliffs joining the shoulders of this river. To the W. the slope of the river is very gentle. The Palisades extend from a point N. of the New York boundary as far S. as Weehawken, the line thus being approximately the 40th parallel of latitude. A slight ridge occurs at the E. base of the Palisades Ridge, but the summit is covered with trees. The trap formation extends from the Kill van Kull Channel, and includes, among other ridges, the so-called First and Second Palisades of Bergen county, known as the "Oranges," or "Orange County."

The fourth and final ridge of the state is the S.W. or Ridged River, more properly the S. of the Ridged River, a gap 200 ft. in altitude. S. of the Ridged River the topography of this belt is similar to that of the previous portion, but much of the area is over 200 ft. above the sea. South-east of the Triassic Lowland lies the fourth topographic belt, the Coastal Plain, containing an area of 4400 sq. m., or slightly more than one-half the entire surface of the state. This belt, bordered on the E., S. and W. by water, is highest near its centre and lowest along its margins. It is free from mountainous ridges, but there are rounded drumlins, the oldest of the series. As a whole, this is a plain, except for a small ridge, the Breakneck Ridge, (250 ft.) in Monmouth county. One-third of the Coastal Plain is below 50 ft. in altitude; two-fifths are between 50 and 100 ft. and more than a fourth of the area is over 100 ft. above sea-level. The total area of the belt as high as 200 ft. and more does not exceed 15 sq. m. About one-eighth of the area consists of tidal marsh, lying chiefly between the long sandy ridges or barrier beaches. The ridges and the marshes are wide apart, and the marshes vary from 1 to 6 m. being least in the extreme N. and S. and greatest near the mouths of streams. There is also a marsh along Delaware Bay, unprotected by a beach. The waters between these beaches and the mainland are very full and part of the state, and changing into tidal marsh. In addition to the stretches of marsh along the coast, the coastal-flowing rivers of the Coastal Plain are fringed with large areas of swamp land, some of which is well forested.

For the entire state the average elevation is 250 ft., with 4100 sq. m. below 100 ft.; 2100 sq. m. between 100 and 500 ft.; 1400 sq. m. between 500 and 1500 ft.; and 400 sq. m. between 1500 ft. and 3500 ft. The four topographic belts of the state correspond very closely to the outcrops of its geological formations; the rocks of the Appalachian belt being of Palaeozoic age; the formation of the Highlands are of Mesozoic, and that of the S.W., or Ridged River, are of Tertiary age. The Great terminal moraine of the glacial epoch crosses the N.E. and S.W. line of the state, forming an irregular line running W. and N.W., from Staten Island, N.Y.

The effect of the glacial scour is seen in the irregular course of the streams, the numerous lakes and freshwater marshes and the falls that are a feature of the rivers. These streams have been shaped by man and changed by the various types of forest cover which have grown on the same ground. As the waters of the stream have been diverted into mill races, the river very seldom makes this leap in its natural channel. The power thus generated has been largely instrumental in creating the city of Paterson (p. 51.)

The Passaic is a great forest area of the state; it contains about 1200,000 acres of woodland, practically continuous, and portions of it still sparsely inhabited. The woods are chiefly of hardwoods and in the best part of the forest of the same species, chiefly pitch pine with a variety of oaks, replaces it. Within "The Pines," immediately north of the Passaic river, lies an area of about 20,000 acres called "The Plains." These are very much inferior to the forest, and the trees are less evenly distributed. Tree forms are entirely absent. The cause of this condition is still undetermined. Along the streams in this section are many swamps, valuable for the white cedar that they produce, or when cleared, for cranberry bogs. The northern part of the state is much more rugged, as the waters of the stream have been diverted into mill races, the river very seldom makes this leap in its natural channel. The power thus generated has been largely instrumental in creating the city of Paterson (p. 51.)

The total length of the Passaic is about 100 m., but its course is so circuitous that it is hard to give a straight line from its source to its mouth which is only about 15 m. See G. B. Hollister and M. O. Leighton, The Passaic Flood of 1902 (Washington, 1903), and M. O. Leighton, The Passaic Flood of 1902, New Jersey State Water Supply and Irrigation Papers of the U.S. Geological Survey.
and the forests are chiefly of chestnut and various species of oak. Though much broken by farms and other elements of culture they aggregate about 740,000 acres. New Jersey's forests have suffered much from fire, but with the exception of 'The Plains,' the soil everywhere is rich and the climate and good market facilities increase the potential value of the whole woodland area. The state maintains a Forest Commission whose chief concern is to control the fires and thereby give value and stability to the remaining stands. In this it is having considerable success. The state is also acquiring, and maintaining as demonstration acres and public parks, forest reserves in various parts of the state. The five reserves now held are in Atlantic, Burlington and Warren counties.

Climate.—Between the extreme northern and southern sections of the state there is a greater variation in climate than would naturally be expected in a state so narrow in latitude. This is due to the climate of the ocean in the S., and to the relatively high altitudes in the N. Near Cape May fruit trees bloom two or three weeks earlier than in the Highlands. The mean annual temperature ranges from 49° to 51°, except the extreme N.W. district, where it is in the order of 50°. The average date of the first killing frost at Dover is the 4th of October, and of the last, the 10th of May; at Atlantic City, on the sea-coast, these dates are respectively the 4th of November and 11th of April. At Dover the mean annual temperature is 49°; the mean for the winter is 28°, with an extreme minimum recorded of −13°; and the mean for the summer is 70°, with an extreme maximum recorded of 102°. At Camden the mean annual temperature is 52°; for the winter it is 34°, with an extreme of −7°; and for the summer, 70°, with an extreme of 96°. At Vineland, a southern interior town, the mean annual temperature is 53°; for the winter 31°, with an extreme of −6°; and for the summer, 74°, with an extreme of 105°. These records of temperature afford a striking illustration of the moderating influence of the ocean upon the climate. The average wind direction along the coast is from the sea. New Jersey has a more equable climate than some of the states in the same latitude farther west. During the summer months the general course of the wind along the sea-coast is interrupted about midday by an incoming current of air, the "sea breeze," which gradually increases until about three o'clock in the afternoon, and then gradually lessens until the offshore wind takes its place. As the heat is thus made less oppressive along the coast, the state has more habitable space for cities and cities that have become popular summer resorts—among the best known of these are Long Branch, Asbury Park, Ocean Grove, Atlantic City (also a winter resort) and Cape May. Among the interior resorts are Lakewood, a fashionable winter resort, and Lake Hopatcong, and Greenwood Lake and surrounding regions, much frequented in the summer. In the summer the prevailing winds throughout the state are from the S.W.; in the Winter, from the N.W. The normal annual precipitation is 47.7 in., varying from 46-6 in. on the sea-coast to 49.1 in. in the Highlands and the Kitta- tawa. Very slight precipitation is fairly common in the summer than in the other seasons, which differ among themselves very little in the average amount of rainfall. From December to March, inclusively, part of the precipitation is in the form of snow. In the northern part of the state snow is more common in winter. In no part of the state is free from snow storms. In the summer thunder storms are frequent, but are generally local in extent, and are much more common in the afternoon and early evening than in the morning.

Soils.—The soils of the state exhibit great variety. Those of the northern and central sections are made up in part of glacial drift; those of the southern sandy or loamy, and are locally enriched by deposits of marl. The most fertile soils of the state lie in the clay and marl belt, a region from 10 to 20 m. wide extending across the state in a general south-western direction from Long Branch to Salem. South of this belt the soils are generally sandy and are not very fertile except at altitudes of less than 50 ft., where they are loamy and of alluvial origin.

Agriculture.—In 1900 very little more land was under cultivation than in the year 1890, the average for these years being respectively 2,849,966 and 2,752,946. The number of farms, however, increased from 23,905 to 34,294, and the average size of the farms decreased from 115.2 acres to 82.2 acres, an indication that agriculture gradually became more intensive. In 1900, 22% of the farms contained from 20 to 50 acres, 48.3%, 50-175 acres and only 7.8% contained over 175 acres. Farms were smallest in Hudson county, where the average size was 77.9 acres; largest in Warren county, where the average size was 143.4 acres. The counties with the largest total acreage were Burlington (343,996), Sussex (256,866) and Hunterdon (248,773). Between 1890 and 1900 the percentage of farm-accounts and acreage increased from 75.4 to 70.1; the per- 1 The amount of timber cut within the state is very small. Before the appearance of forest-products, lumbermen cut only small quantities of timber. The cutting of young trees for the manufacture of charcoal was a profitable industry. Since 1860 the forest area has only slightly diminished, and the production of the timber has improved, but large trees are still scarce. 2 centage of cash tenants increased from 10.5 to 13.2; and that of share tenants remained about stationary, being 12.4 in 1880 and 14.6 in 1900. In this last year 27.5% of the farms derived their principal income from live stock, 20.5% from vegetables, 17.2% from dairy produce, 7.8% from fruits and 7.8% from hay and grain.

In 1907, according to the report of the United States Department of Agriculture, the principal crops were: hay, 634,000 acres, value $3,447,708; potatoes, 78,000 acres, value $320,704; Indian corn, 8,757,000 bushels ($5,177,000); wheat, 1,998,000 bushels ($1,958,000); rye, 1,372,000 bushels ($1,043,000); oats, 1,770,000 bushels ($991,000). The number and value of each of these crops are not surpassed by any other state. Asparagus, the older vegetable crop, and China capsicums, were surpassed in 1908 by tomatoes, for which the acreage in 1898 was as follows: horses, 102,000 ($11,526,000); mules, 5,000 ($765,000); milk cows, 190,000 ($8,170,000); other next cattle, 38,000 ($558,000); sheep and lambs, 1,254,000 ($1,555,000). In 1899, 5,959 farms were classified as dairy farms, i.e. they derived at least 40% of their income from dairy products; and the total value of dairy products was $8,456,566, the larger portion of which was from the sale of milk, butter and cheese at $6,110,000. Poultry raising also is an important agricultural industry: poultry in the state was valued at $1,300,853 on the 1st of June 1900; and for the 1st 9 months of 1901 the value of all poultry raised was $2,256,316, and the value of eggs $1,938,304. In the production of cereals the state has not taken high rank since the development of the wheat fields of the western states; but in 1899 the acreage in cereals was 1,432,000 acres, valued at $1,682,576, and the yield was 57-5% of that of all crops. Of the total acreage in cereals in 1907, 278,000 acres were in Indian corn; 168,000 in wheat; 78,000 in rye; and 60,000 in oats. The chief cereal-producing counties in 1900 were Burlington, Cumberland, and Warren. The acreage in the valuable fallow field crop in 1907 was hay and forage, consisting mostly of clover and cultivated grasses; in 1899 the value of this crop was $2,300,375.

Since 1830 market gardening in New Jersey has become increasingly important, especially in the vicinity of large cities, and has proved more profitable than the growing of cereals. In the total average devoted to the raising of vegetables in marketable quantities New Jersey in 1900 was surpassed by only two other states. The value of the marketable vegetables in 1899 was $1,610,658, and the value of the total vegetable crop, $3,425,596, or 30.7% of that of all crops. These vegetables are of great importance; in 1907 there were 70,000 acres in potatoes, yielding 8,400,000 bushels, valued at $6,216,000. Between 1899 and 1907 the value of the potato crop more than doubled. In 1899 the Jersey potato was also grown and the potato crop was valued at $2,594,061; of small fruits the largest crop is that of cranberries, which in 1899 was valued at $47,500, but in 1907 $89,100, and in 1908 $113,372. Other important crops are strawberries, which were cultivated on 974 acres in 1908, and the value of the strawberry crop was $3,210. Strawberries and cranberries of the Jersey type are characteristic of the state. The cranberry crop is valuable in the vicinity of the Delaware river and in the vicinity of Palmyra; and the Woodmanse, area in Ocean county. As the clay pits contain only small amounts of any one kind of clay, it has proved more profitable for manufacturers to buy their raw materials from a number of miners than for them to operate the mines themselves, and consequently clay mining and the manufacture of clay products are largely done in other states. The clay yields of New Jersey are doubtless more important than in any other state, the amount mined and sold in 1902 being a third of the entire output of the United States, and the amount in 1907 (440,130 tons) being more than one fifth of all clay produced in the United States. The clay products are: brick and tile, $6,019,834, and pottery, $6,985,626. New Jersey was uncontrolled only by Ohio and Pennsylvania, and lead and silver are also mined in the state. The manufacture of Portland cement, an industry that has attained importance since 1892, is of value in the state; it is the value of its product in 1907 ($4,715,516) New Jersey was surpassed only by Pennsylvania. In the manufacture of Portland cement, an industry that has attained importance since 1892, is of value in the state; it is the value of its product in 1907 ($4,715,516) New Jersey was surpassed only by Pennsylvania.
...section; and limestone and trap rock are important mineral resources. In 1907 the total value of stone quarried in the state was $1,532,312, of which $905,436 was the value of trap rock, $274,422 of limestone, $177,760 of sandstone, and $66,876 of granite and marble. Some roofing slate is produced in Sussex county; in 1907 the output was valued at $8000. The mining of natural fertilizers—white and greensand marl—is a long established industry; the output in 1907 was $33,795. Of mineral ores the most important are iron, zinc and copper. The manufacture of iron in New Jersey dates from 1764, when the metal was reduced from its ores at Shrewsbury, Monmouth county. This industry was largely worked up to 1870 by the three chief in Morris, Passaic, and Sussex counties, form the basis of the present industry. Bog ores were mined until about 1840; since that date they have had no market. The chief iron-mining districts are Passaic valley, where iron was being nearly 1,000,000 tons of ore in 1892, 257,235 tons in 1897; and $49,770 tons in 1907, when the output was valued at $1,815,586, and was about nine-tenths magnetite and one-tenth brown ore. The chief places of production are Hibernia (Morris county) and Mt Pleasant (Hunterdon county); in 1907 four mines in the state produced 316,236 tons. In the production of zinc New Jersey once took a prominent part; in 1907 the only producer was The New Jersey Zinc Company's mine at Franklin Furnace, Sussex county, with an output of 15,577 short tons, valued at $1,601,614. The chief deposits consist of red oxide, silicate and franklinite, and the average value of the ores is about $15 per ton. Zinc from each of the several mines was smelted, rolled into sheets and worked to a small extent in colonial days. One of the brass cannon used at Yorktown was made of copper taken from the Watchung Mountains during the War for Independence. These mountains are still a source of copper ore, and the ores of copper, lead, zinc, chalcedony and chrysocola, are also found in various parts of the Piedmont region. In the years following 1900 there was renewed interest in copper mining, and in 1907 eleven springs (three in Bergen and eight in Passaic county, in Morris, Camden and Somers county) reported to the U.S. Geological Survey the sale of 682,445 gallons (mostly table water), valued at $6,334. Other minerals, which are not found in commercial quantities, are lead in the form of galena, in Sussex county; graphite, in the crystalline schistose rocks of the Highlands; molybdenum, in the form of a sulphide, in Sussex county; and barytes in Monmouth and Sussex counties. In Bergen, Warren, and Morris counties there are numerous bogs containing peat of a good quality.

Manufactures.—After 1890 New Jersey made rapid progress in manufacturing. In 1900 factories and manufactory of New Jersey, 7.7 % of the population were employed as wage-earners in manufacturing establishments; in 1900, 12.8 %. The value of the product in 1890 was $305,821,256; in 1900, $354,573,571; in 1900, $611,748,033. Such figures of the census of 1900 are as comparable with those of the special census of 1905, when the only establishments under the factory system were enumerated, show that between 1900 and 1905 the number of factories increased 9.3 %, the capital, 49.5 %, the labor engaged, 9.0 %, and the value of products (in 1900 to $774,390,092). This rapid development is due to the excellent transportation facilities, and to the proximity of large markets and of raw materials. Among the mining districts were those (in Chester and Salem counties) for the production of coal and iron of Pennsylvania. The chief manufacturing centres in 1905, as judged by the value of their products, were Newark ($160,045,377), Jersey City ($75,760,593), Bayonne ($50,633,761), Paterson ($49,138,200), Elizabeth ($40,046,575), and Trenton ($32,719,945). In 1905, 67.1 % of the factories were in municipalities having a population of at least 8000 in 1900, and their product was 74.1 % in value of the total. There are indications, however, that industries are slowly shifting to the smaller towns. The textile industries taken together are the most important of the manufacturing industries, having a greater output in 1900, $81,910,850; in 1905, $96,040,034), employing more labourers and capital, and paying more wages than any other group. Among the various textiles silk takes the first place, the value of the factory products increasing from $66,666,021 to $101,043,496, and the value of the silk output from $31,161,433 in 1900 to $62,804,602 in 1905. The chief silk manufacturing centres in 1905, as judged by the value of their products, were Elizabeth ($50,666,500), Paterson ($49,138,200), Jersey City ($75,760,593). In 1900 the value of the silk output was 48.8 % of the total value of the textiles, and silk manufacturing was more important than any other industry (textile or not); in 1905, however, owing to the great production of cotton goods, silk occupied only 33.6 % of the value of the silk goods manufactured in 1907, of which 51 % was worth $11,979,947, being 23.3 % of the total for the country) and in 1908 (value, $15,692,167, being 23.6 % of the total for the country). The greatest gain made by any of the textiles. In this industry New Jersey was manufactured only by Massachusetts, Rhode Island and Pennsylvania. During this five-year period there was an increase of 113.5 % in the value of the cotton goods manufactured in New Jersey; of 12.6 % (from $3,441,516 to $3,441,516) in that of linen goods; of 43.3 % (from $7,482,148 to $10,450,178) in that of hosiery and knit goods, and of 14.8 % (from $1,795,157 to $2,077,140) in that of ready made wearing and bedding. Silk goods increased from $1,537,689 in 1901 to $2,441,516 in 1905. The manufacture of cotton goods is carried on in Trenton, Somers county; Paterson is the centre of this industry in New Jersey.

