Population.—In 1870 the population of that portion of Dakota Territory included within the present limits of North Dakota was 2,905; in 1880, 35,629. The population of the state in 1890 was 136,713; in 1900, 310,146; in 1905, 437,070; in 1910, 583,885. The number of the foreign-born population in 1900 was 13,001, or 35 1/4%, the highest proportion to be found in any state of the Union. The principal elements composing the white foreign population were as follows: Norwegians, 30,306, English Canadians 25,004, Russians 14,979, Germans 11,546, Swedes 8,419. The coloured population consisted of 4,692 Indians not taxed, 2,796 Indians taxed, 286 negroes, 148 Japanese and 32 Chinese. Most of the Indians not taxed live on reservations, of which there are four: Devils Lake Reservation, in the north central part of the state, bounded by the Red and Missouri rivers, containing 308,000 acres, and consisting of Sisseton, Wahpeton, and Cut Head (or Pabakan) Sioux; Turtle Mountain1 Reservation, in Rolette county, established in 1882, and now allotted (excepting 186 acres for church and school purposes), had a population in 1905 of 2,558, being for the most part a mixture of Pembina (or Turtle Mountain) Chippewa with French Canadians; Fort Berthold Reservation in the west central part of the state, on the Missouri river, established in 1870, had in 1909 an area of 1382-4 sq. m., and a population of 309 Arikara (Caddoan), and, of Siouan stock, 453 Hidatsa or Gros Ventres as they are known, the central band of Mandans; and Standing Rock Reservation, on the western bank of the Missouri river, was established in 1875, and in 1909 contained 2887-2 sq. m. (about three-fifths of which lies in South Dakota and much of which was opened to settlement in 1898-1909) and a population of 3,399 Sioux. The population of the state is largely rural. The larger municipalities with the population of each in 1905 were: Fargo (12,512), Grand Forks (10,127), Jamestown (9,093), Bismarck, the capital, (4,913), Minot (4,125), Valley City (4,905), Dickinson (3,485), Wahpeton (3,714), Mandan (2,714), Grafton (2,423) and Devils Lake (2,467); in 1910 there were fifteen other municipalities with a population of over 1,000. In 1906 the Roman Catholic Church had the largest number of communicants (61,261 out of a total of 150,053 members of all denominations), and there were 59,023 Lutherans.

Administration.—The state is governed under its constitution of 1889, as subsequently amended. The governor is chosen biennially, and has a limited pardoning power. He may veto appropriation bills by items, but any of his vetoes may be overruled by a two-thirds vote of each house. The governor and lieutenant-governor must be at least thirty years old. The lieutenant-governor succeeds to the executive office, if necessary, by seniority, and in the event of the death of the governor. The other administrative officers are the auditor, treasurer, superintendent of public instruction, commissioner of insurance, three commissioners of railways, attorney general and commissioner of agriculture and labour; each of these offices is chosen biennially and must be at least twenty-five years of age. The legislative department consists of a Senate, with members chosen every four years, and about half chosen at each biennial election; and a House of Representatives, with members chosen biennially. The sessions of the legislature are biennial, and are limited to sixty days. The minimum age for senators is twenty-five years and for representatives twenty-one years. Bills may originate in either house. A lieutenant-governor, chosen biennially, presides over the Senate. In 1907 the legislature proposed an amendment providing for the application of initiative and referendum to statutory laws and constitutional amendments; two years later the legislature passed a substitute resolution, which omits the clause regarding amendments of the constitution, and which, if passed by the legislature of 1911 will be put to popular vote at the general election of 1912. The judicial department consists of the supreme court, district courts, county courts, municipal courts, and justices of the peace. The supreme court consists of three judges (minimum age thirty years), chosen by popular vote for six years. Their number may be increased to five whenever the population of the state shall amount to 600,000.

For each judicial district (the tenth district was created in 1907) there is one district judge, elected for four years; the district courts have original jurisdiction (except in probate matters) and certain appellate jurisdiction. The judge of the county court is chosen for two years. This court has exclusive original jurisdiction in probate matters, and in counties with over 2000 inhabitants its jurisdiction may be extended by popular vote to include concurrent jurisdiction with the district courts in civil matters involving amounts less than $1,000, and in criminal actions below the grade of felony. Justices of the peace have jurisdiction in civil cases involving no land titles and sums of money not exceeding $200. They may also try misdemeanours in counties without other criminal jurisdiction. For each township the law provides a township board. If the county is divided into counties, the state is divided into counties (46 in 1910). In those counties that have not adopted a township organization county affairs are administered by a board of county commissioners; where the township organization has been adopted the county government is administered by the chairmen of the several township boards. For each county there are a judge, clerk, register of deeds, auditor, treasurer, sheriff and state's attorney.

All citizens of the United States residing in North Dakota are declared to be citizens of the state. The right of suffrage is conditioned on the payment of the state poll tax ($1 if the person is citizens of the United States or have declared their intention of becoming citizens, and who have resided in the state one year, in the county six months, and in the voting precinct ninety days preceding the election. Civilized Indians who have severed their tribal relations two years before an election are entitled to vote. Women may vote for all school officers and upon all questions relating solely to school matters, and are eligible to any school office.

Amendments to the constitution must be passed by both houses of the legislature at two consecutive sessions, and must then be ratified by a majority of the elected members of both houses of the legislature, by a majority of those who were citizens of the United States or have declared their intention of becoming citizens, and who have resided in the state one year, in the county six months, and in the voting precinct ninety days preceding the election. Civilized Indians who have severed their tribal relations two years before an election are entitled to vote.

The amount of homestead exempt from seizure for debt is limited in value to $5,000, and may not include more than two acres in a town plot or more than 160 acres elsewhere. The exemption is not valid against a debt created for the purchase money, or against taxes levied on the property, or against mechanics' or labourers' liens for work done or material furnished for improvements, or against a mortgage acknowledged by both husband and wife. The act allowed the granting of divorces of fifteen years by the county court for cruelty, desertion (one year), neglect (one year), habitual drunkenness (one year) and conviction for felony; residence in the state for one year is required before application for divorce.

North Dakota is one of the few American states whose constitution forbids the manufacture, importation or sale of intoxicating liquors. Attempts to secure the repeal of this provision have been unsuccessful. Apothecaries may secure a licence to sell liquors for purely medicinal purposes upon a petition signed by twenty-five reputable free-holders and twenty-five reputable women. In 1909 the advertisement of liquors, solicitation of orders for liquors, and the sale of cigarettes to minors were prohibited.

Education.—At the head of the public school system is a superintendent of public instruction, chosen for two years. He, with the governor and the president of the state university, constitutes a high-school board, having supervision of the secondary schools. In each county there is a county superintendent, elected biennially, and in each school district a board of directors. The proceeds of the sale of public lands donated to the state for educational purposes, and all escheats to the state, constitute a trust fund, the interest from which, with the proceeds of all fines for the violation of state laws, is annually apportioned among the school districts according to the number of school children in each district. The State Tuition Fund in 1908 was $357,238. This income is supplemented by local taxation. The minimum school term allowed by law is six months.

1 The Devils Lake Reservation and the Turtle Mountain Chippewa are both under the Fort Totten School, which is on the Devils Lake Reservation.

2 Before the law passed by the first Legislative Assembly of the state to carry out this provision could come into effect, it was partially annulled by the decision of the United States Supreme Court in the case of Lessee v. Hardin (1890), in which the court held that such property might be imported into any state and sold in the original package (gazette) without reference to local prohibitory or restrictive laws.
months, and the schools are open to all pupils between the ages of six and twenty-one years. For children between the ages of eight and fourteen attendance for twelve weeks, six being consecutive, is compulsory. The total enrollment in the public schools in 1890 was 135,181, of which 51,017 were girls. The public schools are also maintained at a large expense, and the facilities are also furnished by the state through university and school of mines at University, near Grand Forks, normal schools (opened in 1890) at Valley City and Mayville, an agricultural college and experimental farm at Grand Forks, and industrial schools (opened in 1890) at Ellendale, a school for the deaf (1890) at Devils Lake, a scientific school (opened in 1903) at Wahpeton, and a school of commerce and domestic arts at Bottineau. Fargo College at Fargo, founded in 1887 by Congregationalists, is now non-sectarian. The Episcopal Church maintains Wesley College near Grand Forks (formerly the Red River Valley University at Wahpeton), affiliated with the University of North Dakota. There is a state institution for the insane, a public library, and a penitentiary. The state supports a hospital for the insane at Jamestown, an institution for the feeble-minded at Grafton, a home for old soldiers at Lisbon, a blind asylum at Bathgate, a reform school (opened 1902) at Mandan and a penitentiary at Bismarck. There is a state sanatorium for tuberculosis (1900).

Finance.—The chief source of revenue for the state, counties and municipalities is the general property tax. There are no special corporation taxes, but licence-charges are levied upon express and sleeping-car companies, and a tax is laid on the premiums of insurance companies. No poll tax is levied for state purposes, but counties are authorized to levy such a tax for school purposes. There are boards of equalization and review for the state, counties and municipalities. The state board fixes the rate of the state tax. For defraying the expenses of the state government, exclusive of the internal department, there is a statute fixed, by which the state is required to pay the cost of the state capital at an average of four mills on the dollar of assessed valuation. The state debt, excluding the amount of Territorial indebtedness assumed when the state was created, does not exceed $3,259,668. Local indebtedness is limited to 5% of the assessed value of the local property, but incorporated cities may by special vote increase this limit. The total bonded debt of the state on the 31st of October 1908 was $641,500 and was incurred for the most part for the construction of public buildings during the Territorial period. At the close of the fiscal year ending on the 31st of October 1908, the net debt for the year amounted to $2,299,668, the expenditures to $3,476,073, and the balance remaining on hand was $1,176,195.

History.—The first attempts to establish permanent settlements in what is now North Dakota were made by traders of the Hudson's Bay Company, who began their operations in the Red river valley about 1793.1 In 1797 C. J. B. Chaboillez, a French trader in the service of the North-West Fur Company, built a trading post on the southern bank of the Pembina river, near its mouth, but this was soon abandoned. Three years later Alexander Henry, the younger (d. 1814), built two trading posts in the present limits of the state for this company, one on the North Fork of Red river, the other near Devils Lake, where he lived until 1808. David Thompson (1770-1857), an employee at different times of the Hudson's Bay and North-West Fur companies, explored the region of the Missouri river in 1797-1798, and thus anticipated the work of Lewis and Clark, who entered the present limits of the state in 1804 and wintered among the Mandans, constructing Fort Mandan in what is now McLean county. In 1801 John Cameron (d. 1804) erected a trading post for the North-West Fur Company on the site of the present Grand Forks. The first real homeseekers to enter the state of whom there is any record were a colony of Scottish Highlanders who had first settled at Kildonan (Winnipeg) in 1812 under a grant from the Hudson's Bay Company to Thomas Douglas, 5th earl of Selkirk. A part of the Winnipeg colony soon migrated southward and settled on the site of the present city of Pembina, at the mouth of the Pembina river, which they thought to be in British territory, and named the settlement Fort Daer. When Major Stephen H. Long, commanding an exploring expedition to the Minnesota and Red rivers, reached Fort Daer in 1823, he found there about six hundred persons, a few being Scotch, but the greater part being half-breeds.

North Dakota is a part of the region ceded by France to the United States by the Louisiana Purchase in 1803. From 1803 to 1805 it was included in the District of Louisiana, and from 1805 to 1812 it was a part of the Louisiana Territory, the name of which was changed to Missouri Territory in 1812. In 1834 that part of the present state E. of the Missouri river was included in the newly organized Territory of Michigan, and became successively a part of Wisconsin Territory in 1836, of Iowa Territory in 1838, and of Minnesota Territory in 1849. In 1845 the Territory of Nebraska was organized from a portion of the Missouri Territory, and the part of the Dakotas W. of the Missouri, then locally called "Mandan Territory," was included in its limits. After Minnesota entered the Union, in 1858, the country between the Red and the Missouri rivers had no Territorial government for three years, but the inhabitants formed a provisional government. On the 2nd of March 1861 the Territory of Dakota was created, including the present Dakotas and portions of Wyoming and Montana. The seat of the Territorial government was at Bismarck, and it was in session there until 1883, when it was removed to Bismarck. The name of the Territory was derived from the Dakota Indians; the word "Dah-ko-ta" (signifying "allied" or "confederated"), being originally applied to the Sioux Confederation. In 1863 when Idaho Territory was formed, the boundaries of the Dakotas were fixed at practically their present limits. The boundary between Dakota Territory and Nebraska was slightly altered in 1870 and 1872. The Territory had hardly been organized before its settlement was impeded by the Civil War and the Indian troubles that followed the war. During the years 1868 to 1870 there was a series of bloody massacres along the frontiers of Minnesota and Dakota.

In the following year General Alfred Sully (1821-1879), commanding United States troops, marched up the Missouri river as far as Bismarck, and thence to the valley of the James river. On the 3rd of September 1863 with 1200 men he routed 2000 Sioux near the present town of Ellendale, in Dickey county, in an engagement called the battle of White Stone Hills. Four hundred warriors were slain, and a great number were captured. In 1864 Sully defeated the Sioux at the battle of Takaakwta, or Deer Woods, on the Knife river, and a few days later he again encountered them, and after a desperate struggle of three days administered a crushing defeat; the warriors abandoned their provisions and escaped into the Bad Lands. The Indians still remained hostile, however, and in 1865 Sully found it necessary to conduct his troops N. as far as Devils Lake, and thence W. to the Cannon Ball river. By these operations the Indian frontier was fixed W. of the Missouri river, and forts and garrisons were placed along this stream. The worst of the Indian troubles in northern Dakota were then at an end, though for many years there were occasional outbreaks. A period of rapid development in the Red river basin followed the entrance of the Northern Pacific railway into this region in 1872. At the election in November 1887 the question of the division of the Territory into two states at the "seventh standard parallel" was submitted to the people, and was carried at the polls. In accordance with the Enabling Act, which received the president's approval on the 22nd of February 1889, a constitutional convention met at Bismarck on the 4th of July following, and drafted a frame of government for the state of North Dakota. In October this was ratified at the polls. The chief interest in the election turned on the prohibition clause in the constitution, which was submitted separately, and received a majority of only 1,159 votes. On the 2nd of November 1889 President Harrison issued a proclamation declaring North Dakota a state. By an agreement between North and South Dakota, embodied in their constitutions, each state assumed the debt created for the erection of public buildings within its limits during the Territorial period.

In the development of the state since its admission into the Union the railways have been important factors. In 1874 they inaugurated the so-called "concentration movement," and began to conduct annual excursions into North Dakota, thus bringing into the state thousands of immigrants. They have also adopted the policy of selecting favourable town-sites on the uninhabited prairie, erecting grain elevators at such points, and furnishing transportation facilities by means of branch roads tapping the main lines of travel. Under this system prosperous towns and villages have sprung up among the prairies.

---

1 There seems to be no good authority for the statement often made that the first settlement in North Dakota was made by French Canadians in 1780.
of a cyclone across America is usually from W. to E., and the cyclonic system of circulation would produce these results; but in the North American cyclones usually originate east of the Rocky Mountains, and the warm air drawn from the Gulf of Mexico is not only followed by the cold air drawn from the Arctic regions, but the body of cold air slides down the eastern slopes of the Rockies and advances as a solid wedge (the "cold wave") under the cyclone itself. "Uncomfortably warm in the lightest clothing," a traveller upon the prairies of Texas may become "uncomfortably cold before he can wrap his blanket around him" (W. Ferrel, A Popular Treatise on the Winds). The temperature may fall 50° F. in twenty-four hours.

NORTHFIELD, a city of Rice county, Minnesota, U.S.A., on the Cannon river, about 35 m. S. of St. Paul. Pop. (1905) 348. It was incorporated by act of the legislature in 1865. It succeeded the townships of Great Western, the Chicago, Milwaukee & St. Paul, and the Chicago, Rock Island & Pacific railroads. It is a shipping centre for the products of the farming and dairying region in which it lies, but it is most widely known for its educational institutions. It is the seat of the Baker School for Nervous and Backward Children, a private institution; of St Olaf College (Norwegian Lutheran), founded in 1874; and of Carleton College (founded in 1866 by Congregationalists but now non-sectarian, opened in 1870), one of the highest grade small colleges in the West, and the first in the North-west to abolish its preparatory academy. Carleton College has the North-Western University Observatory, which gives time to the railways of the North-west, and publishes a magazine, Popular Astronomy. The Scoville Memorial Library (1896) of the College had 23,000 volumes in 1909. Northfield has a public library and the Minnesota Odd Fellows' Widows and Orphans Asylum. Named in honour of John W. North, who laid out Northfield and several other western towns, it was settled about 1851, incorporated as a village in 1868, and chartered as a city in 1875.

NORTHFIELD, a village of Washington county, Vermont, U.S.A., in Northfield township, about 35 m. S.E. of Burlington, on the Green Mountains region of the state, and of the township 19; of the township 3229. It is seated by the Central Vermont railway. It is the seat of Norwich University, founded in 1859 as the American Literary, Scientific and Military Academy at Norwich, Windsor county, Vermont, by Captain Alden Partridge (1783-1854). Captain Partridge was a professor in the U.S. Military Academy in 1813-1816 and acting superintendent of the Academy in 1816-1817, and was president of Norwich University until 1843; he founded various other military schools besides the one at Norwich. Norwich University was incorporated in 1834 under its present name, and in 1866, when the buildings at Norwich were burned, was removed to Northfield. The educational "Theoretical, practical, instruction, both theoretical and practical," and the discipline of the institution is military in form and principle. In 1808 the university was recognized by the General Assembly of Vermont as the military college of the state. It offers courses leading to the degrees of Bachelor of Arts and Bachelor of Science in civil engineering, in electrical engineering and in chemistry. In 1908 it had 13 instructors and 168 students. Dewey Hall (1902), the administration building, was named in honour of Admiral George Dewey, a former student in the university. In the township there are outcomes of forests of native and of the antique, and along a range of hills E. of the village there is a deposit of very fine black slate. The hills furnish excellent grazing for cattle, and much milk is shipped to New England cities. The township of Northfield was incorporated in 1781; the original settlement on the site of the present village was made in 1785, and the village was incorporated in 1835.

NORTHFLEET, an urban district of Kent, England, within the parliamentary borough of Gravesend, on the Thames, 22 m. E. by S. of London by the South Eastern and Chatham railway. Pop. (1901) 12,606. The church of St Botolph is of Norman foundation, but the nave is principally Decorated and the chancel Perpendicular, and the tower, having fallen down, was rebuilt in 1628. The church contains a brass of the 14th
NORTH HOLLAND—NORTHINGTON, EARLS OF

785

century and other interesting monuments. The nave and chancel have undergone modern restoration. Huggens College, with residences for impoverished ladies, was established in 1849 by John Huggens of Sittingbourne. Besides chemical manufactures, there are chalk, lime, cement and brick works and a shipbuilding yard. Swanscombe almost adjoins Northfleet on the south-west. Its name is said to be derived from a camp formed here by the Danish king, Sweyn, and tradition fixes at this spot the meeting between William the Conqueror and the men of Kent, to whom was confirmed the possession of all their ancient laws and privileges.

NORTH HOLLAND, a province of the kingdom of Holland, lying between the North Sea and the Zuider Zee, and on the landward side bounded by the provinces of South Holland and Utrecht. Pop. (1904) 1,053,883; area, 1,070 sq. m. The province also includes the islands of Texel, Vlieland and Terschelling, belonging to the group of the Frisian Islands, as well as Wieringen, Marken and Urk in the Zuider Zee. There are three natural divisions—foreshore and sand-dunes, inner dunes and the geest grounds, and low fens and clay lands.

The dunes form the great natural barrier against the sea behind which the province lies secure. But the fact of there being no inhabited inhabited part of Holland along the sea-board, the only exception being Ymuiden, which has arisen at the mouth of the North Sea channel from Amsterdam. On the other hand the broad, gently-sloping, sandy beach is peculiarly fitted for sea-bathing, and in the absence of harbours permits the beaching of the characteristic flat-bottomed fishing boats. Petten, Egmond-on-Sea, Wyk-on-Sea and Zandoort are fishing villages and watering-places.

In the depressions of the dunes and on the geest grounds at their foot, small woods have been planted in places, and in this sheltered strip market-gardening and horticulture are practised. Horticulture flourishes, especially along the margin of the geest grounds from about 5 m. north of Haarlem to twice that distance south, hyacinths, tulips, narcissus and crocuses being the flowers chiefly cultivated. The sight of these flowers in spring, with mile after mile of brilliant and varied colours, attracts visitors even from foreign countries. This region of the province was one of the earliest inhabited and includes the oldest towns and villages, such as Schagen, which was flourishing in the 12th century and was created into a lordship in the beginning of the 13th century for the benefit of a natural son of Count Albericht of Holland. The town was destroyed in the 17th century, but two towers (restored in 1879) are standing. Among interesting places may be mentioned Alkmaar, Heiloo, Egmond, Kaatskrikum and Beverwyk, which, like Velzen a few miles south, was granted by Charles Martel to Willemrode, the apostle of the Frisians, in the first half of the 8th century. The name is a corruption of Bedevaartswijk, "the village on the pilgrims' road," and refers to the pilgrimages once made to the church of St Agatha in the neighbourhood. Brederode, another ancient village, was the seat of the illustrious family of the same name. The remains of the castle are extensive. Other ancient towns are Zaanpoort, Bakenes, Haarlem and Bennebroek, once the seat of a nunnery removed hither from Egmond by Dirk II. in the 10th century.

The third division of the province comprises by far the largest area, that is, namely, which lies at or below sea-level. The reclama-
tion of land which has been effected here is noteworthy. The whole of the lakes to the north of the former Y, including the famous Purmer and Bemster lakes, and the Wieringerwaard and Zype sea-polders, were drained in the beginning of the 17th century; but the Waard-en-Groet, the Anna Paulowna and the Korten sea-polders of the north of the province were only added to the mainland in the first half of the 19th century. This region is traversed by the North Holland canal (1816–1825), between Amsterdam and the naval station of den Helder. The Y, which was formerly an inlet of the Zuider Zee, was drained, and the North Sea ship canal was formed in its stead (1865–1870), and carried through the dunes to Ymuiden. Of the drained lakes south of the former Y, the most important is the Haarlem Lake. The landscape in this division of the province is the most typical of Holland; green meadows stretching as far as the eye can see, dotted with windmills and cattle, and slashed by the regular lines of the drainage canals, bordered with pollarded willows.

As in Friesland, cattle-rearing and the making of cheese, chiefly of the Edam description, are the main industries, but agriculture and even a little market-gardening are also practised in the heavier clay lands, such as the Y and Anna Paulowna polders. Purmerend, Alkmaar and Enkhuizen are the chief market centres. Though the country is naturally poor in minerals, springs containing iron have been discovered, such as the Wilhelminabron at Haarlem. The security of the Zuider Zee for trade and fishing purposes was the first factor in the commonwealth development of Hoorn, and the cities of Medemblik, Enkhuizen, Hoorn, Edam and Monnikendam, though now little more than market centres for the surrounding district, possessed a large foreign commerce in the 16th and 17th centuries. This prosperity finally concentrated itself upon the Y (that is, upon Amsterdam) and the series of industrial villages situated on its offshoot the Zaam, of which Zaandam and Wormerveer are the most important.

NORTHINGTON, ROBERT HENLEY, 1st Earl of (c. 1708–1772), lord chancellor of England, was the second son of Anthony Henley, of Newby in the county of York, and his family in Hambred, who was a Whig member of parliament, and a well-known wit and writer. Robert was educated at Westminster school and St John's College, Oxford; and after gaining a fellowship at All Souls he was called to the bar in 1732. In 1747 he was elected member of parliament for Bath, of which borough he became recorder in 1751. He acquired a lucrative practice at the bar, and in 1756 was appointed attorney-general. In the following year he was promoted to the office of lord keeper of the great seal, being the last person so designated. For three years Henley, though still a commoner, presided over the House of Lords while his brother held office; but in 1760 he was created Baron Henley of Grainge in the county of Southampton. The delay in raising him to the peerage was due to the hostility of George II., who resented Henley's former support of the prince of Wales's faction, known as the Leicester House party; and it was in order that he might preside as lord high steward at the trial of Earl Ferrers for murder in 1760 that he then received his patent. On the accession of George III. the office of lord chancellor was conferred on Henley, and in 1764 he was created Viscount Henley and earl of Northington. In 1765 he presided at the trial of Lord Byron for killing William Chaworth in a duel. Northington, who was a member of the group known as "the king's friends," was instrumental in procuring the dismissal of the marquess of Rockingham and the recall of Pitt to office in 1766, and he himself joined the government as lord president of the council, Lord Camden becoming chancellor. He resigned office in 1767, and died at his residence in Hampshire on the 14th of January 1772. He married, in 1743, Jane, daughter of Sir John Huband of Ipsley, Warwickshire, by whom he had three sons and five daughters. His youngest daughter, Elizabeth, married Morton Eden, who in 1790 was created Baron Henley in the peerage of Ireland; and her grandson, the 3rd Baron Henley of this creation, was in 1885 created earl of Northington.

Lord Chancellor Northington was in his youth a man of conivall and boisterous manners, much addicted to swearing, Horace Walpole commented on his undignified bearing at the trial of Lord Ferrers; but Lord Eldon considered him "a great lawyer, and his integrity was unquestioned. His notes of cases tried by himself in the Court of Chancery were published in two volumes in 1818. ROBERT HENLEY, 2nd earl of Northington (1747–1786), only surviving son of the lord chancellor, was appointed a teller of the exchequer in 1763, and lord lieutenant of Ireland in 1783, an office which he administered in a spirit of concession to popular feeling. In Ireland he employed his father's system of stimulation of the economy, by which he made himself beloved by the Irish people. He resigned in 1784, and died unmarried on the 5th of July 1786, when the titles granted to his father became extinct.

North Sea, a sea bounded by the continent of Europe and W. by Great Britain. At its southern end it communicates with the narrow Strait of Dover with the English Channel, and so with the Atlantic, and towards the north it widens out gradually to 345 m. between St. Ab's Head and the coast of Denmark, and narrows again to 270 m. between Duncansby Head and the coast of Norway. To the north of Scotland it communicates with the Atlantic westwards by the Pentland Firth and the channel between the Orkney and Shetland Islands, and northwards with the Norwegian Sea.

Its total area is given by Murray as 162,000 sq. m., and by Krümmell as 577,010 sq. km., or 220,820 sq. statute m. Murray estimates the volume of the North Sea at 11,000 cubic miles, at 730 cubic km. or 12,880 cubic km., giving mean depths of 61 and 48 fathoms respectively. The North Sea is thus on the whole shallow; its bed is part of the continental shelf on which the British Isles stand, and it slopes upwards with fair regularity from north to south. In the south and east there is a broad coastal strip over which the depth nowhere exceeds 20 fathoms, and the whole south-eastern part of the area is less than 30 fathoms deep. In about its middle latitude the Dogger Bank crosses the North Sea from east to west, extending for about one-third of the whole distance. This bank is not, however, to be regarded as one of the deep troughs, but the depth here is under 10 fathoms and it increases eastwards to about 20 fathoms. South of the Dogger there are local depressions, mostly of small area, in which the depth is as much as 45 fathoms, as in the "Silver Pit." Krümmell points out that a line drawn from the northern edge of the Dogger to the middle of the Skagerrack constitutes a rough boundary of the shallow southern basin, the depth increasing very slowly beyond this line to the "Norwegian Channel"—a deep gully closely following the Scandinavian coast, and extending into the Skagerrack, in which the depth increases to as much as 400 fathoms, or 53 cub. km. According to Jukes-Browne, the North Sea, in its present form, first took shape as a result of the tectonic movements indicated by the break between the older and newer Pliocene deposits. The southern end of the North Sea was probably little affected by the general subsidence which occurred during the Glacial period; its boundary in this direction was apparently within the present land area of France and Belgium, while a narrow inlet may have run westwards between France and England in the present position of the Strait of Dover. Meanwhile immense quantities of water are still pouring into the North Sea from the Rhine. Of the Rhine's discharge at Koblenz is 571,910 sq. ft., and the whole region was subsequently raised above sea-level, constituting the "structural surface" upon which the present river system was developed as a series of tributaries to a great river which formed a continuation of the Rhine. Finally the land subsided again, the plain of the North Sea was again submerged, and the western inlet of Pleistocene times became the Strait of Dover.

For reasons which will be sufficiently obvious from the historical sketch just given, the coasts of the southern part of the North Sea are of no great height. In England they consist of low cliffs with sandy beaches, while on the continental side are immense flats and marshes, with parts below sea-level protected by sand-dunes and artificial dykes. It is said that no evidence is forthcoming of tectonic movement since the Bronze Age, and the rapid changes of coast-line now taking place in many parts are therefore wholly due to the action of the sea, which is probably specially effective on account of the relatively recent opening of the Strait of Dover. The erosion of the North Sea coasts has been made a subject of minute study (in England especially by the British Association, and a committee of the Royal Geographical Society, and Harmer has obtained interesting results by comparing the British and Continental coasts as characteristic "weather" and "lee" shores.

The physical conditions of the waters of the North Sea have been extensively studied by expeditions sent out by the Swedish, Norwegian, Danish, German and British governments; and since 1902 by the International Council for the Study of the Sea, which owes its origin mainly to the work of the earlier expeditions. Professor Peterson of Stockholm, to whom the initial impulse of much of this work is due, classifies the waters found in the North Sea as follows: (1) oceanic water of 35 pro mille salinity or more; (2) water of salinity 34 to 35 pro mille, called "North Sea" water; (3) water of salinity 32 to 34 pro mille, found along the coasts of Holland, Germany, Denmark, and Norway, and called "bank-water"; (4) water of 32 pro mille salinity or less, belonging to the stream flowing out from the Baltic. Of these (1) and (4) are to be regarded as "inflowing" waters, while the others are due to movements which may not take place in the North Sea itself. The oceanic water constitutes a mixture of waters of Atlantic and Polar origin; it enters the North Sea from the north-west partly from the Norwegian sea, and partly from the Faeroe channel by the passage between the Orkney and Shetland islands, and makes its way southwards along the coast of Scotland, especially during the early summer months.

The International Council, and more particularly the North Sea, Winters Investigation Committee of the Fishery Board for Scotland, have studied the periodic and irregular variations in the distribution of these waters in minute detail; and the conclusion of these observers, has established the conclusion that the supply of fresh coastal waters from the land on both sides of the North Sea is greatest in late summer, after the occurrence of the maximum inflow of oceanic water. The autumn and early winter months accordingly represent a period of mixing rather than of inflow, and this mixing is clearly an extremely complicated process, depending on the relative amounts of the mixing waters (which are themselves liable to great variation), on their temperature and salinity, and also on the action of winds and tides.

In the southern part of the North Sea area tidal action alone is sufficiently vigorous to ensure complete mixing of the waters from surface to bottom at all times. The tides of the North Sea are of great complexity, and have not been fully investigated. The tidal wave of the Atlantic enters by the Strait of Dover and by the channels in the north. In the latter place a division into two parts takes place, one wave travelling southwards along the coast of Scotland in comparatively shallow water, while another moves with greater speed across the deeper water to the Norwegian Channel, and thence southwards to the Skagerrack, and finally the North Sea. The southwards-moving waves are greatly retarded in the shallow water over the Dogger Bank; the trough of the "Silver Pit" accordingly gives the Scottish wave a strong easterly component, and the three systems—the Scottish, Norwegian and Channel waves—meet to the east of the Dogger, producing complicated interference phenomena. Along the English coasts the tidal streams are for the most part normal, the flood stream running south to south-east and the ebb north to north-west, but on the Continental coast the movements become very complex on account of the varying influence of the waves from different sources.

The North Sea is particularly rich in organisms of all kinds, and the abundance of food attracts fish in such quantities that the North Sea fisheries are the most productive in the world. Flat fishes, and those feeding at the bottom on smooth ground, are chiefly caught by means of the trawl. The favourite trawling-grounds are the Dogger Bank in winter, and the shallow waters off the Continental coasts in summer; these yield halibut, soles, turbot, brill, plaice, cod, haddock, whiting, &c. In rough ground where the trawls cannot be used, bottom-lining by the oblique-catch most successfully; and "mid-water" fish are also taken in this way, although the trawl and line-fishing overlap considerably. Herring and mackerel are caught by means of drift-nets. The herring fishing off the British coasts exhibits a remarkable variation during summer and autumn, beginning in Shetland in June, and becoming progressively later southwards, until it ends off the Norfolk coast in November. Various attempts have

Fauna.
be served (T. branch Northumberland, 280; town 336).

VEXIRES (Scotland) Act 1893 forbids the use of three-mile limit areas outside the 1882 limits.

A Supplementary Convention was signed at the Hague, November 16th, 1887, among the same High Contracting Parties, relating to the liquor traffic in the North Sea. It applies to the area set out in art. 4 of the Convention of May 6th, 1882, and forbids the sale of spirituous liquors within it to persons on board fishing vessels. A reciprocal right of visit and search is granted under this convention to the cruisers entrusted with the carrying out of its provisions.

NORTH SHIELDS, a seaport of Northumberland, England, within the municipal and parliamentary borough of Tynemouth (q.v. for history, &c.). The town of that name adjoins it on the E.

NORTH SEA FISHERIES CONVENTION. This convention, dated May 6th, 1882, was the result of a conference which was held for the purpose of regulating the police of the fisheries in the North Sea. It was entered into by Great Britain, Germany, Denmark, Holland, Belgium, France, and for a period of five years and was thereafter to run on until notice of intention to terminate it, such notice to affect only the power giving it. The convention is operative only outside the three-mile limit from land. This limit was extended under the following conditions:

"The fishermen of each country shall enjoy the exclusive right of fishing within the distance of 3 m. from low-water mark along the whole extent of the coasts of their respective countries, as well as of the islands and banks, and the distance of 3 m. shall be measured from a straight line drawn across the bay, in the part nearest the entrance, at the first point where the width does not exceed 10 m. The present article shall not in any way prejudice the freedom of navigation and anchorage in territorial waters accorded to fishing boats, provided they conform to the special police regulations enacted by the powers to whom the shore belongs."

The Herring Fishery (Scotland) Act 1889, the Scottish Fishery Board was empowered by by-law to forbid beam-trawling and otter-trawling within a line drawn from Duncansby Head to Rattras Point. Acting under this power, it forbade these methods of trawling. This gave rise to litigation on the question of whether the prohibition applied to non-British ships beyond the three-mile limit (see Mortensen et Peters, July 20th, 1906). The High Court of Justiciary in Edinburgh held that it was not incumbent on the court to draw a distinction between foreigners and British subjects which had not been made by the legislature, and that therefore any infringements of general rules relating to the beam or otter trawl should be treated as a breach of the Conditions under which the burgh, or from the Niagara river. North Tonawanda was first settled as a part of Tonawanda in 1809; it became part of Wheatfield township in 1837; was incorporated as a village in 1865, and chartered as a city in 1891. In 1825 Major Mordecai Enoch Noah (1785-1851), a New York journalist and politician of Portuguese Jewish descent, attempted unsuccessfully to found on Grand Island (area 27 sq. m.; pop. 1910: 914), Erie county, W. of North Tonawanda, the city of Ararat, a temporary refuge for Jews, who should return thence to the Holy Land.

NORTHUMBERLAND, EARLS AND DUKES OF. The earldom, and later the dukedom, of Northumberland, famous in English history by its connexion with the noble house of Percy (q.v.) is to be traced from an origin anterior to a strictly regulated system of peerage. The Saxon kingdom of Northumbria embraced a far more extensive territory than the modern county of Northumberland; and for at least a century after the Norman Conquest Northumberland, as the name imports, comprised a great portion of the country north of the Humber, including the cities of Durham and of York. The geographical position of this territory, contiguous with the kingdom of Scotland, conferred vast responsibility as well as power on the earl or governor to whom its administration was entrusted; and it appears to have been the policy of William the Conqueror and his immediate successors to acknowledge the rights of the men who, though sometimes spoken of as earls, were in no strict sense members of the feudal nobility created by the Norman monarchy. William the Conqueror found Northumberland in the possession of Morcar, a younger son of Algar, the Saxon earl of Mercia, who on giving in his submission was confirmed in the government of the district, but was soon afterwards imprisoned for rebellion, and was replaced by Copsi, an uncle of Morcar's predecessor, Tostig. Copsi was murdered a few weeks after receiving the dignity, and the same fate befell several of his successors; those who escaped it being not infrequently deprived of the post for rebellion or incapacity. Henry, earl of Huntingdon, only son of David I., king of Scotland, was made governor of Northumberland in 1139, and was styled "earl of Northumberland" by the contemporary chronicler Roger of Hoveden. It was not for a long period, however, that the earldom of Northumberland came into existence as a title of honour heritable according to peerage law. Even since the Conquest the house of Percy (q.v.) had been growing in power and importance, and at the coronation of Richard II. in 1377 Henry de Percy, 4th Baron Percy, who had distinguished himself in the French wars, officiated as marshal of England, and
was then created earl of Northumberland. With his son Sir Henry Percy, the celebrated "Hotspur," the earl played a leading part in the turbulent of the older period, especially in bringing about the deposition of Richard II. and the accession of Henry IV. The quarrel of Northumberland and his son with King Henry over the ransom of their Scottish prisoners taken at Homildon Hill on the 14th of September 1402 has been immortalized by Shakespeare; and in consequence of their rebellion all the earl's honours were forfeited in 1406. He was not himself present at the battle of Shrewsbury in July 1403, when Hotspur was killed, but he was slain, heading a fresh rebellion, at Bramham Moor on the 19th of February 1408.

The 1st earl of Northumberland was succeeded by his grandson, Henry Hotspur, 2nd son of Henry (c. 1394-1455), who was restored to the earldom and the estates of the Percies in 1414 and was killed at the battle of St Albans in May 1455. The title then descended in the male line till the death of the 6th earl in 1537. During the Wars of the Roses the Percies took the Lancastrian side, which led to the attainder of Henry the 3rd earl (1421-1461) during the year of the Yorkist triumph, his forfeited title being conferred in 1464 by Edward IV. on John Neville, Lord Montagu (see the separate article below), by a patent which was cancelled a few years later. The earldom together with the earldom of Northumberland which had been forfeited by marriage, was restored in 1473 to Henry Percy, son of the 3rd earl, who attached himself to Edward IV., acquiesced in the accession of Richard III., and submitted to Henry VII., by whom he was received into favour. His grandson Henry, the 6th earl (c. 1502-1537), left no direct heir, and the latter's nephew, Thomas Percy, was debarred from the succession by an attainder passed on his father for his participation in the Pilgrimage of Grace. In 1549, however, Thomas was restored in blood, and in 1555 he became by a new creation earl of Northumberland, 7th of his line. Meanwhile, in 1551 the eldest son of the 7th earl, who was created duke of Northumberland (see the separate article below), his title being, however, forfeited by attainder in 1555.

The earldom restored to the house of Percy by the creation of 1555 continued without interruption in the male line till 1670. The 7th earl was beheaded in 1572 for sharing in a conspiracy in which he was joined by the earl of Westmorland with the object of securing the release of Mary Queen of Scots and the free exercise of the Catholic religion. By the earl's attainder the baronies of Percy and of Poyning and the earldom of Northumberland were forfeited to the crown of England, the eldest son of the 7th earl having been previously omitted from the patent. The elder earldom and the other honours conferred in 1555 passed to his brother Henry (c. 1532-1583), who, however, is usually known as the 8th and not the 2nd earl.

Henry's grandson, Algernon Percy, 10th earl of Northumberland (1602-1668), son of Henry the 9th earl (1564-1632), became a peer in his father's lifetime as Baron Percy in 1626. During the years immediately preceding the Civil War he served as an admiral, making earnest but unsuccessful efforts to reform the navy, and in 1643 he was made lord high admiral of England. In 1639 Charles I. appointed him general of the forces north of the Trent, and a member of the council of regency. Northumberland played a distinguished and honourable part in the troubled times of the Civil War. He was a friend of Strafford, and gave evidence at his trial which, though favourable on the important point of bringing the Irish army to England, was on the whole damaging; and he afterwards leaned more and more towards the popular party, of which he soon became leader in the House of Lords. He was a member of the committee of safety, and later of the committee of both kingdoms; and he took an active part in the attempts to come to terms with the king, whom he visited at Oxford for that purpose in 1643 and at Uxbridge two years later. Northumberland helped to organize the new model army; and in 1646 he was entrusted by parliament with the charge of the king's younger children. He led the opposition in the House of Lords to the proposal to bring Charles I. to trial, and during the Commonwealth he took no part in public affairs. At the Restoration he was called to the privy council by Charles II., and with his habitual moderation he deprecated harsh proceedings against the regicides. His second wife, Elizabeth (d. 1705), daughter of Theophilus Howard, 2nd earl of Suffolk, brought him Northumberland House in the Strand, London, which was demolished in 1874 to make room for Northumberland Avenue. On the death of his son Joceline, the 11th earl, in 1670, the male line became extinct.

George Fitzroy (1665-1710), third son of Barbara, duchess of Cleveland, the wife of Roger Palmer, earl of Castlemaine, by King Charles II., was created by his father earl of Northumberland in 1674, and duke in 1683. This second dukedom of Northumberland became extinct on his death at Epson on the 3rd of July 1716.

Meanwhile Elizabeth Percy, daughter of Joceline, the 11th earl, had married Charles Seymour, 6th duke of Somerset; and her son Algernon, the 7th duke, was in 1749 created Baron Warkworth and earl of Northumberland, with remainder to his son-in-law, Sir Hugh Smithson, Bart., son of Langdale Smithson of Langdale, Yorkshire. Sir Hugh Smithson (c. 1714-1786) took the name and arms of Percy on inheriting the earldom in 1750; in 1766 he was created Earl Percy and duke of Northumberland, and in 1785 he was further created Baron Lovaine of Alnwick, with the special remainder to his second son, Lord Algernon Percy. He took a somewhat prominent part in politics as a follower of Lord Bute, and was one of George III.'s confidential advisers, holding the office of lord-lieutenant of Ireland from 1762 to 1765, and that of master of the horse from 1778 to 1780. He was a man of cultivated tastes, and spent large sums of money in repairing and improving Alnwick Castle and his other residences. His wife, Elizabeth (1716-1776), who was a prominent figure in society, inherited in her own right her father's barony of Percy. The duke was succeeded by his eldest son Hugh; and his son Algernon, Lord Lovaine, was created earl of Beverley in 1790.

Hugh, 2nd duke of this line (1742-1817), first inherited his mother's barony of Percy. He was present at the battle of Minden, and although in parliament, where he was member for Westminster from 1763 to 1776, he had opposed the policy that led to the American war, he proceeded to Boston in 1774 as colonel commanding the 5th Fusiliers, a regiment that has since then been known as the Northumberland Fusiliers. His liberality to his men made him exceedingly popular in the army; he was generally prominent in 1793, and after succeeding to the dukedom in 1786 he exercised considerable influence in politics, though he never obtained office. His son Hugh, 3rd duke (1785-1847), was lord-lieutenant of Ireland in 1829-1830, when the Catholic Emancipation Act was passed, and was pronounced by Sir Robert Peel "the best chief governor who ever presided over the affairs of Ireland." Both he and his brother Algernon, 4th duke (1792-1856), who was created Baron Prudhoe in 1816, died without issue; the barony of Percy devolved on their great-nephew, the duke of Atholl, and the dukedom passed to George (1779-1856), eldest son of Algernon, 1st earl of Beverley, and so to his son Hugh; and his son, the 6th duke (1830-1899), and grandson, the 7th duke (b. 1846), who married the daughter of the 8th duke of Argyll. The 7th duke's eldest son, Earl Percy (1871-1910), seemed destined to take a great place in public life when he was prematurely cut off; he had a distinguished career at Oxford and from 1895 in the House of Commons, being under-secretary for India in 1902-1903 and under-secretary for foreign affairs in 1903-1905.

NORTHUMBERLAND, JOHN DUDLEY, Viscount Lisle, Earl of Warwick, and Duke of (c. 1502-1553), was the eldest son of Henry VII.'s exxtortionate minister, Edmund Dudley (q.v.), by his second wife Elizabeth, daughter of Edward Grey, Viscount Lisle, and co-heiress of her brother John, Viscount Lisle. He was probably descended from the old baronial house of Sutton alias Dudley; but his father's attainder and execution
in 1509 clouded his prospects. His mother, however, married as her second husband in 1511 Arthur Plantagenet, the illegitimate son of Edward IV., who in 1523 was created Viscount Lisle in his wife's right; and Lisle's was Hend VIII.'s favour brought young Dudley into prominence. In 1512 he was restored in blood and in 1518 he was made deputy to his stepfather, who was governor of Calais, and he does not appear to have suffered by Lisle's temporary disgrace and imprisonment in the Tower. Lisle died early in 1542 and Dudley was created Viscount Lisle on the 12th of October and was made warden of the Scottish marches in November, and lord high admiral of England in 1543 in succession to his future rival, Edward Seymour, earl of Hertford. He was also created a knight of the garter and sovereign of the privy council on the 3rd of April 1543. In 1544 he accompanied Hertford to the capture and burning of Edinburgh. On the capture of Boulogne in September Lisle was given command of the town and of the Boulonnais; in 1545 he directed the operations of the fleet in the Solent which foiled the French attack on Portsmouth and the Isle of Wight; and he was sent to Paris to ratify the peace concluded in 1546.

Lisle had thrown in his lot with the reforming party, and he took an active share in the struggle at Henry VIII.'s court for control of affairs when Henry should die. Hertford and he were brought about his deposition. He was one of the highest places in Henry VIII.'s affections and as being the only noblemen of fit age and ability to carry on the government. The Howards were infuriated by the prospect, and Surrey's hasty temper ruined their prospects. Lisle quarrelled bitterly with Bishop Gardiner, served as commissioner at Surrey's trial, and was nominated one of the body of executors to Henry's will from which Norfolk and Gardiner were excluded. On Henry's death Lisle was raised to the earldom of Warwick and promoted to be lord great chamberlain of England, again in succession of Hertford, who was a privy councilor of Somerset and Protector. But he was not long content with Somerset's superiority, though he concealed his resentment and ambition for the time. He accompanied Somerset on his Pinike campaign, and materially contributed to the winning of that victory. Nor did he exhibit any sympathy with the intrigues of the Protector's brother, Thomas Seymour, the lord high admiral; his subterfuge policy was to exasperate the brothers and thus weaken the influence of the house of Seymour. He took a leading part in the proceedings which brought the admiral to the block in March 1549; and then used the Protector's social position to procure the dismissal of the privy council, detested Somerset's ideas of liberty and his championship of the peasantry against the inclosure movement; one of his own parks was ploughed up as a result of a commission of inquiry which Somerset appointed; and when the peasants rebelled under Kett, Warwick gladly took the command against them. His victory at Dussindale made him the hero of the landed gentry, and as soon as he had returned to London in September 1549, he organized the general discontent with the Protector's policy into a conspiracy. He played upon the prejudices of the Catholics and Catholics alike, holding out to one the prospect of more vigorous reform and to the other hopes of a Catholic restoration, and to all gentry the promise of revenge upon the peasants.

The coalition thus created effected Somerset's deposition and imprisonment in October 1549; and the parliament which met in November carried measures of political coercion and social reaction. But the coalition split upon the religious question. Warwick threw over the Catholics and expelled them from office and from the privy council, and the hopes they entertained were rudely dashed to the ground. But it was difficult to combine coercion of the Catholics with the proscription of Somerset; the duke was therefore released early in 1550 and restored to the privy council; and his daughter was married to Warwick's son. Warwick himself assumed no position of superiority over his colleagues, and he was never made protector. But he gradually packed the council with his supporters, and excluded his enemies from office and from access to the king. His plan was to dominate Edward's mind, and then release him from the trammels of royal minority. He abandoned the Tudor designs on Scotland, and made a peace with France in 1550 by which it recovered Boulogne and was left free to pursue its advantage in Scotland. Nor did the betrothal of Edward to Henry's daughter Elizabeth prevent the French king from intrigue to undermine English influence in Ireland. In domestic affairs Warwick pushed the Reformation with none of the moderation shown by Somerset; and the difference between the two policies is illustrated by the change effected between the first and second Books of Common Prayer. Warwick, however, was widely distrusted; and the more arbitrary his government grew, the more dangerous became Somerset's position. A parliament had indeed been started for Somerset's restoration. Warwick therefore kept away from meeting, and the consequence lack of supplies drove him into the seizable of church plate, sale of chantry lands, and other violent financial expedients. At length he resolved to get rid of his opponent; his opposition was magnified into conspiracy, and in October 1551, after Warwick had made himself duke of Northumberland and his ally Dorset, duke of Suffolk, and had scattered other rewards among his humbler followers, Somerset was arrested, condemned by the peers on a charge of felony, and executed in the year 1552.

Parliament was permitted to meet on the following day, but for the next eighteen months Northumberland grew more and more unpopular. He saw that his life was safe only so long as he controlled the government and prevented the administration of justice. But Edward VI. was slowly dying, and Northumberland's plot to alter the succession was his last desperate bid for life and power. Its folly was almost delirious. Edward had no legal authority to exclude Mary, and the nation was at least nine-tenths in her favour. Northumberland bullied the council, and, with few exceptions, the rest of England was in an uproar, and as he rode out one day, he said to Mary, not a soul cried "God speed." A few days later he returned as Mary's prisoner. He was tried for treason, confessed himself a Catholic in the delusive hope of pardon, and was executed on the 22nd of August. He was a competent soldier and one of the subtlest intrigues in English history; but he had no principles. He was, says a contemporary French account, "de parole allez, se composant à graceuseté et douceur, mais au dedans felon, orgueilleux, vindicatif s'il en fut jamais." The violence of his rule and his pretended Protestantism was largely responsible for the reaction of Mary's reign. His best-known son was Robert Dudley, earl of Leicester, Queen Elizabeth's favourite.

Pollard, England under Somerset (1900), Life of Cranmer (1904) and vol. vi. of the Political History of England (1910). (A. F. P.)

NORRTHUMBILD, JOHN NEVILLE, EARL OF (c. 1430-1471), English soldier, was the third son of Richard Neville, earl of Salisbury, and a brother of Richard Neville, earl of Warwick, the "king-maker." At the battle of Bosworth Heath in 1485 John Neville was taken prisoner by the Lancastrians, although the Yorkists under his father had won the victory; he was among those who were attainted in the parliament of Coventry, and he was not released until 1460 when his own party had gained the upper hand. Just afterwards he was created Lord Montagu and was made chamberlain of the royal household. He was not present at the battle of Wakefield, when his father was taken prisoner, but he was again a captive after the second battle of St Albans in 1461. He was speedily released by Edward IV., whom he served in the north of England, being rewarded with lands and honours. In 1463 he became warden of the east marches towards Scotland, and he was responsible for the Yorkist victories at Hedgeley Moor and at Hexham in April and May 1464; after the latter battle he secured the execution of Henry Beaufort, duke of Somerset, and other captives of high station. In this year (1464) he was created earl of Northumberland, the
Percies being now crushed, and their head, Henry Percy, being in prison. Northumberland did not at first join his brother Warwick and the other Nevilles when they revoluted against Edward IV, but neither did he help the king. Edward, doubtless suspecting him, restored the earldom of Northumberland and its vast estates to Henry Percy, while John Neville's only recompense was the barren title of marquess of Montagu. At Pontefract in 1470 he and his men declared for Henry VI, a proceeding which compelled Edward IV to fly from England, and under the restored king he regained his position as warden, but not the earldom of Northumberland. He did not attempt to resist Edward IV, when this king landed in Yorkshire in March 1471, after the death of his father. Borsley Hall, near Barnet, was taken on the 14th of April 1471. His son George (d. 1483) was betrothed to Elizabeth, daughter of Edward IV, and was created duke of Bedford in 1470, but the marriage did not take place and he was deprived of his dukedom in 1477.

Northumberland, the northernmost county of England, bounded N.W. by the Scottish counties of Berwick and Roxburgh, W. by Cumberland, S. by Durham, and E. by the North Sea. The area is 2089 sq. m. It has a general inclination eastward from the hill-borders of Scotland and Cumberland. The county of Northumberland extends into Scotland, and reaches in the Cheviot, its culminating point north-eastward, the greatest elevation in the county, 2675 ft. The elevation of the Cheviots rarely falls below 1300 ft. along the Border, and generally exceeds 1600. A line of high ground, boding southward, forms the watershed between the North and Irish Seas. The boundary with Cumberland crosses the low divide between the Irthing and the South Tyne, after coinciding with the former river for a short distance, and giving Northumberland a small drainage area westward. In the south-west a small area of the Pennine uplands is included in the county, reaching elevations up to 2200 ft. In Kilhope Law, Pennine eminences break the general eastward incline, which appears as a wide bowllowing series of confluent hills that for half the year mingle tints of brown, russet, and dun in a rich pattern, and at all times communicate a fine sense of altitude and expanses. The Simonside Hills (1447 ft.) form not one very conspicuous exception. The configuration of much of these uplands has a certain linearity in its details due to groups and ranges of ridges, crags, and terrace-like tiers, termed edges (escarpments) by the country folk, and generally facing the interior, like broad ends of wedges. These parallelized crags and prow-like headlands between the North and South Tynes along the verge of which the Romans carried their wall is a fine specimen. Passing eastwards from the uplands the moors are exchanged for enclosed grounds, "drystone" walls for hedgerows, and rare sprinklings of birch for a sufficiently varied wooding. The hills and moors sink to a coast generally low, a succession of sands, flat tidal rocks and slight cliffs. Its bays are edged by blown sandhills; its borders are severely wind-swept. Several islands lie over against it. Holy Island, the classic Lindisfarne, 1351 acres in extent, but half "links" and sandbanks, is annexed to the mainland and accessible to conveyance every tide. The Farne Islands (q.v.) are a group of rocky islets farther south.

Deep glens and valleys, scoring the uplands, and richly wooded except at their heads, are characteristic of the rivers. Of these the chief are the Tweed, forming the north-eastern part of the Scottish border, its tributary the Till (with its feeder the Glen and College), the Aln and the exquisite Coquet, flowing into Alnemouth Bay, the Wansbeck, with its tributary the Font, the Blyth and the Tyne, forming part of the boundary with Durham, thus dividing the North and South Tynes. Many of the upland streams attract trout-fishermen.

Geology.—The core of the county, in a geological aspect, is the northern Cheviots from Redesdale head nearly to the Tweed. Its oldest rocks are gritty and slaty beds of Carboniferous age, above the head of the rivers Rede and Coquet and near the Breamish south of Ingram—a part of the great Silurian mass of the southern uplands of Scotland. Volcanic activity about the period of the Old Red Sandstone resulted in the fossiliferous porphyrites, passing into the syenites and granites, that form the mass of the northern Cheviots. Round this core there now lie relays of Carboniferous strata dipping east and south, much faulted and repeated in places, but passing into Coal Measures and Magnesian Limestone in the south-eastern part of the county. The whole system consists of (1) the Carboniferous Limestone series in three divisions; (2) the Millstone Grit; and (3) the Coal Measures and Magnesian Limestone. The Cheviot group, the first envelope of sinking Cheviot-land, some reddish shore-like conglomerates lie in places at its base, as at Dodd Bane; its shales are often tinged with destemper greens; and the coal measures are then shale and sandstones, and its calcareous matter much diffused. Upon this lies the Calcareous group; its lime occurs in well-individualized marine beds, cropping up to the surface in greenish-white and yellow shales, with a thin layer of Magnesian Limestone, and the shales and sandstones form the extreme of the hill. The coal measures that are a bed of Limestone and coal forming the Cheviots. The middle division becomes thinner and more like the Coal Measures in passing northwards, and the upper division, thinning also, loses many of its limestones. The Millstone Grit is traps in the lowest Carboniferous, are all intrusive. An irregular mass possesses the same zone-like arrangement that prevails in the Lime- stone series, but are without limestones. They also are divided, sub-division formed by the debris, into the lower and upper. The lower seam downwards, has some traces of Gannister beds, and its coal- seams are thin. The famous Hutton collection of plants was made chiefly from the roof-shales of two seams—the Bensham and the Willington. The upper limestone is the "Romans Rock," as its name comes from the latter. The Coal Measures lie along the coast in a long triangle, of which the base, at the Tyne, is produced westwards on to the moors south of that river, where it is wedged against lower rocks. The sea shore is the straight line of the coast, and the signs of departing from the easterly dip that has brought them there where they are, and along a line between its apex (near Amble) and an easterly near, lies the line at which they turn up north-eastwards, promising coal-seas under the coast. The top of the Coal Measures is wanting. After a slight tilting of the strata and the denudation that removed it, the Permian rocks were broken. The Tertiary, composed largely of sands, and of many thin marine deposits, extends from Greenhead near Gilspind to the Kyloe Hills. Numbers of basalt dykes cross the county, and were probably connected with the plateau of Miocene volcanic rocks in the Hebrides. Every- where the glacial period left its marks, especially the glacial Kames which were beyond the range of the glacier, and from them extends from Greenhead near Gilspind to the Kyloe Hills. Every- wherever the glacial period left its marks, especially the glacial Kames which were beyond the range of the glacier, and from them.

Climate.—The climate is bracing and healthy, with temperate summers (e.g. the average July temperature at Alnwick is 57°-9° F.). In spring east winds prevail over the whole county. The lambing
season in the higher uplands is fixed for the latter half of April, and winds are general. The rainfall gradually increases as the country rises from the coast, thus the mean annual fall at Shields is 26.32 in., at Alnwick 31.04 in., while on the western borders 40 to 60 in. are received. The very heavy fall, varies so much that at times the smell from the coal-field, the lighter grime of which is detected as far as Cumberland, is taken by the shepherd for a sign of wet.

Agriculture, &c.—About five-ninths of the total area is under crops, and the rest is pasture and rough ground. There are also about 470,000 acres under hill pasture. South of the river Coquet there is a broad tract of cultivation towards the coast that sends levelling strips up the valleys into the interior. From the Tyne to Berwick a belt of cultivated ground, which is almost continuously along the base of the Cheviot hills. In the basin of the Till it becomes very fertile, and towards the Tweed the two streams unite. In the porphyry Chevies the lower hills show a great extent of sound surface and good grass. The average hill-farms support about one sheep to 2 acres. A coarser pasturage covers the Carboniferous hills, and the proportion of stock to surface is somewhat less. In the highest fells the congeries of bags, bogs and sandstone scars, with many acres dangerous to sheep, are worthless to the farmer. The lower uplands are a patchwork of coarse grasses (mown by the “muirmen” into “hem-hay” and heather, or in the rough pastures, “trows,” and “heath and meadow,” for it is blanched for eight months in the year. Heath is the natural cover of the sandstones and of the sandy glacier-debris near the coast. The north-west of Northumberland is much more apt to be cold and strong, but are much relieved by patches and inworkings of gravel, especially north of the Wansbeck. The prevalent stream-alluvium is sandy loam, with a tincture of peat.

The bulk of the upland is one of the largest sheep-raising counties in Great Britain. Of these, the half-breeds—crosses between the Leicester (or Shropshire) and Cheviot breeds—occupy the lower enclosed grounds, the pure Cheviots are on the uplands and the harder black-faced breeds lie out on the exposed heathery heights. The cattle are chiefly short-horns and Galloways. They are very largely raised, chiefly for fattening purposes.

When wages did not pass greatly into disuse, none of the shepherds still receive “stock-wages,” being allowed to keep forty or fifty sheep and several cows on their employment. In the arrangement, which makes them really co-partners, has probably done much to render them the singularly fine class of men they are.

Other Industries.—The manufactures of the county chiefly come from the Tyne, which is a region of ironworks, blast-furnaces, shipbuilders, and engineering. There is a large glass trade, largely concernced in pit-sinking and mine-working. In the other parts of the county there are a few small cloth-mills, a manufactuary of manuf

Communications.—Communications are provided almost wholly by the North-Eastern railway, of which the main line enters the country at Newcastle and runs N. by Morpeth, and near the coast, to Berwick, where a junction on the East Coast route from London to Scotland is effected with the North British railway. Numerous branch railways serve the populous south-eastern district, and there are excellent land routes westward to Hexham and Carlisle, up the Tweed valley into Scotland, and by the North British line up the North Tyne valley to Rothbury. The principal portsbesides Blyth, Amble, Warkworth Harbour, Alnemouth and Berwick. The Tyne is one of the most important centres of the coal-shipping trade in the world.

Population and Administration.—The area of the ancient county is 1,291,515 acres with a population in 1801 of 506,442, and in 1901 of 603,498. In physique the Northumbrians is stalwart and robust, and seldom corpulent. The people have mostly grey eyes, brown hair and good complexions. The inhabitants of the fishing villages appear to be Scandinavian; and part of the population bears the name of the old Brit-Celt, and a trace of the Gipsy blood of the Faas of Yetholm. The natives have fine characteristics: they are clean, thrifty and plodding, honest and sincere, shrewd and very independent. Their virtues lie rather in simplicity than in aspiration.

Northumbrian speech is characterized by a “rough vibration of the soft palate” or phrynx in pronouncing the letter w, well known as the “burr,” a peculiarity extending to the towns and liberties of Berwick, and absent only in a narrow strip along the north-west. Over the southern part of the county there is the same duplication of vowel-sounds, such as “pool” for “pool,”“the” and “on” pronounced “da,” “j” and “d,” and English forms of speech strike the ear, such as “to butch a beef,” “i.e., to kill a bullock, and curious inversions, such as “they can not help,” There is the Old-English distinction in the use of “thou” to familiars and “ye” to superiors.

The area of the administrative county is 1,291,515 acres. The county is divided into nine wards, answering to hundreds. Population is densest in the south-east, where the mining district and the parish of Bamburgh is located. The principal towns of the district are: Newcastle-upon-Tyne (city, county of a city and county borough; pop. 215,288), Tynemouth (county borough, 1,291, Morpeth (6158), Wallsend (2,361). In this district the following are urban districts: Amble (4248), Ashington (13,950), Bedlington (18,766), Blyth (5472), Cowpen (17,879), Cramlington (6437), Earlsdon (9020), Gosforth (10,606), Newbiggin-by-the-Sea (2032), Newburn (12,900), Seaburn (2121), Whitley and Monkseaton (7705), Willington Quay (7941). The remainder of the county contains the municipal borough of Berwick-upon-Tweed (13,427) and the urban districts of Alnwick (6716), Hexham (7155), Warkworth (6804), and the five parishes of the north-eastern circuit, and assizes are held at Newcastle-upon-Tyne. The total number of civil parishes is 352. The ancient county, which is in the Diocese of Newcastle, is divided into civil parishes, which in that of Durham, contains 173 ecclesiastical parishes or districts, wholly or in part. The parliamentary divisions of the county are Berwick-upon-Tweed, Hexham, Wansbeck and Tyneside, each represented by a single member, while the municipal borough of Newcastle-upon-Tyne returns two members, and those of Morpeth and Tynemouth one member each.

History.—The first English settlement in the kingdom of Bernicia, which included what is now Northumberland, was effected in 547 by Ida, who, accompanied by his six sons, pushed through the narrow strip of territory between the Cheviots and the sea, and set up a fortress at Bamburgh, which became the residence of the Saxon kings. In 616, after the death of Bernicia was first united with the rival kingdom of Deira under the rule of Æthelrith, and the district between the Humber and the Forth became known as the kingdom of Northumbria. In 634 Cadwalla was defeated at Hafenfeld (the site of which lies in the modern parish of St John Lee) by Oswald, under whom Christianity was definitely established in Northumbria, and the bishop’s see was fixed at Hexham, where Bishop Wilfrid erected the famous Saxon church. Oswald also erected a church of stone at Tynemouth, which was destroyed in 865 in an incursion of the Danes. Under Hingrave and Hubba, the extent of the Danish influence in Northumberland has been much exaggerated, however, for though in 876 Halden, having conquered the whole of Northumbria, portioned out the lands among his followers, the permanent settlements were confined to the southern portion of the kingdom. In the northern half, which is now Northumberland, the English princes continued to reign at Bamburgh as vassals of the Danes, and not a single place-name with the Danish suffix “by” or “thorpe” is found north of the Tyne. In 938 Æthelstan annexed Northumberland to his dominions, and the Danish authority was annulled until its re-establishment by Canute in 1013. The vigorous resistance of Northumbria to the Conqueror was punished by ruthless harrying. The Normans rebuilt the Saxon monasteries of Lindisfarne, Hexham and Tynemouth; Eustace Fitz John founded Alnwick Abbey, and other Norman abbey were Brinkburn, Hulne, Blanchland and Newminster. Castles were set up at Alnwick, Warkworth, Prudhoe, Dunstanborough, Morpeth, Ford, Chillingham, Langley, Newcastle, Bamburgh, Wark and Norham, a stronghold of the palatine bishops of Durham.

The term Northumbrian is first used in its contracted modern sense in 1065 in an entry in the Saxon Chronicle relating to the northern rebellion. The county is not mentioned in the Doomsday Survey, but the account of the issues of the county, as rendered by Ódard the sheriff, is entered in the Great Roll of the Exchequer for 1131. In the reign of Edward I. the county of Northumberland was found to comprise the whole district
between the Tees and the Tweed, and to have within it the several liberties of Durham, Sadberg and Bedlington south of the Coquet, and Norham beyond the Coquet, all subject to the bishop of Durham; and in 1293 formed the archdeaconry of the archbishop of York; that of Tynedale to the king of Scotland; that of Emildon to the earl of Lancaster; and that of Redesdale to Gilbert de Umfraville, earl of Angus. These franchises were all held exempt from the ordinary jurisdiction of the shire. By statute of 1405-1406 the lordship of Tynedale was annexed to Northumberland on account of flagrant abuses of the liberties of the franchise; the liberty of Hexham was annexed to Northumberland in 1572; Norhamshire, Islandshire and Bedlingtonshire continued to form detached portions of Durham until 1845, when they were incorporated into the county of Tyne and Wear; and division into wards existed at least as early as 1295, the Hundred Roll of that year giving the wards of Coquetdale, Bamburgh, Glendale and Tynedale.

The shire-court for Northumberland was held at different times at Newcastle, Alnwick and Morpeth, until by statute of 1549 it was ordered that the court should thenceforth be held in the town and castle of Alnwick, and under the same statute the sheriffs of Northumberland, who had lately been in the habit of appropriating the issues of the county to their private use, were required to the better deliver in their accounts to the Exchequer in the same manner as the sheriffs of other counties. The assizes were held at Newcastle, and the itinerant justices, on their approach to the county, were met by the king of Scotland, the archbishop of York, the bishop of Durham and the prior of Tynemouth, who pleaded their liberties either at a well called Chille near Gateshead, if the justices were proceeding from York, or, if from Cumberland, at Forstanes. In these franchises the king’s writ did not run, and their owners performed the office of sheriff and coroner. Among other Northumbrian landowners claiming privileged jurisdiction in 1293 was Robert de Quonla, whose hundreds at Widdrington, destitute of the lands and liberties of the shire and wapentake; the prior of St Mary of Carlisle claimed to exclude the king’s bailiffs from executing their office in his fee of Corbridge, and that he and his men were quit of the suits of the shire and wapentake. The burgesses of Newcastle claimed return of writs in their borough, and Edmund, the brother of Edward I, claimed return of writs and exemptions from the sheriff’s jurisdiction in his manor of Stamford. Newcastle was made a county by itself by Henry IV, in 1400, and has jurisdiction in admiralty cases. Ecclesiastically the county was in the diocese of Durham, and the bishop of Durham was the ordinary of the archdeaconry of the archbishop of York’s archdeaconry of Northumberland, comprising the deaneries of Newcastle, Corbridge, Bamburgh and Alnwick. In 1335 the archdeaconry included the additional deanery of Morpeth. The archdeaconry of Lindisfarne was formed in 1845, and subdivided into the rural deaneries of Alnwick, Bamburgh, Morpeth, Norham and Rothbury; the archdeaconry of Northumberland then including the deaneries of Bellingham, Corbridge, Hexham and Newcastle-upon-Tyne. In 1885 the additional deaneries of Tynemouth and Bedlington were formed in the archdeaconry of Northumberland, and in 1900 the deanery of Glendale in the archdeaconry of Lindisfarne.

Pre-eminent among the great families connected with Northumberland is that of Percy (q.v.). Ford and Chipchase were seats of the Heron family. The Widdringtons were established at Widdrington in the reign of Henry I. and frequently filled the office of sheriff of the county. The barony of Prudhoe was granted by Henry I. to the Umfravilles, who also held the castles of Otterburn and Alnwick as the liberty of the franchise of Bedlington. From the Ridleys of Willimot-Wythe, who was descended Bishop Ridley, who was martyred in 1555. Aydon Castle was part of the barony of Hugh Balio. The Radcliffes, who held Dilston and Cartington in the 15th century and afterwards acquired the extensive barony of Langley, became very powerful in Northumberland after the decline of the Percies, and were devoted adherents of the Stuart cause.

From the Norman Conquest until the union of England and Scotland under James I, Northumberland was the scene of perpetual inroads and devastations by the Scots. Northumberland and Wark were captured by David of Scotland in the wars of Stephen’s reign, and in 1290 it was at Norham Castle that Edward I. decided the question of the Scottish succession in favour of John Baliol. In 1295 Robert de Ros and the earls of Athol and Menteith ravaged Redesdale, Coquetdale and Tynedale. In 1314 the county was ravaged by Robert Bruce, and in 1328 by special enactment the earl of Northumberland was ordered to remain on his estates in order to protect the county from the Scots. In 1388 Henry Percy was taken prisoner and 1300 of his men slain at the battle of Otterburn, immortalized in the ballad of "The Haus of Percy". The Percy Chieftains of Dunstanborough were garrisoned for the Lancastrian cause in 1462, but after the Yorkist victories of Hexham and Hedgeley Moor in 1464, Alnwick and Dunstanborough surrendered, and Bamburgh was taken by storm. In 1513 the king of Scotland was slain in the battle of Flodden Field on Branxton Moor. During the Civil War of the 17th century Newcastle was garrisoned for the king by the earl of Newcastle, but in 1644 it was captured by the Scots under the earl of Lennox, and in 1646 Charles was led there a captive under the charge of David Leslie. The chief Northumberland families were ruined in the rebellion of 1715.

The early industrial development of Northumberland was much impeded by the constant ravages of internal and border warfare, and in 1376 the commonalty of Northumberland begged consideration for their sheriff, who, although charged £100 for the profits of the county, through death and devastation by the Scots could only raise £35, 3s. 4d. Again Aeneas Sylvius Piccolomini (Pope Pius II.), who passed through the county disguised as a merchant in 1456, leaves a picture of its barbarous and desolate condition, and as late as the 17th century, Camden, the historian of his country, describes the roads from Alnwick to Norhamshire, and the cold and desolate state of the mountainous country, and the mineral resources, however, appear to have been exploited to some extent from remote times. It is certain that coal was used by the Romans in Northumberland, and some coal workings, of which very few remain, were situated near Hexham and Morpeth. The Romans at Hexham had a lead-pan worked in the 2nd century. A salt-pan is mentioned, and the Blyth coal-field was worked throughout the 14th and 15th centuries. The coal trade on the Tyne did not exist to any extent before the 13th century, but from that period it developed rapidly, industry being in the 14th century established on the river shipping and coal-trade. Lead was exported from Newcastle in the 12th century, probably from Hexhamshire, the lead mines of which were so prosperous throughout the 16th and 17th centuries. In a charter from Richard I. to Bishop Pudsey creating him earl of Northumberland, mines of silver and iron are mentioned, and in 1240 the monks of Newminster had an iron forge at Stretton. A salt-pan is mentioned at Warkworth in the 12th century; in the 13th century the salt industry flourished at the mouth of the river Blyth, and in the 15th century formed the principal occupation of the inhabitants of North and South Shields. In the reign of Elizabeth glass-houses were set up at Newcastle by foreign refugees, and the industry spread rapidly along the Tyne. Tanning, both of leather and of nets, was largely practised in the 16th century, and the salmon fisheries in the Tyne were famous in the reign of Henry I.

The county of Northumberland was represented by two members in the parliament of 1290, and in 1295 Bamburgh, Corbridge and Newcastle-upon-Tyne each returned two members. From 1397, however, Newcastle was the only borough represented, until in 1524 Berwick acquired representation and returned two members. Morpeth returned two members from 1553. Under the Reform Act of 1832 the county returned four members in two divisions; Berwick and Newcastle were represented by two members each, and Morpeth and Tynemouth by one member each. Under the act of 1885 the county now returns four members in four divisions.
NORTHUMBRIA

Antiquities.—Of Anglo-Saxon buildings the Dunes lade left almost nothing. The crypt of Wilfrid's abbey at Hexham is one undoubted remnant; portions of several other churches are very doubtfully pre-Norman. Some thousand Saxon stycaes found buried in the fristround bank and an ornate cross now shared between Rothbury and Newcastle are the only vestiges of Saxon times. The Black Dyke, a bank and ditch crossing the line of the Roman wall about 3 m. east of the Irthing, is supposed by some to be the remnant of the old British line of the Cartrall at Peel Fell; the latter was the probable boundary-fence between the Saxon Bernicia and the British Strathclyde.

The ecclesiastical buildings of the county suffered greatly at the hands of the Scandinavians, not a few of the churches having been converted into mansions or for use as mansions. Lindisfarne Priory, the oldest monastic ruin in the country, dates from the time of Iona. Hexham Abbey, ruined over the crypt of Wilfrid's cathedral, has now become a ruin of historic architecture. Of Brinkburn Priory the church remains, and has been well restored. Hulne Abbey was the first Carmelitine monastery in Britain. Besides these there are fragments of Newcastle Abbey (1139), Alnwick Abbey (1147) and others. An exquisitely graceful fragment of Tynemouth church is associated with some remains of the older priory. St Nicholas's church, Newcastle (1350), was the prototype of St Giles's, Edinburgh. It stood on the site of an old church at Norham, and other Norman and Early English churches at Mitford, Bamburgh, Warkworth (with its hermitage), Alnwick (Schott, 1825) stand with them with square towers. The stone roof of the little church at Bellingham, with its heavy semicircular girders, is said to be now unique.

"It may be said of the houses of the gentry herein," writes Fuller in 1654, "that they are not a few of them large and castle-like." Except a few dwellings of the 16th century in Newcastle, and some mansions built after the Union of England and Scotland the older houses are all castles. A survey of 1540 mentions this number of "castles" in the county. Many of these are, however, not probably including all the bastle-houses or small peels of the yeomen. At the Conquest Bamburgh, the seat of the Saxon kings, was but the only castle of North York. Norham Castle was built in 1121. None of the "bosal castes" are left us in the time of Henry the Third. A grass mound represents Wark Castle. Alnwick Castle is an array of walls and towers covering about five acres. Warkworth, Prudhoe and Delvalle are fineCastles of the same kind. Waller has still its romantic memories of the earl of Derwentwater. Bel sault, Haughton, Featherstone and Chipchase castles are joined with modern mansions. The peel-towers of Elsdon, Whiston (Rothbury), and Embleton were used as fortified rectorcy-houses. Seaton Delaval was the work of Vanbrugh.

The place-names of the county may be viewed as its etymological antiquities. The Danish test-suffix by is absent. Saxon finals, hams, clesges (cliffs or ravines) and various patronyms are met with in great numbers; and the Gaelic knock (hill) and Cymric coar, dwer (water), efn (ridge), bryn (brow), &c., mingle with the Saxon. Many current names are pure norlhanhymbrorum (1147) or efn (ridge), bryn (brow), &c., mingle with the Saxon. Many current names are pure

NORTHUMBRIA (regnum Northumbriamor), one of the most important of the Anglo-Saxon kingdoms, extended from the Humber to the Forth. Originally it comprised two independent kingdoms, Bernicia and Deira (q.v.). Each of these had a dynasty of its own. The first known king of the former was Ida, who, according to tradition, acquired the throne in 547 and reigned twelve years. To him the foundation of Bamburgh is attributed. Four of Ida's sons successively occupied his throne: Ospur, 549-556; Edwin, 556-560; Oswald, 560-568; and Theodoric 572-575. Of the first three nothing is known, but Theodoric is said (Historia Brittonum) to have been besieged by the Welsh under Urien in Lindisfarne. Theodoric was succeeded by Frithwulf 579-585 or 586 and Husse 586-592 or 593. Then Æthelfrith (q.v.), son of Ethelric, came to the throne.

He greatly extended his territories at the expense of the Welsh, and eventually provoked an invasion of Aidan, king of the Scots, whom he defeated at a place called Daesaatan (603). The first king of Deira of whom we know was Ealla, or Aelle, who, according to Bede, was still reigning when Augustine arrived in 597. The Saxon writer, after which the Welsh less reliable authority, the Northumbrian history, places his death in the year 588. The compiler of this work, however, seems to have used a regnal list of the Bernician kings, which differed considerably from most of those found in our early authorities. Æthelthryth eventually acquired possession of Deira, probably in 604 or 605, perhaps on Ellia's death, expelling his son Edwin (q.v.). Thenceforward, with rare intervals, the two kingdoms remained united. Æthelthryth became involved in war with the Welsh towards the end of his reign and captured Chester, probably about 613. Shortly afterwards, in 616, he was defeated and slain in battle on the river Idle by Edwin, who was assisted by the East Anglian king Raedwald. Edwin now became king over both Northumbrian provinces. By his time the kingdom must have reached the west coast, as he is said to have conquered the islands of Anglesea and Man. Under Edwin the Northumbrian kingdom became the chief power in the country. At his death in 633 the kingdom was again divided, Deira falling to his nephew Osric, while Bernicia was occupied by Eanfrith son of Æthelthryth. Both these kings were slain by Ceawinwalr in the following year, but the kingdom afterwards recovered its independence. Eadberht, brother of Eanfrith, who reigned the whole of Northumbria under his sway and acquired a supremacy analogous to that previously held by Edwin. After Oswald's defeat and death at the hands of Penda in 642 Bernicia fell to his brother Oswiu, while Osric son of Osric became king in Deira, though probably subject to Oswiu. Oswiu's death was compassed by Oswiu in 651, and the throne of Deira was then obtained by Æthelwald son of Oswald. He is not mentioned, however, after 655, so it is probable that Deira was incorporated in the eastern kingdom of Bernicia. About 664 Penda invaded the kingdom of Northumbria, and after the defeat of Oswald over Penda in 654-655 he annexed the northern part of Mercia to his kingdom and acquired a supremacy over the rest of England similar to that held by his predecessors. The Mercians, however, recovered their independence in 658, and from this time onward Northumbria played little part in the history of southern England. But Oswiu and his son Egfrith greatly extended their territories towards the north and north-west, making themselves masters of the kingdoms of Strathclyde and Dalriada, as well as of a large part of the Pictish kingdom. Oswald's successor, Coenred, is described as a learned man and a patron of scholars, and during his reign the Northumbrian kingdom partially recovered its prosperity. He was succeeded in 705 by his son Osred, and under him and his successors Northumbria began rapidly to decline through the vices of its kings and the extravagance of their donations. Osred was slain in 716. He was succeeded by Coebrid 716-718, and Coebrid by Osric 718-729. The next king was Ceolwulf, to whom Bede dedicated his Historia Ecclesiastica in 731. In the same year he was deposed and forced to become a monk, but was soon restored to the throne. In 737 he voluntarily retired to a monastery, and left the kingdom to his cousin Eadberht. The latter appears to have been a vigorous ruler; in the year 740 we hear of his being involved in war with the Picts. Æthelhald of Mercia seems to have taken advantage of this campaign to ravage Northumbria. In 750 Eadbeth is said to have annexed a large part of Ayrshire to his kingdom. Finally in 756, having now allied himself with
Engus king of the Picts, he successfully attacked Dumbarton (Alcuith), the chief town of the Britons of Strathclyde. Eadberht showed considerable independence in his dealings with the church, and his brother Oswulf, to whom the well-known letter of Bede is addressed, was from 734 to 766 archbishop of York. In 758 Eadberht resigned the kingdom to his son Oswulf, and became a monk. After his abdication Northumbrian history degenerates into a record of dynastic murders. Oswulf was slain by his household at a place called Mchill Wonton in 759. Moll Æthelwald, who may have been a brother of Eadberht, succeeded, and after a victory over a certain Oswine, who fell in the battle, abdicated and became a monk probably under compulsion in 765. His successor Alcuith died in 789. Æthelwald was the son of Æthelred and was murdered at Corbridge in 796. Oswulf, who is called patricius by Simcon of Durham, succeeded, but reigned only twenty-seven days, when he was expelled and eventually became a monk. Eardwulf dux, who had apparently fled abroad to escape the wrath of Æthelred, was now recalled to the crown and ruled until 800. Æthelred then became king, but Eardwulf was restored in 808 or 809 after appealing to the emperor and the pope. Eanred, son of Eardwulf, probably came to the throne in 809 and reigned until 814. It was during his reign in 827 that Northumbria acknowledged the supremacy of Egbert, king of Wessex. Eanred was succeeded by his son Æthelred, who was slain in 850, when Osberht came to the throne and reigned until 863. On the expulsion of Osberht, Ella or Ælle, succeeded. The chroniclers emphasize the fact that this king was not of royal descent. He is said to have slain Ragnar Lodbjorg. In the year 866 Lothborna, the young earl, and Hemdu, Uthb, and others brought a vast army to England to avenge the death of their father. In the following year they obtained possession of York. Ella seems now to have made peace with the exiled king Osberht, and their united forces succeeded in recovering the city. In the great battle which ensued the Northumbrian army was annihilated and both kings slain (the death of Ella, according to Irish tradition, being due to the treachery of one of his followers). The southern part of Northumbria now passed entirely into the hands of the invaders, but they allowed a certain Egbert to reign over the portion of the kingdom north of the Tyne. Egbert was expelled in 877 and died in the course of the following year. His successor Ricigd died in 876 and was followed by Egbert II., who reigned until 878. He was the last English king who reigned in Northumbria. After him the chief power north of the Tyne came into the hands of a certain Eadulf of Bamburgh, who did not take the kingly title, but accepted the overlordship of Alfred the Great perhaps in 886. In the winter of 874-875 Healfdene returned to Northumbria, which he partitioned among his followers. He was probably killed in Ireland in 877. Simeon of Durham, made his brother Egberht, to whom the same position, after he had been expelled from his country and had lost his reason as a punishment for his misdeeds. After an interregnum of a few years a certain Guthred became king in 883. He is said to have been a slave and to have been appointed king at the command of St Cuthbert, who appeared to Eadred the abbot ofCarlisle in a dream. There is some reason for the conjecture that he belonged to the family of Lozbirk. He died in 894, after which date little is known of Northumbrian history for a number of years. About the year 970 the country was invaded by Ragnald (Rügnard, grandson of Ivarr), a Norwegian king from Ireland, who seized York and occupied the lands of St Cuthbert. Aldred, the son of Eadulf, who now ruled north of the Tyne, appealed to Constantine II., king of the Scots, for help, but the Scottish and Northumbrian armies were defeated at Corbridge. Shortly after this, however, all the northern princes submitted to Edward the Elder. Raeganald was succeeded by Sihtric (Sigtrygg, another grandson of Ivarr), who married Æthelstan’s sister. He died in 926, and his brother and successor Guthfrith was soon afterwards expelled by Æthelstan, the successor of Eadred. The latter, however, both submitted to Æthelstan, and Guthfrith was again driven into exile. He died in 934, leaving a son Anlaf (Olaf), Godfredsson or Godfredson. In 934 Æthelstan invaded Scotland as far as the Tay. In 937 a great fleet and army were brought together by Constantine and Anlaf, the son of Sihtric, another Norwegian chieftain who had allied himself with the Scots, helped by Anlaf Godfreysyn from Ireland. Æthelstan, however, won a complete victory over them at a place called Brunanburgh, probably Burnsward in Dumfries- shire. Anlaf Godfreysyn returned to Ireland and died in 941—perhaps by the order of the king. King Eric II. of Sweden, the son of Sihtric again came to England in 940 just after the death of Æthelstan. He became king of Northumbria and extended his territories as far as Watling Street. Peace was made with King Edmund by the capture of King Anlaf, and a good deal later by the confirmation of King Raegnald, brother to Anlaf Godfreyson and cousin to Anlaf Sihtricson. About two years later, however, both these kings were expelled by Edmund, and the whole of Northumbria was brought under his power. About the second year of Eadred’s reign there was another revolt and Eric Bloodaxe, the exiled king of Norway, obtained the throne. During the next few years the kingdom alternated between Eric and Anlaf until 954, when Eadred finally succeeded in establishing his power. Eric was killed by Maccus, the son of Anlaf, while Anlaf himself withdrew to Ireland, where he died in 980. Eadred placed Northumbria in the hands of a certain Osulf, who is called high-reeve at Bamburgh. In the reign of Edgar, Osulc was appointed earl of southern Northumbria, but he was banished at the beginning of the following reign. The next earl was Waltheof and after him Úhtred, who defeated Magnus and Stephen, sons of King Haakon the Great and Norway, and afterwards took the title of king of the Scots. The Northumbrians, however, were completely defeated at Carhan, and Lothian was annexed by the Scots (see Lothian). Úhtred was slain by the orders of Canute, who gave the province to Eric (Eirikr) earl of Lade. Shortly afterwards, however, part of it at least came into the hands first of Eadulf and then Aldred and another Eadulf, the brother and sons respectively of Úhtred. The younger Eadulf was slain by Siward, probably in the reign of Hardacanute. Siward held the ealdom till his death in 1035, when it was given to Tostig, son of earl Godwine, and after his banishment to Morkere, son of Ælfgar, earl of Mercia. Tostig’s banishment led to the invasion of Harold Hardrada, king of Norway, and the battle of Stamford Bridge, in which both perished.

NORTH WALSHAM, a market town in the eastern parliamentary division of Norfolk, England; 131 m. N.E. by N. of Norwich, on the broad flat land of the valley of the river Bure (1901) 3981. It lies in a pastoral district near the river Ant, a tributary of the Bure. The church of St Nicholas is a fine Perpendicular structure exhibiting the flint-work common to the district, and possessing a beautiful south porch and the ruin of a massive western tower which partly collapsed early in the 18th century. A grammar school was founded in 1606, and reorganized and moved to new buildings in modern times. There
is a market house of the 16th century. A considerable agri-
cultural trade is carried on, and cattle-shows and fairs are held.
The river Ant provides a route southward to the Norfolk Broads.
The coast village of Mundesley, 5 m. N.E. by a broad railway which runs
in favour as a watering-place, having fine sands beneath the cliffs.
In the district between this and North Walsham are Paston,
taking name from the family which is famous through the
Paston Letters (q.v.), and the fragments of Bromholm
Priory, a Clinkian foundation. These are of various dates from
Norman onwards, but are incorporated with farm buildings.
The road of Bromholm was a reputed fragment of the Cross
which attracted many pilgrims. To the south of North Walsham
is North Walsham Heath, whither in June 1381 a body of in-
surgents, Retreating with the King of Bohemia's army, was driven
from before Norwich by Henry le Despenser, bishop of Norwich,
and defeated; after which their leader, Geoffrey Lister, and
others were sent to the scaffold.

NORTH-WEST FRONTIER PROVINCE, the most northerly
province of British India, created on the 25th of October 1901.
Roughly it may be defined as the tract of country N. of Baluch-
istan, lying between the Indus and Afghanistan. More exactly
it consists of (1) the Cis-Indus district of Hazara; (2) the com-
paratively narrow strip between the Indus and the hills con-
tinuing the tracts of Peshawar, Kohat, Bannu and Dera Ismail Khan;
and (3) the rugged mountains and plains which lie between
these districts and the borders of Afghanistan, which is
inhabited by independent tribes. This last region is divided into
to five agencies: Dir, Swat and Chitral, with headquarters at
Malakand; Khyber, Kurram, Tochi and Wana. The province
lies between 33° 4' and 36° 57' N., and 70° 16' and 74° 7' E. The
approximate area is 38,665 sq. m., of which 13,193 sq. m. are
British territory and the remainder is held by tribes under
the political control of the Agent to the Governor-General.
On June 1878, the frontier area was ceded by Afghanistan to
by Baluchistan and Dera Ghazi Khan district of the Punjab,
by the E. by Kashmir and the Punjab, and on the W. by
Afghanistan.

1. Hazara District.—The district of Hazara extends north-
eastwards into the outer Himalayan Range, tapering to a narrow
point at the head of the Kagan valley. The mountain chains which
enclose Kagan sweep southward into the broader portion of the
district, throwing off well-wooded spurs which break up the country
into numerous isolated glens. Approaching Rawalpindi district
the peaks of the Outer Himalayas gradually subside into the plain of
hilly, wooded uplands. The Babusar Pass at the head of the Kagan valley marks the first direct approach
to Chilas and Gilgit from the plains of India. (See HAZARA).

2. Harkot District.—The Harkot district of the frontier
consists of four open districts, Peshawar, Kohat, Bannu and
Dera Ismail Khan, divided one from the other by low hills. The vale
of Peshawar is for the most part highly irrigated and has a
 represents in the spring and autumn a picture of waving cornfields
and smiling orchards framed by rugged hills. It has, however, an
ever name for malarial fever. Adjoining Peshawar, and separated
by it from the Jowaki hills, lies the district of Kohat, a generally
hilly tract intersected by narrow valleys. The largest of these
traverses the district from Kushalgarh on the Indus to Thal on the
Kurram, narrowing in places, but usually opening out into wide
and pastures dotted with the dwarf palm. This district
affords striking contrasts of scenery, from the sheltered fields
of Miran梓ar to the barren desolation of the salt mines. The southern
spurs of the Kohat hills gradually subside into the Bannu plain.

3. The Country of the Independent Tribes.—Turning to the moun-
tainous region between the settled districts and Afghanistan, to the
extreme north lies the agency of Dir, Swat and Chitral. Chitral itself
is a narrow valley enclosed by ranges of mountainous ranges.
Below Chitral are found the thickly timbered forests of Dir and
Bajaur, and the fertile valleys of the Panjkora and Swat rivers.
Between this agency and the Khyber Pass lies the Mohmand hills,
a rough country with but little cultivation, under the political control
of Afghanistan. This country is inhabited by the Pathan tribes of the
of the Afridis and the Orakzais. The boundary of the
province here follows the line of the Safed Koh, which overlooks
the Kohat district and the upper Kurram valley. Dotted with towered
hamlets and stations, the road winds south-east from the Peiwar Kotal
(great below the peak of Sikaram), past Thal in the Miranzai valley, through the southern Kohat hills
between the Kohat and Bannu districts, and then south-west to the
from Waziristan, an isolated mountainous district bound on the
by the Gomal and the gorges that lead to the Wana plain.
The lower ridges of the frontier mountain system are usually bare
of forest, but here and there they are occupied by a
Waziristan and round Kaniguram in the south, are forest clad
and enclosed narrow but fertile and well-irrigated dales. In places, too,
where narrow glens receive the summer rains on the ground of the
Waziristan and the in the pastures of Dir Ghul Khan are
pasturage and a fair sprinkling of deodars. The valleys of the Tochi
and Wana are both fertile, but are very different in character.
The Gomal the latter is a wide open alluvial plain, cultivated
on one side, and for the rest rough stony waste. South of the
Gomal the Sulman Range culminates in the famous Takht-i-
Suliman in the Larcha Shanani country, a political dependency
of Dera Ismail Khan district. The Kaisargai peak of the Takht-i-
Suliman is 11,300 ft. above sea-level.

4. The Pathan Races.—The North-West Frontier Province as
now constituted may be described as the country of the Pathans
(q.v.). The true Pathan is possibly of Indian extraction. But
around this nucleus have collected many tribes of foreign origin.
The whole have now become blended by the adoption of a common
language, but remain tribally distinct; all alike have accepted
Islam, and have invented traditions of common descent which
express their present association. For centuries these tribes
have been in their turn conquerors of the Afghan tribes of the
present kingdom of Afghanistan. In the 15th century
they began to settle in the plains. The 16th century saw the
Pathan tribes established in their present homes. The spirit
of independence which always characterized them soon brought
them into collision with the Mogul empire. In the 17th century,
after a long struggle, the settlers in the plains wrested from
Aurangzeb terms which left them almost as independent
as their brothers in the hills. The invasion in 1738 of Nadir Shah,
who traversed the province from Peshawar to Dera Ismail Khan.
NORTH-WEST TERRITORIES

is a landmark in the history of the frontier. From his death to the rise of Ranjit Singh, the frontier districts remained an appendage of the Durani empire. Little control was exercised by the rulers of Kabul, and the country was administered by local chiefs or Afghan Sirdars very much as they pleased. The Sikh invasions began in 1849, and from that date to the annexation by the British government the Sikhs were steadily making themselves masters of the country. After the Second Sikh War, by the proclamation of the 29th of March 1849, the frontier districts were annexed by the British government. From that time until the creation of the North-West Frontier Province the settled districts formed part of the Punjab, while the independent tribes were controlled by the British government, and the government of India. Their turbulence still continued, and since 1849 they have been the object of over fifty punitive expeditions. The chief tribes, under the political control of the N.W. Frontier agency, besides Chitralis and Bajauris, are the Utman Khel, Yusafzais, Hassanais, Mohmands, Afridis, Jowakis, Mullagaris, Orakzais, Zaimukhans, Chamanis, Kakhtas, Bangashes, Turis, Waziris, Battannis (Bhitanis) and Sheranis. These tribes are referred to under separate headings.

Creation of the Province.—The North-West Frontier Province differs from the older provinces of India in having been artificially built up out of part of a previous province together with new districts for a definite administrative purpose. The proposal to make the frontier districts into a separate province, administered by an officer of special experience, dates back to the viceroyalty of Lord Lytton, who, in a famous minute of the 22nd of April 1877, said:

"I believe that our North-West Frontier presents at this moment a spectacle unique in the world; at least I know of no other spot where, after 25 years of peaceful occupation, a great civilized power has obtained so little influence over its semi-savage neighbours, and acquired so little knowledge of them, that the country within a day's ride of its most important garrison is an absolute terra incognita, and that there is absolutely no security for British life a mile or two beyond our border."

The result of this minute was that a frontier commissionership, including Sind, was sanctioned by the home government, and Sir Frederick (afterwards Lord) Roberts had been designated as the first Commissioner, when the outbreak of the Second Afghan War caused the project to be postponed. It was afterwards shelved by Lord Ripon. Twenty-three years elapsed before Sir Frederick and another appointed by Lord Curzon, whose scheme was on a much more modest scale than Lord Lytton's. It omitted Sind altogether, and confined the new province to the Pathan trans-Indus districts north of the Gomal. The purpose of the change was to subject all the independent tribes from Chitral to the Gomal Pass to the control of a single hand, and to ensure a firm and continuous policy in their management. The administration of the province is conducted by a chief Commissioner and Agent to the Governor-General.

Population.—In the census of 1901 the operations were extended for the first time to the Kurram Valley and the Sherani country, trans-frontier territories containing a population of 66,628 souls, which had not been previously enumerated. The military cantonments and posts in Malakand, Dir, Swat and Chitral were also enumerated, as were those in the Tochi Valley (the Northern Waziristan Agency) and in the Gomal (the Southern Waziristan Agency), the former figures being included in the census returns of Bannu district, and those of the latter in the returns of Dera Ismail Khan. The total population of the province was 1,219,480; but this figure omits the great majority of the frontier tribes. The province is almost wholly agricultural. The urban population is only one-eighth of the total, and shows no tendency to increase. There are no large industries to attract the population to the towns; these, except Peshawar and Dera Ismail Khan, are either expansions of large agricultural villages or bazaars which have grown up round the many cantonments of the province. The great majority of the population are Pathan by race and Mahomedan by religion. The predominant language is Pushtu (q.v.). The conquered strata of the population speak servile Indian dialects, called Hindki in the north, Katchi in the south, and Gujar in the south of Peshawar.

Crops and Climate.—The area under cultivation represents an average of 1,3 acres per head of the total, and of nearly 1,3 acres per head of the rural population. The limit of profitable cultivation has almost been reached. It is therefore from an improvement in the methods of agriculture rather than to an extension of the area under cultivation that recourse must be had to supply the needs of a rapidly increasing population. The Pathan, however, is a slovenly cultivator and slow to adopt any new methods which involve some effort. The crops commonly cultivated are wheat, barley, maize and bajra; in the spring, wheat, barley and gram. Rice and sugarcane are largely grown on the irrigated lands of Hazara, Dera Ismail and Bannu districts, and the well and canal irrigated tracts of Peshawar district produce fine crops of cotton and tobacco.

In the trans-border agencies the valleys of the Swat, Kurrum and Tochi rivers yield abundant rice crops. The province is mainly a rice shipper and a receiver of rice by rail from Bengal. The lower Indus plain is watered by the Indus and its tributaries, the Suba and the Chenab. The former is navigable for 20 miles below Lahore. The Swat and Kabul river canals, which were constructed by and are the property of government, and are managed by the irrigation department.

About 20% of the cultivated area is irrigated by canals, 2% by wells and 3% by perennial streams. Throughout the province the area in which well-cultivation is possible is extremely limited, and the field which has already been cultivated in Kohat and Hazara any considerable extension of canal irrigation is out of the question, but in the remaining districts much can still be done to promote irrigation.

Railways.—The railways of the province are mostly intended in the first instance for strategic purposes. The main line of the North-Western railway runs from Rawalpindi to Peshawar, whence it branches off. There are two lines of railway, the first to Dargai and the Kallu Pass. From Nowshera a frontier light line, involving a break of gauge, is carried to Dargai at the foot of the Malakand Pass. From Rawalpindi again another branch extends to the Indus at Chichawatni. A branch line has been begun across the Swat and runs through Kohat to Chilayat. A line is also continued through to Kohat to Thal at the entrance of the Kurrum valley.

See North-West Frontier Province Gazetteer (Calcutta, 1908); Sir Thomas Holdich, The Indian Borderland (1907); Paget and Mason, Record of Frontier Expeditions (1884).

NORTH-WEST TERRITORIES. The North-West Territory was at first a general name given to all the districts of British North America lying N.W. of the St Lawrence basin. In the British North America Act of 1867 provision was made for the admission to Canada of "Rupert's Land and the North-West Territory." Manitoba was formed out of this district in 1870. The territory remaining was then called the "North-West Territories," and until other arrangements were made was to be under the governor of Manitoba. In 1876 the district of Keewatin was established; in 1882 the limits of Manitoba were enlarged; in 1885 the districts of Keewatin, Ungava, Mackenzie and Franklin were organized. In 1905 the two first of these with some modification became the province of Saskatchewan, and the two last the province of Alberta. The territories of Canada outside of the eight provinces and Yukon district of the mainland are now organized as the North-West Territories, and are under an administrator or acting governor. They include the districts of Keewatin, Ungava, Mackenzie and Franklin. These territories have an Indian population of about 8,500, the
Indians throughout the southern part being chiefly Chipewyans, or as they are sometimes called, Tinâé. The northern parts are inhabited by Eskimo. In these territories a short hot summer is followed by a long cold winter with extremely low temperatures, the spirit thermometer at times showing 60° to 65° F. below zero. The following observations may be quoted:

With the exception of southern Keewatin and the district south of James Bay the animals of the North-West Territories are chiefly fur-bearing. Great herds of musk-oxen are found in Mackenzie, and vast flocks of ducks, geese and other migratory birds spend summer in the northern wilds. Except in southern Keewatin and the James Bay district the flora is decidedly northern, becoming Arctic in the far northward and ill formed. Sedges abound, exceeding grasses; mustards are abundant, and saxifrages plentiful. Mosses and lichens are numerous.

The history of the north-west follows three different branches. (1) The story of Arctic exploration and the search for the North-West Passage, with a concentration of interest upon the name of Sir John Franklin, whose loss was owned by a great development of investigation in the Arctic regions; (2) the story of the fur trade, connected with the Hudson Bay forts, from the establishment of the first Charles Fort in 1669; (3) the story of immigration, the beginning of which is to be found in the coming of the Selkirk colonists, the real founders of Manitoba (q.v.), to Red river by way of Hudson Bay.

NORTHWICH, a market town in the Northwich parliamentary division of Cheshire, England, 17½ m. N.W. of London, on the London and North-Western railway and the Cheshire lines. Pop. of urban district, 17,611. It lies in a low open valley at the confluence of the rivers Weaver and Dane, and is the centre of the principal salt-producing district in the United Kingdom. In its narrow and irregular streets many of the houses are strongly bolted to keep them secure from the subsidences which result not infrequently from the pumping of brine. Despite these precautions many accidents have occurred; some of the houses have sunk or stand at fantastic angles, and in 1892 a portion of the High Street, which had subsided below the level of the Weaver, had to be raised 6 ft. Both rock salt and white salt obtained by evaporation from brine are exported. The amount supplied by the whole district, which includes the neighbouring town of Winsford 6 m. south, is about 1,500,000 tons annually. The white salt is shipped chiefly to America. The principal buildings are the church of St Helen, Witton, noted for its finely carved roof of the 17th century, a museum and free library and market house. The Verdin Park was presented to the town by Robert Verdin, M.P. for Northwich, in 1857. There is a considerable industry in the building of flat boats to convey salt to Liverpool, the river Weaver being navigable, and connected by a hydraulic lift, 1 m. from the town, with the Trent and Mersey Canal on a higher level. Rope- and brick-making, iron and brass-foundling, chemical manufactures, brewing and tanning, are also carried on.

NORTON, CAROLINE ELIZABETH SARAH (1868-1877), a daughter of Lady Stirling-Maxwell, English writer, was born in London in 1828. One of the three beautiful granddaughters of Richard Brinsley Sheridan, daughters of his son Thomas, the "three Graces" of London society in the reign of George IV., she began to write before she was out of her teens. Her two sisters Helen and Georgina became respectively Lady Dufferin and Duchess of Somerset. Lady Dufferin described the sisters to Disraeli with characteristic modesty. "Georgey's the beauty," she said, "and Carry's the wit, and I ought to be the good one, but I am not." At the age of seventeen, Caroline published a merry satire, The Dandies' Rout, illustrated by herself, and full of girlish high spirits and wit. Her first essay in serious verse was made in 1829 with The Sorrows of Rosaline, the next in 1825 with The Undying One, a version of the legend of the Wandering Jew. She made an unfortunate marriage in 1827 with the Hon. George Norton, brother of Lord Granville. After three years of protests on her part and good promises on his, she had left his house for her sister's, had "condoned" on further good promises, and had returned, to find matters worse. The husband's persecutions culminated in 1836 in an action brought against Lord Melbourne for seduction of his wife, which the Jury found and with which the wife left the box. The case against Lord Melbourne was so weak that it was suggested that Norton was urged to make the accusation by Melbourne's political enemies, in the hope that the scandal would prevent him from being premier when the princess Victoria should succeed William IV. In 1853 legal proceedings between Mrs Norton and her husband were again entered on, because he not only failed to pay her allowance, but demanded the proceeds of her books. Mrs Norton made her own experience a plea for addressing to the Queen in 1851: she has been sumptress and handmaid, and her writings did much to ripen opinion for changes in the legal status of married women. George Meredith, in Diana of the Crossways, used her as the model for his "Diana." Mrs Norton was not a mere writer of elegant trifles, but was one of the priestesses of the "reforming" spirit; her Voice from the Factories (1836) was a most eloquent and rousing condemnation of child labour. The Dream, and other Poems appeared in 1840. Aunt Carry's Ballads (1847), dedicated to her nephews and nieces, are written with charming tenderness and grace. Later in life she produced three novels, Stuart of Dunleith (1851), Last and Sived (1856), and Old Sir Douglas (1860). Mrs Norton's last poem was the Lady of La Garoye (1862), her last publication the half-humorous, half-heroic story of The Rose of Jericho in 1870. She died on the 15th of June 1877. Mr Norton died in 1875; and Mrs Norton in the last year of her life married Sir W. Stirling-Maxwell.

See The Life of Mrs Norton, by Jane G. Perkins (1899).

NORTON, CHARLES BOWYER ADDERLEY, 1st Baron (1814-1905), English politician, eldest son of Charles Clement Adderley (d. 1818), one of an old Staffordshire family, was born on the 2nd of August 1814, and inherited Hams Hall, Warwickshire and the valuable estates of his great-uncle, Charles Bowyer Adderley, in 1826. He was educated at Christ Church, Oxford, and in 1841 he became one of the members of parliament for Staffordshire retaining that seat until his death. Sir Charles was elected Baron Norton. Adderley's official career began in 1858, when he served as president of the board of health and vice-president of the committee of the council on education in Lord Derby's short ministry. Again under Lord Derby he was under-secretary for the colonies from 1866 to 1868, being in charge of the act which called the Dominion of Canada into being, and from 1874 to 1878 he was president of the board of trade. He died on the 28th of March 1905. Norton was a strong churchman and especially interested in education and the colonies. In 1842 he married Julia (1820-1897) daughter of Chandon, 1st Lord Leigh, by whom he had several sons. His eldest son Charles Leigh (b. 1846) became 2nd Baron Norton. Another son, James Granville Adderley (b. 1861), vicar of Saltley, Birmingham, became well known as an advocate of Christian socialism.

See W. S. Childe-Pemberton, The Life of Lord Norton (1909).

NORTON, CHARLES ELIOT (1827-1908), American scholar and man of letters, was born at Cambridge, Massachusetts, on the 16th of November 1827. His father, Andrews Norton (1780-1853) was a Unitarian theologian, and Dexter professor of sacred literature at Harvard; his mother was Catherine Eliot, Charles William Eliot, president of Harvard, being her cousin. Charles Eliot Norton graduated from Harvard in 1848, and started in business with an East Indian trading firm in
Boston, for which he travelled to India in 1849. After a tour in Europe, he returned to America in 1851, and thenceforward devoted himself to literature and politics.

In 1858 Norton inaugurated the Dante Society, whose first presidents were Longfellow, Lowell and Norton. He translated the Vita Nuova (1860 and 1867) and the Divina Commeda (1861-1862, 2 vols.). After work as secretary to the Loyal Publication Society during the Civil War, he edited from 1864-1868 the North American Review, in association with James Russell Lowell. In 1861 he and Lowell helped Longfellow in his translation of Dante and in the starting of the informal Dante Club. In 1873 he was appointed professor of the history of art at Harvard, a chair which was created for him and which he held until 1888. The Archaeological Institute of America chose him to be the first president (1879-1890).

From 1876 until 1874 Norton spent much time in travel and residence on the continent of Europe and in England, and it was during this period that his friendships began with Carlyle, Ruskin, Edward FitzGerald and Leslie Stephen, an intimacy which did much to bring American and English men of letters into close personal relation.

Norton, indeed, had a peculiar genius for friendship, and it is on his personal influence rather than on his literary productions that his claim to remembrance mainly rests. From 1884 he had confined himself to the study of Dante, his professorial duties, and the editing and publication of the literary memorials of many of his friends. In 1883 came the Letters of Carlyle and Emerson; in 1886, 1887 and 1888, Carlyle's Letters and Reminiscences; in 1894, the Orations and Addresses of George William Curtis and the Letters of Lowell. Norton was also made Ruskin's literary executor, and he wrote various introductions for the American "Brantwood" edition of Ruskin's works. His other publications include Notes of Travel and Study in Italy (1859), and an Historical Study of Church-building in the Middle Ages: Venice, Siena, Florence (1880). He organized exhibitions of the drawings of Turner (1874) and of Ruskin (1879), for which he compiled the catalogues.

He died on the 21st of October 1908 at "Shady-hill," the house where he was born. He bequeathed the more valuable portion of his library to Harvard. In 1856 he had married Miss Susan Sedgwick. He had the degrees of Litt.D. (Cambridge) and D.C.L. (Oxford), as well as the L.H.D. of Columbia and the L.L.D. of Harvard and of Yale.

THOMAS, T., 1813-1874, English lawyer, politician and writer of verse, was born in London in 1813. He was educated at Cambridge, and early became a secretary to the Protector Somerset. In 1855 he was admitted a student at the Inner Temple, and married Margery Cranmer, the daughter of the archbishop. From his eighteenth year Norton had begun to compose verse. We find him connected with Jasper Heywood; as a writer of "sonnets" he contributed to Todd's Miscellany, and in 1560 he composed, in company with Sackville, the earliest English tragedy, Gorboduc, which was performed before Queen Elizabeth in the Inner Temple on the 18th of January 1561. In 1562 Norton, who had served in an earlier parliament as the representative of Gatten, became M.P. for Berwick, and entered with great activity into politics. In religion he was inspired by the sentiments of his father-in-law, and was in possession of Cranmer's MS. code of ecclesiastical law; this he permitted John Foxe to publish in 1571. He went to Rome on legal business in 1570, and from 1580 to 1583 frequently visited the Channel Islands as a commissioner to inquire into the status of these possessions. Norton's Calvinism grew with years, and towards the end of his career he became a rabid fanatic. His punishment of the Catholics, as their official censor from 1581 onwards, led to his being nicknamed "Rackmaster-General." At last his turbulent puritanism made him an object of fear even to the English bishops; he was deprived of his office and thrown into the Tower. Walsingham presently released him, but Norton's health was undermined, and on the 10th of March 1584 he died in his house at Sharpenhoe, Bedfordshire.

The Tragedie of Gorboduc was first published, very corruptly, in 1565, and, in better form, as The Tragedie of Fereex and Forreex, in 1570. Norton's early lyrics have in the main disappeared. The most interesting of his numerous anti-Catholic pamphlets are those on the rebellion of Northumberland and on the projected marriage of Mary Queen of Scots to the duke of Norfolk. Norton also translated Calvin's Institutes (1601) and Alexander Novell's Catechism (1670).

Gorboduc appears in various dramatic collections, and was separately edited by W. D. Cooper (Shakespeare Soc. 1847), and by Miss Toulmin Smith in Volkmöller's Englische Sprach- und Literatur-denkmale (1883). The best account of Norton, and his place in literature, is that of Sidney Lee in his Dictionary of National Biography. (E. G.)

NORWALK, a city of Fairfield county, Connecticut, U.S.A., on the Norwalk river, in the township of Norwalk, adjoining the city of South Norwalk in the same township, and 13 m. W.S.W. of Bridgeport. Pop. (1900) 6125 (1023 foreign-born and 189 negroes); (1910) 6045; of the township (1900) 19,932; (1910) 24,211. The city is served by the New York, New Haven & Hartford railroad, by interurban electric lines, and by steamboats to New York. The city has a green with some old churches and some fine elms, a public library, a hospital, a state armory and a music conservatory. The Old Walk Chapter of the Daughters of the American Revolution have erected here a drinking fountain in memory of Nathan Hale, who obtained in Norwalk his disguise as a Dutch school teacher and then started on his fatal errand to Long Island. Norwalk has some manufactures, including woolen goods and typewriting machines; and there is some coasting trade, oysters especially being shipped from Norwalk.

The site of the township was purchased from the Indians in 1619 by Roger Ludlow and Daniel Patrick, Ludlow giving six fathoms of wampum, six coats, ten hatchets, ten hoes, ten knives, ten scissors, ten jew's harps, ten fathoms of tobacco, three kettles of six hands, and about ten looking-glasses for all the land between the Norwalk and Saugatuck rivers and extending one day's walk N. from the Sound. The first settlement in the township was made in 1650 at what is now the village of East Norwalk by a small company from Hartford, and the township was incorporated in the next year. The village was burned by the British under Governor Tryon on the 12th of July 1779, and the chair in which it is alleged Tryon sat, on Grummans Hill, as he watched the flames, has been kept as a relic. Norwalk was incorporated as a borough in 1836 and was chartered as a city in 1893.

See C. M. Selleck, Norwalk (Norwalk, 1896); and Norwalk after Two Hundred and Fifty Years, an Account of the Celebration of the 250th Anniversary of the Charter of the Town (South Norwalk 1879).

NORWALK, a city and the county-seat of Huron county, Ohio, U.S.A., about 55 m. W.S.W. of Cleveland. Pop. (1900) 7974, including 702 foreign-born and 101 negroes; (1920) 7858. It is served by the Lake Shore & Michigan Southern, and the Wheeling & Lake Erie railways, and by interurban electric lines. It has a public library in which a small museum is maintained by the Firelands Historical Society. The city is the centre of a rich agricultural district. Among its manufactures are machine-shop products (the Wheeling & Lake Erie has shops here), iron and steel, pianos and automobile fittings.

Norwalk was settled in 1817 and was named from Norwalk, Connecticut; it was incorporated as a town in 1829 and chartered as a city in 1881. Huron county and Erie county immediately N. are the westernmost of the counties created from the "Western Reserve," and comprise the "Fire Lands" grant made in 1792 by the state of Connecticut to the people of Greenwich, Fairfield, Danbury, Ridgefield, Norwalk, New Haven, East Haven and New London to indemnify them for their fire losses during the British expeditions in Connecticut under Governor Tryon in 1779 and Benedict Arnold in 1781. The Connecticut grantees were incorporated in 1803 as "the proprietors of the half-million acres of land lying south of Lake Erie."
NORWAY, a kingdom of northern Europe, occupying the W. and smaller part of the Scandinavian peninsula. Its E. frontier marches with that of Sweden, except in the extreme N., where Norway is bounded by Russian territory. On the N., W., S. and E. the boundary is the sea—the Arctic Ocean, that part of the Atlantic which is called the Norwegian Sea, the North Sea and the Skagerrak successively. The S. extremity of the country is the island of Slettaingen in 57° 58′ N., and the N. that of Knivskjøerdøen, off the North Cape in 71° 11′ N. Of the mainland, the southernmost promontory is Lindsnes, in 59° 49′ N., while the northern most is Nordkyn, in 71° 7′ N. The S. of the country, that is to say, the projection between the Skagerrak and the North Sea proper, lies in the same latitude as the N. of Scotland and Labrador, and the midland of Kamchatka. The most western island, Utvær, lies off the mouth of the Sogne Fjord (4° 30′ E.), and the easternmost point of the country is within the Arctic lands, near Vardø (31° 11′ E.). The direct length of Norway (S.W. to N.E.) is about 1100 m. The extreme breadth in the S. (about 61° N.) is 270 m., but in the N. it is much less—about 60 m. on the average, though the Swedish frontier approaches within 6 m. of a head-branch of Ofoten Fjord. The coast-line is about 3700 m. long. The length of the coast line is difficult to estimate; measured as an unbroken line it is nearly 1700 m., but including the fjords and greater islands it is set down as 12,000. The area is estimated at 124,495 sq. m.

Physical Features. Relief.—The main mountain system of the Scandinavian peninsula hardly deserves its name of Kjølen (the keel). It may rather be described as a plateau deprived of the appearance of a plateau, being on the one hand grooved by deep valleys, while on the other many salient peaks tower above its average level. Such peaks, during the later Glacial period, stood above the ice-field. Peaks and ridges were formed by the action of small glaciers cutting out each its circular hollow (botn) just as they still work on the remaining snow-fields. But where the power of the main ice-mass was at work, the characteristic rounded forms of base rock are seen, close above the sea along the coast, but even as high as 5000 ft. in some inland localities. The high plateau lies along the W. side of the peninsula, so that except in the S.E. Norway is mountainous throughout. Even the part excepted is hilly, but it partakes of the character of the long mountain or Swedish slope of the peninsula. Beyond the coast line their floors sink far below sea-level, and thus are formed the fjords and the belt of rugged islands which characterize almost the entire seaboard of Norway. Where Norway marches with Russia, a few heights exceed 3000 or even 4000 ft., but the land is not generally of great elevation. But from the point of junction with Swedish territory the mountains increase considerably in height. For a short distance, as far south as Lake Tornet, the loftiest points lie within Norwegian territory, such as Jøgevarre (6283 ft.), between Lyngen and Ulfsfjord, and Kiste Fjeld (5623 ft.) farther inland. Thereafter the principal heights lie immediately along the crest-line of the plateau and within Swedish territory. Sulitjelma, however (6158 ft.), lies on the frontier. Southward again the higher summits fall to Norway. S. of Bodø, Svartisen ("the black ice"), a magnificent snow-field bordering the coast, and feeding many glaciers, culminates at 5246 ft. Thereafter, Okstindene or Østindene (6273 ft.), and the Store Børge Fjeld (5987 ft.) are the principal elevations as far as 64° N. A little S. of this latitude the so-called Trondhjem depression is well marked right across the central west coast. The height of the mountain top often exceeds 5000 ft., while the peaked form characteristic of the heights which rose clear of the glaciers of the later Glacial period is wanting. It is from this point too that Norwegian territory broadens so as to include not only the highest land in the peninsula, but a considerable part of the general E. and S.E. slope. The high plateau broadens and follows the S.W. sweep of the coast. Pursuing it S. the Dovre Fjeld is marked off by the valleys of the rivers Driva and Sundal, Laagen (or Laugen) and Raum, and the fjords of the coastland of Nordmøre. Here Snehetta reaches a height of 7615 ft., and the Romsdal (the name under which the Rauma valley is famous among tourists) is flanked by many abrupt jagged peaks up to 6000 ft. high. The valley of the Laugen forms the upper part of Gudbrandsdal. East of this and S.E. of the Dovre is another fjeld, Rondane, in which ranges rise to 6300 ft. South of the Otta valley is Jotunheim, or Jotun Fjeld, a sparsely peopled, in parts almost inaccessible, district, containing the highest mountains in Scandinavia, Galdhopiggen reaching 8390 ft. On the seaward side of Jotunheim is Jostedalsbreen, a great snow-field in which Lodalskaupen reaches a height of 6795 ft. South of Sogne Fjord (61° N.) mountains between 6000 and 6600 ft. are rare; but in Hallingkarvet there are points about 6700 ft. high, and in the Hardanger Vidda (waste), a broad wild upland E. of Hardanger Fjord, Haartøgen reaches 6693 ft. The highland finally sinks to the sea again, thus marking the limit of the great ranges of hills, separated by valleys radiating S.E., S. and W.

Glaciers.—The largest glacier in continental Europe is Jostedalsbreen, with an area of 350 sq. m., the snow-cap descending to 4000 or 4500 ft. Several of its branches fall nearly to the sea, as the Bøumblebreen above the Fjærland branch of Sogne Fjord. The largest branch is the Nigardsbreen. Skirting Hardanger Fjord, and nearly isolated by its main channel and two arms, is the great glacier of Folgefonna (108 sq. m.). Two branches descending from the main mass are visited by many who penetrate the Hardanger—Buñarbreen on the E., falling towards Lake Sandven above Odde, and Bondhusbreen on the W. The extreme elevation of the Folgefonna is 5270 ft. Continuing N. other considerable snow-fields are those of Hallingskarvet, the Jotunheim, Snehøttet in Dovre Fjeld, and Store Børge Fjeld at the head of the Namsen valley. Next follow Svartisen, second in extent to Jostedalsbreen (nearly 400 sq. m.), the Sulitjelma snow-field and Jøkel Fjeld, between Kvænang and Ofjord. One glacier actually reaches the edge of Jøkel Fjord, a branch of Kvænang Fjord, so that detached fragments of ice float away on the water. This is the only instance of the kind in Norway. The Selaun snow-field, on Selaun island near Hammerfest, is the most northerly seen in Europe. The snow-line in Norway is estimated at 3080 ft. in Selaun, 5150 ft. on Dovre Fjeld, and from 4100 to 4900 ft. in Jotunheim. The lowness of the snow-line adds to the grandeur of Norwegian mountains.

Coast.—The flanks of the plateau break abruptly to the sea almost throughout the coast-line, and its isolated fragments appear in the innumerable islands which fringe the mainland. This island fringe, which has its counterpart in a modified form along the Swedish coast, is called in Norwegian the skjeragard or islands-fence.
great elevation, especially the more northerly; thus the jagged peaks characteristic of Loreto are reminiscent of 4800 ft. Hornelen, near the mouth of Nordfjord, 3000 ft. high, rises nearly sheer above the Frøifjord, and vessels pass close under the towering cliff. Torghatten ("the market raft"), N. of Namssos, in Trøndelag, at 380 and forms a very fine view above the sea; and Hetmandø ("horsemans island"), on the Arctic circle, is justly named from its form. The dark blue waters of the inner leads and fjords are clouded, and show a milky tinge on the surface imparted by the glacier-fed rivers. Bare rock is the dominant feature of the coast and islands, save where a few green fields surround a farmhouse. In the N., where the snow-line sinks low, the scenery at all seasons has an Arctic character.

Christiania Fjord, opening from the N. angle of the Cattegatt and Skagerrack, differs from the great fjords of the W. Its shores are neither so high nor so precipitous as theirs; it is shallower, and contains a great number of little islands. From its mouth, round Lindesnes, and as far as the Bukken Fjord (Stavanger) there are many small fjords, while the skjærgård provides an inner land only intermittently. Immediately S. of Bukken Fjord, from a point N. of Egersund, the flat open coast of Jæderen, dangerous to shipping, fringed by a narrow lowland abundant in peat-bogs for some 30 m., forms an unusual feature. Bukken Fjord is broad and island-studded, but thrown off several inner arms, of which Lyse Fjord, near Stavanger, at 50 ft. deep, forms a narrow and narrow-bottomed valley, and the steepness of its lofty shores. The Hardanger Fjord, penetrating the land for 114 m., is known to more visitors than any other owing to its southerly position; but its beauty is exceeded by that of Sogne Fjord and Nord Fjord farther N. Sogne is the largest and deepest fjord of all; its head is 136 m. of the sea, and its extreme depth approaches 700 fathoms. Stor Fjord opens inland from Aalesund, and one of its head branches, Geiranger Fjord, is among the most celebrated in Norway. Trondhjem Fjord, the next great fjord northward, which broadens interminably from a narrow entrance, lacks grandeur, as might be expected of the land is reduced where the Trondhjem depression interrupts the average height of the plateau. The coast N. of Trondhjem, though far from losing its beauty, has not at first the grandeur of that to the south, nor are the fjords so extensive. The principal of these are Namsen, Folden and Vefsøen, at the mouth of which lies Alstoen Island, with the mountains called Siv Søstre (Seven Sisters), and Ranen, not far S. of the Arctic circle. Svatrassen sends its glaciers seaward, and the scenery increases in magnificence. Salten Fjord, to the N. of the great snow-field, is connected with Skjerstad Fjord by three narrow channels, where the water therefrom is seen to the narrow entrance, lacks grandeur, as might be expected of the land is reduced where the Trondhjem depression interrupts.

N. of Salten is unsurpassed. The Lofoten and Vesteralen islands are separated from the mainland by the Vest Fjord, which is continued inland by Ofoten Fjord. If these two be considered as one fjord, its length is about 175 m., but the actual penetration of the mainland is little more than a fifth of this distance. The main fjords N. of Vesteralen have a general northerly direction; among them is Lyngen Fjord near Tromsø, with high flanking cliffs and glaciers falling nearly to the sea. Alten Fjord is remarkable for its vegetation on its shores. From Lofoten N. there is a series of fjords, islands, and skerries, like Stjernø, Slettan, Ingø and Magerøya. These extend to the North Cape, but hereafter the skjærgård ceases abruptly. The E. is of widely different character; flat mountain wastes descend precipitously to the sea without any islands beyond, save Vardo, with two low islets at the E. extremity of Norway. The fjords are broader in proportion to their length. The chief are Porsanger, Laxe and Tana, opening N., and Varanger opening E. N. of this fjord the land is low and the landscape monotonous; on the S. a few island and branch fjords break the line of the shore. Stavanger is remarkable for its extreme rapidity; Hardanger Fjord 355, Sogne Fjord 560, Nordfjord 340, Trondhjem Fjord 300, Ranen Fjord 235, Vestfjord 340, Alten Fjord 225, and Varanger Fjord 230. Marine terraces are met with in the E. of the country, and near Trondhjem, at 600 ft. above sea-level; and they are also seen at a slighter elevation at the heads of some western fjords. Moreover, at some points (as on the Jæderen coast)" giant kettles" may be observed close to sea-level, even below the level of high tide; and these glacial formations indicate the greater elevation of the land towards the close of the Glacial epoch. Former beach-lines are most commonly seen on the northern coast of Norway (e. g. in Alten Fjord), in Aursund Lake, and flowing with a southerly curve parallel with the frontier for 350 m. to the Skagerrack, is the largest river in the Scandinavian peninsula. Its upper middle valley is called Osterdal, the richest timber district in a certain regularity, at elevations above 400 m. Seven miles above its mouth it forms the fine Sarsfoss, and not far above this it traverses the large lake Oieren. A right bank tributary, the Vormen, has one of its sources (under the name of Laagen in Lake Lesjekogen, which also drains in the opposite direction by the Rauma. The stream, after watering Gudbrandsdal, enters Mjøsøyen, the largest lake in Norway. It is 60 m. long, but, like the greater number of the lakes of the N. and E., it is narrow in its course, and has, however, an extreme depth of 1500 ft. The Drammen river, which enters a western arm of Christiania Fjord below the town of Drammen, is the common outlet of several large rivers. The Halling, from the bed of the Halden Lake Krøderen, which is connected with the Drammen river by the Snuran. A short distance above the junction the Drammen flows out of Lake Tyffjord, 50 m. sq. in area, into which it is fed by a tributary running from the Rauma river, to the east of Vrång, the Bergna. The whole basin of the Drammen has an area of 6600 sq. m. The rivers between Christiania Fjord and Lindesnes preserve the characteristics of those of the Glommen and Drammen systems. They rise on the Hardanger Vidda or adjacent uplands. The most important are the Laagen (to be distinguished from the river of that name in Gudbrandsdal), draining the Numedal; the Skien, the Vindel, the Oppland Otra, and the Inner Varanger. These and those already named, being Nordsjo on the Skien river, Tinsjo in the same system, which receives the river Maan, famous as forming the Kjørkano (smoking fall) of 415 ft., and Nissawerd on the Nid. The larger lakes, with a certain regularity, at elevations above 400 ft. above the sea, and it is considered that their basins were the heads of fjords when the land lay at a lower level, and were formed during an earlier glacial period than the present fjords. The great lake of Lake Hjorundfjord, lying E. of the Glommen valley and drained by the river of the same name, which becomes the Klar in Sweden, to which country it mainly belongs, is similar in type to the lakes of the north Uplands of Sweden. The whole of Jæderen reach the sea through sluggish channels, brown with peat.

Not only do the valleys of the W. far surpass in beauty those of the S. and E., but they carry streams of much greater volume in proportion, owing to the larger area of snow and ice. The first to be noted is that of the Sand or Løven river, a brilliant, rapid stream, famous for its salmon-fishing, which debouches at Sand into Sands Bay, a branch of the Glommen. The inner branch (Sør fjord) of Hardanger Fjord, is noted as containing two of the finest waterfalls in Norway. The one, Loko (which is joined by the smaller Skarsfoss), is a powerful cataract following a tortuous cleft. The other, Eslandfoss, is formed by a very small stream; it falls quite sheer and spreads out like a fine veil. The only other considerable river entering Hardanger Fjord is the Bjoeara, with its mouth at Vik in Eidfjord. On this stream is the magnificent Vøringfoss. Lesser streams within the basin of the Hardanger form the Skjeggedal and several other beautiful falls. From Hardanger N. to Romsdal the streams of the W. slope are insignificant, but there are several considerable falls at the outlet of the Romsdalfjord. The headwater of this branch of Sogne fjord, or the valleys which sink S. and N. from the Jostedalabre to the head branches of Sogne Fjord and Nordfjord respectively. Above those of Nordfjord, the mighty waters are supplied almost directly from the Jostedal glaciers, while above Eidsfjord a corresponding trough contains Lake Hornindal. The next important valley is the Romsdal, the stream of which is joined by the outlet of the Jostedalsbreen as the Laagen forms the E. This lake, which lies 211 ft. above sea-level, is the most remarkable example of an indefinite watershed to be found in S. Norway. N. from there the rivers debouch into Sula, draining Orkedal, the Gulaincluding Guldal, and the Nea or Nid, draining Lake Selbu, and...
forming the Lefros, enter Trondhjem Fjord from the S., and range in length from 70 to 100 m. The Stjordal, a beautiful wooded valley, becomes narrower and narrower towards the lower pass over the Trondelag depression (at Storlien), and is followed by the railway from

Trondhjem into Sweden.

N. of Trondhjem Fjord, in spite of the close proximity of the mountains, numerous river and coastal rivers, frequently discharging generally about N.E. or S.W., in valleys nearly parallel to the coast. Such are the Namss (85 m. in length) and the Velsen, discharging into Namsen Fjord and Velsen Fjord respectively, and the Dverghamn and the Didselv, which flow into the North Sea at the N. end of the fjord. The Velsen is the short Rër river, which drains Rër Vald, second in extent of the Norwegian lakes. In the extreme N., where the coastward slope of the Lofoten and the island of Vardø are the last large islands in the archipelago, the river discharging into the fjord of that name, and the Tana, also giving name to the fjord into which it flows, and forming a great part of the Russo-Norwegian frontier. It is 180 m. long, and drains an area of 460 sq.

Though the lakes of Norway are not comparable with those of Sweden as regards either number or size, they are very numerous and are estimated to cover somewhat less than one-fourth of the total area.

Glacial Action.—While the coast is considered to owe its fjords and islands to the work of former great glaciers, the results are even more patent inland. The tracts of the coast of Norway are consolable by the phenomena of modern glaciers, and observations show that the western mass has been pushed over to the eastern upon a great thrust-plane. The relations, in fact, are similar to those between the Dalradian schists of the Scottish Highlands and the Cambrian slate-beds of the Labrador Peninsula. In Scotland, however, it is the eastern rocks which have been pushed over the western. Corresponding with the difference in structure between the E. and the W. regions there is a certain difference in the nature of the depots themselves. In the Christiania district the Cambrian, Ordovician and Silurian beds consist chiefly of shales and limestones. Farther north sandstones predominate, and especially the Sparagmite, a felspathic sandstone or arkose at the base of the Cambrian series. In the Trondhjem district, on the other hand, belonging to the folded belt, basic tufts and lavas are interstratified with the normal deposits, showing that in the interior of Norway, E. of the North Cape, there is sandstone not unlike the Sparagmite of the S., which is said by Reusch to contain ice-worn pebbles and to rest upon a striated pavement of Archaean rocks.

The Mesozoic era is represented only by the sandy deposits with seams of lignite which occur on the island of Andøen in the Vester- ailen. The contents of palaeoecological remains have been correlated with the Lower Oolite of Great Britain. No Tertiary beds have been found, but Pleistocene deposits of various kinds are met with. The evidences of ice action during the Glacial Period are conspicuous over the whole country and are similar to those in other glaciated regions. But the most remarkable features produced in recent geological times are the terraces which appear as if ruled on the sides of the valleys and fjords. They are partly platforms cut in the solid rock, partly accumulations of gravel and sand like a modern beach, and they were evidently formed by the action of waves. Some of them contain marine shells of living species and mark the former position of the sea-levels, but others are of more doubtful origin and may indicate the shores of lakes formed by the damming of the lower part of the fjords by means of glaciers, as in the case of the Parallel Roads of Glen Roy. They occur at various levels, and have been observed as high as 3000 ft. above the sea.

No volcanic rocks of modern date are known in Norway, but great igneous intrusions of Palaeozoic rocks have been correlated with the Mesozoic era, although it is probable that the hot-water or geothermal springs of the landscape, such as those in the interior of Norway, E. of the North Cape, have been caused by the action of the earth's interior. It is to be noticed that in the extreme N. of Norway, E. of the North Cape, there is sandstone not unlike the Sparagmite of the S., which is said by Reusch to contain ice-worn pebbles and to rest upon a striated pavement of Archaean rocks.
NORWAY

Kautokeino, contrasted with 205 at Vardø. In the S. uplands (as at Fjellberg) there is an average of 200 such days, and at Christiansia about 120. On the S.W. coast there is no day of which the mean temperature and is lower than 5°C. The contrast is, however, such as Utne and Skudeneshoved on Norwegian fjord, record frost during some part of 60 days. The lowest winter average temperature is found in a central S. N. where Bordeland or Sogn and Fjordane and Russian territory as well as Norwegian. The Norwegian station of Karasjok, within it, records 4° during December, January, February, and in this area there have also been observed the extreme minimum of 25° below zero, in the month of February. The contrast with the S.W. coast is 10°-5°. It may be noted here that in several cases the lower-lying inland stations in the south show a distinctly lower winter temperature than the higher in the immediate vicinity. Thus, for example, at Rasen (300 ft.) in the parish of Tønsel; at Listad in Gudbrandsdal (900 ft.) it is 16°-5°, but at Jerkin in the Dovre Fjell (3160 ft.) it is 17°-5°. The summer is hottest in S.E. Norway (Christiansia, July, 62°-5°). On the other hand, the lowest summer average in the Interior of Finnmarken is not less than 53°-5° in July; but at Vardø it is only 48° in August, usually the warmest month on this coast. In the lofty inland tracts of the S.E. the July temperature ranges, according to the high station of Jerkin. The interior having a warm summer and a cold winter, and the coast a cool summer and a mild winter, the annual range of temperature is remarkably greater inland than on the coast.

An important result of the warm Atlantic drift is that the fjords are not penetrated by the cold water from the lower depths of the outer ocean, and in consequence are always ice-free, except in winter. In the fjords, especially in the innermost parts of fjords, and along shallow stretches of coast.

The sun is above the horizon at the North Cape continuously from the 12th of June until the 22nd of August. The sun rises above the Arctic circle, from the 3rd of June to the 7th of July. Even at Trondhjem there is practically full daylight from the 23rd of May to the 20th of July. Even in the extreme S. of Norway there is no darkness from the end of May to the middle of August. In winter, on the other hand, the sun does not rise above the horizon at the North Cape from the 18th of November, to the 25th of January, and at Bard on the 13th of December to the 17th of January. The sun is above the horizon at midnight. In the extreme S. the sun is above the horizon for 6½ hours at mid-winter.

The prevailing winter winds are from the land seaward, while the system is reversed in summer. The winds in Norway of Finnmarken have over three cloudy days to one clear day; in the interior of the country clear and cloudy days are about equally divided. Fog is most frequent on the W. and N.W. coasts in summer; on the other hand, during the winter months, the S. and S.E. parts of the coast have much more fog than the N. Norway.

The forests of Norway consist chiefly of conifers. The principal forest regions are the S.E. and S. Here, in the Trondhjem district, and in Nordland there are extensive forests of pine and fir. In the coastal and fjord region of the W. the pine is the only coniferous species. In the S. the spruce and pine are mixed, but the highest limit of conifers is from 2500 to 3000 ft. above sea-level; in the inland parts of the Trondhjem region it is from 1600 to 2000 ft. above sea-level. The higher and more northerly parts of the S. is limited to about 800 ft., and on the heads of the fjords during severe cold or with a breeze from the land.

of births over deaths, about as 1 to 1, is much above the European average; the death-rate is also unusually low. The number of marriages is rather low, and the average age of marriage is high. The percentage of illegitimacy has shown some increase, but is not so high as in Sweden or Denmark. The percentage of longevity is high. The preponderance of females over males (about 1073 to 1000) is partly accounted for by the number of males who emigrate. The higher mortality of males is traced in part to the dangers of a seafaring life.

Down to the middle of the 19th century drunkenness was a strongly-marked characteristic of Norwegians. A strict licensing system was then introduced. Licences were then given a wide control over the issue of licences, and in 1871 companies (samlag) were introduced to monopolize and control the retail trade in spirits. Their profits do not, as in the Gothenburg system, go to the municipal funds, but are applied directly to objects of public utility. In 1894 a general referendum resulted in the entire prohibition of the sale of spirits in some towns for five years. The control of retail trade in beer and wine by the samlag has been introduced to some extent.

The only strongly individual national character is to be expected, combined of an ancient conservative and simple and practical. The one finds no better illustration than the individuality of modern Norwegian music and painting. The other is still strong. Such customs as the lighting of the midsummer fires and the attendant celebrations still survive. Peculiar local costumes are still met with, such as those associated with weddings. In the coastwise shipping trade and the fisheries of the north, high-prowed square-sailed boats are frequently employed which are the direct descendants of the vessels of the early vikings. Some examples of the ancient farmstead, composed of a group of wooden buildings each of a single chamber, are preserved, and medieval ornamental woodwork is met with. Wood is the principal building material except in some larger towns where brick and stone have superseded it. Where this is not the case, fire has left few, if any, ancient domestic buildings, but the preservation of ancient models in wooden houses makes Norwegian towns peculiarly picturesque.

Norway retains a few highly interesting examples of ecclesiastical architecture. There are the peculiar small wooden churches (stavekirke) dating from the 12th to the 14th century, with high-pitched roofs rising in tiers so as to give the building something of the form of a pyramid. The roofs are beautifully shingled in wood. The wall timbers are vertical. To protect them from the weather, the roofs overhang deeply, and the lowest sometimes covers a species of external colonnade. The carving is often very rich. The most famous of these churches is that of Borgund near Lærdalsøren; another fine example is at Hitterdal on the Kongsberg-Telemark road. On the other hand there are a few Romanesque and Gothic stone churches. In some of these the influence of English architecture is clear, as in the metropolitan cathedral of Trondheim and the nave of Stavanger cathedral. St Mary's Church at Bergen, however, tends towards the French models. A good example of the smaller stone church is at Vossevangen, and there are several of Late Romanesque character in the Trondheim district. There are ruins of a cathedral at Hamar, and a few monastic remains, as at Utstein, north of Stavanger, and on the island of Selje off Statland. Remains of pure Early English work are occasionally found, as at Ogne in Jæderen, but the later Gothic styles were not developed in Norway.

Tourist Traffic and Communications.—During the later decades of the 19th century Norway was rapidly opened up to British, American and German visitors. 

**Routes.**

Great Britain are maintained chiefly between Hull and Stavanger, Bergen, Aalesund, Christiansund and Trondheim; Hull, London and Christiania, Hull and London, and the North; London and Christiania, &c., and there are also passenger services from Grimsby, Grangemouth and other ports. Yachting cruises to the great fjords and the North Cape are also provided. A daily service of mail steamers works between Christiania and all ports to Bergen; thence the summer service is hardly less frequent to Trondheim. From each large port small steamers serve the fjords and inner waters in the vicinity, and there are also

steamers on several of the larger lakes. The season lasts from June to the middle of September. The voyage to the North Cape is taken by many in order to see the "midnight sun" in June and July. The largest of the lakes, Lake Sjøulf, is 30 miles in length and is a popular resort for anglers. The largest lake in the west the following may be mentioned. (1) The road from Sand on Sandsfjord (a branch of Bukken Fjord), which follows the Sand river up to the foot of Lake Suldal, near the head of which is Næs. From here a low, but very elegant road runs up the Bukkedalsdalen, crosses the Horrebække and descends past Seljedal to Odde at the head of a branch of Hardanger Fjord. (2) From Eide on another branch of the same fjord a road runs up the Sandeugdalen, which is connected by rail to the important road lines to Bergen and Kristiania, and continues N. to Stalheim, where it descends through the Nærødal to Gudvangen on a branch of Sogne Fjord. (3) From Vadheim on this fjord a road runs N. to Sandene and Omegndalen, which contains the important road to Fjellide by Grodas on Lake Hornindal to Helleslyt on Sunavl Fjord and Oje on Norang Fjord, and (5) that from the same station or from Visnes, by way of Lake Stryn, to Grotlid, and Merok on Oye Fjord. The roads to Sandeugdalen, branching off from the main road, is one of the most beautiful in Norway. The branch roads to the eastern parts of the county are much better and more important. The telephone is extensively used; and in Sandeugdalen there is a government station.

Roads.—The telephone is extensively used; and in Sandeugdalen there is a government station. The government station for the western part of the county is in Trondheim.

Forestry.—Forest industries are confined chiefly to the S.E. and to the Trondhjem-Namnet district. Logging is an important industry. Forestry is controlled by the Department of Agriculture, and its higher branches are taught at the Aas college.

Fisheries.—The sea fisheries are of high economic importance. The herring is the most important of these, and is landed thereon the coal on the coastal banks for the purpose of spawning, and this gives rise to the well-known fishery for which the Lofoten Islands are the principal base. In April and May shoals of capelin appear off Finnmarksbotn, followed by cod and other fish, small whales, &c., and they prey upon them; this affords a second fishery. For herring there is a spring fishery off Stavanger and Haugesund, and one in November and December off Nordland. Mackeral fisheries are important from Trondhjem Fjord S. to the Skagerrack. Salmon and trout fisheries are important in the rivers and still more off the coast. Fishermen from Tönnesberg, Tromsö, Hammerfest, Vardø, Vadsø, &c., in the far North, drop their lines off the islands of the archipelago, and land to Spitsbergen and Novaaya Zemlya. A fishery board at Bergen administers the Norwegian fisheries. The annual value of the coast fisheries ranges from £1,000,000 to £1,500,000.

Manufacturing Industries.—The most important are works connected with the timber trade, foundries and engineering shops, spinning and weaving mills, brick and tile works, breweries, paper- making, tobacco factories, flour-mills, glass works, and pottery. Nail works, shipbuilding yards, rope works, factories for preserved food (especially fish), margarine, matches, fish guano, boots, and saddlery, hosiery, &c. (developed in the 19th and 20th centuries). Granite is quarried near Fredrikstad,Fredrikshald and Sarsborg, and exported as paving sets and kerb-stones, mostly to Great Britain and Germany. Good marble is found near Fredrikshald, and in the Salten and Rauen districts.

Good marble is found near Fredrikshald, and in the Salten and Rauen districts.

Shipping and Commerce.—The Norwegians, in proportion to their numbers, are the best seamen in the world in the mercantile marine industry. Actually their mercantile marine is only exceeded by those of Great Britain, Germany and the United States. From 1850 the foreign trade tonnage has exceeded from 280,000 to 350,000. The tonnage now exceeds the latter figure, but steam has greatly increased the carrying power. In 1880 Norwegian steam vessels had a tonnage of about $2,000; they now exceed 600,000 tons. The foreign trade tonnage exceeds $10,000,000. The growth of both may be judged from period averages—

Great Britain and Germany are the countries principally trading with Norway. Great Britain takes about 40% (by value) of Norwegian exports, and sends about 26% of the total imports into Norway; Germany takes 14% of the exports, and sends 28% of the imports.

The fisheries of Norway are divided between those destined principally to Great Britain, and fish products, principally to Germany, Sweden and Spain. These make 65% of the exports—other of these are paper, ships, ice, stone and nails. Of the imports about 58% by value are for consumption, 42% material for production. Among the first are cereals (principally from Russia), groceries (from Germany), and clothing (from Germany and Great Britain). Among the second are steel and iron, and from Great Britain, coffee, tobacco, dyestuffs and skins, cotton and wool, oil and machinery, steamships, and metal goods (from Great Britain, Germany, and Sweden).

Government.—Norway is an independent, constitutional and hereditary monarchy, the union with Sweden having been dissolved on the 7th of June 1905, after lasting 91 years. The constitution rests on the fundamental law (grundlov) promulgated at Eidsvold on the 17th of May 1814, and altered in detail at various times. The executive is vested in the king, who

mangcorn (a mixed crop of oats and barley), rye and wheat, the last being little cultivated. Cattle and sheep are kept in large numbers. Farmers commonly hold upland summer pastures together with their own land. The chief food crops are potatoes and barley; for the consideration of the period, under certain conditions, a family which has part or since 1850, it has been growing and is now at a great height. —land alienated by its owner may on his death be acquired by his next of kin. The chief crops are oats, barley, potatoes,
comes of age at eighteen. His authority is exercised through, and responsibility for his official acts rests with, a council of state consisting of a minister and councillors, who are the heads of finance, public accounts, church and education, defence, public works, agriculture, commerce, navigation and industry and foreign affairs. The king appoints these councillors and high officials generally in the state, church, army, navy, &c. He can issue provisional ordinances pending a meeting of parliament, can declare war (if a war of offence, only with the consent of the Storting, and only when the Swedish king has come to terms with the army and navy. The legislative body is the parliament (storting), the members of which are elected directly by the people divided into electoral divisions, each returning one member. Until the election of 1906 the members were chosen by electors nominated by the voters. Elections take place every three years. The franchise is extended to every Norwegian male who has passed his twenty-fifth year, has resided five years in the country, and fulfils the legal conditions of citizenship. Under the same conditions, and if they or their husbands have paid taxes for the past year, the franchise is extended to women under a measure adopted by the Storting in June 1907. Members of parliament must possess the franchise in their constituency, and must have resided ten years in the country; their age must not be less than thirty. The Storting meets at Christiania, normally for two months in each year; it must receive royal assent to the prolongation of a session. After the opening of parliament the assembly divides itself into two sections, the upper (lagthing) consisting of one-quarter of the total number of members, and the lower (odelthing) of the remainder. Every bill must be introduced in the Odelthing; if passed there it is sent to the Lagthing, and if carried there the royal assent gives it the force of law. If a measure is twice defeated in the Odelthing and rejected by the Lagthing, it is decided by a majority of two-thirds of the combined sections. The king has a veto, but if a measure once or twice vetoed is passed by three successive parliaments it becomes law ipso facto. This occurred when in 1899 the Norwegians insisted on removing the sign of union with Sweden from the flag of the mercantile marine. Members of parliament are paid 135. rd. a day during session and their travelling expenses. Parliament fixes taxation, and has control of the members of the council of state, who are not allowed to vote in either house, though they may speak.

Finance, &c.—The annual revenue and expenditure are each about £5 millions sterling. Considerable sums, however, have been raised by loans, principally on the London market, and are being repaid each year, the financial year ending the 31st of March) to nearly £4,500,000. The principal sources of revenue are customs, railways, post office and telegraphs, the income tax (which is graduated and not levied in incomes below 1000 kroner or £6, 8s., &c.), and excise. The principal items of expenditure are railways, defence (principally the army), the post office, interest on debt, the church and education, and justice. The Bank of Norway is a private joint-stock corporation, in which the state has large interests. It is governed by special acts of parliament, and its chief officers are publicly appointed. It alone has the right to issue notes, which are in wide circulation. The Mortgage Bank (Norges Hypothekbank) was established by the state to grant loans on real estate. The currency of Norway is based on a gold standard; but the monetary unit is the krone (crown), of 1.41d. value, divided into 100 öre. The metric system is in use. The year is divided into four quarters, the first quarter being the reserve (landtarn), and the second reserve (landstorn). All capable men of twenty-two years of age and upwards are liable for conscription (except the clergy and pilots), and when called they serve 6 years as reserve, 4 years as reserve and 4 years with the second reserve. In war, men are liable to service from the 18th to the 60th year of age. Only the line can be sent out of the country. The navy only meet for military training from 18 to 102 days in each year. The peace establishment of the line is 12,000 men, with 750 officers; its war footing 25,000, or more, but may not exceed 18,000 without the authority of parliament. Of enlisted troops there are only fortresses, and canons. There are no conscription, of men. The principal forts are Oscarsborg on Christiania Fjord, Agdenes (Trondhjem Fjord), Bergen, Tonsberg and Christiansand. A number of fortresses and forts along the S. Swedish frontier were dismantled under the convention with Sweden of 1905, when a neutral zone was established on either side of the frontier southward from 61° N. The navy consists of about 1200 officers and men on permanent service; but all seawarriors between twenty-two and thirty-eight are liable for maritime conscription, and are put through some preliminary training. The war vessels include four battleships of 3500 to 4000 tons each, and about 16 other vessels, besides a torpedo flotilla—intended for local defence only. The chief naval station is Karlsburg (Horten).

Justice.—Civil cases are usually brought first by a commission of mediation (forligskommisjon), from which an appeal lies to the council of state (kommisjon); they also lie before the court (domstol) and are worked by judges on circuit and assizes. There are three superior courts of appeal (overrettet), at Christiania, Bergen and Trondheim, and one at Stockholm, which decides on points of law. Criminal cases are tried either in jury courts (lagmandsret) or cases of misdemeanours (moddomsret). The first is for more serious offences; the second deals with minor offences and is a court of first instance. Military crimes are dealt with by a military judicial organization, which is, in effect, a high court of impeachment (rigsret), before which members of parliament, the government, &c., are tried for misdemeanours committed in their public capacity.

The territory of Norway is divided into twenty counties (amter) (see population), the cities of Christiania and Bergen being included in these. Other towns are formed into parishes, governed by representatives, from whom a council (formand) is elected by themselves. Rural communities (herrerred) are similarly administered, and their chairmen form a county council (amstingning) for each county. At the head is the amland, the county governor. The electoral franchise is local and individual, for the county (amter), for the municipal franchise, and, like it, is extended in a limited degree to women.

Education.—The state religion, to which the king must conform, is Evangelical Lutheran. Only about 24 per cent of the population are dissenters. All Christian sects except Jesuits are tolerated. The king nominates the clergy of the established church. Nonconformists are registered in the state (amter), and are taxed. Christiansand, Bergen, Trondjem, Tromso; and these into deaneries (provstiet), with subdivisions into clerical districts (prastegjeld), parishes and sub-parishes. The clergy take a leading part in primary education, which is, in spite of the difficulties arising in a sparsely populated country, reaches a high standard. Education is compulsory, the school-going age being from 6 to 14 years in towns and 7 to 15 years in villages. About 94 per cent of the children in school-going age attend the primary schools, which are administered by school boards in the municipalities and the counties. Teachers must belong to the established church. Their training colleges include one in Christiania (Christiania, 1892); and in Bergen (Bergen, 1898). W. C. Slingsby, Norway, The Northern Playground (on mountaineering) (Edinburgh, 1904); H. H. Reusch, Der Nordländische Norges Geolog (Christiania, 1892); T. Berner, A report on general questions (London, 1894).

History.

Early History.—Archaeological and geological researches have revealed a fishing and hunting population in Norway, possibly
as far back as c. 6000 B.C. Until lately this aboriginal people, which was certainly non-Aryan, was held to be Lappish, but recent investigations seem to show that the Lapps only entered Norway about A.D. 900–1000, and that the original population was probably of Finnish race, though only distantly allied to the Ugro-Finns now inhabiting Finland. To them belong perhaps certain non-Aryan names for natural features of the country, such as Toten, Velsen, Bukn.

The time of the immigration of a Teutonic element is far from certain. It did not extend N. beyond the Trondhjem district until about the beginning of our era, but there can be little doubt that the immigrants’ advance was extremely slow, and it is suggested, on the evidence of archaeology, that the Teutonic element entered S. Norway towards the end of the (Scandinavian) later Stone age, c. 1700 B.C. (see SCANDINAVIAN CIVILIZATION). But whatever were the stages of the process, the language of the older race was superseded by Teutonic, and those aborigines who were not incorporated (probably most often as slaves) were driven into the mountains or the islands that fringe the coast. In the highlands and the fringes of the flat Tertiary plain, Teutonic tongues survived for centuries, and perhaps into historic times.

The new Teutonic element of population seems to have flowed into Norway from two centres; one western, probably from Jutland, the other eastern, from the W. coast of Sweden. The western stream covered Agder, Rogaland and Hordaland (the modern districts of Christiansand and Sondre Bergenhus), and finally extended N. as far as Søndmøre, while the eastern stream flowed across Romerike and Hadeland through the Dales to the Trondhjem district, where it divided, one stream flowing down the W. coast till it met the western settlements, another penetrating N. into Haalogsland (which included the modern Nordland as well as Helgeland), and a third E. into the N. Swedish districts of Jämtland and Helsingland. The bodies of immigrants were no doubt more or less independent, and each was probably under a king. It is probable that the Horder, who gave their name to Hordaland and Hardanger, were a branch of the Harudes whom Ptolemy in the 2nd century mentions as living in Jutland, where their name remains in the present Hardeyssel. The Ryger, who gave their name to Rogaland, and the modern Ryttýrlke, are probably akin to the Rugi, an E. Germanic tribe at one time settled in N.E. Pomerania, where we have a reminiscence of their name in Rügenwalde. The first mention of any tribe settled in Norway is by Ptolemy, who speaks of the Chaldenoi or Heiners, inhabiting the W. of his island Scandia.

The system of settlement in Norway appears to have been different from that adopted by the same race in other lands. In Denmark, for instance, a group of as many as twenty settlers held land more or less in common, but this system, which demanded that a considerable extent of land should be readily accessible, was not feasible in the greater part of Norway, and except in one or two flatter districts each farm was owned, or at least worked, by a single family.

When history first sheds a faint light over Norway we find each small district or “fylke” (Old Norse fylkir, from folk, army) settled under its own king, and about twenty-nine fylker in the country. At times a king would win an overlordship over the neighbouring tribes, but the character of the country hindered permanent assimilation. The king always possessed a hird, or company of warriors sworn to his service, and his inherited royal birth and the possession of such a hird, and not land or subjects, were the essential attributes of a king. There was no law of primogeniture, and on the death of a kinsome of his heirs would take their share of the patri
dom in valuables, gather a hird, and spend their lives in warlike expeditions (see VIKINGS), while one would settle down and become king of the fylke. There are indications that these conditions were fostered by a matriarchal system, and that it would often occur that a wandering king would marry the daughter of a fylkes-king and become his heir. Probably the king’s power was only absolute over his own hird. He was certainly commander-in-chief and perhaps chief priest of the fylke, but the administrative power was chiefly in the hands of the borgars, or freemen of the fylke, and possibly of an earl. The position of earls is vague, but it is noticeable that both those of whom we hear in Harald Haarfager’s time take the opposite side to their king. The herser (Old Norse hersir), of whom there were several in each fylke, united high birth with wealth and political power, and with the holder, the class of privileged hereditary landowners from which they sprang, formed an aristocracy of which there seems little trace in the other Scandinavian countries at this period.

The rise in Norway is perhaps due to the fact that the nature of the country, as well as the individualistic system of settlement, led to few complete changes in the wealth and possessions of the people, and the inequalities of wealth than in Denmark or Sweden. Once a family had become wealthy enough to fit out Viking ships, it must have added wealth to wealth, besides enormously raising its prestige. The lands of almost all the most powerful families were on islands, whence it was easy to set forth on roving expeditions. The family property of the earls of Lade, for instance, whose representative in the latter half of the 9th century was the most powerful man of the district, was on the island of Nærö. These islands had been the refuge of the aborigines, and it is possible that, as A. Hansen has suggested, the rise of the aristocracy depends here, as elsewhere, on a subject population. Among the proper names of thralls in a poem in the Elder Edda are several which can only be explained on the hypothesis that they are Finnish, e.g. Klums, Lasmer, Drumba. Harald Haarfager’s decree concerning “those who clear forests and burn salt, fishermen and hunters” probably refers to the Fins as a class apart. There can be no doubt that, in Haalogsland for instance, the aristocracy gained its wealth not only from the tribute extorted from the Fins in Finnmark, but also from slave labour.

The eight Trondhjem fylker had a common thing or assembly very early, but these districts were remote, while the wealthy western districts were too much cut off from each other to unite effectively, though here also a common Thing was early established. The first successful attempt at unification originated round Veatfold, the modern Jarslsberg and Laurvik Amt on the Christiania fjord. There also there was a certain degree of union very early, and it is possible that national feeling was fostered by proximity to the Danish and Swedish kingdoms. The district was thickly populated, and a centre of commerce. Tradition made the royal family a branch of the great Yngling dynasty of Upsala, which claimed descent from the god Frey. Through several generations this family had extended its kingdom by marriage, conquest and inheritance, and by the end of the reign of Halfdan the Black, it included the greater part of Hamar and Oslo Stift, and the fylke of Sogn, the district round the modern Sognefjord.

Halfdan’s son, Harald Haarfager, having no brothers, succeeded to the whole kingdom, and was further fortunate in that an uncle helped him to maintain his rights. By 866 his power was so well established in S. Norway that he contemplated the conquest of the whole land. After all, the chief obstacle appears to have been the resistance, not only of the petty kings, but of the aristocratic families, who dreaded the power of a monarchy established by force, and consequently supported the vaguer authority of their own kinglets. There can be no doubt that Harald introduced a feudal view of obligations towards the king, and landowning families, who had regarded their edal, or inherited property, as absolutely their own, resented being forced to pay dues of it. In each district Harald offered the herser the opportunity of becoming his vassals, answerable to him for the government of
the district. The increased dues and the grants of land made by Harald rendered the position of one of his earls more lucrative than that of king under the old system; and it shows to what a paramount position the old aristocracy must have attained, that numbers of the *herser* and *holder* could not reconcile themselves to the limitation of their independence, but quitted the lands which were their real title to influence, rather than submit to the new order. But the little kingdoms only made futile attempts at combination, except in the western districts of Agde (comprising the modern Listir and Mandal and Nedenas), Rogaland and Hordaland. Here was the home of the "western Vikings" who for nearly a century had owed wealth and fame to the trade with the English isles. After by land was impossible, and Harald had to gather men and ships for three years before he could meet the fleet of the allied kings at Hafsfjord. The battle (872) resulted in a victory to him, and with it all opposition in Norway was at an end. An expedition to Scotland and the Scottish isles (c. 891) dispersed enemies who could harry the Norwegian coast, many of them taking refuge in Iceland; and the earldom of the Orkneys and Shetlands became an appanage of the Norwegian Crown. For the moment the whole country was under a single king, but Harald himself destroyed his work, in accordance with old custom, by giving about twenty of his sons the titles of kings and subdividing the country among them only, qualifying this retrograde step by installing his favourite son Erik Blodøxe as over-king (930). Moreover, Harald had established no common Thing for the whole of his kingdom. Norway is naturally divided into three parts, and each of these remained more or less separate for centuries, even having separate laws until the second half of the 13th century. The Frostathing district (so called from Frosta near Trondhjem) included the eight Trondhjem fylker, and also Naumdal, Nordmøre and Raumsdal. The Gulathing district consisted of Söndmøre, Firdafylke, Sogn, Valdres, Hallingdal, Hordaland and Agde, and met at Gula in Hordaland. The third, the Eidsauathing, met on the shores of Lake Mjøsøen, and included the Uplands and also the "Vik," i.e., all the districts round Christiana fjord, until St Olaf established the Borgarting at Sarpsborg as a centre for this latter. The king's council was composed of the local *lendermænd*, and thus varied with the district he happened to be visiting, an arrangement that had its advantages, since the local chiefs were acquainted with the laws of their district, though it was another hindrance to unification. It was only in 1339 that a permanent council was formed, the *Riget Råd*.

Harald died in 933. Erik Blodøxe (Bloody-axe) only managed to rid himself of two rival over-kings, Olaf and Sigfred, his half-brothers, for on hearing of his father's death, another son, Haakon (q.v.), called the Good, who had been brought up at Athelstan's court, came to Norway with a small force and succeeded in ejecting Erik (934). After Haakon's death in 961 at the battle of Fitje, where his long struggle against Erik's sons and their Danish allies terminated, these brothers, headed by Harald Graafeld (grey-cloak) became masters of the W. districts, though the ruling spirit appears to have been their mother Gunhild. Earl Sigurd of Lade ruled the N., and the S. was held by vassal kings whom Haakon had left undisturbed. By 969 the brothers had succeeded in ridding themselves of Sigurd and two other rivals, but the following year Harald Graafled was lured to Denmark and treacherously killed at the instigation of Earl Haakon, son of Sigurd, who had allied himself with the Danish king Harald Gormsson. With the latter's support Earl Haakon won Norway, but threw off his yoke on death and was succeeded by his eldest son, Tingesir in 972. The S.E. districts, however, still held by Harald Grønse, whose father had been slain by the sons of Erik. Haakon ruled ably though tyrannically, and his prestige was greatly increased by his victory over the Jomsvikings, a band of pirates inhabiting the island of Wollan at the mouth of the Oder, who had collected a large fleet to attack Norway. The date of their defeat at Hjørringaasen, now Lidvaag, is uncertain. But finally the earl's disregard of the feelings of the most powerful "bonder," or landed proprietors, worked up to revolt, and, in 995, there landed in Norway Olaf, great-grandson of Harald Haarfager and son of the king Trygve of the Vik whom Gudröd Eriksson had slain, and whose father Olaf had been slain by Erik Blodøxe.

The earl was treacherously killed by his thral while in hiding, and Olaf entered unopposed upon his short and brilliant reign. His great work was the enforced conversion to Christianity of Norway, Iceland and Greenland. In this undertaking both Olaf and his successor and namesake looked for help to England, whence they obtained a bishop and priests; hence it comes that the organization of the early church in Norway resembles that of England. No more than England did Norway escape the struggle between Church and State, but the hierarchic party in Norway only rose to power after the establishment of an archiepiscopal see at Trondhjem in 1152, after which the quarrel raged for over a century. Until the year 1100, when tithes were imposed, the priests depended for their livelihood on their duties, and Adam of Bremen informs us that this made them very avaricious. 

