INITIALS USED IN VOLUME XIX. TO IDENTIFY INDIVIDUAL
CONTRIBUTORS,1 WITH THE HEADINGS OF THE
ARTICLES IN THIS VOLUME SO SIGNED.

A. A. W. H. AMBROSIUS ARNOLD WILLEM HUBRECHT, LL.D., D.Sc., PH.D.
Professor of Zoology, and Director of the Institute of Zoology in the University
of Utrecht. Author of Nemertines.

A. Ca. ARTHUR CAVLEY, LL.D., F.R.S.
See the biographical article: CAVLEY, ARTHUR.

A. E. S. ARTHUR EVERETT SHIPLEY, M.A., D.Sc., F.R.S.
Joint-editor of the Cambridge Natural History.

A. F. P. ALBERT FREDERICK POLLARD, M.A., F.R.HIST.S.
Professor of English History in the University of London. Fellow of All Souls' College, Oxford. Assistant Editor of the Dictionary of National Biography, 1893-
1901. Lothian Frizeman, Oxford, 1892; Arnold Frizeman, 1898. Author of England under the Protector Somerset; Henry VIII.; Life of Thomas Cranmer; &c.

A. Ge. SIR ARCHIBALD GEIKIE, K.C.B.
See the biographical article: GEIKIE, SIR ARCHIBALD.

A. Go.6 REV. ALEXANDER GORDON, M.A.
Lecturer in Church History in the University of Manchester.

A. Ha. ADOLF HARNACK, PH.D.
See the biographical article: HARNACK, ADOLF.

A. H.-S. SIR A. HOUTUM-SCHINZLER, C.I.E.
General in the Persian Army. Author of Eastern Persian Irak.

A. J. G. REV. ALEXANDER JAMES GRIEVE, M.A., B.D.
Professor of New Testament and Church History at the United Independent College, Bradford. Sometime Registrar of Madras University and Member of Mysore Educational Service.

A. L. ANDREW LANG, LL.D.
See the biographical article: LANG, ANDREW.

A. Li. D. ARTHUR LLEWELLYN DAVIES (d. 1907).
Trinity College, Cambridge; Barrister-at-Law, Inner Temple. Formerly Assistant Reader in Common Law under the Council of Legal Education.

A. M. Cl. AGNES MURIEL CLAY (Mrs Edward Wilde).
Late Resident Tutor of Lady Margaret Hall, Oxford. Joint-editor of Sources of Roman History, 133-70 B.C.

A. N. ALFRED NEWTON, F.R.S.
See the biographical article: NEWTON, ALFRED.

A. P. H. ALFRED PETER HILLIER, M.D., M.P.

A. R. S. SIR ALEXANDER RUSSELL SIMPSON, M.D., LL.D., D.Sc., F.R.S. (Edin.).
Emeritus Professor of Midwifery, Edinburgh University. Dean of the Faculty of Medicine and Professor in the University, 1870-1905.

A. S. E. ARTHUR STANLEY EDDINGTON, M.A., M.Sc., F.R.A.S.
Chief Assistant at the Royal Observatory, Greenwich. Fellow of Trinity College, Cambridge.

1 A complete list, showing all individual contributions, appears in the final volume.

MUN, ADRIEN ALBERT MARIE DE, COUNT (1841- ), French politician, was born at Lumigny, in the department of Seine-et-Marne, on the 28th of February 1841. He entered the army, saw much service in Algeria (1862), and took part in the fighting around Metz in 1870. On the surrender of Metz, he was sent as a prisoner of war to Aix-la-Chapelle, whence he returned in time to assist at the capture of Paris from the Commune. A fervent Roman Catholic, he devoted himself to advocating a patriarch type of Christian Socialism. His eloquence made him the most prominent member of the Cercles Catholiques d'Ouvriers, and his attacks on Republican social policy at last evoked a prohibition from the minister of war. He thereupon resigned his commission (Nov. 1875), and in the following February stood as Royalist and Catholic candidate for Pontivy. The influence of the Church was exerted to secure his election, and the pope during his progress sent him the order of St Gregory. He was returned, but the election was declared invalid. He was re-elected, however, in the following August, and for many years was the most conspicuous leader of the anti-Republican party. "We form," he said on one occasion, "the irreconcilable Counter-Revolution." As far back as 1878 he had declared himself opposed to universal suffrage, a declaration that lost him his seat from 1879 to 1881. He spoke strongly against the expulsion of the French princes, and it was chiefly through his influence that the support of the Royalist party was given to General Boulanger. But as a faithful Catholic he obeyed the encyclical of 1892, and declared his readiness to rally to a Republican government, provided that it respected religion. In the following January he received from the pope a letter commending his action, and encouraging him in his social reforms. He was defeated at the general election of that year, but in 1894 was returned for Finistère (Morbihan). In 1897 he succeeded Jules Simon as a member of the French Academy. This honour he owed to the purity of style and remarkable eloquence of his speeches, which, with a few pamphlets, form the bulk of his published work. In Mémorial social (1908) he wrote an explanation and justification of his career.

MUN, THOMAS (1571-1641), English writer on economics, was the third son of John Mun, mercer, of London. He began by engaging in Mediterranean trade, and afterwards settled down in London, amassing a large fortune. He was a member of the committee of the East India Company and of the standing commission on trade appointed in 1622. In 1621 Mun published A Discourse of Trade from England unto the East Indies. But it is by his England's Treasure by Forraign Trade that he is remembered in his history of economics. Although written possibly about 1630, it was not given to the public until 1664, when it was "published for the Common good by his son John," and dedicated to Thomas, earl of Southampton, lord high treasurer. In it we find for the first time a clear statement of the theory of the balance of trade.

MUNCHAUSEN, BARON. This name is famous in literary history on account of the amusingly mendacious stories known as the Adventures of Baron Munchausen. In 1785 a little shilling book of 49 pages was published in London (as we know from the Critical Review for December 1785), called Baron Munchausen's Narrative of his Marvellous Travels and Campaigns in Russia. No copy is known to exist, but a second edition (apparently identical) was printed at Oxford early in 1786. The publisher of both these editions was a certain Smith, and he then sold it to another bookseller named Kearsley, who brought out in 1786 an enlarged edition (the additions to which were stated in the 7th edition not to be by the original author), with illustrations under the title of Gulliver Reviv'd: the Singular Travels, Campaigns, Voyages, and Sporting Adventures of Baron Munchausen, commonly pronounced Munchausen; as he relates them over a bottle when surrounded by his friends. Four editions rapidly succeeded, and a free German translation by the poet Gottfried August Bürger, from the fifth edition, was printed at Göttingen in 1786. The seventh English edition (1793), which is the usual text, has the moral sub-title, Or the Vice of Lying properly exposed, and had further new additions. In 1792 a Sequel appeared, dedicated to James Bruce, the African traveller, whose Travels to Discover the Nile (1790) had led to incredulity and ridicule. As time went on Munchausen increased in popularity and was translated into many languages. Continuations were published, and new illustrations provided (e.g. by T. Rowlandson, 1809; A. Crowquill, 1859; A. Cruikshank, 1869; the French artist Richard, 1878; Gustave Doré, 1862; W. Strang and J. B. Clark, 1893). The theme of Baron Munchausen, the "drawer of the long-bow " par excellence, has become part of the common stock of the world’s story-telling.

The original author was at first unknown, and until 1824 he was generally identified with Bürger, who made the German translation of 1796. But Bürger's biographer, Karl von Reinhard, in the Berlin Gesellschaft of November 1824, set the matter at rest by stating that the real author was Rudolf Erich Raspe (q.v.). Raspe had apparently become acquainted at Göttingen with Hieronymus Karl Friedrich, Freiherr von Münchhausen, of Bodenwerder in Hanover. This Freiherr von Münchhausen (1720-1797) had been in the Russian service and
served against the Turks, and on retiring in 1760 he lived on his estates at Bodenwerder and used to amuse himself and his friends, and puzzle the quiddities and the dull-witted, by relating extraordinary instances of his prowess as soldier and sportsman. His stories became a byword among his circle, and Raspe, when hard up for a living in London, utilized the suggestion for his little brochure. But his narrative owed much also to such sources, known to Raspe, as Heinrich Bebel's Facetiae bebelianae (1508), J. P. Lange's Deliciæ academicae (1665), a section of which is called Mendacia ridicula, Castiglione's Cortegiano (1528), the Travels of the Finkenritter, attributed to Lorenz von Lauterbach in the 16th century, and other works of this sort. Raspe can only be held responsible for the nucleus of the book; the additions were made by book-sellers' hacks, from such sources as Lucian's Vera historia, or the Voyages imaginaires (1757), while suggestions were taken from Baron de Tott's Memoirs (Eng. trans. 1785), the contemporary travelogues and other accounts of Montgolfier and Blanchard, and any topical "sensations" of the moment, such as Bruce's explorations in Africa. Münchhausen is thus a medley, as we have it, a classical instance of the fantastical mendacious literary genre.

See the introduction by T. Seccombe to Lawrence and Bullen's edition of 1895. Adolf Eilifsen, whose father visited Freiherr von Münchhausen in 1795 and found him very uncommunicative, brought out a text in 1890 which was considered the nearest to the original in general. There is useful material in Carl Muller-Fraureuth's Die deutschen Lügendichtungen auf Münchhausen (1881) and in Griesbach's edition of Bürger's translation (1890).

MÜNCH-BELLINGHAUSEN, ELIGIUS FRANZ JOSEPH, Freiherr von (1806-1871), Austrian poet and dramatist (who wrote under the pseudonym of Friedrich Halm), was born at Cracow on the 2nd of April 1806, the son of a district judge. Educated at first at a private school in Vienna, he afterwards attended lectures at the university, and in 1826, at the early age of twenty, married and entered the government service. In 1840 he became Regierungsrat, in 1845 Hofrat and custodian of the royal library, in 1861 life member of the Austrian Herrenhaus (upper chamber), and from 1869 to 1871 was intendant of the two court theatres in Vienna. He died at Hüttenfeld near Vienna on the 22nd of May 1871. Münch-Bellinghausen's dramas, among them notably Griseldis (1835; publ. 1837; 11th ed. 1860), Der Adept (1836; publ. 1838), Camespa (1838), Der Sohn der Wildnis (1842; 4th ed., 1869), and Der Pfleger von Rudolstadt (1869; 4th ed., 1875), were all distinguished by elegance of language, melodious versification and clever construction, and were for a time exceedingly popular.

His poems, Gedichte, were published in Stuttgart, 1850 (new ed. Vienna, 1877). His works, Sämtliche Werke, were published in eight volumes (1856-1864), to which four posthumous volumes were added in 1872. Ausgewählte Werke, ed. by A. Scholz, 4 vols. (1904). See F. Pachler, Jugend und Lehrjahre des Dichters F. Halm (1877); J. Simiani, Gedenkbücher an F. Halm (1873). Halm's correspondence with Enk von der Burg has been published by R. Schachinger (1890).

MUNCIE, a city and the county-seat of Delaware county, Indiana, U.S.A., on the West Fork of the White river, about 57 m. N.E. of Indianapolis. Pop. (1880), 5219; (1890), 11,345; (2000) 56,444. It was founded in 1825, but not incorporated until 1875. It is served by the Central Indiana, the Chicago, Cincinnati & Louisville, the Cleveland, Cincinnati, Chicago & St Louis, the Pittsburgh, Cincinnati, Chicago & St Louis, the Fort Wayne, Cincinnati & Louisville, and the Lake Erie & Western railways, and by the Indiana Union Traction, the Dayton & Muncie Traction, and the Muncie & Portland Traction (electric inter-urban) railways. The city is built on level ground (altitude 950 ft.), and has an attractive residential section. It is one of the principal manufacturing centres in Indiana, owing largely to its situation in the natural gas belt. In 1900 and in 1903 it was the largest producer of glass and glassware in the United States, the value of its product in 1900 being $5,544,000. Muncie (named after the Muscian Indians, one of the three principal divisions of the Delawareans) was settled about 1833 and was chartered as a city in 1865.

MUNDAS. The Mundā (Mundā) family is the least numerous of the linguistic families of India. It comprises several dialects spoken in the two Chota Nagpur plateaux, the adjoining districts of Madras and the Central Provinces, and in the Mahadeo hills. The number of speakers of the various dialects, according to the census of 1901, is as follows: Santalī, 1,795,113; Mundā, 460,744; Bhumij, 111,364; Birhār, 526; Kōdā, 23,733; Hō, 371,860; Tūrī, 388; Asurī, 4,894; Korvā, 16,442; Kōrī, 87,675; Kharī, 82,506; Juang, 10,833; Savara, 157,136; Gardā, 37,250; total, 3,164,036. Santālī, Mundāri, Bhumij, Birhār, Kōdā, Hō, Tūrī, Asurī and Korvā are only slightly differing forms of one and the same language, which can be called Kherwārī, a name borrowed from Santālī tradition. Kherwārī is the principal Mundā language, and quite 88% of all the speakers of Mundā tongues belong to it. The Körwā dialect, spoken in the western part of Chota Nagpur, connects Kherwārī with the remaining Mundā languages. Of these it is most closely related to the Kūkāri language of the Mahadeo hills in the Central Provinces. Kūkāri, in its turn, in important points agrees with Kharī and Juang, and Kharī roughly agrees to Savara and Gardā. The two last-mentioned forms of speech, which are spoken in the north-east of the Madras Presidency, have been much influenced by Dravidian languages.

The Mundā dialects are not in sole possession of the territory where they are spoken. They are, as a rule, only found in the hills and jungles, while the plains and valleys are inhabited by people speaking some Aryan language. When brought into close contact with Aryan tongues the Mundā forms of speech are apt to give way, and in the course of time they have been partly superseded by Aryan dialects. There are accordingly some Aryanized tribes in northern India who have formerly belonged to the Mundā stock. Such are the Cheros of Behar and Chota Nagpur, the Kherwars, who are found in the same localities, in Mirzapur and elsewhere, the Savaras, who formerly extended as far north as Shahabad, and others. It seems possible to trace an old Mundā element in some Tibeto-Burman dialects spoken in the Himalayas from Bashahr eastwards.

By race the Mundās are Dravidians, and their language was likewise long considered as a member of the Dravidian family. Max Müller was the first to distinguish the two families. He also coined the name Mundā for the smaller of them, which has later on often been spoken of under other denominations, such as Kolarian and Kherwarian. The Dravidian race is generally considered the oldest race in the Indo-Aryan tribe, and the Mundās, who do not appear to have extended much farther towards the south than at present, must have mixed with the Dravidians from very early times. The so-called Nahāl dialect of the Mahadeo hills seems to have been originally a Mundā form of speech which has come under Dravidian influence, and finally passed under the spell of Aryan tongues. The same is perhaps the case with the numerous dialects spoken by the Bhils. At all events, Mundā languages have apparently been spoken over a wide area in central and north India. They were then early superseded by Dravidian and Aryan dialects, and at the present day only scanty remnants are found in the hills and jungles of central and the Central Provinces.

Though the Mundā family is not connected with any other languages in India proper, it does not form an isolated group. It belongs to a widely spread family, which extends from India in the west to Easter Island in the eastern Pacific in the east. In the first place, we find a connected language spoken by the Khasis of the Khasi hills in Assam. Then follow the Mūn-Khāmr languages of Farther India, the dialects spoken by the aboriginal inhabitants of the Malay Peninsula, the Nancauy of the Nicobars, and, finally, the numerous dialects of Austro- nesia, viz. Indonesian, Melanesian, Polynesian, and so on. Among the various members of this vast group the Mundā languages are most closely related to the Mūn-Khāmr family. Farther India, Kūkāri, Kharī, Juang, Savara and Gardā are more closely related to that family than is Kherwārī, the principal Mundā form of speech. We do not know if the Mundās entered India from without.
The Mundā languages abound in vowels, and also possess a richly developed system of consonants. Like the Dravidian languages, they avoid beginning a word with a more than one consonant. While those last two or three letters which are pronounced as short a at the end of words, the Mundās have the opposite tendency, viz. to shorten such sounds still more. The usual stopped consonants — viz. k, c (i.e. English ch), s and p — are formed by stopping the current of breath at different points in the mouth, and then letting it pass out with a kind of explosion. In the Mundā language this operation can be abruptly checked half-way, so that the breath does not touch the organs of speech in passing out. The result is a sound that marks in the expression of a thought and has been described as an abrupt tone. Such sounds are common in the Mundā languages. They are usually written k', c', s' and p'. Similar sounds are also found in the Môn-Khmer languages and in Indo-Chinese.

The vowels of consecutive syllables to a certain extent approach each other in sound. Thus in Kherwarī the open sounds ə (nearly English a in all) and a (the a in care) agrees with each other and not with the close sound ə (the a in cola) and a (the a in Tata). The Santālī passive suffix ək becomes ək' after ə or a; compare sán-ək', go, but dal-ək', to be struck.

Words are formed from monosyllabic bases by means of various additions. The simplest development (the addition of the suffix -a, placed in the close sound of the base and infixes which are inserted into the base itself). Suffixes play a great role in the inflexion of words, while prefixes and infixes are of greater importance as formative additions. Compare Kurku kā-ha, Savara ənə, son; Khāri ra-məng, Kherwarī mə house; Santālī bōr, to bear; bo-bōr, bear; dal, to strike; da-pəl, to strike each other.

The various cases of words are not clearly distinguished. The same base can often be used as a noun, an adjective or a verb. The words simply denote some being, object, quality, action or the like, but they do not tell us how they are conceived.

In their usual grammatical agglutinative way by means of additions which are "glued" or joined on to the unaltered base. In many respects, however, Mundā inflexion has struck out peculiar lines. Thus there is no grammatical distinction of gender. Nouns can be used both as those that denote beings and those that denote inanimate objects respectively. There are three numbers — the singular, the dual and the plural. On the other hand, there are no real cases, at least in most the typical Mundā languages. The direct and the indirect objects and adverbials are denoted by means of certain additions to the verb. Certain relations in time and space, however, are indicated by means of suffixes, which have probably from the beginning been separate words with a definite meaning, and which can therefore be regarded as adjectives preceding the governing word, is often derived from such forms denoting locality. Compare Santālī hār-rod, in a man; hā-rōd, of a man.

Higher numbers are counted in twenties, and not in tens as in the Dravidian languages.

The pronouns abound in different forms. Thus there are double sets of the dual and the plural of the pronoun of the first person, one for the direct and the other for the indirect object. A. Nottrott aptly illustrates the importance of this distinction by remarking how it is necessary to use the exclusive form if telling the servant that "we shall dine at seven." Otherwise the speaker will invite the servant to partake of the meal. In addition to the usual personal pronouns there are also short forms, used as suffixes and infixes, which denote a direct object, an indirect object, or a genitive. Thus the Mundā languages possess a number of demonstrative pronouns. Thus the pronoun that in Santālī has different forms to denote a living being, an immaterial object, something seen, something heard, and so on. On the other hand, there is no relative pronoun, the words which are used being formed by verbal bases, which can in this connexion be called relative participles.

The most characteristic feature of Mundā grammar is the verb, especially in Kherwarī. Every independent word can perform the functions of a verb, and the verbal suffix, is turned into a noun or an adjective. The bases of the different tenses can therefore be described as different words which can be used as a noun, as an adjective, and as a verb, but which are in reality none of them. Each set of participles is described by a verbal base, in Santālī the base dal-ket', struck, which is formed from the base dal, by adding the suffix ket' of the active past, can be used as a noun (connected with the tracers, those that struck), as an adjective (compare dal-ket-kār, struck man, the man that struck), and as a verb. In the last case it is necessary to add an a if the action really takes place; thus, dal-ket'a, somebody struck.

It has already been remarked that the cases of the direct and indirect objects are indicated by adding forms of the personal pronouns to the verb. Such phonetical affixes are inserted before the verb. This is a characteristic of the articulate part of speech. The third person singular is e, and by inserting it in dal-ket'a we arrive at a form dal-ket-e-a, somebody struck him. Similar affixes can be added to denote that the object or subject of an action belongs to another person. Thus Savara dal-kat-dha, that very man whom we struck-themselves, my son who belongs to me struck them.

In a sentence such as har kōr-e dal-ket-e-a, man boy-he struck him, the man struck the boy, the Santals first put together the ideas man boy, and a striking in the past. Then the e tells us that the striking affects the boy, and finally the -a indicates that the whole action really takes place. It will be seen that a single verbal form in this way often corresponds to a whole sentence or a series of sentences in other languages. If we add that the most odd-sounding Mundā languages possess different bases for the active, the middle and the passive, that there are different causal, intensive and reciprocal participles, which are conjugated in different bases, and that the person of the subject is often indicated in the verb, it will be understood that Mundā conjugation presents a somewhat bewildering aspect. It is, however, quite regular throughout, and once the mind becomes accustomed to these peculiarities, they do not present any difficulty to the understanding.

MUNDAY (or MONDAY), ANTHONY (c. 1553-1633), English dramatist and miscellaneous writer, son of Christopher Monday, a London draper, was born in 1553-1554. He had already appeared on the stage when in 1576 he bound himself apprentice for eight years to John Alke, the stationer, an engagement from which he was speedily released, for in 1578 he was in Rome. In the opening lines of his English Romayne Lyfe (1583) he avers that he is going abroad he is,"a nimble fox, spoiled by the fruit of learning, and taught to learn foreign languages; but he must be regarded, if not as a spy sent to report on the English Jesuit College in Rome, as a journalist who meant to make literary capital out of the designs of the English Catholic readers in France and Italy. He says that he and his companion, Thomas Nowell, were robbed of all they possessed on the road from Boulogne to Amiens, where they were kindly received by an English priest, who entrusted them with letters to be delivered in Reims. The transported to the English ambassador in Paris, where under a false name, as the son of a well-known English Catholic, Monday gained recommendations which secured his reception at the English College in Rome. He was treated with special kindness by the English College, and was received by the Jesuits, and the Jesuit, and was freed from all obligation by the Jesuits, and afterwards made a Jesuit. He was perhaps the first of a long line of Roman Catholic Jesuits who were to be the chief of the English College in Rome, and finally of the martyrdom of Richard Atkins (? 1559-1581). He returned to England in 1578-1579, and became an actor again, being a member of the Earl of Oxford's company between 1579 and 1584. In a Catholic tract entitled A True Report of the death of — M. Campion (1581), Munday is accused of having deceived his master Alke, a charge which he refuted by publishing Alke's signed declaration to the contrary, and he is also said to have been hissed off the stage. He was one of the chief witnesses against Edmund Campion and his associates, and wrote about this time five anti-papist pamphlets, among which the Savages and Beggars, and the Defended and Confessed. A Discovery of Edmund Campion and his Confessors—wherein is added the execution of Edmund Campion, Raph Shervin, and Alexander Brian, the first part of which was read aloud from the scaffold at Campion's death in December 1581. His political services against the Catholics were rewarded in 1584 by the post of messenger to her Majesty's chamber, and from this time he seems to have ceased to appear on the stage. In 1598-1599, when he travelled with the earl of Pembroke's men in the Low Countries, it was in the capacity of playwright to furnish up old plays. He devoted himself to writing for the booksellers and the theatres, compiling religious works, translating Amadis de Gaule and other French romances, and putting words to popular airs. He was the chief pageant-writer for the City from 1605.
to 1616, and it is likely that he supplied most of the pages between 1592 and 1605 of which no authentic record has been kept. It is by these entertainments of his, which raved in succession those of Ben Jonson and Middleton, that he won his greatest fame; but of all the achievements of his versatile talent the only one that was noted in his epigram in St Stephens, Coleman Street, London, where he was buried on the 10th of August 1633, was his enlarged edition (1618) of Stow's Survey of London. In some of his pages he signs himself "citizen and draper of London," and in his later years he is said to have followed his father's trade.

Of the eighteen plays between the dates of 1584 and 1602 which are assigned to him, Munday collaborated with Henry Chettle, Michael Drayton, Thomas Dekker and other dramatists, only four are extant. John a Kent and John a Camber, dated 1595, is supposed to be the same as Wiseeman of West Chester, produced by the Admiral's men at the Raye Theatre on the 2nd of December 1594. A ballad of British Sisamen, on which it may have been founded, was entered at Stationers' Hall in 1579. The Downfall of Robert Earl of Huntingdon, afterwards called Robin Hood of morrie Sherwoodes (acted in February 1590) was followed in the same month by a second part, The Death of Robert Earl of Huntingdon (printed 1601), in which he collaborated with Henry Chettle. Munday also had a share with Michael Drayton, Robert Wilson and Richard Hathway in the First Part of the history of the Caledonian War (1599) which was first printed in 1600, with the name of William Shakespeare, which was speedily withdrawn, on the title page. William Webbe (Discourse of English Poetrie, 1586) praised him for his pastoral, of which there remain but the few surviving Stanzas of Soley, and Amongst Shepherds and Nymphs; and Francis Meres ( Palladis Tamia, 1598) gives him among dramatic writers the exaggerated praise of being "our best poet." Munday is also mentioned as Antonio Balladino, pageant poet. Munday's works usually appeared under his own name, but he sometimes used the pseudonym of "Lazarus Plot." A. H. Bullen identifies him with the "Shepherd Torpe" (in his "Nature morte sat bathing by a spring") and six other lyrics to England's Helicon (ed. Bullen, 1890, p. 15).

The complete account of Anthony Munday is T. Seccombe's article in the Dict. Nat. Biog. A life and bibliography are prefixed to the Shakespeare Society's reprint of John the Kettle, John a Camber (ed. J. P. Collier, 1854). His two "Robin Hood" plays were edited by J. P. Collier in Old Plays (1828), and his English Romance Lyfe was printed in the Harleian Miscellany, vii. 156 seq. (ed. B. B.). In an account of his city pages see F. W. Fairholt, Lord Mayor's Pageants (Percy Soc., No. 38, 1843).

MUNDELLA, ANTHONY JOHN (1825-1897). English educational and industrial reformer, of Italian extraction, was born at Leicester in 1825. After a few years spent at an elementary school, he was apprenticed to a hosier at the age of eleven; he afterwards became successful in business in Nottingham, filled several civic offices, and was known for his philanthropy. He was sheriff of Nottingham in 1853, and in 1859 organized the first courts of arbitration for the settlement of disputes between masters and men. In November 1868 he was returned to parliament for Sheffield as an advanced Liberal. He represented that constituency until November 1885, when he was returned for the Brightside division of Sheffield, which he continued to represent until his death. In the Gladstone ministry of 1868 Mundella was vice-president of the council, and shortly afterwards was nominated fourth charity commissioner for England and Wales. In February 1886 he was appointed president of the board of trade, with a seat in the cabinet, and was sworn a member of the privy council. In August 1892, when the Liberals again came into power, Mundella was again appointed president of the board of trade, and he continued in this position until 1894, when he resigned office. His resignation was brought about by his connexion with a financial company which went into liquidation in circumstances calling for the official intervention of the board of trade. However innocent his connexion was with the company, the event excited unpleasant public discussion, and his position became untenable. Having made a close study of the educational systems of Germany and Switzerland, Mundella was an early advocate of compulsory education in England. He rendered valuable service in connexion with the Elementary Education Act of 1870, and the educational code of 1882, which became known as the "Mundella Code," marked a new departure in the regulation of public elementary schools and the conditions of the Government grants. To his initiative was chiefly due the Factory Act of 1875, which established a ten-hours day for women and children in textile factories; and the Children's Act of 1878 removed certain restrictions on trade unions. It was he also who established the labour department of the board of trade and founded the Labour Gazette. He introduced and passed bills for the better protection of women and children in brickyards and for the limitation of their labours in factories; and he effected substantial improvements in the Mines Regulation Bill, and was the author of much other useful legislation. In recognition of his efforts, a marble bust of himself, by Boehm, subscribed for by 80,000 factory workers, chiefly women and children, was presented to Mrs Mundella. He died in London on the 2nd of July 1897.

MUNDEN, JOSEPH SHEPHERD (1758-1832). English actor, was the son of a London poulterer, and ran away from home to join a strolling company. He had a long provincial experience as actor and manager. His first London appearance was in 1790 at Covent Garden, where he practically remained until 1811, becoming the leading comedian of his day. In 1813 he was at Drury Lane. He retired in 1824, and died on the 6th of February 1832.

MÜNĐEN, a town of Germany, in the Prussian province of Hanover, picturesquely situated at the confluence of the Fulda and the Werra, 21 m. N.E. of Cassel by rail. Pop. (1905), 19,755. It is an ancient place, municipal rights having been granted to it in 1247. A few ruins of its former walls still survive. The great Lutheran church of St Blasius (14th-17th centuries) contains the sarcophagus of Duke Eric of Brunswick-Calenberg (d. 1540). The 13th-century Church of St Aegidius was injured in the siege of 1625-26 but was subsequently restored. There is a new Roman Catholic church (1895). The town hall (1619), and the ducal castle, built by Duke Eric II. about 1570, and rebuilt in 1689, are the principal secular buildings. In the latter is the municipal museum. There are various small industries and a trade in timber. Münden, often called "Hannoversch-Münden" (i.e. Hanoverian Münden), to distinguish it from Prussian Münden, was founded by the landgraves of Thuringia, and passed in 1247 to the house of Brunswick. It was for a time the residence of the dukes of Brunswick-Lüneburg. In 1666 it was destroyed by Tilly.

See Willigerod, Geschichte von Münden (Göttingen, 1808); and Henze, Führer durch Münden und Umgebung (Münden, 1906).

MUNDRCUS, a tribe of South American Indians, one of the most powerful tribes on the Amazon. In 1788 they completely defeated their ancient enemies the Muras. After 1803 they lived at peace with the Brazilians, and many are civilized.

MUNDT, THEODOR (1858-1861), German author, was born at Potsdam on the 19th of September 1808. Having studied philology and philosophy at Berlin, he settled in 1812 at Leipzig, as a journalist, and was subjected to a rigorous police supervision. In 1839 he married Klara Müller (1814-1873), who under the name of Luise Mühlbach became a popular novelist, and he removed in the same year to Berlin. Here his intention of entering upon an academical career was for a time thwarted by his collision with the Prussian press laws. In 1842, however, he was permitted to establish himself as privatdocent. In 1848 he was appointed professor of literature and history in Breslau, and in 1850 ordinary professor and librarian in Berlin; there he died on the 30th of November 1861. Mundt wrote extensively on aesthetic subjects, and as a critic he had considerable influence in his time. Prominent among his works are Die Kunst der Architektonik (1847); Geschichte der Malerei der Kegengewaert (1840); Aesthetik; die Idee der Schönheit und des Kunstwerks im Lichte unserer Zeit (1845, new ed. 1868); Die Götterwelt der alten Völker (1846, new ed. 1854). He also wrote several historical novels; Thomas Müntzer (1841); Mendosa, der Vater der Schelmern (1847) and Die Metadore (1830). But perhaps Mundt's chief title to fame was his part in the emancipation of women, a theme which he elaborated in his Madonna, Unterhaltungen mit einer Heiligen (1835).
MUNICH (Ger. München), a city of Germany, capital of the kingdom of Bavaria, and the third largest town in the German Empire. It is situated on an elevated plain, on the river Isar, 25 m. N. of the foot-hills of the Alps, about midway between Strassburg and Vienna. Owing to its lofty site (1700 ft. above the sea) and the proximity of the Alps, the climate is changeable, and its mean annual temperature, 49° to 50° F., is little higher than that of many places much farther to the north. The annual rainfall is nearly 30 in. Munich lies at the centre of an important network of railways connecting it directly with Strassburg (for Paris), Cologne, Leipzig, Berlin, Rosenheim (for Vienna) and Innsbruck (for Italy via the Brenner pass), which converge in a central station.

Munich is divided into twenty-four municipal districts, nineteen of which, including the old town, lie on the left bank of the Isar, while the suburban districts of Au, Haidhausen, Giesing, Bogenhausen and Ramersdorf are on the opposite bank. The old town, containing many narrow and irregular streets, forms a semicircle with its diameter toward the river, while round its periphery has sprung up the greater part of modern Munich, including the handsome Maximilian and Ludwig districts. The walls with which Munich was formerly surrounded have been pulled down, but some of the gates have been left. The most interesting is the Isartor and the Karlstor, restored in 1835 and adorned with frescoes. The Siegestor (or gate of victory) is a modern imitation of the arch of Constantine at Rome, while the stately Propylæae, built in 1854-1862, is a reproduction of the gates of the Athenian Acropolis.

Munich owes its architectural magnificence largely to Louis I. of Bavaria, who founded the throne in 1825, and his successors; while its collections of art entitle it to rank with Dresden and Berlin. Most of the modern buildings have been erected after celebrated prototypes of other countries and eras, so that, as has been said by Moriz Carrière, a walk through Munich affords a picture of the architecture and art of two thousand years. In carrying out his plans Louis I. was seconded by the architect Leo von Klenze, while the external decorations of painting and sculpture were mainly designed by Peter von Cornelius, Wilhelm von Kaulbach and Schwanthaler. As opportunity offers, the narrow streets of the older city are converted into broad, straight boulevards, lined with palatial mansions and public buildings. The hygienic improvement effected by these changes, and by a new and excellent water supply, is shown by the mortality averages—40-4 per thousand in 1871-1875, 30-9 per thousand in 1881-1885, and 20-5 per thousand in 1903-1904. The architectural style which has been principally followed in the later public buildings, among them the law courts, finished in 1897, the German bank, St. Martin’s hospital, as well as in numerous private dwellings, is the Italian and French Rocco, or Renaissance, adapted to the traditions of Munich architecture in the 17th and 18th centuries. A large proportion of the most notable buildings in Munich are in two streets, the Ludwigstrasse and the Maximilianstrasse, the creations of the monarchs whose names they bear. The former, three-quarters of a mile long and 40 yds. wide, entirely contains buildings in the Renaissance style by Friedrich von Gartner. The most striking of these are the palaces of Duke Max and of Prince Luitpold; the Odeon, a large building for concerts, adorned with frescoes and marble busts; the war office; the royal library, in the Florentine palatial style; the Ludwigskirche, a successful reproduction of the Italian Romanesque style, built in 1829-1844, and containing a huge fresco of the Last Judgment by Cornelius; the blind asylum; and, lastly, the university. At one end this street is terminated by the Siegestor, while at the other is the Feldherrenhalle (or hall of the marshals), a copy of the Loggia del Lanzo at Florence; the exquisite statues of Willy and Wrede by Schwanthaler. Adjacent is the church of the Theatines, an imposing though somewhat over-ornamented example of the Italian Rococo style; it contains the royal burial vault. In the Max-}

Munichstrasse, which extends from Haidhausen on the right bank of the Isar to the Max-Joseph Platz, King Maximilian II. tried to introduce an entirely new style of domestic architecture, formed by the combination of older forms. At the east end it is closed by the Maximilianeum, an extensive and imposing edifice, adorned externally with large sculptural groups and internally with huge paintings representing the chief scenes in the history of the world. Descending the street, towards the west are passed in succession the old buildings of the Bavarian national museum, the government buildings in which the Composite style of Maximilian has been most consistently carried out, and the mint. On the north side of the Max-Joseph Platz lies the royal palace, consisting of the Alte Residenz, the Königsbau, and the Festsaalbau. The Alte Residenz dates from 1601 to 1616; its apartments are handsomely fitted up in the Rococo style, and the private chapel and the treasury contain several crowns and many other interesting and valuable objects. The Festsaalbau, erected by Klenze in the Italian Renaissance style, is adorned with mural paintings and sculptures, while the Königsbau, a reduced copy of the Pitti Palace at Florence, contains a series of admirable frescoes from the Niehstungenlily by Julius Schnorr von Carolsfeld. Adjoining the palace are two theatres, the Residenz or private theatre, and the handsome Hoftheater, accommodating 2500 spectators. The Allerheiligen-Hofkirche, or court-church, is in the Byzantine style, with a Romanesque façade.

The Ludwigstrasse and the Maximilianstrasse both end at no great distance from the Frauenplatz in the centre of the old town. On this square stands the Frauenkirche, the cathedral church of the archbishop of Munich-Freising, with its lofty cupola capped towers dominating the whole town. It is imposing from its size, and interesting as one of the few examples of indigenous Munich art. On the north side, adjacent Marienplatz are the old town-hall, dating from the 14th century and restored in 1865, and the new town-hall, the latter a magnificent modern Gothic erection, freely embellished with statues, frescoes, and stained-glass windows, and enlarged in 1900-1905. The column in the centre of the square was erected in 1638, to commemorate the defeat of the Protestants near Prague by the Bavarians during the Thirty Years’ War. Among the other churches of Munich the chief place is due to St Boniface’s, an admirable copy of an early Christian basilica. It is adorned with a cycle of religious paintings by Heinrich von Hess (1788-1863), and the dome is supported by sixty-four monoliths of grey Tyrolean marble. The parish church of Au, in the Early Gothic style, contains gigantic stained-glass windows and some excellent wood-carving; and the church of St John in Haidhausen is another fine Gothic structure. St Michael’s in the Renaissance style, erected for the Jesuits in 1538-1595, contains the monument of Eugène Beauharnais by Thorwaldsen. The façade is divided into storeys, and the general effect is by no means ecclesiastical. St Peter’s is interesting as the oldest church in Munich (11th century), though no trace of the original basilica remains. Among newer churches the most noticeable are the Evangelical church of St Luke, a Transitional building, with an imposing dome, finished in 1856, and the Gothic parish church of the Giesing suburb, with a tower 312 ft. high and rich interior decorations (1866-1884). The valuable collections of art are enshrined in handsome buildings, mostly in the Maximilian suburb on the north side of the town. The old Pinakothek, erected by Klenze in 1826-1836, and somewhat resembling the Vatican, is embellished externally with frescoes by Cornelius and with statues of twenty-four celebrated painters from sketches by Schwanthaler. It contains a valuable and extensive collection of pictures by the earlier masters, the chief treasures being the early German and Flemish works and the unusually numerous examples of Rubens. It also affords accommodation to more than 300,000 engravings, over 20,000 drawings, and a large collection of vases. Opposite stands the new Pinakothek, built 1846-1853, the frescoes on which, designed by Kaulbach, show the effects of wind and weather. It is devoted to works by painters of the last century, among which Karl Rottmann’s Greek landscapes are perhaps the most important. The Glyptothek, a building by Klenze in the Ionic style, and adorned with several groups and
MUNICH

The Immense scientific collection in the Bavarian national museum, illustrative of the march of progress from the Roman period down to the present day, compares in completeness with the similar collections at South Kensington and the Musée de Cluny. The building which now houses this collection was erected in 1894–1900. On the walls is a series of well-executed frescoes of scenes from Bavarian history, occupying a space of 760 ft. The geographical museum, the cabinet of coins, and the collections of fossils, minerals, and physical and optical instruments, are also worthy of mention. The art union, the oldest and most extensive in Germany, possesses a good collection of modern works. The chief place among the scientific institutions is due to the academy of science, founded in 1755. The royal library contains over 1,300,000 printed volumes and 30,000 manuscripts. The observatory is equipped with instruments by the celebrated Josef Fraunhofer.

At the head of the educational institutions of Munich stands the university, founded at Ingolstadt in 1472, removed to Landshut in 1800, and transferred thence to Munich in 1826. In addition to the four usual faculties there is a fifth—of political economy. In connexion with the university are medical and other schools, a priests' seminary, and a library of 300,000 volumes. The polytechnic institute (Technische Hochschule) in 1899 acquired the privilege of conferring the degree of doctor of technical science. Munich contains several gymnasium or grammar-schools, a military academy, a veterinary college, an agricultural college, a school for architects and builders, and several other technical schools, and a conservatory of music. The general prison in the suburb of Au is considered a model of its kind; and there is also a large military prison. Among other public buildings, the crystal palace (Glas-palast), 705 ft. in length, erected for the great exhibition of 1854, is now used, as occasion requires, for temporary exhibitions. The Wittelsbach palace, built in 1843–1850, in the Early English Painted style, is one of the residences of the royal family. Among the numerous monuments with which the squares and streets are adorned, the most important are the colossal statue of Maximilian II. in the Maximilianstrasse, the equestrian statues of Louis I. and the elector Maximilian I., the obelisk erected to the 30,000 Bavarians who perished in Napoleon's expedition to Moscow, the Wittelsbach fountain (1895), the monument commemorative of the peace of 1871, and the marble statue of Justus Liebig, the chemist, set up in 1883.

The English garden (Englischer Garten), to the north-east of the town, is 600 acres in extent, and was laid out by Count Rumford in imitation of an English park. On the opposite bank of the Isar, above and below the Maximilianeum, extend the Gasteig promenades, commanding fine views of the town. To the south-west of the town is the Theresienwiese, a large common where the popular festival is celebrated in October. Here is situated the Ruhmeshalle or hall of fame, a Doric colonnade containing busts of eminent Bavarians. In front of it is a colossal bronze statue of Bavaria, 150 ft. high, designed by Schwanthaler. The botanical garden, with its large palm-house, contains frescoes of Greek landscapes by Rottmann, and the Maximilian park to the east of the Isar, complete the list of public parks.

The population of Munich in 1905 was 538,993. The permanent garrison numbers about 10,000 men. Of the population, 84% are Roman Catholic, 14% Protestants, and 2% Jews. Munich is the seat of the archbishop of Munich-Freising and of the general Protestant consistory for Bavaria. About twenty newspapers are published here, including the Allgemeine Zeitung. Some of the festivals of the Roman Church are celebrated with considerable pomp; and the people also cling to various national fêtes, such as the Metzgersprung, the Schäffler-ritt, and the great religious festival of Corpus Christi.

Munich has long been celebrated for its artistic handicrafts, such as bronze-foundling, glass-staining, silversmith's work, and wood-carving, while the astronomical instruments of Fraunhofer and the mathematical instruments of Traugott Liebervon Ertel (1778–1838) are also widely known. Lithography, which was invented at Munich at the end of the 18th century, is extensively practised here. The other industrial products include paper-wall, railway plant, machinery, gloves and artificial flowers. The most characteristic industry, however, is brewing. Four important markets are held at Munich annually. The city is served by an extensive electric tramway system.

History.—The Villa Municipen or Forum ad monachos, so called from the monkish owners of the ground on which it lay, was first called into prominence by Duke Henry the Lion, who established a mint here in 1158, and made it the emporium for the salt coming from Hal len and Reichenhall. The Bavarian dukes of the Wittelsbach house occasionally resided at Munich, and in 1255 Duke Louis made it his capital, having previously surrounded it with walls and a moat. The town was almost entirely destroyed by fire in 1337, after which the emperor Louis the Bavarian, in recognition of the loyalty of the citizens, rebuilt it very much on the scale it retained down to the beginning of the 19th century. Among the succeeding rulers those who did most for the town in the erection of handsome buildings and the foundation of schools and scientific institutions were Albert V., William V., Maximilian I., Max Joseph and Charles Theodore. In 1632 Munich was occupied by Gustavus Adolphus, and in 1705, and again in 1742, it was in possession of the Austrians. In 1791 the fortifications were razed.

Munich's importance in the history of art is entirely of modern growth, and may be dated from the acquisition of the Aeginitan marble by Louis I., then crown prince, in 1812. Among the eminent artists of this period whose names are more or less identified with Munich were Leo von Klenze (1784–1864), Joseph Daniel Ohmiller (1791–1839), Friedrich von Gartner (1792–1847), and Georg Friedrich Ziebland (1800–1873), the architects; Peter von Cornelius (1783–1869), Wilhelm von Kaulbach (1802–1874), Julius Schnorr von Carolsfeld (1794–1871), and Karl Rottmann, the painters; and Ludwig von Schwanthaler, the sculptor. Munich is still the leading school of painting in Germany, but the romanticism of the earlier masters has been abandoned for drawing and colouring of a realistic character. Karl von Piloty (1826–1886) and Wilhelm Diez (1839–1907) long stood at the head of this school.

Tisch, Das Stadtrecht von München (Bamberg, 1891); F. Pecht, Geschichte der münchener Kunst im 19. Jahrhundert (Munich, 1888); and Trautwein, Führer durch München (20th ed., 1906). There is an English book on Munich by H. R. Wadeleigh (1910).
MUNICIPALITY—MUNICIPIUM

MUNICIPALITY, a modern term (derived from Lat. munici-pium; see below), now used both for a city or town which is organized for self-government under a municipal corporation, and also for the governing body itself. Such a corporation in Great Britain consists of a head or mayor or president, of a number of aldermen, and of councillors, together with the simple corporators, who are represented by the governing body; it acts as a person by its common seal, and has a perpetual succession, with power to hold lands subject to the restrictions of the Mortmain laws; and it can sue or be sued. Where necessary for its primary objects, every corporation has power to make by-laws and to enforce them by penalties, provided they are not unjust or unreasonable or otherwise inconsistent with the objects of the charter or other instrument of foundation.

See Borough, Commune, Corporation, Local Government, Finance, &c., and for details of the functions of the municipal government, 1 excepting the general headings of the different countries and the sections on the history of these countries.

MUNICIPIUM (Lat. munus, a duty or privilege, capere, to take), in ancient Rome, the term applied primarily to a status, a certain relation between individuals or communities and the Roman state; subsequently and in ordinary usage to a community, standing in such a relation to Rome. Whether the name signifies the taking up of burdens or the acceptance of privileges is a disputed point. But as ancient authorities are unanimous in giving munus in this connexion the sense of "duty" or "service," it is probable that the chief feature of municipalitas was the performance of certain services to Rome.1 This view is confirmed by all that we know about the towns to which the name was applied in republican times. The status had its origin in the conferment of citizenship upon Tusculum in 381 B.C. (Livy vi. 26; cf. Cic. pro Planc. 8, 19), and was widely extended in the settlement made by Rome at the close of the Latin War in 338 B.C. (see Rome, History). Italian towns were then divided into three classes: (1) Coloniae civium Romanorum, whose members had all the rights of citizenship; (2) munici-pia, which received partial citizenship; (3) foederatae civitates (including the so-called Latin colonies), which remained entirely separate from Rome, and stood in relations with her which were separately arranged by her for each state by treaty (foedus). The munici-pia stood in very different degrees of dependence on Rome. Some, such as Fundi (Livy viii. 14; cf. Cass. Dio 70, 19), were at first local communities with limited control of their own affairs. But after the close of the second Punic War, when Rome had become the chief power, not only in Italy, but in all the neighbouring lands round the Mediterranean, we can trace a growing tendency among the Italian cities to regard citizenship of this great state as a privilege, and to claim complete citizenship as a reward of their services in helping to build up the Roman power. During the 2nd century B.C. the jus suffragii and jus honorum were conferred upon numerous munici-pia (Livy xxxviii. 36, 37); whose citizens were then enrolled in the Roman tribes. They can have exercised their public rights but seldom, owing to their distance from Rome; but the consulsips of C. Marius,

1 For a contrary view, however, see Marquardt, Röm. Staatsverw. i. p. 26, n. 2 (2nd ed., Leipzig, 1881), and authorities there cited.
2 For a different view see Willems, Droit public romain, p. 381 (Louvain, 1874).

a municipium of Arpinum (between 107 and 100 B.C.), and the strength of the support given to Tiberius Gracchus in the assembly by the voters from Italian towns (133 B.C.) show what an important influence the members of these municipia could occasionally exercise over Roman politics. The cities thus privileged, however, though receiving complete Roman citizenship, were not, as the logic of public law might seem to demand, incorporated in Rome, but continued to exist as independent urban units; and this anomaly survived in the municipal system which was developed, on the basis of these grants of citizenship, after the Social War. That system recognized the municipia as at once a citizen of a self-governing city community, and a member of the city of Rome, his dual capacity being illustrated by his right of voting both in the election of Roman magistrates and in the election of magistrates for his own town.

The result of the Social War which broke out in 91 B.C. (see Rome: History) was the establishment of a new uniform municipalitas throughout Italy, and the obliteration of any important distinction between the three classes established after the Latin War. By the Lex Julia of 90 B.C. and the Lex Plautia Papiaria of 89 B.C. every town in Italy which made application in due form received the complete citizenship. The term munici-pium was no longer confined to a particular class of Italian towns but was adopted as a convenient name for all urban communities of Roman citizens in Italy. The organization of a municipal system, which should regulate the governments of all these towns on a uniform basis, and define their relation to the Roman government, was probably the work of Sulla, who certainly gave great impetus to the foundation in the provinces of citizen colonies, which were the earliest municipia outside Italy, and extended within the same year as the Italian towns. Julius Caesar extended the sphere of the Roman municipal system by his enfranchisement of Cisalpine Gaul, and the consequent inclusion of all the towns of that region in the category of municipio. He seems also to have given a more definite organization to the municipia as a whole. But, excepting those in Cisalpine Gaul, the municipal system still embraced no towns outside Italy other than the citizen colonies. Augustus and his successors adopted the practice of granting to existing towns in the provinces either the full citizenship, or a partial civitas known as the jus Latii. This partial civitas does not seem to have been entirely replaced, as in Italy, by the grant of full privileges, to urban communities possessing it, and the distinction between the two classes of municipia was maintained in the provinces. But, the uniform system of administration gradually adopted in all three classes rendered the distinction entirely unimportant, and the general term municipalitas is used of all alike. The incorporation of existing towns, hitherto non-Roman, in the uniform municipal system of the principate took place mainly in the eastern part of the Empire, where Greek civilization had long fostered urban life. In the west city communities rapidly sprung up under direct Roman influence. The development of towns of the municipal type on the sites where legions occupied permanent quarters can be traced in several of the provinces. The Roman government, however, had already before the end of the 1st century the principate municipia are numerous in the western as well as the eastern half of the Empire, and the towns are everywhere centres of Roman influence.

Of the internal life of the municipia very little is known before the Empire. For the period after Julius Caesar, however, we have two important sources of information. A series of municipal laws gives us a detailed knowledge of the constitution imposed, with slight variations, on all the municipia; and a host of municeps inscriptions gives particulars of their social life.

The municipal constitution of the 1st century of the municipia is based upon the type of government common to Greece and Rome from earliest times. The government of each town consists of magistrates, senate and assembly, and is entirely
MUNICIPIUM

independent of the Roman government except in certain cases of higher civil jurisdiction, which come under the direct cognisance of the praetor urbans at Rome. On the other hand, each community is bound to perform certain services to the Imperial government, such as the contribution of men and horses for military service, the maintenance of imperial post roads through its neighbourhood, and the occasional entertain-
ment of Roman officials or billeting of soldiers. The citizens were of two classes: (1) cives, whether by birth, naturalization or emancipation, (2) incolae, who enjoyed a partial citizenship based on domicile for a certain period. Both classes were liable to civic burdens, but the incolae had none of the privileges of citizenship except a limited right of voting. The citizens were grouped in either tribes or curiae, and accordingly the assembly sometimes bore the name of Comitia Tributa, sometimes that of Comitia Curiata. The theoretical powers of these comitia were extensive both in the election of magis-
trates and in legislation. But the growing influence of the senatorial party in the Senate over elections on the one hand, and on the other hand the increasing reluctance of leading citizens to become candidates for office (see below), gradually made popular election a mere form. The senatorial recommendation of the necessary number of candidates seems to have been merely ratified in the comitia; and a Spanish municipal law of the 1st century makes special provision for occasions on which an insufficient number of candidates are forthcoming. In Italy, however, the reality of popular elections seems to have survived to a later date. The inscriptions at Pompeii, for instance, give evidence of keenly contested elections in the 2nd century. The local senate, or curia, always exercised an important influence on municipal politics. Its members formed the leading nobility, and at an early date special privileges were granted by Rome to provincials who were senators in their native towns. For the composition, powers, and history of the provincial senate see DECURIO.

The magistrates were elected annually, and were six in number, forming three pairs of colleagues. The highest magistrates were the IIvirii (Duovirii) juri dicundo, who had charge, as their name implies, of all local jurisdiction, and presided over the assembly. Candidates for this office were required to be over 25 years of age, to have held one of the minor magistracies, and to possess all the qualifications required of members of the local senate (see DECURIO). Next in dignity were the IIvirii aediles, who had charge of the roads and public buildings, the games, and general maintenance of municipal public order. In some towns they appear to have been regarded as subordinate colleagues (collegae minores) of the IIvirii juri dicundo, and in some towns at least to have had the right to convene and preside over the comitia in the absence of the latter. Indeed many inscriptions speak of IVirii (Quattuovirii) consisting of two IIvirii juri dicundo and two IIvirii aediles; but in the majority of cases the former are regarded as distinct and superior magistrates. The two quaestores, who appear to have controlled finance in a large number of municipia, cannot be traced in others; and it is probable that in the municpia, as at Rome, the quaestorship was locally instituted, as need arose, to relieve the supreme magistrates. The business of the two junior municipal magistrates frequently referred to in the inscriptions are the quinquaremnales and praefecti. The quinquaremnales superseded the IIvirii or IVirii juri dicundo every five years, and differed from them only in possessing, in addition to their other powers, those exercised in Rome before the time of Sulla by the censors. Two classes of praefecti are found in the municipalities under the Empire, both of which are to be distinguished from the officials who bore that name in the municipia before the Social War. The first class consists of those praefecti who were nominated as temporary delegates by the IIvirii, when through illness or compulsory absence they were unable to discharge the duties of their office. The second class, referred to in inscriptions by the name of praefecti ab decurionibus creati legi Petronii, seem to have been appointed by the local senate in case of a complete absence of higher magistrates, such as would have led in Rome to the appointment of an interrex.

From a social point of view the municipia of the Roman Empire may be classified under three heads: (1) as religious centres, (2) as governmental centres, (3) as industrial centres. (1) The chief feature of the local government of the towns was the widespread activity of the municipal authorities in improving the general conditions of town life. The fund for maintenance of public buildings, or provision was made out of the public funds for feeding the poorest part of the population, and providing a supply of corn which could be bought by ordinary citizens at a moderate price. In Pliny's time there existed in many towns public wells, controlled by the municipal authorities, concerning which Pliny remarks that they were a source of considerable disturbance in the town at the times when the need was greatest to appease the gods. (2) Cities were generally assisted by large benefactions, either in money or in works, from individual citizens; but direct taxation for municipal purposes was hardly ever resorted to. The treasury was filled out of the proceeds of the landed possessions of the community, especially such fruitful sources of revenue as mines and quarries, and out of import and export duties. It was occasionally subsidized by the emperor on occasions of sudden and exceptional calamity. (3) The chief feature of the municipal towns was the important position they occupied as centres for the cult of the emperor. Caesar-worship as an organized cult developed spontaneously in many provincial towns during the reign of Augustus, and was later ordered by imperial edicts. The importance of the emperor in these centres of vigour and prosperity a strong loyalty to Rome and the emperor, which was one of the firmest supports of the latter's power. The order of Augustales, officials appointed to regulate the cult, and the offices of its superintendents, the empire, were prominent offices in civic life, and had a special importance in municipal society. It was composed of the leading and the wealthiest men among the lower classes of the popula-
tion. The organization of the order on these lines Augustus secured the double object of maintaining Caesar-worship in all the most vigorous centres of provincial life, and attracting and attracting to himself and his successors the special devotion of the industrial class which had been undermined in the days of Augustus. It was one of the greatest political forces in modern Europe.

The development of this free industrial class is the chief feature of the municipia considered as centres of industry and handicraft. The power of the municipia increased as the wealth and importance of the towns increased. By the late part of the 1st century the Roman government had to some extent modified the old Roman principle that trade and commerce were beneath the dignity of the governing class; but long after the fall of the Republic the artis-
tian and the working classes were an important element in the population. As the organization of the order on these lines Augustus secured the double object of maintaining Caesar-worship in all the towns, and the building of the emperors, families of buildings in the provinces where their names were most popular in the Roman Empire, and has become the greatest political force in modern Europe.

3. The development of this free industrial class is the chief feature of the municipia considered as centres of industry and handicraft. The power of the municipia increased as the wealth and importance of the towns increased. By the late part of the 1st century the Roman government had to some extent modified the old Roman principle that trade and commerce were beneath the dignity of the governing class; but long after the fall of the Republic the artis-
tian and the working classes were an important element in the population. As the organization of the order on these lines Augustus secured the double object of maintaining Caesar-worship in all the towns, and the building of the emperors, families of buildings in the provinces where their names were most popular in the Roman Empire, and has become the greatest political force in modern Europe.
partly to the general prosperity of the towns, which removed any acute discontent. The wealthy citizen seems always to have had to bear heavy financial burdens, and to have enjoyed in return a dignity and an actual political preponderance which made the general character of municipal constitutions distinctly tyrannical.

The policy adopted by the early emperors of encouraging, within the limits of a uniform system, the independence and civic patriotism of the towns, was superseded in the 3rd and 4th centuries by a deliberate effort to use the towns as instruments of the imperial government, under the direct control of the emperor or his representatives in the provinces. This policy was accompanied by a gradual decay of civic feeling and municipal enterprise, which showed itself mainly in the unwillingness of the townsfolk to become candidates for local magistracies, or to take up the burdens entailed in membership of the municipal senate. Popular control of the local government of the towns was ceasing to be a reality as early as the end of the 1st century of the Empire. Two centuries later local government was a mere form. And the self-governing communities of the middle ages were a restoration, rather than a development, of the flourishing and independent municipalities of the age of Augustus and his immediate successors.

MUNIMENT, a word chiefly used in the plural, as a collective term for the documents, charters, title-deeds, &c. relating to the property, rights and privileges of a corporation, such as a college, a family or private person, and kept as "evidences" for defending the same. Hence the medieval usage of the word munimentum, in classical Latin, a defence, fortification, from munire, to defend.

MUNI RIVER SETTLEMENTS, or SPANISH GUINEA, a Spanish protectorate on the Guinea Coast, West Africa, rectangular in form, with an area of about 9800 sq. m. and an estimated population of 150,000. The protectorate extends inland about 135 miles and is bounded W. by the Atlantic, N. by the German colony of Cameroon, E. and S. by French Congo. The coastline, 75 m. long, stretches from the mouth of the Campo in 2° 16' N. to the mouth of the Muní in 3° 20' N., on the north arm of Corisco Bay. The small islands of Corisco (q.v.), Elobey Grande, Elobey Chico and Bana in Corisco Bay also belong to Spain.

From the estuary of the Campo the coast trends S.S.W. in a series of shallow indentations, until at the bold bluff of Cape San Juan it turns eastward and forms Corisco Bay. The coast plain, from 12 to 25 m. wide, is succeeded by the foot-hills of the Crystal Mountains, which traverse the country in a north to south direction. These are a table-land, from which rise granite hills 700 to 1200 ft. above the general level, which is about 250 ft. above the sea. The western thalweg of the Campo extends inland beyond the Spanish frontier, contains many narrow valleys and marshy depressions. The greater part of the country forms the basin of the river Benito, which, rising in French Congo a little east of the frontier, flows through the centre of the Spanish protectorate and enters the sea, after a course of 300 m., about midway between the Campo and Muní estuaries. The southern bank of the lower course of the Campo and the northern bank of the lower course of the Muní, form part of the protectorate. The mouths of the Campo and Benito are obstructed by sand bars, whereas the channel leading to the Muní is some 36 ft. deep and the river itself is more than double that depth. It is from this superiority of access that the country has been named after the Muní River. The course of all the rivers is obstructed by rapids in their descent from the table-land to the plain. The greater part of the country is covered with dense prismatic forest. This forest growth is due to the fertility of the soil and the great rainfall, Spanish Guinea with the neighbouring Cameroons country possessing one of the heaviest rain records of the world. The humidity of the climate joined to the excessive heat (the average temperature is 78° F.) makes the climate try. In the eastern parts of the protectorate the forest is succeeded by more open country. Among the most common trees are oil-palms, rubber-trees, ebony and mahogany. The forests are the home of monkeys and of innumerable birds and insects, often of gorgeous colouring. In the north-east of the country elephants are numerous.

The inhabitants are Bantu-Negroid, the largest tribe represented being the Fang (q.v.), called by the Spaniards Pammes. They are immigrants from the Congo basin and have pushed before them the tribes, such as the邦ga, which now occupy the coast-lands. The villages of the Fang are usually placed on the top of small hills. They cultivate the yam, banana and manioc, and are expert fishers and hunters. The European settlements are confined to the coast. There are trading stations at the mouths of the Campo, Benito and Muní rivers, at Bata, midway between the Campo and Benito, and at Elobey Chico. There are cocoa, coffee and other plantations, but the chief trade is in natural products, rubber, palm oil and palm kernels, and timber. Cotton goods and alcohol are the principal imports. Trade is largely in the hands of British and German firms. The annual value of the trade in 1903-1906 was about £3,000,000.

Spain became possessed of Fernando Po at the end of the 18th century, and Spanish traders somewhat later established "factories" on the neighbouring coast of the mainland, but no permanent occupation appears to have been contemplated. During the 19th century a number of treaties were concluded between Spanish naval officers and the chiefs of the lower Guinea coast, and when the partition of Africa was in progress Spain laid claim to the territory between the Campo river and the Gabun. Germany and France also claimed the territory, but in 1885 Germany withdrew in favour of France. After protracted negotiations between France and Spain a treaty was signed in June 1900 by which France acknowledged Spanish sovereignty over the coast region between the Campo and Muní rivers and the hinterland as far east as 11° 20' E. of Greenwich, receiving in return concessions from Spain in the Sahara (see Río de Oro), and the right of pre-emption over parts of the West African possessions. In 1901-1902 the eastern frontier was demarcated, being modified by concession to natural features. The newly acquired territories were placed under the superintendence of the governor-general of Fernando Po, sub-governors being stationed at Bata, Elobey Chico and Corisco.

Lorin, "Les colonies espagnoles du golfe de Guinée", in Quest. dip. ed. vol. xiv (1906); B. L. PERUZZI, "El Estado actual de los territorios espanoles de Guinea", in Revista de geogr. colon. y mercantil (Madrid, 1905); J. B. ROCHE, Au pays des Pahouins (Paris, 1904). A good map compiled by A. Ysart is contained on the opposite page of the map of Spain in Madrid in 1903. Consult also the works cited under FERNANDO PO.

MUNKÁCS, a town of Hungary, in the county of Berег, 220 m. E.-E. of Budapest by rail. Pop. (1900), 13,640. It is situated on the Latorcza river, and on the outskirts of the East Beskides mountains, where the hills touch the plains. Its most noteworthy buildings are the Greek Catholic cathedral and the beautiful castle of Count Schönborn. In the vicinity, on a steep hill 580 ft. high, stands the old fort of Munkács, which played an important part in Hungarian history, and was especially famous for its heroic defence by Helene Zrínyi, wife of Emerenc Tökől and mother of Francis Rákóczi II., for three years against the Austrians (1685-1688). It was afterwards used as a prison. Ypsilanti, the hero of Greek liberty, and Kazinczy, the regenerator of Hungarian letters, were confined in it. According to tradition, it was near Munkács that the Hungarians, towards the end of the 9th century, entered the country. In 1896 in the fort was built one of the "millennial
mony's " established at seven different points of the kingdom.

MUNKACSY, MICHAEL VON (1844-1900), Hungarian painter, whose real name was Michael (Miska) Leo Lieb, was the third son of Michael Lieb, a collector of salt-tax in Munkác, Hungary, and of Cécilia Röck. He was born in that town on the 20th of February 1844. In 1848 his father was arrested at Miskolce for complicity in the Hungarian revolution, and died shortly after his release; a little earlier he had also lost his mother, and became dependent upon the charity of relations, of whom an uncle, Röck, became mainly responsible for his maintenance and education. He was apprenticed to a carpenter, Langi, in 1855, but shortly afterwards made the acquaintance of the painters Fischer and Szamosy, whom he accompanied to Arad in 1858. From them he received his first real instruction in art. He worked mainly at Budapest during 1863–1865, and at this time first adopted, from patriotic motives, the name by which he is always known. In 1865 he visited Vienna, returning to Budapest in the following year, and went thence to Munich, where he contributed a few drawings to the Fliegende Blätter. About the end of 1867 he was working at Düsseldorf, where he was much influenced by Ludwig Knaus, and painted (1868–1869) his first picture of importance, "The Last Day of a Condemned Prisoner," which was exhibited in the Paris Salon in 1870, and obtained for him a médaille unique and a very considerable reputation. He had already paid a short visit to Paris in 1867, but on the 25th of January 1872 he took up his permanent abode in that city, and remained there during the rest of his life. Munckacsy's chief images of public men, which he often exhibited in the Russian £4 and which afterwards appeared in various publications—Herrmann, Beiträge zur russischen Geschichte, Staat, und Reich (Russischer Reiche (Leipzig, 1843). See Hempel, Leben Münchacs, (Bremen, 1874); Halem, Geschichte des F. M. Grafen Münchacs (Oldenburg, 1883; 2nd ed., 1838); Kostomarov, Feldmarschall Münchacs (Russische Geschichte in Biographien, v. 2).

MUNRO, SIR HECTOR (1776–1803), British general, son of Hugh Munro of Novar, in Crenarty, was born in 1776, and entered the army in 1740. He went to Bombay in 1761, in command of the 89th regiment, and in that year effected the surrender of Mahé from the French. Later, when in command of the Bengal army, he suppressed a mutiny of sepoys at Patna, and on the 23rd of October 1764 won the victory of Buxar against Shuja-ud-Dowlah, the nawab wazir of Oudh, and Mir Kasim, which ranks amongst the most decisive battles ever fought in India. Returning home, he became in 1768 M.P. for the Inverness Burghs, which he continued to represent in parliament for more than thirty years, though a considerable portion of this period was spent in India, whither he returned in 1779 to take command of the Madras army. In that year he took Pondicherry from the French, but in 1780 he was defeated by Hyder Ali near Conjeeveram, and forced to fall back on St. Thomas's Mount. There Sir Eyre Coote took over command of the army, and in 1781 won a signal victory against Hyder Ali at Porto Novo, where Munro was in command of the right division. Negapatam was taken by Munro in November of the same year; and in 1782 he returned to England. He died on the 27th of December 1805.

MUNRO, HUGH ANDREW JOHNSTONE (1810–1885), British scholar, was born at Elgin on the 19th of October 1819. He was educated at Shrewsbury school, where he was one of Kennedy's first pupils, and proceeded to Trinity College, Cam- bridge, and took his B.A. in 1836. He became a fellow of his college in 1840, second classic and first chancellor's medallist in 1842, and fellow of his college in 1843. He became classical lecturer at Trinity College, and in 1869 was elected to the newly-founded chair of Latin at Cambridge, but resigned it in 1872. The great work on which his reputation is mainly based is his edition of Lucretius, the fruit of the labour of many years (text only, v, 1860; text, commentary and translation, 2 vols., 1864). As a textual critic his knowledge was profound and his judgment unrivalled; and he made close archaeological studies by frequent travels in Italy and Greece. In 1867 he published an improved text of Aeneis with commentary, and in the following year a text of Horace with critical introduction, illustrated by specimens of ancient gems selected by C. W. King. His knowledge and taste are nowhere better shown than in his Criticisms and Eulogiums of Catullus (1878). He was a master of the art of Greek and Latin verse composition. His contributions to the famous volume of Shrewsbury verse, Sabrinas corolla, are among the most remarkable of a remarkable collection. His Translations into Latin and Greek Verse were privately printed in 1884. Like his translations into English, they are characterized by minute fidelity to the original, but never cease to be idiomatic. He died at Rome on the 30th of March 1885. See Memoir by J. D. Duff, prefixed to a re-issue of the trans. of Lucretius in "Bucoli's Classical Library." (1888)

MUNRO, MONRO or MONROE, ROBERT (d. c. 1688), Scots general, was a member of a well-known family in Ross-shire, the Munroes of Foulis. With several of his kinsmen he served in the continental wars under Gustavus Adolphus; and he
appears to have returned to Scotland about 1638, and to have taken some part in the early incidents of the Scottish rebellion against Charles I. In 1642 he went to Ireland, nominally as second in command under Alexander Leslie, but in fact in chief command of the Scottish contingent against the Catholic rebels. After the Battle of Benburb and plundering works in April 1642, and inef-
tually attempting to subdue Sir Phelip O'Neill, Munro succeeded in taking prisoner the earl of Antrim at Dunlucce. The arrival of Owen Roe O'Neill in Ireland strengthened the cause of the rebels (see O'NEILL), and Munro, who was poorly supplied with provisions and war materials, showed little activity. Moreover, the civil war in England was now creating confusion among parties in Ireland, and the king was anxious to come to terms with the Catholic rebels, and to enlist them on his own behalf against the parliament. The duke of Ormonde, Charles's lieutenant-gener- al in Ireland, acting on the king's orders, signed a cessation of hostilities with the Catholics on the 15th of September 1643, and exerted himself to despatch aid to Charles in England. Munro in Ulster, holding his commission from the Scottish parliament, did not recognize the armistice, and his troops accepted the solemn league and covenant, in which they were joined by many English soldiers who left Ormonde to join him. In April 1644 the English parliament entrusted Munro with the command of all the forces in Ulster, both English and Scots. He thereupon seized Belfast, made a raid into the Pale, and unsuccess- fully attempted to gain possession of Dundalk and Drogheda. His force was weakened by the necessity for sending troops to Scotland to withstand Montrose; while Owen Roe O'Neill was strengthened by receiving supplies from Spain and the pope. On the 5th of June 1646 was fought the battle of Benburb, whereafter the wide and viscous Montgomery was routed; and Munro, but suffered him to withdraw in safety to Carrickfergus. In 1647 Ormonde was compelled to come to terms with the English parliament, who sent commissioners to Dublin in June of that year. The Scots under Munro refused to surrender Carrick-
fergus and Belfast when ordered by the parliament to return to Scotland, and Munro was superseded by the appointment of Monk to the chief command in Ireland. In September 1648 Carrickfergus was delivered over to Monk by treachery, and Munro was taken prisoner. He was committed to the Tower of London, where he remained a prisoner for five years. In 1654 he was permitted by Cromwell to reside in Ireland, where he had estates in Ireland. He was then appointed to office under Lord Protector. Munro continued to live quietly at Comber, Co. Down, for many years, and probably died there about 1680. He was in part the original of Dugal Dalgetty in Sir Walter Scott's Legend of Montrose.

MUNRO, SIR THOMAS (1761-1827). Anglo-Indian soldier and statesman, was born at Glasgow on the 27th of May 1761, the son of a merchant. Educated at Glasgow University, he was at first intended to enter his father's business, but in 1789 he was appointed to an infantry cadetship in Madras. He served with his regiment during the hard-fought war against Hyder Ali (1780-83), and again in the first campaign against Tippoo (1790-92). He was then chosen as one of four military officers to administer the Baramahal, part of the territory acquired from Tippoo, where he remained for seven years, learning the principles of revenue survey and assessment which he afterwards applied throughout the presidency of Madras. After the final downfall of Tippoo in 1799, he spent a short time restoring order in Kanara; and then for another seven years (1800-1807) he was placed in charge of the norther districts "ceded" by the nizam of Hyderabad, where he introduced the ryotwari system of land revenue. After a long furlough in England, during which he gave valuable evidence upon matters connected with the renewal of the company's charter, he returned to Madras in 1814 with special instructions to reform the judicial and police systems. On the outbreak of the Pindari War in 1817, he was appointed as brigadier-general to command the reserve division formed to reduce the southern territories of the Peshwa. Of his signal services on this occasion Cantonment (see Cantonment) and Madras were cited in the House of Commons: "He went into the field with not more than five or six hundred men, of whom a very small proportion were Europeans... Nine forts were surrendered to him or taken by assault on his way; and at the end of a silent and scarcely observed progress he emerged... leaving everything secure and tranquil behind him." In 1820 he was appointed governor of Madras, where he remained for the systems of revenue assessment and general administration which substantially remain to the present day. His official minutes, published by Sir A. Arbuthnot, form a manual of experience and advice for the modern civilian. He died of cholera on the 6th of July 1827, while on tour in the "ceded" districts, where his name is preserved by more than one memorial. An equestrian statue of him, by Chantrey, stands in Madras city.

See biographies by G. R. Gleig (1830), Sir A. Arbuthnot (1881) and J. Bradshaw (1894).

MUNshi, or Moonoos, the Urdu name of a writer or secretary, used in India of the native language teachers or secretaries employed by Europeans.

MÜNSTER, GEORG, COUNT ZU (1776-1844), German palae-onologist, was born on the 17th of February 1776. He formed a famous collection of fossils, which was ultimately secured by the Bavarian state, and formed the nucleus of the palaeontological museum at Munich. Count Münster assisted Goldfuss in his great work Petrefacta Germaniae. He died at Bayreuth on the 23rd of December 1844.

MÜNSTER, SEBASTIAN (1489-1552), German geographer, mathematician and Hebraist, was born at Ingelheim in the Palatinate. After studying at Heidelberg and Tübingen, he entered the Franciscan order, but abandoned it for Lutheran-ism about 1529. Shortly afterwards he was appointed court preacher at Heidelberg, where he also lectured in Hebrew and Old Testament exegesis. From 1536 he taught at Basel, where he published his Cosmographia universalis in 1544, and where he died of the plague on the 23rd of May 1552. A disciple of Elias Levi, he was the first German to edit the Hebrew Bible (2 vols., fol., Basel, 1534-1535); this edition was accom-
pounded by a new Hebrew translation and a large number of annota-
tions. He published more than one Hebrew grammar, and was the first to prepare a Grammatica haldeaica (Basel, 1527). His lexicographical labours included a Dictionarium haldeaicum (1527), and a Dictionarium irlinique, of Latin, Greek and Hebrew (1530). But his most important work was his Cosmo-
graphia, which also appeared in German as a Beschreibung aller Länder, the first detailed, scientific and popular description of the world in Münster's native language, as well as a supreme effort of geographical study and literature in the Reformation period. In this Münster was assisted by more than one hundred and twenty collaborators.

The most valued edition of the Cosmographia or Beschreibung is that of 1550, enlarged for the portrait and its city and costume pictures. Besides the works mentioned above, we may notice Münster's Germaniae descriptio of 1530, his Nume oris of 1532, his Mapa Europae of 1536, his Rhetia of 1538, his editions of Strasburg, Mela and Ptolemy, his Historia of 1538-1540 and among non-geographical treatises his Horologographia, 1531, on dialling (see Dial), his Organum uranicum of 1536 on the planetary motions, and his Rudimenta mathematica of 1551. His published maps numbered 140.

See V. Hantzsch, Sebastian Münster (1898), in vol. xviii. of the Publications of the Royal Society of Sciences, Saxony, Historical-Philological Section).

MÜNSTER, a town of Germany, in the district of Upper Alsace, 16 m. from Colmar by rail, and at the foot of the Voges Mountains. Pop. (1905), 6078. Its principal industries are spinning, weaving and bleaching. The town owes its origin to a Benedictine abbey, which was founded in the 7th century, and at one time it was a free city of the empire. In its
neighbourhood is the ruin of Schwarzenberg. The Münstertal, or Gregorieland, is watered by the river Ficht, is famous for its cheese.

**MÜNSTER**, a town of Germany, capital of the Prussian province of Westphalia, and formerly the capital of an important bishopric. It lies in a sandy plain on the Dortmund-Emms canal, at the junction of several railways, 107 m. S.W. of Bremen on the line to Cologne. Pop. (1885), 44,460; (1905) 81,468. The town preserves its medieval character, especially in the "Prinzipal-Markt" and other squares, with their lofty gabled houses and arcades. The fortifications were dismantled during the 18th century, their place being taken by gardens and promenades. Of the many churches of Münster the most important is the cathedral, one of the most striking in Germany, although disfigured by modern decorations. It was rebuilt in the 13th and 14th centuries, and exhibits a combination of Romanesque and Gothic forms; its chapter-house is specially fine. The beautiful Gothic church of St Lambert (14th century) was largely rebuilt after 1868; on its tower, which is 312 ft. in height, hang three iron cages in which the bodies of John of Leiden and two of his followers were exposed in 1536. The church of St Ludger, erected in the Romanesque style about 1170, was extended in the Gothic style about 200 years later; it has a tower with a picturesque lantern. The church of St Maurice, founded about 1070, was rebuilt during the 13th century, and the Gothic church of Our Lady dates from the 14th century. Other noteworthy buildings are the town-hall, a fine Gothic building of the 14th century, and the Stadtkeller, which contains a collection of early German paintings. The room in the town-hall called the Friedens Saal, in which the peace of Westphalia was signed in October 1648, contains portraits of many ambassadors and princes who were present at the ceremony. The Schloss, built in 1767, was formerly the residence of bishops of Münster. The private houses, many of which were the winter residences of the nobility of Westphalia, are admirable examples of German domestic architecture in the 16th, 17th and 18th centuries. The university of Münster, founded after the Seven Years' War and closed at the beginning of the 19th century, was reopened as an academy in 1818, and again attained the rank of a university in 1902. It possesses faculties of theology, philosophy and law. In connexion with it are botanical and zoological gardens, several scientific collections, and a library of 120,000 volumes. Münster is the seat of a Roman Catholic bishop and of the administrative and judicial authorities of Westphalia, and is the headquarters of an army corps. The Westphalian society of antiquaries and several other learned bodies also have their headquarters here. Industries include weaving, dyeing, brewing and printing, and the manufacture of furniture and machines. There is a brisk trade in cattle, grain and other products of the neighbourhood.

**History.**—Münster is first mentioned about the year 800, when Charlemagne made it the residence of Ludger, the newly appointed bishop of the Saxons. Owing to its distant situation from any available river or important highway, the growth of the settlement round the monasterium was slow, and it was not until after 1186 that it received a charter, the name Münster having supplanted the original name of Minegardevoord about a century earlier. During the 13th and 14th centuries the town was one of the most prominent members of the Hanseatic League. At the time of the Reformation the citizens were inclined to adopt the Protestant doctrines, but the excesses of the Anabaptists led in 1535 to the armed intervention of the bishop and to the forcible suppression of all divergence from the older faith. The Thirty Years' War, during which Münster suffered much from the Protestant armies, was terminated by the peace of Westphalia, sometimes called the peace of Münster, because it was signed here on the 24th of October 1648. The authority of the bishops, who seldom resided at Münster, was usually somewhat limited, but in 1661 Bishop Christoph Bernhard von Galen took the place by force, built a citadel, and deprived the citizens of many of their privileges. During the Seven Years' War Münster was occupied both by the French and by their foes. Towards the close of the 18th century the town was recognized as one of the intellectual centres of Germany.

The bishopric of Münster embraced an area of about 2500 sq. m., and contained about 350,000 inhabitants. Its bishops, who resided generally at Ahaus, were princes of the empire. In the 17th century Bishop Galen, with his army of 20,000 men, was so powerful that his alliance was sought by Charles II. of England and other European sovereigns. The bishopric was secularized and its lands annexed to Prussia in 1803.

See Geibis, *Merkwürdigkeiten der Stadt Münster* (1877); Erhard, *Das heilige Stad Münster* (1837); A. Tibus, *Die Stadt Münster* (Münster, 1882); Hellinghaus, *Quellen und Forschungen zur Geschichte der Stadt Münster* (Münster, 1898); Pieper, *Die alte Universität Münster* 1771-1818 (Münster, 1902). See also Tübingen, *Geschichte des Stifts Münster unter C. B. von Galen* (Münster, 1865).

**MÜNSTER**, a province of Ireland occupying the S.W. part of the island. It includes the counties Clare, Tipperary, Limerick, Kerry, Cork and Louth, in part of Leinster, &c. Owing to the occupation of Ireland by the Milesians, Münster (Umbra) became nominally a provincial kingdom; but as the territory was divided between two families there was constant friction and it was not until 327 that Oiliol Ollum established himself as king over the whole. In 248 he divided his kingdom between his two sons, giving Desmond (q.v.) to Eoghan and Thomond (Tuadh-Mumha) or north Munster to Cormac. He also stipulated that the rank of king of Munster should belong in turn to their descendants. In this way the kingship of Munster survived until 1194; but there were kings of Desmond and Thomond down to the 16th century. Munster was originally divided into three parts, the present province, excepting that it included the district of Ely, which belonged to the O'Carrons and formed a part of the present King's County. During the 16th century, however, Thomond was for a time included in Connaught, being declared a county under the name of Clare (q.v.) by Sir Henry Sidney. Part of Munster had been included in the system of shiring generally attributed to King John. In 1570 a provincial presidency of Munster (as of Connaught) was established by Sidney, Sir John Perrot being the first president, and lasted until 1672. Under Perrot a practically new shiring was carried out.

**MÜNSTER AM STEIN**, a watering-place of Germany, in the Prussian Rhine province, on the Nahe, 23 m. S. of Kruenzech, on the motorway from Königswinter to Strassburg. Pop. (1905), 915. Above the village are the ruins of the castle of Stein-graffenstein (12th century), formerly a seat of the count palatine of the Rhine, which was destroyed by the French in 1689, and those of the castle of Ebernburg, the ancestral seat of the lords of Sickingen, and the birthplace of Franz von Sickingen, the famous landsknecht captain and protector of Ulrich von Hutten, to whom a monument was erected on the slope near the ruins in 1890. The spa (sulphate and carbonate springs), specific in cases of feminine disorders, is visited by about 5000 patients annually.

See Welsch, *Das Sol- und Thermalbad Münster am Stein* (Kreuznach, 1886) and Messerschmidt, *Führer durch Bad Kreuznach und Münster am Stein* (Kreuznach, 1905).

**MÜNSTERBERG, HUGO** (1863- ). German-American physiologist, was born at Danzig. Having been extraordinary professor at Freiburg-im-Breisgau, he became in 1892 professor of experimental psychology at Harvard University. Among his more important works are Beiträge zur experimentellen Psychologie (4 vols., Freiburg, 1889-1892); *Psychology and Life* (New York, 1899); *Grundzüge der Psychologie* (Leipzig, 1900); *American Traits from the Point of View of a German* (Boston, 1895); *Educational Psychology* (New York, 1901); *Science and Idealism* (New York, 1906); *Philsophie der Werte* (Leipzig, 1908); *Aus Deutsch-Amerika* (Berlin, 1908); *Psychology and Crime* (New York, 1908). He has been prominently identified with the modern developments of experimental psychology.
MÜNSTERBERG—MÜNZER

(see Psychology), and his sociological writings display the acuteness of a German philosophic mind as applied to the study of American life and manners.

MÜNSTERBERG, a town of Germany, in the Prussian province of Silesia, on the Oblau, 36 m. by rail S. of Breslau. Pop. (1905), 8475. It is partly surrounded by medieval walls. It has drains of drain-pipes and fireproof bricks; there are also sulphur springs. Münsterberg was formerly the capital of the principality of the same name, which existed from the 14th century down to 1791, when it was purchased by the Prussian crown. Near the town is the former Cistercian abbey of Heinrichau.

MUNTÀNER, RAMON (1265-1337?), Catalan historian, was born at Peralada (Catalonia) in 1265. The chief events of his career are recorded in his chronicle. He accompanied Roger de Flor to Sicily in 1300, was present at the siege of Messina, served in the expedition of the Almogavares against Asia Minor, and became the first governor of Gallipoli. Later he was appointed governor of Jerba or Zerbi, an island in the Gulf of Gabes, and finally entered the service of the infante of Majorca. On the 17th of May 1325 (some editions give the year 1333) he began his Chronica, o descrizion de fetes, e hanzas del seny rey Don Jaume Primer, in obedience, as he says, to the express command of God who appeared to him in a vision. Muntaner's book, which was first printed at Valencia in 1538, is the chief authority for the events of his period, and his narrative, though occasionally perfunctory, uncritical and egotistical, is faithful and vivid. He is said to have died in 1336. His chronicle is most accessible in the edition published by Karl Lanz at Stuttgart in 1844.

MUNTJAC, the Indian name of a small deer typifying the genus Cervulus, all the members of which are indigenous to the southern and eastern parts of Asia and the adjacent islands, and are separated by marked characters from all their allies. For the distinctive features of the genus see Deer. As regards general characteristics, all muntjacs are small compared with the majority of deer, and have long bodies and rather short limbs and neck. The antlers of the bucks are small and simple; Muntjacs are solitary animals, even two being rarely seen together. They are fond of hilly ground covered with forests, in the dense thickets of which they pass most of their time, only coming to the skirts of the woods at morning and evening to graze. They carry the head and neck low and the hind-quarters high, their action in running being peculiar and not elegant, somewhat resembling the pace of a sheep. Though with no power of sustained speed or extensive leaping, they are remarkable for flexibility of body and facility of creeping through tangled underwood. A popular name with Indian sportsmen is "harking deer," on account of the alarm-cry—a kind of short shrill bark, like that of a fox, but louder. When attacked by dogs the males use their sharp canines, which inflict deep and even dangerous wounds.

In the Indian muntjac the height of the buck is from 20 to 22 in.; allied types, some of which have received distinct names, occur in Burma and the Malay Peninsula and Islands. Among these, the Burmese C. muntjac grandicornis is noteworthy on account of its large antlers. The Tibetan muntjac (C. lachrymans), from Moupin in eastern Tibet and Hangchow in China, is somewhat smaller than the Indian animal, with a bright reddish-brown coat. The smallest member of the genus (C. reevesi) occurs in southern China and has a reddish-brown coat, spotted with white, and a head and neck of white. The last-mentioned species, by its small rounded ears, general brown coloration, and minute antlers, connects the typical muntjacs with the small tufted deer or tufted muntjacs of the genus Euphaedra of eastern China and Tibet. These last have coarse bristly hair of a purplish-brown colour with light markings, very large head-tufts, almost concealing the minute antlers, of which the pedicles do not extend as ribs down the face. They include E. cephalophus of Tibet, E. michianus of Ningpo, and E. sanchensis of the mountains of Ichang.

MÜNZER, THOMAS (c. 1459—1523), German religious enthusiast, was born at Stolberg in the Harz near the end of the 15th century, and educated at Leipzig and Frankfort, graduating in theology. He held preaching appointments in various places, and his restless nature prevented him from remaining in one position for any length of time. In 1520 he became a preacher at the church of St Mary, Zwickau, and his rude eloquence, together with his attacks on the monks, soon raised him to influence. Aided by Nicholas Storch, he formed a society the principles of which were akin to those of the Taborites, and claimed that he was under the direct influence of the Holy Spirit. His zeal for the purification of the Church by casting out all unbelievers brought him into conflict with the governing body of the town, and he was compelled to leave Zwickau. He then went to Prague, where his preaching won numerous adherents, but his violent language brought about his expulsion from this city also. At Easter 1523 Münzner came to Allstedt, and was soon appointed preacher at the church of St John, where he made extensive alterations in the services. His violence, however, aroused the hostility of Luther, in retaliation for which Münzner denounced the Wittenberg teaching. His preaching soon produced an uproar in Allstedt, and after holding his own for some time he left the town and went to Mühlhausen, where Heinrich Pfeiffer was already preaching doctrines similar to his own. The union of Münzner and Pfeiffer caused a disturbance in this city and both were expelled. Münzner went to Nuremberg, where he issued a writing against Luther, who had been mainly instrumental in bringing about his expulsion from Saxony. About this time his teaching became still more violent. He despised established governments, and advocated the abdication of the monarchs of the Holy Roman Empire. After living in south Germany he returned to Mühlhausen, overthrew the governing body of the city, and established a communal theocracy. The Peasants' War had already broken out in various parts of Germany; and as the peasantry around Mühlhausen were imbued with MüNZER'S teaching, he collected a large body of men to plunder the surrounding country. He established his camp at Frankenhausen; but on the 15th of May 1525 the peasants were dispersed by Philipp, landgrave of Hesse, who captured MüNzer and executed him on the 27th at Mühlhausen. Before his
death he is said to have written a letter admitting the justice of his sentence.