In the manufacture of clay products, including brick, tile, terra cotta, and fire-clay products, the value of the pottery product, terra cotta and fire-clay products increased from $8,482,723 in 1900 to $11,717,103 in 1905; in 1905 the most valuable pottery product was sanitary ware, valued at $5,006,406; and in that year New Jersey furnis...
important artificial waterway. Its main channel (opened for traffic in 1838) extends from Bordentown, Burlington county, on the Delaware to New Brunswick, on the Raritan, 44 m. by the canal; 35 m. by the Delaware River; 50 m. by the Passaic; 100 m. by the Raritan. The canal cuts across the state, discharging it into the Raritan at New Brunswick. It is 40 ft. wide, at the bottom, 80 ft. at the top and 9 ft. deep; it has a navigable feeder (30 ft. wide at the bottom and 60 ft. long) in the Delaware trench for 30 m. from the Delaware at Bull’s Head to Trenton. The canal passes through Trenton (the highest point—50 ft. above mean tide), and Griggstown, Westen and Boughton Brook, and has one lock (or more) at each of these places. It is used chiefly for the transportation of Pennsylvania coal to New York, and is controlled by the Pennsylvania railway. The total cost up to 1896 was $513,749, including $227,017 for the canals proper, $24,760 for the feeder, 30 ft. wide at the bottom and 5 ft. deep, and (excluding 4 m. of feeders) 102-38 m. long, beginning at Jersey City and passing through Newark, Bloomfield, Paterson, Little Falls, Boonton, Kinnelon, Dover, Fort Oran, Lake Hopatcong, Hackentor, and Washington to Phillipsburg on the Delaware; it is practically in two sections, one east and the other west of Lake Hopatcong (Sussex and Morris counties; about 928 ft. above sea-level; 9 m. long from N.E. to S.W.; maximum width, 1 m.), which is a reservoir and feeder for the canal’s eastern and western branches, and which was enlarged considerably when the canal was built. There is another feeder, the Pompton (a 30-ft. m. long) which crosses the Passaic and Pompton rivers on aqueducts. The canal (the Morris Canal Banking Company) was leased in April 1871 to the Lehigh Valley Railroad Company for 999 years. It is no longer used independently. The Morris Canal connects with an important coal carrying canal (lying almost entirely in Pennsylvania), the property of the Lehigh Coal and Navigation Company, 100 ft. wide, 60 ft. deep, extending the 42 m., and which follows the Lehigh river toCoalport (Carbon county, Pennsylvania), penetrating the coal regions of Pennsylvania. 

Population.—The population of the state in 1880 was 1,131,116; in 1890, 1,444,933; in 1900, 1,883,660 (431,884 foreign-born, and 69,844 negroes); in 1905 (census) 2,144,134; in 1910, 2,510,145. Of the native-born white population in 1900, 594,004 were of foreign parentage, and 825,973 were of native parentage.

Among the various elements comprising the foreign-born population were 119,508 Germans; 94,844 Irish; 45,428 English; 41,865 Italians; 10,745 Russians; 14,013 Hungarians; 14,728 Austrians; 14,372 Poles; 14,211 Scotch; and 10,261 Dutch.

In 1800 barely 2% of the population was urban; in 1900 80% of the inhabitants either lived in cities or were in daily communication with Philadelphia or New York. The rural population is practically stationary. The chief cities in 1910 were New York, 3,447,982; Jersey City, 313,947; Trenton (96,815), Camden (94,538) and Hoboken (79,324). Owing to its milder climate and its larger number of cities New Jersey has a negro population somewhat larger than that of the states of the same latitude farther west. The rate of increase of this element, which is greatest in the cities, is about the same as that for the white inhabitants. Since 1881 colonies of Hebrews have been established in the southern part of the state, among them being Alliance (1881), Rosenhyn (1882), Carmel (1883), and, most noted of all, Woodbine, which owes its origin to the liberalism of Baron de Hirsch, and contains the Baron de Hirsch Agricultural and Industrial School. As regards church affiliation, in 1906 Roman Catholics were the most numerous, with 444,432 members out of a total of 877,548 communicants of all denominations; there were 122,511 Methodists, 79,612 Presbyterians, 65,248 Baptists, 53,921 Protestant Episcopalians, 32,290 members of the Reformed (Dutch) Church in America, and 24,147 Lutherans.

The Morris Canal & Banking Company was chartered in 1831 to build the Morris Canal, which never proved a financial success, partly because of the competition of the Delaware Raritan, which soon commanded the coal trade, and partly because of physical and mechanical defects. It was exempted from all taxation by the state for seventy years. The cost of the canal was $2,474,132; the company was not authorized to issue stocks or bonds; the company was not allowed to make a fair price, in 1833, without making any payment, to succeed to the actual ownership in 1873 upon the expiration of the charter. The idea of utilizing the Mississippi, through the Gulf of Mexico, failed of materialization, the company was defunct. A peculiar feature of the canal was a system of inclined planes or railways on which there were cradles, carrying the canal boat up (or down) the incline; these were devised by Pro- fessor John Winterbotham. Length of the canal, 75 m. in the eastern division raised boats altogether about 720 ft., and 11 of them in the western division lowered the boats about 690 ft.—the remainder of the grade was overcome by locks.

1 The Pennsylvania railway has constructed tunnels under the Hudson river, and has erected a large terminal station on Manhattan Island.

2 In William Winterbotham’s An Historical, Geographical, Commercial and Philosophical View of the American United States, &c. (London, 1795) there was a discussion of the feasibility of a canal between the Delaware and the Raritan. In 1804 a company was chartered to build such a canal; in 1816 a route was surveyed; in 1819 a company was appointed which recommended a route and suggested that the state take part in building the canal; in December 1826 a canal company was incorporated with a monopoly of the Delaware river, a grant of 300,000 acres in Pennsylvania; the company was authorized, but Pennsylvania refused permission to use the waters of the Delaware, and the charter lapsed; in 1830 the Delaware and Raritan Canal Company was incorporated by an act which foreclosed the right of the company to the 300,000 acres of land, and which provided that the canal be a 40-ft. m. wide, and that the company should pay the state 500,000 m. for the use of the Delaware and the Raritan, and which reserved to the state the right to take the waterway 30 years (changed in 1831 to 50 years); and in 1831 the canal was completed. In 1831 it was opened for traffic, and contributed greatly to its financial success. In 1831 it was combined with the Camden & Amboy railway.
Administration.—The state is governed under the constitution of 1844, with subsequent amendments of 1875 and of 1897. The only other constitution under which the state has been governed was that of 1776 (see History below). The right of suffrage is conferred upon all men, twenty-one years of age and over, who have resided in the state for one year and in the county for five months preceding the election.1 Paupers, idiots, insane persons and persons who are convicted of crimes which exclude them from being witnesses and who have not been pardoned and restored to civil rights, are not eligible. The executive power is vested in a governor, who is elected for a term of three years and may not serve two successive terms, though he may be re-elected after he has been out of office for a full term. He must be at least thirty years of age, and must have been a citizen of the United States for at least twenty years, and a resident of the state seven years next preceding his election. He may not be elected by the legislature, during the term for which he is elected as governor, to any office under the state or the United States governments. He receives a salary of $10,000 a year. If the governor die, resign or remove himself from office during the term for which he is elected, the secretary of the Senate, who serves until another governor is elected and qualified. The governor's powers under the constitution of 1776 were greatly limited by the constitution of 1844. His appointive power is unusually large. With the advice and consent of the state Senate he selects the secretary of state, attorney-general, superintendent of public instruction, chancellor, chief justice, judges of the supreme, circuit, inferior and district courts, and the so-called "lay" judges of the court of errors and appeals, in addition to the minor administrative officers who are usually appointive in all American states. The governor may make no appointments in the last week of his term. The state treasurer, comptroller and the commissioners of deeds are appointed by the two houses of the legislature in joint session. The governor is ex officio a member of the court of pardons, and his affirmative vote is necessary in all cases of pardon or commutation of sentence (see below).

The legislative department consists of a Senate and a General Assembly. In the Senate each of the 21 counties has one representative, chosen for a term of three years, and about one-third of the membership is chosen each year.1 The members of the General Assembly are elected annually, are limited to sixty (the actual number in 1900), and are apportioned among the counties according to population, with the important proviso, however, that every county shall have at least one member.

The arrangement of senatorial representation is very unequal; and the densely populated counties are under-represented. The members of the house of assembly must be at least twenty years old, and must have been a citizen and inhabitant of the state for four years and of his county for one year immediately preceding his election; and an assemblyman must at the time of his election be at least twenty-one years old, and must have been a citizen and inhabitant of the state for two years, and of his county for one year, immediately preceding his election. The annual salary of each senator and of each member of the General Assembly is $100. Money bills originate in the lower house, but the Senate may propose amendments. The legislature may not create any debt or liability "which shall, single or in aggregate with any previous debt, involve the liabilities, at any time except $600,000," except for purposes of war, to repel invasion or to suppress insurrection, without specifying distinctly the purpose or object, providing for the payment of interest, and limiting the liability to thirty-five years; and the measure as thus passed must be ratified by popular vote.

The constitution as amended in 1875 forbids the legislature to pass any private or special laws regulating the affairs of towns or counties, or to grant any money, funds or property to any corporation, priest, religious or ministerial societies, and prescribe in imposing taxes the assessment of taxable property shall be according to general laws and by uniform rules, and levied only to support and maintain the public schools. The constitution also prohibits the amendment prohibiting the legalization of lotteries, of pool-selling or of other forms of gambling. The governor may (since 1875) veto any item in any appropriation bill, but any bill (or item) may be passed over his veto by bare majorities of (all members elected) in both houses, and to this vote there shall be added no more than one vote of (all members elected to each house), and then be ratified by the voters at a special election, and no amendment or amendments may be submitted by the legislature to the people oftener than once in five years.

The judicial system is complex and is an interesting development from the English system of the 18th century. At its head is a court of errors and appeals composed of the chancellor, the justices of the supreme court and six additional "lay" judges. The supreme court consists of a chief justice and eight associate justices, but it may be held by the chief justice alone or by any one of the associate justices. The state is divided into nine judicial districts, and each supreme court holds circuit courts within each county of a judicial district, besides being associated with the president "judge of the court of common pleas of the county in holding the court of quarter sessions, the court of oyer and terminer and the orphans' court. One of five additional judges may hold a circuit court in the absence of a justice of the supreme court, or the "president" judge of a court of common pleas may do so if the supreme court justice requests it. In each township there are from two to five justices of the peace, any one of whom may preside over the "small cause court," which has jurisdiction of cases in which the matter in dispute does not exceed $200 and is not an action of replevin, one in which the charge is slander, trespass, trespass assualt and battery, or imprisonment, or in which the title to real estate is in question.

The court of common pleas, which may be held either by the "president" judge or by a justice of the supreme court, may hear appeals from the "small cause court," and has original jurisdiction in all matters, except those arising out of divorce or annulment proceedings, or proceedings for the recovery of debts or money or profits, and proceedings for the appointment of guardians, and for the administration of property, and proceedings for the guardianship and administration of the affairs of insane persons.

The court of common pleas, which may be held either by the judge of the court of common pleas or by a justice of the supreme court, has jurisdiction over all criminal cases except those of treason or murder. The court of oyer and terminer is a higher criminal court, and has cognizance of all crimes and offences whatever. Except in counties having a population of 300,000 or more, a justice of the supreme court must preside over it, and the judge of the court of common pleas may or may not sit with him; in a county having a population of 50,000 or more the judge of the court of common pleas may sit alone. Writs of error in cases punished in the court of common pleas may be obtained by either defendant or plaintiff. Appeals in error may be had from the court of appeals in either of the courts named, or from either of those courts to the supreme court. Appeals are permitted in criminal cases. The orphans' court may be held either by the judge of the court of common pleas or by a justice of the supreme court; and it has jurisdiction over matters arising out of divorces, and proceedings for the appointment of guardians, and proceedings for the determination of the nature, quality and extent of the property of insane persons;

Brevity in argument and the absence of technicalities are characteristic of the New Jersey court of nisi prius, but the language of the law is precise and the rules of evidence are strictly adhered to.

1 The constitution of 1844 limited the suffrage to white males, and although this limitation was annulled by the fifteenth amendment to the Federal Constitution, it was not until 1875 that the state was entirely freed from it. (Adopted in 1897.) (Adopted in 1897.) The word "white" from its suffrage clause. At the same time another amendment was adopted providing that sailors and soldiers in the service of the United States in time of war might vote although absent from their election districts.
than 5000 inhabitants may be incorporated as a town, with its government vested in a mayor and council. Any township or part thereof with less than 4 sq. m. of territory, and less than 5000 inhabitants, may be incorporated as a borough, with its government vested in a mayor and council.

In 1903 a law (revised in 1908) was passed providing for the conduct at public cost of primary elections for the nomination of new town school board candidates and for the nomination of party nominating conventions; nominations for primary elections are made by petitions signed by at least ten voters (except in very small election districts) who make affidavit as to their party affiliation and will file a letter of endorsement. Under this act a "political party" is one which polled at least one-twentieth of the total number of votes cast in the next preceding election at the time the petition is made; there must be one delegate from each election district, and one delegate for each 200 votes cast by the party in the next preceding gubernatorial election.

An act approved on the 12th of April 1908 authorized a Civil Service Commission of four members appointed by the governor, who choose a chief examiner and a secretary of the commission. Civil service rules adopted by this commission went into effect in the same year for certain state employees. In 1919 that part of the law permitting municipalities to adopt these rules through their governing bodies was declared unconstitutional; but municipalities may adopt them by vote.

A state Board of Railroad Commissioners (three appointed by the governor), created in 1907, became in 1910 a Board of Public Utility Commissioners with jurisdiction over all public utilities (including electric, telegraph, telephone, and banking) for the issue of stock or bonds, but it has no power to fix rates.

The state acts concurrently with New York in preserving the natural scenery of the Palisades on the Hudson river; and in 1908 the Palisades Interstate Park, with a width of 13 m. on the Hudson, from Fort Lee to Piermont, was dedicated.

The homestead exempt from sale under seizure is limited to the house and lot, not exceeding $1000 in value, of a debtor having a family. To entitle the property to exemption, it must be registered as a homestead in the office of the county clerk, and it may be sold, then, only with the consent of the husband and wife, and the proceeds must be used to remove a debt or to purchase the purchase of another homestead. The exemption does not extend to a sale for unpaid taxes, for labour done on the homestead, materials furnished therefor, or for a debt incurred in the purchase thereof, or prior to the recording of the notice. The exemption inures to the benefit of the widow and family of the holder of the homestead under the laws in force, and the age of the homestead before the age of 18.

The homestead is by electrocution. A law of 1902 provides the death penalty for any murderous assault on the president of the United States, the chief executive of any state, or the heir to any foreign throne.

The ground in an absolute divorce are only: adultery and "willful, obstinate refusal to live with a spouse in accordance to their mutual consent". The grounds in a divorce or annulment are the same: that the continuance of a marriage is a cause of action arose and has continued to reside there, no suit for a divorce can be begun until one of the parties shall have resided in the state for the two years next preceding. Furthermore, the cause of action must be recognized in the jurisdiction in which the petitioner resided at the time it arose.

No child less than fourteen years old is permitted to work in any factory, workshop or mill; and the penalty for each offence is $50.

The employment of children under sixteen years of age in any mercantile establishment for more than 10 hours a day, or 55 hours a week, or between 6 o'clock in the evening and 6 o'clock in the morning, is prohibited, except one evening each week when 8 hours may be permitted to work until 9 o'clock, and except in the evenings from the 15th to the 25th of December when they may be permitted to work until 10 o'clock. There are strict provisions for the protection and welfare of farm children, apprentices, and in sweat-shops.

A state law (1899) requires the payment of wages in lawful money at least every two weeks to its employees on the part of every firm, association or partnership doing business in the state.

Education: During the colonial period there were schools maintained by churches, a few town schools of the New England type, and, in the latter part of the era, a number of private schools. But the schools of colonial New Jersey, especially the private schools, were usually taught by incompetent masters, and many children were permitted to grow up without any schooling whatever. Public interest in education, however, began to awaken soon after the close of the War of Independence. Under the encouragement of an act of the legislature passed in 1794 several academies were established. A public school fund was established in 1817. Three years later townships were authorized to levy taxes for maintaining schools for poor children.

The division of townships into school districts and the election of three trustees were provided for in 1829. In 1846 each township was required to raise as much money for school purposes as the state contributed. In 1855 a normal school for training teachers was established at Trenton. And in 1867 a school law was passed which established the main features of the present school system, although it was four years later before a state school tax was imposed and schools were made free to all children in the state. The public school system is administered under the direction of a superintendent of public instruction selected by the board of education.

Controversies arise under the school law, and exercises a general supervision over the public schools; the latter has the control of a number of special state educational institutions, appoints the county superintendents and supervises the execution of the school laws of the state. In general each city, town and township in the state constitutes a separate school district, although two or more of these may unite to form a single district. Each district is required to furnish free textbooks. All children between the ages of 7 and 13 are required to attend school for the full school year. Those whose parents or guardians fail to cause the grammar school course to continue are subject to fines.

Funds for the support of the public schools are derived from various sources: the state aid (except surplus revenue ($795,670), deposited with New Jersey by the Federal government in 1836; (2) the income from the state school fund, consisting largely of receipts from the sale and rental of riparian lands; (3) a state tax on real property; (4) a special tax; (5) the state law to supplement the school tax, so that the two combined will form a sum equal to a tax of two and three-fourths mills on each dollar of taxable property; and (6) local taxes. At the close of the fiscal year 1899-1900 the tuition in the public schools was $29,418,322. The income for the year was $224,233,56 and the disbursements were $373,095,76. The income from the state school fund is divided among the counties on the basis of the total number of days of attendance of the public school pupils; the legislative appropriation, however, is apportioned among the counties according to their assessed property values. Each county also received 90% of the state school tax it has paid, the remaining forming a reserve fund to be distributed among the counties at the discretion of the state board. The state will duplicate any yearly sum between $2500 and $5000 which a school district may raise to maintain a school or purchase apparatus; and a school district or a county may purchase for $20 for a library will receive the same amount from the state, which will also contribute $10 each year thereafter for maintenance, and the state legislature will increase the amount to $50. The state in the public schools in 1908 was 10,279; the total school enrollment was 402,866, with an average daily attendance of 288,176; and the average length of the school term was nine months and two days. For the benefit of veteran and invalid public school teachers there is "a retirement fund," which owes its origin to voluntary contributions by teachers in active service. The state has taken official recognition of this fund and administers it on behalf of the contributors through a board of trustees appointed by the governor.