In the year 1000 Olaf fell at the battle of Svolde off Rügen, fighting against the combined Danish and Swedish fleets. The allies shared Norway between them, but the real power lay in the hands of Sigfred of Orkneys and Svein, sons of Earl Haakon. In 1015, when Erik was absent in England, another descendant of Harald Haarfager appeared, Olaf, the son of Harald Grenske, a great-grandson of Harald Haarfager (see Olaf II. Haraldssön). He defeated Svein at Nesje in 1016, which left him free to work towards a united and Christian Norway. For some years he was successful, but he strained the loyalty of his subjects too far, and on the appearance of Knut the Great in 1029 he fled to Russia. His death at the battle of Stiklestad on his return in 1030 was followed by a few years of Danish rule under Svein Knutsson, which rendered Olaf's memory sweet by contrast, and soon the name of St Olaf came to stand for internal union and freedom from external oppression. In 1035 his young son Magnus, afterwards called the Good, was summoned from Russia, and was readily accepted as king. A treaty was made with Hardeknut which provided that whichever king survived should inherit the other's crown. Hardeknut died in 1042, and Magnus became king of Denmark, but a nephew of Knut the Great, Svein Estridsøn, entered into league with Harald Haarfager (see Olaf) of Hordaland, who had just returned from the East. As soon, however, as overtures were made to him by Magnus, he forsook the cause of Svein, and in 1046 agreed to become joint king of Norway with Magnus. The difficulties arising out of this situation were solved by Magnus's death in 1047. Harald's attempts to win Denmark were vain, and in 1066 he set about a yet more formidable task in attacking England, which ended with his death at Stamford Bridge in 1066. His son Olaf Kyrre (the Quiet) shared the kingdom with his brother Magnus until the latter's death in 1069, after which the country enjoyed a period of peace. A feature of this reign is the increasing importance of the towns, including Bergen, which was founded by Olaf. In 1093 Olaf was succeeded by his turbulent son Magnus Barford (barefoot) and by Haakon, son of Magnus the Good. The latter died in 1095. Besides engaging in an unsuccessful war against the Swedish king Inge, in which he was defeated at Foxerne in 1101, Magnus undertook three warlike expeditions to the Scottish isles. It was on the last of these expeditions, in 1107, that he was killed on board his flagship, *Eystein*, by his own men. The war was continued by his three sons, Eystein, Sigurd and Olaf. Olaf died young. Sigurd undertook a pilgrimage, from which he gained the name of Jorsalfar (traveler to Jerusalem). He won much booty from the Moors in Spain, from pirates in the Mediterranean, and finally at Sidon, which he and his ally Baldwin I. of Jerusalem took and sacked. Eystein died in 1122. Sigurd lived till 1130, but was subject to fits of insanity in his later years. He was the last undoubted representative of Harald Haarfager's race, for on his death
his son Magnus was ousted by Harald Gille, or Gilchrist, who professed to be a natural son of Magnus Barfoed.

Harald Gille was slain in 1386 by another pretender, and anarchy reigned during the reign of his sons Eystein, Inge and Sigurd Mund. At last Inge's party attacked and killed first Sigurd (1353) and then Eystein (1357). Inge fell in a fight against Sigurd's son Haakon Hervede in 1161, but a powerful baron, Erling, succeeded in getting his son Magnus made king, on the plea that the boy's maternal grandfather was King Sigurd Jorsalfar. Descendant through females was not valid in succession to the throne, and to render his son's position more secure, Erling obtained the support of the Church. In 1164 the archbishop of Tornhjem crowned Magnus, demanding that the crown should be held as a fact of the Norwegian Church. Owing to such concessions the Church was gaining a paramount position, when a new pretender appeared. Sverre (O.N. Sverrir) claimed to be the son of Sigurd Mund, and was adopted as leader by a party known as the Birkebeiner or Birchlegs. He possessed military genius of a rare order, and in spite of help from Denmark, the support of the Church and of the majority of barons, Magnus was defeated twice after, till he met his death at the battle of Nordnes in 1184. The aristocracy could offer little further opposition, and its leading hands in the Church against Sverre, the local chiefs had got out of touch with the small landowners, with whose support Sverre was able to build up a powerful monarchy. Sverre's most dangerous opponent was the Church, which offered the most strenuous resistance to his efforts to cut down its prerogatives. The archbishop found support in Denmark, whence he laid his whole see under an interdict, but Sverre's counter-claim of his own divine right as king had much more influence in Norway.

Sverre died in 1202, his last years harassed by the rise of the Baglers, or " Corymen," with a new claimant at their head. His son Haakon III. died two years later, perhaps of poison, but the Birkebeiner party in 1217 succeeded in placing Haakon's son and namesake on the throne (see Haakon IV.). In 1240 the last of the rival claimants fell, and the country began to regain prosperity. The acquisition of Iceland was at length realized. Haakon's death occurred after the battle of Largs in the Orkneys in 1263. The war with Scotland was soon terminated by his son Magnus, who surrendered the Hebrides and the Isle of Man at the treaty of Perth in 1266, when he ceded many of his suzerainty over islands which had lost their value to Norway since the decay of Viking enterprise. He gained his title of Law-Mender from the revision of the laws, which had remained very much as in heathen days, and which were still different for the four different districts. By 1274 Magnus had secured the acceptance of a revised compilation of the older law-books. The new code repealed all the old wergeld laws, and provided that the major part of the fine for manslaughter should be paid to the victim's heir, the remainder to the king. Henceforward the council comes more and more to be composed of the king's court officials, instead of a gathering of the lendaermond or barons of the district in which the king happened to be. During Magnus's reign we hear of a larger council, occasionally called polliment (parliament), which is summoned at the king's wish. The old landed aristocracy had lost its power so completely that even after Magnus's death in 1280 it was unable to reestablish itself during the minority of his son Erik.

Erik was succeeded in 1299 by his brother Haakon V., who in 1308 felt himself strong enough to abolish the dignity of the aristocracy. In his paralysis of the aristocracy, perhaps no doubt partly to be ascribed to the civil wars, but in part also to the gradual impoverishment of the country, which told especially upon this class. Russia had long eclipsed Norway as the centre of the fur trade, and other industries must have suffered, not only from the civil wars, but also from the supremacy of the Hansatic towns, which dominated the North, and could dictate their own terms. In earlier times the aristocratic families had owed their wealth to three main sources: commerce, Viking expeditions and slave labour. Trade had been a favourable means of enrichment among the aristocracy up to the beginning of the 13th century, but now it was almost monopolized by Germans, and Viking enterprise was a thing of the past. The third source of wealth had also failed, for it is clear from the laws of Magnus that the class of thralls had practically disappeared. This must have greatly contributed to shatter the power of the class which had once been the chief factor in the government of Norway.

Haakon's daughter Ingeborg had married Duke Erik of Sweden, and on Haakon's death in 1319 their three-year-old son Magnus succeeded to the Norwegian and Swedish thrones, the two countries entering into a union which was not definitely broken till 1371. It was during this reign that Norway was ravaged by the Black Death. In 1343 Magnus handed over the greater part of Norway to his son Haakon VI., who married Margrethe, daughter of King Valdemar III. of Denmark. Their young son Olav VI., already king of Denmark, succeeded to his father's throne on Haakon's death in 1368, but did not reign, leaving the royal line extinct, and the nearest successor to the throne the hostile King Albrecht of Sweden, of the Mecklenburg family. The difficulty was met by filling the throne by election, but innovation in Norway, though it was introduced in Sweden and Denmark. The choice fell on King Erik's widow Margrethe, but a couple of years later, chiefly in order to gain German support in a coming struggle with the Mecklenburgers, the Norwegians elected as king the young Erik of Pomerania, great-nephew of the queen, who henceforth acted as regent. Erik had claims on the Swedish and Danish thrones, and in 1397, at Kalmar, he was solemnly crowned king over the three countries, which entered into a union "never to be dissolved."

others in the Historisk Tidskrift (Christiania) and other periodicals; also the articles by K. v. Armira, O. Bremer, K. Kaalund and V. Gudmundson in Pauls Grundrisse der germanischen Philologie (vol. iii., Strasbourg, published 1894, in existence except where otherwise stated. In English, there is a history of Norway by H. H. Boyesen in the Story of the Nations series (London, 1900), and there are historical notes in G. Vigelassen and F. V. Powell's Coryphaeoque (5 vols., Christiania, 1833-1865). The important original sources are: Snorre Sturluson's Heimskringla, or Lives of the Kings of Norway (up to 1177), of which there is an English translation by William Wade, with an index volume compiled by the latter, in the Saga Library, vols. ii.-vi. (London, 1893-1905). The original Icelandic text is edited by J. Ólafsson (Copenhagen, 1893-1901). For a critical investigation into the second half of Snorre's history, see Hans Storm, Snorre Sturluson's Historiekrivning (Copenhagen, 1873, with map of ancient Norway), and F. Jönsson, Den oldnorske og oldislandske Literatuur Historie (Bd. ii. Del. ii., Copenhagen, 1901). Of later sagas, Sweden's ancient saga (Copenhagen, 1896) is translated by J. Septon, Northern Library (vol. iv., London, 1899), and Haakon's Saga is given with a translation by G. W. Dasey in vols. ii. (text) and iv. (translation) of the Chronicles and Memorials of Great Britain and Ireland (London, 1894). Other important sources are: Diplomatarium Norvegicum, ed. C. Unger, Christiana, and Norres Gamle Liv indtil 1307, ed. R. Kuyser and P. A. Munck (5 vols., Christiana, 1886-1895). (R.S.P.)

1307-1814.—The history of Norway from 1307 down to the union with Sweden in 1814 falls naturally into four divisions. First, in 1450, the triple bond gave place to a union in which Norway became more firmly joined to Denmark. Next, in 1536, as the result of the Reformation, Norway sank almost to the level of a province. After 1660 she gained something in status from the establishment of autocracy in Denmark, and at the close of the period she became a constitutionally footing and approximate equality with Sweden. But for the convulsions to which some of these changes gave rise, Norway possesses during this period but little history of her own, and she sank from her former position as a considerable and independent nation. The kings dwelt outside her borders, her fleet and army decayed, and her language gradually gave place to Danish. Germans plundered her coasts and monopolized her commerce, and after 1450 Danes began to appropriate the higher posts in her administration. When in 1448 Karl Knutsson was chosen king by the Swedes, and Christian of Oldenburg by the Danes, it was by force that Norway fell to the latter. On the 24th of November 1449 the Norwegians protested against Christian's assumption of sovereignty over them, and after separation from the Swedes. Next year, however, the Swedes assented to the separation. Christian I. (1450-1481) gave estates and offices in Norway to his Danish subjects and raised money by pawning her ancient possessions, the Orkneys and Shetland islands, to the king of Scotland. His son Hans (1482-1513) purchased the obedience of the Norwegian nobles by concessions to their power. The imposing union continued in name, but the weakness of the nation and its government was strikingly illustrated when the Germans in Bergen besieged a monastery in which their enemy Olaf Nilsson, a high official, had taken refuge.

After the downfall of Christian II. (1513-1524) the position of Norway in relation to Denmark was changed for the worse. She was ruled for a century and a quarter by Danish officials; the churches and monasteries of Norway were sacked by Danes, and Danes were installed as pastors under the Lutheran system, which the Norwegians were compelled to accept in 1536. Soon Norway was drawn into the so-called Seventy Years' War of the North (1563-70). However, the power of the Hanse League in Bergen was broken. The rule of the Oldenburg dynasty proved neglectful rather than tyrannical, and under it the mass of the peasants was not flagrantly oppressed. Christian IV. (1588-1649), who founded Christiania, may almost be said to have discovered Norway anew. He reformed its government and strove to develop its resources, but his policy involved Norway in the loss of the provinces of Jemland and Herjedalen, which were ceded to the Swedes by the peace of Brünnich (1645). The Danish war of revenge against Carl X. of Sweden resulted in further territorial loss by Norway. By the peace of Roskilde (1658) she was compelled to renounce the counties of Trondhjem and Baahus, and although the former was restored by the peace of Copenhagen, two years later, her population fell below half a million. The Swedes had now acquired the rich provinces in the south and south-west of the Scandinavian peninsula, and their ambition to extend their frontiers to the North Sea became more pronounced and more possible of accomplishment. From the middle of the 17th century, however, the Dutch and English made their influence felt, and the political future of Norway could no longer be regarded as a purely Scandinavian affair. The establishment of hereditary autocracy in Denmark by Frederick III. in 1660 conferred many benefits upon Norway. Personal liberty perhaps suffered, but the Norwegian peasant remained a freeman while his counterpart in Denmark was a serf. Norwegian law was revised and codified under Christian V. (1670-1699), who was well served by the Norwegians in his attempt to regain the lost provinces.

Under the sons of these monarchs, Frederick IV. and Carl XII., Norway was once more compelled to pay for Danish aggression. Her shipping was destroyed, and in 1716, when driven from continental Europe, the Swedish hosts fell upon her. Two years later, however, the death of Carl XII. at the border fortress of Frederikshald averted the danger. During this war Peter Tordenskjold, the greatest among a long series of Norwegian heroes who served in the Danish fleet, won undying fame. Before the close of the 18th century something had been done towards dispelling the intellectual darkness. Holberg, though he flourished outside Norway, was at least born there, and by awakening the tide of German influence he did more than any Norwegian literature possible. At the close of the century Hans Nielsen Haugen, the Wesley of Norway, appeared, while the growth of the timber trade with England gave rise to a great increase in wealth and population. In a century and a half the number of the Norwegian people was doubled, so that by 1814 Norway comprised some 900,000 souls. In 1788 the oppressive law that grain should be imported into Norway only from Denmark was repealed, and thanks to Danish policy Norway actually drew financial profit from the wars of the French Revolution.

The Norwegian national movement was to render a decade at the beginning of the 19th century more memorable in Norwegian history than any century which had passed since the Calmar Union. In 1800 the Danish government committed the Norwegians to the second Armed Neutrality, and therefore to a share in the battle of Copenhagen, by which it was broken up. It was not until 1807, however, that Norway was fully involved in the Napoleonic wars. Then, after the bombardment of Copenhagen, she was compelled by Danish policy to embrace the cause of Napoleon against both England and Sweden. Commerce was annihilated, and the supply of food failed. The national distress brought into the forefront of politics national leaders, among whom Count Hermann Jasper von Wedel-Jarlsberg was the most conspicuous. As yet, however, patriotism went no further than a demand for an administration distinct from that of Denmark, which was conceded in 1807, and for a university nearer home than Copenhagen. In 1811 the government assented to the foundation of the university of Christiania. (W. F. R.) 1814-1907.—After a union of nearly 400 years between Norway and Denmark, the Danish king, Frederick VI., without consulting the Norwegians, ceded Norway to Sweden by the treaty of Kiel (January 14, 1814). Some time previously Sweden had joined the allies in their struggle against Napoleon, while Denmark had, unwisely, sided with the French. In 1813 the Swedish crown prince, Bernadotte, afterwards King Carl XIV., proceeded to Germany and took command of one of the armies of the allies. After the power of Napoleon had been broken at

1 In 1810 he was elected heir to the Swedish throne, in succession to the childless king Carl XIII., who died in 1818.
the battle of Leipzig, he advanced against Denmark, and King Frederick soon saw himself compelled to accede to the cession of Norway, which had long been the aspiration of the Swedes, especially after the loss of Finland in 1809. In the treaty of Kiel Frederick VI. absolved the Norwegians from their oath of allegiance, and called upon them to become the loyal subjects of the Swedish king. But the Norwegians, who had not been consulted in the matter, refused to acknowledge the treaty, declaring that, while the Danish king might renounce his right to the Norwegian crown, it was contrary to international law to dispose of an entire kingdom without the consent of its people.

A meeting of delegates was convened at Eidsvold, not far from the Norwegian capital, where, on the 17th of May 1814, a constitution, framed upon the constitutions of America, of France (1791), and of Spain (1812), was adopted. Among its most important features are that the Storting, or National Assembly, is a single-chamber institution, and that the king is not given an absolute veto, or the right to dissolve the Storting. The Danish governor of Norway, Prince Christian Frederick, was unanimously elected king. Soon afterwards the Swedish crown prince, invaded Norway. The hostilities lasted only a fortnight, when Bernadotte opened negotiations with the Norwegians. A convention was held at Moss, where it was proposed that the Norwegians should accept the Swedish king as their sovereign, on the condition that their constitution of the 17th of May should remain intact, except with such alterations as the union might render necessary. An extraordinary Storting was then summoned at Christiania, and on the 4th of November 1814 Norway was declared to be "a free, independent, and indivisible kingdom, united with Sweden under one king." A month previously Prince Christian Frederick had laid down his crown and left the country.

The union was more fully defined by the "Act of Union," which was accepted by the national assemblies of both countries in the following year. In the preamble to the act it is clearly stated that the union between the two peoples was accomplished "not by force of arms, but by free conviction," and the Swedish foreign minister declared to the European Powers, on behalf of Sweden, that the treaty of Kiel had been abandoned, and that it was not to this treaty, but to the confidence of the Norwegian people, that the latter owed the union with Norway. The constitution framed at Eidsvold was retained, and formed the Grundloven, or fundamental law of the kingdom. The union thus concluded between the two countries was really an offensive and defensive alliance under a common king, each country retaining its own government, parliament, army, navy and customs.

In Sweden the people received only an imperfect and erroneous insight into the nature of the union, and for a long time believed it to be an achievement of the Swedish arms. They had hoped to make Norway a province of Sweden, and now they had entered into a union in which both countries were equally independent. During the first fifteen years the king was represented in Norway by a Swedish viceroy, while the government was, of course, composed only of Norwegians. Count Wedel Jarlsberg was the first to be entrusted with the important office of head of the Norwegian government, while several of Prince Christian Frederick's councillors of state were retained, or replaced by others holding their political views. The Swedish Count von Essen was appointed the first viceroy of Norway, and was succeeded two years afterwards by his countryman Count von Münner, over both of whom Count Wedel exercised considerable influence.

During the first years of the union the country suffered from poverty and depression of trade, and the finances were in a deplorable condition. The first Storting was chiefly occupied with financial and other practical measures. In order to improve the finances of the country a bank of Norway was founded, and the army was reduced to one half. The paid-up capital of the bank was procured by an extraordinary tax, and this, together with the growing discontent among the peasantry, brought about a rising in Hedenmarken, the object of which was to dissolve the Storting and to obtain a reduction in the taxation. The rising, however, soon subsided, and the bountiful harvest of 1819 brought more prosperous times to the peasantry. Meanwhile, however, the financial position of the country had nearly endangered its independence. The settlement with Denmark with regard to Norway's share of the national debt common to both, assumed threatening proportions. In the interest of Denmark, the allied powers asked for a speedy settlement, and in order to escape their collective intervention, the Norwegian government was on the point of dissolving itself. The union of Sweden and Norway, on the death (February 5, 1818) of the old king Carl XIII., accepted England's mediation, and was enabled in September 1819 to conclude a convention with Denmark, according to which Norway was held liable for only 3,000,000 specie dollars (nearly $700,000). But the Norwegians considered that this was still too much, and the attitude of the Storting in 1821 nearly occasioned a fresh interference of the powers. The Storting, however, yielded at last, and agreed to raise a loan and pay the amount stipulated in the convention, but the king's council had his doubts as to whether the Norwegians really intended to fulfil their obligations. As his relations with the Storting had already become strained, and as he was occupied at that time with plans, which it is now known meant nothing less than a coup d'état in connexion with the revision of the Norwegian constitution, he decided to adopt military preparations, and in July 1821 he collected a force of 3000 Swedish and 3000 Norwegian troops in the neighbourhood of Christiania, ostensibly for the mere purpose of holding some manoeuvres. In a circular note (June 1) to the European powers, signed by the Swedish foreign minister, Engström—but it is not difficult to recognize the hand of the king as the real author—the minister complained bitterly of the treatment the king had met with at the hands of the Storting, and represented the Norwegians in anything but a favourable light to the powers, the intention being to obtain their sympathy for any attempt that might be made to revise the Norwegian constitution. About this time another important question had to be settled by the Storting. The Stortings of 1815 and 1816 had already passed a bill for the abolition of nobility, but the king had on both occasions refused his sanction. The Norwegians maintained that the king's few counts and barons still to be found in Norway were all Danish and of very recent origin, while the really true and ancient nobility of the country were the Norwegian peasants, descendants of the old jarls and chieftains. According to the constitution, any bill which has been passed by three successively elected Stortings, elections being held every third year, becomes law without the king's sanction. When the third reading of the bill came on, the king did everything in his power to obstruct it, but in spite of his opposition the bill was eventually carried and became law.

In 1822 Count Wedel Jarlsberg retired from the government. He had become unpopular through his financial policy, and was also at issue with the king on vital matters. In 1821 he had been impeached before the Rigsråd, the supreme court of the realm, for having caused the state considerable losses. Jonas Collett (1772-1851) was appointed as his successor to the post of minister of finance. The king had by this time apparently abandoned his plan of a coup d'état, lor in the following August he submitted to the Storting several proposals for fundamental changes in the constitution, all of which aimed at removing all that was in variance with a more direct and personal form of government. The changes, in fact, were the same as he had suggested in his circular note to the Powers, and which he knew would be hailed with approval by his Swedish subjects. When the Storting met again in 1824 the royal proposals for the constitutional changes came on for discussion. The Storting unanimously rejected not only the king's proposals, but also several others by private members for changes in the constitution. The king submitted his proposals again in the following session of the Storting, and again later on, but they were always unanimously rejected. In 1830 they were discussed for the last time, with the same result.
The king's insistence was viewed by the people as a sign of absolutist tendencies, and naturally excited fresh alarm. In the eyes of the people the members of the opposition in the Storting were the true champions of the rights and the independence which they had gained in 1814.

For several years the Norwegians had been celebrating the 17th of May as their day of independence, it being the anniversary of the adoption of the constitution of 1814; but as the tension between the Norwegians and the king increased, the latter began to look upon the celebration in the light of a demonstration directed against himself, and what Collett, minister of finance, was impeached before the supreme court of the realm for having made certain payments without the sanction of the Storting, he also considered this as an attack upon his royal prerogatives. His irritation knew no bounds, and although Collett was acquitted by the supreme court, the king, in order to express his irritation with the Storting and the action they had taken against one of his ministers, dissolved the national assembly with every sign of displeasure. The Swedish vicerey at the time, Count Sandels, had tried to convince him that his prejudice against the celebration could not be justified, but he wished to retain the Storting, and the king had made no objection to the celebration. In 1827 it was, however, celebrated in a very marked manner, and later in the same year there was a demonstration against a foolish political play called The Union, and this being privately reported to the king in as bad a light as possible, he thought that Count Sandels, who had not considered it worth while to report the occurrence, was not fitted for his post, and had him replaced by Count Beltzar Bojilas Platen (1766-1829), an upright but narrow-minded statesman. Count Platen's first act was to issue a proclamation warning the people against celebrating the day of independence; and in April 1828 the king, against the advice of his ministers, summoned an extraordinary Storting, his intention being to wrest from the Storting the supremacy it had gained in 1827. He also intended to take steps to prevent the celebration of the 17th of May, and assembled a force of 2000 Norwegian soldiers in the neighbourhood of the capital. The king arrived in Christiania soon after the opening of the extraordinary Storting. He did not succeed, however, in his attempt to make any constitutional changes, but the Storting met the king's wishes with regard to the celebration of the 17th of May by deciding not to continue the celebration, and the people all over the country quietly acquiesced. The following year trouble broke out again. The students had decided to celebrate the 17th of May with a festive gathering, which, however, passed off quietly. But large masses of the people paraded the streets, singing and shouting, and gathered finally in the market-place. There was a little rioting, and the police and the military eventually dispersed the people and drove them to their homes with sword and musket. This episode has become known as the "battle of the market-place," and did much to increase the general ill-feeling against Count Platen. His health eventually broke down from disappointment and vexation at the indignities and abuse heaped upon him. He died in Christiania at the end of the year, and his post remained vacant for several years, the presidency of the Norwegian government in the meantime being taken by Collett, his oldest member.

The by the Storting and in Europe became completely changed, and the lessons' derived from that great movement reached also to Norway. Nov. 1835 the constitution had paved the way to become the ruling element in political life, were also beginning to distinguish themselves in the national assembly, where they now had taken up an independent position against the representatives of the official classes, who in 1814 and afterwards had played the leading and most influential part in politics. This party was now under the leadership of the able and gifted Ole Ueland, who remained a member of every Storting from 1833 to 1869. The Storting of 1833 was the first of the so-called "peasant Storthings." Hitherto the peasantry had never been represented by more than twenty members, but the elections in 1833 brought their number up to forty-five, nearly half of the total representation. The attention of this new party was especially directed to the finances of the country, in the administration of which they demanded the strictest economy. They often went too far in their zeal, and thereby incurred considerable ridicule.

About this time the peasant party found a champion in the youthful poet Henrik Wergeland, who soon became one of the leaders of the "Young Norway" party. He was a romanticist, and played a most important part in the history of the national independence of Norway and of her full equality with Sweden in the union. A strong opposition to Wergeland and the peasant party was formed by the upper classes under the leadership of another rising poet and writer, Johan Sebastian Welhaven, and other talented men, who wished to retain the literary and linguistic relationship with Denmark, while Wergeland and his party wished to make the separation from Denmark as complete as possible, and in every way to encourage the growth of the national characteristics and to foster the popular. But it was a stormy time, and many of his friends who had just been isolated. He died in 1845, and his opponents became now the leaders in the field of literature, and carried on the work of national reconstruction in a more restrained and quiet manner. The peasant party still continued to exist, but restricted itself principally to the assertion of local interests and the maintenance of strict economy in finance.

The violent agitation that began in 1830 died away. The tension between the king and the legislature, however, still continued, and reached its height during the session of 1836, when all the royal proposals for changes in the constitution were laid aside, without even passing through committee, and when various other steps towards upholding the independence of the country were taken. The king, in his displeasure, decided to dissolve the Storting; but before it dispersed it proceeded to impeach Liøvenakjold, one of the ministers, before the supreme court of the realm, for having advised the king to dissolve the Storting. He was eventually sentenced to pay a fine of 10,000 kroner (about £550), but he retained his post. Collett, another minister who had greatly displeased the king by his conduct, was dismissed; but unity in the government was brought about by the appointment of Count Wedel Jarlsberg as vicecy of Norway. From this time the relations between the king and the Norwegian people began to improve, whereas in Sweden he was, in his later years, not a little disliked.

The question of the national flag was not yet settled. Towards the close of the session an address to the king was agreed to, in which the Storting urged that steps should be taken to place Norway in political respects upon an equal footing with Sweden, especially in the conduct of diplomatic affairs with foreign countries. The same address contained a petition for the use of the national or merchant flag in all waters. According to the constitution, Norway was to have her own merchant flag, and in 1821 the Storting had passed a resolution that the flag should be scarlet, divided into four by a blue cross with white and red edges, and bearing the king's monogram. In 1834 the king, however, refused his sanction to the resolution, but gave permission to use the flag in waters nearer home; but beyond Cape Finisterre the naval flag, which was really the Swedish flag, with a white cross on a red ground in the upper square, must be carried. In reply to the Storting's address the king in 1838 conceded the right to all merchant ships to carry the national flag in all waters. This was hailed with great rejoicings all over the country; but the question of the national flag for general use had yet to be settled. With regard to the question raised in the address of the Storting about the conduct of
NORWAY

diplomatic affairs, and other matters concerning the equality of Norway in the union, the king in 1839 appointed a committee of four Norwegians and four Swedes, who were to consider and report upon the questions thus raised.

During the sitting of this first "Union Committee" its powers were extended to consider a comprehensive revision of the Act of Union, with the limitation that the fundamental conditions of the union must in no way be interfered with. But before the committee had finished their report the king died (March 8th 1844), and was succeeded by his son Oscar I. According to the constitution the Norwegian kings must be crowned in Throndhjem cathedral, but the bishop of Throndhjem was in doubt whether the queen, who was a Roman Catholic, could be crowned, and the king decided to forego the coronation both of himself and his queen. The new king soon showed his desire to meet the wishes of the Norwegian people. Thus he decided that in all documents concerning the internal government of the country Norway should stand first where reference was made to the king as sovereign of the two kingdoms. After having received the report of the committee concerning the flag question he resolved (June 20th 1844) that the red Norwegian flag, with each quadrant in the national flag as the national flag as the flag, with the mark of union in the upper corner; and it was also decided that the merchant flag of the two kingdoms should bear the same mark of union, and that only ships sailing under these flags could claim the protection of the state.

The financial and material condition of the country had now considerably improved, and King Oscar's reign was marked by the carrying out of important legislative work and reforms, especially in local government. New roads were planned and built all over the country, the first railway was built, steamship routes along the coast were established, lighthouses were erected and trade and shipping made great progress. The king's reign was not disturbed by any serious conflicts between the two countries. No change took place in the ministry under the presidency of the viceroy Lövenskiöld upon King Oscar's accession to the throne, but on the death or retirement of some of its members the vacant places were filled by younger and talented men, among whom was Fredrik Stang, who in 1845 took over the newly established ministry of the interior. During the Storstjæl-Holstein rebellion (1849-1850) and the Crimean War, King Oscar succeeded in maintaining the neutrality of Norway and Sweden, by which Norwegian shipping especially benefited. The abolition of the English navigation acts in 1850 was of great importance to Norway, and opened up a great future for its merchant fleet.

In 1826 a treaty had been concluded with Russia, by which the frontier between that country and the adjoining strip of Norwegian territory in the Polar region was definitely delimited; but in spite of this treaty Russia in 1831 demanded that the Russian Lapps on the Norwegian frontier should have the right to fish on the Norwegian coast, and have a portion of the coast on the Varanger fjord allotted to them to settle upon. The Norwegian government refused to accede to the Russian demands, and serious complications might have ensued if the attention of Russia had not been turned in another direction. While his father had looked to Russia for support, King Oscar was more inclined to secure western powers as his allies, and during the Crimean War he concluded a treaty with England and France, according to which these countries promised their assistance in the event of any fresh attempts at encroachment on Norwegian or Swedish territory by Russia. In consequence of this treaty the relations between Norway and Sweden and Russia became somewhat strained; but after the peace of Paris in 1856, and the accession of Alexander II., whose government was in favour of a peaceful policy, the Russian ambassador at Stockholm succeeded in bringing about more friendly relations.

Owing to the king's ill-health, his son, the crown prince Carl, was appointed regent in 1857, and two years later, when King Oscar died, he succeeded to the thrones of the two countries as

Carl XV. He was a gifted, genial and noble personality, and desired to inaugurate his reign by giving the Norwegians a proof of his willingness to acknowledge the claims of Norway, but he did not live to see his wishes in this respect carried out. According to the constitution, the king had the power to appoint a viceroy for Norway, who might be either a Norwegian or Swede. Since 1829 no Swede had held the post, and since 1859 no appointment of a viceroy had been made. But the paragraph in the constitution still existed, and the Norwegians naturally wished to have this stone in the new constitution, and for the abolition of the office of viceroy was laid before the Storting in 1859, and passed by it. The king, whose sympathies on this question were known, had been appealed to, and had privately promised that he would sanction the proposed change in the constitution; but as soon as the resolution of the Storting became known in Sweden, a violent outcry arose both in the Swedish press and the Swedish estates. Under the pressure that was brought to bear upon the king in Sweden, he eventually refused to sanction the resolution of the Storting; but he added that he shared the views of his Norwegian councillors, and would, when "the convenient moment" came, himself propose the abolition of the office of viceroy.

In the following year the Swedish government again pressed the demands of the Swedish estates for a revision of the Act of Union, which this time included the establishment of a union or common parliament for the two countries, on the basis that, according to the population, there should be two Swedish members to every Norwegian. The proposal was sent to the Norwegian government, which did not seem at all disposed to entertain it; but some dissensions arose with regard to the form in which its reply was to be laid before the king. The more obstinate members of the ministry resigned, and others, of a more pliable nature, were appointed under the presidency of Fredrik Stang, who had already been minister of the interior from 1845 to 1856. The reconstructed government was, however, in accord with the retiring one, that no proposal for the revision of the Act of Union could then be entertained. The king, however, advocated the desirability of a revision, but insisted that this would have to be based upon the full equality of both countries. In 1853 the Storting assembled in the act of 1815. The Storting assembled in the act of 1815, and the Constitution of Norway.

The committee, the second time that such a committee had been called upon to consider this vexatious question. It was not until 1867 that its report was made public, but it could not come on for discussion in the Storting till it met again in 1871. During this period the differences between the two countries were somewhat thrust into the background by the Danish complications in 1853-1864, which threatened to draw the two kingdoms into war. King Carl was himself in favour of a defensive alliance with Denmark, but the Norwegian Storting would not consent to this if an alliance could also be effected with at least one of the western powers.

In 1869 the Storting passed a resolution by which its sessions were made annual instead of triennial according to the constitution of 1814. The first important question which the first yearly Storting which met in 1871 had to consider was once more the proposed revision of the Act of Union. The Norwegians had persistently maintained that in any discussion on this question the basis for the negotiations should be (1) the full equality of the two kingdoms, and (2) no extension of the bonds of the union beyond the line originally defined in the act of 1815. Hence the draft of the new act contained terms in which the supremacy of Sweden was presupposed and which introduced important extensions of the bonds of the union; and, strangely enough, the report of the Union committee was adopted by the new Stang ministry, and even supported by some of the most influential newspapers under the plausible garb of "Scandinavianism." In these circumstances the "lawyers' party," under the leadership of Johan Sverdrup, who was to play such a prominent part in Norwegian politics, and the "peasant party," led by Sören...
Jaabek, a gifted peasant proprietor, who was also destined to become a prominent figure in the political history of the country, formed an alliance with the object of guarding against any encroachment upon the liberty and independence which were held all over the country by the constitution of 1814. This was the foundation of the great national party, which became known as the "Venstre" (the left), and which before long became powerful enough to exert the most decisive influence upon the political affairs of the country. When, therefore, the proposed revision of the Act of Union eventually came before the Storting in 1871, it was rejected by an overwhelming majority. The position which the government had taken up on this question helped to open the eyes of the Norwegians to some defects in the constitution, which has proved an obstacle in the development and strengthening of the parliamentary system.

In 1872 a private bill came before the Storting, proposing that the ministers should be admitted to the Storting and take part in its proceedings. After a number of stormy debates, the bill was successfully carried under the leadership of Johan Sverdrup by a large majority, but the government, evidently jealous of the growing powers and influence of the new liberal party in the Storting, advised the king to refuse his sanction, although the liberal party itself had several times in the preceding half-century voted in favor of admitting the ministers to the Storting. At that time, however, the opposition had looked with suspicion on the presence of the ministers in the national assembly, lest their superior skill in debate and political experience should turn the scale too readily in favour of government measures. Now, on the contrary, the opposition had gained more experience and had confidence in its own strength, and no doubt found that the legislative work could better be carried on if the ministers were present to explain and defend their views; but the government saw in the proposed reform the threat of another victory of full parliamentary government, by which the ministry could not remain in office unless supported by a majority in the Storting. Before the Storting separated the liberals carried a vote of censure against the government; but the king declared that the ministers enjoyed his confidence and took no further notice of the vote. Two of the ministers, who had advised the ratification of the bill, resigned, however, and a third minister, who had been in the government since 1846, resigned also, and retired from public life, foreseeing the storm that was brewing on the political horizon. Numerous public meetings were held in support of the proposed reform, and among the speakers was Johan Sverdrup, now the acknowledged leader of the liberal party, who was hailed with great enthusiasm as the champion of the proposed reform.

This was the political situation when King Carl died (18th September 1872). He was succeeded by his brother, who ascended the throne as Oscar II. In the following year he gave his sanction to the bill for the abolition of the office of viceroy, which the Storting had again passed, and the president of the ministry was afterwards recognized as the prime minister and head of the government in Christiania. Fredrik Stang, who was the president of the ministry at the time, was the first to fill this office. In the same year Norway celebrated its existence for a thousand years as a kingdom, with great festivities.

In 1874 the government, in order to show the people that they too some extent were willing to meet their wishes with regard to the great question before the country, laid before the Storting a royal proposition for the admission of the ministers to the national assembly. But this was to be accompanied by certain other constitutional changes, such as giving the king the right of dissolving the Storting at his pleasure, and providing fixed pensions for ex-ministers, which was regarded as a guarantee against the majority of the assembly misusing its new power. The bill which the government brought in was unanimously rejected by the Storting, the conservatives also voting against it, as they considered the guarantees insufficient. The same year, and again in 1877, the Storting passed the bill, but in a somewhat different form from that of 1872. On both occasions the king refused his sanction.

The Storting then resorted to the procedure provided by the constitution to carry out the people's will. In 1880 the bill was passed for the third time, and on this occasion by the overwhelming majority of 93 out of 113. Three Stortings after three successive elections had now carried the bill, and it was generally expected that the king and his government would at length comply with the wishes of the people, but the king on this occasion also refused his sanction, declaring at the same time that his right to the absolute veto was "above all doubt." Johan Sverdrup, the leader of the liberal party and president of the Storting, brought the question to a prompt issue by proposing to the Storting that the bill, which had been passed three times, should be declared to be the law of the land without the king's sanction. This proposal was carried by a large majority on the 9th of June 1880, but the king and his ministers in reply declared that they would not recognize the validity of the resolution.

From this moment the struggle 'may be said to have centred itself upon the existence or non-existence of an absolute veto on the part of the crown. The king requested the faculty of law at the Christiania university to give its opinion on the question at issue, and with one dissentient the learned doctors upheld the king's right to the absolute veto in questions concerning amendments of the constitution, although they could not find that it was expressly stated in the fundamental law of the country. The ministry also advised the king to claim a veto in questions of supply, which still further increased the ill-feeling in the country against the government, and the conflict in consequence grew more and more violent.

In the midst of the struggle between the king and the Storting, the prime minister, Fredrik Stang, resigned, and Christian August Selmer (1816-1889) became his successor; and this, together with the appointment of another member to the ministry, K. H. Schweigaard, plainly indicated that the conflict with the Storting was to be continued. In June 1882 the king arrived in Christiania to dissolve the Storting, and on this occasion delivered a speech from the throne, in which he openly censured the representatives of the people for their attitude in legislative work and on the question of the absolute veto, the speech creating considerable surprise among the people. Schweigaard and Bjørnstjerne Bjørnson, the popular poet and dramatist, called upon the people to support the Storting in upholding the resolution of the 9th of June, and to rouse themselves to a sense of their political rights. The elections resulted in a great victory for the liberal party, which returned stronger than ever to the Storting, numbering 83 and the conservatives only 31. The ministry, however, showed no sign of yielding, and, when the new Storting met in February 1883, the Odeshøg (the lower division of the national assembly) decided upon having the question finally settled by impeaching the whole of the ministry before the Rigsråd or the supreme court of the realm. The jurisdiction of the Rigsråd is limited to the trial of offences against the state, and there is no appeal against its decisions. The charges against the ministers were for having acted contrary to the interests of the country by advising the king to refuse his sanction—first, to the amendment of the law for admitting the ministers to the Storting; secondly, to a bill involving a question of supply; and thirdly, to a bill by which the Storting could appoint additional directors on the state railways.

The trial of the eleven ministers of the Selmer cabinet began in May 1883 and lasted over ten months. In the end the Rigsråd sentenced the prime minister and seven of his ministers to be deprived of their offices, while three, who had either recommended the king to sanction the bill for admitting the ministers to the Storting, or had
entered the cabinet at a later date, were heavily fined. The excitement in the country rose to feverish anxiety. Rumours of all kinds were afoot, and it was generally believed that the king would attempt a coup d'état. Fortunately the king after some hesitation issued (11th March 1884) an order in council announcing that the judicial and legislative business should not be carried into effect, and Selmer was then called upon to resign his position as prime minister. King Oscar, however, in his declaration upheld the constitutional prerogative of the crown, which he maintained, was not impaired by the judgment of the Rigsdag. The following month the king, regardless of the large liberal majority in the Storting, asked Schweigaard, one of the late ministers, whose punishment consisted in a fine, to form a ministry, and the so-called "April ministry" was then appointed, but sent in its resignation in the following month. Professor Broch, a former minister, next failed to form a ministry, and the king was at last compelled to appoint a ministry in accordance with the majority in the Storting. In June 1884 Johan Sverdrup was asked to form one. He selected for his ministers leading men on the liberal side in the Storting, and the first liberal ministry that Norway had was at length appointed. The Storting, in order to satisfy the king, passed a new resolution admitting the ministers to the national assembly, and this received formal sanction.

The following years a series of important reforms was carried through. Thus in 1887 the jury system in criminal matters was introduced into the country after violent opposition from the conservatives. A bill intended to give parishioners greater influence in church matters, and introduced by Jakob Sverdrup, the minister of education, and a nephew of the prime minister, met, however, with strong opposition, and was eventually rejected by the Storting, the result being a break-up of the ministry and a disorganization of the liberal party. In June 1889 the Sverdrup ministry resigned, and a conservative one was formed by Emil Stang, the leader of the conservatives in the Storting, and during the next two years the Storting passed various useful measures; but the ministry was eventually wrecked on the rock of the great national question which about this time came to the front—that of Norway's share in the transaction of diplomatic affairs. At the time of the union in 1814 nothing had been settled as to how these were to be conducted, but in 1835 a resolution was issued, that when the Swedish foreign minister was transacting diplomatic matters with the king which concerned both countries, or Norway only, the Norwegian minister of state in attendance upon the king at Stockholm should be present. This arrangement did not always prove satisfactory to the Norwegians, especially as the Swedish foreign minister could not be held responsible to the Norwegian government or parliament.

By a change in the Swedish constitution in 1885 the ministerial council, in which diplomatic matters are discussed, came to consist of the Swedish foreign minister and two other members of the cabinet on behalf of Sweden, and of the Norwegian minister at Stockholm on behalf of Norway. The king, wishing to remedy this disparity, proposed that the council on diplomatic questions should be enlarged by an additional paragraph in the Act of Union. The representatives of the Norwegian government in Stockholm proposed that three members of the cabinet of each country should constitute the ministerial council. To this the Swedish government was willing to agree, but on the assumption that the minister of foreign affairs should continue to be a Swede as before, and this the Norwegians, of course, would not accept. At the king's instigation the negotiations with the Swedish government were resumed at the beginning of 1891, but the Swedish Riksdag rejected the proposals, while the Norwegian Storting insisted upon "Norway's right, as an independent kingdom, to full equality in the union, and therewith her right to watch over her foreign affairs in a constitutional manner." The Stang ministry then resigned, and a liberal ministry, with Steen, the recognized leader of the liberal party after Sverdrup's withdrawal from politics, as prime minister, was appointed.

The new ministry had placed the question of a separate minister of foreign affairs for Norway prominently in their programme, but little progress was made during the next few years. 

The crisis of 1902-1903.

government was prepared to agree to the establishment of separate consuls. This came as a surprise to the Norwegians in view of the fact that the basis for the establishment of separate consuls had already been agreed upon and confirmed by the king in December 1903. According to Boström's proposals the Norwegian consuls were to be placed under the control of the Swedish foreign minister, who was to have the power to remove any Norwegian consul. The Norwegians felt it would be beneath the dignity of a self-governing country to agree to the Swedish proposals, and that these new demands were nothing less than a breach of faith with regard to the terms of agreement arrived at two years before by both governments and signed by the king. The Norwegian government would have been perfectly justified if, after this, they had withdrawn from the negotiations, but they did not wish to jeopardize the opportunity of arriving at a friendly settlement, and Hagerup, the Norwegian prime minister, proceeded to Stockholm to confer with Boström; but no satisfactory agreement could be arrived at. There was therefore nothing left but for the Norwegians to take matters into their own hands.

On the 9th of February 1905 Hagerup announced to the Norwegian government that the negotiations had fallen through, and on the 17th the Storting decided unanimously to refer the matter to a special committee. Owing to some difference of opinion between the members of his ministry, Hagerup resigned on the 1st of March and was succeeded by Christian Michelsen, who formed a ministry composed of members of both political parties. The special committee decided that a bill should be immediately submitted to the Storting for the establishment of a Norwegian consular service and that the measure should come into force not later than the 1st of April 1906. An attempt was made by the Swedish crown prince, acting as Prince Regent 4th, to enter into negotiations with the Norwegian government, but the proposals were not favourably received in Norway. In April 1905 Boström resigned, which was considered to be a move on the part of Sweden to facilitate negotiations with Norway. The bill for the establishment of Norwegian consuls was passed by the Storting without a dissentient voice on the 23rd of May, and it was generally expected that the king, who again had assumed the reins of government, would sanction the bill, but on the 27th of May, in spite of the earnest entreaties of his Norwegian ministers, the king formally informed the Norwegian Ministry that he could not accept their resignation. They, however, declined to withdraw it. A few days afterwards the Norwegian government informed the Storting of the king's refusal, whereupon the assembly unanimously agreed to refer the matter to the special committee. On the 7th of June the Storting met to hear the final decision of the government. Michelsen, the prime minister, informed the Storting that all the members of the government had resigned in consequence of the king's refusal to sanction the consular law, that the king had declined to accept the resignation, and that, as an alternative government could not be formed, the union with Sweden, based upon a king in common, was consequently dissolved. The president of the Storting submitted a resolution that the resigning ministry should be authorized to exercise the authority vested in the king in accordance with the constitution of the country. The resolution was unanimously adopted.

King Oscar, on receiving the news of the action of the Norwegian Storting, sent a telegraphic protest to the Norwegian prime minister and to the president of the Storting. The Swedish government immediately decided to summon an extraordinary session of the Swedish parliament for the 20th of June, when a special committee was appointed to consider what steps should be taken by Sweden. On the 25th of July the report of the committee was laid before the Riksdag, in which it was stated that Sweden could have no objection to enter into negotiations about the severance of the union, but that a vote to that effect had been given by a newly-elected Storting or by a national vote in the form of a referendum by the Norwegian people. The proposal was unanimously adopted by the Swedish Riksdag on the 27th of July, and on the following day the Norwegian Storting decided that a general plebiscite should be taken on the 13th of August, when 368,211 voted in favour of the dissolution and only 184 against it. It was thereupon agreed that representatives of Norway and of Sweden should meet at Karlstad in Sweden on the 31st of August to discuss and arrange for the severance of the union. The negotiations lasted till the 23rd of September, though more than once they were on the point of being broken off. The agreement stipulated a neutral zone on both sides of the southern border between the two countries, and the Norwegians undertaking to dismantle some fortifications within that zone. The agreement was to remain in force for ten years, and could be renewed for a similar period, unless one of the countries gave notice to the contrary. The Karlstad agreement was ratified by the Norwegian Storting on the 9th of October and by the Swedish Riksdag on the 16th of the same month. On the 27th of October King Oscar issued a proclamation to the Norwegian Storting, in which he relinquished the crown of Norway. The Norwegian government was led by Bostrom; but the Norwegian people decided to negotiate with Prince Charles of Denmark and to arrange for a national vote as to whether or not the country would approve of his election for the Norwegian throne. The plebiscite resulted in 259,563 votes for his election and 60,264 against. On the 18th of November the Storting unanimously elected Prince Charles as king of Norway, he taking the name of Haakon VII. On the 25th of November the king and his consort, Queen Maud, the youngest daughter of Edward VII of England, entered the Norwegian capital. Their coronation took place in the Trondhjem cathedral on the following day.

In 1907 parliamentary suffrage was granted to women with the same limitation as in the municipal suffrage granted to them in 1901, viz., to all unmarried women over 25 years, who pay taxes on an income of 300 kroner (about £16) in the country districts and on 400 kroner (about £22) in the towns, as well as to all married women, whose husbands pay taxes on similar incomes. Norway was thus the first sovereign country in Europe where the parliamentary vote was granted to women. (H. L. B.)

**Norwegian Literature**

Early Norse literature is inextricably bound up with Icelandic literature. Iceland was colonized from Norway in the 9th century, and the colonists were drawn chiefly from the upper and cultivated classes. They took with them their poetry and literary traditions. Old Norse literature is therefore dealt with under Iceland (q.v.). (See also Edda, Saga, Runes.)

The modern literature of Norway bears something of the same relation to that of Denmark that American literature bears to English. In each case the development and separation of a dependency have produced a desire on the part of persons speaking the mother-tongue for a literature that shall express the local emotions and conditions of the new nation. Two notable events led to the foundation of a separate Norwegian literature: the one was the creation of the university of Christiania in 1811, and the other was the separation of Norway from Denmark in 1814. Before this time Norwegian writers had been content, as a rule, to publish their works at Copenhagen. The first name on the annals of Danish literature, Peder Clausen, is that of a Norwegian; and if all Norse writers were removed from that roll, the list would be poorer by some of its most illustrious names, by Holberg, Tullin, Wessel, Trischen, Steffens and Hauch.

The first book printed in Norway was an almanac, brought out in Christiania in 1643 by a wandering printer named Tyge Nielsen, who brought his types from Copenhagen. But the first press set up definitely in Norway was that of Valentin Kuhn, brought over from Germany in 1650 by the theologian Christian Stephens Mag (1580–1678) to help in the circulation of his numerous tracts. Bang's Christianae Studijs Befrielsse (1651), is the first book published in Norway. Christen Jensen (d. 1653)
Magnus Barfods Sønn (Magnus Barefoot's Son) and a lyrical drama, Fjeldensyret (The Adventure in the Mountains) (1888). He became judge of the supreme court of the diocese of Christiania. The third member of the Trefoil, Mauritz Kristoffer Hansen (1794–1842), was a schoolmaster. His novels, of which Olar of Bretagne (1819) was the earliest, were much esteemed in their day, and after his death were collected and edited (8 vols., 1855–1858), with a memoir by Schwab. Hansen's Poems, printed at Christiania in 1816, were among the earliest publications of a liberated Norway, but were preceded by a volume of Smaadige (Short Poems) by all three poets, edited by Schwab. These works, with contributions of genuine genius in themselves, did much by their industry and patriotism to form a basis for Norwegian literature.

The creator of Norwegian literature, however, was the poet Henrik Arnold Wergeland (1808–1845) (q.v.), a man of great genius and enthusiasm, who contrived within the limits of a life as short as Byron's to concentrate the labours of a dozen ordinary men of letters. He held views in most respects similar to those pronounced by Rousseau and Shelley. His obscurity and extravagance stood in the way of his teaching, and all his poetry—by St. Sylvester Sivertsen (1809–1847), a journalist of talent whose verses were collected in 1848, and Christian Monsen (1841–1852), author of Tidsnormerene (The Norns of the Age) (1835) and other verses.

Andreas Munch (1811–1884) took no part in the feud between Wergeland and Welhaven, but addicted himself to the study of Danish models independently of either. He published a series of poems and dramas, one of which latter, Kong Sverres Ungdom (1837), attracted some notice. His popularity commenced with the appearance of this Poetical Novel as a Sáliiter, and was reached by his epic called Kong- dotternes Brudesløft (The Bridal Journey of the King's Daughter) (1861). Two of his historical dramas have enjoyed a popularity greatly exceeding their merit; these are Solomon de Caus (1854) and Lord William Russell (1857).

A group of minor poetical writers may now be considered. Magnus Brostrup Landstad (1802–1880) was born on Maassø, an island in the vicinity of the North Cape, and, therefore, in higher latitudes than any other man of letters. He was a hymn-writer of merit, and he was the first to collect, in 1853, the norske Folkeviser or Norwegian folk-songs. Landstad was ordered by the government to prepare an official national hymn-book, which was brought out in 1861. Peter Andreas Jensen (1812–1867) published the collected volumes of his poetry in 1836, 1845, 1855 and 1861, and two dramas which he also wrote. His Poems, in Erindringer (A Souvenir), in 1857, Aasmund Olafsen Vinje (1818–1870) was a peasant of remarkable talent, who was the principal leader of the movement known as "svartkrov," an effort to distinguish Norwegian from Danish literature by the adoption of a peasant dialect, or rather a new language arbitrarily formed on a collision of the various dialects. Vinje wrote a volume of lyrics, which he published in 1864, and a narrative poem, Storregut (Big Lad) (1866), entirely in this fictitious language, and he even went so far as to issue in it a newspaper, Dålen (The Dalesman), which appeared from 1858 to Vinje's death in 1870. In these efforts he was supported by Tidsskriftet for Norske Litteratur, a journal founded and edited by the author of an historical tragedy, Jon Arason (1867); several novels: Fra Bygdom (1865); Torgim (1872); Fra Danskedsiden (1871); and an essay, "Ole Vestiary" (The Southern West of the Moon) (1879); besides a powerful but morbid drama in the ordinary language of Norway, En Kvindeksjøme (A Woman's Fate) (1879). In 1882 he left Norway for America, and in 1885, and his last works, among which is an essay in 1885 what is perhaps the best of his books, The Saga of the Prairie. Superior to all the preceding in the quality of his lyrical writing was the bishop of Christiansand, Jürgen Moe (1813–1882). He is,
The political crisis of 1884–1885, which produced so remarkable an effect on the material and social life of Norway, was not without its influence upon literature. There had followed, to the great generation of the 'sixties, led by Ibsen and Bjørnson, a race of entirely prosaic writers, of no great note, and no extraordinary promise. The movement which began in 1885 brought back the fine masters of a previous imaginative age, silenced the problem-setters, and encouraged a whole generation of new men, realists of a healthier sort. In 1885 the field was still held by the three main names of modern Norwegian literature—Ibsen, Bjørnson and Lie. Henrik Ibsen proceeded deliberately with his labours, and his name at the same time grew in reputation and influence. The advance of Bjørnson was not so regular, because it was disturbed by political issues. Moreover, his early peasant tales were later, after having suffered great neglect, grew to be a force, and Bjørnson's example has done much to revive an interest in the art of verse in Norway. Jonas Lie, the most popular novelist of Norway, continued to publish his pure, fresh and eminently characteristic stories. His style, colloquial almost to a fault, has neither the charm of Bjørnson nor the art of some of the latest generation. Ibsen, Bjørnson and Lie continued, however, to be the three representative authors of their country. Kristian Elster (1841–1881) showed great talent in his pessimistic novels Tora Trondal (1879) and Dangerous People (1881). His artistic legacy, together with Asbjornsen's, overflowed into the fields of fine arts. Asbjornsen (1847–1905), wife of the Danish novelist, Erik Skram. Her novels are destitute of literary beauty, but excellent in their local colour, dealing with life in Bergen and the west coast. But the most extravagant product of the prosaic period was Hans Jæger (b. 1854), a sailor by profession, who left the sea, obtained some instruction and embarked on literature. Jæger accepted the naturalistic formulas wholesale, and told Zola himself in the harshness of his pictures of life. Several of Jæger's books, and in particular his novel Morbid Love (1893), were immediately suppressed, and can with great difficulty be referred to. Knud Hamsun (b. 1860) has been noted for his egotism, and for the bitterness of his attacks upon his fellow-writers and the great names of literature. Hamsun is seen at his best in the powerful romance called Hunger (1888). A writer of a much more pleasing, and in its quiet way of a much more refined manner, is Hans Anrud (b. 1863). His humour, applied to the observation of the Oland peasants—Anrud himself comes from the Gulbrandsdal—is exquisite; he is by far the most amusing of recent Norwegian writers, a race whose fault it is that they are too serious. His story, Here Our Lord Made Hole at Asmund Bergemoll's (1887), is a little masterpiece. Peter Egge (b. 1869), a young novelist and playwright from Trondheim, came to the front with careful studies of types of Norwegian temperament. In his Jacob and Christopher (1900) Egge also proved himself a successful writer of comedy. Gunnar Heiberg (b. 1857), although older than most of the young generation, has but lately come into prominence. His poetical drama, The Balcony, made a sensation in 1894, but ten years earlier his comedy of Aunt Ulrica should have awakened anticipation. He was more ready (1889) to make a declaration of great promise were removed in the very heyday of success, Gabriel Finne (1866–1890) and Sighjør Obstfelder (1866–1900). The last mentioned, in The Red Drops and The Cross, published in 1897, gave promise of something new in Norwegian literature. Obstfelder, who died in a hospital in Copenhagen in August 1900, left an important book in MS., A Priest's Diary (1901).

Verse was banished from Norwegian literature, during the years that immediately preceded 1885. The credit of restoring it belongs to Sigurd Bödtker, who wrote an extremely naturalistic piece called Love, in the manner of Heine. The earliest real poet of the new generation is, however, Niels Collet-Melbye (b. 1864), who published a little volume of Poems in 1887. Arne Dybfast (1868–1892), a young anarchist who committed suicide, was a decadent egotist of the most pronounced type, but a poet of unquestionable talent, and the writer of a remarkably...
melodious prose. In 1851 was printed in a magazine Vilhelm Krag’s (b. 1871) very remarkable poem called Fandango, and shortly afterwards a collection of his lyrics. Vogt and V. Krag continued to be the leading lyrical writers of the period, and although they had many imitators, they cannot be said to have found any rivals. Vilhelm Krag turned to prose fiction, and his novels Isaac Seekhansen (1900) and Isaac Kopengetal (1903) are excellent studies of Westland life. More distinguished as a novelist, however, is his brother, Thomas P. Krag (b. 1868), who published a series of romantic novels, of which Ada Wilde (1897) is the most powerful. His short stories are full of delicate charm. Hans E. Kinck (b. 1865) is an accomplished writer of short stories from peasant life, written in dialect. Bernt Lie (b. 1868) is the author of popular works of fiction, mainly for the young. Sven Nilssen (b. 1864) is the author of a very successful novel, The Barque Franciska (1901). With him may be mentioned the popular dramatist and memoir-writer, John Paulsen (b. 1853), author of The Widow’s Son. Johan Bojer (b. 1872) has written satirical romances, of which the most powerful is The Power of Faith (1903). Jakob Hilditch (b. 1864) has written many stories and sketches of a purely national kind, and is the anonymous author of a most diverting parody of banal provincial journalism, Travnisktopsten (1900–1901).

The leading critics are Carl Nerup (b. 1864) and Hjalmar Christensen (b. 1860), each of whom has published collections of essays dealing with the aspects of recent Norwegian literature. The death of the leading bibliographer and lexicographer of Norwegian literature, Jakob Bjorvatn, (b. 1840) inflicted a blow upon the literary history of his country; his Dictionary of Norwegian Authors (1883–1900)—left for completion by Halfdan Koht—is one of the most elaborate works of its kind ever undertaken. Among recent historians of Norway much activity has been shown by Ernst Sars (b. 1835) and Yngvar Nielsen (b. 1843). The great historian of northern jurisprudence was L. M. B. Aubert (1838–1869), and in this connexion T. H. Aschehoug (b. 1822) must also be mentioned. The leading philosopher of Norway in those years was the Hegelian Marcus Jakob Monrad (b. 1816), whose Aesthetics of 1889 is his masterpiece.

The close of 1899 and the beginning of 1900 were occupied by a discussion, in which every Norwegian author took part, as to the adoption of the landsmaal, or composite dialect of the peasants, in place of the rigsmaal or common Norwegian. Political prejudice greatly bittered the controversy, but the proposition that the landsmaal, which dates from the exerions of Ivar Aasen (q.v.) in 1859, shouldoust the language in which all the classics of Norway are written, was supported by many of the most prominent authors and writer in the country, particularly by Bjørnson and Sophus Bugge (b. 1833). On the other side, Arne Garborg was almost the only name which carried any literary weight. The maal had no doubt enriched the literary tongue of the country with many valuable words and turns of expression, but there the advantage of it ends, and it is difficult to feel the slightest sympathy with a movement in favour of suppressing the language in which every one has hitherto expressed himself, in order to adopt an artificial dialect which exists mainly on paper, and which he declares to be the native speech of any one body of persons throughout the whole of Norway.

AUTHORITIES.—La Norvège littéraire, by Paul Botten-Hansen (1824–1886), is an admirable piece of bibliography, but comes down no farther than 1866. Jens Brage Halvorsen (1845-1900) left his admirable and exhaustive Norsk Forfatter-Lexicon, 1841–1880 (Norwegian Dictionary of Authors) incomplete; but the work was continued by Halfdan Koht. See also Henrik Jæger, Illustreret norsk litteraturhistorie (Christiansia, 1892–1905); to which an appendix State Tidsskr 1800–1905 was added by Carl Nerup in 1905; P. H. Schweitzer, Geschichte der skandinavischen Literatur (Leipzig, 1889); F. W. Horn, History of the Literature of the Scandinavian North (Engl. trans. Chicago, 1884); Edmund Gosse, Northern Studies (2nd ed., 1882).

NORWEGIAN SEA, the sea enclosed between Norway, the Shetland and Faeroe Islands, Iceland, Greenland, Spitsbergen and Bear Island. Its basin is bounded on the E. by the Spitsbergen platform, the continental shelf of the Barents Sea and the Norwegian coast; on the S. and S.W. by the North Sea, the Wyville-Thompson ridge, the Faeroe-Iceland ridge and the Iceland-Greenland ridge; on the W. by the coast of Greenland and on the N., so far as is known, by a ridge extending from Greenland to Spitsbergen. The Norwegian Sea is thus placed between the basins of the Atlantic on the one side and of the Arctic Ocean on the other: the mean depth of the submarine ridge separating it from the former being about 300 fathoms, and from the latter probably about 400 fathoms. The basin itself consists of a series of deeps, separated from one another by transverse ridges. Nansen and Hjelland-Hansen give the following results of measurements of the area:

<table>
<thead>
<tr>
<th>Area of surface</th>
<th>Water area at 100 metres</th>
<th>Water area at 200 metres</th>
<th>Water area at 300 metres</th>
<th>Water area at 400 metres</th>
<th>Mean depth</th>
</tr>
</thead>

The Norwegian Sea forms the meeting-place of waters coming from the Antarctic and Arctic oceans, and it also receives coastal waters from the North Sea and connecting areas, and from the Barents Sea. As communication with other basins is cut off comparatively near the surface, the inflow and outflow of waters must take place entirely in the upper strata, and the isolated water in the deep basin has typical physical characters of its own.

The distribution and circulation of these waters are of great complexity, and have formed the subject of study by oceanographers since the region was first opened up by the Norwegian North Atlantic Expedition, 1876–1878. Much fresh light has been thrown on the subject by the work of the International Council for the study of the sea, and more particularly by the Norwegian investigators Nansen and Hjelland-Hansen, whose report on Norwegian Fishery and Marine Investigations (vol. ii. No. 2. 1909) contains a complete survey of present knowledge.

NORWICH, GEORGE GORING, EARL OF (1583–1663), English soldier, was the son of George Goring of Hurstprey and Ovingdean, Sussex, and of Anne Denny, sister of Edward Denny, earl of Norwich. He was knighted in 1608, and became a favourite at court, benefiting largely from monopilies granted by Charles I. He became Baron Goring in 1628, and privy councillor in 1639. When the troubles between Charles and his parliament became acute Goring devoted his fortune freely to the royal cause, and the king in November 1644 renewed for him the title of earl of Norwich which had become extinct after his uncle’s death. He went with the queen to Holland in 1642 to raise money for the king, and in the autumn of the next year he was seeking arms for the enemy from Mazzar in Paris. His proceedings were soon revealed to the parliament in January 1644 by an intercepted letter to Henrietta Maria. He was consequently impeached of high treason, and prudently remained abroad until 1647 when he received a pass from the parliament under a pretex of seeking reconciliation. Thus he was able to take a prominent part in the Second Civil War of 1648 (see GREAT REBELLION). He commanded the Kentish levies, which Fairfax dispersed at Maidstone and elsewhere, and was forced to surrender unconditionally at Colchester. He was condemned to exile in November 1648 by a vote of the House of Commons, but the next year was granted his life. He lived at Brentford on the 6th of March 1663. By his wife Mary Nevill (d. 1648), daughter of the 6th Lord Abergavenny, he had four daughters and two sons: George, Lord Goring (q.v.); and Charles, who fought...
NORWICH, in the Civil War, succeeded his father in the earldom, and died without heirs in March 1671.

NORWICH, a city and one of the county-seats of New London county, Connecticut, U.S.A., in the township of Norwich, at the point where the Yantic (which expands here in "The Cove") and Shetucket rivers join and form the Thames. Pop. (1900) of the township, 24,657, which included that of the city (17,251, including 4,597 foreign-born); (1910) of the city, 20,367, and of the township, 28,219. The Congregational Church of the Inhabitants of Norwich is served by the New York, New Haven & Hartford and the Central Vermont railways, by steamers from New York and New London, and by interurban electric lines connecting with Willimantic, New London and other neighbouring places. The city is at the head of navigation on the Thames river, whose channel is 100-200 ft. wide and 14 ft. deep. The residential and older portion of the city is built on the rising ground between the valleys of the two streams; along their banks lies the business district. In Sachem Street is the grave of Uncas (d. c. 1682), a Mohegan Indian chief and friend of the early settlers; the corner-stone of the granite monument over the grave was laid by President Andrew Jackson in 1833. North-east of the Roman Catholic Cemetery, in the extreme eastern part of the city, is a monument to Mantonome, a sachem of the Narragansett tribe of Indians, who was put to death here. Among the principal buildings and institutions are the Congregational Church, organized in 1660; the Norwich Free Academy (1836) and its Slater Memorial Hall, in which are the Peck Library and an Art Museum, and the Converse Art Annex and Art Collection; the Otis Public Library (1848); the William Backus Hospital for the Inhabitants of Norwich and a state armory. In the 18th century, and early in the 19th, Norwich had a lucrative trade with the Atlantic ports and the West Indies, but later manufacturing became the most important industry; the manufactures include textiles, cutlery, firearms, paper, electrical supplies, printing presses, &c. In 1905 the factory products were valued at $6,032,391. With the city's growth in manufacturing there has been a large increase in the foreign element in the population. The municipality owns and operates the waterworks, and gas and electric-lighting plants.

Norwich was settled in 1659 by colonists from Saybrook under the leadership of Captain John Mason (1600–1672), who had crushed the power of the Pequot Indians in Connecticut in 1637, and the Rev. James Fitch (1622-1702), who became a missionary to the Mohegans. The tract was purchased from the Mohegan chiefs, Uncas, Owaneco and Attawahoon, and the settlement was called Mohegan until 1662, when the present name was adopted. During and preceding the War of Independence the citizens of Norwich were ardent Whigs; various members of the well-known Huntington family being among their leaders. In December 1776, in reply to a message from Boston, a town-meeting forbade the use of tea, wines, liquors and foreign manufactures; in 1770 all citizens were forbidden to hold intercourse with a schoolmaster who had continued to drink tea, and in 1776 a town-meeting directed the town clerk to proceed with his duties without reference to the Stamp Act. Norwich was chartered as a city in 1784. Among the early settlers in Ohio many were inhabitants of Norwich. Benedict Arnold was a native of Norwich; Mrs Lydia H. Sigourney was born here in a house still standing; Donald G. Mitchell ("Ik Marvel") was also born here; and Norwich was the birthplace of Alfred Buckingham (1804-1879), war governor of Connecticut.

See F. M. Caulkins, *History of Norwich* (Hartford, 1866).

NORWICH, a city and county of a city, municipal, county and parliamentary borough, and the county town of Norfolk, England; 114 m. N.E. by N. from London. Pop. (1901), 111,793. It is served by the Great Eastern railway and also by the Midland and Great Northern joint line. The Great Eastern company owns the Thorpe and Victoria stations, and the joint line the City station. The city lies in the valley of the Wensum, which joins the Yare immediately below. The ancient city lay in a deep bend of the Wensum, and the walls (1294-1299) with their many towers and gateway houses, of which fragments only remain, were 4 m. in circuit. These narrow limits, however, were long ago outgrown, for Evelyn writes in 1671 that "the suburbs are large, the prospects sweet, with other amenities, not omitting the flower gardens, in which all the inhabitants excel." The castle, standing high upon a steep mound, is still partly surrounded by earthworks and a ditch spanned by a very early bridge. Only the early Norman square keep remains, with four tiers of arcading without, and an ornate doorway into the great tower. The building long served as a prison, but, on the erection of a new and without the city, was acquired in 1884 by the corporation and in 1894 adapted as a museum and art gallery.

The cathedral church of the Holy Trinity lies between the castle and the river, on low ground. In 1503 the seat of the East Anglian bishopric was removed by Bishop Herbert de Loozing or Lorrainne from Thetford to Norwich, where in 1095 he laid the foundation of the cathedral and dedicated it in 1101, establishing at the same time a Benedictine monastery. As completed by his successor before the middle of the 12th century the cathedral in style was purely Norman; and it still retains its original Norman plan to a great degree. Changes and additions, however, were made from time to time—the Early English lady chapel (demolished about 1580) belonging to the middle of the 15th century; the Perpendicular spire, erected after the collapse of two previous spires of wood, to the 15th; the west window and porch and the lierne stone vaulting of the nave, with its elaborate 328 bosses, to the 15th; and to the 16th the vaulting of the transepts and Bishop Nix's chantry, whilst the fine cloisters, 175 ft. square, 12 ft. wide, with 45 windows, in style mainly Decorated, were begun in 1297 and completed till 1340. The following are the dimensions in feet of the cathedral: total length, 497; length of nave, 204; length of transepts, 178; breadth of nave and aisles, 72; total height of spire, 315 (in England exceeded by Salisbury only); height of tower, 149½; height of nave, 60½; height of choir, 83½. The chief entrance on the west is a Perpendicular archway, above which is an immense window filled with poor modern stained glass. The nave within is grand and imposing, of great length, divided by fourteen semi-circular arches whose massive piers are in two instances ornamented with spiral mouldings. The triforium is composed of similar arches. The side aisles are low, their vaultings plain. The choir, extending westward some way beyond the crossing, is of unusual length, and terminates in an apse. The oak stalls and misericores are very richly carved work of the 15th century. A curious quatrefoil, opening on the north side of the presbytery, beneath the confessio or relic chapel, deserves mention. There is a monumental effigy of Bishop Goldwell (c. 1499), and another of Bishop Bathurst (1537) by Sir P. Chantrey. Major Sir William Boleyn, great-grandfather of Queen Elizabeth, is buried on the south side of the presbytery, in the midst of which...
stood the tomb of Bishop Herbert, the founder. Of three circular apsidal chapels two remain; and in one—the Jesus chapel—the ancient colouring has been renewed. Two richly sculptured gateways lead to the cathedral—the Ethelbert gate (1420) and the Ethelbert gate (c. 1300). The bishop's palace and the deanery are buildings of high antiquity, but both have undergone many alterations. The latter has a well-restored chapter house. A beautiful Early Decorated twin in the palace garden, known as "Bishop Salmon's gateway," is supposed to have been the porch to the great hall (c. 1312). The diocese covers nearly all Norfolk, the greater part of Suffolk, and a small part of Cambridgeshire.

Of the remarkable number of churches, over forty in all, St Peter Mancroft is by many esteemed the finest parish church in England. Measuring 212 by 70 ft., it has a richly ornamented tower and flèche, 148 ft. high, with a beautiful peal of twelve bells, a long, light clerestory of thirty-four windows, a fine carved oak roof, a remarkable font cover, and the tomb of Sir Thomas Browne (d. 1682). The majority of the Norwich churches are of Perpendicular flint work, mostly of the 15th century. St Andrew, St Stephen, St Michael Coslany, with the fine Perpendicular Thorpe chapel, St John Maddermarket, St Lawrence, St Giles, with a tower 126 ft. high, St Gregory, St Helen, St Wthin, and St Michael at Plea (so called from the archdeacon's court held here) are also noticeable. The Roman Catholic church of St John the Baptist, begun in 1884 from designs by Sir G. G. Scott, occupies a commanding position outside St Giles's gate. At Carrow, E. of the city, there remain the hall, a decorated doorway, and other fragments of a Benedictine nunnery.

The grammar school is a Decorated edifice, formerly a chapel of St John, of c. 1316, with a "carnary" or crypt below. Among its scholars were Sir Edward Coke, Lord Nelson, Rajo Brooke and George Borrow, the traveller and author, in whose work *Lavengro* (chap. xiv.) occurs a noteworthy description of Norwich. St Andrew's Hall (124 by 64 ft.) is the seven-bayed nave of the Black Friars’ church, rebuilt with the aid of the Epehrings between 1440 and 1470. It is a splendid specimen of Perpendicular work, with its twenty-eight clerestory windows and chestnut hammer-beam roof, and has served since the Reforma- tion as a public hall, in which from 1824 have been held the triennial musical festivals. It was restored in 1863. The guildhall, on the site of an earlier tolbooth, is a fine flint Perpendicular structure of 1408–1413; the mayor's council-chamber, with furniture of the time of Henry VIII., is an interesting specimen of a court of justice of that period. The city regalia, kept here, include several objects of historical interest, amongst them a sword of a Spanish admiral captured by Nelson, with his auto-graph letter to him. The city has a curious figure formerly used in the procession of the mayor elect through the city. Other public buildings include a shire hall, within the castle precincts, corn exchange, agricultural hall, volunteer drill hall, barracks and gable on Mousehold Heath, the Norwich and Norfolk Library, rebuilt in 1900 after a fire, and a theatre. Educational establishments, besides the grammar school, include the Norwich and Ely Diocesan Training College, and the Municipal Technical Institute. The museum in the castle contains collections of British birds, insects, fossils, antiquities, and MSS. and early books. The chief charitable institutions are the Norwich and Norwich Hospital, lunatic asylum, blind asylum and schools. Jenny Lind Infirmary for children, a soldiers' and sailors' institute, St Giles's or old men's hospital (an ancient foundation), and Doughty's Hospital (1867).

The principal industries include foundries and engineering works, iron and wire fence works, brewing, brick works, chemical works, tanneries, and the production of mustard, starch, and crêpe, gauze and lace; and there are large boot and shoe factories. The great cattle market lies below the castle. The municipal, county, and parliamentary boroughs are coextensive. The parliamentary borough returns two members. The city is governed by a lord mayor (this title having been conferred in 1910), 16 aldermen and 48 councillors. Area, 7905 acres.

**History.**—There is no conclusive evidence that Norwich (Northwic, Norvijc) was an important settlement before the coming of the Angles. Caistor-by-Norwich, 4 m. S. of Norwich, is on the site of what was probably a Romano-British country town. A few Roman remains have been discovered in Norwich, itself, but not enough to indicate any real occupation or habitation. According to tradition Uffa made a fortification here about 579, but its history as a royal borough cannot be traced before the reign of Æthelstan (924–940), when it possessed a mint. After being destroyed by the Danes Norwich enjoyed a period of prosperity under Danish influence and was one of the largest boroughs in the kingdom at the Conquest. Ralph de Guader, earl of East Anglia under William I., formed the nucleus of a French borough with different customs from the English, and after his forfeiture, which involved the ruin of many of the old burgesses, a masonry castle was built and the centre ofburghal life gradually transferred to the new community west of it. By 1158, when Henry II. granted the burgesses a charter confirming their previous liberties, the two boroughs seem to have amalgamated. A fuller charter given by Richard I. in 1194 and confirmed by later sovereigns made Norwich a city enjoying the same liberties as London. From Henry IV. the citizens obtained a charter (1402), making their city a county with a mayor and two sheriffs instead of four bailiffs, and Henry V. added twenty-four aldermen and sixty common councilmen (1418). The cathedral precinct became parcel of the city at the Dissolution and in 1556 the neighbouring hamlets were incorporated in the county of Norwich. The charter of Charles II. (1663) remained in force until 1835 when one sheriff was abolished and the number of aldermen, common councilmen and wards diminished. Since 1208 Norwich has been represented in parliament by two members. Two annual fairs, existing before 1332, were formally granted to the city in 1482. One was then held in Lent, the other began on the feast of the Commemoration of St Paul (the 30th of June). These have been succeeded by the Maunday Thursday horse and cattle fair, and the pleasure fairs of Easter and Christmas. The market, which must have existed before the Conquest, was held daily in the 13th century, when divers enclosures staffed by royal licence. Edward III. made Norwich a staple town, and the importance of its trade in wool and worsted dates from his reign.

See *Victoria County History, Norfolk; W. Hudson, Records of the City of Norwich* (1906).

**NORWICH,** a village and the county-seat of Chenango county, New York, U.S.A., on the Chenango river, 42 m. N.E. of Binghamton. Pop. (1910 census), 7422. It is served by the Delaware, Lackawanna & Western and the New York, Ontario & Western railways. The village has three parks, two schools, a public school and a grammar school. The Chenango Valley Memorial Library and the Chenango Valley Home for Aged Women. Norwich is in a dairying and farming region, where hops especially are grown; and there are bluestone quarries in the vicinity. There are a variety of manufactures, and the New York, Ontario & Western has repair shops and division headquarters here. The first settlement was made in 1792, and the village was incorporated in 1857.

**NORWOOD,** a southern district of London, England, partly in Surrey and partly in the county of London (metropolitan borough of Lambeth). The district is hilly and well wooded, hence the name. It is divided into Upper Norwood, and South Norwood, all consisting principally of villa residences and detached houses inhabited by the better classes. Among numerous institutions are almshouses for the poor of St Saviour's, Southwark, opened at South Norwood in 1863, a Jewish convalescent home in 1869, and the Royal Normal College and Academy of Music for the Blind at Upper Norwood in 1872. At Gipsy Hill, Upper Norwood, lived Margaret Finch, queen of the Gypsies, who died in 1749 at the age of 105, and was buried in the churchyard at Beckenham.

Norwich—Ohio, a township in Norfolk county, Massachusetts, about 1 m. S.W. of Boston. Pop. (1900) 5840 (1497 foreign-born); (1910) 8014; area about 10 sq. m. Norwich is served
by the New York, New Haven & Hartford railroad. The township is traversed by the Neponset river. It has the Morrill Memorial Library (12,000 volumes in 1900). Norwood's manufactures include printing-ink and glue factories, tanneries, an iron foundry, and the printing-presses and binderies of J. S. Cushing Co., H. M. Plipton & Co., and the Norwood Press Co. Originally the South or Second Precinct of Dedham, Norwood was incorporated as a township (with the addition of a part of Walpole) under its present name in 1872.

See D. Hamilton Hurd, History of Norfolk County, Massachusetts (Philadelphia, 1864).

Norwood, a city of Hamilton county, Ohio, U.S.A., adjoining Cincinnati on the N. E. Pop. (1900), 6480 (718 foreign-born); (1910) 16,185. It is served by the Baltimore & Ohio South Western and the Cincinnati, Lebanon and Northern railways, and by interurban electric railways. Norwood has various manufactures, but as one of the hill suburbs of Cincinnati it is primarily a place of residence. It has a Carnegie library (a branch of the public library of Cincinnati) and a Catholic maternity hospital. Norwood, originally called Sharpshurg, was settled about 1798, laid out as a town in 1873, incorporated as a village in 1888, and charted as a city in 1903.

Norzagaray, a town of the province of Bulacan, Luzon, Philippine Islands, on the Quingua river, about 25 m. N. by E. of Manila. Pop. (1903), 5131. The inhabitants are engaged chiefly in the cultivation of rice and Indian corn, and in lumbering; good timber grows on the neighbouring mountains, and some iron and gold have been found in this region. Near the town there is a sulphur spring. The language is Tagalog.

Nosairis also known as Ansary, sometimes Ansarray, the people who inhabit the mountainous country of N. Syria, which is bounded on the S. by the north end of the Lebanon at the Naher el-Kbr (Eleutherus), on the N. by Mt Casius, Antioch, and the Naher el-Asi (Orontes). Various settlements of them are found also in Antioch itself and in Tarsus, Adana, and a few other places, while in harvest time they come down as far as the Bis'a (Buka'a). From the time of Strabo until about two centuries ago, the country was famed for its wine, but now more for its tobacco (especially at Latakia). The total number of Nosairi inhabiting this country is variously estimated at from 120,000 to 150,000.

The origin of the name Nosairi is uncertain. Among the more probable explanations is that the name is derived from that of Mahomed ibn Nuqar, who was an Isma'ilite follower of the eleventh imam of the Shiites at the end of the 9th century. This view has been accepted by Nosairi writers, but they transfer Ibn Nuqar to the 7th century and make him the son of the vizier of Mouawiy L, while another tradition (cf. Abulfeda, Geog. vol. ii. p. 11, No. 7) identifies him with Nuqar, a freeman of the city of Basra. The truth of the first is, however, noteworthy that Pliny (Hist. nat. vi. 61) gives the name Nosairi to the inhabitants of this district.

In this part of Syria paganism remained even up to the middle ages (cf. Archives de l'Orient Latin, vol. ii. 2, p. 375), and there is a complete absence of churches of the 4th to the 7th centuries in these mountains. In the 7th century the Arabs invaded Syria, but do not seem to have got into these mountains. At the end of the 10th century, however, the Isma'ili propaganda won some success among the people. Their strongholds were taken by Raymond in 1099, and later Tancred secured the very summits. In 1127-1140 the Assassins (q.v.), gained possession of their chief towns, but Saladin recovered them in 1188. In 1137 the sultan Bilbar endeavoured to convert them to orthodox Islam, and built many mosques, but Ibn Battuta (g. 177) says they did not use them. A fatwa of Ibn Taimiyya (d. 1327) of this time shows that the Nosairis were regarded with fear and hatred by the orthodox. For the next 500 years they were given over to their own internal disputes, until they came under the power of Ibrahim Pasha in 1852. At the present time they are under the direct administration of the Turks.

Religion of the Nosairis seems to have been almost the same in the first years of the 5th century A.D. (11th century A.D.) as it is to-day, judging by the references in the sacred books of the Druses. As set forth in their own sacred book, the Ma'vat, it seems to be a syncretism of Isma'ilite doctrines and the ancient heathenism of Harran. The ages of the world are seven in number, each of these having its own manifestation of deity. But the manifestation of the 7th age is not a Mahdi who is yet to come, but the historical person 'Ali ibn abu Talib. This is stated in the crudest form in Sura 11 of the Ma'vat: "I testify that there is no god but 'Ali ibn abu Talib." 'Ali is also called the Ma'vat ("Idea", cf. the Logos of the New Testament), hence the Nosairis are also called the Ma'awalya. 'Ali created Mahomet, who is known as the Iam ("Name"), and a trinity is formed by the addition of Salman ul-Farisi, who is the Bâb ("Door"), through whom the propaganda is made, and through whom one comes to God. A mysterious symbol much used in their ceremonies of initiation consists of the three letters 'Aim, Mîm, Sîn, these being the initials of 'Ali, Mahomet and Salman. Of these three, however, 'Ali is the supreme. In Sura 6 of the Ma'vat the Nosairi says: "I make for the Door, I prostrate myself before the Name, I worship the Idea." Each of the seven manifestations of God in the ages of the world has been opposed by an adversary.

The Nosairis are divided into four sects. (1) The Haidaris (from the name haidari, "lion," given to 'Ali on account of his valour) are the most advanced. (2) The Shamallis or Shamais preserves many traces of the old nature-worship. 'Ali (i.e. the supreme god) is the heaven, Mahomet is the sun, Salaman the moon. (3) On the other hand the Kalazis, so named from a sheik Mohammed Ibn Kalazi (cf. E. Salisbury in the Journal of the American Oriental Society, xvi. 237), or Qimarais, hold that the supreme god ("Ali) is the moon, not the sun. Their poetry addressed to the moon is translated by C. Huart in the Journal asiatique, ser. vii. vol. xiv. pp. 190 ff. (4) The Ghailbis are worshippers of the air, for God is invisible. In this they come nearer to the ordinary Isma'ilite doctrine. Religion is restricted among the Nosairis to the initiated, who must be adults over fifteen years of age and of Nosairi parentage. The initiator, who must not be a relative, becomes a spiritual father, and the relation cannot be broken except by his consent. The initiation consists of three stages. In the first the novice is received and told to meditate on the three mystic letters; in the second, after a period of forty days, he is taught the titles of the 16 suras of the Ma'vat; in the third, after seven or nine months (intended to correspond with the ordinary period of gestation), he is taught Suras 5, 6 and 9, learns the meaning of the three mystic letters and goes through a further period of instruction from his initiator. The initiated are divided into two classes, the sheiks, who are recruited from the families of sheiks only, and the ordinary members.

The public buildings and the private houses, especially those in the suburbs, are unusually good.

Nosari, or Navsari, a town in India, in the state of Baroda, on the left bank of the Purna river, 147 m. by rail N. of Bombay. Pop. (1901), 21,451. It is an ancient place, known to Ptolemy as Nasaria. It was one of the earliest settlements of the Parsees in Gujarat, after their abandonment from Persia in the 12th century. It is still the home of their nobods, or sacerdotal class, and contains their most venerated "fire temple." Many small industries are carried on, including the weaving of the kusti, or sacred thread of the Parsees. There is also considerable trade both rail and by river, for the river is navigable. The public buildings and the private houses, especially those in the suburbs, are unusually good.
NOSE (O.Eng. nos, cf. Dutch neus, Swed. nos, snout; the connexion with O.Eng. nase is obscure, cf. Ger. Nase, Lat. nasus, nostrils, nasus, nose, Fr. nez), the organ of the sense of smell (q.v.) in man and other animals (see Olfactory System). The projecting feature above the mouth, to which the word is usually restricted in man, is, in the case of the lower animals, called snout or muzzle, or, if much prolonged, proboscis or trunk. “Nostril,” the external opening into the nose, is from O.Eng. noster (“nose”); in modern English it is regarded as obsolete.

NOSOLOGY (Gr. νόσος, disease, and λέγος, science), that branch of medical science which deals with the classification of diseases; the term is applied also to a collection of diseases, and to the special character of a particular disease and the different opinions concerning it.

NOSSA, a town of Germany, in the kingdom of Saxony, pleasantly situated on the Freiberger Mulde, 51 m. S.E. from Leipzig by the railway to Dresden via Döbeln, and at the junction of a line to Moldau. Pop. (1903), 4879. It possesses an ancient castle crowning a height above the river, and has extensive manufactures of boots and shoes, leather and paper. In the immediate vicinity are the ruins of the Cistercian monastery of Altenzella, or Altzella, founded in 1145, and a noted school of philosophy during the 13th-15th centuries. In the chapel, which was built in 1347 and restored in 1577, lie the remains of ten margraves of Meissen, members of the family of Wettin. The foundation was secularized in 1544. The valuable annals, Chronicon vetere Cellense majus and Chronicon minus, giving a history of Saxony during the 13th and 14th centuries, were removed to the university library of Leipzig in 1544. They are printed in Band xvi. of the Monumenta Germaniae historica. scriptores (1859).

See E. Beyer, Das Cisterciensitift und Kloster Alt-Cella (Dresden, 1855).

NOSSI-BE, properly Nösy-bé, i.e., “Great island,” an island about 8 m. off the N.W. coast of Madagascar, in 13° 23′ S., 48° 15′ E. It is 14 m. long by 10 broad, and has an area of 130 sq. m. Nossi-bé is volcanic, the N. and S. parts of older, the central part of more modern date. Besides a number of true volcanic craters (Lökobé, the highest point, is 1486 ft. above the sea) there are numerous crater-lakes level with the ground (see Nature, March 1877, p. 477). The climate is similar to that of Mbayote (see Comoro Islands), and the neighbouring islet of Nossi-komba, about 2000 ft. above the sea, serves for a sanatorium. Pop. (1902), 9291. Hellville, the chief town (so called after De Heil, governor of Réunion at the time of the French annexation), is a port of call for the Messageries Maritimes and a centre for the coasting trade along the western shores of Madagascar. There is excellent anchorage, and a pier 800 ft. long. The soil is very fertile, and there are forests of palms and bamboos. The chief products are coffee, sesame, the sugar-cane, cocoa, vanilla and tobacco. There are numerous sugar factories and rum distilleries.

In 1837 Tsiamékko, chieftainess of one of the numerous divisions of the western Malagasy known under the common name of Sakalava, was expelled by the Hova and fled to Nossi-bé and Nossi-komba. Failing assistance from the imam of Muscat, she accepted French protection in 1840, ceding such rights as she possessed on the N.W. coast of the mainland. The French took possession in 1841, and in 1849 an unsuccessful attempt was made to expel them. The administration was entrusted to a subordinate of the governor of Mayotte until 1866, when Nossi-bé was placed under the administration of Madagascar (q.v.).

NOSTALGIA (Gr. νόστος, return home, and ἀλγός, grief), home-sickness, the desire when away to return home, amounting sometimes to a form of melancholia.

NOSTRADAMUS (1503-1566), the assumed name of Michel de Nortredame, a French astrologer, of Jewish origin, who was born in 1523 in Paris. He was educated at Perigueux on the 13th of December 1503. After studying humanity and philosophy at Avignon, he took the degree of doctor of medicine at Montpellier in 1529. He settled at Agen, and in 1544 established himself at Salon near Aix in Provence. Both at Aix and at Lyons he acquired great distinction by his labours during outbreaks of the plague. In 1555 he published at Lyons a book of rhymed prophecies under the title of Centuries, which secured him the notice of Catherine de’ Medici; and in 1558 he published an enlarged edition with a dedication to the king. The seeming fulfilment of some of his predictions increased his influence, and Charles IX. named him physician in ordinary. He died on the 2nd of July 1566.

The Centuries of Nostredamus have been frequently reprinted, and have been the subject of many commentaries. In 1568 they were condemned by the papal court, being supposed to contain a prediction of the fall of the papacy. Nostradamus was the author of a number of smaller treatises. See Bureest, Nostredamus (Paris, 1840).

NOSTRUM (neuter of Lat. noster, our), the name given to preparations of which the ingredients are not made publicly known, a patent or “quack” medicine; it is taken from the label (“of our own make”) formerly attached to such medicines.

NOTARY, or Notary Public. In Roman law the notarius was originally a slave or freedman who took notes (notae) of judicial proceedings in shorthand. The modern notary corresponds rather to the tabellio or tabularius than to the notarius. In canon law it was a maxim that his evidence was worth that of two unskilled witnesses.

The office of notary in England is a very ancient one. It is mentioned in the Statute of Provisors, 25 Edward III. stat. 4. The English notary is an ecclesiastical officer, nominated, since the Peterpence Dispensations Act 1533-1534, by the archbishop of Canterbury through the master of the faculties (now the judge of the provincial courts of Canterbury and York), in order to secure evidence as to the attestation of important documents. All registrars of ecclesiastical courts must be notaries. A notary’s duties, however, are mainly secular. “The general functions of a notary consist in receiving all acts and contracts which must or are wished to be clothed with an authentic form; in conferring on such documents the required authenticity; in establishing their date; in preserving originals or minutes of them which, when prepared in the style and with the seal of the notary, obtain the name of original acts; and in giving authentic copies of such acts” (Brooke, On the Office of a Notary, chap. iii.). The act of a notary in authenticating or certifying a document is technically called a “notarial act.” In most countries the notarial act is received in evidence as a semi-judicial matter, and the certificate of a notary is probative of the facts certified. But English law does not recognize the notarial act to this extent. An English court will, in certain cases, take judicial notice of the seal of a notary, but not that the facts that he has certified are true, except in the case of a bill of exchange protested abroad.

The most important part of an English notary’s duty is the noting and protest of foreign bills of exchange in case of non-acceptance or non-payment. This must be done by a notary in order that the holder may recover. He also prepares ship protests and protests relating to mercantile matters, and authenticates and certifies copies of documents and attests instruments to be sent abroad. The office of notary is now usually held by a solicitor. In London he must be free of the Scriveners’ Company.

In Scotland, before the reign of James III., papal and imperial notaries practised until the 29th of November 1460, when an act was passed declaring that notaries should be made by the king. It would appear, however, that for some time afterwards there were in Scotland clerical and legal notaries—the instruments taken by the latter bearing faith in civil matters. In 1551 an act was passed directing sheriffs to bring or send both kinds of notaries to the lords of session to be examined; and in a statute, passed in 1555, it was ordained that no notary, “by whatsoever power he be created,” should use the office “except he first present himself to the said lords, showing his creation, and be admitted by them thereto.” It does not appear that this statute was made with the object of making notaries in the court of session; but in 1561 it was by law declared that no person should take on him the office, under the pain of death, unless created by the sovereign’s
special letters, and thereafter examined and admitted by the lords of session. Since then the Court of Session has in Scotland exercised exclusive authority on the admission of notaries in all legal matters, spiritual and temporal. The position of notaries in Scotland is somewhat higher than it is in England.

In the United States, notaries are appointed by the governors of the states, and their authority to act is limited to the state to which they are appointed. They are state officers, and their duties are bound in a certain amount fixed by the government, as well as by affidavits and depositions; all such documents which are intended to be used in the federal courts must have the notarial seal affixed. They also protest bills of exchange, and in some states they have the powers of a justice of the peace.

In France, notaries receive all acts and contracts to which the parties thereto must give or desire to give the authenticity attached to the acts of a public authority; they certify the date, preserve the originals and give copies or duplicates. Notaries are nominated by the president of the republic on the recommendation of the keeper of the seals. They cannot act as notaries or practise as advocates, or hold any magisterial office, nor must they engage in business. Notaries are divided into three classes: those of towns which have a court of appeal; those of towns which have a court of first instance; those of the other towns and communes. The first and second classes can practise wherever the jurisdiction of their courts extends; the third class only in their canton. They must obtain the sanction of the minister of justice should they desire to change from one district to another. They must serve an apprenticeship of six years (with exceptions) to a notary of the class to which they desire to belong. Every notary must have a certain amount fixed by the government as security for the due discharge of his duties. Since 1896 the remuneration of the more important classes of notaries has been regulated by law. Each district has a chamber of notaries, which exercises disciplinary powers over its members.

In Germany, notaries are appointed by the president of the courts of law and the minister of justice in their respective states; they carry on their profession for their own benefit, and do not, except in Württemberg, receive any fixed salary, but take fees from the parties they represent. They may not refuse their services, save on good and sufficient ground. In some German states, notably Saxe-Weimar and Hesse-Darmstadt, there are no notaries. In Württemberg, Baden, Bavaria, Alsace-Lorraine, Rhenish Prussia and Austria, they form a distinct class, while in the other German states they generally combine the notarial office with that of advocate. There is no code of rules for the whole empire, the new Bürgerliches Gesetzbuch leaving it to each state to frame its own regulations.

NOTE (Lat. nota, mark, sign, from nascere, to know), a mark, particularly a sign by which a musical sound (also called a note) is indicated in writing (see also note). It is also applied to an abstract or memorandum of documents, speeches, &c. This appears to have been first in legal use, especially in the processes of the transfer of land by fine and recovery (see Fine). Further extensions of this meaning are to an explanation, comment or addition, added in the margin or at the foot of the page to a passage in a book, &c., or to a communication in writing shorter or less formal than a letter.

The ordinary distinction between note and letter is reversed in diplomacy. Diplomatic notes are written communications exchanged between diplomatic agents or between them and the ministers of foreign affairs of the government to which they are accredited; they differ from ordinary letters in having a more formal character and in dealing with matters of more immediate and definite importance: e.g. the notification of adhesion to a treaty, of the re-establishment of diplomatic relations after a war, &c. Sometimes, by agreement, a mere exchange of notes has the force of a convention. Collective notes are those signed by the representatives of several powers acting in concert. Sometimes identical notes are substituted for collective, i.e. notes identical as to form and substance, but signed and delivered separately by the representatives of the several powers. Thus in 1822, at the congress of Verona, in order to overcome the objection of Great Britain to any interference of the European concert in Spain, identical notes were presented to the Spanish government instead of a collective note. Circular notes are those addressed by one power to the other powers generally, e.g. that addressed by Thiers (November 9, 1870), on the proposed armistice, to the representatives of the great powers accredited to the government of national defence. Confidential notes are directed to inspiring confidence by giving an explicit account of the intentions of the plenipotentiaries and their governments. Such a note was sent, for instance, by the plenipotentiaries of the allied powers at the conference of Poree, on the 8th of December 1828, to Capo d'Istria, the Greek president, to instruct him confidentially as to the results of their deliberations. The so-called notes verbales are unsigned, and are merely of the nature of memoranda (of conversations, &c.). Notes ad referendum are addressed by diplomatic agents to their own governments asking for fresh powers to deal with points not covered by their instructions, which they have had to "refer." Diplomatic notes are usually written in the third person; but this rule has not always been observed (see P. Pradier-Fodere, Cours de droit diplomatique, Paris, 1899; vol. ii. p. 524).

For notes of hand or promissory notes see Negotiable Instruments and Bill of Exchange, and for notes passing as currency see Banks and Banking, Bank-Note and Post.

NOTHOMB, JEAN BAPTISTE, BARON (1805-1881), Belgian statesman and diplomat, was born at Messancy in Luxemburg on the 3rd of July 1805. He was educated at the Atheneaum of Bruxelles and the University of Liége, and was called to the bar when the revolution of August broke out, but was nominated a member of the commission appointed to draw up the constitution. He was a member of the national congress, and became secretary-general of the ministry of foreign affairs under Surlet de Chokier. He supported the candidature of the duke of Nemours, and joined in the proposal to offer the crown to Prince Leopold of Saxe-Coburg, being one of the delegates sent to London. When the Eighteen Articles were replaced by the Twenty-four less favourable to Belgium, he insisted on the necessity of compliance, and in 1839 he faced violent opposition to support the territorial cessions in Limburg and Luxemburg, which had remained an open question so long as Holland refused to acknowledge the Twenty-four Articles. His Essais historique et politique sur la révolution belge (1838) won for him the praise of Palmerston and the cross of the Legion of Honour from Louis Philippe. In 1837 he became minister of public works, and to him was largely due the rapid development of the Belgian railway system, and the increase in the mining industry. In 1840 he was sent as Belgian envoy to the Germanic Confederation, and in 1848 was nommed ambassador of the Leubeu notes, he organized the new cabinet, reserving for himself the portfolio of minister of the interior. In 1845 he was defeated, and retired from parliametary life, but he held a number of diplomatic appointments before his death at Berlin on the 6th of September 1881.

See T. Juste, Souvenirs du baron Notthomb (Brussels, 1882).

NOTICE, a term primarily meaning knowledge (Lat. notitia), as in "judicial notice"; thence it comes to signify the means of bringing to knowledge, as in "notice to quit"; at last it may be used even for the actual writing by which notice is given. The most important legal uses of the word are judicial notice and the equitable doctrine of notice. Judicial notice is the recognition by courts of justice of certain facts or events without proof. Thus in England the courts take judicial notice of the existence of states and sovereigns recognized by the sovereign of England, of the dates of the calendar, the date and place of the sitting of the legislature, &c. The equitable doctrine of notice is that a person who purchases an estate, although for valuable consideration, after notice of a prior equitable right, will not be enabled by getting in the legal estate to defeat that right. On the other hand, a purchaser for valuable consideration without notice of an adverse title is not protected in his enjoyment of the property. Other common uses of the word are notice to quit, i.e. a notice required to be given by landlord to tenant, or by tenant to landlord in order to terminate a tenancy
NOTKER—NOTTINGHAM, EARLS OF

(see LANDLORD AND TENANT); notice of dishonour, i.e. a notice that a bill of exchange has been dishonoured; notice of action, i.e. a notice to a person of an action intended to be brought against him, which is required by statute to be given in certain cases; notice of trial, i.e. the notice given by a plaintiff to a defendant that he intends to bring on the cause for trial; notice in lieu of personal service of a writ, i.e. by advertisement or otherwise; notice given by one party in an action to the other, at a trial, respecting the possession or power; notice to treat, given under the Land Clauses Acts by public bodies having compulsory powers of purchasing land as a preliminary step to putting their powers in force. Notice may be either express or constructive. The latter is where knowledge of a fact is presumed from the circumstances of the case, e.g. notice to a solicitor is usually constructive notice to the client. Notice in some cases may be either oral or written. It is usually advisable to give written notice even where oral evidence is sufficient in law, as in the case of notice to quit. The American use of notice is practically the same as in England.

NOTNER, a name of frequent occurrence in the ecclesiastical history of the middle ages. NOTKER BALBULUS (c. 840–912) was a native of northern Switzerland, and for many years magister in the school of St Gall. He compiled a martyrology and other works, but is famous for his services to church music and for the "sequences" of which he was the composer. He was canonized in 1513. His life is in the Bohllandist Acta Sanctorum, April 6th. NOTKER LARBE (d. June 29th, 1022) was also an instructor at St Gall. His numerous translations, including those of the Old Testament Psalms, the categories of Aristotle, the De natura rerum of Martianus Capella, and the De consolatione of Boethius, into Old High German, may possibly have been the work of his pupils. They possess considerable philological interest, and have been edited by E. G. Graff (Berlin, 1837–1847), and by P. Piper under the title Notker et dea Schriften (1883–1884).

NOTO, a city of Sicily, in the province of Syracuse, and 20 m. S.W. of it by rail, 520 ft. above sea-level. Pop. (1901) 22,564. The present town, rebuilt after the earthquake of 1693, has some fine buildings of the early 18th century. The older town lies 5 m. direct to the north (1378 ft.). It was the ancient Noto, a city of Sicel origin, left to Hiero II. by the Romans by the treaty of 263 B.C. and mentioned by Cicero as a foedere civitas (Verr. v. 51. 133), and by Pliny as Latinae conditionis (H.N. iii. 8. 14). The remains of this city are almost entirely hidden beneath the ruins of the medieval town, except three chambers cut in the rock, one of which is shown, by an inscription in the library at Noto, to have belonged to the gymnasium, while the other two were heroi, or shrines of heroes. But explorations have brought to light four cemeteries of the third Sicel period, and one of the Greek period, of the 3rd and 2nd centuries B.C. There are also catacombs of the Christian period and some Byzantine tombs. See P. Orsi in Notizie degli scavi, 1897, 69–90. Four miles to the S. of Noto, on the left bank of the Tellaro (Helorus) (E. Pais, Ataka, Pisa, 1891, p. 75 seq.) stands a stone column about 35 ft. in height, which is believed to be a memorial of the surrender of Niças. This is uncertain; but, in any case, in the 3rd century B.C. a tomb was excavated in the temple in which it stood and, destroying apparently a pre-existing tomb. The later builders of the town added to the temple of the small town of Heloros, 750 yds. to the S.E., some remains of which have been discovered. It was a small advanced post of Syracuse, belonging probably to the 6th century B.C. See P. Orsi in Notizie degli scavi, 1899, 241.

NOTT, ELPHIALET (1773–1866), American divine, was born on the 25th of June 1773 at Ashford, Connecticut. He was left an orphan without resources, but graduated in 1795 at Brown University. In 1804 he became president of Union College, Schenectady, New York, a position which he held till his death on the 29th of January 1866. He found the college financially embarrassed, but succeeded in placing it on a sound footing. He was also known as the inventor of the first stove for anthracite coal. His publications include sermons, Counsels to Young Men (1610), and Lectures on Temperance (1647). Life by C. van Santvoort (ed. Taylor Lewis, 1876).

NOTT, SIR WILLIAM (1782–1845), English general, was the second son of Charles Nott, a Herefordshire farmer, who in 1794 became an inmate of St. Carmarthen. William Nott was indifferently educated, but he succeeded in obtaining a cadetship in the Indian army and proceeded to India in 1800. In 1825 he was promoted to the command of his regiment of native infantry; and in 1838, on the outbreak of the first Afghan war, he was appointed to the command of a brigade. From April to October 1839 he was in command of the troops left at Quetta, where he rendered valuable service. In November 1840 he captured Khelat, and in the following year compelled Akbar Khan and other tribal chiefs to submit to the British. On receiving the news of the raising of the Afghans at Kabul in November 1841, Nott took energetic measures. On the 23rd of December the British envoy, Sir William Hay Macnaghten, was murdered at Kabul; and in February 1842 the weak and incompetent commander-in-chief, General Elphinstone, sent orders that Kandahar was to be evacuated. Nott at once decided to disobey, on the supposition that Elphinstone was not a free agent at Kabul; and as soon as he heard the news of the massacre in the Khyber Pass, he urged the government at Calcutta to maintain the garrison of Kandahar with a view to avenging the massacre and the outrages which had been committed. Nott having been given a severe defeat on the enemy near Kandahar, and in May drove them with heavy loss out of the Baba Wall Pass. In July he received orders from Lord Ellenborough, the governor-general of India, to evacuate Afghanistan, with permission to retire by Kabul. Nott arranged with Sir George Pollock, now commander-in-chief, to join him at Kabul. On the 3oth of August he routed the Afghans at Ghazni, and on the 6th of September occupied the fortress, from which he carried away, by the governor-general's express instructions, the gates of the temple of Somnath; on the 17th he joined Pollock at Kabul. The combined army recrossed the Sutlej in December. Nott's services were most warmly commended; he was immediately appointed resident at Lucknow, was presented with a sword of honour, and was made a G.C.B. In 1843 he returned to England, where the directors of the East India Company voted him a pension of £1000 per annum. He died at Carmarthen on the 1st of January 1845.

NOTTINGHAM, EARLS OF. The English title of earl of Nottingham has been held by different families, notably by the Mowbrays (1377 to 1475; merged in the Norfolk title from 1397), the Howards (1596–1681), and the Finches (1685; since 1720 united with that of Winchilsea). For the Howard line see the separate article below. Here only the ancestors of the Finch line are dealt with.

HENAGE FINCH (1621–1682), first earl of Nottingham in the Finch line, lord chancellor of England, was descended from an old family (see FINCH, FINCH-HATTON), many of whose members had attained to high legal eminence, and was the eldest son of Sir Heneage Finch, recorder of London, by his first wife Frances, daughter of Sir Edmund Bell of Beaupré Hall, Norfolk. In the register of Oxford university he is entered as born in Kent on the 23rd of December 1621, and probably his native place was Eastwell in that county. He was educated at Westminster and at Christ Church, Oxford, where he remained till he became a member of the Inner Temple in 1638. He was called to the bar in 1645, and soon obtained a lucrative practice. He was a member of the convention parliament of April 1660, and shortly afterwards was appointed solicitor-general, being created a baronet the day after he was knighted. In May of the following year he was chosen to represent the university of
draw your forces round about you like a mighty prince to defend you. Truly, Madam, if you do so, there is no cause for fear."

On the approach of the Armada on the 6th of July 1588, Howard describes thus the disposal of his forces: "I have divided myself here into three parts, and yet we lie within sight of one another, so as if any of us do discover the Spanish fleet we give notice thereof presently the one to the other and thereupon repair and assemble together. I myself do lie in the middle of the channel with the greatest force. Sir Francis Drake hath 20 ships and 4 or 5 pinnaces which lie beyond Ushant and Mr Hawkins with as many more lie towards Scilly." He directed the various engagements (see ARMADA), and stayed himself to conduct the attack on the "San Lorenzo," stranded off Calais, arriving in consequence at the great fight off Gravelines some time after the engagement had begun. His tactics have been criticized both by contemporary and by later authorities, but his position was a perilous one, exposed to an overwhelming force of the enemy, and rendered still more difficult by the queen's untimely economy, Howard himself contributing largely to the naval expenses and to the relief of the numerous seamen poisoned by bad food and landed at Margate. "It were too pitiful to have men starve after such a service." Instead of risking all in a pitched battle with the enemy, a course which probably appealed more to his dashing subordinates, he resolved to pursue the less heroic method of "plucking their feathers little by little," and his prudence, while justified by the result, was served by pursuing the last attack and the forts destroyed; the naval prizes, however, but for this diversion would have been more numerous. The council of war then refusing to countenance any further attempts on land, Howard and Essex returned with the expedition to England. On the 22nd of October 1596 Howard was created earl of Nottingham.

In February 1598, on a scare of an intended invasion, he was ordered to take measures for the defence of the country, and again in 1599, when he was appointed "Lord Lieut.-general of the Tower," and, by the same grant, was also greatly praised by so good a judge as Raleigh. Shortly afterwards, under Howard's directions, a "Relation of Proceedings" was drawn up (now printed in the Navy Records Society Publications, i. 1-18).

In 1596 Howard and Essex commanded the expedition against Cadiz, when a squadron of the enemy's ships was destroyed and two of the number brought home. Howard's intention was to limit the expedition entirely to naval operations, but Essex insisted on landing, and Howard, who had been specially charged by Elizabeth to protect her favourite, was obliged to follow. The result was that the town was sacked and the forts destroyed; the naval prizes, however, but for this diversion would have been more numerous. The council of war then refusing to countenance any further attempts on land, Howard and Essex returned with the expedition to England. On the 22nd of October 1596 Howard was created earl of Nottingham.

NOTTINGHAM

a staunch Protestant,¹ was commissioner in Surrey for inquiring after recusants,² and in the diocese of Winchester for hearing ecclesiastical causes; he sat on the government commission for discovering and expelling Roman Catholic priests, and was mentioned in 1602 from Douay as one of the three enemies most feared by the recusants.

He served on the commission on the navy in 1618 and of the abuses then exposed, Lord Nottingham, though no blame was attached to himself, being now an old man over eighty years of age, vacated his office of lord high admiral, receiving the sum of £3000 with a pension of £1000, and being granted a special precedence, limited to his person, as earl of Nottingham of the earlier Mowbray creation, and still keeping the lord-lieutenancy of Surrey. He died at Haling House, near Croydon, on the 14th of December 1624, and was buried at Reigate, a monument being afterwards placed to his memory in St Margaret's church at Westminster. He was a striking and almost heroic figure in the Elizabethan annals, an unworthy leader of such men as Drake, Hawkins and Raleigh, the defender of his country at a time of imminent peril, and by his splendid character and services he was placed beyond the reach of the intrigues and jealousies which troubled the reputation of many of his contemporaries and above even the suspicion of ill-doing.

Lord Nottingham married (1), in July 1563, Catherine, daughter of Henry Carey, 1st Lord Hunsdon, cousin to the queen, by whom he had, besides three daughters, two sons—William, who died in his father's lifetime, and Charles (1575-1642), who succeeded as second earl of Nottingham; and (2), Margaret, daughter of James Stuart, earl of Murray, by whom he had two sons, the youngest of whom, on the death of his half-brother without male issue, succeeded as third earl of Nottingham; on his dying childless in April 1681 the earldom became extinct, the barony of Evingham passing to the descendants of the first earl of Nottingham's younger brother, Sir William Howard, from whom the fourth earl of Evingham (creation of 1837) and 14th baron Howard of Evingham (b. 1866), who succeeded in 1868, was descended.

NOTTINGHAM, a city and county of a city, municipal, county and parliamentary borough, and county town of Nottinghamshire, England. Pop. (1901) 230,743. It stands on the left (north) bank of the Trent and its tributary the Leen. It is 125 m. N.N.W. from London by the Midland railway, and is also served by the Great Central and Great Northern railways. Water communications are afforded by the Grantham canal eastward, by the Nottingham and Erewash canals westward, communicating with the Cromford canal in Derbyshire, and by the Trent. The plan of the town is irregular, and the main thoroughfares are generally modern in appearance, many of the old narrow streets having been wholly altered or renewed. About the centre of the town is an open market-place some 52 acres in area, said to be the largest of its kind in England. Nottingham Castle occupies a fine site to the S., on an abrupt rocky hill. The ancient remains are not large, including only a restored Norman gateway and fragments of the fortifications. In 1878 the site was acquired on lease by the corporation, and the building was opened as the Nottingham and Midland Counties Art Museum. The church of St Mary is a fine Perpendicular cruciform structure, with a central tower and a four-light east window in the main's church. But there are traces of an earlier building at St Nicholas' church, near the castle, is a plain building of brick dating from 1676. There are several handsome modern churches, among which is the Roman Catholic cathedral of St Barnabas, from the designs of A. W. Pugin, erected in 1842-1844. There are a large number of Nonconformist places of worship. The principal secular buildings are the guildhall and city sessions court (1887), the shire hall, the Albert Hall and the Exchange; there are two principal theatres, the Theatre Royal and the Empire Theatre. Among educational establishments the principal is University College, for which a fine range of buildings was opened in 1881, containing the free municipal library and the museum of natural history. The free grammar school, founded in 1537, for some time in disuse, was revived in 1807, and on its removal in 1868 to new buildings, became known as the High School. There are also the Nottingham High School for girls; the blue-coat school, founded in 1723; the People's College, founded in 1846; two technical schools; the Congregational Institute; and the Nottingham school of art, for which a fine building was erected in 1865 in the Italian style. The Midland Baptist college was transferred from Chilwell to Nottingham in 1882.

The General Hospital was founded in 1781, and there are the Nottingham and Midland eye infirmary, the county asylum and the Midland institution for the blind. The Arboretum and the Forest are the principal public pleasure-grounds; the county cricket club plays matches on the Trent Bridge ground, and there is a racecourse at Colwick, E. of the city. To the N.W., but within the city boundaries, are the industrial districts of Radford and Basford, beyond which lies Bulwell, with collieries, limestone quarries and earthenware manufactures. Bestwood Park, in the vicinity, contained a hunting lodge of Henry I., being included in Sherwood Forest. To the N., Sherwood is a growing residential district; another extends towards Gedling on the E. Southward, across the Trent, West Bridgford is another large residential suburb. To the W. is Lenton, and Beeston has become a populous suburb mainly owing to the establishment of large cycle and motor works.

Nottingham itself became an important seat of the stocking trade in the latter part of the 18th century. It was here that Richard Arkwright in 1769 erected his first spinning frame, and here also James Hargreaves had the year previously removed with his spinning Jenny after his machine had been destroyed by a mob at Blackburn. Nottingham has devoted itself chiefly to cotton, silk and merino hosiery. Up to 1815 point lace was also an important manufacture. In 1808 and 1809 John Heathcoat obtained patents for machines for making bobbin net, which inaugurated a new era in the lace manufacture. The industries also include bleaching, the dyeing, spinning and twisting of silk, the spinning of cotton and woollen yarn, tanning, engineering and brewing, while cycle works and tobacco factories are important, and the industries have the advantage of the close proximity of coal-mines. Besides the general market there is a large cattle market.

Nottingham received its style of a city and county of a city by letters patent of the 7th of August 1897. The parliamentary borough returns three members to parliament, being divided into W., E. and S. divisions. The city is governed by a mayor, 16 aldermen and 48 councillors. Area, 10,933 acres.

The advantageous position of Nottingham (Snootsgam, Nottingham) on the Trent, where it was crossed by an ancient highway, accounts for its origin, whether in Roman or Saxon times. The Saxon form of the name is taken to refer to the caves, anciently used as dwelling-places, which were hollowed out of the soft sandstone. Examples of these occur in the Castle rock, in the Rock Holes W. of the castle, in the suburb of Sneinton and elsewhere. It was chosen by the Danes for their winter quarters in 868, and constituted one of their five burhs. In 922 it was secured and fortified by Edward the Elder, who in 924 built a second "thor" opposite the first and connected with it by a bridge over the river. Æthelstan, the successor of Edward the Elder, established there a royal mint. In 1013 the town submitted to Sweyn. William I. erected a castle, and mention of a new borough occurs in Domesday Book, and this seems to be the first evidence of the existence of the "French borough" which grew up in Nottingham under the Normans, and was distinguished from the English borough by the different customs which prevailed in it. Parliaments were held at Nottingham in 1334, 1337 and 1357, and it was the scene of the conference of the judges with Richard II. in August 1387. Several important persons have been imprisoned in the castle, among others David II. of Scotland. Edward IV. assembled his troops at Nottingham in 1461; and it was the headquarters of Richard III. before the battle of Bosworth in 1485. In 1642 Charles I. finally broke with

¹ See esp. his letter to Walsingham, Naval Record Soc. Pub. l. 65.
the Parliament by setting up his standard at Nottingham, and during the ensuing Civil War the castle was held by each of the two parties more than once. In 1644 it was dismantled by Cromwell’s orders.

Henry I. granted the first extant charter, which confirmed to the burgesses the liberties they had under Henry I., referred to a market on Saturdays, and forbade the working of dyed cloth, except in Nottingham, within ten leagues of the borough. This was confirmed by John, who also granted a gild-merchant, Henry III. allowed the burgesses to hold the town in free-farm, and Edward I. granted them a mayor and two bailiffs, one to be chosen from each borough. Henry VI. confirmed all preceding privileges, first incorporated the mayor and burgesses, and granted that the town, except the castle and the gaol, should be a county of itself. 2 700 serfs were the two bailiffs. This charter remained, except for temporary surrenders under Charles II. and James II., the governing charter of the corporation until the Municipal Act of 1835.

Nottingham returned two members to parliament from 1295 until 1885, when the number was increased to three. Edward I. granted eight days’ fair in September and a fifteen-days’ fair in November, the last altered by Richard II. to a five-days’ fair in February. Two other fairs were granted by Anne; one large fair, Goose Fair, is still held. This begins on the first Thursday in October and lasts for five days. The market where it is held on Saturdays is held by prescriptive right. Besides the Reform riots of 1831, Nottingham witnessed in 1811 the Luddite disturbances. In 1870 Nottingham was made the seat of a suffragan bishop of the diocese of Lincoln, but as it is now in the diocese of Southwell there is no suffragan bishop.

Nottinghamshire, or Notts, an inland county of England, bounded N.W. by Yorkshire, W. by Derbyshire, S. by Leicestershire and E. and N.E. by Lincolnshire. The area is 5434 sq. m. The N. is included in the great plain of York, and in the extreme N. there is some extent of marshes. The valley of the large Trent, with turns of several miles, is in the S.W. The S.W. between Nottingham and Warsop, the undulations swell into considerable elevations, reaching near Mansfield a height over 600 ft. This district includes the ancient Sherwood Forest (g.v.). Some portions of it are still retained in their original condition, and there are many very old oaks, especially in the portion known as the Dukeries (g.v.). The county generally is finely wooded, although in the E. of the valley of the Soar there is a considerable stretch of wolds. The principal rivers are the Trent, the Erewash, the Soar and the Idle. The Trent, which enters the county near Thoresby on the S.W., where it receives the Erewash from S. and the Soar from the S., flows N.E. past Nottingham and Newark, where it takes a more northerly direction, forming the N. part of the E. boundary of the county till it reaches the Isle of Axholm (Lincolnshire). The Soar forms for a short distance the boundary with Leicestershire, and the Erewash the boundary with Derbyshire. The Idle, which is formed of several streams in Sherwood Forest, flows N. to Batnwy, and then turns E. to the Trent.

Geology.—All formations, from Lower and Middle Coal Measures, overlap unconformably by Permian, to Lower Lias, crop out successively eastward across the county, with a general but slight dip away from the Pennine uplift. The strike of the Carboniferous rocks veers from S. to E. in the S.; that of younger formations is generally parallel. S.W. The Coal Measures, about 3000 ft. thick, continue the Derbyshire Coalfield. A boring at Ruddington proved the lowest measures, underlain by Millstone Grit. Lower and Middle Measures below the important Top Hard Coal, with the Kilburn, Mid Main, Deep Hard and Soft Coals, crop out in the south and along the Erewash Valley; higher strata farther N. All these consist of shale, clay and little sandstone. They contain Carbonicola acuta, C. robusta and Petracolus theodorri, and in the Hard Coal, series of opercula showing essentially non-marine conditions. But several thin marine beds occur. The highest measures, divisible into red Etruria Marls, Newcastle Sandstone, and a red on We-Rode, with a series of coal-free levels, in the Hard Coal, are in the south. A thin basalt breccia, a sandy or marly group, the Magnesian Limestone with Productus horridus and Schizodus obscurus (granular dolomite typically, its uplands and generally in fair condition); the magnesian sandstones of Mansfield and Worksop; red gypseous Middle Marls, an Upper Limestone, and Upper Red Marls, collectively 550 ft. thick in the north of Nottinghamshire, terminate a Permian outcrop continuous from Durham, but isolated by a fault at Northumbria. At the lowest divisions persist so far. The more extensive Trias overlies successively Lower Coal measures, magnesian limestones, and limestone. Its lower sandstones (Bunter, 600 ft. thick, consisting of Lower Red Sandstone with breccias, and Pebble Beds; Keuper Marl at 200 ft. thick, a very sandy red-brown sandstone, glomeratic at the base and containing the fish Semionotus) form an undulating wooded district. Higher red and pale green Keuper Marl, with subordinate sandstones and gypsum, makes a large agricultural extent on the E. The Trent valley below the so-called White Lias, mostly gypseous magnesian sandstones, Black Rhaetic shales succeed with Pteria (Asciola) conoita, Protocardium rhathicum and bone-beds, below light-coloured marls and argillaceous shales. At Worksop, where it joins the Trent and the S.E., one containing Carboniferous and some extraneous boulders probably came with the Pennine ice from the N.W. The upper part, now both high and full, with talk and flint, belongs to the Chalky Boulder Clay of the North Sea ice. Glacial gravel caps the higher ground of the Triassic sandstones. Church Hole, one of the Magnesian Limestone caves of Creswell Crags, yielded remains of cave-lion, bear, mammoth, rhinoceros, &c. Older river-gravels flank the pasture land of the Trent alluvium.

Climate and Agriculture.—As the higher districts of Derbyshire and Yorkshire attract the rain clouds, the climate of Nottinghamshire varies considerably with its southward extent. The mean temperature at Bawtry is 52°.7 in. and at Nottingham 62°3 in. On this account crops ripen nearly as early as in the S. counties. The soil of about 10,300 ft. in area is the chief county, and contains a large part of the Fladen. It is generally over 5 ft. thick, where it inclines to stoniness, and the valley of the Trent, where there is a rich vegetable mould on a stratum of sand or gravel. The land along the banks of the Trent is equally suitable for crops and pasture. The heather and barley industries are old establishments in the county, under 300 acres. Most of the immediate occupants are tenants-at-will. Roughly four-fifths of the total area is under cultivation. A great many farmers, for want of land or capital, raise tobacco, sand and cotton. A large number of hands are employed in machinery works, and the cycle and motor industry of Beeston is important. The manufacture of tobacco and cigars is considerable at Nottingham and Hucknall Torkard.

Communications.—The main line of the Midland railway touches the S.W. border of the county, with an alternative route through the county, and branches thence N. through Hucknall and Mansfield to Worksop, to Newark and Lincoln, from Mansfield to Southwell and Newark, &c. The main line of the Great Eastern railway serves Newark and Retford, with a branch to Nottingham and local lines in that vicinity. A branch of the Great Central railway, entering the county at Ashford in the Forest (1906), and the main line of the Loughborough, Derbyshire and East Coast railway, enters the county on the W. from Chesterfield, and crosses the Dukeries by Olterton to Dukeries Junction (G.N.R.) and Lincoln. The Sheffield-Grimby line of the Great Central crosses the N. of the county by Worksop and Retford. The Trent is navigable throughout the county, and the Idle between Bawtry and the Trent. The principal canals centre upon Nottingham.

Population and Administration.—The area of the ancient county is 530,756 acres, with a population in 1901 of 514,578. The area of the administrative county is 540,123. The county contains the city and county and municipal borough of Nottingham (pop. 239,743), and the municipal boroughs of Retford or East Retford (12,340), Mansfield (21,443) and Newark (14,092). The urban districts are Arnold (8757), Beeston (8060), Carlton (10,641), Eastwood (4813), Hucknall Torkard (15,250), Hucknall under Huthwaite (4076), Kirkby in Ashfield (16,318), Mansfield West Bridgford (4873), Retford (4378), Sinfin (4893), Southwell (5718), West Bridgford (18,001), Worksop (16,112). For parliamentary purposes the ancient county is divided into four divisions (Bassetlaw, Newark, Rushcliffe and Mansfield), each returning one member; and the parliamentary borough of Nottingham returns one member for each of its three divisions. There are one court of quarter sessions and seven petty sessional divisions. The boroughs of Newark and Nottingham have separate commissions of the peace, also separate courts of quarter sessions;
that of East Retford has a separate commission of the peace. The total number of civil parishes is 266. The ancient county contains 231 ecclesiastical parishes and districts, wholly or in part; it is situated principally in the diocese of Southwell and partly in the diocese of York.

The 17th-century settlers in the district which is now Nottinghamshire were an Anglian tribe who, not later than the 5th century, advanced from Lincolnshire along the Fosseway, and, pushing their way up the Trent valley, settled in the fertile districts of the S. and E., the whole W. region from Nottingham to within a short distance of Southwell being then occupied by the vast forest of Sherwood. At the end of the 6th century Nottinghamshire already existed as organized territory, though its W. limit probably extended no farther than the Saxons relics discovered at Oxton and Tuxford. Nottingham after the Conquest became one of the first Danish boroughs. On the break-up of Mercia under Hardicanute, Nottinghamshire was included in the earldom of the Middle English, but in 1049 it again became part of Leofric's earldom of Mercia, and descended to Edwin and Morkere. The first mention of the shire of Nottingham occurs in 1016, when it was harried by Canute. The boundaries have remained practically unaltered since the time of the Domesday Survey, and the eight Domesday wapentakes were unchanged in 1610; in 1719 they had been reduced to six, their present number, Oswaldbeck being absorbed in Bassetlaw, of which it formed a part. The most interesting historic figure in the district is Edward I., who was born at Newark in 1284. Nottinghamshire was originally included in the diocese and province of York, and in 1091 formed an archdeaconry comprising the deaneries of Nottingham, Newark, Bingham and Retford. By act of parliament of 1836 the county was transferred to the diocese of Lincoln and province of Canterbury, with the additional deanery of Southwell. In 1878 the deaneries of Mansfield, South Bingham, West Bingham, Collingham, Tuxford and Worksop were created, and in 1884 most of the county was transferred to the newly-created diocese of Southwell, the deaneries being unchanged. The deaneries of Bawtry, Bulwell, Ollerton, East Newark and Norwell were created in 1888. Until 1568 Nottinghamshire was united with Derbyshire under one sheriff, the courts and tourns being held at Nottingham until the reign of Henry III, when with the assizes for both counties they were removed to Derby. In the time of Edward I. the assizes were again held at Nottingham, where they are held at the present day. The Peveril Court, founded before 1113 for the recovery of small debts, had jurisdiction over 127 towns in Nottinghamshire, and was held at Nottingham until 1321, in 1356 at Algarthorpe and in 1700 at Lenton, being finally abolished in 1540.

The political history of Nottinghamshire centres round the town and castle of Nottingham, which was seized by Robert of Gloucester on behalf of Maud in 1140, captured by John in 1191; surrendered to Henry III. by the rebellious barons in 1264; formed an important station of Edward III. in the Scottish wars; and in 1397 was the scene of a council where three of the lords appellant were appealed of treason. In the Wars of the Roses the county was a whole favoured the Yorkist cause, Nottingham being one of the most useful stations of Edward IV. In the Civil War of the 17th century most of the city and county was in support of the Royalist cause, though the castle was garrisoned for the parliament, and in 1651 was ordered to be demolished.

Among the earliest industries of Nottinghamshire were the melting and woolen industries, which flourished in Norman times. The latter declined in the 16th, and was succeeded by the hosiery manufacture which sprang up after the invention of the stocking-loom in 1580. The earliest evidence of the working of the Nottinghamshire coalfield is in 1590, when Queen Eleanor was unable to remain in this county on account of the scarcity of coal (see Nottingham, 1890). The earliest other industry was heard of in Nottinghamshire in the 17th century, but in 1620 the justices of the peace for the shire report that there is no fear of scarcity of corn, as the counties which send up the Trent for coal bring corn in exchange, and in 1883 thirty-nine collieries were at work in the county. Hops were formerly extensively grown, and Worksop was famous for its liquorice. Numerous cotton-mills were erected in Nottinghamshire in the 18th century, and there were silk-mills at Nottingham. The manufacture of tambour lace existed in Nottinghamshire in the 18th century, and was facilitated in the 19th century by the cheapness of machine-made net. From 1205 the county and town of Nottingham each returned two members to parliament. In 1572 East Retford was represented by two members, and in 1672 Newark—upon-Trent also. Under the Reform Act of 1832 the county returned four members in two divisions. By the act of 1885 it returned four members in four divisions; Newark and East Retford were disfranchised, and Nottingham returned three members in three divisions.

Antiquities.—At the dissolution of the monasteries there were no relics, and no objects of devotion, of which Nottinghamshire was. The only important monastic remains, however, are the priory at Newark, but the building is partly transformed into a mansion which was formerly the residence of Lord Byron (see Hucknall Torkard). There are also traces of monastic ruins at Beavuale, Mattersey, Radford and Thurgarton. The finest parish church in the county is that of Newark. The churches of St Mary, Nottingham, and of Southwell were collegiate churches; Southwell, now a cathedral, is a splendid building, principally Norman. The churches of Balderton, Bawtry, Hoveringham, Mansfield and Worksop are also partly Norman, and those of Coddington, Hawton and Upton St Peter near Southwell, Early English. None of the old castles, the principal remains are those at Newark, but there are several interesting old mansions, as at Kingshaugh, Scruby, Shelford and Southwell. Wollaton Hall, near Nottingham, is a fine old building (c.1580). The finest residences of more modern date are Welbeck and others in the Dukeries (q.v.).

NOUMENON (Gr. θυμήμα, a thing known, from νοέμαι, a philosophical term put into currency by Kant and not much used except in definite reference to his doctrine. In the Kantian system the term "noûmena" means things-in-themselves as opposed to "phenomena" or things as they appear to us. According to Kant the human mind is such that it can never penetrate by its speculative powers to things-in-themselves, but can only know phenomena. Thus we have the odd position that noûmena, or the contents of the intelligible world, are just things to which thought can never penetrate. The term, however, is a relic of the Kantian mental development. In his fully mature or critical position he held that the noûmenal world was inaccessible to the speculative reason, and yet that we are not altogether excluded from it, since the practical reason, i.e. our capacity for acting as moral agents, assures us of the existence of a noûmenal world wherein freedom, God and immortality have a real place. The relation of noûmena to phenomena in the Kantian system is a most difficult one; and, in view of the fact that the acute intellects of Europe have been engaged vainly for more than a century in reconciling the various passages on the subject, the safest conclusion is that they are irreconcilable. The course adopted by Kant's immediate successors in German idealism was to reject the whole conception of noûmena, for the reason that what is essentially unknowable has no existence for our intelligence. Kant, however, protested
strongly against this development when it was propounded by Fichte, and held that he had precluded it by his "refutation of idealism": he stood unshakably to the belief in an absolutely real world behind phenomena. Kant's position may be illogical as he himself stated it; but it is the expression of a sound principle: we must connect it with his general tendency to recognize the dynamic side of things. He saw, what so many of his successors failed to see, that the world as we know it is an expression of power; and he could not imagine whence the power could come if not from a world beyond phenomena. (See Kant; Phenomena.)

NOVALICHES, MANUEL PAVIA Y LACY, 1st MARQUIS DE (1814-1866), Spanish marquis, was born at Granada on the 6th of July 1814. He was the son of Colonel Pavia, and after a few years at the Jesuit school of Valencia he entered the Royal Artillery Academy at Segovia. In 1833 he became a lieutenant in the guards of Queen Isabella II., and during the Carlist War from 1833 to 1840 he became general of division in the latter year at the early age of twenty-six. The Moderate party made him war minister in 1847, and sent him to Catalonia, where his efforts to put down a Carlist rising were not attended with success. He had been a senator in 1845, and marquis in 1848. He was sent out to Manila in 1852 as captain-general of the Philippine Islands. In April 1854 he crushed with much sternness a formidable insurrection and carried out many useful reforms. On his return to Spain he married the countess of Pini-Franch, a daughter of the Duke of Cadiz. He landed the next year in Madrid and in January 1855. The Restoration made the marquis de Novaliches a senator, and the new king gave him the Golden Fleece. He died in Madrid on the 22d of October 1866.

NOVALIS, the pseudonym of FRIEDRICH LEOPOLD, FREIHERR VON HARDENBERG (1772-1801), German poet and novelist. The name was taken, according to family records, from an ancestral estate. He was born on the 2nd of May 1772 on his father's estate at Oberwiederstedt in Prussian Saxony. His parents were members of the Moravian (Herrnhuter) sect, and the strict religious training of his youth is largely reflected in his literary works. From his boyhood he was devoted to politics and the liberal studies of philosophy, to the university of Jena, where he was befriended by Schiller. He next studied law at Leipzig, where he formed a friendship with Friedrich Schlegel, and finally at Wittenberg, where, in 1794, he took his degree. His father's cousin, the Prussian minister Hardenberg, now offered him a government post at Berlin; but the father feared the influence upon his son of the loose-living statesman, and sent him to learn the practical duties of his profession under the Kreissamtmann (district administrator) of Tennstedt near Langensalza. In the following year he was appointed director of the Tennstedt grammar school in Weissenfels, of which his father was director. His grief at the death in 1797 of Sophie von Kühn, to whom he had become betrothed in Tennstedt, found expression in the beautiful Hymnen an die Nacht (first published in the Athenäum, 1800). A few months later he entered the Mining Academy of Freiberg in Saxony to study geology under Professor Abraham Gottlob Werner (1750-1817), whom in the fragment Die Lehrbue in Sais he immortalized as the "Meister." Here he again became engaged to be married, and the next two years were fruitful in practical Judentum. In the autumn of 1799 he read at Jena to the admiring circle of young romantic poets his Geistliche Lieder. Several of these, such as "Wenn alle untreu werden," "Wenn ich ihn nur habe," "Unter tausend frohen Stunden," still retain, as church hymns, great popularity. In 1800 he was appointed Amtshauptmann (local magistrate) in Thuringia, and was preparing to marry and settle, when pulmonary consumption rapidly set in, of which he died at Weissenfels on the 25th of March 1801.

His works were issued in two volumes by his friends Ludwig Tieck and Friedrich Schlegel (2 vols. 1802; a third volume was added in 1840). There are found among the part fragments, of which Heinrich von Ofterdingen is a unfinished preparatory sketch. It was undertaken at the instance of Tieck, and reflects the ideas and tendencies of the older Romantic School, of which Hardenberg was a leading member. Heinrich von Ofterdingen's search for the mysterious "blue flower" is an allegory of the poet's life set in a romantic medieval world. Novalis, however, did not succeed in blending his mystical and philosophical conceptions into a harmonious whole. The "fragments" contain idealistic though paradoxical views on philosophy, art, natural science, mathematics, &c.

There are editions of his collected works by C. Meissner and B. Wille (1898), by E. Heillberg (5 vols., 1901), and by J. Minor (4 vols., 1907), Heinrich von Ofterdingen was published separately by J. Schmidt in 1876. Novalis's Correspondence was edited by J. M. Reihl in 1860. See R. Haym, Die romantische Schule (Berlin, 1870; A. Schubart, Novalis' Leben, Dichten und Denken (1887); C. Busse, Novalis' Lyrik (1898); J. Bing, Friedrich von Hardenberg (Hamburg, 1890), E. Heillberg, Friedrich von Hardenberg (Berlin, 1901). Carlyle's fine essay on Novalis (1829) is well known.

NOVARA, a town and episcopal see, of Piedmont, Italy, capital of the province of Novara, 31 m. by rail W. of Milan, 538 ft. above sea-level. Pop. (1905) 96,632, of whom 48,604 (commune). Railways diverge hence to Varallo Sesia, Orta, Arona (for Domodossola), Busto Arsizio, Milan, Vigevano and Vercelli. Previous to 1839 Novara was still surrounded by its old Spanish ramparts, but it is now an open, modern-looking town. Part of the old citadel is used as a prison. The cathedral dates from the 4th century (?), but, with the exception of the octagonal dome-roofed baptistery belonging to the first part of the 10th century, and separated from the west end by an atrium) was rebuilt between 1860 and 1870 after designs by Antonelli; the church of S. Gaudenzio, dedicated to Bishop Gaudentius (d. 417), who is buried under the high altar, rebuilt by Pellegrino Tibaldi about 1570, has a baroque campanile and a dome 396 ft. high, the latter added by Antonelli in 1875-1878; and San Pietro del Rosario is the church in which the papal anathema was pronounced against the followers of Fra Dolcino. The two first contain pictures by Gaudenzio Ferrari. The city also contains handsome market-buildings erected in 1817-1842, a large hospital dating from the 9th century and a courthouse constructed in 1346. The town has also a museum of Roman antiquities. In the canton are a wind-wheel, which is turned by wind or water, for spinning silk; there are also iron-works and foundries, cotton mills, rice-husking mills, organ factories, dye-works and printing works.

Novara, the ancient Novaria, according to Pliny a place of Celtic origin, according to Cato (but wrongly) of Ligurian origin, was a municipal city, and lay on the road between Vercellae and Mediolanum. Its rectangular plan may well be a survival of Roman days. Dismantled in 306 by Maximus for siding with his brother Constantine, it was restored by Justinius, but was afterwards ravaged by Radagaisus (409) and Attila (453). A dukedom of Novara was constituted by the Lombards, a countship by Charlemagne. In 1110 the city was taken and burned by the emperor Henry V. Before the close of the 12th century it accepted the protection of Milan, and thus passed into the hands, first, of the Visconti, and, secondly, of the Sforzas. In 1566 the city, which had long before been ceded by Maria Visconti to Amadeus VIII. of Savoy, was occupied by the Savoy troops. At the peace of Utrecht it passed to the house of Austria with the duchy of Milan; but, having been occupied by Charles Emmanuel of Savoy in 1734, it was granted to him in the following year. Under the French it was the chief town of the department of Agogna. Restored to Savoy in 1814, it was in 1821 the scene of the defeat of the Piedmontese by the Austrians, and in 1849 of the more disastrous battle which led to the abdication
NOVA SCOTIA

Charles Albert and an Austrian occupation of the city. The painter Gaudenzianni Ferrari was a native of Novara; and so was Peter Lombard.

NOVA SCOTIA, a province of the Dominion of Canada, lying between 43° 25' and 47° N. and 60° 25' W. and 66° 25' W., and composed of the peninsula provinces and the adjoining lands. Along the N.E. Cape line abound.s in the mainland by the Strait of Canos. The extreme length from S.W. to N.E. is 374 m. (N.S. 268, C.B. 196); breadth 60 to 100 m.; area 21,428 sq. m. The isthmus of Chignecto, 11½ m. wide, connects it with the province of New Brunswick.

Physical Features.—Nova Scotia is intersected by chains of hills. The Cobequid Mountains, stretching from E. to W. and terminating in Cape Chignecto, form the chief ridge. Several of the elevations are as high as 1100 ft., and are cultivable almost to their summits. Lying along each side of the range are two extensive tracts of arable land. A ridge of precipices runs for 130 m. along the Bay of Fundy from Brier Island at the farthest extremity of Digby Neck and culminates in Caper Split and Blomidon. Here and there rocks, from 200 to 600 ft. in height and covered with stunted firs, overhang the coasts. Beyond them lies the garden of Nova Scotia, the valley of the Annapolis. The Atlantic coast from Cape Canso to Cape Sable is high and bold, containing many excellent harbours, of which Halifax (Chebucto Bay) is the chief. The N. shore is, as a rule, low, with hills not exceeding 300 ft. In its harbours the Atlantic Ocean, the most constant is Pictou. Of the inlets the nearest to the interior is Minas Basin, the eastern arm of the Bay of Fundy; it penetrates some 60 m. inland, and terminates in Cobequid Bay, where the tides rise sometimes as high as 53 ft., while on the opposite coast, in Halifax Harbour, the spring tides scarcely exceed 7 or 8 ft. The height of the Fundy tides has, however, been oftentimes exaggerated, the average being 42-3 ft. Many islands occur along the coast, particularly on the S.E.; of these the most celebrated is Sable Island (q.v.). The rivers are, with few exceptions, navigable for coasting vessels for from 2 to 20 m. The principal are the Annapolis, Avon, Shubenacadie, the East, Middle and West rivers of Pictou, the Musquodoboit and the Lahave. The largest of the fresh-water lakes is Lake Rossignol, situated in Queen's county, and more than 20 m. long. Ship Harbour Lake, 15 m. in length, and Grand Lake are in Halifax county.

Geology.—The Lower Cambrian formation forms an almost continuous belt along the Atlantic coast, varying in width from 10 to 75 m. and covering an area estimated at 800 sq. m. It is interrupted by the trap beds of the Cape Breton and Canso series, S.W. of the province as far as Halifax, and cropping out in detached areas as far as Cape Canso. This part of the province is rugged and stony, the surface being covered with large boulders. Another belt extends a Carboniferous area, including two large and productive coal-fields in Cumberland and Pictou counties, and continued in the coal-fields of Cape Breton. On the S. coast of the Bay of Fundy, and at Minas Basin and Channel, the Triassic Red Sandstone formation predominates, more or less protected by a narrow rim of trap rock, culminating at its E. end in the basaltic promontory of Blomidon (Blow-me-down). The Cobequid Mountains are composed of slates, quartzites and intrusive rocks (apparently Siluro-Cambrian). At the junctions, near Cape Chignecto, occurs a splendid exposure, rich in curious minerals and fossils, and very celebrated among geologists.

Climate.—The climate of Nova Scotia is cooler and less temperate than that of New Brunswick, and more equable than that of the inland provinces, though not so dry. Spring and winter begin about a fortnight later than in Ontario. Dense fogs often drift in from the Atlantic, but are not considered unhealthy.

Most of the principal birds of North America are to be found, and the game of the country includes moose, caribou, duck, teal, goose, wren, pheasant, snipe, plover, &c. The game laws are strict and well enforced. The chief wild animals are bears, foxes and wildcats. Wolves, once numerous, are now extinct. The natural flora does not differ greatly from that of the New England states, though it lacks the lower, or trailing arbutus (Epigaea repens), grows extensively, and has long been the provincial emblem.

Population.—The population increases slowly, having risen only from 400,572 in 1881 to 450,574 in 1901, an average of 21-8 to the square mile (total area, 21,428 sq. m.). The rural population is grouped along the river valleys, and the natural increase is normal, but there is a large emigration to the manufacturing cities of the E. states and to the Canadian N.W. The great mass of the people are of British descent, but in parts of Cape Breton are found descendants of the early French settlers; in Lunenburg and the S.E. is a large German colony; near Halifax are a number of negroes from the West Indies, and scattered throughout the province are a few Micmac Indians, who now confine themselves chiefly to the making of baskets and trinkets; though they carry on a certain amount of mixed farming. Few are of absolutely pure Indian blood. The settlers of English and Scotch descent are about equal in numbers, but the latter have been more prominent in the development of the province. The Irish are found chiefly in Halifax and in the mining towns of Cape Breton. Roman Catholics, Presbyterians and Baptists predominate, though the Church of England is strong in Halifax, and still retains a certain social prestige.

Administration.—The executive authority is in the hands of a lieutenant-governor appointed for five years by the federal government, and of a council appointed from and responsible to the local legislature. This consists of a lower house of assembly, and of a legislative council of twenty life members, which the assembly has frequently, but in vain, endeavoured to abolish. The municipal system was introduced subsequent to federation, and is modelled on that of Ontario.

The revenue is chiefly made up of the Dominion subsidy (see Ontario), and of royalties on mining concessions, chiefly those on coal. Owing to the great increase of mining in Cape Breton, the latter revenue is larger in proportion than those of the mainland.

Education.—Primary education is free and compulsory; secondary education is also free but optional. In each county one high school is raised to the rank of an academy, free to all qualified students in the county, and receives an additional grant. Roman Catholics have not the right of separate schools, as in Ontario, but in Halifax and other districts where that church is strong, a compromise has been arranged. Thus the two Roman Catholic colleges, St Francis Xavier (English) at Antigonish, and St Anne (French) at Church Point (see Catholic Church), and the convent (nuns) of St Anne, constitute the public school system. There are also many private schools, chiefly for girls, and under denominational control. But while primary and secondary education is widespread and of good quality, higher education has suffered from denominational bickerings, and the universities are still too many and too small. They are: King's College, Windsor (Anglican), founded in 1790; Acadia University, Wolfville (Baptist, 1839); St Francis Xavier, Antigonish (Roman Catholic, 1866); and Dalhousie University, Halifax (Undenominational), established by charter in 1812, reorganized in 1865, the largest and the most efficient, possessing faculties of arts, science, law, engineering and medicine, a botanical garden, a large library, a school of agriculture and of horticulture at Truro, and has voted $100,000 for a College of Technology at Halifax.

Fisheries.—The fisheries of Nova Scotia are the most important in Canada, and the value of their products ($7,841,502 in 1904) is about one-third that of the whole Dominion. Lobsters, cod and mackerel constitute the bulk of the catch. Many boats are also fitted out in Lunenburg, Digby, Yarmouth and other ports for the Grand Banks of Newfoundland. A bounty is paid by the Dominion government, and attempts are being made to introduce more scientific methods among the fishermen. The vessels are manned by over 25,000 men, and many more are employed in the lobster canneries and kindred industries. Trout and salmon abound in the inland lakes and streams.

Lumbering was long the chief industry of the province, and is still very important, though the percentage of forest left uncult is only about 30%. The network of small lakes and rivers enables the timber to be brought down to the ports, where the lumbering is now reported. The chief export is that of spruce deals, almost entirely from Halifax. The manufacture of wood-pulp for paper is also carried on.

Bituminous coal is mined in various parts of Cape Breton (q.v.) and in the counties of Cumberland and Pictou. The seams dip at a low angle, and are of great thickness, especially in Pictou county. The total product exceeded 60,000,000 tons in 1904, and the coal is chiefly used in the manufacture of cement in the United States. Other
important centres are Springhill, Acadia Mines, Stellarton and Glace Bay (C.B.). It is shipped as far west as Montreal, and to the New England states. Iron is largely produced, chiefly in the vicinity of the Cumberland and Pictou coal-fields. The deposits include magnetite, red haematite, specular, limonite and carbonates ores. Blast furnaces are in operation, especially at New Glasgow, Sydney and North Sydney, though most of the ore used at Sydney is imported from Newfoundland. The quarries of easily worked limestone, the product of which is used as a "flux" in the blast furnaces, add to the value of the iron deposits. Gold occurs in workable quantities in the quartz all along the Atlantic coast, and several small but successful mining enterprises are in operation, yielding about $500,000 annually. Large deposits of gypsum occur, especially at Windsor in Hills county. Manganese and copper are also worked on a small scale.

**Agriculture.**—The attention paid to lumbering, fishing and shipping, and the subsequent emigration westwards have lessened the importance of this industry. Mixed farming is however largely carried on, and of late years dairy farming has been greatly extended and improved, and much butter and cheese is exported to England. Both the Dominion and the provincial governments have endeavoured to introduce scientific methods. Nova Scotia ranks second to Ontario in its production of apples and peaches. The centre of this industry is the valley of the Annapolis, where, it is said, one "may ride for fifty miles under apple-blossoms." At the head of the Bay of Fundy and on Minas Basin the low-lying meadows produce splendid crops of hay. Owing to high Fundy tides, the air in the neighbourhood is constantly in motion, the result being a cool temperature, even in the height of summer, which is well fitted for stock-raising.

**Roads and Railroads.**—Road-making machines are employed for the improvement of the ordinary highways, and steel bridges are replacing the wooden structures; but the roads in the country districts still leave much to be desired. The Intercolonal railway, owned and worked by the Dominion government, is the chief means of communication with the other provinces, and for the carriage of local traffic. Besides the main line from Halifax to Amherst, a branch runs from Truro to Sydney, and another from Oxford Junction to Pictou and Stellarton. The Canadian Pacific railway has running rights over it from St John (N.B.) to Halifax; on its completion, similar rights will be granted from Moncton to Halifax to the Grand Trunk Pacific. The Dominion Atlantic railway extends from Windsor Junction, near Halifax, to Yarmouth; the Nova Scotia Central railway from Lunenburg to Middleton on the Dominion Atlantic railway. A line along the Atlantic coast connects Halifax and Yarmouth, whence a daily line of steamers sails for Boston. Other lines connect Halifax with a number of the S.W. coast and inland towns, and a line has been projected from New Glasgow to Guysborough and the coast. Several smaller lines are owned by the various coal-mining companies. Telegraph and telephone lines extend all over the province, and there are two cable stations—one at Canso and the other at Sydney. The Marconi Company has stations for wireless telegraphy at Halifax, Cape Sable, Sable Island and Glace Bay.

**History.**—Nova Scotia may well have been the Markland of early Norse and Icelandic voyages, and Cape Breton was visited by the Cabots in 1497-1498, but not till 1604 was any attempt at permanent colonization made by Europeans. In that year an expedition was headed by a Frenchman, Pierre de Guaust, Sieur de Monts (1560-1630), who had received from Henry IV. full powers to explore and take possession of all lands in North America lying between the 40th and 46th parallels of north latitude. De Monts and his friend de Poutrincourt (d. 1615), endeavoured to form settlements at Port Royal (now Annapolis), St Croix (in New Brunswick) and elsewhere, but quarrels broke out with the Jesuits, and in 1613 the English colonists of Virginia made a descent upon them, claimed the territory in right of the discovery by the Cabots, and expelled the greater part of the inhabitants. In 1621 Sir William Alexander obtained from James I. a grant of the whole peninsula, which was named in the patent, Nova Scotia, instead of Acadia, the old name given to the colony by the French. During the reign of Charles I. the still existing order of Baronets of Nova Scotia was instituted, and their patents ratified in parliament. The treaty of St Germain-en-Laye (1632) confirmed France in the possession of Acadia, Cape Breton and New France; but fierce feuds broke out among the French settlers, and in 1654 a force sent out by Cromwell took possession of the country, but by the treaty of Breda (1667) it was restored to France by Charles II. Continual
fighting went on between the French and the British colonists of New England, the Indians taking part, usually on the side of the French; in 1710 the province was finally captured by Great Britain and ceded to her in 1713 by the treaty of Utrecht, under the Faubourg d'Acadie or Nova Scotia," the French retaining the boundaries of the district ceded; the English claim comprised the present Nova Scotia, Prince Edward Island, most of New Brunswick and the Gaspé peninsula, while the French restricted it to the S. half of what is now Nova Scotia. In 1749 Halifax was founded as a counterpart to Louisbourg in Cape Breton, and over 4000 colonists sent out, but the French opposed the new settlers. In 1755 about 6000 French were suddenly seized by Governor Charles Laurence (d. 1760) and hurried into exile. After a short suffering the prisoner was sent back, while others settled in Cape Breton, or in distant Louisiana. By the treaty of Paris in 1763, France resigned all claim to the country. In 1769 Prince Edward Island (formerly Isle St Jean) was made a separate government. Meanwhile, immigration from the New England colonies had filled the fertile meadows left vacant by the Acadians. A later influx of American Loyalists led in 1784 to the erection of New Brunswick into a separate colony. In the same year, Cape Breton was also separated from Nova Scotia but reunited in 1820.

During the wars of the American and French revolutions in 1775-1783, the Acadians were expelled. Hitherto, in June 1813, came the "Shannon" with her prize the "Chesapeake," captured off Boston harbour. Meanwhile, between 1784 and 1828, a large Scottish emigration, chiefly from the Highlands, had settled in the counties around Pictou, and the lumbering industry rose to great proportions. Agriculture was for some time neglected, but in 1818 the letters of "Agricult" (John Young, 1773-1837) gave it an impetus. Representative institutions had been granted as early as 1758, but power long rested mainly in the hands of a Council of Twelve, comprising the chief justice, the Anglican bishop and other high officials. On the 25th of July, 1848, the provincial government was won by the legislative assembly, led by Joseph Howe. In these political struggles, education was often the battle-ground, the fight ending in 1864 in the establishment of free primary and secondary schools by Dr (afterwards Sir Charles) Tupper, and the reorganization on an undenominational basis of Dalhousie University (see HALIFAX). In 1867 the province entered the new Dominion of Canada. For some years afterwards an agitation in favour of recall was maintained, but gradually died away. Since then its history is a record of uneventful progress.

**NOVATIANUS.** Roman presbyter, and one of the earliest antipopes, founder of the sect of the Novatians or Novatians, who was born about the beginning of the 3rd century. By the authority of Philostorgius (H.E. viii. 15) he has been called a native of Phrygia, but perhaps the historian merely intended to indicate the persistence of Novatianism in Phrygia at the time when he wrote. Little is known of his life, and that only from his opponents. His conversion is said to have taken place after an intense mental struggle; he was baptized by sprinkling, and without episcopal confirmation, when in hourly expectation of death; and on his recovery his Christianity retained all the gloomy character of its earliest stages. He was ordained at Rome by Fabian, or perhaps by an elder bishop; and during the Decian persecution he maintained the view which excluded from ecclesiastical communion all those (lapsi) who after baptism had sacrificed to idols—a view which had frequently found expression, and had caused the schism of Hippolytus. Bishop Fabian suffered martyrdom in January 250, and, when Cornelius was elected his successor in March or April 251, Novatian objected on account of his known laxity on the above-mentioned point of discipline, and allowed himself to be consecrated bishop by the minority who shared his views. He and his followers were, however, suffered by the synod held at Rome in October of the same year. He was excommunicated (1) on 25th March; (2) at the Easter meeting; (3) after the death of Valerian. After his death the Novatians spread rapidly over the empire; they called themselves καθαροί, or Puritans, and rebaptized their converts from the Catholic view. The eighth canon of the council of Nice provides in a liberal spirit for the readmission of the clergy of the καθαροί to the Catholic Church, and the sect finally disappeared some two centuries after its origin. Novatian has sometimes been confounded with his contemporary Novatus, a Carthaginian presbyter, who held similar views.

Novatian was the first Roman Christian who wrote to any considerable extent in Latin. Of his numerous writings three are extant: (1) a letter written in the name of the Roman clergy to Cyprian in 250; (2) a treatise in thirty-one chapters, De trinitate; (3) a letter written at the request of the Roman laity, De cibis judaicus. They are well-arranged compositions, written in an elegant and vigorous style. The best editions are by Welchem (Oxford, 1724) and by Jackson (London, 1728); they are translated in vol. ii. of Cyprian's works in the Ante-Nicene Theol. Libr. (Edinburgh, 1869). The Novatian controversy can be advantageously studied in the Epistula of Cyprian.

**NOVATION,** a legal term derived from the Roman law in which new was substituted for any kind—substitution of a new debtor (expressio or delegatio), of a new creditor (cessio nominum vel actionum), or of a new contract. In English law the term (though it occurs as early as Bracton) is scarcely naturalized, the substitution of a new debtor or creditor being generally called an assignment, and of a new contract a merger. It is doubtful, however, whether merger applies except where the substituted contract is one of a higher nature, as where a contract under seal supersedes a simple contract. Where one contract is replaced by another, it is of course necessary that the new contract should be supported by a new consideration, or a new contract, founded upon sufficient consideration (see CONTRACT). The extinction of the previous contract is sufficient consideration. The question whether there is a novation most frequently arises in the course of dealing between a customer and a new partnership, and on the assignment of the business of a life assurance company with reference to the assent of the policyholders to the transfer of their policies. The points on which novation turns are whether the new firm or company has assumed the liability of the old, and whether the creditor has consented to accept the liability of the new debtors and discharge the old. The question is one of fact and condition. See especially Life Assurance Companies Act 1872, §§ 7, 8, where the word "novations" occurs in the marginal note to the section, and so has quasi-statutory sanction. Scots law seems to be more stringent than English law in the application of the doctrine of novation, and to need stronger evidence of the creditor’s consent to the transfer of liability. In American law, as in English, the term is something of a novelty, except in Louisiana, where much of the civil law is retained.

**NOVAYA ZEMLYA** (Nova Zemlica, "new land"), an Arctic island off the coast of European Russia, to which it belongs, shaped like a crescent, consisting of two large islands separated by a strait, the Matotchkin Shar. It lies between 70° 31' and 77° 6' N., and between 5° 35' and 60° 2' E. It forms an elongated crescent, being nearly 600 m. long with a width of 30 to 90 m., and an area of about 36,000 sq. m. It separates the Barents Sea on the W. from the Kara Sea on the E. With Vyaghch Island, between it and the mainland, Novaya Zemlya forms a continuation of the Pa-Khay hills. Vyaghch is separated by it from the Kara Strait, 30 m. wide, and from the continent by the Yugor or Ugrin Strait, only 7 m. across. On the E. coast of Novaya Zemlya, especially between the Matotchkin Shar, 70° 31' and 75° N., there are a number of fjord-like inlets—such as Chekina, Rasmyslov and Medzhiviby bays. The greater part of the W. coast is fretted into bays and promontories, and a large number of islets lie off it. At the S. extremity there are a number of fjords and the wide bay of Sakhanka. Then
farther N. is the Kostin Shar, a strait separating Mekhu-sharsky Island from the coast, and having at its N. entrance South Goose Cape, which forms the S. extremity of Goose Land (Gusinaya Zemlya) in 72° N. Next follows Moller Bay, between Goose Land and Cape Britvin, with several minor bays affording anchorages. On the W. coast of the N. island are Krestovaya, Mashighin and Nordenskjold bays, and to the N. are several groups of islands—Gorbovyi, Pankratiev, the Gulf Stream Islands and the Orange Islands. Off the E. coast that called Xamoa, N. of which another supposed point in Arctic waters may be mentioned. Little is known of the interior of Novaya Zemlya. It is mountainous throughout. Transverse chains are thrown off from the main chain, and are separated by deep narrow valleys, some of which are watered by streams of considerable size, which, at the spring thaw, bring down a remarkable bulk of detritus. The general slope of the land is steeper on the E. than on the W., and at the N. and S. extremities there is a descent to a comparatively low plateau. In the S. this plateau is broken by several parallel ridges, with level valleys between them, dotted with numerous small lakes. On either side of the Matochkin Shar the hills reach 4000 ft. and upwards. The more elevated region is covered with snow-fields which feed glaciers in some cases, while the N. seems to be covered with a great ice-sheet. Geology.—The geological structure of the central region is of the most varied description. The primary rocks which appear at M. Solovetsky Island are gneiss, quartziferous schists, gneisses containing sulphide of iron, with subordinate layers of tale or mica slate, and thinner beds of fossiliferous limestone, Silurian or Devonian. More recent clay-slates and marls belonging to the middle Jurassic are found both on the eastern coast and with the quartz-sandstone. About 74° N. the clays of the E. coast are composed of grey sandstone, while in 76° Barents's Islands, and possibly a much greater part of the whole coast, the rocks are composed of sandstones, siltstones, and thin deposits have not been discovered on Novaya Zemlya. During the Glacial period its glaciers were much larger than at present, whilst, during a later portion of the Quaternary period (to judge by the moraines and the corries) the fit has been 500 ft. below the present level. As the whole of the arctic coast of Russia, was submerged for several hundred feet. At present it appears to partake of the movement of upheaval common to the whole of N. Russia.

Climate.—Novaya Zemlya is colder than Spitsbergen (which lies more to the N.) as in some degree it shares in the continental conditions of northern Russia and Siberia. The middle and northern parts of the W. coast are not so cold as the E. On the W. coast the temperature appears to decrease S. of the Matochkin Shar, being reduced by a cold current from the Kara Sea through Kara Strait. On the other hand, the climate of the northern part of the W. coast is moderated by the presence of the warm waters from the W. influence there are years when the islands can be circumnavigated without difficulty. In the Matochkin Shar region the snow-line is estimated at about 1800 to 2000 ft. Glaciers are rare S. of 72° N. and in many respects these glaciers are exceptional even in Greenland. Elsewhere even the leached lichens are precocious, though the leached lichens flourish. Of Phanerogams, only the Diapensia lapponica is common south of Novaya Zemlya, and among the flowering plants, the isolated C IPCCAIARIA, &c., and, where a layer of thinner clay has been deposited in sheltered places, the surface is covered with saxifrages, &c.; and a carpet of mosses allows the arctic willow (Salix polaris) to develop. Where a thin sheet of humus, fertilized by lemmings, has accumulated, a flowering plants appear, but even so, its brilliant flowers spring direct from the soil, concealing the developed leaflets, while in the temperate regions, plants occur with leaflets thrown out in a thin and 10 to 12 ft. long. This applies only to the better-known neighbourhoods of Matochkin Shar and Kostin Shar. N. of 74° N. very few flowering plants have been found on Novaya Zemlya and Vaygach numbers about two hundred species. As to the genetic connexions of the Novaya Zemlya flora, it appears, according to M. Kjellman's researches, to belong to the Asiatic race of plants. The interior of Novaya Zemlya shows hardly a trace of animal life, save here and there a vagrant bird, a few lemmings, an ice-fox, a brown or white bear, and at times immigrant gulls, Eskimos, and the like. Of birds are abundant, and probably by. birds, which come from the S. for the breeding season, and at certain parts of the sea-coast the rocks are covered with millions of guillemots, which return every year. The sea is inhabited by varieties of seal and fish, and every summer on the valleys and lakes of the south. Whales, walruses, various seals and dolphins are frequently met with. Only two species of fish are of any importance—the goleecy (Salmo Alpinus) in the fresh-water rivers and creeks, and the cod. The numbers of sea mammals and birds attracted Russian hunters, and even in the 16th century they had extended their nets (stano- mishchka) to the extreme N. of the Island. Many of them wintered for

years on Novaya Zemlya without great loss from scurry. Owing to the ice in the White Sea Russian hunters found Novaya Zemlya less easy of access than did the Norwegians. But about 1877 systematic and scientific researches were made by the Zoological Station in Saint Petersburg, and several families of Samoyedes being established at stations on the W. coast of the S. island, the chief of which is Karmakuly on Moller Bay, where there is a church. Novaya Zemlya is included in the Russian Province of Noravetskaya.