His Aussergeärtliche Empfohlung des falschen Glaubens has been edited by R. Jordan (Mühlhausen, 1901), and a life of Müntzer, Die Geschichte des Münzingers der dörischizingen Uffir, has been attributed to Philip Melanchthon (Hagenau, 1525). See G. T. Strobel, Leben, Schriften und Lehren Thomä Münzers (Nuremberg, 1795); J. K. Seidemann, Thomas Müntzer (Leipzig, 1832); W. J. Thome, and Heinrich von Poerort (Göttingen, 1889); G. Wolfrau, Thomas Münzer in Allsiedt (Jena, 1852).

MUNZINGER, WERNER (1832-1875), Swiss linguist and traveller, was born at Olten in Switzerland, on the 21st of April 1832. After studying natural science, Oriental languages and history, at Bern, Munich and Paris, he went to Egypt in 1852 and spent a year in Cairo perfecting himself in Arabic. Entering a French mercantile house, he went as leader of a trading expedition to various parts of the Red Sea, fixing his quarters at Massawa, where he acted as French consul. In 1855 he removed to Keren, the chief town of the Bogos, in the north of Abyssinia, which country he explored during the next six years. In 1861 he joined the expedition under T. von Heuglin to Central Africa, but separated from him in November in northern Abyssinia, proceeding along the Gash and Athbara to Khartum. Thence, having meantime succeeded Heuglin as leader of the expedition, he travelled in 1862 to Kordofan, failing, however, in his attempt to reach Darfur and Wadai. After a short stay in Europe in 1865, Munzinger returned to the north and north-east border-lands of Abyssinia, and in 1865, the year of the annexation of Massawa by Egypt, was appointed British consul at that town. He rendered valuable aid to the Abyssinian expedition of 1867-68, among other things exploring the almost unknown Abar country. In acknowledgment of his services he received the C.B. In 1868 he was appointed French consul at Massawa, and in 1870, was named by the Khedive Ismail, governor of the 1875 Munzingers, started for Ankober with a force of 350 men, being accompanied by an envoy from Menelek. The desert country to be traversed was in the hands of hostile tribes, and on reaching Lake Aussa the expedition was attacked during the night by Gallas—Munzinger, with his wife and nearly all his companions, being killed.

Munzingers contributions to the knowledge of the country, people and languages of north-eastern Africa are of solid value. See Proc. R.G.S., vol. xiii.; Journ. R.G.S., vols. xxxi., xxxii., and xxxiii. (obituary notice); Potsmannen Mitteilungen für 1858, 1867, 1872 et seq.; Dietlicher and Weber, Werner Münzinger, ein Lebensbild (1875); J. v. Keller-Zschokke, Werner Münzinger Pasha (1860). Munzingers published the following works: Über die Sitten und das Recht der Bogos (1859); Ostafrikanische Studien (1864); 2nd ed., 1883; his most valuable book; Die deutsche Expedition in O斯塔frika (1855); Vocabulaire de la langue de Yépi (1865), besides papers in the geographical serials referred to, and a memoir on the northern borders of Abyssinia in the Zeitschrift für allgemeine Erdkunde, new series, vol. iii.

MURAD, OF AMURATH, the name of five Ottoman sultans.

Murad I., surnamed Khudavendigahar (1319-1389), was the son of Orhan and the Greek princess Nilofar, and succeeded his father in 1359. He was the first Turkish monarch to obtain a definite footing in Europe, and his main object throughout his career was to extend the European dominions of Turkey. The revolt of the prince of Caramania interfered with the realization of this plan, and trouble was caused from this quarter more than once during his reign until the decisive battle of Konia (1387), when the power of the prince of Caramania was broken.

The state of Europe facilitated Murad's projects: civil war and anarchy prevailed in most of the countries of Central Europe, where the feudal system was at its last gasp, and the small Balkan states were divided by mutual jealousies. The capture of Adrianople, followed by other conquests, brought about a coalition under the king of Hungary against Murad, but his able lieutenant Lalashahin, the first beylerbey of Rumelia, defeated the Hague forces in the battle of the Murata in 1563. In 1566 the king of Servia was defeated at Samokov, and the frontier was pushed forward to pay tribute. Kustendil, Philippiopolis and Nish fell into the hands of the Turks; a renewal of the war in 1581 led to the capture of Sofia two years later. Europe was now aroused; Lazar, king of Servia, formed an alliance with the Albanians, the Hungarians and the Moldavians against the Turks. Murad hastened back to Europe and met his enemies on the field of Kosovo (1389). Victory finally inclined to the side of the Turks. When the rout of the Christians was complete, a Servian named Milosh Kabilovich penetrated to Murad's tent on pretence of communicating an important secret to the sultan, and stabbed the conqueror. Murad was of independent character and remarkable intelligence. He was fond of pleasure and luxury, cruel and cunning. Long relegated to the command of a distant province in Asia, while his brother Suleiman occupied an enviable post in Europe, he became revengeful; thus he exercised great cruelty in the repression of the rebellion of his son Prince Sauji, the first instance of a sultan's son taking arms against his father. Murad transferred the Ottoman capital from Brusa to Adrianople, where he built a palace and added many embellishments to the town. The development of the feudal system of timars and ziamets and its extension to Europe was largely his work.

Murad II. (1405-1451) succeeded his father Mahommed I. in 1421. The attempt of his uncle Prince Mustafa to usurp the throne, supported as it was by the Greeks, gave trouble at the outset of his reign, and led to the unsuccessful siege of Constantinople in 1422. Murad maintained a long struggle against the Bosnians and Hungarians, in the course of which Turkey sustained many severe reverses through the valour of Janos Hunyadi. Accordingly in 1444 he concluded a treaty at Szegedin for ten years, by which he renounced all claim to Servia and recognized George Brancovich as its king. Shortly after this, being deeply affected by the death of his eldest son Prince Ala-ud-in, he abdicated in favour of Mahommed, his second son, then fourteen years of age. But the treacherous attack, in violation of treaty, by the Christian powers, imposing too hard a task on the inexperienced young sovereign, Murad returned from his expedition, enraged his unfortunate enemies at the battle of Varna (November 10, 1444), and again withdrew to Magnesia. A revolt of the janissaries induced him to return to power, and he spent the remaining six years of his life in warfare in Europe, defeating Hunyadi at Kossovo (October 17-19, 1448). He died at Adrianople in 1451, and was buried at Brusa. By some considered as a fanatical devotee, and by others as given up to mysticism, he is generally described as kind and gentle in disposition, and devoted to the interests of his country.

Murad III. (1496-1555), was the eldest son of Selim II, and ascended the throne in 1497. His accession marks the definite beginning of the decline of the Ottoman power, which had only been maintained under Selim II. by the genius of the all-powerful grand vizier Mahommed Sokollu. For, though Sokollu remained in office until his assassination in October 1578, his authority was undermined by the harem influences, which with Murad III. were supreme. Of these the most powerful was that of the sultan's chief wife, named Safi (the pure), a beautiful Venetian of the noble family of Baffo, whose father had been governor of Corfu, and who had been captured as a child by Turkish corsairs and sold into the harem. This lady, in spite of the sultan's sensuality and of the efforts, temporaril successul, to supplant her in his favour, retained her ascendancy over him to the last. Murad had none of the qualities of a ruler. He was good-natured, though cruel enough on occasion: his accession had been marked by the murder, according to the
custom then established, of his five brothers. His will-power had early been undermined by the opium habit, and was further weakened by the sensual excesses that ultimately killed him. Nor had he any taste for rule; his days were spent in the society of musicians, buffoons and poets, and he himself dabbled in verse-making of a mystic tendency.

His one attempt at reform, the order forbidding the sale of intoxicants so as to stop the growing intemperance of the janissaries, broke down on the opposition of the soldiery. He was the first sultan to share personally in the proceeds of the corruption which was undermining the state, realizing especially large sums by the sale of offices. This corruption was fatally apparent in the army, the feudal basis of which was sapped by the confiscation of fields for the benefit of nominees of favourites of the harem, and by the intrusion, through the same influences of foreigners and rayahs into the corps of janissaries, of which the discipline became more and more relaxed and the temper increasingly turbulent. In view of this general demoralization not even the victorious outcome of the campaigns in Georgia, the Crimea, Daghestan, Yemen and Persia (1578–1590) could prevent the decay of the Ottoman power; indeed, by weakening the Musulman states, they hastened the process, since they facilitated the advance of Russia to the Black Sea and the Caspian.

Murad, who had welcomed the Persian War as a good opportunity for ridding himself of the presence of the janissaries, whom he dreaded, had sooncause to fear their triumphant return. Incensed by the debasing of the coinage, which robbed them of part of their pay, they invaded the Divan clamouring for the heads of the sultan’s favourite, the beylerbey of Rumelia, and of the defterdar (finance minister), which were thrown to them (April 3, 1580). This was the first time that the janissaries had invaded the palace: a precedent to be too often followed. The outbreak of another European war in 1592 gave the sultan an opportunity of ridding himself of their presence. Murad died in 1595, leaving to his successor a legacy of war and anarchy.

It was under Murad III, that England’s relations with the Porte began. Negotiations were opened in 1570 with Queen Elizabeth through certain British merchants; in 1580 the first Capitulations with England were signed; in 1583 William Harebone, the first British ambassador to the Porte, arrived at Constantinople, and in 1593 commercial Capitulations were signed with England granting the same privileges as those enjoyed by the French. (See Capitulations.)

Murad IV. (1611–1640) was the son of Sultan Ahmed I., and succeeded his uncle Mustafa I. in 1623. For the first nine years of his reign his youth prevented him from taking more than an observer’s part in affairs. But the lessons thus learnt were sufficiently striking to mould his whole character and policy. The minority of the sultan gave full play to the anarchic elements in the state; the soldiery, spahis and janissaries, conscious of their power and reckless through impunity, rose in revolt whenever the whim seized them, demanding privileges and the heads of those who displeased them, not sparing even the sultan’s favourites. In 1631 the spahis of Asia Minor rose in reprisal for an act of protest against the deposition of the grand vizier Khosrev; their representatives crowded to Constantinople, stoned the new grand vizier, Hafiz, in the court of the palace, and pursued the sultan himself into the inner apartments, clamouring for seventeen heads of his advisers and favourites, on penalty of his own deposition. Hafiz was surrendered, a voluntary martyr; other ministers were deposed; Mustafa Pasha, agha of the janissaries, was saved by his own troops. But Mured was now beginning to assert himself. Khosrev was executed in Asia Minor by his orders; a plot of the spahis to depose him was frustrated by the loyalty of Koes Mahomed, agha of the janissaries, and of the spahi Rum Mahomed (Mahomed the Greek); and on the 20th of May 1632, by a successful personal appeal to the loyalty of the janissaries, Murad crushed the rebels, whom he surrounded in the Hippodrome. At the age of twenty he found himself possessed of effective autocratic power.

His severity has remained legendary. Death was the penalty for the least offence, and no past services—as Koes Mahomed was to find to his cost—were admitted in extenuation. The use of tobacco, coffee, opium and wine were forbidden on pain of death; eighteen persons are said to have been put to death in a single day for infringing this rule. During his whole reign, indeed, supposed offenders against the sultan’s authority were done to death, singly or in thousands. The tale of his victims is said to have exceeded 100,000.

But if he was the most cruel, Murad was also one of the most manly, of the later sultans. He was of gigantic strength, which he maintained by constant physical exercises. He was also fond of hunting, and for this reason usually lived at Adrianople. He broke through the alleged tradition, bequeathed by Suleiman the Magnificent to his successors, that the sultan should not command the troops in person, and took command in the Persian war which led to the capture of Bagdad (1638) and the conclusion of an honourable peace (May 7, 1639). Early in 1640 he died, barely twenty-nine years of age. The cause of his death was acute gout brought on by excessive drinking. In spite of his drunkenness, however, Murad was a bigoted Sunni, and the main cause of his campaign against Persia was his desire to extirpate the Shia heresy. In the intervals of his campaigns and cruelties the sultan would amuse his entourage by exhibiting feats of strength, or compose verses, some of which were published under the pseudonym of Muradi.

See, for details of the lives of the above, J. von Hammer-Purgstall, Geschichte des osmanischen Reiches (Fest, 1840), where further authorities are cited.

Murad V. (1840–1894), eldest son of Sultan Abd-ul-Mejid, was born on the 21st of September 1840. On the accession of his uncle Abd-ul-Aziz, Prince Mahomed Murad Effendi—as he was then called—was deprived of all share in public affairs and imprisoned, owing to his opposition to the sultan’s plan for altering the order of succession. On the deposition of Abd-ul-Aziz on the 30th of May 1876, Murad was haled from his prison by a mob of softas and soldiers of the “Young Turkey” party under Suleiman Pasha, and proclaimed “emperor by the grace of God and the will of the people.” Three months later, however, his health, undermined by his long confinement, gave way; and on the 31st of August he was deposed to make room for his younger brother, Abd-ul-Hamid II. He was kept in confinement in the Cheregan palace till his death on the 29th of August 1904.

See Kéfény, Mourad V., prince, sultan, prisonnier d’état 1840–1876 (Paris, 1878); Djemaleddin Bey, Sultan Murad V., the Turkish Dynasty Mystery, 1870–1895 (London, 1895).

MURAENA, the name of an eel common in the Mediterranean, and highly esteemed by the ancient Romans; it was afterwards applied to the whole genus of fishes to which the Mediterranean species belongs, and which is abundantly represented in tropical and sub-tropical seas, especially in rocky parts or on coral reefs. Some ninety species are known. In the majority a long fin runs from the head along the back, round the tail to the vent,
but all are destitute of pectoral and ventral fins. The skin is scaleless and smooth, in many species ornamented with varied and bright colours, so that these fishes are frequently mistaken for snakes. The mouth is wide, the jaws strong and armed with formidable, generally sharp-pointed, teeth, which enable the *Muraena* not only to seize its prey (which chiefly consists of other fishes) but also to inflict serious, and sometimes dangerous, wounds on its enemies. It attacks persons who approach its places of concealment in shallow water, and is feared by fishermen.

Some of the tropical *Muraenae* exceed a length of 10 ft., but most of the species, among them the Mediterranean species, attain to only half that length. The latter, the "morena" of the Italians and the *Muraena helena* of ichthyologists, was considered by the ancient Romans to be one of the greatest delicacies, and was kept in large ponds and aquaria. It is not confined to the coasts of Southern Europe, but is spread over the Indian Ocean, and is not uncommon on the coasts of Australia. Its body is generally of a rich brown, marked with large yellowish spots, each of which contains smaller brown spots.

**Mural Decoration**, a general term for the art of ornamenting wall surfaces. There is scarcely one of the numerous branches of decorative art which has not at some time or other been applied to this purpose. For what may be called the practical or furnishing point of view, see *Wall-coverings*. Here the subject is treated rather as part of the history of art.

1. *Reliefs sculptured in Marble or Stone.*—This is the oldest method of wall-decorations, of which numerous examples exist. The tombs and temples of Egypt are rich in this kind of mural ornament of various dates, extending over nearly 5000 years. These sculptures are, as a rule, carved in low relief; in many cases they are "counter-sunk," that is, the most projecting parts of the figures do not extend beyond the flat surface of the ground. Some unfinished reliefs discovered in the rock-cut tombs of Thebes show the manner in which the sculptor set to work. The plain surface of the stone was marked out by red lines into a number of squares of equal size. The use of this was probably twofold: first, as a guide in enlarging the design from a small drawing, a method still commonly practiced; second, to help the artist to draw his figures with just proportions, following the strict canons which were laid down by the Egyptians. No excessive realism or individuality of style arising from a careful study of the life-model was permitted. When the surface had been covered with these squares, the artist drew with a brush dipped in red the outlines of his relief, and then cut round them with his chisel.

When the relief was finished, it was, as a rule, entirely painted over with much minuteness and great variety of colours. More rarely the ground was left the natural tint of the stone or marble, and only the figures and hieroglyphs painted. In the case of sculpture in hard basalt or granite the painting appears often to have been omitted altogether. The absence of perspective effects and the severe self-restraint of the sculptors in the matter of composition show a sense of artistic fitness in this kind of decoration. That the rigidity of these sculptured pictures did not arise from want of skill or observation of nature on the part of the artists is apparent when we examine their representations of birds and animals; the special characteristics of each creature and species were unerringly caught by the ancient Egyptian, and reproduced in stone or colour, in a half-symbolic way, suggesting those peculiarities of form, plumage, or movement which are the "differentia" of each, other ideas bearing less directly on the point being eliminated.

The subjects of these mural sculptures are endless; almost every possible incident in man's life here or beyond the grave is rendered with the closest detail. The tomb of TIh at Sakkarah (about 4500 B.C.) has some of the finest and earliest specimens of these mural sculptures, especially rich in illustra-

1 See also *Ceramics; Mosaic; Painting; Sculpture; Tapestry; Tiles; also Egypt; Art and Archaeology; Greek Art; Roman Art; &c.*

During the earliest times—more than 4000 years before our era—there appear to have been exceptions to this rule.

Fig. 1.—Assyrian Relief, on a Marble Wall-slab from the Palace of Sardana-palus at Nineveh.

in long horizontal bands, and their reserved conventional treatment are somewhat similar to those of ancient Egypt, but they show a closer attention to anatomical truth and a greater love for dramatic effect than any of the Egyptian reliefs. As in the art of Egypt, birds and animals are treated with greater realism than human figures. A relief in the British Museum, representing a lioness wounded by an arrow in her spine and dragging helplessly her paralysed hind legs, affords an example of wonderful truth and pathos. Remarkable technical skill is shown in all these sculptures by the way in which the sculptors have obtained the utmost amount of effect with the smallest possible amount of relief, in this respect calling strongly to mind a similar peculiarity in the work of the Florentine Donatello.

ThesalipalacesatMashitaonthe bajjroadinMoab, built by the Sasanian Chosroes II. (A.D. 614-629), is ornamented on the exterior with beautiful surface sculpture in stone. The designs are of peculiar interest as forming a link between Assyrian and Byzantine art, and they are not remotely connected with the decoration on Moslem buildings of comparatively modern date.3

Especially in Italy during the middle ages a similar treatment 4 Among the Mashita carvings occurs that oldest and most widely spread of all forms of Aryan ornament—the sacred tree between two animals. The sculptured slab over the "lion-gate" at Mycenae has the other common variety of this motive—the fret-saw between the beasts. These designs, occasionally varied by figures of human worshippers instead of the beasts, survived long after their meaning had been forgotten; even down to the present day they frequently appear on carpets and other textiles of Oriental manufacture.
of marble in low relief was frequently used for wall-decoration. The most notable example is the beautiful series of reliefs on the west front of Orvieto Cathedral, the work of Giovanni Pisano and his pupils in the early part of the 14th century. These are small reliefs, illustrative of the Old and New Testaments, of graceful design and skillful execution. A growth of branching foliage serves to unite and frame the tiers of subjects.

Of a widely different class, but of considerable importance in the history of mural decoration, are the beautiful reliefs, sculptured in stone and marble, with which Moslem buildings in many parts of the world are ornamented. These are mostly geometrical patterns of great intricacy, which cover large surfaces, frequently broken up into panels by bands of more flowing ornament or Arabic inscriptions. The mosques of Cairo, India and Persia, and the domestic Moslem buildings of Spain are extremely rich in this method of decoration. In western Europe, especially during the 15th century, stone panelled-work with rich tracery formed a large part of the scheme of decoration in all the more splendid buildings. Akin to this, though without actual relief, is the stone tracery—inlaid flush into rough flint walls—which was a mode of ornament largely used for enrichment of the exteriors of churches in the Romanesque and Norman periods. It is almost peculiar to the district, and is an example of the skill and taste with which the medieval builders adapted their method of ornamentation to the materials in hand.

2. Marble Veneer.—Another widely used method of mural decoration has been the application of thin marble lineings to wall-surfaces, the decorative effect being produced by the natural beauty of the marble itself and not by sculptured reliefs. One of the oldest buildings in the world, the so-called "Temple of the Sphinx" among the Giza pyramids, is built of great blocks of granite, the inside of the rooms being lined with slabs of semi-transparent African alabaster about 3 in. thick. In the 1st century A.D. the veneers of richly coloured marbles were largely used by the Romans to decorate brick and stone walls. Pliny (H. N. xxxvi. 6) speaks of this practice as being a new and degenerate invention in his time. Many examples exist at Pompeii and in other Roman buildings. Numerous Byzantine churches, such as St. Saviour's at Constantinople, and St. George's, Thessalonica, have the lower part of the internal walls richly ornamented in this way. It was commonly used to form a dado, the upper part of the building being covered with mosaic. The cathedral of Monreale and other Siculo-Norman buildings owe a great deal of their splendour to these lineings of richly variegated marbles. In most cases the main surface is of light-coloured marble or alabaster, inlaid bands of darker tint or coloured mosaic being used to divide the surface into panels. The peculiar Italian-Gothic of northern and central Italy during the 14th and 15th centuries, and at Venice some centuries earlier, relied greatly for its effects on this treatment of marble. St Mark's at Venice and the cathedral of Florence are magnificent examples of this work used externally. Both inside and out most of the richest examples of Moslem architecture owe much to this method of decoration; the mosques and palaces of India and Persia are in many cases completely lined with the most brilliant sorts of marble of contrasting tints.

3. Wall-Lineings of Glazed Bricks or Tiles.—This is a very important class of decoration, and from its almost imperishable nature, its richness of colour, and its brilliance of surface is capable of producing a splendour of effect only rivalled by glass mosaics. In the less important form—that of bricks modelled or stamped in relief with figures and inscriptions, and then coated with a brilliant colour in siliceous enamel—it was largely used by the ancient Egyptians and Assyrians as well as by the later Sasanians of Persia. In the 11th and 12th centuries the Moslems of Persia brought this art to great perfection, and used it on a large scale, chiefly, though not invariably, for internal walls. The main surfaces were covered by thick earthenware tiles, overlaid with a white enamel. These were not rectangular, but of various shapes, mostly some form of a star, arranged so as to fit closely together. Delicate and minute patterns were then painted on the tiles, after the first firing, in a copper-like colour with strong metallic lustre, produced by the deoxidization of a metallic salt in the process of the second firing. Bands and friezes with Arabic inscriptions, modelled boldly in high relief, were used to break up the monotony of the surface. In these, as a rule, the projecting letters were painted blue, and the flat ground enriched with very minute patterns in the lustre-colour.

This combination of bold relief and delicate painting produces great vigour and richness of effect, equally telling whether viewed in the mass or closely examined tile by tile. In the 15th century lustre-colours, though still largely employed for plates, vases and other vessels, especially in Spain, were little used for tiles; and another class of ware, rich in the variety and brilliance of its colours, was extensively used by Moslem builders all over the Mahommedan world. The most sumptuous sorts of tiles used for wall-coverings are those of the so-called "Rhodian" and Damascene wares, the work of Persian potters at many places. Those made at Rhodes are coarsely executed in comparison with the produce of the older potteries at Isfahan and Damascus (see Ceramics). These are rectangular tiles of earthenware, covered with a white "slip," and painted in brilliant colours with slight conventionalized representations of various flowers, especially the rose, the hyacinth and the carnation. The red used is applied in considerable body, so as to stand out in slight relief. Another class of design is more geometrical, forming regular repeats; but the most beautiful compositions are those in which the natural growth of trees and flowers is imitated, the branches and blossoms spreading over a large surface covered by hundreds of tiles without any repetition. One of the finest examples is the "Mecca wall" in the mosque of Ibrahim Agha, Cairo; and other Egyptian mosques are adorned in the same way (fig. 2). Another variety, the special production of Damascus, has the design almost entirely executed in blue. It was about A.D. 1600, in the reign of Shah Abbas I., that this class of pottery was brought to greatest perfection, and it is in Persia that the most magnificent examples are found, dating from the 12th to the 17th centuries. The most remarkable examples for beauty and extent are the mosque at Tabriz, built by Ali Khoja in the 12th century, the ruined tomb of Sultan Khodabend (A.D. 1303-1316) at Sultaniyas, the palace of Shah Abbas I. and the tomb of Abbas II. (d. A.D. 1666) at Isfahan, all of which buildings are covered almost entirely inside and out.

Another important class of wall-tiles are those manufactured by the Spanish Moors, called "azulejos," especially during the 14th century. These are in a very different style, being designed.
to suggest or imitate mosaic. They have intricate interlacing geometrical patterns marked out by lines in slight relief; brilliant enamel colours were then burned into the tile, the projecting lines forming boundaries for the pigments. A rich effect is produced by this combination of relief and colour. They are mainly used for dadoes about 4 ft. high, often surmounted by a band of tiles with painted inscriptions. The Alhambra and Generalife Palaces at Granada, begun in the 13th century, but mainly built and decorated by Yūsuf I and Mahommed V. (A.D. 1313-1351), and the Alcazar at Seville have the most beautiful examples of these “azulejos.” The latter building chiefly owes its decorations to Pedro the Cruel (A.D. 1364), who employed Moorish workmen for its tile-coverings and other ornaments. Many other buildings in southern Spain are enriched in the same way, some as late as the 16th century.

Almost peculiar to Spain are a variety of wall-tile the work of Italians in the 16th and 17th centuries. These are effective, though rather coarsely painted, and have a rich yellow as the predominant colour. The Casa de Pilatos and Isabel’s Chapel in the Alcazar Palace, both at Seville, have the best specimens of these, dating about the year 1500. In other Western countries tiles have been used more for pavements than for wall-decoration.

4. Wall-Coverings of Hard Stucco, frequently enriched with Reliefs.—The Greeks and Romans possessed the secret of making a hard kind of stucco, creamy in colour, and capable of receiving a polish like that of marble; it would stand exposure to the weather. Those of the early Greek temples which were built, not of marble, but of stone, such as the Doric temples at Aegina, Phigaleia, Paestum and Agrigentum, were all entirely coated inside and out with this material, an admirable surface for the further polychromatic decoration with which all Greek buildings seem to have been ornamented. Another highly artistic use of stucco among the Greeks and Romans, for the interiors of buildings, consisted in covering the walls and vaults with a smooth coat, on which while still wet the outlines of figures, groups and other ornaments were sketched with a point; more stucco was then applied in lumps and rapidly modelled into delicate relief before it had time to set. Some tombs in Magna Graecia of the 4th century B.C. are decorated in this way with figures of nymphs, cupids, animals and wreaths, all of which are models of grace and elegance, and remarkable for the dexterous way in which a few rapid touches of the modelling tool or thumb have produced a work of the highest artistic beauty (fig. 3). Roman specimens of this sort of decoration are common, fine examples have been found in the baths of Titus and numerous tombs near Rome, as well as in many of the houses of Pompeii.

These are mostly executed with great skill and frequently with good taste, though in some cases, especially at Pompeii, elaborate architectural compositions with awkward attempts at effects of violent perspective, modelled in slight relief on flat wall-surfaces, produce an unpleasing effect. Other Pompeian examples, where the surface is divided into flat panels, each containing a figure or group, have great merit for their delicate richness, without offending against the canons of wall-decoration, one of the first conditions of which is that no attempt should be made to disguise the fact of its being a solid wall and a flat surface.

The Moslem architects of the middle ages made great use of stucco ornament both for external and internal walls. The stucco is modelled in high or low relief in great variety of geometrical patterns, alternating with bands of more flowing ornament or long Arabic inscriptions. Many of their buildings, such as the mosque of Tulūn at Cairo (A.D. 879), owe nearly all their beauty to this fine stucco work, the purely architectural shell of the structure being often simple and devoid of ornament. These stucco reliefs were, as a rule, further decorated with delicate painting in gold and colours. The Moorish tower at Segovia in Spain is a good example of this class of ornament used externally. With the exception of a few bands of brick and the stone quoins at the angles, the whole exterior of the tower is covered with a network of stucco reliefs in simple geometrical patterns. The Alhambra at Granada and the Alcazar at Seville have the richest examples of this work. The lower part of the walls is lined with marble or tiles to a height of about 4 ft. and above that in many cases the whole surface is encrusted with these reliefs, the varied surface of which, by producing endless gradations of shadow, takes away any possible harshness from the brilliance of the gold and colours (fig. 4).

During the 16th century, and even earlier, stucco wall-reliefs were used with considerable skill and decorative effect in Italy, England and other Western countries. Perhaps the most graceful
examples are the reliefs with which Vasari in the 16th century
encrusted pillars and other parts of the court in the Florentine
Palazzo Vecchio, built of plain stone by Michelozzo in 1454.
Some are of flowing vines and other plants winding spirally
round the columns. The English examples of this work are
effectively designed, though coarser in execution. The outside
of a half-timbered house in the market-place at Newark-upon-
Trent has high reliefs in stucco of canopied figures, dating from
the end of the 15th century. The counties of Essex and Suffolk
are rich in examples of this work used externally; and many
16th-century houses in England have fine internal stucco
decoration, especially Hardwicke Hall (Derbyshire), one of the
rooms of which has the upper part of the wall enriched with
life-sized stucco figures in high relief, forming a deep frieze all
round.

5. Sgraffito.—This is a variety of stucco work used chiefly in
Italy from the 16th century downwards, and employed only for
exteriors of buildings, especially the palaces of Tuscany and
northern Italy. The wall is covered with a coat of stucco made
black by an admixture of charcoal; over this a second thin coat
of white stucco is laid. When it is all hard the design is produced
by cutting and scratching away the white skin, so as to show the
black under-coat. Thus the drawing appears in black on a white
ground. This work is effective at a distance, as it requires a
bold style of handling, in which the shadows are indicated by
cross-hatched lines more or less near together.1 Flowing arabesques mixed with grotesque figures occur most frequently in
gsgrafito. In recent years the sgraffito method has been revived;
and the result of Mr Moody's experiments may be seen on the
east wall of the Royal College of Science in Exhibition Road,
London.

6. Stamped Leather.—This was a magnificent and expensive
form of wall-hanging, chiefly used during the 16th and 17th
centuries. Skins, generally of goats or calves, were well tanned
and cut into rectangular shapes. They were then covered with
silver leaf, which was varnished with a transparent yellow lacquer
making the silver look like gold. The skins were then stamped
or embossed with patterns in relief, formed by heavy pressure
from metal dies, one in relief and the other sunk. The reliefs
were then painted by hand in many colours, generally brilliant
1 A good description of the process is given by Vasari, Tre arti del
disegno, cap. xxvi.

silver leaf, which was varnished with a transparent yellow lacquer
making the silver look like gold. The skins were then stamped
or embossed with patterns in relief, formed by heavy pressure
from metal dies, one in relief and the other sunk. The reliefs
were then painted by hand in many colours, generally brilliant

in tone. Italy and Spain (especially Cordova) were important
seats of this manufacture; and in the 17th century a large
quantity was produced in France. Fig. 5 gives a good example
of Italian stamped leather of the 16th century. In England,
chiefly at Norwich, this manufacture was carried on in the
17th and 18th centuries. In durability and richness of effect
stamped leather surpasses most other forms of movable wall-
decoration.

7. Painted Cloth.—Another form of wall-hanging, used most
largely during the 15th and 16th centuries, and in a less extensive
way a good deal earlier, is canvas painted to imitate tapestry.
English medieval inventories both of ecclesiastical and domestic
goods frequently contain items such as these: "stayed cloths for
hangings," "painted cloths with stories and batailes," or
"painted cloths of beyond sea work," or "of Flanzer's work." Many
good artists working at Ghent and Bruges during the first
half of the 15th century produced fine work of this class, as well
as designs for real tapestry. Several of the great Italian artists
devoted their skill in composition and invention to the painting
of these wall-hangings. The most important existing example
is the series of paintings of the triumph of Julius Caesar executed
by Andrea Mantegna (1485-1492) for Ludovico Gonzaga, duke
of Mantua, and now at Hampton Court. These are usually,
but wrongly, called "cartoons," as if they were designs meant
for their original purpose of real tapestries; it is not in reality,
as the paintings themselves were used as wall-hangings. They are
the same in number as the compartments of the tapestry, and each,

Fig. 5.—Italian Stamped Leather; 16th century.

each compartment, 9 ft. square, was separated from the next
by a pilaster. They form a continuous procession, with life-
sized figures, remarkable for their composition, drawing and
delicate colouring—the latter unfortunately much disguised by
"restoration." Like most of these painted wall-hangings,
they are executed in tempera, and rather thinly painted, so
that the pigment might not crack off through the cloth falling
slightly into folds. Another remarkable series of painted cloth
hangings are those at Reims Cathedral. In some cases dyes
were used for this work. A MS. of the 15th century gives
receipts for "painted cloth," showing that sometimes they were
dyed in a manner similar to that of the painted stucco
indigo vat, as well as a receipt for removing or
"discharging" the colour from a cloth already dyed. Another
method employed was a sort of "encaustic" process; the cloth
was rubbed all over with wax, and then painted in tempera;
hot wax was then applied so that the colours sank into the melting
wax, and were thus firmly fixed upon the cloth.

8. Printed Hangings and Wall-Papers.—The printing of
various textiles with dye-colours and mordants is probably one of
the most ancient arts. Pliny (ii. N. xxxv.) describes a
dying process employed by the ancient Egyptians, in which
the pattern was probably formed by printing from blocks.
Various methods have been used for this work—wood blocks in
relief, engraved metal plates, stencil plates and even hand-
painting; frequently two or more of these methods have
been employed for the same pattern. The use of printed stuffs
is of great antiquity among the Hindus and Chinese, and
was certainly practised in western Europe in the 13th century,
and perhaps earlier. The Victoria and Albert Museum has
13th-century specimens of block-printed silk made in Sicily,
of beautiful design. Towards the end of the 14th century a
great deal of block-printed linen was made in Flanders,
and largely imported into England.

Wall-papers did not come into common use in Europe till the
18th century, though they appear to have been used much
earlier by the Chinese. A few rare examples exist in England
which may be as early as the 17th century; these are imitations,
generally in flock, of the fine old Florentine and Genoese cut
velvets, and hence the style of the design in no way shows the
date of the wall-paper, the same traditional patterns being
reproduced for many years with little or no change. Machinery
enabling paper to be made in long strips was not invented till
the end of the 18th century, and up to that time wall-papers were printed on small square pieces of hand-made paper, difficult to hang, disfigured by numerous joints, and comparatively costly; on these accounts wall-papers were slow in supersedng the older modes of mural decoration. A little work by Jackson of Battersea, printed in London in 1744, throws some light on the use of wall-papers at that time. He gives reduced copies of his designs, mostly taken from Italian pictures or antique sculpture during his residence in Venice. Instead of flowing patterns covering the wall, his designs are all pictures—landscapes, architectural scenes or statues—treated as panels, with plain paper or painting between. They are all printed in oil, with wooden blocks worked with a rolling press, apparently an invention of his own. They are all in the worst possible taste, and yet are offered as great improvements on the Chinese papers which he says were then in fashion. Fig. 6 is a good English example of 18th-century wall-paper printed on squares of stout hand-made paper 22 in. wide. The design is apparently copied from an Indian chintz.

In the 19th century in England, a great advance in the designing of wall-papers was made by William Morris and his school.

9. Painting.—This is naturally the most important and the most widely used of all forms of wall-decoraion, as well as perhaps the earliest.

Egypt (see Egypt: Art and Archaeology) is the chief storehouse of ancient specimens of this, as of almost all the arts.

Owing to the intimate connexion between the sculpture and painting of early times, the remarks above as to subjects and treatment under the head of Egyptian wall-sculpture will to a great extent apply also to the paintings. It is an important fact, which testifies to the antiquity of Egyptian civilization, that the earliest paintings, dating more than 4000 years before our era, are also the cleverest both in drawing and execution. In later times the influence of Egyptian art, especially in painting, was important even among distant nations. In the 6th century B.C. Egyptian colonists, introduced by Cambyses into Persepolis, influenced the painting and sculpture of the great Persian Empire and throughout the valley of the Euphrates. In a lesser degree the art of Babylon and Nineveh had felt considerable Egyptian influence several centuries earlier. The same influence affected the early art of the Greeks and the Etrurians, and it was not till the middle of the 5th century B.C. that the further development and perfecting of art in Greece obliterated the old traces of Egyptian mannerism. After the death of Alexander the Great, when Egypt came into the possession of the Lagidae (320 B.C.), the tide of influence flowed the other way, and Greek art modified though it did not seriously alter the characteristics of Egyptian painting and sculpture, which retained much of their early formalism and severity. Yet the increased sense of beauty, especially in the human face, derived from the Greeks was counterbalanced by loss of vigour; art under the Ptolemies became a dull copyism of earlier traditions.

The general scheme of mural painting in the buildings of ancient Egypt was complete and magnificent. Columns, mouldings and other architectural features were enriched with patterns in brilliant colours; the flat wall-spaces were covered with figures-subjects, generally in horizontal bands, and the ceilings were ornamented with sacred symbols, such as the vulture or painted blue and studded with gold stars to symbolize the sky. The wall-paintings are executed in tempera on a thin skin of fine lime, laid over the brick, stone or marble to form a smooth and slightly absorbent coat to receive the pigments, which were most brilliant in tone and of great variety of tint. Not employing fresco, the Egyptian artists were not restricted to "earth colours," but occasionally used purples, pinks and greens which would have been destroyed by fresh lime. The blue used is very beautiful, and is generally laid on in considerable body—it is frequently a "small" or deep-blue glass, coloured by copper oxide, finely powdered. Red and yellow ochre, carbon-black, and powdered chalk-white are most largely used. Though in the paintings of animals and birds considerable realism is often seen (fig. 7), yet for human figures certain conventional colours are employed, e.g. white for females' flesh, red for the males, or black to indicate people of negro race. Heads are painted in profile, and little or no shading is used. Considerable knowledge of harmony is shown in the arrangement of the colours; and otherwise harsh combinations of tints are softened and brought into keeping by thin separating lines of white or yellow. Though at first sight the general colouring, if seen in a museum, may appear crude, yet it should be remembered that the internal paintings were much softened by the dim light in Egyptian buildings, and those outside were subdued by contrast with the bright sunshine under which they were always seen.

The rock-cut sepulchres of the Etrurians supply the only existing specimens of their mural painting; and, unlike the tombs of Egypt, only a small proportion appear to have been decorated in this way. The actual dates of these paintings are very uncertain, but they range possibly from about the 8th century B.C. down to almost the Christian era. The tombs which possess these paintings are

Fig. 6.—Early 18th-century Wall-Paper. (22 in. wide.)

Fig. 7.—Egyptian Wall-Painting of the Ancient Empire in the Bulak Museum.
MURAL DECORATION

mostly square-shaped rooms, with slightly-arched or gabled roofs, excavated in soft sandstone or tufa hillside. The earlier ones show Egyptian influence in drawing and in composition: they are broadly designed with flat unshaded tints, the faces in profile, except the eyes, which are drawn as if seen in front. Colours, as in Egypt, are used conventionally—male flesh red, white or pale yellow for the females, black for demons. In one respect these paintings differ from those of the Egyptians; few colours are used—red, brown, and yellow ochres, carbon-black, lime or chalk-white, and occasionally blue are the only pigments. The rock-walls are prepared by being covered with a thin skin of lime stucco, and lime or chalk is mixed in small quantities with all the colours; hence the restriction to "earth pigments," made necessary by the dampness of these subterranean chambers. The process employed was in fact a kind of fresco, though the stucco ground was not applied in small patches only sufficient for the day's work; the dampness of the rock was enough to keep the stucco skin moist, and so allow the necessary infiltration of colour from the surface. Many of these paintings when first discovered were fresh in tint and uninjured by time, but they are soon dulled by exposure to light. In the course of centuries great changes of style naturally took place; the early Egyptian influence, probably brought to Etruria through the Phoenician traders, was succeeded by an even more strongly-marked Greek influence—at first archaic and stiff, then developing into great beauty of drawing, and finally yielding to the Roman spirit, as the technique became advanced under their powerful but inartistic Roman conquerors.

Throughout this succession of styles—Egyptian, Greek and Graeco-Roman—there runs a distinct undercurrent of individuality due to the Etruscans themselves. This appears not only in the drawing but also in the choice of subjects. In addition to pictures of banquets with musicians and dancers, hunting and racing scenes, the workshops of different craftsmen and other domestic subjects, all thoroughly Hellenic in sentiment, other paintings occur which are very un-Greek in feeling. These represent the judgment and punishment of souls in a future life. Mantus, Charun and other infernal deities of the Rasena, hideous in aspect and armed withhammers, or furies depicted as black-bearded demons winged and brandishing live snakes, terrify or torture shrinking human souls. Others, not the earliest in date, represent human sacrifices, such as those at the tomb of Patroclus—a class of subjects which, though Homeric, appears rarely to have been selected by Greek painters. The constant import into Etruria of large quantities of fine Greek painted vases appears to have contributed to keep up the supremacy of Hellenic influence during many centuries, and by their artistic superiority to have prevented the development of a more original and native school of art. Though we now know Etruscan painting only from the tombs, yet Pliny mentions (H. N. xxxv. 3) that fine wall-paintings existed in his time, with colours yet fresh, on the walls of ruined temples at Ardea and Lavinium, executed, he says, before the founding of Rome. As before mentioned, the actual dates of the existing paintings are uncertain. It cannot therefore be asserted that any existing specimens are much older than 600 B.C., though some, especially at Veii, certainly appear to have the characteristics of more remote antiquity. The most important of these paintings have been discovered in the cemeteries of Veii, Caere, Tarquinii, Vulci, Cervetri and other Etruscan cities.

Even in Egypt the use of colour does not appear to have been more universal than it was among the Greeks (see GREEK ART), who applied it freely to their marble statues and reliefs, the whole of their buildings inside and out, and who no doubt were the forerunners of the somberfaced Roman artists. They appear to have cared little for pure form, and not to have valued the delicate ivory-like tint and beautiful texture of their fine Pentelic and Parian marbles, except as a ground for coloured ornament. A whole class of artists, called ἀγαλματοφύλετοι ἐγγαματί, were occupied in colouring marble sculpture, and their services were very highly valued. ¹ In some cases, probably for the sake of

¹ This process, circumlito, is mentioned by Pliny (H. N. xxxv. 40).

hiding the joints and getting a more absorbent surface, the marble, however pure and fine in texture, was covered with a thin skin of stucco made of mixed lime and powdered marble. An alabaster sarcophagus, found in a tomb near Corneto, and now in the Etruscan museum at Florence, is decorated outside with beautiful purely Greek paintings, executed on a stucco skin as hard and smooth as the alabaster. The pictures represent combats of the Greeks and Amazons. The colouring, though rather brilliant, is simply treated, and the figures are kept strictly to one plane without any attempt at complicated perspective. Other valuable specimens of Greek art, found at Herculanenum and now in the Naples Museum, are some small paintings, one of girls playing with dice, another of Theseus and the Minotaur. These are painted with miniature-like delicacy on the bare surface of marble slabs; they are almost monochromatic, and are of the highest beauty both in drawing and in gradations of shadow—quite unlike any of the Greek vase-paintings. The first-mentioned painting is signed ΛΕΞΑΝΔΡΟΣ ΑΘΗΝΑΙΟΣ. It is probable that the strictly archaic paintings of the Greeks, such as those of Polygnotus in the 5th century B.C., executed with few and simple colours, had much resemblance to those on vases, but Pliny is wrong when he asserts that, till the time of Apelles (c. 350-310 B.C.), the Greek painters only used black, white, red and yellow.² Judging from the peculiar way in which the Greeks and their imitators the Romans used the names of colours, it appears that they paid more attention to tones and shades and to the colour they produced than to the actual names. Thus Greek painters used "alabaster green," "glaucus," "gold," and Latin colour-names are now untranslatable. Homer's "winelike sea" (ἀλβα), Sophocles's "wine-coloured ivy" (Οἰδ. Κάλ.), and Horace's "purpureus oler" probably refer less to what we should call colour than to the chromatic strength of the various objects and their more or less strong powers of reflecting light, either in motion or when at rest. Nor have we any word like Virgil's "flavirus," which could be applied both to a lady's hair and to the leaf of an olive-tree.³

During the best periods of Greek art the favourite classes of subjects were scenes from: poetry, especially Homer and contemporary history. The names ποιητικῆς καὶ στοάς αἰθήματα were given to many public buildings from their walls being covered with paintings. Additional interest was given to the historical subjects by the introduction of portraits; e.g. in the great picture of the battle of Marathon (490 B.C.), on the walls of the στοὰς αἰθήματα in Athens, portraits were given of the Greek generals Miltiades, Callimachus, and others. This picture was painted about forty years after the battle by Polycnemos and Micon. One of the earliest pictures recorded by Pliny (xxxv. 8) represented a battle of the Magnesians (c. 716 B.C.); it was painted by Bularchus, a Lydian artist, and bought at a high price by King Canaudles. Many other important Greek historical paintings are mentioned by Pausanias and earlier writers. The Pompeian mosaic of the defeat of the Persians by Alexander is probably a Romanized copy from some celebrated Greek painting; it obviously was not designed for mosaic work.

Landscape painting appears to have been unknown among the Greeks, even as a background to figure-subjects. The poems especially of Homer and Sophocles show that this was not through want of appreciation of the beauties of nature, but partly, probably, because the main object of Greek painting was to tell some definite story, and also from their just sense of artistic fitness, which prevented them from attempting in their mural decorations to disguise the flat solidity of the walls by delusive effects of aerial perspective and distance.

It is interesting to note that even in the time of Alexander the Greek taste for the somewhat archaic works of the earlier painters were still appreciated. In particular Aristotle praises Polygnotus.

² Pliny's remarks on subjects such as this should be received with caution. He was neither a trained artist nor a practising artist.

³ So also a meaning unlike ours is attached to Greek technical words—by τόνες they meant, not "tone," but the gradations of light and shade, and by ἀμφότηρι the relations of colour. See Pliny, H. N. xxxv. 5; and Ruskin, Mod. Painters, pt. iv. cap. 13.
both for his power of combining truth with idealization in his portraits and for his skill in depicting men's mental characteristics; on this account he calls him ὁ θεόγραφος. Lucian too praises Polygnotus alike for his grace, drawing and colouring. Later painters, such as Zeuxis and Apelles, appear to have produced easel pictures more than mural-paintings, and these, being easy to move, were mostly carried off to Rome by the early emperors. Hence Pausanias, who visited Greece in the time of Hadrian, mentions but few works of the later artists. Owing to the lack of existing specimens of Greek painting it would be idle to attempt an account of their technical methods, but no doubt those employed by the Romans described below were derived with the rest of their art from the Greeks. Speaking of their stucco, Pliny refers its superiority over that made by the Romans to the fact that it was always made of lime by plaster and pounded in a mortar before being laid on the wall; he is here speaking of the thick stucco in many coats, not of the thin skin mentioned above as being laid on marble. Greek mural painting, like their sculpture, was chiefly used to decorate temples and public buildings, and comparatively rarely either for tombs or private buildings—at least in the days of their early republican simplicity.

A large number of Roman mural paintings (see also Roman Art) now exist, of which many were discovered in the private houses and baths of Pompeii, nearly all dating between A.D. 62, when the city was ruined by an earthquake, and A.D. 79, when it was buried by Vesuvius. A catalogue of these and similar paintings from Herculaneum and Stabiae, compiled by Professor Helbig, comprises 1566 specimens. The excavations in the baths of Titus and other ancient buildings in Rome, made in the early part of the 16th century, excited the keenest interest and admiration among the painters of that time, and largely influenced the later art of the Renaissance. These paintings, especially the "grotesques" or fanciful patterns of scroll-work and pilasters mixed with semi-realistic foliage and figures of boys, animals, and birds, designed with great freedom of touch and inventive power, seem to have fascinated Raphael during his later period, and many of his pupils and contemporaries. The "loggic" of the Vatican and of the Farnesina palace are full of carefully studied 16th-century reproductions of these highly decorative paintings. The excavations in Rome have brought to light some mural paintings of the 1st century A.D., perhaps superior in execution even to the best of the Pompeian series (see Plate).

The range of subjects found in Roman mural paintings is large—mythological, legendary, religious, and human life and even landscape (the latter generally on a small scale, and treated in an artificial and purely decorative way), and lastly history. Pliny mentions several large and important historical paintings, such as those with which Valerius Maximus Messalla decorated the walls of the Curia Hostilia, to commemorate his own victory over Hiero II. and the Carthaginians in Sicily in the 3rd century B.C. The earliest Roman painting recorded by Pliny was by Fabius, surnamed Pictor, on the walls of the temple of Salus, executed about 300 B.C. (H.N. xxxv. 4).

Pliny (xxxv. 1) laments the fact that the wealthy Romans of his time preferred the costly splendours of marble and porphyry wall-linings to the more artistic decoration of paintings by good artists. Historical painting seems then to have gone out of fashion; among the numerous specimens now existing few from Pompeii represent historical subjects; one has the scene of Massinissa and Sophonisba before Scipio, and another of a riot between the people of Pompeii and Nocera, which happened 59 A.D.

Mythological scenes, chiefly from Greek sources, occur most frequently: the myths of Eros and Dionysus are especial favourites. Only five or six relate to purely Roman mythology. We have reason to think that some at least of the Pompeian pictures are copies, probably at third or fourth hand, from celebrated Greek originals. The frequently repeated subjects of Medea meditating the murder of her children and Iphigenia at the shrine of the Tauric Artemis suggest that the motive and composition were taken from the originals of these subjects by Titianes. Those of Io and Argus, the finest example of which is in the Palatine "villa of Livia" and of Andromeda and Perseus, often repeated on Pompeian walls, may be from the originals by Nicias.

In many cases these mural paintings are of high artistic merit, though they are probably not the work of the most distinguished painters of the time, but rather of a humbler class of decorators, who reproduced, without much original invention, stock designs out of some pattern-book. They are, however, all remarkable for the rapid skill and extreme "verve" and freedom of hand with which the designs are, as it were, flung on to the walls with few but effective touches. Though in some cases the motive and composition are superior to the execution, yet many of the paintings are remarkable both for their realistic truth and technical skill. The great number of copies, however, of the frescoes of Pompeii, now in the Naples Museum, is a work of the highest merit.

In the usual scheme of decoration the broad wall-surfaces are broken up into a series of panels by pilasters, columns, or other architectural forms. Some of the panels contain pictures with figure-subjects; others have conventional ornament, or hanging festoons of fruit and flowers. The lower part of the wall is painted one plain colour, forming a dado; the upper part sometimes has a well-designed frieze of flowing ornaments. In the better class of painted walls the whole is kept flat in treatment, and is free from too great subdivision, but in many cases great want of taste is shown by the introduction of violent effects of architectural perspective, and the space is broken up by column-like or pilaster-like designs, with pictures in varying scales which have little relation to their surroundings. The colouring is on the whole pleasant and harmonious—unlike the usual chromo-lithographic copies. Black, yellow, or a rich deep red are the favourite colours for the main ground of the walls, the pictures in the panels being treated separately, each with its own background.

An interesting series of early Christian mural paintings exists in various catacombs, especially those of Rome and Naples. They are of value both as an important link in the history of art and also as throwing light on the mental state of the early Christians, which was distinctively different from the Christian thought of both the earlier and later periods. The earliest paintings of about the 4th century we find Christ represented as a beardless youth, beautiful as the artist could make him, with a lingering tradition of Greek idealization, in no degree like the "Man of Sorrows" of medieval painters, but rather a kind of genius of Christianity in whose fair outward form the peace and purity of the new faith were visibly symbolized, just as certain distinct attributes were typified in the persons of the gods of ancient Greece. The favourite early subject, "Christ the Good Shepherd" (fig. 8), is represented as Orpheus playing on his lyre to a circle of beasts, the pagan origin of the picture being shown by the Phrygian cap and by the presence of lions, panthers and other incongruous animals among the listening sheep. In other cases Christ is depicted standing with a sheep borne on His shoulders like Hermes Criophoros or Hermes Psychopompos—favourite Greek subjects, especially the former, a statue of which Pausanias (ix. 22) mentions as existing at Tanagra in Boeotia. Here again the pagan origin of the type is shown by the presence in the catacomb paintings of the pan-pipes and pedum, special attributes of Hermes, but quite foreign to the notion of Christ. Though in a degraded form, a good deal survives in some of these paintings, especially in the earlier ones, of the old classical grace of composition and beauty of drawing, notably in the above-mentioned representations where old models were copied without any adaptation to their new meaning. Those of the 5th and 6th centuries follow the classical

---

1 One instance only of a tomb-painting is mentioned by Pausanias (vii. 22). Some fine specimens have been discovered in the Crimea, but not of a very early date; see Stephan, Compie rendu, &c., (St Petersburg, 1878), &c.
A wall painting in the Museo Nazionale, at Rome, from a Roman villa discovered in 1878. Early Imperial style.
lines, though in a rapidly deteriorating style, until the introduction of a foreign—the Byzantine—element, which created a fresh starting-point on different lines. The old naturalism and survival of classical freedom of drawing is replaced by stiff, conventionally hieratic types, superior in dignity and strength to the feeble compositions produced by the degradation into which the native art of Rome had fallen. The designs of this second period of Christian art are similar to those of the mosaics,

such as many at Ravenna, and also to the magnificently illuminated MSS. For some centuries there was little change or development in this Byzantine style of art, so that it is impossible in most cases to be sure from internal evidence of the date of any painting. This to some extent applies also to the works of the earlier or pagan school, though, roughly speaking, it may be said that the least meritorious pictures are the latest in date.

These catacomb paintings range over a long space of time; some may possibly be of the 1st or 2nd century, e.g. those in the cemetery of Domitilla, Rome; others are as late as the 9th century, e.g. some full-length figures of St Cornelius and St Cyprian in the catacomb of St Callixtus, under which earlier paintings may be traced. In execution they somewhat resemble the Etruscan tomb-paintings; the walls of the catacomb passages and chambers, excavated in soft tufa, are covered with a thin skin of white stucco, and on that the mural and ceiling paintings are simply executed in earth colours. The favourite subjects of the earliest paintings are scenes from the Old Testament which were supposed to typify events in the life of Christ, such as the sacrifice of Isaac (Christ's death), Jonah and the whale (the Resurrection), Moses striking the rock, or pointing to the manna (Christ the water of life, and the Eucharist), and many others. The later paintings deal more with later subjects, either events in Christ's life or figures of saints and the miracles they performed. A fine series of these exists in the lower church of S. Clemente in Rome, apparently dating from the 6th to the 9th centuries; among these are representations of the passion and death of Christ—subjects never chosen by the earlier Christians, except as dimly foreshadowed by the Old Testament types. When Christ Himself is depicted in the early catacomb paintings it is in glory and power, not in His human weakness and suffering.

Other early Italian paintings exist on the walls of the church of the Tre Fontane near Rome, and in the Capella di S. Urbano alla Caffarella, executed in the early part of the 11th century. The atrium of S. Lorenzo fuori le mura, Rome, and the church of the Quattro Santi Incoronati have mural paintings of the first half of the 13th century, which show no artistic improvement over those at S. Clemente four or five centuries older.

It was not in fact till the second half of the 13th century that still traditional Byzantine forms and colouring began to be superseded by the revival of native art in Italy by the painters of Florence, Pisa and Siena. During the first centuries of the Christian era mural painting appears to have been for the most part confined to the representation of sacred subjects. It is remarkable that during the earlier centuries council after council of the Christian Church forbade the painting of figure-subjects, and especially those of any Person of the Trinity; but in vain. In spite of the zeal of bishops and others, who sometimes with their own hands defaced the pictures of Christ on the walls of the churches, in spite of threats of excommunication, the forbidden paintings by degrees became more numerous, till the walls of almost every church throughout Christendom were decorated with whole series of pictured stories. The useless prohibition was becoming obsolete when, towards the end of the 4th century, the learned Paulinus, bishop of Nola, ordered the two basilicas which he had built at Fondi and Nola to be adorned with wall-paintings of sacred subjects, with the special object, as he says, of instructing and refining the ignorant and drunken people. These painted histories were in fact the books of the unlearned, and we can now hardly realize their value as the chief mode of religious teaching in ages when none but the clergy could read or write.

During the middle ages, just as long before among the ancient Greeks, coloured decoration was used in the widest possible manner not only for the adornment of flat walls, but also for the enrichment of sculpture and all the fittings and architectural features of buildings, however, the material in be painted was plaster, stucco, marble or wood. It was only the damp and frost of northern climates that to some extent limited the external use of colour to the less exposed parts of the outsides of buildings. The varying tints and texture of smoothly worked stone appear to have given no pleasure to the medieval eye; and in the rare cases in which the poverty of some country church prevented its walls from being adorned with painted ornaments or pictures the whole surface of the stonework inside, mouldings and carving as well as flat wall-spaces, was covered with a thin coat of whitewash. Internal rough stonework was invariably concealed by stucco, forming a smooth ground for possible future paintings. Unhappily a great proportion of mural paintings have been destroyed which is so often the result of the modern taste, and still exist in England. It is difficult (and doubly so since the so-called "restoration" of most old buildings) to realize the splendour of effect once possessed by every important medieval church. From the tiled floor to the roof all was one mass of gold and colour. The brilliance of the mural paintings and richly coloured sculpture and mouldings was in harmony with the splendour of the oak-work—screens, stalls, and roofs—all decorated with gilding and painting, while the light, passing through stained glass, softened and helped to combine the whole into one mass of decorative effect. Colour was boldly applied everywhere, and thus the patchy effect was avoided which is so often the result of the modern taste. The partial use of painted ornament. Even the figure-sculpture was painted in a strong and realistic manner, sometimes by a wax encaustic process, probably the same as the circumstilio of classical times. In the accounts for expenses in decorating Orvieto cathedral wax is a frequent item among the materials used for painting. In one place it is mentioned that wax was supplied to Andrea Pisano (in 1345) for the decoration of the beautiful reliefs in white marble on the lower part of the west front.

From the 11th to the 16th century the lower part of the walls, generally 6 to 8 ft. from the floor, was painted with a dado—the favourite patterns till the 13th century being either a sort of sham masonry with a flower in each rectangular space (fig. 9), or a conventional representation of a curtain with
regular folds stiffly treated, pictures with figure-subjects

Above this dado ranges of were painted in tiers one above the other, each picture frequently surrounded by a painted frame with arch and gable of architectural design. Painted bands of chevron or other geometrical ornament till the 13th century, and flowing ornament afterwards, usually divide the tiers of pictures horizontally and form the top and bottom boundaries of the dado. In the case of a church, the end walls usually have figures to a larger scale.

On the east wall of the nave over the chancel arch there was generally a large painting of the "Doom" or Last Judgment. One of the commonest subjects is a colossal figure of St Christopher (fig. 10) usually on the nave wall opposite the principal entrance—selected because the sight of a picture of this saint was supposed to bring good luck for the rest of the day. Figures were also often painted on the jambs of the windows and on the piers and soffit of the arches, especially that opening into the chancel.

The little Norman church at Kempley in Gloucestershire (date about 1100) has perhaps the best-preserved specimen of the complete early decoration of a chancel.1 The north and south walls are occupied by figures of the twelve apostles in architectural niches, six on each side. The east wall had single figures of saints at the sides of the central window, and the stone barrel vault is covered with a representation of St John's apocalyptic vision—Christ in majesty surrounded by the evangelistic beasts, the seven candlesticks and other figures. The chancel arch itself and the jambs and mouldings of the windows have stiff geometrical designs, and over the arch, towards the nave, is a large picture of the "Doom." The whole scheme is very complete, no part of the internal plaster or stonework being undecorated with colour. Though the drawing is rude, the figures and their drapery are treated broadly and with dignity. Simple earth colours are used, painted in tempera on a plain white ground, which covers alike both the plaster of the rough walls and the smooth stone of the arches and jambs.

In the 13th century the painters of England reached a high point of artistic power and technical skill, so that paintings were produced by native artists equal, if not superior, to those of the same period anywhere on the Continent. The central paintings on the walls of the chapter-house and on the retable of the high altar of Westminster Abbey are not surpassed by any of the smaller works even of such men as Cimabue and Duccio di Buoninsegna, who were living when these Westminster paintings were executed. Unhappily, partly through the poverty and anarchy brought about by the French wars and the Wars of the Roses, the development of art in England made little progress after the beginning of the 14th century, and it

chamber" from the rows of fine pictures with which its walls were covered. After the 15th century the "masonry pattern" was disused for the lower parts of walls, and the chevrony and other stiff patterns for the borders were replaced by more flowing designs. The character of the painted figures became less monumental in style; greater freedom of drawing and treatment was adopted, and they cease to recall the archaic majesty and grandeur of the Byzantine mosaics.

It may be noted that during the 14th century wall-spaces unoccupied by figure-subjects were often covered by graceful flowing patterns, drawn with great freedom and rather avoiding geometrical repetition. Fig. 12, from the church of Stanley St Leonard's, Gloucestershire, is a good characteristic specimen of 14th-century decoration; it is on the walls of the chancel, filling up the spaces between the painted figures; the flowers are blue, and the lines red on a white ground. In some cases the motive of the design is taken from encaustic tiles, as at Bengeo Church, Herts, where the wall is divided into squares, each containing an heraldic lion. This imitative notion occurs during all periods—masonry, hanging curtains, tiles and architectural features such as niches and canopies being very frequently represented, though always in a simple decorative fashion with no attempt at actual deception—not probably from any fixed principle that shams were wrong, but because the good taste of the medieval painters taught them that a flat unrealistic treatment gave the best and most decorative effect. Thus in the 15th and 16th centuries the commonest forms of unpictorial wall-decoration were various patterns taken from the beautiful damasks and cut velvets of Sicily, Florence, Genoa and other places in Italy, some form of the "pine-apple" or rather "artichoke" pattern being the favourite (fig. 13), a design which, developed partly from Oriental sources, and coming to perfection at the end of the 15th century, was copied and reproduced in textiles, printed stuffs and wall-papers with but little change down to the present century—a remarkable instance of survival in design. Fig. 14 is a specimen of 15th-century English decorative painting, copied from a 14th-century Sicilian silk damask. Diapers, powderings with flowers, sacred monograms and sprays of blossom were frequently used to ornament large surfaces in a simple way. Many of these are extremely beautiful (fig. 15).

Subjects of Medieval Wall-Paintings.—In churches and domestic buildings alike the usual subjects represented on the walls were specially selected for their moral and religious teaching; either stories from the Bible and Apocrypha, or from the lives of saints, or, lastly, symbolical representations setting forth some important theological truth, such as figures of virtues and vices, or the Scala humanae salvationis, showing the perils and temptations of the human soul in its struggle to escape hell and gain paradise—a rude foreshadowing of the great scheme worked out with such perfection by Dante in his Commedia. A fine example of this subject exists on the walls of Chaldon church, Surrey.1 In the collection of saints for paintings in England, those of English origin are naturally most frequently represented, and different districts had certain local favourites. St Thomas of Canterbury was one of the most widely popular; but few examples now remain, owing to Henry VIII's special dislike to this saint and the strict orders that were issued for all pictures of him to be Destroyed. For a similar reason most paintings of saintly popes were obliterated.

Methods of Execution.—Though Eraclius, who probably wrote before the 10th century, mentions the use of an oil-medium, yet till about the 15th century mural paintings appear to have been executed in the most simple way, in tempera mainly, with earth colours applied on dry stucco; even when a smooth stone surface was to be painted a thin coat of whitening or fine gesso was laid as a ground. In the 15th century, and perhaps earlier, oil was commonly used both as a medium for the pigments and also to make a varnish to cover and fix tempera paintings. The Van Eycks introduced the use of driers of a better kind than had yet been used, and so largely extended the application of oil-painting. Before their time it seems to have been the custom to dry wall-paintings laboriously by the use of charcoal braziers, if they were in a position where the sun could not shine upon them. This is

specially recorded in the valuable series of accounts for the expenses of wall-paintings in the royal palace of Westminster during the reign of Henry III., printed in *Vetusta Monumenta*, vol. vi. (1842). All the materials used, including charcoal to dry the paintings and the wages paid to the artists, are given. The materials mentioned are *plumbum album et rubrum*, viridus, vermilio, *syn dope*, *ocre*, *azu r*, *aurum*, *corn*, *collis*, *oleum*, *vernix*.

Two foreign painters were employed—Peter of Spain and William of Florence—at sixpence a day, but the English painters seem to being broken up by some such delicate reliefs as that shown in fig. 16, so its effect was never dazzling. (W. Mo.: J. H. M.)

Mural painting in England fell into disuse in the 16th century, until attempts to revive it were made in the 19th century. For domestic purposes wood panelling, stamped leather, and tapestry were chiefly used as wall-coverings. In the reign of Henry VIII., probably in part through Holbein's influence, a rather coarse tempera wall-painting, German in style, appears to have been common. A good example of arabequesque painting of this period in black and white, rudely though boldly drawn and Holbeinesque in character, was discovered in 1881 behind the panelling in one of the canons' houses at Westminster. Other examples exist at Haddon Hall (Derbyshire) and elsewhere.

Many efforts have been made in England to revive fresco painting. The Houses of Parliament bear witness to this, the principal works there being those of William Dyce and Daniel Maclise. That of G. F. Watts, whose easel work also is generally distinguished by its mural feeling, is full of serious purpose and dignity of conception. "Buono fresco" (the painting in tempera upon a freshly laid ground of plaster while wet), "spirit fresco" or Gambier-Parry method (the painting with a spirit medium upon a specially prepared plaster or canvas ground?), and "water-glass" painting (wherein the method is similar to water-colour painting on a prepared plastered wall, the painting when finished being covered with a chemical solution which hardens and protects the surface), have both been tried. Other methods are also in the experimental stage, such as that known as Keim's, which has been successfully tried by Mrs Merritt in a series of mural paintings in a church at Chilworth. Unless, however, some means can be found of enabling the actual painted wall to resist the natural dampness of the English climate, it does not seem likely that true fresco painting can ever be naturalized in Great Britain. Of two of the few modern artists entrusted with important mural work in England, Ford Madox Brown and Frederick J. Shields, the former distinguished especially for his fine series of mural paintings in the Manchester town-hall, in recent years; the latter there adopted the modern method of painting the design upon canvas in flat oil colour, using a wax medium, and afterwards affixing the canvas to the wall by means of white lead. This is a usual method with modern decorators. Mr Shields has painted the panels of his scheme of mural decoration in the chapel of the Ascension at Bayswater, London, also upon canvas in oils, and has adopted the method of fixing them to slabs of slate facing the wall so as to avoid the risk of damp from the wall itself. Friezes and frieze panels or ceilings in private houses are usually painted upon canvas in oil and affixed to the wall or inserted upon their strainers, like pictures in a frame. (Walter Crane has used fibrous plaster panels, painting in ordinary oil colours with turpentine as a medium, as in Redcross House.)

2 It was in this method that the lunette, or panel of tempera painting, and a group of painters are producing works on panel and canvas painted in tempera or fresco secco, with yolk of egg as a medium, according to the practice of the early Italian painters and the directions of Cennino Cennini. A pure luminous quality of colour is produced, valuable in mural decoration and also durable, especially under varnish. (W. C.)

**MURANO**

anc. *Amorariun*, an island in the Venetian lagoon about 1 m. north of Venice. It is 5 m. in circumference, and a large part of it is occupied by gardens. It contained 5436 inhabitants in 1901, but was once much more populous than it is at present, its inhabitants numbering 30,000. It was a favourite resort of the Venetian nobility before they began to build their villas on the mainland; and in the 15th and 16th centuries it is gardens and casinos, of which some traces remain, were famous. It was here that the literary clubs of the Venetians, the Studiosi and the Occulti, used to meet.

4 There are very pretty little drollery, or the story of the prodigal, or the German hunting in *waterwork*, is worth a thousand of these bed-hangings and these fly-bitten tapestries."

5 See *L'Anticuarios* by Lord Leighton at the Victoria and Albert Museum were painted on the plaster wall. The same painter produced a fresco at Lyndhurst Church, Hants.
The town is built upon one broad main canal, where the tidal current runs with great force, and upon several smaller ones. The cathedral, S. Donato, is a fine basilica, of the 12th century. The pavement (of 1111) is as richly inlaid as that of St Mark's, and the mosaics of the tribune are remarkable. The exterior of the tribune is beautiful, and has been successfully restored. The church of St Peter the Martyr (1306) contains a fine picture by Gentile Bellini and other works, and S. Maria degli Angeli also contains several interesting pictures. Murano has from ancient times been celebrated for its glass manufactories. When and how the art was introduced is obscure, but there are notices of it as early as the 11th century; and in 1290 Christo- foro Bariati attempted the imitation of agate and chalcedony. From the labours of his pupil Miotto sprang that branch of the glass trade which is concerned with the imitation of gems. In the 15th century the first crystals were made, and in the 17th the various gradations of colour and iridescent glass were invented, together with the composition called "avventurine"; the manufacture of beads is now a main branch of the trade. The art of the glass-workers was taken under the protection of the Government in 1275, and regulated by a special code of laws and privileges; two fairs were held annually, and the export of all materials, such as alum and sand, which enter into the composition of glass was absolutely forbidden. With the decay of Venice the importance of Murano, that of the Murano, has been diminished; but D. Salvati (1816-1890) rediscovered many of the old processes, and eight firms are engaged in the trade, the most renowned being the Venezia Murano Company and Salvati. The municipal museum contains a collection of glass illustrating the history and progress of the art.

The island of Murano was first populated by the inhabitants of Altino. It originally enjoyed independence under the rule of its tribunes and judges, and was one of the twelve confederate islands of the lagoons. In the 12th century the doge Vital Micheli II. incorporated Murano in Venice and attached it to the Sestiere of S. Croce. From that date it was governed by a Venetian nobleman with the title of podestà whose office lasted sixteen months. Murano, however, retained its local constitution of a greater and a lesser council for the transaction of municipal business, and also the right to coin gold and silver as well as its judicial powers. The interests of the town were watched at the ducal palace by a nuncio and a solicitor; and this constitution remained in force till the fall of the republic.

MURAS, a tribe of South-American Indians living on the Amazon, from the Madeira to the Purus. Formerly a powerful people, they were defeated by their neighbours the Mundurucus in 1788. They are now partly civilized. Each village has a chief whose office is hereditary, but he has little power. The Muras are among the lowest of all Amazonian tribes.

MURAT, JOACHIM (1767-1815), king of Naples, younger son of an innkeeper at La Bastide-Fortunière in the department of Lot, France, was born on the 25th of March 1767. Destined for the priesthood, he obtained a bursary at the college of Cahors, proceeding afterwards to the university of Toulouse, where he studied canon law. His vocation, however, was certainly not sacral, and after dissipating his money he enlisted in a cavalry regiment. In 1789 he had attained the rank of maréchal des logis, but in 1790 he was dismissed the regiment for insubordination, after a period of idleness, he was enrolled through the good offices of J. B. Cavaignac, in the new Constitutional Guard of Louis XVI. (1791). In Paris he gained a reputation for his good looks, his swaggering attitude, and the violence of his revolutionary sentiments. On the 30th of May 1792, the guard having been disbanded, he was appointed sub-lieutenant in the 21st Chasseurs à cheval, with which regiment he served in the Aronne and the Pyrénées, obtaining in the latter campaign the command of a squadron. After the 9th Thermidor, however, and the proscription of the Jacobins, with whom he had conspicuously identified himself, he fell under suspicion and was recalled from the front.

Returning to Paris (1795), he made the acquaintance of Napoleon Bonaparte, another young officer out of employment, who soon gained a complete ascendancy over his vain, ambitious and unstable nature. On the 13th Vendémiaire, when Bonaparte, commissioned by Barras, beat down with cannon the armed insurrection of the Paris sections against the Convention, Murat was his most active and courageous lieutenant, and was rewarded by the lieutenant-colonelcy of the 21st Chasseurs and the appointment of first aide de camp to General Bonaparte in Italy. In the first battles of the famous campaign of 1796 Murat so distinguished himself that he was chosen to carry the captured flags to Paris. He was promoted to be general of brigade, and returned to Italy in time to be of essential service to Bonaparte at Bassano, Corona and Fort St Giorgio, where he was wounded. He was then sent on a diplomatic mission to Genoa, but returned in time to be present at Rivoli. In the advance into Tirol in the summer of 1797 he commanded the vanguard, and by his passage of the Tagliamento hurried on the preliminaries of Leoben. In 1798 he was for a short time commandant at Rome, and then accompanied Bonaparte to Egypt. At the battle of the Pyramids he led his first famous cavalry charge, and so distinguished himself in Syria that he was made general of cavalry on the 30th June 1799. He returned to France with Bonaparte, and on the 18th Brumaire led into the orangerie of Saint Cloud the sixty grenadiers whose appearance broke up the Council of Five Hundred. After the success of the coup d'état he was made commandant of the consular guard, and on the 20th of January 1800 he married Caroline Bonaparte, youngest sister of the first consul. He commanded the French cavalry at the battle of Marengo, and was afterwards made governor in the Cisalpine Republic. As commander of the army of observation in Tuscany he forced the Neapolitans to evacuate the Papal States and to accept the treaty of Florence (March 28, 1801). In January 1804 he was given the post of governor of Paris, and in this capacity appointed the military commission by which the d'Enghien was tried and shot (March 20); in May he was made marshal of the empire; in February 1805 he was made grand admiral, with the title of prince, and invested with the grand eagle of the Legion of Honour. He commanded the cavalry of the Grand Army in the German campaign of 1805, and was so conspicuous at Austerlitz that Napoleon made him grand duke of Berg and Cleves (March 15, 1806). He commanded the cavalry at Jena, Eylau, and Friedland, and in 1808 was made general-in-chief of the French armies in Spain. He entered Madrid on the 25th of March, and on the 2nd of May suppressed an insurrection in the city. He did much to prepare the events which ended in the abdication of Charles IV. and Ferdinand VII. at Bayonne; but the hopes he had cherished of himself receiving the crown of Spain were disappointed. When the 1st of August, however, he was appointed by Napoleon to the throne of Naples, vacated by the transference of Joseph Bonaparte to Spain.

King Joachim Napoleon, as he styled himself, entered Naples in September, his handsome presence and open manner gaining him instantaneous popularity. Almost his first act as king was to attack Capri, which he wrested from the British; but, this done, he returned to Naples and devoted himself to establishing his kingship according to his ideas, a characteristic blend of the vulgarity of a borghese with the essential principles of the Revolution. He dazzled the lazaroni with the extravagant splendour of his costumes; he set up a sumptuous court, created nobility, nominated marshals. With an eye to the overthrow of his legitimate rival in Sicily, he organized a large army and even a fleet; but he also swept away the last relics of the effete feudal system and took efficient measures for suppressing brigandage. From the first his relations with Napoleon were strained. The emperor upbraided him sarcastically for his "monkey tricks" (singeries); Murat ascribed to the deliberate ill-will of the French generals who served with him, and even to Napoleon, the failure of his attack on Sicily in 1810. He resented
his subordination to the emperor, and early began his pose as an Italian king by demanding the withdrawal of the French troops from Naples and naturalization as Neapolitans of all Frenchmen in the service of the state (1811). Napoleon, of course, met this demand with a curt refusal. A breach between the brothers-in-law was only averted by the Russian campaign of 1812 and Napoleon’s invitation to Murat to take command of the cavalry in the Grand Army. This was a call which appealed to all his strongest military instincts, and he obeyed it. During the disastrous retreat he showed his usual headstrong courage; but in the middle of December he suddenly threw up his command and returned to Naples. The reason of this was the suspicion which had been growing on him for two years past, that Napoleon was preparing for him the fate of the king of Holland, and that his own wife, Queen Caroline, was plotting with the emperor for his dethronement. To Marshal Davout, who pointed out to him that he was only king of Naples “by grace of the emperor and the blood of Frenchmen,” he replied that he was king of Naples as the emperor of Austria was emperor of Austria, and that he could do as he liked. He was, in fact, already dreaming of exchanging his position of a vassal king of the French Empire for that of a national Italian king. In the enthusiastic reception that awaited him on his return to Naples on the 4th of February there was nothing to dispel the belief that Italian patriots flocked round him, flattering and cajoling him: the patriots, because he seemed to them loyal and glorious enough to assume the task of Italian unification; the partisans of the dispossessed princes, because they looked upon him as a convenient instrument and as simple enough to be made an easy dupe.

From this moment dates the importance of Murat in the history of Europe during the next few years. He at once, without consulting his minister of foreign affairs, despatched Prince Carlati on a confidential mission to Vienna; if Austria would secure the renunciation of his rights by King Ferdinand and guarantee the possession of the kingdom of Naples to himself, he would place his army at her disposal and give up his claims to Sicily. Austria herself, however, had not as yet broken definitively with Napoleon, and before she openly joined the Grand Alliance, after the illusory congress of Prague, many things had happened to make Murat change his mind. He was offended by Napoleon’s bitter letters and by tales of his slighting comments on himself; he was alarmed by the emperor’s scarcely veiled threats; but after all he was a child of the Revolution and a born soldier, with all the soldier’s instinct of loyalty to a great leader, and he grasped eagerly at any excuse for believing that Napoleon, in the event of victory, would maintain him on his throne. Then came the emperor’s advance into Germany, supported as yet by his allies of the Rhénish Confederation. On the fatal field of Leipzig Murat’s troops were defeated on Napoleon’s side, leading the French squadrons with all his old valour and dash. But this crowning catastrophe was too much for his wavering faith. On the evening of the 16th of October, the first day of the battle, Metternich found means to open a separate negotiation with him: Great Britain and Austria would, in the event of Murat’s withdrawal from Napoleon’s army and refusal to send reinforcements to the viceroy of Italy, secure the cession to him of Naples by King Ferdinand, guarantee him in its possession, and obtain for him further advantages in Italy. To accept the Austrian advances seemed now his only chance of continuing to be a king. At Erfurt he asked and obtained the emperor’s leave to return to Naples; “our adieux,” he said, “were not over-cordial.”

He reached Naples on the 4th of November and at once informed the Austrian envoy of his wish to join the Allies, suggesting that the Papal States, with the exception of Rome and the surrounding district, should be made over to him as his reward. On the 31st of December Count Neipperg, afterwards the lover of the empress Marie Louise, arrived at Naples with powers to treat. The result was the signature, on the 10th of January 1814, of a treaty by which Austria guaranteed to Murat the throne of Naples and promised her good offices to secure the assent of the other Allies. Secret additional articles stipulated that Austria would use her good offices to secure the renunciation by Ferdinand of his rights to Naples, in return for an indemnity to hasten the conclusion of peace between Naples and Great Britain, and to augment the Neapolitan kingdom by territory embracing 400,000 souls at the expense of the states of the Church.

The project of the treaty having been communicated to Castlereagh, he replied by expressing the willingness of the British government to conclude an armistice with “the person exercising the government of Naples” (Jan. 22), and this was accordingly signed on the 3rd of February by Bentinck. It was clear that Great Britain had no intention of ultimately recognizing Murat’s right to reign. As for Austria, she would be certain that Murat’s own folly would, sooner or later, give her an opportunity for repudiating her engagements. For the present the Neapolitan alliance would be invaluable to the Allies for the purpose of putting an end to the French domination in Italy. The plot was all but spoiled by the prince royal of Sicily, who in an order of the day announced to his soldiers that their legitimate sovereign had not renounced his rights to the throne of Naples (Feb. 20); from the Austrian point of view it was compromised by a proclamation issued by Bentinck at Leghorn on the 14th of March, in which he called on the Italians to rise in support of the “great cause of their fatherland.” From Dijon Castlereagh promptly wrote to Bentinck (April 3) to say that the proclamation of the prince of Sicily must be disavowed, and that if King Ferdinand did not behave properly Great Britain would recognize Murat’s title. A letter from Metternich to Marshal Bellegarde, of the same place and date, insisted that Bentinck’s operations must be altered; the last thing that Austria desired was an Italian national rising.

It was, indeed, by this time clear to the allied powers that Murat’s ambition had o’erleaped the bounds set for them. “Murat, a true son of the Revolution,” wrote Metternich, in the same letter, “did not hesitate to form projects of conquest; he would have been limited in simple calculations as to how to preserve his throne... He dreamed of a partition of Italy between him and us... When we refused to annex all Italy north of the Po, he saw that his calculations were wrong, but refused to abandon his ambitions. His attitude is most suspicious.” “Press the restoration of the grand-duke in Tuscany,” wrote Castlereagh to Bentinck; “this is the true touchstone of Murat’s intentions. We must not suffer him to carry out his plan of extended dominion; but neither must we break with him and so abandon Austria to his augmented intrigues.”

Meanwhile, Murat had formally broken with Napoleon, and on the 16th of January the French envoy quit Naples. But the treason by which he hoped to save his throne was to make its loss inevitable. He had betrayed Napoleon, only to be made the cat’s-paw of the Allies. Great Britain, even when descending to negotiate with him, had never recognized his title; she could afford to humour Austria by holding out hopes of ultimate recognition, in order to detach him from Napoleon; for Austria alone of the Allies was committed to him, and Castlereagh well knew that, when occasion should arise, her obligations would not be suffered to hamper her interests. With the downfall of Napoleon Murat’s defection had served its turn; moreover, his equivocal conduct during the campaign in Italy had blunted the edge of whatever gratitude the powers may have been disposed to feel; his ambition to unite all Italy south of the Po under his crown was manifest, and the statesmen responsible for the re-establishment of European order were little likely to do violence to their legitimist principles in order to maintain on his throne a revolutionary sovereign who was proving himself so potent a centre of national unrest.

At the very opening of the congress of Vienna Talleyrand, with astounding effrontery, affected not to know “the man”

1 He had contributed to the defeats of the viceroy Prince Eugène in January and February 1814, but did not show any eagerness to press his victories to the advantage of the Allies, contenting himself with occupying the principality of Benevento.
MURAT

who had been casually referred to as "the king of Naples"; and he made it the prime object of his policy in the weeks that followed to secure the repudiation by the powers of Murat's title, and the restoration of the Bourbon king. The powers, indeed, were very ready to accept at least the principle of this policy. "Great Britain," wrote Castlereagh to Lord Liverpool on the 3rd of September from Geneva, "has no objection, but the reverse, to the restoration of the Bourbons in Naples."

Prussia saw in Murat the protector of the malcontents in Italy.\(^1\) Alexander I. of Russia had no sympathy for any champion of Liberalism in Austria save himself. Austria confessed "sub sigillo" that she shared "His Most Christian Majesty's views as to the restoration of a legitimate dynasty." \(^2\) The main difficulties in the way were Austria's treaty obligations and the means by which the desired result was to be obtained.

Talleyrand knew well that Austria, in the long run, would break faith with Murat and prefer a docile Bourbon on the throne of Naples to this incalculable child of the Revolution; but he had his private reasons for desiring to "score off" Metternich, the continuance of whose quasidiplomatic liaison with Caroline Murat he rightly suspected. He proposed boldly that, since Austria, in view of the treaty of Jan. 11, 1814, was naturally reluctant to undertake the task, the restored Bourbon king of France should be empowered to restore the Bourbon king of Naples by French arms, thus reviving once more the ancient Italo-French ties. This was a useful breach of the peace of Italy, and that it would be regarded as an attack on Austria and a rupture of the alliance. Murat's suspicions of Austrian sincerity were now confirmed;\(^3\) he realized that there was no question now of his obtaining any extension of territory at the expense of the states of the Church, and that in the Italy as reconstructed at Vienna his own position would be intolerable. Thus the very motives which had led him to betray Napoleon now led him to break with Austria. He would secure his throne by proclaiming the cause of united Italy, chasing the Austrians from the peninsula, and establishing himself as a national king.

To contemporary observers in the best position to judge the enterprise seemed by no means hopeless. Lord William Bentinck, the commander of the English forces in Italy, wrote to Castlereagh \(^7\) that, "having seen more of Italy," he doubted whether the whole force of Austria would be able to expel Murat; "he has said clearly that he will raise the whole of Italy; and there is not a doubt that under the standard of Italian independence the whole of Italy will rally." This feeling, continued Bentinck, was due to the foolish and illiberal conduct of the restored sovereigns; the inhabitants of the states occupied by the Austrian troops were "discontented to a man"; even in Tuscany "the same feeling and desire" universally prevailed. All the provinces, moreover, were full of unemployed officers and soldiers who, in spite of Murat's treason, would rally to his standard, especially as he would certainly first put himself into communication with Napoleon in Elba; while, so far as Bentinck could hear of the disposition of the French army, it would be "dangerous to assemble it anywhere or for any purpose." The urgency of the danger was, then, fully realized by the powers even before Napoleon's return from Elba; for they were well aware of Murat's correspondence with him. On the first news of Napoleon's landing in France, the British government wrote Wellington\(^4\) that this event together with "the proofs of Murat's treachery" had removed "all remaining scruples on their part, and that they were now "prepared to enter into a concert for his removal," adding that Murat should, in the event of his resigning peaceably, receive "a pension and all consideration." The rapid triumph of Napoleon, however, altered this tone. "Bonaparte's successes have altered the situation," wrote Castlereagh to Wellington on the 24th, adding that Great Britain would enter into a treaty with Murat, if he would give guarantees "by a certain redistribution of his forces" and the like, and that in spite of Napoleon's success he would be "true to Europe.

In a private letter enclosed Castlereagh suggested that Murat might send an auxiliary force to France, where "his personal presence would be useful and necessary."\(^8\)

Clearly, bad King Joachim played his cards well he had the game in his hands. But it was not in his nature to play them well. He should have made the most of the chastened temper of the Allies, either to secure favourable terms from them, or to hold them in play until Napoleon was ready to take the field. But his head had been turned by the flatteries of the "patriots"; he believed that all Italy would rally to his cause, and that alone he would be able to drive the "Germans" over the Alps, and thus, as king of united Italy, he in a position to treat on equal terms with Napoleon, should he prove victorious; and he determined to strike without delay. On the 23rd the news reached Metternich at Vienna that the Neapolitan troops were on the march to the frontier. The Allies at once decided to commission Austria to deal with Murat; in the event of whose defeat, Ferdinand IV. was to be restored to Naples, on promising a general amnesty and giving guarantees for a "reasonable system of government."