In addition to the regular public schools, the state maintains a normal and a model school at Trenton, a normal school at Montclair, the State Normal School at East Orange, Girls' High School, the Training and Industrial School for Colored Youth at Bordentown, and an agricultural college and experiment station, maintained in connection with Rutgers College, at New Brunswick. There are preparatory schools in Newark, Hoboken, and Trenton, which the state made an appropriation of $20,000 in 1908. Among the prominent institutions not receiving state aid are Princeton University, Rutgers College (excluding its agricultural school); New Brunswick State Teachers College; New Brunswick State University; Stevens Institute of Technology, at Hoboken. Among the denominational institutions are the Theological Seminary (Presbyterian) at Princeton; the Drew Theological Seminary; Union Theological Seminary and Hall College (Roman Catholic), at South Orange; St Peter's College (Roman Catholic) at Jersey City; St Benedict's College (Roman Catholic) at Newark; the German Theological School of Newark

The state's title to its riparian lands was established, after a long controversy, in 1887 by the Supreme Court of New York and Newark R. R. Co. (5 Vroom's Reports 532). Since that date, with the exception of the period of Governor Abbott's second administration (1890-1893), the proceeds from the sale and rental of these lands have been regularly applied to the school fund.
NEW JERSEY

(Presbyterian) at Bloomfield; and the Theological Seminary of the (Dutch) Reformed Church in America, at New Brunswick. There are many private academies and secondary schools, sectarian and non-sectarian.

The state supports the following charitable and correctional institutions all under the supervision of the State Department of Charities and Correction (1903); hospitals for the insane at Trenton and Morristown, a penal and reformatory prison at Trenton (partly supported by the state) and a home for feeble-minded women at Vineland; a sanatorium for tuberculous diseases at Glen Gardner; a village for epileptics, with a farm of 700 acres, near Skillman, Somerset county, on land purchased by John (now owned by the state) Jamesburg, Middlesex county, and for girls in Ewing township, near Trenton; a state reformatory for criminals sixteen to thirty years of age, at Somerville, near Trenton; a home for disabled soldiers at Kearney; Hudson county; a home for disabled soldiers, sailors and their wives at Vineland; and a school for the deaf at Trenton. There is no institution for the blind, but the state pays the expenses of blind children who are sent to New Jersey or the New York State School for the Blind. A State Board of Children's Guardians, with an office in Jersey City, cares for destitute children. A convict parole law went into operation in 1891.

Finance.—The revenues for state and for local purposes are derived from separate sources. The expenses of the state government are met chiefly by special taxes on railway and canal corporations; taxes on railroad corporations; a collateral inheritance tax and taxes of riparian lands. The counties and municipalities derive their revenues chiefly from taxes on real and personal property. Real and personal property is free from a state tax, except for school purposes. The school tax is apportioned among the counties in proportion to their taxable property.

A large part of the state's revenue comes from the tax on railways and canals, which is levied on the property actually employed in their operation. Any property of railways other than the "main stem" (i.e. the road-bed with the rails and sleepers not over 100 ft. in width), is that employed in operating the road or canal is taxed by the state for local purposes. Counties and municipalities may tax the property which they are authorized to tax by law. There are also railroad taxes actually used for railway purposes. Domestic telegraph, telephone, express, cable, parlour- and sleeping-car, gas- and electric-lighting, oil and pipe line companies, and several classes of insurance companies, are taxed on the amount of their gross receipts. Other domestic corporations are taxed on the amount of their capital stock. The rate of this tax decreases as the amount of capital stock increases, thus favouring large corporations. On all capital stock up to $3,000,000, the rate is one-tenth of 1%; on all amounts between three and five million dollars, the rate is one-twentieth of 1%; and on all above five million dollars, thirty dollars per million, or 1% on $1,000,000.

The inheritance tax is levied on all bequests in excess of $500 to persons other than specially exempted classes; and in 1907 the receipts from the "collateral inheritance tax" were $214,486. County and municipal revenue are derived from the state on account of property and personal property belonging to railroads and other corporations, which devote the proceeds to roads and schools. The fees received for issuing charters to corporations are another source of revenue.

The corporations policy of New Jersey has always been liberal; there is no limit fixed either to capitalization or to bonded indebtedness; the tax rate, as already indicated, is lower for large than for small corporations; and so many large combinations of capital have been incorporated under the laws of the state that it is sometimes called "the home of the trusts. For the fiscal year 1907 the fees collected from corporations by the secretary of state amounted to $204,454, the receipts from the tax on corporations other than railways amounted to $2,584,363-60, and the receipts from the tax on railway corporations were $807,780. It is the revenue from these sources that has enabled New Jersey to hold her position as the wealthy state of the Union, and to carry on the necessary public service a very large part of the expenses of the state, and a large part of the expenses of localities for the support of railroads, (tyrant taxes, pending litigation). In the state fund, the total

1 Also receives Federal aid.
2 Idem.
3 Idem. 4 In 1907 six depot buildings were included as part of the "main stem" until 1906, when their exclusion gave considerable added revenue to the municipalities.

The tax on railway corporations collected by the state for local purposes, and paid over to the local governments in 1907 amounted to $591,704.

5 The only state debt is state certificates for $116,000 issued to the commissioners of the Agricultural College.

Receipts for the year were $4,602,100, and the total disbursements, $5,366,813.

History.—Bones and implements have been found in the Quaternary gravels at Trenton, which have been held by some authorities to prove the presence of Palaeolithic man; but the earliest inhabitants of New Jersey of whom there is any certain record were the Leni-Lennapé or Delaware Indians, a branch of the Algonquian family. They were most numerous in the southern and central portions of the state, preferring the river valleys; but their total number, perhaps, never exceeded a thousand. They were conquered by the whites, and in the few wars that occurred between the Indians and the English, their only weapons were clubs, and they seldom any manifestations of acute hostility, though each race feared and distrusted the other. Many Indians were enslaved, and intermarriage between them and negro slaves became common. During the 18th century the Indian title to the soil was rapidly extinguished, and at the same time the vices and diseases of the stronger race were gradually reducing their numbers. In 1758 an Indian reservation, said to have been the first established within the present limits of the United States, was established at Edgepelick, or Brotherton (now called Indian Mills), and a reservation of 1,000 acres was granted to these Indians in 1809. In the following year Eustace Gomez, a Portuguese sailor in the service of the emperor Charles V., in his reputed voyage southward from Labrador, is said to have made note of the Hudson and Delaware rivers. It is very probable, also, that French traders soon afterward penetrated the region along the lower Hudson. Voyages to this region for exploration, trade and settlement, however, may be said to have really begun with the year 1609, when Henry Hudson explored the region between Sandy Hook and Raritan Bay and sailed up the river which now bears his name. After this voyage came Dutch traders who established themselves on Manhattan Island and soon spread across the Hudson river into what are now Hudson and Bergen counties. In 1614 Cornelis Jacobsen Mey explored the lower Delaware, and two years later Cornelis Hendrickseon more thoroughly explored this stream. In 1623 the first party of permanent home-seekers arrived at New Amsterdam, and a portion of these formed a settlement on the eastern bank of the Delaware and built Fort Nassau near the site of the present Gloucester City. In 1631 Samuel Godyn and Samuel Blommaert secured a patent from Peter Minuit, the director of New Netherland, authorizing them to plant a settlement near Cape May, but it was soon abandoned. A trading hut built at Paulus Hook in 1633 was the beginning of the present Jersey City. On the western bank of the Hudson the trading post of Hobocan-hackings, on the site of the present city of Hoboken, was established at an early date. From these places and from New Amsterdam the Dutch spread into the Raritan Valley. During the rule of Governor William Kieft, the Indians, disturbed by the encroachments of the settlers, assumed a hostile attitude.

The actual occasion of the Indian outbreak was the massacre of a number of Tappan Indians in 1643 by soldiers acting under Kieft's orders. From the Connecticut to the Delaware Indians rose in arms, laid waste the farms, massacred the settlers and compelled those who escaped to take refuge on Manhattan Island. The Dutch engaged the services of about fifty Englishmen under Captain John Underhill, a hero of the Pequot War, and in 1644 the Indians were defeated in several engagements, but a general peace with them was not established until the 30th of August 1645.

In the meantime colonists of another nationality had set foot on the shores of the lower Delaware. To found a colony
the new world was long the desire of Gustavus Adolphus of Sweden, but incessant European wars prevented the establishment of any settlement until after his death. In 1638 fifty colonists landed on the western bank of the Delaware and built Fort Christina on the site of the modern Wilmington. Five years later, on the eastern bank a triangular fort, called Elsaborgh, was constructed near the present Salem. But the Swedish rule was short-lived, as in 1655 the settlements surrendered to Peter Stuyvesant and passed under the control of the Dutch. Upon the surrender of the region between New Jersey and Holland and Sweden at colonization had very little influence. The Dutch and Swedes between the Delaware and the Hudson were mostly traders, and therefore did not make many permanent settlements or establish forms of government.

By the English of New England and Virginia the Dutch and Swedes were regarded as intruders, and were repeatedly warned against trespassing on English soil.1 As early as 1634 a patent had been issued to Sir Edmund Powden, appointing him governor over New Albion, a tract of land including the present states of New Jersey, Delaware, Maryland and Pennsylvania. In spite of repeated efforts by Sir Edmund and his adherents to plant a colony, it failed. In 1634 a party of English from Virginia, having ascended the Delaware and occupied Fort Nassau, which the Dutch had abandoned, were promptly captured by the Dutch, taken to New Amsterdam, and thence sent home, arriving just in time to prevent the departure of a second English expedition up the Delaware. In 1641 English colonists from New Haven migrated southward and planted a settlement on the eastern bank of the Delaware river, declaring it to be a part of the New Haven jurisdiction. In the following year Governor Kieft, the successor of the Swedes, arrested the English and sent them back to New Haven.

Many years elapsed before an English sovereign made any effort to oust the Dutch from the dominions he claimed by virtue of the discovery of the Cabots. On the 13th of March 1664 Charles II. bestowed upon his brother James, duke of York, all the lands between the Connecticut river and the eastern side of Delaware Bay, as well as all the islands between Cape Cod and the Hudson river. An expedition was sent from England in May, under the command of Richard Nicolls, and in the following August the English flag floated over New Amsterdam. In October Sir Robert Carr took possession of the settlements on the Delaware, and terminated the rule of the Dutch. The few inhabitants of what is now New Jersey acquiesced in the new order. While the expedition commanded by Nicolls was still at sea, the duke of York, by deeds of lease and release, transferred to Lord John Berkeley, baron of Stratton, and Sir George Carteret (q.v.), all that part of his new possessions extending eastward from the Delaware Bay and river to the Atlantic Ocean and the Hudson river, and northward from Cape May to a line drawn from the northernmost branch of the Delaware, "which is 42° 40' lat.," to the Hudson river in 41° N. lat. To this tract the name of New Caesarea, or New Jersey, was given, as the same name had been given in a patent to Carteret issued in 1659, to "a certain island and adjacent islets" near Virginia, in America, which were never settled—in honour of Carteret, who governed the isle of Jersey in 1643-1651 and there entertained Prince Charles during his exile from England. The

1 As early as 1613, Captain Samuel Argall, on his way to Virginia, after breaking up some Jesuit settlements at Port Royal, and Mount Desert, passed through the Narrows near the mouth of the Hudson, and finding a group of Dutch traders, made them haul down their flag and replace it with that of England. In the spring of 1620 Thomas Dermer, an English ship captain, on his way from Monhegan to England, visited Manhattan island, and told the Dutch traders that they would not be allowed to remain. In 1627 Governor William Bradford of Plymouth protested by letter to the Dutch against their occupancy, and this warning from the Pilgrims was repeated at least twice.

2 As late as 1784, Charles Varlo, an Englishman who had purchased one-third of the grant from the heirs of Sir Edmund Powden, came to New Jersey and sought to substantiate his claim. Failing in a suit in chancery to obtain redress, he returned to England, and nothing further was heard of the claimants to New Albion.

grant conferred upon Berkeley and Carteret all the territorial rights which the royal charter had conferred upon the duke of York; but whether or not the rights of government went with these soon became a vexed question. In order to attract immigrants, the proprietors in February 1665 published their "Concessions and Agreement," by which they made provision for a governor, a governor's council, and an assembly chosen by the freemen and having the power to levy taxes. Special inducements in the way of land grants were offered to persons embarking for America, and by a separate act, William of Orange, or the governor of New York, ignorant of the grant to Berkeley and Carteret, had approved certain Indian sales of land to settlers within New Jersey, and had confirmed their titles to tracts in what later became Elizabethtown, Middletown and Shrewsbury. In this way he unconsciously opened the way for future trouble. Moreover, when he had learned that the duke had parted with New Jersey he convinced him that it was a great loss, and in the effort to save what was possible, Staten Island was taken from the proprietors on the plea that one arm of the Hudson flowed along its eastern border.

In August 1665 Philip Carteret, a relative of Sir George, arrived in the province as its first governor. In May 1668 he convoked the first assembly at Elizabethtown. At the next session, in the following November, the towns of Shrewsbury and Middletown declared that they held their grants from Governor Nicolls, and that they were consequently exempt from any quit-rents the proprietors might claim. They refused to pay their share of the public expenses; and their deputies, on refusing to take the oath of allegiance and fidelity, were expelled from the assembly. The dissolution soon spread and led to the so-called "disorganizing" assembly in 1672, which went so far as to make James Carteret, a landgrave of Carolina and presumably a natural son of Sir George, as "President." Philip Carteret returned to England and laid the case before the proprietors; they ordered President Carteret to continue on his way to Carolina and confirmed as governor John Berry, whom Governor Carteret had left behind as deputy. The duke of York declared that the grants made by Nicolls were null and void; the king enjoined obedience to the proprietors, and quiet was restored. Another change was impending, however, and in August 1673, when a Dutch fleet appeared off Staten Island, New Jersey for a second time became a part of New Netherland. The settled region was called "Achter Koll," or "Back Bay," after Newark Bay, whose waters, lying behind the bay of New York, had to be crossed in order to reach Elizabethtown. The period of Dutch rule was short, and by the treaty of Westminster, of the 9th of February 1674, the territory was restored to England. The crown lawyers decided that the rights of the proprietors of New York and New Jersey had been extinguished by the conquest, and that by treaty the lands had been reconveyed, not to the proprietors, but to the king. On the 13th of June 1674 Charles II. accordingly wrote a letter confirming the title and power of James Carteret in the eastern half of New Jersey. No similar grant was made to Berkeley, as on the 18th of March he had sold his interest in the province to John Fenwicke, sometime major in the Parliamentary army and later a member of the Society of Friends, and Edward Bllingy, (d. 1677), a Quaker merchant. On the 29th of June the duke of York received a new patent similar to that of 1664, and he at once (on the 28th and 29th of July) confirmed Carteret in all his rights in that portion of New Jersey N. of a line drawn from Barnegat Creek to "Rankokus Kill," the name a little to the west of the site of the present Paramus, which was considerably more than one-half of the province. The duke of York commissioned Sir Edmund Andros as governor of his dominions, including "all ye land from ye West side of Connecticutt River to ye East side of Delaware Bay." Sir George Carteret again sent over his kinsman Philip Carteret to be governor of the eastern part of New Jersey, and the two governors arrived in October 1674 in the same ship. A disagreement arose as to the extent of the grant, and as the season was ending, they agreed to meet the following summer. They did meet, and in May 1675, after transacting many matters, they agreed that the eastern line of their boundary should be the river Delaware, and concluded the following agreement and truce.