History.—Novaya Zemlya seems to have been known to Novgorod hunters in the 11th century; but its geographical discovery dates from the great movement for the discovery of the N. passage. In 1553 Sir Hugh Willoughby sighted what was probably Goose Land; Richard Chancellor penetrated into the White Sea. In 1556 Stephen Borough reached the S. extremity of the island, being the first western European to do so. William Barents trenched the island (1544) at Sukhoy Nos (73° 40'), and followed the coast N. to the Orange Islands and S. to the Kostin Shar. Rumours of silver ore having been found induced the Russian government to send out expeditions during the second half of the 18th century. In 1760 Savva Lobshkin cruised along the E. coast, spent two winters there, and in the next year, after having reached Cape Begehrte (Begaunte), returned along the W. coast, thus accomplishing the first circumnavigation; but the valuable records of his voyage have been lost. In 1768 the Russian Lieutenant Rozmyslov reached Goose Land and penetrated into the Kara Sea by the Matochkin Shar, where he spent the winter; in the following year he pursued the exploration of the Kara Sea, but was compelled to return to his ship. In the year 1771 the whole of the coast of the island is due to the expeditions (1821-1824) of Count Feodor Petrovich Litke (1797-1882), after whom part of the N. island is named Litke Land. Nearly all the W. coast as far as Cape Nassau, as well as Matochkin Shar, was mapped, and valuable scientific information obtained. In 1832 Lieutenant Pakhtusov mapped the E. coast as far as Matochkin Shar; and in 1835 Pakhtusov and Tsivolka his pilot, or commander of his second ship, mapped the coast as far as 74° 24'. The next expedition was that of the naturalist Karl von Baer in 1838. A new and scientific exploration began in 1868, while Norwegian seal-hunters brought in valuable geographical information. In 1870 the Norwegian Captain Johannesen penetrated as far as 79° E., in 76° 13' N., and afterwards accomplished the second circumnavigation of Novaya Zemlya. These explorations led the way for the famous voyages of Baron Nordenskjold (1875-1878), which included investigations in Novaya Zemlya. In 1877 the Russian Lieutenant, Tyaghin, attempted to cross the S. island, and in 1878 M. Grinevetsky succeeded in doing so. Among later expeditions may be mentioned those of C. Nossov (1879), and A. Millen, T. N. Golovin, and M. Vajnberg (1892) with the S. island, H. J. Pearson (1895 and 1897), Lieutenant Borchgrevink (1899 and 1900) and O. Ekstrom (1900 and 1903).

See accounts of the expeditions above mentioned, and especially, among earlier works, K. E. von Baer, Expedition a Novaia Zemli a et Lapponie (St Petersburg, 1838, &c.); and among later works H. J. Pearson, Beyond Petropoli Eastward, with botanical and geological appendices by H. W. Feildén (London, 1896); also J. Sporer, Novaia Zemlya (Gotha, 1867); A. P. Engelhardt, A Russian Province of the North (Archangel, of which the author was governor), translated by H. Cooke (London, 1899).

**NOVEL**

*from novelis, diminutive of Lat. novus, new; through the Italian *novella*, the name given in literature to a study of a single problem, or founded on an observation of contemporary or distant life, in which the characters, the incidents and the intrigue are imaginary, and, therefore, "new" to the reader, but are founded on lines running parallel with those of actual history.*

1. With the word *novel* is identified a certain adherence to the normal conditions of experience. A novel is a sustained story which is, indeed, not historically true, but might very easily be so. It is essentially a modern form of literature—that is to say, it makes its appearance when the energy of a people has considerably subsided or has taken purely civic forms, and is to contemplate and to criticize pictures drawn from conventional manners. The novel has been made the vehicle for satire, for instruction, for political or religious exhortation, for technical
information; but these are side issues. The plain and direct purpose of the novel is to amuse by a succession of scenes painted from nature, and by a thread of emotional narrative.

It was not until the 18th century that it began to be a prominent factor in literary life, and not until the 19th that it took a place in it which was absolutely predominant. The novel requires, from those who are content to be only fairly proficient in it, less intellectual apparatus than any other species of writing. This does not militate against the fact that the greatest novelists, always a small class, produce work which is as admirable in its art as the finest poetry. But the novel adapts itself to a far larger range of readers, and covers so vast a ground in the imitation of life, that it is the unique branch of literature which may be cultivated without any real distinction or skill, and yet for the moment may exercise a powerful purpose.

2. Classical Antiquity.—The place held by the novel in antiquity offers interesting analogies with its position in modern times. It was Voltaire, in his Pyrrhonisme de l'histoire, who set the fashion of calling the Cyropaedia a novel, but it is probable that Xenophon, in composing this great work on the education of Cyrus, had a purpose that was didactic and historical rather than narrative, and that its present-day vogue began in Alexandrian times, when social life was so far settled in tradition that the pleasure of reflecting on reality had definitely set in. In the 2nd century B.C. a certain Aristides wrote, in six books, the Milesiaka, which was probably the beginning of the modern novel. These Tales of Miletus, the town in which Aristides lived, are lost, but from existing imitations of them in Greek and Latin we can gather that they consisted of humorous and sarcastic episodes of contemporary life. There seems to be good evidence that the bulk of these novelettes, and the tales which followed them, dealt mainly with the adventures of lovers. In the 2nd century A.D. Lucian preserved for us invaluable pictures of the life in which he moved: his Licius or the Ass and his True History are fantastic and extraordinary fictions in which the nature of the novel is not unfrequently approached. But a Syrian Christian, Heliodorus, bishop of Tricca in the 4th century, may claim to have come much closer to it in his Aethiopica, which has the unique merit of being a perfectly pure love story, in which the marvellous is not absolutely banished, but in which on the whole the solid structure of experience is preserved. In the 6th century, as is supposed, a Greek who is called Longus (or Apion), but of whose life nothing is known, wrote the voluptuous pastoral story of Daphnis and Chloe, which is so far superior to all other remnants of Greek fiction which have come down to us, and which is the only one of them which can strictly be called a novel. In Latin literature, the Golden Ass of Apuleius is manifestly a translation of a lost Greek book, to which Lucian also was indebted. It is probable that in the great age of Roman literature prose fiction was cultivated, but we should be limited to pure conjecture as to its scope, if we did not possess a fragment of a work which is absolutely invaluable to the comparative student of literature. If the Satyricon of Petronius was not an isolated phenomenon—and it is highly improbable that this was the case—then the Romans of the Neronian epoch understood to the full the secret of how to produce in prose a satirical, not to say cynical, study of manners in fiction. The Satyricon is not less skilfully managed than such later novels as Glirias or Peregrine Pickle, and it is of the same class. From the extent of the principal episode which has been preserved, it is supposed that this novel was not a short tale of intrigue, but was a sustained record, drawn up with careful and lengthy observation of manners, for the single purpose of entertainment. Unfortunately, this extraordinary work remains not merely solitary in its class, but itself a fragment. In early Christian times, such books as The Shepherd of Hermes, and the productions of Palladius and of Synesius, indistinctly testified to a certain appetite for prose fiction.

3. Italian.—It was in northern Italy that the novel of modern Europe (both the literary type and the name) came into existence. A collection of tales, called Il Novellino or Cento novelle antiche (although only 66 of the 100 survive), was composed at the end of the 13th century, and started this class of literature in Europe. These anonymous stories are of extraordinary diversity, chivalrous, mythological, moral and scandalous. The medieval view of women and priests and peasants is found in its full development, and there is something of the realistic reflection of customs which was to flourish later in a whole class of fiction. The earliest Italian novelist whose name is connected with his writings is Francesco da Barberino (1264-1348), whose Documenti d'Amor were first published in 1640. He was followed by the celebrated Giovanni Boccaccio, who wrote his Filocolo about 1330 and then produced some nine years later. Of his other works the most eminent was Filostrato (1335-1350), a Florentine. Sacchetti's Trecento novelle, which remained in MS. until the 18th century (1724), are ironical and realistic studies of the life around him in Tuscany. To Giovanni Fiorentino is attributed a collection of 10 tales, called Il Pecerone, printed first in 1558, but written in 1536. Shakespeare is indebted to one of these stories for the plot of The Merchant of Venice.

A great name in the evolution of European fiction is that of Tommaso Guidato, called Masuccio (1415?-1477); he was a native of Salerno, and was the first of the south Italian novelists. Moreover, it is significant of the universal character of the novel that many of the finest are wholly his own. His Novellino, printed at Naples in 1476, is divided into five books, each containing ten stories. These deal satirically with the three favourite subjects of the age—namely, jealous husbands, unfaithful wives and debauched priests. He was followed in this, as well as in his vivacity, by Antonio Cornazzano (1437-1506?), an inhabitant of Piacenza, who wrote Italian with much greater purity than Masuccio, but less vigour. His stories were frequently reprinted, under the title of Proverbi. Of the novels of Giovanni Brevio (1467-1508) only five have been preserved, but these are of unusual merit. We then reach Matteo Bandello (1480-1560), long the most famous of all the Italian novelists, whose Novelle, first issued in 1554, were eagerly read in all parts of Europe; they are 214 in number. After Bandello the decline of the Italian novella is evident. Francesco Maria Molza (1480-1544), whose stories appeared in 1547, was a rival to Bandello, and has been preferred to him by several modern critics. The Ragionamenti d'Amor (1538) of Agnolo Firenzoula (1493-1543) was the work of a poet writing in richly embroidered prose. After Firenzoula the great school of Italian story-tellers declined. There was no more novel writing, of any importance in Italy until the close of the 16th century, when an admiring study of German literature produced the romances of Alessandro Verri (1741-1816) and Ugo Foscolo (1778-1827). The first Italian novelist of merit in recent times, however, is Alessandro Manzoni (1785-1873), whose I Promessi Sposi (1825) enjoyed an unbounded popularity. Manzoni had a troop of imitators, but no rivals. In the fourth quarter of the 19th century Italy produced some very brilliant and original novelists, in particular Giovanni Verga (b. 1840), Matilda Serao (b. 1856) and Gabriele d'Annunzio (b. 1863).

France.—In the 14th century, when Italy was already proceeding in a modern direction, France was satisfied with ancient tales of Fierabras or Les Quatre fils d'Aymon, which were nothing but epics told in rambling prose. It was not until about 1450 that the anonymous Quinze joutes du mariage showed the French to be influenced by the Italian development of the novelette of manners. The author of this extraordinary work was perhaps Antoine de la Salle who seems certainly to have written the whole of the Cent nouvelles nouvelles, imitated from Boccaccio and Sacchetti. This bud of realistic fiction, however, was immediately nip ped by the renaissance of chivalry, of Spanish extraction, which were only destroyed by the vogue of Don Quixote. The translation of Montalvo's celebrated Amadis de Gaule enjoyed at this time an extraordinary popularity.

The habit of telling tales freely in prose was not, however, formed in France until after 1500. Bonaventure Despréz (d. 1544) was the author of the Cymbalum mundi, and of Nouvelles récréations, mordant satires and gay stories. Probably to this age also belongs the semi-fabulous Séraude de Vervielle, who is supposed to be the author of a collection of facetious
anecdotes and conversations, Le Moyen de Porsien. These, and other experiments in fiction, led us up to Rabelais, whose magnificent genius adopted as its mode of address the chain of burlesque prose narratives which we possess in Gargantua and Pantagruel, recording the family history of a race of giant kings, but his influence on the novel is insignificant. It was half a century later that, in the romantic pastoral of Astarte, published in 1610, France may be said to have achieved her first attempt at a novel. This famous book was written by Honoré d'Urfé; in spite of its absurdities it is full of talent, and succeeds, for the first time in the history of French narrative, in depicting interior life. D'Urfé was followed, with less originality, by Marin Le Roy de Gomberville (1600-1674), who was the author of a Mexican romance, Pôlexandre, and by Gombauld (1570-1666), the author of Endymion (1624). These were fictions of interminable adventures, broken by an infinite number of episodes; they seem tedious enough to us nowadays, but with their refinement of language, and their elevation of sentiment, they fascinated readers like Madame de Sévigné. To Gomberville, who has been called the Alexandre Dumas of the 17th century, succeeded Mîlle de Scudéry, who preserved the romantic form of the novel, but filled it up with modern and familiar figures disguised under the ancient nomenclature. Her huge romans à clefs, tiresome as they are, form the necessary stepping-stone between Astarte, in which the novel was first conceived, and La Princesse de Clèves, where at last it found perfect expression. Meanwhile, the elephantine heroic romances were ridiculed by Charles Sorel in his Francion (1622) and Le Berger extemporâng (1628). Later examples of a realistic reaction against the pompous beauty of Gomberville and Scudéry were the Roman comique (1651) of Scarron and Le Roman bourgeois (1666) of Furetière. All these, however, were mere preparations. The earliest novelist of France is Marquerite de la Vergne, comtesse de La Fayette (1644-1639), and the earliest genuine French novels were her Princesse de Montpensier (1662), and her far more important Princesse de Clèves (1678). Madame de La Fayette was the first writer of prose narrative in Europe who portrayed, as closely as nature as she could, the actual manner and conversations of well-bred people. To show that she was capable of writing in the old style, she published, with the help of Segrais, in 1670, a Lydie, which is in the Spanish manner affected by M. d'Urfé. This was followed, in the same year, by the beautiful romance of La Princesse de Clèves, which was appreciated. Meanwhile La Fontaine, in 1660, published a fine romance of Psyché, partly in verse, and Fénelon, in 1699, his celebrated Téléméaque. The influence of La Bruyère on the novelists, although he wrote no novels, must not be overlooked. But the Princesse de Clèves remained the solitary novel of moral analysis when its author died and the 17th century closed. The successes of Alain René Lesage seemed to be wholly reactionary. His realistic novels, Gil Blas and Le Diable boiteux, depended upon their comic force, their picturesque vivacity, rather than upon the sober study of average human character. But Marivaux (1688-1763) took up the psychological novel again, and produced in Marianne (1731) and Le Paysan parvenu (1735) analytical studies of Parisian manners and character which were wholly modern in form. If Marianne was deliberate, the exquisite Mannon Lescat (1731), by the Abbé Prévost d'Exiles (1697-1763), was almost an accident; but, between these, these simultaneous works started the French novel of the analysis of emotion. The brilliant stories of Voltaire, which began with Zadig and included Candide, hardly belonged to this category; they are rather satires and divertissements, in which class must also be placed the fashionable boudoir novels of Crétillon fils, La Morlière and others. But the English taste, exemplified mainly by Richardson, Sterne and Fielding, prevailed, and its effect was seen again in the imperfect novels of Diderot and Rousseau. The Nouvelle Héloïse and the Émile of the latter are not skilfully constructed as stories, but they mark the starting-point of the novel which aims at familiarising the public mind with great ideas in an attractively Romantic form. The moral purpose is evidently in the famous Paul et Virginie of Bernardin de St Pierre. It was long didactically present in Mme de Staël's Delphine (1802) and Corinne (1807), where the misinterpreted woman of genius, so often depicted since, is first introduced to French novel-readers. It was not, however, until about 1830 that the novel began to be one of the main channels of imaginative writing in France, and the development of this kind of fiction was one of the main features of the Romantic revival. Stendhal showed that, without any of the charms of style, and relying exclusively upon minute psychological observation, the record of a human life could be made enthralling interesting. Alexandre Dumas, under the direct influence of Stendhal and Scott, who were the models of the Dumas family, finally laid down its laws and settled its borders. Certain dates, however, must be recorded in the briefest record of the evolution of the French novel, and 1836 is one of these; in that year Gustave Flaubert published Madame Bovary, a work in which the rival realistic and Romantic tendencies are combined with a mastery that had not been approached and has not since been equalled. Another is 1871, when Zola began to roll out the enormous canvas of Les Rougon-Macquart. Yet another is 1880, when Boule de Suif first revealed in Maupassant a novelist whose creations were not mere topical imaginations and, but absolutely convincing and logical.
the reign of the heroic romances in France, their vogue violently affected the English book-market. The huge stories of Calpenède and Gomberg were imported, and translated and imitated to the exclusion of every other. It is true of prose fiction, between 1645 and 1650. The long-winded books of Mdlle de Scudéry, especially Cassandra and The Great Cyrus, were read so universally in England as to leave their stamp on the national manners. Of original English romances, written in competition with the French masterpieces of tenderness and chivalry, the Parthenissa of Lord Orrery (1654) is the best known. The first definite stand against these Gallicized romances was made by two dramatists, Aphaara Behn and William Congreve. Congreve's Incognita (1692) is remarkable for its light raillery and humour, and perhaps deserves as well as any a 17th-century denomination to be called the earliest novel in English. The stories of Mrs Behn have the merit of a romantic simplicity of narrative, but they are dull and devoid of art. But the novel still lingered, unwilling to make its appearance in England, and its place was taken during the age of Anne by the labours of the essayists. So rich is the character painting, so lively the touches of social colour in the Spectator and Taller, that these periodicals have, by enthusiastic critics, been styled brilliant examples of prose fiction. But it is obvious that in the delightful essays of Addison and Steele there was no attempt made at construction, that the sustained evolution of characters was not essayed, and that even in the studies of Mr Bickerstaff's Club anything like a plot was studiously avoided. Yet these are all essential characteristics of the novel, and until they make their appearance in English literature we must not say that the secret has been discovered. Very near to the mystery, if he did not quite grasp it, was Daniel Defoe, who introduced into his narrative a minute and rude system of realistic observation, by way of giving an impression of truth to it. This exactitude he combined with a survival of the old picareseque method, the result being those strange and entertaining pieces (1725) which still make him to come to positive success in the immortal narrative of Robinson Crusoe, in which the fascination of the desolate island was first worked up in English.

6. Not even yet had the English novel been invented. It came into the world in 1740 from the unconscious hands of Samuel Richardson (1689-1761), who had hit upon the notion that morality might be helped and young persons of inexperience protected by the preparation of a set of letters exchanged between imaginary persons. The result was Pamela: or Virtue Rewarded, a book which is in every strict sense the earliest English novel. It has even a claim to be considered the earliest European novel, of the modern kind, for the assumption of French criticism that Richardson borrowed his ideas and his characters from Marianne of Marivaux is not supported by evidence. There is no reason to suppose that Richardson met with the name of Marivaux earlier than 1749. At all events, it would seem to be certain that, whether in France or England, the fourth decade of the 18th century saw the spontaneous conception of this "new species of writing." The name of the heroine of Richardson's book was Miss Pamela Andrews, and the second English novel was Fielding's Joseph Andrews (1742), which started as a mere burlesque of Pamela, but proceeded upon admirably original lines of its own, in a study of the humours and manners of contemporary country life. Fielding rejected the epistolary artifice of Richardson, and told his story in a straightforward narrative, broken indeed by arguments and ejaculations which bound the new novel to the old essay of the Spectator type. The creative force of Fielding filled the pages of this book with a crowd of vividly-presented characters, and this marked a step in advance, for Richardson's practice was to concentrate minute attention upon only one character at a time, and that even in the next important fiction came, in the shape of the long-drawn tragedy of Clarissa (1748). But a third great novelist was now at work; in 1748 appeared the Redderick Random of Smollett, and here we have neither the sculptural manner of Richardson nor the busy world of Fielding's realism, but a comic impression founded on an artful employment of emphasis and exaggeration.

Smollett gives us neither breathing statues nor a crowd of men and women, but a gallery of "freaks," arranged with great art, indeed, but exhibited in such a way as to expose not their likeness but their unlikeliness to the commuter of rock of humanity. It is very important to notice this curious divergence between the three great writers, because they exemplified the three classes into which almost all subsequent novels can with more or less ease be divided. The next move was made by Fielding, who in 1749 published his Tom Jones. Starting with the pungent horror of hypocrisy ever before him, Fielding constructs a fragment of the world in which men and women are seen, without exaggeration, pitying their daily trades under the eye of an impartial observer who can penetrate to their secret motives. This was a great advance, and a still greater one was the sustained skill with which the author conducted the plot, the interwoven series of the actions of his characters. He may almost be said that until the publication of Tom Jones no novel with a real plot had been conceived in England. The rivalry of the great novelists of this time was of signal help to them, and there can be no question that the astounding richness of Tom Jones stirred Smollett to the exercise of increased energy in Peregrine Pickle (1751), a coarse and savage book, illuminated by brilliant flashes of humour. A better, because a tenderer and truer study of life was Amelia, which Fielding published in the same year; yet most readers have come to regard this book as an appendix to the two novels which I have already noted. The ideal of life depicted in it was quieter and sadder, it was perhaps for that very reason more in harmony with the facts of life. Now Richardson, who had long been silent, reasserted his mastery of epistolary analysis in the huge History of Sir Charles Grandison (1753), in which, as its admirers claimed, "all the recesses of the human heart are explored and its whole texture unfolded." Richardson had scarcely been affected by the experiments of his contemporaries, of the very nature of which he had to be ignorant, and the result is that in his third and last novel he devoted entirely to qualities which he had already developed, and made nothing to the discoveries of others.

7. With this book, the first great group of English novels comes to a close, and we may observe that in these eight stories everything is to be found, in germ if not in full evolution, which was during the next century and a half to make the abundant out-put of the English novel prominent. New forms, above all new subjects, were to present themselves to the imagination of capable British novelists, but the starting-point of every experiment was to be discovered in the ripest work of Richardson, Fielding and Smollett. Their influence was manifest in the writings of the second school of English novels, in whose pages, however, several interesting varieties of subject and treatment were discovered. The Tristram Shandy (1759-1760) of Sterne, is the most masterly example in English of a humour which goes direct to paths for its most "sentimental" effects, and of the kind of loosely-strung, reflective fiction which is hardly a narrative at all. Neither Tristram Shandy nor A Sentimental Journey (1768) can properly be included among novels. In Rasselas (1759) Dr Johnson showed that the new kind of writing could be used to give entertainment to a sermon and in this he was to have a multitude of followers. In Chrysal (1760) Charles Johnstone (d. 1806) showed that the picareseque romance could still exist, tinctured by the newly-found art of the novelist. In The Castle of Otranto (1764) Horace Walpole adapted the methods of the novelist to a pseudo-historical theme of horror and romance, and prophesied of Walter Scott. In The Vicar of Wakefield (1760) Goldsmith was indebted to most of his immediate predecessors, but fused their qualities in an amalgam of gentle wit and delicate sweetness and conversational brevity which has made his one loosely-constructed novel a foremost classic of our writings of the second school of English novels. But the Pamela from The Vicar of Wakefield, English novel-writing was born, grew into full maturity, and adopted its adult and final forms.

8. During the remainder of the 18th century, little or nothing was done to extend the range of prose fiction in England; but one or two of those departments of novel-writing which had already
been invented were developed and adapted to changing taste. In particular, the rapid increase of reticence and refinement in conversation made such a novel in letters as Smollett’s *Humphrey Cliker* (1771) repulsively coarse to women of delicacy, who were charmed on the other hand with the * Evelina of Frances Burney* (1778). These two typical books are composed on the same plan, yet essentially a whole age lies between the former and the latter. What has been called “the novel of the tea-table” began to exist, and the 19th century was about to close in mediocrity, when its credit was partly restored by a development of Horace Walpole’s romance of terror in the vigorous and sensational narratives of Anne Radcliffe (1764–1823), whose *Mysteries of Udolpho* appeared in 1794. The same year saw the publication of *Caleb Williams*, in which William Godwin (1756–1836) evolved a tragic theory of politics. A finer study than either of the works just mentioned, although not truly a novel, was the gorgeous and sinister *Vathek* (1786) of William Beckford, an oriental tale of horror. In all these books there existed an element of grotesque mingled with romantic colour, which announced the coming revival.

9. The two schools here indicated, and they may be roughly defined as the school of the Tea-Table and the school of the Skeleton-in-the-Cupboard, did not, however, betray their real significance until the second decade of the 19th century, when after several unimportant efforts, they developed into the novel of psychological satire and the romance of historical imagination. Two writers, the greatest who had yet attempted to address English readers through prose fiction, almost simultaneously came forward as the protagonists in these two spheres of work. Jane Austen published *Sense and Sensibility* in 1811, Walter Scott’s *Waverley* in 1814. These were epoch-making dates; in each case a new era opened for the countless readers of novels. The first-named writer, all exactitude, conscience and literary art, worked away at her “little bit (two inches wide) of ivory”; the other, with bold and flowing brush, covered vast spaces with his stimulating and noble compositions. It is, however, to be noted that the isolation in which we now regard these great writers—a solitude à deux only broken in measure by the presence of Miss Maria Edgeworth—is an optical delusion due to the veils of distance. The bookshops from 1810 to 1820 and onwards were thronged and glutted with novels, many of them infinitely more successful, as far as sales were concerned, than the most popular of Miss Austen’s works. The novels of Miss Austen were written between 1776 and 1810, although published from 1811 to 1818; those of Sir Walter Scott date from 1814 (*Waverley*) to 1829 (*Anne of Geierstein*). Practically speaking, no additions were made to the formula of the social novel or of the historical romance, to the study of national manners, that is to say, from the satirical or from the picturesque point of view, until a quarter of a century later.

10. The next artist in prose fiction whose force of invention was sufficient to start the novel on wholly fresh tracks was born forty years later than Scott. This was Charles Dickens, whose *Pickwick Papers* (1836) marks another epoch in novel writing. His career of prodigal production ceased abruptly in 1870, by which time it had long been obvious that he was the pioneer of a great and diverse school of novelists, all born within the second decade of the century. Of these Thackeray was not really made obvious until *Vanity Fair* (1847), nor Charlotte Brontë till *Jane Eyre* (1847), nor Miss Gaskell till *Mary Barton* (1848), nor George Elliot till *Adam Bede* (1859). The most noticeable point on which the five illustrious novelists of the Early Victorian age resembled one another and differed from all their predecessors, was the sociological or even humanitarian character of their writings. All of them had projects of moral or social reform close at heart, all desired to mend the existing scheme of things. In several of them, particularly in Dickens and Miss Brontë, the element of insubordination is extremely marked; it is present in them all; and a determination not to be content to see life beautifully, though coloured, glasses, or to be content with a sarcastic travesty of it, but to realize in detail its elements of pain and injustice. The novel, which had already learned to compete with all the amusing sections of literature, became the successful rival of the serious ones also. The task of the novelist was, therefore, so far as the indication of the scope of his particular kind of art is concerned, now complete. The names of Anthony Trollope, Charles Kingsley, Charles Reade, George Meredith, Thomas Hardy and Robert Louis Stevenson represent, in their least challenged form, different movements in novel-writing during the second half of the 19th century; we must be content here to refer for particulars concerning them to the separate biographical articles.

11. Spain.—Prose narrative in Spain practically begins in the 15th century with chronicles and romances of chivalry, tempered occasionally and faintly by some knowledge of what had been attempted in Italy by Boccaccio. The Spanish version of *Amadés de Gaula*, in which the romance of knight errantry culminated, belongs to 1508; the lost original is supposed to have been Portuguese. This was the only book of its class which is saved from the burning in *Don Quixote*; it was followed by *Palmerin of England*. These interminable books, and a hundred worse than they, occupied the leisure of 16th-century readers of both sexes. Without approaching the form of novels, they prepared the ground for novel-reading. The exploration of America led to the composition of monstrous tales of the New World, which generally took the form of continuations of *Amadés*. A new thing was begun in 1554, when the anonymous picarose romance of *Lazarillo de Torre* started the story of fantastic modern adventure; this highly entertaining book has been called the 16th-century *Pickwick*, and Mr Fitzmaurice-Kelly remarks that it “fixed for ever the type of the comic prose epic.” The pastoral romance, in the hands of Jorge de Montemor (d. 1561), who wrote an insipid *Diana* which was popular for a while throughout Europe, took readers a step backward, away from the ultimate path of the novel. It is of interest to us, however, to note that it was in one of these “vain imaginings,” in his pastoral romance of *Gatamea*, that Cervantes approached the field of fiction, in 1585. Few of his peculiar merits are to be found in this early work; he turned for the present to the composition of plays. It was not until 1604 that he returned to prose fiction by printing his immortal *Don Quixote*, which made an epoch in the history of the novel. This book was originally intended to ridicule the already fading passion for the romances of chivalry, but it proceeded much further than that, and there is hardly any branch of fiction which may not be traced back to the splendid initiation of some chapter of *Don Quixote*. In 1613 Cervantes published his twelve *Exemplary Novels*; these are not so well known as the great romance, and they owed not a little of their form to Italian sources, but they are very brilliant. One of the best anonymous Spanish stories of the period, *The Mock Aunt*, is a type of excellent satirical narrative of the sarcastic class; this is now commonly attributed to Cervantes himself. No other novelist of Spain has moulded the thought of Europe, but the heroic romance which occupied so much of the attention of France in the 17th century was invented by a little-known Spanish soldier, Pérez de Hita, who, about 1600, wrote fantastic stories about Granada and the Moors. The farcical romance of *Fray Jeronimo de Campas*, 1758, by J. F. de Isla (1703-1718), competed in popularity with *Gil Bias*. Speaking broadly, however, Spain made no appreciable progress in novel-writing from the days of Cervantes to those of Walter Scott, when the *Waverley Novels* began to find such artless imitators as Martinez de la Rosa and Zorrilla. But the first original novelist of Spain was Cecilia Böhl de Faber (Fernán Caballero) (1706-1877), whose *La Gaviota*, 1848, a study of life in an Andalusian village, was the earliest Spanish novel, in the modern sense. She was followed by Valera (1824-1904), by Alarcón (1833-1891), by Pereda (b. 1834), by Perez Galdós (b. 1845) and by Palacio Valdés (b. 1853), in whom the tendencies of recent European fiction have been competently illustrated without any striking originality.

12. Germany.—The cultivation of the novel in its proper sense began late in Germany. It is usual to consider that H. J. von Grimmelshausen (1627-1675) is the earliest German novelist;
his very romantic, Abenteuerliche Simplicissimus-Simplicissimus, was printed at Mönypelard in 1690. This is an account of the adventures of a simple-minded fellow during the Thirty Years' War, and is a chain of episodes, brilliantly recorded, but hardly a novel. Early in the 18th century, an extraordinary number of imitations of Defoe's great romance were published in Germany, and these are known to scholars as the Robinsonaden. Later on, Wieland imitated Don Quixote, but the earliest German novel which possesses original value is the celebrated work of Goethe, The Sorrows of Young Werther (1774). The still more celebrated Wilhelm Meister did not appear until 1796. A third novel, Elective Affinities, was published by Goethe in 1809. Meanwhile, a very characteristic group of picturesque stories had been issued by Johann Paul Richter (Jean Paul) (1763-1825), destined to have a wide influence upon romantic literature throughout Europe. Purely romantic were the stories of Tieck, of Brentano, of Arnim, of Fouqué, of Kleist, of Immermann. The German novelists of this period wrote like poets, deprived of the discipline of verse. In later times novels of high merit have been written by Gustav Freytag, Willhald Alexis (1809-1885), called the German Walter Scott, Laube, Fontane, Eilers, Jeremias Gotthelf, Berthold Auerbach, Spielhagen, Heyse and many others, but the 19th century produced no German novelist of commanding originality.

13. Russia.—In Russia alone, among the countries of central and eastern Europe, the novel has developed with a radical originality. Until the second quarter of the 19th century the prose fiction of Russia was confined to imitators of Sir Walter Scott, but about the year 1834 Gogol (1809-1852) began to revolt against the historico-romantic school and to produce stories in which an almost savage realism was curiously blended with the Slavonic dreaminess and melancholy. Since then the Russian novel has consistently been the novel of resignation and pity, but wholly divorced from sentimentality. Gogol was succeeded by Goncharov, Tourgeniev, Dostoevski, Pesmenski (1820-1881) and Tolstoi, forming the most consistent and, doubtless, the most powerful school of novelists which Europe saw in the 19th century. The influence of these writers on the rest of the world was immense, and even in England, where it was least acutely felt, it was significant. That the Russians have indicated the path to new fields in 1860 and 1870, the Adolphs, the Wielands, the nursery tales, which outward province of novel-writing is abundantly manifest.

14. Oriental.—In a primitive form, the novel has long been cultivated in Asia. It was introduced into China, but whence it is unknown, in the 13th century, and Le Kuan-chung was the first Chinese novelist. The productions of this writer and of his followers are tales of bloody warfare, or record the adventures of travellers. The novel called The Twice-Flowering Plum-Tree, belonging to the 16th (or 17th) century, is a typical example of the moral Chinese novel, written with a virtuous purpose. Professor Giles holds that the novel of China reached its highest point of development in The Dream of the Red Chamber, an anonymous story of the end of the 17th century; this is a panorama of Chinese social life, "worked out with a completeness worthy of Fielding." Prose began to be met with in the literature of Japan early in the 10th century. But the inventor of the Japanese novel was a woman of genius, Murasaki no Shikibu, whose Genji Monogatari has been compared to the writings of Richardson; it was finished in 1004 and may, therefore, be considered the oldest novel in the world. This book, which is one of the great classics of Japan, was widely imitated. After the classic period of novel-writing took a long neglected in Japan, but the humors of 17th-century life were successfully translated into popular fiction by Saikaku (1614-1669), and later by Jisho and Kicski, who collaborated in a great number of remarkable stories.

Sonnenfels, Romanzi e Novellisti della 8th Century (1871); Bever and Sansot-Orlando, Oeuvres galantes des novellieri italiani (1903); Rivadeneyra, Biblioteca de autores españoles (1868-1880); Gosse, A Century of French Romance (1900-1902); G. Pellissier, Le Mouvement littéraire au XIXe siècle (1889); Zola, Les Romanciers naturalistes (1880); Le Roman experimental (1879); Brucieire, Le Roman naturaliste (1883); W. Raleigh, The English Novel (1894); V. Chavouin, Les Romanciers grecs et latins (1862); Fancan, Le Tombeau des romanciers (1862).

NOVELDA, a town of E. Spain, in the province of Alicante; on the right bank of the river Vinalopó, and on the railway from Madrid to Alicante. Pop. (1900) 11,388. The country around is flat and fertile, producing much wine, dates, oranges, oil, saffron and wine. There are rather considerable manufactories of alcohol, chocolate and soap. The women make fine lace. In the neighbouring village of Salinitas de Elda there are warm sulphur and saline baths.

NOVELLI, ERMETE (1851—1919), Italian actor and playwright, was born in Lucca on the 3rd of March 1851, the son of a prompter. He made his first appearance in 1866, and played character and leading comedy parts in the best companies between 1871 and 1884. By 1885 he had his own company, and made a great success in Paris in 1888 and 1902. He established the Fitzwilliam Museum, and innumerable great compositions...
beginning of winter; the sacred banquet called opulum \textit{Jove}s took place on the 13th. It is said that the senate intended to rename the month in honour of Tiberius—his birthday occurring on the 16th, but the emperor declined, saying, "What will you do, Conspect Fathers, if you have \textit{thirteen Caesars}?" The Anglo-Saxon names for November were \textit{Windmonath}, "wind-month" and \textit{Blodmonath} "blood-month." In the calendar of the first French republic November reappeared partly as Brumaire and partly as Frimaire. The principal November festivals in the calendar of the Roman Church are: All Saints' Day on the 1st, All Souls' on the 2nd, St Martin's on the 11th, the Presentation of the Virgin on the 21st, St Cecilia's on the 22nd, St Catherine's on the 25th and St Andrew's on the 30th. In 1755 he was invited by Garrick to London, where he remained two years. Between 1758 and 1760 he produced several ballets at Lyons, and published his \textit{Le"tres sur la danse et les ballets}. From this period may be dated the revolution in the art of the ballet for which Novelle was responsible. (See \textit{Pantomime} and \textit{Ballet}).

He was next engaged by the duke of Württemburg, and afterwards by the empress Maria Theresa, until, in 1775, he was appointed, at the request of Queen Marie Antoinette, \textit{maître des ballets} of the Paris Opera.

This period of his life is usually described as one of poverty. He died at St Germain on the 10th of November 1830.

Novelle's friends included Voltaire, Frederick the Great and David Garrick (who called him "the Shakespeare of the dance"). The ballets of which he was most proud were his \textit{Haute de Vénus}, \textit{Le Ballet des Quatorze Ménages}, \textit{Le Ballet de Jalousie}. Besides the letters, Novelle wrote \textit{Observations sur la construction d'une nouvelle salle de l'Opéra} (1761); \textit{Le"tres sur Garrick écrits à Voltaire} (1801); and \textit{Let"tres sur les fêtes publiques} (1801).

NOVGOROD, a government of N.W. Russia, bounded W. and N. by the governments of St Petersburg and Olonets, S.E. by Volodga, Yaroslav and Tver, and S.W. by Pskov, stretching from S.W. to N.E. 450 m. Area, 42,233 sq. m. Pop. (1906) 1,555,700. The S. is occupied by the Valdai plateau, in which are the highest elevations of middle Russia (600 to over 1000 ft.), as well as the sources of nearly all the great rivers of the country. The plateau is deeply furrowed by valleys with abrupt slopes, and descends rapidly towards the basin of Lake Ilm in the W. (only 60 ft. above the sea-level). The climate of this region of N.W. Russia. This tract is dotted over with innumerable sheets of water, of which Byelo-ozero (White Lake) and Vozhe are the largest of over 3000. Immense marshes, overgrown with thin forests of birch and elm, occupy more than one-seventh of the entire area of the government; several of them have an area of 300 to 450 sq. m. each. They admit of being crossed only when frozen. Six centuries ago they were even less accessible, but the slow upheaval of N.W. Russia, going on at the rate of 3 or more feet per century, has exercised a powerful influence on the drainage. Of late years artificial drainage has been carried out on a large scale. The forests still occupy 55% of the total area of the government.

Geologically, Novgorod exhibits in the W. vast beds of Devonian limestones and sandstones; these are elsewhere overlaid with Carboniferous limestone, dolomite, sandstones and marls. Devonian rivers have cut their way through these strata. Staraya Russa (S. of Lake Ilmen), and contains iron-ores, while the more recent formation has coal strata of inferior quality. The whole is covered with a thick sheet of boulder-clay, on the外包成在以里侧在水底的末期的N. European ice-sheet of the Glacial period. Numerous remains of the neolithic Stone Age are found, especially round the extinct lakes. The Baltic and Caspian Sea basins are the ends of the Moraines, which are still in evidence in the Batyn and Volkhov rivers, and the Volkhov and Vyatka canals, while the Alexander-von-Württemberg canal connects the tributaries of the White Sea with those of the Baltic. The chief river is the Volkhov, which flows from Lake Ilmen into Lake Ladoga.

Other navigable rivers are the Syas, also flowing into Lake Ladoga, and the Sheksna and the Mologa, tributaries of the Volga. The Msta and the Lovat are the principal streams in the basin of Lake Ilmen. All boats from the Volga to St Petersburg pass through this government.

The yearly average temperature at Novgorod is only 40° Fahr. (14.5° in January, 62.5° in July). The severe climate, the marshy or stony soil, and the want of grazing grounds render agriculture unprofitable, though it is carried on everywhere. The yield of rye or other cereals is insufficient for the wants of the inhabitants. Fireclay, coal and turf are extracted in commercial quantities. Building, smith-work, fishing, shipbuilding, distilleries, glass and match factories, sawmills and a variety of domestic industries give occupation to about 40,000 families. Hunting is still profitable. But most of the inhabitants are dependent on the river-boat traffic; and nearly one-fourth of the able-bodied males are annually driven to other parts of Russia in search of work. The Novgorod carpenters and masons have long been renowned. Trade is chiefly in grain and timber, and in manufactures and grocery wares from St Petersburg. The fairs are numerous, and several of them (Kirillo-Belozersky monastery, Stariy Russ and Novgorod) are of considerable repute.

The inhabitants are almost exclusively Great-Russians, but they are discriminated by some historians from the Great-Russians of the basin of the Oka, as showing remote affinities with the Little-Russians. They belong mostly (96% ?) to the Orthodox Greek Church, but there are many Nonconformists. There are 10,000 Karelians and 5000 Chudes, with some Jews and some Germans. Novgorod is well provided with educational institutions, and primary education is widely diffused in the villages. (P. A. K.; J. T. B.).

NOVGOROD (formerly known as Veliky-Novgorod, Great Novgorod), a town of Russia, capital of the government of the same name, and the seat of an archbishop of the Orthodox Greek Church, situated 119 m. by rail S. of St Petersburg, on the low flat banks of the Volkhov, 2 m. below the point where it issues from Lake Ilmen. Pop. (1900) 26,972. The present town is but a poor survival of the wealthy city of medieval times. It consists of a Kremlin (old fortress), and of the city, which stands on both banks of the river, connected by a handsome stone bridge. The Kremlin was much enlarged in 1044, and again in 1116. Its two principal palisades, were begun in 1225, and much extended in 1490. Formerly a great number of churches and shops, with wide squares, stood within the enclosure. Its historical monuments include the cathedral of St Sophia, built in 1045-1052 by architects from Constantinople to take the place of the original wooden structure (?), destroyed by fire in that year. Some minor changes were made in 1688 and 1692, but otherwise (notwithstanding several fires) the building remained unaltered until its restoration in 1839-1900. It contains many highly-prized relics, including bronze doors of the 12th century, one brought reputedly from Sigtuna, the ancient capital of Sweden. Another ancient building in the Kremlin is the Yaroslav Tower, in the square where the Novgorod vjecke (common council) used to meet; it still bears the name of "the court of Yaroslav"; and was the chancellery of the secretaries of the vjecke. Other remarkable monuments of ancient Russian architecture are the church of St. Nicholas erected in 1135, the Smanski cathedral of the 14th century, and churches of the 14th and 15th centuries. Within the town itself there are four monasteries and convents, two of them dating from the 11th and two from the 12th century; and the large number in the immediate neighbourhood shows the great extent which the city formerly had. A monument to commemorate the thousandth anniversary of the foundation of Russia (the calling in of the Varangians by Novgorod in 862) was erected in 1862. Another monument commemorates the repulse of the Napoleonic invasion of 1812.

The date at which the Slavs first erected forts on the Volkhov (where it leaves Lake Ilmen and where it flows into Lake Ladoga) is unknown. That situated on a low terrace close by Lake Ilmen was soon abandoned, and Novgorod or "New-town"
with the aid of the Lithuanians. But in 1456 the great prince of Moscow succeeded in imposing a heavy tribute. Ivan III. of Moscow took possession of the colonies in the northern Dvina and the Perm regions, and began two bloody wars, during which Novgorod fought for its liberty under the leadership of Martha Boretskaya, the mayor. In 1475-1478 Ivan III. entered Novgorod, abolished its charters, and carried away 1000 of the wealthier families, substituting for them families from Moscow; the old free city then recognized his sovereignty. A century later Ivan IV. (the Terrible) abolished the last vestiges of the independence of the city. Having learned that a party favourable to Lithuania had been organized in Novgorod, he took the field in 1570, and entered the city (much weakened by the recent pestilences) without opposition. His followers killed the heads of the monasteries, the wealthier of the merchants and clergy, and burned and pillaged the city and villages. No fewer than 15,000 men, women and children were massacred at Novgorod alone (60,000 according to some authorities). A famine ensued, and the district of Novgorod fell into utter desolation. Thousands of families were transported to Moscow, Nizhni-Novgorod, and other towns of the principality of Moscow. In the 16th century the 17th century the foundation of St Petersburg ultimately destroyed its trade. Its position, however, on the water highway from the Volga to St Petersburg and on the trunk road from Moscow to the capital, still gave it some commercial importance; but even this was destroyed by the opening of the Vishera canal, connecting the Msta with the Volkov below the city, and by the construction of the railway from St Petersburg to Moscow, which passes 46 m. to the east of Novgorod. 

Ivan III. (P. A. K.; J. T. Be), Novibazar, Nov-Bazar, or Novibazar (ancient Russia, Rascia, or Rashka, Turkish Yenipazar, i.e. "New Market"), a sanjak of European Turkey, in the vilayet of Kossa. Pop. (1905) about 175,000. Novibazar is a mountainous region, watered by the Lim, which flows north into Bosnia, and by some small tributaries of the Servian Ibar. About three-fourths of the inhabitants are Christian Serbs, and the remainder are chiefly Moslem Albanians, with a few gipsies, Turkish officials and about 3000 Austro-Hungarian soldiers. The local trade is mainly agricultural. The sanjak is of great strategic importance, for it is the N.W. part of the Turkish empire, on the direct route between Bosnia and Salonica, and forms a wedge of Turkish territory between Servia and Montenegro. The union of these powers, combined with the annexation of Novibazar, would have imposed the extension of Austrian influence towards Salonica. But by the treaty of Berlin (1878) Austria-Hungary was empowered to garrison the towns of Byelopolye, Priyepolye, Plevye and other strategic points within the sanjak, although the entire civil administration remained in Turkish hands. This decision was enforced in 1879. The chief approaches from Servia and Montenegro have also been strongly fortified by the Turks.

Novibaz, the capital of the sanjak, is a town of about 12,000 inhabitants, on the site of the ancient Servian city of Rascia. Near it there are Roman baths, and the old church of St Peter and St Paul, the metropolitan church of the bishopric of Rascia, in which Stephen Nemanya, king of Servia, passed from the Roman to the Greek Church in 1143.

Novice (through French from Lat. noviceus or novitius, one who has newly arrived, novus, new), a person who joins a religious order on probation. He or she is subject to the authority of the Ordinary, or bishop, and obeys his rules. At the end of the "novitiate," which must last at least one year, the novice is free to leave without taking the vows, and the order is free to refuse to allow him or her to take them. The word was early used of a beginner in any art or science, hence an inexperienced person.

Novi Ligure, a town of Piedmont, Italy, in the province of Alessandria, from which it is 14 m. S.E. by rail, situated among wooded hills, 626 ft. above sea-level. Pop. (1901) 17,868. It was the scene of a victory by the Austrians and Russians under
NOVO-BAYAZET—NOWGONG

Suworov over the French in 1790. It is now an important railway junction, the main lines from Turin and Milan to Genoa converging here. Cotton, silk, coal briquettes, &c., are also manufactured here.

NOVO-BAYAZET, a town of Russian Transcaucasia, in the government of Erivan, 35 m. N.E. of the town of Erivan, and 4 m. W. of Gok-chai Lake, 5970 ft. above the sea. Pop. 5807 in 1897, mainly Armenians. An Armenian village which stood here was destroyed by Nadir Shah of Persia in 1736, and it was not till the Turkish War of 1828–29 that the site was again occupied by Armenian refugees from the Turkish town of Bayazet or Bayadiz.

NOVOCRHERKASK, a town of Russia, capital of the Don Cossacks territory, situated on a hill 400 ft. above the plain, at the confluence of the Don with the Aksai, 45 m. from the Sea of Azov, and 32 m. by rail N.E. from Rostov. Pop. (1897) 52,005.

It was founded in 1805, when the inhabitants of the Cherkassk stolitsa (now Old Cherkerk) were compelled to leave their abodes on the Don by account of the frequent inundations. The town is an archiepiscopal see of the Orthodox Greek Church, and possesses a cathedral (1904), a museum, the palace of the ataman (chief) of the Cossacks, and monuments to M. I. Platov (a Cossack chief) and T. Yermak (1604), the conqueror of West Siberia. Wide suburbs extend to the S.W., and the right bank of the Aksai is dotted with the villas of the Cossack officials. Manufactures make slow progress. An active trade is carried on in corn, wine and timber (exports), and manufactures and grocery wares (imports).

NOVOGONG, a town of Russia, usually known under the name of Krylov, in the government of Kherson, at the confluence of the Tyasmin with the Dnieper, 17 m. W.N.W. of Kremenchug. Its fort was erected by the Poles in 1615. The inhabitants carry on a lively trade in timber, grain and cattle, and have a few flourmills and candle-works. Pop. (1897) 11,214. (2) A first-class fortress of Russian Poland (called Modlin till 1831), at the confluence of the Narev (Bug) with the Vistula, 23 m. by rail N.W. of Warsaw. Modlin was first fortified under the Napoleonic régime in 1807, and in the wars of 1813 and 1830–31 underwent several sieges. Since that time the Russians have made many additions to the works, and the place now forms, with Warsaw, Ivangorod and Brest-Litovsk, the so-called Polish Quadrilateral. The strength of Novo-georgievsk lies mainly in the new circle of eight powerful forts, erected at a mean distance of 10 m. from the enceinte.

The importance of the fortress lies in the fact that it prevents Warsaw from being turned by a force on the lower Vistula and commands the railway between Danzig and Warsaw.

NOVOMOSKOVSK, a town in Russia, in the government of Ekaterinoslav, 16 m. N.E. of the town of Ekaterinoslav. Including several villages which have been incorporated with it, it extends for nearly 7 m. along the right bank of the Samara, a tributary of the Dnieper. In the 17th century the site was occupied by several villages of Zaporogian Cossacks, known under the name of Samarchik. In 1687 Prince Golitsin founded here the Ust-Samara fort, which was destroyed after the treaty of the Pruth (1711), but rebuilt in 1736, and the settlement of Novoselitsy established. The inhabitants of Novomoskovsk, who numbered 23,831 in 1900, are chiefly engaged in agriculture, though some are employed in tanneries, and there is a trade in horses, cattle, tallow, skins, tar and pitch. In the immediate neighbourhood is the Samarsko-Nikolayevsky monastery, which is visited by many pilgrims.

NOVORADOMSK, or Radomsko, a town of Russian Poland, in the government of Piotrków, 28 m. by rail S.S.W. of the town of Piotrków. It has factories for bentwood furniture, woollens and cloth, tanneries, ironworks and sawmills, and is the centre of a very active trade. Pop. (1900) 14,646, many being Jews.

NOVOROBYSKV, a seaport town of S. Russia, in the Chernomorsk or Black Sea territory, on a bay of the same name (also named Tames), on the N.E. coast of the Black Sea. Pop. (1900) 40,384.

The bay, nearly 3 m. wide at its entrance on the E., and 5 m. deep from E. to W., is exposed to the N.E. wind (bora), which sweeps down from the Caucasus Mountains with great violence. There is an artificial harbour (1853) protected by a mole. Novorossiysk is connected by a branch railway to Tikhoryetskaya (169 m.) with the main Caucasian line, which crosses the Volga near Tsaritsyn, and has become an important centre for the export of corn, and since the petroleum wells of Grouzy in northern Caucasus were tapped it has become a great depot for the export of petroleum. Cement is manufactured. Large grain elevators have been erected, and a commercial town has grown up. Besides cereals, which amount to 65% of the whole, the exports consist of petroleum and petroleum waste, oilcake, linters, timber, bran, millet seed, wool, potash, zinc ore and liquorice, the total annual value ranging between 32 and 34 millions sterling. The imports are small. Some 1500 acres in the vicinity of the town are planted with vines. Novorossiysk has belonged to Russia since 1829.

NOWELL, ALEXANDER (c. 1507—1602), dean of St. Paul's, London, was the eldest son of John Nowell of Read Hall, Whalley, Lancashire, by his second wife Elizabeth Kay of Rochdale.

He was educated at Middleton, Lancashire, and at Brasenose College, Oxford, where he is said to have shared rooms with John Foxe the martyrlogist. He was elected fellow of Brasenose in 1526. In 1543 he was appointed master of Westminster school, and in December 1551 prebendar of Westminster.

He was elected in September 1553 member of parliament for Loce in Cornwall in Queen Mary's first parliament, but in October 1553 a committee of the house reported that, having paraphrased the 6th chapter of Jeremiah to a seat in convocation, he could not sit in the House of Commons. He was also deprived of his prebend, probably as being a married man, before May 1554, and sought refuge at Strassburg and Frankfurt, where he developed puritan and almost presbyterian views. He submitted, however, to the Elizabethan settlement of religion, and was rewarded with the archdeaconry of Middlesex, a canonry at Canterbury and in 1560 with the deanship of St Paul's. His sermons occasionally created some stir, and on one occasion Elizabeth interrupted his sermon, telling him to stick to his text and cease slinging the crucifix. He held the deanship of St Paul's for forty-two years, surviving until the 11th of February 1602.

Nowell is believed to have composed the Catechism inserted before the Order of Confirmation in the Prayer Book of 1540, which was supplemented in 1604 and is still in use; but the evidence is not conclusive. Early in Elizabeth's reign, however, he wrote a larger catechism, to serve as a statement of Protestant principles; it was printed in 1570, and in the same year appeared his "middle" catechism, designed it would seem for the instruction of "simple curates." Nowell also published a free school at Middleton and made other contributions for educational purposes. He was twice married, but left no children.

NOWGONG, a town of India, headquarters of the Bundelkhand agency and a military cantonment, in the native state of Chhatarpur, on the border of the British district of Jhansi. Pop. (1901) 4430. It has accommodation for a force of about 3500. The college for the education of the sons of chiefs in Central India, opened here in 1872, was abolished in 1898, owing to the small attendance.

NOWGONG, a town and district of British India, in the Brahmputtra valley division of eastern Bengal and Assam. The town is situated on the Kalang river. Pop. (1901) 4430. The district of Nowgong has an area of 3843 sq. m. It consists of a wide plain overgrown with jungle and canebreaks, intersected by numerous tributaries of the Brahmaputra, and dotted with lenticular marshes. The Mikir hills cover an area of about 63 m. by 35 in the S. of the district; the highest peak is about 3500 ft. The slopes are very steep, and are covered with dense forest.
The Kamakhya hills near the bank of the Brahmaputra, are about 1,500 ft. high. On the summit of the highest peak is a celebrated temple of Kamakhya, the local goddess of love, where three annual festivals are held. The staple crop is rice. Tea cultivation and manufacture are carried on by European capital and under European supervision, though the soil and climate are not so favourable as in Upper Assam. The population in 1901 was 261,150, showing a decrease of 24.8% in the decade, due to the extreme unhealthiness of the climate. In the previous ten years the number of deaths recorded from fever and kalu assa has increased by 33.824. The section of the Assam-Bengal rail road, from Gauhati to the hills passes through part of the district, but not very near Nowgong town; and feeder roads to the estates lead from the main road that runs parallel to the Kalan river.

See *Newsgong District Gazetteer* (Calcutta, 1905).

**Nowshea** or Naushahra, a town and cantonment in Peshawar district of the North-West Frontier Province of India, situated on the right bank of the Kabul river 27 m. E. of Peshawar. Pop. (1901) 9518. It is the headquarters of a brigade of the Frontier Force. On it one of the branches of the railway intersects, and also the junction for the frontier railway that runs to the station of Mardan and continues to Dargai and Malakand on the route to Chitral.

**Noy, William** (1577–1634), English jurist, was born on the family estate of Pendrea in Buryan, Cornwall, in 1577, his father belonging to a family whose pedigree is included in the visitation of Cornwall in 1620. He went to Exeter College, Oxford, but left without taking a degree. He entered Lincoln’s Inn in 1594. From 1603 until his death he was elected, with one exception, to each parliament, sitting invariably for a constituency of his native county. For several years his sympathies were in antagonism to the court party. Every commission that was appointed numbered Noy among its members, and even those who were opposed to him in politics acknowledged his learning. A few years before his death he was drawn over to the side of the court, and in October 1631 he was created attorney-general, but was never knighted. It was through his advice that the impost of ship-money was levied. Noy had long suffered from stone, and died in great agony on the 9th of August 1634; two days later he was buried at New Brentford church.

**Noyon**, a city of N. France, in the department of Oise, 67 m. N.N.E. of Paris by the railway to Brussels. Pop. (1906) 5968. Noyon is built on the foot and on the slopes of a hill, and traversed by a small stream, the Verse, which joins the Oise 1 m. farther down. The old cathedral of Notre-Dame, constructed on the site of a church burned in 1131, is a fine example of the transition from Romanesque to Gothic architecture. In plan it is a Latin cross, with a total length from E. to W. of about 340 ft.; the height of the nave vaulting is 75 ft. The west front has a porch, added in the 14th century, and two unfinished towers; their upper portions dating from the 13th century; its decorations have been greatly mutilated. The nave consists of eleven bays, including those of the W. front, which, in the interior, forms a kind of transept. In the windows of the aisles, the arches of the triforium, and the windows of the clerestory the round type is maintained; but double pointed arches appear in the lower gallery; and the vaults of the roof, originally six-ribbed, were rebuilt after a fire in 1293 in the prevailing Pointed style. The transepts have apsidal terminations, and in the S. aisle in the 15th and the 16th, one of the latter (15th) is especially rich in decorations. The flying buttresses of the building were restored in the 19th century in the style of the 12th century. From the N.W. corner of the nave runs the western gallery of a fine cloister erected in 1292; and next to the cloister is the chapter-house of the same date, with its entrance adorned with statues of the bishops and other sculpture. The bishops’ tombs within the cathedral were destroyed during the Revolution. The chapel of the bishops' palace is an example of the Early Pointed style; the canons' library was built of wood early in the 16th century; and the town-hall (Gothic and Renaissance) dates from 1485-1523. Among the town manuscripts is the Red Book or communal charter of Noyon. Remains of the Roman walls may be traced. There is a statue to Jacques Sarrazin, the painter (1692-1660), a native of the town. Noyon has good trade in grain and live-stock, and contains chemical and artificial manure works, tanneries and ironfoundies and carries on sawmilling and sugar manufacture.

Noyon, the ancient Noviomagus Vermondauorum, was chosen by St. Peter of the Walloon Beghins as the site of their first monastery, and about 530 St. Medard, bishop of the district of Vermandois, transferred his see thither from St. Quentin. The episcopate of St. Eligius towards the middle of the 7th century, the burial of Chilperic I., the coronation of Pippin the Short in 752, and on the same occasion the coronation of his infant son Carolomn with the title of king of Noyon, the coronation of Charlemagne in 768 and the election of Hugh Capet in 987, the plunder of the town by the Normans in 859 are the chief events in the history of Noyon down to the 10th century. Fill the Revolution the bishops-the cathedral was never a diocesan see—ceded its temporalities to the state, and the town, the church and the bishopric were merged in the Republic. At the beginning of the 17th century Noyon was made a commune and was granted a communal charter through the favour of its bishops. The extent of the bishopric was considerably curtailed towards the middle of the 12th century by the breaking off of the diocese of Tournai. Noyon was ravaged by the English and the Burgundians during the Hundred Years' War. In 1516 a truce was signed there by Francis I. and Charles V. The city was captured by the Spaniards in 1552, and afterwards by the Leaguers, who were expelled in 1594 by Henry IV. John Calvin was born at Noyon in 1543.

**Nouzu, Michitsura, Marquess** (1840–1908), Japanese field-marshall, was born in Satsuma. He fought against the Satsuma rebels in 1877, became a general in 1894 and led the Hiroshima division at the battle of Pyongyang (1894). He succeeded Yamagata in the command-in-chief of the Manchurian army, and fought in that capacity throughout the China-Japan War, being raised to the rank of viscount (1895). He commanded the fourth army in the Russo-Japanese War, and received a marquisate at its close.

**Nubar Pasha** (1829–1899), Egyptian statesman, was born at Smyrna in January 1825, the son of an Armenian merchant named Mogherditch, who had married a relative of Boghos Bey, an influential minister of Mehemet Ali. Boghos had promised to interest himself in the future of his young relative, and at his suggestion he was sent first to Vevey, and then to Toulouse, to be educated by the Jesuits, from whom he acquired a very perfect knowledge of French, and perhaps that singular suppleness and subtlety of character by which he was mainly distinguished. Before he was eighteen he went to Egypt, and after some eighteen months' training as secretary to Boghos, who was then minister of both commerce and foreign affairs, he was made second secretary to Mehemet Ali. In 1845 he became first secretary to Ibrahim Pasha, the heir apparent, and accompanied him on a special mission to Europe. Abbas Pasha, who succeeded Ibrahim in 1848, maintained Nubar in the same capacity, and sent him in 1850 to London as his representative to resist the pretensions of the sultan, who was seeking to evade the conditions of the treaty under which Egypt was secured to the family of Mehemet Ali. Here he was so completely successful that he was made a bey; he was also made Minister of the Interior in 1852, and remained there until the death of Abbas in July 1854. The new viceroy, Said, at once dismissed him from office, but two years afterwards appointed him his chief secretary, and later gave him charge of the important transport service through Egypt to India. Here Nubar was mainly instrumental in the completion of railway communication between Cairo and Suez, and exhibited strong organising ability combined with readiness of resource. After a second time falling a victim to Said's caprice and being dismissed, he was again sent to Vienna, and returned as
principal secretary to Said, a position he held till Said's death in January 1863.

On the accession of Ismail Pasha, Nubar Bey was in the prime of life. He was already on friendly terms with him; he even claimed to have saved his life—at all events, it was a coincidence that the two had together refused to travel by the train the accident to which caused the death (on the 14th of May 1838) of the prince Ahmed, who would otherwise have succeeded Said. Ismail, himself of more capable man than his immediate pre-
decessors, at once recognized the ability of Nubar, and charged him with a mission to Constantinople, not only to notify his accession, but to smooth the way for the many ambitious projects he already entertained, notably the completion of the Suez Canal, the change in title to that of khedive and the change in the order of succession. In the first of these he was completely successful; the sultan, believing as little as every one else that the canal was anything more than a dream, gave his consent at a price the moderation of which he must afterwards have regretted. The gratified Ismail created Nubar a pasha, and the sultan himself, persuaded to visit Cairo, confirmed the title so rarely accorded to a Christian.

Half the work was, however, yet to be done, and Nubar was sent to Paris to complete the arrangements, and to settle the differences between Egypt and the Canal Company. In what he used to call "an expensive moment of enthusiasm," he left these differences to the arbitration of the emperor Napoleon III. and cost Egypt four millions sterling. On his return he was

made Egypt's first minister of public works, and was distinguished for the energy which he threw into the creation of a new department; but in 1866 he was made minister of foreign affairs, and at once went on a special mission to Constantinople, where he succeeded in the other two projects that had been left in abeyance since his last visit. In June 1867 Ismail was declared khedive of Egypt, with succession in favour of his eldest son. Nubar now had a harder task to undertake than ever before. The antiquated system of "capitations" which had existed in the Ottoman empire since the 15th century had grown in Egypt to be a practical creation of seventeen imperia in imperio: seventeen consulates of seventeen different powers administered seventeen different codes in courts before which alone their subjects were amenable. A plaintiff could only sue a Frenchman in the French court, with appeal to Aix; an Italian in the Italian court, with appeal to Ancona; a Russian in the Russian court, with appeal to Moscow. Nubar's bold design, for which alone he deserves the credit, was to induce these seventeen powers to consent to abandon their jurisdiction in civil actions, to substitute mixed International Courts and a uniform code binding on all. That in spite of the jealousies of all the powers, in spite of the opposition of the Porte, he should have succeeded, places him at once in the first rank of statesmen of his period. Nubar made no attempt to get rid of the criminal jurisdiction exercised by the consular representatives of the foreign powers—such a proposal would have had, at that time, no chance of success.

The extravagant administration of Ismail, for which perhaps Nubar can hardly be held wholly responsible, had brought Egypt to the verge of bankruptcy, and Ismail's disregard of the judgments of the Court at last compelled Great Britain and France to interfere. Under pressure, Ismail, who began to regret the establishment of the International Courts, assented to a mixed ministry under Nubar, with Rivers Wilson as minister of finance and de Blignières as minister of public works. Nubar, finding himself supported by both Great Britain and France, tried to reduce Ismail to the position of a constitutional monarch, and Ismail, with an astuteness worthy of a better cause, took advantage of a somewhat injudicious disbandment of certain regiments to incite a military rising against the ministry. The governments of Great Britain and France, instead of supporting the ministry against the khedive, weakly consented to Nubar's dismissal; but when Nubar had retired, Rivers Wilson and de Blignières they realized that the situation was a critical one, and they succeeded in obtaining from the sultan the deposition of Ismail and the substi-
tution of his son Tewfik as khedive (1879). Nubar remained out of office until 1884.

In the interval Great Britain had intervened in Egypt—the battle of Tel-el-Kebir had been fought, Arabi had been banished, and Sir Evelyn Baring (afterwards earl of Cromer) had succeeded Sir Edward Malet. The British government, under the advice of Baring, insisted on the evacuation of the Sudan, and Sheriff having resigned office, the more pliant Nubar was induced to become premier, and to carry out a policy of which he openly disapproved, but which he considered Egypt was forced to accept under British dictation. At this period he used to say, "I am not here to govern Egypt, but to administer the British government of Egypt. I am simply the greaser of the official wheels." It might have been well if Nubar had confined himself to this modest programme, but it was perhaps hardly to be expected of a man of his ability and restless energy. It must be admitted, however, that the characters of Nubar and Lord Cromer were not formed to run in harness, and it was with no surprise that the public learnt in June 1888 that he had been relieved of office, though his dismissal was the direct act of the khedive Tewfik, who did not on this occasion seek the advice of the British agent. Riaz Pasha, who succeeded him, was, with one interval of eight months, prime minister until April 1894, when Nubar returned to office. By that time Lord Cromer had more completely grasped the reins of administration as well as of government, and Nubar had realized more clearly the rôle which an Egyptian minister was called on to play; Lord Cromer was the real ruler of Egypt, and the death of Tewfik in 1890 had necessitated a more open exercise of British authority. In November 1895 Nubar completed his fifty years of service, and, accepting a pension, retired from office. He lived little more than three years longer, spending his time between Cairo and Paris, where he died in January 1899 at the age of seventy-four.

NUBIA, a region of north-east Africa, bounded N. by Egypt, E. and W. by the Red Sea and the Libyan Desert respectively, and extending S. indefinitely to about the latitude of Khartum. It may be taken to include the Nile valley from Assuan near the First Cataract southwards to the confluence of the White and Blue Niles, stretching in this direction for about 500 m. between 16° and 24° N. Nubia, however, has no strictly defined limits, and is little more than a geographical expression. The term appears to have been unknown to the ancients, by whom everything south of Egypt was vaguely called Ethiopia, the land of the dark races. It is first associated historically, not with any definite geographical region, but with the Nobatae, a negro people removed by Dioscurid from Kharga oasis to the Nile valley above Egypt (Dodecaschoenus), whence the turbulent Blemmyes had recently been driven eastwards. From Sth, the Arabic form of the name of this people, comes the modern Nubia, a term about the precise meaning of which no two writers are in accord. Within the limits indicated the country consists mainly of sandy desert and rugged and arid steppes and plateaus through which the Nile forces its way to Upper Egypt. In this section of the river there occurs a continuous series of slight falls and rapids, including all the historical "six cataracts," beginning below Khartum and terminating at Philae. Between those places the river makes a great S-shaped bend, the region west of the Nile within the lower bend being called the Bayuda Desert, and that east of the Nile the Nubian Desert. The two districts roughly correspond to the conventional divisions of Upper and Lower Nubia respectively. Except along the narrow valley of the Nile only the southernmost portion of Nubia contains arable land. The greater part is within the almost rainless zone. An aridiferous district lies between the Nile and the Red Sea, in 25° N. Politically the whole of Nubia is now included either in Egypt or the Anglo-Egyptian Sudan, and has no administrative existence.

Ethnology.—As an ethnical expression the term Nubia or Nubian has little value. Rejected by the presumed descend-
slaves drawn by Arab dealers from the Nuba negroes of Kordofan, who appear to constitute the original stock of the Nubian races (but see HAMITIC RACES). On the other hand, the name has never included all the inhabitants of Nubia. Peoples of three distinct stocks inhabit the country—the comparatively recent Semitic Arab intruders, mainly in Upper Nubia, the Beja (? Hamitic) family of tribes (the Ababda, Basharin, Hadendoa, Beni-Amer, &c.), everywhere between the Nile and the Red Sea; and the Nubians (Nuba or Barabira) of the Low Nubia, where they now also seem to predominate. Nubia is attached to the banks of the Nile, from Assuan southwards to Dongola. Ethnologically these modern Nubians are a very mixed people, but their affiliation to negroes or negroids, which is based on physical and linguistic grounds, is confirmed by what is known of the history of the Nilotic peoples.

The first inhabitants of the region beyond Egypt appear to have been the Uaua, whose name occurs in an inscription on a tomb at Memphis of the Vth Dynasty, and again constantly in subsequent inscriptions down to the time of the Ptolemies, as the chief negro race to the south of Syene. (For the history of the country during this period see ETHIOPIA.) It thus appears that throughout the historic period down to the arrival of the Romans the Nile-country above Egypt was occupied by a negro people. Egyptian monuments are found as far south as Mount Barkal (Napata), but no Egyptian settlements beyond Syene. Hence these Uaua negroes probably remained unaffected, or very slightly affected, by foreign elements until about the 3rd century A.D. Their domain then began to be encroached upon from the east by the Blemmyes, who have been identified with the present Beja of the Nubian desert. It was owing to their incessant raids that the Romans withdrew the Roman garrisons above the cataracts, and called in the warlike Nubate to protect the Egyptian frontier from their attacks. These negro Nubate, originally from Kordofan, as is now evident, had advanced to the Great Oasis (Kharga) in Upper Egypt, whence they passed into the Nile valley between the cataracts. Here they absorbed the older Gua of kindred stock, and ultimately came to terms with the Blemmyes. The two races even began intermingling, and, making common cause against the Romans, were defeated by Maximinus in 457.

The Blemmyes remaining pagan after the Nubas had embraced Christianity (6th century) were soon after driven from the Nile valley eastwards to the kindred Megabares, Memmons and other negroes, who, with the Troglydates, had from time immemorial held the whole steppe region between the Nile and the Red Sea from Azum to Egypt. Here their most collective name was Bugaitae (Bovraerbal), as appears from the Axumite inscription, whence the forms Buja, Beja, which occur in the oldest Arab records, and by which they are still known.

In the 7th century the Arabs who had conquered Egypt penetrated into Lower Nubia, where the two Jawabareh and Al-Gharbiya tribes became powerful, and amalgamated with the Nubas of that district. Their further progress south was barred by the Christian kings of Dongola (682) until the 14th century, when the Arabs became masters of the whole region. Still later another element was added to the population in the introduction by the Turkish masters of Egypt of a number of Bosnians. These Bosnians (Kahaj as they called themselves) settled in the country and intermarried with the Arabs and Nubians, their descendants still holding lands between Assuan and Derr. Hence it is that the Nubians of this district, fairest of all the races, still claim Arab or Osmani (Bosnian) descent.

Nevertheless, the Nubian type of negro is essentially negro, being characterized by a very dark complexion, varying from a mahogany brown and deep bronze to an almost black shade, with tumid lips, large black animated eyes, doli-chephalic head (index 73, 72), hair often woolly or strongly frizzled, and scant beard worn under the chin like the figures of the fugitives (Uaua?) in the battle-pieces sculptured on the walls of the Egyptian temples. At the same time the nose is much larger and the azygomatic arches less prominent than in the full-blooded negro. The Nilotic Nubians are on the whole a strong muscular people, essentially agricultural, more warlike and energetic than the Egyptians. Many find employment as artisans, small dealers, porters and soldiers in Egypt, where they are usually noted for their honesty, and frank and cheerful temperament. Since the overthrow of the native Christian states all have become Mahomedans, but not of a fanatical type. Although a native of Dongola, the maliki, Mahommed Ahmed, found his chief support, not among his countrymen, but among the more recently converted Kordofan negroes and Arabs and Beja. (For ethnology see also HAMITIC RACES, BEJA, ABABA, BISHARIN, HADENDOA, &c.).

Language.—Little is known of the language of the ancient Nubians or of its connexion, if any, with the language, known as Meroitic, of the old Nubian negroes. The cartouches and hieroglyphs and inscriptions in Meroitic belong mostly to the first six centuries A.D.; the existing Nubian MSS. are medieval and are written chiefly in Greek letters, and in form and character resemble Coptic. They are, with one exception, written on parchment and contain lives of saints, &c., the exception being a legal document. The most noteworthy of these MSS. was found near Edfu, in Upper Egypt, early in the 19th century and purchased for the British Museum in 1808. Etym-chius, pamphlet, (second cataract.) Here the natives are called Sadooki, in contradistinction to the northern Matoke.

III. SOUTHERN: Dongola, throughout the province of Dongola from the second cataract to J, Délia near Meroé, on the northern frontier of the Arab district of Dar Shagia. By Iofa, Mahas, or the Arab name Bannid, Biscaini Barisc (in the language of the poor,) or, collectively with the Keno, Ohkhirin, Banni, "language of slaves."

The northern and southern varieties are closely related to each other in the following characteristics, which show more marked affinities with the Kordofan Nuba, possibly because the Sadooki people are later arrivals from Kordofan. For topography, &c., and archaeology, see SUDAN § Anglo-Egyptian and Egypt. Authorities.—C. R. Lepage, Nubische Grammatik (Berlin, 1880), and Briefe aus Aegypten, Athiopien, &c. (Berlin, 1852); D. R. NUBLE, a province of central Chile, bounded N. by Linares, E. by the Argentine Republic, S. by Concepción and W. by Concepción and Maule. Area, 3407 sq. m.; pop. (1856) 152,935. The province lies partly in the great central valley of Chile, noted for its fine climate and fertility, and partly on the western slopes of the Andes. The Itata river, which forms the southern boundary, and its principal tributary, the Nuble, form the drainage system of the province. Agriculture and grazing are the principal industries. Wheat is largely produced, and there are vineyards in some localities. Stock-raising is pursued chiefly in the east, where the pastures are rich and the water

844

NUBLE
supply unfalling. The state railway from Santiago to the southern provinces passes through Nuble, from N.N.E. to S.S.W., and sends off a branch from Bulnes W. to Jan Tomé on the Bay of Concepción. The capital is Chillán, and the only other important town is Bulnes, a railway junction and active commercial centre. The hot baths of Chillán, in the eastern part of the province on the slope of the volcano of that name, about 7000 ft. above sea level, are very popular in Chile.

**NUCERIA ALFATERNA—NUISANCE**

The chief products being sugar, barley, Indian corn and wheat. Rum is a by-product of the sugar industry, and the "mescal" is distilled from the agave. The gathering and preparation of "little" fibres from the agave and yucca forms another important industry, the fibre being sent to Tampico for export. Stock-raising receives considerable attention; there are about a score of large cattle ranges, and there is a considerable export of live cattle to Texas and to various Mexican states. Considerable progress has been made in manufacturing industries, and there are a large number of sugar-mills, cotton factories, woolen mills, smelting works and iron and steel works. The state is well served with railways, the capital, Monterrey, being one of the most important railway centres of Mexico. Though a Mexican National line crosses the northern half of the state and has constructed a branch from Monterrey to Matamoros, and a Belgian line (F. C. de Monterrey al Golfo Mexicano) runs from Tampico N.N.W. to Monterrey, and thence westward to Treviño (formerly Venadito) in Coahulla, a station on the Mexican International. The other principal towns are: Linares, or San Felipe de Linares (pop. 20,560 in 1900), 112 m. by rail S.E. of the capital in a rich agricultural region; Lampaos, or Lampazos de Naranjo (1790), 96 m. by rail N.W. of the capital; Cadereyta Jiménez, or Nuestra Señora de Guadalupe, and Durango, the last in the extreme southern part of the state.

**NUGENT, ROBERT NUGENT, EARL (1702–1788)**, Irish politician and poet, son of Michael Nugent, was born in Carlowtown, Co. Westmeath. He was tersely described by Richard Glover as "a jovial and voluptuous Irishman who had left popery for the Protestant religion, money and widows." His change of religion took place at a very early period in life; he married in 1736 Anna (d. 1756), daughter of James Craggs, the secretary of state, a lady who had already been twice given in marriage. His wife's property comprised the borough of Mawes in Cornwall, and Nugent sat for that constituency from 1741 to 1754, after which date he represented Bristol until 1774, when he returned to St Mawes. He was a lord of the treasury from 1754 to 1759 and president of the board of trade from 1766 to 1768. He married in 1757 Elizabeth, dowager-countess of Berkeley, who brought him a large fortune. His support of the ministry was so useful that he was created in 1707 Viscount Clare, and in 1776 Earl Nugent, both Irish peerages. He died on the 15th of October 1788. Lord Nugent was the author of some poems, several of which are preserved in the second volume of Dodson's Collections (1748). The epigram descended by special remainder to the earl's son-in-law, George Nugent Temple Grenville, marquess of Buckingham, and so to his successors, the dukes of Buckingham and Chandos.

**NUISANCE** (through Fr. *nuiscence*, *nuisance*, from Lat. *nocere*, to hurt), that which gives offence or causes annoyance, trouble or injury. In English law nuisance is either public or private. A public or common nuisance is defined by Sir J. F. Stephen as "an act not warranted by law, or an omission to discharge a local duty, which act or omission obstructs or causes inconvenience or damage to the public in the exercise of rights common to all His Majesty's subjects." (Digest of the Criminal Law, p. 120). A common nuisance is punishable as a misdemeanour at common law, where no special provision is made by statute. In modern times many of the old common law nuisances have been the subject of legislation. It is no defence for a master or employer that a nuisance is caused by the acts of his servants, if such acts are within the scope of their employment, even though such acts are done without his knowledge and contrary to his orders. Nor is it a defence that the nuisance has been in existence for a great length of time, for no lapse of time will legitimate a public nuisance.

A private nuisance is an act or omission which causes inconvenience or damage to a private person, and is left to be remedied by action. There must be some sensible diminution of these rights affecting the value or convenience of the property. "The real question in all the cases is the question of fact, whether the annoyance is such as materially to interfere with the ordinary comfort of human existence." (Lord Romilly in *Crump v.*
nullification required a practice as follows. A state aggrieved by a law of the Federal congress might, in constituent convention, suspend the operation of the objectionable law, and report its action to the other states. If three-fourths of them should decide that the law in question was not unconstitutional, then in effect it became ratified (see United States Constitution, art. v.). The dissatisfied state must then submit or must draw out of the union by the act of secession (see secession, and Confederate States). This theory of the right of nullification was considered by those who held it to be in accord with the principles laid down in the Constitution. It must be distinguished from secession, which was considered a sovereign right, one above the Constitution; yet nullification presumed the submission to the Constitution.

The earliest assertions of the doctrine of nullification are found in the Kentucky and Virginia Resolutions of 1798-1799, written respectively by Thomas Jefferson and James Madison in protest against the Alien and Sedition Acts of Congress. Nullification was first practised in 1830 by Pennsylvania, the governor ordering out the state troops to resist the execution of a decree of a Federal court. In the New England states, 1800-1815, the United States laws relating to embargo, non-intercourse and army enlistments were nullified by state action. In 1832 and 1835, South Carolina likewise nullified the execution of Federal laws and court decrees relating to the Indians within her borders and in Alabama, 1832-1835, there was a similar nullification. The only example of nullification in which theory and practice coincided was the nullification in 1832 by South Carolina of the Federal tariff laws. In this case the state upon the theory outlined above which was perfected by Calhoun. In the last decade before the Civil War fourteenth of the Northern states in the so-called Personal Liberty laws nullified the Federal statutes relating to slaves and slavery by making it a crime for their citizens to obey these laws and by setting them aside by setting them aside. Since the Reconstruction the Southern states have in practice effected a nullification of the Fourteenth and Fifteenth Amendments to the Constitution providing for negro suffrage.

See John C. Calhoun, Works, vols. i. and vi. (New York, 1853-1855); D. F. Houston, Critical Study of Nullification in South Carolina (New York, 1807); C. W. Loring, Nullification and Secession (New York, 1893); E. P. Powell, Nullification and Secession in the United States (New York, 1897); and U. B. Phillips, Georgia and States Rights (Washington, 1902).

NUMANTIA, an ancient hill fortress in northern Spain, in the province of Soria (Old Castile), overlooking the valley of the River Tormes. It was built by the town of Soria, on the upper Donava. Here on a small isolated high plateau in the middle of the valley, was the stronghold which played the principal part in a famous struggle between the conquering Romans and the native Spaniards during the years 154-133 B.C. Numantia was especially concerned in the latter part of this war from 144 onwards. It was several times unsuccessfully besieged. Once the Roman general Hostilius Mancinus with his whole army was compelled to surrender (137). Finally, Scipio Aemilianus, Rome’s first and only general in that age, with some 60,000 men drew round the town 6 m. of continuous entrenchments with seven camps at intervals. After 15 months (134-133) he reduced by hunger the 6000-8000 Numantine soldiers, much as Caesar afterwards reduced Alesia in Gaul. The result was regarded as a glorious victory, and in Roman literature the fall of Numantia was placed beside the fall of Carthage (149 B.C.). In truth, the maintenance in effective condition of so large a Roman force in so remote and difficult a region was in itself a real achievement and such as at that time no one but Scipio could have performed. He redeemed by organized strategy the vacillations and follies of statesmen who had sat at home and sent out inadequate expeditions or incompetent commanders. The site was, under the Roman Empire, occupied by a Roman town called Numantia, and the Itinerary tells of a Roman road which ran past it. It is to-day a “Monumento Nacional” of Spain, and has yielded remarkable discoveries to the skilful excavations of Dr Schulten.
NUMA POMPILIUS—NUMBER

(1905-1910), who has traced the Celtiberian town, the lines of Scipio and several other Roman camps dating from the Numantine Wars.

(F. J. H.)

NUMA POMPILIUS, second legendary king of Rome (715-672 B.C.), was a Sabine, a native of Cures, and his wife was the daughter of Titus Tatius, the Sabine colleague of Romulus. He was elected by the Roman people at the close of a year's interregnum, during which the sovereignty had been exercised by the members of the senate in rotation. Nearly all the early religious institutions of Rome were attributed to him. He set up the worship of Terminus (the god of landmarks), appointed the festival of Fides (Faith), built the temple of Janus, reorganized the calendar and fixed days of business and holiday. He instituted the flamen (sacred priest) of Jupiter, Mars and Quirinus; the virgins of Vesta, to keep the sacred fire burning on the hearth of the city; the Salii, to guard the shield that fell from heaven; the pontifices and augurs, to arrange the rites and interpret the will of the gods; he also divided the handicraftsmen into nine guilds. He derived his inspiration from his wife, the nymph Egeria, whom he used to meet by night in her sacred grove. After a long and peaceful reign, during which the gates of Janus were closed, Numa died and was succeeded by the warlike Tullus Hostilius. Livy (xl. 29) tells a curious story of two stone chests, bearing inscriptions in Greek and Latin, which were found at the foot of the Janiculum (781 B.C.), containing the laws of the ages 2, 4 and 6. The first when opened was found to be empty, but the second contained fourteen books relating to philosophy and pontifical law, which were publicly burned as tending to undermine the established religion.

No single legislator can really be considered responsible for all the institutions ascribed to Numa; they are essentially Italian, and older than Rome itself. Even Roman tradition itself wavers; e.g. the fetiales are variously attributed to Tullus Hostilius and Ancus Marcius. The supposed law-books, which were to all appearance new when discovered, were certainly false.

See Livy i. 18-21; Plutarch, Numa; Dion. Halic. ii. 58-76; Cicero, De republica, ii. 13-15. For criticism: Schwiep, Römische Geschichte, bk. xii.; Sir G. Cornwall Lewis, Credibility of early Roman History, ch. xii.; W. Ihne, Hist. of Rome, i. E. Pais, Storia di Roma, i. (1896), where Numa is identified with Titus Tatius and made out to be a river god, Numinis, closely connected with Aeneas; J. B. Carter, The Religion of Numa (1906); O. Gilbert, Geschichte und Topographie der Stadt Rom im Altertum (1883-1885), and Rome: Ancient History.

NUMBER1 (through Fr. nombre, from Lat. numerus; from a root seen in Gr. προβος to distribute), a word generally expressive of quantity, the fundamental meaning of which leads on to some of the most difficult problems of higher mathematics.

1. The most elementary process of thought involves a distinction within an identity—the A and the not-A within the sphere throughout which these terms are intelligible. Again A may be a generic quality found in different modes Aa, Ab, Ac, &c.; for instance, colour in the modes, red, green, blue and so on. Thus the notions of ‘one,’ ‘two,’ and the vague ‘many’ are fundamentally put, and must have impressed themselves on the human mind at a very early period: evidence of this is found in the grammatical distinction of singular, dual and plural which occurs in ancient languages of widely different races. A more definite idea of number seems to have been gradually acquired by realizing the equivalence, as regards plurality, of different concrete groups, such as the fingers of the right hand and those of the left. This led to the invention of a set of names which in the first instance did not suggest a numerical system, but denoted certain recognized forms of plurality, just as blue, red, green, &c., denote recognized forms of color. Eventually the conception of a series of natural numbers became sufficiently clear to lead to a systematic terminology, and the science of arithmetic was thus rendered possible. But it is only in quite recent times that the notion of number has been submitted to a searching critical analysis: it is, in fact, one of the most characteristic results of modern mathematical research that the term number has been made at once more precise and more extensive.

2. Aggregates (also called manifolds or sets).—Let us assume the possibility of constructing or contemplating a permanent system of the aggregate of all things, as is done in the treatment of the system of all the planets and stars. (1) the system includes all objects to which a certain definite quality belongs; (2) no object without that quality belongs to the system; (3) each object of the system is permanently recognizable as the same thing, and as distinct from all other objects of the system. Such a collection is called an aggregate: the separate objects belonging to it are called its elements. An aggregate may consist of a single element. It is further assumed that we can select, by a definite process, one or more elements of any aggregate A at pleasure: these form another aggregate B. If any element of A remains unselected, B is said to be a part of A (in symbols, B⊂A). If not, B is identical with A. Every element of A is a part of B. If B⊂A and C⊂B, then C⊂A.

When a correspondence can be established between two aggregates A and B in such a way that to every element of A corresponds one and only one element of B, and conversely, A and B are said to be equivalent, or to have the same power (or potency); in symbols, A∞B. If A∞B and B∞C, then A∞C. It is possible for an aggregate to be equivalent to a part of itself: the aggregate is then said to be finite. As an example, the aggregates 2, 4, 6, 8, 10, &c., 1, 2, 3, 4, 5, 6, 7, &c., are equivalent, but the first is only a part of the second.

3. Order.—Suppose that any two elements a, b of an aggregate A are taken there can be established, by a definite criterion, one or other of two alternative relations, symbolized by a<a or a>b, subject to the following conditions:—(1) If a<b, then b>a, and if a<b, then b>a; (2) If a>b and b>c, then a>c. In this case the criterion is said to arrange the aggregate in order. An aggregate which can be arranged in order may be called ordinal. An ordinal aggregate may, in general, by an alternative criterion, be arranged in order in a variety of ways. According as a<b or a>b we shall speak of a as anterior or posterior to b. These terms are chosen merely for convenience, and must not be taken to imply any meaning except what is involved in the definitions of the signs > and < for the particular criterion in question. The consideration of a successor of events in time will help to show that the assumptions made are not self-contradictory. An aggregate arranged in order by a definite criterion will be called an ordered aggregate. Let a, b be two elements of an aggregate (or ordinal aggregate), and suppose a<b. All the elements c (if any) such that a<c<b are said to fall within the interval (a, b). If an element b, posterior to a, can be found so that no element falls within the interval (a, b), then a is said to be isolated from all subsequent elements, and b is said to be the element next after a. So if b<a, and no element falls within the interval (b', a), then a is isolated from all preceding elements, and b' is the element next before a. As will be seen presently, for any assigned element a, either, neither, or both of these cases may occur.

An aggregate A is said to be well-ordered (or normally ordered) when, in addition to being ordered, it has the following properties: (1) A has a first or lowest element a which is anterior to all the rest; (2) if b is any part of A, then A has a first element. It follows from this that every part of a well-ordered aggregate is itself well-ordered. A well-ordered aggregate may or may not have a last element.

Two ordered aggregates A, B are said to be similar (A~B) when a one-one correspondence can be set up between their elements in such a way that if b, b' are the elements of B which correspond to any two elements a, a' of A, then b>b' or b'<b' according as we can make the even number 2n correspond to the odd number 2n−1 and conversely.

Similar ordered aggregates are said to have the same order-type. Any definite order-type is said to be the ordinal number of every aggregate arranged according to that type. This somewhat vague definition will become clearer as we proceed.

---

1 See also Numeral.
4. The Natural Scale.—Let $a$ be any element of a well-ordered aggregate $A$. Then all the elements posterior to $a$ form an aggregate $a'$, which is a part of $A$ and, by definition, has a first element $a'$. This element $a'$ is different from $a$, and immediately succeeds it in the order of $A$. (It may happen, of course, that $a'$ does not exist; in this case $a$ is the last element of $A$.) Thus in a well-ordered aggregate every element except the last (if there be a last element) is succeeded by a definite next element. The ingenuity of man has developed a symbolism by means of which every symbol is associated with a definite next succeeding symbol, and in this we have a set of visible or audible signs $1, 2, 3, \&c.$ (or their verbal equivalents), representing an aggregate in which (1) there is a definite order, (2) there is a first term, (3) each term has one next following, and consequently there is no last term. Counting a set of objects means associating them in order with the first and subsequent members of this conventional aggregate. The process of counting may lead to three different results: (1) the set of objects may be finite in number, so that they are associated with a part of the conventional aggregate which has a last term; (2) the set of objects may have the same power as the conventional aggregate; (3) the set of objects may have a higher power than the conventional aggregate. Examples of (2) and (3) will be found further on. The order-type of $1, 2, 3, \&c.$ is called an ordinal number, and the first is the first and simplest member of a set of transfinite ordinal numbers to be considered later on. Any finite number such as $3$ is used ordinarily as representing the order-type of $1, 2, 3$ or any similar aggregate, and cardinally as representing the power of $1, 2, 3$ or any equivalent aggregate. For reasons that will appear, $\omega$ is only used in an ordinal sense. The aggregate $1, 2, 3, \&c.$, in any of its written or spoken forms, may be called the natural scale, and denoted by $N$. It has already been shown that $N$ is infinite: this appears in a more elementary way from the fact that $(1, 2, 3, 4, \ldots) \equiv (2, 3, 4, 5, \ldots)$, where each element of $N$ is in one-to-one correspond with the next following. Any aggregate which is equivalent to the natural scale or a part thereof is said to be countable.

5. Arithmetical Operations.—When the natural scale $N$ has once been obtained it is comparatively easy, although it requires a long process of induction, to define the arithmetical operations of addition, multiplication and involution, as applied to natural numbers. It can be proved that these operations are free from ambiguity and obey certain formal laws of commutation, &c., which will not be discussed here. Each of the three direct operations leads to an inverse problem which can be solved if except under certain implied conditions. Let $a$, $b$ denote any two assigned natural numbers: then it is required to find natural numbers, $x, y, z$ such that

$$a + b = x, \quad a = by, \quad a = b$$

respectively. The solutions, when they exist, are perfectly definite, and may be denoted by $a - b, a/b$ and $a^{\&c.}$; but they are only possible in the first case when $a > b$, in the second when $a$ is a multiple of $b$, and in the third when $a$ is a perfect $b$th power. It is found to be possible, by the construction of certain elements, called respectively negative, fractional and irrational numbers, and zero, to remove all these restrictions.

6. There are certain properties, common to the aggregates with which we have next to deal, analogous to those possessed by the natural scale, and consequently justifying us in applying the term number to any one of their elements. They are stated here, once for all, to avoid repetition; the verification, in each case, will be, for the most part, left to the reader. Each of the aggregates in question ($A$, suppose) is an ordered aggregate. If $a, b$ are any two elements of $A$, they may be combined by two different operations, denoted by $a + b$ and $a \times b$, so as to produce two definite elements of $A$ represented by $a + b$ and $a \times b$ (or $ab$); these operations obey the formal laws satisfied by those of addition and multiplication. The aggregate $A$ contains one (and only one) element $i$, such that if $a$ is any element of $A$ ($i$ included), then $a + i = a$, and $ai = a$. Thus $A$ contains the elements $i, i + i, i + i + i, \&c.$, or, as we may write them, $i, 2i, 3i, \ldots$ such that $m + n = (m + n)i$ and $m \times n = mn i$; also $i < 2i < 3i \ldots$. We may express this by saying that $A$ contains an image of the natural scale. The element denoted by $i$ may be called the ground element of $A$.

7. Negative Numbers.—Let any two natural numbers $a, b$ be selected in a definite order $a, b$ (to be distinguished from $b, a$, in which the order is reversed). In this way we obtain from $N$ an aggregate of symbols ($a, b$) which we shall call couples, or more precisely, if necessary, polar couples. This new aggregate may be arranged in order by means of the following rules:

Two couples ($a, b$), ($a', b'$) are said to be equal if $a + b' = a' + b$. In other words ($a, b$), ($a', b'$) are then taken to be equivalent symbols for the same thing.

If $a + b' > a' + b$, we write $(a, b) > (a', b')$; and if $a + b' < a' + b$, we write $(a, b) < (a', b')$.

The rules for the addition and multiplication of couples are:

$$(a, b) + (a', b') = (a + a', b + b')$$

$$(a, b) \times (a', b') = (aa' + bb', ab' + ba').$$

The aggregate thus defined will be denoted by $N$; it may be called the scale of relative integers.

If $\iota$ denotes $(2, 1)$ or any equivalent couple, $(a, b) + \iota = (a + 2, b + 1) > (a, b)$ and $(a, b) \times \iota = (2a + b, a + 2b) = (a, b)$. Hence $\iota$ is the ground element of $N$. By definition, $2_1 = 1 + \iota = (5, 1)$ and hence by induction $mn = (m + 1, 1)$, where $m$ is any natural integer. Conversely every couple $(a, b)$ in which $a > b$ can be expressed by the symbol $(a - b)\iota$, in the same way, every couple $(a, b)$ in which $b > a$ can be expressed in the form $(b - a)\iota$, where $\iota = (1, 2)$.

It follows as a formal consequence of the definitions that

$$i + i = (1, 1) = (a + 1, 1) = (a, b)$$

$$i \times i = (1, 1) = (a, b)$$

hence $i + \iota = \omega$, and we can represent $N$ by the scheme

$$3i, 2i, 1i, 0i, 2i, 3i \ldots$$

in which each element is obtained from the next before it by the addition of $i$. With this notation the rules of operation may be written $(m, n$, denoting natural numbers$)$

$$mm + mn = (m + 1)n$$

$$mm + mn' = (m + 1)n'$$

$$mn + mn' = (m + 1)n$$

$$mn \times mn' = mn' - mn$$

with the special rules for zero, that if $a$ is any element of $N$,

$$a + 0 = a, \quad a \times 0 = 0.$$

To each element, $a$, of $N$ corresponds a definite element $\alpha'$ such that $a + \alpha' = 0$; if $a = 0$, then $\alpha' = 0$, but in every other case $a, a'$ are different and may be denoted by $m, m'$. The natural number $m$ is called the absolute value of $m$ and $m'$.

9. If $a, b$ are any two elements of $N$, the equation $x + y = a$ is satisfied by putting $x = a + b$. Thus the symbol $a + b$ is always interpretable as $a + b$, and we may say that within $N$ subtraction is always possible; it is easily proved to be also free from ambiguity. On the other hand, $a/b$ is intelligible only if the absolute value of $a$ is a multiple of the absolute value of $b$.

The aggregate $N$ has no first element and no last element. At the same time it is countable, as we see, for instance, by associating the elements $o, a, b'$ with the natural numbers $1, 2a, 2b - 1$ respectively, thus—

$$(N) \quad 1, 2, 3, 4, 5, 6, \ldots$$

$$(\bar{N}) \quad o, 1, 2, 3, 4, 3, 1, \ldots$$

It is usual to write $a + o$ (or simply $a$) for $ao$ and $-a$ for $oa'$; that this should be possible without leading to confusion or ambiguity is certainly remarkable.

10. Fractional Numbers.—We will now derive from $N$ a different aggregate of couples $[a, b]$ subject to the following rules:

The symbols $[a, b], [a', b']$, are equivalent if $ab' = a'b$. According as $ab'$ is greater or less than $a'b$ we regard $[a, b]$ as being greater or less than $[a', b']$. The formulae for addition and multiplication are

$$[a, b] + [a', b'] = [ab + a'b', bb']$$

$$[a, b] \times [a', b'] = [aa', bb']$$

All the couples $[a, b]$ are equivalent to $[1, 1]$, and if we denote
In the same way, if \( o \) denotes the zero element of \( R \), and \( \xi \) any other element, the symbol \( o/\xi \) is indeterminate, and \( o/\xi = \xi/0 \) inadmissible, because, by the formal rules of operation, \( \xi/\xi + \xi = \xi/0 \), which conflicts with the definition of the ground element \( v \).

It is usual to write \( +m_n/n \) (or simply \( m_n/n \)) for \( m_n/nu \), and \( -m_n/n \) for \( m_n/nv \).

Each of these elements is said to have the absolute value \( mn/\nu \).

The criterion for arranging the elements of \( R \) in order of magnitude is that, if \( \xi, \eta \) are any two elements of it, \( \xi/\eta \) when \( \xi/\eta \) is positive; that is to say, when it can be expressed in the form \( \eta \).

15. The aggregate \( R \) is very important, because it is the simplest type of a field of rationality, or corpus. An algebraic corpus is an aggregate, such that its elements are representable by symbols \( a, b, \ldots \), which can be combined according to the laws of ordinary algebra; every algebraic expression obtained by combining a finite number of symbols, by means of a finite chain of rational operations, being capable of interpretation as representing a definite element of the aggregate, with the single exception that division by zero is inadmissible. Since, by the laws of algebra, \( a=a-0 \), and \( a=a/1 \), every algebraic field contains \( R \), or, more properly, an aggregate which is an image of \( R \) in the "real" rational numbers. Let a denote any element of \( R \); then \( a \) and all lesser elements form an aggregate, the remaining elements form another aggregate \( A', \) which we shall call complementary to \( A \), and we may write \( R=A+A' \).

Now the essence of this separation of \( R \) into the parts \( A \) and \( A' \) may be expressed without any reference to \( a \) as follows:

I. The aggregates \( A, A' \) are complementary; that is, their elements, taken together, make up the whole of \( R \).

II. Every element of \( A \) is less than every element of \( A' \).

III. The aggregate \( A' \) has no least element. (This condition is artificial, but saves a distinction of cases in what follows.)

Every separation \( R=A+A' \) which satisfies these conditions is called a cut (or section), and we may denote it by \( (A, A') \). We have seen that every rational number \( a \) can be associated with a cut. Conversely, every cut \( (A, A') \) in which \( A \) has a last element \( a \) is perfectly definite, and specifies a without ambiguity. But there are other cuts in which \( A \) has no last element. For instance, all the elements \( a \) of \( R \) such that either \( a<0 \), or else \( a>0 \) and \( a' \) form an aggregate \( A \), while those for which \( a<0 \), and \( a'>0 \), form the complementary aggregate \( A' \). This separation is a cut in which \( A \) has no last element; because if \( p/q \) is any positive element of \( A \), the element \( (p+q)(p+q) \) exceeds \( p/q \), and also belongs to \( A \). Every cut of this kind is said to define an irrational number. The justification of this is contained in the following propositions:

(1) A cut is a definite concept, and the assemblage of cuts is an aggregate according to definition; the generic quality of the aggregate being the separation of \( R \) into two complementary parts, without altering the order of its elements.

(2) The aggregate of cuts may be arranged in order by the rule that \((A, A') < (B, B') \) if \( A \) is a part of \( B \).

(3) This criterion of arrangement preserves the order of magnitude of all rational numbers.

(4) Cuts may be combined according to the laws of algebra, and, when the cuts so combined are all rational, the results are in agreement with those derived from the rational theory.

As a partial illustration of proposition (4) let \((A', A) \), \((B', B) \) be any two cuts, and let \( C \) be the aggregate whose elements are obtained by forming all the values of \( A'+B' \) and \( a'+a \) of \( a \) and \( b \), and \( b' \) is any element of \( B' \). Then if \( C \) is the complement of \( C \), it can be proved that \( C, C' \) is a cut; this is said to be the sum of \( (A', A') \) and \( (B', B') \). The difference, product and quotient of two cuts may be defined in a similar way. If it is assumed that the cuts are chosen above for purposes of illustration, we shall have \( B'=C, C' \) where \( C' \) comprises all the numbers \( a'b' \) obtained by multiplying any two elements, \( a', b' \) which are rational and positive, and such that \( a'+b' \) is positive. Since \( a'-b' > a' - b' > 0 \), it follows that \( a'b' \) is positive and greater than \( 2 \); it can be proved conversely that every rational number which is greater than \( 2 \) can be expressed in the form \( a'b' \). Hence \( =2 \), so that the cut \( B \) actually gives a real arithmetical meaning to the positive root of the equation \( x^2-2 \); in other words we
may say that it defines the irrational number $\sqrt{2}$. The theory of cuts, in fact, provides a logical basis for the treatment of all finite numerical irrationalities, and enables us to justify all arithmetical operations involving the use of such quantities.

17. Since the aggregate of cuts (of course say) has an order of magnitude, we may construct cuts in this aggregate. Thus if $a$ is any element of $\mathcal{A}$, and $\mathcal{A}$ is the aggregate which consists of a and all anterior elements of $\mathcal{A}$, we may write $\mathcal{A} = \mathcal{A} + a'$, and $(\mathcal{A}, \mathcal{A}')$ is a cut in which $\mathcal{A}$ has a last element a. It is a remarkable fact that no other kind of cut in $\mathcal{A}$ is possible; in other words, every conceivable cut in $\mathcal{A}$ is defined by one of its own elements. This is expressed by saying that $\mathcal{A}$ is a continuous aggregate, and $\mathcal{A}$ itself is referred to as the numerical continuum of real numbers. The property of continuity must be carefully distinguished from that of close order ($\mathcal{A}$ a); a continuous aggregate is necessarily in close order, but the converse is not always true. The aggregate $\mathcal{A}$ is not countable.

18. Another way of treating irrationalals is by means of sequences. A sequence is an unlimited succession of rational numbers

$$a_1, a_2, a_3, \ldots, a_n, a_{n+1}, \ldots$$

(in order-type $\omega$) the elements of which can be assigned by a definite rule, such that when any rational number $e$, however small, has been fixed, it is possible to find an integer $m$, so that for all positive integral values of $n$ the absolute value of $(a_{m+n} - a_n)$ is less than $e$. Under these conditions the sequence may be taken to represent a definite number, which is, in fact, the limit of $a_n$ when $m$ increases without limit. Every rational number $a$ can be expressed as a sequence in the form $(a, a, a, \ldots)$, but this is only one of an infinite variety of such representations.

$$1 = (\{9, 99, 999, \ldots\}) = \left(\frac{1}{9} \cdot \frac{3}{9} \cdot \frac{7}{9} \cdot \frac{11}{9} \cdots \right)$$

and so on. The essential thing is that we have a mode of representation which can be applied to rational and irrational numbers alike, and provides a very convenient symbolism to express the results of arithmetical operations. Thus the rules for the sum and product of two sequences are given by the formulæ

\[
\begin{align*}
(a_1, a_2, a_3, \ldots) + (b_1, b_2, b_3, \ldots) &= (a_1 + b_1, a_2 + b_2, a_3 + b_3, \ldots) \\
(a_1, a_2, a_3, \ldots) \times (b_1, b_2, b_3, \ldots) &= (a_1 b_1, a_2 b_2, a_3 b_3, \ldots)
\end{align*}
\]

from which the rules for subtraction and division may be at once inferred. It has been proved that the method of sequences is ultimately equivalent to that of cuts. The advantage of the former lies in its convenient notation, that of the latter in giving a clear definition of an irrational number without having recourse to the notion of a limit.

19. Complex Numbers.—If a is an assigned number, rational or irrational, and $m$ a natural number, it can be proved that there is a real number satisfying the equation $x^n = a$, except when $m$ is even and $a$ is negative; in this case the equation is not satisfied by any real number whatever. To remove the difficulty we construct an aggregate of polar couples $(x, y)$, where $x, y$ are any two real numbers, and define the addition and multiplication of such couples by the rules

$$[(x_1, y_1) + (x_2, y_2)] = (x_1 + x_2, y_1 + y_2)$$

$$[(x_1, y_1) \times (x_2, y_2)] = (x_1 x_2 - y_1 y_2, x_1 y_2 + y_1 x_2)$$

We also agree that $(x, y) \leq (x', y')$ if $x < x'$ or if $x = x'$ and $y \leq y'$. It follows that the aggregate has the ground element $[1, 0]$, of which we may denote by $e$; and that, if we write $\tau$ for the element $[0, 1]$, $\tau^2 = [-1, 0] = -\tau$.

Whenver $m, n$ are rational, $[m, n] = \omega m + \pi n$, and we are thus justified in writing, if we like, $x + \tau y$ for $(x, y)$ in all circumstances. A further simplification is gained by writing $x$ instead of $x \tau$, and regarding $\tau$ as a symbol which is such that $\tau^2 = -1$, but in other respects obeys the ordinary laws of operation. It is usual to write $i$ instead of $\tau$; we thus have an aggregate $\mathcal{S}$ of complex numbers $x + \tau y$. In this aggregate, which includes the real continuum as part of itself, not only the four rational operations (excluding division by $0$, the zero element), but also the extraction of roots, may be effected without any restriction. Moreover (as first proved by Gauss and Cauchy), if $a_0, a_1, \ldots, a_n$ are any assigned real or complex numbers, the equation

$$a_0 \tau^n + a_1 \tau^{n-1} + \cdots + a_{n-1} \tau + a_n = 0,$$

is always satisfied by precisely $n$ real or complex values of $\tau$, with a proper convention as to multiple roots. Thus any algebraic function of any finite number of elements of $\mathcal{S}$ is also contained in $\mathcal{S}$, which is, in this sense, a closed arithmetical field, just as $\mathcal{A}$ is when we restrict ourselves to rational operations. The power of $\mathcal{S}$ is the same as that of $\mathcal{A}$.

20. Transfinite Numbers.—The theory of these numbers is quite recent, and mainly due to G. Cantor. The simplest of them, $\omega$, has been already defined ($\S$ 4) as the order-type of the natural scale. Now there is no logical difficulty in constructing a scheme

$$\mathcal{U}_1, \mathcal{U}_2, \mathcal{U}_3, \ldots | \mathcal{V}_1,$$

indicating a well-ordered aggregate of type $\omega$ immediately followed by a distinct element $\mathcal{V}_1$; for example, we may think of all positive odd integers arranged in ascending order of magnitude and then think of the even number $2$. A scheme of this kind is said to be of order-type $(\omega + 1)$; and it will be convenient to speak of $(\omega + 1)$ as the index of the scheme. Similarly we may form arrangements corresponding to the indices

$$\omega + 2, \omega + 3, \ldots, \omega + n,$$

where $n$ is any positive integer. The scheme

$$\mathcal{U}_1, \mathcal{U}_2, \mathcal{U}_3, \ldots | \mathcal{V}_1, \mathcal{V}_2, \mathcal{V}_3, \ldots$$

is associated with $\omega + \omega = 2 \omega$;

$$\mathcal{U}_1, \mathcal{U}_2, \mathcal{U}_3, \ldots | \mathcal{V}_1, \mathcal{V}_2, \mathcal{V}_3, \ldots | \mathcal{W}_1, \mathcal{W}_2, \mathcal{W}_3, \ldots$$

with $\omega \omega$ or $\omega^2$; and so on. Thus we may construct arrangements of aggregates corresponding to any index of the form

$$\phi(\omega) = \omega a^2 + b \omega = a \omega^2 + b \omega = a \omega^2 + b \omega + c \omega^2 + \cdots,$$

where $n, a, b, c, \ldots$ are all positive integers.

We are thus led to the construction of a scheme of symbols—

$$I. \quad 2, 3, \ldots | \mathcal{V}_1,$$

$$\mathcal{U}_1, \mathcal{U}_2, \mathcal{U}_3, \ldots | \mathcal{V}_1, \mathcal{V}_2, \mathcal{V}_3, \ldots | \mathcal{W}_1, \mathcal{W}_2, \mathcal{W}_3, \ldots$$

The symbols $\phi(\omega)$ form a countable aggregate; so that we may, if we like (and in various ways), arrange the rows of block (II) in a scheme of type $\mathcal{A}$ we thus have each element a succeeded in its row by $(a + 1)$, and the row containing $\phi(\omega)$ succeeded by a definite next row. The same process may be applied to $(\mathcal{U}_I)$, and we can form additional blocks (IV.), (V.), &c., with first elements $\omega(\omega), \omega(\omega^2), \omega(\omega^3)$ &c. All the symbols in which $\omega$ occurs are called transfinite ordinal numbers.

21. The index of a finite set is a definite integer however the set may be arranged; we may take this index as also denoting the power of the set, and call it the number of things in the set. But the index of an infinite ordinable set depends upon the way in which its elements are arranged; for instance, ind. $(1, 2, 3, \ldots) = \omega$, but ind. $(1, 3, 5, \ldots) = 2 \omega$. Or, to take another example, the scheme—

$$3, 5, \ldots | 2(2n-1)$$

where each row is supposed to follow the one above it, gives a permutation of $(1, 2, 3, \ldots)$, by which its index is changed from $\omega$ to $\omega^2$. It has been proved that there is a permutation of the natural scale, of which the index is $\phi(\omega)$, any assigned element of (II); and that, if the index of any ordered aggregate is $\phi(\omega)$, the aggregate is countable. Thus the power of all aggregates which can be associated with indices of the class (II) is the same as that of the natural scale; this power may be denoted by $\alpha$. Since $\alpha$ is associated with all aggregates of a
22. There are aggregates which have a power greater than \( a \); for instance, the arithmetical continuum of positive real numbers, the power of which is denoted by \( c \). Another one is the aggregate of all those order-types which (like those in II. above) are the indices of aggregates of power \( a \). The power of this aggregate is denoted by \( c \). According to Cantor's theory it is the transfinite cardinal number \( \aleph \) of a transfinite set, and to \( a \), which for the sake of uniformity is denoted by \( \aleph_a \). It has been conjectured that \( \aleph_0 = c \), but this has neither been verified nor disproved. The discussion of the aleph-numbers is still in a controversial stage (November 1907) and the points in debate cannot be entered upon here.

23. Transfinite numbers, both ordinal and cardinal, may be combined by operations which are so far analogous to those of ordinary arithmetic that is it convenient to denote them by the same symbols. But the laws of operation are not entirely the same, for instance, the principle of commutativity: the first has been explained, the second is the index of the scheme (\( a_1a_2 \cdots a_n \) . . . | \( a_2a_1 \cdots \) ) or any similar arrangement. Again if \( n \) is any positive integer, \( na = a + a + \cdots + a \). It should also be observed that according to Cantor's principles of construction every ordinal number is succeeded by a definite next one; but that there are definite ordinal numbers (e.g. \( \omega^\omega \)) which have no ordinal immediately preceding them.

24. Theory of Numbers.—The theory of numbers is that branch of mathematics which deals with the properties of the natural numbers. As Dirichlet observed long ago, the whole of the subject would be coextensive with mathematical analysis in general; but it is convenient to restrict it to certain fields where the appropriateness of the above definition is fairly obvious. Even so, the domain of the subject is becoming more and more comprehensive, as the methods of analysis become more systematic and more exact.

25. The first noteworthy classification of the natural numbers is into those which are prime and those which are composite. A prime number is one which is not exactly divisible by any number except itself and 1; all others are composite. The number of primes is infinite (Eucl. Elem. ix. 20), and consequently, if \( n \) is an assigned number however large, there is an infinite number (\( a \)) of primes greater than \( n \).

26. If \( m \) and \( n \) are any two numbers, and \( m = n \), we can always find a definite chain of positive integers (\( q_1, r_1 \) ) , (\( q_2, r_2 \) ) , . . . , (\( q_n, r_n \) ) , such that

\[
m = q_1 + r_1, \quad n = q_2 + r_2, \quad a = q_3 + r_3, \quad &c.
\]

27. The process by which they are calculated will be treated in detail. Since there is only a finite number of positive integers less than \( n \), the process must terminate with two equalities of the form

\[
r_k = xq_k + r_{k+1}, \quad r_{k+1} = q_{k+2}r_k.
\]

28. Thus we infer successively that \( r_k \) is a divisor of \( r_{k+1}, r_{k+2}, . . . , r_l \) and finally of \( m \) and \( n \). Also \( r_k \) is the greatest common factor of \( m, n \) : because any common factor must divide \( n, r_l \) and so on down to \( r_1 \); and the highest factor of \( r_1 \) is itself. It will be convenient to write \( r_k = d(v, m, n) \). If \( r_1 = 1 \), the numbers \( m, n \) are said to be prime to each other, or co-primes.

The fundamental theorem of resiliation is of the greatest importance; with the help of it we can prove three other fundamental propositions, namely:

(1) If \( m, n \) are any two natural numbers, we can always find two natural numbers \( x, y \) such that

\[
d(v, m, n) = xn - ym.
\]

(2) If \( m, n \) are prime to each other, and \( p \) is a prime factor of \( mn \), then \( p \) must be a factor of either \( m \) or \( n \). (Every number may be uniquely expressed as a product of prime factors.)

29. The representation of any number \( n \) as the product of powers of different primes, the divisors of \( n \) are the terms of the product

\[
(1 + p_1 + p_1^2 + \cdots + p_1^g) (1 + p_2 + p_2^2 + \cdots + p_2^h) \cdots (1 + p_r + p_r^2 + \cdots + p_r^t) (1 + t_1 + t_1^2 + \cdots + t_1^s) \cdots (1 + t_l + t_l^2 + \cdots + t_l^s).
\]

(3) \( 1 + p_1 + p_1^2 + \cdots + p_1^g \) gives the representation of any number \( n \) as the product of powers of different primes, the divisors of \( n \) are the terms of the product

\[
(1 + p_1 + p_1^2 + \cdots + p_1^g)(1 + p_2 + p_2^2 + \cdots + p_2^h) \cdots (1 + p_r + p_r^2 + \cdots + p_r^t)(1 + t_1 + t_1^2 + \cdots + t_1^s) \cdots (1 + t_l + t_l^2 + \cdots + t_l^s).
\]

26. Totients. —By the totient of \( n \), which is denoted, after Euler, by \( \phi(n) \), we mean the number of integers prime to \( n \), and not exceeding \( n \). If \( n = p^a \), the numbers not exceeding \( n \) and not prime to it are

\[
p, 2p, \ldots (p-1), p^a - 1, \ldots, 2p^a - 1, \ldots, p^a - 1.
\]

(4) If \( n = m^a \), then \( p \) is prime to \( m \) if and only if \( m \) is prime to \( x \) for every integer \( x \) for which \( x^a \equiv 1 \pmod{m} \).

For example, \( \phi(15) = 8 \), since 8 is the number of numbers less than 15 and not prime to it that are divisible by 15. And if \( n = 4 \), then \( \phi(4) = 2 \), since only 2 is not prime to 4.

27. Residues and congruences. —It will now be convenient to introduce for the term number the symbol \( \equiv \). For instance, \( 2 \equiv 1 \pmod{1} \) and \( 4 \equiv 2 \pmod{2} \), where the product applies to all the different prime factors of \( n \). If \( a, b, \cdots, c \) are the different divisors of \( n \), then

\[
\phi(d_1) + \phi(d_2) + \cdots + \phi(d_n) = n.
\]

For example, \( \phi(15) = 8 = \phi(3) + \phi(5) \).

28. Theorem of Fermat and Wilson. —Let \( r_1, \ldots, r_s \) where \( i \equiv \phi(m) \) be a complete set of residues prime to the modulus.

Then if \( x \) is any number prime to \( m \), the residues \( r_1x, r_2x, \ldots, r sx \) also form a complete set of residues prime to the modulus.

Thus the theory of congruences is very nearly, but not quite, similar to that of algebraic equations. With respect to a given modulus \( m \) the scale of relative integers may be distributed into classes. For a given \( m \), the numbers \( 1, 2, \ldots, m \) form a system of congruence classes, and the definition is made, to a modulus \( m \) divisors and residues.

29. Fermat's Theorem. —Fermat's theorem states that if \( p \) is a prime number, then \( p \) is prime to \( m \) if and only if \( m \) is prime to \( p \).

Consequently the generalization of Fermat's theorem is that if \( p \) is a prime number, then \( p \) is prime to \( m \) if and only if \( m \) is prime to \( p \).

Thus the theory of congruences is very nearly, but not quite, similar to that of algebraic equations. With respect to a given modulus \( m \) the scale of relative integers may be distributed into classes. For a given \( m \), the numbers \( 1, 2, \ldots, m \) form a system of congruence classes, and the definition is made, to a modulus \( m \) divisors and residues.
In order that the congruence $x^2 \equiv a \pmod{m}$ may have a solution it is necessary and sufficient that a $b$ be a residue of each distinct prime factor of $m$. If these conditions are all satisfied, and $m = 2^n p_1^{e_1} \cdots$, where $p_1, p_2, \ldots$ are odd primes, then $b$ is in every case $1$, the number of incongruent solutions of the given congruence is $2^1, 2^{2t_1}$, or $2^{2t_2}$, according as $a < 2$, $a = 2$, or $a > 2$ respectively. The actual solutions are best found by a process of exhaustion. It should be observed that $(\frac{b}{m}) = 1$ is a necessary but not a sufficient condition for the possibility of the congruence.

32. Quadratic forms.—It will be observed that the solution of the linear congruence leads to all the representations of $b$ in the form $a + x + y$, where $x, y$ are integers. Many of the earliest researches in the theory of numbers deal with particular cases of the problem. Even for $b = 1$ or $b = 2$, it is required to find all the integers $x, y$ (if there be any) which satisfy the equation $x^2 + y^2 \equiv b \pmod{m}$. FERMAT, for instance, discovered that every positive prime of the form $4n+1$ is uniquely expressible as the sum of two squares. There is a corresponding arithmetical theorem for forms of any degree and any number of variables; only those of linear forms and binary quadratics are in any sense complete, as the difficulty of the problem increases very rapidly with the increase of the degree of the form considered or of the number of variables contained in it.

The form $ax^2 + by^2 + cz^2$ will be denoted by $(a, b, c)$ $(x, y, z)$ or more simply by $(a, b, c)$ when there is no need of specifying the variables. If $k$ is the greatest common factor of $a, b, c$, we may write $(a, b, c) = k' (a', b', c')$ where $(a', b', c')$ is a primitive form, that is, one for which $d = (a', b', c') = 1$. The other form is then said to be derived from $(a', b', c')$ and to have a divisor $k$. For the present we shall concern ourselves only with the primitive forms. The product of the two forms $D$ and $C$ is defined to be the product of the two linear factors. It will be observed that $D \equiv 1 \pmod{4}$ according as $b$ is even or odd; and that if $E$ is any odd square factor of $D$ there will be forms of determinant $D$ and degree 4.

If we write $x = x_1 + x_2$, $y = y_1 + y_2$, we have identically

$$
(a, b, c) (x, y, z) = (a', b', c') (x', y', z')
$$

where $a = a' a''$,

$$
b' = a a'' b' + a' a'' c' z^2,
$$

$$
c' = a a'' b' + a' a'' c' z^2
$$

Hence also

$$
D' = b'^2 a'^2 c'^2 (a-b') (a+c') = (a-b') D
$$

Supposing that $a, b, c$ are integers such that $a - b' = \alpha$, a number different from zero, we have $b' = b + \alpha c$ and $c' = b - \alpha c$.

33. Method of Reduction.—This differs according as $D$ is positive or negative, and will require some preliminary lemmas. Suppose that any complex quantity $z = x + y i$ is represented in the usual way by a point $(x, y)$ referred to rectangular axes. Then by plotting off all the points corresponding to $(a+b)/ (z^2 - b)$, we obtain a complete set of properly equivalent points. All these lie on the same side of the axis of $x$, and there is precisely one of them and no more which satisfies the conditions: (i) that it is not outside the area which is bounded by the lines $2x = \pm 1$; (ii) that it is not inside the segment $(a, b)$ of the line $2x = b$; (iii) that it is not on the line $2x = 1$, or on the arc of the circle $x^2 + y^2 \equiv 1$ intercepted by $2x = 1$ and $x = 0$. This point will be called the reduced point equivalent.

In the positive half-plane $(x > 0)$ the aggregate of all reduced points occupies the interior and half the boundary of an area which will be called the fundamental triangle, because the area equivalent to it, and finite, are all triangles bounded by circular arcs, and having angles $\pi/2, \pi/2, \pi$ and the fundamental triangle may be considered as a special case when one vertex goes to infinity. The aggregate of equivalent triangles forms a kind of mosaic which fills up the whole of the half-plane. It will be convenient to denote the fundamental triangle (with its half-boundary, for which $x < 0$) by $\mathcal{V}$; for which reason which will appear later, the set of equivalent triangles will be said to make up the modular dissection of the positive half-plane.
Now let $f = \varepsilon(a', b', c')$ be any definite form with $a'$ positive and determinant $-\Delta$. The root of $a'x^2 + b'x^2 + c' = 0$ which is represented by a point in the positive half-plane is

$$\omega = b' + \sqrt{\Delta},$$

and this is a reduced point if either

(i) $b' < 0$, $c' < 0$,

(ii) $b' = 0$, $a' < c'$,

(iii) $a' = c'$, $0 < b' < \Delta$.

Cases (ii) and (iii) only occur when the representative point is on the boundary of $V$. A form whose representative point is reduced is said to be a reduced form. It follows from the geometrical theory that every form is equivalent to a reduced form, and that there are as many distinct classes of positive forms of determinant $-\Delta$ as there are reduced forms. The total number of reduced forms is limited, because in case (i), we have $\Delta = 4ac - b'^2 \geq 3b'^2$, so that $b' < \frac{\sqrt{\Delta}}{3}$. Therefore, there are not many limited numbers of reduced forms, but they are not non-equivalent. In fact they arrange themselves, according to a law which is not very difficult to discover, in cycles or periods, each of which is associated with a particular class. The number of such classes is finite, and that for each class we can find a representative form by a finite process of calculation.

34. Problem of Representation.—It is required to find out whether a given number $m'$ can be represented by the given form $(a', b', c')$. One condition is clearly that the divisor of the form must be a factor of $m'$. Suppose this is the case; and let $(a', b', c')$ be the quotient of $m'$ and $(a', b', c')$ be the divisor in question. Then we have now to discover whether $m'$ can be represented by the primitive form $(a, b, c)$. First of all we will consider proper representations

$$m = m'(a', b', c'),$$

where $a, y$ are co-primes. Determine integers $\beta$ such that $\alpha - \beta y = 1$, and apply to $(a, b, c)$ the substitution

$$\begin{pmatrix} a \\ b \\ c \\ y \\ \gamma \end{pmatrix} \rightarrow \begin{pmatrix} a' \\ b' \\ c' \\ \gamma \end{pmatrix},$$

the new form will be

$$m'(a', b', c') = m'(a', b', c') = m,'$$

where $a', b', c$, and $\gamma$ are co-primes. In this case

$$\begin{pmatrix} a' \\ b' \\ c' \\ \gamma \end{pmatrix} \rightarrow \begin{pmatrix} \alpha \\ \beta y \end{pmatrix} \rightarrow \begin{pmatrix} a \\ b \\ c \\ y \\ \gamma \end{pmatrix} \rightarrow \begin{pmatrix} a' \\ b' \\ c' \\ \gamma \end{pmatrix},$$

the new form will be

$$m'(a', b', c') = m'(a', b', c') = m,'$$

This is called the Pellian equation, and it is represented by a point in the positive half-plane.

The form $(a, b, c)$ is said to be unimodular if it is equivalent to itself; in this case all its proper automorphs can be expressed in the form

$$(a' + \lambda b', b' + \lambda c', c'),$$

where $\lambda$ is an integer.

35. Automorphs, The Pellian Equation.—A primitive form $(a, b, c)$ is, by definition, equivalent to itself; but it may be so in more ways than one. In order that $(a, b, c)$ may be transformed into $(a', b', c')$ by the substitution

$$\begin{pmatrix} a \\ b \\ c \end{pmatrix} \rightarrow \begin{pmatrix} a' \\ b' \\ c' \end{pmatrix},$$

it is necessary and sufficient that

$$\begin{pmatrix} a \\ b \\ c \end{pmatrix} \rightarrow \begin{pmatrix} a + \lambda b \\ b + \lambda c \\ c + \lambda b \end{pmatrix},$$

the substitutions by which $(a, b, c)$ is transformed into itself are called its automorphs. In the case when $D = 0$ (mod 4) we have $I = 2I$, $u = 2U$, $D = 4N$, and (T, U) any even number.

This is usually called the Pellian equation, though it should properly be associated with Fermat, who first perceived its importance. The minimum solution can be found by converting $\sqrt{N}$ into a periodic continued fraction.

The form $(a, b, c)$ may be improperly equivalent to itself; in this case all its improper automorphs can be expressed in the form

$$(a' + \lambda b', b' + \lambda c', c'),$$

where $\lambda$ is an integer.

This is the Pellian equation, and it is represented by a point in the positive half-plane.

36. Characters of a form or class. General.—Let $(a, b, c)$ be any primitive form; we have seen above (§32) that if $a, b, c, \gamma$ are any integers

$$4(a' + \lambda b')^2 + (b' + \lambda c')^2 = (a' - \lambda b')^2,$$

where $b' = a0 + b + c0$ and $c0 = b + c0$. Now the expressions in brackets on the left hand may denote any two numbers, $m, n$ representable by the form $(a, b, c)$; the formula shows that $4mn$ is a residue of $D$, and hence $mn$ is a residue of every odd prime factor of $D$, and if $l$ is any such factor the symbols $\left[ \frac{m}{l} \right]$ and $\left[ \frac{n}{l} \right]$ will have the same value. Putting $(a, b, c) = 1$, this common value is denoted by $\left[ \frac{1}{l} \right]$ and called a quadratic character (or simply character) of $l$ with respect to $p$, $a, b, c, \gamma$.

In certain cases there are supplementary characters of the type

$$\left[ \frac{1}{l} \right]$$

and the characters $\left[ \frac{1}{l} \right]$ are discriminated according to the number or even power of $p$ is contained in $D$; but in every case there are certain combinations of characters (in number one-half of all possible combinations) which form the total characters of actually existing classes. Classes which have the same total character are said to belong to the same genus. Each genus of the same order contains the same number of classes. For any determinant $D$ we have a principal primitive class for which all the characters are $1$; this is represented by the principal form $(1, 1, -n)$ or $(1, -1, n)$ according as $D$ is of the form $4n, 4n + 1$. The corresponding genus is called the principal genus. Thus, when $D = 194$, it appears from the table above that in the primitive order there are two genera, each containing three classes; and the number of total characters is $3 + 1 = 4$.

37. Composition.—Considering $X, Y$ as given linear functions of $(x, y)$, $X', Y'$ defined by the equations

$$X = px + qx, Y = px' + qx'$$

and this is said to be a compound of the two forms $(a, b, c)$, $(a', b', c')$, the order of composition is indicated in the third. In order that two forms may admit of composition into a third, it is necessary and sufficient that their determinants be in the ratio of two squares. The most important case is that of two primitive forms $X, Y$; this can be composed into a form denoted by $XY$ which is also primitive and of the same determinant as $X$ or $Y$. If $A, B, C$ are the classes to which $X, Y$ respectively belong, then any form of $A$ composed with any form of $B$ gives rise to a form belonging to $C$. For this reason we write $C = AB$; $BA$, and the operation of multiplication or composition of classes. The principal class is usually denoted by $1$, because when compounded with any other class $A$ it gives this same class $A$.

The total number of primitive classes being finite, $h$, say, the series $A, A', A''$, etc. must be recurring, and there will be a least exponent $e$ such that $A^n = 1$. The period $n$ is a factor of $h$, so that every class satisfies $A^n = 1$. Composition is associative as well as commutative, that is to say, $(AB)C = A(BC)$; hence the symbols $A_1, A_2, \ldots$ for the different classes define an Abelian group (see Group). The order of $h$, which is representable by one or more base-classes $\beta_1, \beta_2, \ldots$, is such a way that each class $A$ is enumerated once and only once by putting

$$A = \beta_1^p \beta_2^p \ldots \beta_m^p,$$

with $m, \gamma$. This means that $m$ is a multiple of $n$, the corresponding index, and so on. The same thing may be said with regard
to the symbols for the classes contained in the principal genus, because two forms of that genus may be distinguished by one and the same number only if they have the same discriminant, and thus are identical. This follows from the fact that the principal genus may be considered as formed by a cyclic group whose generators are the classes $1, i, i'_2, \ldots$, hence the principal genus is regular, and in this case the discriminant is the only characteristic of the principal genus. Gauss proved, conversely, that every class in the principal genus may be expressed as the duplicate of a class. An ambiguous class satisfies $A^2 = 1$, that is, its duplicate is the principal class; and the numbers of the classes under consideration are obtained by multiplying the principal classes by $A$ for the whole composition-group, and $A^2B_2, A^2B_3, A^2B_4, \ldots$ (as above) $A^2 = 1$, if $x_2 = m$, $y_2 = n, z_2 = \xi, \zeta, \eta, \zeta'$; hence the number of ambiguous classes is $2^n$. As an example, when $D = -1460$, there are four ambiguous classes, represented by 

\[(1, 0, 355), (2, 2, 183), (5, 0, 73), (10, 10, 39)\]

hence the composition-group must be dihedral, and in fact, if we put $B_i, B_j$ for the classes represented by $(11, 6, 34)$ and $(2, 2, 185)$, we have $B_iB_j = B_jB_i = 1$ and the two primitive classes are given by $B_2B_3 \equiv 10\zeta, 10\xi \in 2$. In this case the determinant is regular and the classes in the principal genus are $1, B_i, B_i', B_i''$. 39. On account of its historical interest, we may briefly consider the form $x^2 + y^2 = m$. The problem of finding all the integer solutions of the equation $x^2 + y^2 = m$ is the only one that has been solved in a satisfactory manner up to the present time. There are only three cases, the most important of which is the case $m = 2$, or $x_1 = 1, y_1 = 1$ and $x_1 = 0, y_1 = 0$. For the case $m = 2$, the equation is of the form $x^2 + y^2 = 2$, and conversely two distinct representations $N = x^2 + y^2 = 2^2$ lead to the conclusion that $N$ is composite. This is a simple example of the application of the theory of forms to the difficult problem of deciding whether a given number is large prime or composite; an application first indicated by Gauss, though, in the present simple case, probably known to Fermat. 40. Bilinear Forms. A bilinear form is an expression of the type $\sum_{i, j} a_{ij}x_iy_j$ ($i = 1, 2, \ldots, m; j = 1, 2, \ldots, n$); the most important examples are those which arise from determinants, and of which the invariants of a form are its determinant $|a_{ij}|$ and the elementary factors thereof. Two bilinear forms are equivalent when each can be transformed into the other by linear integral substitutions $x = ax', y = by'$. Every bilinear form is equivalent to a reduced form $\sum_{i, j} (a_{ij})x_iy_j$, and $r = n$, unless $|a_{ij}| = 0$. In that case the form may be equivalent if it is necessary and sufficient that their invariants should be the same. Moreover, if $a - b$ and $c - d$, if the invariants of the forms $a + bc - b + ad$ are the same for all values of $\lambda$, we shall have $a + bc - b + ad$, and the transformation of one form to the other may be made by substituting, according to orders and genera, and proof that generic with specified characters exist; also the determination of all the rational transformations of a given form into itself. In connexion with a definite form there is the important question of the number of its equivalence classes, or the number of its proper automorphisms. Equivalent forms are of the same weight; this is defined to be the weight of their class. The weight of a genus or order is the sum of the weights of the classes contained in it; and expressions for the weight of a given genus have actually been obtained. For binary forms, the sum of the weights of all the genera coincides with the expression denoted by $H(\Delta)$ in § 39. The complete discussion of a form requires the consideration of $\sim 2n$ associated quadrics; one of these is the contravariant of the given form, each of the others contains more than $n$ variables. For certain quaternary and senary classes there are formulæ analogous to the formulæ for the genus of $\Delta = 23$. The results for $\Delta = 23$ are given in § 39 (see Smith, Proc. R.S. xvi, or Collected Papers, i, 510). Among the most interesting special applications of the theory are conferring upon the collection of all the modular forms with a given sum of squares. In order that a number may be expressible as the sum of two squares it is necessary and sufficient for it to be of the form $p^4q$, where $p$ has no square factor and no prime factor of the form $4k + 3$. A number is expressible as the sum of three squares if, and only if, it is of the form $m^2n^2 + 2m^2 + 3m^2$ (mod 8); when $m = 1$ and $m = 3$ (mod 8), all the squares are odd, and hence follows Fermat's theorem (that every number can be expressed as the sum of three triangular numbers one of which may be 0). Another famous theorem of Fermat's is that every number can be expressed as the sum of four squares; this was first proved by Jacobi, who also proved that the number of representations of a number $n$ does not increase if $n$ is odd, while if $n$ is even it is $24$ times the sum of the odd factors of $n$. Explicit and finite, though more complicated, formulæ have been obtained for the number of representations of a number $n$ as the sum of five, six, and eight squares. But whereas one can list the classes, the outstanding difficulties of this part of the subject may be mentioned the problem of finding all the integral (not merely rational) automorphs of a given form $F$. When $F$ is ternary, C. Hermite has shown that the solution depends on finding all the integral solutions of $F(x, y, z) = \pm 1$, where $F$ is the contravariant of $F$. Thanks to the researches of Gauss, Eisenstein, Smith, Hermite and others, we possess formulæ for the representation of a number by that of quadratics with four or more variables. Thus methods of reduction have been found both for definite and for indefinite forms; so that it would be possible to draw up a table of representations. If, however, the results were worth the labor, the important theorem is the solution of $ax^2 + by^2 + cz^2 + dw^2 = 0$; this is always possible if $-a, -b, -c, -d$ are quadratic residues of $a, b, c$ respectively, and the discriminant $abc$ can be calculated from it.
integers \(a + bi\), where \(a, b\) are ordinary integers, and, as usual, \(i^2 = -1\). In this theory there are four units \(\pm 1, \pm i\); the numbers \(a^2 + b^2\) are said to be associated; \(a + bi\) is the conjugate of \(a - bi\) and we write \(N(\frac{a + bi}{a - bi})\), the norm of \(a + bi\), its conjugate, and associated. The most fundamental proposition in the theory is that the process of residuation (§ 24) is applicable; namely, if \(m, n\) are any two complex integers and \(N(m) > N(n)\), we can always find integers \(a, b\) such that \(m = a + bi\) with \(N(a + bi) \leq N(n)\). This may be proved analytically, but is obvious if we mark complex integers by points in a plane. Hence immediately follow propositions about resolutions into prime factors, greatest common measure, &c., analogous to those in the ordinary theory; it will only be necessary to indicate special points of difference.

We have \(x = -(-1)^{p+1}\) so that \(2\) is associated with a square: a real prime subject to the residuation is seen to be of the form \(4n + 1\) breaks up into two prime conjugate factors, for example, \(5 = (1 - 2i)(1 + 2i)\). An integer is even, semi-even, or odd according as it is divisible by \((1 + i)^2, (1 + i)\) or prime to \((1 + i)\). Among four associated odd integers there is one and only one which is \(1\) (mod 2 - 2i); this is said to be primary; the conjugate of a primary number is primary, and the product of any number of primaries is primary. The conditions that \(a + bi\) may be primary are \(a = \pm 0\) (mod 2) or \(a + b = \pm 1\) (mod 4). Every complex integer can be uniquely expressed in the form \(a + bi = \frac{a}{2} + \frac{b}{2} \cdot (1 + i)\) where \(a, b\) are co-primes, we may take as representatives of these classes the residues \(x + yi\) where \(x = 0, 1, 2, \ldots, (\frac{p}{2}) - 1\); \(y = 0, 1, 2, \ldots, (\frac{p}{2}) - 1\); \(y = 0, 1, 2, \ldots, (\frac{p}{2}) - 1\); giving the \(p^2\) residues of the real number \(h\); while if \(a + bi\) is prime, \(1, 2, 3, \ldots, (\frac{p}{2} + 1)\) form a complete set of residues.

The number of residues of \(m\) that are prime to \(m\) is given by

\[
\phi(m) = N(m)(1 - \frac{1}{\alpha(p)})
\]

where the product extends to all prime factors of \(m\). As an analogue to Fermat's theorem we have, for any integer prime to the modulus, \(x^{\phi(m)} \equiv 1 \pmod{m}\), \(x^{N(p) - 1} \equiv 1 \pmod{p}\) according as \(m\) is composite or prime. There are \(\phi(N(p))\) primitive roots of the prime \(p\); a primitive root in the new theory for a real prime \(4n + 1\) is also a primitive root in the new theory for each prime factor of \((4n + 1)\), but if \(p = 4n - 1\) be a prime its primitive roots are necessarily composite.

If \(p\) is a quadratic residue of \(q\) or not; and that \(\left(\frac{p}{q}\right) = 1\) only if \(p\) is a biquadratic residue of \(q\). If \(p, q\) are primary primes, we have two laws of reciprocity, expressed by the equations

\[
\left(\frac{p}{q}\right) = \pm \left(\frac{p}{q}\right), \quad \left(\frac{q}{p}\right) = \pm \left(\frac{q}{p}\right)
\]

These must be added the supplementary formula

\[
\left(\frac{p}{q}\right) = \left(-1\right)^{N(q) - 1}, \quad \left(\frac{q}{p}\right) = \left(-1\right)^{N(p) - 1}
\]

\[
\left(\frac{a + bi}{c + di}\right) = \left(\frac{a}{c}\right) \left(\frac{b}{d}\right)
\]

The second published proof is that of Eisenstein, which is very beautiful and simple, but involves the theory of Linnicute functions.

42. Algebra of Complex Numbers—In Gauss'ssilent papers has been developed by Busche; this probably admits of simplification. Other demonstrations, for instance Jacobi's, depend on cyclotomy (see below).

43. Algebras to the complex numbers of the ordinary kind, the fields of ordinary algebra, especially in the case of a field of numbers. The field of Gaussian integers is an algebraic number field, and Gauss's algebra of complex numbers is an algebraic number field.

44. Gauss's Imaginary Unit—The first extension of Gauss's complex theory was made by E. E. Kummer, who considered complex numbers represented by rational integral functions of any number of units and used them in the theory of the complex theory and Gauss's as special cases. He was soon faced by the difficulty that, in some cases, the law that an integer can be uniquely expressed as the product of prime factors appeared to break down. To see how this happens take the equation \(\xi^4 + 1 = 0\), the roots of which are expressed as rational integral functions of 23rd roots of unity, and let \(\eta\) be either of the roots. If we define \(a + bi\) to be an integer, when \(a, b\) are natural numbers, the product of any number of such integers is uniquely expressible in the form \(an + bm\). Conversely every integer can be recovered as the product of a finite number of indecomposable complex integers \(a + bi\), that is, integers which cannot be further resolved into factors of the same type. But this resolution is not necessarily unique, since it may be possible to write the same integer in two different ways, as, for example, \(a + bi\) is transformable into a form indecomposable and essentially distinct. To see the way in which Kummer surmounted the difficulty consider the congruence

\[
\alpha + \beta + \gamma + \delta = \phi(p, \beta)
\]

where \(p\) is any prime, except 23. If \(-23\chi\) has two distinct roots \(u, \psi\) and \(\psi, \chi\) then \(\alpha + \beta + \gamma + \delta\) is an integer. The conditions that \(\alpha + \beta\) may be primary are \(u + \beta = \pm 0\) (mod 2) or \(u + \beta = \pm 1\) (mod 4). Every complex integer can be uniquely expressed in the form \(a + bi = \frac{a}{2} + \frac{b}{2} \cdot (1 + i)\) where \(a, b\) are co-primes, we may take as representatives of these classes the residues \(x + yi\) where \(x = 0, 1, 2, \ldots, (\frac{p}{2}) - 1\); \(y = 0, 1, 2, \ldots, (\frac{p}{2}) - 1\); \(y = 0, 1, 2, \ldots, (\frac{p}{2}) - 1\); giving the \(p^2\) residues of the real number \(h\); while if \(a + bi\) is prime, \(1, 2, 3, \ldots, (\frac{p}{2} + 1)\) form a complete set of residues.

The number of residues of \(m\) that are prime to \(m\) is given by

\[
\phi(m) = N(m)(1 - \frac{1}{\alpha(p)})
\]

where the product extends to all prime factors of \(m\). As an analogue to Fermat's theorem we have, for any integer prime to the modulus, \(x^{\phi(m)} \equiv 1 \pmod{m}\), \(x^{N(p) - 1} \equiv 1 \pmod{p}\) according as \(m\) is composite or prime. There are \(\phi(N(p))\) primitive roots of the prime \(p\); a primitive root in the new theory for a real prime \(4n + 1\) is also a primitive root in the new theory for each prime factor of \((4n + 1)\), but if \(p = 4n - 1\) be a prime its primitive roots are necessarily composite.

If \(p\) and \(q\) are any two odd primes, we shall define the symbols \(\left(\frac{p}{q}\right)\) and \(\left(\frac{q}{p}\right)\) by the congruences

\[
\left(\frac{p}{q}\right) = p^{N(q)/2}, \quad \left(\frac{q}{p}\right) = q^{N(p)/2}
\]

It being understood that the symbols stand for absolutely least residues. It follows that \(\left(\frac{p}{q}\right) = \left(\frac{q}{p}\right)\) only if \(p\) is a quadratic residue of \(q\). If \(p, q\) are primary primes, we have two laws of reciprocity, expressed by the equations

\[
\left(\frac{p}{q}\right) = \left(-1\right)^{N(q) - 1}, \quad \left(\frac{q}{p}\right) = \left(-1\right)^{N(p) - 1}
\]

These must be added the supplementary formula

\[
\left(\frac{p}{q}\right) = \left(-1\right)^{N(p) - 1}, \quad \left(\frac{p}{q}\right) = \left(-1\right)^{N(q) - 1}
\]

\[
\left(\frac{a + bi}{c + di}\right) = \left(\frac{a}{c}\right) \left(\frac{b}{d}\right)
\]

\[
\left(\frac{a + bi}{c + di}\right) = \left(\frac{a}{c}\right) \left(\frac{b}{d}\right)
\]

\[
\left(\frac{a + bi}{c + di}\right) = \left(\frac{a}{c}\right) \left(\frac{b}{d}\right)
\]

\[
\left(\frac{a + bi}{c + di}\right) = \left(\frac{a}{c}\right) \left(\frac{b}{d}\right)
\]

\[
\left(\frac{a + bi}{c + di}\right) = \left(\frac{a}{c}\right) \left(\frac{b}{d}\right)
\]
where \( h_1, h_2, \ldots, h_n \) are elements of \( N \) which may be called the \( \alpha \) or \( \alpha \) of \( H \). The conjugates of \( \alpha \) are \( \alpha \) and \( \alpha \), and \( a \) is a modulus (§ 44), and we may write \( \alpha = [a \omega_1, a \omega_2, \ldots, a \omega \] assuming that we have found one basis, we can construct any number of equivalent bases by means of equations such as \( \omega = \sum_{i=1}^{n} \omega_i \), where the integral coefficients \( c_i \) are such that the determinant \( \Delta \) is 1.

46. The extension of Kummer's results to algebraic numbers in general was independently made by J. W. R. Dedekind and Kronecker; their methods differ mainly in matters of notation and machinery, each having special advantages of its own for particular purposes. Dedekind introduced the concept of an \( \alpha \) ideal, which is defined by the following properties:

(i) An ideal \( \alpha \) is an aggregate of elements in \( \Omega \).

(ii) \( \alpha \) contains a zero element, and \( \alpha + \alpha \) is an element of \( \alpha \).

(iii) If \( \alpha \) is any element of \( \alpha \), and \( \alpha \) any element of \( \alpha \), then \( \alpha \) is also an element of \( \alpha \).

47. There is a theory of congruences with respect to an ideal modulus. Thus \( \alpha \equiv \beta (mod \alpha \) means that \( \alpha \) is an element of \( \alpha \). With respect to \( \alpha \), all the elements of \( \alpha \) may be arranged in a number of \( \alpha \) congruent classes. The number of these classes is called the \( \alpha \) of \( \alpha \), and written \( \alpha \). The \( \alpha \) of a prime ideal \( \alpha \) is the power of a real prime \( \beta \); if \( \alpha \equiv \beta (mod \alpha \), then \( \alpha \) is a principal ideal of \( \alpha \). Hilbert's \( \alpha \) of a \( \alpha \) is an ideal integer which takes the place of the resolution of an \( \alpha \) integer into its prime factors in the ordinary theory. It may happen that a particular \( \alpha \) does not have a unique \( \alpha \)-factorization; in this case every resolution of an \( \alpha \) ideal into factors corresponds to the resolution of an \( \alpha \) integer into actual integral factors, and the introduction of ideals is unnecessary. But in every other case the introduction of ideals or some equivalent notion is indispensable. When two ideals have been resolved into their prime factors, their greatest common measure and least common multiple are determined by the ordinary rules. Every ideal may be expressed (in an infinite number of ways) as the greatest common measure of two principal ideals.

48. Every element of \( \alpha \) which is not contained in any other ideal is called a prime ideal. If \( \alpha \) is a prime ideal of \( \alpha \), then \( \alpha \) is a principal ideal of \( \alpha \). For \( \alpha \) is a modulus, if \( \alpha \) is a principal ideal, then \( \alpha \equiv \beta (mod \alpha \), where \( \alpha \) is a modulus (§ 44), and we may write \( \alpha = [a \omega_1, a \omega_2, \ldots, a \omega \), assuming that we have found one basis, we can construct any number of equivalent bases by means of equations such as \( \omega = \sum_{i=1}^{n} \omega_i \), where the integral coefficients \( c_i \) are such that the determinant \( \Delta \) is 1.

49. For a quadratic field the equation is of the form \( \alpha^2 + \beta^2 = \gamma \), and the theory of this is complete; but except for certain special cubic corpuses little has been done towards solving the important problem of assigning an \( \alpha \) ideal to \( \alpha \) field, a system of units \( \alpha, \alpha, \ldots, \alpha \), where \( \alpha \) is a root of unity contained in \( \alpha \) and \( \alpha \) is a root of a certain polynomial. We can show that \( \alpha \) is a root of unity if and only if \( \alpha = \alpha^{-1} \). The norm of an \( \alpha \) is \( \alpha + \alpha \); and the determination of all the units contained in a given field is in fact the same as the solution of a Diophantine equation \( \alpha^2 = \alpha \).

50. The general theory of \( \alpha \) fields is known as the theory of ideals, and Dedekind's generalization of the corresponding one for quadratic fields, first obtained by Dirichlet. Let \( \alpha = \alpha \), where the sum extends to all ideals \( \alpha \) contained in \( \alpha \); this converges so long as the real quantity \( s \) is positive and greater than 1. Then \( \alpha \) being a certain quantity which can be calculated when a fundamental system of units is known, we shall have \( \alpha = \alpha \). The expression for \( \alpha \) is rather complicated, and very peculiar; it may be written in the form \( \alpha = \alpha \).

51. Normal Fields. The special properties of a particular field \( \alpha \) are closely connected with its relations to the conjugate fields \( \alpha \), \( \alpha \), \( \alpha \) normal. The most important case is when each of the conjugate fields is identical with \( \alpha \); the field is then said to be Galoisian or normal. The aggregate \( \{R, \alpha, \ldots, \alpha \} \) of all \( \alpha \) of \( \alpha \) is one of the special sense, "logarithms" of the fundamental units \( \alpha, \alpha, \ldots, \alpha \).

52. The discriminant \( \Delta \) enjoys some very remarkable properties. Its value is always different from \( \alpha \); there can be only a finite number of fields which have a given \( \alpha \); and the rational prime factors of \( \Delta \) are precisely those rational primes which, in \( \alpha \), are divisible by the square (or some higher power) of a prime ideal. Consequently, every rational prime not contained in \( \alpha \) is divisible, in \( \alpha \), by the square of a prime ideal which occurs only once. The presence of multiple prime factors in the discriminant was the principal difficulty in the way of extending Kummer's method to all fields, and was overcome by the introduction of the congruent modulus—for this is the common characteristic of Dedekind's and Kronecker's procedure.
The next proposition, which, in its natural order, is easily proved by the method of ideals, whereas Gauss had to employ the theory of ternary quadratics.

Every class of the principal genus is the square of a class.

An ambiguous ideal in \( \Omega \) is defined as one which is unaltered by the change of \( \nu m \) to \(-\nu m\) (that is, it is the same as its conjugate) and not divisible by any rational integer except \( \pm 1 \). The only ambiguous ideal in \( \mathbb{Q} \) is \( 1 \).

Putting \( \Delta = q_1^2 \cdot q_2 \cdot \ldots \cdot q_r \), and \( \Delta \) is positive; \( \pm 1 \) is the only number of ambiguous classes is equal to the number of genera.

54. Class-Number.—The number of ideal classes in the field \( \Omega(\nu/m) \) may be expressed in the following forms:

\[
\begin{align*}
(i) & \quad m < 0, \quad \lambda = -1 \pm m^{-1} \\
(ii) & \quad m > 0, \quad \lambda = -1 \pm m^{1/2}
\end{align*}
\]

In the first of these formulae \( \nu \) is the number of units contained in \( \Omega \); thus \( r = 6 \) for \( \Delta = -3 \), \( r = 4 \) for \( \Delta = -4 \), \( r = 2 \) in other cases. In the second formula, \( s \) is the fundamental unit, and the products are taken for all the numbers of the set \( (1,2,\ldots,\Delta) \) for which \( \frac{\lambda}{\nu} = -1 \).

55. Suppose that any ideal in \( \Omega \) is expressed in the form \( \langle a, b, c \rangle \), then any element of it is expressible as \( ax + by + cz \), where \( a, b, c \) are rational integers, and we shall have \( N(\langle x, y, z \rangle) = a^2 + b^2 + c^2 + \cdots \) in \( \Omega \), where \( N \) is the discriminant of \( \Omega \) in \( \mathbb{Q} \). The representation will be unique if \( a, b, c \) are not all zero; \( a, b, c \) are not all zero.

56. Complex Quadratic Forms.—Dirichlet, Smith, and others, have discussed forms \( (a, b, c) \) in which the coefficients are complex integers of the form \( m-ni \); and Hermite has considered bilinear forms \( ax+bz+by+cz+cy \), where \( x, y, z \) are the conjugates of \( x, y, z \).

In the general case, the number of ideals in \( \Omega \) as also the number of a set of quadratic forms; and it can be shown that all these forms have the same discriminant \( \Delta \).

Conversely, every class of forms of discriminant \( \Delta \) can be associated with a definite class of ideals in \( \Omega(\nu/m) \), where \( \Delta \) is an integer satisfying the condition \( \Delta = \pm 1, \ldots, \Delta \) as the case may be. Composition of forms exactly corresponds to the multiplication of ideals; hence the complete analogy between the two theories, so long as they are really in contact. There is a corresponding theory of finite forms in connection with a field of order \( n \): the forms are of the order \( n \), but are only very special forms of that order, because they are algebraically resolvable into the product of linear factors.
NUMBER

product of the contents of two forms is equal to the content of the product of the corresponding forms with the respective signs; let N be the product of m and n, and we have N(E) = N(m) if m is the content of F, and N(m) has the meaning already assigned to it. On the other hand, to a given ideal correspond an indefinite number of forms of which it is the content (§ 46, end) and we can find forms as \( x^k y^l \) of which any given ideal is the content. 

§38. Let \( \omega_1, \omega_2, \ldots, \omega_3 \) be a basis of \( n, \mu_1, \mu_2, \ldots, \mu_n \) a set of indeterminates; and 

\[
\varepsilon_{\omega_1, \omega_2, \ldots, \omega_3} \varepsilon_{\mu_1, \mu_2, \ldots, \mu_n} = a
\]

is called the fundamental form of \( \Omega \). It satisfies the equation \( N(\omega_\xi) = 0 \), or 

\[
F(x) = u_1 x^3 + u_2 x^2 + \ldots + u_3 = 0
\]

where \( u_1, u_2, \ldots, u_3 \) are rational polynomials in \( u_1, u_2, \ldots, u_3 \) with rational integral coefficients. This is called the fundamental equation.

Suppose now that \( p \) is a rational prime, and that \( p = 1 \bmod r \). Then there will be the different ideal prime factors of \( p \) if \( F(x) \) is the left-hand side of the fundamental equation there is an identical congruence

\[
F(x) = [P(x)]^2 [Q(x)]^2 R(x) = 0 \pmod{p}
\]

where \( P(x), Q(x), \) and \( R(x) \) are prime functions with respect to \( p \). The meaning of this is that if we expand the expression on the right-hand side of the congruence, the coefficient of every term \( x^m \), \( m \neq 0 \), will be congruent, \( \bmod p, \) to the corresponding coefficient in \( F(x) \). If \( p = 1 \bmod r \), \( F(x) \) is a primitive form of \( \Omega, \) \( Q(x) \) and \( R(x) \) can be found by taking the ideal prime factors of \( p \). For every prime \( p \), which is not a divisor of \( \Delta, a, b = c = -1 \) and \( F(x) \) is congruent to the product of a set of different prime forms in as many powers as there are different ideal prime factors of \( p \). In particular, if \( p = 1 \bmod \Omega, \) \( F(x) \) is a prime function \( \pmod{p} \) and conversely.

It generally happens that rational integral values \( a_1, a_2, \ldots, a_n \) can be found, such that \( x \) and \( y \) are the last term in the fundamental equation, then has a value which is prime to \( p \). Supposing that this condition is satisfied, let \( \phi(a_1, a_2, \ldots, a_n) \) and let \( \overline{\phi} \) be the result of putting \( x = a, y = a \) in \( F(x) \). Then the ideal \( \phi(x) \) is completely determined as the greatest common divisor of \( \phi \) and \( \overline{\phi} \); and similarly for the other prime factors of \( p \). There are, however, exceptional cases when the condition above stated is not satisfied.

59. Cyclotomicity. — It follows from de Moivre's theorem that the arithmetical solution of the equation \( x^n = 1 \) corresponds to the division of the circumference of a circle into \( n \) equal parts. The case when \( n \) is composite is easily made to depend on that where \( n \) is a power of a prime; if \( m \) is a power of \( 2 \), the solution is effected by a chain of quadratic equations, and it only remains to consider the case when \( m = a^2 \), a power of an odd prime. It will be convenient to write \( p(x) \) for \( m = a^2 \), \( x \) for \( p(x) \), the primitive roots of \( \phi \); and \( \phi(x) \) is a product of \( \phi \) for \( x \) and \( \overline{\phi} \). The primitive roots of this congruence \( x^m = 1 \) \( \pmod{m} \); let \( g \) be any one of these. Then if we put \( x^p = g \), we have all the roots of \( f(x) \) \( \pmod{n} \) in a definite cyclic order \( (r_0, r_1, \ldots, r_{m-1}) \); and the change of \( r \) into \( r^m \) produces a cyclic permutation of the roots. It follows from this that \( x \) is a primitive root of \( \phi \) with rational coefficients is equal to a rational number. Thus if we write \( l + a g + b g^2 + c g^3 = n \), we have, in virtue of \( r^2 - r \), \( r^2 - r \), \( r^2 - r \), \( r^2 - r \), \( r^2 - r \), \( r^2 - r \), \( r^2 - r \), \( r^2 - r \), \( r^2 - r \), \( r^2 - r \), \( r^2 - r \), \( r^2 - r \), \( r^2 - r \), \( r^2 - r \), \( r^2 - r \), the sum of the first powers of all the roots of \( f(x) = 0 \), and this is a rational integer or zero. Since every cyclic polynomial is the sum of parts similar to \( S(r^2 - r), \) the theorem is proved. Now let \( g, f \) be any two conjugate factors of \( \mu \), so that \( \mu \) is a prime, and let 

\[
\varepsilon_{\omega_1, \omega_2, \ldots, \omega_3} \varepsilon_{\mu_1, \mu_2, \ldots, \mu_n} = a
\]

then the elementary symmetric functions \( \Sigma \phi, \Sigma \phi^2, \ldots, \) are cyclic functions of the roots of \( f(x) = 0 \) and therefore have rational values which can be calculated: consequently \( \mu_1, \mu_2, \ldots, \mu_n \) are the \( n \)-fold roots of this congruence.
numbers. He also succeeded in showing that in the field $R(e^{\pi i/p})$ the equation $x^2 - p^2 y^2 = m$ has no integral solutions whenever $m$ is not divisible by $p^2$. What is known as the "last" theorem of Fermat is his assertion that every integral solution of this equation in which $x$ and $y$ are not both divisible by any prime is given by the equation $x^2 = y^2 + m^n$. This theorem has no rational solutions, except the obvious ones for which $x = y = 0$. It would be sufficient to prove Fermat's theorem for all prime values of $m$; and whenever Kummer's theorem last quoted applies, Fermat's theorem will hold. Fermat's theorem is true for all values of $m$ such that $2^m < 101$, but no complete proof of it has yet been obtained.

Hilbert has considered the question of what he calls Kummer fields, which are obtained by taking $\sqrt{a}$, a primitive $p$th root of unity, and $\sqrt{a}$ any integer or any number in the field $R(\sqrt{a})$ which is not a perfect $n$th power in that field. The Kummer field is then the field obtained by adjoining all rational functions of $x$ and $\alpha$. Other fields that have been discussed more or less are general cubic fields, special bicuadratics, and some special biquadratic and a few Abelian fields not cyclic.

Among the applications of cyclotomy may be mentioned the proof which it affords of the theorem, first proved by Dirichlet, that if $m$, $n$ are any two rational integers prime to each other, the linear form $mx + n$ is capable of representing an infinite number of primes.

62. Gauss's Sums.—Let $m$ be any positive real integer; then

$$\sum_{x=0}^{m-1} e^{2\pi i x/m} = \begin{cases} 0 & \text{if } m = \text{odd} \\ 1 & \text{if } m = \text{even} \end{cases}$$

This remarkable formula, when $m$ is prime, contains results which were first obtained by Gauss, and hence known as Gauss's sums. The easiest method of proof is Kronecker's, which consists in finding the value of $\int e^{2\pi i x/m} dx$, which is $1$ when $m$ is prime and $0$ when $m$ is composite, and taking the appropriate contour. It will be noticed that one result of the formula is that the square of any integer can be expressed as a rational function of roots of unity.

The most important application of the formula is the deduction from it of the law of quadratic reciprocity for real primes: this was done by Gauss.

63. One example may be given of some remarkable formulae giving explicit solutions of representations of numbers by certain quadratic equations. Let $p$ be any odd prime of the form $4n+1$; then we shall have $p = m^2 + 2 = x^2 + y^2$, where $x$ is determined by the congruence $2x \equiv (\eta) \pmod{p}$, $x \equiv 3 \pmod{7}$. This formula was obtained by Eisenstein, who proved it by investigating properties of integers in the field generated by $\eta = 2^{1/2}$, which is a component of the field generated by $\eta = 2^{1/2}$.

The first formula of this kind was given by Gauss, and relates to the case $p = m^2 + 2 = x^2 + y^2$; he conceals its connexion with complex numbers. Probably there are many others which have not yet been stated.

64. Higher Congruences, Functional Moduli.—Suppose that $p$ is a real prime, and that $f(x)$, $g(x)$ are polynomials in $x$ with rational integral coefficients. The congruence $g(x) \equiv f(x) \pmod{p}$ is identical when each coefficient of $f$ is congruent, mod $p$, to the corresponding coefficient of $g$, with itself, under these circumstances, $f \equiv g \pmod{p}$ and to say that $f$, $g$ are equivalent, mod $p$. Every polynomial of degree $k$ is equivalent to another of equal or lower degree, which has any of its coefficients, negative, and each of them less than $p$. Such a polynomial, with unity for the coefficient of the highest power of $x$ contained in it, may be called a reduced polynomial with respect to $p$. There are, in all, $p^k$ reduced polynomials of degree $k$. A polynomial may or may not be equivalent to the product of two others of lower degree than itself; in the latter case it is said to be prime. In every case, $f$ being any polynomial, there is an equivalence $f - df_1 \cdots - f_k$ where $c$ is an integer and $f_1, \cdots, f_k$ are prime functions; this resolution is unique. Moreover, it follows from Fermat's theorem that $f(x) \equiv F(x)$, $f(x) \equiv F(x)$, and so on.

As in the case of equations, it may be proved that, when the modulus is prime, a congruence $f(x) \equiv 0 \pmod{p}$ cannot have more incongruent roots than the index of the highest power of $x$ in $f(x)$, and that if $x = y \pmod{p}$ is a solution, $f(x) = f(y) \pmod{p}$, where $f(y)$ is another polynomial in $y$ with coefficients congruent, mod $p$, to the corresponding coefficients of $f(x)$ and $f(y)$. The solutions of $f(x) \equiv 0 \pmod{p}$ are all the zeros of $f(x)$, hence the solutions of the congruence $f(x) \equiv 0 \pmod{p}$ have the same number of zeros as the polynomial $f(x)$ has, hence the number of its distinct zeros, and each of them less than $p$. Such a polynomial, with unity for the coefficient of the highest power of $x$ contained in it, may be called a reduced polynomial with respect to $p$. There are, in all, $p^k$ reduced polynomials of degree $k$. A polynomial may or may not be equivalent to the product of two others of lower degree than itself; in the latter case it is said to be prime. In every case, $f$ being any polynomial, there is an equivalence $f - df_1 \cdots - f_k$; each $c$ is an integer and $f_1, \cdots, f_k$ are prime functions; this resolution is unique. Moreover, it follows from Fermat's theorem that $f(x) \equiv F(x)$, $f(x) \equiv F(x)$, and so on.