Meanwhile, in Naples itself there were signs enough that Murat's popularity had disappeared. In Calabria the indiscriminate severity of General Manhès in suppressing brigandage had made the government hated; in the capital the general disorder and the interior disaffection led to rigorous police, while conscripts had to be dragged in chains to join their regiments.\(^9\) In these circumstances an outburst of national enthusiasm for King Joachim was hardly to be expected; and the campaign in effect proved a complete fiasco. Rome and Bologna were indeed occupied without serious opposition; but on the 12th of April Murat's forces received a check from the advancing Austrians at Ferrara and on the 2nd of May were completely routed at Tolentino. The

4. Sorel, viii. 411 seq.
5. Ci a "most secret" communication to be made to M. de Blacas (in Metternich to Bombelles, Vienna, Jan. 13, 1815). Murat's aggressive attitude, and the unrest in Italy, are largely due to the threatening attitude of France. ... H.I.M. is not prepared to risk a rising of Italy under the national flag. How will France coerce Naples? By sending an army into Italy across our states, which would thus become infected with revolutionary views? ... The emperor could not allow such an expedition. When Italy is settled—and we will not allow Murat to keep the Marches ... he will lose prestige, and then ... will be the time for Austria to give effect to the views which, all the time, she shares with His Most Christian Majesty." (In Castlereagh to Liverpool, "private," Jan. 11, 1815. F.O. Vienna Congress, xi.)
6. This they were fully convinced, clear from the following extract from a letter of Metternich to Bombelles at Paris (dated Vienna, Jan. 13, 1815). "Whether Joachim or a Bourbon reigns at Naples is for a very short time the question. When Europe is established on solid foundations the fate of Joachim will no longer be problematical, but do not let us risk destroying Austria and France and Europe, in order to solve this question at the worst moment it would be put on the table. ... This is no business of the Congress, but let the Bourbon Powers declare that they maintain their claims." (In Castlereagh's private letter to Lord Liverpool, Jan. 15, 1815, F.O. Vienna Congr. xi.)
Austrians advanced on Naples, when Ferdinand IV. was duly restored, while Queen Caroline and her children were deported to Trieste.

And that himself escaped to France, where his offer of service was contemptuously refused by Napoleon. He hid for a while near Toulon, with a price upon his head; then, after Waterloo, refusing an asylum in England, he set out for Corsica (August). Here he was joined by a few rash spirits who urged him to attempt to recover his kingdom. Though Metternich offered to allow him to join his wife at Trieste and to secure him a dignified position and a pension, he preferred to risk all on a final throw for power. On the 25th of September he sailed for Calabria with a flotilla of six vessels carrying some 250 armed men. Four of his ships were scattered by a storm; one deserted him at the last moment, and on the 8th of October he landed at Pizzo with only 30 companions. Of the popular enthusiasm for his cause which he had been led to expect there was less than no sign, and after a short and unequal contest he was taken prisoner by a captain named Trenta-Capilli, whose brother had been executed by General Manhes. He was imprisoned in the fort of Pizzo, and on the 13th of October 1815 was tried by court-martial, under a law of his own, for disturbing the public peace, and was sentenced to be shot in half an hour. After writing a touching letter of farewell to his wife and children, he bravely met his fate, and was buried at Pizzo.

Though much good may be said of Murat as a king sincerely anxious for the welfare of his adopted country, his most shining title to fame is that of the most dashingly cavalier leader of his age. As a man he was rash, hot-tempered and impetuously brave; he was adored by his troopers who followed their idol, the “golden eagle,” into the most terrible fire and against the most terrible odds. Napoleon lived to regret his refusal to accept his services during the Hundred Days, declaring that Murat’s presence at Waterloo would have given more concentrated power to the cavalry charges and might possibly have changed defeat into victory. By his wife Maria Annunciata Carolina Murat had two sons. The elder, NAPOLEON ACHILLE MURAT (1801–1847), during his father’s reign prince royal of the Two Sicilies, emigrated about 1821 to America, and settled near Tallahassee, Florida, where in 1826–1838 he was postmaster. In 1836 he married a great-niece of Washington. He published Lettres d’un citoyen des Etats-Unis à un de ses amis d’Europe (Paris, 1839); Esquisse morale et politique des Etats-Unis (ibid. 1832); and Exposition des principes du gouvernement républicain tol qu’il a été perfectionné en Amérique (ibid. 1833). He died in Florida on the 15th of April 1847.

The second son, NAPOLEON LUCIEN CHARLES MURAT (1803–1878), who was created prince of Ponte Corvo in 1813, lived with his mother in Austria after 1815, and in 1824 started to join his brother in America, but was shipwrecked on the coast of Spain and held for a while a prisoner. Arriving in 1825, two years later he married in Baltimore a rich American, Georgina Frazer (d. 1879); but her fortune was lost, and for some years his wife supported herself and him by keeping a girls’ school. After several abortive attempts to return to France, the revolution of 1848 at last gave him his opportunity. He was elected a member of the Constituent Assembly and of the Legislative Assembly (1849), was minister plenipotentiary at Turin from October 1849 to March 1850, and after the coup d’état of the 2nd of December 1851 was made a member of the consultative commission. On the proclamation of the Empire, he was recognized by Napoleon III. as a prince of the blood royal, with the title of Duke of Murat, and, in addition to the payment of 2,000,000 fr. of debts, was given an income.

As a member of the Senate he distinguished himself in 1861 by supporting the temporal power of the pope, but otherwise he played no conspicuous part. The fall of the Empire in September 1870 involved his retirement into private life. He died on the 10th of April 1878, leaving three sons and two daughters.

(1) Joachim, Prince Murat (1834–1901), in 1854 married Maley Berthier, daughter of the Prince de Wagram, who bore him a son, Joachim (b. 1856), who succeeded him as head of the family, and two daughters, of whom the younger, Anna (b. 1865), was married to Giuseppe Romano, a quiet but honest man who was given an income by the Austrian minister Count Goultchowski. (2) Achille (1847–1895), married Princess Daddian of Mingrella. (3) Louis (b. 1851), married in 1873 to the widowed Princess Eudoxia Orbeliani (née Somov), was for a time orderly officer to Charles XV. of Sweden. (4) Caroline (b. 1832), married in 1850 Baron Charles de Chassiron and in 1872 Mr John Garden (d. 1889). (5) Anna (b. 1841), married in 1865 Antoine de Noailles, duc de Mouchy.

MURATORI, LUDOVICO ANTONIO (1672–1750), Italian scholar, historian and antiquary, was born of poor parents at Vignola in the duchy of Modena on the 21st of October 1672. While young he attracted the attention of Father Bacchini, the librarian of the ducal of Modena, by whom his literary tastes were turned toward historical and antiquarian research. Having taken minor orders in 1688, Muratori proceeded to his degree of doctor in utroque iure before 1694, was ordained priest in 1695 and appointed by Count Carlo Borromeo one of the doctors of the Ambrosian library at Milan. From manuscripts now placed under his charge he made a selection of materials for several volumes (Anedota), which he published with notes. The reputation he acquired was such that the duke of Modena offered him the situation of keeper of the public archives of the duchy. Muratori hesitated, until the offer of the additional post of librarian, on the resignation of Father Bacchini, determined him in 1700 to return to Modena. The preparation of numerous valuable tracts on the history of Italy during the middle ages, and of dissertations and discussions on obscure points of historical and antiquarian interest, as well as the publication of his various philosophical, theological, legal, poetical and other works absorbed the greater part of his time. These brought him into communication with the most distinguished scholars of Italy, France and Germany. But they also exposed him in his later years to envy. His enemies spread abroad the rumour that the pope, Benedict XIV., had discovered in his writings passages savouring of heresy, even of atheism. Muratori appealed to the pope, repudiating the accusation. His Holiness assured him of his protection, and, without expressing his approbation of the opinions in question of the learned antiquary, freed him from the imputations of his enemies. Muratori died on the 23rd of January 1750, and was buried with much pomp in the church of Santa Maria di Pomposa, in connexion with which he had laboured as parish priest for many years. His remains were removed in 1774 to the church of St Augustin.

Muratori is rightly regarded as the “father of Italian history.” This is due to his great collection, Rerum italicarum scriptores, to which he devoted about fifteen years’ work (1723–1738). The gathering together and editing some 25 huge folio volumes of texts was followed by a series of 75 dissertations on medieval Italy (Antiquitates italicæ medii ævi, 1738–1742, 6 vols. folio). To these he added a Novæ thesauri inscriptionum (4 vols., 1739–1743), which was of great importance in the development of epigraphy. Then, anticipating the action of the learned society, he set about a popular treatment of the historical sources he had published. These Annales d’Italia (1744–1749) reached 12 volumes, but were imperfect and are of little value. In addition to this national enterprise (the Scriptores were published by the aid of the Societá palatina di Milano) Muratori published Anecdota exAMBROSIANABIBLIOTHECAE CODD. (2 vols. 4to, Milan, 1697, 1698; Padua, 1713; Anecdota graeca (3 vols. 4to, Padua, 1700); Antichita Estens
MURAVIEV—MURCHISON

(a vola. fol., Modena, 1717); Vita e rime di F. Petrarca (1711), and Vita ed opere di L. Costelettro (1727).

In biblical scholarship Muratori is chiefly known as the discoverer of the so-called Muratorian Canon, the name given to a fragment (53 lines) of early Christian literature, which he found in 1740, embedded in an 8th-century codex which forms a compendium of theological tracts followed by the five early Christian creeds. The document contains a list of the books of the New Testament, a similar list concerning the Old Testament having apparently preceded it. It is in barbarous Latin which has probably been translated from original Greek—the language prevailing in Christian Rome until c. 200. There is little doubt that it was composed in Rome and we may date it about the year 190. Lightfoot inclined to Hippolytus as its author. It is the earliest document known which enumerates the books in order.

The first line of the fragment is broken and speaks of the Gospel of St Mark, but there is no doubt that its compiler knew also of St Matthew. Acts is ascribed to St Luke. He names thirteen letters of St Paul but says nothing of the Epistle to the Hebrews. The alleged letters of Paul to the Laodicceans and Alexandrians he rejects, "for gall must not be mixed with honey." The two Epistles of Peter and the Epistle of James are not referred to, but that of Jude and two of John are accepted. He includes the Apocalypse of John and also the Apocrypha of the Old Testament. The Shepherd of Hermas of February 21, 21 of Muratori, is dated February 21, 576, but its origin, but this test of canonicity is not consistently applied for he allows the "Wisdom written by the friends of Solomon in his honour." He rejects the writings of the Gnostics Valetinus and Basildes, and of Montanus.

The list is not an authoritative decree, but a private register of what the author considers the prevailing Christian sentiment in his neighbourhood. He notes certain differences among the Gospels, because not all the evangelists were eye-witnesses of the life of Jesus; yet Mark and Luke respectively have behind them the authority of Peter and of Paul, who is thus regarded as on a footing with the Twelve. The Fourth Gospel was written by John at the request of the bishops and the bishops on the basis of a revelation made to Andrew. The letters of Paul are written to four individuals and to seven different churches, like the seven letters in the Apocalypse of John.

It is interesting to notice the coincidence of his list with the evidence gained from Tertullian for Africa and from Irenaeus for Gaul and indirectly for Asia Minor. Before the year 200 there was widespread agreement in the sacred body of apostolic writings read in Christian churches on the Lord's Day along with the Old Testament.

Muratori's Letters, with a Life prefixed, were published by Lazzari, (2 vols., Venice, 1783). His nephew, F. G. Muratori, also wrote a Vita del celebre Ludov. Ant. Muratori (Venice, 1736). See also A. G. Spinelli "Bibliografia delle lettere stampa di L. A. Muratori" in Bollettino dell'istituto storico italiano (1888), and Carducci's preface to the new Scriptores. The Muratorian Canon is given in full with a translation in H. M. Guittin's Selections from Early Christian Writers. It is also published as No. 1 of H. Lietzmann's Kleine Texte für theologische Vorlesungen (Bonn, 1902). See also Journal of Theological Studies, vii. 537.

MURAVIEV, MICHAEL NIKOLAEVICH, Count (1845–1900), Russian statesman, was born on the 19th of April 1845. He was the son of General Count Nicholas Muraviev (governor of Grodno), and grandson of the Count Michael Muraviev, who became notorious for his drastic measures in stamping out the Polish insurrection of 1863 in the Lithuanian provinces. He was educated at a secondary school at Poltava, and was for a short time at Heidelberg University. In 1864 he entered the chancellery of the ministry for foreign affairs at St Petersburg, and was soon afterwards attached to the Russian legation at Stuttgart, where he attracted the notice of Queen Olga of Württemberg. He was transferred to Berlin, then to Stockholm, and back again to Berlin. In 1877 he was second secretary at the Hague. During the Russo-Turkish War of 1878 he was a delegate of the Red Cross Society in charge of an ambulance train provided by Queen Olga of Württemberg. After the war he was successively first secretary at Paris, chancellor of the embassy at Berlin, and then minister at Copenhagen. In Denmark he was brought much into contact with the imperial family, and on the death of Prince Lobanov in 1897 he was appointed by the Tsar Nicholas II. to be his minister of foreign affairs. The next three and a half years were a critical time for European diplomacy. The Chinese and Cretan questions were disturbing factors. As regards Crete, Count Muraviev's policy was vacillating; in China his hands were forced by Germany's action at Kiaochow. But he acted with singular lègéré with regard at all events to his assurances to Great Britain respecting the leases of Port Arthur and Talienwan from China; he told the British ambassador that these would be "open ports," and afterwards essentially modified his pledge. When the Tsar Nicholas inaugurated the Peace Conference at the Hague, Count Muraviev extricated his country from a situation of some embarrassment; but when, subsequently, Russian agents in Manchuria and at Peking connived at the agitation which culminated in the Boxer rising of 1900, the relations of the responsible foreign minister with the tsar became strained. Muraviev died suddenly on the 21st of June 1900, of apoplexy, brought on, it was said, by a stormy interview with the tsar.

MURCHISON, SIR RODERICK IMPEY (1752–1817), British geologist, was born at Tarradale, in eastern Ross, Scotland, on the 10th of February 1792. His father, Kenneth Murchison (d. 1796), came of an old Highland clan in west Ross-shire, and having been educated as a medical man, acquired a fortune in India; while still in the prime of life he returned to Scotland, where, marrying one of the Mackenzies of Fairburn, he purchased the estate of Tarradale and settled for a few years as a resident Highland landlord. Young Murchison left the Highlancls when three years old, and at the age of seven was sent to the grammar school of Durham, where he remained for six years. He was then placed at the military college, Great Marlow, to be trained for the army. With some difficulty he passed the examinations, and at the age of fifteen was gazetted ensign in the 36th regiment. A year later (1808) he landed with Wellesley in Gdacias, and was present at the actions of Rorica and Vimbiera. Subsequently under Sir John Moore he took part in the retreat to Corunna and the final battle there. This was his only active service. The defeat of Napoleon at Waterloo seeming to close the prospect of advancement in the military profession, Murchison, after eight years of service, quitted the army, and married the daughter of General Hugonin, of Nestred House, Hampshire. With her he then spent rather more than two years on the Continent, particularly in Italy, where her cultivated tastes were of signal influence in guiding his pursuits. He threw himself with all the enthusiasm of his character into the study of art and antiquities, and for the first time in his life tasted the pleasures of truly intellectual pursuits.

Returning to England in 1818, he sold his paternal property in Ross-shire and settled in England, where he took to field sports. He soon became one of the greatest fox-hunters in the midland counties; but at last, getting weary of such pursuits and meeting Sir Humphry Davy, who urged him to turn his energy to science, he was induced to attend lectures at the Royal Institution. This change in the current of his occupations was much helped by the sympathy of his wife, who, besides her artistic acquirements, took much interest in natural history. Eager and enthusiastic in whatever he undertook, he was fascinated by the young science of geology. He joined the Geological Society of London, and soon showed himself one of its most active members, having as his colleagues there such men as Sedgwick, W. D. Conybeare, W. Buckland, W. H. Fitton and Lyell. Exploring with his wife the geology of the south of England, he devoted special attention to the rocks of the north-west of Sussex and the adjoining parts of Hants and Surrey, on which, aided by Fitton, he wrote his first scientific paper, read to the society in 1825. Though he had reached the age of thirty-two before he took any interest in science, he developed his taste and increased his knowledge so rapidly that in the first
three years of his scientific career he had explored large parts of England and Scotland, had obtained materials for three important memoirs, as well as for two more written in conjunction with Sedgwick, and had risen to be a prominent member of the Geological Society and one of its two secretaries. Turning his attention for a little to Continental geology, he explored with Lyell the limestone region of Auvergne, parts of southern France, northern Italy, Tirol and Switzerland. A little later, with Sedgwick as his companion, he attacked the difficult problem, of the geological structure of the Alps, and their joint paper giving the results of their study will always be regarded as one of the classics in the literature of Alpine geology.

It was in the year 1831 that Murchison found the field in which the chief work of his life was to be accomplished. Acting on a suggestion made to him by Buckland he betook himself to the borders of Wales, with the view of endeavouring to discover whether the greywacke rocks underlying the Old Red Sandstone could be grouped into a definite order of succession, as the Secondary rocks of England had been made to tell their story by William Smith. For several years he continued to work vigorously in that region. The result was the establishment of the Silurian system—under which were grouped for the first time a remarkable series of formations, each replete with distinctive organic remains older than and very different from those of the other rocks of England. These researches, together with descriptions of the coal-fields and overlying formations in south Wales and the English border counties, were embodied in The Silurian System (London, 1839), a massive quarto in two parts, admirably illustrated with map, sections, pictorial views and plates of fossils. The full import of his discoveries was not at first perceived; but as years passed on the types of existence brought to light by him from the rocks of the border counties of England and Wales were ascertained to belong to a geological period of which there are recognizable traces in almost all parts of the globe. Thus the term “Silurian,” derived from the name of the old British tribe Silures, soon passed into the vocabulary of geologists in every country.

The establishment of the Silurian system was followed by that of the Devonian system, an investigation in which, aided by the palaeontological assistance of W. Lonsdale, Sedgwick and Murchison were fellow-labourers, both in the south-west of England and in the Rhineland. Soon afterwards Murchison projected an important geological campaign in Russia with the view of extending to that part of the Continent the classification he had succeeded in elaborating for the older rocks of western Europe. He was accompanied by P. E. P. de Verneuil (1805–1873) and Count A. F. M. L. A. von Keyserling (1815–1891), in conjunction with whom he produced a magnificent work on Russia and the Ural Mountains. The publication of this monograph in 1845 completes the first and most active half of Murchison’s scientific career. In 1846 he was knighted, and in the same year he presided over the meeting of the British Association at Southampton. During the later years of his life a large part of his time was devoted to the affairs of the Royal Geographical Society, of which he was in 1830 one of the founders, and he was president from 1834–1846. He was also consulted as to the appointment of explorers, and his views were always influential and constant and active were his exertions on behalf of geographical exploration that to a large section of the contemporary public he was known rather as a geographer than as a geologist. He particularly identified himself with the fortunes of David Livingstone in Africa, and did much to raise and keep alive the sympathy of his fellow-countrymen in the fate of that great explorer.

The chief geological investigation of the last decade of his life was devoted to the Highlands of Scotland, where he believed he had succeeded in showing that the vast masses of crystalline schists, previously supposed to be part of what used to be termed the Primitive formations, were really not older than the Silurian period. He was able to distinguish two groups of periods, the Silurian and the more easterly, and the ancient rocks of the Highlands now bear his name. At this time, however, he seems to have found it necessary to make a change in the system of classification, and he accordingly entered into a controversy with his fellow-geologist, the late Sir Roderick Murchison, as to the relative ages of strata in different parts of the British Isles. That the controversy was one of great importance, affecting as it did the foundations of geological science, needs no further illustration here.

MURCIA, a maritime province of south-eastern Spain, bounded on the E. by Alicante, S.E. and S. by the Mediterranean Sea, W. by Almería and Granada and N. by Albacete. Pop. (1900), 577,987; area, 4453 sq. m. The extent of coast is about 75 m.; from Cape Palos westwards to Villaricos Point (where Almeria begins) it is fringed by hills reaching their greatest elevation immediately east of Cartagena; northwards from Cape Palos to the Alicante boundary a low sandy tongue encloses the shallow lagoon called Mar Menor. Eastward from the Mar Menor and northward from Cartagena stretches the plain known as the Campo de Murcia, and the central part of the province is diversified by ranges of hills, belonging to the same system as the Sierra Nevada, which connect the mountains of Almeria and Granada with those of Alicante. The general direction of these ranges is from south-west to north-east; they reach their highest point (5150 ft.) on the Sierra de España, between the Mula and Sangonera valleys. They are rich in iron, copper, argentiferous lead, alum, sulphur, and saltpetre. Mineral springs occur at Mula, Archena (hot sulphur), and Alhama (hot chalybeate). The greater part of the province drains into the Mediterranean, chiefly by the Segura, which enters it in the north-west below Hellin in Albacete, and leaves it a little above Orihuela in Alicante; within the province it issues on the left the Arroyo del Jus, and on the right the Caravaca, Quipar, Mula, and Sangonera. The smaller streams of Nogalte and Albujon fall directly into the Mediterranean and the Mar Menor respectively. The climate is hot and dry, and
agriculture is largely dependent on irrigation, which, where practicable, has been carried on since the time of the Moors. Wheat, barley, maize, hemp, oil, and wine (the latter somewhat rough in quality) are produced; fruit, especially the orange, is abundant along the course of the Segura; mulberries for sericulture are extensively grown around the capital; and the number of bees kept is exceptionally large. Esparto grass is gathered on the sandy tracts. The live stock consists chiefly of asses, mules, goats and pigs; horses, cattle and sheep being relatively few. Apart from agriculture, the principal industry is mining, which has its centre near Cartagena. Large quantities of lead and esparto, as well as of zinc, iron and copper ores, and sulphur, are exported. The province is traversed by a railway which connects Murcia with Albacete and Valencia; from Alcantarilla there is a branch to Lorca and Baza. Near the capital and other large towns there are good roads, but the means of communication are defective in the remoter districts. This deficiency has somewhat retarded the development of mining, and, although it has been partly overcome by the construction of light railways, many rich deposits of ore remain unworked. The chief towns are Murcia, the capital, Cartagena, Lorca, Totana, Jumilla, and Cieza. The cathedral, built in 1651, is the seat of the bishoprics of Cartagena, Murcia, Totana, Cieza, Mula, Moratalla, and Cehegin. Other towns with more than 7,000 inhabitants are Alhama, Bullas, Fuente Álamo, Molina and Torre Pacheco.

The province of Murcia was the first Spanish possession of the Carthaginians, by whom Nova Cartagho was founded. The Romans included it in Hispania Tarraconensis. Under the Moors the province was known as Todmir, which included, according to Edrisi, the cities Murcia, Orihuela, Cartagena, Lorca, Mula and Chinchilla. The kingdom of Murcia, which came into independent existence after the fall of Omayyads (see CALIPHRATE) included the present Albacete as well as Murcia. It became subject to the crown of Castile in the 12th century. Until 1232 the province of Murcia also included Albacete.

MURCIA, the capital of the Spanish province of Murcia; on the river Segura, 25 m. W. of the Mediterranean Sea. Pop. (1900), 111,539. Murcia is connected by rail with all parts of Spain, and is an important industrial centre, sixth in respect of population among the cities of the kingdom. It has been an episcopal see since 1291. It is built nearly in the centre of a low-lying fertile plain, known as the huerta or garden of Murcia, which includes the valleys of the Segura and its right-hand tributary the Sangonera, and is surrounded by mountains. Despite the proximity of the sea, the climate is subject to great variations, the summer heat being severe, while frosts are common in winter. The city is built mainly on the left bank of the Segura, which curves north-eastward after receiving the Sangonera below Murcia, and falls into the Mediterranean about 30 m. N.E. A fine stone bridge of two arches gives access to the suburb of San Benito, which contains the bull-ring. As a rule the streets are broad, straight and planted with avenues of trees, but the Calle de Platería and Calle de la Trapería, which contain many of the principal shops, are more characteristically Spanish, being lined with old-fashioned balconied houses, and so narrow that wheeled traffic is in most parts impossible. In summer these thoroughfares are shaded by awnings. The Malecon, or embankment, is a fine promenade skirtling the left bank of the Segura; the river is here crossed by a weir and supplies power to several silk-mills. The principal square is the Arenal or Plaza de la Constitución, planted with orange trees and adjoining the Glorieta Park. The cathedral, dating from 1388-1467, is one of the works of many architects; in the main it is late Gothic, but a Renaissance dome and a tower 480 ft. high were added in 1531, while a Corinthian façade was erected in the 18th century. There are some good paintings and fine wood-carving in the interior. Other noteworthy buildings are the colleges of San Fulgencio and San Isidro, the bishops' palace, the hospital of San Juan de Dios, the Moorish Alhondiga, or grain warehouse, the buildings of the municipal and provincial councils and the Contraste, which is adorned with sculptured coats-of-arms, and was originally designed to contain standard weights and measures; it has become a picture-gallery. There are two training schools for teachers, a provincial institute and a museum. Since 1875 the industrial importance of Murcia has steadily increased. Mulberries (for silkworms), oranges and other fruits are largely cultivated in the huerta, and the silk industry, which dates from the period of Moorish rule, is still carried on. Manufacturers of woollen, linen and cotton goods, of salt petre, flor, leather and hats, have been established in more modern times, and Murcia is the chief market for the agricultural produce of a large district. A numerous colony of giparos has settled in the west of the city.

Murcia was an Iberian town before the Punic Wars, but its name then, and under Roman rule, is not known, though some have tried to identify it with the Roman Vergilia. To the Moors, who took possession early in the 8th century, it was known as Medina Murisia. Edrisi described it in the 12th century as populous and strongly fortified. After the fall of the caliphate of Cordova it passed successively under the rule of Almeria, Toledo and Seville. In 1171 it was taken by the Almohades, and from 1223 to 1243 it became the capital of an independent kingdom. The Castilians took it at the end of this period, and in 1248 it was recaptured by the Moors. In 1504 the region was added to the Spanish crown; the Catholic Monarchs by treaties with the Moors in 1517 gave to Murcia and the other provinces from the river Segura to the Mediterranean more than 4,500,000 ducats. Murcia and Province settled in the town; French and Catalan names are still not uncommon. Moorish princes continued to rule in name over this mixed population, but in 1269 a rising against the suzerain, Alphonso the Wise, led to the final incorporation of Murcia (which then included the present province of Albacete) into the kingdom of Castile. During the War of the Spanish Succession Bishop Luis de Belluga defended the city against the archducal army by flooding the huerta. In 1810 and 1812 it was attacked by the French under Marshal Soult. It suffered much from floods in 1631, 1679 and 1907, though the construction of the Malecon has done much to keep the Segura within its own channel. It is 1,829 years since the cathedral, one of the most ancient, received its present form. The cathedral, though built on the site of an earlier one erected by the Moors, has been much damaged and renovated. Its long history is marked by the frequent changes in its patron, the Moors, the Christians, and at one time a Moorish viceroy and Catholic bishop. It has been described as the most beautiful Gothic cathedral in Italy. It is surrounded by a strong and beautiful convent of nuns. The town has a fine promenade by the sea, and is a sorely needed resort. Murcia is a centre of manufacture, an export centre, and a railway junction. It has a university, founded in 1511, with 700 students, and an observatory. It has always been a centre of Spanish politics and literature. Several of the wealthier and most influential families have been prominent in the political and commercial life of the country. Among the cities of Murcia are Bullas, Fuente Álamo, Lorca, Mula, and Chinchilla. Murcia is an important centre of mining, of which the principal mines are those of the Huerta de la Negra in the province of Albacete. The principal minerals are lead, zinc, silver, copper, and traces of gold. The town is a great fairs and has considerable trade. There are a number of manufacturing establishments, especially in the silk trade. Murcia is the seat of the bishop of Murcia, who is also the bishop of Cartagena.

MURDOCK, WILLIAM (1754-1839), British inventor, was born near the village of Auchinleck in Ayrshire on the 21st of August 1754. His father, John Murdock (as the name is spelt in Scotland), was a millwright and miller, and William was brought up in the same occupation. In 1777 he entered the employment of Bouton & Watt in the Soho works at Birmingham, and about two years afterwards he was sent to Cornwall to superintend the fitting of Watt's engines. It is said that while staying at Redruth he carried a series of experiments in the distillation of coal so far that in 1792 he was able to light his cottage and offices with gas, but the evidence is not conclusive. However, after his return to Birmingham about 1799, he made such progress in the discovery of practical methods for making, storing and purifying gas that in 1802 a portion of the exterior of the Soho factory was lighted with it in celebration of the peace of Amiens, and in the following year it was brought into use for the interior. Murdock was also the inventor of important improvements in the steam-engine. He was the first to devise an oscillating engine, of which he made a model about 1784; in 1786 he was busy—somewhat to the annoyance of both Bouton and Watt—with a steam carriage or road locomotive; and in 1799 he invented the long D slide valve. He is also believed to have been the real deviser of the sun and planet motion patented by Watt in 1781. In addition his ingenuity was directed to the utilization of compressed air, and in 1803 he constructed a steam gun. He retired from business in 1830, and died at Soho on the 15th of November 1839.

At the celebration of the centenary of gas lighting in 1892, a bust of Murdock was unveiled by Lord Kelvin in the Wallace Monument.
MURE—MURGER

Stirling, and there is also a bust of him by Sir F. L. Chantrey at Handsworth Church, where he was buried. His "Account of the Application of Gas from Coal to Economical Purposes" appeared in the Phil. Trans. for 1808.

MURE, SIR WILLIAM (1594-1657), Scottish writer, son of Sir William Mure of Rowallan, was born in 1594. His mother was Elizabeth, sister of the poet Alexander Montgomerie (q.v.). He was a member of the Scottish parliament in 1643, and took part in the English campaign of 1644. He was wounded at Marston Moor, but a month later was commanding a regiment at Selby. In 1645 he became a member of the London university council, and in 1646 he wrote Dido and Aeneas, a translation (1652) of Boyd of Trogir's Latin Hecateum Christianum; The True Cruizise for True Catholics (1629), a paraphrase of the Psalms; the Historie and Descent of the House of Rowallan; A Counter-buff to Lysmachius Nicaron; The Cry of Blood and of a Broken Covenant (1659); besides much miscellaneous verse and many sonnets.

A complete edition of his works was edited by William Toug for the Scottish Text Society (2 vols., 1808). Mure's Late-Book, a musical and several other, is preserved in the Laid collection of MSS. in the library of the university of Edinburgh.

MURE, WILLIAM (1799-1860), Scottish classical scholar, was born at Calderd, Ayrshire, on the 9th of July 1799. He was educated at Westminster School and the universities of Edinburgh and Bnn. From 1846 to 1853 he represented the county of Renfrew in parliament in the Conservative interest, and was lord rector of Glasgow University in 1847-1848. For many years he devoted his leisure to Greek studies, and in 1850-1857 he published five volumes of a Critical History of the Language and Literature of Ancient Greece, which, though unfinished and somewhat antiquated, is still useful. He died in London on the 1st of April 1860.

MURENA, the name of a Roman plebeian family from Lanuvium, belonging to the Licinian gens, said to be derived from the fondness of one of the family for lampreys (murenae). The principal members of the family were Lucius Licinius Murena, who was defeated by Mithradates in Asia in 81 B.C., and his son Lucius Licinius Murena, who was defended by Cicero in 62 B.C. against a charge of bribery (Cic. Pro Murena). The son was for several years legate of Lucius Licinius Lucullus in the third Mithradatic War. In he was praetor and made himself popular by the magnificence of the games provided by him. As administrator of Transalpine Gaul after his praetorship he gained the goodwill of both provincials and Romans by his impartiality. In he was elected consul, but before entering upon office he was accused of bribery by Servius Sulpicius, an unsuccessful competitor, supported by Marcus Porcius Cato the younger and Servius Sulpicius Rufus, a famous jurist and son of the accuser. Murena was defended by Marcus Licinius Crassus (afterwards triumvir), Quintus Hortensius and Cicero, and acquitted, although it seems probable that he was guilty. During his consulship he passed a law (lex Junia Licinia) which reinforced more strictly the provision of the lex Aemilia that laws should be promulgated three undvinae before they were proposed to the comitia, and further enacted that, in order to prevent forgery, a copy of every proposed statute should be deposited before witnesses in the aedarium.

MURETUS, the Latinized name of MARC ANTOINE MURET (1526-1582), French humanist, who was born at Muret near Limoges on the 12th of April 1526. At the age of eighteen he attracted the notice of the elder Scaliger, and was invited to lecture in the archiepiscopal college at Auch. He afterwards taught Latin at Villeneuve, and then at Bordeaux. Some time before 1552 he delivered a course of lectures in the college of Carcassonne at Paris, which was largely attended, Henry II. and his queen being among his hearers. His success made him many enemies, and he was thrown into prison on a disgraceful charge, but released by the intervention of powerful friends. The same accusation was brought against him at Toulouse, and he only saved his life by timely flight. The records of the town show that he was burned in effigy as a Huguenot and as shamefully immolared (1554). After a wandering and insecure life of some years in Italy, he received and accepted the invitation of the Cardinal Ippolite d'Este to settle in Rome in 1559. In 1571 he revisited France as a member of the cardinal's suite at the conference between Roman Catholics and Protestants held at Poissy. He returned to Rome in 1565. His lectures gained him a European reputation, and in 1578 he received a tempting offer from the king of Poland to become teacher of jurisprudence in his new college at Cracow. Muretus, however, who about 1576 had taken holy orders, was induced by the liberality of Gregory XIII. to remain in Rome, where he died on the 4th of June 1585.

Complete editions of his works: eddito princeps, Verona (1727- 1730) by D. R. Poppo (1789), by C. H. Froschel (1834-1841); two volumes of Scripta selecta by F. Boyer (1871); Vincent Leissenu, by F. A. Wolf and J. H. Falsi (1791-1828). Muretus edited a number of classical authors with learned and scholarly notes. His other works include Juventia et poesae varia, epitomata, and epistolae. See monograph by C. Dejob (Paris, 1801); J. E. Sandus, Hist. Class. Schol., (2nd ed., 1802), ii. 148-152.

MUREXIDE (NH_2-C_6H_4N_2O_4-H_2O), the ammonium salt of purpuric acid. It may be prepared by heating allatonic in ammonium gas to 100°C, or by boiling uramil with mercuric oxide (J. v. Liebig, F. Wohler, Ann., 1838, 26, 319), 2CH_3OH+O = NH_2-C_6H_4N_2O_4+H_2O. W. N. Hartley (Jour. Chem. Soc., 1905, 87, 1791) found considerable difficulty in obtaining specimens of murexide sufficiently pure to give concordant results when examined by means of their absorption spectra, and consequently devised a new method of preparation for murexide. In this process allatonic is dissolved in a large excess of boiling absolute alcohol, and dry ammonium gas is passed into the solution for about three hours. The solution is then filtered from the precipitated murexide, which is washed with absolute alcohol and dried. The salt obtained in this way is in the anhydrase state. It may also be prepared by digesting allatonic with alcoholic ammonia at about 78°C; the purple solid so formed is easily soluble in water, and the solution produced is indistinguishable from one produced by this method.

On the constitution of murexide see also O. Ploidy (Ann., 1904, 333, 30); R. Mohlau (Ber., 1904, 37, 2686); and M. Stimmer and J. Stiglitz (Amer. Chem. Jour., 1904, 31, 661).

MURFREESBORO, a city and the county-seat of Rutherford county, Tennessee, U.S.A., near the Stone River, 32 m. S.E. of Nashville. Pop. (1850) 3739; (1900) 3999 (2248 negroes); (1910) 4679. It is served by the Nashville Chattanooga & St Louis railway. It is in an agricultural region where cotton is an important crop, and has a considerable trade in red cedar, hardwood, cotton, livestock and grain; it has also various manufactures. At Murfreesboro are Soule College for girls (Methodist Episcopal South; 1852), Tennessee College for girls (Baptist, 1906), Mooney School for boys (1901), and Bradley Academy for negroes. Murfreesboro was settled in 1811; was incorporated in 1817, and from 1819 to 1825 was the capital of the state. It was named in honour of Colonel Hardy Murflee (1732-1809), a native of North Carolina, who served as an officer of North Carolina troops in the War of Independence, and after 1807 lived in Tennessee. About 2 m. west of the city the battle that Murfreesboro, or Stone River (q.v.), was fought on the 31st of December 1862 and the 2nd of January 1863.

MURGER, HENRY (1822-1861), French man of letters, was born in Paris on the 24th of March 1822. His father was a German concierge and a tailor. At the age of fifteen Murger was sent into a lawyer's office, but the occupation was ungenial and his father's trade still more so; and he became secretary to Count Alexi Tolstoi. He published in 1843 a piece called Le dunkel, but it made no mark. He also tried journalism, and the paper Le Castor, which figures in his Vie de Bohème as having combined devotion to the interests of the hat trade with recondite philosophy and elegant literature, is said to have existed, though shortlived. In 1848 appeared the collected sketches called Scènes de la vie de Bohème. This book describes the fortunes and misfortunes, the loves, studies, amusements and sufferings of a group of impecunious students, artists and
MURGHAB—MURILLO

men of letters, of whom Rodolphe represents Murger himself, while the others have been more or less positively identified. Murger, in fact, belonged to a clique of so-called Bohemians, the most remarkable of whom, besides himself, were Privat d'Angle- mont and Champfleury. La Vie de Bohème, arranged for the stage in collaboration with Théodore Barrière, was produced at the Variétés on the 22nd of November 1849, and was a triumphant success; it afterwards formed the basis of Puccini's opera, La Bohème (1868). From this time it was easy for Murger to live by journalism and general literature. He was introduced in 1853 to the Revue des deux mondes. But he was a slow, fastidious and capricious worker, and his years of hardship and dissipation had impaired his health. He published among other works Claude et Marianne in 1851; a comedy, Le Bonhomme Jadis in 1852; Le Pays Lain in 1852; Adèle Protat (one of the most graceful and innocent if not the most original of his tales) in 1853; and Les Bouchers d'eau in 1855. This last, the most powerful of his books next to the Vie de Bohème, traces the fate of certain artists and students who, exaggerating their own powers and disdaining merely profitable work, come to an evil end. When Murger's death occurred, nearly ten years after his death, which took place in a maison de santé near Paris on the 28th of January 1861, Murger went to live at Marlottne, near Fontainebleau, and there he wrote an unequal book entitled Le Sabot rouge (1860), in which the character of the French peasant is uncomplimentarily treated.

See an article by A. de Pontmartin in the Revue des deux mondes (October 1861).

MURGHAB, a river of Afghanistan, which flows into Russian territory. It rises in the Firozkhoi highlands, the northern scarp of which is defined by the Band-i-Turkestan, and after traversing that plateau from east to west it turns north through deep defiles to Bala Murghab. Beyond this, in the neighbourhood of Maruchak, it forms for a space the boundary-line between Afghan and Russian Turkestan; then joining the Kusgh river at Pul-Khishi (Tash Kupir) it runs north to Merv, losing itself in the sands of the Merv desert after a course of about 450 m., its exact source being unknown. In the neighbourhood of Bala Murghab it is 50 yds. broad and some 3 ft. deep, with a rapid current. In the lower part of its course it is flanked by a remarkable network of canals. The ancient city of Merv, which was on its banks, was the great centre of medieval Arab trade, and Buddhist caves are found in the scarped cliffs of its right bank near Panjdeh.

MURI, a province of the British protectorate of Northern Nigeria. It lies approximately between 6° and 11° 40' E. and 7° 10' and 9° 40' N. The river Benue divides it through its length, and the portion on the southern bank of the river is watered by streams flowing from the Cameroon region to the Benue. The province is bounded S. by Southern Nigeria, S.E. by German territory (Cameroon), E. by the province of Yola, N. by Bauchi, W. by Nassarawa and Bassa. The district of Katsena-Allah extends south of the Benue, considerably west of 6° E., the approximate limit of the remainder of the province. Muri has an area of 25,500 sq. m. and an estimated population of about 328,000. The province is rich in forest products and the people own the district of Nasara, which extends on the right bank of the river. Cotton is grown, and spinning thread, weaving and dyeing afford occupation to many thousands. The valley of the Benue has a climate generally unhealthy to Europeans, but there are places in the northern part of the province, such as the Fulah settlement of Wase on a southern spur of the Murchison hills, where the higher altitude gives an excellent climate. Muri includes the ancient Jukon empire together with various small Fulah states and a number of pagan tribes, among whom the Munshi, who extend into the provinces of Nassarawa and Bassa, are among the most turbulent. The Munshi occupy about 4000 sq. m. in the Katsena-Allah district. The pagan tribes in the north of the province are lawless cannibals who by constant outrages and murders of traders long rendered the main trade route to Bauchi unsafe, and cut off the markets of the Benue valley and the Cameroon from the Hausa states. Only two routes, one via Wase and the other via Gatari, pass through this belt. In the south of the province a similar belt of hostile pagans closed the access to the Cameroon except by two routes, Takum and Beli. For Hausa traders to cross the Muri province was a work of such danger and expense that before the advent of British administration the attempt was seldom made.

Muri came nominally under British control in 1900. The principal effort of the administration has been to control and open the trade routes. In 1904 the expedition against the northern cannibals resulted in the capture of their principal fortresses and the settlement and opening to trade of a large district, the various routes to the Benue being rendered safe. In 1905 an expedition against the Munshi, rendered necessary by an unprovoked attack on the Niger Company's station at Abinsi, had a good effect in reducing the riverain portion of this tribe to submission. The absence of any central native authority delayed the process of bringing the province under administrative control. Its government has been organized on the same system as the rest of Northern Nigeria, and is under a British resident. It has been divided into three administrative divisions with their respective head quarters at Lau, Amar and Ibi. Provincial and native courts of justice have been established. The telegraph has been carried to the town of Muri. Muri is one of the provinces in which the slave trade was most active, and its position between German territory and the Hausa states rendered it in the early days of the British administration a favourite route for the smuggling of slaves.

MURILLO, BARTOLOMÉ ESTEBAN (1617-1682), Spanish painter, son of Gaspar Esteban Murillo and María Perez, was born at Seville in 1617, probably at the end of the year, as he was baptized on the first of January 1618. Esteban-Murillo appears to have been the compound surname of the father, but some inquirers consider that, in accordance with a frequent Andalusian custom, the painter assumed the surname of his maternal grandmother, Elvira Murillo, in addition to that of his father. His parents (the father an artisan of a humble class), having been struck with the sketches which the boy was accustomed to make, placed him under the care of their distant relative, Juan del Castillo, the painter. Juan, a correct draughtsman and dry colourist, taught him all the mechanical parts of his profession with extreme care, and Murillo proved himself an apt pupil. The artistic appliances of his master's studio were not abundant, and were often of the simplest kind. A few casts, some stray fragments of sculpture and a lay figure formed the principal aids available for the Sevillian student of art. A living model was a luxury generally beyond the means of the school, but on great occasions the youths would strip in turn and proffer an arm or a leg to be studied by their fellows. Objects of still life, however, were much studied by Murillo, and he early learnt to hit off the ragged urchins of Seville. Murillo in a few years painted as well as his master, and as still. His two pictures of the Virgin, executed during this period, show how thoroughly he had mastered the style, with all its defects. Castillo was a kind man, but his removal to Cádiz in 1639-1640 threw his favourite pupil upon his own resources. The boy then set up a small school of his own, only a hand or a head would be his model; his parents were either dead or too poor to help him, and he was compelled to earn his bread by painting rough pictures for the "feria" or public fair of Seville. The religious daubs exposed at that mart were generally of as low an order as the prices paid for them. A "pintura de la feria" (a picture for the fair) was a proverbial expression for an execrably bad one; yet the street painters who thronged the market-place with their "clumsy saints and unripe Madonnas" not unfrequently rose to be able and even famous artists. This rough-and-ready practice, partly for the market-place, partly for convicts in Mexico and Peru, for whom Madonnas and popular saints were produced and shipped off by the dozen, doubtless increased Murillo's manual dexterity; but, if we may judge from the picture of the "Virgin and Child" shown in the Murillo-room at Seville as belonging to this period, he made little improvement
in colouring or in general strength of design. Struck by the favourable change which travel had wrought upon the style of his brother artist Pedro de Moya, Murillo in 1642 resolved to make a journey to Flanders or Italy. Having bought a large quantity of canvas, he cut it into squares of different sizes, which he conveyed into pieces of a kind likely to sell. The Flemish traders bought up his pieces, and he found himself sufficiently rich to carry out his design. He placed his sister, who was dependent on him, under the care of some friends, and without divulging his plans to any one set out for Madrid. On reaching the capital he waited on Velazquez, his fellow-townsmen—then at the summit of his fortune—and asked for some introduction to friends in Rome. The master liked the youth, and offered him lodging in his own house, and proposed to procure him admission to the royal galleries of the capital. Murillo accepted the offer, and here enjoyed the masterpiece of Italy and Flanders without travelling beyond the walls of Madrid. The next two years were chiefly spent in copying from Ribera, Vandyck and Velazquez; and in 1644 he so astonished the latter with some of his efforts that they were submitted to the king and the court. His patron now urged him to go to Rome, and offered him letters to smooth his way; but Murillo preferred returning to his sister and his native Seville.

The friars of the convent of San Francisco in Seville had about this time determined to adorn the walls of their small cloister in a manner worthy of their patron saint. But the brotherhood had no money; and after endless begging they found themselves incapable of employing an artist of name to execute the task. Murillo was needy, and offered his services; after balancing their own poverty against his obscurity the friars bade him begin. Murillo covered the walls with seven large pictures of remarkable power and beauty—displaying by turns the strong colouring of Ribera, the lifelike truthfulness of Velazquez, and the sweetness of Vandyck. Among them were to be found representations of San Francisco, of San Diego, of Santa Clara and of San Gil. These pictures were executed in his earliest style, commonly called his frio or cold style. It was based chiefly on Ribera and Caravaggio, and was dark with a decided outline. This rich collection is no longer in Seville; Marshal Soult carried off ten of the works. The fame of these productions soon got abroad, and "El Claudio Chico" swarmed daily with artists and critics. Murillo was no longer friendless and unknown. The rich and the noble of Seville overwhelmed him with their commissions and their praises.

In 1648 Murillo married a wealthy lady of rank, Doña Beatriz de Cabrera y Sotomayor, of the neighbourhood of Seville, and his house soon became the favourite resort of artists and connoisseurs. About this time he was associated with the landscape-painter Yriarte—the two artists interchanging figures and landscapes for their respective works; but they did not finally agree, and the co-operation came to an end. Murillo now painted the well-known "Flight into Egypt," and shortly afterwards changed his earliest style of painting for his calido or warm style. His drawing was still well defined, but his outlines became softer and his figures rounder, and his colouring gained in warmth and transparency. His first picture of this style, according to Cean Bermudez, was a representation of "Our Lady of the Conception," and was painted in 1652 for the brotherhood of the True Cross; he received for it 2500 reals (£26). In 1655 he executed his two famous paintings of "San Lendro" and "San Isidoro" at the order of Don Juan Federigo, archdeacon of Carmona, which are now in the cathedral of Seville. These are two noble portraits, finished with great care and admirable effect, but the critics complain of the figures being rather short. His next picture, the "Nativity of the Virgin," painted for the chapter, is regarded as one of the most delightful specimens of his calido style. In the following year (1656) the same body gave him an order for a vast picture of San Antonio de Padua, for which he received 10,000 reals (£104). This is one of his most celebrated performances, and still hangs in the baptistery of the cathedral. It was "repaired" in 1833; the grandeur of the design, however, and the singular richness of the colouring may still be traced. The same year saw him engaged on four large semicircular pictures, designed by his friend and patron Don Justino Neve y Yevenes, to adorn the walls of the church of Santa Maria la Blanca. The first two (now in Madrid) were meant to illustrate the history of the Our Lady of the Snow, or the "Virgen de la Nieve," in the Roman basilica of Santa Maggiore. The one represents the wealthy but childless Roman senator and his lady asleep and dreaming; the other exhibits the devout pair relating their dream to Pope Liberius. Of these two noble paintings the Dream is the finer, and in it is to be noticed the commencement of Murillo's third and last style, known as the vaporoso or vapoury. It should be noted, however, that the three styles are not strictly separable into date-periods; for the painter alternated the styles accordingly to his subject-matter or the mood of his inspiration, the calido being the most frequent. In the vaporoso method the well-marked outlines and careful drawing of his former styles disappear, the outlines are lost in the misty blending of the light and shade, and the general finish betrays more haste than was usual with Murillo. After many changes of fortune, these two pictures now hang in the Academy at Madrid. The remaining pieces executed for this small church were a "Virgin of the Conception," and a figure of "Faith." Soult laid his hands on these also, and they have not been recovered.

In 1658 Murillo undertook and consummated a task which had hitherto baffled all the artists of Spain, and even royalty itself. This was the establishing of a public academy of art. By superior tact and good temper he overcame the vanity of Valdes Leal and the presumption of the younger Herrera, and secured their co-operation. The Academy of Seville was accordingly opened for the first time in January 1660, and Murillo and the second Herrera were chosen presidents. The former continued to direct it during the following year; but the calls of his studio inclined him to leave it in other hands. It was then flourishing, but not for long.

Passing over some half-length pictures of saints and a dark-haired Madonna, painted in 1668 for the chapter-room of the cathedral of his native city, we enter upon the most splendid period of Murillo's career. In 1661 Don Miguel Manana Vicen- telo de Leca, who had recently turned to a life of sanctity from one of the wildest profligacy, resolved to raise money for the restoration of the dilapidated Hospital de la Caridad, of whose pious gild he was himself a member. Manana commissioned his friend Murillo to paint eleven pictures for this edifice of San Jorge. Three of these pieces represented the "Annunciation," the "Infant Saviour," and the "Infant St John." The remaining eight are considered Murillo's masterpieces. They consist of "Moses striking the Rock," the "Return of the Prodigal," "Abraham receiving the Three Angels," the "Charity of St Juan de Dios," the "Miracle of the Loaves and Fishes," "Our Lord healing the Paralytic," "St Peter released from Prison by the Angel," and "St Elizabeth of Hungary." These works occupied the artist four years, and in 1674 he received for his eight great pictures 78,115 reals or about £900. The "Moses," "Vapors and Fishes," the "San Juan," and the three subjects which we have named first, are still at Seville; the French carried off the rest, but the "St Elizabeth" and the "Prodigal Son" are now back in Spain. For compass and vigour the "Moses" stands first; but the "Prodigal's Return" and the "St Elizabeth" were considered by Bermudez the most perfect of all as works of art. The front of this famous hospital was also indebted to the genius of Murillo; five large designs in blue glazed tiles were executed from his drawings. He had scarcely completed the undertakings for this edifice when his favourite Franciscans again solicited his aid. He accordingly executed some twenty paintings for the humble little church known as the Convent de los Capucinios. Seventeen of these Capuchin pictures are preserved in the Museum of Seville. Of these the "Charity of St Thomas of Villanueva" is reckoned the best. Murillo himself was wont to call it "su lieno" (his own picture). Another little piece of extraordinary
MURIMUTH—MURNER

merit, which once hung in this church, is the "Virgin of the Napkin," believed to have been painted on a "servilleta" and presented to the cook of the Capuchin brotherhood as a memorial of the artist's pen.

In 1670 Murillo is said to have declined an invitation to court, preferring to labour among the brown coats of Seville. Eight years afterwards his friend the canon Justino again employed him to paint three pieces for the Hospital de los Venerables: the "Mystery of the Immaculate Conception," "St Peter Weeping," and the "Blessed Virgin." As a mark of esteem, Murillo next painted a full-length portrait of the canon. The spaniel at the feet of the priest has been known to call forth a snarl from a living dog. His portraits generally, though, are of great beauty. Towards the close of his life Murillo executed a series of pictures illustrative of the life of "the glorious doctor" for the Augustinian convent at Seville. This brings us to the last work of the artist. Mounting a scaffolding one day at Cadiz (whither he had gone in 1681) to execute the higher parts of a large picture of the "Espousal of St Catherine," on which he was engaged for the Capuchins of that town, he stumbled, and fell so violently that he received a hurt from which he never recovered. The great picture was left unfinished, and the artist returned to Seville to die. He died as he had lived, a humble, pious, brave man, on the 3rd of April 1682 in the arms of the chevalier Pedro Nuñez de Villavicencio, an intimate friend and one of his best pupils.

Another of his numerous pupils was Sebastian Gomez, named "Murillo's Mulatto." Murillo left two sons (one of them at first an indifferent painter, afterwards a priest) and a daughter—his wife having died before him.

Murillo has always been one of the most popular of painters—not in Spain alone. His works show great technical attainment without much style, and a strong feeling for ordinary nature and for truthful or sentimental expression without lofty beauty or ideal elevation. His ecstasies of Madonnas and Saints are the themes of some of his most celebrated achievements. Take as an example the "Immaculate Conception" or "Assumption of the Virgin," (for the titles may, with reference to Murillo's treatments of this subject, almost be interchanged) in the Louvre, a picture for which, on its sale from the Soulit collection, one of the largest prices on record was given in 1832, some £24,600. His subjects may be divided into two great groups—the scenes from low life (which were a new experiment in Spanish art, so far as the subjects of children are concerned), and the Scriptural, legendary and religious works. The former, of which some salient specimens are in the Dulwich Gallery, are, although undoubtedly truthful, neither ingenious nor sympathetic; sordid unsightliness and repulsive squalor are their foundation. Works of this class belong mostly to the earlier years of Murillo's practice. The subjects in which the painter most excels are crowded compositions in which some act of sinlessness, involving the ascetic or self-mortifying element, is being performed—subjects which, while repulsive in some of their details, emphasize the broadly human and the expressly Catholic conceptions of life. A famous example is the picture, now in the Madrid Academy, St Elizabeth of Hungary washing patients afflicted with the scab or itch, and hence commonly named "El Tifoso." Technically considered, it unites his three styles of painting, more especially the cold and the warm. His painter of giving atmosphere to combined groups of figures is one of the marked characteristics of Murillo's art; and he may be said to have excelled in this respect all his predecessors or contemporaries of whatever school.

Seville must still be visited by persons who wish to study Murillo thoroughly. A large number of the works which used to adorn this city have, however, been transported elsewhere. In the Prado Museum at Madrid are forty-five specimens of Murillo—the "Infant Christ and the Baptist" (named "Los Niños della Concha"), "St Ildefonso vested with a Chasuble by the Madonna," &c.; in the Museo della Trinidad, "Christ and the Virgin appearing to St Francis in a Cavern" (an immense composition), and various others. In the National

Gallery, London, the chief example is the "Holy Family"; this was one of the master's latest works, painted in Cadiz. In public galleries in the United Kingdom there are altogether twenty-four examples by Murillo; in those of Spain, seventy-one.

Murillo, who was the last pre-eminent painter of Seville, was an indefatigable and prolific worker, hardly leaving his painting-room save for his devotions in church; he realized large prices, according to the standard of his time, and made a great fortune. His character is recorded as amiable and soft, yet independent, subject also to sudden impulses, not unmixed with passion.

MURIMUTH, ADAM (c. 1274-1347), English ecclesiastic and chronicler, was born in 1274 or 1275 and educated in the civil law at Oxford. Between 1312 and 1318 he practised in the papal curia at Avignon. Edward II. and Archbishop Winchelsey were among his clients, and his legal services secured for him canonnries at Hereford and St. Paul's, and the prebendaryship of Exeter Cathedral. In 1331 he retired to a country living (Wranborough, Bucks), and devoted himself to writing the history of his own times. His Continuatio chronicarum, begun not earlier than 1325, starts from the year 1303, and was carried up to 1347, the year of his death. Meagre at first, it becomes fuller after 1340 and is specially valuable for the history of the French wars. Murimuth has no merits of style, and gives a bald narrative of events. But he incorporates many documents in the latter part of his book. The annals of St. Paul's which have been edited by Bishop Stubbs, are closely related to the work of Murimuth, but probably not from his pen. The Continuatio was carried on, after his death, by an anonymous writer to the year 1380.

(H. W. C. D.)

MURNER, THOMAS (1475-1537 ??), German satirist, was born on the 24th of December 1475 at Obernheim near Strassburg. In 1490 he entered the order of Franciscan monks, and in 1495 began a wandering life, studying and then teaching and preaching in Freiburg-in-Breisgau, Paris, Cracow and Strassburg. The emperor Maximilian I. crowned him in 1505 poeta laureatus; in 1506, he was created doctor theologiae, and in 1513 was appointed custodian of the Franciscan monastery in Strassburg, an office which, on account of a scrurious publication, he was forced to vacate the following year. Late in life, in 1518, he began the study of jurisprudence at the university of Basel, and in 1519 took the degree of doctor juris. After journeys in Italy and England, he again settled in Strassburg, but, disturbed by the Reformation, sought an exile at Lucerne in Switzerland in 1526. In 1533 he was appointed priest of Oberenheim, where he died in 1537, or, according to some accounts, in 1536. Murner was an energetic and passionate character, who made enemies wherever he went. There is not a trace of human kindness in his satires, which were directed against the corruption of the times, the Reformation, and especially against Luther. His most powerful satire—and the most virulent German satire of the period—is Von dem grossen lutherischen Narren, wie ihn Dr. Murner beschworren hat. Among others may be mentioned Die Narrenbeschroebnung (1512); Die Schelmenzunft (1512); Die Gänzmatt, which treats of enamoured fools (1510), and a translation of Virgil's Aeneid (1519) dedicated to the emperor Maximilian I. Murner also wrote the humorous Chastiludium logicae (1527) and the Ludus studentum freiburgensis (1531), besides a translation of Justinian's Institutiones (1519).

All Murner's more important works have been republished in
critical editions; a selection was published by G. Balke in Kürschner's Deutsche Nationalliteratur (1890). Cf. W. Kawerau, Murner und die Kirche des Mittelalters (1890); and by the same writer, Murner und die deutsche Reformation (1891); also K. Ott, Über Murner's Kontroversen (1899).

MUROM, a town of Russia, in the government of Vladimir, on the craggy left bank of the Oka, close to its confluence with the Tesa, 105 m. by rail S.E. of the city of Vladimir. Pop. (1900), 12,874. Muron has an old cathedral. It is the chief entrepôt for grain from the basin of the River Oka, and carries on an active trade with Moscow and Nizhny-Novgorod. It is famed, as in ancient times, for kitchen-gardens, especially for its cucumbers and seed for canaries. Its once famous tanneries have lost their importance, but the manufacture of linen has increased; it has also steam flour-mills, distilleries, manufactories of soap and of iron implements.

MURPHY, ARTHUR (1777–1852), Irish actor and dramatist, son of a Dublin merchant, was born at Clonquin, Roscommon, on the 27th of December 1777. From 1738 to 1744, under the name of Arthur French, he was a student at the English college at St Omer. He entered the counting-house of a merchant at Cork on recommendation of his uncle, Jeffery French, in 1747. A refusal to go to Jamaica alienated French's interest, and Murphy exchanged his situation for one in London. By the autumn of 1752 he was publishing the Grey's Inn Journal, a periodical in the style of the Spectator. Two years later he became an actor, and appeared in the title-roles of Richard III. and Othello; as Biron in Southerne's Fatal Marriage; and as Osmyn in Congreve's Four Sons. His first attempt, The Age of Reason, given at Drury Lane on the 2nd of January 1756. It was followed, among other plays, by The Upholsterer (1757), The Orphan of China (1759), The Way to Keep Him (1760), All in the Wrong (1761), The Grecian Daughter (1772), and Know Your Own Mind (1777). These were almost all adaptations from the French, and were very successful, securing for their author both fame and wealth. Murphy edited a political periodical, called the Test, in support of Henry Fox, by whose influence he was called to the bar at Lincoln's Inn, although he had been refused at the Middle Temple in 1757 on account of his connexion with the stage. Murphy also wrote a biography of Fielding, an essay on the life and genius of Samuel Johnson and translations of Sallust and Tacitus. Towards the close of his life the office of a commissioner of bankrupts and a pension of £200 were conferred upon him by government. He died on the 18th of June 1805.

MURPHY, JOHN FRANCIS (1853– ), American landscape painter, was born at Oswego, New York, on the 11th of December 1853. He first exhibited at the National Academy of Design in 1876, and was made an associate in 1885 and a full academician two years later. He became a member of the Society of American Artists (1901) and of the American Water Color Society.

MURPHY, ROBERT (1806–1843), British mathematician, the son of a poor shoemaker, was born at Mallow, in Ireland, in 1806. At the age of thirteen, while working as an apprentice in his father's shop, he became known to certain gentlemen in the neighbourhood as a self-taught mathematician. Through their exertions, after attending a classical school in his native town, he was admitted to Caius College, Cambridge, in 1825. Third wrangler in 1829, he was elected in the same year a fellow of his college. A course of dissipation led him into debt; his fellowship was sequestrered for the benefit of his creditors, and he was obliged to leave Cambridge in December 1832. After living for some time with his relations in Ireland, he repaired to London in 1836, a penniless literary adventurer. In 1838 he became examiner in mathematics and physics at London University. He had already contributed several mathematical papers to the Cambridge Philosophical Transactions (1831–1836), Philosophical Magazine (1832–1842), and the Philosophical Transactions (1837), and had published Elementary Principles of the Theories of Electricity (1833). He now wrote for the "Library of Useful Knowledge" a Treatise on the Theory of Algebraical Equations (1839). He died on the 12th of March 1843.

MUROPSBO, a city and the county-seat of Jackson county, Illinois, U.S.A., in the south part of the state, on the Big Muddy River, about 57 m. N. of Cairo. Pop. (1890), 3880; (1900), 4643; including 557 foreign-born and 356 negroes; (1910), 4951; (1920), 4922; (1930), 5145. It is served by the Illinois Central, the Mobile & Ohio and the St Louis, Iron Mountain & Southern Railways. It is the centre for a farming region, in which there are deposits of coal, iron, lead and shale, and there are various manufactories in the city. Murphysboro was incorporated in 1867, and re-incorporated in 1875.

MURRIN (derived through O. Fr. marine, from Lat. mori, to die), a general term for various virulent diseases in domesticated animals, synonymous with plague or epizooty. The principal diseases are dealt with under KINDEREFEST; FLEURO-PNEUMONIA; ANTIRRHINUM; and FOOT AND MOUTH DISEASE. See also VETERINARY SCIENCE.

MURRAY (or Moray), EARLS OF. The earldom of Moray was one of the seven original earldoms of Scotland, its lands corresponding roughly to the modern counties of Inverness and Ross. Little is known of the earls until about 1314, when Sir Thomas Randolph, a nephew of King Robert Bruce, was created earl of Moray (q.v.), and the Randolphs held the earldom until 1346, when the childless John Randolph, 3rd earl of this line and a soldier of repute, was killed at the battle of Neville's Cross. According to some authorities the earldom was then held by John's sister Agnes (c. 1312-1369) and her husband, Patrick Dunbar, earl of March or Dunbar (c. 1285-1368). However this may be, in 1359 an English prince, Henry Plantagenet, duke of Bedford (d. 1361), was made earl of Moray by King David II.; but in 1372 John Dunbar (d. 1391), a grandson of Sir Thomas Randolph and a son-in-law of Robert II., obtained the earldom. The last of the Dunbar ears was James Dunbar, who was murdered in August 1429, and after this date his daughter Elizabeth and her husband, Archibald Douglas (d. 1455), called themselves earl and countess of Moray.

The next family to bear this title was an illegitimate branch of the royal house of Stuart, James IV. creating his natural son, James Stuart (c. 1499-1544), earl of Moray. James died without sons, and after the title had been borne for a short time by George Gordon, 4th earl of Huntly (c. 1514-1562), who was killed at Corrichie in 1562, it was bestowed in 1562 by Mary Queen of Scots upon her half-brother, an illegitimate son of James V. This was the famous regent, James Stuart, earl of Moray, or Murray (see below), who was murdered in January 1570; after this event a third James Stuart, who had married the regent's daughter Elizabeth (d. 1591), held the earldom. He, who was called the "bonny earl," was killed by his hereditary enemies, the Gordons, in February 1592, when his son James (d. 1638) succeeded to the title. The earldom of Moray has remained in the Stuart family since this date. Alexander, the 4th earl (d. 1701), was secretary of state for Scotland from 1680 to 1695, and in 1706 the 9th earl (1737-1810), was made a peer of the United Kingdom as Baron Stuart.

MURRAY, ALEXANDER STUART (1841–1904), British archaeologist, was born at Arbroath on the 8th of January 1841, and educated there, at Edinburgh high school and at the universities of Edinburgh and Berlin. In 1867 he entered the British Museum as an assistant in the department of Greek and Roman antiquities under Sir Charles Newton, whom he succeeded in 1886. His younger brother, George Robert Milne Murray (b. 1838), was made keeper of the botanical department in 1895, the only instance of two brothers becoming heads of different departments at the museum. In 1873 Dr Murray published a Manual of Mythology, and in the following year contributed to the Contemporary Review two articles—one on the Homeric question—which led to a friendship with Mr Gladstone, the other on Greek painters. In 1886–1883 he brought out his History of Greek Sculpture, which at once became a standard work. In 1886 he was selected by the Society of Antiquaries of Scotland to deliver the Rhind lectures on archaeology, out of
which grew his *Handbook of Greek Archaeology* (1862). In 1894–1896 Dr Murray directed some excavations in Cyprus undertaken by means of a bequest of £5000 from Miss Emma Tournour Turner. The objects obtained are described and illustrated in a new edition of *Cyprus*, published by the trustees of the museum in 1900. Among Dr Murray's other official publications are three folio volumes on *Terra-cotta Sarcophagi*, *While Athenian Vases* and *Designs from Greek Vases*. In 1886 he wrote for the *Portfolio* a monograph on Greek bronze, founded on lectures delivered at the Royal Academy in that year, and he contributed many articles on archaeology to standard publications. In recognition of his services to archaeology he was made LL.D. of Glasgow University in 1887 and elected a corresponding member of the Berlin Academy of Sciences in 1900. He died in March 1904.

**MURRAY, DAVID** (1840–1890), Scottish painter, was born in Glasgow, and spent some years in commercial pursuits before he practised as an artist. He was elected an associate of the Royal Academy in 1891 and academician in 1905; and also became an associate of the Royal Scottish Academy and of the Royal Society of Painters in Water Colours, and a member of the Royal Scottish Water Colour Society. He is a landscape painter of distinction, and two of his pictures, "My Love is gone a-sailing" (1884) and "In the Country of Constable" (1903), have been bought for the National Gallery of British Art. "Young Wheat," painted in 1890, is one of his most noteworthy works.

**MURRAY, JUStACE CLARE GRENVILLE** (1824–1881), English journalist, was born in 1824, the natural son of the 2nd duke of Buckingham. Educated at Magdalen Hall (Hertford College), Oxford, he entered the diplomatic service through the influence of Lord Palmerston, and in 1851 joined the British embassy at Vienna as attaché. At the same time he agreed to act as Vienna correspondent of a London daily paper, a breach of the conventions of the British Foreign Office which cost him his post. In 1853 he was transferred to Hanover, and thence to Constantinople, and finally, in 1855, was made consul-general at Odessa. In 1868 he returned to England, and devoted himself to journalism. He contributed to the early numbers of *Vanity Fair*, and in 1869 founded a clever but abusive society paper, the *Queen's Messenger*. For a libel published in this paper Lord Carrington horse-whipped him on the doorstep of a London club. Murray was subsequently charged with perjury for denying on oath his authorship of the article. Remanded on bail, he escaped to Paris, where he subsequently lived, acting as correspondent of various London papers. In 1874 he helped Edmund Yates to found the *World*. Murray died at Passy on the 20th of December 1881.

His score of books, several of which were translated into French and published in Paris, include *French Pictures in English Chats* (1876–1878); *The Roving Englishman in Turkey* (1854); *Men of the Second Empire* (1872); *Young Broads* (1874); *Sidelights on English Society* (1881); and *Under the Lens: Social Photographs* (1885).

**MURRAY, LORD GEORGE** (1694–1756), Scottish Jacobite general, fifth son of John, 1st duke of Atholl, by his first wife, Catherine, daughter of the 3rd duke of Hamilton, was born at Huntingtower, near Perth, on the 4th of October 1694. He joined the army in Flanders in June 1712; in 1715, contrary to their father's wishes, he and his brothers, the marquis of Tullibardine and Lord Charles Murray, joined the Jacobite rebels under the earl of Mar, each brother commanding a regiment of men of Atholl. Lord Charles was taken prisoner at Preston, but after the collapse of the rising Lord George escaped with Tullibardine to South Uist, and thence to France. In 1719 Murray took part in the Jacobite attempt in conjunction with the Spaniards in the western highlands, under the command of Tullibardine and the earl marshal, which terminated in "the affair of Glenshiel" on the 10th of June, when he was wounded while commanding the right wing of the Jacobites. After hiding for some months in the highlands he reached Rotterdam in May 1720. There is no evidence for the statement that Murray served in the Sardinian army, and little is known of his life on the continent till 1724, when he returned to Scotland, where in the following year he was granted a pardon. The duke of Atholl died in 1724 and was succeeded in the title by his second son James, owing to the attainder of Tullibardine; and Lord George leased from his brother the old family property of Tullibardine in Strathern, where he lived till 1745.

On the eve of the Jacobite rising of 1745 the duke of Perth made overtures to Lord George Murray on behalf of the Pretender; but even after the landing of Charles Edward in Scotland in July, accompanied by Tullibardine, Murray's attitude remained doubtful. He accompanied his brother the duke to Crieff on the 21st of August to pay his respects to Sir John Cope, the commander of the government troops, and he permitted the duke to appoint him deputy-sheriff of Perthshire. It has been suggested that Murray acted with duplicity, but his hesitation was natural and genuine; and it was not till early in September, when Charles Edward was at Blair Castle, which had been vacated by the duke of Atholl on the prince's approach, that Murray decided to espouse the Stuart cause. He then wrote to his brother explaining that he did so for conscientious reasons, while realizing the risk of ruin it involved. On joining the Jacobite army Lord George received a commission as lieutenant-general, though the prince ostentatiously treated him with want of confidence; and he was flouted by the Irish adventurers who were the Pretender's trusted advisers. At Perth Lord George exerted himself with success to introduce discipline and organization in the army he was to command, and he gained the confidence of the highland levies, with whose habits and methods of fighting he was familiar. He also used his influence to prevent both excesses and arbitrariness. As a result of his dealings with civil rights which Charles was too ready to sanction on the advice of others. At Prestonpans, on the 21st of September, Lord George, who led the Jacobite left wing in person, was practically commander-in-chief, and it was to his able generalship that the victory was mainly due. During the six weeks' occupation of Edinburgh he did useful work in the further organization and disciplining of the army. He opposed Charles's plan of invading England, and when his judgment was overruled he prevailed on the prince to march into Cumberland, which he knew to be favourable ground for highlander tactics, instead of advancing against General Wade, whose army was posted at Newcastle. He conducted the siege of Carlisle, but on the surrender of the town on the 14th of November he resigned his commission on the ground that his authority had been insufficiently upheld by the prince, and he obtained permission to serve as a volunteer in the ranks of the Atholl levies. The dissatisfaction, however, of the army with the appointment of the duke of Perth to succeed him compelled Charles to reinstate Murray, who accordingly commanded the Jacobites in the march to Derby. Here on the 5th of December a council was held at which Murray urged the necessity for retreat, owing to the failure of the English Jacobites to support the invasion and the absence of aid from France. As Murray was supported by the council the retreat was ordered, to the intense chagrin of Charles, who never forgave him; but the failure of the enterprise was mainly chargeable to Charles himself, and it was not without justice that Murray's aide de camp, the chevalier Johnstone, declared that "had Prince Charles slept during the whole of the expedition, and allowed Lord George Murray to act for him according to his own judgment, he would have found the crown of Great Britain on his head when he awoke." Lord George commanded the rear-guard during the retreat; and this task, rendered doubly dangerous by the proximity of Cumberland in the rear and Wade on the flank, was made still more difficult by the incapacity and petulance of the Pretender. By a skilfully fought rear-guard action at Clifton Moor, Lord George enabled the army to reach Carlisle safely and without loss of stores or war materials, and on the 3rd of January 1746 the force entered Stirling, where they were joined by reinforcements from Perth. The prince laid siege to Stirling Castle, while Murray defeated General Hawley near Falkirk; but the losses of the Jacobites by sickness and desertion, and the approach of Cumberland, made retreat
to the Highlands an immediate necessity, in which the prince was compelled to acquiesce; his resentment was such that he gave ear to groundless suggestions that Murray was a traitor, which the latter's failure to capture his brother's stronghold of Blair Castle did nothing to refute.

In 1760 Lord William Murray was in the neighbourhood of Inverness, and the prince decided to give battle to the duke of Cumberland. Charles took up a position on the left bank of the Nairn river at Culloden Moor, rejecting Lord George Murray's advice to select a much stronger position on the opposite bank. The battle of Culloden, where the Stuart cause was ruined, was fought on the 16th of April 1746. On the following day the duke of Cumberland intimated to his troops that "the public orders of the rebels yesterday was to give us no quarter"; Hanoverian news-sheets printed what purported to be copies of such an order, and the historian James Ray and other contemporary writers gave further currency to a calumny that has been repeated by modern authorities. Original copies of Lord George Murray's "orders at Culloden" are in existence, one of which is among Cumberland's own papers, while another was in the possession of Lord Hardwicke, the judge who tried the Jacobite peers in 1746, and they contain no injunction to refuse quarter. After the defeat Murray conducted a remnant of the Jacobite army to Ruthven, and prepared to organize further resistance. Prince Charles, however, had determined to abandon the enterprise, and at Ruthven Lord George received an order dismissing him from the prince's service, to which he replied in a letter upbraiding Charles for his distrust and mismanagement. Charles's belief in the general's treachery was shared by several leading Jacobites, but there appears no ground for the suspicion. From the moment he threw in his lot with the exiled prince's cause Lord George Murray never deviated in his loyalty and devotion, and his generalship was deserving of the highest praise; but the discipline he enforced and jealousy of his authority made enemies of some of those to whom Charles was more inclined to listen than to the general who gave him sound but unwelcome advice.

Murray escaped to the continent in December 1746, and was graciously received in Rome by the Old Pretender, who granted him a pension; but in the following year when he went to Paris Charles Edward refused to see him. Lord George lived at various places abroad until his death, which occurred at Medemblik in Holland on the 11th of October 1760. He married in 1728 Amelia, daughter and heiress of James Murray of Strowan and Glencarse, by whom he had three sons and two daughters. His eldest son John became 3rd duke of Atholl in 1764; the two younger sons became lieutenant-general and vice-admiral respectively in the British service.

Murray, James (c. 1719-1794), British governor of Canada, was a younger son of Alexander Murray, 4th Lord Elibank (d. 1736). Having entered the British army, he served with the 15th Foot in the West Indies, the Netherlands and Brittany, and became lieutenant-colonel of this regiment by purchase in 1751. In 1757 he led his men to North America to take part in the war against France. He commanded a brigade at the siege of Louisburg, was court-martialled by Wolfe's thrombute for his part in the mutiny against Quebec, and commanded the left wing of the army in the famous battle in September 1759. After the British victory and the capture of the city, Murray was left in command of Quebec; having strengthened its fortifications and taken measures to improve the morale of his men, he defended it in April and May 1760 against the attacks of the French, who were soon compelled to raise the siege. The British troops had been decimated by disease, and it was only a remnant that Murray now led to join General Amherst at Montreal, and to be present when the last batch of French troops in Canada surrendered. In October 1760 he was appointed governor of Quebec, and he became governor of Canada after this country had been formally ceded to Great Britain in 1763. In this year he quelled a dangerous mutiny, and soon afterwards his alleged partiality for the interests of the French Canadians gave offence to the British settlers; they asked for his recall, and in 1766 he retired from his post. After an inquiry in the House of Lords, he was exonerated from the charges which had been brought against him. In 1774 Murray was sent to Minorca as governor, and in 1781, while he was in charge of this island, he was besieged in Fort St Philip by a large force of French and Spaniards. After a stubborn resistance, which lasted nearly seven months, he was obliged to surrender the place; and on his return to England he was tried by a court-martial, at the instance of Sir William Draper, who had served under him in Minorca as lieutenant-governor. He was acquitted and he became a general in 1783. He died on the 18th of June 1794. Murray's only son was James Patrick Murray (1782-1834), a major-general and member of parliament.

Murray, Sir James Augustus Henry (1837—), British lexicographer, was born at Denholm, near Hawick, Roxburghshire, and after a local elementary education proceeded to Edinburgh, and thence to the university of London, where he graduated B.A. in 1873. Sir James Murray, who received honorary degrees from several universities, both British and foreign, was engaged in scholastic work for thirty years, from 1855 to 1885, chiefly at Hawick and Mill Hill. During this time his reputation as a philologist was increasing, and he was assistant examiner in English at the University of London from 1875 to 1879 and president of the Philological Society of London from 1878 to 1880, and again from 1882 to 1884. It was in connexion with this society that he undertook the chief work of his life, the editing of the New English Dictionary, based on materials collected by the society. These materials, which had accumulated since 1857, when the society first projected the publication of a dictionary on philological principles, amounted to an enormous quantity, of which an idea may be formed from the fact that Dr Furnivall sent in "some ton and three-quarters of materials which had accumulated under his roof." After negotiations extending over a considerable period, the contracts between the society, the delegates of the Clarendon Press, and the editor, were signed on the 1st of March 1879, and Murray began the examination and arrangement of the raw material, and the still more troublesome work of re-animating and maintaining the enthusiasm of "readers." In 1885 he removed from Mill Hill to Oxford, where his Scriptorium came to rank among the institutions of the University city. The first volume of the dictionary was printed at the Clarendon Press, Oxford, in 1888. A full account of its beginning and the manner of working on it will be found in Murray's presidential address to the Philological Society in 1879, while reports of its progress are given in the addresses by himself and other presidents in subsequent years. In addition to his work as a philologist, Murray was a frequent contributor to the transactions of the various antiquarian and archaeological societies of which he is a member; and he wrote the article on the English language for this Encyclopaedia. In 1885 he received the honorary degree of M.A. from Balliol College; he was an original fellow of the British Academy, and in 1908 he was knighted.

Murray (or Moray), James Stuart, Earl of (c. 1531-1570), regent of Scotland, was an illegitimate son of James V. of Scotland and Margaret Erskine, daughter of John Erskine, Earl of Mar. In 1566, at the age of 16, James Murrays, accompanied by Lord St Andrews in order that James V. might obtain possession of his funds. Educated at St Andrews University, he attacked, in September 1549, an English force which had made a descent on the Fife coast, and routed it with great slaughter. In addition to the priory of St Andrews, he received those also of Pittenweem and Mâcon in France, but manifested no vocation.
MURRAY, JOHN

for a monastic life. The discourses of Knox, which he heard at Calder, won his approval, and shortly after the return of the reformer to Scotland in 1559, James Stuart left the party of the queen regent and joined the lords of the congregation, who resolved forcibly to abolish the Roman service. After the return of Queen Mary in 1561, he became her chief adviser, and his cautious firmness was for a time effectual in inducing her to adopt a policy of moderation towards the reformers. At the beginning of 1562 he was created earl of Murray, a dignity also held by George Gordon, earl of Huntly, who, however, had lost the queen's favour. Only a few days later he was made earl of Mar, *but as this title was claimed by John, Lord Erskine, Stuart resigned it and received a second grant of the earldom of Murray, Huntly by this time having been killed in battle. Henceforward he was known as the earl of Moray, the alternative Murray being a more modern and less correct variant. About this time the earl married Anne (d. 1583), daughter of William Keith, 1st Earl Marischal.

After the defeat and death of Huntly, the leader of the Catholic party, the policy of Murray met for a time with no obstacle, but he awakened the displeasure of the queen by his efforts in behalf of Knox when the latter was accused of high treason; and as he was also opposed to her marriage with Darnley, he was after that event declared an outlaw and took refuge in England. Returning to Scotland after the murder of Rizzio, he was pardoned by the queen. He contrived, however, to be away at the time of Darnley's assassination, and avoided the tangles of the marriage with Bothwell by going to France. After the abdication of Queen Mary at Lochleven, in July 1567, he was appointed regent of Scotland. When Mary escaped from Lochleven (May 2, 1568), the duke of Châtelherault and other Catholic nobles rallied to her standard, but Murray and the Protestant lords gathered their adherents, defeated her forces at Langside, near Glasgow (May 13, 1568), and compelled her to flee to England. Murray displayed promptness in baffling Mary's schemes, suppressed the border thieves, and ruled firmly, resisting the temptation to place the crown on his own head. He observed the forms of personal piety; possibly he shared the zeal of the reformers, while he moderated their bigotry. But he reapèd the fruits of the conspiracies which led to the murders of Rizzio and Darnley. He had been a persecutor of his faith, and henceforth to be deemed a pure reformer of its abuses. He pursued his sister with a calculated animosity which would not have spared her life had this been necessary to his end or been favoured by Elizabeth. The mode of producing the casket letters and the false charges added by Buchanan, deprive Murray of any claim to have been an honest accuser. His reluctance to charge Mary with complicity in the murder of Darnley was feigned, and his object was gained when he was allowed to table the accusation without being forced to prove it. Mary remained a captive under suspicion of the gravest guilt, while Murray ruled Scotland in her stead, supported by nobles who had taken part in the steps which ended in Bothwell's death. During the year between his becoming regent and his death several events occurred for which he has been censured, but which were necessary for his security: the betrayal to Elizabeth of the duke of Norfolk and of the secret plot for the liberation of Mary; the imprisonment of the earl of Northumberland, who after the failure of his rising in the north of England had taken refuge in Scotland; and the charge brought against Maitland of Lethington of complicity in Darnley's murder. Lethington was committed to custody, but was rescued by Kirkaldy of Grange, who held the castle of Edinburgh, and while there "the chameleon," as Buchanan named Maitland in his famous invective, gained respite for hours in the castle, including Kirkaldy. Murray was afraid to proceed with the charge on the day of trial, while Kirkaldy and Maitland held the castle, which became the stronghold of the deposed queen's party. It has been suspected that Maitland and Kirkaldy were cognizant of the design of Hamilton of Bothwellhaugh to murder Murray, for he had been with them in the castle. This has been ascribed to private vengeance for the ill-treatment of his wife; but the feud of the Hamiltons with the regent is the most reasonable explanation.

As he rode through Linlithgow Murray was shot on the 21st of January 1570 from a window by Hamilton, who had made careful preparation for the murder and had gone to Edinburgh. He was buried in the south aisle of St. Giles Cathedral, Edinburgh, amid general mourning. Knox preached the sermon and Buchanan furnished the epitaph, both panegyrics. The elder of his two daughters, Elizabeth, married James Stuart (d. 1592), son of James, 1st Lord Doune, who succeeded to the earldom of Murray in right of his wife.

The materials for the life of Murray are found in the records and documents of the time, prominent among which are the various Collections of State Papers. Mention must also be made of the many books which treat of Mary, Queen of Scots, and of the histories of the time—especially J. A. Froude, History of England, and Andrew Lang, History of Scotland.

MURRAY, JOHN, the name for several generations of a great firm of London publishers, founded by John McMurray (1743-1793), a native of Edinburgh and a retired lieutenant of marines, who in 1768 bought the book business of William Sandby in Fleet Street, and, dropping the Scottish prefix, called himself John Murray. He was one of the twenty original proprietors of the Morning Chronicle, and started the monthly English Review (1783-1796). Among his publications were Mitford's Greece, Langhorne's Plutarch's Lives, and the first part of Isaac D'Israeli's Curiosities of Literature. He died on the 6th of November 1793.

JOHN MURRAY (2) (1778-1843), his son, was then fifteen. During his minority the business was conducted by Samuel Higlhey, who was admitted a partner, but in 1803 the partnership was dissolved. Murray soon began to show the courage in literary speculation which earned for him later the name given him by Lord Byron of "the Anak of publishers." In 1807 he took a share with Constable in publishing Marmion, and became part owner of the Edinburgh Review, although with the help of Canning he launched in opposition the Quarterly Review (Feb. 1809), with William Gifford as its editor, and Scott, Canning, Southey, Hookham Freer and John Wilson Croker among its earliest contributors. Murray was closely connected with Constable, but, to his distress, was compelled in 1813 to break this association on account of Constable's business methods, which, as he foresaw, led to disaster. In 1811 the first two cantos of Childe Harold were brought to Murray by R. C. Dallas, to whom Byron had presented them. Murray paid Dallas the full price for the copyright. In 1812 he bought the publishing business of William Miller (1769-1834), and migrated to 50, Albermarle Street. Literary London flocked to his house, and Murray became the centre of the publishing world. It was in his drawing-room that Scott and Byron first met, and here, in 1824, after the death of Lord Byron, the MS. of his memoirs, considered by Gifford unfit for publication, was destroyed. A close friendship existed between Byron and his publisher, but for political reasons business relations ceased after the publication of the 7th canto of Don Juan. Murray paid Byron some £50,000 for his various poems. To Thomas Moore he gave nearly £5000 for writing the life of Byron, and to Crabbe Lyric and Tales of the Hall. He died on the 27th of June 1843.

His son, John Murray (3) (1808-1892), inherited much of his business tact and judgment. "Murray's Handbooks" for travellers were issued under his editorship, and he himself wrote several volumes (see his article on the "Handbooks" in Murray's Magazine, November 1889). He published many books of travel; also Campbell's Lives of the Chancellors, The Speaker's Commentary, Smith's Dictionaries; and works by Hallam, Gladstone, Lyell, Layard, Dean Stanley, Borrow, Darwin, Livingstone and Samuel Smiles. He died on the 2nd of April 1892, and was succeeded by his eldest son, John Murray (4) (b. 1851), under whom, in association with his brother, A. H. Hallam Murray, the firm was continued.

See Samuel Smiles, A Publisher and his Friends, Memoirs and Correspondence of the late John Murray... (1861), for the second John Murray; a series of three articles by F. Espinasse on "The
MURRAY, J.—MURREE

House of Murray,” in The Critic (Jan. 1860); and a paper by the same writer in Harper’s New Monthly Magazine (Sept. 1878). See the Letters and Journals of Byron (ed. Prothero, 1898-1901).