2 It has been supposed that Fenwicke and Bllingy intended to establish in America a retreat for those who desired religious and political freedom.
the respective interests of Fenwicke and Byllynge in the western portion of the province, and they chose William Penn, a new member of the Society of Friends, as arbitrator. To Byllynge Penn awarded nine-tenths of the territory and to Fenwicke one-tenth. Financial embarrassment a short time afterward caused Byllynge to assign his shares in trust for his creditors to three Quakers, William Penn, Gawen Lawrie and Nicholas Lucas. Later they acquired control of Fenwicke's share also. In 1675 Fenwicke with his family and a company of settlers reached the Delaware in the ship "Griffith" from London, and on the eastern side of the Delaware they formed the settlement of Salem, the first of the Jerseys. This was the first permanent English settlement in this part of New Jersey. Refusing to recognize Fenwicke's jurisdiction, Governor Andros of New York attempted to secure his peaceful recognition of the duke's authority, and, failing in this, he sent a military force into this district in December 1676 and made Fenwicke a prisoner. In January, however, he was released on his promise not to act in a public capacity until he should receive further authority. Meanwhile the trustees of Byllynge were seeking a division of the province more to their advantage. At this time John Lawrie, chosen by the trustees of the Jersey, surrendered his grant of July 1674, the so-called "quintipartite deed" was executed on the 9th of July 1676. This instrument defined the interests of Carteret, Penn, Lawrie, Lucas and Byllynge, by fixing a line of partition from Little Egg Harbor to a point on the Delaware river, in 41° 40' N. lat., and by assigning the province east of this line (East Jersey) to Carteret and the province west of this line (West Jersey), about five-eighths of the whole, to the Quaker associates. The Quakers' title to West Jersey, however, still bore the cloud resulting from the Dutch conquest, and the duke of York had desired to recover all of his original grant to Berkeley and Carteret ever since Governor Nicolls had protested against it. But at this time his own right to the crown of England was threatened with the Exclusion Bill, and under these conditions instead of pressing his case against the Quakers he not only permitted it to be decided against him but in August 1680 confirmed their title by a new deed. A very liberal frame of government for West Jersey, drafted presumably by William Penn, and entitled "the Concessions and Agreements of the Proprietors, Freeholders and Inhabitants of West Jersey in America," was adopted in March 1677. This vested the principal powers of government in an assembly of one hundred members, who were to be chosen annually and to be subject to instructions from their constituents. In the intervals between sessions of the assembly, affairs were to be managed by ten commissioners chosen by that body. Religious toleration was assured. In August 1677 the ship "Kent" arrived in the Delaware, with 230 Quakers from London and Yorkshire. These founded a settlement, which became the modern Burlington, and in the next few months several hundred more colonists arrived. But the new colony was never actually governed under "the Concessions and Agreements"; for from the beginning until the first assembly was called in November 1681 its affairs were managed by commissioners named by the proprietors, and when in 1680 the duke of York confirmed the title to the land to Byllynge and his associates he conveyed the right to govern to Byllynge alone. Although he was one of the signers of "the Concessions and Agreements" Byllynge now commissioned Samuel Jennings as governor of the province, and the other proprietors acquiesced, appointing Byllynge governor and promising Jennings to serve as his deputy. Jennings immediately called the first assembly, and this body passed a number of fundamental laws which provided for a governor and council, but were in other respects much like the clauses relating to government in "the Concessions and Agreements." When, as if to test his authority, Byllynge, in 1682-1683, removed Jennings, who had been a popular governor, the assembly, by the advice of William Penn, passed a series of resolutions in the form of a protest, and in 1684 two agents were sent to England to negotiate with Byllynge. There the dispute was finally submitted for arbitration to George Fox and other Quakers, and they decided that, as the government of the province was legally vested in Byllynge by the duke's conveyance to him, he had the right to name the deputy governor. Fenwicke, after his release by Andros, endeavoured to re-establish a government at Salem with himself as "Lord and Chief Proprietor" of West Jersey, but the duke's officers further contested his claims and in 1682 Penn effected a peaceful settlement with him. In East Jersey, after the return of Governor Carteret, there was a period of quiet, until the death of Sir George Carteret in 1680 gave the zealous Andros another chance to further the supposed interests of his master. He managed to extend his authority over New Jersey by the terms of his commission, and on February 26, 1681, he issued a proclamation in March 1680 ordering Philip Carteret and his "pretended" officers to cease exercising jurisdiction within the duke's dominions unless he could show warrant. To this Carteret made a spirited reply, and on the 30th of April a detachment of soldiers dragged the governor of East Jersey from his bed and carried him prisoner to New York. Here he was confined for four weeks, and was released only on his promise not to exercise any authority until the matter could be referred to English arbiters for adjudication. When the assembly of East Jersey met in June, Andros had already issued a proclamation, which demanded such measures as he deemed advisable, but the deputies refused to pass them. In England, too, his conduct was disavowed, and he was called home to answer charges that had been preferred against him. Philip Carteret assumed the duties of his office, but his administration, now that Andros was no longer feared, was again marked by much friction with the assembly. Sir George Carteret had bequeathed his province to eight trustees, who were to administer it for the benefit of his creditors, and for the next two years the government was conducted in the name of his widow and executrix, Lady Elizabeth. Early in 1682, after several unsuccessful attempts to effect a sale by other means, the province was offered for sale at public auction, and was purchased by William Penn and eleven associates for £3,400. Later each of these twelve sold one-half of his share to another associate, thus making twenty-four proprietors; and on the 14th of March the duke of York confirmed the sale, and gave them all the powers necessary for governing the province. Robert Barclay, one of the proprietors, was chosen governor for life, with the privilege of performing his duties by deputy, and as his deputy he sent over Thomas Rodyard. In 1683 Rodyard was succeeded by Gawen Lawrie, who brought over with him a curious frame of government entitled "the Fundamental Constitutions." This instrument, which was designed to replace the Concessions, provided for the government of the province by a governor chosen by the proprietors, a common council consisting of the proprietors or their proxies together with 12 freemen, and a great council consisting of the proprietors or their proxies together with 144 freemen chosen by a mixed system of elections and a casting of lots. But the new system was to apply only to those who, in return for the greater privileges which it was alleged to ensure, would agree to a resurvey of their lands, arrange to pay quit-rents and provide for the permanent support of the government, and as Governor Lawrie found the colonists generally unwilling to make the exchange on the proposed terms, he discreetly refrained from any attempt to put the Fundamental Constitutions in operation and thereby avoided the confusion which must have resulted from two sets of laws. The government of the twenty-four proprietors, however, was liberal. Recognizing the necessity of some one in the province with full power "to do all things that may contribute to the good and advancement of the same," they directed the appointment of the American Board of Proprietors—a body of men identified with the province, who with the deputy-governor were to look after the proprietary interests in such matters as the approval of legislation and the granting of lands, and thereby prevent the delay caused by the transmission of such matters to England for approval. In 1686 another effort was made to put the Fundamental Constitutions in force, but when the deputies and the council rejected the instrument, the proprietors did not force the matter. In 1686 Perth Amboy,
the newly created port of East Jersey, became its seat of government.

After his accession to the throne in 1685, James II. showed an unyielding determination to annul the privileges of the colonies, and to unite New York, New Jersey and the New England colonies under a single government. In order, therefore, to save their rights in the soil, the proprietors of East and West Jersey offered to surrender their claims to jurisdiction, and to this arrangement the king consented. Andros, previously appointed viceroy of New England, thereupon received a new commission by his authority over New York and the Jerseys, and in August 1688 he formally annexed these provinces to the Dominion of New England. The seizure of Andros by the people of Boston in April 1689, following the news of the revolt in England against James II., gave the Jersey proprietors an opportunity to resume their rights, but the proprietary governments regained their former footing very slowly. The proprietors were widely separated—some being in America, some in England and others in Scotland—and unity of action was impracticable. For three years there was little or no government in the Jerseys, and the measures taken by local officers for preserving the peace.

In 1692 an important change occurred in the administrative system through the appointment of Andrew Hamilton (d. 1703) as governor of both East and West Jersey. In 1697 a faction opposed to Hamilton secured his removal and the appointment of their partisan, Jeremiah Basse. The opposition in the two colonies to Basse became so formidable that he was removed in 1699 and Hamilton was reappointed. Certain disaffected elements thereupon refused to recognize his authority, on the ground that his appointment had not received the required approval of the crown, and for a time the condition of the provinces bordered on anarchy. These disorders, and especially complaints against the Jerseys as centres of illegal trade, were brought to the attention of King William and his lawyers, who contended that as only the king could convey powers of government exercised by the Jersey proprietors, derived as they were from the duke of York, were without sufficient warrant. Moreover, the inhabitants sent petitions to England, praying that they might be placed under the direct control of the crown. The proprietors of East Jersey had already offered to surrender their jurisdiction, and returned for certain concessions by the royal government, but no action had been taken. In 1701 the proprietors of both provinces made another proposal, which was accepted, and in April 1702 all rights of jurisdiction were transferred to the crown, while the rights to the soil remained in the proprietors. The provinces of East and West Jersey were then united under a government similar to that of the other royal provinces. Until 1738 the governor of New York was also governor of New Jersey; after that date each colony had its own governor. The legislature met alternately at Burlington and Perth Amboy, until 1790, when Trenton was selected as the capital of the state.

The next four decades were years of development disturbed, however, by friction between the assembly and the royal governors, and by bitter disputes, accompanied by much rioting, with the proprietors concerning land-titles (1744-1749). Independence of the absentee landlords was again claimed by virtue of the grants made by Nicolls nearly a century before. Agriculture at this time was the main pursuit. The climate was more temperate and the soil more fertile than that of New England; but there were similar small farms and no marked tendencies towards the plantation system of the southern colonies. Slavery had been introduced by the Dutch and Swedes, and from the time of the earliest English occupation had been legally recognized. East Jersey had a fugitive slave law as early as 1675. With the exception of laying an import duty no legislative effort was made—nor is it likely that any would have been allowed by the crown—to restrict the importation of slaves during the colonial period. In addition to African and Indian slaves there was the class known as "redemptioners," or term slaves, consisting of indentured servants, who bound themselves to their masters before leaving the mother country, and "free willers," who allowed themselves to be sold after reaching America, in order to reimburse the ship captain for the cost of their passage. Between East and West Jersey certain political and religious differences developed. The former, settled largely by people from New England and Long Island, was dominated by Puritans; the latter by Quakers. In East Jersey, as in New England, the township became a vigorous element of local government; in West Jersey the county became the unit. Important events in the period of royal government were the preaching of George Whitefield in 1739 and the following year, the founding of the College of New Jersey (now Princeton University) in 1746, and of Queen's (now Rutgers) College in 1766. The colony gave many proofs of its loyalty to the mother country: it furnished three companies of troops for Admiral Vernon's unfortunate expedition against Cartagena in 1741; in King George's War it raised £2000 for supplies, furnished troops for the capture of Louisburg and sent over six hundred men to Albany; and in the French and Indian (or Seven Years') War its militia participated in the capture of both Quebec and Detroit. The colony itself was the principal point of embarkation for the American troops entering the service of the Hanoverian at the outbreak of the war. During the Revolution the Jersey people opposed the rising tide of Americanism, and were for a time in occupation by Hessian troops. The cession of New Jersey to the United States in 1783 was made amid profound sorrow and regret. The state of the state of opinion in that city, put in at Greenwich and stored his tea there in a cellar. It remained undisturbed till the night of the 29th of November, when a band of about 40 men, dressed as Indians, in imitation of the Boston party, broke into the cellar and made a bonfire of the tea. All attempts to punish the offenders were futile.

1 Greenwich then had some importance as a port on Cohancey Creek. Washington's house there during the winter of 1774-1775 was used as a hospital. On the 23rd of December, 1774, the captain of the ship "Greighound," bound for Philadelphia, was seized by the men on account of the state of opinion in that city, put in at Greenwich and stored his tea there in a cellar. It remained undisturbed till the night of the 29th of November, when a band of about 40 men, dressed as Indians, in imitation of the Boston party, broke into the cellar and made a bonfire of the tea. All attempts to punish the offenders were futile.
inhabitants of the Raritan Valley from British foraging parties.

General Benjamin Lincoln with 500 men was by Washington's orders stationed at Bound Brook, but on the 13th of April 1777 Lincoln was surprised by a force of about 4,000 men under Cornwallis, and although he escaped with small loss it was only by remarkably rapid movements. When the British had gained possession of Philadelphia, in September 1777, their communications between that city and the ocean through the Lower Delaware was obstructed by the New Jersey side by Fort Mercer, commanded by Colonel Christopher Greene, at Red Bank; three battalions of Hessians under Colonel Karl Emil Kurt von Donop attacked the fort on the 22nd of October, but they were repulsed with heavy loss. The fort was abandoned later, however. In 1778, the British army under General Clinton was retreating, in June from Philadelphia to New York, the American army engaged it in the battle of Monmouth (June 28, 1778); the result was indecisive, but that the British were not badly defeated was ascribed to the conduct of General Charles Lee. Before daylight on the 19th of August 1779 was approached by Major Henry Lee with a force of about 400 men surprised the British garrison at Paulus Hook, where Jersey City now stands, and although sustaining a loss of 20 men, killed 50 of the garrison and took about 160 prisoners. In 1779-1780 Morristown was again Washington's headquarters. The Congress of the Confederation met in Princeton, in Nassau Hall, which still stands, from June to November 1783.

After the war New Jersey found its commercial existence threatened by New York and Philadelphia, and it was a feeling of weakness from this cause rather than any lack of power that caused the state to join in the movement for a closer Federal Union. In 1786 New Jersey sent delegates to the Annapolis Convention, which was the forerunner of the Federal Convention at Philadelphia in the following year. In the latter body, on the 15th of June, one of the New Jersey delegates, William Paterson (1745-1806), presented what was called the "New Jersey plan" of union, representing the wishes of the smaller states, which objected to representation in a national Congress being based on wealth or on population. This merely federal plan, reported from a Conference attended by the delegates from Connecticut, New York and Delaware, as well as Major from New Jersey (and by Luther Martin of Maryland), consisted of nine resolutions; the first was that "the Articles of Confederation ought to be so revised, corrected and enlarged as to render the federal Constitution adequate to the exigencies of government and the preservation of the Union"; and the actual plan was for a single legislative body, in which each state should be represented by one member, and which should elect the supreme court and have power to remove the executive (a Council), to lay taxes and import duties, to control commerce, and even, if necessary, to make requisitions for funds from the states. Madison opposed the plan, on the ground that it would not prevent violations by the states of treaties and of laws of nations. On the first resolution only there was a definite vote; on the 19th of June it was voted to postpone the consideration of this resolution and to report the resolutions (the Virginia plan) formerly agreed upon by the committee of the whole. The New Jersey plan left its impress in the provision of the Constitution (approved in the Convention on the 7th of July) for equal representation in the national Senate. The Federal Constitution was ratified by an unanimous vote in the state convention which met at Trenton on the 18th of December 1787.

The state's own constitution, which had been adopted in 1776 and amended in 1777, retained, like other state constitutions framed during the War of Independence, many features of colonial government ill-adapted to a state increasingly democratic. The basis of representation, each county electing three members to the assembly and one member to the legislative council, soon became antiquated. The property qualifications were abolished, the county took thousands its proclamation money, of real and personal estate, in the same county; and, for members of the assembly, "five hundred pounds proclamation money, in real and personal estate, in the same county." These and the property qualifications for suffrage, which was granted to "all inhabitants of this state, of full age, who are worth fifty pounds proclamation money, clear estate in the same," etc., were soon considered undemocratic; and the democratic tendency of certain election officers may be seen from their construing the words "all inhabitants of full age" to include women, and from their permitting women to vote. The result was aggravated by the joint vote of the council and assembly; he was president of the council, with a large salary. In 1787, he was chancellor, captain-general and commander-in-chief of the militia; he had three members of the legislature to act as a privy-council; and he, with the (of which seven formed a quorum), constituted the "Court of Appeals in the last resort in all causes of law, as heretofore," which, in addition, had the power of granting pardons to criminals, after condemnation, in all cases of treason, felony or other offences.

In 1838 the opposition to the governor's extensive powers under the constitution was greatly increased in the "Broad Seal" or "Great Seal" War. After a closely contested election in which six members of Congress were chosen on a general ticket, although there was an apparent Democratic majority of about one hundred votes (in the old manner, 120,000 votes), the returns from townships to elect five Whig candidates to whom the state board of canvassers (mostly Whigs and headed by the Whig governor, William Richardson) gave the badge of seal of the state. Excluding these five members from New Jersey the House of Representatives contained 119 Democrats and 118 Whigs, so that the choice of a Whig speaker could be secured only by a vote of the Democrats, and by a vote of the Democrats only by a vote of the Whigs. In the ensuing struggle the Democratic Whigs and Republicans were divided, and the result was decided by the Democrats. It was decided that only members whose seats were not contested should vote for speaker, and Robert M. T. Hunter, of Virginia, a Democrat and a compromise candidate, was appointed to the position; and on the 26th of February 1839 the Democratic candidates were admitted to their seats, to which a congressional committee, reporting afterwards, declared them entitled.

Agitation for constitutional reform resulted in a constitutional convention, which met at Trenton from the 14th of May to the 29th of June 1844 and drafted a new frame of government, introducing much in the nature of radical changes. This instrument was ratified at the polls on the 13th of August. The election of the governor was taken from the legislature and given to the people; the powers of government were distributed among legislative, executive and judicial departments; representation in the assembly was based on population; and the property qualification for membership in the legislature and for the suffrage was abolished.

The constitution of 1844 declared that "All men are by nature free and independent, and have certain unalienable rights, among which are the right of enjoying and defending life and liberty, of acquiring and pursuing safety and happiness." A similar clause in the constitution of Massachusetts had been interpreted by the courts as an abolition of slavery, and an effort was made to give the same ruling applied in New Jersey, where the institution of slavery still existed. The courts, however, declared that the clause in the constitution of New Jersey was a general proposition, not applying to man in his private, industrial or domestic capacity. An attempt at abolition had previously been made in 1804 by an act declaring that every child born of a slave should be free, but should remain the servant of its mother's owner until twenty-five years of age. The act was based on the supposition that after some time, if a minor child was a male the father, and the owner of the mother, however, might abandon the child after a year, and it then became a public charge. This last provision proved a heavy check to the adoption of a heavy check to the adoption of negro children that in 1811 the statute was repealed. In 1846 an act was passed designating slaves as apprentices bound to service until discharged by their owners, and providing that children of

1 The election to the U.S. Senate in 1865 of John Potter Stockton (1826-1900), a great-grandson of Richard Stockton, a signer of the Declaration of Independence, created hardly less excitement than the "Broad Seal" War. William S. Couper, who as a senator did so by a plurality vote, having previously passed a resolution changing the vote requisite to choose a senator from a majority, to a plurality vote. He took his seat in the Senate and his election was upheld by the Senate committee on the judiciary, whose report was adopted (26 March 1866) by a vote of 22 to 21, his own vote casting the tie; but, because of the objection of Charles Sumner, he withdrew his vote on the 27th of March, and was thereupon unseated by a vote of 23 to 21.
such apprentices should be free at birth, but were to be supported by the masters of their parents for six years. There were consequently a few vestiges of the slavery system in New Jersey until the adoption of the Thirteenth Amendment to the Federal Constitution.

Toward the political questions that disturbed the American people immediately before the Civil War the attitude of the state was conservative. In 1832 the Free-soil candidate for the presidency received only 350 votes in New Jersey; and in 1856 the Democratic candidate received a plurality of 18,605 votes, even though William L. Dayton, a citizen of the state, was the Republican nominee for the vice-presidency. In 1860 three of the state's electoral votes were given to Douglas and four to Lincoln. During the Civil War New Jersey furnished 89,936 men for the Union cause and incurred extraordinary expenditures to the amount of $18,904,717. The state readily consented to the Thirteenth and Fourteenth Amendments to the Federal Constitution, but in 1868 withdrew its consent to the latter. The Fifteenth Amendment was rejected by one legislature, but was accepted by its successor, in which the Republican party had obtained a majority.

Industrially the early part of the 19th century was marked in New Jersey by the construction of bridges and turnpikes, the utilization of water power for manufactures, and the introduction of steam motive power upon the navigable waters. The secret treaty with England interrupted this progress, and at its beginning was so unpopular, especially with the Quakers, that the Federalists carried the elections in the autumn of 1812. But the attempt of this party to retain control by a "gerrymandering" process was unsuccessful. The Democrats were triumphant in 1813, and the Federalist as well as the Democratic administration responded with aid for the defence of New York and Philadelphia. The state also contributed several hundred men to the service of the United States. Material progress in New Jersey after the war is indicated by the construction of the Morris (1824-1836) and the Delaware & Raritan (1828-1838) canals, and the completion of its first railway, the Camden & Amboy, in 1834.