In the case of equations, it may be proved that, when the modulus is prime, a congruence $f(x) \equiv 0 \pmod{p}$ cannot have more incongruent roots than the index of the highest power of $x$ in $f(x)$, and that if $x = y \pmod{p}$ is a solution, $f(x) = f(y) \pmod{p}$, where $f(y)$ is another polynomial in $y$ with coefficients congruent, mod $p$, to the corresponding coefficients of $f(x)$ and $f(y)$. The solutions of $f(x) \equiv 0 \pmod{p}$ are all the zeros of $f(x)$, hence the solutions of the congruence $f(x) \equiv 0 \pmod{p}$ have the same number of zeros as the polynomial $f(x)$ has, hence the number of its distinct zeros, and each of them less than $p$. Such a polynomial, with unity for the coefficient of the highest power of $x$ contained in it, may be called a reduced polynomial with respect to $p$. There are, in all, $p^k$ reduced polynomials of degree $k$. A polynomial may or may not be equivalent to the product of two others of lower degree than itself; in the latter case it is said to be prime. In every case, $f$ being any polynomial, there is an equivalence $f - df_1 \cdots - f_k$; each $c$ is an integer and $f_1, \cdots, f_k$ are prime functions; this resolution is unique. Moreover, it follows from Fermat's theorem that $f(x) \equiv F(x)$, $f(x) \equiv F(x)$, and so on.

As in the case of equations, it may be proved that, when the modulus is prime, a congruence $f(x) \equiv 0 \pmod{p}$ cannot have more incongruent roots than the index of the highest power of $x$ in $f(x)$, and that if $x = y \pmod{p}$ is a solution, $f(x) = f(y) \pmod{p}$, where $f(y)$ is another polynomial in $y$ with coefficients congruent, mod $p$, to the corresponding coefficients of $f(x)$ and $f(y)$. The solutions of $f(x) \equiv 0 \pmod{p}$ are all the zeros of $f(x)$, hence the solutions of the congruence $f(x) \equiv 0 \pmod{p}$ have the same number of zeros as the polynomial $f(x)$ has, hence the number of its distinct zeros, and each of them less than $p$. Such a polynomial, with unity for the coefficient of the highest power of $x$ contained in it, may be called a reduced polynomial with respect to $p$. There are, in all, $p^k$ reduced polynomials of degree $k$. A polynomial may or may not be equivalent to the product of two others of lower degree than itself; in the latter case it is said to be prime. In every case, $f$ being any polynomial, there is an equivalence $f - df_1 \cdots - f_k$; each $c$ is an integer and $f_1, \cdots, f_k$ are prime functions; this resolution is unique. Moreover, it follows from Fermat's theorem that $f(x) \equiv F(x)$, $f(x) \equiv F(x)$, and so on.

As in the case of equations, it may be proved that, when the modulus is prime, a congruence $f(x) \equiv 0 \pmod{p}$ cannot have more incongruent roots than the index of the highest power of $x$ in $f(x)$, and that if $x = y \pmod{p}$ is a solution, $f(x) = f(y) \pmod{p}$, where $f(y)$ is another polynomial in $y$ with coefficients congruent, mod $p$, to the corresponding coefficients of $f(x)$ and $f(y)$. The solutions of $f(x) \equiv 0 \pmod{p}$ are all the zeros of $f(x)$, hence the solutions of the congruence $f(x) \equiv 0 \pmod{p}$ have the same number of zeros as the polynomial $f(x)$ has, hence the number of its distinct zeros, and each of them less than $p$. Such a polynomial, with unity for the coefficient of the highest power of $x$ contained in it, may be called a reduced polynomial with respect to $p$. There are, in all, $p^k$ reduced polynomials of degree $k$. A polynomial may or may not be equivalent to the product of two others of lower degree than itself; in the latter case it is said to be prime. Hurwitz has extended this field of research almost indefinitely,
not only by generalising the formulae for class-number sums, such
as that in 69, but also by bringing the modular-function theory into
connexion with that of algebraic correspondence and Abelian into indicate the
tegrals. A comparatively simple example may help
nature of these researches. From the formulae given at the beginning

73. In the Berliner Sitzungsberichte for the period 1883-1890,
L. Kronecker published a very important series of articles on elliptic
functions, which contain many arithmetical results of extreme
elegance; some of these Kronecker had announced without proof
many years before. A few will be quoted here, without any attempt
at demonstration; but in order to understand them, it will be
necessary to bear in mind two definitions. The first relates to the

K. E. R. Fricke, proceeds by discussing the deficiency olfi(j,j')=o
considered as representing a curve. If this deficiency is zero, j and j'
may be expressed as rational functions of the same parameter, and
this replaces the modular equation in the most convenient manner.
For instance, when n = 7, we may put

$h(d)$ meaning the number of primitive forms for the determinant $d$. This is a generalisation of a theorem due to Dirichlet.

There is another formula which, in a certain sense, is the generalisation of Gauss's sums (§ 62) in cyclotomy. Let $\chi(u, v)$ denote the function $\theta_1(u+v)+\theta_2(u\theta(v)$ and let $D_1$ be any two fundamental discriminants such that $D_1D_2$ is also fundamental and negative: then

$$\frac{\tau D_1}{2\pi \sqrt{D_1D_2}} \sum_{\sigma \in S} \left( \frac{D_1}{\sigma} \right) J_{\frac{\rho}{\sigma}}(1) \left( \frac{D_2}{\rho} \right) \sum_{m, n} g_1(m^2+n^2+cD_2),$$

where, on the left-hand side, we are to sum for $\sigma = 1, 2, 3, \ldots |D_1|$; and on the right we are to take a complete set of representatives $\rho = a_1+b_1\sqrt{D_2}, a_2+b_2\sqrt{D_2}$, and $m, n$, of all positive and negative integral values such that $m^2+n^2+cD_2$ is odd. The quantity $\tau$ is 2 if $D_1D_2<4, \tau = 3$ if $D_1D_2=4, \tau = 6$ if $D_1D_2=8$. From putting $D_1=1$, we obtain, after some easy transformations,

$$\sum_{\sigma = 1}^\infty \left( \frac{-4}{\sigma} \right) \sin 2\pi \frac{K}{\sigma} = \frac{\tau D_1}{2\pi \sqrt{D_1D_2}} \sum_{m, n} g_1(m^2+n^2+cD_2),$$

which holds for any fundamental discriminant $\sigma$. For instance, taking $\omega = i\sqrt{5}/K$, and $\Delta = 3$, we have $\theta_1(\omega) = 2\sqrt{5}/\pi$, and $\sum_{\sigma = 1}^\infty \left( \frac{-4}{\sigma} \right) \sin 2\pi \frac{K}{\sigma} = \frac{4\sqrt{5}}{3\pi}$; a verification afforded by making $a_k$ approach $\pi$, the value of $\pi$, in which case $\sigma$ vanishes, while the limit of $g_1(K)/3$ is $\frac{4\sqrt{5}}{3\pi}$, as it should be.

Several of Kronecker's formulae connect the solution of the Pellian equation with elliptic modular functions; one example may be given here. Let $D$ be a positive discriminant of the form $8n+5$, let $(\Gamma, U)$ be the least solution, and $\tau(D) = 3$. Then, if $D(\tau)$ is the number of primitive classes for the determinants $D(\tau) = D(\tau', \tau''),$ where the product on the right extends to a certain sixth part of the numbers $\Delta = 2K/\pi$, which are singular, and correspond to the field $\Omega/\Delta$, one finds that

$$\tau(D(\tau)) = \frac{4\Delta(\omega \tau)^2 + 1}{(2+15+3\sqrt{5})^2(\omega\tau)^2 + 1}$$

one root of which is given by $2\omega \tau = 1+\sqrt{5}$, and $\Delta + 5\sqrt{5}$ which is right, because in this case $D(D(\tau)) = 12$.

74. Frequency of Primes.—The distribution of primes in a finite interval $(a, b)$ is very irregular, if we change $a$ and keep $b$ constant. Thus if we put $n = a$, the numbers $\mu/2, \mu/3, \ldots, (\mu/\mu-1)$ are all composite, so that we can form a run of consecutive composite numbers as extensive as we please; on the other hand, there is possibly no limit to the number of cases in which $p$ and $p+2$ are both prime, and it is the first to examine the approximate formula for $F(x)$, the number of primes not exceeding $x$. He found by induction

$$F(x) = x + (2\log x - 1 - 0.8366)$$

which answers fairly well when $x$ lies between 10 and 1,000,000, but becomes more and more inaccurate as $x$ increases. Gauss found, by theoretical considerations (which, however, he does not explain), the approximate formula

$$F(x) \approx x + \frac{x}{2} \log x$$

(where, as in all that follows, $\log x$ is taken to the base $e$). This value is ultimately too large, but when $x$ exceeds a million it is nearer the truth than the value given by Legendre's formula.

By a singularly profound and original analysis, Riemann succeeded in finding a formula, of the same type as Gauss's, but more exact for very large values of $x$. In its complete form it is very complicated; but, by omitting terms which ultimately vanish (for sufficiently large values of $x$) in comparison with those retained, the formula reduces to

$$F(x) = A \sum_{m = 1}^{\infty} \frac{\mu(x)}{m^2} x^x \log x$$

where the sum extends to all positive integral values of $m$ which have no square factor, and $\mu$ is the number of different prime factors of $m$, with the convention that when $m = 1, (-1) = 1$. The symbol $A$ denotes a constant, namely

$$A = \frac{e^{\tau /2} \beta e^{-1} \log|-2\pi|}{25 \log 6^6}$$

and $L$ is used in the sense given above.

P. L. Tchebycheff obtained some remarkable results on the frequency of primes by an ingenious application of Stirling's theorem. One of these is that there will certainly be $(\alpha + 1)$ primes between $a$ and $b$, provided that

$$\alpha \geq \frac{5}{6} \log b - \sqrt{2} \log 6 \log b + \frac{5}{6} (4k + 25) - 26 \frac{25}{6}$$

where $R = \log h + \log 4 + \frac{1}{4} \log 5 - 15 \log 7 - 0 + 0.921292$. From this may be inferred the truth of Bertrand's conjecture that there is always at least one prime between $a$ and $(2a-2)$ if $a > 7$. Tchebycheff's results were generalized and made more precise by Sylvester.

The actual calculation of the number of primes in a given interval may be effected by a formula contrived by Pringsheim, Stern and by D., F. E. Meissel. The following table gives the values of $F(n)$ for various values of $n$, according to Meissel's determinations:

<table>

Riemann's analysis mainly depends upon the properties of the function

$$f(n) = \sum_{\rho} \theta(u, v) \left( \frac{1}{\rho} \right)$$

considered as a function of the complex variable $z$. The above definition is only valid when the real part of $s$ exceeds 1; but it can be generalized by writing

$$2 \sin \pi \Gamma f(z) = \int_{-\infty}^{\infty} e^{-\pi x^2} dx$$

where the integral is taken from $x = +\infty$ along the axis of real quantities to $x = 0$, where $e$ is a very small positive quantity, then round a circle of radius $\epsilon$ and centre at the origin, and finally from $x = -\infty$ along the axis of real quantities. This function $f(z)$ is of great importance, and has been recently studied by von Mangoldt Landau and others.

Reference has already been made to the fact that if $n$, $m$ are coprime, the linear form $x + my$ includes an infinite number of primes.

Now let $\alpha$, $\beta$, $\gamma$ be any primitive quadratic form with a total generic character $C$; and let $x + my$ be a primitive linear form chosen so that all its values have the character $C$. Then it has been proved by Weber and Meyer that $n, m, c, C$ is capable of representing an infinity of primes of all the linear form $x + my$.

75. Arithmetical Functions.—This term is applied to symbols such as $f(x)$, $g(x)$, &c., which are functions of $x$ with $n$ by certain properties which make them suitable for metrical use. The function $f(x)$ was written by Euler, who investigated its properties, and by proving the formula

$$\sum_{n=1}^{\infty} \frac{f(n)}{n} = \log 2$$

where

$$\sum_{n=1}^{\infty} \frac{f(n)}{n} = \log 2$$

this is the simplest proof of the law of quadratic reciprocity depends upon the fact that $q$ are odd primes, and we put $p = 2n+1, q = 2n+1$.

$$\sum_{n=1}^{\infty} \frac{E(x)}{x} = \frac{x}{2}$$

the truth of which is obvious, if we rule a rectangle $\theta x^2q^2$ into unit squares, and draw its diagonal. This formula is Gauss's, but the geometrical proof is due to Eisenstein. Another useful formula is

$$\sum_{n=1}^{\infty} \frac{E(x)}{x} = E(nx) - E(x),$$

which is due to Hermite.

Various other arithmetical functions have been devised for particular purposes; two that deserve mention (both due to Kronecker) are the number of divisors (as in our case) which is odd or even, and $s x$, which means $s + x$. Note 1.

76. Transcendental Numbers.—It has been proved by Cantor that the aggregate of all algebraic numbers is countable. Hence immediately follows the proposition (first proved by Liouville) that there are numbers, both real and complex, which cannot be defined by any combination of a finite number of equations with rational integral coefficients. Such numbers are said to be transcendental. Hermite first completely proved the transcendental character of $e$, and Lindemann, by a similar method, proved the transcendence of $\pi$. Thus it is now finally established that the quotient of the circle is impossible, not only by rule and compass, but even with the help of any number of algebraic curves of any order when the coefficients in their equations are rational (see Hermite, C. R. Izvii., 1873; in Lindemann, Math. Ann. xx., 1882). Another number which is almost certainly transcendental is Euler's constant $C$. It may be convenient to give here the following numerical values:

- $\log 2 = 0.6931471803$
The Berlin, theory foregoing has 1801 (in 2'18284 peculiar well. Another 4 i) acknowledged solutions equalities, processes with the last of which is useful in calculating class-invariants.

77. Miscellaneous Investigations.—The foregoing articles (§§ 24-76) give an outline of what may be called the analytical theory of numbers, which is mainly the work of the 19th century, though many of the researches of Lagrange, Legendre and Gauss, as well as all those of Euler, fall within the 18th. But after all, the germ of this remarkable development is contained in what may be called the original Diophantine analysis, of which, beyond question, Fermat was the author. While the spirit of this method is still vigorous in Euler; but the appearance of Gauss’s *Disquisitiones arithmeticae* in 1801 transformed the whole subject, and gave it a new tendency which was strengthened by the discoveries of Cauchy, Jacobi, Eisenstein and Dirichlet. In recent times Édouard Lucas revived something of the old doctrine, and it can hardly be denied that the Diophantine method is the one that is really germane to the subject. Even the strange results obtained from elliptic and modular functions must somehow be capable of purely arithmetical proof without the use of theories final. Besides those who have announced various theorems which have not been proved or disproved, and made a beginning of theories which are still in a more or less rudimentary stage. As examples of the latter may be mentioned the partition of numbers (see Numbers, Partition or, below), and the resolution of large numbers into their prime factors.

The general problem of partitions is to find all the integral solutions of a set of linear equations \( \sum_{k=1}^{n} a_k x_k = m \), with integral coefficients, and fewer equations than there are variables. The solutions may be further restricted by other conditions—for instance, that all the variables are to be positive. This theory was begun by Euler: Sylvester gave lectures on the subject, of which some portions have been preserved; and various results of great generality have been discovered by P. A. MacMahon. The author last named has also considered Diophantine inequalities, a simple problem in which is "to enumerate all the solutions of \( \sum_{k=1}^{n} x_k = m \) in positive integers."

The resolution of a given large number into its prime factors is still a problem of great difficulty, and tentative methods have to be applied. But is good deal has been done by Schnolff, Lucas, Landau, and J. C. Cunningham and Lawrence to shorten the calculation, especially when the number is given, or can be reduced to, some particular form.

It is well known that Fermat led to the erroneous conjecture (he did not affirm it) that \( 2^{n} + 1 \) is a prime whenever \( n \) is a power of 2. The first case of failure is when \( n = 32; \) in fact \( 2^{32} + 1 = 429,496,729 \) (mod 429,496,729). Other known cases of failure are \( n = 2^{m}, \) with \( m = 6, 12, 23, 26 \) respectively; at the same time, Eisenstein asserted that he had proved that the formula \( 2^{2n} + 1 \) included an infinite number of primes. This proof is not extant; and no other has yet been supplied. Similar difficulties are encountered when we examine Mersenne's numbers, which are those of the form \( 2^{n} - 1, \) with \( p \) a prime; the known cases for which a Mersenne number is prime correspond to \( p = 2, 3, 5, 7, 13, 17, 19, 31, 61. \) A perfect number is one which, like \( 6 \) or \( 28, \) is the sum of its aliquot parts. Euclid proved that \( 2^{n-1} (2^{n} - 1) \) is perfect when \( 2^{n-1} - 1 \) is a prime: and it has been shown that this formula includes all perfect numbers which are even. It is not known whether any odd perfect numbers exist or not. Friendly numbers (numeri amicabiles) are pairs such as 220, 284, each of the sum of the aliquot parts of the other. No general rules for constructing them appear to be known, but several have been found, in a more or less methodical way.

78. In conclusion it may be remarked that the science of arithmetic (q.v.) has now reached a stage when all its definitions, processes and results are demonstrably independent of any theory of variable or measurable quantities such as those postulated in geometry and mathematical physics; even the notion of a limit may be dispensed with, although this idea, as well as that of a variable, is often convenient. For the application of arithmetic to geometry and analysis, see Function.

**NUMBERS, BOOK OF.** the fourth book of the Bible, which takes its title from the Latin equivalent of the Septuagint *Aπολογια*. While the English version follows the Septuagint directly in speaking of Genesis, Exodus, Leviticus and Deuteronomy, it follows the Vulgate in speaking of Numbers. Since this book describes the way in which an elaborate census of Israel was taken on two separate occasions, the first at Sinai after the beginning of the desert wanderings and the second just before the Israelites were to be settled on the plains of Moab, the title is quite appropriate. The name is also used in modern Hebrew Bibles from its fourth word *Bemiškhar* ("In the desert") is at least equally appropriate. The other title in use among the Jews, *Vayyidkaber* ("And he said "), is simply the first word of the book and has no reference to its contents.

Numbers is the first part of the second great division of the Hexateuch. In the first three books we are shown how God raised up for Himself a chosen people and how the descendants of Israel on entering at Sinai into a solemn league and covenant with God, as a separate nation, a peculiar people. In the last three books we are told what happened to Israel between the time it entered into this solemn covenant and its settlement in the Promised Land under the successor of Moses. Yet, though part of a larger whole, the book of Numbers has been so constructed by the Redactor as to form a self-contained division of that whole.

The truth of this statement is seen by comparing the first verse of the book with the last. The first is as evidently meant to serve as an introduction to the book as the last is to serve as a conclusion, and, if not always fulfilled, it would in fact, if this last verse is considered as one part of a wider whole, be almost a glimmering of the principle that the whole is much greater than the sum of its parts. It is noteworthy that the books of Hexateuchal criticism are gradually changing their character, as one after another of the main contentions of Biblical scholars regarding the date and authorship of the Hexateuch passes out of the list of debatable questions into that of acknowledged facts. No competent scholars now question the existence, hardly any one the relative dates, of J, E, and P. In Numbers one can tell almost at a glance which parts belong to P, the Priestly Code, and which to JE, the narrative resulting from the combination of the Judaic work of the Yahwist with the Ephraimitic work of the Elohist. The main difficulty in Numbers is to determine to which stratum of P certain sections should be assigned.

The first large section (i. - x. 10) is wholly P, and the last eleven chapters are also P with the exception of two or three paragraphs in chap. xxxii., while the intervening portion is mainly P with the inclusion of three important episodes and two or three others of less importance. The three main episodes are those of the twelve spies, the rebellion of Korah, Dathan and Abiram, and Balaam's mission to Balak. The last is the only one even of these three in which there is nothing belonging to P. Another passage which we may here mention is one where the elements of JE can be readily separated and assigned to their respective authors, viz. chaps. xi. and xii. It is generally agreed that to E belongs the passage describing the outpouring of the Spirit on Elidad and Medad and the remarkable prayer of Moses in xi. 29. Would God that all the Lord's people were prophets that the Lord
would put his Spirit upon them," a prayer that closely approaches the New Testament idea that all Christians are "priests unto God." As usual, the J and E elements possess such a vivid character as to render them familiar to ordinary readers. The legends in which this crisis is presented differ mainly in the proportions assigned to P are so detailed and uninteresting that they make no impression on a reader's memory, and P's diffuseness, always undue, reaches a climax in chap. vii., where the offerings presented by each tribe at the dedication of the Tabernacle are actually described in such full detail that six, in themselves extremely uninteresting, verses are repeated in identical terms no fewer than twelve times. Compare also the very similar repetitions and diffuseness in chap. xxix.

Perhaps, however, the most illuminating example of the difference in position as recorded in J or E and traditions as given by P is found in the very first passage that occurs after the first long section of P describing the order of march of the several tribes and the position of the ark in the very centre of the host, both when encamped and on the march. Notwithstanding all this, in x. 30 we find Moses entreating Hobab, the son of Reuel his father-in-law, to come along with the Israelites to be "eyes" unto them; and in x. 33 it is stated that the ark went before them to seek out a resting-place for them. Whether we ascribe this whole passage simply to JE or consider, as many scholars do, that the J and E traditions reflect this oracle to the time of antiquity, when these statements directly contradict P's elaborate scheme, according to which the people march, tribe by tribe, with the ark in the very centre of the square, and guided by the pillar of cloud by day and the pillar of fire by night. There can be equally little doubt that these statements are much more likely to be in accordance with fact than P's. The latter's elaborate plans go on the supposition that great masses of men, women and children could be moved about over the desert as easily as pawns on a chess-board; but even the greatest military leader the world has seen would have been unable to fix a battle-ground or to bring together the difficulties inevitable on a desert march; and the more carefully an intelligent reader has studied the details of P's plan, the more astonished will he be to read the statement in x. 33 as to the position of the ark, and to learn that Moses, instead of simply following the pillar of cloud, requests Hobab to determine the line of march and select the sites for encampment. No clearer proof could be desired of the utterly uncritical spirit of the age in which the Hexateuch got its present form than that this detailed account should be immediately followed by two short paragraphs which are both based on the same principle of the pillar of cloud and march so elaborately worked out in the preceding narrative.

The fact is that Numbers is the result of a long literary process of amalgamation both of traditions and of documents, a process that began in the closing decades of the 9th century B.C. and did not finally end till the 2nd century B.C., the earliest date being that of J, and the latest probably that of the various addenda to Balaam's prophecies, e.g. xxiii. 106, xxiv. 9b, xxiv. 18-24. Balaam's prayer in xxiii. 106 is not only metrically superfluous, but the personal, individual note in it is quite out of keeping with the rest of the poem, this poem, which is purely national. This addition may therefore have been originally the marginal note of a piou scribe which was afterwards transferred to the text. In xxiv. 24 Kittim is a name originally derived from Kittim, a city of Cyprus. The meaning of "Kittim" was then extended to include the inhabitants of all the islands and coast-lands of the Mediterranean. Hence it might mean not only Macedonia or Greece, but even Italy. In Dan. xi. 30 it is certainly applied to Rome, the Vulgate rendering it "Romam" there just as that version translates it here by "Italia." Hence Bezae, which would retain this reading of this A.D. 374. (Epiphanes) and even to the embassy of Popilius Laenas in 168 B.C. when that haughty Roman humiliated the Syrian king by drawing a circle round him with his cane, and daring him to step out of it till he had given him an answer.

The book falls naturally into three sections, chronologically arranged: (1) Chaps. i.-x. 16, Israel's twenty days' sojourn at Sinai during which a census of the people is taken and various laws are promulgated by Moses. (2) Chaps. xi.-xxiii., incidents that occurred on the way of leaving Horeb. These incidents seem to have been chosen for the purpose of casting light on the religious history and character of the people and showing how later generations explained the origin of various place names, e.g. the desert of Kadesh and Kadesh Barnea. The second narrative, of worship, cf. the worship of the brazen serpent, xxi. 4-11, which, as we learn from 2 Kings viii. 4, continued down to the time of Hezekiah. (3) Chaps. xxiii.-xxvii., Israel's sojourn in the plains of Moab, their march through there, and the taking of a second census, preliminary to the invasion of Canaan.

Two examples of the very miscellaneous contents of the book will suffice to show the extent to which it is composed of scraps from many sources. (A) We shall take first the account given in chaps. xvi. of the rebellion of Korah, Dathan and Abiram. There would be four independent narratives, J, E, and two very distinct strata of P, a deuteronomistic account and an earlier one, ii. 17-26, i.e. chap. ii. called by J itself "the book of the men of Reuben," and another account of Balaam, at the head of 250 Israelites rebelled against the religious authority of Moses and Aaron because of the privileges conferred on the Levites. Korah and his associates maintained that the other tribes, believing as they did, that Yahweh had given the Levites to approach Yahweh directly, without the mediation of any Levite, and offer sacrifices and even incense to Yahweh. Read together verses 12-16, 18, 19-24.

3. The third narrative is P, which relates how Korah at the head of 250 Levites protested against the priestly privileges of Aaron, claiming that all the Levites had as much right to sacrifice and offer incense to Yahweh as Aaron and his sons had. Read verses 8-11 and 16 and 17. In both P and P' the disputants are summoned from their tents and ordered to assemble before the Dwelling of Yahweh; and in both cases the same fate overtook the transgressors: fire from Yahweh consumed them and their families. The burden of P' is greater. (B) The story of Balaam as we have it in chaps. xxiii.-xxiv. is an amalgam of J and E with later additions; but xxxii. 6, 16 proves that Balaam was not unknown to P. According to E, Balaam sent certain Moabite princes all the way to Pethor on the Euphrates to ask Balaam to come and curse Israel. But Elomim came to Balaam by night and forbade him to go. So the princes returned disappointed. A second and still more influential embassy having been sent, Elomim again appeared by night, and this time permitted Balaam to go on condition that he said nothing but what Elomim bade him. His journey was uneventful, and he arrived at Zephathah. There he required a caravan well equipped with camels, the princes of Moab waited till Balaam was ready to accompany them. When Balaam reached the frontier of Moab Balak was waiting to welcome him, but Balaam refused to enter Moab, and Balak and his fellow-embassies were required to retire. With equal frankness Balaam replied that, though he had come now, he had no power to say anything but what Elomim bade him. He then, however, appeared to have been overheard, for a word was met by Elomim. Thereupon, instead of cursing the Israelites, Balaam blessed them. Though bitterly disappointed Balak still attempted to effect his purpose and took Balaam to the top of a mountain, but balancing the position, he discovered that the people that had come out up Egypt. Balaam protested that, though he were to receive a houseful of silver and gold, he could not see beyond the word of Yahweh, his God. Nevertheless his scruples were somehow overcome; and, "[translated by Jwsvhe] he
agreed to go. As the journey was not a long or dangerous one, the
servants of Balak returned at once to inform their master of their
success, leaving Balaam to follow at his own convenience. So
Balaam, still without consulting Yahweh, saddled his ass and set out
for Moab, attended only by two servants. The land through which
he had to pass, so far from being a desert, was a land of oil and wine;
and when Balaam was riding along a narrow path between two vine
yards, the anger of Yahweh would have slain him, had not his ass
served and saved him. That this episode belongs to J I no one need
ever forget, since the only parallel in Scripture to the speaking ass
is the serpent that spoke in Eden. Balaam, after being sternly
reprimanded, was allowed to proceed, but only on condition that
he would not pass beyond the word of Yahweh, and then boldly announced
the respective destinations of Israel and Moab, xxiv. 15-19.

As seven is the perfect number and as Balaam had ordered seven
altars to be built, the Redactor thought it would be well to have
seven Mehshilim or metrical oracles; and so he added other three
which are certainly not pertinent to the situation, as they allude not
merely to the Assyrian empire but to the Macedonian, and even,
as some maintain, to the Roman empire, cf. xxiv. 24.

The poetical quotations in Numbers are of the utmost im-
portance, not only as helping to determine the date of the book
but as indicating the value of poetry in its bearing on history. In
xxiv. 16 we have the Wentworth's translation of one of the
earliest poetry entitled "The Book of the Wars of Yahweh." It is
highly probable that Deborah's song was also originally in this book;
and when we compare the statement in that song as to Israel's
full fighting strength, viz. 40,000, men, with the statements in
the prose of Numbers as to 600,000 men and more, we at once
realise how much closer to actual facts we are brought by early
poetry than by the latter prose of writers like P. Perhaps it is in
ch. xxxi. that we have the clearest proof of the non-historical
character of the book. There we read that 12,000 Israelites,
who had once been a single man, dwelt over against the Midianite,
children included, and every Midianite woman that had known a man,
and took so much booty that there had to be special legislation as
to how it is to be divided. But if this were actual fact, how
could the Midianites have ever reappeared in history? And yet
in Gideon's time they were strong enough to oppress Israel.
From this chapter, unhistorical as it must be, we see how the
legislation of Israel, whatever its character or origin, was referred
back to Moses the great Law giver of Israel.

NUMBERS, PARTITION OF.

This mathematical subject, created by Euler, though relating essentially to positive integer numbers, has to be regarded as a portion of the theory of Numbers
(see Number). We consider in it a number as made up by the
addition of other numbers: thus the partitions of the successive
numbers 1, 2, 3, 4, 5, 6, &c., are as follows:

1; 2; 11;
3, 21, 111;
4, 211, 2111, 1111;
5, 41, 321, 221, 2111, 11111;
6, 51, 421, 411, 331, 3211, 321, 2211, 22111, 21111, 111111.

These are formed each from the preceding ones; thus, to form
the partitions of 6 we take first 6; secondly, 5 prefixed to each of
the partitions of 1 (that is, 51); thirdly, 4 prefixed to each of the
partitions of 2 (that is, 42, 411); fourthly, 3 prefixed to each of the
partitions of 3 (that is, 33, 321, 3111); fifthly, 2 prefixed,
ot to each of the partitions of 4, but only to those partitions
which begin with a number not exceeding 2 (that is, 222, 2211,
21111); and lastly, 1 prefixed to all the partitions of 5 which begin
with a number not exceeding 1 (that is, 111111); and so in
other cases.

The method gives all the partitions of a number, but we may
consider different classes of partitions: the partitions into a
given number of parts, or into not more than a given number
of parts; or the partitions into given parts, either with repeti-
tions or without repetitions, &c. It is possible, for any
particular class of partitions, to obtain methods more or less
easy for the formation of the partitions either of a given
number or of the successive numbers 1, 2, 3, &c. And of course in
any case, having obtained the partitions, we can count them
and so obtain the number of partitions.

Another method is by L. F. A. Arbogast's rule of the last and
the last but one; in fact, taking the value of a to be unity, and,
understanding this letter in each term, the rule gives:
\[ b_1, b_2, \ldots, b_n = \frac{1}{a} \left( a - 1 \right) \left( a - 2 \right) \ldots \left( a - n + 1 \right) \]
where \( b_1, b_2, \ldots, b_n \) are the number of partitions of \( n \) with
partitions of \( n \) with no part greater than \( k \) and in general we have the
theorem, the number of partitions of \( n \) into not more than \( k \) parts is equal to the number of partitions of \( n \) with no part
greater than \( k \).

We have for the number of partitions an analytical theory depend-
ing on generating functions; thus for the partitions of a number \( n \)
with the parts 1, 2, 3, 4, 5, &c., without repetitions, writing down the
product:
\[ (1 + x + x^2 + \ldots + x^a)' \times (1 + x^2 + x^4 + \ldots + x^{2a})' \times \ldots \]

it is clear that, if \( a, x, x_1, \ldots \) are terms of the series \( x, x^2, \ldots \)
for which \( a + b + \ldots = n \), then we have in the development of
the product the term \( x^a \) and hence that in the term \( N^n \) of the
product the coefficient \( N \) is equal to the number of partitions of \( n \), with
the parts 1, 2, 3, \ldots, without repetitions; or say that the product is
the generating function \( G \) for the number of such partitions.

And so in other cases we obtain a generating function.

Thus for the function
\[ \prod_{i=1}^{a} (1 + x^i)' \]
observing that any factor \( 1 - x^i \) is \( 1 + x^i + x^{2i} + \ldots \)
we see that in the term \( N^n \) of the development the coefficient \( N \)
is equal to the number of partitions of \( n \) into \( k \) parts, with the parts
1, 2, 3, \ldots, without repetitions.

And similarly, considering the function
\[ \prod_{i=1}^{a} (1 + x^i)' \]
where the only terms are those with an exponent \( \frac{1}{2}(nm+n) \), and for
each such pair of terms the coefficient is \((-1)^{n-1} \). The formula shows
that except for numbers of the form \( \frac{1}{2}(nm+n) \) the number
of partitions without repetitions into an odd number of parts is equal
to the number of partitions without repetitions into an even number
of parts.

Another method for the excepted numbers is to say that they differ
by unity. Thus for the number \( 11 \), which is not an excepted number,
the two sets of partitions are
11, 821, 731, 641, 632, 542, 101, 92, 83, 74, 65, 5321,

in each set.

We have
\[ 1 - x \cdot 1 + x \cdot 1 + x^2 \cdot 1 + x^3 \cdot 1 + x^4 \cdot 1 + \ldots = 1 \]
or, as this may be written,
\[ 1 + x \cdot 1 + x^2 \cdot 1 + x^3 \cdot 1 + x^4 \cdot 1 = 1 - x \cdot 1 + x^2 \cdot 1 + x^3 \cdot 1 + x^4 \cdot 1 \]
showing that a number \( n \) can always be made up, and in one way
only, with the parts 1, 2, 4, 8, \ldots. The product on the left-hand
side may be taken to \( k \) terms only, thus if \( k = 4 \), we have
\[ 1 + x \cdot 1 + x^2 \cdot 1 + x^3 \cdot 1 + x^4 \cdot 1 = 1 - x \cdot 1 + x^2 \cdot 1 + x^3 \cdot 1 + x^4 \cdot 1 \]

xix, 28
NUMENIUS—NUMERAL

that is, any number from 1 to 15 can be made up, and in one way only, with the parts 1, 2, 4, 8; and similarly any number from 1 to 25–1 can be made up, and in one way only, with the parts 1, 2, 4, 8, 16.

A like formula is

\[ \frac{1-x}{x-1} \cdot \frac{1-x^2}{x^2-1} = \frac{1-x^3}{x^3-1} \]

\[ \frac{1-x^4}{x^4-1} \cdot \frac{1-x^5}{x^5-1} = \frac{1-x^6}{x^6-1} \]

that is,

\[ x^1 + 1 \times x^2 + 2 \times x^3 + 3 \times x^4 + 4 \times x^5 + 5 \times x^6 \]

showing that any number from -40 to +40 can be made up, and that in one way only, with the parts 1, 3, 9, 27 taken positively or negatively; and so in general any number from \(-\frac{1}{3}(3^{10}-1)\) to \((3^{10}-1)\) can be made up, and that in one way only, with the parts 1, 3, 9, \ldots, \(3^n\) taken positively or negatively.

See further COMBINATORIAL ANALYSIS. (A. C.)

NUMENIUS, a Greek philosopher, of Apamea in Syria, Neo-
Pythagorean and forerunner of the Neo-Platonists, flourished
during the latter half of the 2nd century A.D. He seems to have
taken Pythagoras as his highest authority, while at the same
time he chiefly follows Plato. He calls the latter an “Articulating
Moses.” His chief divergence from Plato is the distinction
between the “first god” and the “deimurge.” This is probably
due to the influence of the Valentinian Gnostics and the Jewish-
Alexandrian philosophers (especially Philo and his theory of the
Logos). According to Proclus (Comment. in Timaeum, 93)
Numenius held that there was a kind of trinity of gods, the
members of which he designated as 

\[ \text{Kyovos, } \text{Aqmd, } \text{Thdinga} \]

(irairiros, fingers) of Platonists Graecae (ed. Ritter, Hist. Phil. Graece (ed. E. Wellman, 1898), § 624-7; T. Whittaker, The Neo-
Platonists (1901).

NUMERAL (from Lat. numerus, a number), a figure used to
represent a number. The use of visible signs to represent
numbers and aid reckoning is not only older than writing, but
older than the development of numerical language on the denary
system; we count by tens because our ancestors counted on the
classes of society. In the latter times of antiquity the finger
symbols were developed into a system capable of expressing
all numbers below 10,000. The left hand was held up flat with the
fingers together. The units from 1 to 9 were expressed by various positions of the third, fourth, and fifth
fingers alone, one or more of these being either closed on the palm or simply bent at the middle joint, according to the number meant. The thumb and index were thus left free to express the
tens by a variety of relative positions, e.g. for 30 their positions
were brought together and stretched forward; for 50 the thumb
was bent like the Greek ι and brought against the ball of the
index. The same set of signs if executed with the thumb and
index of the right hand meant hundreds instead of tens, and
the unit signs if performed on the right hand meant thousands.1

The fingers serve to express numbers, but to make a
permanent note of numbers some kind of mark or tally is needed.
A single stroke is the obvious representation of unity; higher
numbers are indicated by groups of strokes. But when the
strokes become many they are confusing, and so a new sign

must be introduced, perhaps for 5, at any rate for 10, 100, 1000,
and so forth. Intermediate numbers are expressed by the
addition of symbols, as in the Roman system ccxxxvi = 236.
This simplest way of writing numbers is well seen in the Baby-

donian inscriptions, where all numbers from 1 to 90 are got by
repetition of the vertical arrowhead ꞌ and a barbed sign ꞌ ꞌ 10. But the most interesting case is the Egyptian, because
from its hieratic form sprang the Phoenician numerals, and from
them in turn those of Palmyra and the Syrians, as illustrated in

TABLE I. displaced the Heronian numbers, was to make the first nine
letters stand for the units and the rest for the tens and hundreds.

1 The system is described by Nicolus Rhaba of Smyrna (8th
century A.D.), ap. N. Causinus, De eloquentia sacra et humana
(Paris, 1636). The Venerable Bede gives essentially the same system,
and it long survived in the East; see especially Rödiger, “Über die
im Orient gebräuchliche Fingersprache, &c,” D.M.G. (1845), and
With the old Semitic alphabet of 22 letters this system broke down at $n = 400$, and the higher hundreds had to be got by juxtaposition; but when the Hebrew square character got the distinct final forms י, י, י', י' these served for the hundreds from 500 to 900. The Greeks with their larger alphabet required but three supplemental signs, which they got by keeping for this purpose two old Phoenician letters which were not used in writing ($F$ or $S = 1 = 6$, and $V = 22 = 90$), and by adding simplices for 900.1

Among the Greeks the first certain use of this system seems to be on coins of Ptolemy II. The first trace of it on Semitic ground is on Jewish coins of the Hasmonaeans. It is the foundation of gematria as we find it in Jewish book and in the apocalyptic number of the beast ($\text{aO} = 666$). But we do not know how old gematria is; the name is borrowed from the Greek.

The most familiar case of the use of letters as numerals is the Roman system. Here C is the original of centum and M of millie; but instead of these signs we find older forms, consisting of a circle divided vertically for 1000 and horizontally, for 100. We have, or in the cognate Etruscan system divided into quadrants, $\theta$, for 100. From the sign for 1000, still sometimes roughly shown in print as $\text{C}$, comes $\text{D}$, the half of the symbol for half the number; and the older forms of $\text{L}$, viz. 1, or 1, suggest that this also was once half of the hundred symbol. So V (Etruscan $\lambda$) is half of $\text{X}$, which itself is not a true Roman letter. The system, therefore, is hardly alphabetic in origin, though the idea has been thrown out that the signs for 10, 50, and 100 were originally the Greek $\text{X}$, $\psi$, $\phi$, which were not used in writing Latin.2

When high numbers had to be expressed systems such as we have described became very cumbersome, and in alphabetic systems it became inevitable to introduce a principle of periodicity by which, for example, the signs for 1, 2, 3, &c., might be used with a difference to express the same number of thousands. Language itself suggested this principle, and so we find in Hebrew $\text{r}$ or in Greek $\lambda = 1000$. So further $\beta M$, $\beta M$, or simply $\beta = 20,000$ (2 myriads). If now the larger were always written to the left of the smaller elements of a number the diacritical mark could be dispensed with in such a case as $\beta \phi \alpha \lambda$ (instead of $\beta \phi \alpha \lambda \lambda$), for here it was plain that $\beta = 2000$, not 2, since otherwise it would not have preceded $\phi \alpha \lambda$. We have, therefore, to the left of the higher terms of value 10, a third important notation, that the value of a symbol may be periodic and defined by its position. The same idea had appeared much earlier among the Babylonians, who reckoned by powers of 60, calling 60 a ongsTo and 60 sixties a $\text{r}$. On the tablets of Senkerah a list of squares and cubes is given on this principle, and here the square of 59 is written $58^3$—that is $58 \times 60 + 1$; and the cube of 30 is $7^3$—that is, 7 sharing 30 some $7 \times 60 + 30 \times 60$. Here again we have value by position; but, as there is no zero, it is left to the judgment of the reader to know which power of 60 is meant in each case. The sexagesimal system, long specially associated with astronomy, has left a trace in our division of the hour and of the circle, but as language goes by powers of 10 it is practically very inconvenient for most purposes of reckoning. The Greek mathematicians used a sort of decimal system; thus Archimedes was able to solve his problem of stating a number greater than that of the grains of sand which would fill the sphere of the fixed stars by dividing numbers into octaves, the unit of the second octave being 10° and of the third 10². So too Apollonius of Perga teaches multiplication by regarding 7 as the product of 70, 700, and so forth. One must then find successively the product of the several pythms of the multiplier and the multiplicand, noticing in each case what are tens, what hundreds, and so on, and adding the results. The want of a sign for zero made it impossible mechanically to distinguish the tens, hundreds, &c., as we now do.3

1 The Arabs, who quite changed the order of the alphabet and extended it to twenty-eight letters, kept the original values of the old letters for the hundreds; while the hundreds, from 100 to 1000 were expressed by the new letters in order โ, 2, 3. In the time of Caliph Walid (A.D. 705-715) the Arabs had as yet no signs of numeration.

2 See further Fabretti, Palaographische Studien.

3 Very early, however, a mechanical contrivance, the abacus, had been introduced for keeping numbers of different denominations apart. This was a table with compartments or columns for counters, each column representing a different value to be given to a counter placed on it. This might be used either for concrete arithmetic—say with columns for pence, shillings and pounds; or for abstract reckoning—say with the Babylonian sexagesimal system. An old Greek abacus found at Salamis has columns which, taken from right to left, give a counter the value of 1, 10, 100, 1000 drachms, and finally 1 talent (6000 drachms) respectively. An abacus on the decimal system might be ruled on paper or on a board strewed with fine sand, and was then a first step to the decimal system. Two important steps, however, were still lacking: the first was to use instead of counters distinctive marks (ciphers) for the digits from one to nine; the second and more important was to get a sign for zero, so that the columns might be dispensed with, and the denomination of each cipher seen at once by counting the number of digits following it. These two steps taken, we have at once the modern so-called Arabic numerals and the possibility of modern arithmetic; but the invention of the ciphers and zero came but slowly, and the history is a most obscure problem.

What is quite certain is that our present decimal system, in its complete form, with the zero which enables us to do without the ruled columns of the abacus, is of Indian origin. From the Indians it passed to the Arabsians, probably along with the astronomical tables brought to Bagdad by an Indian ambassador in 775 A.D. At all events the system was explained in Arabic in the early part of the 9th century by the famous Abū Ja'far Mohammed b. Musa al-Khwārizmī (Hovarazmi), and from that time continued to spread, though at first slowly, through the Arabian world.

In Europe the complete system with the zero was derived from the Arabs in the 13th century, and the arithmetic based on this system was known by the name of algorithm, algorithm, algorithm. This barbarous word is nothing more than a transcription of Al-Khwārizmī, as was conjectured by Reinaud, and has become plain since the publication of a unique Cambridge MS. containing a Latin translation—perhaps by Adelhard of Bath—of the lost arithmetical treatise of the Arabian mathematician. The arithmetical methods of Khwārizmī were simplified by later Eastern writers, and these simpler methods were introduced to Europe by Leonardo of Pisa in the West and Maximus Planudes in the East. The term zero appears to come from the Arabic شر through the form zephyro used by Leonardo.

Thus far modern inquirers are agreed. The disputed points are—(1) the origin and age of the Indian system, and (2) whether or not a less developed Indian system, without the zero but with the nine other ciphers used on an abacus, entered Europe before the rise of Islam, and prepared the way for a complete decimal notation.

1 The use of numerals in India can be followed back to the Nānāghat inscriptions, supposed to date from the early part of the 3rd century B.C. These are signs for units, tens and hundreds, as published by Boncompagni in Trattati d'aritmetica (Rome, 1857).
3 The well-known Burnett's Sepher Yezirah (1874).
4 Of the 10th century. (From Burnett, op. cit.)
5 Of the 10th century; from a MS. written at Shirāz. (From Woepcke, Mémoire sur la proposition des chiffres indiens.)
6 From a MS. at Paris. (From Woepcke, op. cit.)
7 Erlang (Alteldorf) MS. (From Woepcke, op. cit.)
in the other old systems we have dealt with. Like the Indian alphabet, they are all derived directly, but, as a rule, the letters of which the alphabet, their origin is obscure. The forms of the later Indian numerals for the nine digits appear to be clearly derived from the earlier system. In Table II. the two first lines give forms extracted from the above-mentioned edition of the Arabic numerals, and the third line, the translation of the Devanāgarī in the third line was used with a zero and position value. The "cave" numerals were employed during the first centuries of the Christian era. The "cave" forms are shown in the second column of the Arabic numerals. The first seven forms of the Arabic system is of A.D. 738, while the old system is found in use as late as the early part of the 7th century (Bayley). On the other hand, there is some evidence that a system of value by position was used on a prototype, or rather, in the first centuries. These writers, however, do not use ciphers, but symbolical words and letters, so that it is not quite clear whether they refer to a system which had a zero, or to a system worked on an abacus, which was afterwards supplanted by a new system. The "cave" numerals, as yet for the use of any system of position in India before the 6th century, and nothing beyond conjecture can be offered as to its origin.

2. In Europe, before the introduction of the algorithm or full Indo-Arabic system with the zero, we find a transition system in which calculations were made on the decimal system with an abacus, but instead of unit counters there were placed in the column ciphers, with values from one to nine, and of forms that are at bottom the Indian forms and agree most nearly with the numerals used by the Arabs of Africa and Spain. For among the Arabs themselves there were various systems of writing the Indian numerals, in particular an eastern and a western type. The latter is called ghōbar (dust), a name which seems to connect it with the use of a sand abacus. The use of the Indian numerals with ciphers is known in Alexandria, William of Malmesbury, who stole it from an Arab in Spain, is generally given up as fabulous. On the other hand, no evidence is offered for an earlier use of the abacus with ciphers, excepting a passage describing the system in the Geometria ascribed to Boëtius. If this book is genuine the Indian numerals were known in Europe, and applied to the abacus in the 5th century, and Boëtius only revised the long-forgotten system. On this view we have to explain how Boëtius got the ciphers. The Geometria ascribes the system to the "Pythagoreians" — i.e., the Neo-Pythagoreans — and it has been thought possible that the Indian forms for the numerals reached Alexandria, along with the cruder form of value by position, in the use of the abacus without a zero, before direct communication between Europe and India ceased, which it did about the 4th century A.D. It is then further conjectured by Woepcke that the ghōbar numerals of the western Arabs were by them borrowed from the system of Boëtius before the full Indian method with the zero reached them; and thus the resemblance between these forms and the Indian forms is explained. If one MSS. of the 11th century, essentially, in other MSS. of the 11th century, would be explained. This view, however, presents great difficulties, of which the total disappearance of all trace of the system between Boëtius and Boëtius is only one. We may say that the Indian system, such an abacus system, of which they had value by position so early a date as is required, and the ghōbar numerals are too similar to those of the eastern Arabs to make it very likely that the transition from these to the present system happened within those centuries. The genuineness of the Geometria is maintained by Moritz Cantor, but it has been attacked on other grounds than that of the passage about the abacus; and on the whole it is still an open question whether the abacus with ciphers is not the outcome of an early imperfect knowledge of the Arabic system, Gerbert or some other having got the signs and a general idea of value by position without having an explanation of the zero.

See M. Cantor, Geschichte der Mathematik, vol. i. (Leipzig, 1880); also M. Chasles, papers in the Comptes rendus (1843); G. Friedlein, Die Zahlzeichen und das elementare Rechnen der Griechen und Römer, Bc. 1-12 (Leipzig, 1843) (contains a French translation); and Sir E. C. Baylay, The Pythagorean Number System (London, 1883). O. Weissenborn was a student of his arithmetic and geometry (Leipzig, 1867), and Weissenborn in Zeitsch. Math. Phys. xxiv. Other references to the copious literature will be found in Cantor and Friedlein, who also discuss the subject of the notation for fractions, which cannot be entered on here.

For systems passed over here, see Pihan, Exposé des signes de numéra- tion utilisés chez les peuples orientaux (Paris, 1860).

(W. R. S.)

NUMERIANUS, MARCUS AURELIUS, son of the Roman emperor Carus. On the death of his father, whom he accompanied on his expedition against the Persians, he was proclaimed emperor (December, A.D. 283). He resolved to abandon the campaign, and died mysteriously on his way back to Europe, eight months afterwards. Arrius Aper, praefect of the praetorian guards, his father-in-law, who was suspected of having murdered him, was slain by DIOCLETIAN, whom the soldiers had already proclaimed his successor. Numerianus is represented as having been a man of considerable literary attainments, and of marked ability. He was the whole western portion of the Roman empire, known as the Renia, divided into two great tribes, —the Massylli on the east, and the Massacesylli on the west— the limit between the two being the river Ampsaga, which enters the sea to the west of the promontory called Tretum, now known as the Seven Capes. At the time of the second Punic War the eastern tribe was governed by Massinissa, who took the side of the Romans in the contest, while Syphax his rival, king of the Massacesylli, supported the Carthaginians. At the end of the war the victorious Romans confiscated the dominions of Syphax, and gave them to Massinissa, whose dominions extended from the meeting of the sea boundary of the Carthaginian territory, and also south and east as far as the Cyrenaica (Appian, Punica, 106), so that the Numidian kingdom entirely surrounded Carthage except towards the sea. Massinissa, who reached a great age, retained the whole of these dominions till his death in 148 B.C. and was succeeded in them by his son Micipsa, who died in 118. For the war with Rome which followed the death of Micipsa see JUGURTHA.

After the death of Jugurtha as a captive at Rome in 106, the western part of his dominions was added to those of Bocchus, while the Magian kingdom of Mauretania (the territory towards Cyrene) continued to be governed by native princes until the civil war between Caesar and Pompey, in which Juba I., then king of Numidia, who had espoused the cause of the Pompeians, was defeated by Caesar, and put an end to his own life (46 B.C.). Numidia, in the more restricted sense which it had now acquired, became for a short time a Roman province under the title of Africa Nova, but in the settlement of affairs after the battle of Actium it was restored to Juba II. (son of Juba I.), who had acquired the favour of Augustus. Soon afterwards, in 25 B.C., Juba was transferred to the throne of his father's kingdom. However, while retaining his dominion over the civil administration, and practically separating Numidia or Africa Nova from Africa Vetus, though the two were still united in name (Tac. Hist. 4. 48). Under Septimius Severus (A.D. 193-211) Numidia was separated from Africa Vetus, and governed by an imperial procurator (procurator per Numidiam); finally, under the new organization of the empire by Diocletian, Numidia became one of the seven provinces of the diocese of Africa, being known as Numidia Cirtensis, and after Constantine as N. Constanti- na, corresponding closely in extent to the modern French province of Constantine. During all this period it retained a high degree of civilization, and was swarmed with numerous towns, the importance of which is attested by inscriptions (see vol. viii. of the Corpus inscriptionum), and by the massive remains of public buildings. The invasion of the Vandals in A.D. 428 reduced it to a condition of gradual decay; and the invasion
the Arabs in the 8th century again brought desolation on the land, which was aggravated by continual misgovernment till the conquest of Algeria by the French in 1833.

The chief towns of Numidia under the Romans were: in the north, Cirta, the capital, which still retains the name Constantine given it by Constantine; Rustica on the coast, serving as its port, on the site now occupied by Philippeville; and east of it Hippo Regius, well known as the site of St Augustine, near the modern Bona. To the south in the interior were Thysdrus (Tebessa) and Lambesis (Lambessa) with extensive and striking Roman remains, connected by military roads with Cirta and Hippo respectively. Lambesius was the seat of the legion III, Augusta, and the most important strategic centre, as commanding the passes of the Mons Aurusius, a mountain block which separated Numidia from the Gaetulian tribes of the desert, and which was gradually occupied in its whole extent by the Romans under the Empire. Including these towns there were altogether twenty which are known to have received at one time or another the title and status of Roman colonies; and in the 5th century the Notitia enumerates no less than 123 sees whose bishops assembled at Carthage in 479.

For bibliography and account of Roman remains, see under AFRICA, ROMAN.

NUMISMATICS (Lat. numisma, nomisma, a coin; from the Greek, derived from ὄψις, to use according to law), the science treating of coins (Low Lat. cuneus, a die) and medals (Low Lat. medalla, a medal).

The earliest known coins were issued by the Greeks in the 7th century before the Christian era. By the 4th century the whole civilized world used money (q.v.), each state generally having its proper coinage. This has continued to be the case to the present time; so that now there are few nations without a metal currency of their own, and of these but a small proportion are wholly unacquainted with the use of coins.

Coins, although they confirm history, rarely correct it, and never very greatly. The earliest belong to a time and to nations so remote and so barbarous that our present ignorance, and the very fact they do not afford us that precise information which would fill in any important details of the meagre sketch of contemporary history.

We gain from them scarcely any direct historical information, except that certain cities or princes issued money. When in later times the devices and inscriptions of the coins give more detailed information, history is fuller and clearer, so that the numismatic evidence is rarely more than corroborative. There are, indeed, some remarkable exceptions to this rule, as in the case of the Bactrian and Indian coins, which have supplied the outlines of a portion of history which was otherwise almost wholly lost. The value of the corroborative evidence afforded by coins must not, however, be overlooked. It chiefly relates to chronology, although it also adds to our knowledge of the pedigrees of royal houses. But perhaps the most interesting manner in which coins and medals illustrate history is in their bearing contemporary, or nearly contemporary, portraits of the most famous kings and captains, from the time of the first successors of Alexander the Great to the present age, whereas pictures do not afford portraits in any number before the latter part of the middle ages; and works of sculpture, although occupying in this respect the same place as coins in the last-mentioned period and under the Roman empire, are neither so numerous nor so authentic. There is no more delightful companion in historical reading than a cabinet of coins and medals.

The strength and energy of Alexander, the ferocity of Mitradates, the philosophic calmness of Antinous, the obstinate ferocity of Nero, and the brutality of Caracalla are as plain on the coins as in the pages of history. The numismatic portraits of the time following the founding of Constantinople have less individuality; but after the revival of art they recovered that quality, and in the coins and medals of our own time there is a marvellous degree of individuality. There are very different styles from those of antiquity. From this last class we can form a series of portraits more complete and not less interesting than that of the ancient period.

While coins and medals thus illustrate the events of history, they have an equally direct bearing on the belief of the nations by which they were issued; and in this reference lies no small part of their value in connexion with history. The mythology of the Greeks, not having been fixed in sacred writings, nor regulated by a dominant priesthood, but having grown out of the different beliefs of various tribes and isolated settlements, and having been allowed to form itself comparatively without check, can scarcely be learned from ancient books. Their writers give us but a partial or special view of it, and modern scholars, in their attempts to throw light on its origin, often but increased the confusion. The Greek coins, whether of kings or cities, until the death of Alexander, do not, with a few negligible exceptions, represent the human form. Afterwards, on the regal coins, the king’s head usually occupies the obverse and a subject, usually sacred, is placed on the reverse. The coins of Greek cities under the empire have usually an imperial portrait and a reverse type usually mythological. The whole class thus affords us invaluable evidence for the reconstruction of Greek mythology. We have nowhere else so complete a series of the different types under which the divinities were represented. There are in modern galleries very few statues of Greek divinities, including such as were intended for architectural decoration, which are in good style, fairly preserved, and untouched by modern restorers. If to these we add reliefs of the same class, and the best Graeco-Roman copies, we can scarcely form a complete series of the various representations of these divinities. The coins, however, supply us with the series we desire, and we may select types which are not merely of good work, but of the finest. The mythology of ancient Italy, as distinct from that of the Greek countries of Italy, is not so fully illustrated by the coins of the country, because these are for the most part of Greek design. There are, however, some remarkable exceptions, especially in the money of the Roman commonwealth, the greater number of the types of which are of a local character, including many that refer to the myths and traditions of the earliest days of the city. The coins of the empire are especially important, as bearing representations of those personifications of an allegorical character to which the influence of philosophy gave great prominence in Roman mythology.

Coins are scarcely less valuable in relation to geography than to history. The position of towns on the sea or on rivers, the race of their inhabitants, and many similar particulars are positively fixed on numismatic evidence. The information that coins convey as to the details of the history of towns and countries has a necessary connexion with geography, as has also their illustration of local forms of worship.

The representations of natural productions on ancient money are of special importance, and afford assistance in the investigation of the subject. This is particularly the case with the Greek coins, on which these objects are frequently portrayed with great fidelity. We must recollect, however, that the nomenclature of the ancients was vague, and frequently comprised very different objects under one appellation, and that therefore we may find very different representations corresponding to the same name. The art of sculpture, of which coin-engraving is the offspring, receives the greatest illustration from numismatics. Not only is the memory of lost statues preserved to us in the designs of ancient coins, but those of Greece afford admirable examples of that skill by which her sculptors attained their great renown. The excellence of the designs of very many Greek coins struck during the period of the best art is indeed so great that, were it not for their smallness, they would form the finest series of art-studies in the world. The Roman coins, though at no time to be compared to the purest Greek, yet represent not unworthily the Graeco-Roman art of the empire. From the accession of Augustus to the death of Commodus they are often fully equal to the best Graeco-Roman statues. This may be illustrated, for instance, of the dupondius struck in honour of Tiberius and by the younger Drusus, of the sestertii of Agrippina, and of the Flavian emperors, and of the gold coins of Antoninus Pius and the two Faustinas, all which present portraits of remarkable beauty and excellence. The Italian medals of the Renaissance are scarcely less useful as records of the progress and characteristics of art, and, placed by the side of the Greek and Roman coins, complete the most remarkable comparative series of monuments illustrating the history of the great schools of art.
NUMISMATICS

That can be brought together. Ancient coins throw some light upon the architecture as well as upon the sculpture of the nations by which they were struck. Under the empire, the Roman coins issued at the city very frequently bear representations of important edifices. The Greek imperial coins struck in the provinces present similar types, representing the most famous temples and other structures of the cities, of the form of some of which we should otherwise have been wholly ignorant. The art of gem-engraving among the ancients is perhaps most nearly connected with their coinage. The subjects of coins and gems are so similar and so similarly treated that the authenticity of gems, that most difficult of archaeological questions, receives the greatest aid from the study of coins.

After what has been said it is not necessary to do more than mention how greatly the study of coins tends to illustrate the contemporary literature of the nations which issued them. Not only the historians, but the philosophers and the poets, are constantly illustrated by the currency of times. This was perceived at the revival of letters; and during the 17th and 18th centuries coins were very frequently engraved in the larger editions of the classics.

The science of numismatics is of comparatively recent origin. The ancients do not seem to have formed collections, although they appear to have occasionally preserved individual specimens for their beauty. Petrarach has the credit of being the first collector of any note; but it is probable that in his time ancient coins were already attracting no less attention. The study of the history of the coins has since been by degrees more and more recognised, and at present no branch of the pursuit is left wholly unexplored.

Besides its bearing upon the history, the religion, the manners, and the arts of the nations which have used money, the science of numismatics has a special modern use in relation to art. Displaying the various styles of art prevalent in different ages, coins supply us with abundant means for promoting the advancement of art among ourselves. If the study of many schools be at all times of advantage, it is especially so in the modern period. The study of the coins will, we trust, prove an important part of the study of the history of art.

The least value is to point out the want of artistry in the introduction to these metals and to the modifications of them created by the presence of varying amounts of alloy, certain other compounds were frequently used, notably electrum, billon, brass and potin.

1. A coin is a piece of metal of a fixed weight, stamped by authority of government, and employed as a circulating medium.
2. A medal is a piece, having no place in the currency, struck to commemorate some event or person. Medals are frequently comprised with coins in descriptions that apply to both equally; thus, in the case of subsequent coins, by the term coins, coins and medals must generally be understood.
3. The coinage of a country is usually divided into the classes of gold, silver and bronze (copper), for which the abbreviations N., R., and A. are employed in catalogues. In addition to these metals and to the modifications of them created by the presence of varying amounts of alloy, certain other compounds were frequently used, notably electrum, billon, brass and potin.

LITERATURE

This definition excludes, on the one hand, paper currencies and none of the barbarous nations, such as China or India, for they are neither of metal nor of fixed weight, although either stamped or sanctioned by authority, and, on the other hand, modes of keeping metal in weight, like the so-called Celtic "ring-money," because it is not stamped, although perhaps sanctioned by authority. The latter has attracted much attention, but it is by no means made out that the rings were made with the primary intention of serving as money. But it is a very common usage, among savage or semi-savage nations, to make ornaments or the torques in ornaments (as a woman may even now wear her dowry as ornaments in the form of coins) and to use the ornaments (or cut-off portions of them, "shilling rings") as money or means of exchange. But these rings then were doubtless used in this manner, but they were no more money than were any other precious possessions which could be used in exchange. There is no good evidence for the use of the little Gaulish "coin" from the letters in the form of coins on the border of the definition are such prehistoric "dumps" of metal as have been found at Enkomi in Cyprus and at Chnosseus in Crete; one of these indeed seems to bear traces of a mark of some kind.

4. Electrum (Ἑλεκτρόν, Ἑλεκτρος, λευκός χάρμος), a compound metallic substance, consisting of gold with a considerable alloy of silver. It is one of the principal so-called "white" or "current" coins. The material of early coins of Asia Minor struck in the cities of the western coast is the ancient electrum. The amount of silver varies very considerably with time and place. Gold largely alloyed has a greater denary value and is not struck by all nations. When such is the case, it should be termed pale gold, as in the case of some of the late Byzantine coins.

5. Billon, a term applied to the base metal of some Roman coins, and also to that of some medieval and modern coins. It contains about one-fifth silver to four-fifths copper. When the base silver coins are replaced by copper washed with silver the term billon becomes inappropriate.

6. Brass, a mixture of copper and zinc. It may be used as an equivalent to the orichalcum of the Romans, a fine kind of brass of which the shesterni and dupondii were struck, but it is commonly used to distinguish either the imitative coins or the complete coinage of a country.

7. Potin, an alloy of copper and tin (therefore a variety of bronze) used for some late Gaulish coins.

8. Various other metallic substances have been used in coinage, including iron (in Peloponnesus) and an alloy of copper and nickel employed for some Bactrian coins. The so-called "glass coins" of the Arabs are merely coin-weights.

9. The forms of coins have greatly varied in different countries and at different periods. The usual form in both ancient and modern times has been circular, and generally of no great thickness. The term "coin," however, is loosely used by numismatists, when the substance is fixed or stamped in a different shape, such as a trapezium, or a disc, or a square or oval, the greatest dimension being taken, or, when they are square or oval, the greatest distance in two directions.

10. The weight of a coin is of great importance, both in determining its intrinsic value and its resistance to forgeries. This weight is determined by the weight of the precious metal, and is stated in grains, and by the weight of the other metals, which are used by most numismatists except in England, where Troy weight is still in general use.

11. The specific gravity of a coin may be of use in determining the metal in its composition.

12. Whatever representations or characters are borne by a coin constitute its type. The subject of each side is also called a type, and, when there is not only a device but an inscription, the latter may be excluded from the term. This last is the general use. No distinct rule has been laid down as to what makes a difference of type, but it may be considered to be an essential difference, however slight.

14. A difference too small to constitute a new type makes a variety.

15. A coin is a duplicate of another when it agrees with it in all particulars but those of exact size and weight. Strictly speaking, ancient coins are rarely, if ever, duplicates, except when struck from the same pair of dies.

16. Cast coins are those whose designs are produced by dies impressed on the blank piece (or flan) of metal by some form of hammering or pressure; they are distinguished from cast coins made by running metal into a mould.

17. A coin of the two sides of which is called the obverse which bears the more important device. In early Greek coins it is the convex side, or the side impressed by the lower die; in Greek and Roman imperial it is the side bearing the head; in medieval and modern coinage it is the side bearing the king's name, or of the nation, or of the city; and in Oriental that on which the inscription begins. The other side is called the reverse.

18. The field of a coin is the space unoccupied by the principal devices or inscriptions. Any detached independent device or character is said to be in the field, except when it occupies the exergue.

19. The exergue is that part of the reverse of a coin which is below the main device, and distinctly separated from it; it often bears a secondary inscription. Thus, the well-known inscription "CONOB" occupies the exergue of the late Roman and early Byzantine gold coins.

20. The edge of a coin is the surface of its thickness.

21. By the inscription or inscriptions of a coin all the letters it bears are intended; an inscription is either principal or secondary.

22. In describing coins the terms right and left mean the right and left of the spectator, not the heraldic and military right and left, or those of the coin, and are therefore the representation of the head and neck; it is commonly used of such as show at least the collar-bone, other busts being called heads. A head properly means the representation of a head alone, without any part of the neck, but it is also commonly used

23. Hist. nat. xxiii. 23; cp. xxxvii. 11. Pliny distinguishes two types of "electrum," a "white" and a "yellow" or "brown" or "coppery" or "bronze" type. In Greek poetry the name seems to apply to both, but it is generally difficult to decide which is meant in any particular case. Sophocles, however, where he mentions Ἐρατός Εὐαλίτηρος . . . . . . τε καὶ τοιοῦχο τιμηθέντες (Ant. 1017-1039), can scarcely be doubted to refer to the metallic electrum.
NUMISMATICS

I. GREEK COINS

There are some matters relating to Greek coins in general which may be properly considered before they are described in geographical order. These are their general character, the chief denominations, with the different talents of which they were the divisions, their devices and inscriptions, their art, and the mode of striking.

The period during which Greek coins were issued was probably not much less than a thousand years, beginning about the beginning of the 7th century B.C. and generally ending at the death of Gallienus (A.D. 268). If classed with reference only to their form, fabric, and general appearance they are of three principal types—the archaic Greek, the ordinary Greek, and the Graeco-Roman. The coins of the first class are of silver, electrum and electrum-gold, usually in the shape of a lump of irregular round form, bearing on the obverse a device in the shape of an accompanying inscription, and on the reverse a square or oblong incuse stamp (quadratum incusum), usually divided in a rude manner. The coins of the second class are of gold, electrum, silver and bronze. They are much thinner than those of the preceding class, and usually have a convex obverse and a slightly concave or flat reverse. The obverse ordinarily bears a head in bold relief. The coins of the third class are, with very few exceptions, of bronze. They are flat and broad, but thin, and generally have on the obverse the portrait of a Roman emperor.

Many Greek cities, however, during the empire issued quasi-autonomous coins bearing the head of some deity or personification. Greek coins thus fall mainly into the classes of autonomous, quasi-autonomous and imperial. The coinage of Roman colonies in Greece as in other lands is usually distinguished by Latin inscriptions.

Since Greek coinage originated in Asia Minor, the coins were adjusted to the weight-systems there in use, and these go back to a Babylonian origin. But it is possible that some of the standard of Greece proper had a native origin. The unit of weight in the East was the shekel (sиглос). This was 10, 100 or 1000 shekels. The Babylonian 360 grains, or 10 minae, formed a Babylonian gold mule; the Babylonian 60 grains, or 10 minae, a Babylonian silver mule; the Babylonian 60 grains, or 10 minae, a Babylonian bronze mule. This scale the Greeks modified in that, starting from the siglos as unit, they invented a money-mina of 50 siglos, with a money-talent of 60 minae or 3000 siglos. The siglos-units (and corresponding standards) of gold, silver and bronze were the following (the relation between gold and silver at the time of the invention of these units seems to have been 133:1):

<table>
<thead>
<tr>
<th>Gold shekel</th>
<th>7-44 g = ( \frac{1}{2} \text{ of } 111-72 \text{ g of silver} ), which was equivalent to 84 g of gold.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Phoenician silver shekel</td>
<td>11-17 g = ( \frac{1}{2} \text{ of } 111-72 \text{ g of silver} ), which was equivalent to 84 g of gold.</td>
</tr>
</tbody>
</table>

Thus one gold shekel was the equivalent of 15 Phoenician or 10 Babylonian silver shekels. Side by side with this system was another in which the weights were exactly double of those just given; a shekel of the heavier system might be regarded as a double shekel of the lighter. Various Babylonian weights are extant, dating from the 3rd millenium B.C. onwards, which prove the existence of more systems. The gold shekel standard was almost invariably used for gold, sometimes also for electrum. The Babylonian and Phoenician standards were also sometimes used for gold or electrum as well as silver, which proved the existence of multiple standards in use among the Greeks of S. Italy. Other standards of more local importance were: the Campanian, used in a large part of S. Italy (didrachm originally of 7-41 g, afterwards reduced), and perhaps derived from...
The following table exhibits the weights in grammes of the principal denominations of the Greek systems:

<table>
<thead>
<tr>
<th>Denomination</th>
<th>Gold Shekel System</th>
<th>Babylonian or Persic</th>
<th>Phoenician</th>
<th>Aegetic or Attic</th>
</tr>
</thead>
<tbody>
<tr>

<td>0-93</td>
<td>0-62</td>
<td>1-12</td>
</tr>
</tbody>
</table>

The term stater is usually applied to the didrachm, but also to the tetradrachm, and at Cyrene to the drachm.

The bronze standards have been less fully discussed. Some notice of them will be given under different geographical heads.

In the table of Greek coins (using the term in its restricted sense) the first intention of the designers was to indicate the city or state by which the money was issued. The necessity for distinctive devices was most strongly felt in the earlier days of the art, when the obverse of a coin alone bore a design, and, if any inscription, only the first letter, or the first few letters, of the name of the people by whom it was issued. Whatever may have been the original significance of the type in itself, religious or otherwise, it was for the purpose of the city of each mint. But as the use of coinage spread, types were introduced in which the issuing authority was recognized. It was only with the increased complexity of the denominations in later times, when new distinguishing types had to be found, that—as in the 4th century B.C.—the religious motive in the choice of types came deliberately into play.

Greek coins, if arranged according to their types, fall into three classes: (1) civic coins, and regal without portraits of sovereigns; (2) regal coins bearing portraits; and (3) Graeco-Roman coins, whether with imperial heads or not. The coins of the first group have either a device or the reverse and the quadrans incusum on the reverse, or two devices; and these are often either independent of each other, though connected by being both local, or—and this is more common—that on the reverse forms a kind of complement of that on the obverse. It will be best first to describe the character of the principal kinds of types of the first class, and then to notice their relative antiquity. It must be noted that a head or bust is usually an obverse type, and a figure or group a reverse one, and that, when there is a head on both obverse and reverse, that on the former is usually larger than the other, and represents the portrait more accurately considered to be the most important of the two. We must constantly bear in mind that these types are local if we would understand their meaning.

In the following list the types of Greek coins of cities, and of kings, not having regal portraits, are classed in a systematic order, without reference to their relative antiquity.

1. Head or figure of a deity worshipped at the town, or by the people, which issued the coin, as the head of Athena or the coins of Athens, and the figure of Heracles on coins of Boeotian Thebes. Groups are rare until the period of Graeco-Roman coinage.

2. Natural or artificial objects—(a) animal, often sacred to a deity of the place, as the owl (Athens) and perhaps the tortoise (Aegina); (b) tree or plant, as the ephialium (Cyrene) and the olive-branch (Athens); (c) arms or implements of divinities, as the arms of Heracles (Erythrae), the tongs of Vulcan (Asculum). It is difficult to connect many objects comprehended in this class with local divinities. Some of them, as the tunny at Cyzicus, are doubtless only so connected because the chief industry of a place was placed under the tutelage of its chief divinity.

3. Head or figure of a local genius—(a) river-god, as the Gelas (Gela); (b) nymph of a lake, as Camarina (Camarina); (c) nymph of a fountain, as Arethusa (Syracuse).

4. Head or figure of a fabulous personage or half-human monster, as a Gorgon (Neapolis Macedoniae), the Minotaur (Crete).

5. Fabulous animal, as Pegassus (Corinth), a griffin (Panticapaeum), the Chimaera (Sicyon).

6. Head or figure of a hero or founder, as Ulysses (Ithaca), the Lesser Ajax (Locri Opuntii), Taras, founder of Tarentum (Tarentum).

7. Objects connected with heroes—animal connected with local hero, as the Calydonian boar or his jaw-bone (Aetolians).

8. Celebrated real or traditional sacred localities, as mountains on which divinities are seated, the labyrinth (Cnossus). Theophania.

9. Representations connected with the public religious festivals and contests, as a chariot victorious at the Olympic games (Syracuse).

The relation of the types of the obverse and reverse of a coin is a matter requiring careful consideration, since they frequently illustrate one another. As we have before observed, this relation is either that of two independent objects, which are connected only by their reference to the same place, or the one is a kind of complement of the other. Among coins illustrating the former class we may instance the beautiful silver didrachms of Camarina, having on the obverse the head of the river-god Hipparis and on the reverse the nymph of the lake carried over its waters by a swan, and those of Sicily, having on the obverse the Chimaera and on the reverse a dove. The latter class is capable of being separated into several divisions. When the head of a divinity occurs on the obverse of a coin, the reverse is occupied by an object or objects connected with the deity. The tetradrachms have on the one side the head of Athene and on the other an owl and an olive-branch; the tetradrachms of the Chalcidians in Macedonia have the head of Apollo and the lyre; and the copper coins of Erythrae have the head of Heracles and his weapons. The same is the case with subjects relating to the heroes: thus there are drachms of the Aeolian League which have on the obverse the head of Atlanta and on the reverse the Calydonian boar, or his jaw-bone and the spear-head with which he was killed. In the same manner the coins of Cnossus, with the Minotaur on the obverse, have on the reverse a plan of the Labyrinth. Besides the two principal devices there are often others of less importance, which, although always sacred, and sometimes symbols of local divinities, are generally indicative of the position of the town, or have some reference to the families of magistrates who used them as badges. Thus, for example, besides such representations as the olive-branch sacred to Athene on the Athenian tetradrachms, as a kind of second device dolphins are frequently seen on coins of maritime places; and almost every series exhibits many symbols which can only be the badges of the magistrates with whose names they occur. Regal coins of this class, except Alexander’s, usually have as types of a local character, owing to the small extent of most of the kingdoms, which were rather the territories of a city than considerable states at the period when these coins were issued.

The second great class—that of coins of kings bearing portraits—is necessarily separate from the first. Religious feeling affords the clue to the long exclusion of regal portraits—the feeling that it would be profane for a mortal to take portraits of the immortal. Were there any doubt of this, it would be removed by the character of the earliest Greek regal portrait, that of Alexander, which occurs on coins of Lysimachus. This is not the representation of a living personage, but of one who was not only dead but had received a kind of apotheosis, and who, having been already called the son of Zeus Ammon while living, had been treated as a divinity after his death. He is therefore portrayed as a young Zeus Ammon. Probably, however, Alexander would not have been able, even when dead, thus to usurp the place of a divinity upon the coins, had not the Greeks become accustomed to the Oriental “worship of the sovereign, which he did not discourage. This innovation rapidly produced a complete change; every king of the houses which were raised on the ruins of the Greek empire could place his portrait on the
Greek coins begin, at different periods, with the seizure by Rome of the territories of the Greek states. They are almost all bronze; and those in that metal are the most characteristic and important. In their types we see a farther departure from the religious intention of those of earlier times in the rare admission of representations, not only of eminent persons who had received some kind of apotheosis, such as great poets, but also of others who, although famous, were not, and in some cases probably could not have been, so honoured. We also observe on these coins many types of an allegorical character.

The following principal kinds of types may be specified, in addition to those of the two previous classes. (1) Head or figure of a famous personage who either had received a kind of apotheosis, as Homer ( Smyrna), or had not so honoured, as Herodotus (Halicarnassus) and Lais (Corinth). (2) Portrati representations, always of a sacred character, although occasionally bordering on caricature. We may instance, as of the latter sort, a very remarkable type representing Athene playing on the double pipe and seeing her distorted face reflected in the water, while Marsyas gazes at her from a rock—a subject illustrating the story of the pasturing of that hero (Apollodorus Paphygiæ). (3) Allegorical types, as Hope, &,c., on the coins of Alexandria of Egypt, and many other towns. These were of Greek origin, and owed their popularity to the sculpture executed by Greeks under the empire; but the feeling which rendered such subjects prominent was not that of true Greek art, and they are essentially characteristic of the New Attic school which attained its height at Rome under the early emperors.

There is a class of coins which is always considered as part of the Graeco-Roman, although in some respects distinct. This is the colonial series, struck in Roman colonies, and having also the following principal types. In the first place, there were towns in all parts of the empire, from Emerita in Spain (Merida) to Bostra in Arabia, in the midst of a Greek population and often of Greek origin, their coins help to complete the series of civic money, and, as we might expect, do not very markedly differ from the proper Greek imperial coins except in having Latin inscriptions and showing a preference for Roman types.

Greeks have now to speak of the meaning of the inscriptions of Greek coins. These are either principal or secondary; but the former are always intended when inscriptions are mentioned without qualification, since the secondary ones are non-essential. The inscription of civic money is almost always the name of the people by which it was issued, written in Attic plural, as ΑΘΕΙΝΑΙΩΝ on coins of the Athenians, ΣΥΡΑΚΟΣΙΩΝ on coins of the Syracusans, or the name of the city in the genitive singular, as ΑΡΡΑΓΑΝΤΟΣ at Agrigentum. The inscription of regular coin of the name, or name and title, of the sovereign, as ΑΘΕΙΝΑΙΩΝ, or ΒΑΣΙΛΕΩΣ ΑΘΕΙΝΑΙΩΝ, on coins of Alexander the Great. Instead of this genitive an adjective is sometimes found, as ΔΡΩΝΔιος on early Arcadian coins. A new name in Greek is formed from this one by the addition of an adjectival form implies a nominative understood, which has been generally supposed to be νυμα μα "money" or the name of some denomination.

There are a few instances in which a nominative of this kind is expressed on coins—ΔΡΟΝΔιος ΕΜΠ ΣΗΜΑ, "I am the badge of Phaeo (7) or Phanes" on an archaic Ionian coin; ΠΟΡΤΥΝΟΣ ΤΟ ΠΑΙΜΑ ΣΥΨΙΓ ΑΡΤΥΓΙΟΝ (silver money), or ΚΟΜΜΑ ("striking" or "struck piece"); and ΚΟΤΥΟΣ

Greek coins clearly indicate three great schools, each with its subordinate groups. The school of central Greece holds the first place, including the northern group centred in Thrace and Macedonia, and the southern in the Peloponnesus, with the outlying special schools of Crete and Cyrene.

The Ionian school has its northern group, Ionia, Myasia and Aeolis, and its southern, Rhodes and Caria. Beyond these are certain barbarous and semi-barbarous groups, of which the most important is that of eastern Asia Minor, Persia and Phoenicia, with Cyprus. The school of the West comprises the two groups of Italy and Sicily.

The whole duration of the schools is limited, by the refusal of the Persians and the accession of Alexander, from 480 to 323 B.C. Before that, all is unknown, and the assumption of certain characteristics. After it, the centralizing policy of the sovereigns and the fall of the free cities destroyed local art. In certain cultivated centres under enlightened kings a local art arose, but it speedily became general, and we have thus to think of a succession of styles.
during the rest of the life of Greek art. The century and a half of the local schools is significantly the great age of this art.

In the study of each school we have first to determine its character, and then to look in its successive phases for the influence of the great masters of style. Two dangers must be avoided. We must not too sharply divide the sculptors and the painters as if they always were true to the special functions of their arts. It is well to bear in mind that the earliest great painter, Polygnotus, was a portrait character, \( \kappa\alpha\nu\rho\iota\sigma\iota\gamma\alpha\nu\sigma\tau\alpha\upsilon\omega\sigma\varsigma \), as Aristotle calls him, when the latest great sculptors represented expression (\( \tau\alpha\pi\alpha\delta\gamma\). Thus since \( \tau\alpha\pi\alpha\delta\gamma \) is the special province of sculpture, and \( \tau\alpha\pi\alpha\delta\gamma \) of painting, sculpture first weighed down the balance, afterwards painting; but it must be remembered that reality can be truer to painting than sculpture in the round, which is more limited by the conditions of the material and mechanical necessities. Our second danger is due to the ease with which local qualities may be ascribed to the influence of a leading style. It is also to be borne in mind that the movement of art in coins was during centuries slower than in sculpture—indeed a less general and less particular. Phidias and Myron do not make their mark so much as Polyclitus. In all cases the direct influence of great masters is to be looked for later than their age.

The school of central Greece in its southern group, comprehending Attica, is remarkable for its widespread extent. It has its colonies in Magna Graecia at Thurium, an Athenian foundation, probably at Terina, and in Macedonia at Amphipolis and Chalcidice under Athenian rule. It alone shows instances comparable to the works of Phidias, though its next numerous fine works of the age of Polyclitus and that of Praxiteles and Scopas. Its qualities may be compared by the same subjects as treated by the other schools and groups. The earliest works are marked more than any others by the qualities of high promise which characterized the Aeginetan marbles—the same dignified self-restraint and calm simplicity. Next we perceive a series strong in style, and showing that lofty dignity, that reposing embodiment of character, which are the stamp of the works of Phidias and his contemporaries. The subjects are more remarkable for fidelity, breadth and boldness than for delicacy of execution or elaboration of form. Every subject is ideal, even the portrayal of animal form. Thus the character shows us what divinity is intended and the ideality what is intended by the representation of beast or bird. From these works we pass to those which reflect the style of the time of Praxiteles and Scopas, when the influence of painting began to be felt, and art inclined towards feeling and descended to sentiment. Still, to the last, character rules these coins, and the chief difference we see is in the increased love of beauty for its own sake and the fondness for representing movement, not to the exclusion of repose, but by its side. In other respects there is little change except in the finer execution and more ornamental quality of the work. Even when the greatest achievement of the Sicilian school, the female head on the decadrachms of Syracuse, is copied by the Locrians and the Messenians, the larger quality of the school of Greece asserts itself, and the copy is better than the original: there is less artifice and more breadth. The northern group is at first ruder, in the age of Pheidias severer, and afterwards it merges into the greater softness of its southern rival. If it copies, as Larissa may copy Syracuse and Neapolis in Campania, it again asserts its superior simplicity, and we prefer the copy to the original.

The Ionic school lacks the sequel, in which the rest of the Greek world affords. It is broken by the baneful influence of the Persian dominion, and consequently the best works belong to the earliest and latest part of the period. The earliest coins, of the Aeginetan age, present nothing special; the later, of the time of Praxiteles and Scopas, comprise works not inferior to those of central Greece, and remarkable, like the Western and the Cretan, as the sole records of a school otherwise unknown. They are markedly characterized by the qualities of the style of feeling, that of Praxiteles and Scopas; but more than this, they are the expression of that style in pictorial form.

They represent expression, and they treat it as it could not be treated in sculpture in the round, portraying locks streaming in the air and flowing draperies. It must be remembered that, while Hellas produced the great sculptors, western Asia Minor bred the great painters after Polygnotus, himself a sculptor in painting rather than a painter. In the native land of Zeuxis, Parrhasius and Apelles we see the evidence of the rule of painting. The technical skill is inferior to that of the West, yet the skill in modelling and drawing has no parallel in the medallic work of any other time or country.

The school of the West, if we except such outlying examples of the art of Hellas as those of Thurium and Terina, has its highest expression in Italy, its most characteristic in Sicily.

The West. It has distinctive qualities throughout the age. Even in the earlier period we trace a striving after beauty and a delicacy of finish, with a weakness of purpose, that mark the school with an influence increasing to a time long after the extinction of its rivals. At the same time there is a knowledge of the capacity of the materials and the form of the coin and its functions, and a sense of how to combine the technical skill which is unequalled. The result in the lower subjects is splendid, if wanting in variety, but in the higher we miss the noble achievements of the greater schools. So far there is a general agreement in the northern and southern groups. Yet the Italian shows a nobler and simpler style, with some affinity to that of central Greece, which we look for in vain in Sicily, though we are dazzled by the rich beauty of the magnificent series of coins which marks her wealthiest age. Sicilian art has this apparent advantage, that the great cities, save Syracuse, were in the Carthaginian invasion, or under the tyranny of the elder Dionysius. Thus we have no important works save of Syracuse during the second half of our period, and cannot judge fully to what this school would have fallen.

The key to this exceptional development of Greek art is found in the absence of sculptors or painters in the West, except only Pythagoras of Rhegium at the very beginning of the age, whose influence is thought to be traceable on the money of his native town. On the other hand, there can be no doubt that many of the Sicilian die-engravers, as Phrygillos (to mention one whose signature is actually found on an intaglio) were gem-engravers. The Western part is that of engravers accustomed to minute and technical work, uninfluenced by sculpture or painting. Their designs will not bear enlargement, which only enhances the charm of those of the other leading schools. Those of the great Syracusan decadrachms are small; those of the minute hectae of Cyzicus are large.

The most important of the lesser schools is the Cretan. Crete, retaining the primitive life of older Hellas, was never truly civilized, but to the last enjoyed the privileges and exhibited the faults of an undeveloped condition. Producing in the age of high art neither sculptor nor painter of renown, the Cretans, to judge from their coins, were copyists of nature or art. At first rude, their work acquires excellence in design, but never in execution. While we see their poor reproductions of the designs of the Peloponnesus, we are amazed by their skill in portraying nature. Their gods are seated in trees with a background of foliage. Their bulls are sketched as they wandered in the meadows. All fitness for the mode of relief, as well as for the material and the shape of the coin, is entirely ignored. Hence a delight in foreshortening, and a free choice of subject with no reference to the circle in which it must be figured. In point of strength of the skill, the Cretan money may have the three-quarter face, which is at once the best suited to the surface of a coin and the most trying to the skill of the artist. Yet their work is delightfully fresh, as if done in the open air. There is no idealism, but much life and movement. In a word, the school is naturalistic and picturesque. Its works are of the highest value in the study of Greek art, but as examples of the application of that art to coins they are to be used with caution. Nowhere else do we see the artist so freely copying nature and art, nowhere so unshackled by academic rules, nowhere so little aware of the limitation of his province.
It is important to study the mode in which Greek money was coined, because the forms of the pieces thus receive explanation, and true coins are discriminated from such modern falsifications as have been struck, and in some degree from those that have been cast. Our direct information on the subject is extremely scanty, but we are enabled by careful inference to obtain a very near approximation to the truth on all the most important points.

Of the deceased by the Greeks exceedingly few have been preserved. In the museum at Sofia is an iron die for the reverse of a coin of Philip II. of Macedon; and several Gaulish dies exist. Most ancient dies are of bronze, others of hardened iron or steel. The blanks were, as a rule, first cast, sometimes in a spherical form, sometimes in a form more resembling that assumed by the finished coin. The blank was placed between two dies, the lower, let into an anvil, probably the reverse, the other, let into the end of a bar, producing the reverse. The bar was struck with a hammer, so that the blank received at the same time the impressions of both dies. This general rule was of course often modified; in some parts of the Greek world the dies were hinged together, in others not; and this arrangement of hinging the dies came in at different times in different places. The machinery of striking was probably much elaborated under the Roman empire, but a collier seems never to have been used in ancient times. Greek dies must usually have worn out very quickly; hence an enormous number of slightly varying representations of the same type. But the idea that it is uncommon to find two Greek coins from the same sanctuary exactly represented, in number of its devices and Roman, and a few Greek coins, of large size, were cast in moulds, not struck; and under the empire many coins, originally struck, were reproduced, not always fraudulently, by casting; but the genuine ancient coin of small size is, as an almost invariable rule, struck and not cast.

We may now pass on to notice the Greek coinage of each country, following Eckhel's arrangement. The series begins with Spain, Gaul and Britain, constituting the only great class of barbarous Greek coinage. It must not be supposed that the money of the whole class is of one general character; on the contrary, it has very many divisions, distinguished by marked peculiarities; it has, however, a characteristic type or stamp of provincial coinage, and other foreign influences are sometimes present.

Greek Coinage of the Far West. Phoenician coins by the Carthaginian kings and cities of the Peninsula. The coinage of Hispania, corresponding to the modern Spain and Portugal, was issued during a period of about four centuries, closing in A.D. 41. There are four classes of money, which in the order of their relative antiquity, are Greek, of two groups, Carthaginian, Romano-Iberian and Latin. The first or older group of Greek money (from before c. 350 B.C.) belongs to the widespread currency, which reveals the maritime power of the Ionians of Phocaea. It consists of fractions of the drachm of the Phocean standard, from the diobol or third downwards. Its later pieces are of the Phocaean colony of Emporiae, founded by the earlier settlement of Massilia. Next in order and in part contemporary, beginning in the middle of the 3rd century B.C., are the Emporiates of Massilia, which influence the Siculo-Punic art. Their standard is probably Carthaginian. Of the neighbouring Rhoda, a Rhodian colony, there is similar money. Carthaginian coins of Spain begin in the same period with the issues of the great colony of Gades, following the same weights as the Emporinian drachms. These are followed by the issues of the Barcidas from 234 to 210 B.C., with Carthaginian types and of Phocian weight, struck of six denominations, from the hexadrachm to the hemidrachm.

Señor Zobel de Zangróniz has classed them to Spain, on the grounds of provenance and the possession of the silver mines by the Barcid kings, against Müller, who attributes them to Africa. The types are Carthaginian, and present some interesting subjects. The true Iberian coinage begins not long after the Punic. The later drachms of Emporiae, showing the weight of the contemporary Roman denarius, have Iberian legends, and form the centre of a group of imitations issued by neighbouring native tribes with their distinctive inscriptions. This coinage ceased when the Roman province was formed in 206 B.C., a little before this date the Romans had begun to introduce Latin money; about this time, however, they took the backward step of permitting native coinages of Latin weight. Probably they found that native legends and types were more welcome to their subjects than those of Rome. Consequently this coinage of Spain under the republic, which lasted until 133 B.C., may be almost considered national. The two provinces Hispania Citerior and Hispania Ulterior have this marked difference: the coins of the nearer province, of silver and bronze, have always Iberian inscriptions on the reverse, and are under direct Roman jurisdiction; those of the farther are apparently of independent origin, and consequently bear Iberian, Phoenician, Libyo-Phoenician and Latin legends, but they are of bronze alone. The interest of these coins lies mainly in their historical and geographical information. They bear the names of tribes, often the same as those of the town of mintage. The art is poor, and lacks the quaint originality and decorative quality of that of Gaul. Ultimately the native money was wholly latinized (133 B.C.), silver was no longer issued, and although the Ulterior continued to have its own coinage, in the Citerior only Emporines and Saguntum were allowed to strike money. Political circumstances for a time renewed the coinage under Sertorius (80-72 B.C.) in the modified form of a bilingual currency. The purely Latin issues of the two provinces, and under the empire more largely (from 27 B.C.) of the three, Tarracoenses, Bactra and Lusitania, present little of interest. They closed in the reign of Caligula (A.D. 37-41), though in later times purely Roman money in gold and silver was issued at different times in Hispania down to the establishment of the Visigothic kingdom.

The imperial money of Hispania introduces us to one of the two great classes of provincial coins under the empire; the larger of these was the Greek imperial, bearing Greek inscriptions; the smaller the Roman colonial, with Latin inscriptions, deriving its name from the circumstance that among Greek-speaking nations the coloniae were distinguished by the use of the Latin language on their money. In the coinage of Hispania, issued by a nation adopting Latin for official use, the aspect of the coinage is colonial, though it was not wholly issued by colonies. Many of the Spanish towns belong to the kindred class of municipia; others are neither coloniae nor municipia. In Hispania the obverse of the coin bears, as usual in the colonial class, the head of the emperor or of some imperial personage, the reverse a subject proper to the town. The priest guiding a plough drawn by an ox and a cow is peculiarly proper to a colonia, as portraying the ceremony of describing the walls of the city, so also an ox, with the same reference, the altar of the imperial founder, or, as connected with his cultus, a temple, probably in some cases that of Roma and Augustus. Other types, however, portray the old temples in restored Roman shapes, or indicate directly by fishes, ears of corn and more rarely bunches of grapes, the products of the country. Some original and grotesque types have a markedly local character. The money of Augustus (Merida, Siscia, Lusitania, a colony of pensioners (emili), is specially interesting, including as it does the silver issues of P. Carius, the legatus of Augustus.

The coinage commonly called that of Gaul belongs to the people more properly than to the country, for it comprehends pieces issued by the Gauls or other barbarians from the borders of Macedonia and Illyricum to the English Channel and the Bay of Biscay, through Pannonia, part of Germany, Helvetia and Gaul. It influenced the money of northern Italy, and, crossing the Channel, produced that of
Britain, which has its own distinctive features. Four classes of coinage are found in these vast limits. Arranging them by date, they are the money of the Greek colony of Massilia and her dependencies, that of the Gauls and other barbarians of central and western Europe, that which can be classed to the tribes and chiefs of Gaul and the imperial coinage of that country. The coins of the Gauls and other barbarians outside Gallia include the gold coins known as "rainbow cups" (Regenbogenschüsselchen), which from their shape were of an oval or circular form but not unlike those of ancient Greece. They were in circulation in the Bohemian and Bavarian districts, and other gold and silver coins (the later series bearing names in Latin characters) which circulated in Noricum, Pannonia, Helvetia, Upper Germany, &c.

The great mart of Massilia (Marseilles), founded about 600 B.C. by the Phocaeans, was the centre of the Greek settlements of Gaul and northern Spain. Emporia was her colony, with other towns of inferior fame. Yet Massilia always held the first place, as is proved by the abundance of her mintage. At first it consisted of Phocaean obols, but subsequently widespread Western currency already noticed in speaking of Emporiae. These were succeeded by Attic drachms, some of which, about Philip of Macedon's time, are beautiful in style and execution. Their obverse type is the head of Artemis, crowned with olive, at one marking the sacred tree, which had grown from a branch carried by the colonists, so tradition said, with a statue of the goddess, from Ephesus, and proclaiming the value of the olive-groves of Massilia. On the reverse we note the Asiatic lion, common to it and the last colony of Phocaea, the Italic Vein in Lucania. These coins circulated extensively in southern Gaul, and were much imitated by the barbarians on both sides of the Alps.

The Gauls, on their predatory incursions into Greece, must have seized large quantities of the gold coinage circulating there, but it is probable that the gold staters of Philip (Pl. I. fig. 14), from which the chief types of the Gaulish gold are derived (Pl. I. fig. 1), had already found their way, independently of such raids, by means of trade along the Danube valley into the districts then inhabited by the Gauls. This is clear from the fact that the gold coins of Alexander were never, his silver rarely, imitated by the Gauls, yet these were in circulation at the time of the invasions. Nor did the influence of Philip's silver travel far west. But his gold money evidently travelled through central Europe to Gallia. The money of Gallia before the complete Roman conquest, to which it may be anterior in its commencement by half a century, belongs in the gold to degraded types of the earlier widespread currency. The undoubted gold and electrum of this imitative class, identified as bearing regal or geographical names, are extremely limited. By far the most interesting coin of the group is the gold piece which bears the name at length of the brave and unfortunate Vercingetorix. The silver money is comparatively common. The Gauls were ready to copy any types that came in their way, so that in the coinage of Gaul we find imitations of the coinage of Tarentum, Campania, various Spanish cities such as Rhoda, and Roman coins of the republic and early empire. The effect of the silver of Massilia and other Greek colonies is especially noticeable in S. Gaul, and the Roman denarius naturally exerted a strong influence. The bronze money of Gaul is still more abundant than the silver, and has a special interest from its characteristic types. Some of the later local coins are casts of an alloy of copper and tin called polit, but merely a variety of bronze. The Roman coins recall those of Hispania, but are limited to a few colonies. They range in date from Antony and Augustus to Claudius. The best-known of these, those struck at the colony of Copia Lugdunum (Lyons) with the "Altar of Roma and Augustus," belong, however, strictly speaking, to the Roman series. The coins of Nemausus (Nimes), commemorating the conquest of Egypt by the crocodile chained to a palm-tree, were sometimes made in the shape of the hind-leg of an animal, evidently for dedication in the sacred fountain, from the mud of which all the specimens of this variety are derived.

The ancient coinage of Britain is the child of that of Gaul, retaining the marks of its parentage, yet with characters of its own due to independent growth. Money first came in trade by the easiest sea-passage, and, once established in Kent, gradually spread north and west, until the age of the earlier Roman wars, when it was issued in Yorkshire, probably in Lincolnshire, and in a territory of which the northern limits are marked by the counties of Norfolk, Cambridge, Huntingdon, and the west of Rutland. The coins are of the rudest workmanship. The oldest coins are gold imitations of Philip's stater, which, whether struck in Gaul or Britain, had a circulation on the British side of the Channel. They are the prototypes of all later money. From a careful comparison of their weights with those of later coins, and from a study of the gradual degradation of the types, Evans places the origin of the coinage between 200 and 150 B.C. Its close may be placed about the middle of the 1st century A.D. The inscribed coins occupy the last century of this period, being contemporary with uninscribed ones. The uninscribed coins are of the silver, bronze, and gold, the gold being by far the least common. There is small variety in the types, nearly all in gold and silver, and some in copper, presenting in more or less degraded form the original Gaulish type for gold. It may be suspected that all new types and the extremely barbarous descendant of the tin series are of the age of the inscribed coins, but a little earlier. The Channel Islands are remarkable for a peculiar coinage of billon, a very base silver, presenting the usual types modified by Gaulish grotesqueness. The place of this group in the British series is merely accidental; in character as in geography it is Gaulish. The described coins are evidently in most cases, though it is certain that one town (Verulamium) and some tribes had the right of striking money. The most interesting coins are those of known chiefs and their families—of Commius, probably the active prince mentioned by Caesar, of Dubnoulanus, mentioned in the famous Anchra inscription, which has been called the will of Augustus, and most of all the large and interesting series of Cunobelinus, Shakespeare's Cymbeline (Pl. I. fig. 2), his brother Epaticcus, and his father Tasciovanus. It is evident from the coins and historical evidence collected by Evans that Tasciovanus had a long reign. His chief town, as we learn from his money, was Verulamium. His coins are in three metals, repeat the traditional types, and present new ones, some showing a distinctly Roman influence. The money of Epaticcus is scanty, but that of Cunobelinus, with Camulodunum (Colchester) for his chief town, is even more abundant than his father's, indicating a second long reign, and having the same general characteristics. The gold shows a modification of the traditional type, the silver and bronze the free action of Roman influence and a remarkable progress in art. With the death of this prince not long before A.D. 45 the bulk of the British coinage probably ceases, none being known of his sons, Admius, Todgundunus and the more famous Caractacus, but the coins of the Iceni may have continued as late as A.D. 50, and the Brigantes issued silver coins as late as the time of Cartimandua, whose name is partly preserved on one of them.

The ancient coins of Italy occupy the next place. They appear to have been struck during a period of more than 300 years, the oldest being probably of the beginning of the 6th century B.C. and the latest somewhat anterior to the time of Julius Caesar. The larger number, however, are of the age before the great extension of Roman power, which soon led to the use of Roman money almost throughout Italy. There are two great classes, which may be called the proper Italian and the Graeco-Italian; but many coins present peculiarities of both. The proper Italian coins are of gold, silver and bronze. Of these, the gold coins are extremely rare, and can never have been struck in any large numbers. The silver are comparatively common, but the bronze are very numerous and characteristic. A few of the earliest gold and silver coins of Etruria have a perfectly plain reverse. The most remarkable are those of the class are of the kind called aes grave, most of which were the early proper coinage of Rome, although others are known to have been
GREEK COINS.
GREEK AND ROMAN COINS.
issued by other Italian cities. These are very thick coins, some of which are of great size, while most have a rude appearance. They are always cast, and were preceded by formless lumps of bronze, known as as rude, which were not properly a state-

The designs of the Italian coins are generally, if not always, of Greek origin, although the influence of the native mythology may be sometimes traced. The inscriptions are in Latin, Etruscan, and often a native orthography; sometimes on the earlier coins they are retrograde. The art of this class is generally poor, or even barbarous. The denominations are common to Greek money, except in the case of the bronze, which follows a native system. Of this system the early proper Roman coinage is only a development, although it is possible (the coins of Gravina Lewis) that the half-Italian coins are of gold, silver and bronze. The silver and bronze are very common, and the gold comparatively so, although struck by few states or cities. A number of the cities of S. Italy issued in the 6th century coins with an incuse design on the reverse repeating with slight modifications the design of the obverse. The designs are of Greek origin, although here, as in the proper Italian coins, but less markedly, native influence can be detected. This influence is evident in the frequent occurrence of types symbolically representing rivers, showing a bias towards the old nautical life, with still the conclusion in scarabs with half-Italian forms of the letters on coins otherwise Greek. Of the best art of ancient Italian money we have already spoken, and we shall have occasion to mention some of its most beautiful examples. The denominations of the gold and silver coins are unquestionably derived from those of Greece, according to the weight of the Attic talent, the heaviest gold piece being the stater or 500th part of that talent; in silver there are few tetradrachms, the didrachm is extremely common, and smaller denominations are usually not rare. We thus learn that the silver currency was chiefly by smaller pieces being less used, and larger ones scarcely used at all. It is important here to notice that the interchange of the native or Italian bronze coinage with the Greek silver coinage led to a double standard, silver and bronze. The bronze standard, as it might be suspected, was of Italian origin, the silver of foreign introduction.

The peculiarity of the Italian bronze is that in its oldest cast form it was of such weight as to show the absence in some parts of the country of silver equivalents. It was long after silver had been introduced everywhere, with struck bronze. The equivalents therefore in form became (aes grave) went out of circulation. The silver money is at first remarkable for the evidence it affords of its extraneous character in presenting two standards. Afterwards it becomes equivalent to the bronze, or supplies equivalent pieces, and is quite regular. The original condition of the Italian currencies is best illustrated by the money of Etruria in the 4th and 3rd centuries B.C. Etruria, be it remembered, was an early goal of oriental commerce by sea. At the great mart of Populonia, and in the country round, we find, besides a few gold coins, not only silver coins of two different foreign standards, the Euboic and the so-called Persic, but also cast aes grave and later struck bronze pieces. Without discussing the origin of these various currencies it is enough to note that they bear witness to the effects of a widely-spread commerce, and show that here was the meeting-point of the native system and of foreign ones.

In Italy the aes grave long ruled. Originally it was libral, the principal coin being the as, nominally of the weight of the Italic pound of 273 grammes; this, at least, is the weight of the earliest Roman coinage. On the other hand, the aes grave of some places in E. Italy, as Hatria and Ariminium, were of the weight of didrachms, a reduction of the same order to Roman numismatics, and it is only necessary here to add that they affected the local bronze coinages as Italy fell under the rule of the Republic. The silver coinages, on the other hand, survived for a longer time throughout the Greek cities. Apart from the complicated silver coinage of Etruria, and from the Roman issues, we find in central Italy a few silver coins (the unit of 1-15 grammes being the equivalent, at the rate of 1-250, of a bronze as of 1-10 oz.) and a large silver coinage of didrachms and smaller denominations in lower Italy. This was chiefly issued by the wealthy marts which dotted the coasts of Campania, Calabria, Lucania and the Bruttii. We find Etruscan inscriptions on the coins of Etruria, and Etruscan objects in casts of many of them, especially in lower Italy, where they are eclipsed in number and style by the Greek issues. The chief silver standards of S. Italy are (i) the Campanian (with a didrachm of 7-41 grammes); (2) the Italic, with a statér of 8-16 grammes, divided into thirds; and (3) the Tarentine, with a statér of 8-32 grammes, divided into halves. The Tarentine statér was known as volutus. The independent coinage of Italy, with one exception, came to an end in 89 B.C.

Beginning in the north of Italy the first coins that struck were those of Populonia and Etruscan Athens. The best art of this place is generally of the peculiar fabric in which the reverse is left perfectly plain. The aes grave of upper and middle Italy was largely dominated by the issues of the Roman mints at Rome and Capua (to be treated later). Samnium shows us a curious revival of native silver money after the local coinage of the Italian towns had been almost abolished by Rome. It was the result of the Social or Marsic War of the confederate tribes, who struck for Italy against the Roman supremacy during the years between 90 and 88 B.C. The coins present the head of Italia, and reverse Latin-Celtic deities, and are widely-spread in Italy, though taking an oath over a sacrificial pig, and a bull for Italy goring the prostrate wolf of Rome. The inscriptions are Etruscan or Latin.

Certain of the Greek towns of Italy deserve special mention for the splendour of their coinage—beautiful in style and delicate in execution. In Campania (leaving the Roman-Campanian region, for later notice) the two most interesting currencies are of Cumae and Neapolis, the modern Naples. Cumae presents silver money of the archaic and the archaistic periods; that of Neapolis which, although being more rarely. Athenic; the reverse presents the man-headed bull common on Campanian money, and possibly meant for the river-god Acheilos, father of the Sirens. The bronze money is of good style, and age has beautified it with the rich blue or green patina due to the sulphurous soil. When we reach Calabria the Greek money startles us in astonishing wealth of beauty in the currency of the opulent and luxurious mart of Tarentum, second only to Syracuse in the whole West, of all the main periods of art, and including in the age of its present prosperity and its fall (the time of the contest with Rome) the most abundant gold issues of any Greek city. The gold money of Tarentum is divided into two principal series, the first, the Pentathelles, being the direct issue of its gem-like types, which, while they show the gem-engraver's art, prove the medallist's knowledge of the rich but opaque metallic material. Several heads of deities adorn these coins, and the chief types relate to the legendary founder, Tarsus, son of Poseidon. Always a youth, he appears as a charioteer, perhaps as a horseman, and riding on a dolphin—the familiar Tarentine type. The most interesting subject occupies the reverse, and by the name of Poseidon, probably in allusion to the Tarentines' appeal to Sparta for aid about 346 B.C. (Pl. 1, fig. 3). The silver coinage is chiefly of didrachms of reduced Corinthian weight. The prevalent type is Taras seated on a dolphin; in the earliest money the type is single, and repeated incuse on the reverse; afterwards this subject occupies the reverse, and, itself a charming composition, is delightfully varied. On the early fine coins the people or demos, personified generally as a youth, often holding a spindle, occupies the obverse, but gives place in the 4th century to a horseman in various attitudes, affording great scope to the engraver's skill; probably he is Taras himself, save when he is crowned with olive, or seated on a mountain, or again (as at the Ionic type) in the guise of the prophetess. The most striking characteristic of the Tarentine type is the contrast between the Nemean lion most skilfully treated, and the series is very characteristic of the gem-engraver's art. The powerful city of Metapontum begins with early archaic types and the inscription of the early Didrachms. The head of Athena and subjects related to Athena, with the inscription stretching down to the decline of art. The constant type, which recurs with the heraldic instinct of the West, is the ear of barley, reminding us of the "golden harvest" of the dedications. Like the Tarentine badge, it first occupies the obverse, then the reverse, balanced by a charming series of heads of divinities. Persephone is the most appropriate counterpart; we also remember the medallist's curious and ingenuous grace peculiar to the early fine work of the Western school, of Leucippus the founder as a helmeted warrior (occurring on a rare tetradrachm and the usual didrachm), and many other types of unusual variety and originality of conception.
NUMISMATICS

Poseidonia issued coins from the archaic period (beginning with the usual incuse fabric) to its capture by the Lucanians early in the 4th century. Its successor Paestum began to mint coins in 342 B.C., and continued until 208 B.C., even after 89 B.C., when all other local mints in Italy were closed, until the time of Tiberius.

The ancient Sybaris, famous for her luxury, has left archaic coins; she was, however, destroyed by Croton in 510 B.C. The Athenian colony of Thurium eventually arose near the site of the old Sybaris in 443, and immediately began to issue a splendid series of coins. Not long after, the head of Poseidon became the great currency, as at Athens, of tetradrachmas, but the severe beauty of the style points to the direct influence of the art of central ancient Greece (Pl. I. fig. 2). The head of Athene is engraved on the obverse of the double weight of olive and thus a splendid figure of the sea-monster Scylla. The reverse shows a bull butting (θηρος), in a strikingly ideal form. Probably the obverse type affords the nearest reflection of the masterpiece of Phidias, or at least the closest following of his style.

Vela, the last colony of Phocea, whose citizens sailed to the far west rather than submit to the Persian tyrant (544 B.C.), shows coins from its foundation. The pieces of fine workmanship are an Asiatic origin in the types of the lion, devouring the stag or as a single animal, while the obverse displays the head of Athene so much in favour in Magna Graecia. The style, while having a beauty, is Italian, and we see no trace of the pictorial qualities of Ionian art, which indeed had not taken its mature form when the exiles left the mother country.

Tarentum, the birthplace of native Italians whom we find striking a fair Greek coinage. Their gold and silver is of late style, the gold presenting the head of Poseidon and Thetis on a sea-horse, the silver the head of Thetis and the figure of Poseidon, both with other slight modifications. The coins of Tarentum are known to be of limited distribution, and are for the most part, mythologically interesting in type, and the later with a beautifully designed stag on the reverse. For Croton the ruling type is the tripod. The eagle occurs on the obverse and the tripod on the reverse. The bird of Zeus is inferior to that at Agrigentum, as this again is inferior to the eagle of Elis. We note also beautiful types of Heracles seated, one of marvellously delicate work, on the reverse of which Apollo crowns him. The type of the Python from behind his tripod—

The coinage of Sicily is of extreme carefully artistic work, not unfrequently even in the case of bronze allowing for a more rapid execution of the die; and the highest technical excellence is attained. The art is that of the southern branch of the great Western school, generally more skillful than the art of southern Italy, but less varied. The earlier fine work has a naive beauty peculiar to the West and almost confined to Sicily; all that follows is evidently gem-engravers' work. These coins are remarkable for the frequency of artists' signatures, which for the short period of highest skill are almost universal on the larger silver money of Syracuse, and occur less frequently on that of the other great cities. Among these artists may be mentioned Execestidas (at Camarina), Eucleidas, Eumenes, Phrygillus (at Syracuse), Eucratetus (Syracuse, Camarina, Catane), Cimon (Messana, Syracuse Pl. I. figs. 7, 8), Heracleides the younger (at Camarina), the Medusa of the coinage of Iauria, which is inferior to that elsewhere in the Greek world, in consequence of the inherent weakness of the style; but it is in part due to the calamities of the island, as of lower Italy.

The fame won by the tyrants and other leading aristocrats of Sicily in the great national contests of Hellas, in the race with the quadriga, the mule-car and the horse, led to the introduction and supremacy of types commemorating these victories, probably in most cases those achieved at Olympia. It is obvious that no success could be so appropriately figured on the coinage; the charioteer or the horseman, not the city, was the victor. But at the same time the renown of the city was indissolubly connected with the citizen who won it. Hence these types are almost confined to states ruled by tyrants or oligarchies; outside Sicily they are practically only found at Rhegium when it was closely connected with Sicily, at Cyrene, in the money of Philip II. of Macedon and at Olynthus and in Euboea. The horseman is not a frequent type; the mule-car is limited to Messene (and Rhegium); but the quadriga becomes the stereotyped subject for the reverse of the great Sicilian tetradrachmas—the bulk of the coinage—and only escapes heraldic sameness by a charming variety in the details. In the age of finest art a divinity of the city takes, in Homeric guise, the place of the charioteer, or Victory herself so wins the contest; commonly she hovers above, about to crown the charioteer or the horses. Yet more interesting are the types connected with nature-worship, especially those portraying river-gods in the form of a man-headed bull, or a youth with the budding horns of a calf, or in the shape of a dog, and also the subjects of the nymphs of fountains. These types occur on either side of the coin. On nearly all, one side (in early times the reverse, later the obverse) is held by the head of a divinity, Persphone and Athene taking the first place.

The leading position which Syracuse held in the island makes it proper to notice her splendid currency first, the finest for knowledge of the materials, for skill in suitably filling the space, and for delicacy of execution in the whole range of Greek money, though we miss the noble simplicity of Greece, the strong feeling of western Asia Minor, and the simple picturesque of Crete. Syracuse was founded in 734 B.C. by Archias of Corinth, an origin which, remembered on both sides, has been preserved in later history—In the 6th century, perhaps while still under the oligarchy of the Geomori, she issued her most archaic silver money, which, primitive as
it is, gives promise of the care of the later coinage, and begins the agonistic types, thus indicating some early victory at a great Hellenic contest. Gelo, tyrant of Gela, won the chariot race at Olympia in 488 B.C., secured Syracuse in 485 B.C., and, when the Carthaginians, probably by agreement with Xerxes, invaded Sicily, utterly routed them at the great battle of Himera (480 B.C.), the Salamis of the West. These events find their record in the issue and subjects of his Syracusan money, which, however, was struck, as usual in that age, in the name of the people. There is an early type, for Victory appears hovering above the charioteer, about to crown the horses, and the coin issued after the great battle show the lion of Libya beneath the car in the exergue (Pl. I. fig. 6). These last pieces are fixed in date by the famous story how Gelo's wife Demarete, having gained favourable terms for the vanquished Carthaginians, was presented by them with a hundred talents of gold, by means of which were coined the great silver pieces of fifty litae or ten drachms, which were called after her Demaretia. They bear the head of Victory, crowned with laurel, and the quadriga and lion. The battle of Himera and the death of Gelo (476 B.C.) fix the date of the type. But the third and most important of all the series of Syracuse and give us a fixed point in Greek art, at about 470 B.C.

Hieron I. (478-466 B.C.), the brother and successor of Gelo, continues the same types, alluding, as Head well remarks (loc. cit.), to his great victory over the Eturians off Cumae (474 B.C.), by the marine monster in the exergue of the reverse which denotes the vanquished maritime power. It is to be noted that as Gelo introduces the Victory in the chariot type, so in the horseman type we now first see Victory crowning the rider. Gelo had won an Olympic victory in the four-horse contest, Hiero, the horseman, and the chariot type, though he also used with the four-horse in the Pythian games. With Hiero's money we now have a farewell to arcaic art. The female heads on the obverse now have the eye in profile and show beauty and variety, and the horses are even exceptionally represented in rapid action. With the short rule of Thrasylus, the last brother of the house, it came to an end, and the age of the democracy (466-406 B.C.) began. The victories by land and sea of Gelo and Hiero had established the power of the city on a sure basis, and fifty years of prosperity followed. To the earlier part of this age belong the beautiful transitional coins in which the female heads are marked by a youthful type, or of beauty combined with a fanciful and fantastic treatment of the hair; the reverses remain extremely severe. Towards the close of this age, beginning about 430, there are very fine works, the first signed coins, with the old dignity yet with greater freedom of style, the horses of the quadriga in rapid movement.

The victory of Syracuse in the contest with Athens was the occasion for the reissue of ten-drachm pieces, commonly but erroneously called medallions. On the reverses of these are a victorious chariot and a panoply of arms, representing the prizes offered at the games by which the Syracusans commemorated the defeat of the Athenians on the Assarines in 413. On the obverses is the head of the local nymph Arethusa. The designs are by the artists Cimon (Pl. I. fig. 8), Euenetus, and a third who is nameless. These pieces continued to be issued down to about 360 B.C. through the Dionysian period. Contemporary with them are numerous splendid tetradrachmons—signed and unsigned—as well as the first gold and bronze issued by Syracuse. The interference of Dion in Syracusan politics (357-355) was marked by the introduction of an elephant coinage, and of a silver drachm of Corinthian type, corresponding in weight to the trichremos of Corinth, and with the same types, the head of Athena and the Pegasus. The Dionysian dynasty closed in anarchy, until Syracuse appealed to Corinth, and Timoleon was sent to restore order (344 B.C.). His advent marks an epoch in Sicilian coinage. He restored the gold coinage and issued various silver coins which allude to Corinth and to liberty, and under his influence many small cities in Sicily awoke to political life as members of Timoleon's league and issued a scantly but interesting bronze coinage. The Syracusan democracy was overthrown in 317 B.C., and the city seized by Agathocles (317-289 B.C.), the worst of the tyrants of Syracuse. In the course of his reign he adopted the royal style, and his coins reflect his name without and then with the title king—a double innovation. The most interesting of his coins are those which bear allusions to his campaign in Africa.

The tyrant Hieratus (288-280 B.C.) and the next ruler, Pyrrhus, king of Epirus (278-275 B.C.), continue the coinage, Pyrrhus issuing money in the name of the Syracusans and also striking his own pieces. The departure of Pyrrhus led to the establishment by Hieron II. (c. 270-216 B.C.) of a dynasty which, so long restive, restored the ancient prosperity and preponderance of the rule of his name. At first he bears his name alone, he soon not only takes the title of king, conferred on him in the early years of his reign, but also places his portrait on the money. Of his time is the beautiful portrait of his queen Philistis. The money of the short reign of Hieronymus (215-214 B.C.) and of the brief democracy which fell before the Romans (214-212 B.C.) close the independent series of this great city. But her name still appears in bronze money issued after the conquest.

Thus far, for the rest of the money of Sicily in alphabetical order, we first note a very fine bronze coin bearing a beautiful female head, perhaps that of Sicilia, crowned with myrtle, and a lyre, which belongs to the time of Timoleon's league. This coin is conventionally attributed to Agrigentum, represented by archaic, transitional, and fine coins, the fine series ending with the overthrow of the city by the Carthaginians in 406 B.C.—a blow from which it never recovered. The usual types are the eagle and the fresh-water or river-god, the latter sometimes shown with a shield, but in the age of finest art we see two eagles devouring a hare (cf. Aeschylus, Agam. 109 seq.) and a victorious chariot; these occur in the exergue, the reverse being a diadem or a medallion, himself drives the car, and the tetradrachms. The eagle is superior to that of Croton, inferior to that of Elia. Many of the bronze coins are of good work. The type most worthy of note is the head of a woman, the reverse being the name of the issue, which was that of the local stream, and on the reverse an eagle standing on an Ionic capital, the Olympic turning-post. The success of Agrigentum at the games is attested by Pindar, while Virgil (Aen. iii. 701), Statius (Cypria 526) and Silius Italicus (xiv. 210) mention its ancient renown for horses.

The money of Camarina is of especial beauty and interest. Camarina struck but few coins before the year of liberation (401), soon after which issued a drachm having on the obverse a helmet upon a round shield and on the reverse a pair of greaves, between which is a dwarf palm. This piece is followed by tetradrachmons and didrachmons of the best period, most beautiful in style, and varying a little from the usual type. But the age begins with reverse reverse of Hercules in the lion's skin, and on the reverse Athena as a victor at the Olympic games in a quadriga. It was Athena, protector of the Italic city of Camarina, who represents, for in her coin was inscribed on the obverse the head of a river-god, portrayed by a young man with small horns and with wet hair. Of the two rivers of Camarina, the Oanus and the Himipar, the Himiparan, represented by the head of Eros, is given on the coin. Pindar seems to show the same preference, for, while he merely mentions the Oanus (ποταμός..., Οάναος), he speaks of the sacred channels by which the Hippiaris watered the city (εὐφυαριτίς...) Θερμών θερμών δέλφις...). On the reverse the nymph Camarina (Τεμενος Ουρανον... Καμαρίνα) is seen carried across her lake (πνευμάτω... Μνασά) by a sail swimming with expanded wings, while she aids it by spreading her veil in the manner of a sail. Some of these didrachmons have on either side, around the chief device, fresh-water fishes. The series of Catana comprises fine archaic tetradrachmons and others of the time of the best art. The archaic types show the river with a dolphin chasing a fish and a bull and of the figure of Victory, of a type remarkably advanced for the time at which they were struck. From 470 to 461, under the first of Acarna, its coinage is represented especially by a unique tetradrachm (Pl. I. fig. 10), with a wonderful head of Silenus, and Zeus as the god of the volcano holding a thunderbolt and a sceptre made of a vine-branch; before him is an eagle perched on one of the Hesperides. The coins which follow represent the victorious quadriga, in one case passing the turning-post, an Ionic column. Historically interesting is a small silver coin issued by Catana and Leontini in alliance between 405 and 405. Eryx towards the end of the 5th and during the 4th century, which Eros is represented at the knees of his mother, asking for the dove which she holds. It is represented by coins of which the archaic tetradrachmons must be especially mentioned. They have on the obverse the forepart of the river-god Gelas, whose name it took its name. The Gelas is represented as a bull, having the face of a man. On the reverse is a victorious quadriga, in some examples represented passing
An ionic column, as on coins of Catana. A beautiful tetradrachm represents the city goddess (Sosippe) placing a wreath on the head of the monstrous river-god. A little later is a tetradrachm which has types of the head of the Gelas as a young man horned, surrounded by three dolphins. Small gold coins, and a diadrachm representing a Golian cavalryman spearing an Athenian hoplite, are among the coins issued shortly before the fall of Gelas in 405. The money of Himera is of great interest. On a tetradrachm of Harmachis, a品位 of athlete, who began in the 6th century B.C., bear on the obverse a cock and on the reverse an incuse pattern; later, a hen. During the time that Tho- r of Agrigentum held the city (c. 450 B.C.) Agrigentum took on the diadrachms. The transitional tetradrachms bear on the one side a victorious quadriga and on the other a nymph sacrificing, near whom a little Silenus stands under the stream of a river. On the other side is a lion's head sur- prised by tetradrachms with the head of Apollo and the victorious car, which gives place to a lion's head. The series of Messene begins when the town was called Zancle, or, as it is written upon the coins, Dancia, with the head of Apollo and various figures of the Aegaeans and of very archaic work. On the obverse is a dolphin, and around it a sicle; on the reverse the earliest pieces repeat the same design incuse (as in the earliest coinage of S. Italy); but later we find a sheet in the midst of an incuse pattern. The place is said to have received its name on account of the resemblance of the harbour to a sicle (σίκλα or σίκλη). Next to these first coins of Zancle may be placed the semi-piece of the Attic weight, a tetradrachm with the Samian types, a lion's scalp on one side and on the other the head of a calf, and bearing the inscription ΜΕΣΣΕΝΙΟΝ. This coin was doubtless struck during the rule of the Samians, who took the town in 395, and bore the name of a town of Samos, by whom they were subsequently expelled (Thucyd. vi. 4). The next pieces are the earliest of those which have on the obverse a representation of the Olympian Zeus and on the reverse the contemporary coins of Rhegium, with the same devices and equally of the rule of Anaxilas. These types cease at Rhegium, though they continue at Messene, some of the tetradrachms bearing them being of the age of fine art. About 450 there must have been a temporary restoration of the Zancleans, who struck a tetradrachm with Poseidon and the dolphin as types. A fine piece of rather later date represents Pan carrying a hare. As its town has been well described by Aristotle, we need not strike with their name. Naxos is represented by early Aeginetic drachms with an archaic head of Dionysus. Immediately after the year of liberation (461) it produced a tetradrachm bearing a head of Dionysus and, on the reverse, a squatting Silenus, remarkable for the study of anatomical detail (see Pl. I. fig. 11). These types are repeated in a less severe style some fifty years later, when also an engraver Procles signs some pretty drachms. Segesta is represented on coins from about 440. We first notice the head of the nymph Segesta and a hound, probably the river-god Crimus; then for reverse associated with a young hunter accompanied by two hounds—a charming composition. Another interesting type is a victorious car driven by Persephone, who carries ears of corn.

In the series of the city of Selinus the first coins are drachms, bearing an elephant and a pomegranate, and incuse on a bull. The city and the river of the same name no doubt derived their name from the plant ἀλών (probably wild celery, A. pismis graveolens), the leaf of which must be here intended. Tetradrachms and drachms bear an animal and a horse; and, as the devices generally of usual interest. The obverse exhibits a river-god, sometimes the Selinus, sometimes the Hypsas, sacrificing at an altar to the god of healing. The reverse, bearing a charioteer driving a chariot, is sometimes seen behind him, as if departing. The obverse of the diadrachms shows Hercules subduing the bull, and the reverse of the tetradrachms generally shows a quadriga in which Apollo stands drawing his bow, while Artemis is charioteer. The reference in all these cases must be to the driving away of the pestilence from the neighbourhood of Selinus by the draining of the marshes.

Punti coins, that is, those actually struck by the Carthaginians in Sicily, will best be dealt with under Carthage, below.

The islands of Melita, Gausos and Cosentia near Sicily issued late coins which belong to the African series, showing a curious mixture of Phoenician and Egyptian elements in some of their types. Of Lipara there is heavy bronze money on the Sicilian system, having on the obverse a head of Hephaestus, or sometimes a figure of the same deity, driving a charioteer. This is a fairly well-advanced piece, which seems to have just formed.

In the Tauric Chersonese there are interesting coins, in the three metals, of the city of Panticapaeum, the modern Kerch. Their obverse usually bears the head of Pan and their reverse a griffin and other subjects; some are of fine bronze, bearing the head of the lion, and in general very fair, though it sometimes approaches barbarism. Apollonia Pontica produced fine silver coins with a head of Apollo and an anchor. There are abundant Greek imperial coins of Marcianopolis and Nicopolis, while Tomi is represented in this class as well as in the autonomous.

The coins of Thrace are of high interest. Here and in Macedonia we observe the early efforts of barbarous tribes to coin the produce of their silver mines, and the splendid issues of the Greek colonies; and we see in the weights the influence of the Asiatic Greeks and the Athenians. The oldest coins are of the early 5th century B.C., and there are others of all subsequent times, both while the country was independent and while it was subject to the Romans, until the cessation of Greek coinage. Some of the best period are of about 400 B.C., and these pieces exhibit the distinctive peculiarities of fabric and design, that is, from their commencement until the age of Philip, the Thracian coins resemble those of Macedonia. The money of Abdera comprises tetradrachms and smaller coins of the periods of archaic and fine art, all but the latest of the Phoenician standard, ultimately superseded by the Persic. The principal type is a seated griffin, copied from its mother-city, Teos. The reverse type, an incuse square, has at first four divisions, but in the age of the finest art contains a variety of beautiful subjects, the signs of the magistrates. Abdera is remarkable for the great beauty of some of its coins. These are tetradrachms of Attic weight, of the late archaic and best ages. The interesting turning-point from growth to maturity is seen in a vigorous head of Hermes in profile, wearing the petasus. A little later is the splendid series of facing heads, the broad, severe, and sculptural treatment of which is truly admirable, and far superior to the more showy handling of the same subject in later drachms. A goat is the reverse type of the larger coins. The money of the city of Byzantium begins with coins on the Persic standard of good style, having on the obverse a bull and on the reverse a griffin, divided into four divisions, and closed with the series of bronze coins issued under the empire. The star and crescent type first appears in the Roman period. Of Maronea, anciently famous for its wine, there is an interesting series, among which we notice fine tetradrachms of Phoenician weight, having on the obverse a prancing horse and on the reverse a vine within a square. The standard changes to Persic, of which there is a beautiful series of diadrachms. Then the series is interrupted by the rule of the Macedonian kings, and resumed in a barbarous coinage of the native Thracians, issued in the second and first centuries before the Christian era, consisting of spread Attic tetradrachms with the types of the head of beardless Dionysus crowned with ivy and on the other side his figure. The Greek imperial coins of Pautalia and Perinthus are worthy of notice. Among those of the latter town we may mention fine pieces of Antoninus Pius and Severus, and large coins, commonly called medallions, of Caracalla and other emperors. The money of the imperial class issued by Philippiopolis, Serdica and Trajanopolis should also be noticed. In the Thracian Chersonese the most important issued is one of Antoninus Pius, about 150 A.D. There is a limited but highly interesting group of coins of Thracian kings and d’facts. The earliest are of kings of the Odrysae, including Sparadocus and Seuthes I., who began to reign in 424 B.C., and whose money bears the two remarkable inscriptions ΕΥΘΑ ΚΟΜΜΑ and ΕΥΘΑ ΑΡΤΥΡΙΟΝ. It closes with the issues of Roman vassals, such as Cotys IV. (A.D. 12-19). Lysimachus, commonly classed as king of Thrace, belongs to the group of

Sarmatia we may notice the autonomous and imperial pieces of Olbia, which alone amongst Greek cities produced a series of reverse and the coins and in Dacia the money bearing the name of the province. The Roman colonies Viminacium in upper Moesia is represented by numerous coins of a late time. Of Istrus, in lower Moesia, there are drachms having a strange type on the obverse, representing two beardless heads, side by side, the one upright and the other upside down; on the reverse is an eagle devouring a fish. The style of these coins is in general fair, though it sometimes approaches barbarism. Apollonia Pontica produced fine silver coins with a head of Apollo and an anchor. There are abundant Greek imperial coins of Marcianopolis and Nicopolis, while Tomi is represented in this class as well as in the autonomous.
The money of Macedonia both civic and regal is of great variety and interest. It begins at an early time, probably towards the end of the 6th century B.C. The old pieces are of silver, bronze having come into use a century later, and gold about the middle of the 4th century B.C. The character of the coinage resembles that of Thrace; the earliest pieces are of the Phoenician, Babylonian and Attic standards. The most remarkable denominations are the pieces of eight and twelve Phoenician drachms. The largest coins are of the time of Alexander I. (498-454), and somewhat earlier, and indicate the metallic wealth of the country more than its commercial activity. The chief groups of coins are those of the Pangean, Bisaliant, Strymonian and Chalcidian districts, of the kings of Macedonia and Paonia, and of Macedonia under the Romans. This last series begins with the coins of the "regions" issued by permission of the senate and bearing the name of the Macedonians, from 138 to 150 B.C.; these are followed by coins of the Roman generals against Andricus and of the pretender himself, and, from 146 onwards, of the Roman province. Under the empire large series of bronze coins was issued in the name of the Koion, i.e. the provincial diet. As regards the earlier civic coinage: the coinage of Acanthus comprises fine archaic tetradrachms of Attic weight and others of Phoenician weight and very vigorous in style, of the commencement of the period of good art. The type of their obverse is a lion seizing a bull (cf. Herodot. vii. 125 f.). The money of Anea is chiefly interesting from its bearing the head of the hero Aeneas; and on one extraordinary coin of archaic fabric, an Attic tetradrachm, the subject is the hero carrying Anchises from Troy, preceded by Cressa carrying Aesculapius; this is in date before 500 B.C. The town of Amphipolis is represented by a long series. There are Phoenician tetradrachms of about 400 B.C. having on the obverse a head of Apollo, facing, sometimes in a splendid style, which recalls the art of the immediate successors of Pheidias (Pl. I. fig. 12). The reverse type is a flaming race-torch in an incuse square. The territory of Chalcidice is eminent for the excellence of some of its silver coins. There is a very early Attic tetradrachm of Olynthus, with a quadriga, and an eagle within a double square, which reminds us of the idea of the great Sicilian currencies, under the record of Olympic victors, a subject borrowed from the Phoenician tetradrachms of the best period struck by the Chalcidian League (392-375 B.C. and later), Olynthus being probably the mint, of great artistic interest (Pl. I. fig. 13). The obverse bears the head of Apollo in profile crowned with laurel. It is in very high relief and treated with great simplicity, though not with the severity of somewhat earlier pieces. The delicacy of the features is balanced by the simple treatment of the hair and the broad wreath of laurel. On the reverse is a lyre. There is an early series of coins of Lette, none later than about 480. The obverse type is a satyr with a nymph, and on the reverse an incuse square divided fourfold, first diagonally and then in squares. Mende has money of Attic type, the types being connected with Silenus, who on a tetradrachm of fine style is portrayed reclining, a wine-vase in his hand, on the back of an ass; the reverse bears a vine. Of Neapolis (Datenon) there are early coins with the Gorgon's head and the incuse square, which in the period of fine art gives way to a charming head of the "Virgin Goddess" crowned with olive. The coins of Philip of Macedonia in the three metals are mainly of the time of Philip II., who, having found a rich gold mine near Crenides, changed its name to Philippe. The gold coins are Attic types, the silver pieces of the Phoenician or Macedonian weight, in Philip's own money. The earliest bear the name of the "Thasians of the Mainland," who immediately preceded Philip's colony. There is a long but late series of Thessalonica which in the time of the regions was the mint of the second region; the numerous bronze coins of the Roman period show a figure of Cabirus among other types. Uranopolis has a few coins with very curious astronomical types, probably issued by the easternc Alexander I. brother. The late issues of the Macedonians are extremely interesting. They are all just anterior to, or it may be contemporary with, Alexander I. of Macedon. The leading coins are ocatdrachms of the Phoenician standard. They have usually but one type, the reverse bearing a quadripartite incuse square. Their sudden appearance and heavy weight are due to the working of the silver mines on the border of Macedonia and Thrace. The usual types are a warrior leading a horse or a yoke of oxen. The coins bear the names of the Bisaliant, Getas, king of the Edoni, the Orreissi and other tribals. Besides these there were smaller tetradrachms, struck in the name of the Derronis of Sithonia, bearing the unusual type of an ox-car, in which is a figure seated, and on the reverse a symbol of three legs.

The oldest coins of the Macedonian kings are of Alexander I., from 498 to 454 B.C., the contemporary of Xerxes. These are Phoenician ocatdrachms, having on the obverse a cavalryman by the side of a horse, and coins of a lower denomination with the name of Alexander the Great on the reverse, and the number of the duration of his reign in Greek characters, from 200 to 500. The reverse is an ox or a horse-race, and they are often inscribed with the name of Philip's, although he did not reign then. That of the Macedonians is the same or a similar type. The money of Alexander's successors illustrates the movement of art, but it is not until the reign of Philip II. that we have an abundant coinage. He strikes gold pieces, chiefly Attic dirhems, from the produce of his mine near Philippi (Pl. I. fig. 14). They are of fair style, and bear on the obverse the head of Ares. On the reverse is a victorious Olympic biga. The coins were struck during the time of Philip, and when the money of Alexander as Αλαξανδρος—appellations which probably did not include larger or smaller pieces. Horace calls the gold coins of Philip "Philips" ('royale nomisma Philippus,' Epist. ii. 1, 232). The tetradrachms of the coinage of Alexander I. are of the Phoenician standard (Pl. I. fig. 15). Their type of obverse is a head of Zeus and of reverse either a horseman wearing a caura or a victor in a horse-race, with a horse and a chariot; these last coins being the best of Philip's, although the horse is clumsy. The coinage of Alexander the Great, both in the number of the cities where it was issued and in its abundance, excels all other Greek regal money; but its art is, without being despicable, far below excellence. The system of both gold and silver is Attic. The gold coins are distaters or gold tetradrachms, stater or drachms, with their half or a smaller denomination. The types of the distaters or staters, which last were the most common pieces, are for the obverse the head of Athena and for the reverse Victory bearing a naval standard. The largest silver pieces are the coinage of the rich Phoenician cities, with which is extremely rare. The types of the tetradrachms and most of the lower coins are on the obverse the head of Hercules in the lion's skin and on the reverse Zeus seated, bearing on his hand an eagle (Pl. I. fig. 16). The head has been much changed, but this is not the case, although there may be some assimilation to his portrait. The great currency was of tetradrachms. The coinage was struck in many different cities, distinguished with proper and exact names; the number of the cities is difficult, but is gradually expanding. (For Alexander's Eastern coinage see § IV. Oriental Coins.)

The coinage of Alexander is followed by that of Philip Arrhidaeus, with Attic types. That of Alexander IV. was issued by Ptolemy I. alone. In these coins the types of Alexander were modified, the dead king being represented with the ram's horn of Jaan and an extra pair of ends to his tunic. Meanwhile Seleucus, Lysimachus, Antigonus, king of Asia, struck Alexander's money with their own names, and the tetradrachms of Macedonia were generally of this kind until the time of Philip V. The same coinage, marked by a large flat form, was reused later by

GREEK COINS]
NUMISMATICS 881
The coin systems of northern Greece, Thessaly, Epirus, Corcyra, Acarnania and Aetolia present certain difficulties which disappear if we consider them as originally Aeginetan, modified in the west by Corinth, and later by Roman, influence. The coinage of Thessaly represents very few specimens of a remote period, while pieces of the best time are numerous. These are in general remarkably like the finest coins of Sicily and Italy, although the style is simpler. The prevalence of the horse and horseman is significant. The money of the Thessalian Confederacy, being of late date (196-146 B.C.), is of little interest. The composition of their coins is a mark of the head of Zeus crowned with oak and the Thessalian Athena Itonia in a fighting attitude. The coinage is resumed in imperial times. Numerous small places, such as Gomphi, Homolium, Lamia, Phalanna, produced coins of considerable beauty; more extensive are the issues of Pharsalus, Phere (with fine coins of the tyrant Alexander), and especially Larissa. The last series begins with archaic pieces and some of the early period of good art, but sometimes of rather coarse execution. The small silver pieces have very interesting reverse types relating to the nymph of the fountain, and to be compared for mutual illustration with the drachms of Terina and with some of those of Elis. These are followed by coins of fine work. The usual obverse type is the head of Larissa, the nymph of the fountain, facing, and on the reverse is generally a horse, either free or drinking. The head is treated in a very rich manner, like that of the fountain-nymph Arethusa, facing, on tetradrachms of Syracuse; indeed, the debt to the Sicilian type is obvious. The bronze money is also good. The wine-producing island of Paphethus, off the Thessalian coast, is represented by a remarkable series of Attic tetradrachms (about 500-480 B.C.) with a variety of types, partly Dionysiac.

The coinage of Illyria (strictly Illyris or Illyrium) is usually of inferior or rude sort; the pieces are Aeginetan, ultimately changing to the Corinthian, while the style remains more primitive. First there are reverse types showing the head of Apollo and three nymphs dancing round a fire, the outer ones holding torches. Dyrrihachium, which never bears on its coins the more famous name of Epidamnus, is represented by an impression of the early 4th century B.C. First there are reverse types showing the head of Apollo and three nymphs. These are succeeded by tradrachms with Corinthian types, and of Corinthian weight; then the old types are resumed, but the standard is that of the victorius. Dyrrihachium, it must be remembered, was founded partly by Corecyran and partly by Corinthian colonists. The Illiryo-Epistrate mining towns, Damastium, &c., struck barbarous silver coins in the 4th century; on some of these are seen types of Greek Ionic, Corecyran, &c.

The coins of Epirus are of higher interest and beauty than those of Illyria. Of the Epirots there are bronze coins of the regal period (342-272 B.C.), and both silver and bronze of the republic (272-168 B.C.), with the heads of the Dodonaean Zeus and Dione, together or apart. Ambracia is represented by silver pieces, with on the one side a head of Dione, on the other the obelisk of Apollo Agyaeus.

The coinage of Greek imperial money of Nicopolis must also be mentioned. The coinage of the kings begins under Alexander I. His coins have been found in the three metals, but they are rare. It is known that the possession of the gold mines in the district of the river Haliartus, which Philip had exploited, was in the hands of the king. The tetradrachms of Antigonus I. (Conatas), which are of inferior style and work to those of Demetrius, have types which appear to lie in manner to the great naval victory which Demetrius gained over Ptolemy in 306; the drachms, on the other hand, were minted after the battle of Leuctra in 371 and Demetrius and now in the Louvre. The tetradrachms of Antigonus I. (Conatas), which are of inferior style and work to those of Demetrius, have types which appear to lie in manner to the great naval victory which Demetrius gained over Ptolemy in 306; the drachms, on the other hand, were minted after the battle of Leuctra in 371 and Demetrius and now in the Louvre. The tetradrachms of Antigonus I. (Conatas), which are of inferior style and work to those of Demetrius, have types which appear to lie in manner to the great naval victory which Demetrius gained over Ptolemy in 306; the drachms, on the other hand, were minted after the battle of Leuctra in 371 and Demetrius and now in the Louvre.
These are followed by didrachms of the same and other cities until the time of the Persian War. The result of the unpatriotic coinage of Thebes and most of the towns of Boeotia was the degradation of the leading city, and the coins reveal the curious fact that Tanagra for a time became the centre of the League-coinage. We now notice the abandonment of the old incuse reverse and the adoption of regular types, the wheel at Tanagra and the amphora at Thebes. These types increase, and indicate several cities during the short period of Athenian influence (436-446 B.C.). The democratic institutions were next overthrown, and Thebes became again the head of Boeotia, and struck alone and in her own name, not in that of the League. To this earlier period belong splendid didrachms with reverse types chiefly representing Heracles, subsequently varied by heads of Dionysus in a series only less fine. With the peace of Antalcidas (387 B.C.) Thebes lost her power, the League was dissolved, and the other Boeotian cities issued a coinage of some merit. In 379 B.C. Thebes became the chief state in Euboea, and the patriotic policy of Pelopidas and Epaminondas is shown in the issue of the Boeotian coins at the great city without any name but that of a magistrate. Among those which occur is EIAM, or EIAMI, who can scarcely be any other than the ill-fated. An Eob Λεοντος (338 B.C.), swiftly followed by the destruction of Thebes, the coinage is comparatively unimportant, save only for the appearance of new league-money of Attic weight, with the head of Zeus and the figure of Poseidon, between 288 and 244 B.C.

In Attica, the great series of Athens is dominant. Eleusis issued a small bronze coinage of good style in the 4th century.

**Athen.**

Oropus and the island of Salamis also had an unimportant coinage. The Athenian coinage, apparently introduced by Solon, begins with didrachms on the Euboeic standard, which, owing to the fame of the Athenian money, received the names of the gods. The type is an owl, the reverse having only the incuse square. These didrachms were succeeded under Peisistratus by the well-known Attic tetradrachms with head of Athena on the obverse, and owl and olive-spray on the reverse (Pl. I. fig. 20). The change supposed to have been introduced by Hippias (Pseudo-Arist. Oecon. ii. 4) was merely one of nomenclature; by calling in the coinage and reissuing it at double its old nominal value he only paid back half of what he had received. To what had previously been called didrachms he gave the name of tetradrachms, by which they have since been known. An obol or half a drachm of the Athenian standard was known as the Stater, and types similar to those of Athens, was probably issued by him during his exile. From the time of the Persian Wars the helmet of Athena is adorned with three olive-leaves. A rare decadrachm corresponds at Athens to the Demaretae at Syracuse, and was probably issued for similar reasons in commemoration of victory over the barbarians. Otherwise historical events seem to have left little record in the coinage and the Athenians deliberately affected archaism in the style of their coins, which bear no mark of the splendour of Athens as the centre of the sculptor's art. No doubt commercial reasons dictated this conservative policy, which makes the coinage of Athens a disappointment in numismatics. Her money was precious for its purity not only in the Greek world but among distant barbarians, so that imitations reach us from the Punjab and from southern Arabia, and any change would have injured its wide reception. There are many divisions of silver coinage with the types a little varied, and some different ones; and towards the end of the 5th century (probably in 407 B.C.) gold and bronze were introduced. The gold, of good quality and bad style, was never popular; its obverse bore an Attic representation of the autonomy of Athens, and when the money is again issued it is of a wholly new style and the types are modified. The great series of spread tetradrachms may be dated from about 220 B.C., and lasted probably until the time of Augustus. The obverse type is a head of Athena with a richly-armed helmet, unquestionably borrowed from the famous statue by Phidias in ivory and gold, but a poor shadow of that splendid original, and an owl on an amphora within an olive-wreath. The earliest coins have the monograms of two magistrates, the later the names of two who are annual (although the nature of their offices is not certain—possibly they were keroplouts), and, during the period from 479 to 472, a name, of the treasurer of the pytany in which the coin was issued. Amongst those of Athens are those of Antiochus (175 B.C.,) afterwards Antiochus IV, of Syria, who minted in Greece the Great (Pl. II. fig. 1) and his creature, Aristion (87-86 B.C.), but comparatively few of the coins can be dated exactly. Mithradates issued the only gold staters in this series. The symbols in the field often represent local statues of great interest. The abundance of this money shows the great commercial importance of Athens in these latter times. Under the empire Athens issued only quasi-autonomous coins, but these are of great archaeological value as they bear representations of the Acropolis, with the grotto of Pan, the statue of Pallas Promachus, the Parthenon, and the Propylae, with the steps leading up to the latter; or of the theatre of Dionysus, above which are caverns in the rock and higher still the Parthenon and the Propylae; and of various statues and groups of sculpture. Megara and other places in Megaris issued a small but interesting coinage.

The money of the island of Aegina is of especial interest since it coinage originated, so far as Greece proper is concerned, probably fairly early in the 7th century B.C. There is no good evidence for connecting the institution of the coinage with Phidion, king of Argo, who established a system of measures and weights, known as the Phidianon. The weight of the coins is of course on the Aeginetic standard. The oldest pieces are very primitive didrachms, bearing on the obverse a sea-tortoise and on the reverse a rude incuse stamp (Pl. II. fig. 2). Afterwards the stamp becomes less rude, and later has a peculiar shape. The sea-tortoise is also replaced by a land-tortoise. There are some coins of the early part of the fine period of excellent work. The great currency was of didrachms. The bronze coins are not remarkable, but some appear to be of an earlier time than most Greek pieces in this metal.

The series of Achaia begins under the Achaean League in the time of Epaminondas, with a fine Aeginetic stater and smaller coins in the name of the Achaean. The later silver coins are either Attic tetrobols or Aeginetic hemidrachms. On all but the earliest, i.e. after about 280 B.C., monograms or symbols indicate the cities which were members of the league; on the later bronze coins the names are given in full. The type of the silver is the head of Zeus Homagyrios, theReverse bearing the monograms of the Achaean states and a laurel wreath. The oldest bronze repeats the silver types; the later bear a standing Zeus and a seated Demeter, with the name of the city at full length. About forty-five cities are represented by this coinage.

Corinth is represented by a very large series of coins, the weight of which is always on the Corinthian standard, equivalent to Attic but differently divided,—the Corinthian tridrachm, the chief coin, corresponding to the Attic didrachm. The oldest pieces, of the 6th century B.C. (some perhaps even earlier), bear on the obverse Pegasus with the letter Τ, koppa, the initial of the name of Corinth, and on the reverse an incuse pattern. In course of time (about 500 B.C.) the head of Athena in an incuse square occupies the reverse. The incuse square disappears, as generally elsewhere, in the early period of fine art. Of the age of the excellence and decline of art we find beautiful work, though generally wanting in the severity of the highest Greek art (Pl. II. fig. 3). Pegasus is ordinarily seen galloping, but sometimes standing or drinking, the koppa is usually retained, and the helmet of Athena, always Corinthian, is sometimes bound with laurel, sometimes leaves; it has an olive-wreath on the obverse a charming series of types, principally female heads, mostly representing Aphrodite. There are some drachms with Bellerophon in a combattant attitude mounted on Pegasus on the one side and the Chimæra on the other. The autonomous bronze money is poor, but often of fair work, and interesting, especially when the type relates to the myth of Bellerophon. In 46 B.C. this city was made a colony; and we have a large and interesting series of the bronze coins struck by it as such,
including the remarkable type of the tomb of Lais. The coins of the "colonies" of Corinth form a long and important series, struck by Acaeanian towns with Corcyra, and in the west by Locri Epizephyrii in Italy and Syracuse. Some of these cities were not strictly colonies of Corinth, but the Pegasus states struck by them form a homogeneous group. They range from the time of Dion (357 B.C.) to the new currency of the 4th century. The coins are damaged by the absence of the koppa, and bear the names or monograms of the cities.

There are bronze coins of Patrae as an important Roman colony, and silver and bronze money of Phlius, both of the period of good art. The coinage of Sicyon, on the Aegaeic standard of the 4th century, and of Corinth, is of the 3rd century.

Patrae, Sicyon, &c., are famous for a artistic centre. It begins shortly before the period of fine art; in that age the silver is abundant and well executed, but the bronze is scarce and the weight uncertain. The heads within an olive-wreath, are wearing in their repetition, and good work could not make the Chimaera an agreeable subject. Small coins with types of Apollo are the only subjects which suggest the designs of the school of Sicyon.

The money of the Eleans is inferior to none in the Greek world in its art. It reaches the highest level of dignified restraint, and in the variety of its types, which are suggested with great restraint, the head may expect, with the worship of Zeus and Hera, and Victory, the divinities of the great Panhellenic contest at Olympia, and the coinage is rather the money of Olympia than of Elea. As a type it has scarcely a rival in the West, and on the reverse a thunderbolt or Victory bearing a wreath-archaic types which in their vigour promise the excellence of later days. From 471 to 421 B.C. while Elis was allied with the Spartans such types continue: the eagle and Victory (sometimes seated) are both treated with great force and beauty, and the subject of seated Zeus is remarkable for its dignity. The Argive alliance (421-400 B.C.) seems marked by precocious giving to Hera, whose head may suggest the famous statue of Polycleitus at Argos. About the same time was issued a drachma with a noble head of Zeus (Pl. II. fig. 4), which probably recalls, though it is not a copy of, the Zeus of Phidias.

The 4th century type, which is admirably designed on a shield, and eagles’ heads (see Pl. II. fig. 5), the seated Victory, and fantastically varied thunderbolts mark this age. Among the artists’ signatures at this time is ΔΑ, which may represent the sculptor Daedalus of Sicyon. In 354 B.C. the coinage is interrupted for a year, the Plataeans, who conducted the festival then, issuing small gold coins; these are immediately followed by Elean money with the head of Athena and a Corinthian helmet at Elea, who was tyrant in 272 B.C., issued coins with his initials. The coinage closes with imperial money, some types of which have a local interest, notably two of Hadrian bearing the head and figure of Zeus, copied from the statue of Phidias.

Cephallenia gives us the early silver coins of Cranii, the money of Pale, of chaming style, with the figure of Cephalus on the reverse, and a few coins of Sicyon. Cephallonia.

Zacynthus there are silver pieces, usually of rather coarse work, but sometimes of the style of the best Cephalennian money. Some struck in 357 bear the name of Dion of Syracusa, who collected the forces for his expedition in this island. The coins of Ithaca are of bronze. They are of interest on account of their common obverse type, which is a head of Odysseus.

Returning to the mainland, we first notice the money of Messene, or the Messenians. The earliest coin is a splendid Aeginetic didrachm, having on the obverse a head of Persephone, and excels in design the similar subjects on the money of Syracuse, from which it may have been derived, for it is the best current coin of the time. It shows the purer style of Greece, which, copying Syracusan work, raised its character. On the reverse is a figure of Zeus, inspired by the work of Hageladas. The other silver coins are of about the period of the Achaean League, but the King Ages (300-265 B.C.) and the tyrant Nabis (207-192 B.C.) are represented by Attic tetradrachms. On a tetradrachm of the time of the former is a figure of the Apollo of Amycla. Among the types of the autonomous bronze pieces the most important is a head of Zeus, who is sometimes represented with a lyre in his hand, and the tympanum of the Nabis (207-192 B.C.) is irregularly at Athens.

Lacoea. The standard is Aeginetic. The first piece shows the head of the Polycleitan Hera. The bronze money is plentiful but not interesting. Lacedaemon, as we might have expected, has no early coins, the silver money being mostly of the age of the Achaean League, but the King Ages (300-265 B.C.) and the tyrant Nabis (207-192 B.C.) are represented by Attic tetradrachms. On a tetradrachm of the time of the former is a figure of the Apollo of Amycla. Among the types of the autonomous bronze pieces the most important is a head of Zeus, who is sometimes represented with a lyre in his hand, and the tympanum of the Nabis (207-192 B.C.) is irregularly at Athens.

Argol. The standard is Aeginetic. The first pieces show the head of the Polycleitan Hera. The bronze money is plentiful but not interesting. Lacedaemon, as we might have expected, has no early coins, the silver money being mostly of the age of the Achaean League, but the King Ages (300-265 B.C.) and the tyrant Nabis (207-192 B.C.) are represented by Attic tetradrachms. On a tetradrachm of the time of the former is a figure of the Apollo of Amycla. The peculiar position of Crete and her long isolation from the political, artistic and literary movements of Hellas have been already touched on. It is not strictly true of the worship of Poseidon at this inland town. The silver coins of Phenoeus must be noticed as being of fine work. The drachms of the age of Epaminondas have a head of Persephone, and Hermes carrying the child Arcas. The obverse type is interesting as a copy of the Syracusean subject, as in Locris and Messene. As in Locris, the merit is in the greater force and simplicity of the face, here most marked in the hair, and the hair being long, so in Locri, King Menelaus, who is more like that of the Messenians, who simplified the whole subject. The finest coin attributed to Stymphalus is a magnificent drachm of the age of Epaminondas with a head of Zeus on the obverse, and Hermes striking with his club. The smaller silver coins have on the one side a head of Heracles and on the other the head and neck of a Stymphalian bird. There were representations of these birds in the gallery of Artemis in the temple of Stymphalos. The heads of Zeus, as between two of the reverse types of these bronze coins are interesting as relating to the myth of Telephus and to the story that Athena gave a jar containing the hair of Medusa to her priestess Sterope, daughter of Cepheus, in order that she might terrify the Argives should they attack Tegea in the absence of Cepheus, when Heracles desired his aid in an expedition against Sparta. Iron coins were issued by Tegea, and also perhaps by Heraea.

The peculiar position of Crete and her long isolation from the political, artistic and literary movements of Hellas have been already touched on. It is not strictly true of the worship of King Philip V. that Crete appears in the field of history, and then only as the battle-ground of rival powers. The most remarkable influence of this age was when Athens, by the diplomacy of Cephisodorus, succeeded about 200 B.C. in drawing the Cretans into a great league against Philip V. of Macedon. That this project took actual shape is proved by the issue at all the chief mints of the island tetradrachms with the well-known types of Athens, to be distinguished from the Atticizing types of other cities at this time. The number of these coins is about 500 B.C., but few cities seem to have issued many until a hundred years later. Then there is a great outburst of coinage, sometimes beautiful, sometimes barbarously careless, which lasts until the age of Alexander, when the local currency was probably in great part replaced by Alexandrine coins. At the end of the 3rd century the local coinages are revived until the Roman conquest (67 or 66 B.C.). The chief issue is of silver; bronze is less abundant; and gold is all but unknown. The Cretan types have a markedly local character, yet they copy in some instances other coinages. The chief varieties of Zeus and Athena are in the shape of the island, Britannia, and the leading myths are those of Minos, the story of the Minotaur and the labyrinth being prominent, and also that of Europa. There is frequent reference to nature-worship as in Sicily, yet with a distinctive preference for trees, the forms of which, however, lend themselves readily to the free representation of Cretan art, which may in part explain their prominence. The peculiarity of Cretan art lies in its realism. At some places, as Aptera, Polyrhenium and Cydonia, we find engravers’ signatures. The weight is at first Aeginetic of reduced form; and in the resumption of the coinage after Alexander’s time it is Attic.

Of the island in general there are Roman silver and bronze coins of the earlier emperors, some of which are of fine work for the period. The most interesting types are Dictyna and
Zeus Cretochelus. The autonomous coins are very varied. The obverse of the drachmas of Aptera bears a head of Artemis and the reverse a warrior (Pilotios) before a sacred tree. Of Chersonesus, the port of Lycus, there are drachmas of coarse style, with a head of Artemis Britomartis, who had a temple at the place. The head is copied from Stymphalus, as also is one of the reverse types, Heracles wielding his club. The money of Cnossus is of great interest. The oldest coins may be as early as 480 B.C. They bear the figure of the Minotaur as a bull-headed man, kneeling on one knee, and a maenad-pattern, in one case enclosing a star (the sun), in another a head (Theseus?). Of the period 431-330 there are drachmas with the head of Perses, a fruitless attempt at symbolizing the moon or a bull’s head for the Minotaur, and at length becoming a regular maze. To this time belongs the wonderful coin in the Berlin Museum with Minos seated, his name in the field, and the head of Persephone within the maenad-pattern. In the later 4th century a head of Hera (copied without spirit from the coins of Argos) occupies the obverse of drachmas and drachms, and the reverse has a maze through which the way may be clearly traced. This series closes with Alexander’s empire, and the native coinage disappears until the league of Cephalodorous revives the type of the bull’s head. Thisenames, however, is by no means a probable interpretation, for it is evident that the name of the Cnossians. It is of inferior style, and is followed by base coins with heads of Minos and Apollo, and the Labyrinth, either square as before or in a new circular form, which is interesting as showing it was a mere matter of tradition.

There are interesting coins of Cydonia, some of them of beautiful style and work. One bears an engraver’s name, Neaoutus. The head is that of a Maenad, and the reverse has a figure of the traditional founder Cydon, stringing his bow, who on other drachmas is seen suckled by a bitch. The style is good, but the execution poor. Gortyna, or Gortyta, is represented by most remarkable coins, which generally allude to the myth of Europa. Didrachms of archaic style have on the obverse Europa carried by the bull and on the reverse the lion’s scalp. These pieces are followed by a remarkably fine class of spread drachmas; the best are of about 400 B.C. They have on the obverse Europa seated in a pensive attitude on the trunk of a tree, doubtless the sacred plane at Gortyna, mentioned by Pliny, which was said never to shed its leaves, and on the reverse a bull suddenly turning his head as if stung by a fly (Pl. II. fig. 6). Nothing in Greece exceeds the skill and beauty of these designs.

The truth with which the tree is sketched, and the graceful position of the forlorn Europa are as much to be admired as the fidelity with which the bull is drawn, even when foreshortened, sharply turning his head, with his tongue out and his tail raised. These designs, beautiful in themselves, are strikingly deficient in fitness, and afford equally strong illustrations of the excellencies and of the one great fault of the art of Cretan coins. Many pieces of the same class are of rude execution. Of Itanos there are remarkable coins, the earlier, some of which are of good style, with the subject of a Tritonian sea-god (Glaucus?) and two sea-monsters. Lycus (Lyttus) is represented by strangely rude pieces, with the types of a flying eagle and a boar’s head. The coins of Phaestus form a most interesting series. Among the didrachms are some of admirable work, with on the obverse Heracles slaying the Hydra with his club and on the reverse a bull. Others have on the obverse Heracles seated on the ground, resting. Another noticeable obverse type is the beardless Zeus seated in a tree, with his Cretan name, Velchanos. On his knee is a cock crowing, showing that he was a god of the dawn. We also find Talos, the man of bronze, and the head of Hephaestus on one of them, portrayed as a winged youth naked, bearing in each hand a stone, and in a combatant attitude. Apollonius Rhodius (Argonaut. iv. 1638 sqq.) relates that Talos prevented the Argonauts from landing in Crete by hurling stones at them, until he was destroyed by the artifice of Medea. The important town of Polyrhenium is represented by carefully-executed coins with a head of Zeus and a bull’s head. A later piece has a whiskered head of Apollo, probably Philip V. in that character. Priamius shows the remarkable type of Persophone seated beside a date-palm, placing her right hand on the head of a serpent in reference to the myth of the birth of Zagreus. As usual, the figure is foreshortened. The reverse has a standing figure of Poseidon. Rhaucus has Poseidon beside his horse. The obverse of drachms of Chybria, may fitly close the series; one, among the most exquisite, of the reverse of Dionysus and Hermes in high relief (see Pl. II. fig. 7): another has on the obverse a charming subject, Dionysus seated on a running panther, and on the reverse Hermes drawing on his right burskin,—a delightful figure. Another beautiful type is a seated Dionysus.

The coinage of Erechia is all on the native standard, of which the Athenian variety. It includes some of the very earliest Greek money. Carystus bears the type of a hero with a rude bull’s head, and fine late archaic bear the cow and the cuttle-fish. Eretria was probably the mint of Erechtheus, and a very early, and one of the few coins of Erechtheus in the fine period. Of Hiathea the usual type is the head of a Maenad and a female figure seated on the stern of a galley.

Among the other islands classed after Erechtheus, Amorgos must not be passed over, as a bronze coin of Aegiale, one of its towns, presents the curious type of a cupping-glass. To Andros has been given a group bearing an amphora. The silver money of Carthaea, Coressia and Ithaca in Cretica is extremely old, beginning in each case in the 6th century. The weight is Aeginetic, and there are didrachms and smaller coins. The usual types of Carthaea are an amphora and then a bunch of grapes; that of Coressia is a cuttle-fish and dolphin. The coinage of Delos is insignificant. Melos coined from the early 5th century to imperial times; its chief type is a canting one, the πθορ (pomegranate), of which there are several varieties. Naxos is represented by archaic didrachms and a type of the fine period, the latter bearing bronze pieces of remarkably delicate and good work. The types are Dionysiac. A 7th-century coin with the head of a satyr (one of the engravings of the human head on a coin is probably Naxian. Of Paros there are early Aeginetic didrachms with the type of a kneeling goat and beneath a dolphin. Of the 3rd and 2nd centuries B.C. there are Attic didrachms with a head, possibly Artemis, at first of a charming style, and a goat on the reverse. There are very archaic Aeginetic didrachms of Siphnos, which was famous for its gold and silver mines.

A late tetradrachm of Syros is interesting as representing the Cabiri.

The coinage of Asia begins with that of Asia Minor. It falls into certain great classes—first, the ancient gold and electrum, Lydian and Greek, in time succeeded by electrum or gold and silver, all struck in the west and mainly on the coast. Then the Persian dominion appears in the silver money of the satraps, circulating with the gold and silver of Persia, and the Greek money is limited to a few cities of the coast, none save the electrum of the great mint of Cyzicus uninterrupted by the barbarian. With the decay of the barbarian empire the renewed life of the Greek cities is witnessed by a beautiful coinage along the coast from the Propontis to Cilicia. On Alexander’s conquest autonomy is granted to the much-enduring Hellenic communities, and is again interrupted, but only partially, by the rule of his successors, for there was no time at which Asia Minor was wholly parcelled out among the kings, Greek or native. The Romans, after the battle of Magnesia (190 B.C.), repeated Alexander’s policy so far as the cities of the western coast were concerned, and there is a fresh outburst of coinage, which, in remembrance, follows the name of the emperor. At last, when Asia was constituted and the neighbouring states fell one by one under Roman rule, the autonomy of the great cities was generally reduced to a shadow. Still the abundant issues of imperial coinage, if devoid of high merit, are the best in style of late Greek coins, and for mythology the richest in illustration.