MURRAY, JOHN (1778-1820), Scottish chemist, was born at Edinburgh in 1778 and died there on the 22nd of July 1820. He graduated M.D. at St Andrews in 1814, and attained some reputation as a lecturer on chemistry and materia medica. He was an opponent of Sir Humphry Davy’s theory of chlorine, supporting the view that the substance contained oxygen, and it was in the course of experiments made to disprove his arguments that Dr John Davy discovered phosgene or carbonyl chloride. He was a diligent writer of textbooks, including Elements of Chemistry (1801); Elements of Materia Medica and Pharmacy (1804); A System of Chemistry (1806), and (anonymously) A Comparative View of the Huttonian and Neptunian Systems of Geology. He was sometimes confused with another John Murray (1786-1851), a popular lecturer at mechanics’ institutes. The two men carried on a dispute about the invention of a miners’ safety lamp in the Phil. Mag. for 1817.

MURRAY, SIR JOHN (1841-1880), British geographer and naturalist, was born at Coburg, Ontario, Canada, on the 3rd of March 1841, and after some years’ local schooling studied in Scotland and on the Continent. He was then engaged for some time as assistant editor at Bridge of Allan. In 1868 he visited Spitsbergen on a whaler, and in 1872, when the voyage of the “Challenger” was projected, he was appointed one of the naturalists to the expedition. At the conclusion of the voyage he was made principal assistant in drawing up the scientific results, and in 1882 he became editor of the Reports, which were completed in 1896. He compiled a summary of the results, and was part-author of the Narrative of the Cruise and of the Report on Deep-sea Deposits. He also published numerous important papers on oceanography and marine biology. In 1898 he made K.C.B., and the received many distinctions from the chief scientific societies of the world. Apart from his work the connection of the “Challenger” Reports were published in 1880 and 1882 on expeditions to explore the Eareoe Channel, and between 1882 and 1894 was the prime mover in various biological investigations in Scottish waters. In 1897, with the generous financial assistance of Mr Laurence Pullar and a staff of specialists, he began a bathymetrical survey of the fresh-water lochs of Scotland, the results of which, with a fine series of illustrations and maps, were published in 1910 in six volumes. He took a leading part in the expedition which started in April 1910 for the physiological and biological investigation of the North Atlantic Ocean on the Norwegian vessel “Michael Sars.”

MURRAY, LINDLEY (1745-1826), Anglo-American grammarian, was born at Swatara, Pennsylvania, on the 22nd of April 1745. His father, a Quaker, was a leading New York merchant. At the age of fourteen he was placed in his father’s office, but he ran away to a school in Burlington, New Jersey. He was brought back to New York, but his arguments against a commercial career prevailed, and he was allowed to study law. On being called to the bar he practised successfully in New York. In 1783 he was able to retire, and in 1784 he left America for England. Settling at Holgate, near York, he devoted the rest of his life to literary pursuits. His first book was Perus of Religion on the Mind (1787). In 1795 he issued his Grammar of the English Language. This was followed, among other analogous works, by English Exercises, and the English Reader. These books passed through several editions, and the Grammar was the standard textbook for fifty years throughout England and America. Lindley Murray died on the 16th of January 1826. See the Memoir of the Life and Writings of Lindley Murray (partly autobiographical) by Elizabeth of text, Murray, by W. H. Egle (New York, 1885).

MURRAY (or Moray), SIR ROBERT (c. 1660-1763), one of the founders of the Royal Society, was the son of Sir Robert Murray of Craigie, Ayrshire, and was born about the beginning of the 17th century. In early life he served in the French army, and, winning the favour of Richelieu, rose to the rank of colonel. On the outbreak of the Civil War he returned to Scotland and collected recruits for the royal cause. The triumph of Cromwell compelled him for a time to return to France, but he took part in the Scottish insurrection in favour of Charles II. in 1650, and was named lord justice clerk and a privy councillor. These appointments, which on account of the overthrow of the royal cause proved to be at the time only nominal, were confirmed at the Restoration in 1660. Soon after this Sir Robert Murray began to take a prominent part in the deliberations of a club instituted in London for the discussion of natural science, or, as it was then called, the “new philosophy.” When it was proposed to obtain a charter for the society he undertook to interest the king in the matter, the result being that on the 15th of July 1662 the club was incorporated by charter under the designation of the Royal Society. Murray was its first president. He died in June 1673.

MURRAY, the largest river in Australia. It rises in the Australian Alps in 36° 40’ S. and 147° E., and flowing north-west skirts the borders of New South Wales and Victoria until it passes into South Australia, shortly after which it bends southward into Lake Alexandrina, a shallow lagoon, whence it makes its way to the sea at Encounter Bay by a narrow opening at 35° 35’ S. and 138° 55’ E. Near its source the Murray Gates, precipitous rocks, tower above it to the height of 3000 ft.; and the earlier part of its course is tortuous and uneven. Farther on it loses so much by evaporation in some parts as to become a series of pools. Its length till it debouches into Lake Alexandrina is 1120 m., its average breadth in summer is 240 ft., its average depth about 16 ft.; and it drains an area of about 270,000 sq. m. For small steamers it is navigable as far as Albury. Periodically it overflows, causing wide inundations. The principal tributaries of the Murray and those from New South Wales, including the Edward River, the united streams of the Murrumbidgee and Lachlan, and the Darling or Callawatta. In 1829 Captain Sturt traced the Murrumbidgee River till it debouched into the Murray, which he followed down to Lake Alexandrina, but he was compelled, after great hardships, to return without discovering its mouth. In 1831 Captain Barker, while attempting to discover this, was murdered by the natives.

MURRAY COD (Oligorus macquariensis), one of the largest of the numerous fresh-water Perciform fishes of Australasia, and the most celebrated for its excellent flavour. It belongs to the family Serranidae. Its taxonomic affinities lie in the direction of the perch and not of the cod family. The shape of the body is that of a perch, and the dorsal fin consists of a spinous and rayed portion, the number of spines being eleven. The length of the spines varies with age, old individuals having shorter spines—that is, a lower dorsal fin. The form of the head and the dentition also resemble those of a perch, but none of the bones of the head has a serrated margin. The scales are small. The colour varies in different localities; it is generally brownish, with a greenish tinge and numerous small dark green spots. As implied by the name, this fish has its headquarters in the Murray River and its tributaries, but it occurs also in the northern parts of New South Wales. It is the most important food fish of these rivers, and is said to attain a length of more than 3 ft. and a weight of 170 lb.

MURREE, a town and sanatorium of British India, in the Rawalpindi district of the Punjab, 7577 ft. above the sea, about five hours’ journey by cart-road from Rawalpindi town, and the starting-point for Kashmir. The houses are built on the
MURSHIDABAD—MUSCAT

summit and sides of an irregular ridge, and command magnificent views over forest-clad hills and deep valleys, studded with villages and cultivated fields, with the snow-covered peaks of Kashmir in the background. The population in 1901 was 18,445; but these figures omit the summer visitors, who probably numbered 10,000. The garrison generally consists of three mountain batteries. Since 1877 the summer offices of the provincial government have been transferred to Simla. The Murree brewery, one of the largest in India, is the chief industrial establishment. The Lawrence Military Asylum for the children of European soldiers is situated here.

MURSHIDABAD, or MOORSHEEDEEABAD, a town and district of British India, in the Presidency division of Bengal. The administrative headquarters of the district are at Berhampur. The town of Murshidabad is on the left bank of the Bhagirathi or old sacred channel of the Ganges. Pop. (1901), 15,188. The city of Murshidabad was the latest Mahomedan capital of Bengal. In 1794 the nawab Murshid Kulia Khan changed the seat of government from Dacca to Murshidabad, which he called after his own name. The great family of Jagat Seth maintained their position as state bankers at Murshidabad from generation to generation. Even after the conquest of Bengal by the British, Murshidabad remained for some time the seat of administration. Warren Hastings removed the supreme civil and criminal courts to Calcutta in 1772, but in 1775 the latter court was brought back to Murshidabad again. In 1790, under Lord Cornwallis, the entire revenue and judicial staffs were fixed at Calcutta. The town is still the residence of the nawab, who ranks as the first nobleman of the province with the title of nawab bahadur of Murshidabad, instead of nawab nazim of Bengal. His palace, dating from 1837, is a magnificent building in Italian style. The city is crowded with other palaces, mosques, tombs, and gardens, and retains such industries as carving in ivory, gold and silver embroidery, and silk-weaving. A college is maintained for the education of the nawab's family.

The District of Murshidabad has an area of 2143 sq. m. It is divided into two nearly equal portions by the Bhagirathi, the ancient channel of the Ganges. The tract to the west, known as the Rarh, consists of hard clay and nodular limestone. The general level is high, but interspersed with marshes and swamps by hill torrents. The Bagri, the eastern half, belongs to alluvial plains of eastern Bengal. There are few permanent swamps; but the whole country is low-lying, and liable to annual inundation. In the north-west there are a few small detached hillocks, said to be of basaltic formation. Pop. (1901), 1,333,184, showing an increase of 6-6% in the decade. The principal industry is that of silk, formerly of much importance, and now revived with government assistance. A narrow-gauge railway crosses the district, from the East Indian line at Nathali to Azimganj near the Bhagirathi, the home of many rich Jain merchants; and a branch of the Eastern Bengal railway has been opened.

MUS, the name of a Roman family of the plebeian Decian gens. (1) Publius Decius Mus won his first laurels in the Samnite War, when in 343 B.C., while serving as tribune of the soldiers, he rescued the Roman main army from an apparently hopeless position (Liv. vii. 34). In 340, as consul with T. Manlius Torquatus as colleague, he commanded in the Latin War. The decisive battle was fought near Mt Vesuvius. The consuls, in consequence of a dream, had agreed that the general whose troops first gave way should devote himself to destruction, and so ensure victory. The left wing under Decius became disordered, whereupon, repeating after the chief priest the solemn formula of self-devotion he dashed into the ranks of the Latins, and met his death (Liv. viii. 9). (2) His son, also called Publius, consul for the fourth time in 318, followed the example of his father at the battle of Sentinum, when the left wing which he commanded was shaken by the Gauls (Liv. x. 28). The story of the elder Decius is regarded by Mommsen as an unhistorical "doublette" of what is related on better authority of the son.

MUSAEUS, the name of three Greek poets. (1) The first was a mythical seer and priest, the pupil or son of Orpheus, who was said to have been the founder of priestly poetry in Attica. According to Pausanias (i. 23) he was buried on the Museum hill, south-west of the Acropolis. He composed dedicatory and purificatory hymns and prose treatises, and oracular responses. These were collected and arranged in the time of Pelisstratus by Onomacritus, who added interpolations. The mystic and oracular verses and customs of Attica, especially of Eleusis, are connected with his name (Herod. vii. 6; viii. 96; ix. 43). A Titanomachia and Theogonia are also attributed to him (G. Kinkel, Epicurum greceorum fragmenta, 1878). (2) The second was an Ephesian attached to the court of the kings of Pergamum, who wrote a Perséis, and poems on Eumenes and Attalus (Suidas, s.v.). (3) The third (called Grammaticus in all the MSS.) is of uncertain date, but probably belongs to the beginning of the 4th century A.D. as his style and the British Army in India was evidently modelled after Numa. He must have lived before Agathias (530-582) and is possibly to be identified with the friend of Procopius whose poem (430 hexameter lines) on the story of Hero and Leander is by far the most beautiful of the age (editions by F. Passow, 1810; G. H. Schäfer, 1825; C. Dilthey, 1874). The little love-poem Alpheus and Arethusa (Anthol. pal. ix. 362) is also ascribed to Musaeus.

MUSA KHEL, a Pathan tribe on the Dera Ghazi Khan border of the Punjab province of India. They are of Kakar origin, numbering 4000 fighting men. They enter British territory by the Vihowa Pass, and carry on an extensive trade, but are not dependent on India for the necessities of life. They are a peaceful and law-abiding tribe, and have been friendly to the British, but at enmity with the Khetran and the Baluch tribes to the south of their country. In 1879 the Musa Khels and other Pathan tribes to the number of 5000 made a demonstration against Vihowa, but the town was reinforced and they dispersed. In 1884 they were punished, together with the Kakars, by the Zhob Valley Expedition.

MUSÄUS, JOHANN KARL AUGUST (1735-1827), German author, was born on the 29th of March 1735 at Jena, studied theology at the university, and would have become the pastor of a parish but for the resistance of some peasants, who objected that he had been known to dance. In 1760 to 1762 he published in three volumes his first work, Grandzonz des Zweiten, afterwards (in 1781-1782) rewritten and issued with a new title, Der deutsche Glandison. The object of this book was to satirize Samuel Richardson's hero, who had many sentimental admirers in Germany. In 1763 Musäus was made master of the court pages at Weimar, and in 1769 he became professor at the Weimar gymnasium. His second book—Physiognomische Reisen—did not appear until 1778-1779. It was directed against Lavater, and attracted much favourable attention. In 1782 to 1786 he published his best work Völkmärchen der Deutschen. Even in this series of tales, the substance of which Musäus collected among the people, he could not refrain from satire. The stories, therefore, lack the simplicity of genuine folk-lure. In 1785 was issued Freunde Heins Erscheinungen in Holbeins Manier by J. R. Schellenberg, with explanations in prose and verse by Musäus. A collection of stories entitled Strassseufzer, of which a volume appeared in 1787, Musäus was prevented from completing by his death on the 28th of October 1787.

The Volkmarhen have been frequently reprinted (Düsseldorf, 1903, &c.). They were translated into French in 1844, and three of the stories are included in Carlyle's German Romances (1827). Musäus's Nachgelassene Schilden were edited by his relative, A. von Kotzebue (1791). See M. Müller, J. K. A. Musäus (1867), and an essay by A. Stern in Beiträge zur Literaturgeschichte des 18. Jahrhunderts (1893).

MUSCAT, MUSKAT or MUSKAT, a town on the south-east coast of Arabia, capital of the province of Oman. Its value as a naval base is derived from its position, which commands the entrance to the Persian Gulf. The town of Gwadar, the chief port of Makran, belongs to Muscat, and by arrangement with the sultan the British occupy that port with a telegraph station of the Indo-Persian telegraph service. An Indian political residency is established at Muscat. In geographical
MUSCATINE—MUSCLE AND NERVE

position it is isolated from the interior of the continent. The mountains rise behind it in a rugged wall, across which no road exists. It is only from Matrah, a northern suburb shut off by an intervening spur which reaches to the sea, that land communication with the rest of Arabia can be maintained. Both Muscat and Matrah are defended from incursions on the landward side by a wall with towers at intervals. Muscat rose to importance with the Portuguese occupation of the Persian Gulf, and is noted for the extent of Portuguese ruins about it. Two lofty forts, of which the most easterly is called Jalâlî and the western Merâni, overlook the summits of hills on either side the cove overlooking the town; and beyond them on the seaward side are two smaller defensive works called Sirat. All these are ruinous. A low sandy isthmus connects the rock and fortress of Jalâlî with the mainland, and upon this isthmus stands the British residency. The sultan's palace is a three-storied building near the centre of the town, a relic of Portuguese occupation, called by the Arabs El Jereza, a corruption of Igrezia (church). This term is probably derived from the chapel once attached to the buildings which formed the Portuguese governor's residence and factory. The bazaar is insignificant, and its most considerable trade appears to be in a sweetmeat prepared from the gluten of maize. Large quantities of dates are also exported.

History.—The early history of Muscat is the history of Portuguese ascendancy in the Persian Gulf. When Albuquerque first burnt the place after destroying Kâyêt in 1508, Kalhat was the chief port of the coast and Muscat was comparatively unimportant. Kalhat was subsequently sacked and burnt, the great Arab mosque being destroyed, before Albuquerque returned to his ships, "giving many thanks to our Lord." From that date, through 114 years of Portuguese ascendancy, Muscat was held as a naval station and factory during a period of local revolts, Arab incursions, and Turkish invasion by sea; but it was not till 1622, when the Portuguese lost Hormuz, that Muscat became the headquarters of their fleet and the most important place held by them on the Arabian coast. In 1650 the Portuguese were finally expelled from Oman. Muscat had been reduced previously by the humiliating terms imposed upon the garrison by the imam of Oman after a siege in 1648. For five years the Persians occupied Oman, but they disappeared in 1765. Under the great ruler of Oman, Said ibn Sultan (1804—1865), the fortunes of Muscat attained their zenith; but on his death, when his kingdom was divided and the African possessions were parted from western Arabia, Muscat declined. In 1833—1884, when Turki was sultan, the town was unsuccessfully besieged by the Indabâyîn and Rehûyâîn tribes, led by Abdul Aziz, the brother of Turki. In 1885 Colonel Miles, resident at Muscat, made a tour through Oman, following the footsteps of Wellsted in 1835, and confirmed that traveller's report of the fertility and wealth of the province. In 1898 the French acquired the right to use Muscat as a coaling station.

T. H. H.*

MUSCATINE, a city and the county-seat of Muscatine county, Iowa, U.S.A., on the Mississippi river (here crossed by a wagon bridge), at the apex of the "great bend," in the south-east part of the state. Pop. (1890), 11,454; (1900), 14,073, of whom 7,932 were foreign-born; (1910 census) 16,178. It is served by the Chicago Milwaukee & Saint Paul, the Chicago Rock Island & Pacific, and the Muscatine North & South railways. It is built on high rocky bluffs, and is the centre of a pearl-button industry, introduced in 1891 by J. F. Bepple, a German, the buttons being made from the shells of the fresh-water mussel found in the neighbourhood; and there are other manufactures. Coal is mined in the vicinity, and near the city are large market-gardens, the water-melons growing on Muscatine Island (below the city) and sweet potatoes being their most important products. The municipality owns and operates the waterworks. Muscatine began as a trading-post in 1833. It was laid out in 1836, incorporated as a town under the name of Bloomington in 1839, and first chartered as a city, under its present name, in 1851.

MUSCHELKALK, in geology, the middle member of the German Trias. It consists of a series of calcareous, marly and dolomitic beds which lie conformably between the Bunter and Keuper formations. The name Muschelkalk (Fr., calcaire coquillier; conchylien, formation of D'Orbigny) indicates a characteristic feature in this series, viz. the frequent occurrence of lenticular banks composed of fossil shells, remarkable in the midst of a singularly barren group. In its typical form the Muschelkalk is practically restricted to the German region and its immediate neighbourhood; it is found in Thuringia, Harz, Franconia, Hesse, Swabia, and the Saar and Alsace districts. Northward it extends into Silesia, Poland and Heligoland. Representatives are found in the Alps, west and south of the Vosges, in Moravia, near Tonlon and Montpellier, in Spain and Sardinia; in Rumania, Bosnia, Dalmatia, and beyond this into Asia in the Himalayas, China, Australia, California, and in North Africa (Constantine). From the nature of the deposits, as well as from the impoverished fauna, the Muschelkalk of the type area was probably laid down within a land-locked sea which, in the earlier portion of its existence, had only imperfect communications with the more open waters of the period. The more remote representatives of the formation were of course deposited in diverse conditions, and are only to be correlated through the presence of some of the Muschelkalk fossils.

In the "German" area the Muschelkalk is from 250—350 ft. thick; it is readily divisible into three groups, of which the upper and lower are pale thin-bedded limestones with greenish-grey marls, the middle group being mainly composed of gypsiferous and saliniferous marls with dolomite. The Lower Muschelkalk consists, from below upwards, of the following rocks, the ochreous Wellen Dolomiet, lower Wellen Kalk, upper Wellen Kalk (so called on account of the wavy character of the bedding) with beds of "Schaumkalk" (a porous cellular limestone), and Oolite and the Orbicularis beds (with Myophoria orbicularis). In the Saar and Alsace districts and north Eifel, these beds take on a sandy aspect, the "Muschellandsstein." The Middle Muschelkalk or Anhydrite group, as already indicated, consists mainly of marls and dolomites with beds of anhydrite, gypsum and salt. The salt beds are worked at Hall, Friedröhsschal, Heilbronn, Stettin and Erfurt. It is from this division that many of the mineral springs of Thuringia and south Germany obtain their saline contents. The cellular nature of much of the dolomite has given rise to the term "Zellendolomit." The Upper Muschelkalk (Hauptmuschelkalk, Friedrichskalk; of von Alberti) consists of regular beds of shelly limestone alternating with beds of marl. The lower portion or "Truchitenkalk" is often composed entirely of the fragmentary stems of Encrinus illinoisii; higher up come the "Nodosus" beds with Ceratites compressus, C. nodosus, and C. semifortis in ascending order. In Swabia and Franconia the highest beds are platy dolomites with Tringonodus Sander- genesis and the crustacean Bairdia. Styloides are common in all the Muschelkalk limestones. The Alpine Muschelkalk differs in many respects from that of this type area, and shows a closer relationship with the Triassic Mediterranean sea; the more important local phases will be found tabulated in the article TRIAS.

In addition to the fossils mentioned above, the following are Muschelkalk forms: Verticinella, Meusea, Actinocystites, &c. Glauconites, and S. hirsuta, Myophoria vulgaris, Rhyolochites hierundo, Ceratites Münserti, Ptychites studerii, Balatolites balatonicus, Aspidura scutella, Duonella Lommelli, and in the Alpine region several rock-forming Algae, Bacillarium, Gyrocera species, Deipalea, &c. &c. &c.

MUSCLE AND NERVE (Physiology). Among the properties of living material there is one, widely though not universally present in it, which forms the pre-eminent characteristic of muscles.

1. The anatomy of the muscles is dealt with under MUSCULAR SYSTEM, and of the nerves under NERVE and NERVOUS SYSTEM.
Muscle. This property is the liberation of some of the energy contained in the chemical compounds of the cells in such a way as to give mechanical work. The mechanical work is obtained by movement resulting from a change, it is supposed, in the elastic tension of the framework of the living cell. In the fibrils existing in the cell a sudden alteration of elasticity occurs, resulting in increased tension on the points of attachment of the cell to the neighbouring elements of the tissue in which the cell is placed. These yield under the strain, and the cell shortens between those points of its attachment. This shortening is called contraction. But the volume of the cell is not appreciably altered, despite the change of its shape, for its one diameter increases in proportion as its other is diminished. The manifestations of contractility by muscle are various in mode. By tonic contraction is meant a prolonged and equable state of tension which yields under analysis no element of intermittent character. This is manifested by the muscular walls of the hollow visceras and of the heart, where it is the expression of a continuous liberation of energy in process in the muscular tissue, the outcome of the latter's own intrinsic life, and largely independent of any connexion with the nervous system. The muscular wall of the blood-vessels also exhibits tonic contraction, which, however, seems to be mainly traceable to a continual excitation of the muscle cells by nervous influence conveyed to them along their nerves, and originating in the great vas motor centre in the bulb. In the ordinary striped muscles of the skeletal musculature, e.g. gastrocnemius, tonic contraction obtains; but this, like the last mentioned, is not autocothonous in the muscles themselves; it is indirect and neural, and appears to be maintained reflexly. The receptive organs of the muscular sense and of the semi-circular canals are to be regarded as the sites of origin of this reflex tonus of the skeletal muscles. Stripped muscles possessing an autocothonous tonus appear to be the various sphincter muscles.

Another mode of manifestation of contractility by muscles is the rhythmic. A tendency to rhythmic contraction seems discoverable in almost all muscles. In some it is very marked, for example in some viscera, the spleen, the bladder, the ureter, the uterus, the intestine, and especially in the heart. In several of these it appears not unlikely that the recurrent explosive liberations of energy in the muscle tissue are not secondary to recurrent explosions in nerve cells, but are attributable to decompositions arising sua sponte in the chemical substances of the muscle cells themselves in the course of their living. Even small strips of the muscle of the heart, if taken immediately after the death of the animal, continue, when kept moist and warm and supplied with oxygen, to "beat" rhythmically for hours. Rhythmic contraction is also characteristic of certain groups of skeletal muscles, e.g. the respiratory. In these the rhythmic activity is, however, clearly secondary to rhythmic discharges of the nerve cells constituting the respiratory centre in the bulb. Such discharges descend the nerve fibres of the spinal cord, and through the intermediation of various spinal nerve cells excite the respiratory muscles through their motor nerves. A form of contraction intermediate in character between the tonic and the rhythmic is met in the auricle of the heart of the toad. There slowly successive phases of increased and of diminished tonus regularly alternate, and upon them are superposed the rhythmic "beats" of the pulsating heart. The "beat," i.e. the short-lasting explosive contraction of the heart muscle, can be elicited by a single, even momentary, application of a stimulus, e.g. by an induction shock. Similarly, such a single stimulus elicits from a skeletal muscle a single "beat," or, as it is termed, a "twist." In the heart muscle during an ordinary systole of cardiac rhythm the exciting stimulus is delivered at the end of the diastole, and it is a mistake to think of the heart as a muscle working in a series. The stimulus is repeated at the end of each succeeding systole, and the heart contracts between each pair of stimuli. The stimulus is increased each time, and thus small increments may produce a great alteration of the force of the heart. The heart muscle is therefore more excitable than the nervous system. It is capable of preparing itself for any change of condition and proportions in the excitability of the nervous system; and the heart, therefore, is more excitable than the nervous system. It is capable of preparing itself for any change of condition and proportions in the excitability of the nervous system; and the heart, therefore, is more excitable than the nervous system. It is capable of preparing itself for any change of condition and proportions in the excitability of the nervous system; and the heart, therefore, is more excitable than the nervous system. It is capable of preparing itself for any change of condition and proportions in the excitability of the nervous system; and the heart, therefore, is more excitable than the nervous system. It is capable of preparing itself for any change of condition and proportions in the excitability of the nervous system; and the heart, therefore, is more excitab.
muscle produces lactic acids during activity, it has been suggested that acids are among the "fatigue substances" with which muscle poisons itself when deprived of circulating blood. Muscles when active seem to pour into the circulation substances which, of unknown chemical composition, are physiologically recognizable by their stimulant action on the respiratory nervous centre in respect of the fatigue substances: the destruction of the tissue is manifest especially in the relaxation process. The contracted state, instead of rapidly subsiding after discontinuance of the stimulus, slowly and only partially wears off, the muscle remaining in a condition of physiological "contracture." The alkaloid veratrin has a similar effect upon the contraction of muscle; it enormously delays the recovery from the contracted state, as does epinephrin, an alkaloid extracted from the suprarenal gland.

Nervous System.—The work of Camillo Golgi (Pavia, 1885 and onwards) on the minute structure of the nervous system has led to great alteration of doctrine in neural physiology. It had been held that the branches of the nerve cells, that is to say, the fine nerve fibres—since all nerve fibres are nerve cell branches, and all nerve cell branches are nerve fibres—which form a close felt-work in the nervous centres, there combined into a network actually continuous throughout. This continuum was held to render possible conduction in all directions throughout the grey matter of the whole nervous system. The fact that conduction occurred preponderantly in certain directions was explained by appeal to a hypothetical resistance to conduction which, for reasons unascertained, lay less in some directions than in others. The intricate felt-work has by Golgi been ascertained to be a mere interlacement, not an actual anastomosis network; the branches springing from the various cells remain lifelong unattached and unjoined to any other than their own individual cell. Each neuron or nerve cell is a morphologically distinct and discrete unit connected functionally but not structurally with its neighbours, and leading its own life independently of the destiny of its neighbours. Among the properties of the neuron is conductivity in all directions. But when neurons are linked together it is found that nerve impulses will only pass from neuron A to neuron B, and not from neuron B to neuron A; that is, the transmission of the excited state or nervous impulse, although possible in each neuron both up and down its own cell branches, is possible from one nerve cell to another in one direction only. That direction is the direction in which the nerve impulses flow under the conditions of natural life. The synapse, therefore, as the place of meeting of one neuron with the next is called, is said to valve the nerve circuits. This determinate sense of the spread is called the law of forward direction. The synapse appears to be a weak spot in the chain of conduction, or rather to be a place which breaks down with comparative ease under stress, e.g. under effect of poisons. The axons of the motor neurons are, inasmuch as they are nerve fibres in nerve trunks, easily accessible to artificial stimuli. It can be demonstrated that they are practically indefatigable—repeatedly stimulated by electrical currents, even through many hours, they, unlike muscle, continue to respond with unimpaired reaction.

Peripheral Fatigue. Yet when the muscular contraction is taken as index of the response of the nerve, it is found that unmistakable signs of fatigue appear even very soon after commencement of the excitation of the nerve, and the muscle ceases to give any contraction in response to stimuli applied indirectly to it through its nerve. But the muscle will, when excited directly, e.g. by direct application of electric currents, contract vigorously after all response on its part to the stimuli (nerve impulses) applied to it indirectly through its nerve has failed. The inference is that the "fatigue substances" generated in the muscle fibres in the course of their prolonged contraction injure and paralyse the motor end plates, which are places of synapsis between nerve cell and muscle cell, even earlier than they harm the contractility of the muscle fibres themselves. The alkaloid curarin causes motor paralysis by attacking in a selective way this junction of motor nerve cell and striped muscular fibre. Non-myelinate nerve fibres are as resistant to fatigue as are the myelinate.

The neuron is described as having a cell body or perikaryon from which the cell branches—dendrites and axon—extend, and it is this perikaryon which, as its name implies, contains the nucleus. It forms the trophic centre of the cell, just as the hypophysis is the part of each lobe of the pituitary gland which is the trophic centre of the whole lobe. Any part of the cell cut off from the nucleus-containing part dies down; this is as true of nerve cells as of amoeba, and in regard to the neuron it constitutes what is known as the Wallerian degeneration. On the other hand, in some neurons, after severance of the axon from the rest of the cell (spinal motor cell), the whole nerve cell as well as the severed axon degenerates, and may eventually die and be removed. In the severed axon the degeneration is first evident in a breaking down of the naked nerve filaments of the motor end plate. A little later the breaking down of the whole axon, both axis cylinder and myelin sheath alike, seems to occur simultaneously throughout its entire length distal to the place of severance. The complex fat of the myelin becomes altered chemically, while the other components of the sheath break down. This death of the sheath as well as of the axis cylinder shows that it, like the axis cylinder, is a part of the nerve cell itself.

In addition to the trophic influence exerted by each part of the neuron on its other parts, notably by the perikaryon on the cell branches, one neuron also in many instances influences the nutrition of other neurons. When, for instance, the axons of the ganglion cells of the retina are severed by section of the optic nerve, and thus their influence upon the nerve cells of the visual cerebral centres is set aside, the nerve cells of those centres undergo secondary atrophy (Gudden's atrophy). They dwindle in size; they do not, however, die. Similarly, when the axons of the motor spinal cells are by severance of the nerve trunk of a muscle broken through, the muscle cells undergo "degeneration"—dwindle, become fatty, and alter almost beyond recognition. This trophic influence which one neuron exerts upon others, or upon the cells of an extrinsic tissue, such as muscle, is exerted in that direction which is the one normally taken by the natural nerve impulses. It seems, especially in the case of the neuron between certain nerves, that the influence, loss of which endangers nutrition, is associated with the occurrence of something more than merely the nervous impulses awakened from time to time in the leading nerve cell. The wave of change (nervous impulse) induced in a neuron by advent of a stimulus is after all only a sudden augmentation of an activity continuous within the neuron—a transient accentuation of one (the disintegrative) phase of the metabolism inherent in and inseparable from its life. The nervous impulse is, so to say, the sudden evanescent glow of an ember continuously black-hot. A continuous lesser "change" or stream of changes sets through the neuron, and is distributed by it to other neurons in the same direction and by the same synapses as are its nerve impulses. This gentle continuous activity of the neuron is called its tonus. In tracing the tonus of neurons to a source, one is always led by link against the current of nerve force—so to say, "up stream"—to the first beginnings of the chain of neurons in the sensaficient surfaces of the body. From these, as in the eye, ear, and other sense organs, tonus is constantly initiated. Hence, when cut off from these sources, the nutrition of the neurons of various central mechanisms suffers. Thus the tonus of the motor neurons of the spinal cord is much lessened by rupture of the great afferent root cells which normally play upon them, the prominent and practically important illustration of neural tonus is given by the skeletal muscles. These muscles exhibit a certain constant condition of slight contraction, which disappears on severance of the nerve that innervates the muscle. It is a muscular tonus of central source consequent on the continual glow of excitement in the spinal motor neuron, whose outgoing end plays upon the muscle cells, whose ingoing
end is played upon by other neurons—spinal, cerebral and cerebellar.

It is with the neural element of muscle tonus that tendon phenomena are intimately associated. The earliest-studied of these, the "knee-jerk," may serve as example of the class. It is a brief extension of the limb at the knee-joint, due to a simple contraction of the extensor muscle, elicited by a tap or other slight mechanical stimulation. The impulse is conducted along the fibres through the tendon of the muscle. The jerk is obtainable only from muscle fibres possessed of neural tonus. If the sensory nerves of the extensor muscle be severed, the "jerk" is lost. The brevity of the interval between the tap on the knee and the beginning of the resulting brief extension of the muscle seems such as to exclude the possibility of reflex development. A little experience in observations on the knee-jerk imparts a notion of the average strength of the "jerk." Wide departures from standard are not uncommon, both in health and in certain nervous conditions. Stretching of the muscles antagonistic to the extensors—namely, of the flexor muscles—reduces the jerk by inhibiting the extensor spinal nerve cells through the numerous impulses generated by the tense flexor muscles. Hence a favourable posture of the limb for eliciting the jerk is one ensuring relaxation of the hamstring muscles, as when the leg has been crossed upon the other. In sleep the jerk is diminished, in deep sleep quite abolished. Extreme bodily fatigue diminishes it. Conversely, a cold bath increases it. The turning of attention towards the knee interferes with the jerk; hence the device of directing the patient to perform some movement, which, it is a brief extension of the limb, is such as to involve the muscles of the lower extremity at the moment when the light blow is dealt upon the tendon. A slight degree of contraction of muscle seems the \textit{substratum} of all attention. The direction of attention towards the knee interferes with the jerk by causing that looseness and freedom from tension in the thigh muscles which is essential for the provocation of the jerk. The motor cells of the extensor muscles, when preoccupied by cerebral influence, appear unapproachable and it has noted excitation of the jerk to follow extirpation of a cortical centre.

Although the cell body or perikaryon of the neuron, with its contained nucleus, is essential for the maintenance of the life of the cell branches, it has become recognized that the actual process and function of "conduction" in many neurons can, and does, go on without the cell body being directly concerned in the conduction. S. Exner first showed, many years ago, that the nerve impulse travels through the spinal ganglion at the same speed as along the other parts of the nerve trunk—that is, that it suffers no delay in transit through the perikarya of the afferent root-neurons. Bethe has succeeded in isolating their perikarya from certain of the afferent neurons of the antennule of 	extit{Carcinus}. The giant axon of the amphitrochus continues unimpaired for many hours. This indicates that the conjunction between the conducting substance of the dendrons and that of the axon can be effected without the intermediation of the cell body. But the proper function of the conducting substance is indissolubly dependent on the cell branches being in continuity with the cell body and nucleus it contains. Evidence illustrating this nexus is found in the visible changes produced in the perikaryon by prolonged activity induced and maintained in the conducting branches of the cell. As a result the fatigued cells appear shrunken, and their reaction to staining reagents alters, thus showing chemical changes. Most marked is the decrease in the volume of the nucleus, amounting even to 44\% of the initial volume. In the myelinated cell branches of the neuron, that is, in the ordinary nerve fibres, no visible change has ever been demonstrated as the result of any normal activity, however great—a striking contrast to the observations obtained on the perikarya. The chemical changes that accompany activity in the nerve fibre must be very small, for the production of CO₂ is barely measurable, and no production of heat is observable as the result of the most forced tetanic activity.

The nerve cells of the higher vertebrata, unlike their blood cells, their connective tissue cells, and even their muscle cells, are, early and indeed in embryonic life, lose power of spontaneous growth. The number of the formed neurons is definitely closed at an early period of the individual life. Although, unlike so many other cells, thus early sterile for reproduction of their kind, they retain for longer than most cells a high power of individual growth. They continue to grow, and to thurst out new branches and to lengthen existing branches, for many years far into adult life. They similarly possess power to repair and to regenerate their cell branches where these are injured or destroyed by trauma or disease. This is the explanation of the repair of nerve trunks that have been severed, with consequent degeneration of the peripheral nerve fibres. As a rule, a longer time is required to restore the motor than the sensory functions of a nerve trunk.

Whether examined by functional or by structural features, the conducting paths of the nervous system, traced from beginning to end, never \textit{terminate} in the centres of that system, but pass through them. All ultimately emerge as efferent channels. Every efferent channel, after entrance in the central nervous system, subdivides; of its subdivisions some pass to efferent channels soon, others pass further and further within the cord and brain before they finally reach channels of outlet. All the longest routes thus formed traverse late in their course the cortex of the cerebral hemisphere. It is this relatively huge development of cortex cerebri which is the pre-eminent structural character of man. This means that the number of "longest routes" in man is, as compared with lower animals, disproportionately great. In the lower animal forms there is no such nervous structure at all as the cortex cerebri. In the frog, lizard, and even bird, it is thin and poorly developed. In the marsupials it is more evident, and its excitation by electric currents evokes movements in the musculature of the crossed side of the body. Larger and thicker in the rabbit, when excited it gives rise in that animal to movements of the eyes and of the fore-limbs and neck, but it is only in much heavier types, such as the dog, that the cortex yields, under experimental excitation, definitely localized foci, whence can be evoked movements of the fore-limb, hind-limb, neck, eyes, ears and face. In the monkey the proportions it assumes are still greater, and the number of foci, for distinct movements of this and that member, indeed for the individual joints of each limb, are much more numerous, and altogether occupy a more extensive surface, though relatively to the total surface of the brain a smaller one.

Experiment shows that in the manlike (anthropoid) apes the differentiation of the foci or "centres" of movement in the motor field of the cortex is even more minute. In them areas are found corresponding to the muscles in the human body. Ultimately, it is said, the area is complete, that is, it includes the area of the upper lip without the lower, of the tip only of the tongue, or of one upper eyelid by itself. The movement evoked from a point of cortex is not always the same; its character is determined by movements evoked from neighbouring points of cortex immediately antecedently. Thus a point A will, when excited soon subsequent to point B, which latter yields protrusion of lips, itself yield lip-protrusion, whereas if excited after C, which yields lip-retraction, it will itself yield lip-retraction. The movements obtained by point-to-point excitation of the cortex are often evidently imperfect as compared with natural movements—that is, are only portions of complete normal movements. Thus among the tongue movements evoked by stigmatic stimulation of the cortex undeviating protrusion or retraction of the organ is not found. Again, from different points of the cortex the assumption of the requisite positions of the tongue, lips, cheeks, palate and epiglottis, as components in the act of sucking, can be provoked singly. Rarely can the whole action be provoked, and then only gradually, by prolonged and strong excitation of one of the requisite points, e.g. that for the tongue, with which the other points are functionally connected. Again, no single point in the cortex evokes the act of ocular convergence and fixation. All this means that the execution of natural movements employs simultaneous co-operative activity of a number of points in the motor fields on both sides of the brain together.

The accompanying simple figure indicates better than any verbal description the topography of the main groups of foci in the motor field of a manlike ape (chimpanzee). It will be
MUSCLE AND NERVE

noted from it that there is no direct relation between the extent of a cortical area and the mass of muscles which it controls. The mass of muscles in the trunk is greater than in the leg, and in the leg is greater than in the arm, and in the arm is many times greater than in the face and head; yet for the last the cortical area is the most extensive of all, and for the first-named is the least extensive of all.

The motor field of the cortex is, taken altogether, relatively to the size of the lower parts of the brain, larger in the anthropoid than in the inferior monkey brains. But in the anthropoid brain still more increased even than the motor field are the great regions of the cortex outside that field, which yield no definite movements under electric excitation, and are for that reason known as "silent." The motor field, therefore, though absolutely larger, forms a smaller fraction of the whole cortex of the brain than in the lower forms. The statement that in the anthropoid (orang-outan) brain the groups of foci in the motor fields of the cortex are themselves separated one from another by surrounding inexcitable cortex, has been made and was one of great interest, but has not been confirmed by subsequent observation. That in man the excitable foci of the motor field are islanded in excitable surface similarly and even more extensively, was a natural inference, but it had its chief basis in the observations on the orang, now known to be erroneous.

In the diagram there is indicated the situation of the cortical centres for movement of the vocal cords. Their situation is at the lower end of the motor field. That they should lie there is interesting, because that place is close to one known in man to be associated with management of the movements concerned in speech. When that area in man is injured, the ability to utter words is impaired. Not that there is paralyzation of the muscles of speech, since these muscles can be used perfectly for all acts other than speech. The area in man is known as the motor centre for speech; in most persons it exists only in the left half of the brain and not in the right. In a similar way damage of a certain small portion of the temporal lobe of the brain produces loss of intellectual apprehension of words spoken, although there is no deafness and although words seen are perfectly apprehended. Another region, "the angular region," is similarly related to intellectual apprehension of words seen, though not of words heard.

When this differentiation of cortex, with its highest expression in man, is collated with the development of the cortex as studied in the successive phases of its growth and ripening in the human infant, a suggestive analogy is obvious. The nervous paths in the brain and cord, as they attain completion, come to be furnished more and more with fibres that are fully myelinated. At the beginning of its history each is unprovided with myelin sheath by any proceeding. The excitable foci of the cerebral cortex are well myelinated long before the unexcitable are so. The regions of the cortex, whose conduction paths are early completed, may be arranged in groups by their connexions with sense-organs: eye-region, ear-region, skin and somasraesthetic region, olfactory and taste region. The areas of intervening cortex, arriving at structural completion later than the above sence-spheres, are called by some association-spheres, to indicate the view that they contain the neural mechanisms of reactions (some have said "ideas") associated with the sense perceptions elaborated in the several sense-spheres.

The name "motor area" is given to that region of cortex whence, as D. Ferrier's investigations showed, motor reactions of the facial and limb muscles are regularly and easily evoked. This region is often called the Sensori-motor cortex, and the term somasraesthetic has also been used and seems appropriate. It has been found that disturbance of sensation, as well as disturbance of movement, is often incurred by its injury. Patients in whom, for purposes of diagnosis, it has been electrically excited, describe, as the initial effect of the stimulation, tingling and obscure but locally-limited sensations, referred to the part whose muscles a moment later are thrown into co-ordinate activity. The distinction, therefore, between the movement of the eyeballs, elicited from the occipital (visual) cortex, and that of the hand, elicited from the cortex in the region of the central sulcus (somasraesthetic), is not a difference between motor and sensory, for both are sensori-motor in the nature of their reactions; the difference is only a difference between the kind of sense and sense-organ in the two cases, the muscular apparatus in each case being an appanage of the sensual.

That the lower types of vertebrate, such as fish, e.g. carp, possess practically no cortex cerebri, and nevertheless execute 'volitional' acts involving high co-ordination and suggesting the possession by them of associative memory, shows that for the existence of these phenomena the cortex cerebri is in them not essential. In the dog it has been proved that after removal from the animal of every vestige of its cortex cerebri, it still executes habitual acts of great motor complexity requiring extraordinarily delicate adjustment of muscular contraction. It can walk, run and feed; such an animal, on wounding its foot, will run on three legs, as will a normal dog under similar mischance. But signs of associative memory are almost, if not entirely, wanting. Throughout three years such a dog failed to learn that the attendant's lifting it from the cage at a certain hour was the preliminary circumstance of the feeding-hour; yet it did exhibit hunger, and would refuse further food when a sufficiency had been taken. In man, actually gross sensory defects follow even slight lesions of the cortex. Thus the rabbit and the dog are not absolutely blinded by removal of the entire cortex, but in man destruction of the occipital cortex produces total blindness, even to the extent that the pupil of the eye does not respond when light is flashed into the eye.

Examination of the cerebellum by the method of Wallerian degeneration has shown that a large number of spinal and bulbar nerve cells send branches up into it. These seem to end, for the most part, in the gray cortex of the median lobe, some, though not the majority, of them decussating across the median line. The organ seems also to receive many fibres from the parietal region of the cerebral hemisphere. From the organ there emerge fibres which cross to the opposite red nucleus, and directly or indirectly reach the thalamic region of the crossed hemisphere. The pons or middle peduncle, which was regarded,
on the uncertain ground of naked-eye dissection of human anatomy, as commissural between the two lateral lobes of the cerebellum, is now known to constitute chiefly a cerebro-cerebellar decussating path. Certain cerebellar cells send processes down to the cell-group in the thalamus known as the nucleus of Darks, which latter projects fibres down the spinal cord. Whether there is any other or direct emergent path from the cerebellum into the spinal cord is a matter on which opinion is divided.

Injuries of the cerebellum, if large, derange the power of executing movements, without producing any detectable derangement of sensation. The derangement gradually disappears, unless the damage to the organ be very wide. A feeling gait, oscillations of the body which impart a zigzag direction to the walk, difficulty in standing, owing to unsteadiness of limb, are common in cerebellar disease. On the other hand, congenital defect amounting to absence of one cerebellar hemisphere has been found to occasion practically no symptoms whatsoever. Not a hundredth part of the cerebellum has remained, and yet there has existed ability to stand, to walk, to handle and lift objects in a fairly normal way, without any trace of impairment of cutaneous or muscular sensitivity. The damage to the cerebellum must, it would seem, occur abruptly or quickly in order to occasion marked derangement of function, and then the derangement falls on the execution of movements. One aspect of this derangement, named by Luciani astasia, is a tremor heightened by or only appearing when the muscles enter upon action—"intention tremor." Vertigo is a frequent result of cerebellar injury: animals indicate it by their actions; patients describe it. To interpret this vertigo, appeal must be made to disturbances, other than cerebellar, which likewise occasion vertigo. These include, besides ocular squint, many spatial positions and movements unwonted to the body: the looking from a height, the gliding over ice, sea-travel, to some persons even travelling by train, or the covering of one eye. Common to all these conditions is the synchronous rise of perceptions of spatial relations between the self and the environment which have not, or have rarely, before arisen in synchronous combination. The actual organs of the soles, and the muscular sense organs of limbs and trunk, are originating perceptions that indicate that the self is standing on the solid earth, yet the eyes are at the same time originating perceptions that indicate that the solid earth is far below the standing self. The combination is hard to harmonize at first; it is at least not given as innately harmonized. Perceptions regarding the "me" are notoriously highly charged with "feeling," and the conflict occasions the feeling insufficiently described as "giddiness." The cerebellum receives paths from most, if not from all, of the afferent roots. With certain of these it stands associated most closely, namely, with the vestibular, representing the sense organs which furnish data for appreciation of positions and movements of the head, and with the channels, conveying centripetal impressions from the apparatus of skeletal movement. Disorder of the cerebellum sets at variance, brings discord into, the pathways of perceptions contributory to the movement. The body's movement becomes thus imperfectly adjusted to the spatial requirements of the act it would perform.

In the physiological basis of sense exist many impressions which, apart from and devoid of psychical accompaniment, reflexly influence motor (muscular) innervation. It is with this sort of habitually apsychical reaction that the cerebellum is, it would seem, employed. That it is apparently devoid of psychical comitant need not imply that the impressions concerned in it are crude and inelaborate. The seeming want of control of sense which the cerebellum betrays under artificial stimulation and the complete relay system revealed in the histology of the cerebellum, suggest that the impressions are elaborate. Its reaction preponderantly helps to secure co-ordinate innervation of the skeletal musculature, both for maintenance of attitude and for execution of movements.

**Sleep.**—The more obvious of the characters of sleep (q.e.) are essentially nervous. In deep sleep the threshold-value of the stimuli for the various senses is very greatly raised, rising rapidly during the first hour and a half of sleep, and then declining with gradually decreasing decrements. The muscles become less tense than in their waking state: their tonus is diminished, the eyes close, the eyelids fall, and the knee-jerk is abolished. The respiratory rhythm is less frequent and the breathing less deep; the heart-beat is less frequent; the secretions are less copious; the pupil is narrow; in the brain there exists arterial anaemia with venous congestion, so that the blood-flow there is less than in the waking state.

It has been suggested that the gradual cumulative result of the activity of the nerve cells during the waking day is to load the brain tissue with "fatigue-substances" which clog the action of the cells, and thus periodically produce that loss of consciousness, &c., which is sleep. Such a drugging of tissue by its own excreta is known in muscular fatigue, but the fact that the depth of sleep progressively increases for an hour and more after its onset prevents complete explanation of sleep on similar lines. It has been urged that the neurons retract during sleep, and that thus at the synapses the gap between nerve cell and nerve cell becomes wider, or that the supporting cells expand between the nerve cells and tend to isolate the latter one from the other. Certain it is that in the course of the waking day a great number of stimuli play on the sense organs, and through these produce disintegration of the living molecules of the central nervous system. Hence during the day the assimilative processes of these cells are overbalanced by their wear and tear, and the end-result is that the nervous system is in a condition less favourable for further disintegration than to reintegration. That phase of cell life which we are accustomed to call "active" is accompanied always by disintegration. When in the cell the assimilative processes exceed dissipative, the external manifestations of energy are liable to cease or diminish. Sleep is not exhaustion of the neuron in the sense that prolonged activity has reduced its excitability to zero. The nerve cell just prior to sleep is still well capable of response to stimuli, although perhaps the threshold-value of the stimulus has become rather high, whereas after entrance upon sleep and continuance of sleep for several hours, and more, when all spur to the dissimilation process has been long withheld, the threshold-value of the sensory stimulus becomes enormously higher than before. The exciting cause of sleep is therefore no complete exhaustion of the available material of the cells, nor is it entirely any paralysing of them by their excreta. It is more probably abeyance of external function during a periodic internal assimilatory phase.

Two processes conjoin to initiate the assimilatory phase. There is especially connexity between the two, in that the sleep is due both to the dose of metabolic activity that in physiological theory constitute the chemical life of protoplasm, between dissimilation and assimilation. Herings has long insisted on a self-regulative adjustment of the cell metabolism, so that action involves reaction, increased catabolism necessitates after-increase of anabolism. The long-continued incitement to catabolism of the waking day thus of itself predisposes the nerve cells towards rebound into the opposite phase: the increased catabolism due to the day's stimuli induces increase of anabolism, and though recuperation goes on to a large extent during the day itself, the recuperative process is slower than, and lags behind, the dissipative process in its effect. This causes a cumulative effect, the energy being increasing from the opening till the closing hours. The second factor inducing the assimilative change is the withdrawal of the nervous system from sensational stimulation. The eyes are closed, the maintenance of posture by active contraction is replaced by the recumbent pose which can be maintained by static action and the mere mechanical consistence of the body, the ears are screened from noise in the quiet chamber, the skin from localized pressure and from the waving cover. The effect of thus reducing the excitant action of the environment is to give consciousness over more to mere survivals by memory, and gradually consciousness lapses. A remarkable case is well authenticated, where, owing to disease, a young man had lost the use of all the senses save of one eye and of one ear. If these last channels were sealed, in two or three minutes' time he invariably fell asleep.

If natural sleep is the expression of a phase of decreased excitability due to the setting in of a tide of anabolism in the cells of the nervous system, what is the action of narcotics? They lower the
external activities of the cells, but do they not at the same time lower the internal, reparative, assimilative activity of the cell that in natural sleep goes vigorously forward preparing the system for the next day's drain on energy? In most cases they seem not to lower both the internal and the external activity of the nerve cells, to lessen the cell's entire metabolism, to reduce the cell to a mere cell and air. Hence it is not surprising that often the refreshment, the recuperation obtained from and felt after sleep induced by a drug amounts to nothing, or to worse than nothing. But very often refreshment is obtained from the mere sleeping not from the sleep.

**Narcotics.**—But it is not only from the hypnotic process by the hypnotizer without subsequent attempt to open them by the hypnotized subject; the pupils, instead of being constricted, as for near vision, dilate, and there sets in a condition superficially resembling sleep. But in natural sleep the action of all parts of the nervous system is subdued, whereas in the hypnotic the reactions of the lower, and some even of the higher, parts are exalted. Moreover, the reactions seem to follow the sense impressions with such fatality, that, as an inference, absence of will-power to control them or suppress them is suggested. This reflex activity with "paralysis of will" is characteristic of the somnambulistic state. The threshold-value of the stimuli adequate for the various senses may be extraordinarily lowered. Print of microscopic size may be read; a watch ticking in another room can be heard. Judgment of weight and texture of surface is exalted; thus a card can in a dark room be felt and then re-selected from the re-shuffled pack. Akin to this condition is that in which the power of maintaining muscular effort is increased; the individual may lie stiff with merely head and feet supported on two chairs; the limbs can be held outstretched for hours at a time. This is the cataleptic state, the phase of hypnotism which the phenomena of so-called "animal hypnotism" resemble most. A frog or fowl or guinea-pig held in some unnatural position at rest will at the slightest disturbance become "set" in that pose, rather in a passive way, than as if the animal were trying to recover the normal posture. In this state it remains motionless for various periods. This condition is more than usually readily induced when the cerebral hemispheres have been removed. The decerebrate monkey exhibits "cataleptoid" reflexes. Father A. Kircher's *experimentum mirabile* with the fowl and the chalk line succeeds best with the decerebrate hen. The attitude may be described as described to prolonged, not very intense, discharge from reflex centres that regulate posture and are probably intimately connected with the cerebellum. A sudden intense sense stimulus usually suffices to end this tonic discharge. It completes the movement that has already set in but had been checked, as it were, half-way, though tonically maintained. Coincidently with the persistence of the tonic contraction, the higher and volitional centres seem to lie under a spell of inhibition; their action, which would complete or cut short the posture-spasm, rests in abeyance. Suspension of cerebral influence exists even more markedly, of course, when the cerebral hemispheres have been ablated.

But a potent—according to some, the most potent—factor in hypnotism, namely, *suggestion*, is unrepresented in the production of so-called animal hypnotism. We know that one idea suggests another, and that volitional movements are the outcome of the volitional state. If the latter is suggested and voluntary at the basis of ideation, we may take the analogy of the concomitance between a spinal reflex movement and a skin sensation. The physical "touch" that initiates the psychological "touch" initiates, through the very same nerve channels, a reflex movement responsive to the physical "touch," just as the psychological "touch" may be considered also a response to the same physical event. But in the decapitated animal we have good arguments for belief that we get the reflex movement alone as response; the psychological touch drops out. Could we assume that there is in the adult man reflex machinery which is of higher order than the merely spinal, which employs much more complex motor mechanisms than they, and is connected with a much wider range of sense organs; and could we assume that this machinery, if indirectly producing a modification of consciousness, would be a mediating link in the process, we might then wonder whether the memory may not be the result of such a modification of consciousness. We may suddenly remember dimly afterwards that we have done so, and we quite fail to recall the difference between the watch time and the clock time. In many instances hypnotism is established merely by such as usual result only from long and closely attentive practice. The sleeping mother rests undisturbed by the various noises of the house and all the movements that movies and dramas, or adventures which the ship's engineer, engaged in conversation with some visitor to the stateroom, tells apparently undisturbed by all the multifold noise and rattle of the machinery, yet let the noise alter in some item which, though unnoticeable to the visitor, betokens importance to the trained ear, and his passive attention is in a moment caught. The warders at an asylum have been hypnotized to sleep by the bedside of dangerous patients, and we suggested "to awaken the instant the patients attempt to get out of bed, sounds which had no import for them being inhibited by suggestion." Warders in this way worked all day and performed night duty also for months without showing fatigue. This is akin to the "repetition which, read by the schoolboy last thing overnight, is on waking "known by heart." Most of us can wake somewhere about a desired although unusually early, if overnight we desire much to do so.

Two theories of a physiological nature have been proposed to account for the separation of the complex reactions of these conditions of hypnotism from volition and from memory. R. P. H. Heidenhain's view is that the cortical centres of the hemisphere are inhibited by peculiar conditions attaching to sleeplike memory. It is based to a view is that the essential condition for initiation is fatigue of the will-power under a prolonged effort of undivided attention. Hypnotic somnambulism and hypnotic catalepsy are not the only or the most profound changes of nervous condition that hypnotism can induce. The physiological derangement which is the basis of the abeyance of volition may, if hypnotism be profound, pass into more widespread derangement, exhibiting itself as the *hypnotic lethargy*. This is associated not only with paralysis of will but with profound anaesthesia. Proposals have been made to employ hypnotism as a method of producing anaesthesia for surgical purposes, but there are two grave objections to such an object. First, the necessary degree of hypnotic lethargy the subject must be made extremely susceptible, and this can only be done by repeated hypnotization. It is necessary to hypnotize patients every day for several weeks before they can be got into a degree of stupor sufficient to allow of the safe execution of a surgical operation. But the state itself, when reached, is at least as dangerous to life as is that produced by inhalation of ether, and it is more difficult to recover from. Moreover, by the processes the subject has gone through he has had those physiological activities upon which his volitional power depends excessively deranged, and not improbably permanently enfeebled.

**C. S. S.**...
MUSCULAR SYSTEM

As the common white mica obtainable in thin, transparent cleavage sheets of large size it was formerly used in Russia for window panes and known as "Muscovy glass"; hence the name muscovite, proposed by J. D. Dana in 1850. It crystallizes in the monoclinic system; distinctly developed crystals, however, are rare and have the form of rough six-sided prisms or plates; thin scales without definite crystal outlines are more common.

The most prominent feature is the perfect cleavage parallel to the basal plane (c in the figure), on which the lustre is pearly in character. The hardness is 2, and the specific gravity 2.8-2.9. The plane of the optic axes is perpendicular to the plane of symmetry and the acute bisectrix nearly normal to the cleavage; the optic axial angle is 60°-70°, and double refraction is strong and negative in sign.

Muscovite frequently occurs as fine scaly to almost compact aggregates, especially when, as is often the case, it has resulted by the alteration of some other mineral, such as felsapar, topaz, cyanite, &c.; several varieties depending on differences in structure have been distinguished. Fine scaly varieties are damarouite, margarodite (from Gr. μαργαρίτης, a pearl), gilberite, sericite (from σέρικος, silky), &c. In sericite the fine scales are united in fibrous aggregates giving rise to a silky lustre; this variety is a common constituent of phyllites and sericite-schists.

Oncocine (from σώκος, intimateuse) is a compact variety forming rounded aggregates, which swell up when heated before the blowpipe. Closely related to oncocine are several compact minerals, included together under the name pinite, which have resulted by the alteration of ilolite, spodumene and other minerals. Other varieties depend on differences in chemical composition. Fuchsite or "chrome-mica" is a bright green muscovite containing chromium; it has been used as a decorative stone. Ocellacherite is a variety containing some barium. In phengite there is more silica than usual, the composition approximating to H₂KAl₃(SiO₆)₂.

Muscovite is of wide distribution and is the commonest of the micas. In igneous rocks it is found only in granite, never in volcanic rocks; but it is abundant in gneiss and mica-schist, and in phyllites and clay-slates, where it has been formed at the expense of alkali-felspar by dynamo-metamorphic processes. In pegmatite veins traversing granite, gneiss or mica-schist it occurs as large sheets of commercial value, and is mined in India, the United States and Brazil (see Mica), and to a limited extent together with felspar, in southern Norway and in the Uralas. Large sheets of muscovite were formerly obtained from Solovetsky Island, Archangel.

MUSCULAR SYSTEM (Anatomy). The muscular tissue (Lat. musculus, from a fancied resemblance of certain muscles to a little mouse) is of three kinds: (1) voluntary or striped muscle; (2) involuntary or unstriated muscle, found in the skin, walls of hollow viscera, coats of blood and lymphatic vessels, &c.; (3) heart muscle. The microscopical differences of these different kinds are discussed in the article on CONNECTIVE TISSUES. Here only the voluntary muscles, which are under the control of the will, are to be considered.

The voluntary muscles form the red flesh of an animal, and are the structures by which one part of the body is moved at will upon another. Each muscle is said to have an origin and an insertion, the former being that attachment which is usually more fixed, the latter that which is more movable. This distinction, however, although convenient, is an arbitrary one, and an example may make this clear. If we take the pectoralis major, which is attached to the front of the chest on the one hand and to the upper part of the arm bone on the other, the effect of its contraction will obviously be to draw the arm towards the chest, so that its origin under ordinary circumstances is said to be from the chest while its insertion is into the arm; but if, in climbing a tree, the hand grasps a branch above, the muscular contraction will draw the chest towards the arm, and the latter will then become the origin. Generally, but not always, a muscle is partly fleshy and partly tendinous; the fleshy contractile part is attached at one or both ends to cords or sheets of white fibrous tissue, which in some cases pass round pulleys and so change the direction of the muscle's action. The other end of these cords or tendons is usually attached to the periosteum of bone, with which it blends. In some cases, when a tendon passes round a bony pulley, a sesamoid bone is developed in it which diminishes the effects of friction. A good example of this is the patella in the tendon of the rectus femoris (fig. 1, P).

Every muscle is supplied with blood vessels and lymphatics (fig. 1, v, a, l), and also with one or more nerves. The nerve supply is very important both from a medical and a morphological point of view. The approximate attachments are also important, because unless they are realized the action of the muscle cannot be understood, but the exact attachments are perhaps laid too great stress on in the anatomical teaching of medical students. The study of the actions of muscles is, of course, a physiological one, but teaching the subject has been handed over to the anatomists, and the results have been in some respects unfortunate. Until very recently the anatomist studied only the dead body, and his one idea of demonstrating the action of a muscle was to expose and then to pull it, and whatever happened he said was the action of that muscle. It is now generally recognized that no movement is so simple that only one muscle is concerned in it, and that what a muscle may do and what it really does do are not necessarily the same thing. As far as the superficial muscles are concerned, we still have only the anatomical method to depend upon, but with the superficial muscles it should be checked by causing a living person to perform certain movements and then studying which muscles take part in them.

For a modern study of muscular actions, see C. E. Beevor's, Gronian Lectures for 1903 (London, 1904).

Muscles have various shapes: they may be fusiform, as in fig. 1, conical, riband-like, or flattened into triangular or quadrilateral sheets. They may also be attached to skin, cartilage or fascia, instead of to bone, while certain muscles surround openings, which they constrict and are called sphincters. The names of these muscles have gradually grown up, and a settled plan has been used in giving them. Sometimes, as in the coraco-brechialis and thyro-hyoid, the name describes the origin and insertion of the muscle, and, no doubt, for the student of human anatomy this is the most satisfactory plan, since by learning the name the approximate attachments are also learnt. Sometimes the name only indicates some peculiarity in the shape of the muscle and gives no clue to its position in the body or its attachments; examples of this are biceps, semitendinosus and pyiformis. Sometimes, as in the flexor carpi ulnaris and corrugator supercilii, the use of the muscle is shown. At other times the position in the body is indicated, but not the attachments, as in the tibialis, anterior and peroneus longus, while, at other times, as in the case of the pectineus, the name is only misleading. Fortunately the names of the describers themselves are very seldom applied to muscles; among the few examples are Horner's muscle and the.

MUSCULAR SYSTEM

muscular band of Treits. The German anatomists at the Basel conference lately proposed a uniform Latin and Greek nomenclature, which, though not altogether satisfactory, is gaining ground on the European continent. As there are some four hundred muscles on each side of the body it will be impossible here to attempt more than a mere sketch of them; for the details the anatomical textbooks must be consulted.

Muscles of the Head and Face (see fig. 2).—The scalp is moved by a large flat muscle called the occipito-frontalis, which has two muscular bellies, the occipitalis and frontalis, and an intervening epicranial aponeurosis; this muscle moves the scalp and causes the nose several muscles, the actions of which are indicated by their names; they are the compressor, two dilatates and the depressor alae nasi, while the levator labii superioris et alae nasi sometimes goes to the nose. Raising the upper lip, in addition to the last named, are the levator labii superioris proprius and the levator anguli oris, while the zygomaticus major draws the angle of the mouth outward. The lower lip is depressed by the depressor labii inferioris and depressor anguli oris, while the orbicularis oris acts as a sphincter to the mouth.

From A. M. Paterson, Cunningham's Text Book of Anatomy.

FIG. 2.—The Muscles of the Face and Scalp (muscles of expression).

From A. M. Paterson, Cunningham's Text Book of Anatomy.

FIG. 3.—Ptérygoid Region.
The *buccinator muscle* in the substance of the cheeks rises from the upper and lower jaws and runs forward to blend with the *orbicularis oris*. All the foregoing are known as muscles of expression and are supplied by the seventh or facial nerve. The *temporal muscle* at the side of the cranium (fig. 3) and the *masseter* (fig. 2), which rises from the zygoma, close the mouth, since both are inserted into the ramus of the mandible; while, rising from the pterygoid plates, are the *external and internal pterygoid muscles* (fig. 3), the former of which pulls forward the condyle, and so the whole mandible, while the latter helps to close the mouth by acting on the angle of the lower jaw. This group of muscles forms the masticatory set, all of which are supplied by the third division of the fifth nerve. For the muscles of the orbit, see *Eye*; for those of the soft palate and pharynx, see *Pharynx*; and for those of the tongue, see *Tongue*.

**MUSCLES OF THE NECK (fig. 4).**—Just below the mandible is the *digastric*, a double bellied muscle, whose name shows, has two bellies and a central tendon; the anterior belly, supplied by the fifth nerve, is attached to the mandible near the symphysis, the posterior supplied by the seventh of the mastoid process, while the central tendon is bound to the hyoid bone. Stretching across from the side of the lower jaw to the other and forming a floor to the mouth is the *myo-hyoid muscle*; posteriorly this reaches the hyoid bone, and in the mid-line has a tendinous raphe separating the two halves of the muscle. Rising from the manubrium sterni and inner part of the clavicle is the *sterno-cleido-mastoid*, which is inserted into the mastoid process and superior curved lines of the occipital bone; when it contracts it makes the face look over the opposite shoulder, and it is supplied by the spinal accessory nerve as well as by branches from the cervical plexus. It is an important surgical landmark, and forms a diagonal across the quadrilateral outline of the side of the neck, dividing it into an anterior triangle with its apex downward and a posterior with its apex upward. In the anterior triangle the relative positions of the hyoid bone, thyroid cartilage and sternum should be realized, and then the *hyo-glossus, thyro-hyoid, sternohyoid and sternothyroid muscles* are explained by their names. The *omohyoid* muscle rises from the upper border of the scapula and runs across both triangles to the hyoid bone. Where it passes deep to the *sterno-mastoid* it has a central tendon which is bound to the first rib by a loop of cervical fascia. Rising from the stylomastoid process are three muscles, the *stylo-glossus, stylo-hyoid* and *stylo-pharyngeus*, the names of which indicate their attachments. Covering these muscles of the anterior triangle is a thin sheet, close to the skin, called the platysma, the upper fibres of which run back from the mouth over the cheek and are named the *risorius* (fig. 2); this sheet is one of the few remnants in man of the skin musculature or *ponticus carnosus* of lower Mammals. With regard to the nerve supply of the anterior triangle muscles, all those which go to the tongue are supplied by the hypoglossal or twelfth cranial nerve while the muscles below the hyoid bone are apparently supplied from this nerve but really from the upper cervical nerves (see *Nerve, Cranial*; and *Nerve, Spinal*). The posterior triangle is formed by the *sterno-mastoid* in front, the *trapezius* behind, and the clavicle below; in its floor from above downward part of the following muscles are seen: *complexus, splenius, levator anguli scapulae, scalenus medius and scalenus anterior*. Sometimes a small piece of the *scalenus posterior* is caught sight of behind the *scalenus medius*. The *splenius* rotates the head to its own side, the *levator anguli scapulae* raises the upper angle of the scapula, while the three *scaleni* run from the transverse processes of the cervical vertebrae and fix or raise the upper ribs. The *trapezius* (fig. 5) arises from the spines of the thoracic vertebrae and the ligamentum nuchae, and is inserted into the outer third of the clavicle and the spine of the scapula; it is used in shrugging the shoulders and in drawing the upper part of the scapula toward the mid-dorsal line. Its nerve supply is the spinal accessory and third and fourth cervical nerves. When the superficial muscles and complexus are removed from the back of the neck, the *sub-occipital triangle* is seen beneath the occipital bone. Externally it is bounded by the *superior oblique*, running from the transverse process of the atlas to the lateral part of the occipital bone, internally by the *rectus capitis posterior major*, passing from the spine of the axis to the lateral part of the occipital bone, and inferiorly by the *inferior oblique* joining the spine of the axis to the transverse
process of the atlas. These muscles move the head on the atlas and the atlas on the axis. They are supplied by the posterior branch of the first cervical nerve.

MUSCLES OF THE TRUNK.—The trapezius has already been described as a superficial muscle of the upper part of the back; in the loin region the latissimus dorsi (fig. 5) is the superficial muscle, its origin being from the lower thoracic spines, lower ribs and lumbar fascia, and it is inserted into the upper part of the arm bone or humerus. When the trapezius is cut, the rhomboid muscles (major and minor) passing from the upper thoracic spines to the vertebral border of the scapula are seen, and deep to these is the serratus posticus superior passing from nearly the same spines to the upper ribs. On reflecting the latissimus dorsi the serratus posticus inferior is seen running from the lower thoracic spines to the lower ribs. When these muscles are removed the great mass of the erector spinae is exposed, familiar to every one as the upper cut of the sirloin or ribs of beef; it runs all the way up the dorsal side of the vertebral column from the pelvis to the occiput, the complexus already mentioned being its extension to the head. It is longitudinally segmented into many different bundles to which special names are given, and it is attached to the various vertebrae and ribs as it goes up, thus straightening the spinal column. Deep to the erector spinae are found shorter bundles passing from one vertebra to another and forming the semispinalis and multifidus spinae muscles. The latissimus dorsi and rhomboids are supplied by branches of the brachial plexus of nerves, while the deeper muscles get their nerves from the posterior primary divisions of the spinal nerves (see Nerve, Spinal). On the anterior part of the thoracic region the pectoralis major runs from the clavicle, sternum and ribs, to the humerus (fig. 6); deep to this is the pectoralis minor, passing from the upper ribs to

From A. M. Paterson, Cunningham’s Text Book of Anatomy.

Fig. 5.—Superficial Muscles of the Back.
is attached to the deep surfaces of the ribs, and its fibres run horizontally forward. Below, all these muscles are attached to the crest of the ilium and to Poupart's ligament, which is really the lower free edge of the external oblique, while, behind, the two deeper ones, at all events, blend with the fascia lumborum. As they approach the mid-ventral line they become aponeurotic and form the sheath of the rectus. The rectus abdominis (fig. 6) is a flat muscular band which runs up on each side of the linea alba or mid-ventral line of the abdomen from the pubis to the ribs and sternum. This muscle has certain tendinous intersections or linea transversae, the positions of which are noticed in the article Anatomy (Superficial and Artistic), and the morphology of which is referred to later. In front of the lowest part of the rectus is sometimes a small triangular muscle called the pyramidalis. The quadratus lumborum is a muscle at the back of the abdominal wall which runs between the last rib and the crest of the ilium. In front of the bodies of the vertebrae is a prevertebral or hypaxial musculature, of which the rectus capitis anterior major and minor muscles and longus colli in the neck and the psoas in the loins form the chief parts, the latter being familiar as the undercut of the sirloin of beef, while the pelvis is closed below by a muscular floor formed by the levator ani and coccygeus muscles. The diaphragm is explained in a separate article.

Muscles of the Upper Extremity.—The deltoïd (see figs. 7 and 8) is the muscle which forms the shoulder cap and is used in abducting the arm to a right angle with the trunk; it runs from the clavicle, acromial process and spine of the scapula, to the middle of the humerus, and is supplied by the circumflex nerve. Several short rotating muscles pass from the scapula to the upper end of the humerus; these are the subscapularis passing in front of the shoulder joint, the supraspinatus above the joint, and the infraspinatus and teres minor behind. The teres major (fig. 5) comes from near the lower angle of the scapula, and is inserted with the latissimus dorsi into the front of the surgical neck of the humerus. The coracobrachialis (fig. 7) passes from the coracoid process to the middle of the humerus in front of the shoulder joint, while the brachialis anterior passes in front of the elbow from the humerus to the coracoid process of the ulna. Passing in front of both shoulder and elbow is the biceps (fig. 7), the long head of which rises from the top of the glenoid cavity inside the joint, while the short head comes from the coracoid process. The insertion is into the tubercle of the radius. These three muscles are all supplied by the same (musculo-cutaneous) nerve. At the back of the arm is the triceps (fig. 8) which passes behind both shoulder and elbow joints and is the great extensor muscle of them; its long head rises from just below the glenoid cavity of the scapula, while the inner and outer heads come from the back of the humerus. It is inserted into the olecranon process of the ulna and is supplied by the musculo-spinal nerve. The muscles of the front of the forearm form superficial and deep sets (see fig. 7). Most of the superficial muscles come from the internal condyle of the humerus. From without inward they are the pronator radii teres going to the radius, the flexor carpi radialis to the base of the index metacarpal bone, the palmaris longus to the palmar fascia, the flexor sublimis digitorum to the middle phalanges of the fingers, and the flexor carpi ulnaris to the pisiform bone. The important
points of practical interest about these muscles are noticed in the article Anatomy (Superficial and Artistic). In addition to these the brachio-radialis is a flexor of the forearm, though it arises from the outer supracondylar ridge of the humerus. It is supplied by the musculo-spiral nerve, the flexor carpi ulnaris by the ulnar, the rest by the median. The deep muscles of the front of the forearm consist of the flexor longus pollicis running from the radius to the terminal phalanx of the thumb, the flexor profundus digitorum from the ulna to the terminal phalanges of the fingers, and the pronator quadratus.

From A. M. Paterson, Cunningham's Text Book of Anatomy. Fig. 7.—Superficial Muscles on the Front of the Arm and Forearm. passing across from the lower third of the ulna to the same amount of the radius. These three muscles are supplied by the anterior interosseous branch of the median nerve, but the flexor profundus digitorum has an extra twig from the ulnar. The extensor muscles at the back of the forearm are also divided into superficial and deep sets (see fig. 8). The former rise from the region of the external condyle of the humerus, and consist of the extensor carpi radialis longus and brevior inserted into the index and medius metacarpal bones, the extensor communis digitorum to the middle and distal phalanges of the fingers, the extensor minimi digiti, the extensor carpi ulnaris passing to the metatarsal bone of the minimus, and the supinator brevis wrapping round the neck of the radius to which it is inserted. The extensor which runs from the external condyle to the olecranon process is really a part of the triceps. The deep muscles rise from the posterior surfaces of the radius and ulna, and are the extensor ossis metacarpi pollicis, the name of which gives its insertion, the extensor brevis pollicis to the proximal phalanx, and the extensor longus pollicis to the distal phalanx of the thumb, while

From A. M. Paterson, Cunningham's Text Book of Anatomy. Fig. 8.—The Muscles on the Back of the Arm, Forearm and Hand. the extensor indicis joins the extensor communis slip to the index finger; all these posterior muscles are supplied by the posterior interosseous nerve. In front and behind the wrist the tendons are bound down by the anterior and posterior annular ligaments, while on the flexor surface of each finger is a strong fibrous sheath or theca for the flexor tendons. The ball of the thumb is occupied by short muscles called the thenar group, while hypothenar muscles are found in the ball of the little finger. The four lumbrical muscles (fig. 9, d) run from the flexor profundus digitorum tendons to those of the
MUSCULAR SYSTEM

extensor communis between the heads of the metacarpal bones, while, rising from the shafts of these bones, are the three palmar and four dorsal interosseous muscles (fig. 9, c) which also are inserted into the extensor tendons. The two outer lumbricals and the thenar muscles are supplied by the median nerve; all the other hand muscles by the ulnar nerve.

Muscles of the Lower Extremity.—On the front of the thigh the quadriceps extensor muscles are the most important: there are four of them, the rectus femoris (fig. 1) with its straight and reflexed heads rising from just above the acetabulum, the sartorius, deep to this, from the front of the femur, and the vastus externus and internus wrapping tendons on each side on the linea aspera. All these are inserted into the patella, or rather the patella is a sesamoid bone developed where their common tendon passes round the lower end of the femur when the knee is bent. The distal part of this tendon, however, passes from the patella to the tubercle of the tibia, which is the ligamentum patellae. The sartorius is a long ribbon-like muscle running from the anterior superior spine of the ilium to the inner surface of the tibia, obliquely across the front of the thigh. It forms the outer boundary of Scarpa’s triangle, the inner limit of which is the adductor longus and the base Poupart’s ligament. The floor is formed by the iliacus from the iliac fossa of the pelvis, which joins the psoas, to be inserted into the lesser trochanter, and the iliobibial tractus running from the upper ramus of the pubis just below the insertion of the last muscles. The adductor muscles, longus, brevis and magnus, all rise from the subpubic arch, and are inserted into the linea aspera of the femur, so that they draw the femur to extend (the middle line. The gracilis (fig. 10) is part of the adductor mass, though its insertion is into the upper part of the tibia. The extensor muscles of the front of the thigh are supplied by the anterior crural nerve, but the adductor group on the inner side from the obturator. The pectineus is often supplied from both sources. On the back of the thigh the gluteus maximus (figs. 5 and 10) plays an important part in determining man’s outline (see Anatomy: Superficial and Artistic). It rises from the sacral region, and is inserted into the upper part of the femur and the deep fascia of the thigh, which is very thick and is known as the fascia lata; the muscle is a great extensor of the hip and raises the body from the supporting position. The gluteus medius rises from the ilium, above the hip joint, and passes to the great trochanter; it abducts the hip and enables the body to be balanced on one leg, as in taking a step forward. The gluteus minimus is covered by the last muscle, and passes from the ilium to the front of the great trochanter, thus rotating the hip joint inward. Some of its anterior fibres are sometimes separated from the rest, and are then called the sartorius (see JOINTS). When the gluteus maximus is removed, a number of short externally rotating muscles are seen, rising from the pelvis and inserted into the great trochanter (fig. 10); these are, from above downward, the pyroformis, gemellus superior, obturator internus, gemellus inferior and quadratus femoris. They are all supplied by special branches of the sacral plexus. On cutting the quadratus femoris a good deal of the obturator externus can be seen, coming from the outer surface of the obturator membrane and passing to the digital losses of the great trochanter. Unlike the rest of this group, it is supplied by the obturator nerve. Coming from the anterior part of the crest of the ilium is the tensor fasciae latae, which is inserted into the fascia lata, as is part of the gluteus maximus, and the thickened band of fascia which runs down the outer side of the thigh from the head of the tibia is known as the ilio tibial band. The tensor fasciae latae, gluteus medius and minimus, are supplied by the superior gluteal nerve, the gluteus maximus by the inferior gluteal. At the last, though the hamstrings rising from the ischium (fig. 10) are the semimembranosus and semitendinosus, passing to the inner part of the thigh and forming the internal hamstrings, and the biceps femoris or external hamstring, which as an extra head from the shaft of the femur and is inserted into the head of the fibula. These muscles are supplied by the great sciatic nerve and extend the hip joint while they flex the knee. In the leg, as distinguished from the thigh, are three groups of muscles, anterior, middle and posterior. The anterior group is formed from the front of the tibia and fibula, and consist of the extensor longus digitorum, extending the middle and distal phalanges of the four outer toes, the extensor proprius hallucis, extending the big toe, and the peroneus tertius, a purely human muscle inserted into the base of the fifth metatarsal bone. All these are supplied by the anterior tibial nerve.

The external group comprises the peroneus longus and brevis, rising from the outer surface of the fibula and inserted into the tarsus (fig. 11), the longus tendon passing across the sole to the base of the first metatarsal bone, the brevis to the base of the fifth metatarsal. These are supplied by the musculo-cutaneous nerve.
and the *flexor longus hallucis* from within outward. Their tendons all pass into the sole, that of the *flexor longus digitorum* being inserted into the terminal phalanges of the four outer toes, the *flexor longus hallucis* into the terminal phalanx of the big toe, while the tendinous portions pass outwards as the *tibialis posterior*. The nerve supply of this group is the posterior tibial. On the dorsum of the foot is the *extensor brevis digitorum* (fig. 11), which helps to extend the four inner toes, while in the sole are four layers of short muscles, the most superficial of which consists of the *abductor hallucis*, the *flexor brevis digitorum*, and the *abductor minimi digiti*, the names of which indicate their attachments. The second layer is formed by muscles which are attached to the *flexor longus digitorum* tendon: they are the *accessorius*, running forward to the tendon from the lower surface of the calcaneum, and the four *lumbricales*, which arise from the tendon after it has split for the four toes and pass between the toes to be inserted into the tendons of the extensor longus digitorum on the dorsum. The third layer comprises the *flexor brevis hallucis*, *adductor oblatus* and *adductor transversus hallucis* and the *flexor brevis minimi digiti*. The fourth layer contains the three *plantar* and four *dorsal interosseous muscles*, rising from the metatarsal bones and inserted into the proximal phalanges and extensor tendons in such a way that the plantar muscles draw the toes towards the line of the second toe while the dorsal draw them away from that line. Of these sole muscles the *flexor brevis digitorum*, *flexor brevis hallucis*, *abductor hallucis* and the innermost lumbrical are supplied by the internal plantar nerve, while all the rest are supplied by the external plantar.

**Muscular System**

The development of the muscular system is partly known from the results of direct observation, and partly inferred from the study of the part of the nervous system whence the innervation is derived. The unstriped muscle is formed from the mesenchyme cells of the somatic and splanchnic layers of the mesoderm (see Embryology), but never, as far as we know, from the mesodermic somites. The heart muscle is also developed from mesenchymal cells, though the changes producing its freely striped fibres are more complicated. The skeletal or real striped muscles are derived either from the mesodermic somites or from the branchial arches. As the mesodermic somites are placed on each side of the neural canal in the early embryo, it is obvious that the greater part of the trunk musculature spreads gradually round the body from the dorsal to the ventral side and consists of a series of plates called *myotomes* (fig. 12). The muscle fibres in these plates run in the long axis of the embryo, and are at first separated from those of the two neighbouring plates by thin fibrous intervals called *myocomma*. In some cases these myocomma persist and even become ossified, as in the ribs, but more usually they disappear early, and the myotomes then unite with another to form the rami tendinae. In the whole of the trunk a longitudinal cleavage at right angles to the surface occurs, splitting the musculature into a dorsal and ventral part, supplied respectively by the dorsal and ventral primary divisions of the spinal nerves. From the dorsal part the various muscles of the erector spinae series are derived by further longitudinal cleavages either tangential or at right angles to the surface, while the ventral part is again longitudinally split into mesial and lateral portions. A transverse section of the trunk at this stage, therefore, would show the cut ends of three longitudinal strips of muscle: (1) a mesial ventral, from which the rectus, pyramidalis sterno-hyoid, omohyoid and sterno-thyroid muscles are derived; (2) a lateral ventral, forming the flat muscles of the abdomen, intercostals and plates of the sternomastoid and trapezius; and (3) the dorsal portion already noticed. The mesial ventral part is remarkable for the persistence of remnants of myocomma in it, forming the linea transversa of the rectus and the central tendon of the omohyoid. The lateral part in the abdominal region splits tangentially into three layers,

From A. M. Paterson, Cunningham's *Text Book of Anatomy.*
the external and internal oblique and the transversalis, the fibres of which become differently directed. In the thoracic region, the intercostal nerves pass through a slit in the middle or internal oblique layer, because the external oblique is continued headward superficially to the ribs and the transversalis downwards. The inner layer is, however, continued along the ventral surface of the bodies of the vertebrae, and form the hypaxial muscles—such as the psoas, longus colli and recti capitis anterior. The nerve supply indicates that the lowest myotomes taking part in the formation of the abdominal walls are those of the first two lumbar nerves, and are represented by the cremaster muscle in the scrotum. In the perineum, however, the third and fourth sacral myotomes are represented, and these muscles and their cutaneous nerves are the terminations of the third and fourth intercostals.

The bundles of the rectus abdominis give off a medial or superficial division which supplies the rectus abdominis, and the division is directly connected with the deep layer of the rectus sheath. The lateral division supplies the external oblique, and is considered to represent the primitive transversalis muscle of the embryo, and the deep layer is not in continuity, as in the fetal state, with the muscles of the subcutaneous tissue of the body wall, but the intermuscular layers are still connective tissue. In the grown animal, a definite sphincter cloacae is formed round and claspers approach to the base of the oviparous insertion.

In mammals certain muscles vary in their attachments or presence and absence in different orders, sub-orders and families, so that, with the enormous amount of technical knowledge received in recognizing them, they might be useful from a classificatory point of view. There is, however, a greater gap between the musculature of Man and that of the other Primates than there is between many other mammalian orders, and this is probably either directly or indirectly to the assumption of the erect position.

The chief causes which produce changes of musculature are:

1. splitting, (2) fusion, (3) suppression, either partial or complete, (4) shifting or the base of the insertion, (5) new formation, (6) transformation of part of one muscle to another. In many of these cases the nerve supply gives an important clue to the change which has been effected. Splitting of a muscular mass is often the result of one part of a muscle being used separately, and a good example of this is the deep flexor mass of the forearm. In the lower mammals this mass rises from the flexor surface of the radius and ulna, and supplies the flexor muscles of the lower arm. When the thumb is used separately, and, in response to this, that part of the mass which goes to the thumb is completely split off into a separate muscle, the flexor longus pollicis. The process, however, is a gradual one, and not seen in one step. If a muscle is shifted alone for many purposes, and the index slip of the flexor profundus digitum in is used as almost a distinct muscle as the index slip of the flexor longus pollicis. Fusion may be either collateral or longitudinal. The former is seen in the case of the flexor carpi ulnaris. In many mammals (e.g. the dog), there are two muscles inserted separately into the pisiform bone, one rising from the internal condyle of the humerus, the other from the olecranon process, but in many others (e.g. capybara) they are united for a time, and then separated, or in the diaphragm, where the anterior belly is part of the (a) diaphragm and the posterior of the second or hyoid arch; in the quadriceps it is one we would expect, the anterior belly is supplied by the fifth nerve and the posterior by the third, etc. And, in the case of a muscle it is seen in the rhomboid sheet; in the lower mammals this rises from the head, neck and anterior (cervical) thoracic spines, and, in the same hand and most of the next (ischiocrural) is the same.

Complete suppression of a muscle is exemplified in the omo-trachelial, a muscle which runs from the cervical vertebrae to the aeronian process and fixes the scapula for the strong action of the triceps in pronograde mammals; in man this strong action of the triceps is no longer needed for projection, and the fixing muscle has disappeared. Shifting of origin is seen in the short head of the biceps femoris. This in many lower mammals (e.g. rabbit) is a well-marked case of shifting of origin, the short head of the muscle, which is supplied from the nerve of the thoracic wall, has been shifted to the femur, and in the great antecut is it evident that the agitator caudis has been used as a muscle side, because the short head of the biceps femoris is able to act on the long head, and the long head is a distinct muscle. Shifting of an insertion is not nearly as common as shifting of an origin; it is seen, however, in the peroneus tertius of man, in which part of the extensor longus digitorum has acquired a new insertion, and in the case of the hamstrings. The new formation of a muscle is seen in the stylo-hyoides alter, an occasional human muscle; but in this the stylo-hyoid ligament has been converted into a muscle. The insertion of part of one muscle to another is well shown by the humpmadductor magnus. Longitudinal fusion is seen pass from the tuber ischi to the condyle of the femur have a nerve supply from the great sciatic instead of the obturator, and in most low mammals are a separate part of the hamstrings known as the presemimembranosus.