The years following the Civil War were marked by great industrial development. The numerous projects, good and bad, that were inaugurated in 1866-1875, and the various kinds of laws and charters conferring special privileges that were secured, led to the constitutional prohibition of special legislation already mentioned. In this same period there was a bitter railway war. The Delaware & Raritan Canal Company and the Camden & Amboy Railroad Company, both chartered in 1839 and both monopolies, had been practically consolidated in 1831; in 1838 these joint companies gained control of the Philadelphia & Trenton railway; in 1867 these "United New Jersey Railroad & Canal Companies" consolidated with the New Jersey Railroad & Transportation Company (which was opened in 1836 and controlled the important railway link between New Brunswick and Jersey City), and profits were to be divided equally between the four companies; and in 1871 these entire properties were leased for 990 years to the Pennsylvania Railroad Company. This combination threatened to monopolize traffic, and it was opposed by the Atlantic Central Railroad of New Jersey, the Atlantic & Lackawanna & Western and a branch of the North Pennsylvania (from Jenkintown to Yardley; sometimes called the "national" or "air-line"), and by the general public; and in 1873 the state passed a general railway law giving other railways than the United New Jersey holdings of the Pennsylvania the right to connect New York and Philadelphia. In 1876 the "national" line was extended to Bound Brook (as the Delaware & Bound Brook) and this road, the North Pennsylvania & Central Railroad of New Jersey, were operated under a tripartite agreement as a through line between New York and Philadelphia; but in 1879 these three lines were leased for 990 years to the Philadelphia & Reading railway. The state itself then became engaged in a struggle with the railways in order to secure from them their full portion of taxes, as the property of individuals was then taxed many times as heavily as that of railways. In 1884 the state gained the victory by securing the passage of a law taxing the franchises of railway corporations.

A reform movement in politics, called the "New Idea," and led by Everett Colby (b. 1874), then a Republican member of the Assembly and in 1906-1908 a state senator, began in 1904; it did much to secure the passage of acts limiting public service franchises to 20 years (unless extended to 40 years by the voters of the municipality concerned), the increase of taxes on railways, the increase of franchise tax rates by 1 1/2% each year up to 5%, the adoption of direct primary elections, and the modification of the system of railway promoters' liability law.

Before 1880 the state was dominated by the Federalist party; from that date until 1886 it was generally controlled by the Democrats, and from 1896 to 1911 by the Republicans.

The governors of New Jersey have been as follows:

**GOVERNORS: UNDER THE PROPRIETORS**

- Philip Carteret
- John Pownall

**GOVERNORS OF EAST JERSEY AND THEIR DEPUTIES**

- Philip Carteret
- Robert Barclay
- Thomas Ruyrdar

**GOVERNORS OF NEW JERSEY**

- Edward Byllngye
- Samuel Jennings
- Thomas Olive
- John Skene
- Daniel Coxe
- Edward Hunkole

**GOVERNORS OF WEST JERSEY AND THEIR DEPUTIES**

- Edmund Andros
- Andrew Hamilton

**UNDER THE ROYAL GOVERNMENT**

**GOVERNORS OF NEW YORK AND NEW JERSEY**

- Edward Hyde, Lord Cornbury
- Jonathan Belcher
- Richard Ingoldsby, Lieut.-Governor
- Robert Hunter
- William Burnet
- John Montgomerie
- Lewis Morris, 4th Council
- William Cosby

**GOVERNORS OF NEW JERSEY EXCLUSIVELY**

- Lewis Morris
- John Hadlock
- John Anderson, 4th Council
- John Hamilton, 4th Council

**GOVERNORS OF NEW JERSEY ONLY**

- Lewis Morris
- John Hadlock, Pres. Council
- John Reading, Pres. Council
- Jonathan Belcher
- Thomas Powll, Lieut.-Governor
- John Reading, Pres. Council
- Francis Bernard
- Thomas Boone
- Josiah Hardy
- William Franklin

---

1 In 1864 a bill was introduced in the Federal House of Representatives making the Camden & Atlantic (now the Atlantic City) railway and the Raritan & Delaware Bay (now a part of the Central of New Jersey) a post route between New York and Philadelphia and authorizing these railways to carry passengers and freight between New York and Philadelphia. Thereupon the governor and legislature of New Jersey protested that such a measure was an infringement of the reserved rights of the state, since the state had contracted with the Camden & Amboy not to construct nor to authorize others to construct within a specified time any other railway across the state to be used for carrying passengers or freight between New York and Philadelphia.

BIBLIOGRAPHY—For descriptive matter see bibliographies in Bulletin No. 177 and 301 of the United States Geological Survey; the Annual Reports and especially the Final Report of the New Jersey Geological Survey; and the Annual Reports of the New Jersey State Museum, the New Jersey Agricultural Experiment Station, and the New Jersey State Board of Agriculture.

History.—The most important sources are: Documents Relating to the Colonial History of the State of New Jersey (Archives of the State of New Jersey, 3rd series), ed. by J. H. Trumbull; George Ricardo and W. Nelson (26 vols., Newark, 1880-1903); Documents Relating to the Revolutionary History of the State of New Jersey (Archives of the State of New Jersey, 2nd series; 2 vols., Trenton, 1908-1909); and New Jersey, its History from 1609 to 1763, compiled by A. L. and J. S. Parker (Somerville, New Jersey, 1891).

For the period of the Dutch rule, see E. B. O'Callaghan's History of New Netherlands (New York, 1846); and John Romeyn Brodhead's History of the State of New York (2nd vol., New York, 1853, 1871); E. P. Tannen, The Province of New Jersey (New York, 1898), the most thorough study of the period from 1664 to 1783; Samuel Smith's History of the Colony of New Caesarea, or New Jersey (Burlington, 1765; 2nd ed., Trenton, 1877), still one of the best accounts of the colonial period, and particularly valuable on account of its useful extracts from the sources, many of which are no longer accessible; see also, William A. Whitehead's "The English in East and West Jersey, 1664-1689" in vol. iii. of Justin Winsor's Narrative and Critical History of America. Among the monographic contributions are Austin Scott's Influence of the Protestant Baptists in the Founding of the State of New Jersey (Baltimore, 1885) and H. S. Cooley's Study of Slavery in New Jersey (Baltimore, 1896). Other useful contributions are D. H. Nichols, Story of Old Farm; or, Life in New Jersey in the 18th Century (Somerville, New Jersey, 1889), full of interesting details; F. B. Lee and others, New Jersey as a Colony and as a State (4 vols., with an additional biographical volume, New York, 1912), giving life, politics, and literature, as well as the results of an investigation into the legal status of negroes; W. J. Mills, History of New Jersey (Philadelphia, 1902); William Nelson, The New Jersey Coast in Three Centuries (2 vols., New York, 1902); Isaac S. Nesbit, Civil and Political History of New Jersey (Philadelphia, 1851); W. A. Whitehead, East Jersey under the Proprietary Governments (New Jersey Historical Society Collections, vol. i., Newark, 1875); W. S. Stryker, Official Register of the Officers and Men of New Jersey in the Revolutionary War (Trenton, 1872); W. E. Sackett, Modern Battles of Trenton (Trenton, 1898), a political history of New Jersey from 1680 to 1894, dealing especially with the railway controversies; John E. Stillwell, Historical and Genealogical Miscellany (2 vols., New York, 1903-1906), containing data relating to the settlement and settlers of New York and New Jersey; R. S. Field, The Provincial Courts of New Jersey; L. Q. C. Elmer, The Organization and Government of New Jersey (vols. i. and ii. of New Jersey Historical Society Collections, Newark, 1849, 1872); and David Murray, History of Education in New Jersey (No. 23 of Circulars of Information issued by the United States Bureau of Education, Washington, 1899).

NEW JERSEY CHURCH, or New Church, the community founded by the followers of Emmanuel Swedenborg (q.v.). Swedenborg himself took no steps to found a church, but having given a new interpretation of Scripture, it was inevitable that some who accepted his doctrine should form a society and organize a church in accordance therewith. Those who received them fully during Swedenborg's lifetime were few and scattered, but courageously undertook the task of disseminating, and gave themselves to translating and distributing their master's writings. Two Anglican clergymen were conspicuous in this work: Thomas Hartley (d. 1754), rector of Winwick, and John Clowes (1743-1831), vicar of St John's, Manchester. Hartley translated Heaven and Hell (1756) and True Christian Religion (1781); Clowes, who taught New Church doctrine in the existing church of the Church of England. They set up new organizations, translated 17 volumes, including the Arcana Coelestia, and published over 50 volumes of exposition and defense. Through his influence Lancashire became the stronghold of the Swedensborgians, and to-day includes a third of the congregations and more than half the members of the New Church in the United Kingdom.

In 1782 a society for publishing Swedenborg's writings was formed in Manchester, and in December 1783 a little company of sympathizers with similar aims met in London and founded "The Theosophical Society," among the members of which were John Flaxman, William Sharples, the medical men, and F. H. Barbédouleem the composer. In the early days most of them worshipped at the Female Orphan Asylum, St George's, whose chaplain, Rev. Jacob Duche, like Clowes at Manchester, preached the doctrines from his own pulpit. In 1785 and 1787 J. W. Salmon and R. Mather conducted an open-air missionary tour in the Midlands and the North with some success. Five prominent Wesleyan preachers adopted the new teaching and were cut off from their connexion, a step which led, in spite of remonstrance from Clowes and others, to the formal organization of the New Jerusalems under the supervision of W. W. Sanderson. Many of the members met in private houses, but in January 1788 began worship in a church in Great Eastcheap with a liturgy specially prepared by the Rev. James Hindmarsh and Isaac Hawkins. "The Theosophical Society" was now dissolved. In April 1789 a General Conference of British Swedensborgians was held in Great Eastcheap Church, followed by another and by the publication of a journal, the New Jerusalem Magazine, in 1790. Since 1815 conferences have been held every year. A weekly paper, the Morning Light, is published, as well as monthly magazines for adults (the New Church Magazine) and youth. The literature (containing five services for Morning and Evening, together with the order of Baptism, Holy Supper, Marriage, &c.) was prepared in 1828, revised and extended in 1875; the hymn book of 1825 was revised and enlarged in 1880.

In the provinces the first church was at Birmingham (1797), followed by one at Manchester and another at Liverpool (1793). The Accrington church, the largest in Great Britain, was founded in 1802. Many of the early converts to the New Church were among the most fervent advocates of the abolition of slavery, and it was the medical officer of the first batch of convicts sent to Botany Bay; from the house of another, William Cookworth of Plymouth, Captain Cook sailed on his last voyage. Others were pioneers of elementary education, establishing free day schools long before they were thought of by the state.

In 1815 the conference took up the question of home missionary work, and its agents were able to found many branches of the church. In 1813 the Manchester and Salford (now the North of
ENGLAND. Missionary Society was founded, chiefly to provide preachers for the smaller churches in its area; in 1857 a National Missionary Institution was founded and endowed, to which most of the local ones have been affiliated. Other denominational agencies have been concerned with the printing and circulation of Swedenborgian literature, a training college for the ministry (founded in 1852), and a Ministers' Aid Fund (1834), and an Orphanage (1881). The centenary of the New Church as a spiritual system was celebrated in 1857, as an external organization in 1883. A few Swedenborgians still hold to the non-separating policy, but more from force of circumstances than from deliberate principle. The constitution of the New Church is of the Independent Congregational type; the conference may advise and counsel, but cannot compel the obedience of the societies. The returns for 1909 showed 45 named, 5 recognized leaders, 10 recognized missionaries, 70 societies, 6665 registered members, 7907 Sunday scholars. There are also five or six small societies not connected with the conference.

The New Church in Europe.—In Sweden the Philanthropic Ecclesiastical Society was formed by C. F. Nordenskiöld in 1796 to connect the Swedish congregations of Swedenborgian worship. The introduction of alchemy and mesmerism led to its dissolution in 1799, but its work was continued by the society "Pro fide et charitate" (1830). For many years the works of Swedenborg and his followers were proscribed, and receivers of his writings fined or deprived of office, but in 1866, when religious liberty had made progress, the cause was again taken up; in 1875 the Works of Swedenborg (in English) was published in Stockholm, and since 1877 services have been regularly held. There is also a church in Gothenburg, and lectures are given from time to time in most of the towns of Sweden. In Norway there is no New Church organization; in Denmark a church was founded in Copenhagen in 1871. In Germany Prelate Oetinger of Württemberg translated many of Swedenborg's writings between 1765 and 1786, but his work was not published until 1863, when the Tübingen, who not only edited, translated and published, but in 1848 founded a "Union of the New Church in Germany and Switzerland" which held quarterly meetings. There is a church in Berlin, but otherwise active societies in Germany are the "Tiba" in the Swedish-German Society with headquarters at Stuttgart. In Switzerland, on the contrary, there is an organized body of the New Church; divine service being held in the Society at Zurich and by circles at Berne, Hirnsau and Nessau. The Zürich pastor is a member of the American Convention, and has oversight also of the Austrian societies at Vienna and Trieste. In Hungary there are societies at Buda Pesth and Györkony, in France there were early Swedenborgians of rank and learning, and much translation was accomplished before 1800. About 1838 J. F. E. Le Boys de Guays began his masterly translation of all Swedenborg's theological works and in 1852, when work which was carried on at his house for thirty years. Sunday worship is now held in the New Church Temple on the Rue Thouin. In Italy (Rome), Holland (The Hague), Belgium (Antwerp and Bruges), there are small societies, and nearly every European country has some known adherents.

In America.—About 1784 James Glen, a London Scot, delivered lectures "For the Sentimentalists." on the new doctrine in Philad- elphia and Boston and circulated some of Swedenborg's works. Francis Bailey, state printer of Pennsylvania, was attracted by them and became active in their promulgation. During the next ten years a number of prominent men gave their support to the teaching, which gradually spread inland and southward. The first society for worship was formed in Baltimore in 1792 (reorganized 1798), though a short-lived one had preceded it at Halifax, N.S., in 1791. Other churches were formed in Philadelphia, New York, and the General Convention, which meets annually, was formed at Philadelphia in 1817. In 1907 there were 102 ministers and 103 societies with a membership of 6500. Of these, 4 societies and 140 members are in Canada, while the German Synod counts for 11 societies and 325 members.

In Australia, etc.—The formation of societies in Australia began at Sydney in 1817, and Newcastle early in 1820. In Brisbane in 1865, Rodborough, Vic., in 1878. There is a circle in Pерт. New Zealand has a church at Auckland (1883) and scattered members of other churches. Australia has a national conference; Melbourne in 1881 and has continued to meet in alternate years. There is a church at Mauritius, and correspondents in various parts of South and West Africa, India, Japan, the West Indies and South America.

(N. J. G.)

NEW KENSINGTON—NEW LONDON

New Kensington, a borough of Westmoreland county, Pennsylvania, U.S.A., on the Allegheny river, 18 m. N.E. of Pittsburgh. Pop. (1900) 4065 (1042 foreign-born and 86 negroes); (1910) 7727. It is served by the Pennsylvania railroad and by electric railways to neighbouring towns. There is a variety of manufactures. The borough was founded in 1891 and was incorporated in the following year.

Newlands, John Alexander Reina (1838-1898), English chemist, was born in 1838. He was one of the first, if not quite the first, to propound the conception of periodicity among the chemical elements. His earliest contribution to the question took the form of a letter published in the Chemical News in February 1863. In the succeeding year he showed, in the same journal, that if the elements be arranged in the order of their atomic weights, those having consecutive numbers frequently either belong to the same group or occupy similar positions in different groups, and he pointed out that each eighth element starting from a given one is in this arrangement a kind of repetition of the first, like the eighth note of an octave in music. The Law of Octaves thus enunciated was at first ignored or treated with ridicule as a fantastic notion unworthy of serious consideration, but the idea, subsequently elaborated by D. I. Mendeleeff and other workers into the Periodic Law, has taken its place as one of the most important generalizations in modern chemical theory. Newlands, who was of Italian extraction on both sides, was a pupil of the Cape Colony and Italian freedom under Garibaldi in 1860, died in London on the 29th of July 1898. He collected his various papers on the atomicity of the elements in a little volume on the Discovery of the Periodic Law published in London in 1884.

NEW LONDON, a city, port of entry, and one of the county seats of New London county, Connecticut, U.S.A., coextensive with the township of New London, in the S.E. part of the state, on the Thames river, about 3 m. from its entrance into Long Island Sound. Pop. (1890) 13,757; (1900) 17,548, of whom 10,445 were foreign-born (1910 census 19,659). It is served by the New York, New Haven & Hartford, and the New London Northern (leased by the Central Vermont) railways, by electric railway to Norwich, Wethersly, Groton, Stonington and East Lyme, by a daily line of passenger steamboats to New York City, and by two lines of freight steamers, and in the summer months by daily steamboats to Sag Harbor and Greenport, Long Island, and Watch Hill and Block Island, Rhode Island. New London's harbour is the best on the Sound. The city is the headquarters of a United States artillery district, embracing Fort H. G. Wright Barracks, New London, Fort Miech on Gull Island, New York, Fort Terry, New London, Fort Griswold, New London, and is a station of the New York Yacht Club; the boat races between Harvard and Yale universities are annually rowed on the river near the city. Among the places of interest are the Town Hall, built in 1850 by John Winthrop, Jr., in co-operation with the town; the Hempstead Mansion, built by John Hempstead about 1678; the old cemetery, north-east of the city, laid out in 1653; a school house in which Nathan Hale taught; and a court house built in 1785. There is a public library (about 39,000 volumes), and the New London County Historical Society (incorporated 1850) has an historical library. There are two endowed high schools, the Bulkeley School for boys and the Williams Memorial Institute (1861) for girls, and an endowed Manual Training and Industrial School (1872), all offering free instruction. In the 18th century New London had a large trade in lumber, flour and food supplies with the West Indies, Gibraltar
and the Barbary States; but this trade declined after the War of 1812, and the whaling and sealing industries, once very lucrative, have also declined in value. The imports in 1806 were valued at $54,872, and the exports at $60,522; in 1809 their respective values were $10,870 and $10,295. Manufacturing is the principal industry; among the products are silk goods, cotton goods, printing presses, foundry and machine shop products. The total value of factory products was $4,700,628 in 1905, an increase of 11.6% since 1900.