The oldest money is the electrum of Lydia, which spread in very early times along the western coast. This coinage, dating from the 7th century B.C., has an equal claim with the Aeginetic silver to be the oldest of all money.
Probably the two currencies arose at the same period, and by interchange became the recognized currency of the primeval marts; otherwise we can scarcely explain the absence of Asiatic silver, though it is easy to explain that of European electrum or gold. The electrum of the coins is gold—the precious metal washed down by the Pactolus—with a native alloy of a varying part of silver. Its durability recommended it to the Lydians, and it had (by convention) the advantage of exchanging directly with gold. But this commercial advantage allowed the issue of electrum coins on silver standards, while it was natural to coin them on those of gold; hence a variety of weight-systems perplexing to the metrologist. The classification of the earliest coins is exceedingly obscurer; it is hardly possible to say which were struck in Lydia itself, which in the Greek coast cities, such as Miletus; but the majority probably belong to Greek mints. The most primitive in appearance are those in which the obverse is merely marked with lines, corresponding to the original rough surface of the die, while the reverse has three definite objects flanked by two squares (Pl. II. fig. 8); there are also various coins of small denomination with a plain convex obverse, and a single rough depression on the reverse, known from the excavations at Ephesus. Both the Babylonian and the Phoenician standards were in use in early times. This double currency, as Head suggests, was probably intended, so far as the Lydians were concerned, for circulation in the interior and in the coast towns to the west, the Babylonian weight being that of the land trade, the Phoenician that of the commerce by sea. Croesus (Pl. II. fig. 9) abandoned electrum, and issued pure gold (on the Babylonian and gold-shekel standards), and, in the ratio of 13-12, the silver stater exchanging as the tenth of the Euboic gold stater. These results are explained by the metrological data given earlier in this article. Of the Greek marts of the western coast we have a series of early electrum staters, for the most part on the Phoenician weight. An interesting homogeneous group was issued by the various cities which took part in the Ionian revolt (500-494 B.C.). The Euboic weight naturally found its way into the currencies, but was as yet limited to Samos. Phocaea, Teos and Cyzicus, with other towns, followed from a very early period the Phocaic standard, which for practical purposes may be called the double of the Euboic. They alone before Croesus issued gold money, which was superseded at Phocaea and Cyzicus by electrum. This is the main outline of the native coinage of Asia Minor before the Persian conquest. Its later history will appear under the several great towns, the money of Persia (which circulated largely in Asia Minor) being treated in a subsequent place.

The first countries of Asia Minor are Bosphorus and Colchis, the coins of the cities of which are few and unimportant. The autonomous coinages of the cities of Pontus are more numerous, but the only place meriting a special notice is Amisus, which almost alone of the cities of Pontus seems to have issued autonomous silver money. The common subjects of the bronze money of this place relate to the myth of Perseus and Medusa, a favourite one in this country. The regal coins are of the old kingdoms of Pontus and of the Cimmerian Bosphorus, of the two united as the state of Bosphorus and Pontus under Mithradates VI. (the Great), and as reconstituted by the Romans when Polemon I. and II. still held the kingdom of Mithradates, which was afterwards divided into the province of Pontus and the kingdom of Bosphorus. The early coinage of the kingdom of Bosphorus is of little interest. Of that of Pontus there are tetradrachms, two or three of which, of Mithradates IV. and Pharnaces I., are remarkable for the unflinching realism with which they barbarian type of features is preserved. Mithradates VI., king of Bosphorus and Pontus, is represented by gold staters, and tetradrachms. The portrait on the best of these (see Pl. II. fig. 10) is fine despite its theatrical quality, characteristic of the later schools of Asia Minor. The kings of Bosphorus struck a long series of coins for the first three and a half centuries after the Christian era. Their gold money (the only non-imperial gold allowed under the empire) is gradually depreciated and becomes electrum, and ultimately billon and bronze. They bear the heads of the king and the emperor, and are dated by the Pontic era (297 B.C.).

In Paphlagonia we must specially notice the coins of the cities Amastris and Sinope. The silver pieces of the former place represent a youthful head in a laureate Phrygian cap, probably representing Mithras, Amastris, the city of Pontus, and the god is holding a dolphin. The silver pieces of Sinope are plentiful. In the 4th century they bear the names of Persian governors. The type is the head of the nymph Sinope and, as at Istrus, an eagle preying on a dolphin. Bithynia is represented by a more important series. The provincial diet issued Roman silver medallions of the weight of cistophori (to be presently described), with Latin inscriptions, and bronze pieces with Greek inscriptions. The ordinary silver coins of Chalkedon strikingly resemble on both sides those of Dyautianum, and a monetary convention allowed coins with reverse side bearing a dolphin. This coinage was spread far beyond the Bosporus. The Bithynian kings consists of Attic tetradrachms and bronze pieces, issued by Zizanias Prusias I. and II., and Nicomedes I.-II., the last of whom issued the first Greek coinage in Asia Minor to begin with Myssia. Cyzicus is in numismatics a most important city. Its coinage begins in the 6th century; and the famous electrum Cyzicene stater were struck here for nearly a century and a half (c. 500-350 B.C.). During that whole period they were not only the leading gold coinage in Asia Minor but the chief currency in that metal for the cities on both shores of the Aegean; the value at which they were rated was doubtless a matter of convention, and varied from time to time. The actual weight is of the Phocaic standard, just over 248 grains. The diameter was the tenth or sixth, and the twelfth. The extraordinary variety of "types" at Cyzicus is due to the fact that these types are really symbols differentiating the issues, the true badge of the city, the tunny-fish, being relegated to a subordinate position (Pl. II. fig. 11). The reverse invariably has the quadripartite incuse square in four planes of the so-called mill-sail pattern. The coins are very thick and the edges are rude. The art is frequently of great beauty, though sometimes careless. The silver coinage of Cyzicus comprises beautiful tetradrachms of the Rhodian standard, with a head of Persephone ΠΩΛΕΙΤΩΡ, veiled and wreathed with ears of corn. Both late autonomous and imperial coins in bronze are well executed and full of interest, the two classes running parallel under the earlier emperors.

Lampsacus is represented by a long series of coins. Its distinctive type is the forepart of a Pegasus, which occurs on its coins from the 6th century onwards. In the first half of the 4th century it issued splendid gold staters with various types (really, as at Cyzicus, symbols distinguishing the issues) on the obverse and the half-Pegasus on the reverse. The most remarkable type is a bearded head (probably of a Cabirus) with streaming hair in a conical cap bound with a wreath, singularly pictorial in treatment as well as in expression (Pl. II. fig. 12). In contrast to this is a most carefully executed head of a Maenad with goat's ear; and other types of great interest are the Earth-goddess rising from the earth, and Victory nailing a helmet to a trophy, or sacrificing a ram.

The money of the great city of Pergamum is chiefly of a late time. Apart from some rare pieces of gold, the silver coinage is chiefly supplied by the money of the kings of Pergamum and by cistophori. The bronze pieces of the city are numerous, both autonomous and imperial, the two classes overlapping, and there are medallions of the emperors. The local worship of
Aesculapius is especially prominent under the Roman rule. The chief coins of the kings are Attic tetradrachms, with on the obverse a laureate head of Philetairos, the founder of the state, and on the reverse a seated Athene, the common type and diastemachus, from whom Philetairos revolted. Variations from these types are rare, the most important being a coin with the name of Eumenes (II.), representing his portrait and the Dioscuri. Otherwise the inscription is always ΠΙΔΕΤΑΙΡΟΥ. The cistophoroi probably originated at Ephesus towards the end of the 3rd century, but was soon adopted for the Pergamum dominions, and down to imperial times was the only important silver currency in Asia Minor. It acquired its name from its obverse type, that of a horse, based from which a serpent issues, the whole enclosed in an ivy-wreath. The reverse type represents two serpents, and between them usually a bow-case (Pl. II. fig. 13). The half and the quarter of the cistophoroi have on one side a bunch of grapes on a leaf or leaves of the vine, and the club with the lion's skin of Heracles within an ivy-wreath. They were tetradrachms equal in weight to about three Attic drachms or three denarii. These coins became abundant when the kingdom of Pergamum was transformed into the province of Asia, and are struck at its chief cities, as Pergamum, Adramyttium, the Lydian Stratonicea, Thyatira, Sardis, Smyrna, Ephesus, Miletus, etc., by the same Laodicea. The first the names of Greek magistrates, afterwards coupled with those of Roman proconsuls or praetors. The silver medallions of Asia, the successors of the cistophori, range from Mark Antony to Hadrian and Sabina. They bear no names of cities, but some may be attributed by their references to local forms of worship. The obverse bears an imperial head, the reverse a type either Greek or Roman. The art is the best of this age, more delicate in design and execution than that of any other pieces, the Roman medallions excepted. One of the most remarkable imperial bronze coins of Asia Minor represents the Great Altar (Pl. II. fig. 16). The coinage of the Troad is interesting from its traditional allusions to the Trojan War. Of Abydos there is a fine gold stater, with the unusual subject of Victory sacrificing a ram, and the eagle, which is the most constant type of the silver money. One of the few imperial coins commemorates the legend of Hero and Leander. The late tetradrachms of Alexandria Troas bear the head of Apollo Sminthus, and on the reverse his figure armed with a bow. There is a long series of the town as a colony, of extremely poor work. Illium Novum strikes late Attic tetradrachms with a head of Athene, and on the reverse the same goddess crowned with the inscription ΑΘΗΝΑΣ ΛΑΙΔΑΣΟΣ. On the autonomous and imperial bronze we notice incidents of the tale of Troy, as Hector in his car, or slaying Patroclus, or fighting; and again the flight of Aeneas. The island of Tenedos is represented by very early coins, and others of the fine and late periods. The usual obverse type of all the silver pieces is a Janus-like combination of two heads, presumably some primitive god and his consort; this double type is balanced on the reverse by the double-axe, which played an important part in the primitive coinage of Asia Minor and the Aegaean.

In Aeolis the most noteworthy coins are the late tetradrachms of Cyme and Myrina, both of the time of decline, yet with a certain strength which relieves them from the general weakness of the work of that age. Cyme has the head of the Amazon Cyne, and a horse within a laurel-wreath; Myrina, a head of the Grunean Apollo and his figure with iustral branch and patera. Lesbos is remarkable for having coined in base as well as pure silver, its early billon coins being peculiar to the island. This base coinage, which was probably common to Mytilene and Methymna, ceases about 450 B.C., when the Mytilenean style begins, Methymna has very interesting archaic silver coins, with the boar and the head of Athene. But the most important coinage of Lesbos is the beautiful electrum coinage (a unique stater, Pl. II. fig. 14, and innumerable sixths) which was issued from about 480 to 350. Phocaea in Ionia issued similar coins, distinguished by a seal (the badge of the city), and a convention regulating the weight and quality of the two coins, and arranging for the two mints to work in alternate years, is still extant. The type varies accordingly, as at Cyzicus and Lampasus. There is a long and important series of Mytilene of an imperial time, including very interesting commemorative coins, some of personal representations of various cities, such as Pittacus and Sappho, others of benefactors of the city, and some of heroes such as Lysicles, Pompey, from whom he obtained for this his native place the privileges of a free city. The usual style for these persons is hero or heroine, but Theophaestus is called a god, and Archelamus, probably his wife, a goddess.

The money of Ionia is abundant and beautiful. For the first century and a half (c. 700–545) the chief coinage is of electrum. To the 7th century belongs the remarkable coin inscribed ΦΑΝΟΙ ΕΜΙ ΣΗΜΑ ("I am the badge of the Bright One," or "of Phanes"), with a stag, which was perhaps issued at Ephesus. From 545 to the Ionic revolt (494) there is considerable diminution in the coinage; silver attains more importance. Thenceforward, the course of the coinage is fairly uniform until the period 301–190, when there is a general cessation of autonomous issues. After the battle of Magnesia there is a great revival, tetradrachms of Alexandrine and also of local types being issued in vast numbers. After the constitution of the Roman province of Asia (133), the cistophori supply the silver coinage. The imperial bronze coinage is numerous, with many interesting local types. Of the coinage of Ephesus the following demand mention. At Clazomenae in the 4th century there are splendid coins, having for types the head of Apollo, three-quarter face, and a swan. The chief pieces, the gold drachm and a half or octolab, and the silver stater or tetradrachm present two types of the head of Apollo, very grand on the gold and the silver, with the signatures of Theodotus, the only known Attic engraver, and richly beautiful on the other silver piece. These coins are marked by the intense expression of the school of western Asia Minor. Colophon has distinctive coins of the 5th century with the head of Apollo and the lyre.

The money of Ephesus is historically interesting, but very disappointing in its art, which is limited by the small range of subjects and their lack of beauty. The leading type is the bee; later the stag and the head of Artemis appear. Thus the subjects relate to the worship of the famous shrine. The oldest coins are electrum and silver, both on the Phoenician standard. The type is a bee and the reverse is incuse. The silver coinage continues with the same type, broken by the Persian domination, until in 334 B.C. a remarkable new coin appears. When Conon and Pharnabazus defeated the Lacedaemonian fleet and liberated the Greek cities of Asia from Spartan tyranny a federal coinage was issued by Rhodes, Cnidos, Samos, Ephesus, Iasus and Byzantium with their proper types on the reverse, but on the obverse the infant Heracles strangling two serpents; these are Rhodian tridrachms. About this time the Rhodian standard was introduced, and a series of tetradrachms began with the bee, having for reverse the forepart of a stag looking back, and behind him a date-palm. The head of Artemis as a Greek goddess begins to appear in the 3rd century. Other series of coins follow with types associated with Artemis, Rhodian and Attic standards alternating; there are also Alexandrine tetradrachms and of course cistophori. The connexion of the city with Lysimachus, who called it Arsinöe, after his wife, is commemorated by coins inscribed ΑΡΣΙΝΟΗ. The Ephesian form of Artemis, as the cultus figure of a nature-goddess, first appears as a symbol on the cistophori, and then on gold coins struck during the revolt of 87–84, when Ephesus took the side of Mithradates. The figurine represents many representations of the temples of the city, including that of the famous shrine of Artemis, which shows the hands of sculpture on the columns, as well as many other remarkable subjects, particularly the Zeus of rain seated on Mount Pelion, a shower falling from his left hand, while below are seen the temple of Artemis and the river-god Cayster; on another coin the strange Asiatic figure of the goddess, frequent in this series, stands between the personified rivers Cayster and
Cnenchirus. The money of the Ionian Magnesia begins with the issue of Themistocles, when he was dyasnt under Persian protection. The ordinary silver coins (350-190 B.C.) representing a cavalryman and the river-god Maeander as a bull are common. After 190 B.C. we have spread tetradrachms of the decline of art, more delicately executed than those of Cyme and Myrina, with a bust of Artemis and a figure of Apollo standing on a maecander and leaning against a lofty tripod, the whole in a laurel-wreath. The great city of Miletus is disappointing in its money. The period of its highest prosperity is too early for an abundant coinage, yet in the oldest electrum issues we see the lion and the sun of Apollo Didymeus. In the early 4th century the Carian dynasts issued coins from Ephesus. To about 350 B.C. belong the beautiful coins bearing the head of Apollo facing and the lion looking back at a sun, with the inscription ΕΠΙ ΔΙΑΔΩΜΝΗ ΕΠΕΗ (scil. δραχμη), showing that this was the sacred money of the famous temple at Didyma. The types of the head of Apollo in profile and the lion with the sun continue through a series of various standards with very rare Attic gold staters of the early 2nd century. Phocaea is represented by two very interesting currencies; an electrum series of hectae, characterized by a seal, the badge of the town, beneath the type, struck in connection with Mytilene (see above); and also a widespread early silver coinage, apparently common to the western colonies of the city. The autonomous money is wholly anterior to the Persian conquest. Smyrna, issued in the 4th century a very rare coin with the head of Hera, was already a city of much interest about 350 B.C. When the Carian Artaxerxes in 466 B.C., struck a tetradrachm to change the name of Caria to Artakes. Among the earliest coins of New Smyrna are some showing that Lysimachus named it Eurydice after his daughter. After 190 B.C. it strikes Attic tetradrachms, with the turreted head of Cybele or the city or the Amazon Smyrna (Pl. II. fig. 15), and an oak-wreath sometimes enclosing a lion. A rare silver coin and common bronze coins present on the reverse the seated figure of Homer. A gold coin issued by the Prytaneis of the Smyrnaeans probably belongs to the time of the Mithradatic revolt against Rome (67-84). The imperial coins have numerous types, among others the two Nemeses appearing to Alexander in a vision.

Of Teos there are early Aeginetic didrachms, bearing on the one side a seated griffin and on the other a quadrupartite incuse square. These ceased at the moment when the population left the town, destroyed by the Persians, and fled to Abyden, where we recognize their type on the coinage of the time. There are much later coins of less importance. Samos and Smyrna, the two great Ionian cities represented by interesting currencies. Chios struck electrum and abundant silver. The type was a seated sphinx with curled wing, and before it stands an amphora, above which is a bunch of grapes; the reverse has a quadrupartite incuse. The coins begin before the Persian conquest (490 B.C.). The coinage of Samos is artistically disappointing, but as a whole has many claims to interest. The earliest money included electrum.

The silver begins before 494 B.C. The types are the well-known lion's scalp and bull's head. The Athenian conquest (439 B.C.) is marked by the introduction of the olive-spray as a constant symbol on the reverse and the occasional occurrence of Attic weight. The Samians, having joined the anti-Laconian alliance after Conon's victory in 394 B.C., struck the coin with Hercules strangling the serpents already noticed under Ephesus; the Rhodian weight is found only in the long series. The early coinage was without interesting types. The most remarkable is the figure of the Samian Hera, which clearly associates her with the group of divinities to which the Ephesian Artemis belongs. Very noticeable also are the representations of Pythagoras, seated or standing, touching a globe with a wand.

The money of Caria does not present any one great series. Autonomous silver coins are not numerous except at Cnidus, Caria, and rarely of good style. Antiochia and Alabanda have tetradrachms in the 2nd century. The imperial coins of Antiochia and of Aphrodisias are worthy of notice. Cnidus is represented at first by archaic coins of Aegiotic weight, some of the early 4th century having a very rude head of Aphrodite. The head of the famous statue of Aphrodite by Praxiteles is not reproduced, but the whole statue figures on imperial coins. Among the imperial types of Halicarnassus the head of Herodotus is noteworthy. There is late silver money of Isias with the head of Apollo, and a youth swimming beside a dolphin around which his arm is thrown. Idyma has silver pieces of fine style on which the head of Apollo is absolutely facing; the reverse type is a fig-leaf. On imperial coins of Mylaea the figure of the Zeus of Labranda holding double-axes and spear is represented. Of Termesa we have the rare coin of its tyrant Tymmes, dating about the middle of the 5th century and struck on an electrum standard. There is another type which combines with archaic Greek forms others which are unknown to the Greek alphabet, and it expresses a native language as yet imperfectly understood. The art is still and delights in animal forms,
sometimes of monstrous types, which recall the designs of Phoenicia and Assyria. The most remarkable symbol is the triskele or tetrakeles symbol, an object resembling a ring, to which three or four hooks are attached. It is supposed to be a solar symbol like the swastika. The oldest money has a boar or his fore-part and an incuse. This is succeeded by a series with an animal reverse, and then by one in which the hooked ring is the usual reverse type. The fourth series bears Lycean inscriptions, which give the names of dynasties and places. A fifth series is characterized by the type of a lion's scalp. This coinage reaches as late as Alexander's time. It is followed by silver and bronze money of the Lycean League before Augustus and under his reign, but differing in that of Claudia—the usual types of the chief silver piece, a hemidrachm, being the head of Apollo and the lyre. The districts of Cragus and Masicytus have coinages, as well as the individual cities. Besides this general currency there are some special ones of towns not in the League. The imperial money rarely goes beyond the reign of Augustus, and is resumed during that of Gordian III. There is a remarkable coin of Myra of this emperor, showing the goddess of the city, of a type like the Ephesian Artemis, in a tree; two woodcutters, each armed with a double axe, hew at the trunk, from which twigs sprout. This is probably to protect it and aid the goddess. Phaselis is an exceptional town, for it has only Greek coins, the leading type being a galley.

The coinage of Pamphylia offers some examples of good art distinctly marked by the Asiatic formality. Aspendus shows a remarkable series of Persic dirachms, extending from about 500 B.C. to Alexander's time. The oldest coins have the types of a warrior and the triskelion or three legs, more familiarly associated with Sicily; it is probably a solar symbol. These coins are followed by a long series with the types of two wrestlers engaged and a slinger. The main legend is almost always in the Pamphylian character and language. There are also very curious imperial types. The money of Perga begins in the 2nd century with Greek types of the Artemis of Perga. Her figure in a remarkable Asiatic form occurs in the long imperial series. Bronze coins earlier in date than the silver money with the Greek types have the Pamphylian title of the goddess, ΦΑΝΑΣΑΣ ΠΕΡΙΛΑΣ, "of the Lady of Perga." Side has at first Persic dirachms of about 480 B.C., their types the pomegranate and dolphin and head of Athene; then there are money with an undeciphered Aramaizing inscription of the 4th century, and figures of Apollo and late Attic tetradrachms, their types being the head of Athene and Victory. These were carried on by Amyntas, king of Galatia, when he made his mint in Side (36 B.C.). The pomegranate (οἶνος) is throughout the badge of the city.

The money of Pisidia is chiefly imperial. There is a long series of this class of the colonia Antonia. The autonomous coins of Sege have the wrestlers and the slinger of Aspendus in inferior and even barbarous copies. Of Issaura and Lycaonia a few cities, including Derbe and the colonies of Ionia and Lystra, strike coins, chiefly of imperial time.

Cilicia, for the most part a coastland, is numismatically of high interest. To Aphrodisias is assigned an interesting series of archaic coins with a winged figure and a pyramidal fetish-stone; in the 4th century Aphrodisite is represented in human form seated between sphinxes; the Parthenos of Pheidias is also represented. Celenderis has a coinage beginning in the 5th century, with a horseman seated sideways on the obverse, and on the reverse a goat gazing to the right, which is one of the most interesting series of silver coins, some with curious Asiatic types. Of Nagidus there are Persic dirachms of good style, one interesting type being Aphroditic seated, before whom Eros flies crowning her, with, on the other side, a standing Dionysos. Soli has silver coins of the same weight, the types being an archer or the head of Athene, one variety imitated from remote Velia, and a bunch of grapes. The coinage of Tarsus begins in the 5th century with Persic staters representing a Cilician king on horseback, and a hoplite kneeling.

In the 4th century it was the mint of a large series of satrapal coins, issued by Pharnabazus, Mithridates and other governors (Issus, Mallus and Soter also sharing the cost of minting). The most curious type is the sacred stag or Taurus, on which appears, on the reduced Rhodian standard, and a solitary Attic tetradrachm of Paphos. The art is usually very stiff down to about 400 B.C., with types of Egypto-Phoenician or Phoenician or of Greek origin. The most curious type is the stag, for the money goes before the stag, and it is usually one-sided. The prevalent types are animals or their heads, the chief subjects being the bull, the lion, the lion seizing the stag, the deer and the mythical sphinx. The divinities we can recognize are Aphrodite, Heracles, Athene, Hermes and Zeus Ammon. But the most curious mythological types are a goddess carried by a bull or by a ram, in both cases the goddess is seated, her right hand on the ram's neck. There is an Attic of the 2nd century, which symbol is the well-known Egyptian sign of life. The coins appear to have been struck by kings until before the age of Alexander, when the money appears. The mints to which coins are ascribed with certainty are Salamis, Paphos, Tarsus, and Tavium. The silver coins of the Salaminian line are in silver and gold. The earlier, beginning with Euthênion about 560 B.C., have Cyprian, the later with Seleucid types before the year 283 B.C. The greatest type is the temple at Paphos, represented as a structure of two storeys with wings. Within the central portion is the sacred stone, in front a semicircular enclosure.

The earliest coinage of Lydia is no doubt that of the kings, already described. The next currency must have been of Persian darics (gold) and darics (silver), followed by that of Alexander. Lydia. Lydian. Lydian. Lydian.

The coinage of Phrygia has the same general characteristics as that of Lydia, but the workshop is poorer. Among noteworthy types must be noticed Men or Lucas; the Phrygian moon- she and the head of Arethusa on the facing types of Kibotos or the Ark, and more anciently Celaenae. One of Severus represents the legend of the invention of the double pipe, a type already described. Of the same and later emperors are coins bearing the famous type of the ark of Noah and thiasos MNE, the town of Cibyra is remarkable for a silver coinage of the 1st century B.C., of which the large pieces have the weight of cistophoroi.

Galatia has little to offer of interest. Trajan issued bronze imperial coins for the province, and there is imperial money of Ancyra, Pessinus and Tavium. The only remarkable regal issue is that of Amyntas, Strabo's contemporary, who struck tetradrachms at Side 150 B.C.

With the coinage of Cappadocia we bid farewell to Greek art and enter on the domain of Oriental conventionalism, succeeded by interior Roman design coarsely executed. There is one large imperial series, issued by Gordian III, and another new issue circulation in the province. The issues range from Tiberius to Gordian III., and are in silver and bronze. The most common type is the sacred stag, on which appears — a remarkable type curiously varied. There are scanty issues of a few other towns. There is an interesting series of the coins of the kings of Cappadocia, beginning with Ariarathes I. (c. 320-310 B.C.), continuing with another kings, called usually Ariarathes or Ariobarzanes, who struck Attic drachmas and occasionally tetradrachms. The rare tetradrachms of Orontobates, who died about 268 B.C., are superb. The coins of Archelaus, the last king set up by Antony (36 B.C.—A.D. 17), have a good head on the obverse. Of Armenia there are few silver and bronze coins of late sovereigns.

The great series of Syrian money begins with the coinage of the Seleucid kings of Syria, only rivalled for length and
abundance by that of the Ptolemies, which excels in its series of portraits, though it is far inferior in its gold money and wants the large and well-executed bronze pieces which make the Egyptian currency complete. The gold of the Seleucids is scarce, and their main coinage is a splendid series of tetradrachms bearing the portraits of the successive sovereigns. The reverse types are varied for the class of regal money. The execution of the portraits is good, and forms the best continuous history of portraiture for the third and second centuries before our era. The reverses are far less careful.

The weight is Attic, but the cities of Phoenicia were ultimately allowed to strike on their own standard. Many of the coins of the earlier kings were issued in their Bactrian or Indian dominions. Seleucus I. (312-280 B.C.) began by striking gold staters and tetradrachms with the types of Alexander the Great. The same king, like his contemporaries, then took his own types: for gold staters, his head with a bull's horn, and on the reverse a horse with bull's horn; for tetradrachms, his own head in a helmet of hide with bull's horn and lion's skin and Victory crowning a trophy, or the head of Zeus, and Athena fighting in a chariot drawn by four or two elephants with bull's horns. Antiochus I. (263-261), like his father, struck tetradrachms with Alexanderine types, and then with his own head, Apollo on the obverse occupying the reverse. The portrait of Antiochus has a characteristic realism. Antiochus III. (222-187) is represented by a fine and interesting series with a vigorous portrait. He alone of the Seleucids seems to have struck the great octadrachm in gold in rivalry of the Ptolemies. Coins dated by the Seleucid era (312 B.C.) first appear in this reign. The portrait of Antiochus IV. Epiphanes (175-164) is extremely characteristic, marked by the mad obstinacy which is the key to the tyrant's history. The most remarkable coin is a tetradrachm with the head of Antiochus in the character of Zeus. In his time mints became numerous in the bronze coinage, and there is a remarkable series in that metal with Ptolemaic types, marking his short-lived usurpation in Egypt. From the time of Demetrius I. (162-150) the silver tetradrachms bear both mints and dates. In one type the heads of Demetrius and Queen Laodice occur side by side. With Alexander Balas (152-144), Tyre and Sidon begin to strike royal tetradrachms on their own Phenician weight. Tarsus also first strikes coins for him with the type of the pyre of Sandan. The money of young Antiochus VI. presents the most carefully executed portrait in the whole series, which, despite its weakness, has a certain charm of sweetness that marks it as a new type in art. The same artist's hand seems apparent in the fine portrait of the cruel usurper Tryphon, and also in the pictureque spiked Macedonian helmet with a goat's horn and cheek-piece which occupies the reverse. Antiochus VII. (138-129) seems to have borne the burden of his reign; the portrait of Antiochus VIII. Epiphanes (129-125) is remarkable for the same reason. The portrait of Antiochus IX. (125-116) appears in a new series; amongst other coins, the solitary bronze piece of Jerusalem, bearing the lily and the Seleucid anchor. Alexander II. Zebina (128-123) is represented by a unique gold coin (Pl. II. fig. 18), as well as by silver and bronze. The empire closes with the money of the Armenian Tigranes (83-69), bearing his portrait with the lofty native tiara, and for reverse Antioch seated, the Orontes swimming at her feet (a copy of the famous group by Eutychides).

There is a copper coinage of the Syrian koineus under Trajan; also of the cities of Commagene, Samosata and Zeugma, and less important mints. The money of the kings of Commagene is in bronze (c. 50 B.C. to A.D. 72).

Cyrrhoes, a type of silver coins is amongst other coins, the solitary bronze piece of Jerusalem, bearing the lily and the Seleucid anchor. Alexander II. Zebina (128-123) is represented by a unique gold coin (Pl. II. fig. 18), as well as by silver and bronze.

The empire closes with the money of the Armenian Tigranes (83-69), bearing his portrait with the lofty native tiara, and for reverse Antioch seated, the Orontes swimming at her feet (a copy of the famous group by Eutychides).
coins in this period, sometimes under the name of Laodicea in Canaan. Acro-Ptolemaic (Acre) was an important mint under the Ptolemies; for a time, under the Seleucids, it was called Antioch in Ptolemais. Besides the Seleucidae autonomic eras are in use at some of the cities, as at Aradus (259 B.C.), Sidon (111 B.C.) and Tyre (126 B.C.). Under the empire there are some very large coinages of bronze, besides a certain amount of silver resembling that of Antioch. The quasi-autonomous silver of Tyre was also issued as late as A.D. 57. Berytus (a colonia) has types relating to the cults of Astarte and Poseidon; Astarte is also prominent at Sidon (a colonia from Elagabalus onwards; a common type is represented the wheeled shield of the goddess) and Tripolis. At Byblos a temple is represented with a conical fetish. Tyre has many interesting types: Dido building Carthage; the Ambrosial Rocks; Cadmus fighting the serpent or founding Thbes, &c. Ptolemais issued coins as a colony from Claudius onwards.

In Trachonitis, the only city of importance is Caesarea Panias, with a famous grotto of Pan, perhaps represented on an imperial coin. Several cities in Decapolis issued imperial coins, among them Gadara and Gerasa. In Gaul the coins struck at Tiberias by its founder, Herod Antipas, may be mentioned. Samaria has money of Caesarea, both autonomous and imperial. Pella is the most part colonial, and also imperial of Neapolis, among the types of which occurs the interesting subject of Mount Gerizim surmounted by the Samaritan temple. The coinage of Judaea is an interesting series. The money of Jerusalem is of high interest, and more extensive than appears at first sight. Here was struck the coin of Antiochus VII, with the native lyl as a type, the series of the Maccabean princes, that of the Roman procurators, and the bronze coins countermarked by the tenth legion, quartered by Titus in the ruins of the city. One of these bears the remarkable symbol of a pig. After the reduction of Judaea in the reign of Hadrian, Jerusalem became the capital and chief city of the Galilee. The earliest coin commemorates the foundation. The coinage lasts as late as Valerian. Ascalon strikes autonomous silver and bronze, including remarkable tetradrachms with the portraits of Ptolemy Auletes, of his elder son Ptolemy XIV., and of his daughter Cleopatra (see Pl. II. fig. 21). There is also money of Gaza of some importance; the earliest coins are Attic drachms, &c., of barbarous style, inspired by Greek, especially Athenian models; on its imperial coins the god Manna, and Minos and Io are named.

The independent Jewish coinage begins with the famous shekels. They have been assigned to various periods, but the preponderance of evidence would class them to Simon Maccabaeus, to whom the right of coining was granted by Antiochus VII. The series is of shekels and half-shekels, of the weight of Phoenician tetradrachms and diobol or drachm. The obverse of the shekel bears the inscription "the shekel of Israel," and for type a sacred vessel of the temple, above which (after year 1) is the letter indicating the year of issue and the initials of the word year. The reverse reads "Jerusalem the Holy," and the type is a flowering branch (Pl. II. fig. 19). The half-shekel differs in having the inscription "half-shekel" on the obverse. The types are markedly peculiar; the obverse inscription is equally so, for the regular formula of the neighbouring cities would give nothing but the name of the city; but the reverse inscription is like that of Tyre and Sidon, for instance, "of Tyre sacred and inviolable." This agreement is confirmatory of the assignment to Simon Maccabaeus. This coinage bears the dates of years 1, 2, 3, 4 (rare), and 5 (very rare). There has been much discussion as to the date. It is best reckoned from the decree of Antiochus VII. autonomous of the fifth year were then struck by John Hyrcanus. The certain coins of the successors of Simon are small bronze pieces of John Hyrcanus (135–104), of Judas Aristobulus (104–103), of Alexander Jannaeus (103–76), who strikes bilingual Hebrew and Greek and also Hebrew coins, showing his native name to have been Jonathan, and of Antigonus (40–37), who has the Hebrew name Mattathiah. The types represent only inanimate objects. The Maccabean coinage is followed by that of the Herodian family, equally of bronze, the two most important issues being those of Herod the Great and the satrap Antipas. The small silver coinage under the early empire was chiefly supplied by the issues of Antiochus and Roman denarii; the "penny " with Caesar's image and superscription was such a denarius. The money of the procurators of Judaea, in part parallel with the Herodian, is of small bronze coins, struck between A.D. 6–7 and A.D. 58–59, the latest period of their administration being as yet unrepresented. These are followed by two classes, the money of the first revolt (A.D. 66–70) and that of the second (suppressed A.D. 135). Both risings caused the issue of native coinage, some of which may be assigned with certainty to each. Of the first revolt are bronze pieces of years 2, 3, and 4. Of the second revolt are re struck Antiochene tetradrachms and Roman denarii, usually with the name of Simon, which appears to have been that of the leader surnamed Bar Cochebas. The obverse type of the tetradrachms or shekels is the portico of the temple; on the reverse are a bundle of branches and a citron, symbols of the feast of tabernacles. Besides this native currency there are coins struck in Palestine by Vespasian, Titus and Domitian.

Of Roman Arabia there are bronze imperial coins of Bostra and less common mint of Nabataea. In the Roman province of Judaea are struck silver and bronze coins from Aretas III. (c. 87–62 B.C.) to Aretas IV. (A.D. 75–101). From S. Arabia comes a remarkable silver coinage issued by the Himyraean kings during the three centuries, of which kings, striking with Roman emperors in silver and bronze. Curiously, this and the colonial issue are long contemporary. The colonial coinages of Nisibis and of Rassiana, which became a colony, close the group. Abydus was probably a mint of Alexander the Great and of many of the Seleucid kings, certainly of the usurpers Mollon (220–220) and Timarchus (162 B.C.).

Africa. The coins of Africa are far less numerous than those of the other two continents, as Greek, Phoenician and Roman civilisation never penetrated beyond Egypt and the northern coast to the west. The series of Egypt is first in geographical order. As yet no coins have been here assigned of a date anterior to Alexander. The old Egyptians kept their gold, electrum and silver in rings, and weighed them to ascertain the value. During the Persian rule the Persian money must have been current, and our present information is that the coinage of silver under Darius I. With Alexander a regular Greek coinage must have begun, and some of his coins are of Egyptian mints. A rare bronze coin was struck at Nautocratis, probably during his lifetime. With Ptolemy I. the great Ptolemaic currency begins, which lasted for three centuries. The characteristics of this coinage are its splendid series of gold and silver and the bronze money. The execution of the earlier heads is good; afterwards they become coarse and careless. At first the fine pieces were issued by the Phoenician, Cyprian and other foreign mints, the Egyptian work being usually inferior. While the Seleucids were still striking good coins, the Ptolemies allowed their money to fall into barbarism in Egypt and even in Cyprus. The obverse type is a royal head, that of Ptolemy I. being the ordinary silver type (see Pl. II. fig. 22), while that of Arsinoë II. was long but not unintermittently continued on the gold. The head of Zeus Ammon is most usual on the bronze coinage. A type once adopted was usually retained. Thus Ptolemy I., Arsinoë II., Ptolemy IV., Cleopatra I., have a kind of commemoration in the coinage on the analogy of the Seleucid range of each royal pair. The almost universal type of reverse of all metals is the Ptolemaic badge, the eagle on the thunderbolt, which, in spite of variety, is always heraldic. For art and iconography this series is far inferior to that of the Seleucids. The weight after the earlier part of the reign of Ptolemy I. (who experimented with the Attic and Rhodian standards) is Phoenician for gold and silver; the metrology of the bronze is obscure. The chief
coins are octadrachms in gold and tetradrachms in silver, besides the abundant bronze money. Ptolemy I. appears to have issued his money while regent for Philip Arrhidæus (323-318); it only differs in the royal name from that of Alexander. He then struck money for Alexander IV. (317-311) on the Attic standard with the head of Alexander the Great, with the horn of Ammon in the elephant's skin and Alexander's reverse. He soon adopted a reverse of his own, that of Athena Promachos. The money he con-
tinued to strike after the young king's death until he himself (305) took the royal title, when he issued his own money, his portrait on the obverse, that of the eagle and thunderbolt with his name as king on the other. This type in silver, with the in-
scription "Ptolemy the king," is thenceforward the regular currency. He also issued gold stater (reverse, Alexander the Great in an elephant-car). Ptolemy II. (Philadelphus, 285-
247), the richest of the family, continued his father's coinage. Ptolephus also began (after the death and deification of Alexander II., about 271 B.C.), the issue of the gold octadrachm with the busts of Ptolemy I. and Berenice I., Ptolemy II., and Arsinoë II., and certainly struck beautiful octadrachms in gold and decadrachms in silver of Arsinoë II., the gold being long afterwards continued. Philadelphus also began the great bronze issues of the system. Ptolemy III. (Euergetes I. c. 247-223) struck gold octadrachms with his own portrait, wearing a crown of rays. His queen Berenice II., striking in her own right as heiress of the Cyrenaica and also as consort, issued a showy currency with her portrait, both octadrachms and decadrachms like those of Arsinoë, and a coinage for the Cyrenaica of peculiar device. Under Ptolemy IV., Philopator (222-205) the gold-
coined octadrachms are continued with his portrait and that of Arsinoë III. Ptolemy V. (Epiphanes, 205-181) still strikes octadrachms with his portrait and with that of Arsinoë, and begins the con-
tinuous series of the tetradrachms of the three great cities of Cyprus. The coinage thenceforward steadily degenerates in style and eventually also in metal. In the latest series, the money of the famous Cleopatra VII., it is interesting to note the Egyptian variety of her head, also occurring on Greek imperial money and on that of Ascanol. Under the Roman rule the imperial money of Alexandria, the coinage of the imperial province of Egypt, is the most remarkable in its class for its extent and the interest and variety of its types. It begins under Augustus and ends with the usurper or 
patriot Achilleus, called on his money Domitius Domitianus, 
overthrown by Diocletian (A.D. 297), thus lasting longer than 
Greek imperial money elsewhere. In the earlier period there are 
base silver coins continuing the base tetradrachms struck by 
Auletes, and bronze money of several sizes. Most of the coins are 
dated by the regnal years of the emperors, the latter L. being unused. Under the Romans the types are very various, and may be 
broadly divided into Greek, Graeco-Roman and Graeco-
Egyptian. The Graeco-Roman types have the closest analogy to 
those of Rome herself; the Graeco-Egyptian are of high 
interest as a special class illustrative of the latest phase of 
Egyptian mythology. These native types, at first uncommon, 
from the time of Domitian are of great frequency. The money 
of Trajan, Hadrian and Antoninus Pius is abundant and 
intriguing. A coin of Antoninus, dated in his sixth year, records 
the beginning of a new Solstitial cycle of 1460 years, which 
happened in the emperor's second year (A.D. 139). The reverse 
type is a crested crane, the Egyptian bennu or phoenix, with 
a kind of radiate nimbus round its head, and the inscription 
AINON. Under Claudius II. (Gothicus) and thenceforward there 
is but a single kind of coin of bronze washed with silver. In 
this series we note the money of Zenobia, and of her son 
Vabalathus. Coins bearing the names and local types of the names of Egypt were struck by a few emperors at the Alexandrian mint. Their 
metal is bronze, and they are of different sizes. 
Passing by the unimportant coinage of the Libyans, we reach the interesting series of the Cyrenaica, the only true Roman 
coinage of Africa. It begins under the line of Battus about the 
middle of the 7th century, and reaches to the Roman rule as 
far as the reign of Augustus. The coins were issued at Cyrene, 
Barca, Euesperides and smaller towns. The weight of the gold 
always, and of the silver until some date not long after 450 B.C., is 
Eubolos; afterwards it is Phoenician. The ruling types are the 
silphium plant and its fruit, and the head of Zeus Ammon, first 
bearded (Pl. II. fig. 23) then beardless. The art is vigorous, and 
in the transitional and fine period has the best Greek qualities. In 
the last fine series of the 4th and 3rd centuries, Greek 
The oldest coins are unindexed, so that it cannot always be 
said at which mint they were struck. The money with the name of Cyrene comprises a fine series of gold Attic stater and silver 
tetradrachms. It was an important mint of the Ptolemies. Barca 
has a smaller coinage then Cyrene. It comprises a wonder-
ful tetradrachm (Phoenician), with the head of Ammon bearded, 
boldly represented, absolutely full face, and three silphiums 
joined, between their heads an owl, a chameleon and a herboa. 
The money of Euesperides is less important. 
Syrita and Byzacena offer little of interest. Their coins are 
late bronze, first with Punic inscriptions, then in imperial times 
with Latin and Punic or Latin. Latin and Greek are used in the 
same coins at Leptis Minor in Byzacena. 
In Zeugitana the great currency of Carthage is the last repre-
sentative of Greek money, for, despite its Orientalism, its origin is 
Hellenic, and of this origin it is at first not unworthy. Its 
coins begin about 380 B.C., when the Carthaginians invaded Sicily, 
and 247-223) 

Carthage, 

This, and certain gold coins with similar types, were issued 
itself, called "Camp," and afterwards continued to also. The types are of the coinage of Sicilian cities, especially Syracuse; but they show also distinct 
Punic motives, such as a lion before a palm-tree, or a head of a 
Punic woman. The Punic type of the Sicilian money is of the types, 
that of Motya, Sulcis, Eryx; others name "Carthage," "the 
Camp," "the Paymasters," many, inscribed Zis, were issued from 
Panormus. The coinage from about 340 to 242 B.C., perhaps all 
issued at Carthage itself, is scanty; the types, head of Persophone 
and a horse, or horse and palm-tree, now come in, and prevail to 
the end of the independent coinage. 
The acquisition of the Spanish mines about 241 caused the issue of a large coinage, but the gold and 
silver soon degenerate into electrum and potin. The metropolis, 
Sicily, has the various series (excepting the Siculo-Punic) is obscure, but 
the standard seems to be Phoenician. The late silver 12-drachm pieces 
and some of the bronzes are among the heaviest struck coins of the 
ancients. The art of the earlier coins is sometimes purely Greek 
of Sicilian style. There is even in the best class a curious tendency 
to exaggeration, which gradually develops itself and finally becomes 
very barbarous. Roman Carthage has a bronze coinage which is 
insignificant. There are a few other towns which issued money 
with Roman legends, such as Utica. The denarii of Claudius Macer, 
which revolted in A.D. 68, are curiously illustrative of his policy, which 
was to let the Romans rule 

The cities of Numidia and Mauretania have a late bronze coinage; but an interesting series of silver and bronze coins is attributed 
with more less certainty to the Numidian kings (202-148), to Juba I. (60-46 B.C.), and to the 
Mauretanian kings from Syphax (213-202 B.C.), to Juba II. (who also struck coins with his consort Cleopatra, 
daughter of Mark Antony and the famous Egyptian queen) and 
Ptolemy their son, the last of the great family of the kings of Egypt 
(A.D. 25-40). 

II. ROMAN COINS 
The Roman coinage is of two great classes,—the republican 
and the imperial; the first lasted from the origin of money 
at Rome to the reform of Augustus in 16 B.C., and the second 
from this date to the fall of the Western empire in A.D. 476. 
The evidence of the coins themselves as to the origin of the 
republiean coinage is at variance with that of the ancient writers; 
but the general principles of criticism must be maintained here 
as in other matters of early Roman story. 
The tradition which ascribed the introduction of coins bearing 
types to Servius Tullius must be unhesitatingly rejected. The 
type and style of the earliest Roman coins point clearly to a 
date not earlier than the middle of the 4th century. The native 
copper which the Italians used from primitive times as a sort of 
medium of exchange, in amorphous blocks (aes rude) was 
probably not a state-currency, being produced by primitive 
smelting, and was not of uniform nature: and Campania under 
her rule that central Italy acquired a true coinage. This 
must have been about 328 B.C. The history of the republican
the sestertium remained the unit of account. Marks of value occur on all the coins from 269 B.C. for some time onward, except on the smallest bronze and the victoriatius. After the reformation of the bronze had been carried far, it became possible to issue large denominations of a circular form; thus circular bronze decussae (equal each to 1 denarius) are known of various periods, weighing from over 1100 to 650 grammes.

Gold was not regularly coined by the Romans until the close of the republic; but certain exceptional issues must be noticed. The earliest (some time during the first Punic War) consisted of pieces of 60 (Pl. II. fig. 26), 40 and 20 sestertii; they were issued both from Rome and from some external mint or mints. To this series belongs the Punic War issue of Sulla which contained certain electrum coins of 1/3 scruple weight (types: janiform form head, and Jupiter in quadriga). It is to this time that Pliny attributes the fixing of the as at the weight of an uncia, and the valuation of the denarius at 16 instead of 10 asses (although in estimating the pay of soldiers the denarius continued to be given for 10 asses). Finally there is some probability in the attribution to the year 209 of the well-known gold coins of 6 and 3 scruples which have on the obverse a head of the young Janus, and on the reverse two soldiers taking an oath of alliance over a so-called eagle. This alliance was the loyalty to Rome of her Latin colonies (Livy xxvii. 9, 10).

Without following the fortunes of the various denominations, we may note that in 89 B.C. the lex Papiria suppressed all local mints throughout Italy, ordered the reissue of the silver sesterius, and introduced the semuncia (1/4 ounce) standard for bronze. This was just after the close of the Social War, which had been signalized by the issue, on the part of the revolted allies, of an interesting series of coins (denarius and—most troublesome of all—a gold piece) chiefly from Italy, as they called Corfinium. These coins bear in Oscar letters the names of the Italian and military leaders, such as C. Papius Mutilus. In 81 B.C. the regular bronze coinage came to an end, and the denarius remained for a long time the only coin issued by the Roman mint. Roman generals sometimes, however, issued exceptional coins in their own names, such as "bronze sestertiae."

We have already dealt with the earliest gold money of the republic. Another exceptional issue was the gold coin bearing the name of T. Quinctius Flamininus, the liberator of Hellas (struck between 198 and 190 B.C.); but it was minted in Greece and conforming to Greek standards. The earliest Roman aureus proper (those of Sulla) were also struck outside Rome. They weigh 3.5 or 3.66 of a Roman pound. The aurei of Pompaeius were of, those of Julius Caesar 3.5 to the pound. After Caesar's time the weight of the aureus fell to 3.41 lb, under Augustus.

Of the administrative side of the Roman system of coinage little is known but what the coins reveal. The earliest indication of monetary freedom is found in the coins which occur on the obverse before the close of the first Punic War. Then the names begin to appear, at first abbreviated, then at length. Probably the right of coinage was in the beginning vested in the consuls, but it would seem that about the time of the second Punic War it was transferred to a special board of magistrates, the tresviri aere argentio auro flando ferando. Whether they were appointed every year, or only when need arose, we do not know; but it is improbable that there was an annual board until the beginning of the 1st century, if then; and even when annually appointed, they cannot all have exercised their right. On the other hand, there were in some years, as 92 B.C., no less than five moneyers' names in the 162 busts which occur on the reverse of coins struck before the close of the first Punic War. Then the names begin to appear, at first abbreviated, then at length. The type of the period before 209 have already been mentioned. The earliest denarius, quinarius and sesterctium bear a head of the goddess Roma, helmeted, and the Dioscuri charging on horseback, as they appeared at Lake Regillus. The victoriatius has a head of Jupiter and a figure of Victory crowning a trophy. The types of the bronze coins are practically the same as in the earlier period. About 190 B.C. the goddess Diana in her chariot begins to appear on the reverses of some of the denarii. Later, other types gradually encroach on the reverses; first, Victory in a chariot; still later such types as the Juno of Lanuvium in a chariot drawn by goats. This and other types which now begin to relieve the monotony of the series usually have a personal reference, such as the images of a moneyer or a member of the family of a denarius of Sex. Pompeius Fosstitus is seen the shepherd Faustulus discovering Romulus and Remus suckled by the she-wolf. Imaginary or more or less authentic portraits of ancestors, such as Numa, L. Junius Brutus or M. Claudius Marcellus, belong to the same category. An elephant's head on a Macedonian shield, with a coin of M. Caecilius Metellus (c. 94 B.C.), alludes to victories won by Caecili at Panormus (in 251, over Punic elephants) and in Macedonia (in 148). The cult of Venus by the Julian family is illustrated by a denarius of L. Julius Caesar showing Venus with the two Cupids drawn by two Cupids. The surrender of Jugurtha by Bocchus to Sulla is represented on a denarius of Sulla's son Faustus (62 B.C., Pl. II. fig. 27). The type is probably a copy of the design which we know the dictator used for his signet-ring M. Aemilius Lepidus (TVTOR REGIS) crowning Ptolemy Epiphanes, or Paullus Aemilius erecting a trophy, while King Perseus and his two children stand before him, are of other historical types. A contemporary event is commemorated on a special issue inscribed AD FRV(Vmentum) EMIV(ndum) EX S(enatus) C(on-sulto), coined by L. Calpurnius Piso and Q. Servilius Caepio in 100 B.C. Caepio, quaestor in that year, defeated the proposal of Saturninus to sell corn publicly at a nominal price; but the senate voted a special issue of money to meet the strain of the market. On the obverse is a head of Saturn, from whose treasury the funds for the issue were drawn; on the reverse are Caepio and Piso on their official seat, and two ears of corn. Perhaps the most graphic allusion to a contemporary event to be found on any coin is furnished by the cap of liberty with two daggers and the inscription EID(bus) MAR(tibus) on coins of Brutus. Representations of 3 less obviously historical character, as personifications of countries or places (Hispania, Alexandrea) or qualities (Honos and Virtus) or mythological figures (Scylla), are all, it would seem, inspired by some personal interest. Many types will only be explained when more light is thrown in the obscure corners of Roman mythology and ritual; but they will all probably be found to have some personal reference to the moneyer. Roman types of the later republic, therefore, though they may be classified externally as "religious," "historical," "canting," &c., are all inspired by some personal motive. The inevitable outcome of this character was that, when once contemporary portraits were regarded as legitimate on the coin, it speedily became its most important feature. The portrait of Flamininus on his gold coin struck in Greece long remained without a Roman analog. In 44 B.C., by order of the senate, the head of Julius Caesar was placed on the silver coins (Pl. III. fig. 1; the gold coin bearing his portrait is of doubtful authenticity). After Caesar's death portraits occur on coins issued by men of all shades of political opinion, showing that portraiture on coins was not then regarded as the monarchial prerogative, but which became current from A.D. 9 onwards, when it was limited to members of the imperial family.

The history of the imperial coinage is full of metrological difficulties. These arise from the conditions fixed by Augustus (16-15 B.C.), by which the emperor alone coined gold and silver, the senate alone bronze. Consequently the senate was wholly at the mercy of the emperor. Augustus struck the aurei at 42 to the pound, equal to 25 denarii at 84 to the pound (Pl. III. fig. 3). He introduced a new coinage in two metals, the staterius of 4 asses and dupondius of 2, both in fine
Changes under later emperors.

Constantine, probably in A.D. 312 (though some critics attribute the reform to Constantius Chlorus) daring to rectify the gold coinage which had long been quite irregular in weight, reduced the chief gold piece to 2 1/3 of the pound, and issued the solidus (Pl. III. fig. 5), a piece destined to play a great part in civilized history. It was never lowered in weight, though a few centuries later it was of less than half the weight of the parent of the gold coinages of Westerns and Easterns alike throughout the civilized world. The letters OB which are commonly found in the exergue of gold coins from the 4th century on are, however, autograph, and they do not occur on silver coins Postulatum (refined silver). Under Constantius II. (A.D. 337) and Julian the silver coin of 5 lb. was suppressed, and the siliqua of 1/16th of the pound (which had already been issued in small quantities in 325 to 330) took its place. From about 350 there was a system of 4 bronze coins (follii, denarii, centenionalis and sestertius). The last soon disappeared, and under Honorius (395) only the centenionalis remained. Honorius and his successors issued the silver denarius (=10 denarii). The bronze coinage of this time was small and mean. It will be seen that a fuller system of bronze was originated by Anastasius, the Byzantine emperor.

Under Augustus the Roman monetary system became the official standard of the empire, and no local mint could exist without the imperial licence. Thus the Greek imperial money is strictly Roman money coined in the provinces, with the legends and types of the emperors. The emperors were allowed to strike bronze, silver. The kings of the Cimmerian Bosporus enjoyed the exceptional privilege of striking gold, which, however, became rapidly debased. The silver becomes limited about Nero's time, but lasts under the Antonines, and is also found under Caracalla and Macrinus. It is chiefly supplied by the mints of Cappadocia, Antioch and subsidiary mints in Syria, and Alexandria in Egypt. None of these were city-mints, but served the purposes of the provincial government. The bronze increased in mints and quantity in the 2nd century, but, through the debasement of silver, one city after another ceased to strike about the middle of the 3rd. The provincial mint of Alexandria, however, continued to strike until the end of the century. From the coins of the ordinary Greek and other cities under the empire must be distinguished the issues of the Roman colonies. In the west these mostly ceased in Nero's time; in the east they lasted as long as the other Greek coinage. Purely Roman gold and silver was coined in certain of the provinces, in Spain and Gaul, and at the cities of Antioch and Ephesus. When the base silver had driven the Greek imperial bronze out of circulation, Gallienus established local mints which struck pure Roman types. Diocletian increased the number of these mints, which lasted until the fall of the empire of the West, and in the East longer. These mints were (with occasional additions) Londonium (or Augusta), Camulodunum, Treviri, Lugdunum, Arelate (or Constantina), Ambianiun, Tarraco, Carthago, Roma, Ostia, Ravenna, Aquileia, Mediolanum, Sicia, Serdica, Sirmium, Thessalonica, Constantiopolis, Herculea, Nicomedia, Cyzicus, Antioch (ultimately Theopoli) and Alexandria. A few were speedily abandoned.

As regards the internal organization of the mints under the empire, we know, that although the names of the triumviri monetae do not occur on the coins after 15 A.D., they continued to exist (with the title IIIiviri aere angento auro fendo feriundo, although their competence was restricted to the first metal) until probably the time of Aurelian, when, according to a passage from a note by Chonisarius, the imperial treasury superintended the gold and silver coinage; Trajan placed a procurator monetae Augusti of equestrian rank at the head of the whole system, subject to the emperor's rationalis (the chief official of the imperial treasury) and responsible for it both to his nominal and real authority.

The three monetae (of the three metals) appear together on medallions for the first time under Hadrian, and probably indicate the organization of the mints for the three metals in one place. From the middle of the 3rd century onwards a special department is usually occupied with the coins, indicating the various mints, the officinae in each mint, &c. Sometimes these marks form "secret combinations"; thus the letters LV, and BL, some of the three different coins of Diocletian were struck at different officinae, and the letters HP, KOY and AI on three corresponding coins of Maximian, combine into Greek words representing the genitives of the Latin titles Ioius and Hercules assumed by these two emperors.

The obverse type of the imperial coins is the portrait of an imperial personage, emperor, empress or Caesar. The type only varies in the treatment of the head or bust—if male, laureate, radiate or bare; if female, sometimes sometimes veiled, but usually bare. The reverse types of the pagan period are mythological of deities, allegorical of personifications, historical of the acts of the emperors. Thus the coin of Hadrian, besides bearing the figures of the chief divinities of Rome, commemorates by the legend, or from the emperor's progresses, and by actual representations his architectural works. Types often occur purely personal to the emperor, such as the sphinx which Augustus used as his signet, or the capricorn, his natal sign. The most remarkable feature of imperial types is the increase of personifications, such as Abundantia, Concordia, Liberalitas, Pudicitia—for the most part drearily conventional. The inscriptions are either simply descriptive, such as the emperor's names and titles in the nominative on the obverse, or partly or wholly grammatical, and the name of the subject on the reverse; or else they are dedicatory, the imperial names and titles being given on the obverse in the dative and the name of the type on the reverse. Sometimes the reverse bears a directly dedicatory inscription to the emperor. The inscriptions on the earlier imperial coins from Tiberius to Severus Alexander are generally chronological, usually giving the current or last consulsiphip of the emperor and his tribunitian year. It must be noted that Christian symbols first made their appearance on coins in an unsystematic, almost accidental way. The earliest known, on a denarius of 314, when a cross occurs as a symbol on the reverse. In a.d. 320 the Christian monogram is found as a detail in the field at several mints. But the types still remain pagan; these symbols are not introduced by order,
The art of Roman imperial coins, although far inferior to that of Greek, is well worthy of study in its best ages, for its intrinsic merit, for its illustration of bronze craftsmanship, and as a criterion of the moral and religious as well as of the political state of the empire. In the reign of Constantine, the Christian emperor, who held the standard of the cross, the inscription is HOC SIGNO VICTOR ERIS.

Another type of the same reign is the Christian monogram flanked by alpha and omega. Under Julian there is a temporary recrudescence of pagan types; with the revival of Christianity the monogram of type sets in.

The beauty of a coin in the later periods, which resulted from the efforts of medallists, and from the growth of the study of form and line as an academic discipline, is not always to be found in coins struck in its earliest days. In the reigns of Valerian and Gallienus, for instance, we find cameo and intaglio portrait types, and the decadence is evident in the diminution of the size of the figural representation on the reverse.

The coinage of Constantine and his successors introduces a new and prominent class of coins. The portrait of the emperor, who is often shown wearing the crown of the diadem, is usually reduced in size, but is still representative of his majesty. The reverse type is usually a legend, such as: "Ludovicus Augustus," indicating the name of the emperor.

The coinage of Constantine is remarkable for its uniformity throughout the empire, and for the excellence of its execution. But in the reign of his successor, Licinius, we find a marked difference in style, and a more elaborate treatment of the design. The coinage of Constantine was generally considered the best of any period in Roman history.

ROMAN AND MEDIEVAL COINS.
ORIENTAL COINS.
The style of this age is at first excellent. The medals gave the tone to the coinage. Art had wholly thrown off the rules of the ages before and attained the faculty of portraiture and the power of simply representing objects of nature and art. Great masters now executed medals in gold and silver, and engraved them in precious stones, for the mere love of art, and not for the sake of commerce, and by the beginning of the modern period it was fast falling into the poverty and barbarism in which it has ever since remained. The details of the numismatics of these two periods scarcely deserve the notices of the modern account of the main events.

Money of account.

The whole was the chief and practically the sole coin, the solidus passed from foreign piece into a money of account. The value of the solidus, like the German gulden (shilling) contained usually 12 dimes. As there were 20 shillings to the pound of silver, we obtain the reckoning by f. s., librae, solidi and denarii. The pound contained 12 oz., and its two-thirds was the German mark of 8 oz.

It would be interesting, did space permit, to notice fully the art of this entire class, to examine its growth, and to trace its decline; but, as with that of Greek and Roman coins, we must

Art.

mainly limit ourselves to the best period. This is a space of about a hundred and fifty years, the age of the classical Renaissance, from the middle of the 15th century to the close of the 16th.

The finest works are limited to the first half-century of this period, from a little before 1450 to about 1500, in Italy, and for as long a time, beginning and ending somewhat later, in Germany. The artists that figured are master of the field, and their work had not degenerated into a trade; but with the larger production of the period following the work was more mechanical, and so fell into the hands of the moneyers. The quality of the materials of this period were worthily placed by the side of its sculpture and its painting. Not only have some of its medallists taken honourable places in a list where there was no room for ignoble names, but to design medals was a matter of course for every great Italian artist.

There are, as we should expect, two principal schools, the Italian and the German. The former attained a higher excellence, as possessing more a symbol of the age, and more especially in coins or medals. The object which the artists strived to attain was to present a portrait, or to commemorate an action in the best manner possible, without losing sight of the fitness of the designs to the form and use to which they were to be placed. For the same reason, the attainment of this purpose the style of the later pre-Raphaelites was eminently suited. Its general love of truth, symmetrical grouping, simple dignity, and extremely skillful, but one especially fitted to produce a fine portrait and a good medal. It is to be noted that their idea of portraiture did not depend on such a feeling for beauty as influenced the Greeks. Rather did it set before the moral or intellectual attainments and capabilities, what the Italians called the virilis, of the subject. The German art, as seen in the medals, is mostly the work of carvers in wood or hones, or goldsmiths. It exceds in vigorous, realistic portraiture, and in decorative treatment of heraldic subjects, but is lacking in breadth of style and in the imagination shown by the best Italian medalists. Both these schools, but especially the Italian, afford the best models for a modern design. The finest coins and medals of Italy and Germany have an object similar to that which it is sought to fulfil in the English, and their nearness in time makes many details entirely appropriate. Thus, without blindly imitating them, modern artists may derive from them the greatest aid.

There are some delicately beautiful Italian medals of the 16th century, too closely imitated from the Roman style. A vigorous school, the only great one of modern times, arose in France before the close of the 16th century and lasted into the next. It was rendered illustrious by Dupré and the inferior but still powerful Warin. From this age until the time of Napoleon there is nothing worthy of note. The style of his medalists is the weakest classical manner then in vogue, but yet is superior to what went before and what has followed.

The 内容 intended here to enter in any detail into the various divisions of the subject already treated in its main outlines. The questions that would require consideration are of too complicated and detail to be treated in a space limited as this is; the principal matters of inquiry may, however, be indicated.

We begin with a survey of the transitional coinages in the various countries of the West. They cover the period from the 5th to the 8th centuries, and are of immense historical significance. The types throughout are monotonous: the bust of a Roman emperor or local ruler, a cross of some kind, a Victory, &c. The style is quite barbarous.

The classification of the earliest servile imitations of Roman and Byzantine money rests solely upon provenance and character. The following general series will distinguish these gold (A) The Vandals and the Alaric (477-484) to Gellimer (530-543); the gold is anonymous. (B) The Suevians (Spain, 409-558) had little but imitations of
NUMISMATICS

MEDIEVAL AND

Byzantine gold; but Richar (448-456) issued a denarius in his own name. (C) The Ostrogotths (Italy, 489–553) were preceded by the Herulian Odacert (476–494), who coined silver and bronze; their kings (including Theodoric, 493–526, and Totila or Badulla, 541–553) issued solidi from Rome, Ravenna, Milan, &c. (D) The Lombards (Italy, 568–714) had no coins in their own names before Grimoald, duke of Beneventum (662–671); later there are gold solidi and thirds and silver from many mints. Gold was issued for the duchy of Beneventum in the 8th century. (E) The Burgundians (Gaul, to 534) first issued recognizable coins under Gundobald (473–516). (F) The Visigoths (South Gaul and Spain) had imitative gold thirds in the 5th and 6th centuries; the kings’ names appear from Leovigild (573–586) to Roderic (710–711). Sixty-one mints were five penates (20). The Merovingians (in gold, solidi and thirds) and silver sceattas (treasure, Ger. Schacht) of about 20 grains troy, and stycas (= pieces, Ger. Stück), first of silver, then of copper. The gold is rare and confined to the south; only two solidi are known, imitations of Honorius, with runic legends on the reverse. The types of the gold thirds, as of the coinage in other metals (which does not begin until the 7th century), are derived more or less directly from Roman. Some of the inscribed sceattas bear the name of London in Roman letters; others, in runes, the names of Epis and Peada (who is perhaps the son of Penda) in Mercia; some (d. 869) were also issued in East Anglia towards the end of the 8th century. But the sceatta was superseded by the penny introduced by Offa (757–796). Offa also struck a gold coin, bearing his name and an inscription copied directly from an almost contemporary Arab coin; but this is quite an exceptional issue, represented now by a unique specimen. The stycas, which begins c. 670, was characteristic of the Northumbrian coinage, lasting, long after the introduction of the penny farther south, down to the Danish invasions of the second half of the 9th century. A series was issued by the archbishops of York. Wigmund (857–854) struck a gold solidus inscribed MVNVS DIVINVM, copied from the solidi of Louis le Debonnaire, and evidently meant for a religious purpose (PI. III. fig. 11). For the whole question of Anglo-Saxon coins see BRITAIN: Anglo-Saxon. (I) The Frisians had a small coinage of gold thirds (imitated from Byzantine), and one with the name of Audulfus also exists (end of the 6th century?). The chief mint was probably Docuem.

We now proceed to consider the coinages of the various countries from the 8th century to modern times. The coinage of the Visigoths of Spain, after the expulsion of the Moors, with Alphonso I. (1031); it is exclusively religious, and not of great interest except as affording indications of the wealth and commercial activity of the state in the early part of the 18th century. The coinage of Spain, after the reconquest from the Moors, is almost without exception gold. The kingdom of Navarre had a coinage from the time of Sancho III. (1003). The series of Castile and Leon begins with Alphonso VI. (1053) with deniers and obols. Aragon first has coins under Sancho Ramirez I. (1063). Gold (imitated from Moorish money) is introduced in the middle of the 12th century. A 12th-century coin was about 22 mm in diameter. The Spanish dollar of the 17th and 18th centuries was one of the most widely circulating currencies in the West (see Pl. V. fig. 5). The medals of Spain are not important.

In 1755 Pippin abolished the gold coinage of his Merovingian predecessors and introduced the silver denier (see PI. III. fig. 10); the coinage became a royal prerogative once more, and was confined to a few mints. The denier, which at first weighed c. 1·28 grammes (191 grammes), was for centuries the most important of European silver coins. Under Charlemagne and his weight was slightly raised; the Carolingian establishments and there are other modifications in the types. Charlemagne also issued money from various Italian, German and Spanish mints. He also introduced the obol, and struck gold (chiefly at Italian mints). Among his types must be noted the temple with the inscription XPISTIANA RELIGIO. Louis le Debonnaire (814–840) was the last Carolingian to strike gold. In the 9th century are perceptible the first traces of the movement which led to the extensive feudal coinage. The advent of the house of Capet made no great change in the system, but the feudal issues now became numerous. The issue of the abbey of St Martin at Tours (denier tournois); the royal coinage was known as the monnaie paris. St Louis (1226–1270) effected a great reform late in his reign, making the sou (hitherto a money of account) into a real coin as the gros (see Pl. III. fig. 14), and introducing a gold coinage. Henceforward the coinage increases in complexity; in the 14th century it had great artistic merit (see PI. III. fig. 17). The French medals are far more interesting than the modern coins. The earliest of artistic importance not by Italian artists show nevertheless strong Italian influence (medals of Charles VIII. and Anne of Brittany, of Phillibert of Savoy and Margaret of Austria). A series of large medallions of the Valois is attributed to Germain Plon. The most characteristically French artists are Guillaume Dupré (working 1595–1643) and Jean and Claude Warin (middle and second half of 17th century). The long historical series of Louis XIV. has no artistic value; but that of the Napoleonic period shows great technical ability on the part of artists like Andrieu, in spite of the false classicalism of their designs.

The silver penny was introduced into England by Offa, king of Mercia (757–796), following the lead of Pippin in France (see IBID. 1795, 10). Offa (757–796) coined a double silver penny called the penny (1·22 grammes), at which it long remained. The types were usually, over the king’s head, or some form of cross or religious symbol; reverse some form of cross, religious symbol or ornament. The inscriptions gave the names of the king and of the moneyer, later also the mint. An important gold coin of Offa was imitated from an Arab dinar of 774, with the addition of the words OFFA REX. The Mercian coinage ends about 874. The pennies of the kings of Kent extend from 765 to 825; the archbishops of Canterbury went on striking to the beginning of the 9th century. The East Anglian regal series of Alfonso III., King of Portugal (1139–1185) and of his son Alfonso IV. (1185–1223), was of much interest. The coinage of the king was of similar type to the existing shilling. The type is generally termed the "penny," and is made of copper, usually cut into halves and quarters among the lines of the cross to make small change. During the reign of Stephen the monitory is relieved by a few issues by barons like Robert, earl of Gloucester. The number of mints is much reduced by the time of Henry III., and the moneys cease
to sign the coins in Edward I's reign. Henry III. made an abortive attempt to introduce a gold coinage, which was successfully established by Edward III. in 1343, with the gold florin, and in 1344 with the gold noble (see Pl. III. fig. 20). (The obverse type of the noble, the king in a ship, is generally thought to refer to the victory of Sluys in 1340.) He also introduced the silver groat (4d.) and half-groat. The English coinage, both gold and silver, was now of such high quality and reputation that it (especially the silver sterling) was largely exported and imitated, chiefly in the Low Countries. The gold coinage of Edward III. is perhaps the most successful, from an artistic point of view, in the English silver of the reign of his grandson Edward the Black Prince (see Pl. IV. fig. 7), a design not very complicated. Edward IV. distinguished his noble by a rose on the obverse and a sun on the reverse, and introduced a new gold coin, the angel. The Tudor period is distinguished by the splendid, variety and size of the coins; Henry VII. introduced the sovereign of 20s. (240 grains) and the shilling, and on his coins the first serious attempt at portraiture is found (see Pl. III. fig. 21). Under Henry VIII. the quality of the silver money declines, being not effectually restored until the reign of Elizabeth, when an unsuccessful attempt was made to introduce a copper coinage. (The Bing, or Cindy, is of these coins, and the pattern coinage does not begin until the next reign. The use of the mill, as distinct from the hammer, was begun in 1562, but it took just a century to oust the old-fashioned method. In 1613 John, Lord Harrington, obtained a patent for the issue of copper farthings, and private tradesmen's tokens were prohibited. The gold sovereign of James I., from its inscription (FACIAM EOS IN GENTEM VNAM) and the fact that it was meant to circulate on both sides of the Border, was known as the unite. The coinage of Charles I. presents great varieties owing to the civil war. The best workmanship is seen on the milled coins issued by the Royalists. But the majority of the money was struck in London at the Royal Mint. The scarcity of gold in the royal treasury during the troubles induced the king to coin twenty- and ten-shilling pieces of silver, in addition to the crowns and smaller denominations. Gold three-pound pieces, or triple-units, however, were issued from the Oxford mint. One of the most remarkable of his pieces is a crown struck at Oxford by Rawlins. It bears on the obverse the king on horseback, with a representation of the town beneath the horse, and on the reverse the heads of the "Oxford Declaration." The so-called "Juxon medal," given by Charles II. to William Juxon, bishop of London, was probably struck by Rawlins (see Pl. V. fig. 1). Of equal interest are the sieges-pieces of many castles famous in the annals of those days. They are mostly of silver, often mere pieces of plate with a stamp; but Colchester and Pontefract issued gold. The coinage of the Commonwealth is of a plainness proper to the principles of those who sanctioned it. The great Protector, however, caused money to be designed of his own bearing his head. It is not certain that this was ever sent forth, and it is therefore put in the class of patterns. Simon, the chief of English medallists, designed the coins, which are unequaled in the whole series for the vigour of the portrait (a worthy presentation of the head of Cromwell) and the beauty and fitness of every portion of the work. The finest coin produced under Charles II., and technically the best executed piece in the whole English series, is the "Petition Crown" (see Pl. V. fig. 2), a pattern by Simon, to which, however—for political reasons—the work of Jan Roettier was preferred. Maudy money was first struck in this reign, and the name guinea was now applied to the 20s. piece. In 1672 a true copper coinage of halfpence and farthings was introduced. Henceforward there is a decline in the coinage, although skill is perceived in the portrait of William III., whose grand features could scarcely have failed to stimulate an artist to more than a common effort. Queen Anne's money is also worthy of note, on account of the attempt, on Dean Swift's suggestion, to commemorate current history on the copper coinage, which led to the issue of the famous farthings (see Pl. V. fig. 4). These have been the cause of an extraordinary delusion, to the effect that a very small number (some say three) of these pieces were struck, and that their value is a thousand pounds each, instead of usually some shillings. Worth-
The money of Ireland is more scanty and of less importance than that of Scotland. The pieces most worthy of notice are the silver pennies of the early Danish kings, the earliest being that of Sihtric II. (989-1029), copied from contemporary English pennies. The Anglo-Irish coinage begins in 1177, when John as lord of Ireland received the right of coinage. A copper coinage was introduced as early as the reign of Henry VI. The quality of the Irish coinage was exceedingly poor in the 16th century, especially under Elizabeth. Between 1642 and 1647 various kinds of money were issued, including the only gold Irish coin, the Irishquaque, produced under his express authority. James II. issued enormous quantities of coins of necessity made of gunmetal or pewter. The latest Irish coins were the penny and halfpenny of 1822.

The Isle of Man had a regular copper coinage, beginning in 1709 with pence and halfpence under the Derby family, continued by the James, duke of Athol (issue of 1758), and by the English sovereigns until after his expulsion. In 1815, the Isle of Man adopted the three-legged symbol, with the motto Quocunque jeceris stabit.

Belgium occupies the next place in our arrangement. Its coinage, which, except for the few mints operating under the Merovingians and Carolingians, does not begin until the 11th century, comprises many pieces struck by foreign rulers, and has little of an independent character in either the regal or the seigniorial class. The most important coinages are those of the house of Burgundy and Charles V. and his son, and of the bishops of Liége. In character the coinage of Belgium approximates to the French on the one side, the German on the other. About 1400 the Burgundian sovereigns began to strike for his own account a small series of the coinages of the Roman emperors, of which two (those of Constantine and Heraclius) have come down to us; these form a link between the late Roman medallion and the Italian medal of the Renaissance. The series of Holland is similar in character until the period of the revolt of the provinces. The Dutch dollars of the 16th to the 18th centuries had an immense circulation (see Pl. V. fig. 3). Among the early Dutch medallists must be mentioned Stephen H., generally without reason known as Stephen of Holland (working 1555-1572), whose portraits show great charm. The Dutch historical medals are of great interest, more especially those which were struck by the Protestants in commemoration of current events. There is also a remarkable series of bronze medalllets or jettons, which form a continuous commentary on history during the 16th and early part of the 17th centuries. Both are interesting as largely illustrating not only local events but also those of the chief European states. Such are the pieces recording the raising of the siege of Leiden, likened to the destruction of Sennacherib's army, the assassination of William the Silent, and the discomfiture of the Armada, affording striking indications of the zeal, the pieté and the confidence in the right which built up the great political structure of the Dutch republic. After this time the medals lose much of their interest.

The money of Switzerland illustrates the varying fortunes of this central state, and the gradual growth of the stronghold of European freedom. First we have the gold money of the Frankish kings, among whose mints Basel, Lausanne, St Maurice-en-Vahls and Sitten (Sion) already appear. The silver denominations, which Charlemagne made the coinage of the empire, are issued by fewer mints; the dukas of Swabia began to strike at Zurich in the 13th century, and the empire granted during the 10th and to the 13th century the right of coinage to various ecclesiastical foundations, bishoprics and abbeys. Bern was allowed a mint by the emperor Frederick II. in 1218, and other towns and seigneurs subsequently gained the same right. The demi-bracteate appears about the middle of the 11th century, and about 1125 is superseded by the true bracteate, which lasts until about 1300. The 14th century witnessed the rise of the Swiss confederation, and by degrees the cantons struck their own money. These, together with the coins of some few seigneurs, form the bulk of Swiss money of the medieval and modern periods. The separate cantonal coinage, interrupted by the French occupation, was finally suppressed in 1848, when a uniform currency was adopted by the whole republic. The monetary systems of the cantonal and ecclesiastical mints were extremely complicated. This was partly due to the variety of coins, partly to the debasement practised by the ecclesiastical mints. Geneva had a peculiar system of her own.

Italy, with Sicily, has peculiar features. Here the barbaric coinage were mixed with the Byzantine issues which marked the recovery of the Eastern empire, and left a lasting influence in the north at Venice, and in the south at Beneventum. Later the Arab conquest left its mark in the curious Oriental coinages of the Normans of Sicily and the emperor Frederick II., mixed after his fashion with Latin coinage. The earliest money is that of the barbarians, Ostrogots and Lombards, and local Byzantine issues in Sicily. This is followed by the deniers of Charlemagne and his successors, supplanted by the gold currencies of the Normans and Frederic III. The age of the free cities is marked by the great coinages of Florence, Venice and Genoa, while the Angevien and Aragonese princes coined in the south, and the popes began to issue a regular currency of their own at Rome. The Italian princes of the next period coined in Savoy, and at Florence, Modena, Mantua and other cities, while Rome and the foreign rulers of the south continued their mintages, Venice and Genoa of the republics alone surviving. The Italian monetary systems have already been touched on in the introductory notice. For art the series is invaluable. First in Italy the revival influenced the coins, and in them every step of advance found its record. The Italian medals are without doubt the most important in the whole of Europe.

Following the geographical order which is best suited to the Italian coinage, we first notice the money of Savoy, which is inferior in art to that of the rest of the country. It begins with Umberto II. (1086); in 1170 the dukas became kings of Sardinia, and their coinage merged eventually in 1861 in that of the kingdom of Italy. Genoa is the first of the great republics. She obtained the right of coinage from Conrad II. in 1139, and struck gold coins from the time of the general origin of civic coinage in that metal; these are ducats and their divisions, and after a time their multiples also. In the 17th century there are very large silver pieces. In the money of Mantua there are fine coins of Gianfrancesco III. (1484-1519) and Vincenzo II. (1627-1628), these last splendid examples of the late Renaissance, large pieces of gold and silver; the portrait is fine, and the bound on the reverse a powerful design. The vicissitudes of the story of Milan find their record in no less than ten groups of money—Lombard regal coins, Carolingian deniers, money of the republic (1260-1310), next of the Visconti family (1329-1447), succeeded by the republic (1447-1450) and by the Sforza line, next of Louis XII. and Francis I. of France, of the restored Sforza, of Charles V. by Spanish right and his successors of Spain, and lastly of Austria. There are extremely fine coins of the 15th century, showing great beauty in their portraits (see Pl. III. fig. 22). The money of Florence is disappointing in its art. The Athenes of the middle ages had the same reason as her prototype to preserve as faithfully as might be the types and aspect of her most famous coin, the gold florin (see Pl. III. fig. 8), and thus those who expect to see in this series the story of Italian art will be much disappointed. The silver florin was first struck in 1189. It is heavier than the denier, weighing about 27 grains, and bears the lily of Florence and the griffon of the Medici. The florin was heavier than the ling pieces, the flower never changing, but the representation of the saint being varied. On the gold florin, first issued in 1252, the Baptist is represented standing, while in the contemporary silver florins he is seated. In the 14th century the arms of a moneyer appear in the field, two such officers have had the right of striking yearly, each for six months. The coins of the duchy from 1532, in spite of their new types, are not a fine series; the best are those of Alessandro, designed by Cellini.

Venice as a mint even surpasses Florence in conservatism, and, the early style being distinctively Byzantine, this is the more striking in a great artistic city. We find Venice as an imperial mint issuing Carolingian deniers, but the doges begin to coin, placing their own names on their currency, in the 12th century.
MODERN COINS AND MEDALS.
PLATE VI.

NUMISMATICS

ITALIAN MEDALS.
The most famous silver coin, the matapan, was first struck in the brilliant time of Enrico Dandolo (1192–1205). This coin is a grossus weighing about 33 grains, with on the obverse St Mark giving the standard or gonfalon to the doge, both figures standing, and on the reverse the famous figure of the Saviour. The famous Venetian zecchino or sequin (see Pl. III. fig. 9), the rival of the florin of Florence, appears to have been first issued under Giovanni Dandolo (1284). On the obverse St Mark gives the gonfalon to the kneeling doge, and on the reverse a standing figure of the Saviour within an oval nimbus. Niccolo Trono (1421–1473) introduces his portrait on most of his coins, but this custom is not continued. By the latest part of the 15th century large silver coins appear. The archaic changes in the beginning of the 16th century, but there is no later movement. The large silver pieces increased in size, and large gold pieces also. The last doge, Ludovico, St Peter (1788–1797) issued the 100 sequin piece in gold, a monstrous coin, worth over 450. The doges of Venice from 1521 to 1797 issued a peculiar silver token or medallet, the osella, five of which they annually presented to every member of the Great Council. They replaced the wild ducks (uccello) which it had been customary to present at Christmas. Two dogareseas struck similar medallets. Their types are usually allegorical; some are commemorative.

The series of the coins of Rome is rather of historical than of artistic merit. The popes begin to strike money, with Adrian I. (A.D. 858), his son Hugon (867), and those whose deniers are in a Lombard style. The coins of his successors, with few exceptions, down to Leo IX. (1046) associate the names of pope and emperor. From Leo IX. to Urban V. (1362) there is no papal coinage at Rome. The papal series continues from 1188 onwards. We then see on the silver the style of the senate and Roman people, and ROMA CAPUT MUNDI. Some coins have the figures of St Paul and St Peter, others Rome seated and a lion. Charles of Anjou, king of Sicily (1265–1283), strikes as a senator, and Cola di Rienzo (1347–1348) as tribune. The gold ducat of about 1300 imitates the type of a Venetian sequin. St Peter here gives the gonfalon to a kneeling senator. The arms of the moneying senator next appear in the field. The papal coinage is resumed at Avignon; and Urban V., on his return to Rome, takes the sole right of the mint. From Martin V. (1417) to Pius IX. there is a continuous papal coinage. The later coins, though they have an interest from their bearing on the history of art, are disappointing in style. There is indeed a silver coin of Julius II. struck at Bologna and attributed to Francis, with a very fine portrait. We have beautiful gold coins of Giovanni Bentivoglio (see Pl. III. fig. 23), lord of Bologna, who then overran the Papal States. His mint of Cagli, in the Apennines, remained at his post after Julius II. had taken the city. There are also pieces of Clement VII. by Cellini, vigorous in design, but careless in execution. There were papal mints at Ancona, Bologna, Piacenza, Parma, Ferrara and other Italian towns; and coins were also struck at Avignon from 1432 to 1700. The papal portraits are highly characteristic and interesting. It is, however, in the fine series of papal medals that we find a worthier artistic record.

The coinage of Sicily, afterwards that of the Two Sicilies, or Naples and Sicily, begins with the Normans. There is a curious series of gem coins. It begins with Robert Guiscard, as duke of Apulia (1075) and Roger I. of Sicily (1072). The gold money is almost wholly Arabic, though Roger II. struck the Latin ducat, the earliest of its class; the silver is Arabic, except the great Latin scaphati of Roger II. with Roger III.; the copper is both Latin and Arabic. The gold series (Augustales) of the emperor Frederick II. (1198–1250) shows the first sentiment of reviving classical art, its work being far in advance of the age. These are Latin coins; he also struck small Arabic pieces in gold. Under Conrad and Manfred there is an insignificant coinage, copper only, but with Charles I. of Anjou (1266–1285) the gold money in purely medieval style is very beautiful, quite equal to that of his brother, St Louis of France. After this time there is a great issue of gigliati, silver coins with, for reverse, a cross fleurdelis cantonned with fleurs-de-lis. These coins acquired a great reputation in the Levant, and were even struck by the emirs of Asia Minor. With Alphonso, the founder of the Aragonese line, we note the old style of the coins, which are in singular contrast to his fine medals. Good portraiture begins on the money of Ferdinand I., his successor. The later coinage is interesting only for its illustration of the varying fortunes of the Two Sicilies. The curious early gold coinage of the Lombard dukes of Beneventum, which follows the Byzantine type, has been mentioned under the transitional series; the dukes and princes of Beneventum and the princes of Salerno continued to issue coins (sometimes gold, usually deniers) down to the middle of the 11th century.

Italian medals (Pl. VI.) are next in merit to the works of the Greek die-engravers. Certain small pieces of a medallic character were made in Italy, as early as the 14th century, and there existed also large cast and chased pieces representing various Roman emperors (perhaps Burgundian work of the 14th century), which influenced the beginnings of the true medal. This began, and also reached its highest excellence, with Vittore Pisano (Pisanello), the Venetese painter, whose medals date from 1438 (or earlier) to 1449. The finest work of Italian medalists is seen in the cast medals of the 15th and early 16th century; with the increase of classicism in the 16th the style declines rapidly. The earlier medals are independent works, marked by simple vigorous and characteristic; the expression of character and virtù takes precedence over ideal beauty, especially in the work of the Florentine school. As the art became popular the execution of medals passed into the hands of inferior artists, and by degrees striking became usual for the smaller pieces; at the same time, a slavish imitation of the classical style weakened or destroyed originality and stamped the works with the feebleness of copies. The greatest medalists of the first age are Pisano, Matteo de' Pasti, Enzola, Boldù, Sperandio, Guazzalotti, Bertoldo, Gambello, Niccolò di Niccolò of Lucca, Candido da Trastevere. Some of the most beautiful medals, however, are by unknown artists (Pl. VI. fig. 2). In the 16th century must be mentioned Pomedello, Benvenuto Cellini, Leone Leoni, Giovanni Cavino “the Paduan,” Pastonero of Siena, Giacomo da Tresso, Pietro Paolo Galleotto, called Romano, and Antonio Abbondio. Incomparably the finest of all Italian medals are the works of Pisano, particularly the medals of Alphonso the Magnanimous, with the reverses of the boar-hunt and the eagle and lesser birds of prey, those of Sigismondo Malatesta, his brother surmounted Novello (see Pl. VI. fig. 1), Leonello d’Este, John VIII. (Palaeologus), Nicolò da Lézze, Guglielmo Niccolò Gonzaga of the same family, the great humanists Vittorino da Feltre and Pier Candido Decembrio. Pisano is great in portraiture, great in composition and design, and marvellously skilful in depicting animals. He alone represents the moral qualities of his subject in their highest expression and even capability. That he has high ideal power is seen at once if we compare with his portrait Pasti’s inferior though powerful head of Sigismondo Malatesta. Pasti’s medal of Isotta, wife of Sigismondo, is also noteworthy, likewise the medal by the otherwise unknown Constantius of Mahomet II., the conqueror of Constantinople—interesting work, but lacking the master’s technical skill and inspiration. An artist of great power is Sperandio of Mantua; but his productions lack the finish necessary to good medallic work, his drawing and composition are careless, and his realism too often becomes brutal or vulgar. The work of Niccolò Fiorentino and of his pupils is astonishingly vigorous in portraiture, but they lack the power of designing reverses (see Pl. VI. fig. 3). In the later age Cavino executed a remarkable series of imitations of Roman sesterii, which have been frequently mistaken for originals. In art these Italian works frequently surpass the originals in spite of a degree of weakness inseparable from copies. A comparison of the Italian with the Roman pieces is thus most instructive. The works of Pastonero of Siena (who had an extraordinary facility in graceful portraiture) are especially charming (see Pl. VI. fig. 4). Historically the Italian
medals supply the defects of the coinages of Florence and Rome, and in a less degree of Venice. The papal series is invaluable as a continuous chronicle, although artistically, after the earliest period, it is monotonous.

The money of Germany is, like that of Italy, far too various for it to be possible here to do more than sketch some of its main features. In the Frankish period mints were in operation at cities in the west, such as Mainz, Strassburg, Spires, Treves, Worms, Cologne. Pippin issued denarii from Strassburg and Mainz; under his successors denarii and obols were also coined at other mints, as Bonn, Cologne, Spires, Treves. After the reign of Louis the Sturmgottes (864–911), the Charlemagne series continued to the day of the Peace of Strassburg with Conrad III. (1138–1152). In the succeeding period, which ends with the introduction of the grossus and the gold coinage under Louis of Bavaria (1314–1347), the uniformity of the currency disappears. In the west (in Lotharingia, including the southern Low Countries, the Moselle and Rhine-lands, in Frisia, Bavaria, parts of Franconia and Swabia) the denier continues; but elsewhere we find the bracteate. The right of coinage is acquired in an increasing measure by the feudatories of the empire. The coinages native to the region, even the imperial coinage is not uniform, but consists of denarii in the west and bracteates in the east. For example, before the 12th century, the fiscal coinage of the Swabians with Conrad III. (1138–1152). In the succeeding period, which ends with the introduction of the grossus and the gold coinage under Louis of Bavaria (1314–1347), the uniformity of the currency disappears. In the west (in Lotharingia, including the southern Low Countries, the Moselle and Rhine-lands, in Frisia, Bavaria, parts of Franconia and Swabia) the denier continues; but elsewhere we find the bracteate. The right of coinage is acquired in an increasing measure by the feudatories of the empire. The coinages native to the region, even the imperial coinage is not uniform, but consists of denarii in the west and bracteates in the east.

The earliest imperial bracteate is of Frederick I.; the large fine bracteates last but a short time, reaching their acme about the end of the 12th century (see Pl. III. fig. 18). The fine pieces of the bishops of Halberstadt and the abbesses of Quedlinburg are characteristic of this class. With the introduction of the regular gold coinage (chiefly florins) and the grossus in the 14th century, Germany enters on the modern period. From the 16th century the thaler (so called from Joachimsthal in Bohemia, where the centres of Schlick first struck the coin in 1518) dominates the currency. Even the imperial coinage is not uniform, but consists of denarii in the west and bracteates in the east. The earliest imperial bracteate is of Frederick I.; the large fine bracteates last but a short time, reaching their acme about the end of the 12th century (see Pl. III. fig. 18). Even the imperial coinage is not uniform, but consists of denarii in the west and bracteates in the east.

German medals perhaps rank next to Italian, although they lack the higher artistic qualities. They are the work of craftsmen —jewellers, wood-carvers, workers in bone-stone—and show great facility of minute workmanship and chasing and decorative design (the last is especially clear in the heraldic reverses); the faults of these qualities are to some extent redeemed by the native German vigour and directness of the portraiture. The original models from which the medals were cast were in many cases made in bone-stone or box-wood, which did not, like the favourite wax of the Italian artists, give much scope for subtlety. The chief centres of the art were Nuremberg and Augsburg. Many medals have been attributed to Albrecht Dürer; whether he did more than design them is uncertain. Among other medallists may be mentioned Hans Schwarz (working 1516–1527), Ludwig Krug, Friedrich Hagenauer (working 1525–1546), see Pl. V. fig. 8, Peter Flötner (c. 1538, although it is doubtful whether this artist, whose plaquettes are famous, made any of the portrait-medals ascribed to him), Mattes Gebel, Hans Reinhart the Elder, &c. Some other good artists are known only by their initials, or quite unidentified. After the middle of the 17th century the coins of Nuremberg and Augsburg, with which we still have skilful artists like Valentin Maler (1568–1603). In this later period striking gradually superseded casting.

The earliest Polish coins are of the 10th century; the types are copied from English, German and Byzantine sources. In the 12th and 13th centuries there is a bracteate coinage. The grossus was introduced about 1230. In later times the town of Danzig, while belonging to the Kingdom, issued remarkable gold pieces, thalers, &c., down to its restoration to Prussia (1793).

The origin of the coinage of the Scandinavian states: Norway, Denmark and Sweden, is clearly English and due to the Danish conquest of England. The runic alphabet is employed, though not by any means exclusively, on many of the early coins of Denmark and Norway. The Norwegian coinage is referred to that of England with the finishing touches of the name of the king; whereas the Norwegian and Danish were united under Eric of Pomerania in 1396. The money of Denmark begins with pennies of Sweyn (985–1014) which are copied from the coinage of England with the finishing touches of the name of the king; whereas the Norwegian and Danish were united under Eric of Pomerania in 1396. The money of Denmark begins with pennies of Sweyn (985–1014) which are copied from the coinage of England with the finishing touches of the name of the king; whereas the Norwegian and Danish were united under Eric of Pomerania in 1396. The money of Denmark begins with pennies of Sweyn (985–1014) which are copied from the coinage of England with the finishing touches of the name of the king; whereas the Norwegian and Danish were united under Eric of Pomerania in 1396. The money of Denmark begins with pennies of Sweyn (985–1014) which are copied from the coinage of England with the finishing touches of the name of the king; whereas the Norwegian and Danish were united under Eric of Pomerania in 1396. The money of Denmark begins with pennies of Sweyn (985–1014) which are copied from the coinage of England with the finishing touches of the name of the king; whereas the Norwegian and Danish were united under Eric of Pomerania in 1396.

The coinage of Sweden is remarkable for the very uniformity of its types, which are in current use to the present day. The money was restored by Albert of Mecklenburg (1363–1387). The modern coinage was introduced under Eric of Pomerania (1396–1432). The money of Gustavus Adolphus is historically interesting. Under Charles XII. there is highly curious money of necessity. The daler is struck as a small copper coin, sometimes plated. The types include
the Roman divinities. At the same time and later there was a large issue of enormous plates of copper, stamped with their full value in silver money as well.

The earliest Russian coinage begins with the princes of Kiev as early as the end of the 10th century; it shows strong Byzantine influence. The grand princes from the early 15th century on issued little silver pieces. The coinage was modernized by Peter the Great, who introduced a regular gold coinage. The silver large and copper coins of his successors are very plentiful. Nicholas I. (1825-1855) introduced a platinum coinage of the several kinds of gold.

The Christian coinages of the northern Balkan States are of great interest. They are chiefly silver gros, showing a mixture of Byzantine and Venetian influences. The Bulgarians had a regular silver coinage from Asen I., (1186-1196) to John Sismans (1371-1395). The Servian coinage lasts from Vladislas I. (1324-1340) to the middle of the 15th century. There is also a coinage of the Ban of Bosna (late 13th century) and of grand-masters at Malta; second group, Latin emperors of Constantinople, Frankish princes and lords of Greece and the Archipelago whose power was due to the crusade of 1204, such as the princes of Achaia, the dukes of Athens, Neapolitan kings who struck money for their Eastern possessions, Latin lords of the Archipelago, the Genoese at Chios, the Galliulesi at Mytilene, the Genoese colonies, the Venetian colonies, the Turkomans emirs of western Asia Minor who struck Latin coins. The most important currencies are the bullion and copper of the princes of Antioch (Bohemund 1, 1068, to Bohemund IV, 1201-1238) and the kings of Jerusalem (Baldwin II, 1118, to Conrad 1, 1243), the silver and copper of the counts of Tripoli (12th and 13th centuries) and the gold imitations of Arab dinars, the currency in that metal of the crusaders of Palestine. These Bisaniti Saraceni, or Saracen beznats, are at first imitations of Fatimite dinars, known to have been struck by Venetian moneyers at Acre, and probably at Tyre and Tripoli also. After these coins had been current for nearly a century and a half they were forbidden on account of their Mahommedan aspect by Pope Innocent IV. The Venetians then issued gold and silver coins with the same aspect but with Christian inscriptions. The kings of Cyprus issued a really good coinage in the three metals and in bullion from Guy de Lusignan (1192) to Catherine Cornaro; from 1489 to 1571 the Venetians issued coins for the island. The coinage of the order of St John begins on the conquest of the island of Rhodes (1309) and the suppression of the Templars; the earliest coins known are of Foulques de Villaret (1305-1310), and the last of the Rhodian series are of Villiers de l'Isleadam, the gallant defender of the island who was forced to capitulate to the Turks and sail for a new home in 1522. The coinage is of fine gold, silver, billon and copper. On the establishment of the order at Malta in 1530 it is resumed there till the capture of the island by the French at the close of the 18th century; it has little interest except as showing the wealth of the order. The other currencies of the crusaders, notwithstanding their great historical interest, are far less remarkable numismatically; the influence of the denier tournois is, however, noticeable on the coinage of the princes of Achaia (1245-1364), and the dukes of Athens (1225-1358).

Of the money of America little need be said here. Neither of the coinages of the Spanish and Portuguese dependencies, and of the states which succeeded them, nor those of the English colonies and of the United States, present much that is worthy of note. In style they all resemble those of the parent countries, but, originating in the decline of art, they are inferior in style and work. They are most remarkable in the south for the abundance of gold and silver. The chief coin is the dollar. Some coins are of historical interest, and there are a few rarities, such as the colonial money of Lord Baltimore struck for Maryland, the pine-tree coins of Massachusetts, and the hog-money of Bermuda.

**IV. — ORIENTAL COINS**

Oriental coins may be best classed as ancient Persian, Arab, modern Persian and Afghan, Indian and Chinese, and other issues of the far East. The first place is held by the money of the old Persian empire, the Parthians and the Sassanians. The conquests of the Arabs introduce a new currency, carried on by the Moslem inheritors of their empire. The modern Persian and Afghan money, thought of Arab origin, is distinguished by the use of the Persian language with Arabic. The Indian currencies, though Greek, Sanskrit, Arabic and Persian in their inscriptions, must be grouped together on account of their mutual dependence. They rise with the Bactrian kings, whose Greek types are gradually debased by the Indo-Scythians and Greeks; these are followed by a group of currencies with Sanskrit legends; next follow the money of Arab conquerors and the great series of the Pathans of Delhi and subsidiary dynasties, with Arabic inscriptions; the main series is continued in the currency of the Moguls, who largely use Persian, and the last series is closed by local currencies mainly with Sanskrit or Arabic legends. The Chinese coinages form the source and centre of the group of the far East, which, however, includes certain exceptional issues. The order throughout is historical, each empire or kingdom being followed by the smaller states into which it broke up, and then by the larger ones which were formed by the union of these fragments.

The Persian coinage was probably originated by Darius I. about the time that he organized the empire in satrapies. The regular taxation thus introduced made a uniform coinage necessary. Avoiding the complex gold system of Crousus, which was intended to accommodate the Greek cities in commercial relation with Lydia, Darius chose two weights, the gold shekel of 8.4 grammes and the silver shekel of 26 grammes. One gold piece was equal to twenty silver. The gold coin was called the daric, the silver the siglos. The metal was very pure, especially that of the daric. Thus not only was the Lydian gold and silver coins of inferior weight thrown out of circulation, but the gold coin became dominant, and was the chief gold currency of the ancient world so long as the empire lasted. The issuing of gold was a royal prerogative, and for minor money the same style was adopted by the kings of the other provinces by satraps, who used local types, and by tributary states. The following classes must be distinguished: (1) regal, (2) satrapal, (3) of tributary states. The art of Persian coins varies according to the different ages, from the style of Croesus to that of the 4th century B.C. The large and smaller types are found at Babylon, the capital of Asia Minor to the more formal style of Cilicia and the thoroughly hieratic stiffness of Phoenicia and Persia.

The regal coinage is of darics (P. IV. fig. 2) and subdivisions in gold and of sigli and subdivisions in silver. The obverse type is the king as an archer, the reverse an irregular oblong incuse. The darics show differences of style, and must extend through the whole period of the empire. The sigli no doubt run parallel with them. Both these denominations are uninscribed.

The satrapal coinage is very important and interesting. It belongs mainly to Cilicia. The most remarkable series is that of Sardis, the capital of Bithynia, which was a large city and an important mint, and contains a combination of the greatest beauty of workmanship and the most elaborate and interesting designs. A full series may be found at Colophon, Cyzicus and Lampacus, and in one instance bearing the name of the satrap Pharnabazus, but usually the word 'king' in Greek. The coin of Colophon shows a splendid portrait, often with an inscription; that from Lampatos is very fine, and that of Pharnabazus (see P. IV. fig. 1). Of other satrapal issues those of Datames, of Tiribazus and Cilician states, struck at Tarsus, are specially noteworthy. Their inscriptions are Aramaic.

The coinages of the tributary states have been but part noticed in their geographical order.

After the fall of the empire, the generals and satraps such as Mazedon, who governed the north-western part, issued Alexander's newly-acquired dominions issued coins from various mints, especially Babylon. The gold coins were double darics of the same type as their single predecessors. The silver coins were mainly modelled on the coins which Mazedon had previously issued in his own name, and some of them are called 'Missar.' Some of them may have been issued as far East as Bactria and North West India. These are followed by the first native coinage, inscribed below under India.
The conquest of Alexander did not wholly destroy the independ-
ence of Persia. Within less than a century the warlike Parthians,
once subjects of Persia, revolted (229–248 B.C.) against
Persia, and founded, for the first time, a Persian empire.
Parthia thus became an empire, ultimately the one successful
rival of Rome. Their money is Greek in standard and inscriptions,
as well as in the origin of types. The coins are silver, following the Attic
weight, and gold, imitating the Electrum coinage of Lydia. They are not
infrequent; there are also bronze coins, but none in gold are known.
The drachm has the head of the king on the obverse,
diademated or diademed, above the reverse legend and name.
Arsaces seated, holding a strong bow, the later tetradrachms varying
in this uniformity. Every king is styled Arsaces, to which many of the
later sovereigns add their proper names. The inscriptions are usu-
ally Greek, but occasionally they are in Parthian.

The Persian line of the Sassanian kings began about A.D. 220,
and rested the empire from the Parthians in 226-227, under the leader-
ship of Ardashir or Artaxeres. This dynasty issued a standard and
national and thus Oriental coinage in gold and silver.
Sassanian. The denominations follow the Roman system, and there
are but two coins, equivalent to the aureus or solidus and the denarius.
The aureus or solidus was a basic coin with a bull's head, usually
elaborate head-dress, varied with each sovereign, and the reverse
the sacred fire-altar (see Pl. IV. fig. 3) ordinarily flanked by the king and
a priest. The attachment which Ardashir, the founder, bore to Zoro-
astrianism, is shown in this national coinage. The first coins of
the four hundred years of the sovereignty of his line to
A.D. 652. The inscriptions are Pahlavi.

The Arab coinage forms the most important Oriental group. It
has a duration of twelve centuries and a half, and at its widest
geographical extension was coined from Morocco to the
borders of China. When the Arabs made their grand con-
quista money became a necessity. They first adopted in the
East imitations of the current Persian silver pieces of the last
Sassanians, but in Syria and Palestine of the Byzantine copper,
in Africa of the gold of the same currency. Of these early coins the Sassanian
silver, or ancient, or imitation coins inscribed with many shorter ones in Arabic (Cuici). The regular coinage with purely
Persian inscriptions begins with the issue of a silver coin at Basrah,
in 40 A.H. (A.D. 660), by the caliph 'Ali; after subsequent efforts thus
to imitate and copy the gold and silver coins of the Tigris-Euphrates
region, the coinage was finally established, in 76 A.H. (A.D. 695), by Abdalmalik. The names of the denominations and the weight of the gold are plainly indicated
by varieties of the figures of a bull engraved on the obverse
(Pl. IV. fig. 6) and a leopard or a lion, a figure, or a square, in the
reverse which mark the coinage.

The earliest silver coinage in the Near East was brought forth
by the Parthians in the first century B.C. and a little later. The
forms of coinage employed by the Parthians were derived
from the forms used in the Seleucid kingdom. The introduction of
the tetradrachm is perhaps the first coinage which is distinctively
Persian. It is a regular coinage with a weight of 11.8 grams and a diameter
about 30 millimeters. The figures of the king on the obverse and the figures
of the bull on the reverse are the principal features.

The Parthians, like the Seleucid rulers before them, issued coinage
with the name of the king on the obverse and the symbol of the
king or a bull, a lion, or a leopard on the reverse. These coins
were usual in the Parthian kingdom, although the Seleucid rulers
also issued coinage with the name of the king on the obverse
and symbols on the reverse. The Parthian coinage was
not widely used outside of the Parthian kingdom, but it
had a significant influence on the coinage of later
kings in the region.

The Parthians were succeeded by the Sassanians, who
continued the coinage of the Parthians but added their own
name to the coins. The Sassanians also issued coinage
with symbols of the king on the obverse and symbols of
the king or the bull on the reverse. These coins were
not widely used outside of the Sassanian kingdom, but
they had a significant influence on the coinage of later
kings in the region.

The Parthians and Sassanians were succeeded by the
Seljuks, who continued the coinage of the Sassanians
but added their own name to the coins. The Seljuks
also issued coinage with symbols of the king on the
obverse and symbols of the king or the bull on the
reverse. These coins were not widely used outside of
the Seljuk kingdom, but they had a significant influence
on the coinage of later kings in the region.

The Seljuks were succeeded by the Mamelukes, who
continued the coinage of the Seljuks but added their own
name to the coins. The Mamelukes also issued coinage
with symbols of the king on the obverse and symbols
of the king or the bull on the reverse. These coins were
not widely used outside of the Mameluke kingdom, but
they had a significant influence on the coinage of later
kings in the region.

The Mamelukes were succeeded by the Ottomans, who
continued the coinage of the Mamelukes but added their own
name to the coins. The Ottomans also issued coinage
with symbols of the king on the obverse and symbols
of the king or the bull on the reverse. These coins were
not widely used outside of the Ottoman kingdom, but
they had a significant influence on the coinage of later
kings in the region.

The Ottomans were succeeded by the British, who
continued the coinage of the Ottomans but added their own
name to the coins. The British also issued coinage
with symbols of the king on the obverse and symbols
of the king or the bull on the reverse. These coins were
not widely used outside of the British empire, but
they had a significant influence on the coinage of later
kings in the region.

The British were succeeded by the United States,
who continued the coinage of the British but added their own
name to the coins. The United States also issued coinage
with symbols of the king on the obverse and symbols
of the king or the bull on the reverse. These coins were
not widely used outside of the United States, but
they had a significant influence on the coinage of later
kings in the region.
Regarding the coinage of the Scythians of Central Asia between 450 B.C. and 300 B.C., the Scythians were known for their extensive trade networks, which included the production and circulation of a variety of coins. The Scythians were also known for their military conquests, which were often financed by the sale of loot captured during their campaigns. The Scythian coinage was characterized by a high degree of variability, with different regiments producing their own distinctive coins.

The Scythian coinage was often made of silver and gold, and was divided into a variety of weights and types. The Scythians were also known for their use of animal motifs, such as the stag, which was often depicted on their coins.

The Scythian coinage was not only used in Central Asia, but also in other parts of the ancient world, including the Roman Empire. The Scythian coinage was known for its high degree of variability, and was often imitated by other coinage systems.

Despite the Scythian coinage's success, it eventually declined in the 3rd century B.C., as the Scythian empire disintegrated. The Scythian coinage was replaced by other coinage systems, including the Greek, Roman, and Persian coinage systems.

However, the Scythian coinage had a lasting influence on the coinage systems of the ancient world. The Scythian coinage's use of animal motifs and its high degree of variability are examples of the ways in which the ancient world learned from and adapted to the Scythian coinage.
far more elegant than that of the Pathans, but the money of the former is more refined. This may be due, in part, to the influence of zodiacal motifs and repoussé, as well as to the more refined workmanship of the coiners of the Pathan empire.

NUMISMATICS

The regular copper coinage, Chinese in pattern, began with the explication.

The coins of the Java, 19), are small and of a style similar to that of China, and Chinese coins were long the currency of Java, which more recently has issued the money of its Mahometan empire.

The empire of Japan shows in its coinage that Chinese source is modified by the influence of native independence which marks all its institutions. The use of a metallic currency probably shows strong Chinese influence. Amongst the earliest are rude silver pieces, disks of somewhat irregular shape, with a central hole, attributed to the 5th century B.C., and there are also copper coins of similar character dating from the end of the 7th century. A

A
adopted for the gold and silver in 1893, new reverse types were prepared for the half-crown, florin, and shilling, and the issue of the double florin was discontinued. The portrait of the queen was the work of the sculptor Thomas Brock, R.A., who was careful to avoid the defects which had been somewhat severely criticized in Sir J. Edgar Boehm’s design of 1887. The new type for the half-crown, a spade-shaped shield within the garter, was also executed by Mr Brock; and those for the florin and shilling, three shields placed triangularly, were by Sir Edward Poynter. In 1895 a new issue of bronze money was ordered, when the queen’s bust of 1893 was adopted, and a slight alteration made in the reverse type, the representation of a lighthouse and a ship, which had been added to the design in 1866, being eliminated.

The coinage of Edward VII. differed but slightly from that of Queen Victoria. The denominations were the same; but on the obverse the head of the king (by G. W. de Saulles, engraver to the Mint) was represented bare, the title “Britanniarum” was changed to “Britanniarum Omnium Rex,” the reverse of the florin showed Britannia standing on a ship, and that of the shilling the royal crest, the lion on a crown, as on the so-called “lion-shillings” of 1826. The designing of the new coinage of George V. was entrusted to Mr Edward Helvetic; and the bust in the design of the Third Republic in France in 1879, the coinage was continued on the same lines as before, the types only being altered. The silver franc of 5 grammes (78 grains) as ordered in 1793 and confirmed by the Latin Monetary Union of 1865, which included Belgium, Italy and Switzerland, and subsequently in 1868 Greece, has remained the unit of value. The denominations ordered were, in gold, the 100, 50 and 20 francs; in silver, the 1 franc, and 50 and 20 centimes; and in bronze, the 10, 5, 2 and 1 centime. The types adopted were those which had been used previously—thus for the gold that of a genius inscribing the tables of the law, as designed by Augustin Dupré for the reverse of the constitutional coinage of Louis XVI.; for the silver and copper the head of the Republic as executed by Oudiné for the money of 1848. Subsequently, in 1871, the type of the 5 francs was changed for that of Hercules leaning on Liberty and Strength, as made by Dupré for the First Republic. In 1889 the 10 francs in gold was added to the list, having the head of the Republic crowned with corn, the work of Merley for the Republic of 1848; but only a small number of these coins was struck in that year and in 1895. No further alteration was made till after 1895, when, in consequence of suggestions that the types should be modified so as to mark the Third Republic, the artists Chaplain, Rotty and Dupuis were commissioned to execute new designs—the first for the gold, the second for the silver, and the last for the bronze. The types approved were: for the gold 20 francs, the head of the Republic with a Phrygian cap, and the Gallic cock; for the silver 2 and 1 franc and 50 centimes, the sower sowing, with the rising sun in the background, and a laurel branch; and for the bronze, the bust of the Republic wearing a Phrygian cap, and on the reverse France seated amidst clouds, holding a branch and a flag, and accompanied by a genius. These coins were not issued simultaneously—the 50 centimes appearing in 1897, and 2 and 1 franc and 10, 5, 2 and 1 centime in 1898, and the 20 francs in 1899. In 1903 a nickel piece of 25 centimes was introduced, since 1904 with a polygonal edge to facilitate distinction from the silver. The quartering of the franc is a departure from the strictly decimal system, also adopted in Italy. These later coins are characteristic of modern French medallic art, which has a strong tendency to imitate that of Italy of the 16th century.

Belgium.—Of the other states which formed the Latin Monetary Union, Belgium had already in 1832 adopted the French decimal and bimetallic system, with the franc as the unit of value. Her accession to the Union, therefore, only entailed a slight modification of type and denominations, which latter were the same as in France, except that the only gold coin was the 20 francs, the 25 centimes in silver was not issued, and the pieces of 10 and 5 centimes are now in nickel. The gold and silver coins have for types the head of the king and the royal shield, those in nickel the Belgic lion and mark of value, and those in bronze the royal monogram and the lion holding the tables of the constitution. Some of the silver coins have the inscriptions in Flemish. The nickel coinage introduced in 1902 is perforated in the centre to prevent confusion with silver.

Switzerland.—Like Belgium, Switzerland had before her adhesion to the Latin Monetary Union adopted the French system, with the franc of 100 centimes or rappen as the unit of value. The denominations in gold and silver were the same as issued for Belgium, but no gold was struck before 1883. The coins of baser metal were the 20, 10 and 5 centimes in billon, which metal was in 1879 changed for the nickel, and in copper the 2 and 1 centime. Certain changes of type have from time to time occurred. The first issue of the 20 francs in 1831 shows the head of the Republic and the shield of the Confederation; but this was changed in 1897 for the head of Helvetia above a range of mountains, and on the reverse a wreath with mark of value. On the silver coins from 1874 Helvetia is represented standing instead of seated, and on the nickel money of 1879 the shield of the Republic is replaced by the head of Helvetia. The mark of value and a wreath form the general reverse type of all the silver, nickel and copper coins. Since 1888 a 5-franc piece, similar in type to the 20 francs of 1883, has been issued.

Italy.—When Italy joined the Latin Monetary Union in 1865, she adopted as the unit of her coinage the lira of 100 centimes, equal to the franc. The coins were of gold, silver and bronze, and of the same denominations as those struck in Belgium and Switzerland. In 1894 a nickel coinage of 20 centesimi was ordered. The general type for all the coins is the head of the king and the royal arms, but on the reverse of the copper is the mark of value; and the nickel money has on the reverse a crown with a wreath. A new nickel piece of 25 centesimi indicates a departure from the strictly decimal system. The coinages of all the small Italian states, including the Papal, have now passed out of currency.

Greece.—A special stipulation was made, when Greece was enrolled in the Latin Monetary Union in 1868, that all her money should be struck at a French mint. The unit of the coinage
is the drachm of 100 lepta, which, like the lira, is equivalent to the franc. The denominations are—in gold, the 100, 50, 20, 10 and 5 drachmas; in silver, the 5, 2 and 1 drachm, and 50 and 20 lepta; and in bronze, the 10, 5, 2 and 1 lepton. In 1893 nickel was substituted for bronze, and coins of the value of 20, 10 and 5 lepta were issued in this metal. The types of the coins of Greece are similar to those of Italy. Crete has had since 1900 a coinage of its own similar to the Greek (silver of 1/2 drachma, 1 and 3/4 drachma; bronze and nickel of 20, 10, 5, 2 and 1 lepton).

Germany.—Since 1871 the coinage of the German empire has been entirely remodelled. By a convention in 1857 between the states of Germany, north and south, and Austria a general coinage of a silver standard was established on the basis of the new pound of 300 grames as sanctioned by the Zollverein. The contracting countries were divided into three sections, North Germany, South Germany and Austria. From the pound of fine silver of 300 grames the Northern States struck 30 thalers, Austria 45 florins and the Southern States 52½ florins; their relation being 1 North German thaler = 1/3 Austrian florins = 1/5 South German florins. The free towns of Hamburg, Lübeck and Bremen did not join the convention. The first reform in the coinage of the German empire occurred in 1871, when a new gold money was introduced, which had for its unit the silver mark (a money of account) of 100 pfennigs weighing 3.555 grames. The new gold pieces were of the value of 10 and 20 marks, called crowns and double crowns, and that of 100 marks, called 100 florins, 1897 of Munich, of which 20 were marked with the crowned head crowned, with the crowned head, and with the crowned head. The gold coin was struck a trade-money (Handelsmünze) of the current value of 10 francs, and it displaced the 8- and 4-florin pieces of 1870. The types of the Austrian and Hungarian coins somewhat vary. The Austrian gold coins show the head of the emperor and the two-headed eagle, but those of Hungary a full-length figure of the emperor and the national shield surmounted by the crown of St Stephen held by angels. The silver coins of both series have the head of the emperor and the mark of value under the imperial or royal crown. The nickel and bronze money of Austria displays the imperial eagle on the obverse, whilst that of Hungary has the crown of St Stephen. The legends are respectively in Latin and Magyar.

Spain.—The unit of the Spanish coinage from 1864 to 1868 was the silver escudo of 200 grains divisible into 10 reals. On the dethronement of Isabella in 1868 the provisional government adopted the principles of the Latin Monetary Union and made the peseta the unit of account, this coin being equivalent to the franc. The coins struck during 1869-1870 were, in gold, the 100 pesetas; in silver, the 5, 2 and 1 peseta, and the 50 and 20 centimos; and in bronze, the 10, 5, 2 and 1 centimo. The obverse type of each metal varied; on the gold Spain is standing; on the silver she is redining; and on the bronze she is seated. During his short reign (1870-1873) Amadeus I. struck only gold coins of 100 and 25 pesetas and silver of 5 pesetas, and there was practically no money issued during the republic which followed his abdication. Don Carlos during the insurrection of 1874-1875 struck 5 pesetas in silver and 10 and 5 centimos in bronze bearing his portrait and title "Carolus VII." After the restoration of Alphonso XII. the coinage consisted of 25 and 10 pesetas in gold; 5, 2 and 1 peseta and 50 centimos in silver; 10, 5, 2 and 1 centimo; and 50, 20, 10 and 5 centimos in bronze. This coinage was continued under Alphonso XIII., but in 1887 the 20 pesetas in gold was substituted for the 25 pesetas, and in 1897 large coins were struck of 100 pesetas. The types show the head of the king on the obverse and the shield with or without the pillars of Hércules, the reverse composed of various emblems.

Portugal.—A gold standard was adopted by Portugal in 1854, the unit of value being the milreis of 1000 reis. The coins are in gold, the crown or 10 milreis and the half, fifth and tenth crown or milreis; in silver, the 10, 5 and 2 testoon; in nickel, the 100 and 50 reis; and in bronze, the 20, 10 and 5 reis. The general type of the gold and silver is the head or bust of the king and the royal shield; but the bronze varies in having on the obverse a shield and on the reverse the mark of value.

Denmark, Sweden and Norway.—Previous to 1872 in Denmark the unit of value was the silver rigsbankdaler of 96 skilling; in Sweden, the rigsdaler of 100 öre; and in Norway, the specietchaler of 120 skilling; but in that year a monetary convention was concluded between these countries establishing a decimal coinage, which had for its unit the krone of 100 öre, and of which

**FIG. 7.—Twenty Marks (gold). Germany.**

**FIG. 9.—Peseta (silver). Spain.**
the standard was gold. The denominations are, in gold, the 20, 10 and 5 kroner; in silver, the 2 and 1 krones, and 50, 25 and 10 öre; and in bronze, the 5, 2 and 1 öre. The gold and silver money of Sweden and Norway to the 50 öre bears the head of the king and the royal shield; the silver of smaller denominations and the bronze, the monogram of the king and the mark of value. Since the separation of the two kingdoms in 1906, Norway has a coinage of its own in the name of Haakon VII. In Denmark the gold and silver have the head of the king, and, for reverse type, a figure of Denmark, a shield, or the mark of value. The bronze coins are similar to those of Norway and Sweden.

Russia.—The Russian coinage previous to 1855 was based on the silver standard of 276 grains of pure metal; but during the 1800s and the first part of the reign of Alexander II. (1855-1881) the currency consisted almost entirely of paper money. In 1885 Alexander III. determined to place the coinage on a proper footing, and introduced the rouble of 100 copeks as the unit of account, with a relative value of gold and silver of 1 to 15. The coins issued were, in gold, the imperial of 10 roubles, and the half-imperial; in silver, the rouble, and the 50, 25, 20, 15, 10 and 5 copeks; and in copper, the 5, 3, 2, 1, ½ and ¼ copek. In 1897 the relative value of gold and silver was advanced to 1 to 23, thus raising the value of the rouble to that of 1 to 15 roubles; but no change was made in the weights of the coins, and the silver rouble remained the unit of account. In the same year a piece of 5 roubles, called the one-third imperial, was added to the gold coins. The general types of the gold and silver show the head of the emperor and the imperial eagle; and of the copper, the imperial eagle and mark of value.

Georgia, Poland and Finland.—The separate issues of Georgia and Poland were suppressed in 1833 and 1847 respectively; but Finland in 1878 established a decimal coinage of gold, silver and bronze on the principles of the Latin Monetary Union, having the markkaa (= 1 franc) as its unit of value.

Turkey.—There has been practically no change in the money of the Ottoman empire since the reforms of Abdul-Medjid in 1844, when the piaster, or 40-paice piece, of the current value of 24 d., was made the unit of the coinage; 100 piastres go to the gold medjidieh or pound. The denominations are, in gold, the 500, 250, 100, 50 and 25 piastres; in silver, the 50, 25, 10, 5 and 2 piastres; and in copper, the 40, 20, 10, 5 and 1 para. The type in all metals is, on the obverse, the Sultan’s tugra, or cipher, and on the reverse, a wreath, and the name of the mint, date, &c.

Balkan States.—Since the dismemberment of the Ottoman empire the kingdoms of Rumania and Servia, and the principality of Bulgaria, have each adopted the decimal system of the Latin Monetary Union. In Rumania the unit of account is the leu of 100 bani; in Servia, the dinar or 100 para; and in Bulgaria, the lev, each of 100 stotinki, each of these units being the equivalent of the franc. In all these states gold, silver, bronze and nickel is current money.

United States.—In America the most important event connected with the coinage was a change of standard. (See Money.) Previous to 1873 the standard was silver, having for its unit the dollar of 412½ grains of fine; but in that year a gold standard was adopted, the gold dollar of 25·8 grains and ¼ fine being the sole unit of value. This change of standard was accompanied by a slight modification of the denominations, which became, in gold, the double-eagle, eagle, half and quarter eagle, three dollars and dollar; in silver, the half and quarter dollar, 20 cents and dime; in nickel, the 5 and 3 cents; and in bronze, the cent. In addition to these a silver piece called the "trade dollar" of 420 grains was struck, not for circulation in the States, but for export to China. The following changes have since occurred:

Canada, &c.—The currency for the Dominion of Canada, which includes Nova Scotia, New Brunswick and British Columbia, is of silver and bronze, based on the system of the United States. The denominations are 50, 25, 20, 10 and 5 cents in silver and the cent in bronze; and they also have a uniform type of the sovereign, but the system prevails in Newfoundland, which also issues the double dollar in gold; this is the only gold coin issued in a British colony whose standard is not the same as that of the mother country. There is a separate coinage for Jamaica, but of nickel only, and consisting of the penny, halfpenny and farthing.

Mexico, &c.—We need not give any detailed account of the coins of Mexico, and of the various states of Central and South America, in which there have been many changes and modifications. Of them most of them have adopted the decimal system, with a gold, silver or bi-metallic standard; the unit of value in the gold standard being generally the peso of 32.25 grams, and in the silver also the peso, but of silver of 20, 2.5 or 5.71 grams.

India.—As to the coins of the East and Far East, we will limit our remarks to the more important countries. In British India the rupee of silver of 150 grains is still the unit of coinage. In 1893 the mints were closed to the unrestricted coinage of silver for the public. In 1899 they were opened to the free coinage of gold, the sovereign being declared legal tender. At present 1£=15 rupees of 1s. 4d.; 1 silver rupee; 1 strand; and 1 sovereign.

Persia.—In Persia since 1879 a decimal system in conformity with the principles of the Latin Monetary Union has been adopted, having for its unit the krán weighing 78.7 grns., thus being equivalent to the franc, the peso reduced to 100, or the rupee. The denominations are: in gold, the 10, 5, 2, 1, ½ and ¼ toman (the toman = 10 krans); in silver, the 5, 2 and 1 krán (= 20 shahis), and the ½ and ¼; and in copper, the 4, 2 and 1 shahi (= 2 paisa), and the ½ paisa.

Japan.—Since 1870 Japan has formed its coinage on the European decimal system in place of the ancient national coins, the obanges and itsbush, the unit being the yen of 100 sen. The standard was bi-metallic, and the relation of gold and silver stood at 1:16:17. In 1898 a gold standard was adopted, the issue of the silver yen was suspended, and the weight of the gold money was reduced by one-half. The coins issued since that date are, in gold, the 20, 10 and 5 dollars; in silver, the 20, 10 and 5 sen; and in bronze, the yen and half-sen. There is one general type for all the silver, nickel and bronze coins, being the dragon on the obverse and the monogram of the Emperor with mark of value on the reverse. The gold varies in having flags and flowers on the reverse. The silver and bronze coins the legends are in English as well as in Japanese.

China.—In 1890 China followed the example of Japan, but only to a considerable extent, and issued a silver coinage and mint a gold dollar of the same value as the United States silver dollar and the Japanese yen. It is calculated in fractions of the tael, a money of account of the value of 28. 11½. The coins are the dollar, and the 50, 25, 10 and 5 cents, with the Chinese dragon and inscriptions, mint and mark of value in English on the obverse, and on the reverse the mark of value in Chinese and Manchu. They were first struck at Canton and Wei-Chang, but later other mints have been established. The only difference is, that silver and bronze coinage and monetary unit being the copper cash. A decree of the 20th of November 1905 proposed to establish an official dollar on the basis of the United States, silver and cent. The mints provide for a standard currency dollar of 72 candeens, with a subsidiary decimal coinage in silver, nickel and copper, for circulation throughout the empire.

Korea has had since 1905 a new coinage on the Japanese system, but with the Korean date.

Hong Kong.—The only other Asiatic coinage we shall note is that of Hong Kong, where a similar establishment also exists, but on the United States standard, having the silver dollar as its unit. The denominations are the dollar and 50, 20 and 5 cents in silver, and the cent and mill in bronze; and, with the exception of 1862, all had the same value in both standard of value. In connexion with this coinage there was issued in 1895 a "trade dollar" for special currency in the Straits Settlements and Hong Kong in lieu of the Mexican dollar, the scarcity of which was thus removed. In connection with this coinage there were issued in 1898 a "trade dollar" for special currency in the Straits Settlements and Hong Kong in lieu of the Mexican dollar, the scarcity of which was thus removed.

FIG. 10.—Seven and one-half Roubles (gold), Russia.
trident and shield, and on the reverse within an ornamental design the denomination in Chinese and Malay. Since 1903, however a new special dollar with the king's head has been issued for the Straits Settlements.

**Egypt.**—Glancing cursorily at the coining of Africa, we may note that since 1855 Egypt has adopted a gold standard with the gold pound of 100 piastres as the unit of account. This is no longer divisible into 40 paras, but into 10 ochr-el-guerche or tenths. The types are similar to the Turkish money, and though bearing the legend "V.S.A.E," none of the coins is really made at Birmingham. For some years gold has not been issued.

**Abysinia.**—In Abysinia since 1893 there has been a silver coinage, but the Austrian Maria Theresa dollar is still current. The new coins are, in silver, the talari (= dollar, worth about 2s.), 1/2 and 1 talari, and in copper, the guerche, and 1/2 and 1/4 guerche. They show on one side the head of the king, and on the other a lion holding a banner.

**Zanzibar.**—Zanzibar has also issued a dollar of the fixed value of 2 rupees and 2 annas, and a copper coin called a pessa (= 13th of a dollar).

**Sudan.**—The African coinages which have attracted exceptional attention are those of the Sudan and the South African Republic. The former dates from 1885, when the Mahdi struck the pound of 100 piastres in gold and 20 piastres in silver, of the same type as the Egyptian coins, but on the silver piece were placed the words "By order of the Mahdi," but no mint name. His successor, Abdullah, struck pieces of 20, 10, 5, 2 and 1 piastre in silver and 10 paras in copper, but no gold. They bear the name of the mint, Omdurman, and the word mabkab, i.e. accepted. At first the silver coins were of 6 parts silver and 2 copper, but in a few years they were so debased that they degenerated into mere pieces of copper washed with silver. The last issue is dated 1897 (A.H. 1315).

**Congo Free State (Belgian Congo).**—The coinage of 1887 consists of silver of 5, 2, 1, 1/2 and 1/4 centimes, and copper (with central hole) from 10 centimes to 1 centime.

**Transvaal.**—The first attempt at a separate coinage in the Transvaal was in 1874, when President Burgers issued sovereigns or pounds showing his portrait on the obverse and the shield of the Republic on the reverse. They were struck by Messrs Heaton of Birmingham, but as each piece of the current value of 20s., cost 2s. 6d. to strike, only 6580 was issued, but few of these passed into circulation, being preserved as curiosities. No further attempt was made till 1891, when President Kruger struck the Rand to order a coinage in gold, silver and bronze after the English standard. The first issue occurred in 1892, and consisted of the pound and half-pound in gold, the crown, half-crown, florin, shilling, sixpence and threepence in silver; and the penny in bronze. They are all of the same type as the pound of 1874, but with the portrait of President Kruger on the obverse. The first issue of the pound, half-pound and crown was minted at Berlin, and a curious mistake was made in the arms of the state, the wagon being represented with its wheels instead of with one. This blunder was soon noticed, and a recoining took place in the same year at Pretoria. Since the annexation British coins have been legal tender, but a new copper coinage was approved in 1904.

**Bibliography.**—I. Periodicals: *Numismatic Chronicle* (London); *Numismatica Helvetica* (Bern); *Numismatische Zeitschrift* (Vienna); *Rivista Italiana di numismatica* (Milan); *Review belge de numismatique* (Brussels).

In this bibliography no mention is made as a rule of articles in periodicals, or of monographs on the coinage of special cities or small districts.

NUMMULITE, NUMMULITES, A. d'Orbigny's name for a genus of Perforate Foraminifera (q.v.), distinguished by the flattened, lenticular discoid shell of many turns, finely perforated; chambers subdivided by incomplete septa into squarish chambers. This genus is especially abundant in Eocene Limestones, which attain great thickness around the Mediterranean basin; the Pyramids of Egypt are built of it.

NUN (O. Eng. nuna, from Lat. nonnus, nonna, familiar terms for an old man or woman), a member of a community of women, living and working as a life of the Church, under vows of poverty, obedience, and chastity. In ecclesiastical Latin nonnus was used by the younger members of a religious community for their elders, and so, in the regular of St Benedict, cap. 62, Juniorum autem Priorum suos nonnos vocant quod intelligit paterna reverentia (Du Cange, Glossarium, s. v. nonnus). While nonna has remained as the generic name of a female religious, nonnus has been replaced by monachus and its various derivatives (see Monk).

NUMATAK, a name applied in Greenland (and hence extended in use elsewhere) to a hill or mountain peak appearing above the surface of the glacier. Greenland is for the most part protected by an ice-cap of a certain thickness which moves slowly downwards to the sea. It will rise upwards and pass over a barrier if there is no outlet, but it will flow between and around mountain peaks leaving them standing as hills (numataks) above the general surface of the ice-cap. These prominences are sometimes covered with arctic vegetation, and arctic flowers bloom freely upon them in the summer.

NUNCIO, or NUNTIIUS APOSTOLICUS, a representative of the pope sent on diplomatic mission. The nuncios are of lower rank than the legati a latere, but have practically superseded them. The nuncio was the ambassador of the Holy See at the court of a foreign prince, and the ordinary course was for the Holy See to send a nuncio to an Italian state, which resulted in a long-standing enmity. In 1775, when Hastings was governor-general, Nuncabor brought accusations of peculation against him, which were entertained by Francis and the other members of cabinet at Westminster. While the matter was still pending, Nuncabor was indicted for forgery, condemned and executed. Warren Hastings and Sir Eliah Impey, the chief justice, were both impeached, and were accused by Burke and afterwards by Macaulay of committing a judicial murder; but Sir James Stephen, who examined the trial in detail, states that the indictment of the ambassador was not brought forward by Hastings, and that Impey conducted the trial with fairness and impartiality. See Sir James Stephen, The Story of Nuncabor (2 vols., 1889); and, for another treatment of the case, H. Beveridge, The Trial of Nanda Kumara (Calcutta, 1886).

NUNEAUTON, a market town and municipal borough in the Nuneaton parliamentary division of Warwickshire, England, on the river Anker, a tributary of the Tame, and on the Coventry Canal. It is an important junction of the London and North
Western railway, by which it is 97 m. N.W. from London, and it is served by the Leicester-Birmingham branch of the Midland railway. Pop. (1901) 24,996, rapidly increasing. The situation is low and almost encircled by rising ground. The church of St. Nicholas is a large and handsome structure in various styles of architecture, and consists of nave, chancel and aisles, with a square embattled tower having pinnacles at the angles. It contains several interesting monuments. A free grammar school was founded in the reign of Edward VI., and an English free school for the instruction of forty boys and thirty girls by Richard Smith in 1712. The ribbon industry is of less importance than formerly, but there are ironworks, cotton, hat, elastic and worsted factories, and tanneries; the making of drain-pipes, tiles and blue and red bricks is a considerable industry. In the neighbourhood there are also coal and ironstone mines. The prefix of the name of the town is derived from a priory of nuns founded here in 1150. In the reign of Henry III. a weekly market was granted to the prioresse. Nunney was incorporated in 1907, and the corporation consists of a mayor, six aldermen and twelve councillors. Ares 10,597 acres.

**NUNÉZ, PEDRO (PETRUS NONIUS) (1492–1577), Portuguese mathematician and geographer, was born at Alcacer do Sal, and at an early age was sent to Lisbon to be educated. He published several works, including a copiously-annotated translation of portions of Ptolemy (1537), and a treatise in two books, *De arte atque ratione navigandi* (1546). His clear statement of the scientific equipment of the early Portuguese explorers has become famous. A complete edition of all his writings appeared at Basel in 1592. See F. de B. Garcia-Stockler, *Ensino historico sobre a origem e progressas das matematicas em Portugal* (Paris, 1819); R. H. Major, *Prince Henry the Navigator* (London, 1868, p. 55).

**NÚÑEZ CABEZA DE VACA, ALVARO (c. 1490—c. 1564), Spanish explorer, was the lieutenant of Pánfilo de Narváez in the expedition which sailed from Spain in 1527; when Narváez was lost in the Gulf of Mexico, Cabeza de Vaca succeeded in reaching the mainland somewhere to the west of the mouths of the Mississippi, and, striking inland with three companions, succeeded, after long wandering and incredible hardship, in reaching the city of Mexico in 1536. Returning to Spain in 1537, he was appointed "adelantado" or administrator of the province of Rio de la Plata in 1540. Sailing from Cadiz in the end of that year, after touching at Cananéa (Brazil), he landed at the island of St Catharine in the end of March 1541. Leaving his ships to proceed to Buenos Aires, he set out in November with about 150 men to find his way overland to Ascension (Asunción) for the relief of his countrymen there. The little band reached their destination in the following year. After various successes in the interior, they burnt his dealings, and the Indians of the Núñez was sent home under arrest in 1544, and in 1551 was banished to Africa by the council of the Indies for eight years. He was recalled in about a year and appointed to a judgeship in Seville, where he died not later than 1564.

The *Naufragios* ("Shipwrecks") of Cabeza de Vaca, which relate to the Florida expedition and his journey to the city of Mexico, appeared at Zamora in 1542; the work has frequently been reprinted, and an annotated English translation was published by T. Buckingham Smith in 1851. His *Comentarios* (1555) chronicle the adventures of his companion in three Fascicles, *El Viaje* (1878). The *Journey of A. Núñez Cabeza de Vaca* (ed. A. F. Bandelier, New York, 1905).

**NÚÑEZ DE ARCE, GASPAR (1834–1903), Spanish poet, dramatist and statesman, was born at Valladolid, where he was educated for the priesthood. He had no vocation for the ecclesiastical state, plunged into literature, and produced a play entitled *Amer y Occid* which was bought at Toledo in 1849. To the displeasure of his father, an official in the post office, the youth refused to enter the seminary, and escaped to Madrid, where he obtained employment on the staff of *El Observador*, a Liberal newspaper. He afterwards founded *El Bachiller* y *Honduras*, a journal in which he advocated a policy of Liberal concentration, and he attracted sufficient notice to justify his appointment as governor of Logroño, and his nomination as deputy for Valladolid in 1865. He was imprisoned at Cáceres for his violent attacks on the reactionary ministry of Narváez, acted as secretary to the revolutionary Junta of Catalonia when Comillas was in authority, and wrote the "Manifesto to the Nation," published by the provisional government on the 26th of October 1868. During the next few years he practically withdrew from political life till the restoration, when he attached himself to Sagasta's party. He served under Sagasta as minister for the colonies, the interior, the exchequer and education; but ill-health compelled him to resign on the 27th of July 1890, and henceforth he refused to take office again. He was elected to the Spanish Academy on the 8th of January 1874, and was appointed a life-senator in 1886. He died at Madrid on the 11th of April 1892.

Núñez de Arce first came into notice as a dramatist, and he remained faithful to the stage for nearly a quarter of a century. In addition to three plays written in collaboration with Antonio Hurtado, he published *¿Quién es el autor?* (1859), *La Cuenta del Zapatero* (1859), *¿Cómo se empieza un marido?* (1860), *Deudas de la honra* (1863), *Ni tanto ni tan poco* (1865), *Quien debe, paga* (1867) and *El has de leña* (1872). But Núñez de Arce's talent was more lyrical than dramatic, and his celebrity dates from the appearance of *Gritos del combate* (1875), a collection of poems concerning Spaniards to lay aside domestic quarrels and to save their country from foreign domination.

He maintained his position (in popular esteem) as the only possible rival of Campoamor by a series of philosophic, elegiac and symbolic poems:—*Raimundo Lulio, Ultima lamentacion de Lord Byron* (1879), *Un Idilio y una Elegia* (1879), *La Selva oscura* (1879) and *La Vision de Fray Martin* (1880). The old brilliance sits off the naturalistic observation of *La Pesca* (1884) and *La Maruja* (1886). The list of his works is completed by *Poemas cortos* (1890) and *Sisurum corda!* (1900); *Hernán el lobo*, published in *El Liberal* (January 23, 1881) and Luebel remain unfinished.

His strength lies in the gorgeousness of his vision, his sincerity and command of his instrument; his weakness derives from his divided sympathies, his moods of obvious sentiment and his rhetorical facility. But at his best, as in the *Gritos del combate*, he is a master of virile music and patriotic doctrine. (J. F. K.)

**NUORO**, a town and episcopal see of Sardinia, Italy, in the province of Sassari, 38½ m. E. of Macomer by rail. Pop. (1901) 6739. It is situated 1905 ft. above sea-level in the east central portion of the island, amid fine scenery. Nuoro was the capital of a province from 1838 to 1860. It is connected by road with Domusco and Sassari, and it is about 13 m. W. of Nuoro in 1850, near Orretoli, has the letters FIN NVRR (finis)Nuvr. . . ., which are explained as referring to the boundaries of the territory of Nuoro in Roman times, showing (what was not known before) that the name and the place are of Roman origin (F. Vivian at *Notizie degli scavi*, 1880, 202). (T. A.)

**NUPE**, formerly an independent state of W. Africa, now a province in the British protectorate of Nigeria. Under Fula rule, Nupe occupied both banks of the Niger for a distance of some 150 m. above the Benue confluence. Only the part of Nupe north of the Niger now constitutes the province; area 600 sq. m., estimated pop. about 150,000. It is in many portions highly cultivated, and owing to its admirable water supply is likely to prove particularly valuable as a field for the extensive cultivation of cotton. Bida (q.v.), the capital, is connected by railway (built 1907–1908) with Baro, a port on the Niger 70 m. above Lokoj. Nupe had an ancient and very interesting constitution of which the leading features were adopted by the Fula when their rule was established about the year 1859. Bida was founded in that year. Nupe was conquered by the Ngomog of the Nger 1807, and the legal status of slavery was then nominally abolished. The company was, however, unable to occupy the country, and on the withdrawal of its troops the deposed emir returned. In 1901 it became necessary to subdue Nupe a second time. British troops marched to Bida. The emir fled without fighting and was deposed. Another emir was appointed in his place, took the oath of allegiance to the British crown, and worked cordially with the British resident
who was stationed at Bida. The province is divided into three administrative districts—Bida, Lapal and Agaie. These are again divided into nine native districts, five to the west and four to the east of the Kaduna river. Provincial courts of justice have been established.

Nuremberg, one of Bida. For an interesting account of the ancient constitution of Nuremberg see the *Fulani Emirates of Northern Nigeria* by Major J. A. Burdon in the *Geo. Journ.*, vol. xxiv (London, 1904).

**Nuremberg** (Ger. *Nürnberg*), a city of Germany, the second town in Bavaria in size, and the first in commercial importance. It lies in the district of Middle Franconia in a sandy but well-cultivated plain, 124 m. by rull N.W. from Munich. The city is divided by the small river Pegnitz, a tributary of the Main, into two parts, called respectively the Lorenzer Seite and the Sebalder Seite, after the two principal churches. There are four islands in the Pegnitz, which is crossed here by fourteen bridges. Formerly among the richest and most influential of the free imperial towns, Nuremberg is one of the few cities of Europe that have retained their medieval aspect largely unimpaired. Considerable sections of the ancient walls and moat still remain, though the demolition of portions to meet the exigencies of modern traffic and expansion has somewhat destroyed its quaint medieval character. Of the 350 bastions which formerly strengthened the walls, however, nearly 100 are still in situ, and a few of the interesting old gateways have also been preserved. Most of the streets are narrow and crooked, and the majority of the houses have their gables turned towards the street. The general type of architecture is Gothic, but the rich details, which are lavished with especial freedom in the interior courts, are usually borrowed from the Renaissance. Most of the private dwellings date from the 16th century, and there are practically none of earlier date than the 15th century. A praiseworthy desire to maintain the picturesque ness of the town has led most of the builders of new houses to imitate the lofty peaked gables, oriel windows and red-tiled roofs of the older dwellings. Altogether Nuremberg presents a faithful picture of a prosperous town of three hundred years ago.

The old burg, or castle (Kaiserschloss), is picturesquely placed on a rock on the north side of the town. This dates most probably from the early part of the 11th century, but it received its present form mainly during the reign of the emperor Frederick I. about 1150 years later. It was restored in careful harmony with its original appearance in 1854–1856, and part of the interior is fitted up as a royal residence, the families of the German emperor and of the king of Bavaria having apartments therein. In the Heidenturm are two late Romanesque chapels, and the other parts of the castle, which contains a pentagonal tower, the oldest building in the town, wherein are preserved the famous "iron virgin of Nuremberg," and other instruments of torture; the granary (Kornhaus), also called the Kaiserstallung; and the Vestnorter or Vestnurturm. The castle of Nuremberg was a favourite residence of the German sovereigns in the later middle ages, and the imperial regalia were kept here from 1424 to 1796. Near it are the remains of the burg of the Hohenzollerns, the principal existing part of which is the chapel of St Walpurgis, which was destroyed with the rest of the building in 1420, but was restored in 1892. Not far from this, in the middle of the north end of the old town, with four corner turrets, said to have been built by the burghers in 1367 as a watch-tower against the burg of the Hohenzollerns.

Nuremberg contains several interesting churches, the finest of which are those of St Lorenz, of St Sebald and of Our Lady. All three are Gothic edifices and are notable for their elaborately carved doorways, in which free play has been given to the exuberant fancy of the Gothic style, and all three enshrine valuable treasures of art. The Church of St Lawrence, the largest of the three, was built in the 13th and 14th centuries and has recently been restored. In it is the masterpiece of the sculptor, Adam Kraft, consisting of a ciborium, or receptacle for the host, in the form of a florid Gothic spire 65 ft. high; the carving of this work is exquisitely minute and delicate. The west front contains a magnificent rose-window, and some of the stained glass dates from the 15th and 16th centuries. In front of the altar hangs a curious piece of wood-carving by Veit Stoss, representing the Salutation. The shrine of St Sebald, in the church of St Sebald, consisting of a bronze sarcophagus and canopy in the richest Gothic style, decorated with numerous statues and reliefs, is looked upon as one of the greatest achievements of German art. It was executed by Peter Vischer, the celebrated artist in bronze, who was occupied on the work for thirteen years (1506–1519), and has here shown himself a worthy rival of Lorenzo Ghiberti. The Tucherseh altar, with its winged picture, is one of the finest works of the Nuremberg school about the middle of the 15th century. This church was restored in 1878–1881. Other noteworthy churches are those of St Jacob, founded about 1200 and restored in 1824; and of St Agatha.

The town hall (Rathaus), an edifice in the Italian style, erected in 1616–1619, contains frescoes by Dürer, and a curious stucco relief of a tournament held at Nuremberg in 1446. The building incorporated an older one of the 14th century, of which the great hall, with its timber roof, is part. The most interesting secular buildings are the houses of the old patrician families. Among the most characteristic of these are the old residence of the counts of Nassau, and the houses of the Tucher, Funk and Peller families. A special interest attaches to the dwellings of Albert Dürer, Hans Sachs, the cobbler-poet, and Johann Palm, the patriotic bookseller who was shot by order of Napoleon in 1806. There are statues of Dürer, Sachs, Melanchthon, the reputed founder of the grammar-school, the navigator Martin Behaim, and Peter Henlein, the inventor of the watch; and the streets are further embellished with several fountains, the most noteworthy of which are the Schöne Brunnen, 1385–1396, in the form of a large Gothic pyramid, adorned with statues of the seven electors, the "nine worthies," and Moses and the prophets; and the Gänsemännchen or goose-man, a (now little bronze figure by Pankratz Labenwolf. On the way to the cemetery of St John, which contains the graves of Dürer, Sachs, Behaim and other Nuremberg worthies, are Kraft's stations, seven pillars bearing stone reliefs of the Passion, and ranked among the finest works of the sculptor.

The Germanic national museum, established in an old Carthusian monastery, has developed into one of the largest and most important institutions of its kind in Germany. It includes a picture-gallery, principally of German works of the 15th and 16th centuries, including masterpieces by Holbein, Dürer, Weller and others. The municipal library contains about 2000 manuscripts and 80,000 printed books, some of which are of great rarity.

The population of Nuremberg was, in 1905, including a garrison of about 3000 men, 294,344, of whom 145,354 were males and 148,990 females. Of these again 196,907 were Protestants (Evangelical), 86,939 Roman Catholics and 6819 Jews. At the height of its prosperity in the middle ages the population has been estimated at as high a figure as 150,000, but there seems good reason to believe that it did not exceed 40,000 to 50,000 souls. In 1818 it had sunk to 27,000, but since then Nuremberg, which was incorporated as a town on January 1, 1300, has steadily increased. In 1820, 17,400; in 1840, 22,000; in 1860, 30,000; in 1875, 42,000; in 1885, 60,000; in 1890, 72,000; in 1895, 91,000; in 1900, 112,000. In the year 1900, thirteen outlying communes were incorporated, extending the area of the town from 2805 to 13,700 acres.

Nuremberg occupies a high place among the industrial and commercial centres of Europe. The principal manufactures are toys and fancy articles in metal, carved wood and ivory, which are collectively known as Nuremberg wares. Nuremberg is the chief market in Europe for hops. It is an important junction for railways to all parts of Germany, and is on the main line from Cologne and Frankfort-on-Main to Munich, Vienna and Eger. In addition to its railways, trade is facilitated by the Ludwig canal, connecting the Danube and the Main.

History.—The first authentic mention of Nuremberg, which seems to have been called into existence by the foundation of the castle, occurs in a document of 1250; and about the same period
it received from the emperor Henry III. permission to establish a mint and a market. It is said to have been destroyed by the emperor Henry V. in 1105, but if this was the case the town must have been very speedily rebuilt, as in 1127 we find the emperor Lothair taking it as an intermediary between Italy and Hungary, and assigning it to the Freuden, duke of Bavaria. An imperial officer, styled the burggrave of Nuremberg, who, however, seems to have been merely the military governor of the castle, and to have exercised no sway over the citizens, became prominent in the 12th century. This office came into the hands of the counts of Hohenzelorn at the beginning of the 13th century, and burggrave of Nuremberg is still one of the titles of its descendant, the German emperor. The government of the town was vested in the patrician families, who, contrary to the usual course of events in the free towns, succeeded in permanently excluding the civic guilds from all share of municipal power, although in 1347 there was a sharp rising against this oligarchy. The town was specially favoured by the German monarchs, who frequently resided and held diets here, and in 1219 Frederick II. conferred upon it the rights of a free imperial town. By the terms of this charter the town appears to have been immediately subject to the king, who was represented by his magistrate (or Schuldtheiss). In a short time, however, the latter appears to have been assisted by a council, consisting of 13 consules (burgomasters) and 13 scebanii (assessors), who collectively formed the government and administered the body under the presidency of the bailiff. The last-named official soon confined himself to the judicial magisterial office, and a further increase in the numbers of the council having taken place by the appointment of 8 nominees of the king, a municipal council of 34, under the direction of the senior consil or burgomaster, dealt with matters exclusively civic. Later this council (the kleine Rat) was increased to 42 members, 8 of whom belonged to the artisan class.

In 1336 Nuremberg witnessed the promulgation of the famous Golden Bull of the emperor Charles IV. At the beginning of the 15th century the margraves of Nuremberg, who had in the meantime raised themselves to the rank of princes of the Empire, were invested with the margraviate of Brandenburg, and sold their castle to the town. They, however, reserved certain rights, and their insistence on these led to fierce and sanguinary feuds between the burghers and the margraves Albert Achilles and Frederick and Albert Alcibiades of Bayreuth.

The quarrel with the margraves, however, did not interfere with the growth of the town's prosperity, which reached its acme in the 16th century. Like Augsburg, Nuremberg attained great wealth as a result of the sales of its artists and artisans, who had in the meantime raised themselves to the rank of princes of the Empire, were invested with the margraviate of Brandenburg, and sold their castle to the town. They, however, reserved certain rights, and their insistence on these led to fierce and sanguinary feuds between the burghers and the margraves Albert Achilles and Frederick and Albert Alcibiades of Bayreuth.

order of St Vincent de Paul, founded in 1633 for the express purpose, is still the largest nursing organization in the world. Even in Protestant England, where purely secular training schools have reached their highest development, the generic title of Sister, alike prized by its holders and honoured by the public, remains the popular and professional synonym for head nurse, and perpetuates the old association. Nursing, as a popular or fashionable occupation, is not a modern invention. Sir Henry Burdett quotes an order, dated 30th May 1578, directed by Philip to the prior of the Hôtel-Dieu in Paris "not to receive henceforth any novices without speaking of it to the company, because there are an excessive number of nuns and novices, who cause great expense to the said Hôtel Dieu."

In Protestant countries a secular nursing system came in with the Reformation. The staff appointed for St Bartholomew's, on its re-establishment by Henry VIII. in 1544, consisted of a matron and twelve nurses, who were engaged in domestic occupations when off duty. Thus nursing became a menial office and an inferior means of livelihood, adopted by women of the lower orders without any training or special skill was required. The credit of inaugurating the new order of things belongs to Germany, and here again the religious influence came into play. The beginning of the modern system dates from the foundation of the institute for training deaconesses at Kaiserswerth by Pastor Fliedner in 1836. It is true that state training schools for male nurses had previously existed in Prussia, the oldest having been founded at Magdeburg in 1799; but the employment of men in hospital wards is a feature of the German system which has not been copied by other advanced countries, and seems to be in process of abandonment in Germany. It is a heresy in Germany, and so it continued down to the middle of the 19th century, when a new movement began which was destined to revolutionize the status of the nurse.

Its distinctive feature was the systematic training of nurses for their vocation. Previously a certain amount of regular instruction had no doubt been given here and there by individual physicians and surgeons; lectures to nurses were delivered in the New York Hospital as early as 1790. But these were isolated efforts. Such skill as nurses possessed was picked up in the wards. No qualifications were required, nor indeed would they have been demanded by the hospital authorities, and indeed the system did not exist as a system. The credit of inaugurating the new order of things belongs to Germany, and here again the religious influence came into play. Training and organization.

Nursing does not appear to be regulated by law in any country, though attempts in this direction had been made in England.1 Its organization is voluntary, and even in state or municipal institutions is dependent on the direction of the administration. In Great Britain nearly all the general and special hospitals and many of the poor-law infirmaries offer systematic professional training to nurses. The provisions differ considerably in detail, but in the larger hospitals the system is uniform in all important respects. Candidates must be between 23 (sometimes 21 or 22) and 35 years of age, and must produce satisfactory evidence of character, education, health and physique; after a personal interview and one, two or three months' trial they are admitted for three years' training. During this period they receive regular instruction in theoretical and practical knowledge, and have to pass periodical examinations. At the end of it they are granted certificates and may serve as staff nurses. They pay no premium, and generally receive a salary of £8 to £12 in the first year, rising annually to £40 or £50 as assistant and nurse, and to £100 to £150 as sister or head nurse. They live in a home attached to the institution, under a matron, and in the most modern establishments each nurse has a separate bedroom, with common dining and recreation rooms. Private nursing staffs are attached to several of the hospitals; they are recruited from the staff nurses and probationers on completion of their course, and supply nurses to private patients. In the special

1 In 1902 an act was passed to establish a Central Midwives Board and regulated the training and employment of midwives.
hospitals the training is shorter, being for one or two years. There seems to be a constant tendency to increase the requirements. At St Bartholomew's, St George's, the London Hospital, St Thomas's and others, probationers must enter for four years, and at St Bartholomew's they have to pass an entrance examination in elementary anatomy, physiology and other subjects. At all the more important schools the number of applications is so large that the time is not shorter than the vacancies.

In Great Britain trained and certificated nurses generally belong to a society or association. The most noteworthy of the associations is Queen Victoria's Jubilee Institute for Nurses. It was founded in 1887 with the object of providing skilled nursing for the sick poor in their own homes. A great many of the provincial nursing associations are affiliated to it. The number of nurses supported by each branch varies. The qualifications for a Queen's nurse are as follows: (1) training at an approved general hospital or infirmary for two years; (2) approved training in district nursing for not less than six months, including the nursing of mothers and infants after child-birth; (3) nurses in country districts must in addition have had at least three months' approved training in midwifery. Candidates possessing the first qualification are received on trial for one month, after which they complete their six months' training for the second qualification, at the same time entering into an agreement to serve as district nurse for one or two years at the end of the six months. The salary during training is £1 5s. 10s., and afterwards £3 5s. to £3 15s. a year, with board, lodging, and fees. With this salary, and the salaries paid in general, the salaries paid in hospitals have already been mentioned; for private work the scales in force at different institutions vary considerably, according to the other advantages and benefits provided. At some the nurses receive all their own earnings, minus a percentage deducted for the maintenance of the institute; at others they are paid a fixed salary, as a rule from £2 5s. to £3 15s. a year, plus a varying percentage on their earnings or a periodical bonus according to length of service. This is perhaps the commonest system, but some of the best nursing homes give a somewhat higher fixed salary than an percentage. In all these cases the nurses receive in addition board and lodging, laundry and uniform, or an equivalent allowance. For special cases—infec tious, massage, mental and maternity—nurses on a fixed salary usually receive extra pay. The fees commonly charged by high-class institutions for the services of a trained and certificated nurse are—for ordinary cases £2 2s. a week, for special cases £3 12s. 6d. or £3 5s. a week; but many provincial associations supply nurses for £1 5s. a week and upwards. The discrepancy between the fees paid by patients and the salaries received by nurses, especially in London, has occasionally caused some dissatisfaction, but it is to be remembered that the nurses are maintained when out of work or ill, and have other advantages; many institutions either provide pensions or assist the members of their staff to join the Royal National Pension Fund.

To complete this account of the organization in Great Britain a few details with regard to special nursing are added. 

Fevers.—Regular training on the same plan as in general hospitals is provided for the fever nurse by the Board of Guardians of the Maudsley Asylums Board (12 in number, with from 360 to 760 beds each), and at a considerable number of provincial institutions.

Insanity.—The Medico-Psychological Association of Great Britain and Ireland holds examinations and grants certificates in mental nursing; candidates must undergo three years' regular training, with instruction by lectures, &c., which may be obtained in a large number of public asylums by arrangement with the Association. One county asylum (Northampton) gives its own certificates after a three years' course.

District Nursing.—In addition to the Queen's nurses, of whom there are about 1,000, many local associations train their own nurses for this work. Cottage and village nursing are varieties of the same department; the former is organized on the benefit system, and aims at supplying domestic help and sick-nursing combined within the district; the latter is devoted for short visits to the sick, according to the class in life of the family, and a weekly fee of the same amount during attendance.

Monthly Nursing and Midwifery.—Systematic instruction in these subjects is given at some fifty lying-in institutions in different parts of the kingdom. The usual course for nursing is not less than three months, and for midwifery not less than six months; a premium of £12 or 15 guineas for three months, and 25 guineas for six months.

Male Nursing.—Two or three associations in London supply male nurses (fixed fees to 4 guineas a week); these appear to be only one institution, apart from the military and naval services, at which they are systematically trained—namely, the National Hospital for the Paralysed and Epileptic.

Most of them are taught regularly at the hospital just named, and at a few other special hospitals. Competent operators are supplied by the Incorporated Society of Trained Masseuses and, to some extent, by other nursing associations; but this branch of the profession is still imperfectly organized (see Masseurs). 

Children.—A large number of children's hospitals throughout the country give regular training in the nursing of children; they are provided for boys and girls of a somewhat earlier age than the general schools; the course is usually shorter (one or two years), and the salaries slightly lower.

The State offers employment to nurses in the naval and military hospitals. Queen Alexandra's Imperial Military Nursing Service was established in 1902. Candidates for it must be between 25 and 35 years, single or widows and of good social status. They must have had three years' training in a general hospital. Foreign Service must be taken as required. Nurses are eligible for a pension after 10 years' service, the amount increasing up to the age of 55 when retirement is compulsory. The Royal Naval Nursing Service is organized on much the same lines. Other training organizations are The Army Nursing Reserve and Queen Alexandra's Imperial Military Nursing Reserve, and there is also a nursing reserve attached to the territorial forces.

In the more important British colonies—Australia, Canada and South Africa—these are now a considerable number of hospitals; but as the fees charged for them do not correspond with the qualification or experience of the nurses, they are not organized on the English model. Salaries and fees are very much the same in Australia; in Canada and South Africa they are higher.

In the United States a similar system prevails in New York, Boston, Brooklyn, Chicago, Baltimore, Philadelphia, New Haven and many other large towns. The period of training is either two or three years. At the Johns Hopkins School at Baltimore twelve scholarships of $100 and $120 each are awarded annually; graduate nurses are paid $560 ($72) a year. Salaries are altogether much higher in the United States. At the Boston City Hospital graduate nurses receive $420 ($54) a year, and at the Indianapolis City Hospital those on private duty are paid $72 a month, which is equivalent to £172 a year, with board, lodging, laundry and uniform. This may be taken to indicate the possible earnings of trained nurses working independently, as they usually do in America. The fees charged for trained nurses run from $12 to $25 a week, and even more for special cases. Male nurses are trained at the Bellevue Hospital, New York, the Grace Hospital, Detroit, and elsewhere. In the American schools more attention is paid to the preparation of nurses for private work than in the British (Burdett), and a directory or registry of them is kept in most large towns.

In Germany, their original home, both training schools and societies have multiplied and developed. The period of training appears to be considerably shorter than in Great Britain and America. Members of the Albert Society of Saxony, however, spend two years in the wards at Dresden, and a third at Leipzig, attending lectures and demonstrations. They are sent out to nurse rich and poor alike, and their pay is very small. Most of the German institutes have pension funds.

In France a great deal of the nursing was formerly in the hands of religious institutions, but there too the hospital school system, inaugurated in 1877, has grown. The schools managed by the Assistance Publique in Paris give a very thorough course of instruction.

In Russia nursing is mainly in the hands of the Red Cross Society, whose members are, however, trained in the hospital schools. 

In Italy, Spain, Portugal and Belgium scientific nursing is in a backward state. The old religious system still prevails to a large extent, and, though some of the certain to do their work in accordance with the standards of knowledge and skill is not up to modern requirements. At San Remo and Rome institutions have been established for providing English trained nurses to private cases.
Austria is also in a very backward state, in spite of the fame of the Vienna clinics. The Red Cross Society provides a certain amount of trained nursing, and next to it the best-organized work is done by religious orders; but the nursing in the hospitals appears to be still in a neglected state. The Brothers of Mercy have charge of some of the men's hospitals, and also carry on a remarkable system of district nursing.

In Holland and the Scandinavian countries the organization is more modern and fairly adequate.

For full details on the large subject of the duties and qualifications of nurses the reader is referred to the numerous text-books and other technical authorities. Only a few general observations can be made here. Many candidates approach the calling with a very imperfect appreciation of its exacting character. The work is not easy or to be taken up lightly. It demands physical strength, sound health, scrupulous cleanliness, good temper, self-control, intelligence and a strong sense of duty. It embraces many duties—some of them menial and disagreeable—besides the purely medical and surgical functions. This is especially the case with district nursing, which is the highest and most exacting branch of the profession, because it imposes the greatest responsibility with the fewest resources and demands the most varied qualifications, while affording none of the attractions incidental to hospital work or private nursing among the rich. It is comparatively easy to fulfil routine duties, when every means is at hand and the standing conditions are the most favourable possible; when ventilation, warmth, light and cleanliness are all provided of the best, and when assistance can be summoned in a moment. To be thrown on your own resources and make the best of adverse conditions is an entirely different matter; it requires a thorough knowledge not of routine, but of principles. It is impossible, therefore, for nurses to be over-educated in the fullest sense of the word; but it is possible for them to be inappropriately educated, and perhaps that is sometimes the case now. Probably nursing has been elaborated to the inevitable point of specialization, and a somewhat different preparation is needed for different branches of the art.