MUSES, THE (Gr. Mōvou, the thinkers), in Greek mythology, originally nymphs of springs, then goddesses of song, and, later, of the different kinds of poetry and of the arts and sciences generally. In Homer, who says nothing definite as to their origin, they are represented either among the gods among the gods of Olympus, when they sing at their banquets under the leadership of Apollo Musagetes. According to Hesiod (Theog. 77), who first gives the usually accepted names and number, they were the daughters of Zeus and Mnemosyne, the personification of memory; others made them children of
Uranus and Gaea. Three older Muses (Mneme, Melete, Aoide) were sometimes distinguished, whose worship was said to have been introduced by the Aloidae on Mt Helicon (Pausanias ix. 29). It is probable that three was the original number of the Muses, which was increased to nine owing to their arrangement in three groups of three in the sacred choruses. Round the altar of Zeus they sang of the origin of the world, of gods and men, of their exploits, and of the ages successively; and celebrate the marriages of Cadmus and Perseus, and the death of Achilles. As goddesses of song they protect those who recognize their superiority, but punish the arrogant—such as Thamyris, the Thracian bard, who for having boasted himself their equal was deprived of sight and the power of song. From their connexion with Apollo and their original nature as inspiring nymphs of springs they also possess the gift of prophecy. They are closely related to Dionysus, to whose festivals dramatic poetry owed its origin and development. The worship of the Muses had two chief seats—on the northern slope of Mt Olympus in Pieria, and on the slopes of Mt Helicon near Ascora and Thepsia in Boeotia. Their favourite haunts were the springs of Castalia, Aganippe and Hippocrene. From Boeotia their cult gradually spread over Greece. As the goddesses who presided over the nine principal departments of letters, their names and attributes were: Calliope, epic poetry (wax tablet and pencil); Euterpe, lyric poetry (the double flute); Erato, erotic poetry (a small lyre); Melpomene, tragedy (tragic mask and ivy wreath); Thalassa, comedy (comic mask and ivy wreath); Polyhymnia (or Polyhymnia), sacred hymns (veiled, and in an attitude of thought); Terpsichore, choral song and the dance (the lyre); Clio, history (a scroll); Urania, astronomy (a celestial globe). To these Arethusa was added as the muse of pastoral poetry. The Roman poets identified the Greek Muses with the Italian Camenae (or Casmene), prophetic nymphs of springs and goddesses of birth, who possessed a grove near the Porta Capena at Rome. One of the most famous of these was Egeria, the counsellor of King Numa.

See H. Deiters, Ueber die Verehrung der Muser bei den Griechen (1868); P. Decharme, Les Muses (1869); J. H. Krause, Die Museen (1871); F. Rödiger, Die Museen (1875); O. Navarre in Darmberg and Saglio's Dictionnaire des antiquités, and A. Wie in Rovere's Lexicon der Mythologie, the latter chiefly for representations of the Muses in art.

MUSEUMS OF ART. The later 19th century was remarkable for the growth and development of museums, both in Great Britain and abroad. This growth, as Professor Stanley Jevons predicted, was symptomatic with the advancement of education. Public museums are now universally required; old institutions have been greatly improved, and many new ones have been founded. The British parliament has passed statutes conferring upon local authorities the power to levy rates for library and museum purposes, while on the continent of Europe the collection and exhibition of objects of antiquity and art has become a recognized duty of the state and municipality alike.

A sketch of the history of museums in general is given below, under MUSEUMS OF SCIENCE. The modern museum of art differs essentially from its earlier prototypes. The aimless collection of curiosities and bric-à-brac, brought together without method or system, was the feature of certain famous collections in bygone days, of which the Tradescant Museum, formed in the 17th century, was a good example. This museum was a miscellany without didactic value; it contributed nothing to the advancement of art; its arrangement was unscientific, and the public gained little or no advantage from its existence. The modern museum, on the other hand, should be organized for the public service, e.g. musical instruments: should they be included in art exhibits or in the ethnographical section to which they also pertain? Broadly speaking, objects must be classified according to the quality (apart from their nature) for which they are most remarkable. Thus a musket or bass viol of the 17th century, inlaid with ivory and highly decorated, would be properly included in the art section, whereas a common flute or weapon, noteworthy for nothing but its interest as an instrument of music or destruction, would be suitably classified as ethnographic. In England, at any rate, there is no uniformity of practice in this respect, and though it is to be hoped that the ruling desire to classify according to strict scientific rules may not become too prevalent, it would nevertheless be a distinct advantage if in the more of the British museums, some attempt were made to illustrate the growth of domestic arts and crafts according to classification by date. Examples of this classification in Munich, Amsterdam, Basel, Zürich and elsewhere afford excellent lessons of history and art, a series of rooms being fitted up to show in chronological order the home life of our ancestors. In the National Museum of Bavaria (Munich) there is a superb suite of rooms illustrating the progress of art from Merovingian times down to the 19th century. Thus classification, though studied, must not check the elasticity of art museums; it should not be allowed to interfere with the mobility of the exhibits—that is to say, it should always be possible to make the closer inspection of students, and also to send examples on loan to other museums and schools of art—an invaluable system long in vogue at the Victoria and Albert Museum, and one which should be still more widely adopted. An axiom of museum law
is that the exhibits shall be properly shown. "The value of a museum is to be tested by the treatment of its contents" (Flower, p. 24). But in many museums the chief hindrance to study and enjoyment is overcrowding of exhibits. Although a truism, it is necessary to state that each object should be properly seen, cleaned and safeguarded; but all over the world there is the trouble of an adequate collection of objects is one cause of overcrowding, but a faulty appreciation of the didactic purpose of the collection is more frequently responsible.

In Great Britain, museum progress is satisfactory. Visitors are numbered by millions, access is now permitted on Sundays and week-days alike, and entrance fees are being consistently reduced; in this the contrast between Great Britain and some foreign countries is singular. A generation or so ago the national collections of Italy used to be always open to the public. Pay-days, however, were gradually established, with the result that the chief collections are now only visible without payment on Sundays. In Dresden payment is obligatory five days a week. The British Museum never charges for admission. On the other hand, the increase in continental collections is more rapid than in Great Britain, where acquisitions are only made by gift, purchase or bequest. In other European countries enormous collections have been obtained by revolutions and conquest, by dynastic changes, and by secularizing religious foundations. Some of the chief treasures of provincial museums in France were spoils of the Napoleonic armies, though the great bulk of this loot was returned in 1815 to the original owners. In Italy the conversion of a monastery into a museum is a simple process, the Dominican house of San Marco in Florence offering a typical example. A further stimulus to the foundation of museums on the continent is the comparative ease with which old buildings are obtained and adapted for the collections. Thus the Germanisches Museum of Nuremberg is a secularized church and convent; the enormous collections belonging to the town of Ravenna are housed in an old Camaldulensian monastery. At Louvain and Florence municipal palaces of great beauty are used; at Nîmes a famous Roman temple; at Urbino the grand ducal palace, and so on. There are, however, certain disadvantages in securing both building and collection ready-made, and the special care devoted to museums in Great Britain can be traced to the fact that their cost to the community is considerable. Immense sums have been spent on the buildings (the total cost of the Victoria and Albert Museum alone being devoted to the new buildings for the Victoria and Albert Museum in London). Had it been possible to secure them without such an outlay the collections themselves would have been much increased, though in this increase itself there would have been a danger, prevalent but not yet fully realized in other countries, of crowding the vacant space with specimens of inferior quality. The result is that fine things are badly seen owing to the masses of second-rate examples; moreover, the ample space available induces the authorities to remove works of art from their original places, in order to add them to the museums. Thus the statue of St. George by Donatello has been taken from the church of Or San Michele at Florence (on the plea of danger from exposure), and is now placed in a museum where, being dwarfed and undervalued, its chief artistic value is lost. The desire to make financial profit from works of art is a direct cause of the modern museum movement in Italy. One result is to displace and thus depreciate many works of art, beautiful in their original places, but quite insignificant when put into a museum. Another result is that, owing to high entrance fees, the humbler class of Italians can rarely see the art treasures of their own country. There are other collections, akin to art museums, which would best be called biographical museums. They illustrate the life and work of great artists or authors. Of these the most notable are the museums commemorating Dürer at Nuremberg, Beethoven at Bonn, Thoreau at Concord, Shakespeare at Stratford and Michelangelo at Florence. The sacristies of cathedrals often contain ecclesiastical objects of great value, and are shown to the public as museums. Cologne, Aachen, Milan, Monza and Reims have famous treasuries. Many Italian cathedrals have small museums attached to them, usually known as "Opere del Duomo." United Kingdom.—The influence and reputation of the British Museum are so great that its original purpose, as stated in the preamble of the act by which it was founded (1753, c. 22), may be quoted: "Whereas all arts and sciences tend to the advancement with each other, and the progress of mankind; and whereas, in natural philosophy and other branches of speculative knowledge, for the advancement and improvement whereof the said museum or collection was intended, do, or may in many instances give help and success to the most useful experiments and undertakings . . ." The "said museum" above mentioned referred to the collection of Sir Hans Sloane, to be purchased under the act just quoted. Sir Hans Sloane is therein stated, "through the course of many years, with great labour and expense, to have gathered together whatever could be procured, either in our own or foreign countries, that was rare and curious." In order to buy his collections and found the museum a lottery of £35,000 was authorized, divided into 50,000 tickets, the prizes varying from £10 to £10,000. Provision was made for the adequate housing of Sir Robert Cotton's books, already bought in 1700 (12 and 13 Will. III. c. 7). This act secured for the nation the famous Cottonian manuscripts, "of great use and service for the knowledge and preservation of our constitution, both in church and state." Sir Robert's grandson had preserved the collection with great care, and was willing that it should not be disposed of or embezzeled," and that it should be preserved for public use and advantage. This act also sets forth the oath to be sworn by the keeper, and deals with the appointment of trustees. This is still the method of internal government at the British Museum, and additions to the Board of Trustees are made by statute, as in 1824, in acknowledgment of a bequest. The trustees are of three classes: (a) three principal trustees, namely the Primate, the Lord Chancellor and the Speaker; (b) general trustees, entitled ex officio to the position in virtue of ministerial office; (c) family, bequest and nominated trustees. A standing committee of the trustees meets regularly at the museum for the transaction of business. The great departments of the museum (apart from the scientific and zoological collections, now placed in the museum in Cromwell Road, South Kensington) are of printed books, MSS., Oriental books, prints and drawings, Egyptian and Assyrian antiquities, British and medieval sculpture, coins, medals and medals. Each of these eight departments is under a keeper, with an expert staff of subordinates, the head executive officer of the whole museum being styled director and chief librarian. The museum has been enriched by bequests of great importance, especially in the library. Recent legacies have included the porcelain bequeathed by Sir Wollaston Franks, and the valuable collection of works of art (chiefly enamels and goldsmithery) known as the Waddesdon bequest—a legacy of Baron F. de Rothschild. The most important group of acquisition by purchase in the history of the museum is the series of Greek sculptures known as the Elgin Marbles, bought by act of parliament (56 Geo. III. c. 90).

There are four national museums controlled by the Board of Education, until recently styled the Department of Science and Art. The chief of these is the Victoria and Albert Museum at South Kensington. This museum has a direct dependency at Bethnal Green, the Dublin and Edinburgh museums having been now removed from its direct charge. There is also a museum of practical geology in Jermyn Street, containing valuable specimens of pottery and majolica. The Victoria and Albert Museum owed its inception to the Exhibition of 1851, from the surplus funds of which 12 acres of land were bought in South Kensington. First known as the Department of Practical Art, the museum rapidly established itself on a broad basis. Acquisitions of whole collections and unique specimens were accumulated. In 1857 the Shepherds of pictures was presented; in 1879 the India Office transferred to the department the collection of Oriental art formerly belonging to the East India Company; in 1882 the Jones bequest of French furniture and decorative art (1740–1810) was received;
in 1884 the Patent Museum was handed over to the department. Books, prints, MSS. and drawings were bequeathed by the Rev. A. Dyce to Victorian ECM. Meanwhile, gifts and purchases had combined to make the collection one of the most important in Europe. The chief features may be summarized as consisting of pictures, including the Raphael cartoons lent by the king; textiles, silks and tapestry; ceramics and enamels; ivory and plastic art, metal, furniture and Oriental collections. The guiding principle of the museum is the illustration of art applied to industry. Beauty and decorative attraction is perhaps the chief characteristic of the exhibits here, whereas the British Museum is largely archaeological.

With this object in view, the museum possesses numerous reproductions of famous art treasures: casts, facsimiles and electrotypes, some of them so well contrived as to be almost indistinguishable from the originals. An art library with 75,000 volumes and 25,000 prints and photographs is at the disposal of students, and an art school is also attached to the museum. The museum does considerable work among provincial schools of art and museums, "circulation" being its function in this connexion. Works of art are sent on temporary loan to local museums, where they are exhibited for certain periods and on being withdrawn are replaced by fresh examples. The subordinate museum of the Board of Education at Bethnal Green and that at Edinburgh call for no comment, their contents being of a slender value. The Dublin Museum, though now controlled by the Irish Department, may be mentioned here as having been founded and worked by the Board of Education. Apart from the fact that it is one of the most suitably housed and organized museums in the British Isles, it is remarkable for its priceless collection of Celtic antiquities, belonging to the Royal Irish Academy, and transferred to the Kildare Street Museum in 1890. Among its most famous specimens of early Irish art may be mentioned the shrine and bell of St Patrick, the Tara brooch, the cross of Cong and the Ardagh chalice. The series of bronze and stone implements is most perfect, while the jewels, gold ornaments, torques, fibulae, diadems, and so forth are such that, were it possible again to extend the galleries (thus allowing further classification and exhibition space), the collection would surpass the Danish National Museum at Copenhagen, its chief rival in Europe.

The famous collections of Sir Richard Wallace (d. 1890) having been bequeathed to the British nation by his widow, the public has acquired a magnificent gallery of pictures, together with a quantity of works of art, so important as to make it necessary to include Hertford House among national museums. French art predominates, and the examples of bronze, furniture, and porcelain are as fine as those to be seen in the Louvre. Hertford House, however, also contains a most remarkable collection of armour, and the examples of Italian faience, enamels, bijouterie, &c., are of first-rate interest. The universities of Cambridge and Oxford have museums, the latter including the Ashmolean collection, a valuable bequest of majolica from D. Fortnum, and some important classical statuary, now in the Taylorian Gallery. Christ Church has a small museum and picture gallery. Trinity College, Dublin, has a miniature archaeological collection, containing some fine examples of early Irish art. The National Museum of Antiquities of Scotland, controlled by the Board of Manufactures, was formed by the Scottish Society of Antiquaries, and has a comprehensive collection of Scottish objects, lay and religious. The Tower of London contains armour of historic and artistic interest, and the Royal College of Music has an invaluable collection of musical instruments, presented by Mr George Donaldson. Art museums are also to be found in several public schools in the United Kingdom.

The Museums Act of 1825 enabled town councils to found municipal museums. This act was superseded by another passed in 1850, by Mr William Ewart, which in its turn has been replaced by amending statutes passed in 1855, 1866, 1868 and 1885. The Museums and Gymnasia Act of 1891 sanctioned the provision and maintenance of museums for the reception of local antiquities and other objects of interest, and allows a 0d. rate, irrespective of other acts. By this Act, councils have also been enabled to raise private municipal acts, Oldham affording a case in point. Civic museums must still be considered to be in their infancy. Although the movement is now firmly established in municipal enterprise, the collections, taken as a whole, are still somewhat nondescript. In many cases collections have been handed over by local societies, particularly in geology, zoology and other scientific departments. There are about twelve museums in which Roman antiquities are noticeable, among them being Leicester, and the Civic Museum of London, at the Guildhall. British and Anglo-Saxon relics are important features at Sheffield and Liverpool; in the former case owing to the Bateman collection acquired in 1876; while the Mayo collection presented to the latter town contains a highly important series of carved ivories. At Salford, Glasgow and Manchester industrial art is the chief feature of the collections. Birmingham, with perhaps the finest provincial collection of industrial art, is supported by the rates to the extent of £4,200 a year. Its collections (including here, as in the majority of great towns, an important gallery of paintings) are entirely derived from gifts and bequests. Birmingham has made a reputation for special exhibitions of works of art lent for a time to the corporation. These loan exhibitions, about which occasional lectures are given, and of which cheap illustrated catalogues are issued, have largely contributed to the great popularity and efficiency of the museum. Liverpool, Preston, Derby and Sheffield owe their fine museum buildings to private generosity. Other towns have museums which are chiefly supported by subscriptions, e.g. Chester and Newcastle, where there is a fine collection of work by Bewick the engraver. At Exeter the library, museum, and art gallery, together with schools of science and art, are combined in one building. Other towns may be noted as having art museums: Stockport, Nottingham (Wedgwood collection), Leeds, Bootle, Swansea, Bradford, Northampton (British archaeology), and Windsor. There are museums at Belfast, Larne, Killkenny and Armagh. The cost of the civic museum, being generally computed with the maintenance of the free library, is not easily obtained. In many cases the librarian is also curator of the museum; elsewhere no curator at all is appointed, his work being done by a caretaker. In some museums there is no classification or cataloguing and the value of existing collections is impaired both by careless treatment and by the too ready acceptance of worthless gifts; often enough the museums are governed by committees of the corporation whose interest and experience are not great.

Foreign Museums.—Art museums are far more numerous on the continent of Europe than in England. In Germany progress has been very striking, their educational aspect being closely studied. In Italy public collections, which are ten times more numerous than in England, are chiefly regarded as financial assets. The best examples of classification are to be found abroad, at Vienna, Amsterdam, Zürich, Munich and Gizeh in Egypt. The Musée Carnavalet, the historical collection of the city of Paris, is the most perfect civic museum in the world. The buildings in which the objects can be most easily studied are those of Naples, Berlin and Vienna. The value of the aggregate collections in any single country of the great powers, Russia excepted, probably exceeds the value of British collections. At the same time, it must be remembered that masses of foreign collections represent expropriations by the city and the state, together with the inheritance of royal and semi-royal collectors. In Germany and Italy, for instance, there are at least a dozen towns which at one time were capitals of principalities. In some countries the public holds over works of art the pre-emptive right of purchase. In Italy, under the law known as the Edito Pacca, it is illegal to export the more famous works of art. Speaking generally, the cost of maintaining municipal museums abroad is very small, many being without expert or highly-paid officials, while admission fees are often considerable. Nowhere in the United Kingdom are the collections neglected in a manner
through which certain towns in Italy and Spain have gained an unenviable name. Berlin and Vienna have collections of untold richness, and the public are freely admitted. Berlin, besides its picture gallery of antiquities and architectural museum, has a collection of Christian antiquities in the university. The old museum, a royal foundation, is renowned for its classical sculpture and a remarkable collection of medieval statuary, in which Italian art is well represented. The new museum is also noteworthy for Greek marbles, and contains bronzes and engravings, together with one of the most typical collections of Egyptian art. Schliemann’s discoveries are housed in the Ethnographic Museum. The Museum of Art and Industry, closely similar in object and arrangement to the Victoria and Albert Museum in London, contains a collection of the same character—enamels, furniture, ceramics, &c. Vienna also has one of these museums (Kunstgewerbe), in which the great value of the examples is enhanced by their judicious arrangement. The Historical Museum of this city is interesting, and the Imperial Museum (of which the structure corresponds almost exactly with a plan of an ideal museum designed by Sir William Flower) is one of the most comprehensive extent, containing armour of world-wide fame and the choicest specimens of industrial art. Prague, Innsbruck and Budapest are respectively the homes of the national museums of Bohemia, Tirol and Hungary. The National Museum of Bavaria (Munich) has been completed, and its exhibition rooms, too, show the most recent methods of classification, Nuremberg, with upwards of eighty rooms, being its only rival in southern Germany. Mainz and Trier have Roman antiquities. Hamburg, Leipzig and Breslau have good “Kunstgewerbe” collections. In Dresden there are four great museums—the Johanneum, the Albertium, the Zwinger and the Grüné Gewölbe—in which opulent art can best be appreciated; the porcelain of the Dresden galleries is superb, and few branches of art are unrepresented. Gotha is remarkable for its ceramics, Brunswick for enamels (in the ducal cabinet). Museums of minor importance exist at Hanover, Ulm, Würzburg, Danzig and Lübeck.

The central museum of France, the Louvre, was founded as a public institution during the Revolutionary period. It contains the collections of François I., Louis XIV., and the Napoleons. Many works of art have been added to it from royal palaces, and collections formed by distinguished connoisseurs (Campana, Sauvageot, La Caze) have been incorporated in it. The Greek sculpture, including the Venus of Melos and the Níke of Samothrace, is of pre-eminent fame. Other departments are well furnished, and from a technical point of view the manner in which the officials have overcome structural difficulties in adapting the palace to the needs of an art museum is most instructive. The Cluny Museum, bought by the city in 1842, and subsequently transferred to the state, supplements the medieval collections of the Louvre, being a storehouse of select works of art. It suffers, however, from being overcrowded, while for purposes of study it is badly lighted. At the same time the Mairie Cluny is a well-furnished house, decorated with admirable things, and as such has a special didactic value of its own, corresponding in this respect with Hertford House and the Poldi-Pezzoli Gallery at Milan—collections which are more than museums, since they show in the best manner the adaptation of artistic taste to domestic life. The French provincial museums are numerous and important. Twenty-two were established early in the 19th century, and more than 1,000 others have been added from the state, numbers of which were not returned in 1815 to the countries whence they were taken. The best of these museums are at Lyons; at Dijon, where the tombs of Jean sans Peur and Philip the Bold are preserved; at Amiens, where the capital Musée de Picardie was built in 1859; at Marseilles and at Bayeux, where the “Tapestry” is well exhibited. The collections of Lille, Bordeaux, Toulouse, and Avignon are also important. The objects shown in these museums are chiefly local gleanings, consisting largely of church plate, furniture, together with sculpture, carved wood, and pottery, nearly everything being French in origin. In many towns Roman antiquities and early Christian relics are preserved (e.g. Autun, Nîmes, Arles and Luxeuil). Other collections controlled by municipalities are kept at Rouen, Dourai, Montpellier, Chartres (14th-century sculptures), Grenoble, Toulon, Ajaccio, Épinal (Carolingian objects), Besançon, Bourges, Le Mans (with the remarkable enamel of Geoffrey of Anjou), Nancy, Aix and in many other towns. As a rule, the public is admitted free of charge, special courtesy being shown to foreigners. In many cases the collections are ill cared for and uncatalogued, and little money is provided for acquisitions in the civic museums; indeed, in this respect the great national institutions contrast unfavourably with British ones. The collections and exhibits will be treated in detail below.

The national, civic and papal museums of Italy are so numerous that a few only can be mentioned. The best arranged and best classified collection is the Museo Nazionale at Naples, containing many thousand examples of Roman art, chiefly obtained from the immediate neighbourhood. For historical importance it ranks as primus inter pares with the collections of Rome and the Vatican. It is, however, the only great Italian museum where scientific treatment is consistently adopted. Other museums of purely classical art are found at Syracuse, Cagliari and Palermo. Etruscan art is best displayed at Arezzo, Perugia (in the university), Cortona, Florence (Museo Archeologico), Volterra and the Vatican. The Florentine museums are of great importance, consisting of the archaeological museum of antique bronzes, Egyptian art, and a great number of tapestries. The Museo Nazionale, housed in the Bargello (A.D. 1260), is the central depository of Tuscan art. Numerous examples of Della Robbia ware have been gathered together, and are fixed to the walls in a manner and position which reduce their value to a minimum. The plastic arts of Tuscany are represented by Donatello, Verrocchio, Ghiberti, and Cellini, while the Carrand collection of ivories, pictures, and varied medieval specimens is of much interest. This museum, like so many others, is becoming seriously overcrowded, to the lasting detriment of churches, market-places, and streets, whence these works of art are being ruthlessly removed. The public is admitted free one day a week, and the receipts are devoted to art and antiquarian purposes ("tasse . . . destinat . . . alla conversazione dei monumenti, all’ ampliamento degli scavi, ed’ all’ incremento dei instituti . . . nella città."—Law of 1875, §3). The museums of Rome are numerous, the Vatican alone containing at least six—Museo Clementino, of classical art, with the Laocoon, the Apollo Belvedere, and other masterpieces; the Chiaramonti, also of classical sculpture; the Gallery of Inscriptions; the Egyptian, the Etruscan and the Christian museums. The last is an extensive collection corresponding with another papal museum in the Lateran Palace, also known as the Christian Museum (founded 1843), and remarkable for its sarcophagi and relics from the catacombs. The Lateran has also a second museum known as the Museo Profano. Museums belonging to the state are equally remarkable. The Kircher Museum deals with prehistoric art, and contains the “Preneste Hoard.” The Museo Nazionale (by the Baths of Diocletian), the Museo Capitolino, and the Palazzo dei Conservatori contain innumerable specimens of the finest classical art, vases, bronzes, mosaics, and statuary, Greek as well as Roman. Among provincial museums there are few which do not possess at least one or two objects of signal merit. Thus Brescia, besides a medieval collection, has a famous bronze Victory. Pesaro, Urbino, and the Museo Correr at Venice have admirable examples of majolica. Milan, Pisa and Genoa have general archaeology combined with a good proportion of mediocrity. The civic museum of Bologna is comprehensive and well arranged, having Egyptian, classical, and Etruscan collections, besides many things dating from the “Bella Epoca” of Italian art. At Ravenna alone can the Byzantine art of Italy be properly understood, and it is deplorable that the superb collections in its fine galleries should remain uncatalogued and neglected. Turin, Siena, Padua, and other towns have civic museums.
MUSEUMS OF SCIENCE

The Ryks Museum at Amsterdam, containing the national collections of Holland, is a modern building in which a series of historical rooms are furnished to show at a glance the artistic progress of the Dutch at any given period.

Belgium and Holland.

Nine rooms are also devoted to the chronological display of ecclesiastical art. Besides the famous paintings, this museum (the sole drawback of which is the number of rooms which have no top light) contains a library, many engravings, a comprehensive exhibit of armour, costume, metal-work, and a department of maritime craftsmanship. Arnhem and Haarlem have municipal collections. At Leiden the university maintains a scholarly collection of antiquities. The Hague and Rotterdam have also museums, but everything in Holland is subordinated to the development of the great central depository at Amsterdam, to which examples are sent from all parts of the country. In Belgium the chief museum, that of ancient industrial art, is at Brussels. It contains many pieces of medieval church furniture and decoration, but in this respect differs only in size from the civic museums of Ghent and Luxemburg and the Archbishop's Museum at Utrecht. In Brussels, however, there is a good show of Frankish and Carolingian objects. The city of Antwerp maintains the Musée Plantin, a printing establishment which has survived almost intact, and presents one of the most charming and instructive museums in the world. As a whole, the museums of Belgium are disappointing, though, per contra, the churches are of enhanced interest, not having been pillaged for the benefit of museums.

New museums are being founded in Russia every year. Kharkoff and Odessa (the university) have already large collections, and in the most remote parts of Siberia it is curious to find carefully chosen collections. Krasnoyarsk has 12,000 specimens, a storehouse of Burial art. Ikutsuk the capital, Tobolsk, Tomsk (university), Khabarovsky, and Yakutsk have new museums. In these Russian art naturally predominates. It is only at Moscow and St Petersburg that Western art is found. The Hermitage Palace in the latter city contains a selection of medieval objects of fabulous value, there being no less than forty early ivories. But from a national point of view these collections are insignificant when compared with the gold and silver objects illustrating the primitive arts and ornament of Scythia, Crimea and Caucasus, the high standard attained proving an advanced stage of manual skill. At Moscow (historical museum) the stone and metal relics are scarcely less interesting. There is also a museum of industrial art, the specimens of which are not of unusual value, but being analogous to the Kunstgewerbe movement in Germany, it exercises a wholesome influence upon the designers who study in its schools.

American museums are not committed to traditional systems, and scientific treatment is allowed its fullest scope. They exist in great numbers, and though in some cases their exhibits are chiefly ethnographic, a far wider range of art objects is rapidly being secured. The National Museum at Washington, a branch of the Smithsonian Institution (q.s.), while notable for its American historical and ethnological exhibits, has the National Gallery of Art. The Metropolitan Museum of Art (held by trustees for the benefit of the city of New York) has in the Censnola collection the most complete series of Cypriot art objects. It has also departments of coins, Greek sculpture and general examples of European and American art. The Museum of Fine Arts at Boston is very comprehensive, and has a remarkable collection of ceramics, together with good reproductions of antique art. There are museums at St Louis, Chicago, Pittsburgh, Brooklyn, Cincinnati, and Washington, as well as Montreal in Canada; and the universities of Harvard, Chicago, Pennsylvania and Yale have important collections.

The Swiss National Museum is situated at Zürich, and though of medium size (50 rooms), it is a model of arrangement and organization. Besides the special series of rooms illustrating the historical progress of art, its collection of stained glass is important. Basel also (historical museum) is but little inferior in contents or system to the Zürich establishment. Geneva has three collections. Lausanne holds the museum of the canton, and Bern has a municipal collection. All these institutions are well supported financially, and are much appreciated by the Swiss public. The art museums of Stockholm, Christiania and Copenhagen rank high for their intrinsic excellence, but still more for their scientific and didactic value. Stockholm has three museums: that of the Royal Palace, a collection of costume and armour; the Northern Museum, a large collection of domestic art; the National Museum, containing the prehistoric collections, gold ornaments, &c., classified in a brilliant manner. The National Museum of Denmark at Copenhagen is in this respect even more famous, being probably the second national collection in the world. The arrangement of this collection leaves little to be desired, and it is to be regretted that some British collections, in themselves of immense value, cannot be shown, as at Copenhagen, in a manner which would display their great merits to the fullest degree. There is also at Copenhagen a remarkable collection of antique busts (Gamle Glyptotek), and the Thorvaldsen Museum connected with the sculptor of that name. Norse antiquities are at Christiania (the university) and Bergen. Athens has three museums, all devoted to Greek art: that of the Acropolis, that of the Archaeological Society (vases and terracotta) and the National Museum of Antiquities. The state owns all discoveries and these are accumulated at the capital, so that local museums scarcely exist. The collections, which rapidly increase, are of extraordinary value. In the past forty years many, if not all, those objects which used to be spread over the aggregate in other European countries. The Museum of Egyptian Antiquities (Cairo), founded by Mariette Bey at Bulak, afterwards moved to the Giza palace and developed by Maspero, is housed in a large building erected in 1902, well classified, and liberally supported with money and fresh acquisitions. Minor museums exist at Carthage and Tunis. At Constantinople the Turkish Museum contains some good classical sculpture and a great deal of rubbish. The Musée du Prado and the Archaeological Museum at Madrid are the chief Spanish collections, containing numerous classical objects and many specimens of Moorish and early Spanish art. In Spain museums are badly kept, and their contents are of indifferent value. The museums of the chief provinces are situated at Barcelona, Valencia, Granada and Seville. Cadiz and Cordova have also sadly neglected civic collections. The National Museum of Portugal at Lisbon requires no special comment. The progress of Japan is noticeable in its museums as in its industrial enterprise. The National Museum(Weno Park, Tōkyō) is large and well arranged in a new building of Western architecture. Kōtō and Nara have excellent museums, exclusively of Oriental art, and two or three other towns have smaller establishments, including commercial museums. There are several museums in India, the chief one being at Calcutta, devoted to Indian antiquities.

The best history of museums can be found in the prefaces and introductions to their official catalogues, but the following works will be useful for reference: Annual Reports presented to Parliament (official) of British Museum and Board of Education; Civil Service Estimates, Class IV., annually presented to Parliament; Second Report of Select Committee of House of Commons on Museums of Science and Art Department (official); The English Museum and Exhibition of the Arts in England (London, 1840); Professor Stanley Jeovis, "Use and Abuse of Museums," printed in Methods of Social Reform (London, 1882); Report of Committee on Provincial Museums. British Association for the Advancement of Science, 1882 (London, 1883); Muses, Museums and Art Galleries (London, 1888); Professor Brown Goode, Museums of the Future, Report on the National Museum for 1889 (Washington, 1891); Principles of Museum Administration; Report of the committee appointed by the British Association for the Advancement of Science to inquire into the question of the encouragement of the arts in Belgium (Hague, 1892); Sir William Flower, Essays on Museums (London, 1845); Le Gallerie d'Art (Paris, 1863); Jules Sala (Nancy, 1889); P. B. Murray, Art Museums: Their History and Use, with Bibliography and List of Museums in the United Kingdom (3 vols., 1904).

MUSEUMS OF SCIENCE. The ideal museum should cover the whole field of human knowledge. It should teach the truths of all the sciences, including anthropology, the science which deals with man and all his works in every age. All the
sciences and all the arts are correlated. The wide separation of collections illustrative of the arts (see MUSEUMS OF ART above) from those illustrative of the sciences, and their treatment as if belonging to a wholly different sphere, is arbitrary. Such separation, which is to-day the rule rather than the exception, is due to the circumstances of the origin of many collections, or in other cases to the limitations imposed by poverty or lack of space. Many of the national museums of continental Europe had their beginnings in collections privately acquired by monarchs, who, at a time when the modern sciences were in their infancy, entertained themselves by assembling objects which appealed to their love of the beautiful and the curious. The pictures, marbles, bronzes and bric-a-brac of the palace became the nucleus of the museum of to-day, and in some notable cases the palace itself was converted into a museum. In a few instances these museums, in which works of art had the first place, have been enriched and supplemented by collections illustrative of the advancing sciences of a later date, but in a majority of cases these collections have remained what they were at the outset, mere exponents of human handicraft in one or the other, or all of its various departments. Some recent great foundations have copied the more or less defective models of the past, and museums devoted exclusively to the illustration of one or the other narrow segment of knowledge will no doubt continue to be multiplied, and in spite of their limited range, will do much good. A notable illustration of the influence of lack of space in bringing about a separation of anthropological collections from collections illustrative of other sciences is afforded by the national collection in London. For many years the collections of the British Museum, literary, artistic and scientific, were accommodated in ideal relations to one another, but at last the accumulation of treasure became so vast and the difficulties of administration were so pressing that a separation was decided upon, and the natural history collections were finally removed to the separate museum in Cromwell Road, South Kensington. But the student of museums can never fail to regret that the necessities of space and financial considerations compelled this separation, which in a measure destroyed the ideal relationship which had for so many years obtained.

The ancient world knew nothing of museums in the modern sense of the term. There were collections of paintings and statuary in the temples and palaces of Greece and Rome; the houses of private wealth were everywhere adorned by works of art; curious objects of natural history were often brought from afar, as the skins of the female gorillas, which Hanno after his voyage on the west coast of Africa hung up in the temple of Astarte at Carthage; Alexander the Great granted to his illustrious teacher, Aristotle, a large sum of money for use in his scientific researches, sent him natural history collections from conquered lands, and put at his service thousands of men to collect specimens, upon which he based his work on natural history; the museum of Alexandria, which included within its keeping the Alexandrian library, was a great university composed of a number of associated colleges; but there was nowhere in all the ancient world an institution which exactly corresponded in its scope and purpose to the modern museum. The term "museum," after the burning of the great institution of Alexandria, appears to have fallen into disuse from the 4th to the 17th century, and the idea which the word represented slipped from the minds of men.

The revival of learning in the 15th century was accompanied by an awakening of interest in classical antiquity, and many persons laboured eagerly upon the collection of memorials of the past. Statuaries, inscriptions, gems, coins, medals and manuscripts were assembled by the wealthy and the learned. The leaders in this movement were presently followed by others who devoted themselves to the search for minerals, plants and curious animals. Among the circumstances which early collectors of objects of natural history may be mentioned Georg Agricola (1494-1555), who has been styled "the father of mineralogy." By his labours the elector Augustus of Saxony was induced to establish the Kunst und Naturalien Kammer, which has since expanded into the various museums at Dresden. One of his contemporaries was Conrad Gesner of Zürich (1516-1565), "the German Pliny," whose writings are still resorted to by the curious. Others whose names are familiar were Pierre Bélon (1517-1564), professor at the Collège de France; Andrea Cesalpini (1519-1603), whose herbarium is still preserved at Florence; Ulissi Aldrovandi (1522-1605), remnants of whose collections still exist at Bologna; Ole Worm (1588-1654), a Danish physician, after whom the so-called "Wormian bones" of the skull are named, and who was one of the first to cultivate that now is known as the science of prehistoric archaeology. At a later date the collection of Albert Seba (1665-1736) of Amsterdam became famous, and was purchased by Peter the Great in 1716, and removed to St. Petersburg. In Great Britain among early collectors were the two Tradescants; Sir John Woodward (1665-1728), a portion of whose collections, bequeathed by him to Cambridge University is still preserved there in the Woodwardian or Geological Museum; Sir James Balfour (1600-1657), and Sir Andrew Balfour (1630-1694), whose work was continued in Art by Sir Robert Sibthorp (1641-1722). The first person to elaborate and present to modern minds the thought of an institution which should assemble within its walls the things which men wish to see and study was Bacon, who in his New Atlantis (1627) broadly sketched the outline of a great national museum of science and art.

The first surviving scientific museum established upon a substantial basis was the Ashmolean Museum at Oxford, founded by Elias Ashmole. The original collection had been made by the Tradescants, father and son, gardeners who were in the employment of the duke of Buckingham and later of King Charles I. and his queen; it consisted of "twelve cartloads of curiosities," principally from Virginia and Algiers, which the young Tradescant begged from his uncle, and which, after much litigation with Tradescant's widow, he gave to Oxford upon condition that a suitable building should be provided. This was done in 1682 after plans by Sir Christopher Wren. Ashmole in his diary makes record, on the 17th of February 1683, that "the last load of my rarities was sent to the barge, and this afternoon I relapsed into the gown."

The establishment of the German academy of Nature Curiosi in 1652, of the Royal Society of London in 1660, and of the Académie des Sciences of Paris in 1666, imparted a powerful impulse to scientific investigation, which was reflected not only in the labours of a multitude of persons who undertook the formation of private scientific collections, but in the initiation by crowned heads of movements looking toward the formation of national collections, many of which, having their beginnings in the latter half of the 17th century and the early years of the 18th century, survive to the present day.

The most famous of all English collectors in his time was Sir Hans Sloane (1660-1753), whose vast collection, acquired at a great outlay of money, and including the collections of Petiver, Courten, Merret, Plukenet, and Buddle—all of which he had purchased—was by his will bequeathed to the British nation on condition that parliament should pay to his heirs the sum of £20,000 a sum far less than that which he had expended upon it, and representing, it is said, only the value of the coins which it contained. Sloane was a man who might justly have said of himself "humani nihil a me alienum puto"; and his collection attested the catholicity of his tastes and the breadth of his scientific appetites. The bequest of Sloane was accepted upon the terms of his will, and, together with the library of George II., which had likewise been bequeathed to the nation, was thrown open to the public at Bloomsbury in 1759 as the British Museum. As showing the great advances which have occurred in the administration of museums since that day, the following extract taken from A Guide-Book to the General Contents of the British Museum, published in 1761, is interesting: "...fifteen persons are allowed to view it in one Company, the Time allotted is two Hours, and when any Number not exceeding fifteen are inclined to see it, they must send a List of their Christian and Surname, Additions, and Places of Abode, to the Porter's Lodge, in order to their being entered in the Book; in a few Days the respective Tickets will be made out, specifying..."
the Day and Hour in which they are to come, which, on being sent for, are delivered. If by any Accident some of the Parties are prevented from coming, it is proper they send their Ticket back to the Lodge, as nobody can be admitted with it but themselves. It is to be remarked that the fewer Names there are in a List, the sooner they are likely to be admitted to see it."

The establishment of the British Museum was coincident in time with the development of the systematic study of nature, of which Linnaeus was at that time the most distinguished exponent. The modern sciences, the wonderful triumphs of which have revolutionized the world, were just emerging from their infancy. Museums were speedily found to furnish the best agency for preserving the records of advancing knowledge, so far as these consisted of the materials upon which the investigator had laboured. In a short time it became customary for the student, either during his lifetime or at his death, to entrust to the permanent custody of museums the collections upon which he had based his studies and observations. Museums were thenceforth rapidly multiplied, and came to be universally regarded as proper repositories for scientific collections of all kinds. But the use of museums as repositories of the collections of the learned came presently to be associated with their use as seats of original investigation and research. Collections of new and rare objects which had not yet received attentive study came into their possession. Voyages of exploration into unknown lands, undertaken at public or private expense, added continually to their treasures. The comparison of never collections with older collections which had been already made the subject of study, was undertaken. New truths were thus ascertained. A body of students was attracted to the museums, who in a few years by their investigations began not only to add to the sum of human knowledge, but by their publications to shed lustre upon the institutions with which they were connected. The spirit of inquiry was wisely fostered by private and public munificence, and museums as centres for the diffusion of scientific truth came to hold a well-recognized position. Later still, about the middle of the 19th century, when the importance of popular education and the necessity of popularizing knowledge came to be more thoroughly recognized than it had heretofore been, museums were found to be peculiarly adapted in certain respects for the promotion of the culture of the masses. They became under the new impulse not merely repositories of scientific records and seats of original research, but powerful educational agencies, in which by object lessons the most important truths of science were capable of being pleasantly imparted to multitudes. The old narrow restrictions were thrown down. Their doors were freely opened to the people, and at the beginning of the 20th century the movement for the establishment of museums assumed a magnitude scarcely, if at all, less than the movement on behalf of the diffusion of popular knowledge through public libraries. While great national museums have been founded and all the large municipalities of the world through private or civic gifts have established museums within their limits, a multitude of lesser towns, and even in some cases villages, have established museums, and museums as adjuncts of universities, colleges and high schools have come to be recognized as almost indispensable. The movement, however, has been greatest in Great Britain and her colonies, Germany, and the United States of America, although in many other lands it has already advanced far.

There are now in existence the world, exclusive of museums of art, not less than 2000 scientific museums which possess in themselves elements of permanence, some of which are splendidly supported by public munificence, and a number of which have been richly endowed by private benefactions.

Great Britain and Ireland.—The greatest museum in London is the British Museum. The natural history department at South Kensington, with its wealth of types deposited there, constitutes the most important collection of the kind in the world. The Museum of Practical Geology in Jermyn Street contains a beautiful and well-arranged collection of minerals and a very complete series of specimens illustrative of the petrography and the invertebrate paleontology of the British Islands. The botanical collections at Kew are classic, and are as rich in types as are the zoological collections of the British Museum. The Hunterian Museum of the Royal College of Surgeons contains a notable assemblage of specimens illustrating anatomy, both human and comparative, as well as pathology. In London also a number of private owners possess large collections of natural history specimens, principally ornithological, entomological and conchological, in some instances destined to find a final resting place in the national collection. One of the most important of these great collections is that formed by F. Ducane Godman, whose work on the fauna of middle America, entitled Biologia centrali-americana, is an enduring monument to his learning and generosity. The Hon. Walter Rothschild has accumulated at Tring one of the largest and most important natural history collections which has ever been assembled by a single individual. It is particularly rich in rare species which are either already extinct or verging upon extinction, and the ornithological and entomological collections are vast in extent and of the finest types, the type collection of the late Sir Lionel Walter Tennyson, K.C.B., R.E., in the Natural History Museum, South Kensington, at the time of his death, became the property of the British Museum. The Victoria and Albert Museum, in the South Kensington district of the metropolis, contains the most comprehensive collection of the decorative arts in England, with especial reference to England and the British colonies. The national museums at Cambridge, Merton Hall, near Thetford, the largest and most perfect collection of the microlepidoptera of the world which is in existence.

The Ashmolean Museum and the University Museum at Oxford, and the Woodwardian Museum and the University Museum at Cambridge, are remarkable collections. The Free Public Museum at Liverpool is in some respects one of the finest and most successfully arranged museums in Great Britain. It contains a wealth of valuable scientific material, and is rich in types, particularly of birds. The Manchester Museum of Owens College and the museum in Sheffield have in recent years accomplished much for the cause of science and popular education. The Bristol Museum has very rapidly achieved considerable growth and has become a centre of much enlightened activity. The Royal Scottish Museum, the herbarium of the Royal Botanic Garden, and the collections of the Challenger Expedition Office in Edinburgh, are worthy of particular mention. The museum of the university of Glasgow and the Glasgow Museum contain valuable collections. The museum of St Andrews University is very rich in material illustrating marine zoology, and so also are the collections of University College at Dundee. The Science and Art Museum of Dublin and the Public Museum of Belfast, in addition to the works of art which they contain, possess scientific collections of importance.

India.—The Indian Museum, the Geological Survey of India, and the herbarium of the Royal Botanic Garden in Calcutta, are richly endowed with collections illustrating the natural history of Hindostan and adjacent countries. The finest collection of the vertebrate fossils of the Sivalik Hills is that found in the Indian Museum. Lord W. The Victoria at Albert Museum, Merton Hall, near Thetford, the largest and most perfect collection of the microlepidoptera of the world which is in existence.

Museums of Science
Canada.—In connection with the Université Laval in Quebec, the McGill University in Montreal, and the university of Toronto in Ontario, beginnings of significance have been made. The Peter Redpath Museum of McGill College contains important collections in a number of subjects, and the university of Victoria, British Columbia, is growing in importance. A movement has been begun to establish at Ottawa a museum which shall in a sense be for the Dominion a national establishment.

France.—Paris abounds in institutions for the promotion of culture. In possession of many of the institutions of learning, such as the École Nationale Supérieure des Mines, the Institut National Agronomique, and the various learned societies, are collections of great value which must be consulted at times by specialists in the various sciences. The Muséum d'Histoire Naturelle in the Jardin des Plantes is the most comprehensive and important collection of its kind in French metropolis, and while not as rich in type of specimens as the British Museum, nevertheless contains a vast assemblage of classic specimens reflecting the labours of former generations of French naturalists. Unfortunately, much of the best material, containing the types of species, has been removed from the display of specimens with the purpose to preserve the records of science, a fact which French naturalists themselves universally admit. As in England, so also in France, there are a number of local historical societies which are more or less important. One of the very largest and finest of all the entomological collections of the world is that at Rennes, belonging to the brothers Oberthür, upon which they have expended princely sums. The Musée des Sciences Naturelles of Lyons is in some respects an important institution.

Belgium.—Brussels has been called "a city of museums." The Musée du Congo and the Musée Royal d'Histoire Naturelle du Belgique are rich in ethnological material. The former is rich in ethnographic and zoological material brought from the Congo Free State, and the latter contains very important paleontological collections.

Holland.—The national museums of the Koninklijk Zoologisch Genootschap, affiliated with the university at Amsterdam, is well known. The Royal museums connected with the University of Leiden are also scientific institutions.

Denmark.—The National Museum at Copenhagen is particularly rich in Scandinavian and Danish antiquities.

Sweden.—In Stockholm, the capital, the Nordiska Museet is deservedly one of the finest museums of natural history in the world. The museum is rich in paleontological, botanical and archaeological collections. Great scientific treasures are also contained in the museums connected with the university of Upsala.

Natural science and botany are the especial interests of the student of marine zoology are contained in the university of Christiania.

Germany.—Germany is rich in museums, some of which are of very great importance. The Museum für Naturkunde, the ethnographic museum in Berlin, the great zoological museum and the agricultural museum in Berlin are noble institutions, the first mentioned being particularly rich in classical collections. Hamburg boasts an excellent museum of mineralogy and zoology, and the universities at Munich, the Museum Godfried and the Museum Umlauf. There are a number of important private collections in Hamburg. The municipal museum in Bremen is important from the standpoint of the naturalist and ethnologist. The Roemer Museum at Hildesheim is one of the best provincial museums in Germany. Dresden even more justly than Brussels may be called "a city of museums," and the mineralogical, archaeological, zoological and anthropological museums are exceedingly important from the point of view of the naturalist. Here also in private hands is the greatest collection of palaearctic lepidoptera in Europe, belonging to the heirs of Dr Otto Saundinger. The ethnographical museum at Leipzig is rich in collections of arctic and south American material.

The natural history museum of Stuttgart is likewise noted for its important paleontological collections. The Senckenbergische Naturforschende Gesellschaft museum at Frankfurt-on-the-Main contains important geological and botanical collections. The museum of the university at Bonn, and more particularly the anatomical museum, are noteworthy. In connexion with almost all the German universities and in almost all the larger industrial towns, there are museums of which there are important assemblages illustrating not only the natural history of the immediate neighbourhood, but in a multitude of cases containing important material collected in foreign lands. One of the most interesting is that at Lübeck, a model in its way for a provincial museum.

Austria-Hungary.—The Imperial Natural History Museum in Vienna is one of the noblest institutions of its kind in Europe, and possesses one of the finest collections of ethnographical and anthropological collections. The natural history collections of the Bohemian national museum at Prague are well arranged, though not remarkably extensive.

Russia.—The Riumantsch Museum in Moscow possesses splendid botanical collections of over 50,000 species, in addition to splendid artistic treasures, and is rich in natural history specimens. It is one of the most magnificent foundations of its kind in Europe. There are a number of magnificent museums in St Petersburg which alone contain a wealth of excellent specimens. There are a number of provincial museums in the larger cities of Russia which are growing in importance.

Italy.—Italy is rich in museums of art, but natural history collections are not as strongly represented as in other lands. Connected with the various universities are collections which possess more or less importance from the standpoint of the specialist. The Museo Civico di Storia Naturale at Genoa, and the collections preserved at the marine biological station at Naples, have most interest for the zoologist.

Spain.—There are no natural history collections of first importance in Spain, though at all the universities there are minor collections, which are in some instances creditably cared for and arranged.

Portugal.—The national history museum at Lisbon contains important ornithological treasures.

Eastern Asia.—The awakening of the empire of Japan has resulted accumulating collections of important scientific and botanical specimens. There are a number of scientific students, mostly trained in European and American universities, who are doing excellent work in the biological and allied sciences. Very creditable beginnings have been made at the National University of Tokyo, and the establishment of a museum of natural history. At Shanghai there is a collection, gathered by the Chinese branch of the Royal Asiatic Society, which is in a decadent state, but contains much good material. Otherwise as yet the movement to establish museums has not laid strong hold upon the inhabitants of eastern Asia. At Batavia in Java, and at Manila in the Philipine Islands, there are found the nuclei of important collections.

United States.—The movement to establish museums in the United States is comparatively recent. One of the very earliest collections (1802), which, however, was soon dispersed, was made by Charles Willson Peale (q.v.). The Academy of Natural Sciences in Philadelphia, established in 1812, is the oldest society for the promotion of the natural sciences in the United States. It possesses a very important library and some most excellent collections, and is rich in ornithological, entomological and botanical types. The city of Philadelphia also points with pride to its museum of natural history, an institution founded by the University of Pennsylvania, and to the Philadelphia museums, the latter museums of commerce, but which incidentally do much to promote scientific knowledge, especially in the domain of ethnology, botany and mineralogy. The Wistar Institute of Anatomy is well endowed and organized. The zoological museum at Harvard University, Cambridge, Massachusetts, is associated with the names of Louis and Alexander Agassiz, the former of whom by his learning and activity as a collector, and the latter by his munificent gifts, as well as by his important researches, not only created the institution, but made it a potent agency for the advancement of science. The Peabody Museum of Archaeology and Ethnology, likewise connected with Harvard University, is one of the greatest institutions of its kind in the New World. The Essex Institute at Salem, Massachusetts, is noteworthy. The Butterfield Museum, Dartmouth College, Hanover, New Hampshire, and the Fairbanks Museum of Natural Science (1891) at St Johnsbury, Vermont, are important modern institutions. In the museum of Amherst College are preserved the types of the birds described by J. J. Audubon, the shells described by C. B. Adams, the mineralogical collections of Charles Upham Shepard, and the palaeontological collections of President Hitchcock. In Springfield (1858) and Worcester, Massachusetts, there are excellent museums. The Peabody Museum of Natural History at Yale University, New Haven, Connecticut, contains much of the palaeontological material described by Professor O. C. Marsh. The New York State Museum at Albany is important from a geological and palaeontological standpoint. The American Museum of Natural History in New York City, founded in 1869, provision for the growth and enlargement of which upon a scale of the
MUSGRAVE—MUSH

utmost magnificence has been made, is liberally supported both by public and private munificence. The ethnographical, paleontological and archaeological material gathered within its walls is immense in extent and superbly displayed. The museum of the New York botanical garden in Bronx Park is a worthy rival to the museums at Kew. The Brooklyn Institute of Arts and Sciences combines with collections illustrative of the arts excellent collections of natural history, many of which are classic.

The United States National Museum at Washington, under the control of the Smithsonian Institution, of which it is a department, has been made the repository for many years past of the scientific and artistic collections coming into the possession of the government. The growth of the material entrusted to its keeping has, more particularly in recent years, been enormous, and the collections have wholly outgrown the space provided in the original building, built for it during the incumbency of Professor Spencer F. Baird as secretary of the Smithsonian Institution. The congress of the United States has in recent years made provision for the erection of a new building upon the Mall in Washington, to which the natural history collections are ultimately to be transferred, the buildings of the National Museum being retained for the display of a collection illustrative of the progress of the arts, until replaced by a building of better construction for the same purpose. The United States National Museum has published a great deal, and has become one of the most important agencies for the diffusion of scientific knowledge in the country. It is liberally supported by the government, and makes use of the scientific men connected with all the various departments of activity under government control as agents for research. The collections of the United States Geological Survey, as well as many of the more important scientific collections made by the Department of Agriculture, are deposited here.

As the result of the great Columbian International exposition, which took place in Chicago in 1893, a movement originated in the city of Chicago, where the exposition was held, to form a permanent collection of large proportions. The great building in which the international exposition of the fine arts was displayed was preserved as the temporary home for the new museum. Marshall Field contributed $1,000,000 to the furtherance of the enterprise, and in his honour the institution was called “The Field Columbian Museum.” The growth of this institution was very rapid, and Mr. Field, at his death, in 1906, bequeathed to the museum $8,000,000, half to be applied to the erection of a new building, the other half to constitute an endowment fund, in addition to the revenues derived from the endowment already existing. The city of Chicago provides liberally for the support of the museum, the name of which, in the spring of 1906, was changed to “The Field Museum of Natural History.” The city of St. Louis has taken steps, as the result of the international exposition of 1904, to emulate the example of Chicago, and the St. Louis Public Museum was founded under hopeful auspices in 1905.

Probably the most magnificent foundation for the advancement of science and art in America which has as yet been created is the Carnegie Institute in the city of Pittsburgh. The Carnegie Institute is a complex of institutions, consisting of a museum of art, a museum of science, and a school for the education of youth in the elements of technology. Affiliated with the museums of art and science, and under the same roof, is the Central Free Library of Pittsburgh. The buildings erected for the accommodation of the institute, at the entrance to Schenley Park, cost $8,000,000, and Mr Andrew Carnegie provided liberally for the endowment of the museums of art and science and the technical school, leaving to the city of Pittsburgh the maintenance of the general library. The natural history collections contained in the museum of science, although the institution was only founded in 1896, are large and important, and are particularly rich in mineralogy, geology, paleontology, botany and zoology. The entomological collections are among the most important in the new world. The conchological collections are vast, and the paleontological collections are among the most important in America. The great Bryant collection is the largest and most complete collection representing European paleontology in America. The Carnegie Museum contains natural history collections aggregating over 1,500,000 specimens, which cost approximately £125,000, and these are growing rapidly. The ethnological collections, particularly those illustrating the Indians of the plains, and the archaeological collections, representing the cultures more particularly of Costa Rica and of Colombia, are large.

In connexion with almost all the American colleges and universities there are museums of more or less importance. The Bernice Pauahi Bishop museum at Honolulu is an institution established by private munificence, which is doing excellent work in the field of Polynesian ethnology and zoology.

Other American Countries.—The national museum in the city of Mexico has in recent years been receiving intelligent encouragement and support both from the government and by private individuals, and is coming to be an institution of much importance. National museums have been established at the capitals of most of the Central American and South American states. Some of them represent considerable progress, but most of them are in a somewhat languishing condition. Notable exceptions are the national museum in Rio de Janeiro, the Museu Paraense (Museu Goeldi), at Pará, the Museu Paulista at Sao Paulo, and the national museum in Buenos Aires, which is particularly rich in prehistoric collections. There is an excellent museum at Valparaiso in Chile, which in recent years has been doing good work.

(W. J. H.)

MUSGRAVE, SAMUEL (1732—1780), English classical scholar and physician, was born at Washfield, in Devonshire, on the 29th of September 1732. Educated at Oxford and elected to a Radcliffe travelling fellowship, he spent several years abroad. In 1766 he settled at Exeter, but not meeting with professional success removed to Plymouth. He ruined his fortune, however, by the publication of a pamphlet in the form of an address to the people of Devonshire, in which he accused certain members of the English ministry of having been bribed by the French government to conclude the peace of 1763, and declared that the Chevalier d’Eon de Beaumont, French minister plenipotentiary to England, had in his possession documents which would prove the truth of his assertion. De Beaumont repudiated all knowledge of any such transaction and of Musgrave himself, and the House of Commons in 1770 decided that the charge was unsubstantiated. Thus discredited, Musgrave gained a precarious living in London by his pen until his death, in reduced circumstances, on the 5th of July 1780. Musgrave wrote several medical works, now forgotten; and his edition of Euripides (1778) was a considerable advance on those of Joshua Barnes.

See W. Munk, Roll of the Royal College of Physicians, ii. (1878).

MUSH, the chief town of a sanjak of the same name of the Bitlis vilayet of Asiatic Turkey, and an important military station. It is situated at the mouth of a gorge in the mountains on the south side of the plain, the surrounding hills being covered with vineyards and some oak scrub. There are few good houses; the streets are ill-paved and winding, while the place and its surroundings are extremely dirty. The castle, of which there are some remains, is said to have been built by Mushig, an Armenian king of the province Daron, who founded the town. A khán, with two stone lions (Arab or Seljuk) in bas-relief, deserves notice, but the bazaar is poor, although pretty embroidered caps, however, are produced. Good roads lead to Erzurum and Bitlis. There are 1,400 inhabitants, consisting of Kurds and Armenians, about equally divided. The climate is healthy but cold in winter, with a heavy snow fall. Mush is the seat of the Gregorian and Roman Catholic Armenian bishops and some American mission schools. Some miles to the west at the edge of the plain is the celebrated monastery of Surp Garabed or St John the Baptist, an important place of Armenian pilgrimage.

Mush plain, 35 m. long by 12 broad, is very fertile, growing wheat and tobacco, and is dotted with many thriving Armenian villages. The Murad or eastern Euphrates traverses the western end of the plain and disappears into a narrow mountain gorge there. Vineyards are numerous and a fair wine is produced.
MUSHROOM

Wood is scarce and the usual fuel is *tesek* or dried cow-dung. There are several sulphur springs, and earthquakes are frequent and sometimes severe. It was on the plain of Mush that Xenophon first made acquaintance with Armenian houses, which have little changed since his day.

MUSHROOM. There are few more useful, more easily recognized, or more delicious members of the vegetable kingdom than the common mushroom, known botanically as *Agaricus campestris* (or *Psalliota campestris*). It grows in short grass in the temperate regions of all parts of the world. Many edible fungi belong to a floccose and minute and often obscure botanical characters for their determination, and may readily be confused with worthless or poisonous species; but that is not the case with the common mushroom, for, although several other species of *Agaricus* somewhat closely approach it in form and colour, yet the true mushroom, if sound and freshly gathered, may be distinguished from all other fungi with great ease. It almost invariably grows in rich, open, breezy pastures, in places where the grass is kept short by the grazing of horses, herds and flocks. Although this plant is popularly termed the "meadow mushroom," it never as a rule grows in meadows. It never grows in well watered places, never in woods, or on or about stumps of trees. An exceptional specimen or an uncommon variety may sometimes be seen in the above-mentioned abnormal places, but the best, the true, and common variety of the table is the produce of short, upright, wind-swept pastures. A true mushroom is never large in size; its cap very seldom exceeds 4 in. at most in diameter. The large examples measuring from 6 to 9 or more in. across the cap belong to *Agaricus arvensis*, called from its large size and coarse texture the horse mushroom, which grows in meadows and damp shady places, and though generally wholesome is coarse and sometimes indigestible. The mushroom usually grows in gardens or hot-heds, in cellars, sheds, &c., is a distinct variety, and is generally described as *A. gallarius*. On being cut or broken the flesh of a true mushroom remains white or nearly so, the flesh of the coarser horse mushroom changes to buff or sometimes to dark brown. To summarize the characters of a true mushroom—it grows only in pastures; it is of small size, dry, and with unchangeable flesh; the cap has a frill; the gills are free from the stem, the spores brown-black or deep purple-black, and the stem solid or slightly pithy. When all these characters are taken together no other mushroom-like fungus—and nearly a thousand species grow in Britain—can be confounded with it.

A mushroom consists chiefly of stem and cap; the stem has a clothy ring round its middle, and the cap is furnished underneath with numerous radiating coloured gills. Fig. 1 (1) represents a section through an infant mushroom, (2) a mature example, and (3) a longitudinal section through a fully developed mushroom. The cap P, Q, R is fleshy, firm and white within, never thin and watery; externally it is pale brown, dry, often slightly silky or floccose, never viscid. The cuticle of a mushroom readily peels away from the flesh beneath, as shown at Q. The cap has a narrow dependent margin or frill, as shown at Q, and in section at H; this dependent frill originates in the rupture of a delicate continuous wrapper, which in the infancy of the mushroom entirely wraps the young plant; it is shown in its continuous state at J, and at the moment of rupture at K. The gills underneath the cap L, M, N are at first white, then rose-coloured, at length brown-black. A point of great interest is to be noted in the attachment of the gills near the stem at Q, P; the gills in the true mushroom are (as shown) usually more or less free from the stem, they never grow boldly against it or run down it; they may sometimes just touch the spot where the stem joins the bottom of the cap, but never more; there is usually a slight channel, as at P, all round the top of the stem. When a mushroom is perfectly ripe and the gills are brown-black in colour, they throw down a thick dusty deposit of fine brown-black or purple-black spores, which, if the mushroom be old, may make a white felted mat, more or less dense, of mycelium; this, when compacted with dry, half-decomposed dung, is the mushroom spawn of gardeners. The stem is firm, slightly pithy up the middle, but soft and hollow beneath; it bears a well-developed ring at Q; Q; this ring originates by the rupture of the thin general wrapper K of the infant plant.

Like all widely spread and much-cultivated plants, the edible mushroom has numerous varieties, and it differs in different places and under different modes of culture in much the same way as our kitchen-garden plants differ from the type they have been derived from, and from each other. In some instances these differences are so marked that they have led some botanists to regard as distinct species many forms usually esteemed by others as varieties only.

A small variety of the common mushroom found in pastures has been named *A. pratensis*; it differs from the type in having a pale reddish-brown cap, and the flesh on being cut or broken changes to pale rose-colour. A variety still more marked, with a darker brown cap and the flesh changing to a deeper rose, and sometimes blood-red, has been described as *A. rufescens*. The well-known compact variety of mushroom-growers, with its white cap and dull purplish clay-coloured gills, is *A. hortensis*. Two sub-varieties of this have been described under the names of *A. hortensis var. campestris* and *A. hortensis var. musseroun*; this can only be distinguished from the pasture mushroom by its elongated bulbous stem and its externally smooth cap. There is also a fungus well known to botanists and cultivators which appears to be intermediate between the pasture variety and the wood variety, named *A. vaporarius*. The large rank horse mushroom, now generally referred to as *A. arvensis*, is probably a variety of the pasture mushroom; it grows in rings in woody places and under trees and hedges in meadows; it has a large scaly round cap, and the flesh quickly changes to buff or brown when cut or broken; the stem too is hollow. An unusually scaly form of this has been described as *A. vitellinus* and another as *A. augustus*.

A species, described by Berkeley and Broome as distinct from both the pasture mushroom and horse mushroom, has been published under the name of *A. elenata*. This grows under oaks, in remote and most unusual situations for the mushroom, and is said to be excellent for the table. An allied fungus peculiar to woods, with a less fleshly cap than the true mushroom, with hollow stem, and strong odour, has been described as a close ally of the pasture mushroom under the name of *A. silicatoc*. Its qualities for the table have not been recorded.

Many instances are on record of symptoms of poisoning, and even death, having followed the consumption of plants which have passed as true mushrooms; these cases have probably arisen from the samples consumed being in a state of decay, or from some mistake as to the species eaten. It should always be specially noted whether the fungus to be consumed is in a fresh and wholesome condition, otherwise they act as a poison in precisely the same way as does any other semi-puritid vegetable. Many instances are on record where mushroom-beds have been invaded by a growth of strange fungi and the true mushrooms have been ousted to the advantage of the new-comers. When mushrooms are gathered for sale by persons unacquainted with the different species mistakes are of frequent occurrence. A very common spurious mushroom in markets is *A. telutinus*, a slender, ringless, hollow-stemmed, black-gilled fungus, common in gardens and about dung and stumps; it is about the size of a mushroom, but thinner in all its parts and far more brittle; it has a black hairy fringe hanging round the edge of the cap when fresh. Another spurious mushroom, and equally common in dealers' baskets, is *A. laevymarginatus*; this grows in the same positions as the last, and is somewhat fleshier and more like a true mushroom; it has a hollow stem, and a slight ring; the gills are black-brown mottled and generally studded with tear-like drops of moisture. In both these species the gills distinctly touch and grow on to the stem. Besides these there are numerous other black-gilled species which find a place in baskets—some species far too small to bear...
any resemblance to a mushroom, others large and deciduous, generally belonging to the stump- and dung-borne genus Coprinus. Because mushroom-beds are always liable to an invasion from other dung-borne forms. The spores of all fungi are constantly floating about in the air, and when the spores of dung-infesting species arrive at a mushroom-bed they find a nidus already prepared that exactly suits them; and if the spawn of the new-comer becomes more profuse than that of the mushroom the stranger takes up his position at the expense of the mushroom. There is also a fungus named Xylaria vororaria, which sometimes fixes itself on mushroom-beds and produces such an enormous quantity of string-like spawn that the entire destruction of the bed results. This spawn is sometimes turned out of the bed in enormous masses and carried away in barrows.

Sometimes cases of poisoning follow the consumption of what have really appeared to gardeners to be true bed-mushrooms, and to country folks as small horse-mushrooms. Even in such a case as the above mentioned, which is more complicated by the fact that these highly poisonous forms now and then appear upon mushroom-beds to the exclusion of the mushroom. This dangerous counterfeit is A. fastidiosum, or sometimes crustuliniformis, a close ally if not indeed a more varietal of the first. A description of one will do for both, A. fastidiosum being a little more slender of the two. Both have fleshy caps, whitish, moist and clammy to the touch; instead of a pleasant odour, they have a disagreeable one. The gills are pallid, whitish, and somewhat pithy. These two fungi usually grow in woods, but sometimes in hedges and in shady places in meadows, or even, as has been said, in abandoned old mushroom-beds. The pale clay-colored gills, offensive odour, and clammy or even viscid top are decisive characters. A reference to the accompanying illustration (fig. 2), which is about one-half natural size, will generally be sufficient. In determining fungi no single character must be relied upon as conclusively, but all the characters must be taken together. Sometimes a beautiful, somewhat slender, fungus peculiar to stumps in woods is mistaken for the mushroom in A. fastidiosum. It has a white, ringless stem and somewhat thin brown cap, furnished underneath with beautiful rose-colored gills, which are free from the stem as in the mushroom, and which never turn black. It is probably a poisonous plant, belonging, as it does, to a dangerous cohort. Many other species of A. fastidiosum more or less resemble A. campesi, notably some of the plants found under the sub-genus Lepiota, Volutaria, Pholiota and Psalliota; but when the characters are noted they may all with a little care be easily distinguished from each other. The better plan is to discard at once all fungi which have not been gathered from open pastures; by this act alone more than nine-tenths of worthless and poisonous fungi will be removed.

In cases of poisoning by mushrooms immediate medical advice should be secured. The dangerous principle is a narcotic, and the symptoms are usually great nausea, drowsiness, stupor and pains in the joints. A good palliative is sweet oil; this will allay any corrosive irritation of the throat and stomach, and at the same time cause vomiting.

Paris mushrooms are cultivated in enormous quantities in dark underground cellars at a depth of from 60 to 160 ft. from the surface. The stable manure is taken into the tortuous passages of these cellars, and the spawn introduced from masses of dry dung where it occurs naturally. In that it is mushroom-growers do not use the company blocks or bricks of spawn so familiar in England, but much smaller flakes of "leaves" of dry dung in which the spawn or mycelium can be seen to exist. Less manure is used in these cellars than we grow in England. For the purpose of mushrooming the bed is of each bed is covered with an inch of fine white stoney soil. The beds are kept artificially moist by the application of water brought from the surface, and the different galleries bear crops in succession. As one is exhausted another is in full bearing, so that by a systematic arrangement a single proprietor will send to the table around the year.

The common mushroom (Agaricus campestris) is propagated by spores, the fine black dust seen to be thrown off when a mature specimen of the fruit-bodies is split open and baked. These spores are periodical, and it is only in the months of July and August that the mushroom-planters are not allowed to reach the fully expanded condition, but are gathered in a large button state, the whole growth of the mushroom being removed and the hole left in the manure covered over by earth. A bed remains in production for eight months, and then the spent manure is taken to the surface again for garden and field purposes. The equable temperature of these cellars and the light through the ceiling is such that in order to this must be added the natural virgin spawn, by continually using spawn taken from mushroom-producing beds the potency for reproduction is weakened. The beds produce mushrooms all through the year.

FIG. 2.—Poisonous Mushroom (Agaricus fastidiosum).

The old method of growing mushrooms in ridges out of doors, or on prepared beds either level or sloping from a small hill or mound, is also still followed. The beds are formed of horse-droppings which have been slightly fermented and frequently turned, and may be made 2 or 3 ft. broad and of any length. A layer of fine earth is then placed on the whole, and well beaten down, and the surface is covered with a thick coat of straw. When the weather is temperate, mushrooms will appear in about a month after the bed has been made, but at other times a much longer period may be required. The prevention of insects is best carried out by a moderate state of moisture and a proper mild degree of warmth; and the treatment must vary according to the season.

These ordinary ridge beds furnish a good supply towards the end of winter, but in April, in addition, the crops from the old beds supply, however, at all seasons, the use of a mushroom-house will be found very convenient. The material employed in all cases is the droppings of horses. These should not be more than 8 or 10 in. thick at the first deposit, and covered with a light dryish earth to the depth of 2 in.; and two similar layers with similar coverings are added, the whole being made narrower as it advances in height. When the bed is finished, it is covered with a layer of straw, which is also 2 in. thick. In about ten days, when the mass is warm, the bed will be ready for spawning, which consists of inserting small pieces of spawn bricks into the sloping sides of the bed, about 6 in. asunder. A layer of fine earth is then placed over the whole, and well beaten down, and the surface is covered with a thick coat of straw. When the weather is temperate, mushrooms will appear in about a month after the bed has been made, but at other times a much longer period may be required. The prevention of insects is best carried out by a moderate state of moisture and a proper mild degree of warmth; and the treatment must vary according to the season.

The atmosphere should range from 60° to 65° till the mushrooms appear, and in the case of the older ones below that lower than 55°. If the beds require watering, water of about 80° should be used, and it is preferable to moisten the covering of litter thoroughly. The thermometer should be introduced as closely as possible, especially in the case of partially exhausted beds, to water with a dilute solution of nitre. For a winter supply the beds should be made towards the end of August, and the end of October. Sugs and other kinds of mushroom beds are described in the foregoing.

The Fairy-ring Champignon,—This fungus, Marasmius Oreades, is more universally used in France and Italy than in England, although it is well known and frequently used both in a fresh and in a dry state in England. It is totally different in appearance from the
MUSIC

1. General Sketch

Introduction. As a mature and independent art, music is unknown except in the modern forms realized by Western civilization; ancient music, and the non-European music of the present day, being (with insignificant exceptions of a character which confirms the generalization) invariably an adjunct of poetry or dance, in so far as it is recognizably an art at all. The modern art of music is in a unique position; for, while its language has been wholly created by art, this language is yet so perfectly organized as to be in itself natural; so that though the music of one age or style may be at first unintelligible to a listener who is accustomed to another style, and though the listener may help himself by acquiring information as to the characteristics and meaning of the new style, he will best learn to understand it by merely divesting his mind of prejudices and allowing the music to make itself intelligible by its own self-sufficiency. The understanding obtained this way is the music itself, which finally depends neither upon technical knowledge nor upon convention, but upon the listener’s immediate and familiar experience of it; an experience which technical knowledge and custom can of course aid him to acquire more rapidly, as they strengthen his memory and enable him to fix impressions by naming them.

Beyond certain elementary facts of acoustics (see Sound), modern music shows no direct connexion with nature independently of art; indeed, it is already art that determines the selection of these elementary acoustic facts, just as in painting art determines the selection of those facts that come under the cognizance of optics. In music, however, the purely acoustic principles are incomparably fewer and simpler than the optical principles of painting; and their artistic interaction transforms them into something no less remote from the laboratory experiments of acoustic science than from the unorganized sounds of nature. The result is that while the ordinary non-artistic experiences of sight afford so much material for plastic art that the vulgar conception of good painting is that it is deceptively like nature, the ordinary non-artistic experience of sound has so little in common with music that musical realism is, with rare though popular exceptions, generally regarded as an eccentricity.

This contrast between music and plastic art may be partly explained by the mental work undergone, during the earliest infancy both of the race and of the individual, in interpreting sensations of space. When a baby learns the shape of objects by taking them in his hands, and gradually advances to the discovery that his toes belong to him, he goes through an amount of work that is quite forgotten by the adult, and its complexity and difficulty has perhaps only been fully realized through the experience of persons who have been born blind but have acquired sight at a mature age by an operation. Such work gives the facts of normal adult vision an amount of organic principle that makes them admirable raw material for art. The power of distinguishing sensations of sound is associated with no such mental skill, and is on no more complex than the power of distinguishing colours. On the other hand, sound is the principal medium by which most of the higher animals both express and excite emotion; and hence, though until

Thus Chinese and Japanese art has attained high organization without the aid of a veracious perspective; while, on the other hand, its carefully formulated decorative principles, though not realistic, certainly rest on an optical and physiological basis. Again, many modern impressionists justify their methods by an appeal to phenomena of complementary colour which earlier artists possibly did not perceive and certainly did not select as artistic materials.

Pasture mushroom, and, like it, its characters are so distinct that there is hardly a possibility of making a mistake when its peculiarities are once comprehended. It has more than one advantage over the meadow mushroom in its extreme commonness, its profuse growth, and the great season in which it may be gathered, the total absence of varietal forms, its adaptability for being dried and preserved for years, and its persistent delicious taste. It is by many esteemed as the best of the edible fungi found in Great Britain. Like the mushroom, it grows in short open pastures and amongst the short grass of open roadsides; sometimes it appears on lawns, but it never occurs in woods or in damp shady places. Its natural habit is to grow in rings, and the grassy fairy-rings so frequent amongst the short grass of downs and pastures are generally caused by the nutritious manure applied to the soil in the previous autumn by the decay of a circle of these fungi. Many other fungi in addition to the fairy-ring champignon grow in circles, so that this habit must merely be taken with its other characters in cases of doubt.

A glance at the illustration (fig. 3) will show how entirely the fairy-ring champignon differs from the mushroom. In the first place, it is about one-half the size of a mushroom, and whitish-buff in every part, the gills always retaining this colour and never becoming salmon-coloured, brown or black. The stem is solid and corky, much more so than the flesh of the cap, and perfectly smooth, never being furred with the slightest trace of a ring. The gills are far apart (v), and in this they greatly differ from the somewhat crowded gills of the mushroom; the junction of the gills with the stem (w) also differs in character from the similar junction in the mushroom. The mushroom is a semi-deliquescent fungus which rapidly falls into putridity in decay, whilst the champignon dries up into a leathery substance in the sun, but speedily revives and takes its original form again after the first shower. To this character the fungus owes its generic name (Marasmius) as well as one of its most valuable qualities for the table, for examples may be gathered from June to November, and if carefully dried may be hung on strings for culinary purposes and preserved without deterioration for several years; indeed, many persons assert that the rich flavour of these fungi increases with years. Champignons are highly esteemed (and especially is this the case abroad) for adding a most delicious flavour to stews, soups and rissoles.

A fungus which may carelessly be mistaken for the mushroom is M. perforatus, but this grows in woods amongst dead leaves, and has a hairy base to the stem and a somewhat acrid taste. Another is M. stesus; this also generally grows in woods, but the gills are not nearly so deep, they soon become brownish, the stem is downy, and the taste is acrid. An Agarius named A. dryophilus has sometimes been mistaken in mistake for the champignon, but this too grows in woods where the champignon never grows; it has a hollow instead of a solid stem, gills crowded together instead of far apart, and flesh very tender and brittle instead of tough. A small slender ally of the champignon, named M. scovolodium, is sometimes found in pastures in Great Britain; this is largely confounded with the C. colioba, and it is esteemed for its powerful flavour of garlic. In England, where, garlic is not used to a large extent, this fungus is not sought for. Another small and common species, M. allivaceus, is interspersed with garlic flavour to an equal extent with the last. A third species, M. allivaceus, is also strongly impregnated with the scent and taste of onions or garlic. Two species, M. impudicus and M. foetidus, are in a stage of growth highly intoxicating. The curious little edible Agarius cœstentus, although placed under the sub-genus Collybia, is allied by its structure to Marasmius. It is a small bitter species common in upland pastures and fir plantations early in the season. Although not wholly in the table in England, it is greatly prized in some parts of the Continent.

Music. The Greek μουσική (sc. τέχνη), from which this word is derived, was used very widely to embrace all those arts over which the Nine Muses (Μούσαι) were held to preside. Contrasted with γυμναστική (gymnastic) it included those branches of education concerned with the development of the mind as opposed to the body. Thus widely different arts and sciences as mathematics, astronomy, poetry and literature generally, and even reading and writing would all fall under μουσική, besides the singing and setting of lyric poetry. On the other hand, those physical and mechanical arts of development of character the philosophers laid chief stress, and this biased their aesthetic analysis. 'Μουσική (harmony), or ἀρμοσική (sc. τεχνῆ), rather than μουσική, was the name given by the Greeks to the art of arranging sounds for the purpose of creating a definite aesthetic impression, with which this article deals.
MUSIC

codified into human speech it does not give any raw material for art, yet so powerful are its primitive effects that music (in the bird-song sense of sound indulged in for its own attractiveness) is as long prior to language as the brilliant colours of animals and flowers are prior to painting (see Song). Again, sound as a warning or a menace is eminently important in the history of the instinct of self-preservation; and, above all, its production is instantaneous and instinctive.

All these facts, while they tend to make musical expression an early phenomenon in the history of life, are extremely unfavourable to the early development of musical art. They invested the first musical attempts with a mysterious power over listener and musician, by re-awakening instincts more powerful, because more ancient and necessary, than any that could ever have been appealed to by so deliberate a process as that of drawing on a flat surface a series of lines calculated to remind the eye of the appearance of solid objects in space. It is hardly surprising that music long remained as imperfect as its legendary powers were portentous, even in the hands of so supremely artistic a race as that of classical Greece; and whatever wonder this backwardness might still arouse in us vanishes when we realize the difference of the process by which the principles of the modern art were established.

Non-harmonic and Greek Music.—Archaic music is of two kinds—the unwritten, or spontaneous, and the recorded, or scientific. The earliest musical art-problems were far too difficult for conscious analysis, but by no means always beyond the reach of a lucky hit from an inspired singer; and thus folk-music often shows real beauty where the more systematic music of the time is merely arbitrary. Moreover, folk-music and the present music of barbarous and civilized non-European races furnish the study of musical origins with material analogous to that given by the present manners and customs of different races in the study of social evolution and ancient history. We may mention as examples the accurate comparison of the musical scales of non-European races undertaken by A. J. Ellis (On the Musical Scales of Various Nations, 1883); the parallel researches and acute and cautious reasoning of his friend and collaborator, A. J. Hipkins (Oriental and Phrygian reconsidered from a Non-harmonic Point of View, 1902); and, perhaps most of all, the study of Japanese music, with its remarkable if uncertain signs of the beginning of a harmonic tendency, its logical coherence, and its affinity to Western scales, points in which it seems to show a great advance upon the Chinese music from which most of it is derived (Music and Musical Instruments of Japan, by J. F. Piggott, 1853). The reader will find detailed accounts of ancient Greek music in the article on that subject in Grove's Dictionary of Music and Musicians (new ed., ii. 293) and in Monro's Modes of Ancient Greek Music (Clarendon Press, 1894), while both the Greek music itself, and the steps by which it passed through Graeco-Roman and early Christian phases to become the foundation of the modern art, are traced as clearly as is consistent with accuracy in The Oxford History of Music, vol. i., by Professor Wooldridge.

Sir Hubert Parry's Evolution of the Art of Music ("International Scientific Series," originally published under the title Of the Art of Music) presents the main lines of the evolution of modern musical ideas in the clearest and most readable form yet attained.

Sir Hubert Parry illustrates in this work the artificiality of our modern musical conceptions by the word "cadence," which to a modern musician belies its etymology, since it normally means for him no "falling" close but a pair of final chords rising from dominant to tonic. Moreover, in consequence of our harmonic notions we think of scales as constructed from the bottom upwards; and even in the above-mentioned article in Grove's Dictionary all the Greek scales are, from sheer force of habit, written upwards. But the ancient and, almost universally, the primitive idea of music is like that of speech, in which most inflections are in fact cadences, while rising inflections express less usual sentiments, such as surprise or interrogation. Again, our modern musical idea of "high" and "low" is probably derived from a sense of greater and less vocal effort; and it has been much stimulated by our harmonic sense, which has necessitated a range of sounds incomparably greater than those employed in any non-harmonic system. The Greeks derived their use of the terms from the position of notes on their instruments; and the Greek kyphai was what we should call the lowest note of the mode, while neith was the highest. Sir George Macfarren has pointed out (Elocut. Brit., 1861, and "Music"") that both Monro's (c. A.D. 500) already fell into the trap and turned the Greek modes upside down. 1

Another radical though less grotesque misconception was also already well exploded by Macfarren; but it still frequently survives at the present day, since the study of non-harmonic scales is, with the best of intentions, apt rather to encourage than to dispel it. The more we realize the importance of differences in position of intervals of various sizes, as producing differences of character in scales, the more irresistible is the temptation to regard the ancient Greek modes as differing from each other in this way. And the temptation becomes greater instead of less when we have succeeded in thinking away our modern key-systems, and restoring the unison and the modes, as the only difference of modes which the melodic intervals are different, but it does this in a fashion that draws the attention almost entirely away from these differences of interval; and without harmony we find it extremely difficult to distinguish one mode from another, unless it be by this different arrangement of intervals. Nevertheless, all the evidence irresistibly tends to the conclusion that while the three Greek genera—diatonic, chromatic, and enharmonic—were scales differing in intervals, the Greek modes were a series of scales identical in arrangement of interval, and differing, like our modern keys, only in pitch. The three genera were applied to all these modes or keys, and we have no difficulty in understanding their modifying effects. The cause of what we have to the mental process by which in a preharmonic age different characteristics can be ascribed to scales identical in all but pitch, is to be found in the limited compass of Greek musical sounds, corresponding as it does to the evident sensiveness of the Greek ear to differences in vocal effort. We have only to observe the compass of the Greek scale to see that in the most esteemed modes it is much more the compass of speaking than of singing voices. Modern singing is normally at a much higher pitch than that of the speaking voice, but there is no natural reason, outside the peculiar nature of modern music, why this should be so. It is highly probable that all modern singing would strike a classical Greek ear as an outcry, and in any case such variations of pitch as are inconceivable in modern singing are extremely emphatic in the speaking voice, so that they might well make all the difference to an ear accustomed to organized sound beyond the speaking compass. Again, much that Aristoxenus and other ancient authorities say of the character of the modes (or keys) tends to confirm the view that the character depends upon the position of the mese or keynote within the general compass. Thus Aristotle (Politics, v. (viii.) 7, 1342 b. 20) states that certain low-pitched modes suit the voices of old men, and thus we may conjecture that even the position of tones and semitones might in the Phrygian, for example, have been on the higher portion of the scale in all three genera into the best regions of the average young voice, while the Ionian and Lydian might lead the voice to dwell more upon semitones and enharmonic intervals, and so account for the heroic character of the former and the sensual character of the latter (Plato, Republic, 398 to 400).

Of the Greek genera, the chromatic and enharmonic (especially

1 It is worth adding that in the 16th century the great contrapun
tal composer Costanzo Porta had been led by doubts on the subject to the wonderful conclusion that ancient Greek music was polyphonic, and so constructed as to be invertible; in illustration of which theory he and Vincentino composed four-part motets in each of the Greek genera (diatonic, chromatic and enharmonic), Porta's being constructed like the 12th and 13th fugues in Bach's Kunst der Fuge so as to be equally euphonious when sung upside down. (See Hawkins's History of Music, i. 112.)
the latter) show very clearly the origin of so many primitive scales in the interval of the downward fourth. That interval (e.g. from C to G) is believed to be the earliest melodic relationship which the ear learnt to fix; and most of the primitive scales were formed by the accretion of auxiliary notes at this distance of this interval, and the addition of similar accretions, below the former. In this way a pentatonic scale, like that of so many Scotch melodies, can easily be formed (thus, C, A, G, F, D, C); and though some primitive scales seem to have been on the nucleus of the rising fifth, while the Siamese now use two scales of which not a single note within the octave can be accounted for by any known principle, still we may consider that for general historic purposes the example above is typical. The Greeks divided their downward fourth into four notes, called a tetrachord; and by an elaborate system of linking tetrachords together they gave their scale a compass of two octaves. The enharmonic tetrachord, being the most ancient, gathered the lower three notes very closely to the bottom, leaving the second note no less than a major third from the top, thus—C, A, G, G; (where G’ stands for a note between A♭ and G). The chromatic tetrachord was C, B♭, A♭, G; and the diatonic tetrachord was C, B, A, G. It is this last that has become the foundation of modern music, and the Greeks themselves soon preferred it to the other genera and found a scientific basis for it. In the first place they noticed that its notes (and, less easily, the notes of the chromatic scale) could be connected by a series of those intervals which they recognized as concordant. These were, the fourth; its converse, or inversion, the fifth; and the octave. The notes of the enharmonic tetrachord could not be connected by any such series.