New London was founded in 1646 by John Winthrop, the younger. It was known by its Indian name "Nameaug" until 1658, when the General Court of Connecticut approved the wish of the settlers to adopt its present name from London, England, the river Monhegan in the same time becoming the Thames. During the War of Independence it was a rendezvous for American privateers. In 1776 the first naval expedition authorized by Congress was organized in its harbour, and there in the next three years twenty privateers were fitted out. On the 6th of September 1781, 800 British troops and Loyalists under General Benedict Arnold (who was born in New London county) raided New London, destroyed much private property, and at Fort Griswold killed 84 American soldiers, many of them after their surrender. The massacre is commemorated by an obelisk, 134 ft. high, on Groton Heights. The city was incorporated in 1784. In 1798 there was an epidemic of yellow fever. From the 7th of November 1812 until the close of the second war with Great Britain the harbour was blockaded by a British fleet.

NEWLYN—NEWMAN, a village in the St Ives parliamentary division of Cornwall, England, on the shore of Mount's Bay, 1 m. S.W. of Penzance. It is a small fishing port, with narrow paved lanes and old-fashioned cottages. Near the parish church of St Peter stands an ancient cross of granite, discovered in a field close by. The harbour, one of the safest for small craft in the west country, is sheltered by two long and picturesque stone piers. A more ancient pier, originally constructed in the reign of Henry VI., was renewed in that of James I. Tin mining and smelting have been largely carried on in the neighbourhood, and several galleries were worked far under the sea. The principal modern industry, however, is fishing, especially for pilchard. The picturesque appearance of the village, with its quays and little harbour, and the grandeur of the cliffs and moorland scenery towards Land's End, make Newlyn an attractive spot. Between 1886 and 1890 an artistic coterie grew up here, the leaders of which were Edwin Harris, Walter Langley, Fred Hall, Soutch Bensley, T. C. Gotch, Mr and Mrs Stanhope Forbes, Chevalier Taylor and H. S. Tuke. The earlier artists at Newlyn were said to have selected it as their centre, because a greyness in the atmosphere helped their depiction of subtleties in tone, part of their creed being subordination of colour to tone-gradation. In later times, the element of a common ideal tended to disappear, but the interest of the "Newlyn school" attracted a regular art- colony, who in various ways assimilated and expressed the picturesque influences of the place (see PAINTING: Recent British). There is a permanent Art Gallery, containing examples of the work of the Newlyn artists.

NEW MADRID, a city and the county-seat of New Madrid county, Missouri, U.S.A., on the right bank of the Mississippi river, about 35 m. S. by W. of St. Louis, Ill. Pop. (1900) 4,899; (1910) 8,882. It is served by the St Louis South-western railway and by river packets. The city is a shipping point for a rich grain, cotton, livestock and lumber region. Among its manufactures are lumber, staves, and hoops. The municipality owns its water-works. Owing to the encroachments of the Mississippi river, the site of the first permanent settlement is now about 11 m. from the E. bank of the river, in Kentucky. This settlement was made in 1788, on an elaborately laid out town site, and was named New Madrid by its founder, Colonel George Morgan (1742–1810), who, late in 1787, had received a grant of a large tract of land on the right bank of the Mississippi river, below the mouth of the Ohio, from Don Diego de Garroqui, Spanish minister to the United States. The tract lay within the province of "Lousiana," and the grant to Morgan was a piece of Garroqui's "map," made at Oxford, where the western American settlements, Morgan being required to establish thereon a large number of emigrants, whom he secured from New Jersey, Canada and elsewhere. Governor Estevan Miro of Louisiana, however, disapproved of the grant, on the ground that it would cause the province to be overrun by Americans; the settlers became restive under the restraints imposed upon them; Morgan himself left; and in December 1811 and January 1812 a series of severe earthquake shocks caused a general emigration. New Madrid was occupied by Confederate troops under General Gideon J. Pillow, on the 8th of July 1863, and after the surrender of Fort Donelson (February 16, 1862) the troops previously at Columbus, forming the Confederate left flank, were withdrawn to New Madrid and Island No. 10 (in the Mississippi about 10 m. S.). There were Confederate batteries on the left bank of the Mississippi opposite Island No. 10, and along the same bank from a point opposite New Madrid to Tiptonville, Tennessee. Behind these batteries were Reelfoot Lake and over-flowed lands. Retreat by land was thus virtually impossible. Early in March, Major-General John Pope and Commodore A. H. Foote proceeded against these positions; New Madrid, then in the hands of the Confederates, was captured by the 14th (Admiral) Henry Walke (1808–1866), commanding the "Carondelet," ran past the batteries of Island No. 10 and the shore batteries on the 4th of April, and Lieut.-Commander Egbert Thompson, commanding the "Pittsburgh," on the 7th; meanwhile the Federals under the direction of Colonel Josiah W. Bissell (b. 1818), of the engineer corps, had, with great difficulty, constructed an artificial channel to New Madrid across the peninsula (swamp land) formed by a great loop of the Mississippi; troops were conveyed by transports through this channel below the island, Federal batteries having been established on the right bank of the river; the retreat of the Confederates down stream was effectually blocked; they evacuated the island on April 7th, and on the 8th the garrison and the forces stationed in the shore batteries, a total of about 7000, under General W. W. Mackall (who had succeeded General Mcgowen on the 31st of March) was surrendered at Tiptonville. The island was subsequently washed away, a new one being formed in the vicinity.

NEWMAN, FRANCIS WILLIAM (1805–1887), English scholar and miscellaneous writer, younger brother of Cardinal Newman, was born in London on the 27th of June 1805. Like his brother, he was educated at Eton College, and at Trin. Coll., Cambridge, where he had a brilliant career, obtaining a double first class in 1826. He was elected fellow of Balliol in the same year. Conscientious scruples respecting the ceremony of infant baptism led him to resign his fellowship in 1830, and he went to Baghdad as assistant in the mission of the Rev. A. N. Groves. In 1833 he returned to England to procure additional support for the mission, but rumours of unsoundness in his views on the doctrine of eternal punishment had preceded him, and finding himself generally looked upon with suspicion, he gave up the vocation of missionary to become classical tutor in an unsectarian college at Bristol. His letters written home during the period of his mission were collected and published in 1836, and form an interesting little volume. Newman's views matured rapidly, and in 1840 he became professor of Latin in Manchester New College, the celebrated Unitarian seminary long established at York, and the parent of Manchester College, Oxford. In 1846 he quitted this appointment to become professor in University College, London, where he remained until 1869. During all this period

1 Morgan had been made Indian agent at Fort Pitt (Pittsburgh) in 1779, and was commissioned a colonel in the Continental Army in 1782. In 1806 he was Warden of N. Y., and near Pittsburgh by Aaron Burr, who told him something about his famous "conspiracy" scheme in the West, which Morgan reported to Jefferson—"the very first intimation I had of the plot," Jefferson afterward wrote to Morgan.
NEWMAN, CARDINAL

he was assiduously carrying on his studies in mathematics and oriental languages, but wrote little until 1847, when he published anonymously a History of the Hebrew Monarchy, intended to introduce the results of German investigation in this department of Biblical criticism. In 1849 appeared The Soul, her Sorrows and Aspirations, and in 1850, Phases of Faith, or Passages from the History of my Creed—the former a tender but searching analysis of the relations of the spirit of man with the Creator, the latter a religious autobiography detailing the author's passage from Calvinism to pure theism. It is on these two books that Professor Newman's celebrity will principally rest; having in both to describe his personal experience, his intense earnestness has kept him free from the eccentricity which marred most of his other writings, excepting his contributions to mathematical research and oriental philology. There was, indeed, scarcely a crotchet, except "spiritualism," of which he was not at one time or another the advocate. His versatility was such that he wrote on logic, political economy, English reforms, Austrian politics, Roman history, diet, grammar, the most abstruse departments of mathematics, Arabic, the emendation of Greek texts, and languages as out of the way as the Berber and as obsolete as the dialect of the Iguvine inscriptions. In treating all these subjects he showed signal ability, but, wherever the theme allowed, an incurable crotchettiness; and in his numerous metrical translations from the classics, especially his version of the Iliad, he betrayed an insensibility to the ridiculous which would almost have justified the irreverent criticism of Matthew Arnold, had the poem been conveyed in more seemly fashion. His miscellaneous essays, some of much value, were collected in several volumes before his death: his last publication, Contributions chiefly to the Early History of Cardinal Newman (1891), was generally condemned as deficient in infantile feeling. He was far from possessing his brother's subtlety of reasoning, but he impresses by a transparent sincerity and singleness of mind not always displayed by the more celebrated writer; his style is too individual to be taken as a model, but is admirable for its simplicity and clearness. His character is vividly drawn by Carlyle in his life of Stere. In the early days of Newman's career, as a man of fine attainments, of the sharpest-cutting and most relentlessly advancing intellect and of the mildest pious enthusiasm." It was his great misfortune that this enthusiasm should have been correlated, as is not unfrequently the case, with an entire insensibility to the humorous side of things. After his retirement from University College, Professor Newman continued to live for some years in London, subsequently removing to Clifton, and eventually to Weston-super-Mare, where he died on the 7th of October 1897. He had been blind for five years before his death, but retained his faculties to the last. He was twice married, by

T. G. Sieveking, Memoir and Letters of Francis W. Newman (1909).

NEWMAN, JOHN HENRY (1801-1890), English Cardinal, was born in London on the 21st of February 1801, the eldest son of John Newman, banker, of the firm of Ramsbottom, Newman and Co. The family was understood to be of Dutch extraction, and the name itself, spelt "New man" in an earlier generation, further suggests Hebrew origin. His mother, Jemima Fountaine, was of a Huguenot family, long established in London as engravers and paper manufacturers. John Henry was the eldest of six children. The second son, Charles, a man of ability but of impracticable temper, a professor of Theology, and a rector, died in 1834. The youngest son, Francis William (q.v.), was for many years professor of Latin in University College, London. Two of the three daughters, Harriett Elizabeth and Jemima Charlotte, married brothers, Thomas and John Mozley; and Anne Mozley, a daughter of the latter, edited in 1892 Newman's Anglican Life and Correspondence, having been entrusted by him in 1883 with an autobiographical written in the third person to form the basis of a narrative of the first thirty years of his life. The third daughter, Mary Sophia, died unmarried in 1883.

At the age of seven Newman was sent to a private school conducted by Dr Nicholas at Ealing, where he was distinguished by diligence and good conduct, as also by a certain shyness and aloofness, taking no part in the school games. He speaks of himself as having been "very superstitious" in these early years. He took great delight in reading the Bible, and also the novels of Scott, then in course of publication. At the age of fifteen, during his last year at school, he was "converted," an incident that throughout life remained to him "more certain than that he had hands or feet." It was in the autumn of 1816 that he thus fell under the influence of a definite creed, and received into his intellect impressions of dogma never afterwards effaced. The tone of his mind was at this date evangelical and Calvinistic, and he held that the pope was anti-Christ. Matriculating at Trinity College, Oxford, 14th December 1816, he went into residence there in June the following year, and in 1818 he gained a scholarship of £60, tenable for nine years. But for this he would have been unable to remain at the university, as in 1810 his father's bank suspended payment, and the year his name was entered at Lincoln's Inn. Anxiety to do well in the final schools produced the opposite result; he broke down in the examination, and so graduated with third-class honours in 1821. Desiring to remain in Oxford, he took private pupils and read for a fellowship at Oriel, then "the acknowledged centre of Oxford intellectualism." To his intense relief and delight he was elected on the 12th of April 1822. E. B. Pusey was elected a fellow of the same society in 1824.

On Trinity Sunday, 13th June 1824, Newman was ordained, and became, at Pusey's suggestion, curate of St Clement's, Oxford. Here for two years he was busily engaged in his small work, but he found time to write articles on "Apolloius of Tyana," on " Cicero" and on "Miracles" for the Encyclopaedia Metropolitana. In 1825, at Whately's request, he became vice-principal of St Alban's Hall, but this post he held for only one year. To his association with Whately at this time he attributed much of his "mental improvement" and a partial conquest of his shyness. He assisted Whately in his popular work on logic, and from him he gained his first definite idea of the Christian Church. He broke with him in 1827 on the occasion of the re-election of Peel for the University, Newman opposing this on personal grounds. In 1826 he became tutor of Oriel, and the same year R. H. Froude, described by Newman as "one of the acutest, cleverest and deepest men" he ever met, was elected fellow. The two formed a high ideal of the tutorial office as clerical and pastoral rather than secular. In 1827 he was a preacher at Whitehall. The year following Newman supported and secured the election of Hawkins as provost of Oriel in preference to Keble, a choice which he later defended or apologized for as having in effect produced the Oxford Movement with all its later consequences. In 1828 he was appointed preacher of St Mary's, to which the chapelcy of Littlemore was attached. He was made regius professor of Hebrew. At this date, though still nominally associated with the Evangelicals, Newman's views were gradually assuming a higher ecclesiastical tone, and while local secretary of the Church Missionary Society he circulated an anonymous letter suggesting a method by which Churchmen might practically cure Nonconformists from all control of the society. This resulted in his being dismissed from the post, 5th March 1830; and three months later he withdrew from the Bible Society, thus completing his severance from the Low Church party. In 1832 he was elected preacher before the University. In 1835, his difference with Hawkins as to the "substantially religious nature" of a college tutorship becoming acute, he resigned that post, and in December went with R. H. Froude, on account of the latter's health, for a tour in South Europe. On board the mail steamer "Hermes" they visited Gibraltar, Malta and the Ionian Islands, and subsequently Sicily, Naples and Rome, where Newman made the acquaintance of Dr Wiseman. In a letter home he described Rome as "the most wonderful place on earth," but the Roman Catholic religion as "polytheistic, degrading and debasing." It was during this course of his tour that he wrote most of the short poems which a year later were printed in the Lyra Apostolica. From Rome Newman returned to Sicily alone, and was dangerously ill with
fever at Leonforte, recovering from it with the conviction that he had a work to do in England.

In June 1833 he left Palermo for Marseilles in an orange boat, which was becalmed in the Strait of Bonifacio, and here he wrote the verses, "Lead, kindly Light," which later became popular as a hymn. In late June, Newman joined Keble on Oxford on the 9th of July, and on the 14th Keble preached at St Mary's an assize sermon on "National Apostasy," which Newman afterwards regarded as the inauguration of the Oxford Movement. In the words of Dean Church, it was "Keble who inspired, Froude who gave the impetus and Newman who took up the work"; but the first organization of it was due to H. J. Rose, editor of the British Magazine, who has been styled "the Cambridge originator of the Oxford Movement." It was in his rectory house at Hadleigh, Suffolk, that a meeting of High Church clergy was held, 27th to 29th of July (Newman was not present), at which it was resolved to fight for "the apostolical succession and the integrity of the Prayer-Book." A few weeks later Newman started, apparently on his own initiative, the Tracts for the Times, from which the movement was subsequently named "Tractarian." Its aim was to secure for the Church of England a definite basis of doctrine and discipline, in case either of disestablishment or of a determination of High Churchmen to quit the establishment, an activity that was thought not impossible in view of the States' recent high-handed dealings with the sister established Church of Ireland. The Tractarians were inspired by Newman's Sunday afternoon sermons at St Mary's, the influence of which, especially over the junior members of the university, was increasingly marked during a period of eight years. In 1835 Pusey joined the movement, which, so far as concerned ritual observances, was later called "Puseyite"; and in 1836 its supporters secured further coherence by their united opposition to the appointment of Hampden as regius professor of divinity. His Bampton Lectures (in the preparation of which Blanco White had assisted him) were suspected of heresy, and his suspicion was accentuated by a pamphlet put forth by Newman, Eulogizations of Dr Hampden's Theological Statments. At this date Newman became editor of the British Critic, and he also gave courses of lectures in a side-chapel of St Mary's in defence of the via media of the Anglican Church as between Romanism and popular Protestantism. His influence in Oxford was supreme about the year 1839, when, however, his study of the monophysite heresy first raised in his mind a doubt as to whether the Anglican position was really tenable on those principles of ecclesiastical authority which he had accepted; and this doubt returned when he read, in Wiseman's article in the Dublin Review on The Anglican Opinion, the words of St Augustine against the Donatists, "securus judicat orbis terrarum," words which suggested a simpler authoritative rule than that of the teaching of antiquity. He continued his work, however, as a High Anglican controversialist until he had published, in 1841, Tract 90, the last of the series, in which he put forth, as a kind of proof charge, to test the tenability of all Catholic doctrine within the Church of England, a detailed examination of the XXXIX. Articles, suggesting that their negations were not directed against the authorized creed of the Church of England, but only against popular errors and exaggerations. This theory, though not altogether new, aroused much indignation in Oxford, and A. C. Tait, afterwards archbishop of Canterbury), with three other senior tutors, denounced it as "suggesting and opening a way by which men might violate their solemn engagements to the university." The alarm was shared by the heads of houses and by others in authority; and, at the request of the bishop of Oxford, the publication of the Tracts came to an end. At this date Newman also resigned the editorship of the British Critic, and was thenceforth, as he himself later described it, "on his deathbed as regards correspondence with the Anglican Church." He now recognized that the position of Anglicans was similar to that of the semi-Arians in the Arian controversy; and the arrangement made at this time that an Anglican bishopric should be established in Jerusalem, the appointment to lie alternately with the British and Prussian governments, was to him further evidence of the non-apostolical character of the Church of England. In 1842 he withdrew to Littlemore, and lived there under monastic conditions with a small band of followers, their life being one of great physical austerity as well as of anxiety and suspense. To his disciples there he assigned the task of writing lives of the English saints, while his own time was largely devoted to the completion of an essay on the development of Christian doctrine, by which principle he sought to reconcile himself to the elaborated creed and the practical system of the Roman Church. In February 1843 he published, as an advertisement in the Oxford Conservative Journal, an anonymous but otherwise formal retraction of all the hard things he had said against Rome; and in September, after the secession of one of the inmates of the house, he preached his last Anglican sermon. The Littlemore land was then assigned as a convent, and still an interval of two years elapsed before he was formally received into the Roman Catholic Church (9th October 1845) by Father Dominic, an Italian Passionist. In February 1846 he left Oxford for Oscott, where Bishop Wiseman, then vicar-apostolic of the Midland district, resided; and in October he proceeded to Rome, where he was ordained priest and was given the degree of D.D. by the pope. At the close of 1847 he returned to England as an Oratorian, and resided first at Maryvale (near Oscott); then at St Wilfrid's College, Cheddle; then at St Ann's, Alcester Street, Birmingham; and finally at Edgbaston, where he remained until his death.