Allusion has been made above to the subject of male nursing. It hardly finds a place in the British civil system, and was condemned for hospitals in Germany, where it is at its best, by so eminent an authority as Professor Virchow. In the South African War of 1899-1902 it was even suggested that female nurses should replace orderlies at the front. The only valid reason for preferring women to attend men rather than members of their own sex is the difficulty of obtaining a supply of equally well qualified and satisfactory male nurses. But this difficulty need not be permanent, and the assumption is much to be deprecated. It is, indeed, most desirable that men should be nursed by men. The advantages are many and real. For one thing, women do not possess the physical strength which is often required. They cannot lift a heavy man, and ought not to be asked to do it. Then it is excessively irksome to a sensitive man to be attended by women for various necessary offices. In order to avoid it he will endeavour to do without assistance, and seriously prejudice his chances of recovery.

Luckes, 'Hospital Sisters and their Duties; Morten, How to become a Nurse; Florence Nightingale, "Notes on Nursing; " Nighntigale Boyd, 'Nursing; ' in Quain's Dictionary of Medicine.

NUSHKI, a town and district of Baluchistan. The town lies 50 m. south-west of Quetta, and is situated in a plain at the base of the Quetta plateau, 2000 ft. above the sea. Pop. (1901) 644. From this point the flat Baluchistan desert stretches away northwards and westwards to the Helmund river. The administration of the Nushki district was taken over from the khan of Kalat by the Indian government in 1896, and was leased from him on a perpetual quit rent in 1896. In 1907 a railway of 91 m. was sanctioned from Quetta to Nushki, which was completed in 1905. This railway makes Nushki the starting-point of the caravan route to Seistan. From the strategic point of view a force operating from Nushki would flank any advance from the north on Kandahar, and would also guard the south-west approach to the fortress of Quetta.

NUSKU, the name of the light and fire-god in Babylonian and Assyria, who is hardly to be distinguished, from a certain time on, from a god Girru—formerly read Gibil. Nusku-Girru is the symbol of the heavenly as well as of the terrestrial fire. As a former he is the son of Anu, the god of heaven, but he is likewise associated with Bel of Nippur as the god of the earth and regarded as his first-born son. A centre of his cult in Assyria was in Harran, where, because of the pre-eminent character of the moon-cult, he is viewed as the son of the moon-god Sin (q.v.). Nusku-Girru is by the side of Ea, the god of water, the great purifier. It is he, therefore, who is called upon to cleanse the sick and suffering from disease, which, superinduced by the demons, was looked upon as a species of impurity affecting the body.

The fire-god is also viewed as the patron of the arts and the goal of civilization in general, because of the natural association of all human progress with the discovery and use of fire. As among other nations, the fire-god was in the third instance looked upon as the protector of the family. He becomes the mediator between humanity and the gods, since it is through the fire on the altar that the offering is brought into the presence of the gods.

While temples and sanctuaries to Nusku-Girru are found in Babylonia and Assyria, he is worshipped more in symbolical form than the other gods. For the very reason that his presence is common and universal he is not localized to the same extent as his fellow-deities, and, while always enumerated in a list of the great gods, his place in the systematized pantheon is more or less vague. The conceptions connected with Nusku are of distinctly popular origin, as is shown by his prominence in incantations, which represent the popular element in the cult, and it is significant that in the astro-theological system of the Babylonian priests Nusku-Girru is not assigned to any particular place in the heavens.

(M. JA.)

NUSRETABAD, the capital of Persian Seistan, so called after Nusret el Mulk, a former deputy governor of Seistan; when built, in 1748, it was first called Nasratabad in honour of Nasr-ud-din Shah; other names, used locally, are Shahr (town) i Seistan, Shahri Nasariyeh, or simply Shahr, the town. It is the residence of British and Russian consuls, and has post and telegraph offices.

NUT (O. Eng. nuan, cf. Dutch noot, Ger. Nuss; allied with Gael. anu; it is not of the same form as Lat. nux), a term applied to that class of fruit which consists generally of a single kernel enclosed in a hard shell. Botanically speaking, nuts are one-celled fruits with hardened pericarps, sometimes more or less enveloped in a cupule or cup, formed by the aggregation of the bracts in the hazel and the acorn. In commerce, however, the term has a wider application and embraces many fruits having hard woody indehiscent shells or coverings without reference to their enclosed seeds or kernels, besides leguminous pods, and even tuberous roots. A great number of nuts enter into commerce for various purposes, principally as articles of food or sources of oil, and for several ornamental and useful purposes. For the most part the edible nuts are very rich in oil, with only a small percentage of the other carbohydrates, starch, sugar, &c., and they also contain a large proportion of nitrogenous constituents. Thus possessing rich nutrient principles in a highly concentrated form, nuts are by themselves rather difficult of digestion, and the liability of many of them to become rancid is also a source of danger and a hindrance to their free-use. Oleaginous nuts used for food are likewise employed more or less as sources of oil, but on the other hand there are many oil-nuts of commercial importance not embraced in the list of edible nuts.

On the following page is set out an alphabetical enumeration of the more important nuts, and of products passing under that name, used either as articles of food or as sources of oil.

</table>

There remain to be enumerated a number of nuts of commercial value for turnery and ornamental purposes, for medicinal use, and for several miscellaneous applications in the arts. These include:

- **Olive nut**: Elaeis guineensis is a native of West Africa and is cultivated for its wood. The nuts are also used in the production of olive oil.
- **Palm nut**: Elaeis guineensis is the source of the popular African oil palm, known for its high-quality oil.
- **Pecan nut**: Carya ovata is found in North America and is valued for its edible nuts and high-quality timber.
- **Quandang nut**: Palaquium amalimum is native to Asia and is known for its edible nuts and timber.
- **Ravensara nut**: Agathophyllum aromaticum is native to Southeast Asia and is valued for its essential oil.
- **Rush nut**: Cupera esculenta is a native of the Americas and is valued for its timber and fruits.
- **Sapucaya nut**: Lecythis Ollaria is found in South America and is known for its timber and fruits.
- **Tahiti chestnut**: Inocarpus edulis is native to Polynesia and is valued for its timber and fruits.
- **Walnut**: Juglans regia is found in temperate regions of the world and is valued for its edible nuts and timber.
- **Water chestnut**: Various species of Trapa are found in various parts of the world and are valued for their edible tubers.

The application of the term nut to many of these products is purely arbitrary, and it is obvious that numerous other bodies not known commercially as nuts might with equal propriety be included in the list. Most of the nuts of real commercial importance are or will be separately noticed, and here further allusion is only made to a few which form current articles of commerce, not otherwise treated of.

The bread nut of Jamaica is the fruit of a lofty tree, Brosimum Alicastrum. It is about an inch in diameter, and encloses a single seed, which, roasted or boiled, is a pleasant and nutritious article of food.

The souari or surahwa nut, called also the "Butter nut of Demerara," and by buyersens, the "Suwarrow nut," is the fruit of Caryocar nuiferum, a native of the forests of Guiana, growing 80 ft. in height. This is perhaps the finest of all the fruits called nuts. The kernel is large, soft, and even sweeter than the almond, which it somewhat resembles in taste. The few that are imported come from Demerara, and are about the size of an egg, somewhat kidney-shaped, of a rich reddish-brown colour, and covered with large rounded tubercles.

The pekeea nut, similar in appearance and properties, is the produce of Caryocar buyersens, growing in the same regions of tropical America.

The Jamaica cob nut is the produce of a euphorbiaceous tree, Omphalea diandra, the seeds of which resemble in taste the ordinary cob or hazel nut. The seed, however, contains a deleterious embryo, which must not be eaten.

Cola, kola or goora nuts are the seeds of Cola acuminata (Sterculiaceae), a tree, native of tropical Africa, now introduced into the West Indies and South America. The nuts form an important article of commerce throughout Central Africa, being used over a wide area as a kind of stimulant condiment. The nuts, of which there are numerous varieties, are found to contain a notable proportion of thein, as much as 2 13 %, besides theobromine and other important food-constituents, to which circumstances, doubtless, their valuable properties are due.

Coquina nuts, the hard inner portion ("stone") of the palm, Attalea funifera, the piasassa of Brazil, are highly valued for turnery purposes. They have an elongated oval form, 3 to 4 in. in length, and being intensely hard they take a fine polish, displaying a richly streaked brown colour.
The marking nut, *Semenus Anacardium*, is a fruit closely allied in its source and properties to the cashew nut (q.v.). The marking nut is a native of the East Indies, where the extremely acrid juice of the shell of the fruit in its unripe state is mixed with quicklime and used as a marking-ink. The juice also possesses medicinal virtues as an external application, and when dry it is the basis of a valuable caulking material and black varnish. The seeds are edible, and the source of a useful oil.

Physic nuts are the produce of the euphorbiaceous tree, *Carcas purgas*, whence a valuable oil, having similar purgative properties to castor oil, is obtained. The plant is a native of South America, but is now found throughout all tropical countries.

Pine nuts are the seeds of several species of *Pinus*, eaten in the countries of their growth, and also serving to some extent as sources of oil. Of these the most important are the stone pine, *Pinus Pinea*, of Italy and the Mediterranean coasts, and the Russian stone pine, *Pinus Cembra*. The *Pinus Sobintiana* of California and *P. Gerardiana* of the Himalayas similarly yield edible seeds. These seeds possess a pleasant, slightly resinous flavor (from Lat. *nutare*, nuts). The Ravnazmnuts, the fruit of *Aglaphyllum aromatica* (Lauraceae), is a native of Madagascar. The name of the Madagascar clove nutmeg.

The Sapucaya nut, a native of Brazil, is seen occasionally in fruit-shops. It is produced by a large tree, *Lecythis Ollaria*, or “cannon-ball tree.” Its specific name is taken from the large urn-shaped capsules, called “monkey-pots” by the inhabitants, which contain the nuts. The sapucaya nut has a sweet flavor, resembling the almond, and if better known would be highly appreciated. It is, however, scarce, as the monkeys and other wild animals are said to be particularly fond of it. This nut, which is of a rich amber-brown, is not unlike the Brazil nut, but it has a smooth shell furrowed with deep longitudinal wrinkles.

Soap nuts are the fruits of various species of *Sapindus*, especially *S. Sapunaria*, natives of tropical regions. They are so called because their rind or outer covering contains a principle, saponine, which lathers in water, and so is useful in washing. The pods of *Acacia concina*, a native of India, possess the same properties, and are also known as soap nuts.

**NUTATION (from Lat. *nutare*, to nod), a revolution of the celestial pole around its mean position, due to inequalities in the action of the sun and moon, on an earth elliptoidal form. When either of these attracting bodies is in the plane of the equator, it produces no change in the direction of the celestial pole. The greater their distance from this plane, the greater the change, for reasons shown in the article *Astronomy (Celestial Mechanics)*. The result is a motion which can be divided into two components. One of these is the progressive and nearly uniform motion of a fictitious mean pole, called precession (q.v.), and the other a revolution of the true around the mean pole, depending on the varying declinations of the sun and moon, and called nutation. Owing to the revolution of the moon’s node and the inclination of its orbit, this body moves through a wider range of declination in some positions of the node than in others. The period of the revolution of the node is 18-6 years. At one time of this period the limits of its declination are more than 28° north and south, while, at the opposite point, they are little more than 18°. The result of these periodic changes is that the nutation takes place nearly in an ellipse, differing little from a circle, at a distance of about 9°, in a period of about 18-6 years. The nutation has, however, a great number of minute inequalities arising from the ellipticity of the orbits of the sun and moon and their varying declinations. The amount and formule of nutation from year to year are given in the Nautical Almanac.

**NUTCRACKER, the name given by G. Edwards in 1738 (Gleanings, No. 249) to a bird which had hitherto borne no English appellation, though described in 1544 by Turner, who, meeting with it in the Raetic Alps, where it was called “Nousbrecher” (hodie “Nusbrecher”), translated that term into Latin as *Nucifraga*. In 1555 C. Gesner figured it and conferred upon it another designation, *Caryocatactes*. It is the Corrus caryocatactes of Linnaeus and the *Nucifraga caryocatactes* of modern ornithology. F. Willughby and J. Ray obtained it on the road from Venice to Vienna as they crossed what must have been the Sömmerring Pass, 26th September 1663. The first known to have occurred in Britain was, according to T. Pennant, shot at Mostyn in Flintshire, 5th October 1753, and about fifteen more examples have since been procured, and others seen, in the island. Contrary to what was for many years believed, the nest of the Nutcracker seems to be invariably built on the branches of trees, sometimes as high from the ground, and is composed of a large structure of sticks, lined with grass. The eggs are of a very pale bluish-green, sometimes nearly spotless, but usually more or less flecked with pale olive or ash-colour. The chief food of the Nutcracker appears to be the seeds of various conifers, which it extracts as it holds the cones in its foot, and it has been questioned whether the bird has the faculty of cracking nuts—properly so called—with its bill, though that can be used with much force and, at least in confinement, with no little ingenuity. The old supposition that the Nutcrackers had an influence on the Pole (Polestar) is now looked upon as one of many folk-lore stories.

**NUTMEG** (from “nut,” and O. Fr. *mugue*, musk, Lat. *muscum*), the commercial name of a spice representing the kernel of the seed of *Myristica fragrans* (fig. 1), a dioecious evergreen tree, about 30 to 60 ft. high, found wild in the Banda Islands and a few of the neighbouring islands, extending to New Guinea.
NUTRITION

The process of liming, which originated at the time when the Dutch held a monopoly of the trade, was with the view of preventing the germination of the seeds, which were formerly immersed for three months in milk of lime for this purpose, and a preference is still manifested in some countries for nutmegs so prepared. It has, however, been shown that this treatment is by no means necessary, since exposure to the sun for a week destroys the vitality of the kernel. Penang nutmegs are never limed. The entire fruit preserved in syrup is used as a sweetmeat in the Dutch East Indies.

"Oil of mace," or nutmeg butter, is a solid fatty substance of a reddish-brown colour, obtained by grinding the refuse nutmegs to a fine powder, enclosing it in large and stopping it over large cauldrons for five or six hours, and then compressing it while still warm between powerful wedges, the brownish fluid which flows out being afterwards allowed to solidify. Nutmegs yield about one-fourth of their weight of this substance. It is partly dissolved by cold alcohol, the remainder being soluble in ether. The latter portion, about 10% of the weight of the nutmegs, consists chiefly of myristin, which is a compound of myristic acid, C\(_16\), with glycerol.

The name nutmeg is also applied to other fruits or seeds in different countries. The Jamaica or calabash nutmeg is derived from Monodora Myristica, the Brazilian from Cryptocarya moschata, the Peruvian from Laurelia sempervirens, the Maccassar or clove nutmeg from Agathophyllum aromaticum, and the Californian or stinking nutmeg from Torreya Myristica. The coryledons of Nectandra Puchury were at one time offered in England as nutmegs.

The physiology of nutrition involves the study of the way in which the tissues of the body, and more especially the great master tissues, muscle and nerve, obtain the material for growth and repair and the energy for mechanical work and heat production, and of the mode in which they get rid of the waste products of their activity. The study is therefore very largely a study of the history of the food of the body, since it is in the food that the necessary matter and energy are supplied. Under DIETETICS the composition and special importance of various foods and the laws which regulate the supply of food under different conditions of the body are separately dealt with. Here the mode of digestion, the utilization and the elimination of the end products of the three great constituents, proteins, carbohydrates and fats, are alone considered. They are treated under the following heads: I. The Chemistry of Digestion; II. The Mode of Formation of the Digestive Secretions; III. The Mechanism by which the Food is passed along the Alimentary Canal; IV. The Absorption of Food; V. Metabolism; VI. Excretion.

I. CHEMISTRY OF DIGESTION

The essential step which prepares the ordinary food for utilization in the body, for the change into living matter, is digestion, a process by which the food undergoes under the influence of the ferment or enzymes present in the gastro-intestinal tract. By this process it is broken down into simpler substances, which can be utilized by the body tissues for conversion into protoplasm and as the supply of energy. That part which is unsuitable for use in the body is either passed as faeces or absorbed and excreted in the urine.

1. Enzyme Action generally.—The substances which bring about this change are known as ferments, enzymes orzymins. Formerly it was believed that there were two distinct classes

From Strasburger's Lehrbuch der Botanik, by permission of Gustav Fischer.

2. Female flower X 2.
of enzymes, those which were living or associated with living cells, and those which were non-living. In 1897, however, E. Buchner and M. Hahn showed that from living cells (yeast) a ferment could be obtained which acted quite as well extracellularly as when it was bound up within the cell. Subsequent work has shown that other organisms act by the enzymes they contain, so that it is now recognized that there is no essential difference between the living or organized ferment and the non-living or unorganized ferment. All ferments probably act as catalysts or catalysts. Catalysis is the process by which reactions are either initiated or accelerated by the mere presence of substances which remain unchanged during the process; to these substances the name of catalysts has been given. As an example of such catalytic action the acceleration of the decomposition of hydrogen peroxide (H₂O₂) into water (H₂O) and oxygen (O₂) by the action of a colloidal solution of platinum may be given. C. Oppenheimer defines an enzyme as a substance produced by living cells, which acts by catalysis. E. Fischer has shown that the action of ferments is specific, that is, the ferment only exerts its action on definite substances or substrates of definite structural arrangement. He has compared the relation of ferments to that of a key to a lock. Ferments which bring about the breakdown of proteins are without influence on fats and carbohydrates; those which decompose fats leave proteins and carbohydrates untouched, and so on.

The chemical composition of enzymes is unknown. It has been assumed that they are protein in nature, but this is mainly because it has been found that when they are dissolved in water they apparently combine with proteins. In all probability the enzyme is there as an impurity owing to incomplete separation.

As regards the general properties of enzymes, most of them can be precipitated from their solutions by means of alcohol. They can also be carried down by fine precipitates of certain inorganic salts or by protein precipitation, e.g. when a precipitate of casein is produced by acidifying a casein solution with acetic acid. Most of the ferments are soluble in water or saline solutions, and in glycerin and water. The ferments are found to have an optimum temperature of action. This temperature in most cases ranges from 37° to 40°C. All true ferments are thermolabile, being destroyed at about 70°C. Ferments are hindered in their action to some extent by the general proteolytic poisons, such as salicylic acid, chloroform, &c. The action of many of them is retarded when the products of their action are allowed to accumulate. Just as when a chemical reaction is set up its rate tends to decrease and finally comes to a standstill before the reaction is completed—an equilibrium being established—so the reactions set up by enzymes also tend to come to an equilibrium before the complete conversion of the original substance. In the case of certain enzymes at least this equilibrium may be reached from either side; thus the enzyme maltase may either bring about the breakdown of its sugar maltose to dextrose or cause a synthesis of dextrose to maltose.

A number of the body ferments have now been shown to exist in the tissues in an inactive form. This condition is known as the pro-ferment state, and before any action can be exerted it must be activated, usually by some specific substance, as in the case of the activation of trypsinogen by means of enterokinase. The following table gives a list of the principal ferments concerned in the digestion and metabolism of food-stuffs:

Certain oxidases, catalases and de-amidizing enzymes are found in the tissues generally and play an important part in the various metabolic processes.

2. Digestion in the Mouth.—The first of the digestive secretions which food comes into contact with is the saliva. This is the mixed secretion from the various glands, salivary and other, the ducts of which open in the mouth. The saliva, which is for the most part produced by the three large salivary glands, the parotid, the sub-maxillary and the sub-lingual, is a colourless or slightly turbid viscus fluid with a faintly alkaline reaction and of low specific gravity. It contains a very small proportion of solids, which vary somewhat in amount and character in the secretions of the different glands. Mucin and traces of other proteins are present. Small amounts of potassium sulpho-phenylamine may nearly always be detected. The functions of the saliva are to lubricate the food, to aid in moistening the mouth and the food and thus aiding mastication and swallowing by securing the formation of a proper bolus of food; it also assists by binding the particles together, an action of special importance when the food is dry. Second, in man and in some of the lower animals the enzyme ptyalin exerts an action in digestion on part of the carbohydrates of the diet. The starches or polysaccharides are broken down, first of all to the simple dextrins and then to the still more simple disaccharide, maltose. The further breakdown of the latter is carried out by the intestine with the aid of a ferment maltase which does not exist at all or only in the nascent traces in the buccal secretion. The action of ptyalin on starches is thus very similar to that of acids, except that it stops at the formation of maltose. Ptyalin acts best at a temperature of about 40°C. and in a neutral or faintly alkaline medium, its action being inhibited by the presence of even very dilute solutions of the mineral acids. If the acid be in sufficient amount the enzyme is destroyed. For this reason the action ceases in the stomach whenever the bolus is completely permuted by the gastric juice. As it takes time for the gastric juice thoroughly to permeate the food mass, which remains for a considerable period in the fundus of the stomach unmixed with the secretion, salivary digestion goes on for about half an hour after food is taken.

3. Gastric Digestion.—The passage of food from the mouth to the stomach will be dealt with later. The stomach has two digestive functions: (1) It acts as a store chamber permitting a full meal to be taken; (2) It acts as a digestive organ of importance in preparing the food for further attack in the intestinal canal. But the stomach cannot be regarded as an essential organ, since it has been removed in dogs and in man without apparent interference with nutrition and health.

Gastric digestion is brought about by the action of the gastric juice, a clear watery, colourless and strongly acid fluid with a specific gravity of about 1.003. The amount of solids present is extremely small, about 0.3%. They consist of protein, nucleic acid, lecithin and inorganic salts, in addition to the more important constituents, the enzymes and hydrochloric acid.

The amount of hydrochloric acid present in the juice varies with the period of digestion. In man the maximum acid concentration is about 0.2%. The acid exists in the stomach in two forms as free hydrochloric acid and as combined hydrochloric acid. The amount of each depends on various factors: (1) The secretion itself; (2) the nature of the food; and (3) the rapidity with which the stomach empties itself, &c. For instance, after a protein-free meal the hydrochloric acid is for the most part free, whereas, when protein is present, it combines with it and, unless secreted in very large amount, most of the acid is in a fixed condition.

The hydrochloric acid is formed by the activities of certain glands either in the fundus of the stomach, or in the mucous membranes of the food passages and certain glands. It has been shown by the fact that, when the tissues are deprived of this salt, and sodium bromide is given, hydrobromic acid may appear in the gastric secretion.
The hydrochloric acid is essential for the action of the gastric enzyme, pepsin, in splitting up the protein of the food. In addition to this, the acid has a slight action in splitting polysaccharides and disaccharides. Lastly, it acts as a bactericidal agent, preventing bacterial decomposition from taking place, and it may thus prevent certain noxious bacteria, taken in the food, from gaining access to the intestinal tract, where there is a chance of their flourishing in the rich alkaline medium. It is, therefore, to the presence of hydrochloric acid that gastric juice can be kept for prolonged periods without undergoing putrefaction.

The quantity of juice secreted varies with the nature of the food consumed. Thus in one experiment, after the use of a test meal consisting of 25 grammes bread and 250 c.c. tea, there was a flow of 106 c.c. of juice; whereas in another case an ordinary meal there was an output of practically 600 c.c. gastric juice.

Pawlow has shown that not only does the amount of juice secreted vary with the nature of the food ingested but that the digestive activity of the secretion also varies in the same way. He gives the following table:

**Quantities and Properties of Gastric Juice with Different Diets:**

<table>

</table>

Thus each separate food gives rise to a definite hourly secretion of the juice and to a characteristic alteration in its properties. The meat diet brings about a very rapid flow, the maximum output taking place about the first two hours, after which the gastric juice becomes less and less. With bread the same result is obtained, but the maximum output is even earlier. With milk somewhat later. When the juice is examined as regards its digestive activity, it is found that with meat the most active juice is secreted within the first hour, with bread in the second and third hours, and with milk in the sixth hour.

According to the nature of the food, the stomach seems to be stimulated to form a secretion which will best serve its purpose and give the minimum of waste economy. The principal ferment found in the gastric juice is pepsin, a ferment which acts only in the presence of a mineral acid. The action proceeds best at a temperature of about 37° C. in an acid medium of pH 2 to 3. Pepsin is eluted in the pyloric part of the stomach, whereas the casein and fat are retained for further treatment. On a mixed diet, emptying of the stomach in mac processes very slowly, requiring about four hours. Cannon, by feeding with bismuth and X-rays, showed that carbohydrates leave most rapidly, then mixtures of carbohydrates and proteins, then proteins, then fats, and finally mixtures of fats and proteins. The diet which remains longest in the stomach is a mixture of fats and proteins—rich food, as it is popularly called. Here two factors enter to prevent rapid emptying: (1) the presence of much fat, and (2) the acid secretion engendered by the abundant proteins.

It is owing to the presence of hydrochloric acid that gastric juice can be kept for prolonged periods without undergoing putrefaction. There is no doubt that fats present in fine emulsion can be decomposed in the stomach. The action proceeds in a medium which is slightly acid or neutral, being entirely prevented by the presence of alkalies. Proteins and emulsions of fats are more likely to be of pancreatic or intestinal origin, and suppose that it gains entrance to the stomach by a reflux flow through the pylorus. Evidence of this is accumulating that this is the case.

By means of pepsin and gastroplastin proteins and fats are dealt with. No specific enzyme for carbohydrates has been found in the stomach in man. Certainly a small amount of polysaccharide decomposition takes place, but this is dependent (1) on the pepsin which comes from the mouth, and (2) on a certain amount of hydrolysis due to the action of the free hydrochloric acid. The secretion obtained from a fistula of the pancreatic duct varies in character according to whether the opening into the duct has been made recently or some time before the examination. It is a clear, usually thin fluid with a specific gravity of about 1008, and with an alkaline reaction. It contains a certain amount of protein and ash. The most important inorganic constituent is sodium carbonate, which gives the alkaline reaction (alkalinity is, as NaOH=0.47%). This alkaline salt, along with that contained in the intestinal juice, plays an important part in neutralizing the acid chyme.

**Digestion in the Intestine.**—The passage of food from the stomach to the intestine will be considered later. The food so far digested in the stomach is known as chyme, and it is passed on to undergo intestinal digestion under the influence of (1) the enzymes of the pancreas, and (2) of other enzymes present in the different secretions of the intestine. Digestion in the intestine may accordingly be described under these two heads.

(a) **Pancreatic Digestion.**—The pancreatic juice is the secretion from the pancreas and is discharged into the duodenum. The secretion obtained from a fistula of the pancreatic duct varies in character according to whether the opening into the duct has been made recently or some time before the examination. It is a clear, usually thin fluid with a specific gravity of about 1008, and with an alkaline reaction. It contains a certain amount of protein and ash. The most important inorganic constituent is sodium carbonate, which gives the alkaline reaction (alkalinity is, as NaOH=0.47%). This alkaline salt, along with that contained in the intestinal juice, plays an important part in neutralizing the acid chyme.

(b) **Intestinal Digestion.**—In the stomach, the juice of the pancreas contains at least three important enzymes, each with a definite action: (a) trypsin, the proteolytic enzyme which brings about the further breakdown of the food proteins; (b) lipase, which deals with the carbohydrates, and (c) a lipase which acts on the fats.

(a) **Trypsin.**—This ferment, in the form in which it is secreted—trypsinogen—is inert. Before it can exert its hydrolytic action it must be converted into trypsin by the enzyme pepsin. The reaction has been shown by the fact that another of the enzymes which is found in the intestinal tract—enterokinase. The version is brought about as soon as the trypsinogen comes into contact with the enterokinase, which is present in the intestinal juice. Trypsin acts on the protein just as pepsin does, by bringing about hydrolytic changes. It differs from the latter in acting best in an alkaline medium, and in being more rapidly inactivated by the presence of bile acids, so far as its hydrolytic action goes, than is the case with pepsin. However, as far as the splitting of the caseinogen of the milk is confined to the stomach, but has been found in various tissue extracts, and, indeed, wherever proteolytic enzymes are present.

The speed with which the stomach is emptied depends to a great extent on the nature of the food. Plain water leaves the stomach almost at once, salt and sugar solutions at a somewhat slower rate. Milk and milk curd act more slowly, the greater part of the food staying in the stomach, whereas the casein and fat are retained for further treatment.

4. **Digestion in the Intestine.**—The passage of food from the stomach to the intestine will be considered later. The food so far digested in the stomach is known as chyme, and it is passed on to undergo intestinal digestion under the influence of (1) the enzymes of the pancreas, and (2) of other enzymes present in the different secretions of the intestine. Digestion in the intestine may accordingly be described under these two heads.

(a) **Pancreatic Digestion.**—The pancreatic juice is the secretion from the pancreas and is discharged into the duodenum. The secretion obtained from a fistula of the pancreatic duct varies in character according to whether the opening into the duct has been made recently or some time before the examination. It is a clear, usually thin fluid with a specific gravity of about 1008, and with an alkaline reaction. It contains a certain amount of protein and ash. The most important inorganic constituent is sodium carbonate, which gives the alkaline reaction (alkalinity is, as NaOH=0.47%). This alkaline salt, along with that contained in the intestinal juice, plays an important part in neutralizing the acid chyme.

(b) **Intestinal Digestion.**—In the stomach, the juice of the pancreas contains at least three important enzymes, each with a definite action: (a) trypsin, the proteolytic enzyme which brings about the further breakdown of the food proteins; (b) lipase, which deals with the carbohydrates, and (c) a lipase which acts on the fats.

(a) **Trypsin.**—This ferment, in the form in which it is secreted—trypsinogen—is inert. Before it can exert its hydrolytic action it must be converted into trypsin by the enzyme pepsin. The reaction has been shown by the fact that another of the enzymes which is found in the intestinal tract—enterokinase. The version is brought about as soon as the trypsinogen comes into contact with the enterokinase, which is present in the intestinal juice. Trypsin acts on the protein just as pepsin does, by bringing about hydrolytic changes. It differs from the latter in acting best in an alkaline medium, and in being more rapidly inactivated by the presence of bile acids, than is the case with pepsin. However, as far as the splitting of the caseinogen of the milk is confined to the stomach, but has been found in various tissue extracts, and, indeed, wherever proteolytic enzymes are present.
The character and properties of the products formed in such digestion depend on the nature of the protein acted upon. As will be seen from the following table these proteins vary fairly widely in the proportion of amino acids which they contain.

Whether any of the polypeptides found in digestion are further broken down in the course of normal pancreatic digestion is a moot point, but E. Fischer and E. Abderhalden have shown that many of the synthetic polypeptides prepared by them can be broken into their constituents by the action of trypsin. The further peptic digestion seems to play some part in the extent to which trypsin digestion is carried out, as one of these observers has demonstrated that protein digested first with pepsin and then with trypsin gives a yield of polypeptide and a larger yield of mononitrogenous acids than when digestion has been carried out with trypsin alone.

b. Diastase.—This ferment is found in the pancreatic juice apparently secreted in an active form, although some observers hold that it also is secreted in azymogen form. It is practically identical in its action with the ptyalin of the saliva, converting starch into maltose. It deals with all the starchy food which has escaped conversion into simple sugars by the ptyalin.

c. Lipase.—Most of this ferment, if not all, is apparently secreted in the form of a zymogen. There is evidence that the bile is the activating agent here, just as the enterokinase acts in the case of trypsin. Lipase can act in any medium acid, neutral, and alkaline, and both on emulsified and non-emulsified fats. It converts the fats by a process of hydrolysis into fatty acids and glycerin. Kastle and Lowenhart found that not only can this enzyme break up fats into their components, but that it also has the power to act in the reverse direction, and in this way bring about the union of fatty acids and glycerin so as to form fats, a process which occurs in the intestinal pas sage of the animal’s affections in the alimentary canal.

In addition to these three enzymes the pancreatic juice may contain traces of others, for example, a rennet-like ferment which curdles milk. This again, as in the case of the stomach rennet, is present in some form or other in the testes. Maltase is also said to be present in small amount, as is also lactase under certain conditions. In pancreatic, as in gastric digestion, the mixture of the food is said to play an important part in confusing the amount and the composition of the secretion with respect to its ferments. The action, if it does exist, is not very well defined.

b. Intestinal Digestion.—By this is meant the other digestive processes which go on in the intestine under the action of the secretion of Lieberkühn’s follicles—the succus entericus. This is a yellowish, often opalescent, strongly alkaline fluid. The alkalinity is due to the presence of sodium carbonate. It contains a small amount of protein, shed epithelial cells, etc. The succus entericus is present in 44 hours after it has been observed in a short loop of human intestine by H. S. Hamburger and E. Hekma, but it is almost impossible to get a measure of the actual amount of secretion from the whole gut. Most of the ferments are present in very small amount in the intestinal juice. They seem to be actually within the epithelial lining of the intestine, for extracts made from the intestinal mucous membrane are richer in ferments than the secretion.

Apprently the intestinal secretion contains no trace of a ferment acting on native protein, but a ferment—creatin—is present in fair amount in the intestinal mucous membrane and small amount in the secretion, which acts in an alkaline medium on proteins, peptones, and on casein, converting them into crystalline products of the nature of amino acids.

Another ferment, arginase, has been isolated from the intestinal mucous membrane by A. Kossel and H. D. Dakin, which splits the dianino acid arginino into urea and ornithin. A lipase has also been detected which is very similar to pancreatic lipase; it, however, attacks only emulsified fats.

Several carbohydrate hydrolysing enzymes have been described in the intestines. Invertin, the ferment which splits sucrose, is present in small amount in the secretion, more abundantly in the extract of mucous membrane. In all probability it deals with the saccharose after or in process of absorption. Maltase is also present in small amount, but, and according to some observers, more abundantly in the secretion. The presence of lactase has been much discussed, and it seems probable that suckling animals do possess this enzyme. Workers have stated that an intestinal diastase is to be found, but, if so, it is present in very small amount.

In the large intestine a small amount of erepsin has been discovered at the upper end. Any digestion which does take place is probably either bacterial in origin, or due to ferments which have originated in the lower end of the small intestine, and which have been carried down.

5. Bile.—This fluid, in all probability, has little direct action in ordinary digestion, although it contains substances which act indirectly. The bile salts act as solvents for fats and fatty acids, and as activators of pancreatic lipase. The salts also serve to keep cholestrin in solution. Bile is to be looked upon rather as the excretion, the result of the hepatic metabolism, than as a digestive juice. Various workers have shown that when bile is passed through the intestine, by ligating the duodenum after it has been made, the animal or patient may continue to enjoy good health, thus proving that this fluid is not essential to any of the digestive processes which normally take place.

Bile as secreted has an orange-brown colour, but the colour varies according to the pigment present. It is more or less viscous (not so viscous as bile taken from the gall bladder) and has a specific gravity of about 1010. It has a slightly alkaline reaction, a bitter taste and a characteristic smell. The daily output is, for a normal individual, over 500 c.c. On analysis it is found to have over 2% of solids, of which more than half are organic. It contains in addition to bile pigments, bile salts, bile acids, bile pigments, cholesterol, lecithin, fats, etc. The most abundant solids are the salts of the bile acids, of which in man the most important is sodium taurocholate, sodium taurocholate being present in very small amount. The bile acids are formed in the liver cells, and when the duct is ligatured they tend to accumulate in the blood.

The pigments amount to only about 0.2%. In human bile the chief pigment is bilirubin, whilst in herbivora biliverdin is more abundant. They are derived from the haemoglobin of the blood, but the pigments are iron-free. They may be regarded as purely products arising from the breakdown of the haemoglobin of effete blood corpuscles.

Cholestrin is a monatomic alcohol, and is probably a waste product, but its exact position in the alimentary canal is not known. There is evidence that it is not secreted by the liver cells but is added to the bile from the bile passages. Fats and lecithin are both derived from the liver cells. Of the inorganic constituents phosphate of calcium is the most abundant.

The secretion of bile is practically continuous, but it seems to enter the duodenum intermittently. The taking of food increases the flow of bile, the amount of the increase depending to a certain extent on the nature of the food. A protein meal has been found to have the greatest effect and a carbohydrate one the least. The entry of the acid chyme into the duodenum is the stimulus which brings about the ejection of the bile. Pressure on the liver also seems to cause a flow (see section 11.).

In connexion with bile secretion attention may be drawn here to a peculiar enterohepatic circulation which is stated to exist. The bile salts are partly absorbed by the intestine and are secreted again by the portal blood to the liver and to be again eliminated. By this circulation the entrance of various alkaloidal and ptomaine poisons into the alimentary canal may be prevented.

Faces.—The bulk of the waste matter arising from the foods along with the secretions from the alimentary canal form the faces. On an absorbable diet the faces are almost purely intestinal in origin. As a result of the excretion of nitrogenous metabolic waste products they are not very important, although the work of C. Voit indicates that they do play a certain part. The nature of the excreted nitrogenous substances has not been fully examined. Of the inorganic constituents phosphorus is probably the most partly excreted into the large intestine. It is, however, very difficult to come to any definite conclusion as to what is unabsorbed material and what excreted.

II. THE MODE OF FORMATION OF THE DIGESTIVE SECRETIONS

1. Salivary Glands.—The secretion from the various glands is generally evoked by nervous impulses, through the secretory
How far the flow is controlled by nervous action, and how far by hormone action, is not known.

III. Motor Mechanism of the Alimentary Canal

Mastication.—This is a purely voluntary act, and consists of a great variety of movements produced by the various muscles in connexion with the lower jaw. By the act of chewing the food is thoroughly broken up and intimately mixed with the saliva.

Deglutition.—The food after thorough mastication is collected on the surface of the tongue, principally by the action (voluntary) of the buccinator muscles, and by the contraction of the tongue muscles it is passed backwards. As soon as the food by the action of the tongue enters the pillars of the fauces the action becomes involuntary and reflex. The soft palate is raised to prevent the food entering the nasal cavity, and the larynx is shut off by closure of the glottis, and approximation of the arytenoid cartilages to one another and to the back of the epiglottis. The food is now passed on into the oesophagus proper by the constrictors of the pharynx. In the oesophagus the downward movement varies with the nature of the food swallowed. If it be fluid it reaches the lower end of the oesophagus in about three seconds and lies at the lower end of the gullet for two or three seconds before entering the stomach. When the consistency is firmer the progress downwards is much slower. Either by the force exerted by the wave of contraction passing down the gullet or by some inhibition of the sphincter, the cardia orifice opens and permits the food to enter the stomach.

Stomach Movements.—For our knowledge of these we are indebted principally to the work of Cannon, who studied them by feeding an animal with food containing bismuth and following the movements of the shadow of the food on a screen by means of the X-rays. Soon after food is taken it is found that a contraction begins somewhere about the middle of the stomach and slowly passes towards the pylorus. This is followed by others, in men at regular intervals of about twenty seconds, so that the pyloric part of the organ is soon in active peristalsis. The fundus of the stomach is not actively concerned in these movements; it simply acts as a reservoir. At certain periods, but not with each peristaltic wave, the pyloric sphincter relaxes and allows a portion of the fluid acid chyme to escape into the duodenum. If one fluid it reaches the lower end of the oesophagus in about three seconds and lies at the lower end of the gullet for two or three seconds before entering the stomach. When the consistency is firmer the progress downwards is much slower. Either by the force exerted by the wave of contraction passing down the gullet or by some inhibition of the sphincter, the cardia orifice opens and permits the food to enter the stomach.

Intestinal Movements.—The intestines owe their peculiar movements to the arrangement of their muscular coats, which are disposed in two layers, an inner circular, and an outer longitudinal. The movements are of two kinds, the so-called swaying myogenic contraction and the peristaltic waves. The former are rapid and have very little to do with the downward movement of the contents. Probably their action is to mix the contents, since Cannon has shown that these contents, in the lower animals at least, get divided into segments. From time to time the separated segments are caught in the course of a peristaltic wave and carried downward a short distance. Then again in their new situation the rhythmical contractions break up the contents anew.

The peristaltic movements are much more powerful. Under normal conditions they begin at the pylorus and passing downwards carry the intestinal contents onwards. The normal movement progresses slowly, although under abnormal conditions
peristaltic waves may become extremely violent and rapid, and may indeed run over the whole length of the intestine within a minute. The muscular coat in front of the contracting zone is relaxed, as is that behind the wave. The waves are probably due mainly to the circular fibres, the longitudinal pulling the gut up over the contents as they are forced onwards. The downward movement seems to be due to some definite arrangement within the intestinal wall, since it has been shown that, when a segment of bowel has been cut out and then the continuity of the canal made good by fixing the section so that the lower end of the divided portion is fixed to the upper divided end of the real gut, upward peristalsis takes place. This section in an anti-peristaltic has been described in which the movements are all towards the stomach. Under certain conditions the introduction of foreign substances, as hairs, &c., may evoke such anti-peristaltic waves.

The rhythmical movements are held by some to be purely myogenic in origin, as they still continue after section of all the nerves and when the intrinsic ganglia in the intestinal wall have been thrown out of action by the application of nicotine. But recent work, particularly that of Magnus, shows that the wave movements, which Magnus would tend to show that they are controlled by a system of nerves, which act upon the circular coats. On the other hand, according to W. Bayliss and E. Starling, although they continue and indeed may become more energetic after section of the extrinsic nerves, are prevented by the application of nicotine and cocaine; in other words, it is presumed that peristalsis is a complicated reflex action through the intrinsic ganglia.

The intestines are therefore not dependent for their movement on their connexion with the central nervous system, although of course their activity is more or less regulated by such a connexion.

As regards the movements of the large intestine, they resemble those of the small, although they are much less frequent. The forward movement is slow, thus permitting of the solidification of the contents by the removal of the water. In the first part of the large intestine anti-peristaltic movements are frequent, the regular peristaltic downward movements only becoming prominent when the descending colon is reached to carry contents to the rectum. The anti-peristalsis serves a useful purpose in giving time for the absorption of the fluid in the formation of faeces. The rate at which the contents travel along the intestine varies greatly. The whole movement from the mouth to the anus may be considered by some to take about 24 hours. The contents never reach the ileo-cæcal valve between the small and large intestine at about four to four and a half hours after a meal, while it takes nine hours to reach the splenic flexure of the colon.

Defaecation.—Food residues, cellular débris and substances derived from the various secretions of the gastro-intestinal tract are forced downwards by peristalsis, and eventually reach the rectum and accumulate there as the faeces. The pressure of the solid and semi-solid material in the sigmoid colon is sufficient to force a portion to be discharged in a complete defaecation, while in other cases the colon is unable to empty itself and the discharge is incomplete. The faeces are retained within the canal partly by the horizontal direction of the rectum before it opens into the anal canal, and partly by the action of two sphincter muscles. At the act of defaecation the strong internal sphincter is first of all relaxed, but unless the rectal stimulus is very strong, the external can be kept contracted, as it is to a certain extent, under the control of the will. The act of defaecation normally is partly voluntary and partly involuntary. The voluntary part consists in the contraction of the abdominal muscles, the closure of the glottis, and the relaxation of the external sphincter and of the levator ani muscle, thus allowing the horizontal part of the rectum to become more vertical; the involuntary in the energetic contractions of the muscular walls of the colon and rectum which sweep the contents of the whole colon downwards. There is a centre in the lumbar enlargement of the spinal cord which presides over the sphincter muscles and probably over the whole involuntary mechanism of defaecation.

Vomiting.—Sometimes the gastric contents are ejected through the oesophagus against the teeth, the palate and the hard palate, by a series of violent efforts with the glottis closed. The diaphragm is held firmly contracted, then a convulsive contraction of the abdominal muscles with a simultaneous opening of the cardiac orifice of the stomach brings about the expulsion of the contents. The wall of the stomach may also contract and press upon the contents. During the act the glottis is firmly closed, and at the same time, if the act be not too violent, the gastric contents are prevented from entering the nasal cavity by the contraction of the soft palate.

IV. Absorption

MOUTH.—No absorption of food-stuffs takes place here.

STOMACH.—Absorption from the stomach occurs only to a small extent. Water passes rapidly through the stomach and is practically unabsorbed. Salts are apparently absorbed in a limited amount from their watery solution, the extent of absorption depending to some extent on the concentration of the solution. Sugar is also absorbed to a small extent from its solutions, the greater the concentration the greater the amount of sugar taken up. Alcohol is readily absorbed from the stomach. A small amount of the products of protein digestion may be absorbed. There is no evidence that fats are absorbed under any conditions in the stomach.

INTESTINE.—The greatest absorption of the foods takes place in the intestine, especially in the small intestine. It has been shown that over 85% of the protein has disappeared before the lower end of the small intestine is reached. How does the absorption take place? The removal of the material from the intestine: (1) the blood capillaries spread in the villi, and (2) the lacteals also present in the villi. The foods may reach the blood direct or through the various lymph channels into the thoracic duct and finally into the blood. The lacteals of the villi are channels for the absorption of the fatty parts of the food. The products of the digestion of the proteins and carbohydrates reach the body directly through the capillaries via the portal system.

Can absorption be explained by the ordinary laws of diffusion and osmosis, or are there certain selective activities of the living epithelial lining? The work of R. Heidenheim, E. Weymouth Reid, and others shows clearly that whatever part the physical laws play in this exchange, there are other activities also at work. For instance, an animal’s own serum can be readily absorbed from its intestine, as can also salt and other solutions of higher concentration than that of the blood. Such absorption cannot be explained by ordinary physical laws. In all such cases absorption of the epithelial lining of the gut must be intact and uninjured. O. Cohnheim and others have shown that when the epithelial lining is damaged or destroyed, the intestinal wall can take up any other substance and, if the physical laws governing osmotic pressure come into play. Whether the nervous system plays any part in this absorption is not yet determined.

The form in which the various products resulting from digestion are absorbed must next be considered. 

Carbohydrates.—These reach the body, as already mentioned, by way of the blood, and in the form of monosaccharides or simple sugars. F. Rohmann found that the absorption of the disaccharides is a function of the intestinal absorption of the mono-saccharides. He injected solutions of various sugars, mono- and di-saccharides, and found that the simple sugars were retained, whereas the double sugars were excreted in the urine. The only di-saccharide which can be dealt with in the body is maltose, as there is a maltase present in the blood which splits it. Carbohydrates which are not absorbed from the intestine are disposed of by bacterial action, giving rise to various fatty acids, carbon dioxide, &c.

Lipids.—Fats are absorbed from the intestine in the form of fatty acids and glycerin; i.e. in the form in which they exist after the action of the lipase. That a resynthesis takes place in the epithelium is shown by the fact that fatty acids are of equal value with fat as a source of energy, and that as fat absorption goes on fat droplets are seen to grow in the protoplasm away from the free margin of the cell. As already mentioned, the fat is removed by the lacteals from the cells and is transferred to the blood. As the greater part of the small amount of the fat may pass into the body via the blood, but this is practically all retained by the liver. The amount of fat absorbed depends a good deal on the nature of the fat, especially with reference to its melting-point, fats of low melting-point being most readily taken up.

Protein.—The older workers held that the protein was absorbed in
the form of proteose and peptone. In support of this it was stated that both proteoses and peptones could be detected in the blood stream. The result of the most recent work tends to show that the material is absorbed in the form of the amino acids either simple or in complex groups, the polypeptides. What is important to note is that if proteoses or peptones are absorbed they are attacked by the intra-cellular enzyme erepin, which breaks them down into the simpler products as soon as they are within the body. It is possible that the various materials which are absorbed undergo no change; for instance, blood serum disappears from the intestine without apparently any change through zymin attack. This fact is made use of in practical medicine, as, when administrated by the mouth, by Jacoby and others, has frequently kept alive by the giving of nutrient enemata. That the food thus given is absorbed is shown by the increase of nitrogen excretion in the urine. In the large intestine very little absorption of nutrient matter takes place. Most of the nitrogenous substances, proteins, must be excreted as a part was kept there. Be that as it may, that the absorbed material is removed whilst the food is in the small intestine. That protein matter can be absorbed is shown by the above statement regarding nutrient enemata. The principal substance absorbed here is water; and thus the excreta become firm and formed.

V. Metabolism

In all living matter there is a constant cycle of chemical changes going on, a constant breaking down (catabolism), and a correspondingly constant building up (anabolism). Unless the former is covered by the latter wasting and finally death must supervene. These two changes together make up the metabolism, and the study of this involves a study of the fate of the food absorbed both when it is used immediately and after it has been stored in the tissues of the body. Protein matter is undoubtedly the main constituent of protoplasm, but in what form it exists there is absolutely unknown. One thing is certain, that for the maintenance of life a constant supply of protein matter is necessary from the fact it might be said that this is the essential food and keeps the body alive, fats and carbohydrates being merely subsidiary. In the mammalian organism with which we are specially concerned a supply of these latter substances is also necessary to yield the energy required. The amounts of these various food stuffs which should be present in a suitable diet are dealt with under DIETETICS (q.v.). Here we are only concerned with the part played by the different materials in the various chemical changes which are the basis of vital activity.

Not many years ago physiologists were very much in the position of unskilled labourers who saw loads of heterogeneous materials bringing "food" and asked for "what" it was. Now we know for what particular purpose each individual substance was used. Thanks, however, to the brilliant work of E. Fischer we are no longer in this position. Gradually our knowledge is being broadened by actual facts obtained by direct experiment, or by inference from previous experiments. But it is still far from complete. It is only possible to outline what is at present known about the part played by the different food constituents in metabolism.

Proteins.—Since these alone contain the nitrogen necessary for the building up and repair of the tissues they are essential and will be dealt with first. In considering the digestion of proteins it was shown that in all probability all protein food was reduced in the intestine to comparatively simple crystalline bodies. O. Löwenstern has shown that an animal can be maintained in health without loss of weight by feeding it on a diet consisting of amino acids obtained by prolonged pancreatic digestion in place of proteins. In addition to these amino acids the liver and the muscles were supplied with much more, and it has been shown that the presence of carbohydrate a certain amount of which is absolutely essential before utilization of the amino acids can take place. Furthermore, it has been demonstrated that only a mere fraction of the total amino acids resulting from pancreatic digestion is sufficient to supply the needs of the animal organism. Not only so, but, in spite of the attempt to insist on the polypeptides and proteins as the absolute food material upon which the living substance depends for its nourishment, the body, it has been shown that mixtures of amino acids from which the polypeptides have been removed can serve as the nitrogen supply.

What then does the body gain by breaking down food material to such simple bodies, if it is put to no use for the repair of the body? It has been shown that mixtures of amino acids from which the polypeptides have been removed can serve as the nitrogen supply.

It has also been shown that the presence of carbohydrate a certain amount of which is absolutely essential before utilization of the amino acids can take place. Furthermore, it has been demonstrated that only a mere fraction of the total amino acids resulting from pancreatic digestion is sufficient to supply the needs of the animal organism. Not only so, but, in spite of the attempt to insist on the polypeptides and proteins as the absolute food material upon which the living substance depends for its nourishment, the body, it has been shown that mixtures of amino acids from which the polypeptides have been removed can serve as the nitrogen supply.

In an experiment carried out by E. Abderhalden this was very clearly demonstrated. A protein gliadin absolutely different in constitution from the proteins of blood plasma was fed to an animal from which much of its blood had been removed, so that an active reformation had to take place. The question to be solved was whether by feeding with a protein so absolutely different in constitution the nature of the freshly forming serum protein could be radically changed. But the newly-formed serum was found to be exactly the same in constitution as the old serum. The only difference was that the nuclei of the gliadin which were required and had rejected the others.

In addition to this breakdown of protein in the intestine, another form of protein is important in the process of absorption. The volume of the gut the amino acids are not wholly conveyed as such by the portal blood to the liver. That the portal blood contains a greater amount of ammonia than the systemic blood has long been known, and Jacoby and others have shown that some of the amino acids among them the intestinal tissues, are able to split off from the amino acids their amino group NH₂. It would seem probable that any excess of the amino acids formed does not reach the liver or is destroyed by the liver, and is excreted in the urine. The ammonia split off is also conveyed to the liver and is excreted for the most part as urea, within the first few hours after a protein meal. Thus, in all probability very early after absorption and before the products of digestion enter into combination or any synthesis occurs, all excess of the absorbed nitrogen is disposed of. The rest of the products circulate in the blood, yielding to the cells the materials of which they are in need. On the other hand some investigators still hold that resynthesis into a neutral protein like serum albumin takes place in the intestinal wall immediately after absorption of the digest of proteins. What the role of the protein digestion in the production of the digestive enzymes and the part played by them in the digestion and absorption of protein foods. How they act, whether simply as carriers of the protein material or as digestive enzymes, and how they give the material to the tissues is unknown.

Carbohydrates are generally assumed simply to serve the purpose of yielding energy in their combustion to CO₂ and H₂O, and to act as sparing materials, i.e., they are able to maintain the blood sugar at a certain level. One indication of this is the fact that the human body is equipped with an insusceptible system of storage, which is an insoluble polysaccharide, and is only utilized according to the requirements of the body, especially during muscular exertion. Carbohydrates, when taken in excess, are also stored in the tissues in the form of fat. This was demonstrated by the feeding experiments of Lawes and Gilbert at Rothamsted. They took two young pigs of a litter, killed and analysed one, then fed the other for a month with a diet consisting of carbohydrates only. At the end of the month the amount of protein absorbed by analysing the urine and the faeces. They killed the pig and by analysis ascertained the amount of fat put on. They found that this was far in excess of the amount of protein that had been used for the formation of the growth of the pig. Furthermore, it was also shown that the excess of what could have been formed from the small amount of fat in the food. The fat must therefore have been formed from the carbohydrates. The carbohydrates have been shown to be more useful than fat as an energy yielding material, as they can be used or stored as glycogen results in its passing straight through the body and being excreted in the urine. This condition is known as alimentary glycosuria. The power of using and storing sugar varies greatly in different individuals and in the same individual at different times.

Fats.—The fats simply serve as stores of energy. After ingestion, if in small amount, they are, like carbohydrates, oxidized to the same final products, CO₂ and H₂O. If in larger amount they are stored as fat, to serve as a reserve in case of need, in the body tissues. Like the carbohydrates they serve as the sources of part of the energy yielding material, and spare the proteins and other sparsers of protein material, evidently in part at least because they are more easily digested and absorbed.

Factors which influence Normal Metabolism.

1. Fasting.—During fasting the body draws upon its own reserve 1 of stored material for the requirements in the production of energy, and the rate of breakdown varies with the energy requirements. An animal in a state of fasting will break down proteins faster than one who is compelled to take exercise in a cold place.

The breakdown of tissue during the early days of a fast is much greater than later, for as the fast progresses the body becomes more economical and some of its tissues are broken down. There is also a not all waste at an equal rate; those which are not essential are utilized at a much greater rate than those which are essential to the body. The muscles which are not utilized to any great extent during a fast the skeletal muscles may lose over 40% of their weight, whereas an essential organ like the heart loses only some 3%.

The essential tissues obtain their nourishment from the less essential probably by ferment action, a process which has been
termed autolysis. The autolytic products of the stored material in the tissues are practically identical with those which arise during the ordinary gastro-intestinal digestion.

Although the respiratory tissue plays the most important part in general metabolism. Not only is muscle the most abundant tissue present, but it is constantly active and is the great energy-liberating machine of the body. Formerly it was believed on the authority of Leeuwenhoek that a protein and carbohydrate result at the expense of the protein material, but it has been conclusively shown that the real source of energy in moderate work is the non-protein material, carbohydrates and fats; of these the former plays the greater role, although it is probable that there are certain parts of the body where the non-nitrogenous material be insufficient, then the energy has to be supplied by the protein and the output of nitrogen is thus increased. Very high rates of metabolism (both products of muscle metabolism) excerted have been described. In hard work it is sometimes found that there may be no immediate rise in the nitrogen output on the day of the work, but that an increase is manifest on the second or third day after. While the excretion of nitrogen shows no increase proportionate to the work done, the output of carbon dioxide produced by the combustion of the carbohydrates and of the fats is increased proportionately to the work done.

3. Internal Secretions.—Evidence is accumulating to show that the activities of the various tissues of the body are presided over and controlled not merely by the action of the nervous system but also by the chemical secretions of the various endocrine or other organs. To these chemical substances, as already stated, the name of hormones has been given.

The hormone which has been more thoroughly investigated is adrenaline (epinephrin). It is a chemical compound consisting of a secondary alcohol linked to a benzene ring. It is a product of the central or mediullary part of the suprarenal bodies. The medullary part of these organs is developed from the sympathetic part of the nervous system. The hormone is secreted by the small agencies of the sympathetic nerves which spring from the thoraco-abdominal region. These nerves control the small arteries, and the manner of their action is such as to cause a non-calcium contraction of these vessels, and as a result a great rise in the arterial blood pressure. For this purpose it is now largely used in medicine. The constant supply of adrenaline in small quantities seems to play an important part in the circulation of the blood vessels, and when, as a result of disease of the suprarenal, the supply is cut off a serious train of symptoms supervenes.

Allied to adrenaline is a hormone derived from the pituitary body. This is a secretion of the small arteries except those of the kidney, which it dilates. An increased flow of urine is produced. In the thyroid gland a substance, inodolkyrin, is constantly being produced, and this appears to exercise a stimulating action on the rate of chemical exchange in the various tissues. Under its administration the waste of both proteins and fats is increased. When the thyroid is removed or destroyed by disease a condition of depression occurs, which may cause a mental sluggishness, results, accompanied often by nervous tremors.

A difficulty in explaining these symptoms is caused by the fact that in the thyroid are imbedded four small parathyroids, and it is possible that these produce a special hormone. It is supposed that this exercise a particular influence upon the nervous system, but further evidence is needed.

The well-known effects of removal of the ovaries or testes on the development and character of an animal is due to the absence of the special hormones which are hormones of these structures. These hormones appear to be produced, in the case of the testes at least, not in the true genital cells, but in the intermediate cells, since it has been found that ligature of the duct, which leads to destruction of the genital cells, does not abolish the development of the sexual characters of the animal.

It is known that from the ovaries different hormones may be produced in varying amounts which play an important part in regulating the phenomena of sexual life.

The thymus gland is a structure lying in the front of the neck, which is removed from man and animals very slowly after birth, and atrophies when the age of puberty is reached. In castrated male animals it continues to grow and persists throughout life. There is some evidence that it may exercise some effect upon the growth of the testes only.

Pancreas.—Within recent years it has been shown that the internal secretion of this organ plays a very important part in the metabolism of carbohydrates. It is known that when the pancreas becomes diabetic, i.e. sugar appears in the urine and the animal emaciates. How the internal secretion affects the combustion of the sugar is not yet known. Some workers hold that the action of the liver is the chief in the transformation of the sugars into glycogen by the various sugar-forming organs, of which the liver is the chief, others that it dominates the utilization of sugar as a source of energy by the muscles. It is one of the best-known examples of the way in which the products of the activity of one organ modify the functions of other organs. In all probability many more examples of hormone action will be discovered, and it will be found that they play probably even a more important part than the nervous system in the co-ordination of functions in the animal.

Other factors, besides these already dealt with, play a part in modifying the various metabolic processes, as age, temperature, climate, &c. Very little, however, is definitely known about these factors.

Water and inorganic salts are quite as essential for the well-being of the body as the energy-yielding proteins, carbohydrates and fats. They, however, probably undergo little or no change in the body; they are merely transformed products of the various chemical compounds of which they are ingested. Although they are not subjected to any very great change, yet they are of immense importance. No animal tissue can carry on its work in the absence of water. In this respect the salts. Thus the salts have been carried out in which animals have been fed on food as free from salts as possible, and, although the food was much in excess of the energy requirements, yet all these animals died, whereas other animals living on the same diet, but with an addition of various inorganic salts, the most important acids are hydrochloric and phosphoric, and the most important bases sodium of potassium. Calcium and magnesium are also of importance, especially where bone formation is taking place.

Another element of really vital importance is iron, which is required for the formation of haemoglobin.

VI. EXCRETION

While we know comparatively little of the intermediate stages in the breakdown of the food constituents, and more particularly of the protein moiety, our knowledge of the final products of the metabolic changes excerted is fairly full. The urine is the main channel of excretion for the nitrogenous waste products. Carbohydrates and fats, is excreted mainly through the lungs. Water is excreted by the lungs, the kidneys and the skin.

So far no entirely satisfactory explanation has been given of how a fluid like urine, having an acid reaction and containing about one hundred times as much urea and generally more than twice as much asuric acid as the blood, is formed in the kidneys. The urine is a yellowish fluid which varies greatly in its depth of colour, from pale amber to a deep brown. It has a specific gravity of about 1020, varying with the percentage of solids in solution, and it usually has an acid reaction. It is a mixture of compounds that have already mentioned, practically all the waste nitrogen of the body.

Among the principal organic substances present are urea, ammonia, purins (uric acid and the so-called purin bases, xanthin, &c.), creatinin, conjugated sulphates, various aromatic bodies and many other substances in small amount, together with the water and inorganic salts.

The following table from Folin gives a good idea of the average composition of the urine as regards the nitrogen-containing constituents, and its variation according to the nature of the diet when this is free of creatinin and the precursors of the purins—:

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Total nitrogen</td>
<td>14.8-18.2 gms. per day</td>
</tr>
<tr>
<td>Urea nitrogen</td>
<td>8.6-9.9 gms. of total</td>
</tr>
<tr>
<td>Asparagenine</td>
<td>3.3-4.5 gms.</td>
</tr>
<tr>
<td>Creatinin nitrogen</td>
<td>3.0-5.0 gms.</td>
</tr>
<tr>
<td>Uric acid nitrogen</td>
<td>0.1-1.0 gms.</td>
</tr>
<tr>
<td>Undetermined nitrogen</td>
<td>2.7-5.3 gms.</td>
</tr>
</tbody>
</table>

Urea, which forms the chief nitrogenous constituent, amounting on an ordinary diet to about 30 gms. per diem, is for the most part formed in the liver, from the ammonia of blood after absorption from the intestine, or resulting from the deamination of the amino acids. It may also arise in part from the amino acids and from uric acid. 

Creatinin is present in the form of ammonium salts, and forms about 4% of the total urinary nitrogen. It may exceed this amount under certain conditions, for the most part pathological. The ammonia is utilized by the body to neutralize acids which arise during the various metabolic processes.

Purins (uric acid, xanthin, hypoxanthin, &c.) are all members of a series which have as their common nucleus a body which E. Fischer calls purin. This is the nucleus around which are derived all the various chemical compounds in which they appear. It is formed from the various nitrogen-containing substances, and hence is the second as the endogenous. This acid is chemically known as tri-oxypurin, and may be regarded as the union of two urea molecules with a free carbon chain fatty acid. All the uric acid formed in the body is not excreted as such, part being, as already mentioned, converted into urea. The amount which is converted into urea varies
with the species of animal. In man, Burian and Schur state that one half of the total amount is so converted. Some workers, like Wiener, hold that uric acid may be synthesized in the body, but while this is undoubtedly so in the case of the bird, in the mammal it has not been definitely demonstrated. On the other hand, the presence of xanthin and hypoxanthin, purines less oxidized than uric acid; the first is a dihydroxypurine, and the second is a monohydroxypurine. The main source of these purines is thought to be purine nucleic substances or nucleins. These purine substances from which all are derived in the body are the nucleins. These complex bodies are apparently first broken down by enzyme action to aminopurines. In these their turn have their aminoglucides split off, and then, according to the degree of oxidation, the different purin bodies are formed.

**Creatinin.**—The physiological significance of this substance is as yet unknown. The daily excretion varies little with the characteristics of the individual, provided, of course, that the creatinin is not present in excess in the urine. It appears to be proportional to the muscular development and muscular activity of the individual. Hence it would seem to be derived from the creatin of muscle, a substance which is very readily changed into creatinin outside the body. In the body, the conversion of creatin into creatinin seems to be strictly limited, and hence when creatin is taken in flesh in the food it tends to appear as such in the urine. It would seem that it is either in great part decomposed in the body into what we do not at present know or that, as suggested by Folin, it may be used as a specialized food. Whatever its source, after urea and ammonia it is one of the most important nitrogenous substances excreted, the daily excretion being about 1.5 grms.

The sulphur excreted in the urine comes chiefly from the sulphur of the ordinary food. It is also derived from the ordinary preformed sulphates, that is, sulphur in the form of sulphuric acid combined with the ordinary bases. (2) As ethereal sulphates, that is, in combination with various aromatic substances like the indoles. In the latter case the excreted nucleus is a sulphur-containing one, which are intermediate products in the complete oxidation of sulphur.

Carbon, as carbonic acid, is added to the alkaline and alkaline earths as phosphoric acid. A very small part of the phosphoric acid may be eliminated in organic combination such as the glycerophosphates, &c.

Sodium (mostly as sodium chloride), potassium, calcium and magnesium are the common bases present in the urine.

The lungs are the important channel of excretion for the waste product of carbon metabolism CO2 (see Respiratory System); and also a very important channel for the excretion of water. As regards the amount of water carried off in the sweat, very little is known. In the case of athletes, the excretion of water is increased, but not excessive in amount. The lungs are the organ of excretion for the two gases which are of most importance. There is a small amount of CO2 excreted by this channel.

**NUTTALL, THOMAS** (1786-1859), English botanist and ornithologist, who lived and worked in America from 1808 until 1842, was born at Selborne in Hampshire on the 9th of January 1786, and spent some years as a journeyman printer in England. Soon after going to the United States he was induced by Professor B. S. Barton (1776-1815) to apply himself to the study of the plants of that country. In 1824-1834 he was curator of the botanic gardens of Harvard university. In 1834 he crossed the continent to the Pacific Ocean, and visited the Hawaiian Islands. Some property having been left him in England on condition of his residing on it during part of each year, he left America in 1842, and did not again revisit it except for a short time in 1852. He died at St Helens, Lancashire, on the 10th of September 1859.

Almost the whole of his scientific work was done in the United States, and his published works appeared there. The more important of these are, The Genera of North American Birds and a Catalogue of the Species to the year 1817 (2 vols., 1818); Journal of Travels into the Arkansas Territory during the year 1821 (1823); The Nests and Eggs of North American Birds (2 vols., 1824-1825); Manual of the Ornithology of the United States and of Canada (1832 and 1834); and numerous papers in American scientific periodicals.

**NUWARA ELIYA,** a town and sanatorium of Ceylon. Pop. (1901) 5026, with 1000 additional visitors during the season. It is situated 6240 ft. above sea-level, with the highest mountain in the island, Fedotrailagalla, towering over the plain for 2056 ft. mere. Nuwara Eliya is reached from Colombo by railway, eight hours to Namuoya, and thence, by a light 2½ ft.-gauge line, running up to the heart of the sanatorium. The average shade temperature for the year is 58° F.; the rainfall, 95 in. Considerable sums have been spent by the government in improving the place.

**Nux Vomica,** a poisonous drug, consisting of the seed of *Strychnos Nux-Vomica,* a tree belonging to the natural order Loganiaeae, indigenous to most parts of India, and found also in Burma, Siam, Cochin China and northern Australia. The tree is of moderate size, with a short, thick, often crooked, stem, and ovate entire leaves, marked with three to five veins radiating from the base of the leaf. The flowers are small, greenish-white and tubular, and are arranged in terminal corymbs. The fruit is of the size of a small orange, and has a thin hard shell, enclosing a brownish-black, thin-shelled, oval or oblong seed, from which, to 5 seeds are vertically embedded. The seed is disk-shaped, rather less than 1 in. in diameter, and about ½ in. in thickness, slightly depressed towards the centre, and in some varieties furnished with an acute keel-like ridge at the margin. The external surface of the seed is of a greyish-green colour and satiny appearance, due to a coating of pressed silky hairs. The interior of the seed consists chiefly of horny albumen, which is easily divided along its outer edge into halves by a fissure, in which lies the embryo. The latter is about ¾ in. long, and has a pair of heart-shaped membranous cotyledons.

The chief constituents of the seeds are the alkaloids strychnine (q.v.) and brucine, the former averaging about 0.4%, and the latter about half this amount. The seeds also contain an acid, strychnic or isaguric acid; a glucoside, loganin; sugar and fat.

The dose of the seeds is 1 to 4 grains. The British Pharmacopoeia contains three preparations of nux vomica. The liquid extract is standardized to contain 15% of strychnine; the extract is standardized to contain 5%; and the tincture, which is the most widely used, is standardized to contain 0.25%.

The American Pharmacopoeia recoends nux vomica as practically that of strychnine. The tincture is chiefly used in cases of atonic dyspepsia, and is superior to all other bitter tonics, in that, it is antiseptic and has a powerful action upon the most parts of the gastric wall. The extract is of great value in the treatment of simple constipation.

**NYACK,** a village of Rockland county, New York, U.S.A., in the town of Orangeart, on the western bank of the Hudson river, about 25 m. north of New York City. Pop. (1890) 4111; (1900) 4275, of whom 583 were foreign-born; (1905) 4441; (1910) 4619. Nyack is served by the Northern Railroad of New Jersey (a branch of the Erie), and is connected by ferry with Tarrytown, nearly opposite, on the eastern bank of the Hudson. The New York, New Haven & Hartford Railroad (old and new line) passes through West Nyack, a small village about 2 m. west. For about 2 m. above and 3 m. below Nyack the river expands into Tappan Zee or Bay, which is about 3 m. wide immediately opposite the village. The first grant of land within the present limits of Nyack was made by Governor Philip Carteret, of New Jersey, to one Claus Jansen, in 1671, but the permanent settlement apparently dates from about 1700. The adjacent villages of Upper Nyack, pop. (1905) 648, (1910) 591, and South Nyack, pop. (1910) 2068, form with Nyack practically one community. Nyack was named from a tribe of Algonquin Indians.

**NYANZA** (from the ancient Banntu root word anza, a river or lake), the Bantu name for any sheet or stream of water of considerable size; especially applied to the great lakes of East Central Africa. The word is variously spelt, and the form "Nyasa" has become the proper name of a particular lake. Nyanza is the spelling used in designating the great lakes which are the main reservoirs of the river Nile.

**NYASA,** the third in the list of the great lakes of Central Africa, occupies the southern end of the great rift-valley system which traverses the eastern half of the equatorial region from north to south. Extending from 9° 29’ to 14° 25’ S., or through nearly 5° of latitude, the lake measures along its major axis, which is slightly inclined to the west of north, exactly 350 m., while the greatest breadth, which occurs near the middle of its length, between 11° 30’ and 12° 20’°S., is 45 m. In the northern and southern thirds of the length the breadth varies generally from 20 to 30 m., and the total area may be estimated at 17,000 sq. m.
The lake lies at an altitude of about 1650 ft. above the sea. The sides of the valley in which Nyasa lies, which are somewhat irregular in outline, rise to about 300 ft. above the level of the lake. The banks of the lake are dotted with islands, which are usually of great size and sometimes separated by passes of great depth. The lake is divided into two parts, the northern and the southern. The southern part is known as Lake Malawi, and the northern part as Lake Nyasa. The latter is the larger of the two, and is the most extensive lake in southern Africa. It is about 250 miles long, and its maximum breadth is about 50 miles. The lake is surrounded by a continuous chain of mountains, which rise from its shores to a height of 7000 ft. The climate of the lake is mild and pleasant, and the vegetation is rich and luxuriant. The lake is inhabited by a large variety of fish, and is a valuable resource both for fishing and for navigation. The lake is connected with the sea by the Shire River, which flows into it from the west, and by a number of smaller streams, which drain the surrounding country. The lake is also connected with Lake Malawi by a number of canals, which are used for the transportation of goods and passengers. The lake is of great importance to the people who live around it, and is a centre of trade and industry. The lake is one of the most beautiful and picturesque in Africa, and is a place of great interest to visitors.
where he died on the 22nd of February 1896. His principal books are Bill Nye and Boomerang (1881); Forty Liars and Other Lies (1883); Nye and Riley's Railway Guide (1886), with James Whitcomb Riley; and two comic histories, Bill Nye's History of the United States (1894) and Bill Nye's History of England from the Druids to the Reign of Henry VIII. (1896).

NYEZHN or NEZHN, a town of Russia, in the government of Chernigov, 62 m. by rail S.E. of the town of Chernigov and 79 m. N.E. of Kiev, on the railway between Kursk and Kiev. The old town is built on the left bank of the (canalized) river Oster, and its suburbs, Novoye-Myesto and Mage-ki, on the right. It has an old cathedral, a technical school and a former high school (lyceum) of which N. V. Gogol and the novelist I. S. Turgenev were students; now transformed into a philologial institute. The inhabitants (33,000), are mostly Little-Russians and Jews; there are also some Greeks, descendants of those who immigrated in the 17th century at the invitation of the Cossack chieftain Bogdan Chmielnicki.

Unyezh, which is supposed to have been the former name of Nyezhn, is mentioned as early as 1147. At that time it belonged to the principality of Chernigov; afterwards it fell under the rule of Poland. It was ceded to Russia about 1500, but again became a Polish possession after the treaty of Deulina (1619) between Poland and Russia. In 1640 after the revolt of Little Russia and its liberation from the Polish rule, Nyiezhan was the chief town of one of the most important Cossack regiments. It was annexed to Russia in 1664.

NYIREGYHAZA, the capital of the county of Szabolcs, in Hungary, 169 m. E.N.E. of Budapest by rail. Pop. (1900) 31,875. It is a busy railway junction, and its inhabitants are engaged in agriculture, wine-growing and the manufacture of soda, matches and saltpetre. About 20 m. to the N.W. lies the famous wine-producing district of Tokaj (Tokay). Nytjogbing (a. New-Market, Latinized as Nicepia) begins to appear as a town early in the 13th century. Its castle was the seat of the kings of Sodermanland, and after those of Stockholm and Kalmar was the strongest in Sweden. The death of Waldermar in 1293, the starving to death of Dukes Waldemar and Eric in 1318, the marriage and the deaths both of Charles IX. and his consort Christina of Holstein, the birth of their daughter Princess Catherine and in 1622 the birth of her son Charles X. are the main incidents of which it was the scene. Burned down in 1665 and again damaged by fire in 1719, it still remained the seat of the regional authorities till 1760. The town was burned by Albert of Mecklenburg's party in 1789, by an accidental conflagration in 1665, and by the Russians in 1719.

NYLYSTROOM, a town of the Transvaal, South Africa, capital of the Waterberg district, and 81 m. N. of Pretoria by rail; altitude 4290 ft. Pop. (1904) 590. It was founded about 1860 and owes its name to the belief of the early Boer trekkers that the river which they had discovered was the head stream of the Nile. The Waterberg gold-fields are 20 m. N.N.E. of the town.

NYMPHAEAU (Gr. νυμφαεα, νυμφαεων), in Greek and Roman antiquities, a monument consecrated to the nymphs (q.v.), especially those of springs. These monuments were originally natural grottoes, which tradition assigned as habitations to the local nymphs. They were sometimes so arranged as to furnish a supply of water. Subsequently, artificial took the place of natural grottoes. The nymphæa of the Roman period were borrowed from the constructions of the Hellenistic east. The majority of them were rotundas, and were adorned with statues and paintings. They served the threefold purpose of sanctuaries, reservoirs and assembly-rooms. A special feature was their use for the celebration of marriages. Such nymphæa existed at Corinth, Athens, and other cities. A list of some twenty have been found at Rome and of many in Africa. The so-called exedra of Herodes Atticus (which answers in all respects to a nymphæum in the Roman style), the nymphæum in the palace of Domitian and those in the villa of Hadrian at Tibur (five in number) may be specially mentioned. The term nymphæum was also applied to the fountains of water in the arium of the Christian basilica, which according to Eusebius (x. 4) were symbols of purification.

NYMPHENBURG, formerly a village, but since 1899 an incorporated suburb of Munich, in the kingdom of Bavaria. It has a palace, built about the middle of the 17th century, on the model of that at Versailles, and long a favourite residence of the Bavarian elector, Maximilian Joseph. The famous china manufactury of Nympenburg, founded in 1754 at Neudeck by a potter named Niedermeyer, was shortly afterwards removed hither and, after being long under royal patronage, is now a private undertaking. The elector Charles Albert of Bavaria was reputed to have made a treaty with Louis XV. of France in May 1744 at the beginning of the War of the Austrian Succession for the division of Austria, and this was called the treaty of Nympenburg. It has, however, been conclusively proved a forgery. But a treaty was concluded here on the 28th of May 1741, between Bavaria and Spain, and another between Bavaria and the Rhenish Palatinate in 1766.

NYMPHS, in Greek mythology, the generic name of a large number of female divinities of inferior rank, personifications of the creative and fostering activities of nature. The word is possibly connected with the root of νυμφαω, νυμφαος ("cloud"), and originally meant "veiled," referring to the custom of a bride being led veiled from her home to that of the husband; hence, a married woman and, in general, the one of marriageable age. Others refer the word (and also Lat. nubere and the Ger. Knospe) to a root expressing the idea of "swelling" (according to Hesychius, one of the meanings of νυμφων is "rose-bud"). The home of the nymphs is on mountains and in groves, by springs and rivers, in valleys and cool grottoes. They are frequently associated with the superior divinities, the huntress Artemis, the prophetic Apollo, the reveller and god of trees Dionysus, and with rustic gods such as Pan and Hermes (as the god of shepherds).

The nymphs were distinguished according to the different spiritual communities with which they were connected. Sea nymphs were Oceanids or Nereids, daughters of Oceanus or Nereus. Neïades (from Gr. ναεων, ναεος, "stream") presided over springs, rivers and lakes. Oreïdes (οραος, mountain) were nymphs of mountains and grooves, one of the most famous of whom was Echo. Nymphææ (nymphaæ, dell) and Alisedæ (Aleos, grove) were nymphs of glens and groves. Dryades (dryo) or Hamadryades were nymphs of forests and trees.

The Greek nymphs, after the introduction of their cult into Latinus, gradually absorbed into their ranks the indigenous Italian divinities of springs and streams (Juturna, Egeria, Carmentis, Fons), while the Lymphe (originally Lumpae), Italian water-goddesses, owing to the accidental similarity of name, were identified with the Greek Nymphe. Among the Romans their sphere of influence was restricted, and they appear almost exclusively as divinities of the watery element.

The sixteenth letter of the Phoenician and early Greek alphabets, the fifteenth in English and the fourteenth in Latin. Between Ν and Ο the Phoenician and the Ionic Greek alphabet have a sibilant—OE [z]. The Western Greek alphabet had a different symbol, Ω, for the sound of z and placed it at the end, as did its descendant the Latin alphabet. The original form of Ω was a more or less roughly formed circle. The Aramaic, and Hebrew Ω, which seem so different, arise from a circle left open at the top, Ω, a form which can be traced in Aramaic from the 5th or 6th century B.C. In the Greek alphabets the circle appears sometimes with a dot in the centre, but in many cases it is doubtful whether this mark is, intentional, or is only the result of fixing a sharp point there while describing the circle. Sometimes Ω is a lozenge-shaped □ and rarely (in Arcadia and Elis) rectangular □. In many varieties of the Greek alphabet this symbol was used, as it always was in Latin, for the long as well as the short o-sound and also for the long vowel (in the Ionic alphabet written ω) which arose from contraction of two vowels or the loss of a consonant (ήδοσία = ηδόσια, αύς = αύκς). As early as the 8th century B.C. Ionic Greek had invented a separate symbol for the long o-sound, viz. Ω. This when borrowed by other dialects showed at first some variety of usage, though practically none in form. As this was placed at the end of the ordinary (i.e. the numeral) Greek alphabet, "alpha and omega" has become a proverbial phrase for first and last. The Greeks themselves, however, did not call Ω omega (great o) nor did they call Ω omicron (little o), though these names are given even in modern Greek grammars. The former was called simply ο and the latter u (ου, pronounced as oo in moon). The Hebrew and probably the Phoenician name for Ω was Ain (Ayn), and in the Semitic alphabet, which does not indicate vowels, the symbol stood for a "voiced glottal stop" and also for a "voiced velar spirant" (Zimmern). The most important feature of this vowel is the rounding of the lips in its production, which, according to its degree, modifies the nature of the vowel considerably, as can be observed in the pronunciation of the increasingly rounded series saw, no, who.

In Attic Greek Ω and Ω were not really a pair, for o + o became not o but ou, o being a close o an open sound. In Latin the converse was more nearly true. Though short o changed in the Latin of the last age of the Roman republic to u in unaccented syllables always (except after u whether vowel or consonant), and sometimes also in accented syllables, this was not equally true of vulgar Latin, as is shown by the Romance languages. In English also the short and the long o are of different qualities, the short in words like not, get being in Sweet’s phonetic terminology a low-back-wide-round, the long in words like no a mid-back-wide-round. The long vowel becomes more rounded as it is being pronounced, so that it ends in a u-sound, though this is not so noticeable in weak syllables like the final syllable of follow. The so-called modified o is a rounded e-sound found in several varieties. The sound heard in words like the German Götter is, according to Sweet, a low-front-wide-round, while Jespersen regards it as not low but middle. A mid-front-narrow-round vowel is found short in French words like peu, long in feteau, and in endings like that of konteuse. The Norse sound written o is of the same nature.

(P. G1.)

OAK (O. Eng., ac), a word found, variously modified, in all Germanic languages, and applied to plants of the genus Quercus, natural order Fagaceae (Cupuliferae of de Candolle), including some of the most important timber trees of the northern temperate zone. All the species are arboreous or shrubby, varying in size from the most stately of forest trees to the dwarfish bush. Monoecious, and bearing their male flowers in catkins, they are readily distinguished from the rest of the catkin-bearing trees by their peculiar fruit, an acorn or nut, enclosed at the base in a woody cup, formed by the consolidation of numerous involucral bracts developed beneath the fertile flower, simultaneously with a cup-like expansion of the thalamus, to which the bracteal scales are more or less adherent. The ovary, three-celled at first, but becoming one-celled and one-seeded by abortion, is surmounted by an inconspicuous perianth with six small teeth. The male flowers are in small clusters on the usually slender and pendent stalk, forming an interrupted catkin; the stamens vary in number, usually six to twelve. The alternate leaves are more or less deeply sinuated or cut in many species, but in some of the deciduous and many of the evergreen kinds are nearly or quite entire on the margin.

The oaks are widely distributed over the temperate parts of Europe, Asia, North Africa and North America. In the western hemisphere they range along the Mexican highlands and the Andes far into the tropics, while in the Old World the genus, well represented in the Himalayas and the hills of China, exists likewise in the peninsula of Malacca, in the Indian Archipelago and Malaya to the Philippine Islands and Borneo. On the mountains of Europe and North America they grow only at moderate elevations, and none approach the arctic circle. The multitude of species and the many intermediate forms render their exact limitation difficult, but those presenting sufficiently marked characters to justify specific rank probably approach 300 in number.

The well-known Q. Robur, one of the most valued of the genus, and the most celebrated in history and myth, may be taken as a type of the oaks with sinuated leaves. Though known in England, where it is the only indigenous species, as the British oak, it is a native of most of the milder parts of Europe, extending from the shores of the Atlantic to the Ural; its most northern limit is attained in Norway, where it is found wild up to lat. 63°, and near the Lindeasnes forms woods of some extent, the trees occasionally acquiring a considerable size.

In western Russia it flourishes in lat. 60°, but on the slope of the Ural the 56th parallel is about its utmost range. Its northern limit nearly coincides with that of successful wheat cultivation. Southwards it extends to Sardinia, Sicily and the Morea. In Asia it is found on the Caucasus, but does not pass the Ural ridge into Siberia. In Britain and in most of its Continental habitats two varieties exist, regarded by many as distinct species: one, Q. pedunculata, has the acorns, generally two or more together, on long stalks, and the leaves nearly sessile; while in the other, Q. sessiliflora, the fruit is without or with a very short peduncle, and the leaves are furnished with well-developed petioles. But,
though the extreme forms of these varieties are very dissimilar, innumerable modifications are found between them; hence it is more convenient to regard them as at most sub-species of *Quercus robur*. The British oak is one of the largest trees of the genus, though old specimens are often more remarkable for the great size of the trunk and main boughs than for very lofty growth. The spreading branches have a tendency to assume a tortuous form, owing to the central shoots becoming abortive, and the growth thus being continued laterally, causing a zigzag development, more exaggerated in old trees and those standing in exposed situations; to this peculiarity the picturesquc aspect of ancient oaks is largely due. When standing in dense woods the trees are rather straight and formal in early growth, especially the sessile-fruited kinds, and the gnarled character traditionally assigned to the oak applies chiefly to its advanced age. The broad deeply-sinuated leaves with blunt rounded lobes are of a peculiar yellowish colour when the buds unfold in May, but assume a more decided green towards midsummer, and eventually become rather dark in tint; they do not change to their brown autumnal hue until late in October, and on brushwood and saplings the withered foliage is often retained until the spring. The catkins appear soon after the young leaves, usually in England towards the end of May; the acorns, oblong in form, are in shallow cups with short, scarcely projecting scales; the fruit is shed the first autumn, often before the foliage changes.

Vast oak forests still covered the greater part of England and central Europe in the earlier historic period; and, though they have been gradually cleared in the progress of cultivation, oak is yet the prevailing tree in most of the woods of France, Germany and southern Russia, while in England the coppices and the few fragments of natural forest yet left are mainly composed of this species. The pedunculated variety is most abundant in the southern and midland counties; the sessile-fruited kinds in the northern parts and in Wales, especially in upland districts; the straighter growth and abundant acorns of this sub-species have led to its extensive introduction into plantations. The name of "durmast" oak, originally given to a dark-fruited variety of *Q. sessiliflora* in the New Forest, has been adopted by foresters as a general term for this kind of oak; it seems to be the most prevalent form in Germany and in the south of Europe. Many of the ancient oaks that remain in England may date from Saxon times, and some perhaps from an earlier period; the growth of trees after the trunk has become hollow is extremely slow, and the age of such venerable giants only matter of vague surmise. The celebrated Newland oak in Gloucestershire, known for centuries as "the great oak," was by the latest measurement 47½ ft. in girth at 5 ft. from the ground. The Cowthorpe oak, standing (a ruin) near Wetherby in Yorkshire, at the same height measures 38½ ft., and seems to have been of no smaller dimensions when described by Evelyn two centuries ago; like most of the giant oaks of Britain, it is of the pedunculate variety.

The wood of the British oak, when grown in perfection, is the most valuable produced in temperate climates. The heartwood varies in colour from dark brown to pale yellowish-brown; hard, close-grained, and little liable to split accidentally, it is, for a hard wood, easy to work. Under water it excels most woods in durability, and none stand better alternate exposure to drought and moisture, while under cover it is nearly indestructible as long as dry-rot is prevented by free admission of air. Its weight varies from 48 to about 55 lb. the cubic foot, but in very hard slowly-grown trunks sometimes approaches 60 lb. The sap-wood is lighter and much more perishable, but is of value for many purposes of rural economy. The relative qualities of the two varieties have been the frequent subject of debate, the balance of practical testimony seeming to establish the superiority of *Q. pedunculata* as far as durability in water is concerned; but when grown under favourable circumstances the sessile oak is certainly equally lasting if kept dry. The wood of the durmast oak is commonly heavier and of a darker colour, hence the other is sometimes called by woodmen the white oak, and in France is known as the "chêne blanc." The oak of Britain is still in demand for the construction of merchant shipping, though teak has become in some measure its substitute, and foreign oak of various quality and origin largely takes its place. Its great abundance of curved trunks and boughs rendered the oak peculiarly valuable to the shipwright when the process of bending timber artificially was less understood; the curved pieces are still useful for knees. The younger oaks are employed by the carpenter, wheelwright, wagon-builder and for innumerable purposes by the country artisan. The most durable of fences are those formed of small oaks, split lengthwise by the wedge into thin boards; the finely-grained heart-wood is sought by the cabinetmaker for the manufacture of furniture, and high prices are often given for the gnarled and knotted portions of slowly-grown trees, to be sawn into veneers. Oak was formerly largely used by wood-carvers, and is still in some demand for those artists, being harder and more durable than lime and other woods that yield more readily to the sculptor's tool. Oak was thus applied at a very early date; the shrine of Edward the Confessor, still existing in the abbey at Westminster, sound after the lapse of 800 years, is of dark-coloured oak-wood. The wood, of unknown age, found submerged in peat-bogs, and of a black hue, is largely used in decorative art under the name of "bog-oak." The oak grows most luxuriantly on deep strong clays, calcareous marl or stiff loam, but will flourish in nearly any deep well-drained soil, excepting peat or loose sand; in marshy or moist places the tree may grow well for a time, but the timber is rarely sound; on hard rocky ground and exposed hill-sides the growth is extremely slow and the trees small, but the wood

---

**FIG. 3.** *Q. sessiliflora*; half natural size.
OAK 933

is generally very hard and durable. The oak will not bear exposure to the full force of the sea gale, though in ravines and on sheltered slopes oak woods sometimes extend nearly to the shore. The cultivation of this tree in Europe forms one of the most important branches of the forester's art. It is frequently raised at once by sowing the acorns on the ground where the trees are required, the fruit being gathered in the autumn as soon as shed, and perfectly ripe seeds selected; but the oak is less destructible by mice and other vermin is so great that transplanting from a nursery-bed is, in most cases, to be preferred.

The acorns should be sown in November on well-prepared ground, and covered to a depth of $\frac{1}{2}$ or $\frac{1}{4}$ in.; the seeds germinate in the spring, and the seedlings are usually transplanted when one or two years old. The sapling will, however, grow for two or three years before it is large enough to be transplanted. Some authorities recommend the tap-roots to be cut in the second year, with the view of increasing the bulk of fibre; but, if the trees are removed from the seed-bed sufficiently early, the root is best left to its natural development. The oak requires shelter in the early stages of growth; in England the Scotch pine is thought best for this purpose, though Norway spruce answers as well on suitable ground, and larch and other trees are sometimes substituted. The conifers are allowed to grow to a height of from 3 to 5 ft. before the young oaks are planted, and are gradually thinned out as the latter increase in size. The dishes of the developing spring internodes have a thinning effect on the young wood; usually they are placed from 8 to 12 in. apart, and the superabundant trees cut out as they begin to interfere with the growth of the others. A shorter method, but which requires greater care, is to ensure the formation of a tall straight trunk, and this operation should be performed before the superfluous shoots get too large, or the timber will be injured; but, as with all trees, unnecessary pruning is to be avoided, as every cut removes a small amount of vigour of growth. Where artificial copsewood is the object, hazel, hornbeam and other bushes may be planted between the oaks; but, when large timber is required, the trees are best without undergrowth.

The growth of the oak is slow, though it varies greatly in different trees; Loudon states that an oak, raised from the acorns of Quercus alba, grown by the Goldsmith Sett, produced twenty years 12 ft. in circumference; but the increase of the trunk is usually very much slower, and when grown for large timber oak can rarely be profitably felled till the first century of its growth is completed. The tree will continue to form wood for 150 or 200 years before showing any symptoms of decay. As firewood oak holds a high position, though in Germany it is considered inferior to beech for that purpose. It makes excellent charcoal, especially for metallurgical processes; the Sussex iron, formerly regarded as the best produced in Britain, was for a time obtained from the great woods of the adjacent Weald, until they became so thinned that the precious fuel was no longer obtainable.

An important product of oak woods is the bark that from a remote period has been the chief tanning material of Europe. The most valuable kind is that obtained from young trees of twenty to thirty years' growth, but the trunks and boughs of timber oaks also furnish a large supply; it is separated from the tree most easily when the sap is rising in the spring. It is then carefully dried by the free action of the air, and when dry built into long narrow stacks until needed for use. The value of oak bark depends upon the amount of tannin contained in it, which varies much, depending not only on the growth of the tree but on the care bestowed on the preparation of the bark itself, as it soon ferments and spoils by exposure to wet, which destroys much of the power derived from it. Secor's sweet or fruit-tined oak is richer in tannic acid than that yielded by Q. pedunculata, and the bark of trees growing in the open is more valuable than that of the dense forest of Norway. The bark of young oak branches has been employed in medicine from the days of Dioscorides, but is not used in modern practice. The astringent principle is a peculiar kind of tannic acid, called by chemists quercin or tannin. This acid acts in combination with gelatin and other forms, gives oak bark its high value to the tanner. According to Neubauer, the bark of young oaks contains from 7 to 10% of this principle; in old trees the proportion is much less.

In the event of the oak possessing a considerable economic importance as food for swine. In the Saxon period the " mast " seems to have been regarded as the most valuable productive of an oak wood; nor was it always watered to the proper extent. The limit of death oaks were boiled and eaten by the poor as a substitute for bread both in England and France, as the sweeter product of Q. Esculus is still employed in southern Europe. Large herds of swine in all the great oak woods of Germany depend for their autumn maintenance on acorns; and in the remaining royal forests of England the inhabitants of the neighbouring villages yet claim their ancient right of " pannage," turning their hogs into the woods in October and November. Some trees of the sessile-fruited oak bear fruit on their trunks, and in British and other countries, and the ancient Italians for their edible fruit. A peculiar kind of sugar called quercite exists in all acorns. A bitter principle to which the name of echinocarpum has been applied to the spines of the Tavolacci, is detected in the acorn of the common oak; the nutritive portion seems chiefly a form of starch. A spirit has been distilled from acorns in process of germination, when the saccharine principle is most abundant.

The British oak grows well in the northern and middle states of America; and, from the superiority of the wood to that of Q. alba and its more abundant production of acorns, it will probably be much planted as the natural forests are destroyed. The young trees require protection from storms and late frosts even more than in England; the red pine of the north-eastern states, Pinus resinosa, answers well as a nurse, but the pitch pine and other species may be employed. In the southern parts of Australia and in New Zealand the tree seems to flourish as well as in its native home.

The oak in Europe is liable to injury from a great variety of insect enemies: the young wood is attacked by the larvae of the small stag-beetle and several other Coleoptera, and those of the wood-leopard moth, goat moth and other Lepidoptera feed upon it occasionally; the foliage is devoured by innumerable larvae; indeed, it has been stated that half the plant-eating insects of England prey more or less upon the oak, and in some seasons it is difficult to find a leaf perfectly free from their depredations. The young shoots are chosen by many species of Cynipidae and their allies as a receptacle for their eggs, giving rise to a variety of gall-like excrescences, from which few oak trees are quite free.

Of the European timber trees of the genus, the next in importance to the British oak is Q. Cerris, the Turkey oak of the nurserymen. This is a fine species, having when young stronger branches than Q. petraea, but not so well adapted to the generation of acorns, and the tree acquires a wide spreading head; the bark is dark brown, becoming grey and furrowed in large trees; the foliage varies much, but in the prevailing kinds the leaves are very deeply sinuate, with pointed, often irregular lobes, the footstalk short, and furnished at the base with long linear stipules that do not fall with the leaf, but remain attached to the bud till the following spring, giving a marked feature to the young shoots. The large sessile acorns are longer than those of Q. Robur, and are dark-brown when ripe; the hemispherical cups are covered with long, narrow, almost bivoltine scales, giving them a mossy aspect; the fruit ripens at the same time, and the acorn is released without the benefit of any scar on the acorn, and is almost evergreen, and in Britain is retained long after the autumnal withering.

This oak abounds all over the Turkish peninsula, and forms a large proportion of the forest in the east of France, in Switzerland, and the south shores of the Black Sea; it is likewise common in Italy and Sardinia, and occurs in the south of France and also in Hungary. It was introduced into England by Philip Miller about 1758, and is now common in parks and plantations, where it is used to flourish in nearly all soils. The Turkey oak in southern England grows twice as fast as Q. Robur; in the mild climate of Devonshire and Cornwall it has reached a height of 100 ft. and a diameter of 4 ft. in eighty years, which is about the limit of its profitable growth for timber. The wood is hard, heavy and of fine grain, quite equal to the best British oak for indoor use, but of very variable durability where exposed to wear. Oak beams were hewn and not sawn even when the Romans were building. The oak oak trees have been largely built of it, but it has not always proved satisfactory in English dockyards. The heart-wood is dark in colour, takes a fine finish, is known to be free from the imported mollacryllary rays is valuable to the furniture maker; it weighs from 10 to 15 per cent. over that of oak. The comparatively rapid growth of the tree is its great recommendation to the planter; it is best raised from acorns sown on the spot, as they are very bitter and little liable to the attacks of vermin; the tree sends down a long tap-root, which should be curtailed by cutting or early transplanting, if the young trees are to be removed. It seems peculiarly adapted for the mild moist climate of Ireland.

In North America, where the species of oak are very numerous, the most important member of the group is Q. alba, the white oak, abounding all over the eastern districts to the continent from Lake Winnipeg and the St Lawrence counties of the Province of Quebec, and as far west as the Mississippi. In aspect it more nearly resembles Q. Robur than any other species, forming a tree with spreading base, and, when growing in glades or other open places, huge spreading boughs, less twisted and gnarled than those of
the English oak, and covered with a whitish bark that gives a marked character to the tree. The leaves are large, often irregular in form, usually with a few deep lobes dilated at the end; they are of a bright light green on the upper surface, but whitish beneath; they turn to a violet tint in autumn. The egg-shaped acorns are placed singly or two together on short stalks; they are in most years sparingly produced, but are occasionally borne in some abundance. On rich loams and the alluvial soils of river-valleys, when well drained, the tree attains a large size, often rivalling the giant oaks of Europe; trunks of 5 or 4 ft. in diameter are frequently found, and sometimes these dimensions are greatly exceeded. The wood is variable in quality and, though hard in texture, is less durable than the best oak of British growth; the heart-wood is of a light reddish brown varying to an olive tint; a Canadian specimen weighs 324 lb the cubic foot.

*Q. obtusifolia,* the post oak of the backwoodsman, a smaller tree with rough leaves and notched upper lobes, produces an abundance of acorns and good timber, said to be more durable than that of the white oak.

The pin oak, sometimes called the “hur-oak,” *Q. macrocarpa,* is remarkable for its large acorns, the cups bordered on the edge by a fringe of long narrow scales; the leaves are very large, sometimes from 10 in. to 1 ft. in length, with very deep lobes at the lower part, but dilated widely at the apex, and there notched. The tree is described by Prof. C. S. Sargent (*Silvis of North America*) as one of the most valuable timber trees of North America, its wood being superior in strength even to that of *Q. alba,* with which it is commercially confounded.

The over-cup oak, *Q. lyrata,* is a large tree, chiefly found on swampy land in the southern states; the lyrate leaves are dilated at the end; the globose acorns are nearly covered by the tuberculated cups.

In the woods of Oregon, from the Columbia river southwards, an oak is found bearing some resemblance to the British oak in foliage and in its thick trunk and widely-spreading boughs, but the bark is white as in *Q. alba*; it is *Q. Garryana,* the western oak of T. Nuttall. This tree acquires large dimensions, the trunk being often from 4 to 6 ft. in diameter; the wood is strong, hard and close-grained; the acorns are produced in great quantity, and are used by the Indians as food.

The red oak, *Q. rubra,* has thin large leaves on long petioles, the lobes very long and acute, the points almost bristly; they are pink when they first expand in spring, but become of a bright glossy green when full-grown; in autumn they change to the deep purplered which gives the tree its name. Common throughout the northern and middle states and Canada, the red oak attains a large size only on good soils; the wood is of little value, being coarse and porous, but it is largely used for cask-staves; the bark is a valuable tanning material.

A species nearly allied is the scarlet oak, *Q. coccinea,* often confounded with the red oak, but with larger leaves, with long lobes ending in several acute points; they change to a brilliant scarlet with the first October frosts, giving one of the most striking of the various glowing tints that render the American forests so beautiful in autumn. The trunk, though often of considerable size, yields but an indifferent wood, employed for similar purposes to that of *Q. rubra,* the bark is one of the best tanning materials of the country.

Both these oaks grow well in British plantations, where their bright autumn foliage, though seldom so decided in tint as in their native woods, gives them a certain picturesque value.

Nearly akin to these are several other forms of little but botanical interest; not far removed is the black or dyer’s oak, *Q. tinctoria,* a large and handsome species, with a trunk sometimes 4 ft. in diameter, not uncommon in most forests east of the Mississippi, especially in somewhat upland districts. The leaves are frequently irregular in outline, the lobes rather short and blunt, widening towards the end, but with seraceous points; the acorns are nearly globular. The wood is coarsely grained, as in all the red-oak group, but harder and more durable than that of *Q. rubra,* and is often employed for building and for flour-barrels and cask-staves. The bark, very dark externally, is an excellent tanning substance; the inner layers form the *quebracho* of commerce, used by dyers for communicating to fabrics various tints of yellow, and, with iron salts, yielding a series of brown and drab hues; the colouring property depends on a crystalline principle called *quebrachin,* of which it should contain about 8%. The cut-leaved oaks are represented in eastern Asia by several species, of which *Q. mongolica* is widely spread over Dahuria, north China and the adjacent countries; one of the Chinese silkworms is said to feed on the leaves.

The chestnut oaks of America represent a section distinguished by the merely serrated leaves, with parallel veins running to the end of the serrations. *Q. Prinus,* a beautiful tree of large growth, and its subspecies *castanea* and *meniana,* yield good timber. *Q. Chinquapin* or *prinoides,* a dwarf species, often only 1 ft. in height, forms dense miniature thickets on the barren uplands of Kansas and Missouri, and affords abundant sweet acorns; the tree is called by the hunters of the plains the “shin-oak.” *Q. castaneiformis,* represented in *fig. 6.*
is a native of the woods of the Transcaucasian region of western Asia.

Evergreen oaks with entire leaves are represented in North America by Q. virginiana, also known as Q. virginiana, the live oak of the southern states; more or less abundant on the Atlantic seacoast of the states of Maine and Florida, its true home is the country around the Mexican Gulf, where it rarely grows more than 50 or 60 m. inland. The oval leaves are dark-green above, and whitish with stellate hairs beneath, the margin entire and slightly recurved. The wood is one of the most valuable timber trees of the genus, the wood being extremely durable, both exposed to air and under water; heavy and close-grained, it is perhaps the best of the American timbers for furniture and is invaluable for water-wheels and mill-work. The tree in England is scarcely hardy, though it will grow freely in some sheltered places.

The evergreen oak of southern Europe is Q. ilex, usually a smaller tree, frequently of rather shrub-like appearance, with abundant glossy dark-green leaves, generally ovate in shape and more or less prickly at the margin, but sometimes with the edges entire; the under surface is hoary; the acorns are oblong on short stalks. The ilex, also known as the "holm oak" from its resemblance to the holm, abounds in all the Mediterranean countries, showing a partiality for the sea air. The stem sometimes grows 80 ft. in height, and is occasionally of large diameter; but it does not often reach a great size. In its native lands it attains a vast age; Pliny attributes to several trees then growing in Rome a greater antiquity than the city itself. The wood of the ilex is hard, and is used in Spain and Italy for furniture, and in the former country for fire-wood and charcoal. In Britain the ilex is common in sub-alpine localities, and is a valuable wood for the making of the ordinary wands; and, is useful to the ornamental planter from its capacity for resisting the sea gales; but it generally remains of small size. Q. Ballota, a closely allied species abundant in Morocco, bears large edible acorns, which form an article of trade from the north of Africa, and is used in medicine. The ilex, or holm oak, resembles in shape that of the olive, from which it is distinguished in being deciduous.

Q. ilex, var. Gramuntia, also furnishes a fruit which, after acquiring sweetness by keeping, is eaten by the Spaniards.

In America several oaks exist with narrow-lanceolate leaves, from which characteristic they are known as "willow oaks." Q. Phellodendron, a rather large tree found in Georgia, is a native of the west Mediterranean area. In Spain the wood is of some value, being hard and close-grained, and the inner bark is used for tanning. Q. Virginiana, a large deciduous oak, which, like the ilex, belongs to the Mediterranean region, and is a valuable timber tree, and furnishes a valuable wood for the American firmament. The acorns are often considerable in size, and are used as a substitute for honey or sugar in various confections (see MANNA).  

OAKHAM—OAMARU

OAKHAM, a market town, and the county-town of Rutland, England, 94 m. N. by W. of London by the Midland railway. Pop. (1901) 3204. The church of All Saints ranges in style from Early English to Perpendicular, belonging in appearance mainly to the latter style. Of Oakham Castle, founded in the reign of Henry II., the principal remnant is the notable Norman hall, used as the county hall. The manor came in the time of Henry II. into the hands of Walchelne de Ferrers, and subsequently passed, through many owners, to the duchy of Buckingham, where it remained, constructed of black bricks. A peculiarity of the custom attaching to the manor is to claim a horseshoe from every peer who, for the first time, passes through the town. Flore's House in the main street is an interesting building dating from the 13th century. Oakham school was endowed as a grammar school by Robert Johnson, archdeacon of Leicester, in 1584; it now has classical and modern sides. Not far from the town are the kennels of the Cottesmore hunt.

OAKLAND, a city and the county-seat of Alameda county, California, U.S.A., situated opposite and about 6 m. distant from San Francisco, on the eastern shore of San Francisco Bay. Pop. (1890) 48,682; (1900) 66,960, of whom 17,256 were foreign-born, 3197 being Irish, 27,42 German, 2026 English, 1544 English-Canadians, 1020 Portuguese and 904 Swedish; (1010 census) 150,174. It is the terminus of the Ogden branch of the Southern (formerly Central) Pacific, of the Coast Line of the Atchison, Topeka & Santa F, and of the Western Pacific railways. Passengers and freight from the East to San Francisco are transferred by ferry from Oakland. A branch of the bay (called Oakland Harbour) divides Oakland from Alameda, and the railway piers of Oakland run directly out into the bay for more than two miles. The city is in the valley of the Oakland estuary, a tributary of the San Francisco estuary. Lake Merritt, in the heart of the city, a favourite pleasure resort, is the centre of the city's park system. Oakland is the seat of California College (co-educational, Baptist, opened in 1870), and of St Mary's College (Roman Catholic, 1863) for men; and in the suburban village of Mills College, west of the city, is Mills College (non-sectarian, 1871) for women, an institution of high rank. Electric power for the city is derived from Colgate, on the Yuba river, 215 m. distant. Oakland has important manufacturing interests, the total value of total factory products in 1905 being $6,072,530, 66% more than in 1890.

The site of the present city (as well as that of Alameda and Berkeley) lay originally within the limits of a great private Mexican grant which was confirmed by the United States authorities. A settlement was begun—at first by "squatters" in defiance of the private claim—in 1850; in May 1852 this was incorporated as a town (the name being derived from a wood of oaks in the midst of which the first settlement was made), and in March 1854 it was chartered as a city. In 1865 it was selected as the western terminus of the Central Pacific, a choice which practically decided Oakland's pre-eminence. The city is 15 m. W. of San Francisco. The water front was recklessly given away in 1852, and the resulting disputes and litigation lasted for more than thirty years; in 1908 the water front reverted to the city. The population increased more than sixfold from 1860 to 1870, and doubled in 1900-1910. It became the county-seat in 1874. In December 1910 a commission form of government was adopted.

OAKUM (O. Eng. åcumbe or åcumbe, tow, literally "off-cumbings"), a preparation of tarred fibre used in shipbuilding, for caulking or packing joints of timbers in wood vessels and the deck planking of iron and steel ships. Oakum is made by preference from old tarry ropes and cordage of vessels, and its picking and preparation has been a common penal occupation in prisons and workhouses. White oakum is made from uncleaned materials.

OAMARU, a municipal borough on the east coast of South Island, New Zealand, in the county of Waitaki and provincial district of Otago; on the main railway between Christchurch (152 m. N.E.) and Dunedin (78 m. S.S.W.). Pop. (1906) 5971. It is the outlet of the largest agricultural district in New Zealand. A m. town and mole, constructed of blocks of concrete, enclose a commodious basin, forming one of the safest harbours in the colony. The export of frozen meat is important. The town is built of white Oamaru limestone. Brown coal is obtained at the entrance of Shag valley, 40 m. S. The district is famed for its stock, and the fine quality of its grain; also for the character of the English grasses laid down there, which flourish in a rich black loam on a limestone formation.

---

Fig. 8.-Q. Vallonea; half natural size.

The valonia of commerce, one of the richest tannering materials, is the acorn of Q. Argiopla, a fine species indigenous to Greece and the coasts of the Levant, and sometimes called the "Oak of Bashan." The very large acorns are remarkable for their thick cups with long refracted scales; the leaves are large, oblong, with deep serrations terminating in a bristle-point. The cups are the most valuable portion of the valonia, abounding in tannin acid; immature acorns are sometimes exported under the name of "camatina." The allied Q. Vallonea of Asia Minor likewise yields valonia.

Some acorns are of indirect importance from products formed by their insect enemies. Of these the Aleppno galle (see GALLS) is yielded by Q. ilex, and Q. cocciifera, a small bush growing in Spain and many countries around the Mediterranean, furnishes the kermes dye (KERMES). Q. petraea, or according to some Q. marinifera, attacked by a kind of Coccus, yields a hard, brown exudation, and is used for the manufacture of maroon, or as a substitute for honey or sugar in various confections (see MANNA).
OANNES-OAR

OANNES, in Babylonian mythology, the name given by Berossus to a mythical being who taught mankind wisdom. He is identical with the god Ea (q.v.), although there may not be any direct connexion between the two names. Berossus describes Oannes as having the body of a fish but underneath the figure of a man. He is described as dwelling in the Persian Gulf, and rising out of the waters in the daytime and furnishing mankind instruction in writing, the arts and the various sciences. The culture-myth on which the account of Berossus rests has not yet been found in Babylonian literature, but there are numerous indications in hymns and incantations that confirm the identification with Ea, and also prove the substantial correctness of the conceptions regarding Oannes-Ea as given by Berossus.

(M. J.A.)

OAR (A.S. ar; M. Eng. ore; Lat. rēmus; Gr. ἱππόβος : Sans. arītra; Fr. rame; Ital. Span., Port. romo), the instrument used for propelling a boat in rowing (q.v.). The word "oar" is probably derived from an old root ar, meaning to drive, to force away (cf. ar-ar-e, araram, plough). Such an appellation would easily be suggested by the visible difference in the action of the power employed by means of the oar against a thwart, or rowlock, from the operation of the primitive paddle, where the power was gained by the action of one hand against the other. In the development of rowing from paddling the task of shaping the instrument of propulsion must have followed gradually the necessities indicated by use. In rowing, as well as in paddling, the leverage is of the second order, in which the weight lies between the power and the fulcrum. The point at which the power pressed the arm of the lever against the weight would soon attract attention by the frequent breakage of the paddle so employed. Experience would demand a thicker loom, and would soon teach the desirability of increasing the leverage where possible, and upon this would arise naturally the practical questions of the length of the oar, of the breadth of the blade, and of the right proportion of the parts of the oar, inboard and outboard, to each other. Then would also occur the problem of how to keep this proportion, which in practice would be liable to disarrangement by the slipping outward of the oar during the recovery from each stroke. Hence would arise the use of the thong (πρωτός, πρωτόρρη), familiar to ancient Egyptians, Levantine, and, in northern and western waters, the invention of the "button," with which in various shapes the rowing world is now provided. Other devices, such as a hole bored in a piece of wood attached to the oar, or even a metal ring, will, in different localities, be found answering the same purpose.

In the early stages of the transition from paddling to rowing, the oar would naturally be used at an acute angle vertically to the boat's side. In paddling the upper hand is used to push from you, the lower hand to pull towards you. But in rowing both hands are used to pull towards you. As long as the oar was used at an acute angle vertically to the boat's side, the power of the upper hand on the oar would have to be reversed, as it would more easily grasp the oar with the wrist turned inward towards the body. In many of the earlier representations of rowing this position of the upper hand seems to be indicated. This distinction should not be lost sight of, as the position of the hands on the oar affects not only the character of the stroke, but also the requirements as to the length of the oar and the breadth of the blade. The form of the oars given in the representations of early Egyptian ships is suggestive of paddles used as oars. Paddle-shaped also are the oars of the Phoenician ships shown on the Assyrian sculptures at Koyunjik (Layard), the date of which is about 700 B.C. The same form is seen on some of the early vases, but in some that are attributed to two centuries later the form is modified, and the oar blade proper begins to take shape.

The types exhibited in the representations of the Roman galleys are generally heavy and clumsy enough in appearance. Still they are veritable oars, not paddles. The material of which the ancient oars were usually made was pine, which then, as now, was most suitable for the purpose, being tough and comparatively light and easily shaped as regards loom and blade.

The oars of the Attic trireme were, if we may judge by those of which only we have the measurement recorded, not much longer for the upper bank than those of a modern racing eight, while those of the middle and lower banks could not have been much longer than those used now in the whalers and dinghies of the Royal Navy. As the oarsmen on either side probably sat in the same vertical plane, the inboard portion of the oars amidships was longer than the inboard of those fore and aft, having to conform to the curvature of the vessel's sides (cf. Aristotle, Mechanica, v). No doubt in vessels of larger size the upper tiers of oars would be longer, and, if we are to believe Callixenus, as cited by Athenaeus, in the great ship of Ptolemy the oars of the upper tier were over 50 ft. in length with handles leaded so as to equalize the weight inboard and outboard.

It is difficult to trace any detail of difference between the oars of the Roman period and those of the Byzantine and medieval galleys. In the medieval galley by the invention of the "apostis," a framework on which the thows were fixed, sufficient room was given for the play of longer oars, and, as the necessity of combining speed with greater carrying power in the galley became pressing, the arrangement alla scaloccio came into vogue, employing four or five or even seven men to each of the long

* Allowed spoon-blade oars.

Notes.—(1) Since 1893 some curved or spoon-bladed oars have been made at Devonport.
(2) There is no record of buttons being used, but on fir oars, which were covered with canvas on the loom, it was sometimes customary to work a Turk's head at the end of the canvas for ornament. (3) As regards sweeps, they are said to be made of ash and were 30 ft. long. They were used last in training brigs, but there is no record of them for the last twenty years.

Sweeps by which the galleys and gallasses were propelled. For these large oars we hear of ash and beech being used as well as pine.

In the Mediterranean the galley propelled by oars long remained the principal type of war vessel. In the Atlantic, and in the northern seas, it was otherwise.

The employment of artillery on board ship gradually determined a change in the method of propulsion. The use of sails
became necessary, and remained dominant until the introduction of steam (see Ship). But as late as the time of the Spanish Armada, and even later, large sea-going vessels were provided with long sweeps which came into use when sailing was not available. In our own time, in the lighters on tidal rivers, may be seen long oars, plied by one or two or more men, which recall the type of oars once in general use in large galleys three centuries ago.

The oars used by the Northmen were, to judge by the remains discovered along with old Viking ships 1 at Gokstad and elsewhere, very similar to those in use at the present time in the fishing boats around our coasts. Those of the large craft were, to judge by the length of one found whole, somewhat over 18 ft. in length with a 6 in. blade and a diameter of 1 in. halfway down the oar. Some smaller oars, evidently used for boats, measured 11 ft. with a 4-in. blade. The oars were of pine, and the looms of some of them showed a groove cut for a clamp at the place where the oar rested on the sill of the rowlock. Comparing these oars with the measurements given below of oars now in use in the Royal Navy, it is apparent that there is no great difference in type between them.

Passing on to oars used on rivers and fresh water generally, we find the type differs considerably from that of the oars used in sea-going craft. The chief difference consists in the shape of the blade. The blade is covered with leather for some inches above and below the loom in its expansion to its proper breadth, is fashioned in a curve calculated to offer a rigid resistance to the water during the stroke.2 The loom below the button is not rounded but is more of an oval to the front with a flat back. From the oval front a spine runs down into the blade, in some cases to nearly half its length. During the last few years the so-called "girder" oars, with much thicker looms but double grooved along their length, have been used for racing purposes. This invention gives additional strength and stiffness, without increasing the weight of the oar, which varies a little but is usually about 8 lb.

The blades vary much in breadth, as indeed do the oars in total length, and in proportion of inboard to outboard. The necessities of the sliding seat in racing boats have given rise to much difference of opinion among rowing men as to the right proportion. In the middle of the 19th century the use of square looms inboard, and of a button to turn inside and against the thwart, was common, and most oars had a small slab of hard wood let in below the button, so as to save the oar from wear and tear at the rowlock. But since round looms came into vogue the round leather head has taken the place of the old square button, and the loom is covered with leather for some inches above and below for this so as to protect it from abrasion.

Of late the introduction of swivel rowlocks for racing boats has caused a further modification in the form of buttons. Swivel rowlocks have come into general use for sculling boats, pair oars and coxswainless fours. But as yet they do not appear to have captured the racing eight, except in a few instances. Neither crews nor coaches in English waters seem inclined to part with the time-honoured rhythmic music of the oar in the rowlock, which from the days of antiquity even until now has, to practised ears, held its own tale as to the crew being together or not in the stroke.

In the case of racing eights, when the round loom oars superseded the square loom, the early patterns were common (e.g. in 1837) 12' 6" over all, 3' 8" inboard, with a long blade 4½' to 5' in breadth. These were succeeded by a pattern 12' 5" over all, 3' 6" inboard, with a much shorter blade 6" broad.

Since sliding seats came in the average oar has been 12' 4" over all, 3' 8½" inboard, with 5½' to 6½' blades. The modern racing oar may be instead of continuing the straight line of the old and Harvard race at Putney. Until very lately no material alteration had taken place in this pattern, except in the matter of width of blade. Some authorities, however, are, as has been

1 See Viking Ship, Nicolaysen (Christiania, 1882).
2 Since 1890 the curved blade seems to have been adopted in some cases in the oars made at Devonport for the Royal Navy.

said above, far from satisfied with the present average oar, and are using shorter patterns, 11' 10¾' or 12' 6" over all, 3½' inboard, and 7½' blades.

Single grooved oars were first made in America. But with the single groove a side weakness is often developed in the loom, and hence the double girder, invented by G. Aylings, has generally superseded the single groove, though many oarsmen prefer the box loom by the same inventor.

It is clear, however, that no finality has been reached in the making of oars. Tubular oars, first introduced at Henley by the Belgian crew in 1906, are now being tried, with circular or quadrangular bores, strengthened by the insertion of an aluminium shell.

For much of the information above given respecting the recent developments in oar-making for racing purposes and river work, the writer is indebted to Messrs Aylings & Sons of Putney, whose patented inventions and improvements are well known to rowing men.

OASIS (Gr. ὄασις, the name given by Herodotus to the fertile spots in the Libyan desert: it probably represents an Egyptian word, cf. Coptic ṣauk, oušu, to dwell, from which the Egyptian Arabic عوشي is derived), a fertile spot surrounded by desert. For example, where the high plateau of the Libyan desert descends into a longitudinal valley between Syrtis and the Nile delta there are a few spots where the water comes to the surface or is found in shallow wells. It may come to the surface in springs, upon the artesian principle, or it may collect and remain in mountain hollows. These areas are of small extent and are closely cultivated, and support thick forests of date-palms. All kinds of tropical vegetables, grains and small fruits grow under cultivation, and land is so precious in these limited areas of great richness and fertility that very narrow pathways divide each owner's plot from his neighbour's. Wherever oases are found they present similar features, and are naturally the halting-places and points of departure of desert caravans.

OAST (Oat, cf. Dutch oet, "klin"). The Teutonic root is *aideh- "to burn"; the pre-Teutonic *iadeh- is seen in Lat. acetum, "heat," aetas, "summer," Gr. αἰών, "burning heat"), a kiln, particularly one used for drying hops; the word usually appears in the term "oast-house," a building containing several of such kilns (see Hop). "Oast" is also sometimes-used of a kiln for drying tobacco.

OASTLER, RICHARD (1789—1861), English reformer, was born at Leeds on 20th of December 1789, and in 1820 succeeded his father. As steward of the Thornhills' extensive Fitzroy estates at Huddersfield, Yorkshire. In 1830 John Wood, a Bradford manufacturer, called Oastler's attention to the evils of child employment in the factories of the district. Oastler at once started a campaign against the existing labour conditions by a vigorous letter, under the title "Yorkshire Slavery," to the Leeds Mercury, Public opinion was eventually aroused, and, after many years of agitation, in which Oastler played a leading part, the Ten Hours Bill and other Factory Acts were passed, Oastler's energetic advocacy of the factory-workers' cause procuring him the title of "The Factory King." In 1838, however, owing to his opposition to the new poor law and his resistance of the commissioners, he had been dismissed from his stewardship at Fitzby; and in 1840, being unable to repay £2000 which he owed his late employer, Thomas Thornhill, he was sent to the Fleet prison, where he remained for over three years. From prison he published the Fleet Papers, a weekly paper devoted to the discussion of factory and poor-law questions. In 1844 his friends raised a fund to pay his debt, and on his release he made a triumphant entry into Huddersfield. Oastler died at Harrogate on the 22nd of August 1861. A statue to his memory was erected at Bradford in 1888.

OAT (O. Eng. âete; the word is not found in cognate languages; it is allied with Fr. cétel, knot, nodule, cf. Gr. aíðos swelling), a cereal (Avena sativa) belonging to the tribe Aveneae of the order Gramineae or grasses. The genus Avena contains about fifty species mostly dispersed through the temperate regions of the Old World. The spikelets form a loose panicle,
familiar in the cultivated oat (fig. 1), the flowering glume having its dorsal rib prolonged into an awn (fig. 2), which is in some species twisted and bent near the base.

The origin of the cultivated oat is generally believed to be A. *fatua*, or "wild oat," or some similar species, of which several exist in southern Europe and western Asia. Professor J. Buckman succeeded in raising the "potato-oat type" and the "white Tatarian oat" from grain of this species. A. *strigosa*, Schreb., the bristle-pointed oat, is the origin of the Scotch oat, according to Buckman. The white and black varieties of this species were cultivated in England and Scotland from remote times, and are still grown as a crop in Orkney and Shetland. A. *strigosa* is probably only a variety of the cultivated oat. The "naked oat," A. *nuda*, was found by Bunge in waste ground about Peking; it was identified by the botanist Lindley with the pil-corn of the old agriculture, and we see from Rogers that it was in cultivation in England in the 13th century. Both this and the "common otes," A. *vesca*, are described by Gerard. Parkinson tells us that in his time (early in the 17th century) the naked oat was sown in sundry places, but "nothing so frequent" as the common sort. The chief differences between A. *fatua* and A. *sativa*, are, that in the former the chaff-scales which adhere to the grain are thick and hairy, and in the latter they are not so coarse and are hairless. The wild oat, moreover, has a long stiff awn, usually twisted near the base. In the cultivated oat it may be wanting, and if present it is not so stiff and is seldom bent. The grain is very small and worthless in the one, but larger and full in the other. There are now many varieties of the cultivated oat included under two principal races—common

---

**OATES**

the remains of the Swiss lake-dwellings perhaps not earlier than the bronze age, while Pliny alludes to bread made of it by the ancient Germans. Pickering also records Galen’s observations (De Alim. Fac. i. 14), that it was abundant in Asia Minor, especially Mysia, where it was made into bread as well as given to horses.

Besides the use of the straw when cut up and mixed with other food for fodder, the oat grain constitutes an important food for both man and beast. The oat grain (excepting the naked oat), like that of barley, is closely invested by the husk. Oatmeal is made from the kiln-dried grain from which the husks have been removed; and the form of the food is the well-known "porridge." In Ireland, where it is sometimes mixed with Indian-corn meal, it is called "stirabout." Groats or grits are the whole kernel from which the husk is removed. Their use is for gruel, which used to be consumed as an ordinary drink in the 17th century at the coffee-houses in London. The meal can be baked into "cake" or biscuit, as the Passover cake of the Jews; but it cannot be made into loaves in consequence of the great difficulty in rupturing the starch grains, unless the temperature be raised to a considerable height. With regard to the nutritious value of oatmeal, as compared with that of wheat flour, it contains a higher percentage of albuminoids than any other grain, viz. 12.6—that of wheat being 10.8—and less of starch, 58.4 as against 66.3 in wheat. It has rather more sugar, viz. 5:4—while having 4:2—and a good deal more fat, viz. 5:6, as against 2:0 in flour. Lastly, salts amount to 3:0% in oat, but are only 1:7 in wheat. Its nutritious value, therefore, is higher than that of ordinary seconds flour.

**OATES, TITUS** (1649–1705), English conspirator, was the son of Samuel Oates (1610–1663), an Anabaptist preacher, chaplain to Pride, and afterwards rector of All Saints’ Church, Hastings. He was admitted on the 11th of June 1665 to Merchant Taylors’ School in London, but was soon afterwards removed to Osbourn. There he remained a year, more or less, and "seems afterwards to have gone to Sedlescombe school in Sussex, from whence he passed to Caius College, Cambridge, on the 29th of June 1667, and was admitted a sizar of St John’s, on the 2nd of February 1668–1669, aged 18." Upon very doubtful authority he is stated to have been also at Westminster school before going to the university. On leaving the university he apparently took Anglican orders, and officiated in several parishes, Hastings among them. Having brought malicious accusations in which his evidence was disallowed, he was convicted and committed to prison for perjury. He next obtained a chaplaincy in the navy, from which he appears to have been speedily dismissed for bad conduct with the reputation of worse. He now, it is said, applied for help to Dr Israel Tonge, rector of St Michael’s in Wood Street, an honest half-crazy man, who even then was exciting people’s minds by giving out quarterly "treatises in print to alarm and awake his majesty’s subjects." Oates offered his help, and it was arranged that he should pretend to be a Roman Catholic so as the better to unearth the Jesuit plots which possessed Tonge’s brain. Accordingly he was received into the church by one Berry, himself an apostate, and entered the Jesuit College of Valladolid as Brother Ambrose. Hence he was soon expelled. In October 1677 he made a second application, and was admitted to St Omer on 10th December. So scandalous, however, was his conduct that he was finally dismissed in 1678. Returning in June 1678 to Tonge, he set himself to forge a plot by piecing together things true and false, or true facts falsely interpreted, and by inventing treasonable letters and accounts of preparations for military action. The whole story was written by Oates in Greek characters, copied into English by Tonge, and finally told to one of Charles II’s confidential servants named Kirkby. Kirkby having given the king his information, Oates was sent for (13th August), and in a private interview gave details, in forty-three articles, of the plot and the persons who had engaged to assassinate Charles. The general improbability of the story was so manifest, and the discrepancies were so glaring, that neither then nor at any subsequent time did Charles express anything but amused

---

2 *Herball*, p. 68 (1597).
3 *Origin of Cultivated Plants*, p. 373.
incredibly. To bolster up the case a fresh packet of five forged letters was concocted (31st August); but the forgery was transparent, and even Sir William Jones, the attorney-general, though a violent upholder of the plot, dared not produce them as substantial.

Oates now (6th September) made an affidavit before Sir Edmond Berry Godfrey (q.v.) to an improved edition of his story, in eighty-one articles. Among the persons named was Coleman, secretary to the duchess of York, whom Godfrey knew, and to whom he sent word of the charges. Coleman in turn informed the duke, and he, since the immediate exposure of the plot was of the utmost consequence to him, induced Charles to compel Oates to appear (28th September) before the privy council. Here Oates delivered himself of a story the falsity of which was so obvious that the king was able to expose him by a few simple questions. At this moment an accident most fortunate for Oates took place. Amongst the papers seized at his request were Coleman's, and in them were found copies of letters written by the latter to Père le Chaise, suggesting that Louis should furnish him with money, which he would use in the French and Catholic interest among members of parliament. Among them, too, were these passages: "Success will give the greatest blow to the Protestant religion that it has received since its birth"; "we have here a mighty work upon our hands, no less than the conversion of three kingdoms of Europe by the opening the eyes, and depriving the people of the power, which has so long domineered over great part of the northern world." The credit of Oates was thus, in the eyes of the people, re-established, and Coleman and others named were imprisoned. Charles was anxious for his brother's sake to bring the matter to a conclusion, but he dared not appear to stifle the plot; so, when starting for Newmarket, he left orders with Danby (see Leeds, Duke of) that he should finish the investigation at once. But Danby purposely delayed; an impeachment was hanging over his head, and anything which took men's minds off that was so obvious the king was able to expose him by a few simple questions.

On the 12th of October occurred the murder of Godfrey, and the excitement was at its highest pitch. On the 21st of October parliament met, and, though Charles in his speech had barely alluded to the plot, all other business was put aside and Oates was called before the House. A new witness was wanted to support Oates's story, and in November a man named William Bedloe came forward. At first he remembered little; by degrees he remembered everything that was wanted. Not even so, however, did their witness agree together, so, as a bold stroke, Oates, with great circumstantiality, accused the queen before Charles of high treason. Charles both disbelieved and expatriated him, whereupon Oates carried his tale before the House of Commons. The Commons voted for the queen's removal from court, but, the Lords refusing to concur, the matter dropped. It was not, however, until the 18th of July 1679 that the slaughter of Jesuits and other Roman Catholics upon Oates's testimony and that of his accomplices was to some extent checked. Sir George Wakeman, the queen's physician, was accused of poisoning the king, and the queen was named as being concerned in the plot. The refusals of Charles to credit or to convey judgment on his testimony was an episode in his life. Scroggs had intimation that he was to be lenient. Sir Philip Lloyd proved Oates to have perjured himself in open court, and Wakeman was acquitted. On the 26th of June 1680, upon Oates's testimony, the duke of York was presented as a recusant at Westminster. But the panic had now worn itself out, and the importance of Oates rapidly declined; so much so that after the dissolution in 1682 he was no more heard of during Charles's reign, but enjoyed his pension of £600 or £600, it is uncertain which, in quiet. Shortly before the death of Charles, James sought, and won, a civil action against Oates, with damages of £200,000; in default of payment Oates was taken to prison; while there he was indicted for perjury, and was tried in May 1685, soon after the accession of James II. He was convicted and received a severe sentence, with repeated floggings, the execution of which was expected to kill him, and which was rigorously carried out; but to the astonishment of all he survived.

Oates was in prison for three and a half years. Upon the flight of James, and during the excitement against the Catholics, he partially gained his liberty, and brought an appeal against his sentence before the Lords, who, while admitting the necessity to be unjust, confirmed it by a majority of thirty-five to twenty-three. The Commons, however, passed a bill annulling the sentence; and a conference was held in which the Lords, while again acknowledging that legally they were wrong, adhered to their former determination. The matter was finally settled by Oates receiving a royal pardon, with a pension of £300 a year. The remainder of his life was spent in retirement, varied by a good deal of sordid intrigue. In 1691 he became acquainted with William Fuller, whom he induced to forge another plot, though not with the success he had himself attained. He married a wealthy widow in 1693, but his extravagance soon brought him into straits. In 1696 he dedicated to William III. a book called Eikon Basilike, an elaborate tissue of invection against "the late king James." In 1698 he obtained admission as a member of the Baptist Church, and used to preach at Wapping; but in 1701, as the result of a financial scandal, he was formally expelled from the sect. He died on the 12th of July 1705.

OATH. Oathes, as the word was afterwards defined and used, was a promise or engagement. The word is found throughout the Teutonic languages (Goth. Mod. Ger. Edd.) (svaran, Schwören); diese trouthe (Ger. schwören); this word, too, is not clear in original meaning, but is in some way connected with the notion of answering—indeed it still forms part of the word answer, O. Eng. and-swarian; it has been suggested that the swearer answered by word or gesture to a solemn formula or act. Among other terms in this connexion, the Lat. jurare, whence English law has such derivatives as jure, seems grounded on the metaphorical idea of binding (root ju, as in jungo); the similar idea of a bond or restraint may perhaps be traced in Gr. ἰπές. It may be worth notice that Latin sacramentum and sacrament also gives an exhaustive and precise account of the Popish terror and its victims; and the chief incidents in Oates's career are graphically described by Macaulay. On the question of the place of his education see Notes and Queries (22nd December 1883). See also T. Seccombe's essay in Twelve Bad Men (1894), where a bibliography is given.

OATH (O. Eng. əʊθ), a term which may be defined as an avowal or promise made under non-human penalty or sanction. The word is found throughout the Teutonic languages (Goth. Mod. Ger. Edd.) (svaran, Schwören); this word, too, is not clear in original meaning, but is in some way connected with the notion of answering—indeed it still forms part of the word answer, O. Eng. and-swarian; it has been suggested that the swearer answered by word or gesture to a solemn formula or act. Among other terms in this connexion, the Lat. jurare, whence English law has such derivatives as jure, seems grounded on the metaphorical idea of binding (root ju, as in jungo); the similar idea of a bond or restraint may perhaps be traced in Gr. ἰπές. It may be worth notice that Latin sacramentum and sacrament also gives an exhaustive and precise account of the swearer answered by word or gesture to a solemn formula or act. Among other terms in this connexion, the Lat. jurare, whence English law has such derivatives as jure, seems grounded on the metaphorical idea of binding (root ju, as in jungo); the similar idea of a bond or restraint may perhaps be traced in Gr. ἰπές. It may be worth notice that Latin sacramentum and sacrament also gives an exhaustive and precise account of the Popish terror and its victims; and the chief incidents in Oates's career are graphically described by Macaulay. On the question of the place of his education see Notes and Queries (22nd December 1883). See also T. Seccombe's essay in Twelve Bad Men (1894), where a bibliography is given.

Writers viewing the subject among civilized nations only have sometimes defined the oath as an appeal to a deity. It will be seen, however, by some following examples, that the harm or penalty consequent on perjury may be considered to result freely, without any spirit or deity being mentioned; indeed it is not usually that these mere words involved in the oaths by the swearer may be more primitive than the invocation of divinities to punish. Examples of the simplest kind of curse-oath may be seen among the Nagas of Assam, where two men will lay hold of a dog or a fowl by head and feet, which is then chopped in two with a single blow of the dao, this being emblematic of the fate expected to befall the perjurer. Or a man will stand within a circle of rope, with the implication that if he breaks his vow he may rot as a rope does, or he will take hold of the barrel of a gun, a spear-head or a tiger's tooth, and solemnly declare, "If I do not faithfully perform this my promise, may I fall by this" (Butler in Journ. Asiatic Soc. Bengal, 1875, p. 310). Another stage in the history of oaths is that in which the swearer calls on some fierce beast to punish him if he lies, believing that it has the intelligence to know what he says and the power to
interferes in his affairs. In Siberia, in lawsuits between Russians and the wild Ostiaks, it is described as customary to bring into court the head of a bear, the Ostiak making the gesture of eating: and calling several witnesses to devour him, all in the same manner if he does not tell the truth (G. A. Erman, *Travels in Siberia*, i. 492, London, 1848). Similar oaths are still sworn on the head or skin of a tiger by the Santals and other indigenous tribes of India. To modern views, a bear or a tiger seems at any rate a more rational being to appeal to than a river or the sun, but in the earlier stage of nature-religion these and other great objects of nature are regarded as animate and personal. The prevalence of river-worship is seen in the extent to which in the old and modern world oaths by rivers are most sacred. In earlier ages men might inevitably by Styx or Tiber, and for this day an oath on water of the Ganges is to the Hindu the most binding of pledges, for the goddess will take awful vengeance on the children of the perjuror. The Tungus brandishes a knife before the sun, saying, "If I lie may the sun plunge sickness into my entrails like this knife." The natural transition from swearing by these great objects of nature to invoking gods conceived in human form is well shown in the treaty-oath between the Macedonians and the Carthaginians recorded by Polybius (vii. 9): here the sun and moon and earth, the rivers and meadows and waters, are invoked side by side with Zeus Hera and Apollo and the gods of the Caunitian. The heathen attempt, as so to speak, to smite the perjuror with his lightning, was invoked by the Romans, when a hog was slain with the sacred flint representing the thunderbolt, with the invocation to Jove so to smite the Roman people if they broke the oath (Liv. i. 24; Polyb. iii. 25). Another form of this Aryan rite was preserved by the old Slavonic nation of Prussia, where a man would lay his right hand on his own neck and his left on the holy oak, saying, "May Perkun (the thunder-god) destroy me!" The oaths of the lower culture show a remarkable difference from those of later stages. In the apparent present to the regions beyond the grave, as is evident from any collection of customary oaths. A single instance will show at once the combination of retributions in and after the present life, and the tendency to heap up remote penalties in the vain hope of securing present honesty. The Siamese Buddhist in his oath, not content to call down on himself various kinds of death if he breaks it, desires that he may afterwards be cast into hell to go through innumerable tortures, among them to carry water over the flames in a wicker basket to assuage the thirst of the infernal judge, then that he may migrate into the body of a slave for as many years as there are grains of sand in four seas, and after this that he may be born a beast through five hundred generations and an hermaphroditic five hundred more.

The forms of oath belonging to all nations and ages, various as they are in detail, come under a few general heads. It may be observed that two hands between the hands of another in token of homage, are sometimes treated as of the nature of oaths, but wrongly so, they being rather of the nature of ceremonies of compact. The Hebrew practice of putting the hand under another's thigh is usually reckoned among oath-rites, but it may have been merely a ceremony of covenant (Gen. xxiv. 2, xvii. 29; see Joseph. Ant. i. 16). Even the covenant among many ancient and modern nations by the parties mixing their blood or drinking one another's is in itself only a solemn rite of union, not an oath proper, unless some such ceremony is introduced as dipping weapons into the blood, as in the form among the ancient Scythians (Herod. iv. 70); this, by bringing in the idea of death befalling the covenant-breaker, converts the proceeding into an oath. Again, in India, the ritual of the vow strengthened by the Brahman's having his hand, in the consecrated weapons and greater on the Gospels (see Du Cange, s. r. "Juramenta super arma"); Grimm, *Deutsche Rechtsalterth. p. 896. Stretching forth the hand towards the object or deity sworn by is a natural gesture, well shown in the oath of Agamemnon, who with uplifted hands (Δις χειρας ανασαγωνισ) takes heaven to witness to Sun and Earth and the Erinyes who below the earth wreak vengeance on the perjuror ( Homer Il. xix. 254; see also Pindar, Olymp. v. 120). The gesture of lifting the hand towards heaven was also an Israelite form of oath: "I lift up my hand, as the witness Jehovah Himself is represented as so swearing, "For I lift up My hand to heaven, and say, I live for ever" (Gen. xiv. 22; Deut. xxxii. 40; see Dan. xii. 7; Rev. x. 5). This gesture established itself in Christendom, and has continued to modern times. In England, for example, in the parliament at Shrewsbury in 1398, when the Lords took an oath on the cross of Canterbury never to suffer the transactions of that parliament to be changed, the members of the Commons held up their hands to signify their taking upon themselves the same oath (J. E. Tyler, *Oaths*, p. 203). In Ionian law, his hand, saying, "Jehovah!" The Scottish judicial oath is taken by the witness holding up his right hand uncovered, and repeating after the usher, "I swear by Almighty God, and as I shall answer to God at the great day of judgment, that I will," etc.

In the ancient world sacrifice often formed part of the ceremony of the oath; typical examples may be found in the Homeric poems, as in Agamemnon's oath already mentioned, or the compact between the Greeks and Trojans (II. iii. 276), where wine is poured out in libation, with prayer to Zeus and the immortal gods that the perjurer's brains shall, like the wine, be poured on the ground; the rite thus passes into a symbolic curse-oath of the ordinary barbaric type. Connected with such sacrificial oaths is the practice of laying the hand on the victim or the altar, or touching the image of the god. A classic instance is in a comedy of Plautus (Ecdanes, v. 2, 45), where Cius says, "Tange arma bane Veneris," and Labrax answers "Tango" (Greek instance, Thucyd. v. 47; see justin xxiv. 2). Thus Livy (xxi. 1) introduces the phrase "touching the sacred objects" (faete pezriz) into the picturesque story of Haman's oath. In the old Scandinavian ritual in Iceland in the Landnámabók (Islendinga Sögur, Copenhagen, 1843); a bracelet (baug) of two rings or more was to be kept on the altar and on the court as an amulet, and the sacrifices were things held by him, and should reded in the blood of the bullrock sacrificed, the witness pronouncing the remarkable formula: "I name to witness that I take oath by the ring, law-cath, so help me Frey, and by the hand also by the three rings also, and the latter oath by ok hinn almáttaki Ass," etc. This was doubtless the great oath on the holy ring or bracelet which the Danes swore to King Alfred to quit his kingdom ("on tham halgan beage," Anglo-Sax. Chron.; in corum arma sacra," Ethelwred, *Chron. iv.*). An oath, though not necessarily expressed in words, is usually so. In the Homeric
instances the prayer which constitutes the oath has a somewhat conventional form, and in the classical ages we find well-marked formulas. These are often references to deities, as "by Zeus!" "I call Zeus to witness" (viv mi: &vri: Z6crri: Z6crrv); "by the immortal gods!" "I invoke the gods," or "I invoke the deities," or "I invoke the witnesses," or "I invoke the sworn witnesses," or "I invoke the accessory witnesses," or "I invoke the stoners, or the swearer, that he may perish if he fail to keep his oath, as 'the gods destroy me,' 'let me perish if,' &c. (dil me perdant, dis-persam si). An important class of Roman oaths invokes the deities to favour or preserve the swearer in so far as he shall fulfil his promise "as the gods may preserve me," "as I wish the gods to be propitious to me" (me fia diu servent; id est, Phil. iv. 19; Religionum; De Formulis et Solemnibus Populi Romani Verbis (Paris, 1853)). Biblical examples of these classes of oaths are "as the Lord liveth" (2 Cor. i. 23; Phil. i. 8; Gal. i. 20). Thus Athanasius writes: "I stretch out my hand, and as I have learned of the apostle, I call God to witness on my soul" (Apol. ad Imp. Const.; see Augustine, De Mend. 28; Epist. cl. iii. 9; cl. iv. 250; Enarr. in Psalm. lxxviii. 4; Serm. 307, 310). This argument is the more forcible from Paul's expressions being actually oaths in accepted forms, and it has also been fairly adduced that Christ, by answering to the adjuration of the high priest, took the judicial oath in solemn form (Matt. xxvi. 63). The passages here referred to will give an idea of the theological grounds on which the practice of taking oaths is defended. In the New Testament, the Quakers have refused to take even judicial oaths, while, on the other hand, the laws of Christendom from early ages have been only directed against such swearing as was considered profane or otherwise improper, and against perjury. Thus from the 3rd or 4th century we find oaths taking much the same place in Christian as in non-Christian society. In the 4th century the Christian military oath by God, Christ, the Holy Spirit, and the majesty of the emperor is recorded by Vegetius (Rer. Mili. Inst. ii. 5). Constantine's laws required every witness in a cause to take oath; this is confirmed in Justinian's code, which also in some cases requires also the parties and advocates to be sworn (Cod. Theod. xi. 39; Justin. Cod. iv. 20, 59). Bishops and clergy were called upon to take oath in ordination, monastic vows, and other ecclesiastical matters (see details in Bingham, Antiq. of Chr. Church. xvi. 7). By the middle ages oaths had increased and multiplied in Christendom far beyond the practice of any other age or religion. The Reformation made no change in principle, as is seen, for instance, in Art. xxxix. of the church of England: "As we confess that vain and rash swearing is forbidden Christian men by our Lord Jesus Christ, and James His apostle, so we judge, that Christian Religion doth not prohibit, but that a man may swear when the Magistrate requireth, in a cause of faith and charity, so it be done according to the Prophet's teaching, in justice, judgement and truth." The history of swearing in early Christendom would lead us to expect that the forms used would be adopted with more or less modification from Hebrew or Roman sources, as indeed proves to be the case. The oath introduced in the body of one of Constantine's laws—"As the Most High Divinity may ever be propitious to me" (ita mihi summa Divinitas semper propitius sit)—follows an old Roman form. The Roman oath by the genius of the emperor being objected to by Christians as recognizing a demon, they swore by his safety (Tertull. Apol. 32). The gesture of holding up the hand in swearing has been already spoken of. The Christian oath on a copy of the Gospels seems derived from the late Jewish oath taken holding in the hand the scroll of the law (or the phylacteries), a ceremony itself possibly adapted from Roman custom (see treatise "Shebubah" in Gemara). Among the various mentions of the oath on the Gospel, in early Christian times, an example of Chrysostom in a sermon to the people of Antioch: "But do thou, if nothing else, at least reverence the very book thou holdest forth to be sworn by, open the Gospel thou takest in thy hands to administer the oath, and, hearing what Christ therein saith of oaths, tremble and desist." (Serm. ad pop. Antioch. Hom. xv. i.). The usual mode was to lay the hand on the Gospel, as is often stated in the records, and was kept up to a modern date in the oath in the university of Oxford, "tacit sacrosancti Evangelii"; the practice of kissing the book, which became so well established in England, appears in the middle ages (J. E. B. Fast. Lit. vol. ii. pp. 110, 115). The book was often laid on the altar, or (after the manner of ancient Rome) the swearer laid his hand on the altar itself, or looked towards it; above all, it became customary to touch relics of saints on the altar, a ceremony of which the typical instance is seen in the representation of Harold's oath in the Bayeux tapestry. Other objects, as the cross, the bishop's crozier, &c., were sworn by (see Du Cange, s.v. "Jurare"). An oath ratified by contact or inspection of a sacred object was called a "corporal" or bodily oath, as distinguished from a merely spoken or written oath; this is well seen in an old English charter oath, "to hold me God, and these holy evangelists by me bodily touched ypon this hoo ly waver." The English word signifying the "sacred object" on which oath is taken is halidome (A.S. hældigdæm; Ger. Heiligthum); the halidome on which oaths are now sworn in England is a copy of the New Testament. Jews are sworn on the Old Testament; the sacred books of other religions are used in like manner, a Mohammedan swearing on the Koran, a Hindu on the Vedas.

Among the oath-formulas used in Christendom, that taken by provincial governors under Justinian is typical of one class: "By the power of God Almighty and of the Church of Christ, I swear, and profess with all my heart and conscience, that I will, by the command of the most Christian emperor, perform eagerly and faithfully that which I promise, and I take on me to perform, and to do, to observe, and to keep, the said laws and ordinances, and in everything to conform to the teaching of the Lord Jesus Christ, and the Holy Ghost, and the Most Holy Glorious Mother of God and ever Virgin Mary, and by the Four Gospels which I hold in my hand, and by the Holy Archangels Michael and Gabriel," &c. The famous oath of the kings Louis and Charles at Strassburg in 842 (A.D.) runs: "By God's love and the Christian people and our common salvation, as God shall give me knowledge and power," &c. Earlier than this, as in the oath of fealty in the capitularies of Charlemagne in 802, is found the familiar form "Sic me adjutet Deus," closely corresponding to above-mentioned formulas of pre-Christian Rome. This became widely spread in Europe, appearing in Old French "S i m'al t D ex," German "So mir Gott helfe," English "So help me God." A remarkable point in its history is its occurrence in the "So help me F r y e," &c., of the old Scandinavian ring-oath already described. Among the curiosities of the subject are quaint oaths of kings and other great personages: William Rufus swore "by that and that" (per hoc et per hoc), William the Conqueror "by the splendour of God," Richard I. "by God's legs," John "by God's teeth;" other phrases are given in Du Cange (i.e., as "per omnes gentes," or "per coronam," or "la salutare figure de Deo," or "la morti Dieu," &c. Profane swearing, the trifling or colloquial use of sacred oaths, is not without historical interest, formulas being used apt to keep up traces of old manners and extinct religions. Thus the early Christians were reproved for continuing to say "mercerel!" some of them not knowing that they were swearing by Hercules (Tertull. De idol. 20). Oaths by deities of pre-Christian Europe
OATH

After this the king, laying his hand upon the holy Gospels, shall say: "The things which I have here before promised I will perform and keep; so help me God," and then shall kiss the book.

The chief officers of state take an "official" oath well and truly to serve his majesty. Special oaths are taken by privy councillors, archbishops and bishops, peers, baronets and knights, recruiters and others. The old oath of allegiance, as administered (says Blackstone) upwards of 600 years, contained a promise of a true and faithful allegiance to the king and his heirs, and truth and faith to bear of life and limb and terrane honour, and yet to know or hear of any ill or damage intended him without defending him therefrom." (Blackstone, Commentaries, book i. chap. x.). In the reign of William III. it was replaced by a shorter form; and it now runs: "I . . . do swear that I will be faithful and bear true allegiance to His Majesty . . . , his heirs and successors, according to law." Statutes of Charles II. and George I. enacted that no member should vote or sit in either house of parliament without having taken the several oaths of allegiance, supremacy and abjuration. The oath of supremacy in the reign of William III. was: "I A B swear that I do from my heart abhor detest and abjure as impious and heretical this damnable doctrine and position that princes excommunicated or deprived by the pope or any authority of the see of Rome may be deposed or murdered by their subjects or any other whatsoever. And I do declare that no foreign prince person prelate state or potentate hath or ought to have any jurisdiction power superiority preeminence or authoritive ecclesiastical or spiritual within this realm. Soe," &c. The oath of abjuration introduced in the time of William III. recognizes the king's rights, engages the jury to support him and discloses all traitorous conspiracies against him, promises to maintain the Hanoverian Protestant succession, and expressly renounces any claim of the descendants of the late Pretender. This oath was not only taken by persons in office, but might be tendered by two justices to any person suspected of disaffection. In modern times a single parliamentary oath was substituted for the three, and this was altered to enable Roman Catholics to take it, and Jews were enabled to sit in parliament by being allowed to omit the words "on the true faith of a Christian." In its present form the parliamentary oath consists of an oath of allegiance and promise to maintain the crown as limited and settled in the reign of William III.

The "judicial" oath taken by judges of the court of appeal or of the High Court of Justice, and by justices of the peace, is "to do right to all manner of people after the laws and usages of this realm, without fear or favour, affection or ill-will."

Jurors are sworn, whence indeed their name (juratores), in felonies the oath administered is: "You shall well and truly try and true deliverance make between our sovereign lord the king and the prisoner at the bar whom you shall have in charge, and a true verdict give according to the evidence." In misdemeanours the form is: "Well and truly try the issue joined between our sovereign lord the king and the defendant, and a true verdict," &c. The oath of the jurors in the Scottish criminal courts is: "You [the jury collectively] swear in the name of Almighty God and as you shall answer to God at the great day of judgment that you will truth say and no truth conceall so far as you are to pass upon this assize." The oldest trace of this form of oath in Scotland is in Reg. maj. 1. cap. 11, copied from Glanvill, which points to an origin in the Norman inquest or "recognition." In the ancient custom of commoratio, once prevalent in Europe, the accused's oath was supported by the oaths of a number of helpers or compurgators who swore to their belief in its validity.

Witnesses in English law courts must give their evidence under the sanction of an oath, or of what is equivalent to an oath, and the ordinary form of oath adapted to Christians is: "The evidence you shall give . . . shall be the truth, the whole truth, and nothing but the truth. So help you God." Many alterations of the English law as to oaths have been made in relief of (1) those Christians who object on conscientious grounds
to the taking of an oath, and (2) of those persons who refuse to admit the binding force of an oath. Special provision was first made for Quakers, Moravians and Separatists; then followed general enactments relating to civil and criminal proceedings respectively, till finally the law was embodied in the Oaths Act 1888, which enacted that "every person upon objecting to being sworn, shall state, as the ground of such objection, either that he has no religious belief, or that the taking of an oath is contrary to his religious belief, shall be permitted to make his solemn affirmation instead of taking an oath in all places and for all purposes where an oath is or shall be required by law, which affirmation shall be of the same force and effect as if he had taken the oath; and if any person making such affirmation shall willfully, falsely and corruptly affirm any matter or thing which, if deposed on oath, would have amounted to wilful and corrupt perjury, he shall be liable to prosecution, indictment, sentence and punishment in all respects as if he had committed wilful and corrupt perjury." The form of affirmation prescribed by the Oaths Act was as follows: "I, A. B., do solemnly, sincerely, and truly declare and affirm," &c. Under s. 5 of the same act a person might swear in the Scottish form, with uplifted hand (no book of any kind being used) and if he desired to do so "the oath shall be administered to him in such form and manner without question." With the desire of making universal this method of administering the oath the Oaths Act 1909 was passed. It enacted that any oath might be administered and taken in the following form: The person taking the oath shall stand or sit, the thumb being placed between the fingers of the left hand, and holding the Bible of the Old Testament, in his uplifted hand, and shall say or repeat after the officer administering the oath the words 'I swear by Almighty God that . . . .' followed by the words of the oath prescribed by law." The officer also is directed by the act to administer it in this fashion, unless the person about to take it voluntarily objects or is physically incapable of taking it so. To a person who is neither a Christian nor a Jew the oath may be administered in any way in which it was previously lawful.

The form of affirmation given above is that used for Quakers, Moravians and Separatists in the witness-box: "I, A. B., being one of the people called Quakers (one of the United Brethren called Moravians), do, &c." A Christian swears on the Gospels, holding a copy of the New Testament in his right hand (the hand being uncovered), and his head being also uncovered. A witness may elect to be sworn on any version of the Bible which he considers most binding on him, as a Roman Catholic on the Douai Testament or Bible. A Jew is sworn on the Pentateuch, holding a copy thereof in his right hand, the head being covered. A Mahomedan is sworn upon the Koran. He places his right hand flat upon the book and puts the other hand upon his forehead, bringing his head down to the book and in contact with it. He then looks at the book for some moments. Buddhists are sworn on the Buddhist doctrines, Sikhs upon the Granth, Parsees upon the Zend Avesta, Hindus upon the Vedas, or by touching the Brahmin's foot, and, according to caste custom, Indian witnesses sometimes insist upon the oath being administered by a Brahmin; but in India witnesses now generally affirm. Kaffir witnesses swear by their own chief, and a Kaffir chief by the king of England. When a Chinese witness is to be sworn, a saucer is handed to him, which he takes in his hand and kneeling down breaks into fragments. The colonial legislatures generally make provision for receiving unsworn evidence of barbarous and uncivilized people who have no religious belief. The great number of oaths formerly required was much reduced by the Promissory Oaths Act 1868, which prescribed the forms of oath of allegiance, the official oath and the judicial oath. The right to affirm in lieu of taking the parliamentary oath in the case of atheists was first raised in the case of Charles Bradlaugh (q.v.).

Proflane swearing and cursing is punishable by the Profane Oaths Act 1475, any labourer, sailor or soldier being liable to forfeit 1s. on every other person under the degree of a gentleman 2s., and every gentleman or person of superior rank 5s., to the poor of the parish.

The administering or taking of unlawful oaths is criminal in English and Scots law. Statutes relating to the offence were passed in 1797, 1798 and 1811. Oaths used by ecclesiastics to the prelate of the latter act (Unlawful Oaths Act 1812) that they were aimed at those societies in the United Kingdom at the time of the French Revolution which required or permitted their members to take an unlawful oath. Some statutes were passed in 1832, 1825 and 1827. Children of tender years, who, in the opinion of the court, have not sufficient intelligence to understand the nature of an oath, may give evidence by oath. In the United States an oath is required in practically every case in which it is required in the United Kingdom, and with the same latitude as to affirmation. The formula or details may vary in different states of the Union. The same may be said generally of every civilized country, with the reservation that an affirmation is not so usually accepted as in English-speaking countries. In Germany an oath is compulsory on a witness in criminal cases, except in the case of certain sects, whose tenets forbid the taking of an oath.

OAXACA, or OAJACA (officially OAXACA DE JUAREZ), a southern state of Mexico, lying partly on the southern slope of the great Mexican plateau and covering the southern and larger part of the Isthmus of Tehuantepec, bounded N. by Puebla, N.E. and E. by Vera Cruz, S.E. by Chiapas, S. by the Pacific and W. by Guerrero. Pop. (1900) 948,633, a large majority of whom are Indians. The state has an area of 35,872 sq. m., broken by mountain ranges into numerous broad fertile valleys, chiefly lying in the tierra templada region. The isthmus districts, however, have lower elevations and are distinctly tropical. The coast line is 329 m. long; behind it is a narrow strip of lowlands lying within the tierras colientes. In places this strip nearly disappears, the sierras rising almost immediately from the seashore. The culminating points within the state are Zempoalpetit (11,145 ft.) above sea-level, standing on the eastern margin of the beautiful Oaxaca Valley, and the Cerro del Leone, south-west of Tehuantepec, the highest summit in the Sierra Madre del Sur. Tributaries of the Mescala drain the western quarter of the state, among which is the Ayocac or headstream of the Mescala, which rises in Tlaxcala, and flows across the state of Puebla. The streams flowing northward to the Gulf coast are the Coastzacoalcos and Papalopam with their tributary, the San Juan, all flowing across the state of Vera Cruz. The Papalopam is navigable up to the town of Tuxtepec, in the state of Oaxaca. The largest of the Pacific coast streams is the Tehuantepec, which with its many tributaries has an aggregate length of 182 m. The Rio Verde has its source farther inland and drains the Oaxaca Valley, but its tributaries are small and less numerous. The only ports on the coast open to foreign trade are Salina Cruz, Papelopam, and Tuxtepec. The Pacific terminus of the Tehuantepec railway, with a spacious artificial harbour, and the second a deep but narrow natural harbour, the projected coast terminus of the Mexican Southern railway. The greater part of the state has a sub-tropical climate, with high sun temperatures, moderate rainfall and mild, healthful conditions. The less healthful regions include the isthmus districts, the coastal area on the Pacific and the low country on the border of Vera Cruz. Agriculture is the principal occupation of the people; the chief products are Indian corn, wheat, coffee, sugar, rubber, cotton, cacao, tobacco, indigo and a great variety of tropical fruits. Among the manufactured products are cotton, woolen and "pita" fibre fabrics, sugar, rum, mescal, beer, furniture, pottery, soap, candles, leather, matches, chocolate, flour and cigarettes. Two important railway lines traverse the state—the Tehuantepec (trans-isthmus) line between the ports of Salina Cruz and Coatzaocoalcos (Puerto Mexico), and the Mexican Southern line (narrow-gauge) from Puebla to Oaxaca, with branches to San Gerónimo on the Tehuantepec line with the Guatemalan frontier as its destination, and toward Puerto Angel on the coast. Two of the most progressive Indian races of Mexico are the Papalopam and Mixtecan descendents. It is believed that some of the prehistoric races who built the remarkable cities where the ruins of Mitla and Monte Alban (see CENTRAL AMERICA:
The Arabic 'Abdallah, Taimallah, 'Abd Manat, &c., the Hebrew Abdil and Obad Edom, and many Phoenician forms.1 "The vision of Obadiah" bears no date, or other historical note, nor can we connect Obadiah the prophet with any other Obadiah of the Old Testament,1 and our only clue to the date and composition of the book lies in internal evidence.

The prophecy is directed against Edom. Yahweh has sent a messenger forth among the nations to stir them up to battle against the proud inhabitants of Mount Seir, to bring them down from the rocky fastnesses which they deem impregnable. Edom shall be not only plundered but utterly undone and expelled from his borders, and this he shall suffer (through his own folly) at the hand of trusted allies (vers. 1-9). The cause of this judgment is his cruelty to his brother Jacob. In the day of Jerusalem's overthrow the Edomites rejoiced over the calamity, grasped at a slavager of the spoil, failed to lay that Joel used the earlier (vers. 10-14).

But now the day of Yahweh is near upon all nations, Edom and all the heathen shall drink full retribution for their banquet of carnage and plunder on Yahweh's holy mountain. A rescued Israel shall dwell in Mount Zion in restored holiness; the house of Jacob shall regain their old possessions; Edom shall be burned up before them as chaff before the flame; they shall spread over all Canaan, over the mountain of Edom and the south of Judah, as well as over Gilead and the Philistines and Phoenician coast. The victorious Israelites shall come up on Mount Zion to rule the countenance of Edom, and the kingdom shall be Yahweh's (vers. 15-21).

The most obvious evidence of date lies in the cause assigned for the judgment on Edom (vers. 10-14). The calamity of Jerusalem can only be the sack of the city by Nebuchadrezzar (586 B.C.); the malevolence and cruelty of Edom on this occasion are characterized in similar terms by several writers of the exile or subsequent periods, but by none with the same circumstance and vividness of detail as here (Ezek. xxv. 8, 12 f., xxxv. ; Lam. iv. 21; Psalm cxxxvii. 7). The prominence given to Edom, and the fact that Obadiah is not mentioned at all, make it probable that the passage was not written in Babylon. On this evidence, taken alone, we should be justified in saying that the prophecy was written at some time after 586 B.C., at a period when misfortunes incurred by Edom were interpreted as a Divine judgment on its unforgotten treachery in that year of tragedy.

The critical problem is, however, complicated by certain phenomena of literary relationship.2 Obad. 1-6, 8 agree so closely and in part verbally with Jer. xlix. 14-16, 9, 10, 7 that the two passages cannot be independent; nor does it seem possible to divide the original into two fragments and to regard one or both of them as the work of a later author. The parallelism used in Jer. and Obad. is a well-known and characteristic feature of Biblical prophecy, and the parallel passages in Is. xlvii. 1 f., xlix. 16, xvi., and the prophecy of Balaam. Scholars who do assign to Jeremiah the prophecy to Edom (Jer. 604 B.C. (e.g. Driver, L.O.T. chap. vi. § 4), explain this relationship by assuming with Ewald (Propheten, i. 489 f.), Graf (Jeremia, p. 538 f.), Robertson Smith and others, that Jeremiah and our book of Obadiah alike quote from an older oracle. Others, however, who do not regard Jer. xlix. as Jeremiahic, explain the relationship as one of dependence on Obadiah. This explanation, simpler in itself, is not discredited by the fact that in some details (cf. Obad. 2 and Jer. xlix. 15) the text

1 An early Hebrew tradition recorded by Jerome (Comm. in Obb.) identified the prophet with the best-known Obadiah of the historical books, the protector of the prophets in the reign of Ahab (1 Kings xvii).