In the articles on Harmony and Sound account is given of the historic and scientific foundations of the modern conception of concord; and although this harmonic conception applies to simultaneous notes, while the Greeks concerned themselves only with successive notes, it is nevertheless permissible to regard the Greek sense of concord in successive notes as containing the germ of our harmonic sense. The stability of the diatonic scale was assured as early as the 6th century B.C. when Pythagoras discovered (if he did not learn from Egypt or India) the extremely simple mathematical proportions of its intervals. And this discovery was of unique importance, as fixing the intervals by a relation that could never be obscured by the changes of taste and custom otherwise inevitable in music that has no conscious harmonic principles to guide it. At the same time, the foundation of a music as yet immature and ancillary to drama, on an acoustic science ancillary to a priori mathematics, was not without disadvantage to the art; and it is arguable that the great difficulty with which during the medieval beginnings of modern harmony the concords of the third and sixth were rationalized may have been increased by the fact that the Pythagorean system left these intervals considerably out of tune. In preharmonic times mathematics could not direct even the most observant ear to the study of those phenomena of upper partials of which Helmholtz, in 1863, was the first to explain the significance; and thus though the Greeks knew the difference between a major and minor tone, on which half the question depended, they could not possibly arrive at the modern reasons for adding both kinds of tone in order to make the major third. (See Sound.) Here we must digress in order to illustrate what is implied by our modern harmonic sense; for the difference that this makes to our whole musical consciousness is by no means universally realized. Music, as we now understand it, expresses itself in the interaction of three elements—rhythm, melody and harmony. The first two are obviously as natural to human consciousness itself. Without the third a musical art of permanent value and intelligibility has not been known to attain independent existence. With harmony music assumes the existence of a kind of space in three dimensions, none of which can subsist without at least implying the others. When we hear an unaccompanied melody we cannot help interpreting it in the light of its most probable harmonies. Hence, when it does not imply consistent harmonies it seems to us quaint or strange; because, unless it is very remote from our harmonic conceptions, it at least implies at any given moment some simple harmony which in the next moment it contradicts. Thus our inferences as to the expression intended by music that has not come under European influence are unsafe, and the pleasure we take in such music is capricious. The effort of thinking away our harmonic preconceptions is probably the most violent piece of mental gymnastics in all artistic experience, and furnishes much excuse for a sceptical attitude as to the artistic value of preharmonic music, which has at all events never become even partially independent of poetry and dance. Thus the rhythm of classical Greek music seems to have been entirely identical with that of verse, and its beauty and expression appreciated in virtue of that identity. From the modern musical point of view the rhythm of words is limited to a merely monotonous uniformity of flow, with moderate undulations which are musically chaotic (see Rhythm). The example of Greek tragedy, with the reports of its all-pervading music (in many cases, as in that of Aeschylus, composed by the dramatist himself) could not fail to fire the imaginations of modern pioneers and reformers of opera; and Monteverde, Gluck and Wagner convinced themselves and their contemporaries that their work was, amongst other things, a revival of Greek tragedy. But all that is known of Greek music shows that it represents no such modern ideas, as far as their really musical aspect is concerned. It represents, rather, an organization of the rise and fall of the voice, no doubt as elaborate and artistic as the organization of verse, but no doubt powerful in heightening the emotional and dramatic effect of words and action, but in no way essential to the understanding or the organization of the works which it adorned. The classical Greek preference for the diatonic scale indicates a latent harmonic sense and also that temperance which is at the foundation of the general Greek sense of beauty; but, beyond this and similar generalities, all the research in the world will not enable us to understand the Greek musician's mind. Non-harmonic music is a world of two dimensions, and we must now inquire how men came to rise from this "flatland" to the solid world of sound in which Palestrina, Bach, Beethoven and Wagner live.

3. Harmonic Origins.—Although the simultaneous blending of different sounds was never seriously contemplated by the Greeks, yet in classical times they were fond of singing with high and low voices in octaves. This was called magadizing, from the name of an instrument on which playing in octaves was rendered easy by means of a bridge that divided the strings at two-thirds of their length. While the practice was esteemed for the beauty of the blending of different voices, it was tolerated only because of the peculiar effect of identity furnished by the different notes of the octave, and no other interval was so used by the Greeks. In the article on Harmony the degrees of identity-in-difference which characterize the simpler harmonic intervals are analysed, and the main steps are indicated by which the more complicated medieval magadizing uses of the fourth and fifth (the symphonia, diaphonia or organum of Hucbald) gave way (partly by their own interchange and partly through experiments in the introduction of ornaments and variety) to the modern conception of harmony as consisting of voices or parts that move independently to the exclusion of such parallel motion. In The Oxford History of Music, vols. i. and ii., will be found abundant examples of every stage of the process, which begins with the organum or diaphony that prevailed until the death of Guido of Arezzo (about 1050) and passes through the discei, or measured music, of the 13th century, to the invention of the procedure of contrapuntal composition, which enables voices to sing contrasted rhythms simultaneously, while the new harmonic criterion of the independence of parts more and more displaces and shows its opposition to the old criterion of parallelism.

The most extraordinary example of these conflicting principles is the famous rota "Sumer is icumen in," a 13th-century round in four parts on a canon called bass in two. Recent researches
MUSIC

have brought to light a number of works in the forms of *motet*, *conductus*, *rondeil* (neither the later rondo nor the round, but a kind of triple counterpoint), which show that "Sumer is icumen in" contains no unique technical feature; but no trace of its fourteenth-century ancestors, which were nearly intelligible to modern ears. Its richness and firmness of harmony are such that the frequent use of consecutive fifths and octaves, in strict accordance with 13th-century principles, has to our ears all the effect of a series of grammatical blunders, so sharply does it contrast with the smooth counterpoint of the rest. In what light this smooth counterpoint struck contemporaries, or how its author (who may or may not be the writer of the Reading MS. John of Formsete) arrived at it, is not clear, though W. S. Rockstro's amusing article, "Sumer is icumen in," in Grove's Dictionary, is very plausible. All that we know is that music in England in the 13th century must have been at a comparatively high state of development; and we may also conjecture that the tuneful character of this wonderful rota has something in common with the unwritten but famous songs of the Aristocratic Troubadours, or *trouvères*, of the 12th and 13th centuries, who, while disdaining to practise the art of accompaniment or the art of scientific and written music, undoubtedly set the fashion in melody, and, being themselves poets as well as singers, formed the current notions as to the relations between musical and poetic rhythm. The music of Adam de la Hale, surnamed Le Bossu d'Arras (c. 1230-1288), shows the transformation of the troubadour into the learned musician; and, nearly a century later, the more ambitious efforts of a greater French poet (like his contemporary Petrarcha, one of Chaucer's models in poetic technique), Guillaume de Machault (fl. 1350), mark a further technical advance, though they are not appreciably more intelligible to the modern ear.

In the next century we find an Englishman, John Dunstable, who had as early as 1437 acquired a European reputation; while his works were so soon lost sight of that until recently he was almost a legendary character, sometimes revered as the "inventor" of counterpoint, and once or twice even identified with St Dunstan! Recently a great deal of his work has come to light, and it shows us (especially when taken in connexion with the fact that the early Netherlands master, G. Dufay, did not die until 1474, twenty-one years after Dunstable) that English counterpoint was fully capable of showing the composers of the Netherlands the path by which they were to reach the art of the "Golden age." In such examples of Dunstable's work as that appended to the article "Dunstable" in Grove's Dictionary (new ed., i. 744) we see music approaching a style more or less consistently intelligible to a modern ear; and in English Carols of the 15th Century (1891) several two-part compositions of the period, in a style resembling Dunstable's, have been made accessible to modern readers and filled out into four-part music by the editor in accordance with the rules of the time. And though it may be doubted whether Mr Rockstro's skill would not have been held in the 15th century to savour overmuch of the Black Art, still the success of his attempt shows that the musical conceptions he is dealing with are no longer radically different from those of our modern musical consciousness.

4. The Golden Age.—The struggle towards the realization of mature musical art seems incredibly slow when we do not realize its difficulty, and wonderfully rapid as soon as we attempt to imagine the effort of first forming those harmonic conceptions which are second nature to us. Even at the time of Dunstable and Dufay the development of the contrapuntal idea of independence of parts had not yet so transformed the harmonic conceptions of that the ancient parallelisms or consecutive fourths and fifths that were the backbone of discord could be seen in their true light as contradictory to the contrapuntal method. By the beginning of the 16th century, however, the laws of counterpoint were substantially fixed; practice was for a while imperfect, and aims still uncertain, but skill was increasing and soon became marvellous; and in 16th-century music we leave the archaic world altogether. Henceforth music may show various phenomena of crudeness, decadence and transition, but its transition-periods will always derive light from the past, whatever the darkness of the future.

In the 17th century we have no need of reference to mental gymnastics, beyond what is necessary in all art to secure intelligent presentation and attention. Its materials show us the "three dimensions" of music in their simplest state of perfect balance. Rhythm, emancipated from the tyranny of verse, is free to co-ordinate and contrast a multitude of melodies which by the very independence of their flow produce a mass of harmony that passes from concord to concord through ordered varieties of transitional discord. The criterion of discord is no longer that of mere harshness, but is modified by the conception of the simplicity or remoteness of the steps by which the flux of independent simultaneous melodies passes from one concord, or perfect repose, to another. When the music reaches a climax, or its final conclusion, the point of repose is, of course, greatly emphasized. It is accordingly the "cadences" or full closes of 16th-century music that show the greatest resemblance to the harmonic ideas of the present day; and it is also at these points that certain notes were most frequently raised so as to modify the ecclesiastical modes which are derived more or less directly from the melodic diatonic scale of the Greeks, and misnamed, according to inevitable medieval misconceptions, after the Greek modes. 1

In other passages our modern ears, when unaccustomed to the style, feel that the harmony is strange and lacking in definite direction; and we are apt to form the hasty conclusion that the contrapuntal art-forms are therefore aborted. At the first glance the art-forms appear with the art soon shows that its shifting and vague modulations are no mere survival of a scale inadequate for any but melodic purposes, but the natural result of a state of things in which only two species of chord are available as points of repose at all. If no successions of such chords were given prominence, except those that define key according to modern notions based upon a much greater variety of harmony, the resulting monotony and triviality would be intolerable. Moreover, there is in this music just as much and no more of formal antithesis and sequence as its harmony will suffice to hold together. Lastly, we shall find, on comparing the masterpieces of the period with works of inferior rank, that in the masterpieces the most archaic modal features are expressive, varied and beautiful; while in the inferior works they are often avoided in favour of ordinary modern ideas, and, when they occur, are always accidental and monotonous, although in strict conformity with the rules of the time. The consistent limitations of harmony, form and rhythm have the further consequence that the only artistic music possible within them is purely vocal. The use of instruments is little more than a necessary evil for the support of voices in case of insufficient opportunity for practice; and although the origins of instrumental music are already of some artistic interest in the 16th century, we must leave them out of our account if our object is to present mature artistic ideas in proper proportions.

The principles of 16th-century art-forms are discussed in more detail in the article on Contrapuntal Forms. Here we will treat the formal criteria on a general basis; especially as with art on such simple principles the distinction between one art-form and another is apt to be either too external or too subtle for stability. With music there is a stronger probability than in any other art that merely mechanical devices will be self-evident, and thus they may become either dangerous or effective. With the masters of the Netherlends they speedily became both. Two adjacent groups of illustrations in Burney's

1 The technical nature of the subject forbids us to discuss the origin and development of the great Ambrosian and Gregorian collections of melodic church music on which nearly all medieval and 16th-century polyphony was based, and from which the ecclesiastical modes were derived... Professor Woodbridge in The Oxford History of Music, p. 537: 16th-century music is a fusion of Christian music with the Graeco-Roman music, and the origin of its modes in the Pythagorean classification (c. A.D. 150) of the Greek diatonic scale; while a recent defence of the ecclesiastical tradition of a revision by St Gregory will be found in the article on "Gregorian music" in Grove's Dictionary (new ed.), ii. 235.
History of Music will show on the one hand the astonishing way in which early polyphonic composers learnt to "dance in fetters," and, on the other hand, the expressive power that they attained by that discipline. Burney quotes from the venerable 15th-century master Ockeghem, or Okenheim, some canons so designed as to be singable in all modes. They are by no means extreme cases of the ingenuity which Ockeghem and his pupils often employed; but though they are not very valuable artistically (and are not even correctly deciphered by Burney) they prove that mechanical principles may be a help rather than a hindrance to the attainment of a smooth and plastic style. Burney most appropriately follows them with Josquin Des Prez's wonderful Deploration de Jehan Ockeghem, in which the tenor sings the plain chant of the Requiem a degree below its proper pitch, while the other voices sing a pastoral dirge in French. The device of transposing the plain chant a note lower, and making the tenor sing it in that position throughout the whole piece, is obviously as mechanical as any form of acrostic: but it is happily calculated to impress our ears, even though, unlike Josquin's contemporaries, most of us are not familiar with the plain chant in its normal position; because it alters the position of all the semitones and gives it a plaintive minor character which is no less impressive in itself than as a contrast to the orthodox form. And that harmonically superstructure is as fine an instance of the expressive possibilities of the church modes at their apogee from modern tonality as could be found anywhere. A still nobler example, which we may perhaps acclaim as the earliest really sublime masterpiece in music, is Josquin's Misereor, which is accessible in a modern edition. In this monumental work one of the tenor parts is called Vagans, because it sings the burden Misereor mei Deus at regular intervals, in an almost monotonous wallowing figure, wandering through each successive degree of the scale throughout the composition. The effect, aided as it is by consummate rhetorical power in every detail of the surrounding mass of harmony and counterpoint, is extremely expressive; and the device lends itself to every shade of feeling in the works of the greatest of all Netherland masters, Orlando di Lasso, Palestrina is less fond of it. Like all more obvious formal devices it is crowded out of his Roman art by the exquisite subtlety of his sense of proportion, and the exalted spirituality of his style which, while it allows him to set the letters of the Hebrew alphabet in the Lamentations of Jeremiah in much the same spirit as that in which they would be treated in an illuminated Bible, forbids him to simulate a sense of form that might distract the mind from the sense of mystery and awe proper to objects of devout contemplation. Yet in one of his greatest motets, Tribulare si notis, the burden of Josquin's Misereor appears with the same treatment and purpose as in its prototype.

But with the lesser Flemish masters, and sometimes with the greatest, such mechanical principles often became not only inexpressive but absolutely destructive to musical effect. The ingenuity necessary to make the stubborn material of music plastic was not so easily attainable as the ingenuity necessary to turn music into a mathematical game; and when Palestrina was in his prime the inferior composers so outnumbered the masters to whom music was a devout language, and so degraded the art, not only by ousting genuine musical expression but by foisting secular tunes and words into the church services, that one of the minor questions with which the Council of Trent was concerned was whether polyphonic church music should be totally abolished with other abuses, or whether it was capable of reform. Legendary history relates that Palestrina submitted for judgment three masses of which the Missa papae Marcelli proved to be so sublime that it was henceforth accepted as the ideal church music (see Palestrina). This tale is difficult to reconcile with the chronology of Palestrina's works, but there is no doubt that Palestrina was officially recognized by the Church as a bulwark against bad taste. But we must not allow this to mislead us as to the value of church music before the 16th century. Not must we follow the example of Baini, who, in his detestation of what he is pleased to call fiammingo square, views with uncritical suspicion any work in which Palestrina does not confine himself to strictly Italian methods of expression. A notion still prevails that Josquin represents counterpart in an anatomical perfection into which Palestrina was the first to breathe life and soul. This gives an altogether inadequate idea of 16th-century music. Palestrina brought the century to a glorious close and is undoubtedly its greatest master, but he is primum inter pares; and in every part of Europe music was represented, even before the middle of the century, by masters who have every claim to immortality that sincerity of aim, originality of thought, and depth and range of feeling give. It has been rightly called the golden age of music, and our chronological table at the end of this article gives but an inadequate idea of the number of its masters whom no lover of music ought to neglect. It is not exclusively an age of church music. It is also the age of madrigals, both secular and spiritual; and, small as was its range of expression, there has been no period in musical art when the distinctions between secular and ecclesiastical style were more accurately maintained by the great masters, as is abundantly shown by the test cases in which masses of the best period have been based on secular themes. (See Madrigal.)

5. The Monodie Revolution and its Results.—Like all golden ages, that of music vanished at the first appearance of a knowledge beyond its limitations. The first and simplest realization of mature art is widespread and nourishes a veritable army of great men; its masterpieces are innumerable, and its organization is so complete that no narrowness or specialization can be felt in the nature of its limitations. Yet these are exceedingly close, and the most modest attempt to widen them may have disastrous results. Many experiments were tried before Palestrina's death and throughout the century, notably by the elder and younger Gabrieli. Perhaps Palestrina himself is the only great composer of the time who never violates the principles of his art. Orlando di Lasso, unlike Palestrina, wrote almost as much secular as sacred music, and in his youth indulged in many eccentricities in a chromatic style which he afterwards learnt to detest. But if experiments are to revolutionize art it is necessary that their novelty shall already embody some artistic principle of coherence. No such principle will avail to connect the Phrygian mode with a chord containing A♯; and, however proud the youthful Orlando di Lasso may be at being the first to write A♯, neither his early chromatic experiments nor those of Cipriano di Rore, which he admired so much, left a mark on musical history. They appealed to nothing deeper than a desire for sensational variety of harmony; and, while they carried the successions of chords far beyond the limits of the modes, they brought no new elements into the chords themselves.

By the beginning of the 17th century the true revolutionary principles were vigorously at work, and the powerful genius of Monteverde speedily made it impossible for men of impressive artistic temper to continue to work in the old style when such vast new regions of thought lay open to them. In the year of Palestrina's death, 1594, Monteverde published, in his third book of madrigals, works in which without going irrevocably beyond the letter of 16th-century law he showed far more zeal for emotional expression than sense of euphony. In 1599 he published madrigals in which his means of expression involve harmonic principles altogether incompatible with 16th-century ideas. But he soon ceased to place confidence in the madrigal as an adequate art-form for his new ideals of expression, and he found an unlimited field in musical drama. Dramatic music received its first stimulus from a group of Florentine dilettanti, who aspired amongst other things to revive the ideals of Greek tragedy. Under their auspices the first true opera ever performed in public, Jacopo Peri's Eurydice, appeared in 1600. Monteverde found the conditions of dramatic music more favourable to his experiments than those of choral music, in which both voices and ears are at their highest sensibility
to discord. Instruments do not blend like voices; and players, producing their notes by more mechanical means, have not the singer's facility in making combinations which the car do not readily understand.

The one difficulty of the new art was fatal: there were no limitations. When Monteverde introduced his unprepared discords, the effect upon musical style was like that of introducing modern metaphors into classical Greek. There were no harmonic principles to control the new material, except those which just sufficed to hold together the pure 16th-century style; and that style depended on an exquisite continuity of flow which was incompatible with any rigidity either of harmony or rhythm. Accordingly there were also no rhythmic principles to hold Monteverde's work together, except such as could be used by the old type of popular music that had hitherto been beneath serious attention. If the 17th century seems almost devoid of great musical names it is not for want of incessant musical activity. The task of organizing new resources into a consistent language was too gigantic to be accomplished within three generations. Its fascinating dramatic suggestiveness and incalculable range disqualified for those who first undertook it the fact that the new art was as difficult and elementary in its beginnings as the very beginning of harmony itself in the 13th and 14th centuries. And the most beautiful compositions at the beginning of the 17th century are rather those which show the decadence of 16th-century art than those in which the new principles were most consistently adopted. Thus the madrigals of Monteverde, though often dull and always rough, contain more music than his operas.

On the other hand, almost until the middle of the 17th century great men were not wanting who still carried on the pure polyphonic style. Their asceticism denotes a spirit less comprehensive than that of the great artists for whom the golden age was a natural environment; but in parts of the world where the new influences did not yet prevail even this is not the case, and a composer like Orlando Gibbons, who died in 1625, is well worthy to be ranked with the great Italian and Flemish masters of the preceding century.

But the main task of composers of the 17th century lay elsewhere; and if the result of their steady attention to it was trivial in comparison with the glories of the past, it at least led to the glories of the greater world organized by Bach and Handel. The early monodists, Monteverde and his fellows, directed attention to the right quarter in attempting to express emotion by means of single voices supported by instruments; but the formless declaration of their dramatic writings soon proved too monotonous for permanent interest, and such methods as it showed became permanent only by being codified into the formulas of recitative, which are, for the most part, very happy idealizations of speech-cadence, and which accordingly survive as dramatic elements in music at the present day, though, like all rhetorical figures, they have often lost meaning from carelessness. 1 It was all very well to revolutionize current conceptions of harmony, so that chords were no longer considered, as in the days of pure polyphony, to be the result of so many independent melodies. But in art, as elsewhere, new thought eventually shows itself as an addition to, not a substitute for, the wisdom of ages. Moreover, it is a mistake, though one endorsed by high authorities, to suppose that the 16th-century composers did not appreciate the beauty of successions of chords apart from polyphonic design. On the contrary, Palestrina and Orlando di Lasso themselves are the greatest masters the world has ever seen of style which depends wholly on the beauty of masses of harmony, without any regard for detail, and held together by a delicately balanced rhythm in which obvious symmetry is as carefully avoided as it is in the successions of chords themselves. Nevertheless, the monody of the 17th century is radically different in principle, not only because chords are used which were an outrage on 16th-

1 The "invention" of recitative is frequently ascribed to this or that monodist, with as little room for dispute as when we ascribe the invention of clothes to Adam and Eve. All monody was recitative, if only from inability to organize melodies. century ears, but because the fundamental idea is that of a solo voice declaring phrases of paramount emotional interest, and not that of making use of such chords as will heighten the poignancy of the voice. And the first advance made on this chaotic monody consisted, not in the reintroduction of vitality into the texture of the harmonies, but in giving formal symmetry and balance to the vocal surface. This involved the strengthening of the harmonic system, so that it could carry the new discords as parts of an intelligible scheme, and not merely as uncontrolable expressions of emotion. In other words, the chief energies of the successors of the monodists were devoted to the establishment of the modern key-system; a system in comparison with which the subtle variety of modal concord sounded vague and ill-balanced, until the new key-system itself was so safely established that Bach and Beethoven could once more appreciate and use essentially monodic successions of chords in their true meaning.

The second advance of the monodic movement was in the cultivation of the solo voice. This developed together with the cultivation of the violin, the most capable and expressive of the instruments used to support it. Monteverde already knew how to make interesting experiments with violins, such as directing them to play pizzicato, and accompanying an excited description of a duel by rapidly repeated strokes on a major chord, followed by sustained dying harmonies in the minor. By the middle of the century violin music is fairly common, and the distinction between Sonata da chiesa and Sonata da camera appears (see Sonata). But the cultivation of instrumental technique had also a great effect on that of the voice; and Italian vocal technique soon developed into a monstrosity that so corrupted musical taste as not only to blind the contemporaries of Bach and Handel to the greatness of their choral art, but, in Handel's case, actually to swamp a great deal of his best work. The balance between a solo voice and a group of instruments was, however, successfully cultivated together with the modern key-system and melodic form; with the result that the classical aria, a highly effective art-form, took shape. This, while it totally destroyed the dramatic character of opera for the next hundred years, yet did good service in furnishing a reasonably effective means of musical expression which could encourage composers and listeners to continue cultivating the art until the day of small things was past. The operatic aria, as matured by Alessandro Scarlatti, is at its worst a fine opportunity for a gorgeously dressed singer to display feats of vocal gymnastics, either on a concert platform, or in scenery worthy of the Drury Lane pantomime. At its best it is a beautiful means of expression for the devout fervour of Bach and Handel. At all times it paralyses dramatic action, and no more ironic revenge has ever overtaken iconoclastic reformers than the historic development by which the purely dramatic declamation of the monodists settled down into a series of about thirty expressive displays of vocalization, designed on rigidly musical conventions, and produced under spectacular conditions by artificial sopranos as the highest ideal of music-drama.

The principal new art-forms of the 17th century are then, firstly, the aria (not the opera, which was merely a spectacular condition under which people consented to listen to some thirty arias in succession); and, secondly, the polyphonic instrumental forms, of which those of the suite or sonata da camera were mainly derived from the necessity for ballet music in the opera (and hence greatly stimulated by the taste of the French court under Louis XIV.), while those of the sonata da chiesa were also inspired by a renaissance of interest in polyphonic texture. The sonata da chiesa soon settled into a conventionality only less inert than that of the aria because violin technique had less possibilities than the voice, and was therefore raised to a higher level of effect the operatic style suggested by Cambert, he brought with him just enough of the new instrumental polyphony to make his typical form of French overture (with its slow introduction in dotted rhythm, and its quasi-fugal allegro) worthy of the important place it occupies in Bach's and Handel's art.
Meanwhile great though subordinate activity was also shown in the evolution of a new choral music dependent upon an instrumental accompaniment of more complex function than that of mere support. This, in the hands of the Neapolitan masters, was destined to lead straight to the early choral music of Mozart and Haydn, both of whom, especially Mozart, subsequently learnt its greater possibilities from the study of Handel. But the modus vivendi of the recitative was, to the time became the despised thing; who never showed that thoughtless acquiescence in the easiest means of effect which was already the bane of Italian art. Consequently, while the German output of the 17th century fails to show that rapid attainment of modest maturity which gives much Italian music of the period a permanent if slight artistic value, there is, in spite of much harshness, a stream of noble polyphonic effort in both organ and choral music in Germany from the time of H. Schütz (who was born in 1585 and who was a great friend and admirer of Monteverde) to that of Bach and Handel just a century later. Nor was Germany inactive in the dramatic line, and the 17th-century Italian efforts in comic opera, which were so interesting and so unjustly neglected by historians, formed a parallel, before Handel's maturity, in the work of R. Keiser, and may be traced through him in Handel's first opera, Almira.

The best proof of the insufficiency of 17th-century resources is to be found in the almost tragic blending of genius and failure shown by our English church music of the Restoration. The works of Pelham Humfrey and Blow already show the qualities which with Purcell seem at almost any given moment to amount to those of the highest genius, while hardly a single work has any coherence as a whole. The patchiness of Purcell's music was, no doubt, increased by the influence of French taste then predominant at court. When Pelham Humfrey was sixteen, King Charles II., as Sir Hubert Parry remarks, "achieved the characteristic and subtle stroke of humour of sending him over to France to study the methods of the most celebrated composer of theatrical music of the time in order to learn how to compose English church music." Yet it is impossible to see how such ideas as Purcell's could have been presented in more than French continuity of flow by means of any designs less powerful than those of Bach and Handel. Purcell's ideas are, like those of all great artists, at least sixty years in advance of the normal intellect of the time. But they are unfortunately equally in advance of the only technical resources then conceivable; and Purcell, though one of the greatest contrapuntists that ever lived, is probably the only instance in music of a really high genius born out of due time. Musical talent was certainly as common in the 17th century as at any other time; and if we ask why, unless we are justified in counting Purcell as a tragic exception, the whole century shows not one name in the first artistic rank, the answer must be that, after all, artistic talent is far more common than the interaction of environment and character necessary to direct it to perfect artistic results.

6. Bach and Handel.—It was not until the 18th century had begun that two men of the highest genius could find in music a worthy expression of their grasp of life. Bach and Handel were born within a month of each other, in 1685, and in the same part of Germany. Bach inherited the tradition of polyphonic effort that the German organists and choral writers had steadily maintained throughout the 17th century; and both profited by the Italian methods that were penetrating Germany. In Bach's case it was the Italian art-forms that appealed to his sense of design. Their style did not affect him, but he saw every possibility which the forms contained, and studied them the more assiduously because they were not, like polyphonic texture, his birthright. In recitative his own distinctively German style attained an intensity and freedom of expression which is one of the most moving things in art. Nevertheless, if he handled recitative in his own way it was not for want of acquaintance with the Italian. Moreover, he is very clear as to where his ideas come from, and extremely careful to maintain every art-form in its integrity. Yet his style remains his own throughout, and the first impression of its resemblance to that of his German contemporaries diminishes the more the period is studied. Bach's art thus forms one of the most perfectly systematic and complete records a life's work has ever achieved. His art-forms might be arranged in a sort of biological scheme, and their interaction and genealogy has a clearness which might almost be an object of envy to men of science even if Bach had not demonstrated every detail of it by those wonderful rewritings of his own works which we have described elsewhere (see BACH).

Handel's methods were as different from Bach's as his circumstances. He soon left Germany and, while he never betrayed his birthright as a great choral writer, he quickly absorbed the Italian style so thoroughly as to become practically an Italian. He also adopted the Italian forms, but not, like Bach, from any profound sense of their possible place in artistic system. To him they were effective, and that was all. He did not trouble himself about the permanent idea that might underlie an art-form and typify its expression. He has no notion of a form as anything higher than a rough means of holding music together and maintaining its flow; but he and Bach, alone among their contemporaries, have an unerring sense of all that is necessary to secure this end. They worked from opposite points of view: Bach develops his art from within, until its detail, like that of Beethoven's last works, becomes dazzling with the glory of the whole design; Handel at his best is inspired by a magnificent scheme, in the execution of which he needs condescend to finish of detail only so long as his inspiration does not harden to the next design. Nevertheless it is to the immense sweep and breadth of Handel's choral style, and its emotional force, that all subsequent composers owe their first access to the larger and more mechanical resources of music. (See HANDEL.)

ii. The Symphonic Classes.—After the death of Bach and Handel another change of view, like that of Copernican revolution for which Kant spoke in philosophy, was necessary for the further development of music. Once again it consisted in an inversion of the relation between form and texture. But, whereas at the beginning of the 17th century the revolution consisted mainly in directing attention to chords as, so to speak, harmonic lumps, instead of moments in a flux of simultaneous melodies; in the later half of the 18th century the revolution concerned the larger musical outlines, and was not complicated by the discovery of new harmonic resources. On the contrary, it led to an extreme simplicity of harmony. The art of Bach and Handel had given perfect vitality to the forms developed in the 18th century, but chiefly by means of the reinforcement of polyphonic texture. The new revolution broke down all that (like the shapes of arioso and suite-movement and the balance and contrasts of such choruses as are not fugues) are, after all, of secondary importance; the real centre of Bach's and Handel's technical and intellectual activity is the polyphony; and the more the external shape occupies the foreground the more the work assumes the character of light music. In the article SONATA FORMS we show how this state of things was altered, and attention is there drawn to the dramatic power of a music in which the form is technically prior to the texture. And it is not difficult to understand that Gluck's reform of opera would have been a sheer impossibility if he had not dealt with music of a sonata style, which is capable of changing its character as it unfolds its design.

The new period of transition was neither so long nor so interesting as that of the 17th century. The contrast between the
MUSIC

Squalid beginnings of the new art and the glories of Bach and Handel is almost as great as that between the monodists and Palestrina, but it appeals far less to our sympathies, because it seems like a contrast between noble sincerity and idle elegance. The new art seems so easy-going and empty that it conceals from us the necessity of the sympathetic historical insight for which the painful experiments of the monodists almost seem to cry aloud. And its boldest rhetorical experiments, such as the fantasias of Philipp Emanuel Bach, show a security of harmony which, together with the very vividness of their realization of modern ideas, must appear to a modern listener more like the hollow rhetoric of a decadent than the prophetic inspiration of a pioneer. And, just as in the 17th century, so in the time before Haydn and Mozart, the work that is most valuable artistically tends to be that which is of less importance historically. The cultivation of the shape of music at the expense of its texture was destined to lead to greater things than polyphonic art had ever dreamt of; but no living art could be achieved until the texture was brought once more into vital, if subordinate, relation to the shape. Thus, far more interesting artistically than the epoch-making earlier pianoforte works of Philipp Emanuel Bach is his historically less fruitful oratorios, and his symphonies, and the rich polyphonic modifications of the modern ideas which appear in the best works of his elder brother Friedemann. Yet the transition-period is hardly second in historic importance to that of the 17th century; and we may gather from it even more direct hints as to the meaning of the tendencies of our own day.

As in the 17th century, so in the 18th the composers and critics of Haydn's youth, not knowing what to make of the new tendencies, and conscious rather of the difference between new and old ideas than of the true nature of either, took refuge in speculations about the emotional and external expression of music; and when artistic power and balance fail it is very convenient to go outside the limits of the art and explain failure away by external ideas. Fortunately the external ideas were capable of serious organic function through the medium of opera, and in that art-form music was passing out of the hands of Italians and assuming artistic and dramatic life under Gluck. The metaphysical and literary speculation which overwhelmed musical criticism at this time, and which produced paper warfarces and musical party-feuds such as that between the Gluckists and the Piccinnists, at all events had this advantage over the Wagnerian and anti-Wagnerian controversies of the last generation and the disputes about the legitimate function of instrumental music at the present day—that it was speculation applied exclusively to an art-form in which literary questions were directly concerned, an art-form which moreover had up to that time been the ground of all the musical composers' chief principles, and which they could put into it. But as soon as music once more attained to consistent principles all these discussions became but a memory. If Gluck's music had not been more musical as well as more dramatic than Piccini's, all its foreshadowings of Wagnerian principles would have availed it no more than it availed Monteverde.

When the new art found symphonic expression in Haydn and Mozart, it became music pure and simple, and yet had no more difficulty than painting or poetry in dealing with external ideas, when these were naturally brought into it by the human voice or the conditions of dramatic action. It had once more become an art which need reject or accept nothing on artificial or extraneous grounds. Beethoven soon showed how gigantic the scale and range of the sonata style could be, and how tremendous was its effect on the possibilities of vocal music, both dramatic and choral. No revolution was needed to accomplish this. The style was perfectly formed, and for the first and so far the only time in musical history a mature art of small range opened out into an equally perfect one of gigantic range, without a moment of decadence or destruction. The chief glory of the art that culminates in Beethoven is, of course, the instrumental music, all of which comes under the head of the sonata-forms (q.v.).

Meanwhile Mozart raised comic opera, both Italian and German, to a height which has never since been approached within the classical limits, and from which the operas of Rossini and his successors show a decadence so deplorable that if "classical music" means "high art" we must say that classical opera buffa begins and ends in Mozart. But Gluck, finding his dramatic ideas encouraged by the eminent theatrical sensibilities of the French, had already given French opera a stimulus towards the expression of tragic emotion which made the classics of the French operatic school well worthy to inspire Beethoven to his one noble operatic effort and Weber to the greatest works of his life. Cherubini, though no more a Frenchman than Gluck, was Gluck's successor in the French classical school of dramatic music. His operas, like his church music, account for Beethoven's touching estimation of him as the greatest composer of the time. In them his melodies, elsewhere curiously cold and prosaic, glow with the warmth of a true classic; and his tact in developing, accelerating and suspending a dramatic climax is second only to Mozart's. Scarcely inferior to Cherubini in mastery and dignity, far more lovable in temperament, and weakened only by inequality of invention, Méhul deserves a far higher place in musical history than is generally accorded him. His most famous work, Joseph, is of more historical importance than his others, but it is by no means his best from a purely musical point of view. It is one of the finest of works to which its composer contributed in the best of his days. But Méhul to make extremely successful experiments in "local colour," which had probably considerable influence upon Weber, whose admiration of the work was boundless. One thing is certain, that the romantic opera of Weber owes much of its inspiration to the opéra comique of these masters.1

8. From Beethoven to Wagner.—After Beethoven comes what is commonly though vaguely described as the "romantic" movement. In its essentials it amounts to little more than this, that musicians found new and prouder titles for a very ancient and universal division of parties. The one party set up a convenient scheme of form based upon the average procedure of all the writers of sonatas except Haydn and Beethoven, which scheme they chose to call classical; while the other party devoted itself to the search for new materials and new means of expression. The classicists, if so they may be called, did not quite approve of Beethoven; and while there is much justification for the charge that has been brought against them of reducing the sonata-form to a kind of game, they have for that very reason no real claim to be considered inheritors of classical traditions. The true classical method is that in which matter and form are so united that it is impossible to say which is prior to the other. The pseudo-classics are the artists who set up a form conveniently like the average classical form, and fill it with something conveniently like the average classical matter, with just such difference as will make their music shine in brilliancy and range. The romanticists are the artists who realize such a difference between their matter and that of previous art as impels them to find new forms for it, or at all events to alter the old forms considerably. But if they are successful the difference between their work and that of the true classics becomes merely external; they are classics in a new art-form. As, however, this is as rare as true classical art is at the best of times, romanticism tends to mean little more than the difference between an unstable artist who cannot master his material and an artist who can, whether on the pseudo-classical or the true classical plane. The term "romantic opera" has helped us to regard Weber as a romanticist in that sphere, but when we call his instrumental works "romantic" the term ceases to have really valuable meaning. As applied to pieces like the Concertstuck, the Invitation à la danse, and other pieces of which the external subject is known either from Weber's letters or from the titles of the pieces themselves, the term means simply "programme-music" such as we have seen to be characteristic of any stage in which the art is imperfectly mastered. Weber's programme-music shows no advance on Beethoven in the illustrative resources of the art; and the application of the term "romantic"

1 We must remember in this connexion that the term opéra comique means simply opera with spoken dialogue, and has nothing to do with the comic idea.
MUSIC

[GENERAL SKETCH]

to his interesting and in many places beautiful pianoforte sonatas has no definite ground except the brilliance of his pianoforte technique and the helplessness in matters of design (and occasionally even of harmony) that drives him to violent and operatic outbreaks.

Schubert also lends some colour to the opposition between romantic and classical by his weakness in large instrumental designs, but his sense of form was too vital for his defective training to warp his mind from the true classical spirit; and the new elements he introduced into instrumental music, though not ratified by concentration and unity of design, were almost always the fruits of true inspiration and never mere struggles to escape from a difficulty. His talent for purely instrumental music was incomparably higher than Weber's, while that for stage-drama, as shown in the most ambitious of his numerous operas, Fierrabras, was almost nil. But he is the first and perhaps the greatest classical song writer. It was Beethoven's work on a larger scale that so increased the possibilities of handling remote harmonic sequences and rich instrumental and rhythmic effects as to prepare for Schubert a world in which music, no less than literature, was full of suggestions for that concentrated expression of a single emotion which distinguishes true lyric art. And, whatever the defects of Schubert's treatment of larger forms, his songs and his small forms which can be compassed by a single melody or group of melodies is unsurpassable and is truly classical in spirit and result.

Schumann had neither Schubert's native talent for larger form nor the irresponsible spirit which allowed Schubert to handle it uncritically. Nor had he the astounding lightness of touch and perfect balance of style with which Chopin controlled the most wayward imagination that has ever found expression in the pianoforte lyric. But he had a deep sense of melodic beauty, a mastery of polyphonic expression which for all its unorthodox tendency was second only to that of the greatest classics, and an epigrammatic fancy which enabled him to devise highly artistic forms of music never since imitated with success though often unintelligently copied. In his songs and pianoforte lyrics his romantic ideas found perfectly mature expression. Throughout his life he was inspired by a deep reverence which, while it prevented him from attempting to handle classical forms with a technique which he felt to be inadequate, at the same time impelled him as he grew older to devise forms on a large scale externally resembling them. The German lyric poetry, which he so perfectly set to music, strengthened him in his tendency to present his materials in an epigrammatic and antithetic manner; and, when he took to writing orchestral and chamber music, the extension of the principles of this style to the designing of large spaces in rigid sequences of short movements of uniform structure and of uniform height of climax in a form which, though neither classical nor strictly natural, was at all events more true in its relationship to his matter than that of the pseudo-classics such as Hummel or even Spohr. Towards the end of his short life, before darkness settled upon his mind, he rose perhaps to his highest height as regards solemnity of inspiration, though none of his later works can compare with his early lyrics for artistic perfection. Be this as it may, his last choral works, especially the latter parts of Faust (which, unlike the first part, was written before his powers failed), show that the sense of beauty and polyphonic life with which he began his career was always increasing; and if he was led to substitute an artificial and ascetic for a natural and classical solution of the difficulties of the larger art-forms it was only because of his insight into artistic ideals which he felt to be beyond his attainment. He shared with Mendelssohn the inevitable misunderstanding of those contemporaries who grouped all music under one or other of the two heads, Classical and Romantic.

There is good reason to believe that Mendelssohn died before he had more than begun to show his power, though this may be denied by critics who have not thought of comparing Handel's career up to the age at which Mendelssohn's ceased. And his mastery, resting, like Handel's, on the experience of a boyhood comparable only to Mozart's, was far too easy to induce him as a critic to reconcile the idea of high talent with distressing intellectual and technical failure. This same mastery also tended to discredit his own work, both as performer and composer, in the estimation of those whose experience encouraged them to hope that imperfection and over-excitement were infallible signs of genius. And as his facility actually did co-operate with the tendencies of the times to deflect much of his work into pseudo-classical channels, while nevertheless his independence of form and style kept him at all times at a higher level of interest and variety than any mere pseudo-classic, it is not to be wondered that his reputation became a formidable object of sacrifice to those apostles of new ideas who felt that their own works were not likely to make way against academic opposition unless they called journalism to their aid.

Nothing has more confused, hindered and embittered the careers of Wagner and Liszt and their disciples than the paper warfare which they did everything in their power to encourage. No doubt it had a useful purpose, and, as nothing affords a greater field for intrigue than the production of operas, it is at least possible that the gigantic and unprecedentedly expensive works of Wagner might not even at the present day have obtained a hearing if Wagner himself had been a tactful and not an officious politician, as he was, and would have let his partisans and his admirers do the propagating. As to Wagner's achievement there is no more important difference of opinion. It has survived all attacks as the most monumental result music has achieved with the aid of other arts. Its antecedents must be sought in many very remote regions. The rediscovery, by Mendelssohn, of the choral works of Bach, after a century of oblivion, revealed the possibilities of polyphonic expression in a grandeur which even Handel rarely suggested; and inspired Mendelssohn with important ideas in the designing of oratorios as wholes. The complete fusion of polyphonic method with external and harmonic design had, under the same stimulus, been carried a step further than Beethoven by means of Schumann's more concentrated harmonic and lyric expression. That wildest of all romantists, Berlioz, though he had less polyphonic sense than any composer who ever before or since attained distinction, nevertheless revealed important new possibilities in his unique imagination in orchestral colour. The breaking down of the barriers that check continuity in classical opera was already indicated by Weber, in whose Euryanthe the movements frequently run one into the other, while at least twenty different themes are discoverable in the opera, recurring, like the Wagnerian leit-motif, in apt transformation and logical association with definite incidents and persons.

All things undreamed of by Weber were necessary to complete the breakdown of the classical barriers; for the whole pace of musical motion had to be emancipated from the influence of instrumental ideas. This was the most colossal reformation ever attempted by a man of real artistic balance; and even the undoubted, though unpolished, dramatic genius shown in Wagner's libretti (the first in which a great composer and dramatist are one) is but a small thing in comparison with the musical problems which Wagner overcomes with a success immeasurably outweighing any defects his less perfect literary mastery allowed to remain in his dramatic structure and poetic diction. Apart from the squabbles of Wagnerian and anti-Wagnerian journalism, the chief difficulty of his supporters and antagonists really lay in this question of the pace of the music and the consequent breadth of harmony and design. The opening of the Walküre, in which, before the curtain rises, the sound of driving rain is reproduced by very simple sequences that take sixteen long bars to move a single step, does not, as instrumental music, compare favourably for terseness and variety with the first twenty bars of the thunderstorm in Beethoven's Pastoral Symphony, where at least four different incidents faithfully portray not only the first drops of rain and the distant thunder, but all the feelings of depression and apprehension which they inspire, besides carrying the listener rapidly through three different keys in chromatic sequence. But Beethoven's storm

in church their an many began. five Diaphonia Joachim's range. its development is of ordinary vant thing. the empty have his to also many mental GENERAL however, largeness Without the the things of Brahms's to his compositions was indisputable idea of poetism and the power of the performing art as the reason for the attention which Wagner's works had and their neglect by the critics who were influenced by the anti-Wagnerian movement of the time. Wagner's later works, however, have shown that his sense of harmony and key turns out on investigation to be the classical sense truly adapted to its new conditions. For this very reason it is in detail quite irrelevant to symphonic art; and there was nothing anti-Wagnerian in the reasons why Brahms had so little to do with it in his music, although every circumstance of the personal controversies and thinly disguised persecutions of Brahms's youth were enough to give any upholder of classical symphonic art a rooted prejudice to everything bearing the name of "romantic." Side by side with Wagner many enthusiasts place Liszt; and it is indisputable that Liszt had in mind a larger and slower flow of musical sequence closely akin to Wagner's, and, no doubt, partly independent of it; and moreover that one of Liszt's aims was to apply this to instrumental music. Also his mastery and poetic power as a pianoforte player were faithfully reflected in his later treatment of the orchestra, and ensured an extraordinary rhetorical plausibility for anything he chose to say. But neither the princely magnanimity of his personal character, which showed itself in his generosity alike to struggling artists and to his opponents, nor the great stimulus he gave (both by his compositions and his unceasing personal efforts and encouragement) to new musical ideas on romantic lines, ought at this time of day to blind us to the homeliness and essential vulgarity of his style. These unfortunate qualities did not secure for his compositions immediate popular acceptance; for they were outweighed by the true novelty of his aims. But recently they have given his symphonic poems an attractiveness which, while it has galvanized a belated interest in those works, has made many critics blind to their historical importance as the foundation of new forms which have undergone a development of sensational brilliance under Richard Strauss.

Meanwhile the party politics of modern music did much to distract public attention from the works of Brahms, who carried on the true classical method of the sonata-forms in his orchestral and chamber music, while he was no less great and original as a writer of songs and choral music of all kinds. He also developed the pianoforte lyric and widened its range. Without losing its characteristic unity it assumed a freedom and largeness of expression hitherto only attained in sonatas. Hence, however, Brahms's work, like Bach's, seemed, from its continuity with the classical forms, to look backward rather than forward. Indeed Brahms's reputation is in many quarters that of an academic reactionary; just as Bach's was, even at a time when the word "academic" was held to be rather a title of honour than of reproach. When the contemporary standpoints of criticism are established by the production of works of art in which the new elements shall no longer be at war with one another and with the whole, perhaps it will be recognized once more that the idea of progress has no value as a critical standard unless it is strictly applied to that principle by which every work of art must differ in every part of its form from every other work, precisely as far as its material differs and no further. Then, perhaps, as the conservative Bach after a hundred years of neglect revealed himself as the most profoundly modern force in the music of the 19th century, while that of his gifted and progressive sons became a forgotten fashion as soon as their goal was attained by greater masters, so may the musical epoch that seems now to have closed be remembered by posterity as the age, not of Wagner and the pioneer Liszt, but the age of Wagner and Brahms.

It will also in all probability be remembered as the age in which the performer ceased to be necessarily the intellectual inferior of the composer and musical scholar. With the exception of Wagner and Berlioz every great composer, since Palestrina sang in the papal choir, has paid his way as a performer; but Joseph Joachim was the first who threw the whole mind of a great composer into the career of an interpreter; and the example set by him, Bülow, Clara Schumann and Jenny Lind, though followed by very few other artists, sufficed to dispel for ever the old association of the musical performer with the mountebank.

Joachim's influence on Brahms was inestimable. The two composers met at the time when new musical tendencies were beginning to arouse violent controversy. At the age of twenty-one Joachim had produced in his Hungarian Concerto a work of high classical mastery and great nobility, and his technique in form and texture was then considerably in advance of Brahms's. For some years Joachim and Brahms interchanged contrapuntal exercises, and many of the greatest and most perfect of Brahms's earlier works owe much to Joachim's criticism. Yet it is impossible to regret that Joachim did not himself carry on as a composer the work he so nobly began, when we realize the enormous influence of his playing in the history of modern music. By it we have become familiar with a standard of truthfulness in performance which all the generous efforts of Wagner and Liszt could hardly have rendered independent of their own special propagandas. And by it the record of classical music has been made a matter of genuine public knowledge, with a unique freedom from those popularizing tendencies which invest vulgar error with the authority of academic truth.

In this respect there is a real change in the nature of modern musical culture. No serious composer at the present day would dedicate a great work to an artist who, like F. Clément, for whom Beethoven wrote his Violin Concerto, would perform the work in two portions and between them play a sonata for the violin on one string with the violin upside down. But it is hardly true that Wagner and Liszt produced a real alteration in the standard of general culture among musicians. Their work, especially Wagner's, appealed, like Gluck's, to many specific literary and philosophical interests, and they themselves were brilliant talkers; but music will always remain the most self-centred of the arts, and men of true culture will measure the depth and range of the musician's mind by the spontaneity and truthfulness of his musical expression rather than by his volubility on other subjects. The greatest musicians have not often been masters of more than one language; but they have always been men of true culture. Their humanity has been illuminated by the constant presence of ideals which their artistic mastery keeps in touch with reality.

CHRONOLOGICAL TABLE

Pythagoras, c. 582-500 B.C. Determines the ratios of the diatonic scale.

Aristoxenus, fl. 320 B.C. Our chief authority on classical Greek music.

Ptolemy, fl. A.D. 130. Astronomer, geographer, mathematician and writer on music. Reforms the Greek modes so as to prepare the way for the ecclesiastical modes.

St Ambrose. Arranges the Ambrosian tunes of church music, A.D. 354.

Hucbald, c. 840-930. Systematizer of Diaphonia or Organum (called by him Symphonie), and inventor of a simple and ingenious notation which did not survive him.
Guido of Arezzo, c. 990–1050. Theorist and systematizer of musical notation and solmization.

Franz Caspar Colonna, 15th-century author of treatises on musical rhythm. Works under the name of Franco appear at dates and places which have led to the assumption of the existence of three different authors, who, however, have been partly explained away again and the 16th century is sometimes called the Francoonian period of discant.

Discants positio vulgaris. An anonymous treatise written before 1130; is said to contain the earliest rules for "measured music," i.e., for music in which different voices can sing different rhythms.

The Reading MS., c. 1240 (British Museum, MS. Harl., 978, fol. 11 b.), contains the proem "Sumer is icumen in."

G. Duray, died 1474. 1514-1516. Proprietary composer.

(Thomas Morley was one of the principal founders of artistic counterpoint.)

MASTERS OF THE GOLDEN AGE

[In the following list when a name is not qualified as "church composer" or "madrigalist," the composer is equally great in both lines; but the qualification must not be taken as exclusive.]

Netherland Masters.

French Masters.

E. Genet, surnamed Carpentraso, fl. 1520. Church composer.

C. Goudem. Killed in the massacre of Lyons, 1572.

Italian Masters.

Palestrina, c. 1525–1594.

L. Marenzio, c. 1560; died 1599.

Spanish Masters.

C. Morales, 1512–1553.

T. L. de Victoria or Vittoria, fl. 1562.

English Masters.

T. Tallis, c. 1505; died 1585. Church composer.

W. Byrd, 1542 or 1543–1623. Greatest as church composer.

J. Willbye, fl. 1600. Madrigalist.

Orlando Gibbons, 1583–1625.

German Masters.

J. Handl, or Gallus, c. 1550–1591.

Hans Leo Hasler or Hassler, 1564–1612. Church composer.

The Monodists.

Cavallieri's La Rappresentazione di Anima e di Corpo, posthumously produced in 1600. The first oratorio, one of the first works dependent on instrumental accompaniment, and one of the first with a "figured bass" indicating by figures what chords are to be used.

Perl's Euridice, 1600. The first opera.

The Renaissance of Texture

H. Schütz, 1585–1672. Combines monodic and polyphonic principles in German church music and Italian madrigal.

Alessandro Scarlatti, 1659–1725. Founder of the aria-form of opera.

H. Purcell, c. 1658; died 1695.

A. Corelli, 1653–1713. First classic of the violin in the forms of suite (or sonata da camera), sonata da chiesa and concerto.

F. Couperin, 1668–1733. French composer of suites (ordre) and much addicted to giving fanciful titles to his pieces which are sometimes "programme music" in fact as well as name.

D. Buxtehude, 1637–1707.

G. F. Handel, 1685–1759.

The Sonata Epoch

Domenico Scarlatti, 1685–1757, son of Alessandro. Harpsichord virtuoso and master of a special early type of sonata.

K. Philipp Emanuel Bach, 1715–1788, third son of Sebastian Bach. The principal pioneer of the sonata style.

F. J. Haydn, 1732–1809.

W. A. Mozart, 1756–1791.

Beethoven, 1770–1827.

The Lyric and Dramatic or "Romantic" Period

[In this list the only lyric names given are those of which the complex conditions of modern art make definition easy as well as desirable; and, as throughout this table, the definitions must not be taken as exclusive. The choice of names is, however, guided by the adepts in modern development, thus accounting for glaring omissions and artistic disproportions.]

Schubert, 1797–1828. The classic of song.

Mendelssohn, 1809–1847. The "fifth" of the romantic composers.

 Liszt, 1811–1886. Pianoforte virtuoso and pioneer of the symphonic poem.

Bruckner, 1824–1896. The symphonist of the Wagnerian party.

Tchaikowsky, 1840–1893.

Development of the symphonic poem.

(D. F. T.)

II.—Recent Music

Under separate biographical headings, the work of the chief modern composers in different countries is dealt with; and here it will be sufficient to indicate the general current of the art, and to mention some of the more prominent among recent composers.

On the death of Brahms, the great German composers seemed, at the close of the 19th century, to have left no successor. Such merely epigonal figures as A. Burgert (b. 1846) and Cyril Kistler (1848–1907) could not be regarded as important; and E. Humperdinck's (b. 1854) striking success with Hansel and Gretel (1893) was a solitary triumph in a limited genre. The outstanding figure, at the opening of the 20th century, was Richard Strauss (q.v.); but it was not so much now in composition, as in the high excellence of his interpretative art kept to the highest level of the school of European music, by her schools, her great conductors and instrumentalists, and her devotion as a nation to the production of musical works.

France.—From the earliest days of their music, the French have had the enviable power of assimilating the great innovations which were originated in other countries, without losing their habit of Warzaw's Dissonances. That which happened with the Netherlandish composers of the 16th century, and with Lulli in the 17th, was repeated, more or less exactly, with Rossini in the early part of the 19th century and with Wagner at its close during the last quarter of the 19th century all that is represented by the once-adored name of Gounod was discarded in favour of a style as different as possible from his. The change was mainly due to the Belgian musicians, César Auguste Duparc (1845–1893), with its influence on the school of symphonic and orchestral composition, as opposed to the conventional methods pursued at the Paris Conservatoire. Massenet was left as almost the only representative of the older school, and from Edouard Lalo (1823–1892) to G. Charpentier (b. 1857) and the younger composers of France adopted the newer style. With these may be mentioned Alfred Bruneau (b. 1857), and Gabriel Fauré (b. 1854). Camille Saint-Saëns (b. 1835), however, remained the chief representative of the sound school of composition, if only by reason of his greater command of resources of every kind and his success in all forms of music. Among the newer school of composers the more original unquestionably was Debussy (q.v.), and among others may be mentioned Ernest Reyer (b. 1823), the author of some ambitious and stinging operas; F. L. V. de Joncières (b. 1853), an enthusiastic follower of Wagner, and a composer of modern value Daniel Carbonetti (1841–1904), a man of extraordinary gift, who wrote one of the finest opéras comiques of modern times, Le Roi malgré lui (1887); Charles Marie Widor (b. 1845), an earnest musician of great accomplishment; and Vincent d'Indy (b. 1851), a strongly original, even crass, but unlike in dramatic, orchestral and chamber compositions. In the class of lighter music, which yet lies above the level of opéra bouffe, mention must be made of Léo Delibes (1836–1891) and André Messager (b. 1855). In describing the state of French music in France it would be wrong to leave undone the great conductors of popular orchestral concerts, such as Jules E. Pasdeloup (1819–1897), Chas. Lamoureux (1834– 1899), and Judas [Edouard] Colonne (b. 1838).
solidity of style and impressiveness, from the time when he wrote his earlier operas. As Arrigo Boito's Mefistofele had an immense influence on modern Italian music. Among the writers of "absolutes" music the most illustrious are G. Spogambi (b. 1843) and G. Martucci (b. 1856), the latter's symphony in D minor being a fine example of this type, in which the influence of which the first production was the Flora mirabilis of Spiro Samara (b. 1861), given in 1886. Its culmination was in the Giuseppe Verdi, whose operas - for all, by the fact that he himself created them - had an interesting influence on the church music of Italy (see PALESTRINA). 

Russia.—The new Russian school of music originated with M. A. Balakirev (b. 1837), who was instrumental in founding the Free School of Music in 1862, and the Union of Russian Composers under his presidency. The names of Berlioz and Liszt entered into Russia; he instilled the principles of "advanced" music into A. P. Borodin (1834-1887), C. A. Cui (b. 1835), M. P. Moussorgsky (1839-1881), and N. A. Rimsky-Koroljow (1844-1908), whose works, though written in the eclectic and modernistic period, are still uncompleted. The followers of Liszt, in particular, are of the old school.
works, such as the oratorios, show some tendency to fall back into the conventionalities from which the renaissance movement was an effort to escape; but in The Coler's Saturday Night; The Story of Drury Lane Theatre; at the time it seemed as though English opera had a chance of getting permanently established, but the same spirit, whereas they failed to have a lasting effect upon the art of the country, and after the production of two operas by MacKenzie, two by Arthur Goring Thomas, one by F. Corder, two by Cowen and one by Stanford, the artistic as in the raising of the standard of orchestral playing, but in spite of the strong influence of French ideals and methods, the music of Arthur Goring Thomas was remarkable for individuality and charm; in any other country his beautiful opera Esmeralda would have formed part of the regular repertory; and his orchestral suites, cantatas and a multitude of graceful and original songs, remain as evidence that if his career had been prolonged, the art of England might have been enriched by some masterpiece it would have been a classic back for a year or two. The new operatic society, and a number of variously successful attempts in the more ambitious and more serious branches of the art, Cowen found his chief success in the treatment of fanciful or fairy subjects, which his own nature and circumstances led him to adopt. If his ideas are uniformly graceful, excellently treated and wonderfully effective. His second tenure of the post of conductor of the Philharmonic Society showed a high degree of tastefulness.

In regard to English opera two more undertakings deserve to be recorded. In 1891 the Royal English Opera House was opened with Sullivan's Ivanhoe, a work written especially for the occasion: the absence of anything like a repertory, and the retention of this one work in the bills for a period far longer than its attractions could warrant, brought the inevitable result, and shortly after the production of a charming French comic opera the theatre was closed. This was a case of the characteristic Shamus O'Brien of Stanford was successfully produced in 1896 at the Opéra Comique theatre. This work brought into public prominence the conductor Mr Henry J. Wood (b. 1870), who exercised a powerful influence on the art of the country by means of his orchestra, which was constantly to be heard at the Queen's Hall, and which attained, by continual performance together, a degree of perfection before unknown in England. It achieved an important work in bringing music within the reach of all classes at the Promenade Concerts given through each summer, as well as by means of the Symphony Concerts at other seasons. His training of the Queen's Hall Orchestra was characterized by a thoroughness and severity previously unknown in English orchestras. This was partly made possible by the fact that he carried the inquisitive spirit of Richard Wagner to London; and it was only after considerable meetings in the rooms of Hubert Parry brought about the institution of the Musical Club, which has borne fruit in many ways, though only in the direction of chamber-music. The Bach Choir, founded by Mr Arthur Duke Coleridge in 1875, and conducted for the first ten years of its existence by Mr Otto Goldschmidt and subsequently by Professor Stanford, worked on purely uncommercial lines and was of the greatest importance. The performance of the works of Bach, it brought forward most important compositions by Englishmen, and had a prominent share in the work of the renaissance. Parry's earlier compositions had a certain austerity in the extreme, and the introduction of them presented no difficulties, and prevented their obtaining wide popularity; and it was not until the date of his choral setting of Milton's Ode at a Solemn Musick that he found his true vein. In this and his many successors, probably the most of all in the improvement of the art of choir-singing in London, there was a nobility of utterance, a sobriety of concepcion, a mastery of resource, that far surpass anything accomplished in England since the days of Purell; while his "Symphonic Variations" for orchestra, and at least two of his symphonies, embarked in his command over the modern modifications of classical forms in great perfection. Like Parry, Stanford first caught the ear of the public at large with a choral work, the stirring ballad-setting of Fingal's Cave. This, like many other English compositions, which include compositions in every form, he shows himself a supreme master of effect; in dramatic or lyrical handling of voices, in symphonic treatment of the orchestra, and in the composition of concerted music, and while his ideas have real distinction, his treatment of them is nearly always the chief interest of his works. The work of the musical renaissance has been more beneficially fostered by these than any other, and that Mr Stanford is the most gifted of the Royal College of Music. In 1876 the National Training School of Music was opened with Sullivan as principal; he was succeeded by Sir John Stainer in 1881, and the circumstance that such a school was opened is a fact of importance. There is a strong foundation of their musical education is the only important fact connected with the institution, which in 1882 was succeeded by the Royal College of Music, under the directorship of Sir George Grove. This college, which was incorporated in 1883, has been a great encouragement to the cause of music in this country. In 1894 Parry succeeded to the directorship, and before and after this date work of the best educational kind was done in all branches of the art. The most important branch of composition, MacKenzie's place among the masters of the seventeenth century is assured by his romantic compositions for orchestra—such as La Belle dame sans merci and the two Scottish Rhapsodies; some of his choral
decided merit and individuality, and by being the composer of a symphony which attained greater and wider fame than any similar work by a British composer. In 1897, The Ecstasy of Beatrice (b. 1862) won great success as a writer of incidental music for plays, and in various lighter forms of music, for which his great skill in orchestration and his knowledge of effect stand him in good stead. The same year he was named a Companion of Honour.

Dr Arthur Somervell (b. 1863), who succeeded Stainer as musical adviser to the Board of Education, first came into prominence as a composer of a number of charming songs, and then wrote a series of orchestral pieces, for which his Royal College of Music, were received with acclamation; but his later work was not of equal value, though his operas Jessie Dow and Dauid were successful. Mr Granville Bantock (b. 1876) is another of our young composers who have written many fine things for orchestra, and Mr William Wallace (b. 1861), in various orchestral pieces played at the Crystal Palace and elsewhere, and in such things as his "Freebooter" songs, has shown of English traditional music. Mr Arthur Hinton (b. 1869) has produced things of fanciful beauty and quaint originality. Miss Ethel M. Smyth, whose Mass was given at the Royal Albert Hall in most favourable conditions, had her opera Fantasia performed by the Westminster Orpheus Chorus and a Band of Music at the Crystal Palace Garden. Miss Maud Valerie White's graceful and expressive songs brought her compositions into wide popularity; and Mme Liza Lehmann (b. 1870), a pupil of Paderewski, has been reclaimed from her retirement from the profession of a singer. The first part of Mr S. Coleridge-Taylor's (b. 1875) Hiawatha scenes was performed while he was still a student at the Royal College, and so great was its success that it was published, and became, what was later to be a war song, for performance by the Royal Choral Society. Mr Cyril Scott is a composer who aims high, though with a somewhat strained originality. Dr H. Walford Davies (b. 1869) and W. Y. Hurst (1876-1906) excelled in the serious kind of chamber-music and use the classic forms with notable skill; and Mr R. Vaughan Williams, in his songs and other works, has shown perhaps the most conspicuous talent among all the younger British composers.

British composers have suffered from foreign competition in the same degree as English composers, and the success of such as Miss Anna Williams, Miss Macintyre, Miss Marie Brema, Miss Clara Butt, Miss Agnes Nicholls, Messrs Santley, Edward Lloyd, Ben Davies, Plunket Greene and Franchinus Davies; or of such pianists as Miss Fanny Davies and Mr Leonard Borwick, is but a continuance of the tradition of British excellence. The British contribution to the art of the magazine - the musical monthly - has been decided upon its place as a branch of musical education; the learned writings of W. S. Rockstro (1832-1895), many of them made public first in the Encyclopaedia Britannica and Grove's Dictionary of Music and Musicians, have lit the way, like the many other

MUSICAL NOTATION, a pictorial method of representing sounds to the ear through the medium of the eye. It is probable that the earliest attempts at notation were made by the Hindus and Chinese, from whom the legacy was transferred to Greece. The exact nature of the Greek notation is a subject of dispute, different explanations assigned to it, and plans for setting up their alphabetical method of delineation. To bothius we owe the certainty that the Greek notation was not adopted by the Latins, although it is not certain whether he was the first to apply the fifteen letters of the Roman alphabet to the scale of sounds included within the two octaves, or whether he was only the first to make record of that application. The reduction of the scale to the octave is ascribed to St Gregory, as also the naming of the seven notes, but it is not safe to assume that such an ascription is accurate or final. Indications of a scheme of notation based, not on the alphabet, but on the use of dashes, hooks, curves, dots and strokes are found to exist as early as the period of the hebrews, with the cards of the 15th century to the alphabetical method of delineation.

The origin of these signs, known as neumes (peliara, or notes), is the full stop (punctus), the comma (virgo), and the mound or undulating line (clivus), the first indicating a short sound, the second a long sound, and the third a group of notes. The musical intervals were suggested by the distance of these signals from the words of the text. The variety of neumes employed at different times, and the fluctuations due to handwriting, have made them extremely difficult to decipher. In the 10th century a marked advance is shown by the use of a red line traced horizontally above the text to give the singer a fixed note (feu fa), thus helping him to approximate the intervals. This was added a second line in yellow (for C=ut), and finally a staff arose from the further addition of two black lines over these. The difficulty of the subject is complicated for the student by the fact that an incredible variety of notations coexisted at one period, all more or less representing attempts in the direction of the modern system. A variety of experiments resulted in the assignment of the four-lined staff to sacred music and of the five-lined staff to secular music. The yellow and red colours were replaced by the use of the letters F and C (la and ut) on the lines. This use of letters to indicate clef is forestalled in a manuscript of Guido of Arezzo's Micrologus, dating from the 12th century, in which is the famous hymn to St John, printed with neumes on a staff of three lines (see Guido of Arezzo). The use of letters for indicating clefs has survived to the present day, our clef signatures being modified forms of the letters C, F and G, which have passed through a multitude of shapes. Before the 12th century there is no trace of a measured notation (i.e. of a numerical time division separating the component parts of a piece of music). It is at the time of Franco of Cologne3 that measured music takes its rise, together with the black notation in place of neumes, which disappeared altogether by the end of the 14th century.

Writing four hundred years after St Gregory, Cottonus complains bitterly of the defects in the system of neumes.4 "The same melody on which Master Trudo sang as thirds, were sung as fourths by Master Albinus; while Master Salomo asserts that sixths are the notes meant, so at last there were many methods of singing as teachers of the art." Possibly the recklessness multiplication of lines in the staff may have contributed to the obscurity of which Cottonus complains. In the black notation, which led to the modern system, the square note with a tail (♩) is the long sound; the square note

3 See S. de Caus, Les forces mouvantes; and article Barrel Organ.

4 The principles of Franco are found in the treatises of Walter Odington, a monk of Evesham who became archbishop of Canterbury in 1228.
without a tail (4) is the breve; and the lozenge shape (6) is the semibreve. In a later development there were added the double long (7) and the minutum (8). The breve, according to Franco of Cologne, was the unit of measure. The development of a fixed time division was further continued by Philippe de Vitry. It has been noted with well-founded astonishment that at this time the double time (i.e. two to the bar) was unknown, in spite of this being the time used in marching and also illustrated in the process of breathing. Triple time (i.e. three to the bar) was regarded as the most perfect because it was indivisible. It was as if there lay some mysterious enchantment in a number that could not be divided into equal portions without the fraction. "Triple time," says Jean de Muris, "is called perfect, according to Franco, a man of much skill in his art, because it hath its name from the Blessed Trinity which is pure and true perfection."

Vitry championed the rights of imperfect time and invented signs to distinguish the two. The perfect circle (6) represented the perfect or triple time; the half circle (7) the imperfect or double-time. This C has survived in modern notation to indicate four-time, which is twice double-time; when crossed it is double-time. The method of dividing into perfect and imperfect was described as prolaction. The addition of a point to the circle or semi-circle (6 6) indicated major prolaction; its absence, minor prolaction. The substitution of white for black notation began with the first year of the 14th century and was fully established in the 15th century.

It has already been shown how the earlier form of alphabetical notation was gradually superseded by one based on the attempt to represent the relative height and depth of sounds pictorially. The alphabetical nomenclature, however, became inextricably associated with the pictorial system. The two conceptions reinforced each other; and from the hexachordal scale, endowed with the solmization of ut, re, mi, fa, sol, la—which was a device for identifying notes by their names when talked of, rather than by their positions when seen on a page of music—arose the use of what are now known as accidentals. Of these it may here be said that the flat originated from the necessity of sinking the B of the scale in order to form a hexachord on the note F in such a way as to cause the semitone to fall in the right place—which in the case of all hexachords was between the third and fourth notes. This softened B was written in a rounded form thus: 8 (rotundum), while the original B remained square thus: B (quadratum). The original conception of the sharp was to cross or lattice the square B, by which it was shown that it was neither to be softened nor to remain unchanged. This flat, which originated in the 10th century, appears to have been of far earlier date than the sharp, the invention of which has been ascribed to Joquin Des Prés (1450-1521). The B-sharp was called B cancellatum, the cross being formed thus X. The use of key signatures constructed out of these signs of sharp and flat was of comparatively late introduction. The key signature states at the beginning of a piece of music the sharps and flats which it contains within the scale in which it is written. It is a device to avoid repeating the sign of sharp and flat with every fresh occasion of their occurring. The exact distinction between what were accidental sharps or flats, and what were sharps or flats in the key, was still undetermined in the time of Handel, who wrote the Suite in E containing the "Harmonious Blacksmith" with these sharps instead of four. The double b (sometimes written b or ) and the double sharp (sometimes written X, or ) were introduced as a result of the demand for music to be called into existence by the demands of modern music, while the sign of natural (7) is the outcome of the original B quadratum or square B B.

The systems known as Tonic Sol Fa and the Galin-Paris-Chevé methods do not belong to the subject of notation, as they are ingenious mechanical substitutes for the experimentally developed systems analysed above. The basis of these substitutes is the reference of all notes to key relationship and not to pitch.

MUSIC HALLS

The variety theatre or the "music-hall" of to-day developed out of the "saloon theatres," which existed in London about 1820—1840; they owed their form and existence to the restrictive action of the "patent" theatres at that time. These theatres had the exclusive right of representing what was broadly called the "legitimate drama," which ranged from Shakespeare to Monk Lewis, and from Sheridan and Goldsmith to Kotzebue and Alderman Birch of Cornhill, citizen and poet, and the founder of the turtle-soup trade. The patent houses defended their rights when they were attacked by the "minor" and "saloon" theatres, but they often acted in the spirit of the dog in the manger. While they pursued up to fine and even imprisonment the poachers on their dramatic preserves, they were often quite happy to neglect the "legitimate drama" for the supposed meretricious attractions offered by their illegitimate competitors. The British theatre gravitated naturally to the inn or tavern. The tavern was the source of life and heat, and warmed all social gatherings. The inn galleries offered rather rough stages, before the Shakespeare and Alcey playhouses were built. The inn yards were often made as comfortable as possible for the "groundlings" by layers of straw, but the tavern character of the auditorium was never concealed. Excisable liquor was always obtainable, and the superior members of the audience, who chose to pay for seats at the side of the stage or platform (like the "avant-scène" boxes at a Parisian theatre), were allowed to smoke Raleigh's Virginian weed, then a novel luxury. This was, of course, the first germ of a "smoking-theatre."

While the drama progressed as a recognized public entertainment in England, and was provided with its own buildings in the town, or certain booths at the fairs, the Crown exercised its patronage in favour of certain individuals, giving them power to set up playhouses at any time in any parts of London and Westminster. The first and most important grant was made by Charles II. to his "trusty and well-beloved" Thomas Killigrew "and Sir William Davenant." This was a personal grant, not connected with any particular sites or buildings, and is known chiefly Liturgical (Historical Music Loan Exhibition, Albert Hall, Killigrew was the author of several unsuccessful plays, and Sir William Davenant, said to be an illegitimate child of William Shakespeare, was a stage manager of great daring and genius. Charles II. had strong theatrical leanings, and had helped to arrange the court ballets at Versailles for Louis XIV. The Killigrew and Davenant patent in course of time descended, after a fashion, to the Theatres Royal, Covent Garden and Drury Lane, and was and still is the chief legal authority governing these theatres. The "minor" and outlying playhouses were carried on under the Music and Dancing Act of George II., and the annual licences were granted by the local magistrates. These are the prehistoric form of the inn or tavern, or, as it was called in the days from the inn or tavern, it was now the turn of the inn or tavern to develop into a place of amusement, and to lay the foundation of that enormous middle-class and lower middle-class institution of interest which we agree to term the music hall. It rose from the most modest, humble and obscure beginning—from the public-house bar-parlour, and its weekly "sing-songs," chiefly supported by voluntary talent from the "harmonic meetings" of the "long-room" upstairs, generally used as a Foresters' or Masonic club-room, where one or two professional singers were engaged and a regular chairman was appointed, to the "assembly-room" entertainments at certain hotels, where private balls and school festivals formed part of an irregular series.

The district "tea-garden" which was then an agreeable feature of suburban life—the suburbs being next door to the city and the country next door to the suburbs—was the first to show dramatic
ambition, and to erect in some portion of its limited but leafy grounds a latch-and-plaster stage large enough for about eight people to move upon without incurring the danger of falling off into the adjoining fish pond and fountain. A few classical statues in plaster, always slightly mutilated, gave an educational tone to the place, and with a few coloured oil-lamps hung amongst the bushes the proprietor felt he had gone as near the "Royal Vauxhall Gardens" as possible for the small charge of a sixpenny refreshment ticket. There were degrees of quality, of course, amongst these places, which answered to the German beer-gardens, though with inferior music. The Beulah Spa at Norwood, the White Conduit House at Pentonville, the Yorkshire Stingo in the Marylebone Road, the Monster at Finsico, the St Helena at Rotherhithe, the Globe at Mile End; the Red Cow at Dalston, the Highbury Barn at Highbury, the Manor House at Mare Street, Hackney, the Rosemary Branch at Hoxton, and other rus-in-urbe retreats, were up to the level of their time, if rarely beyond it.

The suspended animation of the law—the one Georgian act, which was mainly passed to check the singing of Jacobite songs in the tap-rooms and tea-gardens of the little London of 1730, when the population of the United Kingdom was about six millions—encouraged the growth eventually of a number of "saloon theatres" in various London districts, which were allowed under the head of "Music and Dancing" to go as far on the light dramatic road as the patent theatres thought proper to permit. The 25 Geo. II. c. 36, which in later days was still the only act under which the music halls of forty millions and more of people were licensed, was always liberally interpreted, as long as it kept clear of politics.

The "saloon theatres," always being taverns or attached to taverns, created a public who liked to mix its dramatic amusements with smoking and light refreshments. The principal "saloons" were the Effingham in the Whitechapel Road, the Bower in the Lower Marsh, Lambeth, the Albert at Islington, the Britannia at Hoxton, the Grecian in the City Road, the Union in Shoreditch, the Stingo at Paddington and several others of less importance. All these places had good companies, especially in the winter, and many of them nourished leading actors of exceptional merit. The dramas were chiefly rough adaptations from the contemporary French stage, occasionally flying as high as Alexandre Dumas the elder and Victor Hugo. Actors of real tragic power lived, worked and died in this confined area. Some went to America, and acquired fame and fortune; and among others, Frederick Robson, who was trained at the Grecian, first when it was the leading saloon, then a coffee house, and lastly a billiard hall (a distinction with little difference), fought his way to the front after the abolition of the "patent rights" and was accepted as the greatest tragi-comic actor of his time. The Grecian saloon theatre, better known perhaps, with its pleasure garden or yard, as the Eagle Tavern, City Road, which formed the material of one of Charles Dickens's Sketches by Boz, was a place managed with much taste, enterprise and discretion by its proprietor, Mr Rouse. It was the "saloon" where the one and only attempt, with limited means, was ever made to import almost all the original repertory of the Opéra Comique in Paris, with the result that many musical works were presented to a sixpenny audience that had never been heard before nor since in England. Aubé, Hérold, Adolphe Adam, Boieldieu, Grétry, Donizetti, Bellini, Rossini and a host of others gave some sort of advanced musical education, through the Grecian, to a rather depressing part of London, long before board schools were established. The saloon theatres rarely offended the patent houses, and when they did the law was soon put in motion to show that Shakespeare could not be represented with impunity. The Union Saloon in Shoreditch, then under the direction of Mr Samuel Lane, who afterwards, with his wife, Mrs Sara Lane, at the Britannia Saloon, became the leading local theatrical manager of his day, was tempted in 1834 to give a performance of Othello. It was "raided" by the then rather "new police," and all the actors, servants, audience, directors and musicians were taken into custody and marched off to Worship Street police station, confined for the remainder of the night, and fined and warned in the morning. The same and only law still exists for those who are helping to keep a "disorderly house," but there are no holders of exclusive dramatic patent rights to set it in motion. The abolition of this privileged monopoly was effected about this time by a combination of distinguished literary men and dramatists, who were convinced, from observation and experience, that the patent theatres had failed to nurse the higher drama, while interfering with the beneficial freedom of public amusements.

The effect of Covent Garden and Drury Lane on the art of acting had resulted chiefly in limiting the market for theatrical employment, with a consequent all-round reduction of salaries. They kept the Lyceum Theatre (or English Opera House) for years in the position of a music hall, giving sometimes two performances a night, like a "gaff" in the New Cut or Whitechapel. They had not destroyed the "star" system, and Edmund Kean and the boy Betty—the "Infant Roscius"—were able to command sensational rewards. In the end Charles Dickens, Sir Edward Bulwer-Lytton, Sir Thomas Noon Tailourd and others got the patents abolished, and the first step towards freedom in the theatre was accomplished. The patent theatres were under the control of a Crown officer, changing with ministries. This was the lord chamberlain for the time being. The lord chamberlain of this period drew a hard-and-fast line between theatres under his control, where no smoking and drinking were allowed "in front," and theatres or halls where the old habits and customs of the audience were not to be interfered with. These latter were to go under the jurisdiction of the local magistrates, or other licensing authorities, under the 25 Geo. II. c. 36—The Music and Dancing Act—and so far a divorce was decreed between the taverns and the playhouses. The lord chamberlain eventually made certain concessions. Refreshment bars were allowed at the lord chamberlain's theatres in unobtrusive positions, victualled under a special act of William IV., and private smoking-rooms were allowed at most theatres on application. All this implied that stage plays were to be kept free from open smoking and drinking, and miscellaneous entertainments were to enjoy their old social freedom. The position was accepted by those "saloon theatres" which were not tempted to become lord chamberlain houses, and the others, with many additions, formed the public saloons.

Amongst the first of these halls, and certainly the very first as far as intelligent management was concerned, was the Canterburry in the Lower Marsh, Lambeth, which was next door to the old Bower Saloon, then transformed into a "minor theatre." The Canterbury sprang from the usual tavern germ, its creator being Mr. Charles Morton, who honourably earned the name of the "dozen of the music halls." It justified its title by cultivating the best class of music, and exposed the prejudice and unfairness of Flanché's sarcasm in a Haymarket burlesque—"most music hall—most melanoly." Mr Charles Morton added pictorial art to his other attractions, and obtained the support of Punch, which stamped the Canterbury as the "Royal Academy over the water." At this time by a mere accident Gounod's great opera of Faust, through defective international registration, fell into the public domain in England and became common property. The Canterbury, not daring to present it with scenery, costumes and action, for fear of the Stage-play Act, gave what was called "An Operatic Selection," the singers standing in plain dresses in a row, like pupils at a school examination or a chorus in an oratorio at Exeter Hall. The music was well rendered by a thoroughly competent company, night after night, for a long period, so that by the time the opera attracted the tardy attention of the two principal opera managers at Her Majesty's Theatre in the Haymarket and Covent Garden Theatre, the tunes most popular were being
whistled by the "man in the street," the "boy in the gutter" and the tradesman waiting at the door for orders.

With the Canterbury Hall, and its brother the Oxford in Oxford Street—a converted inn and coaching yard—built and managed on the same lines by Mr Charles Morton, the music halls were well started. They had imitators in every direction—some large, some small, and several with architectural pretensions, but all anxious to attract the public by cheap prices and physical comforts not attainable at any of the regular theatres.

With the growth and improvement of these "Halls," the few old cellar "singing-rooms" gradually disappeared. Evans's in Covent Garden was the last to go. Rhodes's, or the Cyder Cellars in Maiden Lane, at the back of the Adelphi Theatre; the Coal Hole, in the Strand, which now forms the site of Terry's Theatre; the Doctor Johnson, in Fleet Street (oddly enough, within the precincts of the City of London) disappeared one by one, and with them the compound material for Thackeray's picture of "The Cave of Harmony." This "Cave," like Dickens's "Old Curiosity Shop," was drawn from the features of many places. To do the "cellars" a little justice, they represented the manners of a past time—heavy suppers and heavy drinks, and the freedom of their songs and recitations was partly due to the fact that the audience and the actors were always composed of men. Thackeray clung to Evans's to the last. It was his nightly "chapel of ease" to the adjoining Garrick Club. In its old age it became decent, and ladies were admitted to a private gallery, behind screens and a convenant grille. Before its death, and its revival in another form as a sporting club, it admitted ladies both on and off the stage, and became an ordinary music hall.

The rise and progress of the London music halls naturally excited a good deal of attention and jealousy on the part of the regular theatres, and this was increased when the first Great Variety Theatre was opened in Leicester Square. The building was the finest example of Moorish architecture on a large scale ever erected in England. It was burnt down in the 'eighties, and the present theatre was built in its place. Originally it was "The Panopticon," a palace of "recreative science," started under the most distinguished direction on the old polytechnic institution lines, and with ample capital. It was a commercial failure, and after being tried for "American Clubs," it was turned into a great variety theatre, the greatest of its kind in Europe, under the name of the Alhambra Palace. Its founder was Mr E.T. Smith, the energetic theatrical manager, and its developer was Mr Frederick Strange, who came full of spirit and money from the Crystal Palace. He produced in 1865 an ambitious ballet—the Dagger Ballet from Auber's Enfant prodigue, which had been seen at Drury Lane Theatre in 1851, translated as "Azazel."

The Alhambra was prosecuted in the superior courts for infringing the Stage-play Act—the 6 & 7 Vict. c. 68. The case is in the law reports—Wigan v. Strange; the ostensible plaintiffs being the well-known actors and managers Horace Wigan and Benjamin Webster, supported by J. B. Buckstone, and the London Alhambra Company. After a long trial before the eminent judges, with eminent counsel on both sides, produced a decision which was not very satisfactory, and far from final. It held that, as far as the entertainment went, according to the evidence tendered, it was not a ballet representing any distinct story or coherent action, but it might have been a "divertissement"—a term suggested in the course of the trial. A short time after this a pantomime scene was produced at the same theatre, called Where's the Policeman which had a clown, a pantaloone, a columbine and a harlequin, with other familiar characters, a mob, a street and even the traditional red-hot poker. This inspired proceedings by the same plaintiffs before a police magistrate at Marlborough Street, who inflicted the full penalties—£50 a performance for 12 performances, and costs. An appeal was made to the Westminster quarter sessions, supported by Serjeant Ballantyne and opposed by Mr Hardinge Giffard (afterwards Lord Chanceller Halsbury), and the conviction was confirmed. Being heard at quarter sessions, there is no record in the law reports.

These and other prosecutions suggested the institution of a parliamentary inquiry, and a House of Commons select committee was appointed in 1866, at the instigation of the music halls and variety theatres. The committee devoted much time to the inquiry and evidence amongst the rest Lord Sydney, the lord chamberlain, who had no personal objection to undertake the control of these comparatively young places of amusement and recreation. Much of the evidence was directed against the Stage-play Act, as the difficulty appeared to be to define what was not a stage play. Lord Denman, Mr Justice Byles, and other eminent judges seemed to think that any song, action or recitation that excited the emotions might be pinned as a stage-play, and that the old definition—"the representation of any action by a person (or persons) acting, and not in the form of narration"—could be supported in the then state of the law in any of the higher courts. The variety theatres on this occasion were encouraged by what had just occurred at the time in France. Napoleon III., acting under the advice of M. Michel Chevalier, passed a decree known as La Liberté des théatres, which fixed the status of the Parisian and other music halls. Operettas, ballets of action, ballets, vaudevilles, pantomimes and all light pieces were allowed, and the managers were no longer legally confined to songs and acrobatic performances. The report of the select committee of 1866, signed by the chairman, Mr (afterwards Viscount) Goschen, was in favour of granting the variety theatres and music halls the privileges they asked for, which were those enjoyed in France and other countries.

Parliamentary interference and the introduction of several private bills in the House of Commons which came to nothing, checked, if they did not altogether stop, the prosecutions. The variety theatres advanced in every direction in number and importance. Ballets grew in splendour and coherence. The lighting and ventilation, the comfort and decoration of the various "palaces" (as many of them were now called) improved, and the public, as usual, were the gainers. Population increased, and the six millions of 1750 became forty millions and more. The same and only act (25 Geo. II. c. 36), adequate or inadequate, still remained. London is defined as the "administrative county of London," and its area—the 16 boroughs—锐 across our The Metropolitan Board of Works retired or was disorganized, and the London County Council was created and has taken its place. The London County Council, with extended power over structures and structural alterations, acquired the licensing of variety theatres and music halls from the local magistrates (the Middlesex, Surrey, Tower Hamlets and other magistrates) within the administrative county of London. The L. C. C. examine and enforce their powers. They have been advised that they can separate a music from a dancing licence if they like, and that when they grant the united licence the dancing means the dancing of paid performers on a stage, and not the dancing of the audience on a platform or floor, as at the short-lived "divertissement"-type of the London County Council. They are also advised that they can withhold licences, unless the applicants agree not to apply for a drink licence to the local magistrates sitting in brevity sessions, who still retain their control over the liquor trade. Theatre licences are often withheld unless a similar promise is made—the drink authority in this case being the Excise, empowered by the Act of William IV. (5 & 6 Will. IV. c. 39, s. 7).

The spread of so-called "sketches"—a kind of condensed drama or farce—in the variety theatres, and the action of the London County Council in trying to check the extension of refreshment licences to these establishments, with other grounds of disquiet on the part of managers (individuals or "limited companies"), led to the appointment of a second select committee of the House of Commons in 1892 and the production of another blue-book. The same ground was gone over, and the same objections were raised against a licensing authority
which is elected by public votes, only exists for three years
before another election is due, and can give no guarantee for
the continuity of its judgments. The consensus of opinion
(as in 1866) was in favour of a state official, responsible to
parliament—like the Home Office or the Board of Trade—the
preference being given to the lord chamberlain and his staff,
who know much about theatres and theatrical business. The
chairman of the committee was Lord Rathmore, and the report in
spirit was at once as the one of 1866. Three forms of licence were suggested:
one for theatres proper, one for music halls, and one for concert
rooms.