In 1835, through the medium of the British Critic, he began a correspondence with Newman, and in 1841 he joined him as an Oratorian. But the union was not amicable, and Newman, in a correspondence published in 1846, said: "I think it is quite impossible to reconcile a man of my宗旨 with the doctrine and practice of the Church which he became jealous of his influence, so that after four years he retired, the best outcome of his stay there being a volume of lectures entitled Idea of a University, containing some of his most effective writing. In 1838 he projected a branch house of the Oratory at Oxford; but this was opposed by Manning and others, as likely to induce Catholics to send their sons to that university, and the scheme was abandoned. In 1859 he established, in connexion with the Birmingham Oratory, a school for the education of the sons of gentlemen on lines similar to those of the school at Stockbridge, which was closed by reason of Want of funds, but which was reopened as The Westminster Oratory, and never again ceased to take the greatest interest. But all this time (since 1841) Newman had been under a cloud, so far as concerned the great mass of cultivated Englishmen, and he was now awaiting an opportunity to vindicate his career; and in 1862 he began to prepare autobiographical and other memoranda for the purpose. The occasion came when, in January 1864, Charles Kingsley, reviewing Froude's History of England in Macmillan's Magazine, incidentally asserted that "Father Newman informs us that truth for its own sake need not be, and on the whole is, a virtue of the Roman clergy." After this preliminary sparring between the two Newman's pamphlet, "Mr Kingsley and Dr Newman: a Correspondence on the Question whether Dr Newman teaches that Truth is no Virtue," published in 1864 and not reprinted, is unsurpassed in the English language for the vigour of its satire: the anger displayed was
NEWMAN, CARDINAL

later, in a letter to Sir William Cope, admitted to have been largely feigned—Newman published in bi-monthly parts his Apologia pro vita sua, a religious autobiography of unsurpassed interest, the simple confidential tone of which "revolutionized the popular estimate of its author," establishing the strength and sincerity of the convictions which had led him into the Roman Catholic Church. King's accusation—that, so far as it concerned the Roman clergy generally, was not precisely dealt with; only a passing sentence, in an appendix on lying and equivocation, maintained that English Catholic priests are as truthful as English Catholic laymen; but of the author's own personal rectitude no room for doubt was left.

In 1870 he put forth his Grammar of Assent, the most closely reasoned of his works, in which the case for religious belief is maintained by arguments differing somewhat from those commonly used by Roman Catholic theologians; and in 1877, in the republication of his Anglican works, he added to the two volumes containing his defence of the via media a long preface and numerous notes in which he criticized and replied to sundry anti-Catholic arguments of his own in the original issues. At the time of the Vatican Council (1869-1870) he was known to be opposed to the definition of Papal infallibility, and in a private letter to his bishop (Ullathorne), surreptitiously published, he denounced the "insolent and aggressive faction" that had pushed the matter forward. But he made no sign of disapproval when the doctrine was defined, and subsequently, in a letter nominally addressed to the duke of Norfolk on the occasion of Mr. Gladstone's accepting the Roman Church of having "equally repudiated modern thought and ancient history," Newman affirmed that he had always believed the doctrine, and had only feared the deterrent effect of its definition on conversions on account of acknowledged historical difficulties. In this letter, and especially in the postscript to the second edition of it, Newman finally silenced all cavillers as to his not being really at ease within the Roman Church. In 1878 his old college (Trinity), to his great delight, elected him an honorary fellow, and he revisited Oxford after an interval of thirty-two years. At the same date died Pope Pius IX, who had long mistrusted him; and Leo XIII was encouraged by the duke of Norfolk and other distinguished Roman Catholic laymen to make Newman a cardinal, the distinction being a marked one, because he was a simple priest and not resident in Rome. The offer was made in February 1879, and the announcement of it was received with universal applause throughout the English-speaking world. The "creation" took place on 12th May, with the title of St George in Velabro, Newman taking occasion while in Rome to insist on the lifelong consistency of his opposition to "liberalism and a different religion." After this promotion he returned to England, and thenceforward resided at the Oratory until his death, 11th August 1890, making occasional visits to London, and chiefly to his old friend, R. W. Church, dean of St Paul's, who as proctor had vetoed the consecration of Tract 90 in 1841. As cardinal Newman published nothing beyond a preface to a work by A. W. Hutton on the Anglican Ministry (1879) and an article on Biblical criticism in the Nineteenth Century (February 1884).

Newman's influence as controversialist and preacher (i.e. as reader of his written sermons, for he was never a speaker) was very great. In the English Church his conversion secured great prestige and the dissipation of many prejudices. Within it his influence was mainly in the direction of a broader spirit and of a recognition of the important part played by development both in doctrine and in Church government. And although he never called himself a mystic, he showed in that his judgment spiritual truth is apprehended by direct intuition, as an antecedent necessity to the professedly purely rational basis of the Roman Catholic creed. Within the Anglican Church, and even within the more strictly Protestant Churches, his influence was greater, but in a different direction, viz. in showing the necessity of dogma and the indispensableness of the austere, ascetic, chastened and graver side of the Christian religion. If his teaching as to the Church was less widely followed, it was because of doubts as to the thoroughness of his knowledge of history and as to his freedom from bias as a critic. Some hundreds of clergymen, influenced by the movement of which for ten or twelve years he was the acknowledged leader, made their submission to the Church of Rome; but a very much larger number, who also came under its influence, failed to learn from him that belief in the Church involves belief in freedom. The natural tendency of his mind is often (and correctly) spoken of as sceptical. He held that, apart from an interior and unreasoned conviction, there is no cogent proof of the existence of God; and in Tract 85 he dealt with the difficulties of the Creed and of the canon of Scripture, with the apparent implication that they are insurmountable unless overridden by the authority of an infallible Church. In his own case these views did not lead to scepticism, because he had always possessed the necessary interior conviction; and in writing Tract 85 his only doubt would have been where the true Church is to be found. But, so far as the rest of the world is concerned, his teaching amounts to this: that the man who has not this interior conviction has no choice but to remain an agnostic, while the man who has it is bound sooner or later to become a Roman Catholic.

He was a man of magnetic personality, with an intense belief in the significance of his own career; and his character may be described as feminine, both in its strength and in its weakness. As a poet he had inspiration and genuine power. Some of his short and earlier poems, in spite of a characteristic element of fierceness and intolerance in one or two cases, are described by R. H. Hutton as "unequaled for grandeur of outline, power of taste and radiance of total effect"; while his latest and longest, "The Dream of Gerontius," is generally recognized as the happiest effort to represent the unseen world that has been made since the time of Dante. His prose style, especially in his Catholic days, is fresh and vigorous, and is attractive to many who do not sympathize with his conclusions, from the apparent candour with which difficulties are admitted and grappled with, while in his private correspondence there is a charm that places it at the head of that branch of English literature. He was too sensitive and self-conscious to be altogether successful as a leader of men, and too impetuous to take part in public affairs; but he had many of the gifts that go to make a first-rate journalist, for, "with all his love for and his profound study of antiquity, there was something about him that was conspicuously modern." Nevertheless, with the scientific and critical literature of the years 1850-1890 he was barely acquainted, and he knew no German. There are a few passages in his writings in which he seems to show some sympathy with a broader theology. Thus he admitted that there was "something true and divinely revealed of that which is at the bottom of things," and his articles is abstractedly the highest state of Christian conception, but was "the peculiar privilege of the primitive Church." And even in 1877 he allowed that "in a religion that embraces large and separate classes of adherents there always is of necessity to a certain extent an exoteric and an esoteric doctrine." These admissions, together with his elucidation of the idea of doctrinal development and his eloquent assertion of the supremacy of conscience, have led some critics to hold that, in spite of all his protests to the contrary, he was himself somewhat of a Liberal. But it is certain that he explained to his own satisfaction and comfort the "great principle" of "the Roman Catholic Creed" and "the Church beyond it, as in holding the pope to be infallible in canonization; and while expressing his preference for English as compared with Italian devotional forms, he was himself one of the first to introduce such into England, together with the ritual peculiarities of the local Roman Church. The motto that he adopted for use with the arms emblazoned for him as cardinal—Cor ad cor loquitur, and that which he directed to be engraved on his memorial tablet at Edgbaston—Ex umbri et imaginibus in terrissem—together seem to disclose as much as can be disclosed of the secret of a life, which, both to contemporaries and to later students, has been one of almost fascinating interest, at once devout and inquiring, affectionate and yet sternly self-restrained.
There is at Oxford a bust of Newman by Woolner. His portrait by Ouelles is at the Birmingham Oratory, and his portrait by Millais is in the possession of the duke of Norfolk, a replica being at the London Oratory. Outside the latter building, and facing Brompton Road, there is a marble statue of Newman as cardinal.

(A. W. Hu.)

The chief authorities for Newman's life are his Apologia and Correspondence, edited by Miss Mozley, above referred to. The letters and memoranda dealing with the years 1845-1890 were entrusted by Newman to the Rev. R. Neville, the literary executor. Works by R. W. Church, J. B. Mozley, T. Monceaux, and Wilfrid Ward should also be consulted, as well as an appreciation by R. H. Hutton. Adverse criticism will be found in the writings of the late Abbe' d'Agincourt in his Christian Cardinals (2 vols., London, 1892), while some minor traits and foibles were noted by A. W. Hutton in the Expositor (September, October and November 1890). See also F. Thureau-Dangin, La Renaissance catholique: Newman et le mouvement d'Oxford (Paris, 1890); Lucie Félix-Faure, Newman, sa vie et ses œuvres (ib. 1901); MacKae, Die religiöse Gewissheit bei John Henry Newman (Jena, 1898); Grappe, John Henry Newman. Essai de psychologie religieuse (Paris, 1902); William Barry, Newman (London, 1903); Lady Blennerhassett, J. H. Cardinal Newman (Berlin, 1904); Brémont, Newman. Le développement du dogme chrétien (Paris, 1903; 4th ed., 1906), Psychologie du fait (ib. 1900), and Essai de biographie psychologique (ib. 1900).

NEW MARCH, WILLIAM (1822-1882), English economist and statistician, was born at Thirsk, Yorkshire, on the 28th of January 1822. He settled in London in 1846 as an official of the Agra Bank, but resigned in 1851 on his appointment as secretary of the Globe Insurance Company. This post he held till 1862, when he became chief officer in the banking-house of Glyn, Mills & Co., in whose employ he remained until 1881. Notwithstanding the continuous pressure of an active business life he found time to contribute largely many valuable articles to the magazines and newspapers of the country. He assisted in the preparation of a series of volumes (about thirty in all) for the Royal Statistical Society (of which he was one of the honorary secretaries, editor of its journal, and in 1869-1871 president) and the Political Economy Club. He was also elected a fellow of the Royal Society. His extensive knowledge of banking was displayed in the evidence which he gave before the select committee on the Bank Acts in 1857. He collaborated with Thomas Tooker in the two final volumes of his History of Prices and was responsible for the greater part of the work in those volumes. For nineteen years he wrote an admirable survey of the commercial history of the United Kingdom, to which he was stricken in 1882. He died at Torquay on the 22nd of March 1882. After his death his friends, in perpetuation of his memory, a Newmarch Lectureship in economic science and statistics at University College, London.

NEW MARKET, a market town in the Newmarket parliamentary division of Cambridgeshire, England, 133 m. E. by N. of Cambridge on the Bury branch of the Great Eastern railway. Pop. (1901) 10,688. A part of the town is in Suffolk, and the urban district is in the administrative county of West Suffolk. Newmarket has been celebrated for its horse-races from the time of James I., though at that time there was more of coursing and hawking than horse-racing. Charles I. instituted the first cup race. For the use of Charles II., during his visits to the races, a palace, no longer extant, was built on the site of the lodge of James I. There are numerous residences belonging to patrons of the turf, together with stables, and racing and training establishments. The racecourse, which lies south-west of the town, has a full extent of 4 m., but is divided into various lengths to suit the different races. The course intersects the so-called Devil's Ditch or Dyke (sometimes also known as St Edmund's Dyke), an earthwork consisting of a ditch and mound stretching almost straight for 5 m. from Reach to Wool. It is 12 ft. wide at the top, 18 ft. above the level of the country, and 30 ft. above the bottom of the ditch, with a slope of 50 ft. on the south-west side and 26 ft. on the north-east. It formed part of the boundary between the kingdoms of East Anglia and Mercia, but is doubtless of much earlier origin. Roman remains have been found in the neighbourhood.

NEW MECKLENBURG (Ger. Neu-Mecklenburg, formerly New Ireland, native Tombara), an island of the Bismarck Archipelago, N.E. of New Guinea in the Pacific Ocean, about 3° 3', 152° E., in the administration of German New Guinea. It is about 240 m. long but seldom over 15 wide. From St George's Channel, separating it from New Pomerania, it sweeps north and then north-west along dividing New Guinea and the Outback, other extremity by Byron Strait. It is mountainous throughout, having an extreme elevation of about 6500 ft. in the north, where the prevalent formations are sandstone and limestone, whereas in the south they are granite, porphyry and basalt. There is a white population of about forty; the natives are Papuans of a less fine type than the natives of New Pomerania, and rather resemble the Solomon Islanders. Jacob Lemaire and Willem Cornelis Schouten sighted New Mecklenburg in 1616, it it only recognised as an island separate from New Guinea by William Dampier in 1699 and as separate from New Pomerania in 1767 by Philip Carteret.

NEW MEXICO, a south-western state of the United States, lying between 31° 20' and 37° N. lat., and 103° and 109° 2' W. long. It is bounded N. by Colorado; E. by Oklahoma and Texas; S. by Texas and Mexico; and W. by Arizona. It has an extreme length N. and S. of 400 m., an extreme width E. and W. of 356 m., and a total area of 122,634 sq. m., of which 131 sq. m. are water-surface.

Physiography.—New Mexico is a region of mountains and high basins. Breaking elevations, its surface is tabularly tilted toward the S. and E., and broken by parallel ranges of mountains whose trend is most frequently N. and S. About midway between the western boundary and the Rio Grande passes the Continental Divide, which separates the waters entering the Gulf of Mexico from those that flow into the Gulf of California. In the region E. of the Continental Divide, which embraces about three-fourths of the surface of the state, the general south-eastern slope is very marked. Thus, at Santa Fé, in the north central part of the state, the elevation is 7013 ft.; at Raton, in the N.E., 6420 ft.; at Las Cruces, in the S., 3570 ft.; and at Red Bluff, in the extreme S.E., 2876 ft.

The Rocky Mountain system enters New Mexico near the centre of the northern boundary; its main ridge, lying E. of the Rio Grande, extends as far S. as the city of Santa Fé. It forms the water-parting between the upper waters of the Canadian river and the Rio Grande, and contains many of the loftiest peaks in New Mexico, among them being Truchas (13,275 ft.), Costilla (12,634 ft.) and Baldy (12,623 ft.). On the E. this ridge is bounded by the region of the Great Plains, with a two thousand-foot relief of which is characterized by many broad valleys intervening. W. of the Rio Grande lies a series of lower ranges, also a part of the Rocky Mountain system, whose long mountain slopes merge almost imperceptibly with the Plateau Region. The San Juan, San Miguel and New River Mountains being the most notable in this group. South of the Rocky Mountains lies the so-called Basin Region, in which isolated, but sometimes lofty and massive, N.Mexico mountains, reared in many instances as a series of numerous parallel faults, rise from level plains like islands from the sea and enclose the valleys with bare walls of grey and brown rock. These valley plains, from 10 m. to 20 m. wide and sometimes 100 m. long, sloping gradually toward their centres, are usually covered with detritus from the neighbouring mountains, and seldom have a distinct drainage outlet. The Spaniards called them "bolsonas" (pores), a term that geologists have retained. In many of these bolsonas are ephemeral lakes, in which the waters collect during the rainy season and stand for several months. These waters are frequently impregnated with alkalii or salt, and on evaporating leave on the bed of the lake a thin encrustation of snow-white spar. Such beds, locally known as "alkali flats," are especially numerous in Valencia, Socorro, Dona Ana and Otero counties, and a number of them furnish all the salt needed by the cattle ranges in their region. West of the region of the great plains is the so-called Basin of New Mexico, lies the basin of the extinct Lake Otero, in which are found the remarkable "white sands," consisting of dunes of fine white sand or gravel, found covering the sea bottom. In this region many species of reptiles and insects are almost perfectly white—an interesting example of protective coloration. Both E. and W. of the central portion of the Basin Region the bolson plains extend on their distinctly flattish surfaces, usually level, the broader and the mountains less lofty and more isolated. East of the Pecos and S. of the Canadian rivers lies the great arid tableland known as the Great Plain, a region of vast plateaus and featureless tablelands, having with almost nothing to break the monotony of its landscape. This is a part of the Great Plains and a continuation of the high plains region of Texas. The Plateau Region includes most of the area N.
of the Gila river and W. of the Rio Grande. Fire, volcanic activity and powers of earth have combined to produce a scene of great scenic effects. The eastern border of this area is formed by the valley of the Rio Grande and the western foot-hills of the Rocky Mountains; the southern boundary overlooks the Gila river; and on the north it is formed by the mountainous boundary of Utah. Near its southern and eastern borders are many lava flows and extinct volcanic mountains, one of the most imposing of those in New Mexico is Pecos peak near Taylor. Such flows as these are surrounded by lava tables and some of the most wonderful volcanic buttes in the world.

In other portions of New Mexico there is also much evidence of former volcanic activity. A conspicuous feature of its landscape is the great many basaltic flows which were formed by differential erosion and projecting above the surrounding country like a table. A notable example is the mesa of Acoma, in Valencia county, capped with volcanic rocks; upon its summit, almost level, are large cultivated fields.

The average elevation of New Mexico is 5700 ft., with 40.20 sq. m. between 3000 and 5000 ft.; 56,680 sq. m. between 5000 and 7000 ft.; 23,550 sq. m. between 7000 and 9000 ft.; and 2000 sq. m. above 9000 ft.