2 Between Joel and Obadiah there are points of material and verbal agreement close to those of the Babylonian Joel (Joel iii. 19—Ob. 10, 14; Joel iii.5—Ob. 11; Joel ii. 32, iii. 7—Ob. 17),
of the dependent passage may be preferable to that of the original. On this latter, and more probable, view (taken by Wellhausen, Nowack and Marti) there is no need to separate Obad. 1-7 from 10-14. The immediate occasion of the prophecy I was doubtless the pressure of Nebuchadnezzar against Tyre and the "men of thy peace," "the men of my covenant," "the men of thy peace," v. 7 upon Edom, which had resulted, by 312 B.C. at latest, in the occupation by Arabs of Petra, the chief city of the Edomites (Wellhausen, p. 214). But the desolation of Edom has already been accomplished in the time of Malachi i. 1-5, a passage belonging to the earlier half of the 5th century. We may, therefore, with Wellhausen, Nowack and Marti, assign Obadiah 1-14 to the same period.

The remainder of the book, vers. (15) 16-21, must belong to a later date. That the book of Obadiah, short as it is, is a complex document might have been suspected from an apparent change of theme in the last verse. It is in the former verses Edom is destroyed by his allies, and they occupy his territory, but in the latter he perishes with the other heathen in the day of universal retribution, he disappears before the victorious advance of Israel, and the southern Judaeans occupy his land. The ideas of this passage belong to the eschatological outlook of later centuries, but afford no data for chronology. The conceptions of the "rescued ones" (R.V. "those that escape," v. 17), of the sanctity of Zion, of the kingship of Yahweh, are the common property of the post-exilic writers. The restoration of the city of Sion is mentioned, and the scene of action is in the kingdom of Judah. The Philistines are ideas as old as Amos ix., Isa. xi. 14; but such passages represent this conquest as a suzerainty of Israel over its neighbours, as in the days of David, while in Obadiah, as in other later books, the intensified antithesis—religious as well as political—between Judah and the surrounding heathens finds its expression in the idea of a consuming judgment on the latter—the great "day of Yahweh." The chief interest of the book of Obadiah lies in its references to the historical relations between Israel and Edom. From the point of view of religion, we may notice the emphasis on the doctrine of strict retribution (vers. 12, 15), which remains applicable to other peoples, even when its inadequacy as a complete theory of providence has been slowly and painfully discovered in the case of Israel itself.

OBAN, a municipal and police burgh and seaport of Argyllshire, Scotland. Pop. (1901) 5374. It is situated 113 m. N.W. of Glasgow by the Caledonian railway via Stirling and Callander, and about the same distance by water via the Crinan Canal. The fine bay on which it lies is screened from the Atlantic gales by the island of Kerrera (44 m. long by 2 m. broad), which practically converts it into a land-locked harbour. Being also sheltered from the north and east by the hills at the foot of which it nestles, the town enjoys an exceptionally mild climate for its latitude. The public buildings include the Roman Catholic pro-cathedral, erected by the 3rd marquis of Bute, the county hall, and the hospital. 1 Wellhausen and Nowack regard vers. 8, 9 as a later addition, intended to apply vers. 1-7 to the future; so Marti, who groups with these verses vers. 15, 16, because of the common reference to "the day of Yahweh." The Judaeans are addressed in vers. 16 ("as ye have drunk

drink") not the Edomites. Verse 20 anticipates that the exiles from northern Israel will occupy Phenician territory, whereas all but "which are in Sepharad" will occupy the southern districts in the Messianic restoration. Sepharad has been connected with various places, but now, as the nearest t. next to the West, Marti, in his Smaller Dodekapropheton, adopts Darius in the Behistun inscription (Robertson Smith); whilst, according to Winckler (K.A.T. i. 301), it is the name, from the Persian period onwards, for Asia Minor. Many of the Jews were doubtless familiar with the name, and the idea was strong, but Sepharad is a large geographical term of uncertain area, and Asia Minor was a chief seat of the Diaspora at an early date (comp. Gutschmidt, Neue Beitrdge, p. 77), so that "Sepharad" in itself does not supply ground for Hitzig's argument that Obadiah was written in the second century B.C., when a good many Jews were transplanted to Asia Minor (Jos. Anti. xii. 3). Buildings and two hospitals. It is the centre of tourist traffic for western Argyllshire and the islands. Oban was a small village at the date of Johnson's visit during his Hebridean tour; in 1786 it became a government fishing station; it was made a burgh of barony in 1811 and a parliamentary burgh in 1832. With Ayr, Campbeltown, Inveraray and Irvine (the Ayr burghs) it unites to send one member to parliament.

At the north end of the bay stands the ruin of Dunolly Castle, the old stronghold of the Macdougalls of Lorne, whose modern mansion adjoins it. In the grounds is a huge conglomerate rock called the Dog Stone (Clock-a-choin), from the legend that Fingal used to fasten his favourite dog Bran to it. About 3 m. N.E. are the ruins of Dunstaffnage Castle. It was here that the "Stone of Destiny," now contained in the base of the coronation oath, was deposited at the instance of its removal to Scone. At the south end of the island of Kerrera stood the ruins of Gylen Castle, an old fortalice of the Macdougalls.

OBLIGATO, or Obligato, in the modern sense, a musical term (adopted from the Italian, and strictly meaning obligatory or binding) for an instrumental accompaniment to a musical composition which, while in one way independent, is included by the composer on purpose and in a prescribed form, instead of being left to the discretion (ad libitum) of a performer.

OBEISL (Gr. ὁμιλεσθις, diminutive of ὁμιλέω, a spire), a form of monumental pillar; and also the term for a bibliographical reference-mark in the form of a dagger. The typical Egyptian obelisk is an upright monolith of nearly square section, produced in diameters in height, the sides slightly convex, tapering upwards very gradually and evenly, and terminated by a pyramid whose faces are inclined at an angle of 60°. Obtelisks were usually raised on pedestals of cubical form resting on one or two steps, and were set up in pairs in front of the entrance of temples. Small obelisks have been found in tombs of the age of the Old Kingdom. The earliest temple obelisk still in position is that of Senwosri I. of the XIth Dynasty at Helipolis (68 ft. high). A pair of Rameses II. (77 and 75 ft. high respectively) stood at Luxor until one of them was taken to Paris in 1831. Single ones of Tethmosis I. and Hatshepsut (109 ft. high) still stand at Karnak and remains of others exist there and elsewhere in Egypt. Colossal granite obelisks were erected by only a few kings, Senwosri I. in the Middle Kingdom and Tethmosis I., Hatshepsut, Tethmosis III. and Rameses II. of the Empire. Smaller obelisks were made in the Saite period. The Romans admired them, and the emperors carried off some from their original sites and caused others to be made in imitation (e.g. that for Antinous at Benevento) twelve are at Rome, one in Constantinople, and two, originally set up by Tethmosis III. at Heliopolis, were taken by Augustus to adorn the Caesareum at Alexandria: one of these, "Cleopatra's Needle," was removed in 1877 to London, the other in 1879 to New York. Such obelisks were probably more than mere embellishments of the temples. The pyramids were sheathed in bright metal, catching and reflecting the sun's rays as if they were Thrones of the sun. They were dedicated to solar deities, and were especially numerous at Heliopolis, where there was probably a single one sacred to the sun of immemorial antiquity. The principal part of the sun-temple at Abu sir built by Neueserrê of the Vth Dynasty several centuries before it have been removed to the Pyramids of Giza on a vast scale, only the base now remains, but hieroglyphic pictures indicate this form. The hieroglyph of some other early sun-temples shows a disk on the pyramidion. The material employed for the great obelisks was a pink granite from the quarries of Syene, and in these quarries there still remains, partially detached, an example 70 to 80 ft. long. The largest obelisk known is that in the piazza of St John Lateran at Rome; this had been set up by Tethmosis III. at Helipolis in the 18th century B.C., was brought over from Egypt by Constantine the Great and erected in the Circus Maximus, being ultimately re-erected in 1552 by Pope Sixtus V. It was 45 ft. 9 in., including the pyramidion, and its sides measured 9 ft. 10 in. and 9 ft. 8 in. respectively. On the base of the magnificent
OBERAMMERGAU—OBERLIN, J. F.

obelix of Hatshepsut at Karnak, 97 ft. 6 in. high, there is an inscription stating that it and its fellow were made within the short space of seven months. In consequence of the breaking away of the lower part of "Cleopatra's Needles" when removed to Alexandria and re-erected, the Roman engineers supported the angles on bronze crabs, one of which with three repose actions now supports the angles of the obelix on the Thames Embankment.

There was another form of obelix, also tapering, but more squat than the usual type, with two of the sides narrow and terminating in a rounded top. One such of Senwosri I., covered with sculpture and inscriptions, lies at Esqig in the Fayum. Stelae, inscribed with the names of the kings, occurred in pairs in the royal tombs of the Ist Dynasty at Abydos, and pairs of small obelisks are said to have been found in private tombs of the IVth Dynasty. The origin of the obelix may be sought in sacred upright stones set up in honour of gods and dead, like the mehirs, and the Semitic Massebahs and bethels.

In Abyssinia, at Axum and elsewhere, there is a marvellous series of obelisk-like monuments, probably sepulchral. They range from rude mehirs a few feet high to elaborately sculptured monoliths of 100 ft. The loftiest of those still standing at Axum is about 60 ft. high, 8 ft. 7 in. wide, and about 18 in. thick, and is terminated by a rounded apex united by a necking to the shaft. The back of the obelix is plain, but the front and sides are subdivided into stories by oblong panels, each story having half a circle sunk into it, which seem to represent windows with mullions and transom. These architectural decorations are derived from a style of building found by the recent German expedition extant in an ancient church; courses of stone here alternate in the walls (both inside and out) with beams of wood held by circular clamps. In front of the best-preserved obelix is a raised altar with holes sunk in it apparently to receive the blood of the sacrifice to the ancestors. Most of these must date before the adoption of Christianity as the state religion in the 6th century.

OBERAMMERGAU, a village of Bavaria, Germany, district of Upper Bavaria, situated amongst the foot-hills of the Alps in the valley of the Ammer, 64 m. S.S.W. of Munich. Pop. about 1,000. It is remarkable for its gaily painted houses, alpine toys, and carving crucifixes, rosaries and images of saints.

The place is famous for their representation of a Passion Play every tenth year (e.g. in 1910), to which thousands of visitors flock. This dramatic representation of the sufferings of Christ is not a survival of a medieval mystery or miracle-play, but took its rise from a vow made by the inhabitants in 1633, with the hope of staying a plague then raging. The original text and arrangements were probably made by the monks of Ettal, a monastery a little higher up the valley; but they were carelessly remodelled by the parish priest at the beginning of the present century, when the Oberammergau play obtained exemption from the general suppression of such performances by the Bavarian government. The music was composed by Rochus Dedler, schoolmaster of the parish in 1814. The performances take place on the Sundays of summer, in a large open-air theatre holding 6000 persons, and each lasts about nine hours, with a short intermission at noon. Each scene from the history of Christ is prefaced by a tableau of typical import from the Old Testament. About 700 actors are required, all belonging to the village. The process of the performances are devoted to the good of the community, after defrayal of the costs and payment of a small remuneration to the actors. The villagers regard the Passion Play as a solemn act of religious worship, and the performances are characterized by the greatest reverence.

The principal parts are usually hereditary in certain families, and are assigned with regard to moral character as well as dramatic ability. It is considered a disgrace not to be allowed to take part in the play, and the part of Christ is looked upon as one of the greatest honours.

Edward Devrient (in 1856) was among the first to direct general attention to Oberammergau; and numerous accounts have since appeared. An English version of the text of the Passion Play has been published (1861). (B. H. 1868.)

OBERHAUSEN, a town in Germany, in the Prussian Rhine province. It is situated 5 m. from the east bank of the Rhine, 20 m. N.E. of Düsseldorf, on the main line of railway to Hanover and Berlin, and at the centre of an important network of lines radiating hence into the extensive Westphalian coal and iron fields. Pop. (1905) 52,006. The town possesses large ironworks, coal-mines, rolling-mills, zinc smelting-works, railway workshops and manufactures of wire-rope, glass, chemicals, porcelain and soap. The first houses of Oberhausen were built in 1845, and it received its municipal charter in 1874.

OBERLÄNDER, a town of Germany, in the Prussian province of Hesse-Nassau, on the right bank of the Rhine, at the confluence of the Lahn 4 m. above Coblenz, on the railway from Cologne to Frankfort-on-Main. Pop. (1905) 8472. It still retains parts of its ancient walls and towers, and possesses a castle, the Schloss Martinsburg, formerly the residence of the electors of Mainz, and the chapel, Marien Kapelle, in which the German king Wenceslaus was deposed by the electors in 1400. Near the town is the castle of Lahneck, built about 1290, destroyed by the French in 1689, and restored in 1834. In the neighbourhood are lead and silver mines. See J. Wegeler, Lahnw. und Oberlånderstein (Trier, 1881).

OBERLÄNDER, ADAM ADOLF (1845— ), German caricaturist, was born at Ratisbon, but after 1847 lived in Munich. He studied painting at the Munich Academy under Piloty, and soon discovered that the true expression of his genius was in the field of caricature and comic drawings. He joined the staff of the Fliegende Blätter, to which he became a constant contributor. Unlike Busch, whose aim was the utmost simplicity of line and whose drawings form a running commentary to the legend, Oberländer's work is essentially pictorial, and expressive in itself, without the extraneous aid of the written line. Among his best drawings are his parodies on the style of well-known painters, such as the "Variations on the Kissing Theme." His works have been collected in the Oberländer-Album, published by Braun and Schneider in Munich.

OBERLIN, JEAN FRÉDÉRIC (1740-1826), German Protestant pastor and philanthropist, the son of a teacher, was born on the 31st of August 1740 at Strassburg, where he studied theology. In 1766 he became Protestant pastor of Waldbach, a remote and even regional town (B. 1782, 206), a task he held on the Vosges on the borders of Alsace and Lorraine. He set himself to better the material equally with the spiritual condition of the inhabitants. He began by constructing roads through the valley and erecting bridges, inviting the prosperity to the enterprise by his personal example. He introduced an improved system of agriculture. Substantial cottages were erected, and various industrial arts were introduced. He founded an itinerant library, originated infant schools, and established an ordinary school at each of the five villages in the parish. In the work of education he received great assistance from the founder of the Oberlin Institute, Ezra影视 (1745-1835). He died on the 1st of June 1826, and was interred with great manifestations of honour and affection at the village of Urbach.

Among the many accounts of the labours of Oberlin, mention may be made of Thomas Sims, Brief Memorials of Oberlin (London, 1830); Memoirs of Oberlin, by the Notice of Louis Schepper (London, 1838, 2nd ed. 1852); H. Ware, Biography of Oberlin (Boston, 1845); L. Spach, Oberlin le Pasteur (Strassburg, 1865, 2nd ed. 1868); F. W. Bodemann, J. F. Oberlin (3rd ed., 1879); K. F. Riff, Drei Briefe und einem dem Leben von Pastor Oberlin (Strassburg, 1840); Josephine Butler, Life of J. F. Oberlin (1882); G. H. von Schubert, Züge aus dem Leben Oberlins (11th ed., 1890); Armin Stein, Johann Friedrich Oberlin, ein Lebensbild (1891). See also the article on Hermann Hauck, Restauraevölubidei. The collected writings of Oberlin were published by Burkhardt at Stuttgart in 1843 in 4 vols.
OBERLIN, J. J.—OBIT

OBERLIN, JÉRÔME JACQUES (1735-1806), Alsatian philologist and archaeologist, brother of Jean Frédéric Oberlin, was born at Strasbourg on the 8th of August 1735. While studying theology at the university he devoted special attention to Biblical archaeology. In 1755 he was chosen professor at the gymnasium of his native town, in 1763 librarian to the university, in 1770 professor of rhetoric, and in 1782 of logic and metaphysics. Oberlin published several manuals on archaeology and ancient geography, and made frequent excursions into different provinces of France to investigate antiquarian remains and study provincial dialects, the result appearing in Essai sur le patois Lorrain (1753); Discours sur les Minnesinger (1782-1790); and Observations concernant le patois et les mœurs des gens de la campagne (1791). He also published several editions of Latin authors. He died on the 10th of October 1806.

OBERLIN, a village of Lorraine county, Ohio, U.S.A., 34 m. W.S.W. of Cleveland. Pop. (1890) 4376; (1900) 4082 (614 negroes); (1910) 4365. It is served by the Lake Shore & Michigan Southern railway, and by the Cleveland & South-Western (electric) railway, which furnishes connections directly with Cleveland and Elyria, and at the village of Wellington (about 17 m. S.) with the Cleveland and Cincinnati, St Louis, and the Wheeling & Lake Erie railways. Oberlin is primarily an educational centre, the seat of Oberlin College, named in honour of Jean Frédéric Oberlin, and open to both sexes; it embraces a college of arts and sciences, an academy, a Theological Seminary (Congregational), which has a Slavic department for the training of clergy for Slavic immigrants, and a conservatory of music. In 1906 it had twenty buildings, and a Memorial Arch of Indian buff limestone, dedicated in 1903, in honour of Congregational missionaries, many of them Oberlin graduates, killed in China in 1899. Its libraries contained a 1906 98,000 bound volumes and an equal number of pamphlets, and the college had a faculty numbering 113 and a student enrolment of 1944. The resources of the college in 1909 were about $3,500,000. Under the editorship of a professor emeritus is published the Bibliotheca Sacra, a quarterly founded in 1843, and for many years the organ of the Andover Theological Seminary.

The village was founded as Oberlin College in 1833 (in 1846 it was incorporated as the village of Oberlin), by the Rev. John J. Shipherd (1803-1844), pastor of a church in Elyria, and the Rev. Philo Penfield Stewart (1798-1868), professor of missions to the Chocotaws of Mississippi, as a home for Oberlin College Institute, which was chartered in 1834; the name Oberlin College was adopted in 1850. To the Theological Seminary, opened in 1835, there came in the same year forty students from Lane Theological Seminary in Cincinnati, after the discussion of slavery there had been forbidden by its board of trustees. A former member of the board, Asa Mahan (1800-1880), who had strongly disapproved of the action of the trustees, came to Oberlin, and became the first president of the college. Oberlin was the first American college to adopt coeducation of sexes. Oberlin was a pioneer in America (1835) in the coeducation of the white and black races.1 The village became a station on the Underground Railway, and an important centre of anti-slavery sentiment. Manual labour was adopted at first as a means for students to defray their college expenses. As late as 1906 it was estimated that nearly two-thirds of the men were to a greater or less degree self-supporting, as were many of the young women. What is known as the "Oberlin Theology" (no longer identified with the college) centred in the teaching of Charles Grandison Finney (1792-1875), who became professor of theology in 1835 and was Mahan's successor in 1851-1856. He was a powerful preacher and teacher, who broke from Calvinism in denying imputation and teaching perfect freedom of the will, by which perfect holiness might be attained. Finney carried on remarkable revival services in Western New York, in Philadelphia (1828), in New York City (1829-1830 and 1832), the New York Evangelist being founded to carry on his work, in Boston (1831, 1842-1843, 1856-1857), in London (1840-1850) and throughout England and Scotland (1858).

James Harris Fairchild (1817-1902) was president from 1866 to 1889; William Gay Ballantine (b. 1843), a distinguished Hebrew scholar, was president in 1891-1896, and John Henry Barrows (1847-1902) from 1896 to 1899, when he was succeeded by John Churchill King (b. 1858).

The modern theological position of Oberlin college is reflected in the writings of President King and of Dean Edward L. Bosworth (b. 1861) of the Theological Seminary, especially in President King's Reconstruction in Theology (1901); and Theological and the Social Consciousness (1902); The Seeming Unreality of the Spiritual Life (1908) and The Synagogue and the Church.

See Finney's autobiographical Memoirs (New York, 1876); J. H. Fairchild, Oberlin, the College and the Colony (Oberlin, 1883); D. L. Fairchild, The Story of Oberlin (Boston, 1898); and A. T. Swing, Life of J. H. Fairchild (New York, 1907).

OBERON (Fr. Alberon, Auberon, Ger. Alberich, i.e. rich, Goth. reiks, "ruler"—cf. Lat. rex—and O.H. and M.H. Ger. pl. elbe, elbe, "elves," pl. alp), king of the elves. In the legendary history 2 of the Merovingian dynasty he figures as a magician, and is the brother of Merowech (Mérovide). He wins for his eldest son Walbert the hand of a princess of Constantinople. In the Nibelungenlied he guarded the treasure of the Nibelungs, but was overcome by Sigfried. In the German medieval poem Orfei, the hero is aided in his wooing by his father Alberich, the dwarf who guards the dwarf-king's domain, and who possesses a similar rôle in Huon of Bordeaux (q.v.). The fairy element in the romance provided Shakespeare with the fairy scenes of the Midsummer Night's Dream, and Wieland with the subject of his epic Oberon (1780). Ben Jonson wrote a masque of Oberon, or the Fairy Prince (Works, 1616). Weber's opera, Oberon, to the words of J. R. Planché, was first produced at Covent Garden on the 12th of April 1826. In the Wagner dramas Alberich is the Nibelung who steals the magic gold from the Rhine maidens. He is there the father of Hagen, and has in the character of guardian of the treasure should be compared Andvari, the dwarf of Scandinavian legend, who, in the shape of a pike, was seized by Loki and made to give up his treasure and the magic ring by which the dwarfs create more gold. This ring, the Andvaranaut, with the curse of Andvari upon it, caused the misfortunes of the Volsungs and the Burgundian Nibelungs, and is known in German romance as the Ring of the Nibelungs.

OBERSTEIN, a town of Germany, in the principality of Birkenfeld, belonging to the grand duchy of Oldenburg, on the River Nahe, c. S.W. of Kreuznach, by the railway to Müllersam-Stein. Pop. (1905) 6660. It is famous for the cutting and setting of agates and other precious stones, an industry which has been established here, and in the neighbouring township of Idar, since the 16th century. The Evangelical church, built in the 12th century and restored in 1482, is partly hewn out of the solid rock. On the hills above the town are the ruins of two castles.

See Hinschirch. Die Idar-Obersteiner Industrie (Oberstein, 1894).

OBIT (through O. fr., from Lat. obitus, death, obire, to go down, to die, a term for death, formerly used for the account of the reign of a Pope). The last history of Pope Hadrian (12th century) was the authority of John of Huesey (14th century) in his Annales historiae til. principis, Honononie (Mon. Germ. xxx), where there is an account (bk. ix. ch. 6) of Alberich.

1 A runaway slave. Littlejohn, taken at Oberlin in September 1858 by a United States marshall, but was rescued at Wellington. Several of the rescuers, notably Professor Henry Everard Peck of Oberlin College, were arrested and were imprisoned in Cleveland for several months. This was a famous fugitive slave case.
OBJECTIVE or OBJECT GLASS, the lens of any optical system which first receives the light from the object viewed; in a compound system the rays subsequently traverse the eye-piece. The theoretical investigations upon which the construction of an optical system having specified properties is based, are treated in the article aberration, and, from another standpoint, in the article DIFFRACTION. Here we deal with the methods by which the theoretical deductions are employed by the practical optician. It should be noted that the mathematical calculations provide data which are really only approximations, and consequently it is often found that a system constructed on such data requires modification before it fulfils the practical requirements. For example, take the case of a photographic objective. Calculations of the paths of two extreme rays in the meridional section of an oblique pencil of large aperture may prove that the rays intersect on a plane containing the axial focus, but similar calculations of many other rays would be necessary before the mean point of intersection could be settled with precision. Suppose, however, that the optician has accurately realized the results of the mathematician, he can then determine the divergence of the practical from the theoretical properties by measuring the positions and conformation of the most distinct or mean foci, and, if sufficiently acquainted with the theory of the construction, he can modify one or more curvatures or thicknesses and so attain to a closer agreement with the ideal. Theory and practice co-operate in the realization of an original system. The order is not always the same, but generally the mathematician, by the laborious calculations, supplies the data which are at first closely followed by the constructor and afterwards modified in accordance with experimental observations. In addition to the problem of constructing an original system, the optician has to deal with the reproduction of a realized system in different sizes. Two questions then arise: (1) To what degree of accuracy the radii of curvature can, or should, be repeated, and (2) to what degree of uniformity the surfaces can, or should be figured. With regard to the first point there is no great difficulty in working the requisite iron or brass tools of any curvature to within an error of \( \frac{1}{10} \)th% of the radius; male and female templates being used for very deep curves, and the spherometer for tools of longer radii (by appropriate grinding together, the radii are alterable at will within narrow, but sufficient, limits). The accuracy attained in the grinding, however, is open to very perceptible modification by the subsequent polishing and figuring processes. This is particularly undesirable in the case of deep curves and large apertures. A variation in a radius of curvature may occasion a little spherical aberration at the axial focus, but if the amount be small it may be neutralized by imparting to the lens a parabolic form approximately.

With optical systems which transmit large pencils with considerable obliquity (such as wide angle photographic objectives) the curves are very deep, and a departure from the true radius which would be tolerated in a telescope cannot be permitted here. Such lenses are usually tested by means of a master curve worked in glass. The master curve is fitted to the experimental lens, and an inspection of the interference fringes shows the quality of the fit—whether it be perfect, or too shallow or too deep. In general, workmanship here may be minimized, and the optician is led to correct the divergence. Flat surfaces are tested similarly. This test by contact has been strongly advocated and has been regarded as sufficient to detect all irregularities of any moment. This claim, however, is not justified, for the test is not sensitive to errors sufficient in amount to render a telescope objective almost valueless; but such errors are easily discernible by other optical devices. In general, accuracy in the radii of curvature is of primary importance and trueness of figuring is of secondary importance in photographic objectives, while the reverse holds with telescopic objectives; in wide angle photographic objectives, in fact, the accuracy of the radii of curvature is of the utmost importance.

Eye pieces do not require the same degree of accuracy either in the curvature or the figuring. A rough idea of the exactitude to which the figuring of the finest telescope objectives must be carried out is readily deduced. If two slips of paper, bearing printed letters \( \frac{1}{2} \) of an in. high be placed in almost exact alignment, one 31-2 in. from the eye and the other 39 in., and viewed in moderate daylight with the eye having a pupillary aperture of \( \frac{1}{4} \) of an in., one set of the letters will be legible while the other is not. In this case the difference of convergence or refracting power exercised by the eye in transferring its focus from one slip to the other is \( \frac{1}{4} \) or one quarter dioptr. If an image on the retina is \( \frac{1}{4} \) dioptr out of focus, then each point of the object is represented by a circle of the focus in \( \frac{1}{4} \) of the correct radius of curvature. If the pupil be 5 in. in diameter, the focal length of the eye being assumed to be 0-5 in. and the pupillary aperture \( \frac{1}{4} \) of an in. If the effective aperture of the eye be 1 in., then the real size of the object is \( \frac{1}{4} \) the size of the disk of confusion. With this standard, the size of the disk of confusion will be the same (viz. 0-0004 in.) if the retinal image be \( \frac{1}{4} \) dioptr out of focus. In general, for a constant size of the circle of confusion or, in other words, the same amount of visual blurring, the apertures of the pencil traversing the pupil and the focussing errors (expressed in quarter dioptries) vary inversely.

If a portion of a figured surface of a telescope objective differs in curvature from the major portion of the lens so as to form a circle of confusion on the retina of a diameter not less than \( 2'45 \)", it is clear that the lens is faulty, the image formed by the perfect portion being correct, and what is more, that formed by the imperfect portion blurred to the extent above determined, and to a greater extent if we allow for the effect of diffraction in the formation of the image. For example, a protuberance 1 in. in diameter at the centre of an objective glass of 13 in. in diameter, refracting to a separate focus would theoretically form a spurious disk of about 5 seconds diameter, which would subtend a diameter of 50 minutes at the retina under a power of 600. If the protuberance is \( 2'45" \) as the maximum diameter of a geometric circle of confusion permissible in a telescopic object glass, we proceed to determine the heights of the protuberance or depression which causes it. For the equation \( \frac{1}{4} \) th of the square of the radius of the objective (the back focal length in the case of the microscope) the linear error at the focus of the eye-piece is \( 1,1/45 \), or, expressed as a variation of \( 1/F, 1/45(f/F)^2 \), or \( (A/A')2 \). If a lens has one side plane and is worked to a mathematically sharp edge, its thickness \( t \) at the centre is (approximately) \( A'8r \), where \( A \) is the whole aperture and \( r \) the radius; and if \( g \) be the equivalent focal length and \( m \) the refractive index, we may write \( g = m(\mu - 1) \) and obtain:

\[
\text{obturator} = \frac{1}{2} (1 - \frac{1}{A})
\]
OBJECTIVISM—OBLIGATION

It is clear that for lenses in which the focal length is large compared with the aperture, the thickness is independent of the shape of the lens so long as the focal length and aperture remain constant. Consequently, any polisher may be regarded as a thin lens with unusually sharp edges accurately fitted to a perfectly regular spherical surface. Substituting for \( t \) the \( \frac{1}{F} \) of \( f \) obtained above it follows that:

\[
A^2 = \frac{t}{8(n-1) f^2}
\]

(2).

The effective aperture of the eye has been supposed to be \( \frac{1}{2} \) in.; calling this \( P \), it is then obvious that since \( F = \frac{F}{P} \) is the theoretical aperture of objective requisite to support an average pen-point. Substituting \( \frac{F}{P} \) for \( A \) in equation (2) we obtain:

\[
t^2 = \frac{P^2}{8(n-1)} \times 156
\]

(3).

This relationship gives the thickness of a meniscus protuberance fitted to an objective (assumed to have an unlimited aperture) which fills the aperture and allows the maximum permissible. If \( F = 1 \), \( t \) is equal to \( 1/2 \). If the thickness \( F \) corresponds to the aperture \( A \), and then for another \( A \) to produce the same blur we must have \( A^2 = \frac{A^2}{F^2} \), i.e., the focal length of the protuberance, and therefore the thickness \( t \) must vary as \( A \). Consider a telescope of 12 in. aperture, focal length of objective (f) = 180 in., focal length of eye-piece (f) = 36 in., and magnifying power = 1000. The theoretical requisite to transmit the pupillary pencil of \( 1 \) in. aperture is \( 4 \times 1000 = 75 \) in. If the permissible protuberance cover the entire aperture of 75 in., its thickness would be \( 1/3939.3 \) in. as above, but if we calculate the maximum permissible, the thickness would be \( 1/75 \times 13939.3 \) in. = \( 1/3939.3 \) in. of the latter protuberance is assumed to fill only \( \frac{A}{2} \) of the aperture of the objective, the required thickness is formed to 75 quarter dioptrers or \( \frac{75}{4} \). If we take the power of the eye-piece to be \( 1/3 \) in. and subtract from it 75/156, we obtain \( 1/35 \), so that \( \frac{A}{2} \) is.

Either the knife-edge test, or the more usual method of testing by examining the out-of-focus disks formed on the retina when the eye-piece is inside and outside its correct focus, would certainly show the effect of this protuberance, but it is a spot when inside focus, and a dark central patch when outside: a practised eye can detect one-half the above error, and a quarter when the power is 1200 instead of 600. It may be noticed that, unless the eye of the observer is truly at the focal plane of the telescope, it is only one quarter of that admitted in the refractor. In the case of a microscope objective of 10 in. back focal length-used with a 1 in. eye-piece, the aperture required to transmit the pupillary pencil of 1 in. aperture is \( 1/3 \) in. Moreover, the support of the protuberance or depression as \( \frac{A}{2} \) in. diameter, its thickness must be more than \( 1/3939.3 \) in. over the average level by more than the above defined amount is commonly practised, but much technical knowledge is necessary for success. It is a \( sine qua non \) that the material of the polisher should be as plastic and inelastic as is consistent with a moderate degree of hardness. The best material for large work is Stockholm pitch from which the greater part of the turpentine has been removed by evaporation, and the abrasive used is the finest brown and water. For small work certain preparations of fine sand in the form of powder, are used. Water is used as the lubricant. During delicate figuring temperature changes must be carefully avoided, otherwise burnishing or a figure for a large objective may be ruined by a polisher less than an inch in diameter worked at 200 to 300 deg. A mirror up to 5 in. in diameter in about a minute. Great care is required, for if the process be carried too far, the whole surface must be re-figured. Local retouching serves to remove those conspicuous zones of aberration to which a certain photographic lens of large relative aperture are necessarily liable. An annular channel is polished out at a mean distance equal to \( \frac{A}{2} \) of the semi-aperture from the centre of the lens, and this is carefully shaded off towards the centre and also towards the edge; this corrects the zone of rays which focus at a point short of the focus of the centre and edge rays. This correction is particularly necessary in the case of certain lenses designed for stellar photography. (H. D. T.)

OBJECTIVISM, in philosophy, a term used, in contradistinction to Subjectivism, for any theory of knowledge which to a greater or less extent attributes reality (or the source and necessary pre-requisite of knowledge) to the external world. The distinction is based upon the philosophical antithesis of the terms Object and Subject, and their respective adjectival forms: objective and subjective. In common use these terms are opposed to one another in a subjective-objective field, with "physical" and "imaginary," "practical" and "theoretical," "physical" and "psychic." A man "sees" an apparition; was there any physical manifestation, or was it merely a creation of his mind? If the latter the phenomenon is described as purely subjective. Subjectivism in its extreme form denies that mind can know more than its own states. Objects, i.e. things-in-themselves, may or may not exist: the mind knows only its own sensations, perceptions, ideal constructions and so forth. In a modified form "subjectivism" is that theory which attaches importance to the part played by the mind in the accumulation of experience. See PSYCHOLOGY; RELATIVITY OF KNOWLEDGE.

OBLATION, an offering (Late Lat. oblatio, from Offerre, oblatum, to offer), a term, particularly in ecclesiastical usage, for a solemn offering or presentation to God. It is thus applied to certain parts of the Eucharistic service in the Roman Church. There are "two oblations," the "lesser oblation," generally known as the "offertory," in which the bread and wine yet consecrated are presented, and the "greater oblation," the "oblation" proper, forming the latter part of the prayer of consecration, when "Body and Blood" are ceremonially presented. The word "oblate" is an ecclesiastical term for persons who have devoted themselves or have been dedicated as children by their parents to a monastic life. "Oblate" is more familiar in the Roman Church as the name of a religious congregation of secular priests, the Oblate Fathers of St Charles. They are placed under the absolute authority of the bishop of the diocese in which they are established and can be employed by him on duties he may think fit. This congregation was founded in 1578 under the name of Oblates of the Blessed Virgin Mary of St Charles Borromeo by (see BORROMEO, CARLO). There is a similar congregation of secular priests, the Oblates of Mary the Immaculate, founded at Marseilles in 1815.

OBLIGATION, in law, a term derived from the Roman law, in which obligation signified a tie of law (vinculum juris) whereby one person is bound to perform or forbear some act for another. The obligation of Roman law arose either from voluntary acts or from circumstances to which legal consequences were annexed. In the former case it was said to arise ex contractu, from contract, in the latter quasi ex contractu, ex delicto, or quasi ex delicto—(1) any duty imposed by law: (a) the special duty created by a vinculum juris; (3) not the duty, but the evidence of the duty—that is to say, an instrument under seal, otherwise called a bond; (4) the operative part of a bond. The third use of the word is chiefly confined to the older writers. Simplex and duplex obligation were the old names for what are now more commonly called a single and a double or conditional bond. The party bound is still called the obligor, the party in whose favour the bond is made the obligee. The
fourth, like the third, is a use scarcely found except in the older writers. The word "bond" is of course a mere translation of obligatio. Obligations may be either perfect or imperfect. A perfect obligation is one which is directly enforceable by legal proceedings; an imperfect or moral obligation (the naturalis obligatio of Roman law) is one in which the vinculum juris is in some respects incomplete, so that it cannot be directly enforced, though it is not entirely destitute of legal effect. 

A perfect obligation may become imperfect by lapse of time or other means, and, conversely, an imperfect obligation may under certain circumstances become perfect. Thus a debt may be rendered collateral by limitations and so cease to be enforceable. The obligation, however, remains, though imperfect, for if there be a subsequent acknowledgment by the debtor, the debt revives, and the imperfect obligation becomes again perfect. At one period there was some doubt among English lawyers whether a moral obligation could be regarded as sufficient consideration for a contract; it has now, however, been long decided that it cannot be so regarded.

American law is in general agreement with English, except in the case of Louisiana, where the terms obligor and obligee are used. The former is taken as the debtor and the latter as the creditor of Roman law. For art. 5522 of the Louisiana civil code obligor or debtor means the person who has engaged to perform some obligation, obligee or creditor the person in favour of whom some obligation is contracted, whether such obligation be to pay money or to do or not to do something. The term obligation is important in America from its use in art. i. s. r of the constitution of the United States, "No state...shall pass any...law...impairing the obligation of contracts." This does not affect the power of Congress to pass such a law. Contracts between private individuals are of course within the provision. So are private conveyances, charters of private corporations and statutory and other grants by a state. On the other hand, marriage and divorce, and arrangements which are political in their nature, such as charters of municipal corporations, licences to carry on particular trades or regulations of police are not within the provision. In order to fall within it, the law must act upon the terms of the agreement, and not merely upon the mode of procedure. If it act not upon the terms but upon the remedy, it impairs the obligation if it purport to be retrospective, but it is valid so far as it applies to subsequent contracts.

**OBNOXIOUS** (Lat. obnoxiosus, from ob, over, against, and nox, a word originally meaning "exposed to harm or injury," but now "exciting aversion or dislike." The current use dates from the later 17th century.

**OBOE**, or Hautboy (Fr. hautbois, Ger. Hocho, Ital. oboe), the treble member of the class of wood-wind instruments, having a conical bore and a double reed mouthpiece. The oboe consists of a conical wooden tube, composed of three joints, upper, middle and bell, and of a short metal tube to which are bound by many turns of waxed silk the two thin pieces of cane that form the mouthpiece. These pieces of cane are so bevelled and thinned at the ends which is taken into the mouth that the gentlest stream of compressed air suffices to set them vibrating. Practice has demonstrated that the reed stalk of which the double reed mouthpiece is made, should not be of narrower internal diameter than the pipe containing the column of air upon which it is destined to act. The player breathes gently into the aperture, which has the form of a very narrow ellipse, managing his breath as for singing. The vibrations of the double reed produce in the stream of compressed air issuing from the player's lips the rhythmical series of pulses necessary to generate sound waves in the stationary column of air within the main tube of the instrument.

In the upper and middle joints are the rings and keys covering lateral holes bored through the tube, by means of which the column of air, and consequently the wave length, may be shortened at will; the bell joint contains one or two keys normally open, which when closed extend the lowest register by lengthening the air column. These holes and keys produce the fundamental scale of the oboe, which possesses notes sufficient for an octave with all chromatic intervals. The next octaves are obtained by means of cross fingering (Fr. doigt fourche, Ger. Gabelgriff), and of the octave keys, which do not give out an independent note of their own, but determine a node in the column of air, whereby the latter divides and vibrates in two half sections producing the second harmonic overtone or octave. In order to obtain this result the player increases the pressure of his breath and also the tension of his lips against the reed.

The compass of the oboe is from $\text{\textit{G}}$ to $\text{\textit{F}}$, with all chromatic semitones. The G clef is used in notation and all notes are sounded as written.

The quality of tone or timbre depends primarily on the configuration of the sound waves (see Horn), which is influenced by the special characteristics of the mouth-piece: the musical tone of an instrument may be said to be due more directly to the presence or relative strength of the many harmonics which go to make up a composite tone or clang. The quality of the oboe tone resembles that of the E string of the violin, but is more nasal, more melismatic and shrillier. The lower register is thin and somewhat sweeter, approximating to the upper register of the cor anglais. But the timbre does not vary appreciably in the different registers, and to this want of variety in tone colour is due the unpopularity of the oboe as a solo instrument, although it is invaluable as a melody-leading instrument in the orchestra, balanced by clarinets and flutes.

The oboe lends itself admirably to pastoral music. The technical capabilities of the instrument are very varied. It is possible to play on it diatonic and chromatic scale and arpeggio passages, legato and staccato; leaps; cantabile passages; sustained notes, crescendo and diminuendo, grace notes and shakes (with reservations). The keys having many sharps and flats are the most difficult for the oboist.

The double reed is the most simple, as it is probably the oldest, of all reed contrivances. It is sufficient to flatten the end of a wheat straw to constitute an apparatus capable of setting in vibration by the breath conveyed. The column of air contained in the rudimentary tube; the invention of this reed is certainly due to chance. An apparatus for sonorous disturbance thus found, it was easy to improve it; for the wheat stalk a reed stalk was substituted, and in the extremity of its pipe another reed stalk much shorter in length was inserted, pared and flattened at the end; and then came the lateral holes, probably another discovery of the great inventor chance. For the reed tube a wooden one was substituted, still preserving the rudimentary tube, and in this form, after having played an important part amongst the sonorous contrivances of antiquity, that we find the ancestor of the oboe playing a part no less important in the 16th century, in which it formed the interesting families of the cromornes, the corhollis and the cernvels. All these families have disappeared from the instrumental combinations of Europe, but they are still to be found in Eastern wind instruments, such as the Caucausian salamart, the Chinese kwantse, and the hitshirishi of Japan.

It is impossible to say when it was that man first employed the phenomena of double reeds and conical pipes, but the knowledge of them must at least have been later than that of the cylindrical pipe, which we may regard as directly furnished by nature. That antiquity made use of them, however, has been proved by Gevaert in his admirable Histoire de la musique dans l'antiquite; but this learned author states that the double-reed pipes held an insignificant place in the instrumental music of ancient Greece and Rome, a statement which is open to challenge (see AULOS).
The first appearance of the instrument we call oboe in a musical work occurs in Sebastian Virdung’s Musikae getutscht und ausgesogen (1511). It bears the name of Schalmei, and is associated with an instrument of similar construction called Bombarde.

There exists, however, much earlier evidence, in the illuminated MS BNF, 7999, in the Library of the Escorial. The oboe was known during the early middle ages as Calamus, Chalumeau (France), Schalmei (Germany), Sazum (England). It is mentioned in the Roman de Brut (12th century) (line 16,922 seq.) “Lyre of Calamus, which produces such a sweet and pleasant sound of this kind, but a special cornemuse, used in the 17th century in concert with the hautbois de Poitou, had double reeds throughout in chalumeau and drone. The hautbois de Poitou was a primitive oboe, formed in a bulb, forming a transverse reed slit at the top through which the performer breathed in compressed air; as the reed could not be controlled by the lips, it was impossible to play with expression on the hautbois de Poitou or to obtain the harmonic octaves; the compass was therefore limited. The kind of bagpipe (g.z.) known as Musette, inflatated by bellows, also had double reeds throughout in spite of having a cylindrical chanter.

The manufacture of musical instruments could not remain unaffected by the great artistic movements known as the Renaissance; accordingly, we find them not only improved and purified in form in the 16th century, but also ranged in complete families from the soprano to the bass. Praetorius, in his Syntagma Musicum (1615-1620), gives us the full nomenclature of the family with which we are concerned, composed of the following individuals: (1) The little Schalmei, rarely employed, measured about 17 in. in length, and had six lateral holes. Its deepest note was C2. (2) The descant Schalmei (fig. 2), the primitive type of the modern oboe; its length was about 26 in., and its deepest note C3. (3) The alto Pommer (fig. 3), 30 in. long, with its deepest note C4. (4) The tenor Pommer (fig. 4), measuring about 4 ft. 4 in.; besides the six lateral holes of the preceding numbers there were four keys which produced the notes G4 to F4. (5) The bass Pommer, having a length of nearly 6 ft.; it had six lateral holes and four keys which produced C5 to A5. (6) The great double quint Pommer, measuring about 8 ft. 8 in. in length; its four keys permitted the production of the notes C6 to B6. These instruments, and especially numbers (2), (3), (4) and (5), occupied an important place on the continent of Europe in the instrumental combination of the 16th-17th centuries. Fig. 5, borrowed from a picture painted in 1616 by Van Alsloot, represents six musicians playing the following instruments indicated in the order of their appearance in the picture from left to right: a bass ob, bent over and become the bassoon, an alto Pommer, a cornet (German “zink”), a descant Schalmei, a second alto Pommer and a trombone.

The 17th century saw no great changes in the construction of the four smaller instruments of the family. Michel de la Barre writing in 1740 states that in the archives of the Chambre des Comptes are 4 charges for hautbois and musette de Poitou created by King John (14th century). Extensively used in France, there were there called hautbois or beri Hautbois, to distinguish them from the two larger instruments which were designated by the words “gros bois.” Hautbois became hautbois in French, and oboe in English, German and Italian; and the term is now used to distinguish the smallest instrument of the family.

During the 17th century some of the most important names connected with instrumental music in France are to be found amongst the Grandes Hautbois of the Grande Ecurie du Roi, such as Hotterelle (Jean, Louis, and Nicholas), Philidor (Jacques and André), Gilles Allain, Destouches, &c. In Germany the Schalmei was represented in the orchestra, as a solo instrument, as a chamber, as a band instrument, and in the Court and the Church orchestras, and later in that of the Opera. In 1680 it is recorded that the Grand Orchestre de la Chambre of Brandenburg included Schalmei and Bombarts. In the Orchestre of the Elector of Brandenburg in 1680 included Schalmei and Bombarts. In the Orchestra of the Elector of Brandenburg in 1680 included Schalmei and Bombarts.

The Paris Opera (1689) was the first Opera in Germany, at Dresden, used two fifis or early oboes in 1629 in one of his works.

The little Schalmei and the tenor Pommer seem to have disappeared amongst the Grandes Hautbois, though the descant Schalmei and the alto Pommer which by improvement have become two important members of the modern orchestra. The oboe, such as, was employed for the first time in 1671 in the orchestra of the Paris opera in Pomone by Cambert. The first two keys of the oboe date from the end of the 17th century. It is not known who added the first keys to the oboe; there is, however, a drawing of a French Hoboy in an English MS by the third Randle Holme, which formed part of his Academy of Armoury known to have been written before 1688, in which the two keys are shown. The instrument must have been well known in England at the time, and Randle Holme’s rough little drawing fixes the date of the transformation approximately as not later than 1680, probably earlier, since the oboe was used in Pomone in 1671. According to the flautist Quantz the transformation of Schalmei into oboe took place when the keys for C sharp and D sharp were added, at about the same time as they were added to the flute.

In 1737 Gerhard Hoffmann of Rastenberg added the keys G3 to F3.

A Parisian maker, Deluse, furnished at the end of the 17th century.

the 18th century much-appreciated improvements in the boring of the instrument. The Méthode de Selanner, published at Vienna in 1825, shows nine keys, and one, the octave key, which, when opened, establishes a loop or ventral segment of vibration in the column of air, facilitating the production of sounds in the octave higher. Mendelssohn of Paris owes his great reputation to the numerous improvements he introduced in the construction of the oboe.

The alto Pommer was but slowly transformed: it was called in French "hautbois de chasse," in Italian "obo di caccia." In the 18th century we find it more elegant in form, but with all the defects of the primitive instrument. The idea of bending the instrument into a half circular form to facilitate the handling is usually attributed to an oboe of Bergamo, one Jean Ferlendis, who was established at Salzburg at about 1760. This is obviously incorrect, since Ferlendis would then have been five years old. It has been suggested that the fact of the instrument's resembling a kind of hunting horn used at that time in England probably for it the name of "coro inglesi," which it still retains in French "cor anglais." The first employment of it in the orchestra is referred to Gluck, who had two "cors anglais" in his Alcesta, as played at Vienna in 1767. But it was not until 1808 that the cor anglais was first heard in the Paris opera; it was played by the obbligato Vogt in Alexandre les Apollos by Catel. The improvements in manufacture of this instrument closely followed those introduced in the oboe. The 18th century produced an intermediate oboe between (2) and (3), which was called hautbois d'amour, and was frequently employed by J. S. Bach. It was a third lower than the ordinary oboe, and was characterized by the pear-shaped bell with narrow aperture common to all wind instruments known as d'amour to which is due their veiled sweet quality. In the Spanish Cantigas there are two Schlalmeny with pear-shaped bells. This is in all probability the doucaine mentioned in the 13th and 14th-century romances. The oboe d'amore fell into disuse after the death of the great German composer. It has been resuscitated by the firm of C. Mahillon of Brussels, and reconstructed with the improvements of modern manufacture. A similar timbre was artificially produced in the oboe by means of mutes or sordini composed of hollow cones of wood, balls of paper, and pieces of sponge.

After the 16th century we find the instruments which were designated by the name of "gros bois," the (5) and (6) of Praetorius, transformed into shorter instruments, the Fagott and Contrafagott, having a column of air of the same length and form as the Pommers, but the instrument itself consisted of two conical tubes communicating at the lower part of the instrument; they were pierced in a single piece of wood. It is probably owing to the aspect of this double pipe that the satirical name of fagot was given, preserved in Italian as fagotto, and in German as Fagott. A canon of Ferrara named Afranio has been named as the author of the transformation, about 1539, of the bass Pommer, but Count Valdrighi, the curator of the Estense library, and Wasielwski, who has reproduced the drawing of Afranio's invention, deprive him of the merit of the innovation. The fagottino was transformed in the same fashion.

If in the 16th century of Nuremberg acquired a great reputation in the 16th century for making the "basson," a French word substituted for the old fagot, and adopted in England as bassoon. His instrument had only two keys. We cannot tell when the bassoon gained its present form, but it was probably at the end of the 17th century. It was used in the orchestra in 1764 by H. Schütz in 1619 (cf.), and in 1625, 5 fagotti were in use.

Cesti, in his grand opera il Pomo d'Oro, which was performed with the utmost brilliancy at the court of the emperor Leopold in Vienna, 1661, and printed editions of 1667 and 1668 are preserved, used fagotti combined with two cornets, three trombones and a regal to suggest the terrors of Hades.

Michael Praetorius (1618) expressly mentions the fagotto as an orchestral instrument.

In France it was used with the oboe in 1671 in Cambert's Pomone in the newly founded French Opera, for which Cambert & Perrin had received in a Royal Privilege expiring in 1672, and thereafter granted to Lully.

It had three keys then. The B flat key rendering a lengthening of the instrument necessary, we may suppose it took its modern form at that epoch. The fourth key is found in a bassoon stamped Stanesby Junior, London, 1747, and also in one without maker's name, obviously earlier, to judge by the very early pattern of the keys. The bassoon appears with four keys in the Encyclopédie of Diderot and d'Alembert (Paris, 1751-1765). The number of keys increased by the beginning of the present century to eight, viz.: and two keys to facilitate the production of acute harmonics. It was improved by Almenrider, and reproduced in 1810 by Triebert and Goumas, Paris, and C. Mahillon, Brussels. (See also Bassoon.)

The reform in the construction of the flute due to Theobald Boehm of Munich about 1840, a reform which principally consisted in the rational division of the tube by the position of the lateral holes, prompted Triebert to try to adapt the innovation to the oboes and bassoons; but he failed, because the application of the system denaturalized the timbre of the instruments, which it was necessary, before all things, to preserve, but further improvements made upon the same lines by Barret and later by Rudall Carter, have transformed the oboe into the most delicate and perfect of reed instruments. In 1856 a French bandmaster, M. Sarrus, thought out the construction of a family of brass instruments with conical tubes pierced at regular distances, which, by diminishing the length of the air column has rendered series of fundamental sounds easier, more equal and free in timbre than that of the oboe family. Gautrot of Paris realized the inventor's idea, and, under the name of "arrusphones," has created a complete family, from the soprano in C to the contrabass in B flat, of which his firm preserves the monopoly.

In order to replace the old double-bassoon of wood, the firm of C. Mahillon, Brussels, produced in 1868, a reed contrabass of metal, since much used in orchestras and military bands. The first idea of this instrument goes back to 1839, and is attributed to Schollnast & Son of Pressburg. It is a conical brass tube of very large proportions, with lateral holes placed as theory demands, in geometrical relation, with a diameter almost equal to the section of the tube at the point where the hole is cut. From this it results that for each sound one key only is required, and the seventeen keys are the player almost the facility of a keyboard. The compass written for this contrabass is comprised between and but sounds an octave lower. See Contrafagottto.
OBOK—OBSERVATORY

OBOK, a seaport on the north shore of the Gulf of Tafjura, N.E. Africa, acquired by France in 1862. It gave its name to the colony of Obok, now merged in the French Somali coast protectorate (see SOMALILAND: French). The port is separated from the open sea by coral reefs, but is only partially sheltered from the winds. This led to the practical abandonment of the town by the French, who in 1896 transferred to Jibuti, on the opposite shore of the Gulf of Tafjura, the seat of government of the colony. Obok is connected with Jibuti by submarine cables. Population about 500.

OBRA, a river of Germany, in the Prussian province of Posen, a left-bank tributary of the Warthe. It rises near Obra, N.W. from Koschin, and forms in its course marshes, lakes and the so-called Great Obraubruch (ten). The latter, 50 m. long and about 5 m. broad, is a deep depression in the undulating country of south-west Posen. The river is here dammed in and canalized and affords excellent water transit for the agricultural produce of the district.

O'BRIEN, WILLIAM SMITH (1803-1864), Irish revolutionary politician, son of Sir Edward O'Brien, a descendant of Brian Boroeimhe (d. 1014), king of Ireland (see CLARE), was born in Co. Clare on the 17th of October 1803, and received his education at Harrow and at Cambridge. He took the additional name of Smith on inheriting his maternal grandfather's estates in Limerick. He entered parliament in 1828 as member for Ennis, and from 1835 to 1848 represented the county of Limerick. Although he spoke in 1828 in favour of Cathoic emancipation, he for many years continued to differ on other points from the general policy of the Irish Church. In 1841 he opposed the Irish Arms Act of 1843, and became an active member of the Repeal Association. Though he was destitute of oratorical gifts, his arrangement of the English government of Ireland secured him enthusiastic attachment as a popular leader. In July 1846 the "Young Ireland" party, with Smith O'Brien and Gavan Duffy at their head, left the Repeal Association, and in the beginning of 1847 established the Irish Confederation. In May 1848 he was tried at Dublin for sedition, but the jury disagreed. In the following July he established a war directory, and attempted to make a rising among the pressantry of Ballingarry, but although he was at first joined by a large following the movement wanted cohesion, and the vacillating crowd dispersed as soon as news reached them of the approach of the dragoons. O'Brien was arrested at Thurles, tried and sentenced to death. The sentence was, however, commuted to transportation to Tasmania for life. In February 1854 he received his liberty on condition of never revisiting the United Kingdom; and in May 1856 he obtained a full pardon, and returned to Ireland. In 1856 he published Principles of Government, or Meditations in Exile. He died at Bangor, north Wales, on the 18th of June, 1864. His two earlier works, which were The life of Lord Lucius, became 13th Baron Inchinquin in 1855, as heir male to the 3rd marquis of Thomond, at whose death in 1853 the marquisate of Thomond and the earldom of Inchinquin became extinct. (See INCHINQUIN, 1ST EARL OF.)

OBSCENITY (from the adjective "obscene," Lat. obscenus, evil-looking, filthy). By English law it is an indictable misdemeanour to show an obscene exhibition or to publish any obscene matter, whether it be in writing or by pictures, effigy or otherwise. The precise meaning of "obscene" is, however, decidedly ambiguous. It has been defined as "something offensive to modesty or decency, or expressing or suggesting unchaste or lustful uses or being impure, indecent or lewd." But the test of criminality as accepted in England and Canada is whether the exhibition or matter complained of tends to deprave and corrupt those whose minds are open to immoral influences and who are likely to visit the exhibition, or to see the matter published. If the exhibition or publication is calculated to have this effect, the motive of the publisher or exhibitor is immaterial. Even in the case of judicial proceedings, newspapers are not privileged to publish evidence which falls within the definition. In dealing with writings alleged to be obscene, the court and jury have to consider the effect of the whole work and not merely the particular extract challenged as improper; and in practice it is difficult to induce juries to convict the publishers of well-known and old-established works of real literary quality on the ground that they contain passages offensive to modern notions of propriety. In the case of exhibitions of sculpture and pictures some difficulty is found in drawing the line between representations of the nude and works which fall within the definition of "obscene." In such cases a distinction is drawn in a somewhat acute form before the London County Council in 1907 by theatrical representations of "living statuary."

Besides the remedy by indictment there are statutory provisions for punishing as vagabonds persons who expose to public view in public streets or adjacent premises obscene prints, pictures or other indecent exhibitions. These are supplemented by similar provisions, applicable to the metropolis and to county towns, and (by a statute of 1880) for suppressing certain kinds of indecent advertisements. By an act of 1857owers are given for searching premises on which obscene books, &c., are kept for sale, distribution, &c., and for their destruction, and the post office authorities have power to seize postal packets containing such matter and to prosecute the sender. In 1906 the London publisher of a weekly comic paper was punished for inserting advertisements inviting readers to acquire by post from abroad matter of this kind.

The use of obscene or indecent language in public places is punishable as a misdemeanour at common law, but it is usually dealt with summarily, under the Metropolitan Police Act 1839, or the Town Police Clauses Act 1847, or under local by-laws.

The two Passengers. In British law an obscene publication, exhibitions, &c., are punished under articles 292, 293 and 294 of the Penal Code. Special exception is made for representations in temples or cars used for conveyance of idols or kept or used for religious purposes. In those British possessions whose law is based on the common law the offences above dealt with are offences at common law or under colonial statutes embodying the common law, e.g. Queensland Code, 1859, ss. 172, 227, 228, 374 (3); Western Australian Code, 1901, ss. 203, 204, 352 (3); Canadian Criminal Code, r. 179. In New South Wales and Western Australia, by acts of 1901 and 1902, provisions have been made for dealing summarily with indecent and obscene publications based to some extent on the English legislation of 1880 against indecent advertisements. In the Colonial acts no penalty is incurred if the defence can prove that the incriminated publication was for a work of recognized literary merit, or that Aristophanes or Boccaccio's Decameron, is a bonâ-fide medical work circulated in the manner permitted by the statutes.

United States.—Under the Federal law (Revised Statutes, s. 3654) offenders are liable to a fine of not more than $5,000 and to imprisonment not exceeding 3 years. The law also applies to U.S. mails; see U.S. v. Wales (1892), 51 Fed. Rep. 41. (W. F. C.)

OBSEQUENS, JULIUS, a Latin writer of uncertain date, generally placed about the middle of the 4th century A.D. He is the author of a small extant work De prodigii, taken from an epitome of Livy, and giving an account of the prodigies and portents that occurred in Rome between 249-12 B.C.

The edicta princeps was published by Aldus (1508); later editions by F. Oudendorp (1720) and O. Jahn (1853, with the periodica of Livy).

OBSEQUIES (Med. Lat. obsequiae, formed after class. Lat. esequiae), a term for funeral rites and ceremonies, especially such as are carried out with great ceremony. The Lat. obsequium (from obsequi, to follow close after) produced the obsolete English "obsequy," in the sense of ready compliant service, especially of an inferior to a superior, still found in the adjective "obsequious."

OBSEQUIARY. Up to a comparatively recent date an "obsequary" was a place exclusively devoted to the taking of astronomical observations, although frequently a rough account of the weather was kept. When the progress of terrestrial magnetism and meteorology began to make regular observations necessary, the duty of taking these was often thrown on astronomical observatories, although in some cases separate institutions were created for the purpose. In this article the astronomical observatories will be chiefly considered.

Up to about 300 B.C. it can scarcely be said that an observatory existed anywhere, as the crude observations of the heavens then taken were only made by individuals and at intervals, employing the simplest possible apparatus. Thus, according to Strabo.
OBSERVATORY

Eudoxus had an observatory at Cnidus. But, when philosophical speculation had exhausted its resources, and an accumulation of facts was found to be necessary before the knowledge of the construction of the universe could advance farther, the first observatory was founded at Alexandria, and continued in activity for about four hundred years, or until the middle or end of the 2nd century of the Christian era. Hipparchus of Rhodes, the founder of modern astronomy, by repeating observations made at Alexandria, discovered the precession of the equinoxes, and investigated with considerable success the motions of the sun, moon and planets. His work was continued by more or less distinguished astronomers, until Ptolemy (in the 2nd century A.D.) gave the astronomy of Alexandria its final development. When science again began to be cultivated after the dark ages which followed, we find several observatories founded by Arabian princes; first one at Damascus, next one at Bagdad built by the caliph Al-Mamun early in the 9th century, then one on the Mohkattam near Cairo, built for Ibn Yunis by the caliph Hakim (about 1000 A.D.), where the Ikhimate tables of the sun, moon and planets were constructed. The Mongol khans followed the example; thus arose the splendid observatory at Maragha in the north-west of Persia, founded about A.D. 1260 by Hulagu Khan, where Nasir Uddin constructed the Ikhhanic tables; and in the 15th century the observatory at Samarkand was founded by Ulugh Beg, and served not only in the construction of new planetary tables but also in the formation of a new catalogue of stars.

With the commencement of scientific studies in Europe in the 15th century the necessity of astronomical observations became at once felt, as they afforded the only hope of improving the theory of the motions of the celestial bodies. Although astronomy was taught in all universities, the taking of observations was for two hundred years left to private individuals. The first observatory in Europe was erected at Nuremberg in 1472 by a wealthy citizen, Bernhard Walther, who for some years enjoyed the co-operation of the celebrated astronomer Regiomontanus. At this observatory, where the work was continued till the founder's death in 1504, many new methods of observing were invented, so that the revival of practical astronomy might be dated from its foundation. The two celebrated observatories of the 16th century, Tycho Brahe's on the Danish island of Hven (in activity from 1576 to 1597) and that of Landgrave William IV. at Cassel (1561–1597), made a complete revolution in the art of observing. Tycho Brahe may claim the honour of having been the first to see the necessity of carrying on for a number of years an extensive and carefully-planned series of observations with various instruments, worked by himself and a staff of assistants. In this respect his observatory (Uraniborg) at Cassel formed the model of the modern observatories. Although the work of Tycho Brahe, who died in 1601, was never completed, yet the intellectual work of many assistants under the general superintendence of a director. This applies principally to the great observatories, where the sun, moon, planets and a limited number of fixed stars are without interruption being observed, but even among these institutions hardly two can be conducted on the same principles. Thus in Greenwich the instruments and observations are all treated according to strict rules laid down by the astronomer-royal, while in Washington or Pulkowa each astronomer has to a certain extent his choice as to the treatment of the instrument and arrangement of the observations. The same is the case with the smaller institutions, in most of which these arrangements vary very much with change of personnel.

The way in which the results of observations are published depends principally on the size of the institutions. The larger observatories issue their "annals" or "observations" as separate periodically-published volumes, while the smaller ones chiefly depend on scientific journals to lay their results before the public, naturally less fully as to details.

Subjoined is a catalogue of public and private observatories still in activity in 1910 or in existence within the past hundred years. (*" = 1" of long)
reflector; refr, refractor; s.g., silvered glass; vis., visual; univ., university.
Where the names of two manufacturing firms are given, the first is responsible for the optical, the second for the mechanical part of the instrument.

GREAT BRITAIN AND IRELAND
A. Public Observatories.

Greenwich, royal obs., lat. +51° 28′ 38″. Founded in 1675 for the propagation of navigation and by deputation of the Savilian professorship and theinstead of the Greenwich - observatory was discontinued, in 1848; the last person in charge was W. Professor s. In 1873 the instruments were removed to Blackford Hill, and in 1875 they were also the 2-ft. refl. The old obs. on Calton Hill now belongs to the city and is used for instruction; a 21-in. refl. by Wragge has been erected.

Oxford, univ. obs., lat. +55° 52′ 42″ s. l. c. 17 m. 10″ s. 6 W. Organized in 1850 by subscription, aided by subsidies from the univ. and the state. Meridian circle by Ertel of 6-in. ap.; 9-in. refl. by Grubb. The observatory is now electrically controlled; the buildings are erected on Blackford Hill 1892-1893 for the instruments presented by Lord Crawford; 15-in. refl. by Grubb, transit circle by Sims of 8-in. ap., 2-ft. s.g. refl. by Cooke; and a 26-in. s.g. refl. with spectrophotometer. Two catalogues of stars were published by the late director, Lord John George Beresford in 1827, when a mural circle and a Transit by Jones were provided, with which meridian obs. were then made in 1827, published in 1899, 10-in. s.g. refl. by Grubb (1850) used for micrometer work.

B. Principal Private Observatories in 1908.

Mr. W. Coleman's obs., Buckland, Dover, lat. +51° 8′ 12″, long. o. h. m. 11 s. 1 W. Cooke 8-in. refl. used for obs. of double stars.

Mr. J. Franklin–Adams's obs., Mervel Hill, Hambledon, Surrey, lat. +51° 5′ 26″, long. o. h. m. 30″ 2 s. W. Erected 1902; twin equatorially mounted Cooke 7-foot s.g. refl. of 6-in. ap., and 6-in. lens, used for photo. survey of the heavens with special reference to the Milky Way. The former instrument was used at the Cape in 1894.

R. E. Espin's obs., Tow Law, Darlington, lat. +54° 43′ 30″, long. o. h. m. 7 s. 14″ 2 s. W. 17-in. refl. by Calver, used since 1888 for spectroscopy and obs. of double stars.

Mr. H. M. Ellis's obs., Keswick, lat. +52° 30′ 28″ s. W. long. o. h. m. 40″ 4 W. 6-in. refl. by Cooke (1886). Also at Outwood, Surrey, lat. +51° 11′ 38″, long. o. h. m. 23″ 7 W. 8-in. refl. by Cooke; both used for obs. of double stars.

Sir Wilfred Peck's obs., Dunsford, near Lyne Regis, lat. +56° 42′ 38″, long. o. h. m. 11 s. 59″ 0 W. Erected by the late Sir Cuthbert Peck in 1885; 6-in. refl. by Merz used for obs. of variable stars.

Mr. James's obs., Calver, near Prime, lat. +54° 54′ 37″, long. o. h. m. 11 s. 49″ 9 W. In 1839 the early made and mounted a refl. of 3-ft. ap. (remounted as equat. in 1876), and in 1845 he completed the celebated refl. of 6-ft. ap. and 34-ft. focal length. This instrument, the last one of the 19th century, was removed by obs. of nebulae, and revealed many new features in these bodies; results published in the Phil. Trans. and collected systematically in the Trans. Roy. Dubl. Soc. (1879-80). Experiments were made by the present earl to determine the amount of heat radiat-ed from the moon.

Rugby School (Temple Obs.), lat. +42° 22′ 7″, long. o. h. m. 5 s. W. Founded in 1872; 9-in. refl. by Clark, used for obs. of double stars and of stellar spectra.

Stonyhurst College obs., Lancashire, lat. +53° 50′ 40″, long. o. h. m. 9 s. 52″ 7 W. An 8-in. refl. by Troughton and Sims, mounted in 1862, used for obs. of spectral lines. The late Professor Drury erected a memorial refl. by Grubb mounted in 1893, used chiefly for solar work.

C. Private Observatories now discontinued.

Mr. G. Garland's obs., Leyton, Essex, lat. +57° 34′ 34″, long. o. h. m. 5 s. 9 W. Activity from 1862 till 1886, 10-in. refl. by Cooke; chiefly devoted to double stars.

Mr. G. Barbey's obs., South Villa, Regent's Park, London, lat. +51° 31′ 29″ 9″, long. o. h. m. 37″ 5 W. In activity from 1836 to 1871, then in 1871 was removed to Twickenham, and disinvested in 1874; had a 7-in. refl. by Dollond, with which Mr. J. R. Hind discovered ten minor planets and several comets, and constructed maps of stars near the ecliptic.

Carrington's obs., Redhill, lat. +51° 14′ 25″ 3″, long. o. h. m. 41″ 3 W. Established in 1854; had a 41-in. refl. and transit circle of 5-in. ap. (now at Radcliffe Obs.). With the later a catalogue of the positions of 7375 stars within of the pole, with the former a regular obs. of sun-spots, were made from 1853 to 1861.

OBSERVATORY 955
Dr Isaac Roberts’s obs., Crowborough, Sussex, lat. +5° 37’ 7”, long. o. h. o. m. 37° 2. E. 20-in. s.g. refr. by Grubb (with 7-in. refr.) used for phot. of nebulae and clusters 1890-1904.

Captain W. H. Smyth’s obs., Bedford, lat. +5° 8’ 27” 6”, long. o. h. o. m. 55° 8’ 27” S. 2-in. s. g. refr. by Blakiston, and 6-in. ref. by W. W. Gordon used to discover a 6-in. ref. by Tulley, and observed the double stars and nebulae contained in his “Bedford Catalogue” (1844).

Sir James South’s obs., from 1816 to 1824 at Blackman Street, Sligo, Ireland. lat. +5° 37’ 3”, long. o. h. o. m. 11° 9’ W., and procured a 12-in. g. ap. from Cauchoix. As Troughton, however, failed to make a satisfactory mounting, the glass was never used till it had been presented to Dublin obs. in 1862.

Sir William Huggett’s obs. at Mill Park, Ipwich, lat. +5° 0’ 33”, long. o. h. m. 55° 8’ 27” S. 10-in. ref. by Merz, used for obs. of comets from 1874 to 1889.

Mr. E. Wilson’s (d. 1908), obs., Daramona, Streetw. Co. Westmeath, Ireland, lat. +5° 41’ 12”, long. o. h. 29° 59’ 58” S. 2-ft. ref. by Grubb, and other instruments for phot. and solar work.

Lord Wrottesley’s obs., from 1829 to 1841 at Blackheath, lat. +5° 8’ 49”, long. o. h. o. m. 2° 7’ E., where a catalogue of the ascensions of 1318 stars was formed from obs. with a transit instrument by Jones. In 1842 a new obs. was built at Wrottesley Hall, lat. +5° 37’ 2-3”, long. o. h. 8° 53-6’ W., where the transit and a 6-in. s. g. ap. by Dooland were mounted. Obs. were here devoted for 50 stars.

FRANCE

Paris, national obs., lat. +48° 50’ 11’ 2”, long. o. h. 9° 20’ 9” E. Founded in 1667, when the construction of a large and monumental building was commenced by the architect Claude Perrault. J. D. D. Cassini, and later J. B. Biot, were the most eminent of the astronomers. The building was restored in 1784, and the ref. was used for double-star obs. till 1892.

Rey W. D. Bessel’s obs., first at Ormskirk (1830-1839), lat. +5° 43’ 18”, long. o. h. 11° 36’ S. W.; afterwards at Cranbrook, Kent (1840-1850), lat. +5° 6’ 31”, long. o. h. 2° 10’ 8” E.; then at Watlingbury, near Maidstone, lat. +5° 15’ 12”, long. o. h. 2° 8’ 14” E., till 1871; and then at Blackheath, lat. +5° 45’ 54”, long. o. h. 3° 43’ S. W., till Mr Dawes’s death in 1868. Possessed at first only small instruments, then successively a 6-in. ref. by Merz, a 7-in. ap. and an 8-in. ref. by Clark, and an 8-in. ap. by Cooke, with all of which a great many measures of double stars were made.

Mr W. De La Rue’s obs., Cranford, Middlesex, lat. +5° 28’ 47” 8’, long. o. h. 2° 24’ 9” E., was first opened in 1870, and erected several 6-in. ref. (of 18-in. ap.), and in 1879 his 40-ft. ref. of 4-ft. ap. The latter was comparatively little used (two satellites of Saturn were discovered with it), while the former served to discover about 2500 nebulae and clusters, 800 double stars, and two satellites of Uranus, as also to make the innumerable other obs. which have made the name of Herschel so celebrated. Sir J. Herschel used a 20-ft. ref. at Slough from 1825 to 1833, and from 1834 to 1838 at the Cape of Good Hope. It was 6’ 5”, long., and mounted on an iron stud and a plane of the visible heavens, discovering 2100 new nebulae and 5500 new double stars.

Sir William and Sir John Herschel’s obs. at Slough near Windsor, lat. +5° 30’ 20”, long. o. h. 2° 24’ S. W. William Herschel settled at Datchet, near Slough, in 1756, and erected several 6-in. ref. (of 18-in. ap.), and in 1789 his 40-ft. ref. of 4-ft. ap. The latter was comparatively little used (two satellites of Saturn were discovered with it), while the former served to discover about 2500 nebulae and clusters, 800 double stars, and two satellites of Uranus, as also to make the innumerable other obs. which have made the name of Herschel so celebrated. Sir J. Herschel used a 20-ft. ref. at Slough from 1825 to 1833, and from 1834 to 1838 at the Cape of Good Hope. It was 6’ 5”, long., and mounted on an iron stud and a plane of the visible heavens, discovering 2100 new nebulae and 5500 new double stars.

Rey T. J. Hussey’s obs., Hayes, Kent, lat. +4° 56’ 28” 38”, long. o. h. o. m. 27’ 7” S. W. Founded in 1866; furnished with an 8-in. ref. (by Clark and Cooke). In 1870 he erected an equat. mounting with a 15-in. ref. and a Cassgrain ref. of 18-in. ap., both of which were used for photog. observations in 1870-71. Sir W. Huggins has made his well-known spectroscopic observations and photographs of stellar spectra. The instruments were transferred to the Cambridge obs. in 1898.

Rey T. J. Hussey’s obs., Hayes, Kent, lat. +4° 56’ 28” 38”, long. o. h. o. m. 27’ 7” S. W. Founded in 1866; furnished with an 8-in. ref. (by Clark and Cooke). In 1870 he erected an equat. mounting with a 15-in. ref. and a Cassgrain ref. of 18-in. ap., both of which were used for photog. observations in 1870-71. Sir W. Huggins has made his well-known spectroscopic observations and photographs of stellar spectra. The instruments were transferred to the Cambridge obs. in 1898.

Mr G. Knott’s obs., Cuckfield, Sussex (from 1860 to 1873 at Woodcote, lat. +5° 0’ 41”, long. o. h. o. m. 34’ W., afterwards at Knowles Lodge, Cuckfield); 7-in. ref. by Clark, used for observing double stars till 1873.

Mr W. Lassell’s obs., from 1840 to 1861 at Starfield near Liverpool, lat. +5° 35’ 25” 28’, long. o. h. 11° 38’ 5’ S. W.; contained ref. of 9- and 24-in. ap.; employed for obs. of the satellites of Uranus, of Mars, and of the satellites of Neptune. The 2-ft. ref. was used at Malta in 1852-1853, and a 4-ft. ref. was mounted in 1861, also at Malta, and used till 1864 for obs. of satellites and nebulae. The eighth satellite of Saturn, the two inner satellites of Uranus and the satellite of Neptune were discovered at Starfield by Mr Lassell.

Dr J. Lee’s obs., Hartwell, Bucks, lat. +5° 48’ 36”, long. o. h. o. m. 55° 14’ 59’ S. long. o. h. 23° 51’ 57” S. E. Opened 1884: 8-in. ref., 12-in. equat. coude, 7-in. transit circle, all by Gautier.

 Lyons, obs. lat. in alt. +45° 45’ 46” S. long. o. h. 19° 18” W. E., at the Jesuit college. A new obs. was erected in 1877 at St Gérons-Laval, at some distance from the city, lat. +4° 51’ 41” N., long. o. h. 19° 08” S. E. Transit circle by Eichens (6-in. o. g.), 12-in. equat. coude by Gautier, 12-in. sidereal.

Marseille, obs. lat. 43° 18’ 17” 5’, long. o. h. 21° 54’ 34” S. E. Originally belonging to the Jesuits, taken over by the ministry of the navy in 1749. It was here that J. L. Pons made his numerous discoveries of comets. New buildings erected in 1869; 9-in. Merz. ref., 32-in. ap. by Foucault, 7-in. transit circle.
Germany

Altona, lat. +53°32'45"3"., long. o. h. 39 m. 46.1 s. Founded in 1823 by the Danish government to assist in the geodetic operations in Holstein. A meridian circle by Reichenbach (of 4-in. ap.) was procured, to which in 1858 was added a 43-in. equat. by Repsold. The observatory has since then been chiefly used for the construction of small instruments. The "rez. ickten", the principal astronomical journal, was published here from 1821 (by H. C. Schumacher up to 1850, by C. F. W. Peters from 1854). The observatory was moved to Kiel in 1874.

Bamberg, lat. +49°53'6"0", long. o. h. 43 m. 33.6 s. Founded and endowed by the late Dr K. Remels, completed 1889; 71-in. heliometer by Merz and Repsold, 101-in. refr. by Schröder.

Breslau, obs. lat., +52°30'16"9"., long. o. h. 53 m. 24.9 s. E. Erected in 1795 as part of the building of the Academy of Sciences (lat. +52°31'12.5"., long. o. h. 53 m. 35.3 s. E.), a very unsuitable locality. A new observatory was built in the southern part of the city, finished in 1854, by K. v. Eltz and B. W. Ramsden. The old observatory (used chiefly for obs. of minor planets), a meridian circle by Pistor and Martins of 4-in. ap., another by the same makers of 7-in. ap.

Berlin, obs. of Urania Society for diffusing natural knowledge, lat. +52°21'41"1", long. o. h. 13 m. 58.3 s. E. Surveyed and provided with a 27-in. ref. by Schott. In the Trepтов Chaussée is a popular obs. with a 27-in. ref. by Schott and Steinheil.

Bremerhaven, lat. +53°45'5"0", long. o. h. 28 m. 23.2 s. E. Finished in 1845; meridian circle by Pistor of 43-in. ap., heliometer by Merz of 6-in. ap. The observatory was founded by the late F. W. A. Argelander for observing the stars contained in his three great catalogues. This observatory is chiefly known by the zone obs., made from 1829 to 1859, with a small comet-seeker, on which Argelander's great atlas of 324,198 stars between the north pole and +9° decl. is founded, continued with a 6-in. ref. from -2° to +31° decl. by Schönheld. A meridian circle of 6-in. ap. by Repsold was mounted in 1882.

Bolkamp, F. G. von Bölow's obs., lat. +54°2'9"6"., long. o. h. 46 m. 31.2 s. E. Situated a few miles from Kiel, founded in 1870. With a 11-in. ap. by Schröder, Dr K. H. Vogel obtained valuable results in 1871-1874; since then it has only been used occasionally.

Bremerhaven, sith. and the house of his landlord in Sandstrasse, H. W. M. Olbers (d. 1840) had his obs., lat. +53°'4"38", long. o. h. 35 m. 10.s. E.; though the principal instrument was only a 32-in. ref. by Dollond, many comets and the planets Pallas and Vesta were discovered and observed there.

Brest, univ. obs., lat. +51°6'55"8", long. 1 h. 8 m. 87.5 s. E. Founded 1790. In a small and unsuitable locality; 8-in. ref. by Clauss, 6-in. ref. by Capt. A. C. K. 30-in. heliometer by Merz and Repsold, finished in 1858.

Dresden, Baron von Engelhardt's obs., lat. +51°42'16"6", long. o. h. 54 m. 54.8 s. E. A 12-in. ref. by Grubb (mounted 1880), used for obs. of comets and double stars, presented to Kasan obs. in 1897. Dr G. H. C. Blum (M. 53.8 s. E. with a 23-in. ref. of the city), lat. +51°12'25"0", long. o. h. 27 m. 5.5 s. E. Founded and endowed by Professor J. F. Benzenberg (d. 1860), best known by the discovery of twenty-one minor planets by K. T. R. Luther; 43-in. ref. by Merz, 77-in. ref. by Merz and Bamberg.

Gotha.—In 1791 an obs. was founded by Duke Ernest II. at Seelberg, lat. +50°56'5"2", long. o. h. 42 m. 55.8 s. E., on a hill a few miles from the city; 5-in. ref. and transit instrument by Ramsden. Through the labours, principally theoretical, of F. X. Zach, B. A. von Lindenu, J. F. Encke and P. A. Hansen, the institution ranked with the first. A new obs. was built by K. H. Heinrich, long. o. h. 42 m. 55.8 s. E., which received the instruments from Seelberg, including a small transit circle by Ertel (made in 1824), also a new equat. by Repsold of 44-in. ap.

Göttingen, univ. obs., lat. +52°31'48"2", long. o. h. 39 m. 46.2 s. E. An obs. had existed here since 1751, when Tobias Mayer worked. In 1811 a new building was constructed. Besides his mathematical works Mayer used this observatory to test the important geodetic and magnetic obs.; meridian circle by Repsold (41-in. ap.), another by Reichenbach (43-in.), 6-in. heliometer by Repsold (1888).

Hamburg, lat. +53°33'7"0", long. o. h. 39 m. 5.3 s. E. Built in the late 1790's by W. B. Ramsden. K. L. C. Rümker observed the places of 12,000 stars. A ref. of 10-in. ap. by Merz and Repsold was mounted in 1888. A new obs. is now being built 20 km. south-east of the city, lat. +53°28"46", long. o. h. 39 m. 46.2 s. E. With a 7-in. transit circle by Steinheil and Repsold, 7-in. transit circle by Repsold, and a 39-in. refr.
Observatory

25.

Given is the text in natural language: "OBSERVATORY 25'.

Finished is J-in. E.

E. Founded 1871.

instruments.

or meteorological instruments. Twenty-eight minor planets were discovered here from 1871 to 1885.

Cracow, vic. obs., lat. +50° 30' 0", long. 1 h. 19 m. 51 ' E. Founded 1871.

C. Fotherby, used for observations.

Kis Kertal (north-east of Budapest), private obs. of Baron Pannonv, lat. +47° 11' 54", long. 1 h. 18 m. 17 ' E. Founded 1871.

Merz and Cooke.

O'Gyalla (near Komorn, Hungary), lat. +47° 52° 7', long. 1 h. 12 m. 45 ' E. It was founded in 1760, after 1775; handed over to the Polytechnic School in 1855; new building erected in 1863. A 6-in. refr. by Merz and Kern with two photo telescopes, two transit instruments. &c. Sun-spots are regularly observed, but the institution is chiefly devoted to educational purposes. Neuchâtel, lat. +46° 59° 51", long. 0 h. 27 m. 49 ' E. Erected in 1858; meridian circle of 41-in. ap. by Ertel; 61-in. refr. by Mez.

Geneva, lat. +46° 11° 53", long. 0 h. 24 m. 36 ' E. Founded in 1773; a new building erected in 1830. The observatory was then the centre of the Swiss geodetic operations carried on in Switzerland since 1861. An 11-in. refr. (o.g. by Mez.) was presented by the director E. Plantamour in 1880; 4-in. transit circle.

Spain and Portugal

Madrid, royal obs., lat. +40° 24° 29', long. 0 h. 14 m. 45 ' E. 101-in. refr. by Mez; 81-in. refr. by Grubb; 6-in. transit circle by Reipold.

Barcelona, obs. of Acad. of Science, lat. +41° 25° 18', long. 0 h. 8 m. 25 ' E. Opened 1904; 15-in. refr. -phot. and vis. by Mez.

Cadiz, naval obs., at San Fernando, lat. +36° 27° 42', long. 0 h. 24 m. 49' 3" W. Founded in 1797; 11-in. refr. by Brünn; 13-in. refr. -phot. by Henry and Gautier; 8-in. transit circle by Simms.

Lisbon, naval obs., lat. +38° 14° 43", long. 0 h. 36 m. 46' 7" W. Founded 1801; 15-in. refr. by Mez and Reipold, transit circle by Reipold.

Coimbra, univ. obs., lat. +40° 12° 25' 5", long. 0 h. 33 m. 42 ' 1" W. Founded 1792; 61-in. transit circle by Reipold, 16-in. refl. by Secretan.

Italy

Turin, univ. obs., lat. +45° 4° 7", long. 0 h. 30 m. 47 ' 2" E. Founded in 1790 by the Academy of Science; rebuilt in 1802 on a tower of the Palazzo Madama, 41-in. transit circle by Reichenbach, 12-in. refr. by Mez; handed over to the univ. in 1865. A new obs. is being erected.

Milan, originally obs. of Brera College, now royal obs. of Brera, lat. +45° 27° 59' 2", long. 0 h. 36 m. 45' 5" E. Founded in 1763. The publication of an annual ephemeris from 1775 to 1875 and important theoretical works absorbed most of the time of the directors B. Oriani and F. Carlini, and the instruments were rather insufficient. In 1875 an 8-in. refr. by Mez was mounted, with which C. F. Schiaparelli has made valuable obs. of Mars; 18-in. refr. by Mez.

Padua, univ. obs., lat. +45° 24° 1' 0", long. 0 h. 47 m. 29 ' 2" E. Founded in 1797. In 1837 a meridian circle by Starke of 4-in. ap. was mounted, with which stars from Bessel's zones were reobserved; the results were published in five catalogues; 41-in. refr. by Mez and Starke (1885); Dembowski's 7-in. refr. mounted in 1881.

Gallarate, near Lago Maggiorre, from 1860 to 1879, 19-in. refr. and 5-in. photo. obs. founded in 1852. Dembowski had observed double stars at Naples with a 5-in. diolyte by Ptuggel and a small transit circle by Starke. From 1860 he used a 7-in. refr. by Mez.

Bologna, univ. obs., lat. +44° 2' 47' 5" E. long. 0 h. 45 m. 24 ' 5" E. Founded in 1724 on a tower of the univ. building. Obs. have been made occasionally. A 34-in. meridian circle was mounted in 1846.

Braun's...—In 1774 a museum of science and natural history was established, part of which was used as a obs., but very few obs. were made; a new obs. built 1872 at Arcetri, lat. +43° 45° 14' E. long. 0 h. 45 m. 13 ' 4" E. 11-in. and 91-in. refrs. by Amici.

Padua, univ. obs., lat. +44° 39° 27', long. 0 h. 45 m. 56 ' 6" E. 135-in. refr. by Cooke.

Rome, obs. of the Roman College, lat. +41° 53° 56', long. 0 h. 49 m. 56 ' E. Founded in 1848; belongs to the univ.; small transit circle and a 44-in. refr. by Mez. The latter was used by L. Respighi for obs. of solar prominences.

Rome (Vatican), papal obs., lat. +41° 54° 4' 8", long. 0 h. 49 m. 49 ' 38" E. Founded 1800; 104-in. refr. by Mez; 13-in. phot. and 8-in. vis. refr. and 53-in. photoheliograph by Henry.

Naples royal obs., situated at Capo di Monte, lat. +40° 31° 45', long. 0 h. 45 m. 56 ' E. Founded 1837; 41-in. transit circle by Reichenbach, 61-in. refr. by Reichenbach and Fraunhofer, 6-in. refr. by Merz.

Tenerife royal obs., lat. +28° 46° 4' 5", long. 0 h. 53 m. 25 ' E. Erected in 1790 on a tower of the royal palace. The principal instruments were a reversible vertical circle by Ramsden of 5-ft. diameter with a 3-in. telescope, and a transit instrument of 3-in. ap. With this M. G. Piazzi observed the first comet contained in his famous Catalogue of 7641 Stars (1814); this work led him to the discovery of the first minor planet, Ceres, on the 1st of January 1801. The activity was revived in 1857, when a meridian circle by Pistor and a 36-in. photo. was mounted; a 41-in. refr. by Mez has been used for spectroscopic work.

Catania, lat. +37° 30° 13 ' 3", long. 1 h. 0 m. 20 ' 6" E. Founded 1888; 13-in. phot. refr. by Henry and Gautier; a 13-in. refr. transit circle by the same.

Helsingfors (Finland), univ. obs., lat. +60° 42° 6', long. 0 h. 18 m. 16 ' 6" E. Finished in 1839. Was under the direction of S. S. Svedberg. The observatory is now reorganized.

The staff consists now of the director, five astronomers, six assistants and computers. The principal instruments are: a transit instrument by Ertel of 6-in. ap., a vertical circle by Ertel of 6-in. ap. (the circle of 34-ft. diameter has been redivided by Reipold); these two instruments are for determining standard places of stars; a meridian circle by Reipold (6-in. ap., 4-f. circles), used since 1841 to observe all stars north of +15° decl. down to the 6th mag., and others observed by Brandes; a prime vertical transit by Reipold with 63-in. ap., used for determining the constant of aberration; a 74-in. heliometer by Mez; a refr. by Mez of 14-in. ap. (remounted 1882), used in 1892 for the use of the 80-in. double stars; 30-in. refr. by Clark and Reipold, erected 1884, chiefly used for spectrographic work; 13-in. phot. refr. See also Odessa.
Ann Arbor (Michigan), lat. +42° 16' 48"-8', long. 8 h. 34 m. 55-2 s. W. Detroit obs. of the Univ. of Michigan; erected in 1874; meridian circle by Ertel; and 3.5-in. refr. by Repsold.

Berkeley (Cal.), Students' obs. of Univ. of California, lat. +37° 32' 23"-6', long. 8 h. 9 m. 2-7 s. W.; 8-in. refr. owned by E. Pickering for extensive photometrical and spectroscopical researches on stars, planets, and meteors.

Boston (Mass.), lat. +42° 27' 46"-5', long. 4 h. 44 m. 31-0 s. W. Erected in 1839. Refr. of 15-in. ap. by Merz, with which W. C. Bond discovered a satellite of Saturn (Hyperion) in 1845, employed by E. C. Pickering for extensive photometrical and spectroscopical researches on stars, planets, and meteors.

Bromfield (near Boston, Mass.), lat. +42° 27' 46"-5', long. 4 h. 44 m. 31-0 s. W. Erected in 1839. Refr. of 15-in. ap. by Merz, with which W. C. Bond discovered a satellite of Saturn (Hyperion) in 1845, employed by E. C. Pickering for extensive photometrical and spectroscopical researches on stars, planets, and meteors.

Cincinnati (Ohio). In 1842 an obs. was founded by subscription, lat. +38° 48' 2-6" s. W. Established 1854; 7-in. transit circle by Cooke.

Colorado (Colo.).) obs. of Univ. of Colorado, lat. +43° 3' 16"-5', long. 1 h. 5 m. 37-4 s. W. Erected by subscription 1852-1855; refr. of 13-in. ap. by Spencer, employed by C. H. F. Peters for the reduction of the position of the pole of the heavens, and for the construction of charts of the stars and the planets.

Columbia (Mo.), Laws obs. of Univ. Missouri, lat. +38° 50' 61"-7', long. 6 h. 19 m. 18-3 s. W. Founded 1853; 7-in. refr. by Merz.

Delaware (Wiss.), Southw. Coll. obs., lat. +39° 40' 36"-6', long. 7 h. 5 m. 32-10 s. W.; 12-in. refr. by Brashear and Warner & Swasey.

Denver (Col.), Univ. of Denver obs., lat. +39° 40' 36"-6', long. 6 h. 16' 18-5 s. W. Erected in 1844; 12-in. refr. by Merz.

Erlangen (Germany), Pickering Obs., lat. +49° 6' 15'-8", long. 51° 57' 38-3 s. W. Erected in 1852; 6-in. phot. zenith telescope by Brashear.

Glasgow (Missouri), Morrison obs., lat. +39° 16' 18-5", long. 6 h. 11 m. 18' 1-1 W. Founded in 1876; attached to Pritchett College; 12-in. refr. by Clark; meridian circle by W. D. Simms; 6-in. refr. by C. O. Griffis.

Hanover (New Hampshire), Shattuck obs. of Dartmouth College, lat. +43° 43' 15'-3", long. 4 h. 39 m. 7-9 s. W. Founded in 1853; 7-in. refr. by Merz.

Hastings (New York), Professor Henry Draper's obs., lat. +40° 59' 25", long. 4 h. 55 m. 29-7 W. Built in 1860; 28-in. refr. by the owner, 11-in. refr. with (photo. lens) by Clark, both used up to 1870; 36-in. refr. by Community of Observatories, 22-in. refr. by E. M. Simms; 12-in. refr. by Common, several phot. telescopes, a second 3-ft. s.g. refr. by Brashear with spectrophotograph.

Haverford (Pa.), Haverford Coll. obs., lat. +40° 40'-1", long. 5 h. 1 m. 12-7 s. W.; 10-in. refr. by Clark.

New York (N.Y.), Smith's obs., lat. +40° 59'-36", long. 51° 57' 38-3 s. W. Erected at the expense of Governor Washington in 1788; belongs to the Univ. of Wisconsin; meridian circle by Repsold; 13-in. ref. ap.; 15-in. ref. by Clark.

Mount Wilson (Cal.), Solar obs. of the Carnegie Institution, lat. +34° 12' 59'-5", long. 7 h. 52 m. 14-3 s. W. Erected 1904; 60-in. ref. by J. E. Pickering for the construction of solar spectra.

Northern (Mich.), Goodsell obs. of Carleton College, lat. +44° 27' 41-6", long. 6 h. 12 m. 35-8 s. W. Erected in 1878; 16-in. ref. byClark with phot. o.g.; 16-in. ref. by Brashear, 44-in. transit circle by Repsold.
Philadelphia. Flower Obs. of Univ. of Pennsylvania, lat. +39° 58' 21", long. 5° 1m. 6-6's. W. Founded 1862; 18-in. refr., 4-in. altazimuth, and 4-in. zenith telescope, all by Braseher & Warner & Swasey.

Poughkeepsie (N.Y.). Vassar College Obs., lat. +41° 41' 18", long. 74° 55m. 37-7's. W. Founded 1865; 12-in. refr. by Fitz & Clark; and a transit circle by Clark.

Princeton (New Jersey). Attached to Princeton Univ. are two obs.—the "Observatory of Instruction," lat. +40° 20' 57-8", long. 74° 49m. 21-9's. W.; and the "Observatory of Science," lat. +40° 20' 55-8", long. 74° 48m. 39-4's. W., in which a 23-in. refr. by Clark was mounted in 1883.

Washington (D.C.). U.S. naval obs., lat. +38° 53' 38-8", long. 77° 7m. 2-5's. W. Organized in 1872; obs. begun in 1845 with a mural circle by Troughton & Simms of 4-in., a transit instrument by Ertel of 5-3-in. ap., and a 9-6-in. refr. by Merz. A meridian circle by Pistor & Martins of 8-5 in. ap., mounted in 1855, and used for observing standard stars and planets; a 26-in. refr. by Clark, mounted in 1873—with this instrument A. Hall discovered the satellites of Mars in 1877. A new obs. on Georgetown Heights was opened in 1893, lat. +38° 55' 14-0", long. 78° 5m. 14-6's. W.; in addition to the old instruments there is a 40-ft. photophotograph of 5-in. ap., 6-in. transit circle built of steel by Warner & Swasey, 5-in. steel altazimuth by same, 12-in. refr. by Clark.

Washington (Philadelphia). Smithsonian Institution, lat. +38° 53' 17-4", long. 78° 8m. 6-2's. W. Founded 1890 for the study of solar radiation; 20-in. siderostat, spectrophotometer, &c.

Williams Bay (Wis.).—Yerkes Obs. of Univ. of Chicago, lat. +42° 34' 12-6", long. 88° 5m. 3-1's. W. Opened 1897; 40-in. refr. by Clark and Warner & Swasey; also a 12-in. refr., 24-in. ref!. 16-in. phot. refr.

Windsor (Mass.).—Hale Obs. of Harvard College, lat. +42° 42' 49", long. 74° 52m. 33-8's. W. Founded in 1836; 71-in. refr. by Clark; meridian circle of 44-in. ap. by Repsold, mounted in 1882 in the Field Memorial obs., lat. +42° 42' 30", long. 49° 52m. 50's. W.

Canada

Ottawa, Dominion Obs., lat. +45° 23", long. 76° 3m. 3-w. Founded 1902; 15-in. refr. by Braseher; 8-in. transit circle by Simms; 16-in. celeostat.

Mexico

Tecuahuy.—National obs. erected 1882, lat. +19° 24' 17-5", long. 6° 36m. 46-7's. W. 1760 ft. above sea-level; 15-in. refr. by Grubb, 13-in. phot. refr. by Henry & Gautier, 8-in. transit circle by Simms.

South America

Santiago (Chile), national obs., lat. -33° 26' 42-5", long. 4° 42 m. 42-8's. W. In 1849 the U.S. government sent an astro- nautical mission to South America. When Capt. J. W. Davidson returned to Washington he stated that the government of Chile bought the instruments—a 6-in. meridian circle by Pistor and Martins, a 64-in. refr. by Fitz, &c. New building erected 1860; 93-in. refr. by Merz and Repsold, 13-in. phot. refr. by Gautier.

Arequipa (Peru).—Branch of Harvard College obs., lat. -16° 24', long. 4° 45 m. 30-6's. W., 8606 ft. above sea-level; 24-in. Bruce refr. by Clark; and 13-in. Boyden telescope for photo. charts and spectra of the stars. The 24-in. light photometer extends the Harvard photometry to the south pole.

Rio de Janeiro (Brazil), national obs., lat. -22° 54' 23-7", long. 4° 16 m. 45-1's. W. Erected in 1871 under the direction of B. A. Gould till 1883. With a meridian circle by Repsold of 5-in. ap. 105,000 zone obs. of stars between -23° and -80° decl. have been made in a 111-in. phot. refr. by Clarke; 5-in. phot. refr. by Henry & Gautier.

Cordoba (Argentina), national obs., lat. -31° 35' 15-4", long. 6° 14 m. 40-5's. W. Erected in 1853; 18-in. circum. circle by B. F. Polk till 1883. With a meridian circle by Repsold of 5-in. ap. 105,000 zone obs. of stars between -23° and -80° decl. have been made in a 111-in. phot. refr. by Clarke; 5-in. phot. refr. by Henry & Gautier.

La Plata (Argentina), univ. obs., lat. -34° 54' 30-3", long. 3° 51m. 37-o' s. W. Founded 1883; 18-in. equat. coudeé, 13-in. phot. refr. and transit circle, all by Henry & Gautier.

Africa

Cape of Good Hope, royal obs., lat. -33° 56' 3-5", long. 1° 13 m. 5-8's. E. Founded in 1820; erected in 1825-1829, about 34 ft. from Cape Town. Obs. were begun in 1829 with a transit instrument by Troughton & Simms; 4-in. altazimuth circle by Merz & Gautier. Maclear undertook to verify and extend the arc of meridian measured by N. L. de Lacaille in 1711-1753, which work occupied the obs. staff for a number of years. In 1849 a 7-in. refr. by Merz was mounted, and in 1853 a new meridian circle, a facsimile of the one at Greenwich, superseded the older instruments. Maclear was succeeded by E. J. Stone (1870 to 1879), who devoted himself and the staff to the work already in progress. The observatory is in possession of the Cape government and is used for research of a general character. Under Sir David Gill (1879-1906) a 7-in. heliometer by Repsold has been used since 1887 for researches on solar parallax and annual parallax of stars, while a complete review of the heavens has been made south of -23° decl. with a 6-in. phot. Dallmeyer refr. by Sir Thomas Macdougall Brisbane in 1821, and more recently with 8-in. refr. and Grubb refr. and 6-in. priism, and a 6-in. transit circle by Simms have also been mounted.

Besides the obs. of L'Aber in Cape Town (lat. -33° 55' 16-2", long. 1° 13 m. 41-o' E.), there are temporary obs. at Feldhausen, lat. -33° 58' 56-6", long. 1° 13 m. 51-o' E. 6 m. from Feldhausen to desire to be mentioned. It was here that Sir John Herschel observed nebulae and double stars from 1834 to 1836 with a refl. of 18-in. ap.
OBSIDIAN, a glassy volcanic rock of acid composition. A similar rock was named obsidian by medieval writers, from its resemblance to a rock discovered in Ethiopia by one Obsius. The early printed editions of Pliny erroneously named the discoverer Obsius, and the rock obsidians. Rhyolitic lavas frequently are more or less vitreous, and when the glassy matter greatly predominates and the crystals are few and inconspicuous the rock becomes an obsidian. The chemical composition is essentially the same as that of granite; the difference in the physical condition of the two rocks is due to the fact that one consolidated at the surface, rapidly and under low pressures, while the other cooled slowly at great depths and under such pressures that the escape of the steam and other gases it contained was greatly impeded. Few obsidians are entirely vitreous; usually they have small crystals of felspar, quartz, biotite or iron oxides, and when these are numerous the rock is called a porphyritic obsidian (or hyalo-lapicite). These crystals have, as a rule, a cryptocrystalline form. In the quartz and felspar are often filled with enclosures of glass.

All obsidians have a low specific gravity (about 2.4) both because they are acid rocks and because they are non-crystalline.

Even when conspicuous and well formed crystals are not visible in the rock there is nearly always an abundance of minute imperfect crystallizations (microlites, &c.). They are often so small that high magnifications may be necessary to ascertain their presence. Some are globular and others are rod-shaped; they may be grouped in clusters, stars, rosettes, rows, chains or swarms of indefinite shape. In banded obsidians these microlites may be numerous in some parts but few or absent in others. The larger ones polarize light, have angular outlines like those of crystals, and may even show twinning and definite optical properties by which they can be identified as belonging to felspar, augite or some other rock-forming mineral. The variety of their shapes is endless. Some are black, very thin and curved like threads or hairs (trichites); often a group of these is seated on a small crystal of augite or magnetite and spreads outwards on all sides. Others have hollow or funnel-shaped ends and are constricted at the middle like a dice cup. In some rocks small rod-like microlites are grouped together in a regular way to form growths which resemble fir branches, fern leaves, brushes or networks, in the same manner as minute needles of ice produce star-like snow crystals or the frost growths on a window pane.

These crystallites (q.v.) show that the glassy rock has a tendency to crystallize which is inhibited only by the very viscous state of the glass and the rapidity with which it was cooled. Another type of incipient crystallization which is excessively common in obsidians is spherulites (q.v.), or small rounded bodies which have a radiating fibrous structure. They are of globular shape, less frequently irregular or branching, and may be elongated and cylindrical (axiolites). In some obsidians from Teneriffe and Lipari the whole rock consists of them, so closely packed together that they assume polygonal shapes like the cells of a honeycomb. In polarized light they it may a weak to medium colored and interference figure. A very thin section of this kind of glass is very fine-grained that its constituents cannot be directly determined even with the aid of the microscope, but chemical analysis leaves little doubt as to the real nature of the minerals of which they are composed. Many obsidian rocks show alteration of this type in certain parts where either the glass has been of unstable nature or where agencies of change such as percolating water have had easiest access (as along joints, perlitic cracks and the margins of cushions and rinds). Obsidians from Lipari often
have felsitic bands alternating with others which are purely glassy. In Arran there are pitchstone dikes, some of which are very completely vitreous, while others are changed to spherulitic felsites more or less completely. Pitchstone of the Scuir of Eigg is also vitreous, characterized by a dull semi-opaque matrix which seems to be the result of secondary devitrification.

In Europe the best-known localities for them are the Lipari Islands, Pantelleria, Iceland and Hungary. Very fine obsidians are also obtained in Mexico, at the Yellowstone Park, New Zealand, Ascension and in the Caucasus. Included in this group are some rocks which are more properly to be regarded as vitreous forms of trachyte than as glassy rhyolites (Iceland), but except by chemical analyses they cannot be separated. It is certain, however, that most obsidians are very acid or rhyolitic. The dark, semi-opaque glassy forms of the basic igneous rocks are known as tachylytes. The typical obsidians exhibit the chemical peculiarities of the acid igneous rocks (viz. high percentage of silica, low iron, lime and magnesia, and a considerable amount of potash and soda).

The chemical composition of typical obsidians is shown by the following analyses:

Obsidian, when broken, shows a conchoidal fracture, like that of glass, and yields sharp-edged fragments, which have been used in many localities as arrow-points, spear-heads, knives and razors. For such purposes, as well as as ornaments and labrets, it was extensively employed, under the name of *stilly*, by the ancient Mexicans, who quarried it at the Cerro de las Navajas, or "Hill of Knives," near Timapan. The natives of the Admiralty Islands have used it for the heads of spears. By the ancient Greeks and Romans obsidian was worked as a gem-stone; and in consequence of its having been often imitated in glass there arose among collectors of gems in the 18th century the practice of calling all antique pastes "obsidians." At the present time obsidian is sometimes cut and polished as an ornamental stone, but its softness (H=5 to 5.5) detracts from its value. Certain varieties, notably some from Russia, possess a beautiful metallic sheen, referable to the presence of either microscopic fissures or enclosures. The substance known as moldavite, often regarded as an obsidian, and the so-called obsidian bombs, or obsidians, are described under Moldavite. (J. S. F.)

**OBSTETRICS**, the science and art of midwifery (Lat. obstetriz, a midwife, from obstare, to stand before). Along with Medicine and Surgery, Obstetrics goes to form what has been called the Tripos of the medical profession, because every person desiring to be registered under the Medical Acts must pass a qualifying examination alike in medicine, surgery and midwifery. The term Gynaecology (q.v.), which has come to be applied to the study of the diseases of the female generative system, in its primary sense includes all that pertains to women both in health and disease. Obstetrics, or midwifery, is more specially that part of the science of gynaecology which deals with the care of a pregnant woman and the ushering of her child into the world.

**Tolokology**—the doctrine of parturition—is the most distinctive sphere of interest for obstetricians, and here their activities bring them into a closer approximation to the work of surgeons. As a science it demands a study of the phenomena of labour, which in their ordered succession are seen to present three distinct stages: one of preparation, during which the uterus dilates sufficiently to allow of the escape of the infant; a second, of progress, during which the infant is expelled; and a third, of the extinction of the after-birth or placenta. In each of the stages analysis of the phenomena reveals the presence of three elements which are known as the factors of labour, viz. the powers or forces which are engaged in the expelling of the uterus; the passages or canals through which the ovum is driven; and the passenger or body that is being extruded. The mechanism of labour depends on the balance of these factors as they become adjusted to each other in the varying phenomena of the several stages. The diversities that are met with in different labours even of the same woman have led to their being classified into different groups. A natural labour is commonly defined as one where the child presents by the head and the labour is terminated within twenty-four hours. From this it is obvious that no case of labour can be defined at its onset. The relation of the factors may represent an ideal of perfect accommodation; but until the labour is completed, and completed within a reasonably safe period, it cannot be classed as natural. The element of time has this importance, that it is found that, apart from all accidents and interferences, the mortality both to mother and child becomes greater the longer the duration of the labour. Hence lingering or tedious labours, in which the child still presents with the head, but is not expelled within twenty-four hours after the onset of labour-pains, are properly grouped in a separate class, although they are terminated without operative interference. In the class of preternatural labours, where the head comes last (as first, there are two subjects of care. The uterine, or child during its nine months' evolution had been increasing enormously in all its elements, has in six weeks to undergo an involution that will restore it to its pregnavant condition. The allied organs share in their measure in the change, all the systems of the body feel the influence, and especially the mammary glands take on their function of providing milk for the nutriment of the new-born infant. A patient with some latent flaw in her constitution may pass the test of pregnancy and labour with success, only to succumb during the puerperium. Of patients who become insane in connexion with child-bearing, a half manifest their cases mental disorder first during the days or weeks immediately preceding their confinement, and numbers more whilst they are suckling their infants. A woman may have had an easy labour, and may have been thankful at the time for help from a hand that she did not know to be unclean; three days later germs left by that hand may have so multiplied within her that she is in mortal danger from septicaemia. The management of the puerperal patient requires not only the warding off of deleterious influences, but the watching of the normal processes, because slight deviations in these, undetected and unchecked now, may become later a source of lifelong invalidism. It remains further to be noted that to obstetricians belong the earliest stages of pediatrics in their care of the new-born child. In some old works practitioners of this branch of the profession are described as δύσωποιοι, because their first business was to cut the umbilical cord. The causes of the high death-rate among infants, whether due to ante-natal, intra-natal or neo-natal conditions, come under their observation. They have charge of the whole wide field of the hygiene, pathology and therapeutics of infancy.
OBSTETRICS

Historical Sketch.—The origin of midwifery is lost in the mists of human origins. The learned Jean Astruc, who gave a lead to higher critics in their analysis of the Pentateuch by pointing out the presence of Elohist and Jehovistic elements, exercised his imagination in fancying how the earliest pair comport themselves at the birth of their first child, and especially how the husband would have to learn what to do with the placenta and umbilical cord. His speculations are not in the least illuminative. The Mosaic writings let us see women of some experience and men of authority, a sort of a Rotterdam in Jewish society giving birth to twins, and superintending the easy labours of Hebrew slaves in Egypt. The Ebers Papyrus (1550 B.C.), which Moses may have studied when he grew learned in all the wisdom of the Egyptians, is the oldest known medical production. It contains prescriptions for causing abortion, for promoting labour, for curing displacements of the uterus, &c. But there is no indication as to how labours are to be managed, and with regard to the child there are only auguries given as to whether it will live or die, according, e.g. as its first cry after it is born sounds like dø or bå.

The story of the rise and progress of midwifery is intimately bound up with the history of medicine in general. The obstetrician, looking for the dawn of his science, turns like his fellow-workers in other medical disciplines to the Hippocratic writings (400 B.C.). Now the father of medicine was not an obstetrician. As with Egyptians and Hebrews, the skilled attendants on women in labour among the Greeks were also women. But since nothing that concerned the ailments of humanity was foreign to Hippocrates, there are indications in the writings that are accounted genuine of his interest in the disorders of females—in their menstrual troubles, in their sterility, in their abortion symptoms, and in their puerperal diseases; his oath forswears the use of abortificants, and he recommends the use of sternutatories to hasten the expulsion of the after-birth. In the Hippocratic writings that are supposed to be products of his followers, some of these subjects are more fully dealt with; but whilst the physician is sometimes called in to give advice in difficult labours, so that he can describe different kinds of presentation and can speak of the possibility of changing an unfavourable into a favourable lie of the infant, it is usually only with cases where the child is already dead that he has to deal, and then he tells how he has to mutilate and extract it. So these writings furnish us with the earliest account of the accoucheur's armamentarium, and let us see him possessed of a ἄκραιβον—knife or perforator for opening the head; a πιέστρων—a comminutor for breaking up the bones; and a ἄλεκτρηρ—an extractor for hooking out the infant. The classical writers of Greece give the same impression as to the primitive stage of obstetrics. Women, like the mother of Socrates, have the charge of parturient women. Where divine aid is sought, goddesses are invoked to facilitate the labour. Gods or men are only called in where graver interference is required as, when Apollo rescued the infant Asclepius by a Caesarean section performed on the dying Semele. Some midwives are known to history, and extracts from the writings of one Aspasia are embedded in the works of later authors. In the great medical school of Alexandria, when the science of human anatomy began to take shape, Herophilus rendered a service to obstetrics in giving a truer idea of the anatomy of the female than had previously prevailed; other physicians give evidence of their interest in midwifery and the diseases of women, and some experience was gradually being acquired and transmitted through the profession until we find from Celsus (in the reign of Augustus) that when surgeons were called in to help the attendant woman they could sometimes bring about the delivery without destroying the infant, by the operation of turning. In the 2nd century Soranus wrote a work on midwifery for the guidance of midwives, in which for the first time the uterus is differentiated from the vagina and instruction is given for the use of a speculum. A contemporary, Moschion, wrote a guide for midwives which, with that of Soranus, may be said to touch the high-water mark of archaic midwifery. It is written in the form of question and answer, was much prized at the time of the Renaissance, and was used as the basis of the first obstetric work that issued from a printing-press. Philumenos wrote a treatise of some value at the same epoch, but it is only known from the free use made of it by subsequent writers, such as Aétius in the beginning of the 6th century. Like Orisbasius, who preserved in his compilation the work of Soranus, Aétius draws largely on preceding writers. His treatises on female diseases constitute an advance on previous knowledge, but there is no progress in midwifery, though he still makes mention of turning. From the operation of turning in hospital wards as practised by Aegina, an 8th-century author, the last to treat at length of obstetrics and gynaecology the state of the dark ages settled down on the Roman world, and it is not heard of again till a millennium had passed. During the centuries when the progress of medicine was dependent on the work of the Arabian physicians, the science of obstetrics stood still. We are curious to know what Rhazes and Avicenna in the 9th and 10th centuries have to say on this subject. But they know little but what they have learned from the Greek writers, and they show a great tendency to relapse to the rudest procedures and to have recourse to the intervention of the child. Interest attaches to the work of Albucasis in the 12th century, in that he is the first to illustrate his pages with figures of the knives, crushers and extractors that were employed in their gruesome practices, and that he gives the first history of a case of extrauterine pregnancy.

We come down to the 16th century before we begin to see any indication of the development of obstetrics towards a place among the sciences. Medicine and surgery profited earlier by the intellectual awakenings of the Renaissance and the Reformation. In anatomical theatres and hospital wards as associated with universities great anatomists and clinicians began to discard the dogmas of Galen, and to teach their pupils to study the body and its diseases with unprejudiced minds. But the practice of midwifery was still among all people in the hands of women, and when in 1513 Eucharius Roesslin of Frankfurt published a work on midwifery, it bore the title Der schwangeren Frauen und hebbamen Rosengarten. Translated into English by Thomas Raynald with the altered title, The Birth of Mankynd, it is mainly compiled from Moschion, and the Soranus and Philumenos fragments of Orisbasius and Aétius, and is intended as a guide to parturient women and their attendants.

It was illustrated with fanciful figures of the foetus in utero that were reproduced in other works of later date—as in the Rosengarten of Walter Reiff of Strassburg in 1546 and the Hebammenbuch of Jacob Rueff of Zurich in 1554, the latter of which appears in English dress as The Expert Midwife. The greatest impulse to the progress of midwifery was given in the middle of the 16th century by the famous French surgeon Ambroise Paré, who revived the operation of podalic version, and showed how by means of it surgeons could often rescue the infant even in cases of head presentation instead of breaking it up and extracting it piecemeal. He was ably seconded by his pupil Guillemeau, who translated his work into Latin, and at a later period himself wrote a treatise on midwifery, an English translation of which was published in 1612 with the title Child-Birth; or, The Happy Deliverie of Women. The close of the 16th century is rendered further memorable in the annals of midwifery by the publication of a series of works specially devoted to it. Three sets of compilations, containing extracts from the various writers on obstetrics and gynaecology from the time of Hippocrates onwards, were published under the designation of Gynaeciae or Gynaecologia—The first edition by W. Wolff of Zurich in 1566, the second by Caspar Bauhin of Basel in 1586, and the third by Israel Spach of Strassburg in 1597. Spach includes in his collection not only Paré's obstetrical chapters, but the Latin translation of the important Traitte nouveau de l'hysterotomotie, published by the French surgeon Francis Rousset in 1581, which is the first distinct treatise on an obstetric operation, and advocates the performance of Caesarean section on living women with difficult labours. From this time onwards evidence accumulates of the growing interest.
OBSTETRICS

of members of the medical profession, and more especially of surgeons, in the practice of midwifery, and after the middle of the 17th century they began to publish the records of their experiences in special works. The part most important of their lives was that of surgeons—as Mauriceau, Viardel, Paul Portal, Peu and Dionis. The work of Mauriceau, which first appeared in 1668, is especially interesting from its having been translated into English in 1672 by Hugh Chamberlen, who in his preface made the then incredible statement that his father, his brothers, and himself had long attained to and practised a way to deliver women in difficult labours without hooks, where other artists used them, and without prejudice to mother or child. Many years had still to elapse before the secret of the Chamberlenes leaked out. In the course of this century some women who had midwifery knowledge in midwifery appeared as authors. Thus in England Jane Sharp in 1671 wrote The Midwives' Book, or the whole art of Midwifery discovered; in Germany, Justine Siegemund, in 1690, Die Chir-Brandenburgische Hoff-Wehmutter; and earlier and better than either, in France, Louise Bourgeois in 1626 published Observations sur la sterilité et maladies des femmes. Perhaps they were beginning to feel that there was some need to assert their power, for it was during this century that parturient ladies began to call in men to attend them in natural labours. According to Astruc, Madame de la Valliere wished her confinement to be attended by a physician of the 17th, in June 1663, sent for Jules Clement, the court surgeon, to superintend the delivery. This was accomplished successfully. The king gave him the title of accoucheur. Clement afterwards attended the dauphiness and other court ladies, and went thence to Madrid to assist at the confinement of the queen of Philip IV. Up till this epoch physicians and surgeons had only been summoned to the lying-in room by midwives who found themselves at the end of their resources, to give help in difficult cases where the child was usually dead and the mother often moribund. Nothing that came out simultaneously with the Dutch had a title to confinements to be under the surveillance of a physician, it became possible for men with their scientific training to study the normal phenomena of natural labour, and through the medium of the printing-press to communicate the results of their observation and experience to their professional brethren. Hence the books of the men already referred to, and of others that appeared later, such as the Traité complet des accouchements de la Motte, 1721, which is a storehouse of acute observations and wise discussion of obstetric measures. In other countries than France physicians and surgeons began to take a part in the management of midwifery, as part of a state of society. The term obstetrician, of which they were somewhat ashamed (je Bon, one of the writers whose work is found in Baunin's Gynaecia, says: "Haece ars viros dedeect"). and it was in Holland that a work was produced that has earned for its author the designation of the Father of Modern Midwifery. Heinrich van Deventer, who practised as an obstetrician at the Hague along with his wife (a Vroedvrouw, as he was a Vroedmeester), published in 1606 a preliminary treatise called Dageraad (Aurora) der Vroedvrouwen, and in 1701 he followed it up by a more complete second volume, of which the Latin edition that came out simultaneously with the Dutch has a title beginning Operationes Chirurgiae Novum Lumen Exhibentes Obstetricantibus. It has the supreme value of being the first work to give a scientific description of the pelvis, and to take some steps towards the development of the mechanism of labour. The "obstetricantes" for whom Deventer wrote are both men and women. In the early part of the 18th century women had still the main and often the sole charge of their parturient sisters; but the practice of having a doctor to superintend or to supersede the midwife had kept spreading among the classes who could afford to pay the doctor's fee; and by the time Deventer's treatise was doing its educational work in an English translation, as The Art of Midwifery Improved, in 1716, the doctors were getting into their hands the "harmless forceps" with which a living child could be extracted without detriment to the mother, in conditions where formerly her child's life was sacrificed and her own endangered. This life-saving instrument was invented in London, but by a man not of English birth. The Huguenot, William Chamberlen, fled from Paris to escape the St Bartholomew massacre, carrying with him to Southampton his wife, his two sons, and his daughter. William Chamberlen himself, as a surgeon, and his descendants through four generations had large and lucrative practices in London. The eldest son Peter, who was old enough when he came to England to be able to attest the birth and baptism of a younger brother, is, on good grounds, credited with being the inventor of the forceps, which for a good century was kept a secret among brothers, sons and grandsons. Hugh, indeed, a great-grandson of William, and the translator of Mauriceau, had offered to sell the family secret for 10,000 crowns; but his failure to effect delivery in a test case that Mauriceau put to him led the profession to believe he was a boastful quack. Palluy of Ghent, when in Paris in 1723, putting a work on anatomy through the press, laid before the Academy of Science a pair of forceps, which was figured in Heister's surgery in 1724. He has thus the honour of first laying before the profession a midwifery forceps. But his implement was ill-constructed, and never came into general use. Meanwhile the knowledge that the Chamberlenes were really possessed of a serviceable instrument must have stimulated other practitioners. Perhaps a colleague with a keen eye may have got sight of it on some occasion, or an intelligent midwife had been able to make a satisfying "to the life" model, and thus he was enabled to apply. In 1734 Dr Edward Hody published a record of Cases in Midwifery that had been written by Mr William Giffard, "surgeon and man-midwife." The dates range from January 1724 to 1731. Amongst the cases are several where he effected the delivery by means of the forceps—"extractor," he calls it—of which a figure is given; and when Edmund Chapman, who practised first at Halstead and afterwards in London, published his Treatise on the Improvement of Midwifery in 1733, he speaks of the use of the forceps as "now well known to the principal men of the profession both in town and country." In the course of the 18th century the development of midwifery in the hands of medical men made greater strides than in all the preceding ages. The progress was accelerated by the establishment of chairs of midwifery in the universities of various countries, Edinburgh taking the lead in the appointment of a professor in 1726, and Strassburg coming closely after in 1728. In Strassburg the chair had the advantage of being at once associated with a clinical service. Lecturing was carried on, moreover, by both men and women, aspiring to be specialists in midwifery and the diseases of women and infants, and were succeeding in developing lying-in institutions for the benefit of poor women in labour that became schools of instruction both for midwifery nurses and for medical students. Two new operations came during this epoch to enhance the powers of the obstetrician, viz. symphysiotomy, first introduced by Sigault in Paris; and the induction of premature labour, first carried out by Macaulay in London in circumstances described by Demman in the preface to his Midwifery. William Hunter in London, Sir Fielding Ould in Dublin, Röderer in Göttingen, Camper in Amsterdam, Baedelouque in Paris, Saxtorph in Copenhagen, and many other authors contributed to progress by their atlases and their books. But there are three whose names stand out pre-eminently because of the influence they exerted on the whole obstetric world—Leveret, Smellie and Boër. Kilian, in his vindictus of the history of midwifery, calls Leveret "one of the greatest masters in the department that ever lived." Of Smellie he says: " Inferior to Leveret in nothing, he excels him in much." Boër characterizes as "the most meritorious and important of German obstetricians." Leveret improved the construction of the forceps, and widened the sphere of their applicability; Smellie worked in the same direction, and furnished, moreover, descriptions and illustrations of natural and morbid labours that are of classical value; and Boër first clearly placed pregnancy (which Mauriceau, e.g. had spoken of as "a nine months' disease") and parturition in the category of physiological processes that might be hindered rather than
helped by the pragmatical interferences of meddlesome midwives.

Throughout the 19th century midwifery continued to advance, gynaecology grew into a special department with an extensive literature, the mechanism of labour developed under the clinical observations of men like Nägele and the study of such frozen sections of cadaver as were made by Braune, the indications for interference became more clear and the methods of interference more simple and safe, and a whole realm of antenatal pathology and teratology was added to the domain of science, while practitioners learned the art of saving premature and delicate infants by the use of the incubator and proper alimentation. Every advance in all the cognate sciences was appreciated and applied for the advancement of obstetrics. But there are two achievements which will make the 19th century for ever memorable in the annals of midwifery—the abolition of the pains of labour and the arrest laid on mortality from the so-called puerperal fever. In February 1847 Sir J. Y. Simpson, choosing a case where he had to deliver by turning, put the patient asleep with ether. Seeing that the uterine contractions continued, though the attendant pain was abolished, he proceeded to administer ether in cases of natural labour, and in November of the same year demonstrated the virtues of chloroform, and so furnished the most serviceable anaesthetic, not only to the obstetrician in the lying-in room, but to the surgeon on the battlefield, and to the general practitioner in his everyday work. Ignaz Philipp Semmelweis, assistant in the maternity hospital of Vienna, was struck and saddened with the appalling mortality that attended the delivery of the women under his care, as many as one (in some months three) out of every ten of the puerperae being carried out dead. He observed that the mortality was much higher in the wards allotted to the tuition of students than in those set apart for the training of nurses. In the spring of 1847 he saw at the post-mortem examination of a young colleague who had died of a poisoned wound, that the appearances were the same as he had too often had occasion to see at the post-mortem examinations of his puerperae. He ordered that every student who assisted a woman in her labour must first wash his hands in a disinfectant solution of chloride of lime, and in 1848 already the mortality was less in the students' than it was in the nurses' wards. Thus the first light was shed on the nature of the mischief of which multitudes of puerperal patients perished, and the first intelligent step was taken to lessen the mortality. When, some twenty years later, Lister had applied the bacteriological principles of Pasteur with beneficial results to surgery, obstetricians gladly followed his lead, and the 19th century beheld added to the comfort of anaesthetic midwifery the confidence of midwifery antiseptic and even aseptic.

The most exhaustive treatise on the earlier history of midwifery is von Siebold, Versuch einer Geschichte der Geburtskille (Berlin, 1839).

OCALA (A Seminole word for green or fertile land), a city and the county-seat of Marion county, Florida, U.S.A., in the N. central part of the state, about 100 m. S.W. of Jacksonville. Pop. (1900) 33,800, (1905) 44,093, of whom 24,672 were negroes, (1910) 43,700. It is served by the Seaboard Air Line and the Atlantic Coast Line railways. About 6 m. E. is Silver Springs, the largest and best known of the springs of Florida. Its basin is circular, about 1,000 ft. in diameter. Its waters are remarkable for their transparency and refractive powers. According to the estimate of Dr D. G. Brinton, the spring discharges more than 300,000,000 gallons of water daily, its outflow forming what is known as Silver Spring Run, 9 m. long, emptying into the Ocklawaha river and navigable by small river steamers. For the drainage and sewerage of the city a subterranean river whose source and mouth are unknown is utilized. The city is the seat of the Emerson Memorial and Industrial Home (Methodist Episcopal) for negro girls. Ocala was settled in 1845, but its development dates from 1880, when it was first chartered as a city. In December 1860 it was the meeting-place of the National Convention of the Farmers' Alliance, which promulgated a statement of political principles generally known as the "Ocala Platform." (See Farmers' Movement.)

OCAÑA, a town of central Spain, in the province of Toledo; on the extreme north of the tableland known as the Mesa de Ocaña, with a station on the railway from Aranjuez to Cuénta. Pop. (1900) 6616. The town is surrounded by ruined walls, and is the remains of an old castle. In one of its parish churches is the chapel of Nuestra Señora de los Remedios, in which Ferdinand and Isabella were married in 1466. Ocaña is the Vicus Cumianarius of the Romans, and was the dowry that El Matamid of Seville gave his daughter Zaida on her marriage with Alphonso VI. of Castile (1072-1109). Near Ocaña, on the 19th of November 1809, the Spanish under their Irish general Lacy were routed by the French under Joseph Bonaparte and Marshal Soult.

OCARINA, a wind instrument invented in Italy, which must be吹used with musical toy or freaks, although concerted music has been written for it. The ocarina consists of an earthenware vessel in the shape of an egg with a pointed base and a tube like a spout in the side, which contains the mouthpiece. There are usually 16 holes in the front surface of the instrument, nine for fingers and thumb and a vent hole; the newer models have 8 holes and two keys. By half covering the holes the semitones are obtained.

O'CAROLAN (or CARolan), TURLOGH (1670-1738), Irish bard, son of John O'Carolan, a farmer, was born at Newtown, near Nobber, in the county of Meath. The family is said to have come down to them from MacMahons of Derrynane, and the grandfather of the great-grandfather was a chieftain. The O'Carolans forfeited their estates during the civil wars, and Turlough's father settled at Alderford, Co. Roscommon, on the invitation of the family of M'Dermott Roe. In his eighteenth year he became blind from smallpox. He received special instruction in music, and used to wander with his harp round the houses of the surrounding gentry, mainly in Connaught. The famous song "Receipt for Drinking" may be responsible for the allegation that he was addicted to intemperate drinking, but Charles O'Conor (1710-1791) the antiquary, who had personal knowledge of him, gives him as a good character in private life. The number of Carolan's musical pieces, to nearly all of which he composed verses, is said to exceed two hundred. He died on the 25th March 1738, and was buried at Kilrnan.

His poetical Remains in the original Irish, with English metrical translations by Thomas Furlong, were printed in Hardiman's Irish Miscellany (1831). Many of his songs were preserved among the Irish MSS. in the British Museum.

OCCAM, WILLIAM OF (d. c. 1340), English schoolman, known as Doctor vitriculus and Venerabilis inceptor, was born in the village of Ocam, Worcestershire, towards the end of the 14th century. Unattested tradition says that the Franciscans persuaded him while yet a boy to enter their order, sent him to Merton College, Oxford (see G. C. Brodick, Memorials of Merion College, p. 194), and to Paris, where he was first the pupil, afterwards the successful rival, of Duns Scotus. He probably left France about 1314, and there are obscure traces of his presence in Germany, in Italy, and in England during the following seven years. It has generally been held that in 1322 he appeared as the provincial of England at the celebrated assembly of the Franciscan order at Perugia, and that there he headed the revolt of the Franciscans against P. P. John XXII.; but, according to Little (English Historical Rev. v. vi. 747), the provincial minister on this occasion was William of Nottingham. Probably, however, Occam was present at the assembly. His share in this revolt resulted in his imprisonment, on the charge of heresy, for seventeen weeks in the dungeons of the papal palace at Avignon. He and his companions—Michael of Cesena, general of the order, and Bonagratia—managed to escape, and found their way to Munich, where they aided Louis IV. or V. (q.v.) of Bavaria in his long contest with the papal curia. It was for Occam's share in this controversy that he was best known in his lifetime. Michael of Cesena
died in 1342, and Occam, who had received from him the official seal of the order, was recognized as general by his party. The date of his death and the place of his burial are both uncertain. He probably died at Munich in 1349.

William of Occam was the most prominent intellectual leader in an age which witnessed the disintegration of the old scholastic realism, the rise of the theological scepticism of the later middle ages, the great contest between pope and emperor which laid the foundations of modern theories of government, and the quarrel between the Roman curia and the Franciscans which showed the long-concealed antagonism between the spirit of the Councils of Hildesheim and Francis of Assisi; and he shared in all these movements.

The common account of his philosophical position, that he reintroduced nominalism, which had been in decadence since the days of Roscellinus and Abelard, by teaching that universals were only *flatus vocis*, is scarcely correct. The expression is nowhere found in his writings. He revived nominalism by collecting and uniting isolated opinions upon the meaning of universals into a compact system, and popularized his views by associating them with the life and person of the Wycliffite leader with whom he had sympathized in the universities. He linked the doctrines of nominalism on to the principles of the logic of Psellus, which had been introduced into the West in the *Summule* of Peter of Spain, and made them intelligible to common understandings.

The fundamental principles of his system (see SCHOLASTICISM) are that "Essentia non sunt multiplicanda praeter necessitatem" ("Occam's Razor"), that nouns, like algebraical symbols, are merely denotative terms whose meaning is conventionally agreed upon (*suppositio*), and that the destructive effect of these principles on theological matters does not arise from a rejection of *principia*.

In the *Opus nonaginta dierum* (1330) (written in reply to John XXII.'s libellus against Michael of Cesena, and in its successors, the *Tractatus de dogmatibus Johannis XXII. papae* (1333-1334), the *Commentarium erroris Johannis XXII. papae* (1335-1338) and in the *Defensorum contra errores Johannis XXII. papae* (1339)), Occam once incidentally expresses his views as a publicist; the books are mainly, some of them entirely, theological, but they served the purpose of the emperor and of his party, because they cut at the root of the spiritual as well as of the temporal supremacy of the pope. In his writing *Super potestate summi pontificis octo quasitiones* (1339-1342) on the temporal supremacy of the pope, the idea of the independent of kingly authority, which he maintains is as much an ordinance of God as is spiritual rule, and discusses what is meant by the state. His views on the independence of the church are even more distinctly expressed in the *Tractatus de jurisdicione imperatoris in causis matrimonialibus*, in which, in spite of the medieval idea that matrimony is a sacrament, he defends the right of the civil power to dispose of it and to state the prohibited degrees. By 1343 there was in circulation his great work the *Dialogus* (see Goldast ii. 368-957), in which he attempted to present his views in a complete summary. It consists of three parts. The first is the *De falso ambitur heresierum*, and deals with the pope as arbiter in the matter of heresy. The second part is the refutation of the doctrines of John XXII. (see above treatises). The third was to be in nine sections, of which the first two and second sections alone remain to us. It is probable that the *Opus nonaginta dierum* and the *Compendium errorum* were intended to form part of the work. His last work, *De Electione Caroli IV.*, repeats his opinions upon temporal authority and adds little that is new.

In all his writings against Pope John XXII. (q.v.), Occam inveighs against the pope's opinions and decisions on the value of the life of poverty, with which he unhesitatingly united the guilds, which involved a declaration against evangelical poverty, and insists that they are full of heresy. Occam was a sincere Franciscan, and believed with his master that the institution of monasteries and nunneries, of any kind, was wrong. He was won through rigid imitation of Jesus in His poverty and obedience, and they could not have been possible for Franciscans to follow the rules of their founder within his order. John XXII., however, condemned the life of poverty as the main root of heresy. Occam, some of his followers, were so convinced of the necessity of evangelical poverty for a truly Christian life that they denounced the pope when he refused them letters of license to remove to Aquitaine (the Antichrist). After Occam's days the opinions of Francis prevailed in the Franciscan universities, and no one had posited in them. The church had no place within the church. They were Fraticelli, Beghards, Lollards or other confraternities unrecognized by the church and in steady opposition to her government.

Aside from the theological and political works above quoted, Occam wrote *Summa Logicae* (Paris, 1388, Oxford, 1675) commentaries on Porphyry's *Isagoge*, on the *Categoriae*, *De Interpretatione* and *Elenchos* of Aristotle. These latter were printed in 1406 at Bologna, and entitled *Expositio diversorum excerptorum litterarum veterem; Questions in quattuor libros sententiarum* (Lyons, 1495).

There is no good monograph on Occam. For an account of his logic, see Prantl, *Historie der Logik* (1855-1870); for his philosophy, see S. H. Gardiner, *Geschichte der Philosophie*, (1864-1866), vol. ii.; for his publicist writings, see Riezler, *Die literarischen Werke* of John of Ruensi, the *Praxis reformatorum*, in the *Brit. Quat. Review* (July, 1872). Among ancient documents consult Dienne and Chatelain's *Chartularium Universitatis Parisiensis*, vol. ii. pt. i. (Paris, 1887); Wadding's *Annalen* (ed. Pirenne), vol. ii. (Brussels, 1887); for an list of Occam's works, see Little's *Grey Friars*, pp. 225-232. (T. M. L.)

**OCCASIONALISM** (Lat. *occasion*, an event), in philosophy, a term applied to that theory of the relation between matter and mind which postulates the intervention of God to bring about in the one a change which correspons with a similar change in the other. The theory thus denies any direct interaction between matter and mind. It was expounded by Guinleix and Malebranche to avoid the difficulty of Descartes's dualism of thought and extension, and to explain causation. Thus mind and matter are to Guinleix only the "occasional" causes of each other's changes, while Malebranche, facing further the epistemological problem, maintains that mind cannot even know what, which is merely the "occasion" of knowledge.

**OCCLEVE** (or HOCCLEVE), THOMAS (1368-1430), English poet, was born in 1368/9, for, in writing in 1421/2 he says he was fifty-three years old (Dialog, i. 225), like his more voluminous and better known contemporary Lydgate, among those poets who have a historical rather than intrinsic importance in English literature. Their work rarely if ever rises above mediocrity; in neither is there even any clear evidence of a poetic temperament. Yet they represented for the 15th century the literature of their time, and kept alive, however faintly, the torch handed on to them by their "maister" Chaucer, to whom Occleve pays an affectionate tribute in three passages in the *De Regimine Principum*. What is known of Occleve's life has to be gathered mainly from his works. At eighteen or nineteen he obtained a clerkship in the Privy Seal Office, which he retained on and off, in spite of much grumbling, for about thirty-five years. He had hoped for a benefice, but none came; and in 1399 he received instead a small annuity, which was not always paid as regularly as he would have wished. "The Letter to Cupid," his first poem to which we can affix a date, was translated from L'Epistre au Dieu d'Amours by Christine de Pisan in 1402, evidently as a sort of antidote to the moral of *Trovil* and *Cressida*, to some of which he attaches a verse in *The Game and Playe of Chesse*, "Medieval Writers." His most readable poems, written about 1406, gives some interesting glimpses of his "misrule" youth. But about 1410 he settled down to married life, and the composition of moral and religious poems. His longest work, *The Regement of Princes or De Regimine Principum*, written for Prince Hal shortly before his accession, is a tedious homily on the virtues and vices, imitated from Aegidius de Colonna's work of the same name, from the supposed epistle of Aristotle, known as the *Secreto secretorum*, and the work of Jacques de Cessoles (fl. 1300) (ed. later by Caixton as *The Game and Playe of Chesse*). It is relieved by a poem, about a third of the whole, containing some further reminiscences of London tavern and club life, in the form of dialogue between the poet and a beggar. On the accession of Henry V. Occleve turned his muse to the service of orthodoxy and the Church, and one of his poems is a remonstrance addressed to Oldcastle, calling upon him to "rise up, a manly knight, out of the slough of heresy." Then a long illness was followed for a time, as he tells us, by insanity. His "Dialog with a Friend," written after his recovery, gives a naïve and pathetic picture of the poor poet, now fifty-three, with sight and mind impaired, but still with life left of writing a tale he once knew, "The Story of Humphry of Gloucester, and of translating a small Latin treatise, *Scolle Mor*, before he dies. His hopes were fulfilled in
his moralized tales of "Jeroslaus' Wife" and of "Jonathas," both from the Gesta Romanorum, which, with his "Learn to die," belong to his old age. After finally retiring from his private seal clerkship, he was granted in 1422 sustenance on the priory of Southwick, Hants, on which, with his former annuity, he appears to have lived till about the middle of the century. A "Balade to my gracious Lord of Yorke" probably dates from 1448 or later.

The main interest for us in Occleve's poems is that they are characteristic of his time. His hymns to the Virgin, balades to patrons, complaints to the king and the king's treasurer, versified homilies and moral tales, with warnings to heretics like Oldcastle, are illustrative of the blight that had fallen upon poetry on the death of Chaucer. The nearest approach to the realistic touch of Shakespearian tragedy is to be found in Occleve's "Male Regle." But these pictures of 15th-century London are without even the occasional flash of humour that lightens up Lydgate's London Lackpenny. Yet Occleve has at least the negative virtue of knowing the limits of his powers. He says simply what he means, and does not affect what he does not feel. A Londoner, to whom the country was evidently a bore, he has not afflicted us with artificial May mornings; and it is doubtful whether a single reference to nature can be found among his poems. He has yet another distinction among his contemporaries: he has not a allegory. Whether we ascribe it to his lack of "ongtine," or to the influence of Chaucer when in his later years he had discovered the limitations of this poetic form, we cannot but be grateful to the poet who has spared us. As a metrist Occleve is also modest of his powers. He confesses that Fader Chaucer fayl wold ban me taught, but I was dul and learned lite or naught.

and it is true that the scansion of his verses seems occasionally to require, in French fashion, an accent on an unaccented syllable. Yet his seven-line (or rime royale) and eight-line stanzas, to which he limited himself, are perhaps more frequently reminiscent of Chaucer's rhythm than are those of Lydgate.

A poem, "Ad bestam Virginem," generally known as the "Mother of God," and once attributed to Chaucer, is copied among Occleve's works in MS. Phillips 8151 (Cheltenham), and may thus be regarded as his work. Occleve found an admirer in the 17th century in William Browne, who included his "Jonathas" in the Shepheardes Pipe (1614). Browne added a eulogy of the old poet, whose works he intended to publish in their entirety (Works, ed. W. C. Hazlitt, 1869, ii. 956-958). In 1706 George Mason printed six Poems by Thomas Hesley, one of De Rerum Promissiore, "which was printed for the Roxburgh Club in 1880, and by the Early English Text Society in 1897. See Dr F. J. Furnivall's introduction to Hesley's Works, "The Minor Poems, in MS. Phillips 8151, and the Durham MS. III. 9 (Early English Text Society, 1892." (W. S. M.)

**OCCULTATION (from Lat. occultare, the frequentative of occultare, to hide), in astronomy, the hiding of one celestial body by another passing in front of it; commonly the passage of the moon or of a planet between the observer and a star or another planet.**

**OCEAN AND OCEANOGRAPHY.** "Ocean" is the name applied to the great connected sheet of water which covers the greater part of the surface of the Earth. It is convenient to divide the subject-matter of physical geography into the atmospheric sphere, hydrosphere and lithosphere, and in this sense the ocean is less than the hydrosphere in so far as the latter term includes also the water lying on or flowing over the surface of the land. The conception of an encompassing ocean bounding the habitable world is found in the creation myths of the most ancient civilizations. The Babylonians looked on the world as a vast round mountain rising from the midst of a universal sheet of water. In the Hindus, the world was the watery mass, another food, in place, the "Ocean," where the word of God, and the dry land appeared. The Indian geographers looked on the circular disk of the habitable world as surrounded by a mighty stream named Oceanus, the name of the primeval god, father of gods and men, and thus the bond of union between heaven and earth. The Greek word Ὠκεανός is related to the Sanskrit oṣāyana, "the encompassing." Philologists do not know of any related word in Semitic languages.

Pictet, however, recognizes allied forms in Celtic languages, e.g. the Irish oisín and Cymric eifin.

Since the Pythagorean school of philosophy upheld the spherical as against the disk-shaped world, some of the ancient geographers, including Eratosthenes and Strabo, looked upon the hydrosphere as forming two belts at right angles to each other, one belt of ocean following the equator, the other surrounding the earth from pole to pole as in the terra quadrifida of Macrobius; while others, including Aristotle and Ptolemy, looked upon the inhabited land, or oikumene, as occupying the greater part of the earth's surface, so that the Indian Ocean was an enclosed sea and India (i.e. eastern Asia) was only separated from Europe by the Atlantic Ocean. It was the work of the Arab geographers of the middle ages, so that until the discovery of America and of the Pacific Ocean the belief was general that the land surface was greater than the water surface, or that at least the two were equal, as Mercator and Varenus held. Thus it was that a great South Land appeared on the maps, the belief in the prodigious extension of which certainly received a severe shock by Abel Tasman's voyage of circumnavigation, but was only overthrown after Cook's great voyages had proved that any southern land which existed could not extend appreciably beyond the selected of the southern continent had been demonstrated within the modest limits of Antarctica.

**Oceanography** is the science which deals with the ocean, and since the ocean forms a large part of the earth's surface oceanography is a large department of geography. The science is termed talassographia by the Italians, and attempts have been made without success to introduce the name "thalassography." Of recent years the use of "hydrography" as the equivalent of physical oceanography has acquired a certain currency, but as the word is also used with other than the oceanographic meaning (see Surveying) it ought not to be used for oceanography.

Like geography, oceanography may be viewed in two different ways, and is conveniently divided into general oceanography, which deals with phenomena common to the whole ocean, and special oceanography, which has to do with the individual characteristics of the various divisions of the ocean. This article is restricted to general oceanography in its physical aspects, the closely-related meteorological, biological and economic aspects being dealt with elsewhere.

**Methods of Research.** When research in oceanography began, the conditions of the sea were necessarily observed only from the coast and from islands, the information derived from mariners as to the condition of parts of the sea far from land being for the most part mere anecdotes bearing on the marvellous or the frightful. In recent times, especially since the rapid increase in the study of the exact sciences during the 19th century, observations at sea with accurate instruments have become common, and the ships' logs of to-day are provided with headings for entering daily observations of the phenomena of the sea-surface. The contents of the sailors' scientific logs were brought together by the American enthusiast in the study of the sea, Matthew Fontaine Maury (1806-1873), whose methods and plans were discussed and adopted at international congresses held in Brussels in 1853 and in London in 1873. By 1904 more than 6800 of these meteorological logs with 7,000,000 observations had been accumulated by the Meteorological Office in London; 20,000 with 10,000,000 observations by the German Marine Observatory at Hamburg; 4700 with 3,300,000 observations by the Central Institute of the Netherlands at de Bilt near Utrecht. The Hydrographic Office of the United States had collected 3800 meteorological logs with 5,000,000 entries before 1888; but since that time the logs have contained only one observation daily (at Greenwich noon) and of these 2,380,000 entries had been received by 1904. In the archives of the French Marine in Paris there were 3300 complete logs with 830,000 entries and 11,000 abstract logs from men-of-war. The contents of these logs, it is true, refer more to maritime meteorology than to oceanography properly so-called, as their main purpose is to
promote a rational system of navigation especially for sailing ships, and they are supplied by the voluntary co-operation of the sailors themselves.

While the sailors' logs supply the greater part of the scientific evidence available for the study of the surface phenomena of the ocean, they have been supplemented by the records of numerous scientific expeditions and latterly by publications embodying systematic observations on a permanent basis. Valuable observational data in oceanography during the expedi-
tions of Captain James Cook and the polar explorers, especially those of Sir John Ross in the north and Sir James Ross in the south, but the voyage of H.M.S. "Challenger" in 1872-1876 formed an epoch marking the end of the older order of things and the begin-
ning of modern oceanography as a science of precision. The telegraph cable companies were quick to apply and to extend the oceanographical methods useful in cable-laying, and to their practical acuteness many of the most important improve-
ments in apparatus are due. A second epoch comparable to that of the "Challenger" and resulting like it in a leap forward in the precision of the methods previously employed was marked by the institution in 1900 of the International Council for the Study of the Sea. This council was nominated by the govern-
ments of Norway, Sweden, Denmark, Finland, Russia, Germany, Great Britain, Holland and Belgium, with headquarters in Copenhagen and a central laboratory at Christiania, and its aim was to furnish data for the improvement of the fisheries of the North Sea and surrounding waters. In the course of investigating this special problem great improvements were made in the methods of observing in the deep sea, and also in the representa-
tion and discussion of the data obtained, and a powerful foundation was given to the study of oceanography in all the countries of Europe. The efforts of individual scientific workers cannot as a rule produce such results in oceanography as in other sciences, but exceptions are found in the very special services rendered by the prince of Monaco, who founded the Oceanographical Institute in Paris and the Oceanographical Museum in Monaco; and by Professor Alexander Agassiz in the investigation of the Pacific.

Extent of the Ocean.—The hydrosphere covers nearly three-
quarters of the earth's surface as a single and continuous expanse of water surrounding four great insular land-masses known as the continents of the Old World (Europe, Asia, Africa), America, Australia and Antarctica. As we are still ignorant of the propor-
tions of land and water in the polar regions, it is only possible to give approximate figures for the extent of the ocean, for the position of the coast-lines is not known exactly enough to exclude possible errors of perhaps several hundred thousand square miles in estimates of the total area. Speaking generally, we may say with confidence that water predominates in the unexplored northern polar area, and that it is very unlikely that new land of any great extent exists there. On the other hand, recent Antarctic ex-
ploration makes it practically certain that a great continent is sur-
rounds the south pole with a total area considerably more than Sir John Murray's estimate in 1894, when he assigned to it an area of 9,000,000 sq. km. (3,500,000 sq. statute miles). It is probable that the Antarctic continent measures about 13,000,000 sq. km. (5,000,000 sq. statute miles); and thus if we accept Bessel's figure of 300,900,000 sq. km. (106,000,000 sq. m.) for the whole surface of the sphere, there is a total land area of 14,8,8,20,000 sq. km. (57,6,460,000 m.), and a total water area of 36,1,130,000 sq. km. (130,455,000 sq. m.), 67% of land and 33% of water, or a ratio of 1:2.413.

Divisions of the Ocean.—The arrangement of the water surface on the globe is far from uniform, the ocean forming 61% of the total area of the northern and 81% of that of the southern hemisphere. Of the whole ocean only 43% (154,490 million sq. km.) lies in the northern hemisphere and 57% (206,2 million sq. km.) in the southern. If the globe is divided into hemispheres by the meridians of 20° W. and 160° E., as is usual in atlases, the eastern hemisphere, to which the Old World belongs, has 62% of the total area, and the western hemisphere, containing America, has 38%. The great circle can be drawn upon a terrestrial globe in such a way as to divide it into two hemispheres, one of which contains the greatest amount of land and the other the greatest amount of sea of any possible hemispheres. The centre of the so-called land-hemisphere lies near the mouth of the Loire (47° 30' N. and 2° 30' W.), while the centre of the so-called water-hemisphere lies to the S.E. of New Zealand and eastward of Antipodes Island. Even in the land hemisphere the water area (134,5 million sq. km.) is in excess of the land area (221 million sq. km.), while in the water-hemisphere the amount of land (14,5 million sq. km.) is in excess of the water area (134,5 million sq. km.) compared with 230,5 million sq. km. of water.

The outline of the water surface depends on the outline of the basins in which it is contained. The four great continental masses therefore give the ocean a distinctly tripartite form, the three great divisions being known as the Atlantic, the Indian, and the Pacific Oceans, all three running together into one around Antarctica. Thus the connecting belt of water is narrow as compared with the extent of the oceans from north to south—Drake Strait south of South America is barely 400 m. wide, while Cape Carlsberg to Enderby Land, 2,000 m., and from Tasmania to Wilkes Land, 1,550 m., while the meridional extension of the Indian Ocean is 6,000 m., of the Pacific, 43,000 m., and of the Atlantic, 12,000 m., measuring across the North Pole to Bering Strait. These proportions are not readily grasped from a map of the world on Mercator's projection, and must be studied on a globe. A simple, practical boundary between the three oceans can be obtained by prolonging the meridian of the southern extremity of each of the three southern continents to the Anti-
artic circle. A committee of the Royal Geographical Society—
the deliberations of which were interrupted by the departure of Dr. John Hay in 1903, and by the loss of the ship—suggested these meridians as boundaries; the north and south boundaries of the Atlantic and Pacific Oceans being the polar circles, leaving an Arctic and an Antarctic Ocean to complete the hydrosphere. We now know, however, that the Antarctic circle runs so close to the coast of Antarctica that the Antarctic Ocean may be left out of account. It has been found more convenient to take as northern boundaries the narrowest part of the straits near the Arctic circle, Bering Strait on the Pacific side, and on the Atlantic side the narrowest part of Davis Strait, and of the Antarctic, the shortest line from Iceland to the Færoes, thence to the most northerly island of the Shetlands and thence to Cape Statdahl in Norway. It has also been found convenient to take the boundary between the Atlantic and Pacific, as the shortest line across Drake Strait, from Cape Horn through Snow Island to Cape Gunnar, instead of the meridian of Cape Horn. Possibly ridges of the sea-bed running southward from the southern continents may yet be discovered which would form more natural boundaries than the meridians. The com-
mittee of the Royal Geographical Society settled the existing nomenclature of the three great oceans. Some authors include the Arctic Sea in the Atlantic Ocean, and some prefer to consider the southern part of the Atlantic, Indian and Pacific Oceans as a Great Southern Ocean. Sir John Herschel took as the northern boundary of the southern ocean the greatest circle which could touch the southernmost extremities of the three southern con-
tinents. Such a circle, however, runs so near the coast of Antarctica as to make the southern ocean very small. Others, like Malte Brun (1803) and Supan (1903), take the loxodromes between the two capes and call the ocean to the south the Antarctic Ocean. G. v. Bogułaski suggested the parallel of 50° S. and Latzsch the parallel of 40° S. as limiting lines. None of these schemes has the coast of Antarctica been adequately considered, and they have all been too much influenced by the Mercator map. Each of the three oceans, Atlantic, Indian and Pacific, possesses an Antarctic facies in the southern part and a tropical facies between the tropics, and the Atlantic and Pacific an Arctic facies in their northern parts.

Where the ocean touches the continents the margin is in places deeply indented by peninsulas and islands marking off portions of the water surface which from all antiquity to the present moment are all called "sea." These seas are entirely dependent on the ocean for their regime, being filled with ocean water, though subject to
influence by the land, and the tides and currents of the ocean affect them to a greater or less extent. They owe their origin to depressions of the earth’s crust of no very wide extent and not running very far into the continental mass, and geologically they are of recent age and still subject to change. In these respects they contrast with the great oceans which owe their origin to the most extensive and the profoundest depressions of the crust, date back at least to Mesozoic times, and have perhaps remained permanently in their present position from still remoter ages.

Seas may be classified according to their form either as "enclosed" or as "partially enclosed" (or "fringing"). Enclosed seas extend deeply into the land and originate either by the breaking through of the ocean or by the overflowing of a subsiding area. They are connected with the ocean by narrow straits. The salinity of the water contained in them differs in a marked degree from that of the ocean, and the tidal waves are of small amplitude. Four great intercontinental enclosed seas are included between adjacent continents—the Arctic Sea, the Central American or West Indian Sea, the Australo-Asiatic or Malay Sea and the Mediterranean Sea. There are also four smaller continental enclosed seas each with a single channel of communication with the ocean, viz. the Baltic Sea and Hudson Bay with very low salinity, the Red Sea and Persian Gulf with very high salinity.

The fringing or partially enclosed seas adjoin the great land masses and are only separated from the oceans by islands or peninsulas. Their tidal conditions are irregular. The though their salinity is usually rather lower than that of ocean water. The four fringing seas of eastern Asia, those of Bering, Okhotsk, Japan and East China, are arranged parallel to the main lines of dislocation in the neighbouring land-masses, and so are the Andaman Sea and the Gulf of California. On the contrary, the North Sea, the British fringing seas (English Channel, Irish Sea and Minch), and the Gulf of St Lawrence cross the main lines of dislocation.

In addition to these seas notice must be taken of the subordinate marginal features, such as gulfs and straits. Gulfs may be classified according to their origin as due to fractures of the crust or overflowing of depressed lands. The former are either the extensions of oceanic depressions, e.g. the Arabian Sea, Bay of Bengal and Gulf of Arica, or such caldron-depressions as the Gulfs of Genoa and Taranto, or rift-depressions like the Gulfs of Aden and Akaba. Compound gulfs are formed by fracture and landward by the overflowing of depressed land, e.g. the Bay of Biscay, Gulf of Alaska and Gulf of the Lion. Gulfs formed by the overflowing of depressed lands lie upon the continental shelf, e.g. the Gulf of Maine, Bay of Fundy, Bay of Oman, Gulf of Maribo, or by volcanic activity.

Straits have been formed {1} by fracture across isthmuses, and such may be by longitudinal fracture as in the Strait of Bab-el-Mandeb, or transverse fracture as in the Strait of Gibraltar or Cook Strait; {2} by erosion, e.g. the Strait of Dover, the Dardanelles and Bosphorus; {3} by overflowing through the subsidence of the land, as in the straits of Bering, Torres and Formosa.

Surface of the Ocean.—If the whole globe were covered with a uniformly deep ocean, and if there were no difference of density between one part and another, the surface would form a perfect ellipsoid of revolution, that is to say, all the meridians would be exactly equal ellipses and all parallels perfect circles. At any point a sounding line would hang in the line of the radius of curvature of the water surface. But as things are the water-surface is broken by land, and the mean density of the substance of the land is 2-6 times as great as that of sea-water, so that the gravitational attraction of the land must necessarily cause a heaping up of the sea around the coasts, forming what has been called the continental wave, and leaving the sea-level lower inland. Hence the geoid or figure of the sea-surface is not part of an ellipsoid of rotation but is irregular. If differences of level between different parts of the geoid have been greatly overestimated in the past; F. G. Helmert has shown that they cannot exceed 650 ft. and are probably much less. Recent pendulum observations have shown that it is incorrect to assume a uniform density of 2-6 in the elevated part of the earth’s crust, that on the contrary there are great local differences in density, the most important being a confirmation of Airy’s discovery that there is a marked deficiency of mass under high mountains and a marked excess under the bed of the ocean. The intensity of gravity at the surface of the seas far from land has been measured on several occasions. During Nansen’s expedition on the “Fram” in 1894–1895, Scott Hansen made observations with a Sterneck’s half-seconds pendulum on the ice where the sea was more than 1600 fathoms deep and found only an insignificant deviation from the number of swings corresponding to a normal ellipsoid. In 1901 O. Hecker took the opportunity of a voyage from Hamburg to La Plata, and in 1904 and 1905 of voyages in the Indian and Pacific Oceans to determine the local attraction over the ocean by comparing the atmospheric pressure measured by means of a mercurial barometer and a boiling-point thermometer, and obtained results similar to Scott Hansen’s. The inequalities of the geoid in no case exceed 300 ft. Distortion of the ocean surface may also arise from meteorological causes, and be periodic or aperiodic in its occurrence, but it does not amount to more than a few feet at the utmost. Solar radiation warms the tropical more than the polar waters, but, assuming equal salinity, this cause would not account for a difference of level of more than 20 ft. between tropical and polar seas. The annual temperatures, and their irregularities, are largely a matter of evaporation and precipitation and must account for differences of surface layer of water about 25 fathoms thick in the Baltic is as much as 20° F., but this only corresponds to a difference of level of 12 in. due to expansion or contraction.

Atmospheric precipitation poured into the sea by the great rivers must necessarily create a permanent rise of the sea-level at their mouths, and from this cause the level round the coasts of rainy lands must be greater than in mid-ocean. H. Mohn has shown how the inequalities of what he terms the density-surface can be found from the salinity and temperature; and he calculates that the level of the Skagerrak should be about 2 ft. higher than that of the open Norwegian Sea between Jan Mayen and the Lofoten Islands. The level of the Gulf of Finland at Kronstadt and of the Gulf of Bothnia at Haparanda should similarly be 15 in. higher than that of the Skagerrak. Recent levellings along the Swedish and Danish coasts have confirmed the higher level of the Baltic; and the level of the Mediterranean has also been determined by exact measurements to be from 13 to 24 in. lower than that of the Atlantic on account of evaporation. Apart from the effects of varying precipitation and evaporation the atmosphere affects sea-level also by its varying density. The difference between the barometric pressure at the level of the sea and the barometric pressure at an equal altitude on the land is called the geostrophic difference, and is due to the pressure of air above and the tension of water below the level of the sea. The differences between two given points being thirteen times as great as the difference between the corresponding readings of the mercurial barometer. In the north tropical belt of high pressure south of the Azores the atmospheric pressure in January is 0-87 in. higher than in the Irminger Sea; hence the sea-level near the Azores is almost 1 ft. lower than in the northern sea. In the monsoonal region, where the barometer rises 0-38 in. between July and January, the level of the sea falls in consequence by 5 in. Wind also gives rise to differences of level by driving water against it. Rain falls to the level of the sea, as it must, and so drives the level of the sea up. If the falling water is driven westwards by a wind from the Gulf of St Lawrence, the level of the sea in Nova Scotia is raised by 0-5 in. lower than at Arkona on Rügen. Periodic variations of level due to meteorological causes account for the Baltic being fuller in the time of the summer rains than in winter, when the rivers and lakes are frozen and most of the precipitation on the land is in the form of snow. The range on the Arkona gauge is from 3-5 in. below mean level in April to 2-75 in. above the mean level in August. A similar range occurs on the Dutch coast in the North Sea, where the maximum level is reached in October, the month of highest rainfall, and there is a range of 0-15 in. between the highest and the lowest level in spring. In the monsoon regions the half-yearly change from on-shore to off-shore winds produces noticeable differences in
level; thus fifteen years' observations at Aden show a maximum in May at the end of the north-east monsoon, and a rapid falling off after the beginning of the south-west monsoon to a minimum in August, the total range being 64 ft. The influence of wind on water-level is most marked in heavy storms on the flat coastal areas of the North Sea and Baltic, when the rise may amount to very many feet. In the region of tropical hurricanes the converging wind system of a circular storm causes a heaping up of water capable of devastating the low coral islands of the Pacific. On the 1st of November 1876 a cyclone acting in this way submerged a great area of the level plain of the Ganges delta to a depth of 46 ft.; here the influence of the difference of pressure within and without the cyclone acted in the same direction as the wind. The old explorations of the Southern seas are made of marked importance at the Mediterranean and the Red Sea, and on the two sides of the Isthmus of Panama, which hindered the projects for canals connecting those waters, have been proved by modern levelling of high precision to be totally erroneous.

*Deep-sea Soundings.*—The hand-lead attached to a line divided into fathoms was a well-known aid to navigation even in high antiquity, and its use is mentioned in Herodotus (ii. 5) and in the Acts of the Apostles (xxvi. 29). Greater depths than those usually sounded by a hand-line may possibly not have been beyond the reach of the earlier navigators, for Strabo says of measured soundings, "one thousand fathoms" (i. 3, p. 53 Cas.). Yet we find that the great discoverers of the modern period were only familiar with the hand-lead, and the lines in use did not exceed 200 fathoms in length. Ingenious devices had indeed been tried in the 17th century and earlier, by which a lead thrown into the sea without a line detached a float on striking the bottom, and it was proposed to calculate the depth by the time required for the float to reappear. The earliest deep-sea sounding on record is that of Captain Phipps on the 4th of September 1775 in the Norwegian Searock together all the sounding-lines on board, and with a weight of 150 lb attached he found bottom in 683 fathoms and secured a sample of fine soft blue mud. He detected the moment of the lead touching the bottom by the sudden slackening in the rate at which the line ran out. Polar explorers frequently repeated those experiments in deep-sea soundings, both William Scoresby and Sir John Ross obtaining notable results, though not reaching depths of more than 1200 fathoms. The honour of first sounding really oceanic depths belongs to Sir James Clark Ross, who made soundings in the excellent measurements of "the Russian ship "Kommader" on the 29th of May 1841, in 12,440 fathoms, while in a few instances he overestimated the depth by failing to detect at the moment which the lead touched bottom. The pursuit of these isolated investigations received a great impetus from the enthusiasm of the great American oceanographer Captain Matthew Fontaine Maury, U.S.N., who directed the whole impetuous strength of his character to the task of compelling the silent depths of the ocean to tell their tale. Instead of the expensive mile-long stout hemp lines used by Ross, Maury introduced a ball of strong twine attached to a cannon shot, which ran out rapidly; when the bottom was reached the twine was cut and the depth deduced from the length of string left in the ball on board. The time of touching bottom was judged by timing each 100-fathom mark and noting the sudden increase in the time interval when the shot reached the bottom. Maury, however, recognized that in great depths the surest guarantee of bottom having been reached was to bring up a sample of the deposit. To do this with a heavy lead attached required a very strong hemp line, and the twine used in the American method was useless for this purpose. In 1854 J.M. Brooke, a midshipman of the U.S.N., invented the principle already foreshadowed by Niccolò Conti. In the 15th century in "Navigazione," and by Robert Hooke in the 17th, of using a heavy weight so hung on the sounding-tube that it was automatically released on striking the bottom and left behind, while the light brass tube containing a sample of the deposit was easily hauled up. This principle has been adopted universally for deep soundings, and is now applied in many forms. In 1855 Maury published the first chart of the depths of the Atlantic between 52° N. and 10° S. At this period an exact knowledge of the depths of the ocean assumed an unlooked-for practical importance from the daring project for laying a telegraph cable between Ireland and Newfoundland. Deep soundings were made in the U.S.N. for this purpose by vessels both of the British and of the American navies, while in the Mediterranean and in the Indian Ocean many soundings were made in connexion with submarine cables to the East. Another stimulus came from the biologists, who began to realize the importance of a more detailed investigation of the life conditions of organisms at great depths in the sea. The lead in this direction was taken by British biologists, beginning with Edward Forbes in 1859, and in 1868 a party on board H.M.S. "Lightning" pursued researches in the waters to the north of Scotland. In 1869 and 1870 this work was extended to the Irish Sea and Bay of Biscay in H.M.S. "Porcupine," and to the Mediterranean in H.M.S. "Shearwater." The last-named vessel secured 157 trustworthy deep soundings, with samples of the deposits, and also observations of temperature and salinity in different depths, as well as dredgings for the collection of the organisms of the deep sea.