Though the rise and progress of the music hall and variety theatre interest is one of the most extraordinary facts of the
last half of the 19th century, the business has little or no
corporate organization, and there is nothing like a complete
registration of the various properties throughout the United
Kingdom. In London the "London Entertainments Pro-
tection Association," which has the command of a weekly
called the Music Hall and Theatre Review, looks after its
interests. In London alone over five millions sterling of
capital is said to be invested in these enterprises, employing
80,000 persons of all grades, and entertaining during the year
about 25,000,000 people. The annual applications for music
licences in London alone are over 300.

MUSK (Med. Lat. muscUS, late Gr. iboxos, possibly Pers.
mushe, from Sansk. muska, the scrotum), the name originally
given to a perfume obtained from the strong-smelling substance
secreted in a gland by the musk-deer (q.v.), and hence applied to
other animals, and also to plants, possessing a similar odour.
The variety which appears in commerce is a secretion of the
musk-deer, but the odour is also emitted by the musk-ox and
musk-elk of India and Europe, by the musk-duck (Bistrula
lobata) of West Australia, the musk-shrew, the musk-beetle
(Callimora moschata), the alligator of Central America, and by
several other animals. In the vegetable kingdom it is present
in the common musk (Mimulus moschatus), the musk-wood
of the Guianas and West Indies (Guarea, spp.), and in the seeds of
Hibiscus Abelmoschus (musk-seeds). To obtain the perfume
of the musk-deer the animal is killed and the gland com-
pletely removed, and dried, either in the sun, on a hot stone,
or by immersion in hot oil. It appears in commerce as "musk
in pod," i.e. the glands are entire, or as "musk in grain," in
which the perfume has been extracted from its receptacle.
Three kinds are recognized: (1) Chinese or Tibetan, imported
from China, the most valued; (2) Assam or Nepal, less
valuable; and (3) Karbardin or Russian (Siberian), imported
from Central Asia by way of Russia, the least valuable and
hardly admitting of adulteration. The Tong-king musk is
exported in small, gaily decorated caddies with tin or lead
linings, wherein the perfume is sealed down; it is now usually
transmitted direct by parcel post to the merchant.

Good musk is of a dark purplish colour, dry, smooth and
unctuous to the touch, and bitter in taste. It dissolves in boiling
water to the extent of about one-half; alcohol takes up one-third
of the substance, and ether and chloroform dissolve still less.
A special method, practised by the Chinese, renders it soluble
in air without any appreciable loss of weight, and its scent is not
only more penetrating but more persistent than that of any
other known substance. In addition to its odoriferous principle,
it contains ammonia, cholesterol, fatty matter, a bitter resinous
substance, and other animal principles. As a material in
perfumery it is of the first importance, its powerful and enduring
odor giving strength and permanency to the vegetable essences,
so that it is an ingredient in many compounded perfumes.

Artificial musk is a synthetic product, having a similar odour to
natural musk. It was obtained by Baur in 1888 by condensing
toluene with isobutyl bromide in the presence of aluminium chloride,
and nitrating the product. It is a symtrinitro-β-butyl toluene.
Many modifications have been made, and it appears that the
odor depends upon the symmetry of the three nitro groups.

MUSK-DEER (Moschus moschiferus), an aberrant member of
the deer family constituting the sub-family Cervidae Moschinae
(see DEER). Both sexes are devoid of antler appendage;
but in this the musk-deer agrees with one genus of true deer
(Hyelaphus), and as in the latter, the upper canine teeth of
the males are long and sabre-like, projecting below the chin,
with the ends turned somewhat backwards. In size the musk-
deer is rather less than the European roe-deer, being about
20 in. high at the shoulder. Its limbs, especially the hinder
pair, are long; and the feet remarkable for the great develop-
ment of the lateral pair of hoofs and for the freedom of motion
they all present, which must be of assistance to the animal
in steadying it in its agile bounds among the crags of its native
haunts. The ears are large, and the tail rudimentary. The
hair covering the body is long, coarse, and of a peculiarly
brittle and pith-like character, breaking easily; it is generally
of a greyish-brown colour, sometimes inclined to yellowish-red,
and often variegated with lighter patches. The musk-deer
inhabits the forest districts in the Himalaya as far west as
Gilgit, always, however, at great elevations—being rarely
found in summer below 8000 ft. above the sea-level, and ranging
as high as the limits of the thickets of birch, rhododendron
and juniper, among which it mostly conceals itself in the day-
time. The range extends into Tibet, Siberia and north-
western China; but the musk-deer of Kansu has been separated
as a distinct species, under the name of M. sikinicus. Musk-
deer are hardy, solitary and retiring animals, chiefly nocturnal
in habits, and almost always found alone, rarely in pairs and
never in herds. They are exceedingly active and surefooted,
having perhaps no equal in traversing rocks and precipitous
ground; and they feed on moss, grass, and leaves of the plants
which grow on the mountains.

Most mammals have certain portions of the skin specially
modified and provided with glands secreting odorous and fatty
substances characteristic of the particular species. The special
gland of the musk-deer, which has made the animal so well
known, and has proved the cause of unremitting persecution
to its possessor, is found in the male only, and is a sac about
the size of a small orange, situated beneath the skin of the
abdomen, the orifice being immediately in front of the prepu
tial aperture. The secretion with which the sac is filled is
dark brown or chocolate in colour, and when fresh of the
consistence of "moist gingerbread," but becoming dry and granular
after keeping (see Musk). The Kansu (M. sikinicus) differs from
the typical species in having longer ears, which are black on
the outer surface.

MUSKEGON, a city and the county-seat of Muskegon
county, Michigan, U.S.A., on Muskegon lake, an expansion of
Muskegon river near its mouth, about 4 m. from Lake
Michigan and 38 m. N.W. of Grand Rapids. Pop. (1890),
22,702; (1900), 20,818, of whom 6236 were foreign-born;
(1910 census) 24,062. It is served by the Grand Trunk, the Père Marquette, the Grand Rapids & Indiana, and the Grand Rapids, Grand Haven & Muskegon (electric) railways, and by steamer lines to Chicago, Milwaukee and other lake ports. There are several summer resorts in the vicinity. As the gifts of Charles H. Hackley (1837-1905), a rich lumberman, the city has an endowment fund to the public schools of about $2,000,000; a manual training school, which has an endowment of $600,000, and is one of the few endowed public schools in the United States; a public library, with an endowment of $275,000; a public hospital with a $600,000 endowment; and a poor fund endowment of $300,000. In Hackley Park there are statues of Lincoln and Farragut, and at the Hackley School there is a statue of McKinley; all three are by C. H. Niehaus. The municipality owns and operates its water-works. Muskegon lake is 5.5 miles long and 1.5 miles, meaning "it has a depth of 30 to 40 ft., and is ice-free throughout the year. The channel from Muskegon lake to Lake Michigan has been improved to a depth of 20 ft., and a width of 300 ft. by the Federal government since 1857. From Muskegon are shipped large quantities of lumber and market-garden produce, besides the numerous manufactures of the city. The total value of all factory products in 1904 was $6,319,441 (39.6% more than in 1900), of which more than one-sixth was the value of lumber. A trading post was established here in 1812, but a permanent settlement was not established until 1834. Muskegon was laid out as a town in 1839, incorporated as a village in 1861, and chartered as a city in 1865. The name is probably derived from a Chippewa word for musker or musker, meaning "grassy bog," still used in that sense in north-western America.

MUSKET (Fr. mousquet, Ger. Muskete, &c.), the term generally applied to the infantry soldier from about 1550 up to and even beyond the universal adoption of rifled small arms about 1850-1860. The word originally signified a male sparrowhawk (Italian moscheto, derived perhaps ultimately from Latin musca, a fly) and its application to the weapon may be explained by the practice of naming firearms after birds and beasts (cf. falcon, basilisk). Strictly speaking, the word is inappplicable both to the early hand-guns and to the arquebuses and calivers that superseded the hand-guns. The "musket" proper, introduced into the Spanish army by the duke of Alva, was much heavier and more powerful than the arquebus. Its bullet retained sufficient striking energy to stop a horse at 300 and 600 yards from the muzzle. A writer in 1598 (quoted s.v. in the New English Dictionary) goes so far as to say that "One good musket may be accounted for two callivers." Unlike the arquebus, it was fired from a rest, which the "musketeer" stuck into the ground in front of him. But during the 17th century the musket in use was so far improved that the rest could be dispensed with (see Gun). The musket was a matchlock, weapons with other forms of lock being distinguished as wheel-locks, flrelocks, match-locks, &c., and soldiers were similarly distinguished as musketeers and foot-soldiers. On the disuse, about 1600-1615, of this form of firing mechanism, the term "muskete" was in France at least, for a time discontinued in favour of fusil, or flint-lock, which thenceforward reigned supreme up to the introduction of a practicable percussion lock about 1830-1840. But the term "musket" survived the thing it originally represented, and was currently used for the firelock (and afterwards for the percussion weapon). To-day it is generically used for military firearms anterior to the modern rifle. The original meaning of the word musketry has remained almost unaltered since 1600; it signifies the fire of infantry small arms (though for this "rifle fire" is now a far more usual term). It is distinguished from calivers and other arms (see Infantry and Rifle). Of the derivatives, the only one that is not self-explanatory is musketoon. This was a short, large-bore musket somewhat of the blunderbuss type, originally designed for the use of cavalry, but afterwards, in the 18th century, chiefly a domestic or coachman's weapon.

MUSKHOGEAN STOCK, a North American Indian stock. The name is from that of the chief tribe of the Creek confederacy, the Muskogee. It includes the Creeks, Choctaws, Chickasaws, Seminoles and other tribes. Its territory was almost the whole state of Mississippi, western Tennessee, eastern Kentucky, Alabama, most of Georgia, and later nearly all Florida. The Muskogean traditions assign the west and north-west as the original home of the stock. Its history begins in 1527, on the first landing of the Spaniards on the Gulf Coast. The Muskogean peoples were then settled agriculturists with an elaborate social organization, and living in villages, many of which were fortified (see Indians: North American).

MUSKOGEE, a city and a county-seat of Muskogee county, Oklahoma, U.S.A., about 3 m. W. by S. of the confluence of the Verdigris, Neosho (or Grand) and Arkansas rivers, and about 130 m. E.N.E. of Oklahoma City. Pop. (1900), 4154; (1907), 14,418, of whom 2498 were negroes and 353 Indians; (1910), 25,278. It is served by the St. Louis & San Francisco, the Missouri, the Missouri, Kansas & Texas, and the Missouri, Oklahoma & Gulf railways. Fort Gibson (pop. in 1910, 1344), about 5 m. N.E. on the Neosho, near its confluence with the Arkansas, is the head of steam-boat navigation of the Arkansas; if is the site of a former government fort and of a national cemetery. Muskogee is the seat of Spaulding Institute (M.E. Church, South) and Nazareth Institute (Roman Catholic), and at Bacon, about 2 m. north-east, is Indian University (Baptist, opened 1884). Muskogee is the commercial centre of an agricultural and stock-raising region, is surrounded by an oil and natural gas field of considerable extent producing a high grade of petrol, and a large oil refinery, railway workshops of the Midland Valley and the Missouri, Oklahoma & Gulf railways), cotton gins, cotton compresses, and cotton-seed oil and flour mills. The municipality owns and operates the water-works, the water supply being drawn from the Neosho river. Muskogee was founded about 1870, and became the chief town of the Creek Nation (Muskogee) and the metropolis and administrative centre of the former Indian Territory, being the headquarters of the Union Indian Agency to the Five Civilized Tribes, of the United States (Dawes) Commission to the Five Civilized Tribes, and of a Federal land office for the allotment of lands to the Creeks and Cherokees, and the seat of a Federal Court. The city was chartered in 1898; its area was enlarged in 1908, increasing its population.

MUSK-OX, also known as musk-buffalo and musk-sheep, an Arctic American ruminant of the family Bovidae (g.) now representing a genus and sub-family by itself. Apparently the musk-ox (Ovibos moschatus) has little or no near relationship to either the oxen or the sheep; and it is not improbable that its affinities are with the Asiatic takin (Budorcas) and the extinct European Criotherium of the Pliocene of Samos. The musky odour from which the animal takes its name does not appear to be due to the secretion of any gland.

In height a bull musk-ox stands about 5 ft. at the shoulder. The head is large and broad. The horns in old males have extremely broad bases, meeting in the middle line, and covering the brow and crown of the head. They are directed at first downwards by the side of the face, and then turn upwards and forwards, ending in the same plane as the eye. The basal half is dull white, oval in section and coarsely fibrous, the middle part smooth, shining and round, and the tip black. In females and young males the horns are smaller, and their bases separated by a space in the middle of the forehead. The ears are small, erect, pointed, and nearly concealed in the hair. The space between the nostrils and the upper lip is covered with short close hair, as in sheep and goats, without any trace of the bare muzzle of oxen. The greater part of the animal is covered with long, coarse woolly hair, thick, matted and curly on the shoulders, so as to give the appearance of a hump, but elsewhere straight and hanging down—that of the sides, back and haunches reaching as far as the middle of the legs and entirely concealing the very short tail. There is also a thick woolly under-fur, shed in summer, when the whole coat comes off in blanket-like masses. The hair on the lower jaw, throat and chest is long and straight, and hangs down like a beard or dewlap, though
there is no loose fold of skin in this situation. The limbs are stout and short, terminating in unsymmetrical hoofs, the external being rounded, the internal pointed, and the sole partially covered with hair.

Musk-oxen at the present day are confined to the most northern parts of North America, where they range over the rocky Barren Grounds between lat. 64° and the shores of the Arctic Sea. Its southern range is gradually contracting, and it appears that it is no longer met with west of the Mackenzie river, though formerly abundant as far as Eschscholtz Bay.

Northwards and eastwards it extends through the Parry Islands and Grinnell Land to north Greenland, reaching on the west coast as far south as Melville Bay; and it also occurs at Sabine Island on the east coast. The Greenland animal is a distinct race (O. m. wardi), distinguished by white hair on the forehead; and it is suggested that the one from Grinnell Land forms a third race. As proved by the discovery of fossil remains, musk-oxen ranged during the Pleistocene period over northern Siberia and the plains of Germany and France, their bones occurring in river-deposits along with those of the reindeer, mammoth, and woolly rhinoceros. They have also been found in Pleistocene gravels in several parts of England, as Maidenhead, Bromley, Freshfield near Bath, Barnwood near Gloucester, and in the brick-earth of the Thames valley at Crayford, Kent; while their remains also occur in Arctic America.

Musk-oxen are gregarious in habit, assembling in herds of twenty or thirty head, or sometimes eighty or a hundred, in which there are seldom more than two or three full-grown males. They run with considerable speed, notwithstanding the shortness of their legs. They feed chiefly on grass, but also on moss, lichens and tender shoots of the willow and pine. The female brings forth one young in the end of May or beginning of June, after a gestation of nine months. The Swedish expedition to Greenland in 1899 found musk-oxen in herds of varying size—some contained only a few individuals, and in one case there were sixty-seven. The peculiar musky odour was perceived from a distance of a hundred yards; but according to Professor Nathorst there was no musky taste or smell in the flesh if the carcase were cleaned immediately the animals were killed.

Of late years musk-oxen have been exhibited alive in Europe; and two examples, one of which lived from 1899 till 1903, have been brought to England. The somewhat imperfect skull of an extinct species of musk-ox from the gravels of the Klondike has enabled Mr. W. H. Osgood to make an important addition to our knowledge of this remarkable type of ruminant. The skull, which is probably that of a female, differs from the ordinary musk-ox by the much smaller and shorter horn-cores, which are widely separated in the middle line of the skull, where there is a groove-like depression running the whole length of the forehead. The sockets of the eyes are also much less prominent, and the whole fore-part of the skull is proportionately longer. On account of these and other differences (for which the reader may refer to the original paper, published in vol. xlviii. of the Smithsonian Miscellaneous Collections)

its describer refers the Klondike skull to a new genus, with the title Symbos tyrelli, the specific name being given in honour of its discoverer. This, however, is not all, for Mr. Osgood points out that a skull discovered many years ago in the vicinity of Fort Gibson, Oklahoma, and then named Onobos or Bootherium cavifrons, evidently belongs to the same genus. That skull indicates a bull, and the author suggests that it may possibly be the male of Symbos tyrelli, although the wide separation of the localities made him hesitate to accept this view. Perhaps it would have been better had he done so, and taken the name Symbos cavifrons for the species. A third type of musk-ox skull is, however, known from North America, namely one from the celebrated Big-Bone Lick, Kentucky, on which the genus and species Bootherium bombifrons was established, which differs from all the others by its small size, convex forehead and rounded horn-cores, the latter being very widely separated, and arising from the sides of the skull. This specimen has been regarded as the female of Symbos cavifrons; but this view, as pointed out by Mr. Osgood, is almost certainly incorrect, and it represents an entirely distinct form.

This, however, is not the whole of the past history of the musk-ox group; and in this connexion it may be mentioned that palaeontological discoveries are gradually making it evident that the poverty of America in species of horned ruminants is to a great extent a feature of the present day, and that in past times it possessed a considerable number of representatives of this group. One of the latest additions to the list is a large sheep-like animal from a cave in California, apparently representing a new generic type, which has been described by E. L. Forbush in the publications of the University of California, under the name of Preptoceras andali. It is represented by a nearly complete skeleton, and has doubly curved horns and sheep-like teeth. In common with an allied ruminant from the same district, previously described as Escuratortherium, it seems probable that Preptoceras is related on the one hand to the musk-ox, and on the other to the Asiatic takin, while it is also supposed to have affinities with the sheep. If these extinct forms really serve to connect the takin with the musk-ox, their systematic importance will be very great. From a geographical point of view nothing is more likely, for the takin forms a type confined to Eastern Asia (Tibet and Szechuan), and it would be reasonable to expect that, like so many other peculiar forms from the same region, they should have representatives on the American side of the Pacific.

MUSK-RAT, or Musquash, the name of a large North American rat-like rodent mammal, technically known as Fiber sibiricus, and belonging to the mouse-tribe (Muridae). Aquatic in habits, this animal is related to the English water-rat and therefore included in the sub-family Microstomine (see Vole). It is, however, of larger size, the head and body being about 12 in.

In length and the tail but little less. It is rather a heavily-built animal, with a broad head, no distinct neck, and short limbs, the ears are small, and the ears project very little from the fur. The fore-limbs have four toes and a rudimentary thumb, all with claws; the hind limbs are larger, with five distinct toes, united by short webs at their bases. The tail is laterally compressed, nearly naked, and scaly. The hair much resembles that of a beaver, but it is shorter, it consists of a thick soft under-fur, interspersed with longer stiff, glistening hairs, which overlie and conceal the former, on the upper surface and sides of the
body. The general colour is dark umber-brown, almost black on the back and grey below. The tail and naked parts of the feet are black. The musky odour from which it derives its name is due to the secretion of a large gland situated in the inguinal region, and present in both sexes.

The ordinary musk-rat is one of several species of a genus peculiar to America, where it is distributed in suitable localities in the northern part of the continent, extending from the Atlantic to the Pacific, and from the Rio Grande to the barren grounds bordering the Arctic seas. It lives on the shores of lakes and rivers, swimming and diving with facility, feeding on the roots, stems and leaves of water-plants, or on fruits and vegetables which grow near the margin of the streams it inhabits. Musk-rats are most active at night, spending the greater part of the day concealed in their burrows in the bank, which consist of a chamber with numerous passages, all of which open under the surface of the water. For winter quarters they build more elaborate houses of conical or dome-like form, composed of sedges, grasses and similar materials plastered together with mud. As their fur is an important article of commerce, large numbers are annually killed, being either trapped or speared at the mouths of their holes. (See also Rodentia.)

**MUSK-SHREW**

*MUSK-SHREW,* a name for any species of the genus *Crocidura* of the family *Soricidae* (see Insectivora). The term is generally used of the common grey musk-shrew (*C. coerulea*) of India. Dr Dobson believed this to be a semi-domesticated variety of the brown musk-shrew (*C. marina*), which he considered the original wild type. The head and body of a full-grown specimen measure about 5 in.; the tail is rather more than half that length; and both greys and the striped phases of the musk-shrew are distributed under the surface. Dr Blanford states that the story of wine or beer becoming impregnated with a musky taint of consequence of this shrew passing over the bottles, is less credited in India than formerly owing to the discovery that liquors bottled in Europe and exported to India are not liable to be thus tainted.

**MUSLIM IBN AL-HAJJĀJ,** the Imam, the author of one of the two books of Mahomedan tradition called *Ṣaḥīḥ,* "sound," was born at Nishapur at some uncertain date after A.D. 815 and died there in 875, i.e., after the death of his son. Like all-Bukhārī (q.v.), of whom he was a close and faithful friend, he gave himself to the collecting, sifting and arranging of traditions, travelling for the purpose as far as Egypt, where he was a plain that his sympathies were with the traditionalist, school or opposed to that to which sought to build up the system of canon law on a speculative basis (see Mahomedan Law). But though he was a student and friend of Ahmad ibn Hanbal (q.v.) he did not go in traditionalism to the length of some, and he defended al-Bukhārī when the latter was driven from Nishapur for refusing to admit that the utterance *laṣa* of the Koran by man was as uncreated as the Koran itself (see Mahomedan Religion; and Patton's *Ahmad ibn Hanbal*, 32 sqq.). His great collection of traditions is second in popularity only to that of al-Bukhārī, and is commonly regarded as more accurate and reliable in details, especially names. His object was more to weed out illegitimate accretions than to furnish a traditional basis for a system of law. Therefore, though he arranged his material according to such a system, he did not add guiding rubrics, and he regularly brought together in one place the different parallel versions of the same tradition. His book is thus historically more useful, but legally less suggestive. His biographers give almost no details as to his life, and its early part was probably very obscure. One gives a list of as many as twenty works, but only his *Ṣaḥīḥ* seems to have reached us.

**MUSLIM** (through Fr. *mousseline* from It. *mussolino*, diminutive of *Mussolo*, i.e., the town Mosul in Kurdistān) a light cotton cloth said to have been first made at Mosul, a city of Mesopotamia. Muslins have been largely made in various parts of India, whence they were imported to England towards the end of the 17th century. Some of these Indian muslins were very fine and costly. Among the specialties are *Arni muslin,* made in the Madras presidency, and *Dacca muslin,* made at Dacca in Bengal. Muslins of many kinds are now made in Europe and America, and the name is applied to both plain and fancy cloths, and to printed calicos of light texture. *Swiss muslin* is a light variety, woven in stripes or figures, originally made in Switzerland. *Book muslin* is made in Scotland from very fine yarns. Musls, jacquets, lenos, and other cloths exported to the East and elsewhere are sometimes described as muslins. Muslim is used for dresses, blouses, curtains, &c.

**MUSONIUS RUFUS,** a Roman philosopher of the 1st century A.D., was born in Etruria about A.D. 20-30. He fell under the ban of Nero owing to his ethical teachings, and was exiled to the island of Cyarus on a trumped-up charge of participation in Piso’s conspiracy. He returned under Galba, and was the friend of Vitellius and Vespasian. It was he who dared to bring an accusation against P. Egnatius Celer (the Stoic philosopher whose evidence had condemned his patron and disciple Soranus) and who endeavoured to preach a doctrine of peace and goodwill among the soldiers of Vespasian when they were advancing upon Rome. So highly was he esteemed in Rome that Vespasian made an exception in his case when all other philosophers were expelled from the city. As to his death, we know only that he was not living in the reign of Trajan. His philosophy, which is in most respects identical with that of his pupil, Epictetus, is marked by its strong practical tendency. Though he did not altogether negate logic and physics, he maintained that virtue is the only real aim of life. This virtue is not a thing of practical activity, but a practical, living reality. It is identical with philosophy in the true sense of the word, and the truly good man is also the true philosopher.

Suidas attributes numerous works to him, amongst others a number of letters to Apollonius of Tyana. The letters are certainly unauthentic; about the others there is no evidence. His views were defended by Claudius (or Jesus) Pella, from whom Stobaeus obtained his information. See Ritter and Preller §§ 477, 488, 489; Tactius, *Annales*, xv, 71 and *Histories*, iii, 81, and compare articles Stoics and Epictetus.

**MUSPRATT, JAMES** (1793-1886), British chemical manufacturer, was born in Dublin on the 12th of August 1793, at the age of fourteen he was apprenticed to a wholesale draper, but his apprenticeship was terminated in 1810 by a quarrel with his master, and in 1812 he went to Spain to take part in the Peninsular War. Lack of influence prevented him from getting a commission in the cavalry, but he followed the British army on foot far into the interior, was laid up with fever at Madrid, and, narrowly escaping capture by the French, succeeded in making his way to Lisbon. There he joined the navy, but after taking part in the blockade of Brest he was led to desert, through the harshness of the discipline on the second of the two ships in which he served. Returning to Dublin about 1814, he began the manufacture of chemical products, such as hydrochloric and acetic acids and turpentine, adding prussiate of potash a few years later. He also had in view the manufacture of alkali from common salt by the Leblanc process, but on the one hand he could not command the capital for the plant, and on the other saw that Dublin was not well situated for the experiment. In 1822 he went to Liverpool, which was at once a good port and within easy reach of salt and coal, and took a lease of an abandoned glass-works on the bank of the canal in Vauxhall Road. At first he confined himself to the manufacture of sulphur, and in 1823, when the tax on sulphur was reduced from 15s, to 2s a bushel, his profits enabled him to erect lead-chambers for making the sulphuric acid necessary for the Leblanc process. In 1828 he built works at St. Helen's and in 1830 at Newton; at the latter place he was long harassed by litigation on account of the damage done by the hydrochloric acid emitted from his factory, and finally in 1850 he left it and started new works at Widnes and Flint. In 1834-1835, in conjunction with Charles Tennant, he purchased sulphur mines in Sicily, to provide the raw material for his sulphuric acid; but on the imposition of the Neapolitan
government of a prohibitive duty on sulphur. Musschenbroek found a substitute in iron pyrites, which was thus introduced as the raw material for the manufacture of sulphuric acid. He was always anxious to employ the best scientific advice available and to try every novelty that promised advantage. He was a close friend of Liebig, whose mineral manures were compounded at his works. He died at Seaforth Hall, near Liverpool, on the 4th May 1856. — After his retirement in 1857 his business was continued in the hands of four of his ten children.

His eldest son, James Sheridan Musschenbroek (1821–1871), studied chemistry under Thomas Graham at Glasgow and London and under Liebig at Giessen, and in 1848 founded the Liverpool College of Chemistry, an institution for training chemists, of which he also acted as director. From 1854 to 1860 he was occupied in preparing a dictionary of Chemistry, ... as applied and relating to the Arts and Manufactures, which was translated into German and Russian, and he published a translation of Plattner’s treatise on the blow-pipe in 1845, and Outlines of Analysis in 1849. His original work included a research on the sulphides (1845), and the preparation of toluidine and nitro-aniline in 1845–1846 with A. W. Hofmann.

Musschenbroek, Pieter van (1692–1761), Dutch natural philosopher, was born on the 14th of March 1692 at Leiden, where his father Johann Joosten van Musschenbroek (1660–1707) was a maker of physical apparatus. He studied at the university of his native city, where he was a pupil and friend of W. J. s'G. Gravesande. Graduating in 1715 with a dissertation, De aëris præsenta in humoribus animalium, Musschenbroek was appointed professor at Duisburg in 1719. In 1725 he was promoted to the chair of natural philosophy and mathematics at Utrecht. In 1731 he declined an invitation to Copenhagen, and was promoted in consequence to the chair of astronomy at Utrecht in 1732. The attempt of George II. of England in 1737 to attract him to the newly-established university of Göttingen was also unsuccessful. At length, however, the claims of his native city overcame his resolution to remain at Utrecht, and he accepted the mathematical chair at Leiden in 1739, where, declining all offers from abroad, he remained till his death on the 9th of September 1761.

His first important production was Epitome elementorum physicomathematicorum (12mo, Leiden, 1726)—a work which was afterwards enlarged and re-issued in a larger folio edition, and which appeared at length (posthumously, ed. by Johann Lulofs, one of his colleagues as Leiden) in 1762, under the title of Introductio ad philosophiam naturalis. The Physicae experimentes et observationes philosophicae, which Musschenbroek had invented, and of several experiments which he had made on the expansion of bodies by heat. Musschenbroek was also the author of Elementa physica (8vo, 1729), and his name is associated with the invention of the Leyden jar (q.v.).

Musschenbroek—Mussel

MUSSEL (O. Eng. muscle, Lat. musculus, diminutive of mus, mouse, applied to small sea fish and mussels), a term applied in England to two families of Lamellibranchiatae— the marine Mytilacea, of which the edible mussel, Mytilus edulis, is the representative; and the fresh-water Unionidae, of which the river mussel, Unio pictorum, and the swan mussel, Anodonta cygnea, are the common British examples. It is not obvious why these fresh-water forms have been associated popularly with the Mytilacea under the name mussel, unless it be on account of the frequently very dark colour of their shells. They are somewhat remote from the sea mussels in structure, and have not even a common economic importance.

The sea mussel (Mytilus edulis) belongs to the second order of the class Lamellibranchiata (q.v.), namely the Filibranchia, distinguished by the comparatively free condition of the gill-filaments, which, whilst adhering to one another to form gill-plates, are yet not fused to one another by concrecence. It is also remarkable for the small size of its foot and the large development of two glands in the foot—the byssus-forming and the byssus-cementing glands. The byssus is a collection of horny threads by which the sea mussel (like many other Lamellibranchia or bivalve molluscs) fixes itself to stones, rocks or submerged wood, but is not a permanent means of attachment, since it can be discarded by the animal, which, after a certain amount of locomotion, again fixes itself by new secretion of byssus from the foot. Such movement is more frequent in young mussels than in the full-grown. Mytilus possesses no siphonal tube-like productions of the margin of the mantle, nor any notching of the same, representative of the siphons which are found in its fresh-water ally, the Dreissensa polymorpha.

Mytilus edulis is an exceedingly abundant and widely distributed form. It occurs on both sides of the northern Atlantic and in the Mediterranean basin. It presents varieties of form and colour according to the depth of water and other circumstances of its habitat. Usually it is found on the British coast encrusting rocks exposed at low tides, or on the flat surfaces formed by sandbanks overlying clay, the latter kind of colonies being known locally as "scallops." Under these conditions it forms continuous masses of individuals closely packed together, sometimes extending over many acres of surface and numbering millions. The readiness with which the young Mytilus attaches itself to wicker-work is the means of artificially cultivating and securing these mussels for the market both in the Bay of Kiel in North Germany and at the mouth of the Somme and other spots on the coast of France.

Natural scalps are subject to extreme vicissitudes: an area of many acres may be destroyed by a local change of current producing a deposit of sand or siltage over the scalp, or by exposure to frost at low tide in winter, or by accumulation of decomposing vegetable matter. The chief localities of natural scalps on the British coast are Morecambe Bay in Lancashire and the flat eastern shores, especially that of the Wash of Lincoln, and similar shallow bays. These scalps are in some cases in the hands of private owners, and the Fisheries Department has made arrangements by which some local authorities, e.g. the corporation of Boston, can lease layoffs to individuals for the purpose of artificial cultivation.

The sea mussel is scarcely inferior in commercial value to the oyster. In 1873 the value of mussels exported from Antwerp alone to Paris was used as human food was £36,000. In Britain the mussel fisheries are of considerable importance, and fisheries are held to be the most effective of all baits. Twenty-eight boats engaged in haddock-fishing at Eyemouth between October (1878) and May in 1879 in 35,000 bushels (47,000,000 individuals), costing nearly £100 to the fisherman, about one-third of which sum was expended on the carriage of the mussels. The quantity of mussels landed on Scottish coasts has decreased in recent years. In 1886 the total quantity landed was from 243,000 cwt., valued at £14,950; in 1902 it was only 95,663 cwt., valued at £5976. In the statistics for England and Wales mussels are not separately distinguished. Many thousand tons of mussels are wastefully employed as manure by the farmers on lands adjoining scalp-producing coasts, as in Lancashire and Norfolk, three half-pence a bushel being the price quoted in such cases. It is a curious fact, illustrative of the ignorant procedure and arbitrary fashions of fisher-folk, that on the Atlantic seaboard of the United States the sea mussel, Mytilus edulis, though common, is not used as bait nor as food. Instead, the soft clam, Mercenaria, a Lamellibranch not used by English or American fisher-men for bait or food, is used to the extent of 1 million bushels per annum, valued at £120,000. At the mouth of the river Conway in North Wales the sea mussel is crushed in large quantities (the density of the water of the North Sea being 1026). Experiments made by removing mussels from salt water to brackish, and finally to quite fresh water show that it is even more tolerant of fresh water than of salt. If the thirty mussels examined were alive after fifteen days. Mytilus edulis is occasionally poisonous, owing to conditions not satisfactorily determined.

The fresh-water Mussels, Anodonta cygnea, Unio pictorum,
and Unio margaritiferus belong to the order Lamellibranchia. Lamellibranchia, Unio differs in no important point from Anodonta. The shells of the family are the same size, shells being used at one time for holding water-colour paints as new shells of this species and of the sea mussel are used for holding gold and silver paint sold by artists' colourmen, but it has no other economic value. Unio margaritiferus, the pearl mussel, was at one time of considerable importance as a source of pearls, and the pearl mussel fishery is to this day carried on under peculiar state regulations in Sweden and Saxony, and other parts of the continent. In Scotland and Ireland the pearl mussel industry was also of importance, but has altogether dwindled to insignificance since the opening up of commercial intercourse with the East and with the islands of the Pacific Ocean, whence finer and more abundant pearls are obtained, than those of the oyster. In the last forty years of the 18th century pearls produced from the Scotch fisheries to Paris to the value of £100,000; round pearls, one inch in diameter, per dozen, were brought as high as £3 or £4. The pearl mussel was formerly used as bait in the Aberdeen cod fishery.

LITERATURE.—For an account of the anatomy of Mytilus edulis the reader is referred to the treatise by Sabatier on that subject (Paris, 1875). The essay by Charles Harding on Mollusca used for Food or Bait, published by the committee of the London International Fisheries Exhibition (1885), may be consulted as to the economic questions connected with the sea mussel. The internal structure of this species is described by Wilson in Fifth Ann. Rep. Scot. Fish. Board (1887).

MUSSELBURGH, a municipal and police burgh of Midlothian, Scotland, 53 m. E. of Edinburgh by the North British railway. Pop. (1901) 17,711. The burgh, which stretches for a mile along the south shore of the Firth of Forth, is intersected by the Esk and embraces the village of Fishersrow on the left bank of the river. Its original name is said to have been Eskmouth, its present one being derived from a bed of mussels at the mouth of the river. While preserving most of the ancient features of its High Street, the town has tended to become a suburb of the capital, its fine beach and golf course hastening this development. The public buildings include the town-hall (dating from 1762 and altered in 1876), the tolbooth (1590), and the grammar school. Loretto School, one of the foremost public schools in Scotland, occupies the site of the chapel of Our Lady of Loretto, which was founded in 1534 by Thomas Duthie, a hermit from Mt Sinai. This was the favourite shrine of Mary of Guise, who betook herself hither at momentous crises in her history. The 1st earl of Hertford destroyed it in 1544, and after it was rebuilt the Reformers demolished it again, some of its stones being used in erecting the tolbooth. In the west end of the town is Pinkie House, formerly a seat of the abbey of Dunfermline, but transformed in 1613 by Lord Seton. It is a fine example of a Jacobean mansion, with a beautiful fountain in the middle of the court-yard. The painted gallery, with an elaborate ceiling, 100 ft. long, was utilized as a hospital after the battle of Pinkie in 1567. Prince Charles Edward slept in it the night following the fight at Prestonpans (1745). Near the tolbooth stands the market cross, a stone column with a unicorn on the top supporting the burgh arms. At the west end of High Street is a statue of David Macbeth Moir ("Voltaire of Scotland"). Musset, Alfred de Musset's most famous son. The antiquity of the town is placed beyond doubt by the Roman bridge across the Esk and the Roman remains found in its vicinity. The chief bridge, which carries the high road from Edinburgh to Berwick, was built by John Rennie in 1807. The principal industries include paper-making, brewing, the making of nets and twine, bricks, tiles and pottery, tanning and oil-refining, besides saltworks and seed-crushing works. The fishery is confined to Fishersrow, where there is a good harbour. The Links are the scene every year of the Edinburgh race meetings and of those of the Royal Caledonian Hunt which are held every third year. Among the public buildings are also a municipal hall and the Caledonian Hotel, which was opened in 1830. The Caledonian Hotel is on the site of the old Tolbooth, which was burned in 1797.

MUSSET, LOUIS CHARLES ALFRED DE (1810-1857), French poet, play-writer and novelist, was born on the 11th of December 1810 in a house in the middle of old Paris, near the Hôtel Chiny. His father, Victor de Musset, who traced his descent back as far as 1140, held several ministerial posts of importance. He brought out an edition of J. J. Rousseau's works in 1821, and followed it soon after with a volume on the Genevan's life and writing. In Alfred de Musset's childhood there were various things which fostered his imaginative power. He and his brother Paul (born 1804, died 1886), who afterwards wrote a biography of Alfred, delighted in reading old romances together, and in assuming the characters of the heroes in those romances. But it was not until about 1826 that Musset gave any definite sign of the mental force which afterwards distinguished him. In the summer of 1827 he won the second prize (at the Collège Henri IV.) by an essay on "The Origin of our Feelings." In 1828, when Eugène Scribe, Joseph Duveyrier, who under the name of Mélesville, was a prolific playwriter and sometimes collaborator with Scribe, and others of note were in the habit of coming to Mme de Musset's house at Autueil, where drawing-room plays and charades were constantly given, Musset, excited by this companionship, wrote his first poem. This, to judge from the extracts preserved, was neither better nor worse than much other work of clever boys who may or may not afterwards turn out to be possessed of genius. He took up the study of law, threw it over for that of medicine, which he could not endure, and ended by adopting no set profession. Shortly after his first attempt in verse he was taken by Paul Fouché to Victor Hugo's house, where he met such men as Alfred de Vigny, Prosper Mérimée, Charles Nodier and Sainte-Beuve. It was under Hugo's influence, no doubt, that he composed a play. The scene was laid in Spain, and some lines, showing a marked advance upon his first effort, are preserved. In 1838, when the war between the classical and the romantic school of literature was growing daily more serious and exciting, Musset had published some verses in a country newspaper, and boldly recited some of his work to Sainte-Beuve, who wrote of it to a friend, "There is amongst us a boy full of genius." At eighteen years old Musset produced a translation, with additions of his own, of De Quincy's "Opium-Eater." This was published by Mame, attracted no attention, and has been long out of print. His first original volume was published in 1829 under the name of Contes d'Espagne et d'Italie, had an immediate and striking success, provoked bitter opposition, and produced many unworthy imitations. This volume contained, along with far better and more important things, a fantastic parody in verse on certain productions of the romantic school, which made a deal of noise at the time. This was the famous "Ballade à la lune," with its recurring comparison of the moon shining above a steeple to the dot over an i. It was sent to Musset's delight, taken quite seriously by many worthy folk.

In December 1830 Musset was just twenty years old, and was already conscious of that curious double existence within him so frequently symbolized in his plays—in Octave and Célio for instance (in Les Caprices de Marianne), who also stand for the two camps, the men of matter and the men of feeling—which he elsewhere described as characteristic of his
MUSSET, ALFRED DE

It is a mark of MUSSET's genius that he could write with equal ease and equal success in the French stage and in the romantic schools. Thus he was strong and keen to weld together the merits of both schools in a new method which, but for the fact that there has been no successor to grasp the wand which its originator wielded, might well be called the school of MUSSET. The serious effect produced upon MUSSET by the failure of his **Nuit vénitienne** is curiously illustrative of his character. A man of greater strength and with equal belief in his own genius might have gone on appealing to the public until he compelled them to hear him. MUSSET gave up the attempt in disgust, and waited until the public were eager to hear him without any invitation on his part. In the case of his finest plays, it was long before that he was fully recognized as a poet of the first rank and as an extraordinary master of character and language in prose writing.

In his complete disgust with the stage after the failure above referred to there was no doubt something of a not ignoble pride, but there was something also of weakness—of a kind of weakness out of which it must be said sprang some of his most exquisite work, some of the poems which could only have been written by a man who imagined himself the crushed victim of difficulties which were old enough in the experience of mankind, though for the moment new and strange to him.

MUSSET now belonged, in a not very whole-hearted fashion, to the "Cénacle," but the connection came to an end in 1832. In 1833 he published the volume called **Un Spectacle dans un fauteuil**. One of the most striking pieces in this—"Namouna"—was written at the publisher's request to fill up some empty space; and this fact is noteworthy when taken in conjunction with the horror which MUSSET afterwards so often expressed of doing anything like writing "to order"—of writing, indeed, in any way or at any moment except when the inspiration or the fancy happened to seize him. The success of the volume seemed to be small in comparison with that of his **Contes d'Espagne**, but it led indirectly to MUSSET's being engaged as a contributor to the **Revue des deux mondes**. In this he published, in April 1834, **André del Sarto**, and he followed this complete work later with **Les Caprices de Marianne**. This play afterwards took and holds rank as one of the classical pieces in the repertory of the **Théâtre Français**. After the retirement in 1837 from the stage of the brilliant actor Delaunay the piece dropped out of the Frangais repertory until it was replaced on the stage by M. Jules Clarétie, administrator-general of the **Comédie Française**, on the 10th of January 1906. **Les Caprices de Marianne** affords a fine illustration of the method referred to above, a method of which MUSSET gave something like a definite explanation five years later. This explanation was also published in the **Revue des deux mondes**, and it set forth that the way of the comic and the lyric comic schools could never end in a definite victory for either school, nor was it desirable that it should so end. "It was time," MUSSET said, "for a third school which should unite the merits of each." And in **Les Caprices de Marianne** these merits are most curiously and happily combined. It has perhaps more of the Shakespearean quality—the quality of artfully mingling the terrible, the grotesque, and the high comedy tones—which exists more or less in all MUSSET's long and more serious plays, than is found in any other of these. The piece is called a comedy, and it owes this title to its extraordinary brilliancy of dialogue, truth of characterization, and stiffness in action, under which there is ever latent a sense of impending doom. Many of the qualities indicated are found in others of MUSSET's dramatic works and notably in **On ne badine pas avec l'amour**, where the skill in insensibly preparing his hearers or readers through a succession of dazzling comedy scenes for the swift destruction of the end is very marked. But **Les Caprices de Marianne** is perhaps for this particular purpose of illustration the most compact and most typical of all.

The appearance of **Les Caprices de Marianne** in the **Revue** (1833) was followed by that of "Rolla," a symptom of the **maladie du siècle**. Rolla, for all the smack which is not to be denied of Wertherism, has yet a decided individuality.

The poem was written at the beginning of MUSSET's liaison with George Sand, and in December 1833 MUSSET started on the unfortunate journey to Italy. It was well known that the rupture of what was for a time a most passionate attachment had a disastrous effect upon MUSSET, and brought out the weakest side of his moral character.

He was at first absolutely and completely struck down by the blow. But it was not so well known until Paul de MUSSET pointed it out that the passion expressed in the **Nuit de décembre**, written about twelve months after the journey to Italy, referred not to George Sand but to another and quite a different woman. The story of the Italian journey and its results are told under the guise of MUSSET's relations with George Sand. The **Confession** is exceptionally interesting as exhibiting the poet's frame of mind at the time, and the approach to a revulsion from the Bonapartist ideas amid which he had been brought up in his childhood. To the supreme power of Napoleon he in this work attributed that moral sickness of the time which he described. "One man," he wrote, "absorbed the whole life of Europe; the rest of the human race struggled to fill their lungs with the air that he had breathed." When the emperor fell, "a ruined world was a resting-place for a generation weighted with care." The **Confession** is further important, apart from its high literary merit, as exhibiting in many passages the poet's tendency to shun or wildly protest against all that is disagreeable or difficult in human life—a tendency to which, however, much of his finest work is due. To 1836 belong the **Nuit d'août**, the **Lettre à Lamartine, les Stances à la Malibran**, the comedy **Il ne faut jurer de rien**, and the beginning of the brilliant letters of Dupuis and Cotonet on romanticism. **Il ne faut jurer de rien** is as typical of MUSSET's comedy work as is **Les Caprices de Marianne** of the work in which a terrible fatality underlies the brilliant dialogue and keen polished characterization. In 1837 was published **Un Caprice**, which afterwards found its way to the Paris stage by a curious road. Mme Allain-Despréaux, the actress, heard of it in St Petersburg as a Russian piece. On asking for a French translation of the play she received the volume **Comédies et dérangements** reprotted from the **Revue des deux mondes**. In 1837 appeared also some of the **Nouvelles**. In 1839 MUSSET began a romance called **Le Pêche d'épouvante**, of which the existing fragments are full of passion and insight. In 1840 he passed through a period of feeling that the public did not recognize his genius—as, indeed, they did not—and wrote a very short but very striking series of reflections headed with the words "À trente ans," which Paul de MUSSET published in his **Life**. In 1841 there came out in the **Revue de Paris** Musset's "Le Rhin allemand," an answer to Becker's poem which appeared in the **Revue des deux mondes**. This fine war-song made a great deal of noise, and brought to the poet quantities of challenges from German officers. Between this date and 1845 he wrote comparatively little. In the last named year the charming "proverb" *Il faut qu'une porte soit ouverte ou fermée* appeared. In 1847
Un Caprice was produced at the Théâtre Français, and the employment in it of such a word as "rebonsoir" shocked some of the old school. But the success of the piece was immediate and marked. It increased Musset's reputation with the public in a degree out of proportion to its intrinsic importance; and indeed freed him from the burden of depression caused by wild and excessive imagination. In 1828 Il ne faut jurer de rien was played at the Théâtre Français and the Chandelier at the Théâtre Historique. Between this date and 1857, Bettine was produced on the stage and Carmosine written; and between this time and the date of his death, from an affection of the heart, on the 2nd of May 1857, the poet produced no large work of importance.

Alfred de Musset now holds the place which Sainte-Beuve first accorded, then denied, and then again accorded to him—as a poet of the first rank. He had genius, though not genius of that strongest kind which its possessor can always keep in check. His own character worked both for and against his success as a writer. He inspired a strong personal affection in his contemporaries. His very weakness and his own consciousness of it produced such beautiful work as, to take one instance, the Nuit d'octobre. His Nouvelles are extraordinarily brilliant; his poems are charged with passion, fancy and fine satiric power; in his plays he hit upon a method of his own, in which no one has dared or availed to follow him with any closeness. He was one of the first, most original, and in the end most successful of the first-rate writers included in the phrase "the 1830 period." The wilder side of his life has probably been exaggerated; and his brother Paul de Musset has given in his Biographie a striking testimony to the finer side of his character. In the later years of his life Musset was elected, not for 

MUSTANG, the wild or semi-wild horse of the prairies of America, the descendant of the horses imported by the Spanish after the conquest in the 16th century (see Horse). The word appears to be due to two Spanish words, mestreno, or mesteñaco, defined by Minshew (1599) as "a strayer." Mestreno (now mesteno) means "wild, having no master," and appears to be derived from mesta, a grazer-association, which among other functions appropriated any wild cattle found with the herd.

MUSTARD. The varieties of mustard-seed of commerce are produced from several species of the genus Brassica (a member of the natural order Cruciferae). Of these the principal are the black or brown mustard, Brassica nigra (Sinapis nigra), the white mustard, Brassica alba, and the Sarepta mustard, B. juncea. Both the white and black mustards are cultivated to some extent in various parts of England. The white is to be found in every garden as a salad plant; but it has come into increasing favour as a forage crop for sheep, and as a green manure, for which purpose it is ploughed down when about to come into flower. The black mustard is grown solely for its seeds, which yield the well-known condiment. The name of the condiment was in French moutarde, mod. moutarde, as being made of the seeds of the plant pounded and mixed with must (Lat. mustum, i.e. unfermented wine). The word was thus transferred to the plant itself. When white mustard is cultivated for its herbage it is sown usually in July or August, after some early crop has been removed. The land being brought into a fine tilth, the seed, at the rate of 12 lb per acre, is sown broadcast, and covered in the way recommended for clover seeds. In about six weeks it is ready either for feeding off by sheep or for ploughing down as a preparative for wheat or barley. White mustard is not fastidious in regard to soil. When grown for a seed crop it is treated in the way about to be described for the other variety. For this purpose either kind requires a fertile soil, as it is an exhausting crop. The seed is sown in April, is once hoed in May, and requires no further culture. As soon as the pods have assumed a brown colour the crop is reaped and laid down in handfuls, which lie until dry enough for thrashing or stacking. In removing it from the ground it must be handled with great care, and carried to the threshing-floor or stack on cloths, to avoid the loss of seed. The price depends much on its being sown as described, and the quality suffers much otherwise. This great evil attends its general culture, for which are unavoidably shed in harvesting the crop remain in the soil, and stock it permanently with what proves a pestilent weed amongst future crops. White mustard is used as a small salad—generally accompanied by garden cress—while still in the seed leaf. To keep up a supply the seed should be sown every week or ten days. The sowings in the open ground may be made from March till October, earlier or later according to the season. The ground should be light and rich, and the situation warm and sheltered. Sow thickly in rows 6 in. apart, and slightly cover the seed, pressing the surface smooth with the back of the spade. When gathering the leaves cut the young plants off even with the ground, or pull

1 There were two kinds of mustum, one the best for keeping, produced after the first treading of the grapes, and called mustum lxicium; the other, mustum torivum, obtained from the mass of trodden grapes by the wine-press, was used for inferior purposes.
MUSTARD OILS—MUSURUS

The uses of mustard leaves in the treatment of local pains are well known. When a marked counter-irritant action is needed, a much too often performed practice, a thin paste of mustard, and in causing a less degree of vescication; but the cutaneous damage done by mustard usually takes longer to heal. A mustard sitz bath will often hasten and alleviate the initial stage of menstruation, and sometimes even to effect a simultaneous elimination in the nose or bronchial. The proportion of an ounce of mustard to a gallon of water is a fair one and easily remembered. But by far the most important therapeutic application of mustard is as a unique emetic.

MUSTARD OILS, organic chemical compounds of general formula R-NCS. They may be prepared by the action of carbon bisulphide on primary amines in alcoholic or ethereal solution, the alkyl dithio-carbamic compounds formed being then precipitated with mercuric chloride, and the mercuric salts heated in aqueous solution.

2-NH₂CS₂CNS₄H₈CH₃ \[ \rightarrow \] HS⁻⁺⁺HS⁻⁺⁺+2R-NCS;

or the isocyanic esters may be heated with phosphorus pentasulphide (A. Michael and G. Palmer, Amer. Chem. Jour., 1884, 6, 257). They are colourless liquids with a very pungent irritating odour. They are readily oxidized, with production of the corresponding amine. Nascent hydrogen converts them into the amine, with simultaneous formation of thio-formaldehyde, RNC⁺⁺⁺⁺H⁺⁺⁺⁺H₂CSH⁻++. When heated with acids to 100° C., they decompose with formation of the amine and liberation of carbon bisulphide and sulphurated hydrogen. They are used industrially in the manufacture of rubber, mercuric salts, and amine and aldehyde enamines.

Methyl mustard oil, CH₃NCS, melts at 35° C. and boils at 119° C. Alkyl mustard oil, CH₃NH₂C₄H₈O₄S, is the principal constituent of the ordinary mustard oil obtained on distilling black mustard seeds. These seeds contain potassium myroant (CH₃NH₂N₂O₄K) which in presence of water is convertible into the chief toxic substances of the seed. CH₃NH₂N₂O₄K = CH₃H₂0+C₂H₂O₅S+CH₃NCS. It may also be prepared by heating alkyl sulphide with potassium sulphocyanide. It is a colourless liquid boiling at 190° C. It combines directly with potassium bisulphide. Phenyl mustard oil, CH₃C₆H₅NCS, is obtained by boiling sulphocyanidate with concentrated hydrochloric acid, some triphenylguanidine being formed at the same time. It is a colourless liquid boiling at 228° C. When heated with copper powder it yields benzonitrile.

MUSTER (Med. Eng. muster, monstre, adapted from the similar O. Fr. forms; Lat. monstrare), originally an exhibition, show, parade, exhibition, was afterwards limited to the assembling of the ranks of a regiment, which in the hands of the commander was a new military discipline invented by Louis XIV. of France. It was not until the middle of the 18th century that the word was brought into the English language with no changing of the meaning. One of the meanings of this common Romance word, viz. pattern, sample, is only used in commercial usage in English (e.g. in the cutlery trade), but it has passed into Teutonic languages, Ger. Muster, Du. monder. The most general meaning is for the assembling of soldiers and sailors for inspection and review, and more particularly for the ascertainment and verification of the numbers on the roll. This use is seen in the Med. Lat. monstrare and monstratio, "recensio militum" (Du Cange, Gloss. s.v.). In the "enlisting" system of army organization during the 16th and 17th centuries, and later in certain special situations, each regiment was enlisted by its colonel and reviewed by the king, "monstrato" in the presence of the king and members on the pay roll of the regiment representing its actual strength. This was a necessary precaution in the days when it was in the power of the commander of a unit to fill the muster roll with the names of fictitious men, known in the military slang of France and England as passe-collants and "fagots" respectively. The chief officer at headquarters was the muster-master-general, later comissary general of musters. In the United States the term is still commonly used, and a soldier is "mustered out" when he is officially discharged from military service.

MUSURUS, MARCUS (c. 1470-1517), Greek scholar, was born in Rhithymna on the island of Crete. At an early age he became a pupil of John Lascaris at Venice. In 1505 he was made professor of Greek at Padua, but when the university was closed in 1509 during the war of the league of Cambrai he
MUTE—MUTILATION

99

returned to Venice, where he filled a similar post. In 1516 he was summoned to Rome by Leo X., who appointed him archbishop of Monemvasia (Malvasia) in the Peloponnesse, but he died before he left Italy. Since 1493 Musurus had been associated with the famous printer Aldus Manutius, and belonged to the "conterfacentia," a society founded by Manutius and other learned men for the promotion of Greek studies. Many of the Aldine classics were brought out under Musurus' supervision, and he is credited with the first editions of the scholia of Aristophanes (1498), Atheneaus (1514), Hesychius (1514), Pausanias (1516).

See R. Menge's De M. Musuri vita studis ingenio, in vol. 5 of M. Schmidt's edition of Hesychius (1686).

MUTE (Lat. mutus, dumb), silent or incapable of speech. For the human physical incapacity see DEAF and DUMB. In phonetics (q.v.) a "mute" letter is one which (like p or g) represents no individual sound. The name of "mutters" is given, for obvious reasons, to the undertaker's assistants at a funeral. In music a "mute" (Ital. sordine, from Lat. sordus, deaf) is a device for deadening the sound in an instrument by checking its vibrations. Its use is marked by the sign c.s. (con sordine), and its cessation by s.s. (senza sordine). In the case of the violin and other stringed instruments this object is attained by the use of a piece of brass, wood or ivory, so shaped as to fit on the bridge without touching the strings and hold it so tightly as to deaden or muffle the vibrations. In the case of brass wind instruments a leather, wooden or papier mâché pad in the shape of a pear with a hole through it is placed in the bell of the instrument, by which the passage of the sound is impeded. The interference with the pitch of the instruments has led to the invention of elaborately constructed mutes. Players on the horn and trumpet frequently use the left hand as a mute. Drums are muted or "muffled" either by the pressure of the hand on the head, or by covering with cloth. In the side drum this is effected by the insertion of pieces of cloth between the membrane and the "snare," or by loosening the "snare." The muting of a pianoforte is obtained by the use of the soft-pedal.

MUTIAN, KONRAD (1471-1526), German humanist, was born in Honberg on the 15th of October 1471 of well-to-do parents named Mut, and was subsequently known as Konrad Mutianus Rutilus, from his red hair. At Deventer under Alexander Hegius he had Erasmus' school followed (1492) by that of the University of Erfurt, where he took the university's degree in 1492. From 1495 he travelled in Italy, taking the doctor's degree in canon law at Bologna. Returning in 1502, the landgraf of Hesse promoted him to high office. The post was not congenial; he resigned it (1503) for a small salary as canonicus in Gotha. Mutian was a man of great influence in a select circle especially connected with the university of Erfurt, and known as the Mutianischer Bund, which included Eoban Hess, Crotus Rubeanus, Justus Jonas and other leaders of independent thought. He had no public ambition; except in correspondence, and as an epigrammatist, he was no writer, but he furnished ideas to those who wrote. He may deserve the title which has been given him as "precursor of the Reformation," in so far as he desired the reform of the Church, but not the establishment of a rival. Like Erasmus, he was with Luther in his early stage, but deserted him in his later development. Though he had personally no hand in it, the Epistola obscurorum virorum (due especially to Crotus Rubeanus) was the outcome of the Reuchlinists in his Bund. He died at Gotha on the 30th of March (Good Friday) 1526.

See F. W. Kampsch Wolfe, Die Universität Erfurt (1858-1860); C. Krause, Eobanus Hessus (1879); L. Geiger, in Allgemeine Deutsche Biographie (1886); C. Krause, Der Briefwechsel des Mutianus Rutilus (1885); another collection by K. Gillert (1890). (A. Go.*).

MUTILATION (from Lat. mutilus, maimed). The wounding, maiming and disfiguring of the body is a practice common among savages and systematically pursued by many entire races. The varieties of mutilation are as numerous as the instances of it are widespread. Nearly every part of the body is the object of mutilation, and nearly every motive common to human beings—vanity, religion, affection, prudence—has acted in giving rise to what has been proved to be a custom of great antiquity. Some forms, such as tattooing and depilation, have stayed on as practices even after civilization has banished the more brutal types; and a curious fact is that analogous operations have been performed by different peoples at vast distances, and proved to have had no relations with one another, at any rate in historic times. Ethnical mutilations have in certain races a great sociological value. It is only after submission to some such operation that the youth is admitted to full tribal rights (see INITIATION). Tattooing, too, has a semi-religious importance, as when an individual bears a representation of his totem on his body; and many mutilations are tribe marks, or brands used to know slaves.

Mutilations may be divided into: (1) those of the skin; (2) of the head; (3) of the body and limbs; (4) of the teeth; (5) of the sexual organs. 1. The principal form of skin-mutilation is tattooing (q.v.), the ethical importance of which is very great. A practice almost as common is depilation, or removal of hair. This is either by means of the razor, e.g., in Japan, by depilatories, or by tearing out the hairs separately, as among most savage peoples. The parts thus mutilated are usually the eyebrows, the face, the scalp and the pubic regions. Many races have a native belief that the hair of the body or the head is impious (e.g., the Boungos) using special instruments. Depilation is common, too, in the South Sea Islands. The Andaman islanders and the Boto-

cudos of Brazil shave the body, using shell-edges and other primitive instruments.

2. Mutilations of the face and head are usually restricted to the lips, ears, nose and cheeks. The lips are simply perforated or distended to an extraordinary degree. The Botocudos insert disks of wood or bone with the lowest part sticking out. The Aleuts of America, too, on the Mackenzie river and among the Aleutians. In Africa they are frequently practised. The Mangana women pierce the upper lips and introduce small metal shields or rings. The Mittu women bore the lower lip and thrust a wooden peg through. In other tribes little sticks of rock crystal are pushed through, which jingle together as the wearer talks. The women of Senegal perforate their chin; the natives of the southern part of Japan, or the Boungos use special pins. The Boto-cudos of Brazil shave the body, using shell-edges and other primitive instruments.

3. Mutilations of the body and limbs are usually restricted to the ears, and sometimes to the nose. The ears are usually mutilated, from the ear-rings of the civilized West to the wooden disks of the Botocudos. In the north and south the practice is universal. Among the following peoples are the Andaman islanders, the Neddahs, the Bushmen, the Fouguens and certain tribes of Sumatra. Ear mutilation in its most exaggerated form is practised in Indo-China by the Mois of Annam and the Penangas of Cambodia, and in Bornoe by the Dyaks. They extend the lobe by the insertion of wooden disks, and metal rings, and weights, until it sometimes reaches the shoulder. In China and Asia earrings sometimes weigh nearly half a pound. Livingstone said that the Zulus extended the lobe in such a manner that the hand closed could be passed through. The Monbuttus thrust through a perforation in the side of the nose which is usually perforated; rings and jewelled pendants (as among Indian and Arabic women, the ancient Egyptians and Jews), or feathers, horns, wooden disks, or shells encircle the edge of this perforation in the lobe. The nose is usually perforated, and this is not always merely decorative. It may denote social position, as among the Ababdes, the Bonos in the Indian peninsula, or among the Moslems, the male Kulus of the Himalaya wear a large ring in the left nostril. Malays and Polynesians sometimes deform the nose by enlarging its base, effecting this by compression of the nasal bones of the nose, and disturbing their alignment.

The cheeks are not so frequently mutilated. The people of the Aleutian and Kurile Islands bore holes through their cheeks and place in them the long hairs from the muzzles of seals. The Guaranas of Brazil and people in the south of the Amazon have holes bored in the top of the head or the skin behind the ears of children is burnt to preserve them from sickness, traces of which mutilation are said to be discoverable on some neolithic skulls; while some small ornaments are cut out and thrust through the ear. Among the Tungus, peoples the deformation of the skull was anciently practised. Herodotus, Hiphocrates and Strabo mention such a custom among peoples of the Caspian and Crimea. Later similar practices were found existing among Chinese mendicant sects, some tribes of Turkестan, the Japanese priesthood, in Malaysia, Sumatra, Java and
the south seas. In Europe it was not unknown. But the discovery of this fact is not far removed from the art of skull-deformities. At the present day the custom is still observed by the Haidas and Chichooks, and by certain tribes of Peru and on the Amazon, by the Kurds of Armenia, by certain Malay primitive societies in the Moluccas and New Hebrides. The reasons for this type of mutilation are uncertain. Probably the idea of distinguishing themselves from lower races was predominant in most cases, as for example in that of the Chinook Indians, who distinguished themselves from the Klickitat by waxing their scalps. Or it may have been through a desire to give a ferocious appearance to their warriors. The deformation was always done at infancy, and often in the case of both sexes. It was, however, more usually reserved for boys, sometimes only for the eldest, on the ground that the boys would be engaged in battle and would have to protect themselves from their foes. Different methods prevailed: by bands, bandages, boards, combs, or saws, with or without grooves stamped on the edges, or even with a knife, applied to the head and held in position while the skull was deformed. There is no hard and fast rule, and it is possible that the method practised in one tribe was borrowed from another.

3. Mutilations of the body or limbs by maiming, lopping off or deforming, are far from rare. Certain races (Bushmen, Kaffirs and others) practised the cutting off of ears and noses for this purpose, especially for parents. The Tongas do the same, in the belief that the evil spirits which bring diseases into the body would escape by the wound. Diseased children are thus mutilated by them. Contempt for female timidity has caused a curious custom among the Gallas (Africa). They amputate the mammae of boys soon after birth, believing no warrior can possibly be brave who possesses them. The fashion of distort the feet of Chinese ladies of high rank, has been preserved to the present day. It is usual in the majority of primitive races to make alliances with themselves from their foes. The women of the Vayana are used to preying with a piece of metal the four lower incisors in children of both sexes. The women of certain tribes on the continent force the growth of the lower incisors by putting a piece of metal to make them project beyond the lower lips. Many of the aboriginal tribes of Australia extract teeth, and at puberty the Australian boys have a tooth knocked out. The Eskimos of the Mackenzie River cut down the crown of the upper incisors so as not to resemble dogs. Some Malay races, too, are said to blacken their teeth because dogs have white teeth. This desire to be unlike animals seems to be at the bottom of many dental mutilations. Another reason is the wish to be different from the Papuan tribes. The lower incisor and the other teeth in order to be unlike other Papuan tribes which they despise. In this way such practices become traditional. Finally, like many mutilations, those of the teeth are trials of endurance of physical pain, and take place at ceremonies of initiation and at puberty. Some Malay races, too, are said to blacken their teeth because dogs have white teeth. This desire to be unlike animals seems to be at the bottom of many dental mutilations. Another reason is the wish to be different from the Papuan tribes. The lower incisor and the other teeth in order to be unlike other Papuan tribes which they despise. In this way such practices become traditional. Finally, like many mutilations, those of the teeth are trials of endurance of physical pain, and take place at ceremonies of initiation and at puberty. The Mois (Scimages) of Cochin-China break the two upper middle incisors with a flint. This is always ceremoniously done at puberty to the accomplishment of fasting and prayers for those mutilated, who use it as a sign of manhood, and which is a part of the Mutsu, Munemitsu, Count (1842–1890), Japanese statesman, was born in 1842 in Wakayama. A vehement opponent of "dan government"—that is, usurpation of administrative posts by men of two or three fiefs, an abuse which threatened the country with internal dissension. Too young to be an advisor, he signed in March 1860, the Edicts of the first and second mutsu, Mutiny, Mutsu, Hitot, Emperor, of Japan (1852–1912), was born on the 31st January 1852, succeeded his father, Osabito, the former emperor, in January 1867, and was crowned at Osaka on the 31st October 1868. The country was then in a ferment owing to the concessions which had been granted to foreigners by the preceding shogun Iyemochi, who in 1854 concluded a treaty with Commodore Perry by which it was agreed that certain ports should be open to foreign trade. This convention gave great offence to the more conservative daimios, and on their initiative the mikado suddenly decided to abolish the shogunate. This resolution was not carried out without strong opposition. The reigning shogun, Keiki, yielded to the decree, but many of his followers were not so compliant, and it was only by force of arms that the new order of things was imposed on the country. The main object of those who had advocated the change was to lead to a reversion to the
primitive condition of affairs, when the will of the mikado was absolute and when the presence in Japan of the hated foreigner was unknown. But the reactionary party was not to be allowed to monopolize revolution. To their surprise and dissatisfaction, the powerful daimios of Satsuma and Choshu suddenly declared themselves to be in favour of opening the country to foreign intercourse, and of adopting many far-reaching reforms. With this movement Mutsu Hito was cordially in agreement, and of his own motion he invited the foreign representatives to an audience on the 23rd of March 1868. As Sir Harry Parkes, the British minister, was on his way to this assembly, he was attacked by a number of two-sworded samurai, who, but for his guard, would doubtless have succeeded in assassinating him. The outrage was regarded by the emperor and his ministers as a reflection on their honour, and they readily made all reparation within their power. While these agitation went on, the emperor, with his advisers, was maturing a political constitution which was to pave the way to the assumption by the emperor of direct personal rule. As a step in this direction, Mutsu Hito transferred his capital from Kioto to Yedo, the former seat of the shoguns' government, and marked the event by renaming the city Tokyo, or Eastern Capital. In 1869 the emperor paid a visit to his old capital, and there took as his imperial consort a princess of the house of Ichijo. In the same year Mutsu Hito bound himself by oath to institute certain reforms, the first of which was the establishment of a deliberative assembly. In this onward movement he was supported by the majority of the daimios, who in a supreme moment of patriotism surrendered their estates and privileges to their sovereign. This was the death-knell of the feudalism which had existed for so many centuries in Japan, and gave Mutsu Hito the free hand which he desired. A centralized bureaucracy took the place of the old system, and the nation moved rapidly along the road of progress. Everything European was eagerly adopted, even down to frock-coats and patent-leather boots for the officials. Torture was abolished (1873), and a judicial code, adapted from the Code Napoléon, was authorized. The first railway—that from Yokohama to Tokyo—was opened in 1872; the European calendar was adopted, and English was introduced into the curriculum of the common schools. In all these reforms Mutsu Hito took a leading part. But it was not to be expected that such far-reaching changes could be effected without opposition, and thrice during the period between 1876 and 1884 the emperor had to face serious rebellious movements in the provinces. These he succeeded in suppressing; and even amid these preoccupations he managed to inflict a check on his huge neighbour, the empire of China. As the government of this state declared that it was incapable of punishing certain Formosan pirates for outrages committed on Japanese ships (1874), Mutsu Hito landed a force on the island, and, having inflicted chastisement on the bandits, remained in possession of certain districts until the compensation demanded from Peking was paid. The unparalleled advances which had been made by the government were now held by the emperor and his advisers to justify a demand for the revision of the foreign treaties, and negotiations were opened with this object. They failed, however, and the consequent disappointment gave rise to a strong reaction against everything foreign throughout the country. Foreigners were assaulted on the roads, and even the Russian cesarevi, afterwards the tsar Nicholas II., was attacked by would-be assassins in the streets of Tokyo. A renewed attempt to revive the treaties in 1894 was more successful, and in that year Great Britain led the way by concluding a revised treaty with Japan. Other nations followed, and by 1901 all those obnoxious clauses suggestive of political inferiority had finally disappeared from the treaties. In the same year (1894) war broke out with China, and Mutsu Hito, in common with his subjects, showed the greatest zeal for the campaign. He reviewed the troops as they left the shores of Japan for Korea and Manchuria, and personally distributed rewards to those who had won distinction. In the war with Russia, 1904–5, the same was the case, and it was to the virtues of their emperor that his generals loyally ascribed the Japanese victories. In his wise patriotism, as in all matters, Mutsu Hito always placed himself in the van of his countrymen. He led them out of the trammels of feudalism; by his progressive rule he lived to see his country advanced to the first rank of nations; and he was the first Oriental sovereign to form an offensive and defensive alliance with a first-rate European power. In 1869 Mutsu Hito married Princess Haru, daughter of Ichiyo Tadaka, a noble of the first rank. He has one son and several daughters, his heir-apparent being Yoshi Hito, who was born on the 31st of August 1879, and married in 1900 Princess Sada, daughter of Prince Kujö, by whom he had three sons before 1909. Mutsu Hito adopted the epithet of Meiji, or "Enlightened Peace," as the nengō or title of his reign. Thus the year 1901, according to the Japanese calendar, was the 34th year of Meiji.

MUTTRA. For MATURA, a city and district of British India in the Agra division of the United Provinces. The city is on the right bank of the Jumna, 30 m. above Agra; it is an important railway junction. Pop. (1901), 60,042. It is an ancient town, mentioned by Fa Hien as a centre of Buddhism about A.D. 400; his successor Hsüan Tsang, about 650, states that it then contained twenty Buddhist monasteries and five Brahmanical temples. Muttra has suffered more from Mahomedan plunder than most towns of northern India. It was sacked by Mahmud of Ghazni in 1017–18; about 1500 Sultan Sikandar Lodi utterly destroyed all the Hindu shrines, temples and images; and in 1636 Shah Jahan appointed a governor expressly to "stamp out idolatry." In 1669–70 Aurangzeb visited the city and continued the work of destruction. Muttra was again captured and plundered by Ahmad Shah with 25,000 Afghan cavalry in 1756. The town still forms a great centre of Hindu devotion, and large numbers of pilgrims flock annually to the festivals. The special cult of Krishna with which the neighbourhood is associated seems to be of comparatively late date. Much of the prosperity of the town is due to the residence of a great family of sultans or native bankers, who were conspicuously loyal during the Mutiny. Temples and bathing-stairs line the river bank. The majority are modern, but the mosque of Aurangzeb, on a lofty site, dates from 1669. Most of the public buildings are of white stone, handsomely carved. There is an American mission, a Roman Catholic church, a museum of antiques, and a cantonnement for a British cavalry regiment. Cotton, paper and pilgrims' charms are the chief articles of manufacture.

The District of Muttra has an area of 1445 sq. m. It consists of an irregular strip of territory lying on both sides of the Jumna. The general level is only broken at the south-western angle by low ranges of limestone hills. The eastern half consists for the most part of a rich upland plain, abundantly irrigated by wells, rivers and canals, while the western portion, though rich in mythological association and antiquarian remains, is comparatively unfavoured by nature. For eight months of the year the Jumna shrinks to the dimensions of a mere rivulet, meandering through a waste of sand. During the rains, however, it swells to a mighty stream, a mile or more in breadth. Formerly nearly the whole of Muttra consisted of pasture and woodland, but the roads constructed as relief works in 1837–1838 have thrown open many large tracts of country, and the task of reclamation has since proceeded rapidly. The population in 1901 was 763,099, showing an increase of 7 % in the decade. The principal crops are millets, pulse, cotton, wheat, barley and sugar cane. The famine of 1878 was severely felt. The eastern half of the district is watered by the Agra canal, which is navigable, and the western half by branches of the Ganges canal. A branch of the Rajputana railway, from Agra to Lucknow, crosses the district; the chord line of the East India, from Agra to Delhi, traverses it from north to south; and a new line, connecting with the Great Indian Peninsula, was opened in 1905.

The central portion of Muttra district forms one of the most sacred spots in Hindu mythology. A circuit of 84 kos around Gokul and Brindaban bears the name of the Braj-Mandal, and
MUTULE—MUZAFFARNAGAR

MUTULE (Lat. mutulus, a stay or bracket), in architecture the rectangular block under the soffit of the corinth of the Greek Doric temple, which is studded with guttae. It is supposed to represent the piece of timber through which the wooden pegs were driven to hold the lintel in position. It is perfectly rectangular, and it follows the rake of the roof. In the Roman Doric order the mutule was horizontal, with sometimes a crowning fillet, so that it virtually fulfilled the purpose of the modillion in the Corinthian cornice.

MUZAFFAR-ED-DIN, shah of Persia (1853-1907), the second son of Shah Nasr-ed-Din, was born on the 25th of March 1853. He was in due course declared vâlî ahd, or heir-apparent, and invested with the governorship of Azerbaijan, but on the assassination of his father in 1856 it was feared that his elder brother, Zill-es-Sultan, the governor of Isfahan, might prove a dangerous rival, especially when it was remembered that Muzaifar-ed-Din had been recalled to Teheran by his father upon his failure to suppress a Kurd rising in his province. The British and Russian governments, in order to avoid widespread disturbances, agreed however to give him their support. All opposition was thus obviated, and Muzaifar-ed-Din was duly enthroned on the 8th of June 1866, the Russian general Kosakovsky, commander of the Persian Cossacks, presiding over the ceremony with drawn sword. On this occasion the new shah announced the suppression of all purchase of civil and military posts, and then proceeded to remit in perpetuity all taxes on bread and meat, thus lightening the taxation on food, which had caused the only disturbances in the last reign. But whatever hopes may have been aroused by this auspicious beginning of the reign were soon dashed owing to the extra- vangence and profligacy of the court, which kept the treasury in a chronic state of depletion. Towards the end of 1866 the Amin-es-Sultan, who had been grand vizier during the last years of Nasr-ed-Din's reign, was disgraced, and Muzaifar-ed-Din announced his intention of being in future his own grand vizier. The Amin-ad-Dowlah, a less masterful servant, took office with the lower title of prime minister. During his short administration an elaborate scheme of reforms was drawn up on paper, and remained on paper. The treasury continued empty, and in the spring of 1868 Amin-es-Sultan was recalled with the special object of filling it. The delay of the British government in sanctioning a loan in London gave Russia her opportunity. A Russian loan was followed by the establishment of a Russian bank at Teheran, and the vast expansion of Russian influence generally. At the beginning of 1900 a fresh gold loan was negotiated with Russia, and a few months later Muzaifar-ed-Din started on a tour in Europe by way of St Petersburg, where he was received with great state. He subsequently went to Paris to visit the Exhibition of 1900, and while there an attempt on his life was made by a madman named François Salsón. In spite of this experience the shah so enjoyed his European tour that he determined to repeat it as soon as possible. By the end of 1901 his treasury was again empty; but a fresh Russian loan replenished it and in 1902 he again came to Europe, paying on this occasion a state visit to England. On his way back he stopped at St Petersburg, and at a banquet given in his honour by the tsar toasts were exchanged of unmistakable significance. None the less, during his visit to King Edward VII. the shah had been profuse in his expressions of friendship for Great Britain, and in the spring of 1903 a special mission was sent to Teheran to invest him with the Order of the Garter.

The shah's misguided policy had created widespread disaffection in the country, and the brunt of popular disfavour fell on the atâbeg (the title by which the Amin-es-Sultan was now known), who was once more disgraced in September 1903. The war with Japan now relaxed the Russian pressure on Teheran, and at the same time dried up the source of supplies; and the clergy, giving voice to the general misery and discontent, grew more and more outspoken in their denunciations of the shah's misrule. Nevertheless Muzaifar-ed-Din defied public opinion by making another journey to Europe in 1905; but, though received with the customary distinction at St Petersburg, he failed to obtain further supplies. In the summer of 1906 popular discontent culminated in extraordinary demonstrations at Teheran, which practically amounted to a general strike. The government was forced to make a liberal morpholine constitution, the first parliament being opened by him on the 12th of October 1906. Muzaifar-ed-Din died on the 8th of January 1907, being succeeded by his son Mohammed Ali Mirza.

MUZAFFARGARH, a town and district of British India, in the Multan division of the Punjab. The town is near the right bank of the river Chenab, and has a railway station. Pop. (1901), 4018. Its fort and a mosque were built by Nawab Muzaifar Khan in 1794-1796.

The District of Muzaifar-Garh occupies the lower end of the Sind-Sagar Doab. Area, 3655 sq. m. In the northern half of the district is the wild thal or central desert, an arid elevated tract with a width of 40 m. In the extreme north, which gradually contracts until it disappears about 10 m. south of Muzaifar-Garh town. Although apparently a table-land, it is really composed of separate sandhills, with intermediate valleys lying at a lower level than that of the Indus, and at times flooded. The towns stand on high sites or are protected by embankments; but the villages scattered over the lowlands are exposed to annual inundations, during which the people abandon their grass-built huts, and take refuge on wooden platforms attached to each house. Throughout the cold weather large herds of camels, belonging chiefly to the Povindah merchants of Afghanistan, graze upon the sandy waste. The district possesses hardly any distinct boundaries of its own, having always formed part of Multan (q.v.). The population in 1901 was 405,656, showing an increase of 0-4% in the decade, due to the extension of irrigation. The principal crops are wheat, pulse, rice and indigo. The most important domestic animal is the camel. The district is crossed by the Northern railway, and the boundary rivers are navigable, besides furnishing numerous irrigation channels, originally constructed under native rule.

MUZAFFARNAGAR, a town and district of British India, in the Meerut division of the United Provinces. The town is 790 ft. above the sea, and has a station on the North-Western railway. Pop. (1901), 23,444. It is an important trading centre and has a manufacture of blankets. It was founded about 1852 by the son of Muzaifar Khan, Khan-i-Jahan, one of the famous Sayid family who rose to power under the emperor Shah Jahan. The District of Muzaifar-Nagar has an area of 1666 sq. m. It lies near the northern extremity of the Doab or great alluvial plain between the Ganges and the Jumna, and shares to a large extent in the general monotony of that level region. A great portion is sandy and unfertile; but under irrigation the soil is rapidly improving, and in many places the villages have succeeded in introducing a high state of cultivation. Before the opening of the canals Muzaifar Nagar was liable to famines and was sometimes flooded; but now it is Memorably im- porated by the spread of irrigation. It is traversed by four main canals, the Ganges, Anupshahr, Deoband and Eastern Jumna. Its trade is confined to the raw materials it produces.
MUZAFFARPUR—MYCENAE

climate of the district is comparatively cool, owing to the proximity of the hills; and the average annual rainfall is 33 in. The population in 1901 was 877,188, showing an increase of 13.5% in the decade, which was a period of unexampled prosperity. The principal crops are wheat, pulse, cotton and sugar-cane. The district is crossed by the North-Western railway from Delhi to Saharanpur.

Hindu tradition represents Muzaffarnagar as having formed a part of the Pahari kingdom of the Mahabharata; authentic history, however, dates from the time of the Moslem conquests in the 13th century, from which time it remained a dependency of the various Mahratta dynasties which ruled in Delhi until the practical downfall of the Mogul Empire in the middle of the 18th century. In 1788 the district fell into the hands of the Maharrattas. After the fall of Aligarh, the whole Doab as far north as the Siwalik hills passed into the hands of the British without a blow, and Muzaffarnagar became part of Saharanpur. It was created a separate jurisdiction in 1824. During the Mutiny there was some disorder, chiefly occasioned by official weakness, but no severe fighting.

See Muzaffarnagar District Gazetteer (Allahabad, 1903).

MUZAFFARPUR, a town and district of British India, in the Patna division of Bengal. The town is on the right bank of the Little Gandak river, and has a railway station. Pop. (1901), 46,617. The town is well laid out, and is an important centre of trade, being on the direct route from Patna to Nepal. It is the headquarters of the Behar Light Horse volunteer corps and has a college established in 1890.

The District of Muzaffarpur has an area of 3,035 sq. m. It was formed in January 1875 out of the great district of Tiharoot, which up to that time was the largest and most populous district of Lower Bengal. The district is an alluvial plain between the Ganges and the Great Gandak, the Baghmat and Little Gandak being the principal rivers within it. South of the Little Gandak the land is somewhat elevated, with depressions containing lakes toward the south-east. North of the Baghmat the land is lower and marshy, but is traversed by elevated dry ridges. The tract between the two rivers is lowest of all and liable to floods. Pop. (1901), 5,754,708, showing an increase of 15% in the decade. Average density, 194 per sq. m., being exceeded in all India only by the neighbouring district of Saran. Indigo (superseeded to some extent, owing to the fall in price, by sugar) and opium are largely grown. Rice is the chief grain crop, and cloth, carpets and pottery are manufactured. The district is traversed in several directions by the Tiharoot system of the Bengal and North-Western railway. It suffered from drought in 1873-1874, and again in 1891-1892.

See Muzaffarpur District Gazetteer (Calcutta, 1897).

MUZIANO, GIROLAMO (1528-1592), Italian painter, was born at Acquafreda, near Brescia, in 1528. Under Romanino, an imitator of Titian, he studied his art, designing and colouring according to the principles of the Venetian school. But it was not until he had left his native place, still in early youth, and had repaired to Rome about 1550, that he came into notice. There his pictures soon gained for him the surname of Il Giovane de' Pizzi (the young pictor); of the older one, Michelangelo, he next tried the more elevated style of historical painting. He imitated Michelangelo in giving great prominence to the anatomy of his figures, and became fond of painting persons emaciated by abstinence or even disease. His great picture of the "Resurrection of Lazarus", at once established his fame. Michelangelo praised it, and pronounced its author one of the first artists of that age. It was placed in the church of Santa Maria Maggiore, but was afterwards transferred to the Quirinal Palace. Muziano, with dogged perseverance (at one time he shaved his head, so as not to be tempted to go out of doors), continued to proceed in the path on which he had entered. He grew excellent in depicting foreign and military costumes, and in introducing landscapes into his historical pieces after the manner of Titian. Mosaic working also occupied his attention while he was employed as superintendent at the Vatican; and it became under his hands a perfect imitation of painting. His ability and industry soon gained for him a handsome fortune. Part of this he expended in assisting to found the Academy of St Luke in Rome. He died in 1592, and was buried in the church of Santa Maria Maggiore.

Many of Muziano's works are in the churches and palaces of Rome; he also worked in Orvieto and Loreto. In Santa Maria degli Angeli, Rome, there is his chief work, "St Jerome preaching to Monks in the Desert"; his "Circumcision" is in the church of the Gesù; his "Ascension" in the Arcelli, and his "St Francis receiving the Stigmata" in the church of the Concepcion. A picture by him, representing Christ washing the feet of His disciples, is in the cathedral of Reims.

MUZZIOLI, GIOVANNI (1854-1894), Italian painter, was born in Modena, whither his family had removed from Castelvetro, on the 10th of February 1854. From the time that he began to attend the local academy at the age of thirteen he was recognized as a prodigy, and four years later, by the unanimous vote of the judges, he gained the Poletti scholarship enabling him to four years' residence in Rome and Florence. After his return to Modena, Muzzioli visited the Paris exhibition, and there came under the influence of Sir L. Alma Tadema. His first important picture was "In the Temple of Bacchus" (1881); and his masterpiece, "The Funeral of Britannicus," was one of the chief successes of the Bologna Exhibition of 1888. From 1878 to his death (August 5, 1894) Muzzioli lived in Florence, where he painted the altar-piece for the church of Castelvetro. See History of Modern Italian Art, by A. R. Willard (London, 1898).

MWERU, a large lake of Eastern Central Africa, traversed by the Luapula or upper Congo. It lies 3,000 ft. above the sea; measures about 76 m. in length by some 25 in breadth, and is roughly rectangular, the axis running from S.S.W. to N.N.E. It is cut by a little stream of its name. On the N.E. corner passes 29° E. At the south end a shallow bay extends to 9° 31' S. East of this and some miles further north, the Luapula enters from a vast marsh inundated at high water; it leaves the lake at the north-west corner, making a sharp bend to the west before assuming a northerly direction. Besides the Luapula, the principal influent is the Kalungwizi, from the east. Near the south end of the lake lies the island of Kilwa, about 8 m. in length, rising into plateaus 600 ft. above the lake. Here the air is cool and balmy, the soil dry, with short turf and clumps of shady trees, affording every requirement for a sanatorium. Mweru was reached by David Livingstone in 1865, but his western shore was first explored in 1880 by Sir Alfred Sharpe, who two years later effected its circumnavigation. The eastern shores from the Luapula entrance to its exit, together with Kilwa Island, belong to British Central Africa; the western to the Belgian Congo.

MYAUNGMYA, a district in the Irrawaddy division of lower Burma, formed in 1893 out of a portion of Bassein district, and reconstituted in 1903. It has an area of 2,663 sq. m., and a population (1907) of 278,119, showing an increase of 49% in the decade and a density of 104 inhabitants to the square mile. Among the population were about 12,800 Christians, mostly KARENS. The district is a deltaic tract, bordering south on the sea and south-west on the Irrawaddy, and the chief cultivation and fishing occupy practically all the inhabitants of the district. The town of Myaungmya had 4711 inhabitants in 1901.

MYCENAE, one of the most ancient cities of Greece, was situated on a hill above the northern extremity of the fertile Argive plain—μυκόνης Ἀργεών ἔποιφας. Its situation is exceedingly strong, and it commands all the roads leading from Corinth and Achaea into the Argive plain. The walls of Mycenae are the greatest monument that remains of the Heroic age in Greece; part of them is similar in style and doubtless contemporary in date with the walls of the neighbouring town Tiryns. There can therefore be little doubt that the two towns were the strongholds of a single race, Tiryns commanding the sea-coast and Mycenae the inner country. Legend tells of the rivalry between the dynasties of the Pelopidae at Mycenae

...
and of the Proctidae at Argos. In early historic times Argos had obtained the predominance. The Mycenaeans, who had temporarily regained their independence with the help of Sparta, fought on the Greek side at Plataea in 479 B.C. The long warfare between the two cities lasted till 468 B.C., when Mycenae was dismantled and its inhabitants dispersed. The city never revived; Strabo asserts that no trace of it remained in his time, but Pausanias describes the ruins. For the character of Mycenaean art and of the antiquities found at Mycenae see Aegean Civilization.