For a region with such a small amount of rainfall the rivers are numerous, but none of the streams is navigable, and in many of them during the dry season (and in some of them during the stratification) the water in places disappears entirely beneath the sandy bed, and after flowing underground for some distance, breaks out at length on as a river, rivulet or spring. The most important stream in New Mexico, as its name implies, enters New Mexico through deep canyons near the centre of the northern boundary and continues southward across the entire state. During the dry season the river flows from its source to a sluggish river turgid with sand in the S. In the lowlands it loses much of its volume through evaporation and absorption by the sands, and through irrigation, and in its lower course in New Mexico it is almost perfectly dry.

The river leaves its banks and inundates the lowlands, spreading over the sand a rich deposit of silt, and on account of this characteristic it is sometimes called the Nile of New Mexico. The stream next in importance is the Pecos river, which rises in Mora county and flows southward into Texas, where it joins the Rio Grande. It has the same general characteristics as the latter river, being a mountain stream, a river of springs, and a stream without banks, sluggish and losing much of its water. Along the lower course many underground streams from the mountains break out as springs and empty into the Pecos. The Canadian river drains the eastern slope of the Rocky Mountains and flows in a general south-easterly direction through Texas into Oklahoma, where it empties into the Arkansas. Most of its course in New Mexico lies through a canyon.

The westward-flowing streams—the San Juan, Rio Puerco of the West, Zunis, Rio San Francisco and Colores—are of little importance, though their flow is perennial. In the valleys there are many small streams whose waters never reach the ocean, but drain into underground passages and springs.

Fauna and Flora.—Of native animals the species are numerous, but their numbers are small. Bison no longer roam the plains, and the elk has been driven out; but among the larger mammals still to be found are the coyote, the jack rabbit (or jackal), the bob-white, the bison and the bison, the antelope, the elk, the bear, the bear, the wolf, the coyote, the timber wolf, lynx (Lynx rufus and Lynx Canadensis) and the black and grizzly bear. Badgers, hares, and rabbits are found everywhere, and prairie-dogs are so numerous in some of the places as to be considered a pest. W. of the Rio Grande are species of aquatic birds. From time to time upon the Rio Grande may be seen ducks, wild geese, swans, cranes, herons and gulls. Eagles are often seen, and in the arid and elevated regions crows and ravens are numerous. Gambel's quail, bob-white, grouse, English phasian and wild turkeys are the most important game birds, and the mocking-bird is common throughout south-western New Mexico. Among the butterflies, dragon-flies, flies, insects and the rattlesnake, the Gila monster (Heloderma suspectum), a poisonous lizard, and the tarantula (Majgale Heintzii), which, however, are common only in certain places and at certain seasons.

The greatest range of elevations that all four of the zones of vegetation into which the South-West has been divided according to altitude are found within its limits; namely, the zone of cacti, which extends from the cactus sands to the cactus desert, the zone of greasewood and sage-brush (3500-4000 ft.), where there is little grass, and the cactus species are less numerous; the zone of the cedar (4000-6800 ft.); and the zone of the pine and fir (6800- 10,000 ft.) where there is much grass. The total area of the land in the state is estimated at 36,700 sq. m., or a little more than 19% of the land area.

The chief varieties of timber are the red fir, Engelmann's spruce and yellow pine. Up to 1910 the Federal government had created eleven forest reservations in New Mexico, embracing an area of 10,971,111 acres.

In the valleys the only trees native to the soil are cottonwood, willow and alder. Beyond the range of irrigation vegetation is limited to scanty grass, with sage-brush and greasewood in the N. and cactus and yucca in the S.

As the winds that reach New Mexico have been described while crossing the plains of Texas or the mountains of the N.W., the climate is characterized by a lack of humidity. The sandy and barren nature of the soil and the scarcity of trees is responsible for the fact that there is great daily variation in the temperature. The low humidity, high altitudes and southern latitude all combine to make the climate salubrious and especially beneficial to persons suffering with tuberculosis. The coldest temperature ever recorded was 110° F. at Roswell; the lowest, 23° at Aztec. At Santa Fé, where mountain and plain meet, the mean annual temperature is 46°; the mean for the winter is 31° and for the summer 70°; and the temperature is at all seasons remarkably uniform. The summer season lasts from May 1st to July 31st, and the winter season lasts from November 1st to February 28th.

Agriculture.—Because of the small amount of rainfall, agriculture is confined chiefly to the river valleys. In 1900 only 4.2% of the land surface was included in farms, and less than 27% of 1% was cultivated. In 1900 the land area of farms was 41,494,529 acres, including 1,784,824 acres of improved land; of this total area, 63% of it was improved between 1880 and 1890, 27% of it between 1880 and 1890, and 10% of it between 1880 and 1880.

In addition to the improved land, there were 41,695,634 acres of unimproved, including 10% of it between 1880 and 1890, 27% of it between 1880 and 1890, and 10% of it between 1880 and 1890. The average area of farms was 410 acres, and the average area of improved land was 214 acres. The average area of farms was 214 acres, and the average area of improved land was 214 acres.

The average area of farms was 214 acres, and the average area of improved land was 214 acres.

The average area of farms was 214 acres, and the average area of improved land was 214 acres.

NEW MEXICO

number in any state or Territory except Montana and Wyoming; and in April 1909 there were 3,200,000 sheep of shearing age in New Mexico, but this number was less than that in Montana or Wyoming at that time.

El Alto was one of the mountain valleys in the N., agriculture was long entirely dependent upon irrigation, which has been practised in New Mexico by the Pueblo Indians since prehistoric times. In 1899 the total irrigated areas of the state (value of all improved land)—an increase of 122.2% in the preceding decade. Of the total land in crops in that year 89.2% was irrigated. After the passage of the Federal Reclamation Act in 1902, a number of extensive irrigation works in New Mexico were undertaken by the Federal government. The Carlsbad reservoir and diverting dam in Eddy county and the Rio Hondo canals and reservoir in Chaves county were completed in 1907 and are capable of supplying water to 20,000 acres of farm land. In 1908 an irrigation reservoir in McKinley county for the use of the Zufi Indians and the Leasburg project (Dona Ana county; 20,000 acres) were completed. Irrigation reservoirs have been made for the storage of the flood waters of the Rio Grande near Engle, New Mexico, in order to reclaim about 155,000 acres of land in New Mexico and Texas, and to deliver to Mexico above the city of Juarez 60,000 acres (feet of water per year, as provided by a treaty (proclaimed on the 16th of January 1907) between that republic and the United States. Other systems contemplated by the government were the Las Vegas project (for reclaiming 60,000 acres, the largest in the state), Lake Otero project (26,000 acres in the Pecos Valley, and the La Plata Valley project for irrigating about 40,000 acres in the northwestern part of New Mexico, 35 m. S.W. of Durango, Colorado. A special session of the legislature created the office of Territorial irrigation engineer. Irrigation by private companies is of some importance, especially in the San Juan Valley, the Rio Grande Valley and the Pecos Valley. In 1909 it was estimated that the value of irrigated lands in New Mexico had proved a great success in New Mexico, as elsewhere in the Southwest, especially since 1900; and in 1907 it was estimated that 2,000,000 acres were under irrigation.

Manufactures.—As New Mexico is primarily a mining and stock-raising region, its manufacturing industries are of comparatively small importance. The value of the manufactured products in 1880 was $2,546,948; in 1890 it was $4,163,195; and in 1907 it was $15,587,040, an increase in the latter decade of 269.7%. In 1905 there were 199 establishments under the factory system (an increase of 14.4% over the number in 1900); the amount of capital invested was $4,059,000, and the value of products $5,795,880 (an increase of 40.5% over the value of the "factory" products in 1900). The leading industries in 1905 were the construction of cars and general railway shop and repair work by steam railway companies (value of product, $2,509,845), the manufacture of lumber and timber products (value $1,315,364) and of flour and gist mill products (value $388,124), and the printing and publishing of newspapers and periodicals (value $373,062). In 1907 the value of the manufactures was $10,528,041. Santa Fe and Socorro were valued at 39.4% of the total value of New Mexico's products.

Minerals.—The existence of valuable mineral deposits was early known to the Spaniards and Mexicans. There was some production of gold by the Mexicans, but the silver mining was unimportant until 1881, when the Lake Valley silver mines in Sierra county began to yield. Before that year all the silver produced was of the value of $25,000. In 1908 the production of silver increased from $275,000 to $3,000,000. After 1885 there was a gradual decline in the output, whose bullion value in 1908 was $250,986. The production of gold has shown a somewhat similar movement; the output in 1881 was valued at $188,000; in 1888, at $1,000,000, and in 1908 at $298,275. The leading gold- and silver-producing counties are Socorro, Grant, Sierra and Dona Ana. Only silver is mined in the last-named county. Copper has been mined for many years, and in 1906 and 1908 constituted New Mexico's most valuable metallic product, the value of the yield in these years being $1,335,533 and $658,855 respectively. Nearly all the product comes from the Don Henry mine in Grant county, which was the only copper mine in New Mexico in 1880. The output in 1908 increased to $3,000,000.

Most of the zinc comes from the Sonoita mine in Grant and Otero counties. In 1905-1908 the decrease in output was large. In the same years there was an increase in the output of zinc, which in 1906 was valued at $57,710 and in 1908 at $270,710. The total output of the state, where the mines of the Magdalena District in 1908 yielded 93% of the entire product. A small amount of lead is produced incidentally to the mining of zinc, being derived from mixed lead and zinc ores. For the most part, lead is impure metallic product, however, is coal, which is found in all forms—lignite to anthracite—and in widely distributed areas. The chief centres of production are the Raton field, in Colfax county; the Mescalero, Ruidosa, and Whiteclows fields, in Lincoln county; and the Los Cerrillos and Tejon areas, in Santa Fe county. Much of the coal is suitable for coke, of which a considerable amount is manufactured for use in the state. In 1906, $1,904,499 was made, and in 1908, $3,366,753. Iron ores are widely distributed, but have not been developed; graphite is mined in Colfax county; mica in Taos county, and to a small extent in Rio Arriba county; marble is quarried in Otero county and sandstone in Bernalillo, Colfax and San Miguel counties. Gypsum beds are widely distributed, and the supply is inexhaustible, but their great distance from centres of consumption has prevented their profitable working. In New Mexico are found turquoise and a few garnets; it seems probable that these were mined by the Aztecs. The largest of the old Spanish turquoise mines is in Socorro county, where a turquoise product between 1890 and 1900 valued at more than $2,000,000. Other mines are in Grant and Otero counties. The New Mexican turquoise is of a more delicate turquoise than the Arizona varieties. The output of precious stones in 1902 was valued at $51,100, in 1908 at $72,100.

Transportation.—The total railway mileage on the 31st of December 1908 was 2,518.02, more than twice as much as that of 1890. The length of railway per inhabitant in New Mexico in 1907 was about five times as great as that for the whole country, but the amount of line per square mile of territory was only about one-third as great as the average for the United States. New Mexico is traversed by a line of the Atchison, Topeka & Santa Fe, from Chicago to San Francisco and the Southern Pacific from New Orleans to San Francisco. The main line of the former enters the state at Las Vegas, in southern New Mexico, and thence westward into Arizona. A southward extension taps the Southern Pacific at El Paso, Texas, and Deming, New Mexico, and there are numerous shorter branches. This system also controls the Peecos Valley & North-Eastern railway, which serves the southwestern part of New Mexico. The Southern Pacific crosses New Mexico westward from El Paso, Texas. The western division of the El Paso & South-Western system, connecting El Paso and Deming, New Mexico, and southward to the Rio Grande boundary. Its eastern division (including the El Paso & North-Eastern, the El Paso & Rock Island, the Alamosagordo & Sacramento Mountains) extends from El Paso to the Rio Grande at the junction with the Rock Island & Pacific at Tucumcari; thus forming a connecting link between that system and the Southern Pacific. The Santa Fe Central, extending southward from Santa Fe to Torrance, is a connection between the Southern Pacific and the El Paso & South-Western systems. Branches of the Denver & Rio Grande serve the northern parts of New Mexico.

Population.—The population of New Mexico consists of three distinct classes—Indians; Spanish-Americans, locally known as "Mexicans"; and the English-speaking class called, in distinction from the others, "Americans." Of the Indians there are several types—by far the largest is the Pueblo, by far the second is the Apache, by far the third is the Navaho, and in the other the Navahos, in the N.W. part of the state, and their near kinsmen, the Apaches, to the south. The Pueblo Indians live in adobe houses, are quiet and usually self-sustaining, and have been converted to the forms of Christianity. They had irrigated farms and dwelt in six-storey communal houses long before the advent of the white man. By the treaty of Guadalupe-Hidalgo, in 1848, the United States government recognized them as citizens. They lived in 19 villages of pueblos, the largest of which, Zufi, is more properly called a reservation, as it has been enlarged from time to time by grants from the Federal government. Several of the Pueblo Indians, the Zufi reservation contained in 1900 a population of 1,217, and a total area of 1,471 sq. m. The pueblos are held under Spanish grants which were confirmed by the United States. The terraced architecture of the villages is very remarkable. Originally the Pueblo Indians lived in many-storied communal houses, built sometimes of stone, sometimes of adobe, and occasionally chiselled into the sides of a stone cliff, as best suited the convenience of the builders. At present there is a tendency among them to copy the one-storey huts of the Mexicans. Taos (pop. in 1900, 419) is one of the most imposing of the pueblos, consisting of three-storeyed pyramidal tenements, separated by a brook. Zufi (pop. 1,525) has a five-storied dwelling surrounded by detached huts; Acoma (pop. 492 in 1900; 566 in 1902), standing on a cliff 357 ft. high (Acoma means "people of the white rock" and Aco, the Indian name for the pueblo, means "white rock "); contains three blocks of three-storeyed terraced buildings,1 and Laguna also contains some three-storied buildings.

About 3 m. N.E. of Acoma stands the Enchanted Mesa (Mesa Encantada), a large rock formation near Katyama, about being 205 ft. long and 100 to 350 ft. wide. Upon its summit, according to Indian tradition, once stood the village of Acoma, but while the inhabitants were tending their crops in the plains a powerful storm arose, and such a tempest of lightning and thunder as could have been no earthly work was sent to destroy the village, with which the summit could be reached. According to the story, three women had been left in the village and these perished. The mesa was first climbed by white men in 1896 by Froelich Rappe (b. 1855), of Princeton University; it was climbed again in 1897 by a party led by F. W. Hodge; and pottery and stone implements were found here.
NEW MEXICO

dwellings, but the Laguna tribe, numbering, 1077 in 1900 and 1384 in 1907, now live mostly in their former summer villages on the plain. The other Indians live on reservations, of which there are three: the Mescalero Apache reservation, in Otero county, containing 554 Indians in 1900; the Jicarilla Apache reservation, in Rio Arriba county, with a population of 829; and the Navaho reservation, in Utah, Arizona and New Mexico, which contains in that part of it situated in New Mexico a population of 2450.

The inhabitants of Spanish descent have been only slightly assimilated and still retain to a marked degree their national peculiarities. As a rule, they live in small groups, build around a court, and are poor and ignorant, but hospitable. They are more Americanized in the Rio Grande Valley than among the mountains, where English is rarely spoken. Many of them have intermarried with the Indians, creating the class of half-breeds known as "Mestizos." Although the proportion of Spanish-American and Indian inhabitants is steadily decreasing with the arrival of immigrants from other parts of the United States, it was nevertheless computed by the New Mexican authorities to be about 63% in 1904. About one-tenth of the Spanish-American and Indian inhabitants use the English language.

The total population of New Mexico in 1870 was 91,874, in 1880, 119,565; in 1890, 153,593; in 1900, 190,310, and in 1910, according to the U.S. census, the figure was 327,301.

Of the native white population in 1900, 17,017 were of foreign parentage. Of the foreign-born element 66,495, or about one-half, were Mexicans, 1360 were Germans and the rest chiefly English, Irish, Canadians, Italians, Scotch and Austrians. The chief cities were Albuquerque (6289), Santa Fé (6063), Las Vegas (3552) and Raton (3540). Far the greater portion of the population (in 1900, 56½%), of the estimated population) are communicants of the Roman Catholic Church, which had in 1900 121,558 members, the total communicants of all denominations in that year numbering 137,009. Among Protestants there were 6560 Methodists, 2935 Presbyterians and 2331 Baptists.

Administration. — The executive officers until 1911 were a governor and a Territorial secretary appointed by the President of the United States, and a treasurer, auditor, superintendent of public instruction, adjutant-general, commissioner of public lands and other administrative officials appointed by the governor.

The legislative department included a council of 14 members and a House of Representatives of 24 members, chosen by popular vote. The sessions were biennial and limited to 60 days. All laws passed by the Assembly and approved by the governor had to be submitted to the Federal Congress for its approval. The Territory was represented in Congress by a delegate, chosen by popular vote, with the right to speak in the national legislature but not to vote. The judicial department included a supreme court, district courts, probate courts and local justices of the peace. The supreme court consisted of a chief justice and six associate justices appointed by the President. There were seven judicial districts, each with a court presided over by a justice of the supreme court. Each county had a probate court, and each precinct a justice of the peace.

For the purposes of local government New Mexico is divided into 26 counties, each being governed by a board of county commissioners, chosen by the people. Each county is divided by the commissioners into precincts. Municipal corporations with a population of 3000 and over are cities, and are governed through a mayor and board of aldermen; those with a population of between 1500 and 3000 are towns, and are governed through a mayor and board of aldermen.

A rather unusual institution within New Mexico is the mounted police, who numbered 11 in 1907, whose work was almost entirely in the cattle country, and who had authority to patrol the entire Territory and to make arrests or to preserve order wherever their presence was necessary, and who were answerable to the jurisdiction of local police.

A homestead not exceeding $1000 in value, and held by a husband and wife or by a widow or widower with an unmarried daughter or an unmarried minor son, may be held exempt from seizure and sale by legal process. The exemption may be claimed by either the husband or the wife, but may not be granted if each owns a home-
de Vaca into Mexico after eight years of wandering across the continent and related to his countrymen the stories he had heard of wonderful cities of stone in the north. He had not seen the cities himself, nor had he, as is frequently asserted, gone as far north as the present New Mexico, but his reports tended to confirm previous rumours and led the viceroy, Don Antonio de Mendoza, to send Fray Marcos de Niza, a Franciscan friar, on a small and inexpensive expedition of discovery.