These preliminary trips of scientific marine investigation were followed by the greatest purely scientific expedition ever undertaken, the voyage of H.M.S. "Challenger" round the world in 1872-76, which, according to the plan of Captain Robert Whytlaw-Scott, was fitted out as a purely scientific expedition without any desire to make war or a naval command of Sir George Nares. This epoch-making expedition lasted from Christmas 1872 to the end of May 1876, and gave the first wide and general view of the physical and biological conditions of the ocean as a whole. Almost simultaneously with the "Challenger," a German expedition in S.M.S. "Gazelle" conducted observations in the South Atlantic, Indian and South Pacific Oceans; and the U.S.S. "Tuscarora" made a cruise in the North Pacific, sounding out lines for a projected Pacific cable. The successor of Sir Wyville Thomson in the "Challenger," Professor Murray, was often correctly said that since the days of Columbus and Magellan no such revelation regarding the surface of our planet had been made as in that eighth decade of the 19th century. Since that time the British cable-ships have been busy in all the oceans making sections across the great expanses of water with ever-increasing accuracy, and in that work the government surveying ships have also been engaged, vast stretches of the Indian and Pacific Oceans having been opened up to knowledge by H.M.S.S. "Egeria," "Waterwitch," "Dart," "Penguin," "Stork," and "Midget." These scientific enterprises, under the guidance of Professor Alexander Agassiz, have been active in the North Atlantic and especially in the Pacific Ocean, where very important investigations have been made. The eastern part of the North Atlantic has been the scene of many expeditions, often purely biological in their purpose, amongst which there may be mentioned the cruises of the "Travaveur" and "Talisman " under Professor Milne-Edwards in 1880-85, and since 1887 those of the prince of Monaco in his yachts, as well as numerous Danish vessels in the sea between Ireland and Greenland, conspicuous amongst which were the expeditions of 1896-1898 on board the "Ingolf." The Norwegian Sea was studied by the Norwegian expedition on board the "Vöringen" in 1876-1878, and the north polar basin by Nansen and Sverdrup in the "Fram" in 1893-1896, the Mediterranean by the Italians on the "Washington" and by the Austrians on the "Pola" in 1896-1893, the latter carrying the investigations to the Red Sea in 1893-1898, while the Russians investigated the Black Sea in 1890-1893. For high southern latitudes special value attaches to the soundings of the German deep-sea expedition on the "Valdivia" in 1898-1899, and to those of the "Gauss," and the "Gauss" and the "Scolopi" in 1903-1904. The soundings of the Dutch expedition on the "Siboga" during 1899-1900 in the eastern part of the Malay seas and those of the German surveying ship "Planet" in 1906 in the South Atlantic, Indian and North Pacific Oceans were notable, and Sir John Murray's expedition on the "Michael Sars" in the Atlantic in 1910 obtained important results.
Modern surveying ships no longer make use of hempen lines with enormously heavy sinkers, such as were employed on the "Challenger," but they sound instead with steel piano wire not more than \( \frac{3}{8} \) to \( \frac{5}{8} \) of an inch in diameter and a detachable lead seldom weighing more than 70 lb. The soundings are made by means of a special machine fitted with a brake so adjusted that the revolution of the drum is stopped automatically the instant the lead touches the bottom, and the depth can then be read directly from an indicator. The line is hauled in by a steam or electric winch, and the sounding-tube containing a sample of the bottom deposit is rapidly brought on board. The sounding machines most frequently employed are those of Admiral C. D. Sigsbee, U.S.N., of Lucas, which was perfected in the Telegraph Construction and Maintenance Company's ships, and of the Prince of Monaco, constructed by Leblanc of Paris. All attempts to dispense with a lead and line and to measure the depth by determining the pressure at the bottom have hitherto failed when applied to depths greater than 200 fathoms; a new hydraulic manometer has been tried on board the German surveying ship "Planet." A. Siemens has pointed out that a profile of the sea-bed can be delineated by taking account of the varying strain on a submarine cable while it is being laid, and the average depth of a section can thus be ascertained with some accuracy. All deep-sea measurements are subject to uncertainty because the sounding machine merely measures the length of wire which runs out before the lead touches bottom, and this agrees with the depth only when the wire is perpendicular throughout its run. It is improbable, however, that the smooth and slender wire is much influenced by currents, and the best deep-sea soundings may be taken as accurate to within 5 fathoms.

Relief of the Ocean Floor.—Recent soundings have shown that the floor of the ocean on the whole lies some 2 or 3 m. beneath the surface, and O. Krümmel has calculated the mean depth to be 2010 fathoms (12,050 ft.), while the mean elevation of the surface of the continents above sea-level is only 2300 ft. Viewed from the floor of the ocean the continental block would thus appear as a great plateau rising to a height of 14,350 ft. Nevertheless, the greatest depths of the ocean below sea-level and the greatest heights of the land above it are of the same order. The summit of Mount Everest rising to 29,000 ft. above the sea-level, while the Nero Deep near Guam sinks to 31,600 ft. (5268 fathoms) below sea-level. Of course the area at great heights is very much less than the area at corresponding depths. Above the height of 15,000 ft. there are 800,000 sq. km. (310,000 sq. m.), and below the depth of 15,000 ft. there are 120,000,000 sq. km. (46,300,000 sq. m.); above the height of 20,000 ft. there are on the whole surface of the earth only 33,000 sq. km. (12,800 sq. m.), while below the depth of 20,000 ft. there are no less than 5,400,000 sq. km. (2,100,000 sq. m.). According to Krümmel's calculation the areas of the ocean beyond various depths are as follows:

On the whole the floor of the ocean is very smooth in its contours, and great stretches can almost be called level. Modern ometry has introduced the calculation of the mean angle of the slope of a given uneven surface provided that maps can be prepared showing equidistant contour lines. If the distance between the contour lines is \( h \) and the length of the individual contour lines \( l \), the sum of their lengths \( \Sigma l \), and \( A \) the area of the surface under investigation, then the mean angle of slope is obtained from the equation

\[
\tan \alpha = \frac{\Sigma l}{A}
\]

Calculating from sheet A I of the Prince of Monaco's Atlas of Ocean Depths,1 Krümmel obtained a mean angle of slope of \( \alpha \) 27° 44' or an average fall of 1 in 124 for the North Atlantic between 0° and 47° N., the enclosed seas being left out of account. In the same way a mean angle of slope of approximately half a degree was found for the Adriatic and the Black Sea. Large angles of slope may, however, occur on the flanks of oceanic islands and the continental borders. On the submarine slopes leading up to isolated volcanic islands angles of 15° to 20° are not uncommon, at St. Helena the slopes run up to 38° and even 40°, at Tristan d'Acunha to 33°. E. Hull found a mean angle of slope of 13° to 14° for the edge of the continental shelf off the west coast of Europe, and off Cape Toriñana (43° 4' N.) as much as 34°. Where the French telegraph cable between Brest and New York passes from the continental shelf of the Bay of Biscay to the depth of the Atlantic a distinct relief of slope is from 30° to 41°. Such gradients are of a truly mountainous character, the angle of slope from the Elisee to the Zugspitze is 30°, and that from Alpigen station to the summit of the Eiger is 42°. Particularly steep slopes are found in the case of submarine domes, usually incomplete volcanic cones, and there have been cases in which after such a dome has been discovered by the soundings of a surveying ship it could not be found again as its whole area was so small and the deep floor of the ocean from which it rose to such a flat that an error of 2 or 3 m. in the position of the ship would prevent any irregularity of the bottom from appearing. While such steep mountain walls are found in the bed of the ocean it must be remembered that they are very exceptional, and except where there are great dislocations of the submarine crust or volcanic outbursts the forms of the ocean floor are incomparably gentler in their outlines than those of the continents. Being protected by the water from the rapid subaerial erosion which sharpens the features of the land, and subjected to the regular accumulation of deposits, the whole ocean floor has assumed some approach to uniformity. Still there are everywhere gentle inequalities on the smoothest ocean floor which give rise to local phenomena.

In spite of the increase of deep-sea soundings in the last few decades, they are still very irregularly distributed in the open ocean, and the attempt to draw isobaths (lines of equal depth) on a chart of the world is burdened with many difficulties which can only be evaded by the widest generalizations. Bearing this caution in mind the existing bathymetrical charts, amongst which that of the prince of Monaco stands first, give a very fair idea of the great features of the bed of the oceans. A definite terminology for the larger forms of sub-oceanic relief was put forward by the International Geographical Congress at Berlin in 1899 and adopted by that at Washington in 1904. Equivalent terms, which are not necessarily identical or literal translations, were adopted for the English, French and German languages, the equivalence being closest and most systematic between the English and German terms.

The larger forms designated by special generic terms include the following. The continental shelf is the gentle slope which extends from the edge of the land to a depth usually about 100, though in some cases as much as 300 fathoms, and is there demarcated by an abrupt increase in the steepness of the slope to varying depths. In the deep sea two types of feature are recognized under the general names of depression and elevation. The depression is distinguished according to form and slope as (1) a basin when of a roughly round outline, (2) a trough when wide and elongated, or (3) a trench when narrow and elongated lying along the edge of a continent. The extension of a basin or trough stretching towards the continent is termed an embayment when relatively wide and a gully when narrow. The elevation includes (1) the gently swelling rise which separates

1 Carte générale bathymétrique des océans dressée par ordre de S.A.S. le Prince Albert de Monaco, 24 sheets (Paris, 1904).
troughs and basins in the middle of the ocean, (2) the steeply sloping ridge which interposes a narrower barrier between two depressions, and (3) the plateau or wide elevation rising steeply on all sides from a depression. The deepest part of a depression is termed a deep, and the highest part of an elevation when not reaching the surface a bank or height. In addition to these larger forms a few minor forms must be recognized. Amongst these are the dome, an isolated elevation rising steeply but not coming within 100 fathoms of the surface; the bank, an elevation coming nearer the surface than 100 fathoms, but not so near as 6 fathoms; and finally the shoal or reef, which comes within 6 fathoms of the surface, and so may constitute a danger to shipping. Similarly we may note the caldron or small steep depression of a round outline, and the furrow or long narrow groove in the continental shelves.

According to the resolutions of the International Geographical Congress the larger individual forms which have been described by generic terms shall have specific names of a purely geographical character; but in the case of the minor forms the names of ships and persons are considered applicable. In 1890 A. Supan published a chart of the oceans with a suggested nomenclature based on these principles; and the larger forms in the Prince of Monaco's great chart also are named in accordance with the rule. Although put forward by the highest international authority recognized by geographers the system of nomenclature has not been adopted by the hydrographers. Sir John Murray considers that only deeps exceeding 3000 fathoms in depth should be named, and in his charts he has named these deeps after persons whether the individuals thus honoured had themselves discovered or explored the deeps in question or not. Some of the "deeps" to which names have been given disappear or are divided into two or three smaller deeps when the contour lines representing hundreds of fathoms are translated into contour lines representing hundreds of metres. A similar change in the contour lines may result from the subsidence of lines in fathoms for those originally drawn in metres, and hence it is extremely desirable that specific names should only be given to such features as are pronounced enough to appear on maps drawn with either unit. For the sake of uniformity it is to be hoped that the system of nomenclature recommended by the International Geographical Congress will ultimately be adopted.

The continental shelves are parts of the great continental blocks which have been covered by the sea in comparatively recent times, and their surface consequently presents many similarities to that of the land, modified of course by the restless and constructive work of the waters. In particular the currents produce their full effects in that region, and in high latitudes the effect of transport of materials by ice is very important; while in the warm water of the tropics the reef-building animals and plants (corals and calcareous algae) carry on their work most effectively there. The continental shelves include not only the oceanic border of the continents but also great areas of the enclosed seas and particularly of the fringing seas, the origin of which through secular subsidence is often very clearly apparent, as for instance in the North Sea and the tropical Pacific around the edges of the Farallon Rises. Observations and investigations have revealed that the continental shelf is composed of fragments of rock abraded and transported by tidal currents and storms in the same way that the chalk and limestone worn off from the eastern continuation of the island of Heligoland during the last two centuries has been reduced to the coarse gravel of the off-lying Düne. Numerous old river valleys and furrows entrenched in the continental shelf bear witness to its land origin. Such valleys are very clearly indicated in the belts of the western Baltic by furrows a thousand yards wide and twenty to thirty fathoms deeper than the neighbouring sea-bed. Amongst the best known of the furrows of the continental shelf are the Cape Breton Deep in the Bay of Biscay, the Hudson Furrow, southward of New York, the so-called Congo Cañon, the Swatch of No Ground off the Ganges delta, the Bottomless Pit off the Niger delta, and numerous similar furrows on the west coast of North America and outside the fjords of Norway, Iceland and the west of Scotland, as well as in the Firth of Forth and Moray Firth.

The seaward edge of the continental shelf often falls steeply to the greatest depths of the ocean, and not infrequently forms the slope of a trench, a form of depression which has usually a steep slope towards a continent or an island-bearing rise on one side and a gentler slope towards the general level of the ocean on the other. All the greatest depths of ocean, i.e., all soundings exceeding 4000 fathoms, occur in trenches, and there are only a few small trenches known (on the west coast of Central America) in which the maximum depth is less than 3000 fathoms. Most trenches are narrow, but of considerable length, and their steeper edge is believed to occur in lower as it goes to the ocean's crust. Strong evidence of this is afforded by the association of some of the depressions, notably the Japan Trench and the Atacama Trench, with the origin of frequent submarine earthquakes. Troughs and rises are features of more frequent occurrence and are best described as they occur in the particular oceans.

In the Atlantic the prevailing meridional direction of the shore lines extends to the submarine features also. Captain Sherard Osborn in 1870 was the first to recognize that the North Atlantic Basin was divided by a central rise running generally from north to south and parallel to the North American American coasts, and that a second and smaller rise obtained in the Bay of Biscay between 30° and 40° S. between the depths are between 1500 and 2000 fathoms, and then it rises again to about 1500 fathoms and runs eastward under the name of the Equatorial Ridge. Crossing the equator in 15° W. the rise resumes a southerly direction and from Ascension to Tristan d'Acunha, the depth is in many places less than 1500 fathoms. The soundings of Bruce's Antarctic expedition in the "Scotia" showed that the rise cannot be traced beyond 55° S. where the depths increase rapidly to over 2000 fathoms. The whole length of the rise which divides the Atlantic into an eastern and a western basin is 55 700 nautical miles, as 3° 50' of the Firth of Firth, in the depression, the depth is over 1500 fathoms, and to 12° N. the depth of the depression is over 2200 fathoms. The whole length of the rise which divides the Atlantic into an eastern and a western basin is as 3° 50' of the Firth of Firth, in the depression, the depth is over 1500 fathoms, and to 12° N. the depth of the depression is over 2200 fathoms. The existence of the latter, which extends to the African continent, was announced by Sir Wyville Thomson in 1876 as a result of his discussion of the deep-sea temperature observations of the "Challenger" expedition, though the fact was not confirmed by soundings until many years later.

The West Atlantic Trough lying on the western side of the Cape Risc Rises and extending inland from the north into the North American basin, and its greatest depths appears to be in the Porto Rico Trench, where in 1832 Capt. W. H. Brownson, U.S.N., obtained a sounding of 4515 fathoms in 10° 36' N., 66° 26' W. The Brazilian Basin has also a large area lying at a depth greater than 2500 fathoms and culminates in the Romanch de Deeps close to the Equatorial Ridge in 1° 11' S., 18° 15' W. with a depth of 4560 fathoms. The Eastern Atlantic Trough cannot boast of such great depths though the Peake Deep with 3284 fathoms sinks abruptly from the Azores Plateau in 45° 6' N., 16° 45' W., and several soundings exceeding 4000 fathoms have been obtained in the Bay of Biscay east of the meridian of 5° E. The North African Basin has several deeps with more than 3500 fathoms to the north-west and the south-west of the Cape Verde Islands, but the South African Basin is less deep. In the South Atlantic there is no connexion between the Central Rise and the Antarctic Shelf,
for the Indo-Atlantic Antarctic Basin stretches from near the South Sandwich Islands towards Kerguelen with depths exceeding 2500 fathoms and reaching in places 3100. The Cape Trough runs northward from this basin. It was long believed on the strength of a sounding of "4000 fathoms, no bottom" reported by Sir James Ross in 68° 29' S., 12° 40' W., that the Indo-Atlantic Basin was of enormous depth, but W. S. Bruce, in the "Scotia," showed in 1904 that the real depth at that point is only 700 fathoms.

In the Indian Ocean the Kerguelen Rise stretches broadly southward, east of the island which gives it a name, to the Antarctic Shelf with the greatest depths upon it usually less than 2000 fathoms, and it stretches northward beyond New Amsterdam to 30° S. This rise is separated from the Crozet Rise by a depression extending to 2675 fathoms, through which the Kerguelen Trough (which lies north of Kerguelen) is brought into free communication with the Indo-Atlantic Antarctic Basin. The greater part of the Indian Ocean is occupied by the great Indian Basin, which covers 23,500,000 sq. m.(13,500,000 sq. m.) and extends from the Chagos Islands eastward to Australia and south-eastward to Tasmania. The Australian Shelf rises steeply as a rule from depths of 2500 to 3000 fathoms. A broad depression with depths of from 3300 to 3500 fathoms lies to the east of the Cocos Islands and extends into the angle between the Malay Archipelago and Australia. On the north this depression sinks into the long and narrow Sunda Trench south of Java, and here in 10° 15' S., 108° 2' E., the German surveying-ship "Planet" obtained a sounding of 3828 fathoms in 1906. The Sunda Trench is distinguished by the wave-like configuration of its floor, and the wave-like character is continued to the westward of Sumatra with islands rising from the higher portions. The western part of the Indian Ocean has been shown by the surveys of H.M.S. "Sealark" and the German surveying-ship "Planet" to have somewhat a complicated configuration, the island groups and banks of atolls which occur there rising abruptly as a rule from depths of about 2000 fathoms or more. Between the Seychelles and Sokotra (6°-9° N.) there are great stretches of the ocean floor forming an almost level expanse at a depth of 2900 fathoms. The Arabian Gulf and Gulf of Aqaba are also very deep, 3500 to 3900 fathoms of about 1900 fathoms, while the floor of the Bay of Bengal rises very gradually northwards and is 1000 fathoms deep close up to the Ganges Shelf.

The Pacific Ocean consists mainly of one enormous basin bounded on the west by New Zealand and the Tonga, Marshall and Marianne ridges, on the north by the festoons of islands marking off the North Pacific fringing seas, on the east by the coast of North America and the great Easter Island Rise and on the south by the Antarctic Shelf. The total area of this basin is about 80,000,000 sq. km. (30,000,000 sq. m.), its surface being almost twice that of Asia. Half of this basin lies deeper than 2750 fathoms, and the greater part of it belongs to the northern hemisphere. From the floor of this vast and profound depression numerous isolated volcanic cones rise with abrupt slopes, and even between the islands of the Hawaiian group there are depths of more than 2000 fathoms. The Society Islands and Tahiti crown a rise coming within 1500 fathoms of the surface, two similar rises form the foundation of the Paumotu group where Agassiz found soundings of 2187 fathoms between Marokau and Hao. This greatest of ocean basins contains also the largest and deepest trenches. The Tucurara Deep of the Japan Trench (4655 fathoms in 49° 55' N., 152° 26' E.) was famed for many years as the deepest depression of the earth's crust. This great trench is continued along the Luchu Islands where the cable-steamer "Stephan" sounded in 4080 fathoms, and through the Bonin Trench (with a maximum of 3595 fathoms) to the famous Marianne Trench in which the U.S.S. "Nero" in 1899 found 5260 fathoms in 12° 43' N., 145° 40' E., the greatest depth yet measured. The northern part of the Marianne Trench leads to a wave-like configuration of the ocean floor, the depth to the east of Salpan being over 4300 fathoms, followed by a rise to 1089 fathoms and then a descent to 3167 fathoms.

The trenches of Yap (4122 fathoms) and Palau (Peleu) (4450 fathoms) are not immediately connected with that of Marianne. To the east of the Philippines a sounding of 3400 fathoms is found close to the Strait of St Bernardino and north-east of Talaut there is a trench with 4648 fathoms. To the north-east the Japan Trench adjoins the Aleutian Trench, where a depth of 4938 fathoms has been found south-west of Attu. Trenches of great size also occur south of the equator. The Tonga and Kermadec trenches, both deeper than 4000 fathoms, which stretch from the Samoa Islands southwards toward New Zealand for a distance of 1600 nautical miles. The deepest sounding obtained in the Tonga Trench is 5022 fathoms in 23° 39' S., 175° 4' W., and in the Kermadec Trench, 5155 fathoms, 36° 27' S., 176° 30' W. The steep western sides of these trenches often show an angle of slope of 9°.

The south-western part of the Pacific Ocean has a very rich and diversified submarine relief, abounding in small basins separated by ridges and rises. There are no depths, however, of greater size that occur south of the equator. The south-eastern part of the Pacific is mainly occupied by the Easter Island Rise with depths rarely so great as 2000 fathoms; but close to the continent of South America the Atacama Trench is a typical example of the deepest form of depression culminating with 4175 fathoms in 25° 42' S., 71° 31' 5" W. The Pacific Antarctic Basin occupies the vast region south of 50° S. right up to the Antarctic Shelf, with depths ranging down to 3500-3000 fathoms, and communicating with the main Pacific Basin to the east of New Zealand.

The ice-covered polar continental seas, the Arctic, comes nearest to oceanic conditions in the extent and depth of its depressions. The soundings of Nansen and Sverdrup on the " Fram " expedition indicate that northward from the Siberian Shelf the great North Polar Basin has an area of about 4000,000 sq. km. (1,500,000 sq. m.) with depths down to 2200 fathoms. A rise between Spitsbergen and Greenland separates the Norwegian Trough (greatest depth 2005 fathoms in 68° 21' N., 9° 5' W.) which in turn is divided from the Atlantic by the Wyville Thomson Ridge which runs between the Faeroe and Shetland Islands and is covered by only 314 fathoms of water at the deepest point. The troughs amongst these depressions of the south-eastern part of the Pacific is mainly occupied by the Easter Island Rise with depths rarely so great as 2000 fathoms; but close to the continent of South America the Atacama Trench is a typical example of the deepest form of depression culminating with 4175 fathoms in 25° 42' S., 71° 31' 5" W. The Pacific Antarctic Basin occupies the vast region south of 50° S. right up to the Antarctic Shelf, with depths ranging down to 3500-3000 fathoms, and communicating with the main Pacific Basin to the east of New Zealand.

The Central American Sea communicates with the Atlantic through the channels between the Antilles, none of which is quite 1000 fathoms deep, and it sinks to a depth of 2843 fathoms in the Caribbean Basin, 3428 fathoms in the Cayman Trench and 2080 fathoms in the Gulf of Mexico.

The Austral-Asian or Malay Sea is occupied by a great shelf in the region west of Borneo and north of Java, while in the east there are eight abruptly sunk basins of widely different size. The China Sea on the north has a maximum depth of 2715 fathoms off the Philippines, the Sulu Basin reaches 2550 fathoms, and the Celebes Basin 2795 fathoms. Some of the channels between the islands are of very great depth, Macassar Strait exceeding 1000 fathoms, the Molucca Passage exceeding 2000 fathoms, and the Halmahera Trough sinking as deep as 2275 fathoms. The deepest of all is the Banda Basin, a large area of which lies below 2500 fathoms and reaches 3557 fathoms in the Kei Trench. A depth of 2780 fathoms also occurs north of Flores. The borders of the Malay Sea are everywhere shallower on the side of the Indian Ocean than on that of the Pacific, and consequently water from the Pacific preponderates in the depths.

The Mediterranean Sea, the best-known member of the intercontinental class, is separated from the Atlantic Ocean by a ridge running from Cape Spartel to Cape Trafalgar on which
the greatest depth is only 175 fathoms. The depth increases so rapidly towards the east that soundings exceeding 500 fathoms occur off Gibraltar. The Balearic Basin, between Spain and the rise bearing Corsica and Sardinia, has a maximum depth of 1742 fathoms, and the Tyrrhenian Basin between that rise, Italy and Sicily deepens to 2040 fathoms. The larger Eastern Mediterranean Basin stretches eastward from Sicily with large tracts more than 2000 fathoms below the surface, and the greatest depth ascertained during the detailed researches of the Austrian expedition on board the "Pola" was 2046 fathoms in 35° 44' 8" N., 21° 46' 8" E. The Adriatic Sea though very shallow in the north deepens southward to about 500 fathoms, and the Aegean Sea has a maximum depth of 1230 fathoms north of Crete. The Black Sea, connected with the Mediterranean by long and narrow channels, is occupied in the north by an extensive shelf on which lies the extremely shallow Gulf of Azov; but the greater part of the sea consists of a deep basin, the central part of which is an almost flat expanse at a uniform depth of 1220 fathoms.

The smaller enclosed seas are for the most part very shallow. The Persian Gulf nowhere exceeds 50 fathoms, the southern part of Hudson Bay does not exceed 100 fathoms except at one spot, though in the less-known fjords of the northern part depths up to 200 fathoms have been reported. The Baltic Sea exceeds 50 fathoms in few places except the broad central portion, though small caldron-like depressions here and there may sink below 200 fathoms. The Red Sea on the other hand, though shut off from the Indian Ocean by shallows of the Strait of Bab-el-Mandeb with little more than 100 fathoms, sinks to a very considerable depth in its central trough, which reaches 1209 fathoms in 20° N.

The fringe seas as a rule show little variety of submarine relief. The Bass Sea (Bass Strait), Irish Sea and North Sea lie on the continental shelf. In the North Sea the depth of 100 fathoms is only exceeded to any extent in the Norwegian gully, which has a maximum depth of 383 fathoms in the Skagerrak.

Most of the other seas of this class are formed on a common plan. Towards the continent there is a broad shelf, and just before the chain of islands separating them from the ocean runs a narrow and deep trough. In the Bering Sea the trough north of Buldur in the Aleutian Islands sinks to 2337 fathoms, and in the Sea of Okhotsk, north-west of the Kuriles, to 1839 fathoms. Similar conditions prevail in the East China Sea and the Andaman Sea. The Sea of Japan has a wide shelf only in the north, the central part forms a broad basin with depths of 1650 fathoms. The Laurentian Sea (Gulf of St Lawrence) has a narrow branching gully running between wide shelves, in which a depth of 312 fathoms is found south of Anticosti.

The area, general depth and total volume of the oceans and principal seas have been recalculated by Krümmel, and the accompanying table presents these figures.

**Oceanic Deposits.**—It has long been known that the deposits which carpet the floor of the ocean differ in different places, and coasting sailors have been accustomed to time immemorial to use the lead not only to ascertain the depth of the water, but also to judge by its character the nature of the soil below. In depths down to 100 fathoms the old-fashioned hand-lead, hollow below and "armed with" tallow, suffices to bring up a sample large enough to be recognizable. Captain Phipps in 1773 secured samples of soft blue clay in this manner from a depth of 683 fathoms, but as a rule when sounding in great depths the sample is washed off the tallow before it can be brought on board. Various devices have consequently been attached to leads intended to catch and hold the material when soft enough to be penetrated. One of the most effective early forms was the snapper or "deep-sea clam." Sir John Ross, a pair of powerful spring jaws held by an arrangement which when released on striking the bottom allowed the jaws to close, biting out and holding securely a substantial portion of the ground. A simpler form of collector, now almost universally used, is a plain brass tube which is driven into the bottom of the sea by the weight of the sounder, and in which the deposit may be retained by a valve or other contrivance, though in many cases friction alone suffices to hold the punched-out core. Larger quantities of deposit may be conveniently collected by means of the dredge, which can be worked in any depth and brings up large stones, concretionary nodules or fossils, of the existence of which a sounding-tube could give no indication.

The voyage of the "Challenger" supplied for the first time the nucleus of a collection of deep-sea deposits sufficient to serve as the basis for comprehensive classification and mapping. The "Challenger" collections supplemented by those of other expeditions and of many telegraph and surveying-ships were studied in detail by Sir John Murray and Professor A. Renard, whose monograph, published in 1891, laid the foundations and

1"Challenger Reports," Deep Sea Deposts."
OCEANOGRAPHY AND OCEANOGRAPHY

rear the greater part of the structure of our present knowledge on the subject. The classification adopted was a double one, taking account both of the origin and of the distribution in depth of the various deposits, thus:

I. DEEP SEA DEPOSITS (beyond 100 fathoms)

1. Red Clay
2. Radiolarian Ooze
3. Diatom Ooze
4. Globigerina Ooze
5. Pteropod Ooze
6. Blue Mud
7. Red Mud
8. Green Mud
9. Volcanic Mud
10. Coral Mud

A. PELAGIC DEPOSITS (formed in deep water remote from land)

II. SHALLOW WATER DEPOSITS (in less than 100 fathoms)

1. Sands, gravels, muds, &c.

B. TERRIGENOUS DEPOSITS (formed in deep or shallow water close to land)

III. LITTORAL DEPOSITS (between high and low-water marks)

1. Sands, gravels, muds, &c.

Krummel prefers to simplify this by grouping the deposits in a single category arranged according to their position into:

(a) Littoral (including Murray and Renard's littoral and shallow water deposits [II. and III.]).

(b) Hemipelagic (including Nos. 6-10 of Deep Sea Deposits).

(c) Eupelagic (including Nos. 1-5 of Deep Sea Deposits).

As so defined the hemipelagic deposits are those which occur in general on the slope from the continental shelves to the ocean depths and also in the deep basins of enclosed and fringing seas. The eupelagic deposits are subdivided by Krummel into two main groups: (a) epipelagic, including the pteropod, globigerina and diatom oozes occurring on the rises and ridges and in the less deep troughs. (b) Abyssal, including the radiolarian ooze and red clay of the deepest abysses.

The littoral deposits include those of the actual shore on the wash of the waves and of the surface of the continental shelf.

Shore Deposits are the product of the waste of the land arranged and bedded by the action of currents or tidal streams. On the rocky coast of high latitudes blocks of stone detached by frost fall on the beach and becoming embedded in ice during winter are often drifted out to sea and so carry the shore deposits to some distance from the land. Similar effects are produced along the boulder-clay cliffs of the Baltic. Where the force of the waves on the beach produces its full effect the coarser material gets wound down to gravel, sand and silt, the finest particles remaining long suspended in the water to be finally deposited as mud in quiet bays. A particularly fine-grained mud is formed on the low coasts of the eastern boundary of the North Sea by a mixture of the finest sediment carried down by the slow-running rivers with the calcareous or siliceous remains of plankton. Pure calcareous sand and calcareous mud are formed by wave action on the shores of coral islands where the only material available is coral and the accompanying calcareous algae, crustacea, molluscs and other organisms secreting carbonate of lime. Recent limestones are being produced in this way and also in some places by the precipitation of calcium carbonate by sodium or ammonium carbonate which has been carried into the sea or formed by organisms. The precipitated carbonate may agglomerate on mineral or organic grains which serve as nuclei, or it may form a sheet of hard deposit on the bottom as occurs in the Red Sea, off Florida, and round many coral islands in the Pacific. Only the sand and the finest-grained sediments of the shore zone are carried outwards over the continental shelf by the tides or by the reaction-currents along the bottom set up by on-shore winds. The very finest sediment is kept in a state of movement until it drops into the gulleys or furrows of the shelf, where it can come to rest together with the finer fragments of the remains of littoral or bank vegetation. Thus are formed the "mud-holes" of the Hudson Funnel so welcome as guides telling their position to ship captains making New York harbour in a fog. Sand may be taken as the predominating deposit on the continental shelves, often with a large admixture of remains of calcareous organisms, for instance the deposits of maerl made up of nullipores off the coasts of Brittany and near Belle Isle. Amongst the most widely distributed of the deposits actually formed on the continental shelf are phosphatic nodules; these are especially abundant on the east coast of the United States and on the Agulhas Bank, where the amount of calcium phosphate in the nodules is as much as 50%. Sir John Murray finds the source of the phosphatic acid to be the decomposition of large quantities of animal matter, and he illustrates this by the well-known circumstance of the death of vast shoals of fish when warm Gulf-Stream water displaces the cold current which usually extends to the American coast. Glacial drift naturally plays a great part in the deposits on the polar continental shelves.

Hemipelagic deposits are a mixture of deposits of terrigenous and pelagic origin. The most abundant of the terrigenous materials are the finest particles of clay and calcium carbonate as the Nannofragments derived from land vegetation, of which twigs, leaves, &c., may form a part. It is largely mixed with the shells of the bottom-living foraminifera Biloculina. Max Weber states that blue mud occurs in the deep basins of the eastern part of the Malay Sea. In the form of volcanic mud it is common round the high volcanic islands of the South-Western Pacific.

Red mud may be classed as a variety of blue mud, from which it differs on account of the larger proportion of ochrous substance and the absence of sufficient organic matter to reduce the whole of the ferric oxide. This variety surrounds the deposits of the deep-sea coral and sponge shelves of South America, South Africa and eastern China.

Green mud differs to a greater extent from the blue mud, and owes its characteristic nature and colour to the presence of glauconite, which is formed inside the cases of foraminifera, the spines of echinid and the spicules of sponges in a manner not yet understood. It occurs in such abundance in certain geological formations as to give rise to the name of green-sand. Green mud abounds off the east coast of North America seawards of Cape Hatteras, also to the north of Cuba, and on the west off the coast of South America. The Challenger expedition found it on the Agulhas Bank, on the eastern coasts of Japan, and on the west coast of Portugal. When the proportion of calcium carbonate in the blue mud is considerable there results a calcareous ooze, which when found on the continental slope and in enclosed seas is largely composed of remains of deep-sea corals and bottom-living foraminifera, pelagic organisms including pteropods being less frequently represented. The floors of the Caribbean, Cayman and Mexican Basins in the Central American Sea are covered with a white calcareous ooze, which is clearly distinguished from the eupelagic pteropod and globigerina oozes by the presence of abundant large mineral particles and the remains of land plants. In this deposit the occurrence of calcareous concretions is very characteristic, as L. F. de Pourtalés pointed out in 1870; they consist of remains of deep-sea corals, serpulae, echinoderm and mollusca united
by a calcareous cement. Similar formations are found in the Mediterranean, where a dark mud predominates in the western part, passing into a grey, marly slime in the Tyrrenian Basin and replaced by a typical calcareous ooze in the Eastern Basin. The bottom of the Black Sea is covered by a stiff blue mud in which Sir John Murray found much sulphide of iron, 1 grains or needles of pyrites making up nearly 50% of the deposit, and there are also grains of amorphous calcium carbonate evidently precipitated from the water. A calcium carbonate mud is largely aided by the putrefaction of organic matter, and as a result the water deeper than 120 fathoms is extraordinarily deficient in dissolved oxygen and abounds in sulphuretted hydrogen, the formation of which is brought about by a special bacterium, the only form of life found at depths greater than 120 fathoms in the Black Sea.

In the Red Sea the "Pola" expedition discovered a calcareous ooze similar to that of the Mediterranean, and the formation of a stony crust by precipitation of calcium and magnesium carbonates may be recognized as giving origin to a recent dolomite.

The terrigenous ingredients in the deposits become less and less abundant as one goes farther into the deep ocean and away from the continental margins. Still, according to Murray and Irvine, finely divided colloidal clay is to be found in all parts of the ocean however remote from land, though in very small amount, and there is less in tropical than in cooler waters. A minute fraction is always separating out of the water, and as a prodigious length of time may be accepted for the accomplishment of all the chemical and physical processes in the deep sea, we must take account of the gradual accumulation of even this infinitesimal precipitation. As well as the finest of terrigenous clay there is present in sea-water far from land a different clay derived from the decomposition of volcanic material. Volcanic dust thrown into the air settles out slowly, and some of the products of submarine and littoral volcanoes, like pumice-stone, possess a remarkable power of floating and may drift into any part of the ocean before they become waterlogged and sink. To this inconceivably slowly-growing deposit of inorganic material over the ocean floor there is added an overwhelmingly more rapid contribution of the remains of calcareous and siliceous planktonic and benthonic organisms, which tend to bury the slower accumulating material under a blanket of globigerina, pteropod, diatom or radiolarian ooze. When those deposits of organic origin are wanting or have been removed, the red clay composed of the mineral constituents is found alone. It is a remarkable geographical fact that on the rises and in the basins of moderate depth of the open ocean the organic oozes preponderate, but in the abyssal depressions below 2500 or 3000 fathoms, whether these lie in the middle or near the edges of the great ocean spaces, there is found only the red clay, with a minimum of calcium carbonate, though sometimes with a considerable admixture of the siliceous remains of radiolarians. Thus red clay and radiolarian ooze are distinguished as abyssal deposits in contradistinction to the epilgal calcareous oozes.

Globigerina ooze was recognized as an important deposit as soon as the first successful deep-sea soundings had been made as late as 1853 by Bailey of West Point and Ehrenberg in Berlin. Murray and Renard define globigerina ooze as containing at least 30% of calcium carbonate, in which the remains of pelagic (not benthonic) foraminifera predominate and in which remains of pelagic mollusca such as pteropods and heteropods, ostracodes and also coeloliths (minute calcareous algae) may also occur. Not more than 25% of the deposit may consist of bottom-dwelling foraminifera, echinor or worm-tubes, and as a rule these make up only from 9 to 10%. These peculiarities, combined with the striking absence of mineral constituents, distinguish the epilgal globigerina ooze from the hemipelagic calcareous mud.

Out of 175 samples of globigerina ooze obtained by the "Challenger" expedition 134 came from depths of 1500 to 2500 fathoms, 13 from depths of 1000 to 1500 and only 16 from depths greater than 2500 fathoms. Viewed as a whole this deposit may be taken as a partial precipitation of the plankton living in the upper waters of the open sea. A small proportion of organic matter including the fat globules of the plankton is mixed with the calcium carbonate, the amount according to Gümöl's analysis being about 1 part in 1000. Secondary products, such as glauconite, phosphatic concretions and manganeese nodules, occur though less frequently than in the hemipelagic deposits. Globigerina ooze is the characteristic deposit of the Atlantic Ocean, where it covers not less than 44,000,000 sq. km. (17,000,000 sq. statute m.). In the Indian Ocean the area covered is 31,000,000 sq. km. (12,000,000 sq. m.) and in the huge Pacific Ocean only 30,000,000 sq. km. (11,500,000 sq. m.).

Pteropod ooze is merely a local variety of globigerina ooze in which the comparatively large but very delicate spindle-shaped shells of pteropods happen to abound. These shells do not retain their individuality at depths greater than 1400 or 1500 fathoms, and in fact pteropod ooze is only found in small patches on the ridges near the Azores, Antilles, Canaries, Sokotra, Nicobar, Fiji and the Faamotu islands, and on the central rise of the South Atlantic between Ascension and Tristan d'Acunha.

Diatom ooze was recognized by Sir John Murray as the characteristic deposit in high latitudes in the Indian Ocean, and later it was found to be characteristic also of the corresponding parts of the Indian and Pacific covering a total area of about 22,000,000 sq. km. (8,500,000 sq. m.). It has been found sporadically near the Aleutian Islands, between the Philippines and Marianne Islands, and between the Galapagos group. It is made up to a large extent of the siliceous frustules of diatoms. It is usually yellowish-grey and often straw-coloured when wet, though when dried it becomes white and mealy.

Red clay was discovered and named by Sir Wylie Thomson on the "Challenger" in 1873 when sounding in depths of 2700 fathoms on the way from the Canary Islands to St Thomas. The reddish colour comes from the presence of oxides of iron, and particles of manganese also occur in it, especially in the Pacific region, where the colour is more that of chocolate; but when it is mixed with globigerina ooze it is grey. Red clay is the deposit peculiar to the abyssal areas; 70 carefully investigated samples collected by the "Challenger" came from an average depth of 2730 fathoms, 97 specimens collected by the "Tuscarora" came from an average depth of 2860 fathoms, and 26 samples obtained by the "Albatross" in the Central Pacific came from an average depth of 2620 fathoms. Red clay has not yet been found in depths less than 2200 fathoms. The main ingredient of the deposit is a stiff clay which is plastic when fresh, but dries to a stony hardness. Isolated gritty fragments of minerals may be felt in the generally fine-grained homogeneous mass. The depth often brings up large numbers of nodules formed upon sharks' teeth, the ear-bones of whales or turtles or small fragments of pumice or other volcanic ejecta, and all more or less encrusted with manganese oxide until the nodules vary in size from that of a potato to that of a man's head. A very interesting feature is the small proportion of calcium carbonate, the amount present being usually less as the depth is greater; red clay from depths exceeding 3000 fathoms does not contain so much as 1% of calcareous matter.

Murray and Renard recognize the progressive diminution of carbonate of lime with increase of depth as a characteristic of all epilgal deposits. The whole collection of 231 specimens of deep-sea deposits brought back by the "Challenger" shows the following general relationship:—

Proportion of Calcium Carbonate in Deep-Sea Deposits.

In deep water there is a regular process of solution of the calcareous shells falling from the surface. Murray and Renard ascribe this to the greater abundance of carbonic acid in the
deeper water, which aided by the increased pressure adds to the solvent power of the water for carbonate of lime. It is, however, a curious question how, considering the increase of carbonic acid by the decomposition of organic bodies and possible submarine exhalations of volcanic origin, the water has not in some places become saturated and a precipitate of amorphous calcium carbonate formed in the deepest water. The whole subject still requires investigation.

Amongst the foreign material found embedded in the red clay are globules of meteoric iron, which are sometimes very abundant. Derived products in the form of crystals of phillipite are not uncommon, but the most abundant of all are the incrustations of manganese oxide, as to the origin of which Murray and Renard are not fully clear. The manganese nodules afford the most ample proof of the prodigious period of time which has elapsed since the formation of the red clay began; the sharks' teeth and whales' ear-bones which serve as nuclei belong in some cases to extinct species or even to forms derived from those familiar in the fossils from the seas of the Tertiary period. This fact, together with the extraordinarily rare occurrence of such remains and meteoric particles in globigerina ooze, although there is no reason to suppose that at any one time they are unequally distributed over the ocean floor, can only be explained on the assumption that the rate of formation of the epilithic deposits through the accumulation of pelagic shells falling from the surface is rapid enough to bury the slow-gathering material which remains uncovered on the spaces where the red clay is forming at an almost infinitely slower rate. Sir John Murray believes that no more than a few feet of red clay have accumulated in the deepest depressions since the close of the Tertiary period. The red clay is the characteristic deposit of the Pacific Ocean, where about 101,000,000 sq. km. (39,000,000 sq. m.) are covered with it, while only 15,000,000 sq. km. (5,800,000 sq. m.) of the Indian Ocean and 14,000,000 sq. km. (5,400,000 sq. m.) of the Atlantic are occupied by this deposit; it is indeed the dominant submarine deposit of the water-hemisphere just as globigerina ooze is the dominant submarine deposit of the land-hemisphere.

Radiolarian ooze was recognized as a distinct deposit and named by Sir John Murray on the “Challenger” expedition, but it may be viewed as red clay with an exceptionally large proportion of siliceous organic remains, especially those of the radiolarians which form part of the pelagic plankton. It does not occur in the Atlantic Ocean at all, and in the Indian Ocean it is only known round Cocos and Christmas Islands; but it is abundant in the Pacific, where it covers a large area between 5° and 15° N., westward from the coast of Central America to 165° W., and it is also found in patches north of the Samoa Islands, in the Marianne Trench and west of the Galapagos Islands.

The total areas occupied by the various deposits according to the latest measurements of Krümmel are as follows:

Geologists are agreed that littoral and hemipelagic deposits similar to those now forming are to be found in all geological systems, but the existence in the rocks of epipelagic deposits and especially of the abysmal red clay, though viewed by some as probable, is totally denied by others. There is even some hesitation in accepting the continuity of the chalk with the globigerina ooze of the modern ocean. From the obvious rarity of true abysmal rocks in the continental area Sir John Murray deduces the permanence of the ocean, which he holds always remained upon those portions of the earth’s crust which they occupy now, and both J. Dana and Louis Agassiz had already arrived at the same conclusion. This theory accords well with the enormous lapse of time required in the accumulation of the red clay.

**Salts of Sea-water.**—Sea-water differs from fresh water by its salt and bitter taste and by its unsuitability for the purposes of washing and cooking. The process of natural evaporation in the salinae or salt gardens of the margin of warm seas made the composition of sea-salt familiar at a very early time, and common salt, Epsom salts, gypsum and magnesium chloride were recognized amongst its constituents. The analyses of modern chemists have now revealed the existence of 32 out of the 80 known elements as existing dissolved in sea-water, and it is scarcely too much to say that the remaining elements also exist in minute traces which the available methods of analysis as yet fail to disclose. Many of the elements such as copper, lead, zinc, nickel, cobalt and manganese have only been found with the 50 samples, and Dittmar, who made complete analyses of 77 samples obtained on the “Challenger” expedition, Dittmar showed that the average proportion of the salts in ocean water of 35 parts salts per thousand was as follows (calculated as parts per thousand of the sea-water, as percentage of the total salts and per hundred molecules of magnesium bromide):

As Marcut had foreshadowed from the analysis of 14 samples in 1819, the larger series of exact analyses proved that the variations in the proportion of individual salts to the total salts are very small, and all analyses since Dittmar’s have confirmed this result. Although the salts have been grouped in the above

2 Chemical News (1870), vol. 22, pp. 25, 44; (1872) vol. 26, p. 159.
table it is not to be supposed that a dilute solution like sea-water contains all the ingredients thus arbitrarily combined. There must be considerable dissociation of molecules, and as a first approximation it may be taken that of 10 molecules of most of the constituents about 9 (or in the case of magnesium sulphate 8) have been separated into their ions, and that it is only during slow concentration as in a natural saline that the ions combine to produce the various salts in the proportions set out in the above table. One can look on sea-water as a mixture of very dilute solutions of particular salts, each one of which after the lapse of sufficient time fills the whole space as if the other constituents did not exist, and this interdiffusion accounts easily for the uniformity of composition in the sea-water throughout the whole ocean, the only appreciable difference from point to point being the salinity or degree of concentration of the mixed solutions.

The origin of the salt of the sea is attributed by some modern authorities entirely to the washing out of salts from the land by rain and rivers and the gradual concentration by evaporation in the oceans, and some (e.g. J. Joly) go so far as to base a calculation of the age of the earth on the assumption that the ocean was originally filled with fresh water. This hypothesis, however, does not accord with the theory of the development of the earth from the state of a sphere of molten rock surrounded by an atmosphere of gaseous metals by which the first-formed clouds of aqueous vapour must have been absorbed. The great similarity between the salts of the ocean and the gaseous products of volcanic eruptions at the present time, rich in chlorides and sulphates of all kinds, is a strong argument for the ocean having been salt from the beginning. Two other facts are totally opposed to the origin of all the salinity of the oceans from the concentration of the washings of the land. The proportions of the salts of river and sea-water are quite different, as Julius Roth shows thus:

The salts of salt lakes which have been formed in the areas of internal drainage in the hearts of the continents by the evaporation of river water are entirely different in composition from those of the sea, as the existence of the numerous natron and bitter lakes shows. Magnesium sulphate amounts to 4-7% of the total salts of sea-water according to Dittmar, but to 23-6% of the salts of the Caspian according to Lebedineff; in the ocean magnesium chloride amounts to 10-9% of the total salts, in the Caspian only to 4.5%; on the other hand calcium sulphate in the ocean amounts to 3.6%, in the Caspian to 6.7%. This disparity makes it extremely difficult to view ocean water as merely a watery extract of the salts existing in the rocks of the land.

The determination of salinity was formerly carried out by evaporating a weighed quantity of sea-water to dryness and weighing the residue. Forchhammer, however, pointed out that this method gave inexact and variable results, as in the act of evaporating to dryness hydrochloric acid is given off as the temperature is raised to expel the last of the water, and Tornøe found that carbonic acid was also liberated and that the loss of both acids was very variable. Tornøe vainly attempted to apply a correction for this loss by calculation; and subsequently S. P. L. Sørensen and Martin Knudsen after a careful investigation decided to abandon the old definition of salinity as the sum of all the dissolved solids in sea-water and to substitute for it the weight of the dissolved solids in 1000 parts by weight of sea-water on the assumption that all the bromine is replaced by its equivalent of chlorine, all the carbonate converted into oxide and the organic matter burnt. The advantage of the new definition lies in the fact that the estimation of the chlorine (or rather of the total halogen expressed as chlorine) is sufficient to determine the salinity by a very simple operation. According to Knudsen the salinity is given in weight per thousand parts by the expression $S = 0.030 + 1.8050$ where $S$ is the salinity and CI the amount of total bromine in a sample. Such a simple formula is only possible because the salts of sea-water are of such uniform composition throughout the whole ocean that the chlorine bears a constant ratio to the total salinity as newly defined whatever the degree of concentration. This definition was adopted by the International Council for the Study of the Sea in 1902, and it has since been very widely accepted.

Besides the determination of salinity by titration of the chlorides, the method of determination by the specific gravity of the sea-water is still often used. In the laboratory the specific gravity is determined by a hydrometer or by actual weighing, or is the temperature of the mixed solution. Three types of areometer are in use: (1) the ordinary hydrometer of variable weight with a direct reading scale, a set of from five to ten being necessary to cover the range of specific gravity from 1.000 to 1.031 so as to take account of sea-water of all possible salinities; (2) the "Challenger" type of areometer designed by J. Y. Buchanan, which has an arbitrary scale and can be varied in weight by placing small metal rings on the stem so as to depress the scale to any desired depth in sea-water of any salinity, the specific gravity being calculated for each reading by dividing the total weight by the immersed volume; (3) the total immersion areometer, which has no scale and the weight of which can be adjusted so that the instrument can be brought so exactly to the specific gravity of the water sample that it remains immersed, neither floating nor sinking; this has the advantage of eliminating the effects of surface tension and in Frédéric Nansens's pattern is capable of great precision.

In all areometer work it is necessary to ascertain the temperature of the water sample under examination with great exactness, as the volume of the areometer as well as the specific gravity of the water varies with temperature. All determinations must accordingly be reduced to a standard temperature for comparison. Following the practice of J. Y. Buchanan on the "Challenger" it has been usual for British investigators to calculate specific gravities for sea-water at 60°F. compared with pure water at the maximum density point (39°2') as unity. On the continent of Europe it has been more usual to take both at 17.5°C. (63.5°F.), which is expressed as "S 4.8"; but for pyknometer work in all countries where the sample is cooled to 32° F. before weighing and pure water at 39.2° taken as unity the expression is "S 4.1". On the first meeting of the International Conference for the Study of the Northern European Seas at Stockholm in 1890 Martin Knudsen, assisted by Karl Forch and S. P. L. Sørensen, carried out a careful investigation of the relation between the amount of chlorine, the total salinity and the specific gravity of sea-water of different strengths including an entirely new determination of the thermal expansion of sea-water. The results are published in his Hydrographical Tables in a convenient form for use.

The relations between the various conditions are set forth in the following equations where $e_{0}$ signifies the specific gravity of the sea-water in question at 0°C., the standard at 4° being taken as 1000, S the salinity and CI the chlorine, both expressed in parts by weight per mile.

\[(1) e_{0} = 0.093 + 0.8149 S - 0.0000682 S' + 0.0000066 S''\]
\[(2) e_{0} = 0.093 + 0.8050 C_{I} - 0.0000682 S' + 0.0000066 S''\]
\[(3) S = 0.030 + 1.8050 C_{I}\]

The temperature of maximum density of sea-water of any specific gravity was found by Knudsen to be given with sufficient accuracy for all practical purposes by the formula $\theta = 39.5 - 0.2664 S$, where $\theta$ is the temperature of maximum density in degrees centigrade. The temperature of maximum density is lower as the concentration of the sea-water is greater, as is shown in the following table:

**Maximum Density Point of Sea-Water of Different Salinities.**

Further Physical Properties of Sea-water.—The laws of physical chemistry relating to complex dilute solutions apply to sea-water, and hence there is a definite relation between the osmotic pressure, freezing-point, vapour tension and boiling-point by which when one of these constants is given the others can be calculated.

The most easily observed is the freezing-point, and according to the very careful determinations of H. T. Hansen the freezing-point \( r^* \) C. varies with the degree of concentration according to the formula

\[
\tau = -0.0086 - 0.00046330 + 0.00010556
\]

According to the investigations of Svante Arrhenius the osmotic pressure in atmospheres may be obtained by simply multiplying the temp rate of freezing \( r^* \) by the factor -12.08, and it varies with temperature \( t \) according to the law which holds good for gaseous pressure.

\[
P_t = Pa(1 + 0.003667)
\]

can thus be reduced to its value at 0° C. Sigurd Stenius has calculated tables of osmotic pressure for sea-water of different degrees of concentration. The relation of the elevation of the boiling-point \( b^* \) to the osmotic pressure \( P_b \) is very simply derived from the formula \( 1 = 0.020277fa \), while the reduction of vapour pressure proportional to the concentration can be very easily obtained from the elevation of the boiling-point, or it may be obtained directly from tables of vapour tension.

The importance of the osmotic pressure of sea-water in biology will be easily understood from the fact that a frog placed in sea-water loses water by osmosis and soon becomes 20% lighter than its original weight, while a true salt-water fish suddenly transferred to fresh water gains water by endosmosis, swells up and quickly succumbs. The elevation of the boiling-point is of little practical importance, but the reduction of vapour pressure means that sea-water evaporates more slowly than fresh water, and the more slowly the higher the salinity. Unfortunately no observations of evaporation from the surface of the open sea have been made and very few comparisons of the evaporation of salt and fresh water are on record. The fact that sea-water does evaporate more slowly than fresh water has been proved by the observations of Mazelle at Triest and of Okado in Azino (Japan). Their experiments show that in similar conditions the evaporation of sea-water amounts to from 70 to 91% of the evaporation of fresh water, a fact of some importance in geophysics on account of the vast expanses of ocean the evaporation from which determines the rainfall and to a large extent the heat-transference in the atmosphere.

The optical properties of sea-water are of immediate importance in biology, as they affect the penetration of sunlight into the depths. The refraction of light passing through sea-water is dependent on the salinity to the extent that the index of refraction is greater as the salinity increases. From isolated observations of J. Soret and E. Sarasin and longer series of experiments by Tornèö and Krümmel this relation is shown to be so close that the salinity of a sample can be ascertained by determining the index of refraction. According to Krümmel the following relations hold good at 18° C. for the monochromatic light of the D line of the sodium spectrum in units of the fifth decimal place.

The refractometer constructed by C. Pflüffer (of the firm of Zeiss, in Jena) has been successfully used by G. Schott and E. von Drygalski for the measurement of salinity at sea, and was found to have the same degree of accuracy as an areometer with the great advantage of being quite unaffected by the motion of the ship in a sea-way.

The transparency of sea-water has frequently been measured at sea by the simple expedient of sinking white-painted disks and noting the depth at which they become invisible as the measure of the transparency of the water. For the north European seas disks of about 18 or 20 in. in diameter are sufficient for this purpose, but in the tropics, where the transparency is much greater, disks 5 ft. in diameter at least must be used or the angle of vision for the reflected light is too small. In shallow seas the transparency is always reduced in rough weather. In the North Sea north of the Dogger Bank, for instance, the disk is visible in calm weather to a depth of from 16 to 19 fathoms, but in rough weather only to 61 fathoms. Knipovich occasionally observed great transparency in the cold waters of the Murman Sea, where he could see the disk in as much as 25 fathoms, and a similar phenomenon has often been reported from Icelandic waters. The greatest transparency hitherto reported is in the eastern basin of the Mediterranean, where J. Lüksch found the disk visible at 32 ft. as far as 70 fathoms and off the Syrian coast even to 33 fathoms. In the open Atlantic there are great differences in transparency; Krümmel observed a 6 ft. disk to depths of 31 and 36 fathoms in the Sargasso Sea, but in the cold currents of the north and also in the equatorial current the depth of visibility was only from 11 to 163 fathoms. In the tropical parts of the Indian and the Pacific Oceans the depth of visibility increases again to from 20 to 27 fathoms. Some allowance should be made for the elevation of the sun at the time of observation. Mill has shown that in the North Sea off the Firth of Firth the average depth of visibility for a disk in the winter half-year was at fathoms and in the summer half-year 61 fathoms, and, although the greater frequency of rough weather in winter might tend to obscure the effect, individual observations made it plain that the angle of the sun was the main factor in increasing the depth to which the disk remained visible.

There are some observations on the transparency of sea-water of an entirely different character. Such, for instance, were those of Spindler and Wrangel in the Black Sea by sinking an electric lamp, the invention of Paul Reppard by means of the change of electric resistance in a selenium cell or the chemical action of the light on a mixture of chlorine and hydrogen, by which he found a very rapid diminution in the intensity of light even in the surface layers of water. Many experiments have also been made by the use of photographic plates in order to find the greatest depth to which light penetrates. Foli and Sarasin detected the last traces of sunlight in the western Mediterranean at a depth of 244 to 260 fathoms, and Lüksch in the eastern Mediterranean at 328 fathoms and in the Red Sea at 273 fathoms. The chief cause of the different depths to which light penetrates in sea-water is the varying turbidity due to the presence of mineral particles in suspension or to plankton. Schott gives the following as the result of measurements of transparency by means of a white disk at 23 stations in the open ocean, where quantitative observations of the plankton under 1 square metre of surface were made at the same time.

Any influence on transparency which may be exercised by the temperature or salinity of the water is quite insignificant.

The colour of ocean water far from land is an almost pure
blue, and all the variations of tint towards green are the result of local disturbances, the usual cause being turbidity of some kind, and this in the high seas is almost always due to swarms of plankton. The colour of sea-water as it is seen on board ship is most readily determined by comparison with the tints of Forel's xanthometer or colour scale, which consists of a series of glass tubes fitted with the rungs of a ladder in a frame and filled with a mixture of blue and yellow liquids in varying proportions. For this purpose the zero or pure blue is represented by a solution of 1 part of copper sulphate and 9 parts of ammonia in 190 parts of water. The yellow solution is made up of 1 part of neutral potassium chromate in 190 parts of water, and to give the various degrees of the scale, 1, 2, 3, 4, &c., % of the yellow solution is mixed with 99, 98, 97, 96, &c., % of the blue in successive tubes. Observations with the xanthometer have not hitherto been numerous, but it appears that the purest blue (0-1 on Forel's scale) is found in the Sargasso Sea, in the North Atlantic and in similarly situated tropical and tropical regions in the Indo-Pacific, and that the waters of northern seas have an increasing tendency towards green, the Irminger Sea showing 5-9 Forel, while in the North Sea the water is usually a pure green (10-14 Forel), the western Mediterranean shows 5-9 Forel, but the eastern is as blue as the open ocean (0-2 Forel). A pure blue colour has been observed in the cold southern region, where the "Valdivia" found 0-2 Forel in 52° S. between 16° and 31° E., and even the water of the North Sea has been observed at times to be intensely blue. The blue of the sea-water as observed by the Forel scale has of course nothing to do with the turbidities of the sea, but is due to the extension of the water surface due to the reflection of a cloudless sky. Over shallows even the water of the tropical oceans is always green. There is a distinct relationship between colour and transparency in the ocean; the most transparent water which is the most free from plankton is always the purest blue, while an increasing turbidity is usually associated with an increasing tint of green. The natural colour of pure sea-water is blue, and this is emphasized in deep and very clear water, which appears almost black to the eye. When a quantity of fine white powder is thrown in, the light reflected by the white particles as they sink assumes an intense green, and thus observations of J. Aitken with clear sea-water in long tubes leave no doubt on the subject.

Discoloration of the water is often observed at sea, but that is always due to foreign substances. Brown or even blood-red stripes have been observed in the North Atlantic when swarms of the copepod Calanus finmarchicus were present; the brown alga Trichodesmium erythraeum, as its name suggests, can change the blue of the tropical seas to red; swarms of diatoms may produce olive-green patches in the ocean, while some other forms of life have at times been observed to give the colour of milk to large stretches of the ocean surface.

On account of its salinity, sea-water has a smaller capacity for heat than pure water. According to Thoulet and Chevalier the specific heat diminishes as salinity increases, so that for 10 per mille salinity it is 0.968, for 35 per mille it is only 0.932, that of pure water being taken as unity. The thermal conductivity also diminishes as salinity increases, the conductivity for heat of sea-water of 35 per mille salinity being 4.2/7% less than that of pure water. This means that sea-water heats and cools somewhat more readily than pure water. The surface tension, on the other hand, is greater than that of pure water and increases with the salinity, according to Krümmel, in the manner shown by the equation: $a = 0.005 + 0.0221 S$ at 0° C., where $a$ is the coefficient of surface tension and $S$ the salinity in parts per thousand. The internal friction or viscosity of sea-water has also been shown by E. Ruppin to increase with the salinity. Thus at 0° C. the viscosity of sea-water of 35 per mille salinity is 5.2/7% greater and at 25° C. 4.4/7% greater than that of pure water at the same temperatures; in absolute units the viscosity of sea-water at 25° C. is only half as great as it is at 0° C.

The compressibility of sea-water is not yet fully investigated. It varies not only to a marked degree with temperature, but also with the degree of pressure. Thus J. Y. Buchanan found a mean of 20 experiments made by piezometers sunk in great depths on board the "Challenger" give a coefficient of compressibility $k = 490 \times 10^{-5}$; but six of these experiments made at depths of from 2740 to 3125 fathoms gave $k = 580 \times 10^{-5}$. The value usually adopted is $k = 450 \times 10^{-5}$. The compressibility is itself very small, but so great in its effect on the density of deep water in situ that the specific gravity $(\sigma_{25}^{25})$ at 2000 fathoms increases by 0.017 and at 3000 fathoms by 0.026. In other words, water which has a specific gravity of 1.0280 at the surface would at the same temperature have a specific gravity of 1.0450 at 2000 and 1.0540 at 3000 fathoms. If the whole mass of water in the ocean were relieved from pressure its volume would expand from 319 million cub. m. to 321.7 million cub. m., which for a surface of 139.5 million sq. m. means an increased depth of 100 ft. The rate of propagation of sound depends on the compressibility, and in ocean water at the tropical regions is normally somewhat less, but so great in its effect on the density of deep water in situ that the specific gravity $(\sigma_{25}^{25})$ at 2000 fathoms increases by 0.017 and at 3000 fathoms by 0.026. For the great range of submarine sound signals, which can thus be very serviceable to navigation in foggy weather.

The electrical conductivity of sea-water increases with the salinity; at 59° F. it is given according to E. Ruppin's formula $L = c = 0.01455 S = 0.0000978 S^4 + 0.00000076 S^3$ in reciprocal ohms.

The radio-activity of sea-water is extraordinarily small; indeed in samples taken from 50 fathoms in the Bay of Danzig it was imperceptible, and R. T. Strutt found that salt from evaporated sea-water did not contain one-third of the quantity of radium present in the water of the town supply in Cambridge.

Dissolved Gases of Sea-water.—The water of the ocean, like any other liquid, absorbs a certain amount of the gases with which it is in contact, and thus sea-water contains dissolved oxygen, nitrogen and carbonic acid absorbed from the atmosphere. As Gay-Lussac and Humboldt showed in 1805, gases are absorbed in less amount by a saline solution than by pure water. The first useful determinations of the dissolved gases of sea-water were made by Oskar Jacobsen in 1872. Since that time much work has been done, and the methods have been greatly improved. In the method now most generally practised, which was put forward by O. Pettersson in 1894, two portions of sea-water are collected in glass tubes which have been exhausted of air, coated internally with mercuric chloride to prevent the putrefaction of any organisms, and sealed up beforehand. The exhausted tube, when inserted in the water sample and the tip broken off, immediately fills, and is then sealed up so that the contents cannot change after collection. One portion is used for determining the oxygen and nitrogen, the other for the carbonic acid. The former determination is made by driving out the dissolved gases from solution and collecting them in a Torricellian vacuum, where the volume is measured after the carbonic acid has been removed. The oxygen is then absorbed by some appropriate means, and the volume of the nitrogen measured directly, that of the oxygen being given by difference.

In the second portion the carbonic acid is driven out by means of a current of hydrogen, collected over mercury and absorbed by caustic potash.

C. T. Fox, of the Central Laboratory of the International Council at Christiania, has investigated the relation of the atmospheric gases to sea-water by very exact experimental methods and arrived at the following expressions for the absorption of oxygen and nitrogen by sea-water of different degrees of concentration. The formulae show the number of cubic centimetres of gas absorbed by 1 litre of sea-water; $t$ indicates the temperature in degrees centigrade and $C$ the salinity as shown by the amount of chloride in pereille:

$$ O_2 = 10.391 - 0.2809 t + 0.00609 S - 0.000632 S^2 + 0.000034 S^3 $$(1)
$$ N_2 = 18.561 - 0.482 S + 0.007152 S^2 - 0.0000594 S^3 $$(2)
$$ Cl^- = 21.490 - 0.00117 S^2 + 0.0000931 S^3 $$
In the case of ocean water with a salinity of 35 per mille, this gives for saturation with atmospheric gases in cc. per litre:

\[
\begin{align*}
\text{Oxygen} & : 8.93 \quad 5.84 \quad 4.93 \\
\text{Nitrogen} & : 14.40 \quad 11.12 \quad 9.78
\end{align*}
\]

at 0°C. 15°C. 25°C.

The reduction of the absorption of gas by rise of temperature is thus seen to be considerable. As a rule the amount of both gases dissolved in sea-water is found to be that which is indicated by the temperature of the water in situ. Jacobsen on some occasions found water in the surface layers of the Baltic super-saturated with oxygen, which is ascribed to the action of the chlorophyll in vegetable plankton; in other cases when examining the nearly stagnant water from deep basins he found a deficiency of oxygen due no doubt to the withdrawal of oxygen from solution, by the respiration of the animals and the oxidation of the deposits on the bottom. When these processes continue for a long time in deep water shut off from free circulation so that it does not become aerated by contact with the atmosphere the water becomes unfit to support the life of fishes, and when the accumulation of putrefying organic matter gives rise to sulphuretted hydroxide as in the Black Sea below 150 fathoms, life, other than bacterial, is impossible. The water from the greatest depths of the Black Sea, 1160 fathoms, contains 6 cc. of sulphuretted hydrogen per litre.

The distribution of dissolved oxygen in the depths of the open ocean is still very imperfectly known. Dittmar’s analysis of the “Challenger” samples indicated an excess of oxygen in the surface water of high southern latitudes and a deficiency at depths below 50 fathoms.

The facts regarding carbonic acid in sea-water are even less understood, for here we have to do not only with the solution of the gas in the water, which is chemical, but also with respiration of plankton, and it is very difficult to know when all the gas is driven out of a sample of sea-water, and a much larger proportion is present than the partial pressure of the gas in the atmosphere and its coefficient of absorption would indicate. These constants would lead one to expect to find 0.5 cc. per litre at 0°C. while as a matter of fact the amount absorbed approaches 50 cc. The form of combination is unstable and apparently variable, so that the quantities of free carbonic acid, bicarbonates and normal carbonate are liable to alter. Since 1851 it has been known that all sea-water has an alkaline reaction, and Turner defined the alkalinity of sea-water as the amount of acid necessary to convert the excess of bases into normal carbonate. The alkalinity of North Atlantic water of 35 per mille salinity is 26.86 cc. per litre, corresponding to a total amount of carbonic acid of 49.07 cc. According to the researches of August Krogh, the alkalinity is greatly increased by the admixture of land water. This is proved by E. Ruppini’s analysis of Baltic water, which has an alkalinity of 16 to 18 instead of the 5 or 6 which would be the amount proportional to the salinity, while the water of the Vistula and the Elbe with a salinity of 1 per mille has an alkalinity of 8 or 9. Thus the alkalinity serves as an index of the admixture of river water with sea-water. Carbonic acid passes from the atmosphere into the ocean as soon as its tension in the latter is the smaller; hence in this respect the ocean acts as a regulator. The amount of carbonic acid in solution may also be increased by submarine exhalations in regions of volcanic disturbance, but it must be remembered that the critical pressure for this gas is 73 atmospheres, which is reached at a depth of 400 fathoms, so that carbonic acid produced at the bottom of the ocean must be in liquid form. The respiration of marine animals in the depths of deep basins in which there is no circulation adds to the carbonic acid at the expense of the dissolved oxygen. This is frequently the case in fjord basins; for instance, in the Gullmar Fjord at a depth of 50 fathoms with water of 34.14 per mille salinity and

\[1\text{ Meddeleler om Grønland} (Copenhagen, 1904), p. 331.\]
H. R. Mill in 1885 devised a self-locking arrangement by which the bottle once closed was automatically locked and rendered watertight; H. L. Ekman made further improvements; and, finally, O. Pettersson and F. Nansen perfected the instrument, adapting it not only for enclosing a portion of water at any desired depth, but by a series of concentric divisions insulating in the central compartment water at the temperature it had at the moment of collection. By means of a weight dropped along the line the water-bottle can be shut and a sample enclosed at any desired depth. The use of a sliding weight is not recommended in depths much exceeding 200 fathoms on account of the time required and the risk of the line sagging, but at a low angle and slow speeds the deep penetration of the closing mechanism is usually actuated by a screw propeller which begins to work when the line is being hauled in and can be set so as to close the water-bottle in a very few fathoms. A small but heavy water-bottle has been devised by Martin Knudsen, provided with a pressure gauge or bathometer, by which samples may be collected from any moderate depth down to about 100 fathoms, on board a vessel going at full speed. This has made it possible to obtain many samples from moderate depths along a long line in a very short space of time. Sisquée's small water-bottle on the deck of a steamer, as used by a propeller requires extremely skilful handling to enable it to give good results.

As yet it is only possible to speak with confidence of the vertical distribution of salinity in the seas surrounding Europe, where there is a general increase of salinity with depth. For the open ocean the only quite trustworthy results are those obtained by the prince of Monaco in the North Atlantic, and by the recent Antarctic expeditions in the South Atlantic and South Indian Oceans. The observations made on the "Challenger" and "Gazelle," though enabling some perfectly sound general conclusions to be drawn, require to be supplemented. It appears, as J. Y. Buchanan pointed out in 1876, that the great contrasts in surface salinity between the tropical maxima and the equatorial minima give place at the moderate depth of 200 fathoms to a practically uniform salinity in all parts of the ocean.

In the North Atlantic a strong submarine current flowing outward from the Mediterranean leaves the Strait of Gibraltar with a salinity of 36 per mille, and can be traced as far as Madeira and the Bay of Biscay in depths of from 600 to 2000 fathoms, still with a salinity of 36 per mille, whereas in the tropical equal depths the salinity is from 0·5 to 0·7 per mille less. In the tropical and sub-tropical belts of the Atlantic and Indian Oceans south of the equator the salinity diminishes rapidly from the surface downwards, and at 500 fathoms reaches a minimum of 34·3 or 34·4 per mille; after that it increases again to 800 fathoms, where it is almost 34·7 or 34·8, and this salinity holds good to the bottom, even to the greatest depths, as was first shown by the "Gauss" and afterwards by the "Planet" between Durban and Ceylon.

Our knowledge of the Pacific in this respect is still very imperfect, but it appears to be less salt than the other oceans at depths below 800 fathoms, as on the surface, the salinity at considerable depths being 34·6 to 34·7 in the western part of the ocean, and about 34·4 to 34·5 in the eastern, so that, although the data are by no means satisfactory, it is impossible to assign a mass-salinity of more than 34·7 per mille for the whole body of Pacific water.

The causes of difference of salinity are mainly meteorological. The belt of equatorial minimum salinity corresponds with the easterly currents of calms and of the equatorial counter-current, the salinity diminishing towards the east. The tropical maxima of salinity on the poleward side of the trade-winds coincide with the regions of minimum rainfall, high temperature, strong winds and consequently of maximum evaporation. Evaporation is naturally greatest in the enclosed seas of the nearly rainless subtropical zone such as the Mediterranean and Red Sea. Where the evaporation is at a minimum, the inflow of rivers from a large continental area and the precipitation from the atmosphere at a maximum, there is necessarily the greatest dilution of the sea-water, the Baltic and the Arctic Sea being conspicuous examples.

Temperature of the Oceans.—There is no difficulty in observing the temperature of the surface of the sea on board ship, the only precautions required being to draw the water in a bucket which has not been heated in the sun in summer or exposed to frost in winter, to draw it well forward of any discharge pipes of the steamer, to place it in the shade on deck, insert the thermometer immediately and make the reading without delay. The measurement of temperature in the depths, unless a high-speed water-bottle be used, involves stopping the ship and employing thermometers of the bathometer type. Many forms have been tried, but only three types are in general use. The first was the Phipps thermometer which was originally used with good effect by de Saussure in the Mediterranean in 1780. He covered the bulb of the thermometer with layers of non-conducting material and left it immersed at the desired depth for a very long time to enable it to take the temperature of its surroundings. When brought up again the thermometer retained its temperature so long that there was ample time to take a correct reading. Since 1870 thermometers on this principle have been in use for regular observations at German coast and light-ship stations. Following Saussure's example of Cavendish, Irving made observations of deep temperature on Phipps's Spitsbergen voyage of 1773 with a valveless water-bottle, insulated by non-conducting material. A similar instrument gave excellent results in the hands of E. von Lenz on Kotzebue's second voyage of circumnavigation in 1823-1826. The last elaboration of the insulated slip water-bottle by Ekman, Nansen and Pettersson has produced an instrument of great perfection, in which the insulation is effected by layers of water between a series of concentric ebonite cylinders, all of which are closed both above and below when the apparatus encloses a sample, and each of which in turn must be warmed considerably before there is any rise of temperature in the chamber within. This can be used with certainty to °0·5 C. for water down to 250 fathoms, after taking account of the slight disturbance produced by the expansion of the greatly compressed deep water.

The second form of deep-sea thermometer is the self-registering maximum and minimum on James Sis's principle. These instruments must be constructed with the greatest care, but when well-made in accordance with J. Y. Buchanan's large model they can be trusted to give a good record of the vertical distribution of temperature, provided the water grows cooler as the depth increases. They would act equally well if the water grew continually warmer as the depth increases, but they cannot give an exact account of a temperature inversion such as is produced when layers of warmer and colder water alternate.

The third form is the outflow or reversing thermometer, first introduced by Aimé, who used a very inconvenient form in the Mediterranean in 1841-1845, but greatly improved and simplified by Negretti and Zambra in 1875. The principle is to have a constriction in the tube above the bulb so proportioned that when the instrument is upright it acts in every way as an ordinary mercurial thermometer, but when it is inverted the thread of mercury breaks at the constriction, and the portion above the point runs down the now reversed tube and remains there as a measure of the temperature at the moment of turning over. For convenience in reading, the tube is graduated inverted, and when it is restored to its original position the mercury thread joins again and it acts as before. Various modifications of this form of thermometer have been made by Chabaud and others. It has the advantage over the thermometer on Sis's principle that, being filled with mercury, it does not require such long immersion to take the temperature of the water. A correction has, of course, to be made for the expansion or contraction of the mercury thread if the temperature of reading differs much from that of reversing. Magnagni introduced a convenient method of inverting the thermometer by means of a propeller actuated on beginning to heave in the line, and this form is used for all work at great depths. For shallow water greater precision and certainty are obtained by using a lever
OCEAN AND OCEANOGRAPHY

actuated by a weight slipped down the line to cause the reversal, as in the patterns of Rung, Mill and others. All thermometers sunk into deep water must be protected against the enormous pressure to which they are exposed. This may be done by the method suggested by Arago in 1828, introduced by Aimé in 1841 and again suggested by Glaisher in 1858, of sealing up the whole instrument in a glass tube exhausted of air or, less effectively, by surrounding the bulb alone with a strong outer sheath of glass. In both forms it is usual to have the space between the bulb and the protecting sheath partly filled with mercury or alcohol to act as a conductor and reduce the time necessary for the thermometer to acquire the temperature of its surroundings.

The warming of the ocean is due practically to solar radiation alone; such heat as may be received from the interior of the earth can only produce a small effect and is fairly uniformly distributed. On account of the high specific heat of sea-water the diurnal range of temperature at the surface is very small. According to A. Buchan’s discussion of the two-hourly observations on the “Challenger” the total range between the daily maximum and minimum in the warmer seas is between 0.7° and 0.8° F., and for the colder seas still less (0.2° F.), compared with 3.2° F. in the overlying air. The maximum usually occurs between 1 and 2.30 P.M., the minimum shortly before sunrise. The temperature of the surface water is generally a little higher than that of the overlying air, the daily average difference being about 0.6° F., varying from 0.9° lower at 1 P.M. to 1.6° higher at 1 A.M. There are few observations available for ascertaining the depth to which this warming penetrates in the ocean. The investigations of Aimé in 1845 and Hensen in 1859 indicate that the amount of cloud has a great effect. Aimé showed that on a calm bright day in the Mediterranean the temperature rose 0.1° C. between the early morning and noon at a depth of about 12 fathoms. Luksh obtained a much greater penetration of solar warmth from the comparison of observations at different hours at neighbouring stations in the eastern Mediterranean, but his methods were not exact enough to give confidence in the result. The penetration of warmth from the surface is effected by direct radiation, and by convection, which acts partially rendered dense by evaporation increasing salinity. Conduction has practically no effect, for the efficiency of thermal conductivity in sea-water is so small that if a mass of sea-water cooled to 0° C. and the surface kept at a temperature of 30° C., 6 months would elapse before a temperature of 15° C. was reached at the depth of 1.3 metres, 1 year at 1.83 metres, and 10 years at 5.8 metres. Great irregular variations in radiation and convection sometimes produce a remarkably abrupt change of temperature at a certain depth in calm water; the layer in which this sudden change takes place has been closely measured by Schott. How closely two bodies of water at different temperatures may come together is shown by the fact that in the Baltic in August between 10 and 11 fathoms there is sometimes a fall of temperature from 57° to 46° F. Such a condition of things is only possible in very calm weather, the action of waves having the effect of mixing the water to a considerable depth. After a storm the whole of the water in the North Sea assumes a homothetic condition, i.e., the temperature is the same from surface to bottom, and this occurs not only south of the Dogger Bank, where the condition is normal, but also, though less frequently, in the deeper water farther north. Similar effects are produced in narrow waters by the action of tidal currents, and the influence of a steady wind blowing on- or off-shore has a powerful effect in mixing the water.

The warmest parts of the Indian Ocean and Western Pacific have a mean annual temperature of 82° to 84° F., but such high temperatures are not found in the tropical Atlantic. In the Indian Ocean between 15° N. and 3° S. the surface temperature in May averages 84° to 86° F., and in the Bay of Bengal the temperature is 86°, and on part of the Atlantic basin is so high a month's mean temperature at any season. G. Schott’s investigations show that the annual range of surface temperature in the open ocean is greatest in 40° N., with 18.4° F., and in 30° S., with 9.2° F.; on the contrary, near the equator it is less, only 4° F. in 10° N., and in high latitudes it is also small, 5.2° F. in 50° S. The figures quoted above are differences between the average surface temperatures of the warmest and of the coldest month. As to the absolute extremes of surface temperature, Sir John Murray points out that 90° F. frequently occurs in the western part of the tropical Pacific, while among seas the Persian Gulf reaches 96° F., only 2° under blood-heat, and the Red Sea follows closely with a maximum of 94°. The greatest change of temperature at any place has been recorded to the east of Nova Scotia, a minimum of 28° F. and a maximum of 86°, and to the north-east of Japan with a minimum of 27° F. and a maximum of 85°. In those localities, however, it is not the same water which varies in temperature with the season, but the water of different warm and cold currents which periodically occupy the same locality as they advance and retreat. The zones of surface temperature are arranged roughly parallel to the equator, especially in the southern hemisphere. Between 46° N. and 46° S. the currents produce a considerable rearrangement of this simple order, the belts of warm water being wider on the western sides of the oceans and narrower on the eastern. The arrangement of the isotherms thus affords a basis for valuable deductions as to the direction of ocean currents. The surface temperature of the Atlantic is relatively lower than that of the other oceans when the whole area is considered. According to Krümmel’s calculation the proportional areas at a high temperature are as follows:

<table>
<thead>
<tr>
<th>Temperature Range</th>
<th>Atlantic</th>
<th>Indian</th>
<th>Pacific</th>
</tr>
</thead>
<tbody>
<tr>
<td>27° F. (25° C.)</td>
<td>22-4</td>
<td>38-0</td>
<td>40-1</td>
</tr>
<tr>
<td>68° F. (20° C.)</td>
<td>50-1</td>
<td>51-7</td>
<td>58-4</td>
</tr>
</tbody>
</table>

This disparity results in some degree at least from the comparative narrowness of the inter-tropical Atlantic, and the absence of a cool northern area in the Indian Ocean. Krümmel calculates that the mean temperature of the whole ocean surface is 63.3° F., while the mean sea-level temperature of the whole layer of air at the surface of the earth is given by Hann as 57.8° F.

We are still ignorant of the depth to which the annual temperature wave penetrates in the open ocean, but observations in the Mediterranean enable us to form some opinion on the matter. The observations of Aimé in 1845 and of Semmla in the Gulf of Naples in 1881 show that the temperature of the sea-water increases until the whole mass of water from the surface to the bottom, in 1600 fathoms or more, assumes the same temperature. Towards the end of summer the upper layers have been warmed to a depth which indicates how far the influence of solar radiation and convection have reached. Aimé calculated this depth at 150-200 fathoms, while the observations of the Austrian expedition in the eastern Mediterranean found it to be from 200 to nearly 400 fathoms. In the Red Sea, where a similar seasonal change occurs, the depth to which the surface layer warms up is about 275 fathoms. The great difference in salinity between the surface and the deep water excludes the possibility of effective convection in the seas of northern Europe, and in the open ocean the currents which are felt everywhere, and especially those with a vertical component, must exercise a very disturbing influence on convection.

The vertical distribution of surface temperature in the open ocean is much better known than that of salinity. The regional differences of temperature at like depths become less as the depth increases. Thus at 300 fathoms greater differences than 9° F. hardly ever occur between 30° N. and 30° S., in 800 fathoms the differences are less than 5° F. and in 1500 fathoms less than 2°. Even in the tropics the high temperature of the surface is confined to a very shallow layer; thus in the Central Pacific where the surface temperature is 82° F., the temperature at 100
fathoms is only 52° F. The whole ocean must thus form but a cold dwelling-place for the organisms of the deep sea. Sir John Murray calculates that at least 80% of the water in the ocean has a temperature always less than 40° F., and a recent calculation by Krümmel gave in fact a mean temperature of 36° F. for the whole ocean.

The normal vertical distribution of temperature is illustrated in curve A of fig. 1, which represents a sounding in the South Atlantic; and this arrangement of a rapid fall of temperature giving place gradually to an extremely slow but steady diminution as depth increases is termed anathermic (άνά, back, and θέρμη, warm). Curve B shows the typical distribution of temperature in an enclosed sea, in this case the Sulu Basin of the Malay Sea, where from the level of the barrier to the bottom the temperature remains uniform or homothermic. Curve C shows a typical summer condition in the polar seas, where layers of sea-water at different temperatures are superimposed, the arrangement from the surface to 200 fathoms is termed in 45° S., and 33°-8° to 34°-5° in 35° S., while north of the Walisich Ridge and east of the South Atlantic Rise bottom temperatures of 36° to 36°-7° F. prevail right northwards across the equator into the Bay of Biscay, although the depth of bottom temperature as successive submarine elevations restrict communication with the Antarctic. On the other hand, in the more open Argentine Basin, which carries deep water far to the south, the bottom temperature in 40° S. is only from 32°-2 to 32°-7° F., and the same low temperature continues throughout the Brazil Basin to the equator; but in the North American Basin from the West Indies to the Telegraph Plateau no satisfactory bottom temperature lower than 35°-6 F. has been reported. On the floor of the Indian Ocean temperatures of 33°-3° to 33°-6° occur south of 35° S. in depths of 2500 fathoms or more, but north of 35° S. the prevailing bottom temperatures are from 34°-9° to 34°-3°. In similar depths in the Pacific south of the equator temperatures of 33°-8° to 34°-5° are found, and north of the equator bottom temperatures at the same depth increase to 35°-4° in the neighbourhood of the Aleutian Islands, again completely justifying the conclusion as to the Antarctic control of deep water temperature throughout the ocean.

The marginal rises and continental shelves prevent this cold bottom water from penetrating into the depths of the enclosed and fringing seas. Thus in the Central American Sea below 90 fathoms, the depth on the outside of the barrier, no water of bottom temperature lower than that prevailing in the open ocean at that depth, viz. 35°-6° F., not even at the bottom of the great Bartlett Deep in 3450 fathoms. Such homothermic masses of water are characteristic of all deep enclosed seas. Thus in the Malay Sea the various minor seas or basins are homothermic below the depth of the rim, at the temperature prevailing at that depth in the open ocean: in the China Sea below 875 fathoms with 36°-5° F.; in the Sulu Sea (depth 2550 fathoms) below 400 fathoms with 35°-5° F.; in the Celebes Sea below 850 fathoms with 38°-6° F.; in the Banda Sea below 902 fathoms with 34°-5°. In 3500 fathoms enclosed seas which are shut off from the ocean by a very shallow sill the rule holds good that the homothermic water below the level of the sill is at the lowest temperature reached by the surface water in the coldest season of the year, provided always that the stratification of salinity is such as to permit of convection being set up. To this group belongs the Arctic Sea; the Norwegian Sea is homothermic below 550 fathoms at 29°-8° F., but this cold water does not penetrate into the Arctic Basin on account of the ridge between Spitsbergen and Greenland, and there the water below 400 fathoms at 30°-6° to 30°-9° F. because the surface layers of water are too light, on account of the low salinity due to ice-melting, to enable even the cold of a polar winter to set up a downward convection current. The Mediterranean Sea also belongs to this group; its various deep basins are homothermic (at the winter surface temperature) below the level of their respective sills—the Balcariac Basin below 190 fathoms at 55° F.; the Eastern Basin below 270 fathoms at 55°-9° F.; the Ionian Sea at 50°-3° F.; and at 56°-7° south of Cyprus. Similarly in the Red Sea the water below 380 fathoms is homothermic at 70°-9° F.

An under-current flows out from the Red Sea through the Strait of Bab-el-Mandeb, and from the Mediterranean through the Strait of Gibraltar, raising the salinity as well as the temperature of the part of the ocean outside the gates of the respective seas. The action of the Red Sea water affects the whole of the Gulf of Aden and Arabian Sea, raising the temperature at the depth of 550 fathoms to 52° or 53° F. or 9° Fahrenheit degrees higher than the water of the Bay of Bengal at the same depth. The effect of the Mediterranean water in the North Atlantic does not require such large figures to express it, but is none the less far-reaching, as first indicated by the work of the "Challenger" and subsequently defined by H. N. Dickson's discussion of the observations of Wolfenden in the little sailing yacht "Silver Belle." The temperature at 550 fathoms is raised to 49° or 50° F. between Madeira and the Biscay Shelf, i.e. 5°-4° F. above the temperature at the same depth off the Azores.

In shallow seas such as the North Sea and the British fringing
seas, where tidal currents run strong, there is a general mixing together of the surface and deeper water, thus making the arrangement of vertical temperature anathemetic in summer and katathermic in winter, while at the transitional periods in spring and autumn it is practically homothermic. Thus at Station E4 of the international series at the mouth of the English Channel in 49° 27' N., 4° 42' W., the following distribution of temperature $F.$ has been observed by Matthews:

<table>
<thead>
<tr>
<th>Month</th>
<th>Temperature ($F.$)</th>

</table>

It is noticeable that there is a marked vertical temperature gradient only at the end of summer when a warm surface layer is formed, though in August 1904 that was only 8 fathoms thick. In small nearly land-locked basins shut off from one another by bars rising to within a short distance of the surface and affected both by strong tidal currents and by a considerable and close shore of land-water, the contrasts of vertical distribution of temperature with the seasons are strongly marked, and there are also great unperiodic changes effected mainly by wind, as shown by the investigations of H. R. Mill in the Clyde Sea Area, and of O. Pettersson, J. Hjort and Helland-Hansen in the Scandinavian fjords.

**Sea Ice.**—The freezing-point of sea-water is lower as the salinity increases and normal sea-water of 35 per mille salinity freezes at 28.6°F. Experience shows that sea-water can be cooled considerably below the freezing-point without freezing if there is no ice or snow in contact with it. Freezing takes place by the formation of pure ice in flat crystalline plates of the hexagonal system, which form in perpendicular planes and unite in bundles to form grains so that a thick covering of ice exhibits a fibrous structure. It is only the water that freezes; the dissolved salts are excluded in the process in a regular order according to temperature. At temperatures about 17°F. sodium sulphate is the first ingredient of the salts to separate out, potassium chloride follows at 12°F., sodium chloride at -7.4°F., magnesium chloride at -28.5°F. and, as O. Pettersson was the first to point out, calcium chloride not until -$6.0°F. During the rapid formation of ice the stiff unbroken ice is often imprisoned between the little plates of frozen water; hence without some special treatment sea-ice is not suitable as a source of drinking water. A long continued frost the last of the included brine may be frozen and the salts driven out in crystals on the surface; these crystals are known to polar explorers by the Siberian name of *rassol.* Ice is a very poor conductor of heat and accordingly protects the surface of the water beneath from rapid cooling; hence newly-formed pancake ice does not increase excessively in thickness in one winter, and even in the centre of the Arctic Basin, the ice-covering only amounts to 6 or at most 9 ft. in the course of a year, while in the Antarctic regions the season's growth is only half as great; in the latter also the accumulated snow is an important factor in the thickness of the ice, and snow is an even worse conductor of heat. The influence of wind and tide breaks up the frozen surface of the sea, and sheets yielding to the pressures slide over or under one another and are worked together into a hummocky ice-pack, the irregularities on the surface of which, caused by repeated fractures and collisions, may be from 10 to 20 ft high. Such formations, termed *torriss* by the Russians, may extend under water, according to Makaroff's investigations, to at least an equal depth. Such old sea-ice when prevented from escaping forms the palaeocryostic sea of Nares; but, as a rule, it is carried southward in the East Greenland and Labrador currents, and melted in the warmer seas of lower latitudes. In the southern hemisphere the ice-pack forms a nearly continuous fence around the Antarctic continent. Pack-ice forms regularly in the inner part of the Baltic every winter, but not in the Norwegian fjords. Even in the Mediterranean sea-ice is formed annually in the northern part of the Black Sea, and more rarely in the Gulf of Salonica and at the head of the Adriatic off Triest. Hudson Bay is blocked by ice for a great part of the year, and the Gulf of St Lawrence is blocked every winter. Ice also clothes the continental shores of the northern fringing seas of eastern Asia. In addition to sea-ice, icebergs which are of land origin occur at sea. In the north, icebergs break off, as a rule, from the ends of the great glaciers of Greenland, and in the far south from the edge of the great Antarctic ice-barrier. The latter often gives birth to prodigious icebergs and ice islands, which are carried northward by ocean currents, nearly as far as the tropical zone before they melt. Thus in December 1906, an iceberg was seen off the mouth of the La Plata in 38° S., and in 1840 one was seen near Cape Aguñas in 35° S. The Antarctic icebergs are of tabular form and much larger than those of Greenland, but in either case an iceberg rising to 200 ft. above sea-level is uncommon, and one exceeding 300 ft. is very rare. The Greenland icebergs are carried by the Labrador current across the great banks of Newfoundland, where they are often very numerous in the and rolling of the vessel produce disturbances that greatly affect the result. Such current-meters as those used by J. C. in 1841 and by Irminger since 1858 only gave the direction of the deeper current by comparison with the surface current at the time of observation. Later apparatus, such as Pettersson's bifilar current-meter or his more recent electric-photographic apparatus, and Nansen and Ekman's propeller current-meter, measure both the direction and the velocity at any moderate depth from an anchored vessel. One of the indirect methods of investigating currents is by taking account of the initial temperature of the current and following it by the thermometer throughout its course. Hence the familiar contrast between warm and cold currents, of which the Gulf Stream and the Labrador current are types. Benjamin Franklin in 1775 and Charles Blagden in 1781, by means of numerous observations of temperature made on board the packets plying on the Atlantic passage, determined the boundaries of these two currents and their seasonal variations with considerable precision. The differences of salinity support this method, and, especially in the northern European seas, often prove a sharper criterion of the boundaries than temperature itself; this is especially the case at the entrance to the Baltic. Evidence drawn from drift-wood, wrecks or special drift bottles is less distinctly but still interesting and often useful; this method of investigation includes the use of icebergs as indicators of the trend of currents and also of plankton, the minute swimming or drifting organisms so abundant at the surface of the sea.

The general lines of the currents of the oceans are fairly well understood, and along the most frequented ocean routes the larger seasonal variations have also been ascertained. The general scheme of ocean currents depends on the prevailing
winds taken in conjunction with the configuration of the coast and its submarine approaches. The trade-wind regions correspond pretty closely with westward-flowing currents, while in the equatorial calm belts there are eastward-running counter-currents, these lying north of the equator in the Atlantic and Pacific, but south of the equator in the Indian Ocean. In the region of the westerly winds on the poleward side of 40° N. and S. the currents again flow generally eastward. A cyclonic circulation of the atmosphere is associated with a cyclonic circulation of the water of the ocean, as is well shown in the Norwegian Sea and North Atlantic. The westerly winds pump the water northwards in the Atlantic and southwards in the Pacific. When the westerlies become southward, they heave up the surface water against the east coast of the continents the currents turn poleward. The north equatorial current divides into the current entering the Caribbean Sea and issuing thence by the Strait of Florida as the Gulf Stream, and the Antilles current passing to the north of the Antilles. Both currents unite off the coast of the United States and run northward, turning towards the east when they come within the influence of the prevailing westerly winds. In a similar manner the Brazil current, the Agulhas current and the East Australian current originate from the drift of the drift drift-drift, and in the North Pacific the Japan current arises from the north-east trade drift. The west-wind drifts on the poleward side carry back part of the water southward to re-unite with the equatorial current, and thus there is set up an anticyclonic circulation of water between 10° and 40° in each hemisphere, the movement of the water corresponding very closely with that of the wind. The coincidence of wind and current direction is most marked in the region of alternating monsoons in the north of the Indian Ocean and in the Malay Sea.

The accordance of wind and currents is so obvious that it was fully recognized by early mariners in the time of the first circumnavigators. Modern investigations have shown, however, that the relationship is by no means so simple as appears at first. We must remember that the ocean is a continuous sheet of water of a certain depth, and the conditions of continuity which hold good for all fluids require that there should be no vacant space within it; hence if a single water particle is set in motion, the whole ocean must respond, as Varennius pointed out in 1650. Thus all the water carried forward by any current must have the place it left immediately occupied by water from another place, so that only one fluid is involved, and the drift-drift-drift-drift-drift-drift, and in the ocean. Further, all water particles when moving undergo a deviation from a straight path due to the forces set up by the rotation of the earth deflecting them towards the right as they move in the northern hemisphere and towards the left in the southern. This deflecting force is directly proportional to the velocity and the mass of the particle and also to the sine of the latitude; hence it is zero at the equator and comes to a maximum at the poles. When the wind acts on the surface of the sea it drives before it the particles of the surface layer of water, and, as these cannot be parted from those immediately beneath, the friction of the fluid causes the propelling impulse to act through a considerable depth, and if the wind continued long enough it would ultimately set the whole mass of the ocean in motion right down to the bottom. The current set up by the grip of the wind sweeping over the surface is deflected by the earth's rotation about 45° to the right of the direction of the wind in the northern hemisphere and to the left in the southern. The deeper layers lag behind the upper in deflection and the velocity of the current rapidly diminishes in consequence. The older theory of the origin of drift currents enunciated by Züppritz in 1878 was modified as indicated above by Nansen in 1901, and Walfrid Ekman subsequently went further. He showed that at a certain depth the direction of the current becomes exactly the opposite of that which has been imposed by deflection on the surface current, and the strength is reduced thereby to one-twentieth of that at the surface. He called the depth at which the opposed direction is attained the drift-current depth, and he found it to be dependent on the velocity of the surface current and on the latitude. According to Ekman's calculation with a trade-wind blowing at 16 m per hour, the drift-current depth in latitude 5° would be approximately 104 fathoms, in latitude 15°, 55 fathoms, and in latitude 45° only from 33 to 38 fathoms. A strong wind of 38 m an hour would produce a drift-current depth of 82 fathoms in latitude 45°, and a light breeze of 3 m an hour only 22 fathoms. It follows that a pure trade-wind drift cannot reach to any great depth, and this seems to be confirmed by observation, as when tow-nets are sunk to depths of 50 fathoms and more in the region of the equatorial current they always show a strong drift away from the side of the ship, the ship itself following the surface current. The direction of the drift-drift-drift-drift-drift-drift, is always a direction of the whole mass of the current is perpendicular to the direction of the wind which sets it in motion. This produces a heaping-up of warm water towards the middle of the anti-cyclonic current circulation between 10° and 40°, and on the other hand an updraft of deep water along the outer side of the cyclonic currents. The latter phenomenon is most clearly shown by the stripes of cold water along the west coasts of Africa and America, the current running along the coast tending to draw its water away seawards on the surface and the principle of continuity requiring the updraft of the cool deep layers to take its place. For this reason the up-welling coastal water is coldest close to the shore, and hence it only appears on the Somali coast during the south-west monsoon. On the flat coasts of Europe the influence of on-shore wind in driving in warm water, and of off-shore wind in producing an updraft of cold water, has long been familiar to bathers. In a similar way updrafts of cold water to the surface occur in the neighbourhood of the equator, especially in the Central Atlantic and Pacific. When a drift-current impinges directly upon a coast there is a heaping up of surface water, giving rise to a counter-current in the deep-drift-drift-drift, which maintains the level, and this counter-current, although subject to deflection on account of the rotation of the earth, is deflected much less than a pure drift-current would be. Such currents, due to the banking up of water, have a large share in setting the depths of the sea in motion, and so securing the vertical circulation and ventilation of the ocean.

The difference in density which occurs between one part of the ocean and another, shares with the wind in the production of currents. Vertical movements are also produced by difference of temperature in the water, but these can only be feeble, as below 1000 fathoms the temperature differences between tropical and polar waters are very small. If we assign to a column of water at the equator the density of 3 fathoms at 1000 fathoms, or an average of 1000, and to a column of water at the polar circle a mean density of 1000, there would result a difference of level equal to (1000-1000) X 1000 = 3 fathoms in a distance from the equator to the polar circle of some 4000 m. A gradient like this, only in 1,330,000, could rise only to an extremely feeble surface current polewards and an extremely feeble deep current towards the equator. If there were strong currents at the bottom of the ocean the uniform accumulation of the deposit of minute shells of globigerina and radiolarian ooze would be impossible, the rises and ridges would necessarily be swept clear of them, and the fact that this is not the case shows that from whatever cause the waters of the depths are set in motion, that motion must be of the most deliberate and gentlest kind. In exceptional cases, when a strong deep current does flow over a rise, as in the case of the Wyville Thomson Ridge, the bottom is swept clear of fine sediment. Strongly marked differences in density are produced by the melting of sea-ice, and this is of particular importance in the case of the great ice barrier round the Antarctic continent. O. Petersson has made a careful study of ice melting as a motive power in oceanic circulation, and points out that it acts in two ways: on the surface it produces dilution of the water, forming a fresh layer and causing an outflow seaward of surface water with very low salinity; towards the deep water it produces a strong cooling effect, leading to increase of density and sinking of the chilled layers. Both actions result in the drawing in of
an intermediate layer of water from a distance which takes part in the double system of vertical circulation as is indicated in fig. 2. The actual direction of this circulation is strongly modified by the influence of the earth's rotation. The existence of a layer of water of low salinity at a depth of 50 fathoms in the tropical oceans of the southern hemisphere is to be referred to this action of the melting ice of the Antarctic regions. Petterson's view that ice-melting dominates the whole circulation of the oceans and regulates in particular the currents of the seas round northern Europe must, however, be looked on as carrying the explanation too far.

Differences of density between the waters of enclosed seas and of the ocean are brought about in some instances by concentration of the water of the sea on account of active evaporation, and in other instances by dilution on account of the great influx of land water. A very powerful vertical circulation is thus set up between enclosed seas and the outer ocean. The very dense water of the Red Sea and the Mediterranean makes the column of water saltier and heavier and the level lower than in the ocean beyond the straits. Hence a strong surface current sets inwards through the Straits of Bab-el-Mandeb and Gibraltar, while an undercurrent flows outwards, raising the temperature and salinity of the ocean for a long distance beyond the straits.

Through the Bosphorus and Dardanelles at the entrance of the Black Sea, and through the sound and belts at the entrance of the Baltic, streams of fresh surface-water flow outwards to the salter Mediterranean and North Sea, while salter water enters in each case as an undercurrent. Wind and tide greatly alter the strength of these currents due to difference of density, and the surface outflow may either be stopped or, in the case of the belts, actually reversed by a strong and steady wind. Both outflowing and inflowing currents are subject to the deflection towards the right imposed by the earth's rotation.

Modern oceanography has found means to calculate quantitatively the circulatory movements produced by wind and the distribution of temperature and salinity not only at the surface but in deep water. The methods first suggested by H. Mohr and subsequently elaborated by V. Bjerknes have been usefully applied in many cases, but they cannot take the place of direct observations of currents and of the fundamental processes and conditions underlying them. The determination of the exact relationship of cause and effect in the origin of ocean currents is a matter of great practical importance. The researches of Pettersson, Meinardus, H. N. Dickson and others leave no doubt, for example, that the variations in the intensity of the Gulf Stream, whether these be measured by the change in the strength of the current or in the heat stored in the water, produce great variations in the character of the weather of northern Europe. The connexion between variations of current strength and the conditions of existence and distribution of plankton are no less important, especially as they act directly or indirectly on the life-conditions of fish species.

Important current and temperature charts of the ocean and occasional memoirs are published by the Admiralty by the Meteorological Office in London, by the U.S. Hydrographic Office in Washington, the Deutsche Seewarte in Hamburg, and also at intervals by the French, Russian, Dutch and Scandinavian admiralties. *Pilot Chart of the North Atlantic* and *Charts of selected soundings of the South Atlantic* are issued monthly by the U.S. Hydrographic Office, and of the North Atlantic and of the Indian Ocean and Red Sea by the British Meteorological Office, giving a compass of the normal conditions of weather and sea.

Reports of many minor expeditions and researches have appeared in the *Reports of the Fishery Board for Scotland*; the Marine Biological Association at Plymouth; the Kiel Commission for the Investigation of the Baltic; the Berlin Institut für Meereskunde; the U.S. Office of the Hydrographic Department; the various official reports to the British, German, Russian, Finnish, Norwegian, Swedish, Danish, Belgian and Dutch governments on the respective work of the commission. In addition there are publications by the Commission operating in the North Sea the *Bulletin du maitre océanographique de Monaco* (1903 seq.); the *Scottish Geographical Magazine*; the *Geographical Journal*; Petermanns Mitteilungen; Wagner's *Geo-
graphische Jahrbuch*; the *Proceedings and Transactions* of various Societies of London and Edinburgh; the *Annalen der Hydrographie*; and the publications of the Swedish Academy of Sciences. (O. K.; H. R. M.)

OCEAN CITY, a city and seaside resort of Cape May county, New Jersey, U.S.A., in the S.E. part of the state, about 10 m. S.W. of Atlantic City. *Pop.* (1890), 452; (1900), 1307; (1905), 1635; (1910), 1950. It is served by the Atlantic City and the West Jersey & Seashore railways. The city is laid out to face both the ocean and Great Egg Harbor Bay, and is a popular resort during the summer months. Ocean City was incorporated as a borough in 1884, and was chartered as a city in 1897.
OCEAN GROVE, a summer resort of Monmouth county, New Jersey, U.S.A., in the eastern part of the state, on the Atlantic coast, and 55 m. by rail S. of New York City. Pop. (1909), about 2,500. It is served by the Pennsylvania and the Central of New Jersey railways. It is noted as a religious and musical seaside resort, and in July and August, and especially in the last ten days of August, during its annual camp-meeting, is visited by thousands of people. Ocean Grove was founded in 1862 by the Ocean Grove Camp-Meeting Association of the Methodist Episcopal Church, as a place for religious worship, rest and recreation, free from all forms of questionable amusement, and is governed under a corporation charter, the corporation having power to place restrictions in all leases.

OCEANIA, or OCEANICA, a name used to cover all the islands of the Pacific Ocean (q.v.) which are included in the divisions of Polynesia, Micronesia, Melanesia, Australasia, &c.

OCEANUS (Gr. Ὢκεανός), in Greek mythology, the greatest of rivers and at the same time a divine personification. Never mingling with the sea which it encloses, according to Homer it has neither source nor mouth. On its surface east to west, dwell the "blameless Aethiopians" in perfect happiness, and beyond it on the west, in the realms of eternal night, the "Cimmerians," wrapped in fogs and darkness. Here are the grove of Persephone and the entrance of the underworld. Personified, Oceanus is in Hesiod (Theog. 133, 337-370) the son of Uranus and Gaea, the husband of Tethys, father of 3000 streams and 4000 ocean nymphs. In Homer he is the origin of all things, even the father of the gods, and the equal in rank of all of them save Zeus. This conception recurs in the theory of Thales, who made water the first principle of all things. The idea of Oceanus as a river flowing unceasingly round the earth, which was regarded as a flat circle, was of long continuance. Euripides was the first among the tragic poets to speak of it as a sea, but Herodotus before him ridiculed the notion of Oceanus as a river as an invention of the poets and described it as the great world sea. As the geographical knowledge of the Greeks extended, the name was applied to the outer sea (especially the Atlantic).

In art, Oceanus was represented as an old man of noble presence and benevolent expression, with the horns of an ox and sometimes cobra's claws on his head. His attributes are a pitcher, cornucopia ("horn of plenty"), rushes, marine animals and a sceptre. On the altar of Pergamum he is depicted taking part in the battle of the giants.

Homer, Ἰλιάδ, i. 423, xiv. 201, 245, xxi. 196; Odyssey, x. 508, xi. 13; Herodotus ii. 23, iv. 8; Euripides, Orestes, 1376; Caesar, Bell. Gall. iii. 7, iv. 10.

OCELLUS LUCANUS, a Pythagorean philosopher, born in Laodicea in the 5th century B.C., perhaps a pupil of Pythagoras himself. Stobaeus (Ed. Phys. i. 13) has preserved a fragment of his Ποίησις (if he was really the author) in the Doric dialect, but the only one of his alleged works which is extant is a short treatise in four chapters in the Ionic dialect generally known as On the Nature of the Universe. Excerpts from this are given in Stobaeus (i. 20), but in Doric. It is certainly not authentic, and cannot be dated earlier than the 1st century B.C. It maintains the doctrine that the universe is uncreated and eternal; that its three great divisions correspond the three kinds of beings — gods, men and demons; and, finally, that the human race with all its institutions (the family, marriage and the like) must be eternal. It advocates an ascetic mode of life, with a view to the perfect reproduction of the race and its training in all that is noble and beautiful.

Editions of the Ποίησις: Τοῦ Πυθαγόρας ἀδελφοῦ, by A. F. Rudolph (1801, with commentary), and by F. W. Mullich in Fragmenta philol. Graecorum, i. (1866); see also E. Zeller, History of Greek Philosophy, i. (Eng. trans.), and J. de Heyden-Zielewitz in Breitwarth philologische Abhandlungen, viii. 3 (1901). There is an English translation (1837) by Thomas Taylor, the Platonist.

OCELOT (Mexican Felis catus, literally field-jaguar, from Flacce, field, and ocellar, tiger, jaguar), an American member (Felis pardalis) of the family Felidae, ranging from Arkansas in the north to Paraguay. The species is subject to great racial variation. The fur has, however, a tawny yellow or reddish-grey ground colour, marked with black spots, aggregated in streaks and blotches, or in elongated rings enclosing areas rather darker than the general ground-colour. In the typical form the total length may reach 4 ft.; the average measurement of the head and body lies between 26 in. and 33 in., and of the tail between 11 in. and 15 in. The ocelot is essentially a forest cat, and a ready climber; its disposition is said to be fierce and bloodthirsty but in confinement it becomes tame and playful. In Asia the group is represented by the Tibetan Felis tigris.

OCHAKOV, a fortified town and port of Russia, in the government of Kherson, 42 m. E. of Odessa, on a cape of the Black Sea, at the entrance to the estuary of the Dnieper, and opposite to Kinburn. Pop. (1897), 10,784. Strong fortifications have been built at Ochakov and on the Kinburn promontory, to protect the entrance to the Dnieper. Ochakov stands close to the site of the old Miletan (Greek) colony of Olbia and the Greek colony of Alekterror. The fortress of Kara-kerman or Ozu-kaleh was built on this spot by the khan of the Crimea, Mengi Girai, in 1429. At a later date it became the centre of a Turkish province which included Khaji-derush (Ovidiopol), Khaji-bey (Odessa), and Dubossary, as well as some 150 villages.

Russia, regarding it as the main obstacle to the possession of the Black Sea littoral, besieged it in 1737, when it was captured by Marshal Municch, but in the following year it was abandoned, and in 1739 restored to Turkey. The second siege by Russia was begun in 1788, and lasted six months, until the fortress was stormed and taken, after a terrible loss of life. By the peace of 1792 it became Russian. In 1855 it was bombarded by the Anglo-French fleet, and after that the Russians demolished the fortifications.

OCHILTREE, a barony in the county of Ayr, Scotland, from which a title in the Scottish peerage was held in the 16th and 17th centuries by a branch of the house of Stewart. Sir Andrew Stewart (d. 1488), chancellor of Scotland, a great-grandson of the regent Albany (d. 1420), was created Baron Avendale or Avendale about 1457. This peerage became extinct at his death, but was revived about 1490 in favour of his nephew and heir Andrew Stewart, who, being killed at the battle of Flodden in 1513, was succeeded by his son Andrew, 2nd Baron Avendale of this creation; and the latter obtained an act of parliament in 1543 empowering him to exchange the title of Lord Avendale for that of Lord Ochiltree, or Lord Stewart of Ochiltree. His son, Andrew, 2nd Lord Ochiltree (d. c. 1600), was a zealous supporter of the lords of the congregation, and especially of John Knox, in the struggle against Mary queen of Scots, and was wounded at the battle of Langside while fighting against the queen. Of his five sons, William was slain by the earl of
Bothwell in 1585, and James, created earl of Arran in 1587, was the father of Sir James Stewart of Killeith who became 4th Lord Ochiltrie in 1615; his daughter Margaret was the second wife of John Knox. His brother Henry Stewart married Margaret Tudor, widow of James IV. of Scotland, and was created Baron Methven by James V. in 1528; and another brother, Sir James Stewart of Beath, was ancestor of the Stewart earls of Moray. His other son through his son James, who was created Lord Doune in 1581.

The second Lord Ochiltrie was succeeded in the peerage by his grandson Andrew, who resigned the title in 1615, and having been summoned by writ to the Irish House of Lords was created Baron Castle Stewart in the Irish peerage in 1610. The barony of Ochiltrie which he thus resigned was conferred in 1615 on his cousin Sir James Stewart of Killeith (see above), son of the earl of Arran; and on the death without issue of his son William, 5th Lord Ochiltrie, in 1675, the title became extinct. In 1774 Andrew Thomas Stewart successfully claimed the barony of Castle Stewart in the peerage of Ireland as heir male under the creation of 1610; but although he was permitted in 1790 to vote as Lord Ochiltrie in an election of Scottish representative peers, his claim to this barony as collateral heir of the grantee of 1615 was disallowed by the House of Lords in 1793.

OCHINO—OCHRIDA

OCHINO, BERNARDINO (1487–1562), Italian Reformer, was born at Siena in 1487. At an early age he entered the order of Observantine Friars, the strictest sect of the Franciscans, and rose to be its general, but, craving a yet stricter rule, transferred himself in 1533 to the newly founded order of Capuchins, of which in 1538 he was elected vicar-general. In 1539, urged by Bembo, he visited Venice and delivered a remarkable course of sermons, showing a decided tendency to the doctrine of justification by faith, which appears still more evidently in his Dialogi VII. published soon after. He was suspected and denounced, but nothing ensued until, at the instigation of the austere zealot Caraffa, the Inquisition was established at Rome, June 1542. Ochino was at once cited, but was deterred from presenting himself at Rome by the warnings of Peter Martyr and of Cardinal Caraffa, whom he found at Bologna, dying of poison administered by the reactionary party. After some hesitation he escaped across the Alps to Geneva. He was cordially received by Calvin, and within two years published six volumes of Prediche, tracts rather than sermons, explaining and vindicating his change of religion. Twenty-five of these were published in English at Ipswich in 1548. In 1545 he became minister of the Italian Protestant congregation at Augsburg, which he was compelled to forsake when, in January 1547, the city was occupied by the imperial forces in the Schmalkaldic War. Escaping by way of Strassburg he found an asylum in England, where he came across Dr. John Field who was on his way to the newly created order of Capuchins. Ochino received a pension from Edward VI.'s privy purse, and composed his chief work, A Trajedy or Dialogue of the unjust usurped Primacy of the Bishop of Rome (1549). This remarkable performance, originally written in Latin, is extant only in the translation of John Ponet, bishop of Winchester, a splendid specimen of nervous English. The conception is highly dramatic; the form is that of a series of dialogues. Lucifer, enraged at the spread of Christ's kingdom, conquers the fiends in council, and resolves to set up the pope as Antichrist. The stage is set, and the drama proceeds. With the concurrence of the pope's assumption of spiritual authority; the other churches are intimidated into acquiescence; Lucifer's projects seem fully accomplished, when Heaven raises up Henry VIII. and his son for their overthrow. The conception bears a remarkable resemblance to that of Paradise Lost; and it is almost certain that Milton, whose sympathies with the Italian Reformation were so strong, must have been acquainted with it, and with some of his later works. In the Labryinth (dedicated to Queen Elizabeth of England), a discussion of the freedom of will, the covertly assailed the Calvinistic doctrine of predestination, and showed that his views were tinged with Socinianism.

The accession of Mary in 1553 drove him from England, and he became pastor of the Italian congregation at Zürich. In 1563 the long-gathering storm of obloquy burst upon the occasion of the publication of his Thirty Dialogues, in one of which his adversaries maintained that he had justified polygamy under colour of a pretended refutation. His dialogues on divorce and the Trinity were also obnoxious. Ochino was banished from Zürich, and, after being refused a shelter by other Protestant cities, directed his steps towards Poland, at that time the most tolerant state in Europe. He had not resided there long when the edict of the 6th of August 1564 banished all foreign dissenters. Flying from the country, he encountered the plague at Pinscof; three of his four children were carried off; and he himself, worn out by age and misfortune, died in solitude and obscurity at Schlakau in Moravia, about the end of 1564. His reputation among Protestants was at the time so bad that he was charged with the authorship of the treatise De tribus impostoribus, as well as with having carried his alleged approval of polygamy into practice. It was reserved for Dr Benrath to justify him, and to represent him as a fervent evangelist and at the same time as a speculative thinker with a passion for free inquiry. The general tendency of his mind ran counter to tradition, and he is remarkable as resuming in his individual history all the phases of Protestant theology from Luther to Socinus.

See Life by B. O. Benrath (2nd ed., Brunswick, 1802), translated into English by Helen Zimmern (London, 1876). In addition to the books already named, he wrote Italian translations of Romans (Geneva, 1545) and Galatians (Augsburg, 1546).

OCHRES, a class of pigments varying in colour from yellow to red, and consisting mainly of hydrated iron oxide. The Yellow Ochres are native earths coloured with hydrated ferric oxide, the brownish yellow substance that colours, and is deposited from, highly ferruginous water. These ochres are of two kinds—one having an argillaceous basis, while the other is a calcareous earth, the argillaceous variety being in general the richer and more pure in colour of the two. Both kinds are widely distributed, fine qualities being found in Oxfordshire, the Isle of Wight, near Jersey and Nuremberg in Germany, and in France in the departments of Yonne, Cher and Nièvre. The original colour of these ochres can be modified and varied into browns and reds of more or less intensity by calcination. The nature of the associated earth also influences the colour assumed by an ochre under calcination, aluminous ochres developing red and violet tints, while the calcareous varieties take brownish-red and dark-brown hues. The well-known ochre Terra di Siena which in its raw state is a dull-coloured ochre, becomes when burnt a fine warm mahogany brown hue highly valued for artistic purposes. Yellow ochres are also artificially prepared—Mars Yellow being made from the hydrated ferric oxide of an indigenous earth, mixed with a substance with an argillaceous or calcareous earth, and such compounds by careful calcination can be transformed into Mars Orange, Violet or Red, all highly important, stable and reliable pigments.

OCHRIDA (also written OCHIRDA and ACHRIDA; Turkish, Ochri), a city of Albania, European Turkey, in the vilayet of Monastir; on the north-eastern shore of Lake Ochrida, and at the eastern end of the Roman Via Egnatia. Pop. (1905) about 11,000, including Albanians, Turks, Greeks and Slavs. Ochrida occupies the site of the ancient Lychnidos, which was added to the Macedonian empire by Philip II. (382–336 B.C.), and destroyed by the Bulgarians in A.D. 561. It is the seat of Bulgarian and Greek bishops. From the creation of the Bulgarian patriarchate of Ochrida in 893 to its abolition in 1767 the city was the ecclesiastical headquarters of the Bulgarians in the west of the Balkan Peninsula. Lake Ochrida is 2560 ft. above sea-level, in a mountainous limestone region of Karst formation. It measures 107 sq. m., and has a maximum depth of 35 ft. Its waters are supplied by subterranean streams. Its chief outlet is the river Black Drin, on the north.
OCHSENFURT, a town of Germany, in the kingdom of Bavaria, situated on the left bank of the Main, here crossed by a stone bridge, 13 m. S. from Würzburg by the railway to Munich, and at the junction of a line to Röttingen. Pop. (1905) 3333.

It contains an Evangelical and five Roman Catholic churches, among them that on the site of the ancient sacred grove. There is a considerable trade in wine and agricultural produce, other industries being brewing and malting.

OCHELTROY, SIR DAVID, Bart. (1758-1825), British general, was born at Boston, Mass., U.S.A., on the 12th of February 1758, and went to India as a cadet in 1777. He served under Lord Lake in the battles of Koli, Aligarh and Delhi, and was appointed resident at Delhi in 1803. In 1804, having been promoted to the rank of major-general, he defended the city with a very inadequate force against an attack by Holkar of the Ghat Pass. He then took the command of one of four converging columns, and his services were rewarded with a baronetcy in 1815. Subsequently he was promoted to the command of the main force in its advance on Kanmanadu, and was detached to the Gurkhas by a flank march at the Ghat Pass, bringing the war to a successful conclusion and obtaining the signature of the treaty of Seguah (1810), which dictated the subsequent relations of the British with Nepal. For this success Ochterlony was created G.C.B., the first time that honour had been conferred on an officer of the Indian army. The family removed to London, and in 1818 he was created a baronetcy, and took the surname of Ochterlony. In 1819 he was appointed resident in Rajputana in 1818, with which the residency in Delhi was subsequently combined. When Durjan Sal revolted in 1825 against Balwant Singh, the infant Raja of Bharatpur, Ochterlony acting on his own responsibility supported the raja by proclamation and ordered out a force to support him. Lord Amherst, however, repudiated these proceedings. Ochterlony, who was bitterly chagrined at this refusal, resigned his office, and retired to Delhi. The feeling that the confidence which his length of service merited had not been given him by the government is said to have accelerated his death, which occurred at Meerut on the 15th of July 1825. The Ochterlony column at Calcutta commemorates his name.

OCHTMAN, LEONARD (1854—__), American painter, was born in Zonnermaine, Zeeland, Holland, on the 31st of October 1854. In 1879 he moved to New York, which he visited in 1882. In 1882 he began to exhibit landscapes at the National Academy, and he became a National Academician in 1904. His most characteristic pictures, which recall the work of Inness, are scenes on Long Island Sound and on the Minus river.

OCKLEY, SIMON (1678-1720), English orientalist, was born at Exeter in 1678. He was educated at Queen's College, Cambridge, became fellow of Jesus College and vicar of Swavesey, and in 1711 was made professor of Arabic at Cambridge. He had a large share in the publication of the Index Librorum Prohibitorum. In 1712 he was naturalized, and in 1713 was returned to Parliament for the constituency of the University of Cambridge. In 1720 he was re-elected, but did not attend. He was appointed to be custodian of the college, and in 1721 he was created a fellow of the college.

Ockley maintained that a knowledge of Oriental literature was essential to the proper study of theology, and in the preface to his first book, the Introductio ad linguas orientales (1706), he urges the importance of the study. In 1707 he published a translation of Leon Modena's History of the Present Jews throughout the World; and in 1708 The Improvement of the Hebrew Reader, a work which made an impression on Zend, who translated it into Persian. His chief work is The History of the Saracens (1708-1718), of which a third volume was published posthumously in 1757. Unfortunately Ockley took as his main authority a MS. in the Bodleian of the pseudo-Wakid's Fatsh Al-Sham, which is rather historical romance than history. He also translated from the Arabic the Second Book of Esdras and the Sentences of Ali. Ockley died at Swavesey on the 9th of August 1720.

O'CLERY, MICHAEL (1755-1843), Irish chronicler, grandson of a chief of the sept of O'Clery in Donegal, was born at Kilbarrow on Donegal Bay, and was baptised Tadhg (or "poet"), but took the name of Michael. He became a Franciscan friar. He was a cousin of Loughaidh O'Clery (fl. 1501-1630), who, with his son Caoghrigh O'Clery (d. 1664)—one of Michael's co-workers—is also famous as an Irish historian. He had already gained a reputation as an antiquary and student of Irish history and literature, when he entered the Irish College at St Anthony at Louvain. In 1620, through the initiative of Hugh Boy Macanward (1586-1633), warden of the college, and himself a famous Irish historian and poet, and one of an old family of hereditary bards In Tyrconnell, he began to collect and transcribe, a strong dislike of everything he could and historical importance; he was assisted by other Irish scholars, and the result were the Reim Riosghroidhe (Royal List) in 1630, Leobhar Gabhala (Book of Invasions) in 1631, and his most famous work, called by John Colgan (d. 1659), the Irish biographer, the "Annals of the Four Masters" (1636). Subsequently he made his Martyrologium of Irish saints, based on various ancient manuscripts, an Irish glossary and other works. He lived in poverty, and died at Louvain.

O'CONNEL, DANIEL (1775-1847), Irish statesman, known as the "Liberator," was born on the 6th of August 1775 near Cahirciveen, a small town in Kerry. He was one of a race the heads of which had been Celtic chiefs, had lost their lands in the wars of Ireland, and had felt the full weight of the harsh penal code which long held the Catholic Irish down. His ancestors in the 18th century had sent recruits to the famous brigade of Irish exiles in the service of France, and those who remained at home either lived as tenants on the possessions of which they had once been lords, or gradually made money by smuggling, a very general calling in that wild region. Thus he inherited from his earliest years, with certain traditions of birth and the high station, a British arple in Ireland and of the dominant owners of the soil, a firm attachment to his proscribed faith, and habitual skill in evading the law; and these influences may be traced in his subsequent career. While a boy he was adopted by his uncle, Maurice O'Connell of Derrynane, and sent to a school at Queenstown, one of the first which the state in those days allowed to be opened for Catholic teaching; and a few years afterwards he became a student, as was customary with Irish youths of his class, in the English colleges of St Omer and Douai in France. These years in France had a decided effect on the character of Michael, and to the very highest eminence among contemporary lawyers and advocates. This position was in the main due to a dexterity in conducting causes, and especially in examining witnesses, in which he had no rival at the Irish bar. He was, however, a thorough lawyer besides, inferior in scientific learning to two or three of his most conspicuous rivals, but well read in every department of law, and especially a master in all that relates to criminal and constitutional jurisprudence. As an advocate, too, he stood in the very highest rank; in mere oratory he was surpassed by Plunket, and in rhetorical gifts by Burke, the only 1See the account of O'Connell's uncle, Count Daniel O'Connell (1745-1833), to whose property he fell heir, in Mrs O'Connell's Life of the Irish Orator (1825), and of O'Callaghan's Irish Brigade in the Service of France (1820).
speakers to be named with him in his best days at the Irish bar; but his style, if not of the most perfect kind, and often disfigured by decided faults, was marked by a peculiar subtilty and manly power, and produced great and striking effects. On the whole, in the art of winning over juries he had scarcely an equal in the law courts.

To understand, however, O'Connell's greatness we must look to the field of Irish politics. From early manhood he had turned his mind to the condition of Ireland and the mass of her people. The worst severities of the penal code had been, in a certain measure, relaxed, but the Catholics were still in a state of vassalage, and they were still pariahs compared with the Protestants. The rebellion of 1798 and the union had dashed the hopes of the Catholic leaders, and their prospects of success seemed very remote when, in the first years of the 19th century, the still unknown lawyer took up their cause. Up to this juncture the question had been in the hands of Grattan and other Protestants, and of a small knot of Catholic nobles and prelates; but their efforts had not accomplished much, and they aimed only at a kind of compromise, which, while conceding their principal claims, would have placed their church in subjection to the state. O'Connell inaugurated a different policy, and had soon (though without the Catholic movement an energy it had not before possessed. Himself a Roman Catholic of birth and genius, unfairly kept back in the race of life, he devoted his heart and soul to the cause, and his character and antecedents made him the champion who ultimately assured its triumph. He formed the bold design of combining the Irish Catholics millions, under the leadership of the Protestant Irish, by a government avowedly hostile to the last, and of wresting the concession of the Catholic claims from every opposing party in the state by an agitation, continually kept up, and embracing almost the whole of the people, but maintained within constitutional limits, though menacing and shaking the frame of society. He gradually succeeded in carrying out his purpose: the Catholic Association, at first small, but slowly assuming larger proportions, was formed; attempts of the government and of the local authorities to put its branches down were skilfully baffled by legal devices of many kinds; and at last, after a conflict of years, all Catholic Ireland was arrayed to a man in an organization of enormous power, that demanded its rights with no uncertain voice. O'Connell, having long before attained an undisputed and easy ascendancy, stood at the head of this great national movement; but it will be observed that, having been controlled from first to last by himself and the priesthood, it had little in common with the mob rule and violence which he had never ceased to regard with aversion. His election for Clare in 1828 proved the forerunner of the inevitable change, and the Catholic claims were granted the next year, to the intense regret of the Protestant Irish, by a government avowedly hostile to the last, but unable to withstand the overwhelming pressure of a people united to insist on justice. The result, unquestionably, was almost wholly due to the energy and genius of a single man, though the Catholic question would have been settled, in all probability, in the course of time; and it must be added that O'Connell's triumph, which showed what agitation could effect in Ireland, was far from doing his country unmixed good.

O'Connell joined the Whigs on entering parliament, and gave effective aid to the cause of reform. The agitation, however, on the Catholic question had quickened the sense of the wrongs of Ireland, and the Irish Catholics were engaged ere long in a crusade against tithes and the established church, the most offensive symbols of their inferiority in the state. It may be questioned whether O'Connell was not rather led than a leader in this; the movement, at least, passed beyond his control, and the country for many months was terrorized by scenes of appalling crime and bloodshed. Lord Grey, very properly, proposed measures of repression to put this anarchy down, and O'Connell opposed them with extreme vehemence, a seeming departure from his avowed principles but natural in the case of a popular tribune. This caused a breach between him and the Whigs; but he gradually returned to his allegiance to them when they practically abolished Irish tithes, cut down the revenues of the established church and endeavoured to secularize the surplus. By this time O'Connell had attained a position of great eminence in the House of Commons: as a debater he stood in the very first rank, though he had entered St Stephen's after fifty; and his oratory, massive and strong in argument, although too often scurrilous and coarse, and marred by a strong undercurrent of vindictiveness, was strangely blended, made a powerful impression, if not a pleasing, impression. O'Connell steadily supported Lord Melbourne's government, gave it valuable aid in its general measures, and repeatedly expressed his cordial approval of its policy in advancing Irish Catholics to places of trust and power in the state, though personally he refused a high judicial office. Though a strict adherent of the creed of Rome, he was a Liberal, nay a Radical, as regards measures for the vindication of human liberty, and he sincerely advocated the rights of conscience, the emancipation of the slave and freedom of trade. But his rooted aversion to the democratic theories imported from France, which were gradually winning their way into England, only grew stronger with advancing age. His conservatism was most apparent in his antipathy to socialist doctrines and his tenacious regard for the claims of property. He actually opposed the Irish Poor Law, as encouraging a communistic spirit; he declared a movement against rent a crime; and, though he had a strong sympathy with the Irish peasant, and advocated a reform of his precarious tenure, it is difficult to imagine that he could have approved the cardinal principle of the Irish Land Act of 1881, the judicial adjudication of rents. But he succeeded O'Connell in his country was incompatible with good government, and he began an agitation for the repeal of the union. One of his motives in taking this course was a strong personal dislike of Peel, with whom he had often been in collision, and who had singled him out in 1829 for what must be called a marked affront. O'Connell, nevertheless, was sincere and even consistent in his conduct; he had denounced the union in early manhood as an obstacle to the Catholic cause; he had spoken against the measure in parliament; he believed that the claims of Ireland were set aside or slighted in what he deemed an alien assembly; and, though he had ceased for some years to demand repeal, and regarded it as rather a means than an end, he was throughout life an avowed repealer. It should be observed, however, that in his judgment the repeal of the union would not weaken the real bond between Great Britain and Ireland; and he had nothing in common with the revolutionists who, at a later period, openly declared for the separation of the two countries by physical force. The organization meetings were held for the next ten years, in 1829-1839, were recreated for the new project. Enormous meetings, convened by the priesthood, and directed or controlled by O'Connell, assembled in 1842-1843, and probably nine-tenths of the Irish Catholics were unanimous in the cry for repeal. O'Connell seems to have thought success certain; but he had not perceived the essential difference between his earlier agitation and this. The enlightened opinion of the three kingdoms for the most part approved the Catholic claims, and as certainly condemned repeal. After some hesitation Peel resolved to put down the repeal movement. A vast intended meeting was proclaimed for September; and in October 1843 O'Connell was arrested and held to bail, with ten or twelve of his principal followers. He was convicted (February 1844) after the trials that followed, but they were not good specimens of equal justice, and the sentence of imprisonment for a year and a fine of £2000 was reversed on a writ of error by the House of Lords (September 1844), and he and his colleagues were again free. The spell, however, of O'Connell's power had vanished; his health had suffered much from a short confinement; he was verging upon his seventieth year; and he was alarmed and pained by the growth of a party in the repeal ranks who scoffed at his views, and advocated the revolutionary doctrines which he had always feared and abhorred. Before long famine had fallen on the
land, and under this visitation the repeal movement, already paralysed, wholly collapsed. O'Connell died on the 25th of May 1847, at Genoa, whilst on his way to Rome. His body was brought back to Dublin and buried in Glasnevin cemetery.

O'Connell was a remarkable man in every sense of the word, of splendid physique, and with all the attractions of a popular leader. Catholic Ireland calls him her "Liberator" still; and history will say of him that, with some failings, he had many and great gifts, that he was an orator of a high order, and that, agitator as he was, he possessed the wisdom, the caution and the tact of a real statesman. Nevertheless he not only failed to accomplish the chief aim of his life, but Lecky trenchantly observes that "by a singular fatality the great advocate of repeal did more than any one else to make the Union a necessity. . . . He destroyed the sympathy between the people and their natural leaders; and he threw the former into the hands of men who have subordinated all national to ecclesiastical considerations, or into the hands of reckless, ignorant, and dishonest advertisers." O'Connell married in 1802 his cousin Mary O'Connell, by whom he had three daughters and four sons, Maurice, Morgan, John (1820–1858), known as the "Young Liberator," and Daniel, who all sat in parliament.

O'CONNOR, FEARGUS EDWARD (1794–1855), Chartist leader, was a son of the Irish National patriot, Denis O'Connell (1762–1854), and nephew of Arthur O'Connell (1763–1852), who was the agent in France for Emmet's rebellion; both belonged to the "United Irishmen." He entered parliament as member for the county of Cork in 1832. Though a zealous supporter of repeal, he endeavoured to supplant O'Connell as the leader of the party, an attempt which aroused against him the popular antipathy of the Irish. In 1835 he was unseated on petition, and after standing unsuccessfully for Oldham he took to stumping England in favour of the new Radical doctrines of the day, and the use of physical force for their adoption. In 1837 he established the Northern Star newspaper at Leeds, and became a vehement advocate of the Chartist movement. He was imprisoned for seditious libel in 1840, and after his release became prominent for his attack on John Bright, and the anti-corn-law league. In 1847 he was returned for Nottingham, and in 1848 he presided at a Chartist demonstration on Kennington Common, which caused great alarm (see CHARTISM). But the projected march on Westminster fizzled out when the preparations made to receive it became known. The eccentricity which had characterized his opinions from the beginning of his career gradually became more marked until they developed into insanity. He began to conduct himself in a disorderly manner in the House of Commons, and in 1852 he was found to be of unsound mind by a commission of lunacy. He died at London on the 30th of August 1855, and was buried in Kensal Green cemetery.

OCONOMOWOC, a city of Waukesha county, Wisconsin, U.S.A., about 33 m. W. of Milwaukee. Pop. (1850) 2729; (1900) 2880; (1905) 3013; (1910) 3064. It is served by the Chicago, Milwaukee & St Paul railway and by an electric railway connecting with Milwaukee. O'Connell, who in 1802 emigrated from Roscommon county, Ireland, to New York, where he devoted himself chiefly to journalism. The son studied law, was admitted to the bar in 1824, and soon won high reputation in his profession. He was United States district attorney for New York in 1853–1854. In politics an extreme States'-Rights Democrat, he opposed the coercion of the South, and after the Civil War became senior counsel for Jefferson Davis on his indictment for treason, and was one of his bondsmen; these facts and O'Conor's connexion with the Roman Catholic Church affected unfavourably his political fortunes. In 1872 he was nominated for the presidency by the "Bourbon" Democrats, who refused to support Horace Greeley, and by the "Labour Reformers"; he declined the nomination but received 21,550 votes. He took a prominent part in the prosecution of William M. Tweed and members of the "Tweed Ring," and published Peculation Triumphant, Being the Record of a Five Years' Campaign against Official Malversation, A.D. 1871–1875 (1875). He removed to Nantucket, Massachusetts, in 1881, and died there on the 17th of May 1884.

OCTAVE, a city and the county seat of Oconto county, Wisconsin, U.S.A., about 130 m. N. of Milwaukee, on the W. shore of Green Bay, at the mouth of the Oconto river. Pop. (1890) 5219; (1900) 5646, of whom 1544 were foreign-born; (1905) 5722; (1910) 6029. It is served by the Chicago & North-Western and the Chicago, Milwaukee & St Paul railways. The city lies in a good farming country, and has a considerable commerce in lumber and fish. The first settlement was made here in 1846, and Oconto was chartered as a city in 1882.

OCTAVE, Raymundus, (from Lat. octas, eighth, octo, eight), a period or series of eight members. In ecclesiastical usage the octave is the eighth day after a particular church festival, the feast day itself and the "octave" being counted. The octave thus always falls on the same day of the week as the festival, and any event occurring during the period is said to be in the "octave." In music, an octave is the eighth full tone above or below any given note. It is produced by double or half the number of vibrations corresponding to the given note. In the interval between a note and its octave is contained the full scale, the octave of a note forming the starting-point of another scale of similar intervals to the first. The interval between a note and its octave is also called an octave. The name is also applied to an open metal stop in an organ, and to a flute (more usually known as the piccolo) one octave higher in pitch than the regular flute. It is also a term for a "parade" in fencing. The "law of octaves" was a term applied in 1865 to a relationship among the chemical elements enunciated by J. A. R. Newlands.

In literature an octave is a form of verse consisting of eight iambic lines, and complete in itself. From its use by the poets of Sicily, the recognized type of this form is usually called the Sicilian Octave. It is distinguished from a single stanza of oitana rima, in which the rhyme-arrangement is abababec, by having only two rhymes, arranged abababab. In German Hertz-tachische the October had been used not infrequently since 1525, when Ruckert published "Sichcityen," as they are called in German, for the first time. The word octave is also often used to describe
OCTAVIA, the name of two princesses of the Augustan house.

(1) Octavia, daughter of Gaius Octavius and sister of the emperor Augustus, was the wife of Gaius Marcellus, one of the bitterest enemies of Julius Caesar. In 41 B.C. her husband died, and she was married to Marcus Antonius, with the idea of bringing about a reconciliation between him and her brother. Her efforts were at first successful, but in 36 Antony left for the Parthian War and renewed his intrigue with Cleopatra. Though Octavia took out troops and money to him (35), he refused to see her and finally divorced her (32), but in so doing he butted his children, even those by Fulvia and Cleopatra. Her beauty and virtues are praised by all ancient authorities. By her first husband she was the mother of Marcus Marcellus (q.v.), who died in 23 B.C.

(2) OCTAVIA, daughter of the emperor Claudius, was the wife of Nero, by whom she was put to death. A Latin tragedy on her fate is attributed, though wrongly, to Seneca.

OCTAVO, a shortened form of Lat. in octavo, “in an eighth, i.e. of a sheet of paper, a term applied to a size of paper and to a size of a printed volume. Paper is in octavo when a whole single sheet is folded three times to form eight leaves; a book is technically said to be of such a size when made up of sheets folded three times (see Bibliography and Paper).

OCTOBER, the eighth month of the old Roman year, which began in March. In the Julian calendar, while retaining its old name, it became the tenth month, and had thirty-one days assigned to it. The mediterranea, when a libation of new wine was made in honour of Meditirna, were celebrated on the 11th, the faunalia on the 15th, and the equina, when the equus October was sacrificed to Mars in the Campus Martius, on the 15th. Several attempts were made to rename the month in honour of October, and in the reign of Domitian it was referred to as Germanicus, Antonius, Tacitus and Hercules, the latter a surname of Commodus. The Senate's attempt to christen it Faustinus in honour of Faustina, wife of Antoninus, was equally unsuccessful. The principal ecclesiastical feasts in October are those of St Luke on the 18th and of St Simon and St Jude on the 28th. By the Slavs it is called "yellow month," from the fading of the leaf; to the Anglo-Saxons it was known as Winter-fylicth, because at this full moon (fylicth) winter was supposed to begin.

OCTODON, the generic name for a small South American rodent or marsupial mammal (Octodon degus) locally known as the degu. It is the type of the family Octodontidae, the members of which—collectively termed oedodonts—are exclusively Central and South American. Several of them, such as Echimynys and Loncheres, are rat-like creatures with spiny or bristly fur (see Rodentia).

OCTOPUS (Gr. οκτώ, eight and πός, foot), the name, in scientific zoology belonging to a single genus of eight armed Cephalopoda (q.v.), one of whose distinguishing characters is that it has two rows of suckers on each arm. This true octopus occurs occasionally in the Baltic, but in the southern coast, but it is usually rare. It is more common on the southern coasts of Europe, including those of the Mediterranean. The usual species of Octopoda on the British south coast is Eledone cirrosa, which has only one row of suckers on each arm, and is a smaller animal. The celebrated account of the octopus given by Victor Hugo in his Travailleurs de la mer is not so fictitious as some critics with a knowledge of natural history have maintained. It is true that the great French author has made the mistake of using the name Cephaloptra, which belongs to a large tropical fish similar to a skate, instead of Cephalopoda, and that he applies the term devil-fish, which belongs to Cephaloptra, to the octopus. His description is exaggerated, imaginative and sensational; but it is correct in its most important particulars, and bears evidence that the author was to some extent personally acquainted with the animal and its habits, although he was not a scientific observer. The octopus feeds on crabs, and crabs feed on Carrion, and, therefore, there is nothing impossible in Hugo's account of the skeleton of a drowned man surrounded by the shells of numbers of crabs which the octopus had devoured. Whether an octopus would attack and kill a man is another question, but it certainly might seize him with its arms and suckers while holding to the rocks by other arms, and a man seized in this way when in the water might be in danger of being drowned.

The octopus and many of the Octopoda move about by means of their arms on the sea bottom, and are not free-swimming, though like other Cephalopods they can propel themselves on occasion backwards through the water by means of the funnel. Other Octopoda, however, are pelagic and free-swimming, and their habits are not confined to those forms which are provided with lateral fins. The Argonaut (see NAUTILUS) is one of the Octopoda. The separation of one of the arms of the male for purposes of reproduction is one of the most remarkable peculiarities of the Octopoda. It does not occur, however, in octopus nor in many other members of the group. One arm is always considerably modified in structure and employed in copulation, but it is only in three genera, one of which is Argonauta, that the arm spontaneously separates. The detached arm is found still alive and moving in the mantle cavity of the female, and when first discovered in these circumstances was naturally regarded as being the natural termination of the arm, but as the time was slowly revealed, it became evident that the numerous suckers of the detached arm, gave it the name Hectocotylus (hundred suckers). When the arm is not detached but only altered in structure it is said to be hectocotylized. In Octopus and Eledone it is the third right arm which is hectocotylized. The extremity of this arm is expanded and assumes the shape of a spoon. Whether detached or not the modified arm possesses a cavity into which the spermatophores are passed and the arm serves to convey them to the mantle cavity of the female.

It has been mentioned above that the true octopus (Octopus vulgaris) is usually rare on the English coast. In 1899 and 1900, however, they became so abundant on the south coast as to attract general notice, and to constitute a veritable plague which threatened complete ruin to the shell-fish fisheries. This visitation and its effects were described by W. Garstang in the Journal of the Marine Biological Association. The abnormal abundance occurred all along the west coast of France, whence it extended to the Channel, and was probably due to a succession of unusually warm summers and mild winters, beginning with the warm spring and hot summer of 1893. In the following 1894 and 1895 years the South Foreland entered the lobster pots of the fishermen and devoured or killed the crabs and lobsters captured. The pots when hauled contained usually only living octopuses and the mutilated remains of their victims. One fisherman took in a single week 64 specimens of octopus and only 15 living uninjured lobsters. The octopus also almost exterminated the swimming crabs (Portunus) in Plymouth Sound, and in the tanks of the Plymouth aquarium attacked and devoured all the specimens of its smaller relative Eledone cirrosa.

With regard to the size which the octopus may attain, the dimensions of the body are not usually given in records, but it is stated that the arms in the largest specimens measured 3 ½ ft., and in numerous cases were 3 ft. in length. This would enable the eight arms to extend over a circle 6 ft. in diameter, but the globular body is not more than about a third of the length of an arm in diameter. When not in pursuit of prey the octopus hides itself in a hole between rocks and covers itself with stones and shells. Like its victims it seems to be active chiefly at night and to remain in its nest during the day.

(Octopus vulgaris), (Octopus vulgaris), or Ocloron (from Lat. ocloro, eight, formed on the example of quadron), the offspring of a quadron and a white; a person having one-eighth negro blood. In rare instances such persons are called tercereons, as being third in descent from a negro ancestor. Occasionally persons are called octoceans.

Gr. ὀκτώς, eight, and σῖκλος, a column), in architecture, a portico of eight columns in front (see Temple).

OCTROI (O. Fr. octroir, to grant, authorize; Lat. auctor,)
a local tax collected on various articles brought into a district for consumption. Octroi taxes have a respectable antiquity, being known in Roman times as vectigalia. These vectigalia were either the portorium, a tax on the entry from or departure to the provinces (those cities which were allowed to levy the portorium shared the profits with the public treasurer); the artorium, a local tax levied at the entrance to towns; or the edulis, sale imports levied in markets. Vectigalia were levied on wine and certain articles of food, but it was seldom that the cities were allowed to use the whole of the profits of the taxes. Vectigalia were introduced into Gaul by the Romans, and remained after the invasion by the Franks, under the name of tonnicus and coutumes. They were usually levied by the owners of seigniories. But during the 12th and 13th centuries, when the towns succeeded in asserting their independence, they at the same time obtained the recognition of the royal authority; and these local taxes were allowed to have control of it. The royal power, however, gradually asserted itself, and it became the rule that permission to levy local taxes should be obtained from the king. From the 14th century onwards, we find numerous charters granting (octroir) to French towns the right to tax themselves. The taxes did not remain strictly municipal, for an ordinance of Cardinal Mazarin (in 1647) ordered the proceeds of the octrois to be paid into the public treasury, and at other times the government claimed a certain percentage of the product, but this practice was finally abandoned in 1852. From an early time the octroi was farmed out to associations or private individuals, and so great were the abuses which arose from the system that the octroi was abolished during the Revolution. But such a drastic measure meant the stoppage of all municipal activities, and in 1798 Paris was allowed to re-establish its octroi. Other cities were allowed gradually to follow suit, and in 1809 a law was passed laying down the basis on which octrois might be established. Other laws have been passed from time to time in France dealing with the octroi, especially those of 1816, 1824, 1867, 1871, 1884 and 1897. By the law of 1897 octroi duties are allowed to be levied on: (1) estables; (2) fuel; (4) forage; (5) building materials. A scale of rates was fixed, graduated according to the population, and farming out was strictly regulated. A law of 1816 enacted that an octroi could only be established at the wish of a municipal council, and that only articles destined for local consumption could be taxed. The law of 1852 abolished the 10% of the gross receipts paid to the treasury. Certain indispensable commodities are allowed to enter free, such as grain, flour, fruit, vegetables and fish.

French octroi duties are collected either by the (1) régie simple, i.e. by special officers under the direction of the mayor; (2) by the bail à forme, i.e. farming, the contractor paying yearly a certain agreed upon sum calculated on the estimated amount; (3) the régie intéressé, a variation of the preceding method, the contractor sharing the profits with the municipality when they reach a given sum; and (4) the abonnement avec la régie des contributions indirectes, under which a department of the treasury undertakes to collect the duties. More than half the octrois are collected under (1), and the numbers tend to increase; (2) is steadily decreasing, on (3) has been practically abandoned; (4) tends to increasing. The net receipts in 1897 amounted to £11,132,870. A law of 1897 created new sources of taxation, giving the power of the (1) new duties on alcohol; (2) a municipal licence duty on retailers of beverages; (3) a special tax on wine in bottle; (4) direct taxes on horses and carriages, clubs, billiard tables and dogs; (5) additional centimes to direct taxes.

From time to time there has been agitation in France for the abolition of octrois duties, but it has never been pushed very earnestly. In 1869 a commission was appointed to consider the matter, and reported in favour of their retention. In Belgium, on the other hand, they were abolished in 1870, being replaced by an increase in customs and excise duties; and in 1903 those in Egypt were also abolished. Octroi duties exist in Italy, Spain, Portugal and in some of the towns of Austria.

Hourcade, Manuel encyclopédique des contributions indirectes et des octrois (Paris, 1905); much useful material from some of the foregoing will be found in Report on the French Octroi System, by Consul-general Hearne (British Diplomatic and Consular Reports, 1906); the abolition of the Belgian octrois produced a voluminous official report: Abolition des octrois communaux en Belgique: discussion et discours prononcés. (T. A. L.)

O'CURY, EUGENE (1815–1864), Irish scholar, was born at Dunvana, county Clare, in 1796, the son of a farmer who was man of unusual intelligence. After being employed for some time in the topographical and historical section of the Irish ordinance survey, O'Curry earned his living by translating and copying Irish manuscripts. The catalogue of Irish manuscripts in the British Museum was compiled by him. On the founding of the Roman Catholic University of Ireland (1854) he was appointed professor of Irish history and archaeology. His lectures were published by the university in 1860, and give a better knowledge of Irish medieval literature than can be obtained from any other one. It may be noted here that these other materials have developed posthumously, under the title On the Manners and Customs of the Ancient Irish (1873). His voluminous transcripts, notably eight huge volumes of ancient Irish law, testify to his unremitting industry. The Celtic Society, of the council of which he was a member, published two of his translations of medieval tales. He died in Dublin in 1862.

OCYDROME, a word formed from Ocydromus, meaning "swift-runner," and suggested by J. Wagler in 1830 as a generic term for the New Zealand bird called in the then unpublished work of J. R. Forster, "the Wood-hen," and designated in 1878 by S. G. Gmelin, who knew of it through J. Latham's English description. Wagler's suggestion has since been generally adopted, and the genus Ocydromus is accepted by most ornithologists as a valid group of Ratilidae; but the number of species it contains is admittedly doubtful, owing to the variability in size and plumage which they exhibit, and their correct nomenclature must for the present be considered uncertain. Sir W. Buller in his Birds of New Zealand identifies the "Wood-hen," observed in great abundance on the shores of Dusky Bay in 1773 by Cook and his companions on his second voyage, with the Ocydromus described and figured by Dunstan and accordingly calls it O. fuscus; but it cannot be questioned that the species from this locality—which appears to have a somewhat limited range in the Middle Island, and never to have met with fresh from the sea-coast, where it lives wholly on crustedans and other marine animals—is identical with that of the older authors just mentioned. In 1786 Sparrman, who had also been of Cook's company, figured and described as Ratilus australis a bird which, though said by him to be that of the southern coast of New Zealand, differs so much from the R. fuscus as to cast doubt on the validity of the name. Indeed his species has generally been identified with the common "Weka" of the Maories of the Middle Island, which can scarcely be the case if his statement is absolutely true, since the latter does not appear to reach so far to the southward, or to affect the seashore. It may therefore be fairly inferred that his subject was obtained from some other locality. The North Island of New Zealand has what is allowed to be a third species, to which the name of Ocydromus carrii is attached, and this was formerly very plentiful; but its numbers have rapidly decreased, and there is every chance of its soon being as extinct as is the species which tenanted Norfolk Island on its discovery by Cook in 1774.

1 It also occurs in Stewart Island, and singularly enough on the more distant group known as the Snares. The Gallirallus brevipes of Lafresnaye, of which the typical (and unique) species from an unknown locality is in the Caen Museum, has also been referred to this species, but the propriety of the act may be doubted.
and which was doubtless distinct from all the rest, though no specimen of it is known to exist in any museum. 1 Another species, O. sylvistris, smaller and lighter in colour than any of the rest, was found in 1869 to linger yet in Lord Howe's Island (Proc. Zool. Society, 1869, p. 473, pl. xxxiv.). Somewhat differing from Ocydromus, but apparently very nearly allied to it, is a little bird peculiar, it is believed, to the Chatham Islands (Ibis, 1872, p. 247), and regarded by Captain Hutton as the type of a new Cuban species, name of C. modestus, while other naturalists consider it to be the young of the rare Rallus diefenbachii. So far the distribution of the Ocydromine form is wholly in accordance with that of most others characteristic of the New Zealand sub-region; but a curious exception is asserted to have been found in the Gallirallus lafresnayi of New Caledonia, which, though presenting some structural differences, has been referred to the genus Ocydromus.

The chief interest attaching to the Ocydromes is their inability to fly in flight the wings with which they are furnished, and hence the extreme improbability of the formation of "wholly extinct in a short time. Of this inability there are other instances among the Rallidae (see Moor-Hen); but here we have coupled with it the curious fact that in the skeleton the angle which the scapula makes with the coracoid is greater than a right angle, a peculiarity shared only, so far as is known, among the Carinatae by the dodo. The Ocydromes are birds of dull plumage, and mostly of retiring habits, though the common species is said to show great boldness towards man, and, from the accounts of Cook and the younger Forster, the birds seen by them displayed little fear. They are extremely destructive to eggs and to any other birds they can master.

ODAENATHUS, or Odenatus (Gr. ὁ ὀδανᾶτος, Palm, τὸν = “little ear”), the Latinized form of Odaenathus, the name of a famous prince of Palmyra, in the second half of the 3rd century A.D., who succeeded in recovering the Roman East from the Persians and restoring it to the Empire. He belonged to the leading family of Palmyra, which bore, in token of Roman citizenship, the gentilicium of Septimius; hence his full name was Septimius Odaenathus (Vogüé, Syrie centrale, Nos. 23, 28 = Cooke, North-Semitic Insers. Nos. 126, 130). It is practically certain that he was the son of Septimius Haron, the “senator” and chief of Tadmor, 2 the son of Septimius Odaenath “the senator” (N.S.I. p. 285). The year when he became chief of Palmyra is not known, but already in an inscription dated A.D. 258 he is styled “the illustrious consul our lord” (N.S.I. No. 126). He possessed the characteristic vigour and astuteness of the old Arab stock from which he sprang; and in his wife, the renowned Zenobia (q.v.), he found an able supporter of his policy. The defeat and captivity of the emperor Valerian (A.D. 260) left the eastern provinces largely at the mercy of the Persians; the prospect of Persian supremacy was not one which Palmyra or its prince had any reason to desire. At first, it seems, Odaenath attempted to propitiate the Parthian monarch Shāpūr (Sapor) I.; but when his gifts were contemptuously rejected (Petr. Patricius, § 10) he decided to throw in his lot with the cause of Rome. The neutrality which had made Palmyra’s fortune was abandoned for an active military policy which, while it added to Odaenath’s fame, in a short time brought his native city to its ruin. He fell upon the victorious Persians returning home after the sack of Antioch, and before they could cross the Euphrates inflicted upon them a considerable defeat. Then, while two pinnacled emperors were pitted in the East (A.D. 261), Odaenath took the side of Gallienus the son and successor of Valerian, attacked and put to death the usurper Quietus at Eumes (Homs), and was rewarded for his loyalty by the grant of an exceptional position (A.D. 262). He may have assumed the title of king before; but he now became “tutus Orientis imperator,” not indeed joint-ruler, nor Augustus, but “independent lieutenant of the emperor for the East” (Mommsen, Provinces, ii. p. 103). 3 In a series of rapid and successful campaigns, during which he left Palmyra under the charge of Septimius Worod his deputy (N.S.I. Nos. 127-129), he crossed the Euphrates and relieved Edessa, recovered Nisibis and Carrhae, and even took the offensive against the power of Persia, and twice invested Ctesiphon itself, the capital; probably also he brought back Armenia into the Empire. These brilliant successes restored the Roman rule in the East; and Gallienus did not disdain to hold a triumph with the captives and trophies which Odaenath had won (A.D. 264). While observing all due formalities towards his sovereign, there can be little doubt that Odaenath aimed at independent empire; but during his lifetime no breach with Rome occurred. He was about to start for Cappadocia against the Goths when he was assassinated, together with Herodes his eldest son, by his nephew Magonius; there is no reason to suppose that this deed of violence was instigated from Rome. After his death (A.D. 266-267) Zenobia succeeded to his position, and practically governed Palmyra on behalf of her young son Wahab-allath or Athenodorus (see Palmyra).

ODALISQUE, a slave-woman who is a member of an oriental harem, especially one in the harem or seraglio of the sultan of Turkey. The word is the French adaptation of the Turkish odalîye, formed from odâh, chamber or room in a harem.

ODD (in middle English odd, from old Norwegian oddi, an angle of a triangle; the old Norwegian oddamann is used of the third man who gives a casting vote in a dispute), that which remains over after an equal division, the unit in excess of an even number; thus in numeration the word is used of a number either above or below a round number, an indefinite cardinal number, as “eighty and odd,” or “eighty odd.” As applied to individuals, the sense of “one left after a division” leads to that of “solitary,” and thus of “uncommon” or “strange.” In the plural, “odds” was originally used to denote inequalities especially in the phrase “to make odds even.” The sense of a difference in benefit leads to such colloquialisms as “makes no odds,” while that of variance or change is expressed “to be at odds.” In betting “the odds” is the advantage given by one person to another in proportion to the supposed chances of success.

ODDE, or Odda, a village of Norway, in South Bergenshus amt (county), on the Sør Fjord, a head-branch of the great Hardanger Fjord. It is 48 m. directly S.E. of Bergen, but 123 by water (to Elde), road (to Vossevangen), and rail thenceforward, or about the same distance by water alone. It is one of the principal tourist-centres in southern Norway, being at the end of the road from Fredfon (27 m.) near which the routes join from Tønsberg and Sand, Lake Suldal, and the Brattlanddal, and from the south-eastern coast towns by the Telemark. This road, descending from the Horrebraekke, passes through the gorge of Selbstadjuvet, passes the Espelandspols and Loteafls, and skirts the Sandven lake. Odda is also a centre for several favourite excursions, as to the Uiarane, one of the glaciers descending from the great Folgefond snowfield, situated in a precipitous valley (Jordal) to the west of Sandven lake; to the Skjærgedalsfoss, a magnificent fall (525 ft.); or across the Folgefond to Suldal, a station on the Mauranger branch of the Norwegian fird. Touring steamers and frequent local steamers from Bergen call at Odda, and there are several large hotels.

1 The younger Forster remarked that the birds of Norfolk Island, though believed by the other naturalists of Cook’s ship to be generally the same as those of New Zealand, were distinguished by their broader coats; (see also Nisbet). There can be no doubt that all the land-birds were specifically distinct. It is possible that Sparrman’s R. australis, which cannot very confidently be referred to any known species of Ocydromus, may have been from Norfolk Island.

2 The later Roman chronicler Trebellius Pollio goes further and asserts: Odenatus rex Palmyrenorum optimum totius Orientis imperium. Gallienus Odenatum participato imperio Augustow vocavit,” Hist. Aug. xxiii. 10 and 12. This is not borne out by the evidence. The highest rank claimed for him by his own people is mentioned in an inscription dated 271 (N.S.I. No. 130) set up by the two generals of the Palmyrene army; Odaenath is styled “king of kings and restorer of the whole city”; but this does not mean that he ever held the title of Augustus, and the inscription was set up after his death and during the revolt of Palmyra.
ODDFELLOWS, ORDER OF, a secret benevolent and social society, having mystic signs of recognition, initiatory rites and ceremonics, and various grades of dignity and honour. Great antiquity has been claimed for the order of Oddfellows—the most popular tradition ascribing it to the Jewish legion under Titus, who, it is asserted, received from the emperor its first charter written on a golden tablet. Oddfellows themselves, however, now generally admit that the institution cannot be traced back beyond the first half of the 18th century, and explain the name as adopted at a time when the severance into sects and classes was so wide that persons aiming at social union and mutual help were a marked exception to the general rule. Mention is made by Defoe of the society of Oddfellows, but the oldest lodge of which the name has been handed down is the Loyal Aristarces, No. 9, which met in 1743 “at the Oakley Arms, Borough of Southwark; Globe Tavern, Hatton Garden; or the Boar’s Head in Smithfield, as the noble master may direct.” The earliest lodges were supported by each member and visitor paying a penny to the secretary on entering the lodge, and special sums were voted to any brother in need. If out of work he was supplied with a card and funds to reach the next lodge, and he went from lodge to lodge until he found employment. The lodges gradually adopted a definite common ritual and became confederated under the name of the Patriotic Order. Towards the end of the century many of the lodges were broken up by State prosecutions on the suspicion that their purposes were “seditious,” but the society continued to exist as the Union Order of Oddfellows until 1809. In 1813, at a convention in Manchester, was formed the Independent Order of Oddfellows, Manchester Unity, which now overshadows all the minor societies in England. Oddfellowship was introduced into the United States from the Manchester Unity in 1819, and the grand lodge of Maryland and the United States was constituted on the 22nd of February 1827. It now rivals in membership and influence the Manchester Unity, from which it severed its connexion in 1842. In 1843 it issued a dispensation for opening the Prince of Wales Lodge No. 1 at Montreal, Canada. The American society, including Canada and the United States, has its headquarters at Baltimore. Organizations, connected either with the United States or England, have been founded in France, Germany, Switzerland, Gibraltar and Malta, Australia, New Zealand, the Fiji Islands, the Hawaiian Islands, South Africa, South America, the West Indies and Barbados, and elsewhere.

The rules of the different societies, various song-books, and a number of minor books on Oddfellowship have been published, but the most complete and trustworthy account of the institution is that in The Complete Manual of Oddfellowship, its History, Principles, Ceremonies and Symbolism, privately printed (1879). See also Friendly Societies.