The extant remains of the town of Mycenae are spread over the hill between the village of Charvati and the Acropolis. They consist of some traces of town walls and of houses, and of an early bridge over the stream to the east, on the road leading to the Heraeum. The walls of the Acropolis are in the shape of an irregular triangle, and occupy a position of great natural strength between two valleys. They are preserved to a considerable height on all sides, except where the ravine is precipitous and they have been carried away by a landslide; they are for the most part built of irregular blocks of great size in the so-called "Cyclopaean" style; but certain portions, notably that near the chief gate, are built in almost regular courses of squared stones; there are also some later repairs in polygonal masonry. The main entrance is called the Lion Gate, from the famous triangular relief which fills the space above its massive lintel. This represents two lions confronted, resting their front legs on a low altar-like structure on which is a pillar which stands between them. The device is a translation into stone of a type not uncommon in gem-cutter's and goldsmith's work of the "Mycenaean" age. The gate is approached by a road commanded on one side by the city wall, on the other by a projecting tower. There is also a postern gate on the north side of the wall, and at its eastern extremity are two apertures in the thickness of the wall. One of these leads out on to the rocks above the southern ravine, the other leads to a long staircase, completely concealed in the wall and the rocks, leading down to a subterranean well or spring. Just within the Lion Gate is a projection of the wall surrounding a curious circular enclosure, consisting of two concentric circles of thin slabs of stone set up on end, with others laid across the top of them; at the part of this enclosure nearest to the Lion Gate is an entrance. Some have supposed the circle of slabs to be the retaining wall of a tumulus; but its structure is not solid enough for such a purpose, and it can hardly be anything but a sacred enclosure. It was within this circle that Dr H. Schliemann found the five graves that contained a marvellous wealth of gold ornaments and other objects; a sixth was subsequently found. Above one of the graves was a small circular altar, and there were also several sculptured slabs set up above them. The graves themselves were mere shafts sunk in the rock. Dr Schliemann identified them with the graves of Agamemnon, Cassandra, and their companions, which were shown to Pausanias within the walls; and there can be little doubt that they are the graves that gave rise to the tradition, though the historical identity of the persons actually buried in them is a more difficult question. Outside the circle, especially to the south of it, numerous remains of houses of the Mycenaean age have been found, and others, terraced up at various levels, occupy almost the whole of the Acropolis. On the summit, approached by a well-preserved flight of steps, are the remains of a palace of the Mycenaean age, similar to that found at Tiryns, though not so complicated or extensive. Above them are the foundations of a Doric temple, probably dating from the last days of Mycenaean independence in the 5th century.

Numerous graves have been found in the slopes of the hills adjoining the town of Mycenae. Most of these consist merely of a chamber, usually square, excavated in the rock, and approached by a "dromos" or horizontal approach in the side of a hill. They are sometimes provided with doorways faced with stucco, and these have painted ornamentation. Many of these tombs have been opened, and their contents are in the Athens museum. Another and much more conspicuous kind of tomb is that known as the beehive tomb. There are eight of them at Mycenae itself, and others in the neighbourhood. Some of them were visible in the time of Pausanias, who calls them the places where Atreus and his sons kept their treasures. There can, however, be no doubt that they were the tombs of princely families. The largest and best preserved of them, now

Based on a plan in Schuchhardt's Schliemann's Excavations.

**Fig. 1.—Plan of the Citadel of Mycenae.**
MYCETOZOA

commonly called the Treasury of Atreus, is just outside the Lion Gate. It consists of a circular domed chamber, nearly 50 ft. in diameter and in height; a smaller square chamber opens out of it. It is approached by a horizontal avenue 20 ft. wide and 115 ft. long, with side walls of squared stone sloping up to a height of 45 ft. The doorway was flanked with columns of alabaster, with rich spiral ornament, now in the British Museum; and the rest of the façade was very richly decorated, as may be seen from Chipiez's fine restoration. The inside of the vault was ornamented with attached bronze ornaments, but not, as is sometimes stated, entirely lined with bronze. It is generally supposed that these tombs, as well as those excavated in the rock, belong to a later date than the shaft-tombs on the Acropolis.

See H. Schliemann, Mycenas (1879); C. Schuchhardt, Schliemans's Excavations (Eng. trans., 1891); Chr. Tsountas, Mykénai και Μυκηναῖοι πολιτισμοί (1893); Tsountas and Manatt, The Mycenaeen Age (1897); Perrot and Chipiez, Histoire de l'art dans l'antiquité, vol. vi., L'Art Mycéénien. Various reports in Περιοδικά της Ἑλληνικής Ἰστορικής Εταιρείας and Εφημερίς αρχαιολογίας.

MYCETOZOA (Mycyomycetes, Schlecht.), in zoology, a group of organisms reproducing themselves by spores. These are produced in or on sporangia which are formed in the air and the spores are distributed by the currents of air. They thus differ from other spore-bearing members of the animal kingdom (which produce their spores while immersed in water or, in the case of parasites, within the fluids of their hosts), and resemble the Fungi and many of the lower green plants.

In relation with this condition of their fructification the structures formed at the spore-bearing stage to contain or support the spores generally have a remarkable resemblance to the sporangia of certain groups of Fungi, from which, however, the Mycetozoa are essentially different.

Although the sporangial and some other phases have long been known, and Fries had enumerated 192 species in 1829, the main features of their life-history were first worked out in 1859-1860 by de Bary (1 and 2). He showed that in the Mycetozoa the spore hatches out as a mass of naked protoplasm which almost immediately assumes a free-swimming flagellate form (zoospore), that after multiplying by division this passes into an amoeboid phase, and that from such amoebae the plasmodia arise, though the mode of their origin was not ascertained by him. The generation of the Mycetozoa is a mass of single protoplasm, without a differentiated envelope and endowed with the power of active locomotion. It penetrates the interstices of decaying vegetable matter, or, in the case of the species Badhamia striolaris, spreads as a film on the surface of living fungi; it may grow almost indefinitely in size, attaining under favourable conditions several feet in extent. It constitutes the dominant phase of the life-history. From the plasmodium the sporangia take their origin. It was Cienkowski who (in 1863) contributed the important fact that the plasmodium arise by the fusion with one another of numbers of individuals in the amoeboid phase—a mode of origin which is now generally recognized as an essential feature in the conception of a plasmodium, whether as occurring among the Mycetozoa or in other groups (7). De Bary clearly expressed the view that the life-history of the Mycetozoa shows them to belong not to the vegetable but to the animal kingdom.

The individual sporangia of the Mycetozoa are, for the most part, minute structures, rarely attaining the size of a mustard-seed, though, in the composite form of aethalia, they may form cake-like masses an inch or more across (fig. 21). They are found, stalked or sessile, in small clusters or distributed by the thousand over a wide area many feet in diameter, on the bark of decaying trees, on dead leaves or sticks, in woods and shrub-beries, among the stems of plants on wet moors, and occasionally, at the surface in localities where there is a substratum of decaying vegetable matter sufficiently moist to allow the plasmodium to live. Tan-heaps have long been known as a favourite habitat of Fuligo septica, the plasmodia of which, emerging in bright yellow masses at the surface prior to the sporangial (in this case aethalial) phase, are known as "flowers of tan." The film-like, expanded condition of the plasmodium, varying in colour in different species and traversed by a network of vein-like channels (fig. 3), has long been known. The plasmodial stage was at one time regarded as representing a distinct group of fungi, to which the generic name Mesenterica was applied. The species of Mycetozoa are widely distributed over the world in temperate and tropical latitudes where there is sufficient moisture for them to grow, and they must be regarded as not inconsiderable agents in the disintegrating processes of nature, by which complex organic substances are decomposed into simpler and more stable chemical groups.

Classification.—The Mycetozoa, as here understood, fall into three main divisions. The Endosporae, in which the spores are contained within sporangia, form together with the Exosporae, which bear their spores on the surface of sporophores, a natural group characterized by forming true plasmodia. They constitute the Euplasmodida. Standing apart from them is the small group of the mould-like Sorophorae, in which the amoeboid individuals only come together immediately prior to spor-formation and do not completely fuse with one another.

A number of other organisms living on vegetable and animal bodies, alive or dead, and leading an entirely aquatic life, are included by Zopf (31) under the Mycetozoa, as the "Monadina," in distinction from the "Eumycetozoa," consisting of the three groups above mentioned. The alliance of some of these (e.g. Protomonas) with the Mycetozoa is probable, and was accepted by de Bary, but the relations of other Monadina are obscure, and appear to be at least as close with the Heliozoa (with which many may in fact belong) as the limits here adopted, following de Bary, include a group of organisms which, as shown by their life-history, belong to the animal stock, and yet alone among animals (3) they have acquired the habit, widely found in the vegetable kingdom, of developing and distributing their spores in air.

Class MYCETOZOA.

Sub-class 1.—Euplasmodida.1

Division 1.—Endosporae.

Sub-cohort 2.—Amaurochaetae.

Sub-cohort 2.—Calonemineae.

Division 2.—Exosporae.

Sub-class 2.—Sorophora.

1 Bursula, a member of Zopf's Monadina, likewise forms spores in air.

2 The classification of the Euplasmodida here given is that of A. and G. Lister (22), the outcome of a careful study of the group extending over more than twenty-five years. The writer of this article desires to express his indebtedness to the opportunities he has had of becoming familiar with the work of his father, Mr A. Lister, F.R.S., whose views on the Mycetozoa he has endeavoured herein to summarize.
MYCETOZOA

LIFE-HISTORY OF THE MYCETOZOA

EUPLASMODIDA

Endosporae.

We may begin our survey of the life-history at the point where the spores, borne on currents of air, have settled among wet decaying vegetable matter. Shrunken when dry, they may absorb moisture, and resume the spherical shape which is found in nearly all species. Each is surrounded by a thin, weak, sheltered by which the protoplasm, though losing moisture by drying, may remain alive for as many as four years. In several cases it has been found to give the chemical reactions of cellulose. It is smooth or variously sculptured according to the species. Within the protoplasm may be seen the nucleus, and one or more contractile vacuoles make their appearance.

After the spore has lain in water for a period varying from a few hours to a day or two months, or perhaps several years, a burst occurs and the contained protoplasm slips out and lies free in the water as a minute colourless mass, presenting amoeboid movements (fig. 1, c). It soon assumes an elongated pear-shaped form, and a flagellum is developed at the narrow end, attaining a length equal to the rest of the body. The minute zoospore, thus equipped, swims away with a characteristic dancing motion. The protoplasm is granular within but hyaline externally (fig. 1, d). The nucleus, lying at the end of the body where it tapers into the flagellum, is limited by a definite wall and contains a nuclear network and a nucleolus. It often presents the appearance of being drawn out into a point towards the flagellum, and a bell-like structure (first described by Plenge (27)) streaming more distinctly than the rest of the protoplasm, extends from the base of the flagellum and invests the nucleus (fig. 2, a and e). The other end of the zoospore may be narrowly rounded (fig. 1, d) or it may be produced into short pseudopodia (fig. 1, c). By means of these the zoospore captures bacteria which are drawn into the body and enclosed in digestive vacuoles. A contractile vacuole is also present near this hind end. Considerable movement may be observed among the granules of the interior, and the mass may be thrown off at any point. The nucleus may apparently become amoeboid, either with (fig. 1, f) or without (fig. 2, c) the temporary retraction of the flagellum; or it may take an elongated slug-like shape and creep with the flagellum extended in front, with tactile and apparently exploratory movements.

Other shapes may be temporarily assumed by the zoospore. By attaching itself to an object it may become amoeboid, either with (fig. 1, f) or without (fig. 2, c) the temporary retraction of the flagellum; or it may take an elongated slug-like shape and creep with the flagellum extended in front, with tactile and apparently exploratory movements.

That the zoospores of many species of the Endosporae feed on bacteria has been shown by A. Lister (18). New light has recently been thrown on the matter by Pinoy (26), who has worked chiefly with Sorophora, in which, as shown below, the active phase of the life-history is passed mainly in the state of isolated amoebae. Pinoy finds that the amoebae of this group live on particular species of bacteria, and that the presence of the latter is a necessary condition for the development of the Sorophora, and even (as has been recognized by other workers) for the hatching of their spores. Pinoy’s results indicate, though they do not conclusively, that bacteria are likewise the essential food of the Euplasmodida in the early phases of their life-history. The zoospores do, however, ingest other solid bodies, e.g. carrots, granules (Saville Kent, 15).

The zoospores multiply by binary fission, the flagellum being withdrawn and the nucleus undergoing mitotic division, with the formation of a well-marked achromatic spindle (fig. 3). It is probable that fusion occurs not at the zoospore stage; but there is not satisfactory evidence to show how often it may be repeated.

At this, as at other phases of the life-history, a resting stage may be assumed as the result of drying, but also from other and unknown causes. The flagellum is withdrawn and the protoplasm, becoming spherical, is endowed, as was first recognized by Cienkowski, with mutual attraction, and on meeting fuse with one another. Fig. 4 represents a group of such amoebae. Several have already united to form a common mass, to which others, still free, are converging. The protoplasmic mass thus arising is the plasmodium. The fusion between the protoplasmic bodies of the amoebae which unite to form it is complete. Their nuclei may be traced for some time in the young plasmodium and no fusion between them has been observed at this stage (26). As the plasmodium increases in size by the addition of amoebae the task of following the fate of the individual nuclei by direct observation becomes impossible.

The presence of an active plasmodium of Badhamia utricularis, which, as we have seen, lives and feeds on certain fungi, is shown in fig. 5. It consists of a film of protoplasm, of a bright yellow colour, varying in size up to a foot or more in diameter. It is traversed by a network of branching and anastomosing strands, which divide up and are gradually lost as they approach the margin where the protoplasm forms a uniform and lobate border. Elsewhere the

1 Figures 1, 4, and 11-22 are from the British Museum Guide to the British Mycetozoa. The other figures are from Lankester’s Treatise on Zoology, part I. Introduction and Protozoa. Fascicle I. Article Mycetozoa.

2 Pinoy states (26) that the spores of Spumaria alba, cultivated with bacteria on solid media, hatch out into amoebae, which under these conditions do not assume the flagellate stage. The amoeba secretes a film of slime which is observed to give rise by three successive divisions to eight amoebae.
spore formation they present an essentially similar appearance. There is, however, great variety in the degree of concentration or expansion presented by plasmodia, in relation with food supply, moisture and other circumstances. The plasmodium move slowly about over or in the substratum, concentrating in regions where food supply is abundant, and leaving those where it is exhausted.

On examining under the microscope a film which has spread over a cover-slip, the channels are seen to be streams of rapidly moving granular protoplasm. This movement is rhythmic in character, being directed alternately towards the margin of an advancing region of the plasmodium, and away from it. As a channel is watched the stream of granules is seen to become slower, and after a momentary pause to begin in the opposite direction. In an active plasmodium the duration of the flow in either direction varies from a minute and a half to two minutes, though it is always longer when in the direction of the general advance over the substratum. When the flow of the protoplasm in this latter direction the border becomes turgid, and lobes of hyaline protoplasm are seen (under a high magnification) to start forward, and soon to become filled with granular contents. When the flow is reversed, the margin becomes thin from the drainage away of its contents. A delicate hyaline layer invests the plasmodium, and is apparently less fluid than the material flowing in the channels. The phenomena of the rhythmic movement of the protoplasm are not inconsistent with the view that they result from alternating contraction and relaxation of the outer layer in different regions of the plasmodium, but any dogmatic statement as to their causation appears at present inadvisable.

Prowazek (a8) has recently referred to nuclear stages, similar to those here regarded as of amitotic division, but has interpreted them as nuclear fusions. He does not, however, discuss the mode of multiplication of nuclei in the plasmodium.

A second group of granules of carbonate of lime are abundant in the plasmodia, and in all Mycetozoa other granules of undetermined nature are present. The colour of plasmodia varies in different species, and may be yellow, white, pink, purple or green. This coloring matter is in the form of minute drops, and in the Calcareae these invest the lime granules.

Nutrition.—The plasmodium of Badhamia utricularis, advancing over the pilei of suitable fungi, feeds on the superficial layer dissolving it. In this the plasmodia of the homothallic species, which contain abundant foreign bodies such as spores of fungi or sclerotium cysts (tide infra) which have been taken in and are undergoing digestion. It has been found experimentally (11) that pieces of corn meal, dipeptide, proteids, and other foodstuffs, be they solid or liquid, can be taken in, coagulated by the plasmodium, and digested in vacuo.

On the other hand it has been found that plasmodia will live, ultimately producing sporangia, in nutrient solutions (6) .1 It would appear that this mode of nutrition, by the digestion of solid foodsstuff, and in part by the absorption of material in solution, and that there is great variety in the complexity of the substances which serve as their food.

Sclerotium.—As the result of drought, the plasmodium, having become much denser by loss of water, passes into the sclerotial condition. Drawing together into a thickish layer, the protoplasm divides up into a number of distinct masses, each containing some 10 to 20 nuclei, and a cyst wall is excreted round each mass (fig. 7). The whole has now a hard brittle consistency. In this state the protoplasm will remain alive for two or three years. On the addition of water the cyst walls are ruptured and in part absorbed, their contents join together, and the active streaming condition of the plasmodium is resumed. It is to be noted, however, that the sclerotal condition may be assumed under other conditions than dryness, and sclerotia may even be formed in water.

The appearance of the sclerotal stage affords a ready means of obtaining the plasmodium for experimental purposes. If a cultivation of the plasmodium of Badhamia utricularis on suitable fungi (Sclerotium, Drawia) is allowed to become partially dry the plasmodium draws together and would, if drying were continued, pass into the sclerotal stage on the fungus. If now strips of wet blotting-paper are placed so as to touch the plasmodium, the latter, attracted by the moisture, crawls on the blotting-paper. If this is now removed and allowed to dry rapidly the plasmodium passes into a state similar to that of the sclerotal stage on the fungus. By this means the plasmodium is removed from the partially disintegrated and decayed fungus on which it has been feeding, and a clean sclerotium is obtained, which, as above stated, remains alive for years (21, p. 7) . An easy method for obtaining small plasmodia for microscopic examination is to scatter small fragments, scraped from a piece of the hard sclerotium, over cover-slips wetted with rain-water and kept in a moist atmosphere. In twelve to twenty four hours small plasmodia will be seen spreading on the cover-slips and these may be mounted for observation.

The plasmodial stage ends by the formation of the sporangia. The plasmodium wall will be thin in the interiors for which it has fed, and emerges on the surface in a diffuse or concentrated mass. In the case of Badhamia utricularis it may withdraw from the fungus on which it has been feeding, or change into a mass of protoplasm. The mode of formation of the sporangia will be described in the case of Badhamia, some of the chief differences in the process and in the structure of the sporangia in other forms being subsequently noticed.

It may happen that the sporangia begins the protoplasm of the plasmodium becomes gradually massed in discrete rounded lobes, about a half to one millimeter in diameter and scattered in clusters filling the area occupied by the plasmodium. The reticulum of channels of the plasmodium becomes meanwhile less and less marked. When the whole of the protoplasm is drawn in to the lobes, the circulation ceases. The lobes are the young sporangia. In some genera, when the food, are ejected, and the protoplasm secretes on its outer surface a delicate membranous, transparent substance which dries as the sporangia ripen. This invests the young sporangia, and as they rise above the substratum they are dried. At this stage (fig. 7) of the sporangium the substance of the sporangium it forms the hypothallus, and in contact with the rounded surface of the sporangium it forms the sporangium-wall. While the sporangium-wall is formed externally a secretion of

---

1 A solution which has thus been found favourable contains the following mineral salts: KHPO₄, K₂HPO₄,MgSO₄, KNO₃, Ca(NO₃)₂, Fe₂(SO₄)₃, and 5% sugar.

2 If the plasmodium is slowly dried it is very apt to pass into sporangia.
similar material occurs along branching and anastomosing tracts through the protoplasm of the sporangium, giving rise to the capillitium. The greater part of the lime granules pass out of the protoplasm and are deposited in the capillitium, which in the ripe sporangia of Badhamia is white and brittle with the contained lime (cf. fig. 8). In this genus some granules are found also in the sporangium-wall. Strasburger concludes that the sporangium-wall of Trichia is a modification of cellulose (29).

Fig. 8.—Sporangia of Badhamia panicula, some intact, others (to left) ruptured, exposing the black masses of spores and the capillitium. The latter is white with deposited lime granules. An empty sporangium is seen above (X 30).

It has been stated (16), but the observation requires confirmation, that a fusion of the nuclei in pairs occurs early in the development of the sporangium.

At a later stage, after the capillitium is formed, the nuclei undergo a mitotic division which affects all the nuclei of a sporangium simultaneously. This was first described by Strasburger (29). While it

c, Capillitium thread (X 650).

is in progress the protoplasm of the sporangium divides, into successively smaller masses, until each daughter nucleus is the centre of a single mass of protoplasm. These nucleated masses are the young spores. A spore-wall is soon secreted and the sporangium has now resolved itself into a mass of spores, traversed by the strands of the capillitium and enclosed in a sporangium-wall, connected with the substratum by a stalk. As ripening proceeds, the wall becomes membranous and readily ruptures, and the dry spores may be carried abroad on the currents of air or washed out by rain.

Fig. 11.—Badhamia utricularis.

a, Sporangia (X 34).
b, Capillitium and cluster of spores (X 140).

c, Sporangium (X 650).

In some genera such as Arcyria and Trichia (illustrated in figs. 9 and 10) the division of the protoplasm does not occur until the nuclei have undergone this division. The protoplasm then divides up about the daughter nuclei to form the spores.
The condition of the capillitium is very various. In the Calcari-
neae the lime may be generally distributed through it (fig. 11), or
aggregated at the nodes of the network in "lime-knots" (figs. 12 and
14) or it may be absent from the capillitium altogether. The
capillitium attains its highest development in the Calcinoneae
in which the threads, distinct (in which case they are known as
elaters, figs. 9 and 10) or united into a network (fig. 20), present
regular thickenings in the form of spiral bands or transverse bars.
These threads, altering their shape with varying states of moisture,
are efficient agents in distributing the spores. In another group,
the Anemoneae, the capillitium is absent altogether.

The Didymiaceae are characterized by the fact that the line,
though present in a granular form in the plasmodium, is deposited
on the sporangium-wall in the form of crystals, either in radiating
groups (fig. 15) or in disks (fig. 16). In most Endosporae the sporangia are separate symmetrical bodies, but in many genera a form of fructification occurs in which

(23, b). Each of these masses now grows out perpendicularly to
the surface of the sporophore. As it does so an envelope is
secreted, which, closing in about the base forms a slender stalk.
When the mass, or stipe, is long enough, the stalk becomes the ellipsoidal sporule, surrounded by the sporophore.

In this manner the whole of the protoplasmic substance of the plasmodium is converted into spores, borne on supporting structures (stalks and sporophores), which are formed by secretion of the plasmodium.

In the course of the development of which the external features have now been traced nuclear changes occur which have been
given by Jahn (14) and by Olive (24 and 25). Jahn has shewn
that prior to the conversion of the protoplasm a mitotic division of
the nuclei takes place, the daughter nuclei of which are those
occupying the protoplasmic masses seen in fig. 23 b. After the
spore has risen on its stalk two further mitotic divisions occur in
forming a group of four nuclei. The four-nucleated condition characteristic of the spore of Ceratiomyxa is, thus attained. The spores, on being brought into water, soon hatch (fig. 23, d), and the four nuclei contain an endospore and a mitotic protoplasm. Meanwhile the
plasmodium divides, at first into four, then into eight masses, and
the latter acquire flagella, although for some time remaining con-

From observation of cultivations of zoosporae the impression is
that here, as in the Endosporae, they multiply by binary division,
though no exact observations of the process have been recorded.
The spores lose their flagella and become amoebulae, but the
fusion of the latter to form plasmodia has not been directly observed in
Ceratiomyxa, although from analogy with the Endosporae it can
hardly be doubted that such fusions occur.

Sorophora.
The Sorophora of Zopf (Acrasieae of Van Tieghem) are a group of
microscopic organisms which feed on the dung of herbivorous
animals and other decaying vegetable matter. As Finlay
(26) has shown, the presence of a particular species of bacteria
with the spores is necessary for their hatching and as the
essential food of the protoplasm which emerge from there. There
is no flagellate stage, and it is in the form of amoebulae, multiplying by fission, that the vegetable stage of the life-
history is passed. At the end of this stage numbers of amoebulae
draw together to form a "pseudo-plasmodium." This
appears to be merely an aggregation of amoebulae in the process
of spor formation. The outlines of the individual amoebulae are
maintained, and there is no fusion between them as in the
development of the plasmodium of the Euplasmida.

In some genera certain of the amoebulae, known as the "amoebulae
cases" (Coproxya, fig. 24, a and b) the pseudo-plasmodium is modified
into a stalk (simple in Gullula and Dictyostelium, and Polysphondylum, adapted to form a stalk, becomes the ellipsoidal sporule, surrounded by the sporophore.

b). The investing protoplasm, with its nuclei, having become arranged in an even layer, undergoes cleavage and thus forms a pavement-like layer of protoplasmic masses, each occupied by a single nucleus

FIG. 21.—Fuligo septica.  
E. Aethalium (X 1).  
B. Group of Plasmodiopsorae (X 2).  
C. A continuous Plasmodiopsorae (X 6).  
D. The spores are produced in masses of more or less irregular outline, retaining in extreme cases much of the distinctive character of the plasmodium. With the spores they contain capillitium, but there are no traces of sporangial walls to be found in their interior. They are known as Plasmodiopsorae (fig. 22). They are characteristic of certain species, but in others they may be formed side by side with separate sporangia from the same plasmodium. There is indeed no sharp line to be drawn between sporangia and plasmodiopsorae. On the other hand, the crowded condition of the sporangia of some species forms a transition to the large compound fructifications known as aethalium (fig. 21). These, either in their young stages or up to maturity, retain some evidence of their formation by a coalescence of sporangia, and in addition to the capillitium they are generally penetrated by the remains of the walls of the sporangia which have thus united.

Exosporae.

It will be convenient to begin our survey of the life-histories of
Ceratiomyxa, the single representative of the Exosporae, at the stage at which the plasmodium emerges from the rotten
wood in which it has fed. At this stage it has been observed to spread as a film over a slice, and to exhibit the network of channels and
rhythmic flow of the protoplasm in a manner precisely similar to that seen in the Endosporae (20, p. 10). It
soon, however, draws together to form compact masses, from the surface of which finger-like or antler-like lobes grow upwards. Here too the secretion of a transparent mucoid substance
occurs, which is at first penetrated by the anastomosing strands of the protoplasm, but gradually the latter tends more and
more to form a reticulate and finally a wholly continuous superficial investment, covering the mucoid ma-
terial. The latter eventually dries and forms the exceedingly delicate support of the spores or sporophore (fig. 23, a). The investing protoplasm, with its nuclei, having become arranged in an even

e-h. Stages in the development of the zoosporae.

1 Jahn (14) described two mitotic divisions at this stage, but in "Myxomycetenstudien 7—Ceratiomyxa," Ber. deut. bot. Gesellschaft, xxvi. a (1908) he shows that only one mitotic division occurs in the mature sporophore prior to cleavage. Olive gives a preliminary account of a fusion of nuclei prior to cleavage, but as he has not seen the mitotic division which certainly occurs at this stage his account cannot be accepted as secure.
At some stage or other we are led by analogy to expect that a division of nuclei would occur in which the number of chromosomes would be reduced by one half, that this would be followed by the formation of gametes, and that the nuclei of the latter would subsequently fuse into one.

It is clear that both in the Endospora and Exospora a mitotic division of nuclei immediately precedes spore-formation. This is regarded by Jahn as a reduction division. If this is the case, the zoological or the amoeboide phase must be represented by the genera of the Endospora, and the division of the former into the genera of the Exospora and Endospora are mitotic divisions.

The fusion of the latter to form plasmodia appears to offer a process comparable with the conjugation of gametes, but though the fusion of the latter to form the sporangia (in which a reduction of the nuclei in a glandular factory) has been found to accompany a fusion of nuclei has indeed been described as occurring in the plasmodium, or at stages in the development of the sporangia or sporidia. The existence of a spore-forming factory is thus the first step in this process, the sporidia being regarded as the first stages of the factory.

Until we have clear evidence on this point the nuclear history of the mycetozoa must remain incomplete.

Jahn's observation of the mitotic division of nuclei preceding spore-formation leads to the conclusion that the mycetozoa of the Endospora and Exospora with the Endospora. Starting from this division it seems clear that the spore of Ceratothyza is comparable with the spore of the Endospora except that the nucleus of the former has undergone two mitotic divisions.

From the school at Rottweil, he went (1510) to the university of Basel, and became a good classic. From 1514 he obtained schoolmaster posts at Basel, where he married, and made the acquaintance of Erasmus and of Holbein, the painter.

In 1516 he was called, as schoolmaster, to Zürich, where he attached himself to the reforming party of Zwingli. This led to his being transferred to Lucerne, and again (1523) reinstated at Zürich. On the death of Zwingli (1531) he migrated to Basel, and there held the office of town's preacher, and (till 1542) the chair of New Testament exegesis. Though he published a good many tracts and pamphlets, he was for a union of all Protestants; though a Zwinglian, his readiness to compromise with the advocates of consubstantiation gave him trouble with the Zwinglian stalwarts. He had, however, a distinguished follower in Theodoric Bihain. He died on the 14th of October 1552.
goldsmith, occupying a shop in Bassishaw, or Basinghall Street; he made money by commercial ventures on the Spanish main, being associated in these with Sir Walter Raleigh; and he was also interested in cloth-making. He was an alderman, and then recorder of Denbigh, and was member of parliament for this borough from 1603 to 1628. In 1609 Myddelton took over from the corporation of London the projected scheme for supplying the city with water obtained from springs near Ware, in Hertfordshire. For this purpose he made a canal about 10 ft. wide and 4 ft. deep and over 38 m. in length, which discharged its waters into a reservoir at Islington called the New River Head. The completion of this great undertaking put a severe strain upon Myddelton's financial resources, and in 1612 he was successful in securing monetary assistance from James I. The work was completed in 1613 and Myddelton was made the first governor of the company, which, however, was not a financial success until after his death. In recognition of his services he was made a baronet in 1622. Myddelton was also engaged in working some lead and silver mines in Cardiganshire and in reclaiming a piece of the Isle of Wight from the sea. He died on the 10th of December 1631, and was buried in the church of St Matthew, Friday Street, London. He had a family of ten sons and six daughters.

One of Sir Hugh's brothers was Sir Thomas Myddelton (c. 1550-1631), lord mayor of London, and another was William Myddelton (c. 1556-1621), poet and seaman, who died at Antwerp on the 27th of March 1621.

Sir Thomas was a member of parliament under Queen Elizabeth and was chosen lord mayor on the 29th of September 1613, the day fixed for the opening of the New River. Under James I. and Charles I. he represented the city of London in parliament, and helped Rolland and Heylyn to publish the first popular edition of the Bible in Welsh. He died on the 10th of August 1631. Sir Thomas's son and heir, Sir Thomas Myddelton (1586-1660), was a member of the Long Parliament, being an adherent of the popular party. After the outbreak of the Civil War he served in Shropshire and in north Wales, gaining a signal success over the royalists at Oswestry in July 1644, and another at Montgomery in the following September. In 1659, however, he joined the rising of the royalists under Sir George Booth, and in August of this year he was forced to surrender his residence, Chirk Castle. His eldest son, Thomas (d. 1663), was made a baronet in 1660, a dignity which became extinct when William, the 4th baronet, died in 1718.

**MYELAT**—**MYERS**

**MYELAT**, a division of the southern Shan States of Burma, including sixteen states, none of any great size, with a total area of 3723 sq. m., and a population in 1901 of 110,445. The name properly means "the unoccupied country," but it has been occupied for many centuries. All central Myelat and great parts of the northern and southern portions consist of rolling grassy downs quite denuded of jungle. It has a great variety of different races, Taungthus and Danus being perhaps the most numerous. They are all more or less hybrid races. The chiefs of the Myelat are known by the Burmese title of *gweynan-su*, i.e. chiefs paying the revenue in silver. The amount paid by the chiefs to the British government is Rs. 90,567.

The largest state, Loi Long, has an area of 1600 sq. m., a great part of which is barren hills. The smallest, Nam Hkon, had no more than 4 sq. m., and has been recently absorbed in a neighbouring state. The majority of the states cover less than 100 sq. m. Under British administration the chiefs have powers of a magistrate of the second class. The chief cultivation besides rice is sugar-cane, and considerable quantities of crude sugar are exported. There is a considerable potato cultivation, which can be indefinitely extended when cheaper means of export are provided. Wheat also grows very well.

**MYELITIS** (from Gr. *myelos*, marrow) a disease which by its inspection and dissection is destructive in the tissues composing the spinal cord. In the acute variety the nerve element in the affected part become disintegrated and softened, but repair may take place; in the chronic form the change is slower, and the diseased area tends to become denser (sclerosed), the nerve-substance being replaced by connective tissue. Myelitis may affect any portion of the spinal cord, and its symptoms and progress will vary accordingly. Its most frequent site is in the lower part, and its existence there is marked by the sudden or gradual occurrence of weakness of motor power in the legs (which tends to pass into complete paralysis), impairment or loss of sensibility in the parts implicated, nutritive changes affecting the skin and giving rise to bed-sores, together with bladder and bowel derangements. In the acute form, in which there is at first pain in the region of the spine and much constitutional disturbance, death may take place rapidly from extension of the disease to those portions of the cord connected with the muscles of respiration and the heart, from an acute bed-sore, which is very apt to form, or from some intercurrent disease. Recovery to a certain extent may, however, take place; or, again, the disease may pass into the chronic form. In the latter the progress is usually slow, the general health remaining tolerably good for a time, but gradually the strength fails, the patient becomes more helpless, and ultimately sinks exhausted or is cut off by some complication. The chief causes of myelitis are injuries or diseases affecting the spinal column, extension of inflammation from the membranes of the cord to its substance (see MENINGITIS), exposure to cold and damp, and occasionally some pre-existing constitutional morbid condition, such as syphilis or a fever. Any debilitating cause or excess in mode of life will act powerfully in predisposing to this malady. The disease is most common in adults. The treatment for myelitis in its acute stage is similar to that for spinal meningitis. When the disease is chronic the most that can be hoped for is the relief of symptoms by careful nursing and attention to the condition of the body and its functions. Good is sometimes derived from massage and the use of baths and douches to the spine.

**MYERS, FREDERIC WILLIAM HENRY** (1843-1902), English poet and essayist, son of Frederic Myers of Keswick—author of Lectures on Great Men (1856) and Catholic Thoughts (first collected 1873), a book marked by a most admirable prose style—was born at Keswick, Cumberland, on the 6th of February 1843, and educated at Cheltenham and Trinity College, Cambridge, where he won a long list of honours and in 1865 was appointed classical lecturer. He had no love for teaching, which he soon discontinued, but he took up his permanent abode at Cambridge in 1872, when he became a school inspector under the Education Department. Meanwhile he published, in 1867, an unsuccessful essay for the Seatonian prize, a poem entitled St Paul, which met at the hands of the general public with a success that would be difficult to explain, for it lacks sincerity and represents views which the writer rapidly outgrew. It was followed by small volumes of collected verses in 1870 and 1882; both are marked by a flow of rhetorical ardour which culminates in a poem of real beauty, "The Renewal of Youth," in the 1882 collection. His best verse is in heroic couplets. Myers is more likely to be remembered by his two volumes of Essays, Classical and Modern (1883). The essay on Virgil, by far the best thing he ever wrote, represents the matured enthusiasm of a student and a disciple of Thomas Carlyle. The aim of Virgil's method was profoundly congenial. Next to this in value is the carefully wrought essay on Ancient Greek Oracles (this had first appeared in Hellenica). Scarcely less delicate in phrasing and perception, if less penetrating in insight, is the monograph on Wordsworth (1881) for the "English Men of Letters" series. In 1882, after several years of inquiry and discussion, Myers took the lead among a small band of explorers (including Henry Sidgwick and Richard Hodgson, Edmund Gurney and F. Podmore), who founded the society for Psychical Research. He continued for many years to be the mouthpiece of the society, a position for which his *perferriodum ignatum*, still more his abnormal fluency and alertness, admirably suited him. He contributed greatly to the coherence of the society by steering a mid-course between extremes (the extreme sceptics on the one hand, and the enthusiastic spiritualists on the other), and by helping to sift and revise the cumbrous mass of
MYINGYAN—MYLODON

Proceedings, the chief concrete results being the two volumes of *Phantasms of the Living* (1886), to which he contributed the introduction. Like many theorists, he had a faculty for ignoring hard facts, and in his anxiety to generalize plausibly upon the alleged data, and to hammer out striking formulae, his insight into the real character of the evidence may have left something to be desired. His long series of papers on subliminal consciousness, the results of which were embodied in a posthumous work called *Human Personality and Its Survival of Bodily Death* (2 vols. 1907), constitute his own chief contribution to psychical theory. This, as he himself would have been the first to admit, was little more than provisional; but Professor William James has pointed out that the series of papers on subliminal consciousness is "the first attempt to consider the phenomena of hallucination, hypnotism, automatism, double personality and mediumship, as connected parts of one whole subject." The last work published in his lifetime was a small collection of essays, *Science and a Future Life* (1893). He died at Rome on the 17th of January 1901, but was buried in his native soil at Keswick.

MYINGYAN, a district in the Meiktila division of Upper Burma. It lies in the valley of the Irrawaddy, to the south of Mandalay, on the east bank of the river. Area, 3,137 sq. m. Pop. (1901), 356,052, showing an increase of 1% in the decade and a density of 114 inhabitants to the square mile. The greater part of the district is flat, especially to the north and along the banks of the Irrawaddy. Inland the country rises in gently undulating slopes. The most noticeable feature is Popa hill, an extinct volcano, in the southern-eastern corner of the district. The highest peak is 4,062 ft. above sea-level. The climate is dry and healthy, with high south winds from March till September. The annual rainfall averages about 35 in. The temperature varies between 106° and 70° F. The ordinary crops are millet, sesameum, cotton, maize, rice, gram, and a great variety of peas and beans. The district as a whole is not well watered, and most of the old irrigation tanks had fallen into disrepair before the annexation. There are no forests, but a great deal of low scrub. The lacquer wares of Nyaung-u and other villages near Pagan is noted throughout Burma. A considerable number of Chinese inhabit Myingyan and the larger villages. The headquarters town, MYINGYAN, stands on the Irrawaddy, and had a population in 1901 of 16,139. It is the terminus of the branch railway through Melktila to the main line from Mandalay to Rangoon. The steamers of the Irrawaddy Flotilla Company also call here. A cotton-pressing machine was erected here in the time of independent Burma, and still exists.

MYITKYINA, the most northerly of the districts of Upper Burma in the Mandalay division, separated from Bhamo district in 1895. It is cut up into strips by comparatively low parallel ranges of hills running in a general way north and south. The chief plan is that of Myitkyina, covering 600 sq. m. To the east of the Irrawaddy, which bisects the district, it is low-lying and marshy. To the west it rises to a higher level, and is mostly dry. Except in the hills inhabited by the Kachin tribes there are practically no villages off the line of the Irrawaddy. The Indawgyi lake, a fine stretch of water measuring 16 m. by 6, lies in the south-west of the district. A small stream, the Dov, runs along the eastern side of the lake. The Irrawaddy, which at this place is 10,640 sq. m.; estimated population (1901) 67,390, showing a density of six persons to the square mile. More than half the total are Kachins, who inhabit the hills on both sides of the Irrawaddy. The headquarters town, MYITKYINA, had in 1901 a population of 30,188. It is the limit of navigation on the Irrawaddy, and the terminus of the railway from Rangoon and Sagaing.

MYLODON (Gr. for "mill-tooth" from μύλων and δόντης), a genus of extinct American edentate mammals, typified by a species (M. horlani) from the Pleistocene of Kentucky and other parts of the United States, but more abundantly represented in the corresponding formations of South America, especially Argentina and Brazil. The mylodons belong to the group of ground-sloths, and are generally included in the family Megatheriidae, although sometimes made the type of a separate family. From Megatherium these animals, which rivalled the Indian rhinoceros in bulk, differ in the shape of their cheek-teeth; these (five above and four below) being much smaller, with an ovate section, and a cupped instead of a ridged crown-surface, thus resembling those of the true sloths. In certain species of mylodon the front pair of teeth in each jaw is placed some distance in front of the rest and has the crown surface obliquely bevilled by wearing against the corresponding teeth in the opposite jaw. On this account such species have been referred to a second genus, under the name of *Lestodon*, but the distinction scarcely seems necessary. The skull is shorter and lower than in *Megatherium*, without any vertical expansion of the middle of the lower jaw, and the teeth also extend nearly to the front of the jaws; both the genus being sloth-like. In the fore feet the three inner toes have large claws, while the two outer ones are rudimentary and clawless; in the hind-limbs the first toe is wanting, as in *Megatherium*, but the second and third are clawed. The skin was strengthened by a number of small deeply-embedded bony nodules.

Although the typical *M. horlani* is North American, the mylodons are essentially a South American group, a few of the representatives of which effected an entrance into North America when that continent became finally connected with South America. Special interest attaches to the recent discovery in the coves of Ultima Esperanza, South Patagonia, of remains of the genus *Glossotherium* or *Cryotherium*, a near relative of *Mylodon*, but differing from it in having a bony arch connecting the nasal bones of the skull with the premaxillae; these include a considerable portion of the skin with the hair attached. Ossicles somewhat resembling large coffee-berries had been previously found in association with the bones of *Mylodon*, and in *Glossotherium* nearly similar ossicles occur embedded on the inner side of the thick hide. The coarse and shaggy hair is somewhat like that of the sloths. The remains, which include not only the skeleton and skin, but likewise the droppings, were found buried in grass which appears to have been chopped up by man, and it thus seems not only evident that these ground-sloths dwelt in the cave, but that there is a considerable probability of their having been kept there in a semi-domesticated state by the early human inhabitants of Patagonia. The extremely fresh condition of the remains has given rise to the idea that *Glossotherium* may still be living in the wilds of Patagonia.

*Sclerotherium* is another genus of large South American Pleistocene ground-sloths, characterized, among other features, by the elongation and slenderness of the skull, which thus makes a decided approximation to the anteater type, although retaining the full series of cheek-teeth, which were, of course, essential to an herbivorous fauna. The feet resemble those of *Megatherium*. A much smaller South American species represents the genus *Nothrotherium*. In North America *Mylodon* was accompanied by another gigantic species typifying the genus *Megalonyx*, in which the fore part of the skull was usually wide, and the third and fourth front toes carried claws. Another genus has been described from the Pleistocene
of Nebraska, as *Paramylodon*; it has only four pairs of teeth, and an elephant-like mouth. It appears to have been a relative of *Mega*therium in having a foramen on the inner side of the lower end of the humerus. A presumed large ground-sloth from Madagascar has been described, on the evidence of a limb-bone, as *Brady-therium* sp. It is suggested by Dr. F. Ameghino that it really belongs to a lemuroid. Be this as it may, the North American mammals described as *Moropus* and *Morotherium*, in the belief that they were ground-sloths, are really referable to the ungulate group Anserata.

Although a few of the Pleistocene ground-sloths, such as *Nothro-\textit{pus} and *Nothotherium (= Coelodon), were of comparatively small size, in the Santa Cruz beds of Patagonia few of the representatives of the family much exceeded a modern sloth in size, and the known generic types are *Eucleoholops*, *Hopalops* and *Pseudakalops*, of which considerable portions of the skeleton have been disintegrated. In these diminutive ground-sloths the correctness of the once accepted appellation of *Megatherium*, or the diagnostic generic type of *Megalltherium*, as distinct from the subcylindrical type occurring in *Mylonodon*, *Glossotherium*, etc.

By many palaeontologists a group of North American Lower Tertiary mammals, known as Gondodonta, has been regarded as representing the ancestral stock of the ground-sloths and those of other South American edentates; but according to Professor W. B. Scott this view is incorrect and there is no affinity between the two groups. If this be so, we are still in complete darkness as to the stock from which the South American edentates are derived.

**MYLONITE** (Gr. μυλόν, a mill), in petrology, a rock which has been crushed and ground down by earth movement and at the same time rendered compact by pressure. Mylonites are fine-grained, sometimes even flinty, in appearance, and often banded in parallel fashion with stripes of varying composition. The great majority are quartzose rocks, such as quartzite and quartz-schist; but in almost any type of rock mylonitic structure may be developed. Graininess of various kinds, hornblende-schists, chlorite-schists and the like, frequently serve as a basis for the formation of mylonites. The process of crushing by which mylonites are formed is known also as "granulitization" and "cataclasis," and mylonites are often described as granulites, though the two terms are not strictly equivalent in all their applications. Mylonites occur in regions where there has been considerable metamorphism. Thrust planes and great reversed faults are often bounded by rocks which have all been crushed to fine slaty mylonites, that split readily along planes parallel to the direction in which movement has taken place. These "crush-belts" may be only a few feet or several hundred yards broad. The movements have probably taken place slowly with little change in structure, and hence the rocks have not recrystallized to any extent.

Crushing and movement on so extensive a scale are to be expected principally in regions consisting of rocks greatly folded and compressed. Hence mylonites are commonest in Archean regions, but may be found also in Carboniferous and later rocks where the necessary conditions have prevailed. Within a short space it is often possible to trace rocks from a normal to a highly mylonitized condition, and to follow by means of the microscope all the stages of the process. A sandstone, grit, or fine quartzose conglomerate, for example, when it approaches a mylonitic zone begins to lose its clastic or pebbly structure. The rounded grains of quartz become cracked, especially near their edges, and are then surrounded by narrow borders, consisting of detached granules; this is due to the peculiar conditions which, on one hand, remove the rock from the pressures which once at least it is almost always reserved, giving the rock a flat banding and marked schistosity (see *PETROLEO*, Pl. iv., fig. 6). When these mylonitic gneisses contain pink garnet (often with kyanite or sillimanite) they approach to normal granitoid gneisses; limestones, if fissilolose, become changed into finely crystalline calcareous, often well-laminated, calc-schists, with lenticular or augen structure. An interesting variety of mylonite, developed in granite-porphry and gneiss, is fine, dark and almost always in the appearance, consisting mainly of very minute grains of quartz and felspar and resembling flint in appearance. These form threads and vein-like streaks ramifying through the normal rocks. Examples are furnished by the flinty-crushes of west Scotland and the "trap-shotten" gneisses of south India. (J. S. F.)

**MYENSINGH**, or MAIMENSINGH, a district of British India, in the Dacca division of Eastern Bengal and Assam. It occupies a portion of the alluvial valley of the Brahmaputra east of the main channel (called the Jamuna) and north of Dacca. The administrative headquarters are at Nasirabad, sometimes called Mymensingh town. Area, 6,622 sq. m. (1901), 3,560,150, showing an increase of 12.8% in the decade. The district is for the most part level and open, covered with well-cultivated fields, and intersected by numerous rivers. The Madhupur jungle is a slightly elevated tract, extending from the north of Dacca district into the heart of Mymensingh; its average height is about 60 ft. above the level of the surrounding country, and it nowhere exceeds 100 ft. The jungle contains abundance of sal, valuable both as timber and for charcoal. The only other elevated tract in the district is on the southern border, where the Susung hills rise. They are for the most part covered with thick thorny jungle, but in parts are baren and rocky. The Jamuna forms the western boundary, being about 2 miles wide at its mouth. It is navigable for large boats throughout the year; and during the rainy season it expands in many places to 5 or 6 m. in breadth. The Brahmaputra enters Mymensingh at its north-western corner near Karaihari, and flows south-east and south till it joins the Meghna a little below Bhairab Bazar. The gradual formation of clays and bars of sand in the upper part of its course has diverted the main volume of water into the present channel of the Jamuna, which has in consequence become of much more importance than the Brahmaputra proper. The Meghna only flows for a short distance through the south-east portion of the district, the eastern and south-eastern parts of which abound in marshes. The staple crops of the country are rice, jute and oil-seeds. A branch line of the Eastern Bengal railway runs north from Dacca through Nasirabad, etc., to the Jamuna. The district was severely affected by the earthquake of the 12th of June 1897.

**MYNGS, SIR CHRISTOPHER** (1625-1666), British admiral, came of a Norfolk family. Pepys' story of his humble birth is said to be erroneous. It is probable that he saw a good deal of sea-service before 1642. He first appears prominently as the captain of the "Elisabeth," which after a sharp action brought in a Dutch convoy with two men-of-war as prizes. From 1652 to 1655 he continued to command the "Elisabeth," high in favour with the council of state and recommended for promotion by the flag officers under whom he served. In 1665 he was appointed to the "Marston Moor," the crew of which was on the verge of mutiny. His firm measures quelled the insubordinate spirit, and he took the vessel out to the West Indies, where he remained for some years. The Restoration government retained him in his command, and in 1664 he was made vice-admiral in Prince Rupert's squadron. As vice-admiral of the White he flew his flag at Lowestoft in 1665, and for his share in that action received the honour of knighthood. In the following year he served under the new lord high admiral, Sandwich, as vice-admiral of the Blue. He was on detachment with Prince Rupert when the great Four Days' Battle began, but returned to the Channel to meet the time of part, and in this action he received a wound of which he died.

**MYONEMES**, in Infusoria and some Flagellates, the differentiated threads of cecosarc, which are contractile and doubly refractive, performing the function of muscular fibres in the Metazoa.

**MYRA** (mod. Dembre), an ancient town of Lycia situated a short distance inland between the rivers Myrus and Andracus. In common with that of most other Lycian towns its early history
is not known, and it does not play any part of importance in either Greek or Roman annals. Its fame begins with Christianity. There St Paul touched on his last journey westward (A.D. 62), and changed into "a ship of Alexandria sailing into Italy." In the 3rd century the great St Nicholas, born at Patara, was its bishop, and he died and was buried at Myra. His tomb is still shown, but his relics are supposed to have been translated to Bari in Italy in the 11th century. Theodosius II. made Myra the Byzantine capital of Lycia, and a much it was hemmed and taken by Harun al-Rashid in 808. The town seems shortly afterwards to have decayed. A small Turkish village occupied the plain at the foot of the acropolis, and a little Greek monastery lay about a mile westward by the church of St Nicholas. The latter has formed the nucleus of modern Dembre, which has been increased by settlers from the Greek island of Castelforte. Myra has three notable sights, its carved cliff-cemetery, its theatre, and its church of St Nicholas. The first is the most remarkable of the Lycian rock-tomb groups. The western scarp of the acropolis has been sculptured into a number of sepulchres imitating wooden houses with pillared façades, some of which have painted reliefs and inscriptions in Lycian. The theatre lies at the foot of this cliff and is partly excavated out of it, partly built. It is remarkable for the preservation of its corridors. The auditorium is perfect in the lower part, and the scena still retains some of its decoration—both columns and carved entablature. The church of St Nicholas lies out in the plain, at the western end of Dembre, near a small monastery and new church recently built with Russian money. Its floor is far below the present level of the plain, and until recently the church was half filled with earth. The excavation of it was undertaken by Russians about 1854 and it cost Dembre dear; for the Ottoman government, suspicious of foreign designs on the neighbouring harbour of Kêkova, proceeded to inhibit all sale of the precious marbles and to carry the church under a minor state of siege. The ancient church is of the domed basilica form with throne and seats still existent in the tribunal. In the south aisle as a tomb with marble balustrade which is pointed out as that wherein St Nicholas was laid. The locality of the tomb is very probably genuine, but its present ornament, as well as the greater part of the church, seems of later date (end of 7th century?). None the less this is among the most interesting early Christian churches in Asia Minor. There are also extensive ruins of Andreae, the port of Myra, about 3 m. west, containing churches, baths, and a great grain store, inscribed with Hadrian's name. They lie along the course of the Andrakí river, whose navigable estuary is still fringed with ruinous quays.

See E. Petersen and F. v. Luschek, Reisen in Lykien, &c. (1886).

(M. G. H.)

MYRIAPODA (Gr. for "many-legged"), arthropod animals of which centipedes and millipedes are familiar examples. Linnaeus included them in his Insecta Aptera together with Crustacea and Arachnida; in 1796 P. A. Latreille designated them as Myriapoda, making of them, along with the Crustacean Oniscus, one of the seven orders into which he divided the Aptera of Linnaeus. Later on J. C. Saviugy, by study of the mouth-parts, clearly distinguished them from Insects and Crustacels. In 1824 W. E. Leach defined them and divided them into Centipedes and Millipedes. In 1825 Latreille carried further the observations of Leach, and suggested that the two groups were very distinct, the millipedes being nearer Crustacea and the centipedes approaching Arachnida and Insecta. Although Latreille's suggestion has not been adopted, it is recognized that centipedes and millipedes are too far apart to be united as Myriapoda, and they are now treated as separate classes of the Arthropoda. See CENTIPEDA (Chilopoda) and MILLIPEDAE (Diplopoda).

MYRMIDONES, in Greek legend, an Achaean race, in Homeric times inhabiting Phthiotis in Thessaly. According to the ancient tradition, their original home was Aegina, whence they crossed over to Thessaly with Peleus, but the contrary view is now more generally accepted. Their name is derived from a supposed ancestor, son of Zeus and Eurymedusa, who was wooed by the god in the form of an ant (Gr. μυρμής); or from the reappearance of Aegina (when all its inhabitants had died of the plague) with ants changed into men by Zeus at the prayer of Aeacus, king of the island. The word "myrmidon" has passed into the English language to denote a subordinate who carries out the orders of his superior without mercy or consideration for others. See Strabo viii. 375, ix. 433; Homer, IIiad, li. 681; schol. on Pindar Nem. iii. 21; Clem. Alex., Protrepticum, p. 34, ed. Potter.

MYROBALANS, the name given to the astringent fruits of several species of Terminalia, largely used in India for dyeing and tanning and exported for the same purpose. They are large deciduous trees and belong to the family Combretaceae. The chief kinds are the chebulic or black myrobalan, from Terminalia Chebula, which are smooth, and the beleric, from T. bellerica, which are five-angled and covered with a greyish down.

MYRON, a Greek sculptor of the middle of the 5th century B.C. He was born at Eleutheræa on the borders of Boeotia and Attica. He worked almost exclusively in bronze: and though he made back the discus with the full stretch of his arm, and is about to his representations of athletes, in which he made a revolution by introducing greater boldness of pose and a more perfect rhythm. His most famous works according to Pliny (Nat. Hist., 34, 57) were a cow, Ladas the runner, who fell dead at the moment of victory, and a discus thrower. The cow seems to have earned its fame mainly by serving as a peg on which to hang epigrams, which tell us nothing about the pose of the animal. Of the Ladas there is no known copy. But we are fortunate in possessing several copies of the discobolus, of which the best is in the Massimi palace at Rome (see Greek Art, Pl. iv. fig. 68). The example in the British Museum has the head put on wrongly. The athlete is represented at the moment when he has swung back the discus with the full stretch of his arm, and is about to hurl it with the full weight of his body. The head should be turned back toward the discus.

A marble figure in the Lateran Museum (see Greek Art, Pl. iii. fig. 64), which is now restored as a dancing satyr, is almost certainly a copy of a work of Myron, a Marsyas desirous of picking up the flutes which Athena had thrown away (Pausanias, i. 24, 1). The full group is copied on coins of Athens, on a vase and in a relief which represent Marsyas as oscillating between curiosity and the fear of the displeasure of Athena.

The ancient critics say of Myron that, while he succeeded admirably in giving life and motion to his figures, he did not succeed in rendering the emotions of the mind. This agrees with the extant evidence, in a certain degree, though not perfectly. The bodies of his men are of far greater excellence than the heads. The face of the Marsyas is almost a mask; but from the attitude we gain a vivid impression of the passions which sway him. The face of the discus-thrower is calm and unruffled; but all the muscles of his body are concentrated in an effort. A considerable number of other extant works are ascribed to the school or the influence of Myron by A. Furtwängler in his suggestive Masterpieces of Greek Sculpture (pp. 168-219). These attributions, however, are anything but certain, nor do the arguments by which Furtwängler supports his attributions bear abridgment.

A recently discovered papyrus from Egypt informs us that Myron made statues of the athlete Timanthus, victorious at Olympia in 456 B.C., and of Lycius, victorious in 448 and 444. This helps us to fix his date. He was a contemporary, but a somewhat older contemporary, of Phidias and Polyclitus.

(M. P. G.)

MYRRH (from the Latinized form myrrha of Gr. μύρρος; the Arabic murr, bitter, was applied to the substance from its bitterness), a gum-resin highly esteemed by the ancients as an unguent and perfume, used for incense in temples and also in embalming. It was one of the gifts offered by the Magi, and a royal oblation of gold, frankincense and myrrh is still annually presented by the sovereign on the feast of Epiphany in the Chapel Royal in London, this custom having been in
existence certainly as early as the reign of Edward I. The tree is the product of Balsamodendron (Commiphora) Myrrha, a small tree of the natural order Amyridaceae that grows in eastern Africa and Arabia, but the name is also applied to gum resins obtained from other species of Balsamodendron.

1. Balsa Bol, Bhesa Bol or Bissa Bol, from Balsamodendron Katal, resembles true myrrh in appearance, but has a disagreeable taste and is scarcely bitter. It is used in China, mixed with food, to give to milch cows to improve the quality and increase the quantity of milk, and when mixed with lime as a size to impart a gloss to walls. (2) Opaque balsamm produced by B. Playfairii, when shaken with water forms a slight but permanent lather, and on this account is used by the Somali women for cleansing their hair, and by the men to whiten their shields; it is known as meena harma in Bombay, and was formerly used there for the expellation of the guinea-worm. (3) African balsamm is from B. africanaum, and like opaque balsamm lacks the white streaks which are characteristic of myrrh and bessa bol, both are acid, but have scarcely any bitterness or aroma. (4) Indian balsamm, probably identical with the Indian drug googol obtained in Sind and Baluchistan from B. Mukul and B. pubescens, Hook, is of a dark reddish colour, has an acid taste and an odour resembling cedar-wood, and softens in the hand.

As met with in commerce true myrrh occurs in pieces of irregular size and shape, from ⅛ in. to 2 or 3 in. in diameter, and of a reddish-brown colour. The transverse fracture has a resinous appearance with white streaks; the flavour is bitter and aromatic, and the odour characteristic. It consists of a mixture of resin, gum and essential oil, the resin being present to the extent of 25 to 40%, with 2% to 8% of the oil, myrrhol, to which the odour is due.

Myrrh has the properties of other substances which, like it, contain a volatile oil. Its only important application in medicine is as a carminative to lessen the griping caused by some purgatives such as aloes. The volatile oils have for centuries been regarded as of value in disorders of the reproductive organs, and the reputation of myrrh in this connexion is simply a survival of this ancient but ill-founded belief.

**MYRTLE.** The μύρος of the Greeks, the myrtus of the Romans, and the myrtle, Myrtus communis (see fig.), of botanists, as now found growing wild in many parts of the Mediterranean region, doubtless all belong to one and the same species. It is a low-growing, evergreen shrub, with opposite leaves, varying in holes owing to the translucency of these oil-cysts. The fragrance of the plant depends upon the presence of this oil. Another peculiarity of the myrtle is the existence of a prominent vein running round the leaf within the margin. The flowers are borne on short stalks in the axils of the leaves. The flower-stalk is dilated at its upper end into a globose or ovoid receptacle enclosing the 2- to 4-partitioned ovary. From its margin proceed the five sepals, and within them the five rounded, spoon-shaped, spreading, white petals. The stamens spring from the receptacle within the petals and are very numerous, each consisting of a slender white filament and a small yellow two-lobed anther. The style surmounting the ovary is slender, terminating in a small button-like stigma. The fruit is a purplish berry, consisting of the receptacle and the ovary blended into one succulent investment enclosing very numerous minute seeds. The embryo-plant within the seed is usually curved. In cultivation many varieties are known, dependent on variations in the size and shape of the leaves, the presence of so-called double flowers, &c. The typical species is quite hardy in the south of England. The Chilean species, M. *Ugni*, a shrub with ovate, dark green leaves and white flowers succeeded by globular red or black glossy fruit with a pleasant smell and taste, is a greenhouse shrub, hardy in south-west Britain. The common myrtle is the sole representative in Europe of a large genus which has its headquarters in extra-tropical South America, whilst other members are found in Australia and New Zealand. The genus *Myrtus* also gives its name to a very large natural order, Myrtaceae, the general floral structure of which is like that of the myrtle above described, but there are great differences in the nature of the fruit or seed-vessel according as it is dry or capsular, dehiscent, indehiscent or pulpy; minor differences exist according to the way in which the stamens are arranged. The aromatic oil to which the myrtle owes its fragrance, and its use in medicine and the arts, is a very general attribute of the order, as may be inferred from the fact that the order includes, amongst other genera, *Eucalyptus* (gums), *Pimenta* and *Eucalyptus* (gloves). Myrtol, a constituent of myrtle oil, has been given in doses of 5-15 minims on sugar or in capsules for pulmonary tuberculosis, fetid bronchitis, bronchiectasis, and similar conditions. It appears to lessen expectoration in such cases. The leaves of *Myrtus chekan* are aromatic and expectorant, and have been used in chronic bronchitis.

**MYSIA,** the district of N.W. Asia Minor in ancient times inhabited by the Mysians. It was bounded by Lydia and Phrygia on the S., by Bithynia on the N.E., and by the Propontis and Aegean Sea on the N. and W. But its precise limits are difficult to assign, the Phrygian frontier being vague and fluctuating, while in the north-west the Troad was sometimes included in Mysia, sometimes not. Generally speaking, the northern portion was known as Mysia Minor or Hellespontica and the southern as Major or Pergamene.

The chief physical features of Mysia (considered apart from that of the Troad) are the two mountain-chains, Olympus (7600 ft.) in the north and Temnus in the south, which for some distance separates Mysia from Lydia, and is afterwards prolonged through Mysia to the neighbourhood of the Gulf of Adramyttium. The only considerable rivers are the Maeus and its tributary the Rhynacus in the northern part of the province, both of which rise in Phrygia, and, after diverging widely through Mysia, unite their waters below the lake of Apollonia about 15 m. from the Propontis. The Caicus in the south rises in Temnus, and from thence flows westward to the Aegean Sea, passing within a few miles of Pergamum. In the northern portion of the province are two considerable lakes, Artynia or Apolloniatis (Abulliont Geul), and Aphnith (Maniyan Geul), which discharge their waters into the Maeus and from the east and west respectively.

The most important cities were Pergamum (q.v.) in the valley of the Caicus, and Cyrus (q.v.) on the Propontis. But the whole sea-coast was studded with Greek towns, several of which were places of considerable importance; thus the northern portion included Parium, Lampascus and Abydos, and the southern
ASSUS, ADRANYTTUS, and farther south, on the Elatic Gulf, Elaea, Myrina and Cyme.

Ancient writers agree in describing the Mysians as a distinct people, like the Lydians and Phrygians, though they never appear in history as an independent nation. It appears from Herodotus and Strabo that they were kindred with the Lydians and Carians, a fact attested by their common participation in the sacred rites at the great temple of Zeus at Labranda, as well as by the statement of the historian Xanthus of Lydia that their language was a mixture of Lydian and Phrygian. Strabo was of opinion that they came originally from Thrace (cf. Bithynia), and were a branch of the same people as the Mysians or Moesians (see Moesia) who dwelt on the Danube—a view not inconsistent with the fact that they have considered by Phrygians and Lydians also as having migrated from Europe into Asia. According to a Carian tradition reported by Herodotus (i. 171) Lydus and Myus were brothers of Car—an idea which also points to the belief in a common origin of the three nations. The Mysians appear in the list of the Trojan allies in Homer and are represented as settled in the Carcianus of Lydia; at the coming of Telephus to Pergamum; but nothing else is known of their early history.

The story told by Herodotus (vii. 20) of their having invaded Europe in conjunction with the Teurcians before the Trojan War is probably a fiction; and the first historical fact we learn is their subjugation, together with all the surrounding nations, by Lydian Croesus. After the fall of the Lydian monarchy they remained under the Persian Empire until its overthrow by Alexander. After his death they were annexed to the Syrian monarchy, of which they continued to form a part until the defeat of Antiochus the Great (190 B.C.), after which they were transferred by the Romans to the dominion of Eumenus of Pergamum. After the extinction of the Pergamene dynasty (130 B.C.) Mysia became a part of the Roman province of Asia, and from this time disappears from history. The inhabitants probably became gradually Hellenized, but none of the towns of the interior, except Pergamum, ever attained to any importance.

See C. T. Wood, _Asia minore_ (Paris, 1839); W. J. Hamilton, _Researches_ (London, 1842); J. A. R. Munro in _Geog. Journal_ (1897); Hellespontica; W. von Dries, _Petermanns Mitth._ (Erganzungshft 94; Gotta, 1889; Pergamene).

**MYSLOWITZ,** a town of Germany, in the Prussian province of Silesia. Pop. (1905), 15,845. It lies on the navigable Przewa, across which an iron bridge leads to the Polish town of Modrzejow, 120 m. S.E. from Breslau by rail, and an important junction of lines to Oswiecim-Lemberg and Vienna. It contains a Protestant and three Roman Catholic churches, a palace and a gymnasium, and other schools. Extensive coal-mines are worked, and among its other industries are flax-spinning and brick-making. It became a town in 1587.

See Lustig, _Geschichte von Myslowitz_ (Myslowitz, 1867).

**MYSOER,** a native state of southern India, almost surrounded by the Madras presidency, but in political relations with the governor-general. It is naturally divided into two regions of distinct character—the hill country called the Malnad, on the west, and the more open country known as the Maidan, comprising the greater part of the state, where the wide-spreading valleys and plains are covered with villages and populous towns. The drainage of the country, with a slight exception, finds its way into the Bay of Bengal, and is divisible into three great river systems—that of the Kistna on the north, the Cauvery on the south, and the Northern and Southern Penner and Palar on the east. Owing to either rocky or shallow beds none of the Mysore rivers is navigable, but some are utilized for floating down timber at certain seasons. In the main streams, especially the Cauvery and its tributaries, support an extensive system of irrigation by means of channels drawn from immense dams (anicut), which retain the water at a high level and permit only the overflow to pass down stream. The streams which gather from the hill-sides and fertilize the valleys are embanked at every favourable point in such a manner as to form a series of reservoirs or tanks, the outflow from one at a higher level supplying the next lower, and so on, all down the course of the stream at short intervals. These tanks, varying in size from small ponds to extensive lakes, are dispersed throughout the country to the number of 20,000; the largest is the Sulekere lake, 40 m. in circumference.

Mysore is perhaps the most prosperous native state in India. Situated on a healthy plateau, it receives the benefit of both the south-west and north-east monsoons, a natural advantage which, in conjunction with its irrigation system, has brought to Mysore a larger degree of immunity from famine than almost any other internal tract of India (always excepting the great caluminy of 1876-1877, when one-fourth of the population is believed to have perished). Coffee, sandal-wood, silk, gold and ivory are among the chief products. The famous Kolar gold-fields are worked by electric power, which is conveyed for a distance of 92 m. from the Cauvery Falls. This was the first electric power scheme of magnitude in Asia. A long period of administration by British officers led to the introduction of a system based on British models, which has been maintained under a series of exceptionally able native ministers, and the state can boast of public works, hospitals, research laboratories, &c., unsurpassed in India.

The total area of the state is 29,433 sq. m., subdivided into 8 districts, namely: Bangalore, Kolar, Tumkur, Mysore, Hassan, Kadur, Shimoga and Chitrala. Pop. (1901), 5,539,399, showing an increase of 18% between 1891 and 1901, and of 12% between 1881 and 1901. The proportion of Hindus (90.1%) is larger than in any province of India, showing how ineffectual was the persecution of Hyder and Tippoo. The Christians (apart from native converts, who are chiefly Roman Catholics) largely consist of the garrison at Bangalore, the families of military pensioners at the same town, coffee-planters and gold-miners. The finances of the state have been very successfully managed under native rule, assisted by large profits from railways and gold-mines. The revenue amounts to about £1,400,000, of which nearly half is derived from land. In accordance with the "instrument of transfer," Mysore pays to the British government a tribute of £234,000, as contribution to military defence; but the full amount was not exacted until 1866. The state maintains a military force, consisting of two regiments of siddlar cavalry and three battalions of infantry—total, about 2800 men; and also a regiment of imperial service lancers, with a transport corps. An interesting experiment has been made, in the constitution of a representative assembly, composed of 350 representatives of all classes of the community, who meet annually to hear an account of the state administration for the previous year. The assembly has no power to enact laws, to vote supplies, or to pass any resolution binding upon the executive. But it gives to the leading men of the districts a pleasant opportunity of visiting the capital, and to a limited extent brings the force of public opinion to bear upon the minister. Since 1891 this representative assembly has been elected by local boards and other public bodies.

In the earliest historical times the northern part of Mysore was held by the Kadamba dynasty, whose capital, Banavasi, is mentioned by Ptolemy; they reigned with more or less splendour during fourteen centuries, though latterly they became feudatories of the Chalukyas. The Cheras were contemporary with the Kadambas, and governed the southern part of Mysore till they were subverted by the Cholas in the 8th century. Another ancient race, the Pallavas, held a small portion of the eastern side of Mysore, but were overthrown by the Chalukyas in the 7th century. These were overthrown in the 12th century by the Ballalas (Hoysalas), an enterprising and warlike race professing the Jain faith. They ruled over the greater part of Mysore, and portions of the modern districts of Coimbatore, Salem and Dharwar, with their capital at Dwarasamudra (the modern Halebid); but in 1310 the Ballala king was captured by Malik Kafur, the general of Ala-ud-din; and seventeen years later the town was entirely destroyed by another force sent by Mahommed Tughlak. After the subversion of the Ballala dynasty, a new and powerful Hindu sovereignty arose at Vijayanagar on the Tungabhadra.
In 1653 a confederation of the Mahoomedian kingdoms defeated the Vijayanagar sovereign at the battle of Talikota; and his descendants ultimately became extinct as a ruling house. During the feeble reign of the last king, the petty local chiefs (ruledars) asserted their independence. The most important of these was the wodeyar of Mysore, who in 1610 seized the fort of Seringapatam, and so laid the foundation of the present state. His fourth successor, Chikka Deva Raja, during a reign of 34 years, made his kingdom one of the most powerful in southern India. In the middle of the 18th century the famous Mahoomedian adventurer Hyder Ali usurped the throne, and by his military prowess made himself one of the most powerful princes of India. His dynasty, however, was as brief as it was brilliant, and ended with the defeat and death of his son Tippoo at Seringapatam in 1799. A representative of the ancient Hindoo line was then replaced on the throne. This prince, Krishnaraja Wodeyar, was only five years old, and until he came of age in 1811 the state was under the administration of Parnaiya, the Brahmam minister of Hyder and Tippoo. When Krishnaraja took over the management of his state he received an orderly and contented principality with a surplus of two crores of rupees. Within twenty years he had driven his subjects into rebellion and involved himself and his state in heavy debt. The British government therefore assumed the administration in 1831, and placed it in the hands of commissioners. In 1856 the new Maharaja Krishnaraja adopted him as his son and successor, although he had been informed that no adoption could be recognized except to his own private property, already once more heavily weighted with private debts. In 1867 the policy of government underwent a change; it was determined to secure the continuance of native rule in Mysore, by acknowledging the adoption upon certain conditions which would secure to the people the continued benefits of good administration enjoyed by them under British control. The old maharaja died on the 27th of March 1868, and Chamarajendra Wodeyar was publicly installed as the future ruler of Mysore on the 23rd of September 1868. His education was taken in hand, abuses which had grown up in the palace establishment were reformed, the late maharaja's debts were again paid off, and the whole internal administration perfected in every branch during the minority. On the 25th of March 1883 Maharaja Chamarajendra, having attained the age of 18 years, was publicly entrusted with the administration of the state. He made over to the British government, with full jurisdiction, a small tract of land at Bangalore, forming the "civil and military station," and received in return the island of Seringapatam. But the most important incident of the change was the signing of the "instrument of transfer," by which the young maharaja, for himself and his successors, undertook to perform the conditions imposed upon him. To that agreement the maharaja steadfastly adhered during his reign, and the instrument is a landmark in the history of British relations with the protected states of India. The maharaja's first minister was Ranga Charlu, who had been trained in the British administration of Mysore. He signalized the restoration of native rule by creating the representative assembly. In 1883 Sheshadri Aiyar succeeded Ranga Charlu, and to him Mysore is indebted for the extension of railways and schemes of irrigation, the development of the Kolar goldfields, and the maintenance of the high standard of its administration. The maharaja died at Calcutta on the 28th of December 1894. His eldest son, Krishnaraja Wodeyar, born in 1884, succeeded him, and his widow, Maharani Vanivilas, was appointed regent, until in 1902 the maharaja was formally invested with full powers by the viceroy in person.

See B. L. Rice, Mysore (2nd ed., Bangalore, 1897); Mysore and Coorg Gazetteer (Calcutta, 1908).

MYSORE, capital of the state of Mysore, India, 10 m. S.W. of Seringapatam on the Mysore State railway. Pop. (1901), 68,111. The city, which is spread over an area of about 7½ sq. m., has its nucleus at the foot of the Chamundi hill, in a valley formed by two parallel ridges running north and south. The fort stands in the south of the town, forming a quarter by itself; the ground-plan is quadrangular, each of the sides being about 4½ yds. long. The old palace of the maharaja within the fort, built in an extravagant style of Hindu architecture, was partly destroyed by fire in 1897, whereupon a new palace was built on the same site. The principal object of interest in the old palace was the throne, which is said to have been presented to Chikka Deva Raj by the emperor Aurangzeb. The houses of the European residents are for the most part to the east of the town. The residency or government house was built in 1805. The building afterwards used for the district offices was originally built by Colonel Wellesley (duke of Wellington) for his own occupation. The domed building for the public offices in Gordon Park, the Maharaja's College, the Victoria Jubilee Institute, and the law courts are conspicuous. Mysore, though the dynastic capital of the state, was superseded by Seringapatam as the seat of the administration from the middle of the 18th century until the British occupation, the seat of administration was removed to Bangalore.

MYSTERY (Gr. μυστήριον, from μύστης, an initiate, μικροί, to shut the mouth), a general English term for what is secret and wonder, derived from the word μυστήριον, which is often associated with and at times appears synonymous with the words ταξιν, δρωγα. We may interpret "mystery" in its original Greek meaning as a "secret" worship, to which only certain specially prepared people—εὐμυστήριοι—were admitted after a special period of purification or other preliminary probation, and of which the ritual was so important and perilous that the "catechumen" needed a hierophant or expounder to guide him aright. In the ordinary public worship of the state or the private worship of the household the sacrifice with the prayer was the chief act of the ceremony; in the "mysteries" something other than a sacrifice was of the essence of the rite; something was shown to the eyes of the initiated, the mystery was a δραμα, νυκτα, and δραματους και μυστα, and δραμα and δραματους are verbal terms expressing the mystical act. We have an interesting account given us by Theo Smyrnæus of the various elements and moments of the normal mystic ceremony: first is the καθαρια, or preliminary purification; secondly, the ταξιν, or the revelation to sight of certain holy things, which is the central point of the whole; fourthly, the crowning with the garland, which is henceforth the badge of the privileged; and finally, that which is the end and object of all this, the happiness that arises from the friendship or communion with the deity. This exposition is probably applicable to the Greek mysteries in general, though it may well have been derived from his knowledge of the Eleusinian. We may supplement it by a statement of Lucian's that "no mystery was ever celebrated without dancing" (De saltat. 15), which means that it was in some sense a religious drama, ancient Greek dancing being generally mimetic, and represented some ιερος λογος or sacred story as the theme of a mystery-play.

Before we approach the problem as to the content of the mysteries, we may naturally raise the question why certain

1 De ult. math., Herscher, p. 15.
ancient cults in Greece were mystic, others open and public. An explanation often offered is that the mystic cults are the Pelasgic or pre-Hellenic and that the conquered populations desired to shroud their religious ceremonies from the profane eyes of the conquerors. But we should then expect to find them administered chiefly by slaves and the lower population; on the contrary they are generally in the hands of the noblest families, and the evidence that slaves possessed in any of them the right of initiation is only slight. Nor does the explanation in other respects fit the facts at all. The deities who are worshipped with mystic rites have in most cases Hellenic names and do not all belong to the earliest stratum of Hellenic religion. Besides those of Demeter, by far the most numerous in the Hellenic world, we have record of the mysteries of Ge at Phyle in Attica, of Aglauros and the Charities at Athens, of Hecate at Aegina; a shrine of Artemis Moera on the road between Sparta and Arcadia points to a mystic cult of this goddess, and we can infer the existence of a similar worship of Themis. Now these are either various forms of the earth-goddess, or are related closely to her, being powers that we call "chthonian," associated with the world below, the realm of the dead. We may surmise then that the mystic setting of a cult arose in many cases from the dread of the religious mismas which emanated from the nether world and which suggested a prior ritual of purification as necessary to safeguard the person before approaching the holy presence or handling certain holy objects. This would explain the necessity of mysteries in the worship of Dionysus also, the Cretan Zagreus, Triphonius at Lebadeia, Palaeon-Melicertes on the Isthmus of Corinth. They might also be necessary for those who desired communion with the deified ancestor or hero, and thus we hear of the mysteries of Dryops at Asine, of Antinous the favourite of Hadrian at Martineia. Again, where there was hope or promise that the mortal should by communion be able to attain temporarily to divinity, so hazardous an experiment would be safeguarded by special preparation, secrecy and mystic ritual; and this may have been the prime motive of the institution of the Attis-Cybele mystery. (See Great Mother of the Gods.)

For the student of Hellenism, the Eleusinian and Orphic ceremonies are of paramount importance; the Samothracian, which vied with these in attractiveness for the later Hellenic world, were not Hellenic in origin, nor wholly hellenized in character, and cannot be considered an article of the common culture...

As regards the Eleusinian, we are in a better position for the investigation of them than our predecessors were; for the modern methods of comparative religion and anthropology have at least taught us to ask the right questions and to apply relevant hypotheses; archaeology, the study of vases, excavations on the site, yielding an ever-increasing hoard of inscriptions, have taught us much concerning the external organization of the mysteries, and have shown us the beautiful figures of the deities as they appeared to the eye or to the mental vision of the initiated.

As regards the inner content, the secret of the mystic celebration, it is in the highest degree unlikely that Greek inscriptions or art would ever reveal it; the Eleusinian scenes that appear on Attic vases of about the 5th century cannot be supposed to show us the heart of the mystery, for such sacrilegious rashness would be dangerous for the vase-painter. If we are to discover it, we must turn to the ancient literary records. These must be handled with extreme caution and a more careful scrutiny than is often applied. We must not expect full enlightenment from the Pagan writers, who convey to us indeed the poetry and the glow of this fascinating ritual, and who attest the deep and purifying influence that it exercised upon the religious temperament, but who are not likely to tell us more. It is to the Christian Fathers we must turn for more esoteric knowledge, for they would be withheld by no scruple from revealing what they knew. But we cannot always believe that they knew much, for only those who, like Clement and Arnobius, had been Pagans in their youth, could ever have been initiated. Many of them uncritically confuse in the same context and in one sweeping verdict of condemnation Orphic, Phrygian-Sabazian and Attis-Mysteries with the Eleusinian; and we ought not too lightly to infer that these were actually confused and blended at Eleusis. We must also be on our guard against supposing that when Pagan or Christian writers refer to "mysteries," they always have the Eleusinian in their mind.

The questions that the critical analysis of all the evidence may hope to solve are mainly these: (a) What do we know or what can we infer concerning the personality of the deities to whom the Eleusinian mysteries were originally consecrated, and were new figures admitted at a later period? (b) When was the mystery taken over by Athens and opened to all Hellas, and what was the state-organization provided? (c) What was the inner significance, essential content or purport of the Eleusinia, and what was the source of their great influence on Hellas? (d) Can we attribute any ethical value to them, and did they strongly impress the popular belief in immortality? Limits of space allow us only to adumbrate the results that research on the lines of these questions has hitherto yielded.

The paramount divine personalities of the mystery were in the earliest period of which we have literary record, the mother and the daughter, Demeter and Kore, the latter being never styled Persephone in the official language of Eleusis; while the third figure, the god of the lower world known by the euhemeristic names of Plato (Plouton) and at one time Eubouleus, the ravisher and the husband, is an accessory personage, comparatively in the background. This is the conclusion naturally drawn from the Homeric hymn to Demeter, a composition of great ritualistic value, probably of the 7th century B.C., which describes the abduction of the daughter, the sorrow and search of the mother, her sitting by the sacred well, the drinking of the κονάκιον or sacred cup and the legend of the pomegranate. An ancient hymn of Paphbos, from which Paussanias freely quotes and which he regards as genuine,1 appears to have told much the same story in much the same way. As far as we can say, then, the mother and daughter were there in possession at the very beginning. The other pair of divinities known as ὁ θεὸς ἡ θεά, that appear in a 5th-century inscription and on two dedicatory reliefs found at Eleusis, have been supposed to descend from an aboriginal period of Eleusinian religion when deities were nameless, and when a peaceful pair of earth-divinities, male and female, were worshipped by the rustic community, before the earth-goddess had pluralized herself as Demeter and Kore, and before the story of the madre dolorosa and the lost daughter had arisen.2 But for various reasons the contrary view is more probable, that ὁ θεὸς and ἡ θεά are later cult-titles of the married pair Pluto-Cora (Plouton-Kore), the personal names being omitted from that feeling of reverential shyness which was specially timid in regard to the sacred names of the deities of the underworld. And it is a fairly familiar phenomenon in Greek religion that two separate titles of the same divinity engender two distinct cults.

The question as to the part played by Dionysus in the Eleusinian is important. Some scholars, like M. Foucart, have supposed that he belonged from the beginning to the inner circle of the mystery; others that he forced his way in at a somewhat later period owing to the great influence of the Orphic sects which captured the stronghold of Attic religion and engraved the Orphic-Sabazian ἔριστος λάγος, the story of the incestuous union of Dionysos-Sabazius with Demeter-Kore, and of the death and rendering of Zagreus, upon the primitive Eleusinian faith. A saner and more careful criticism rejects this view. There is no genuine trace discovered as yet in the inner circle of the mysteries of any characteristically Orphic doctrine; the names of Zagreus and Phanes are nowhere heard, the legend of Zagreus and the death of Dionysus is not known to have been mentioned there. Nor is there any print within or in the precincts of the ἄλοιχαν: the hall of the Μυστέρες, of the footsteps of the Phrygian deities, Cybele, Attis, Sabazius.

1 38: 39: i. 39: 1.
2 See Dittenberger, Syll. 13; Corp. inscr. alt. 2, 1620 c. 3, 1190; Ephem. arch. (1886), iv. 31; Hesbert in Pafstarch für Benndorf, 3, Tal. 4; Von der Osten in Athen. Mittheil. (1899), p. 255.
The exact relation of Dionysus to the mysteries involves the question as to the divine personage called Iacchus; who and what was Iacchus? Strabo (p. 468), who is a poor authority on such matters, describes him as "the daemon of Demeter, the founder of the leader of the mysteries." More important is it to note that "Iacchus" is unknown to the author of the Homeric hymn, and that the first literary notice of him occurs in the well-known passage of Herodotus (viii. 63), who describes the procession of the mystae as moving along the sacred way from Athens to Eleusis and as raising the cry "Iacchus." We find Iacchus the theme of a glowing invocation in an Aristophanic Ode (Frogs, 324-398), and described as a beautiful "young god"; but he is first explicitly identified with Dionysus in the beautiful ode of Sophocles' Antigone (1119); and that this was in accord with the popular ritualistic lore is proved by the statement of the scholiast on Aristophanes (Frogs, 482) that the people at the Lenaea, the winter-festival of Dionysus, responded to the command of "Invoke the god!" with the invocation "Hail, Iacchus, son of Semele, thou giver of wealth!" We are sure, then, that in the high tide of the Attic religious history Iacchus was the youthful Dionysus, a name of the great god peculiar to Attic cult; and this is the name we shall use.

We can now answer the question raised above. This youthful Attic Dionysus has his home at Athens; he accompanies his votaries along the sacred way, filling their souls with the exaltation and ecstasy of the Dionysiac spirit; but at Eleusis he had no temple, altar or abiding home; he comes as a visitor and departs. His image may have been carried into the Hall of the Mysteries, but whether it played any part there in a passion-play we do not know. That he was a primary figure of the essential mystery is hard to believe, for we find no traces of his name in the other Greek communities that at an early period had instituted mysteries on the Eleusinian model. Apart from Iacchus, Dionysus in his own name was powerful enough at Eleusis as in most other localities. And the votaries carried with them no doubt into the hall the Bacchic exaltation of the Iacchus procession and the nightly revel with the god that preceded the full initiation; many of them also may have belonged to the private Dionysiac sects and might be tempted to read a Dionysiac significance into much that was presented to them. But all this is conjecture. The interpretation of what was shown would naturally change somewhat with the changing sentiment of the ages; but the mother and the daughter, the stately and beautiful figures presented to us by the author of the homeric hymn, who says no word of Dionysus, are still found reigning paramount and supreme at Eleusis just before the Gothic invasion in the latter days of Paganism. Triptolemus the apostle of corn-culture, Eubouleus—originally a euphemistic name of the god of the under-world, "the giver of good counsel," conveying a hint of his oracular functions—these are accessory figures of Eleusinian cult and mythology that may have played some part in the great mystic drama that was enacted in the hall.

The development and organization of the Eleusinia may now be briefly sketched. The legends concerning the initiation of Heracles and the Dioscuri preserve the record of the time when the mysteries were closed against all strangers, and were the privilege of the Eleusinians alone. Now the Homeric hymn in its obvious appeal to the whole late pre-Greek world to avail themselves of these mysteries gives us to suppose that they had already been thrown open to Hellas; and this momentous change, abolishing the old gentle barriers, may have naturally coincided with, or have resulted from, the fusion of Eleusis and Athens, an event of equal importance for politics and religion which we may place in the prehistoric period. The reign of Peisistratus was an era of architectural activity at Eleusis; but the construction of the νυμφεῖον σπήδος was one of the achievements of the Periclean administration. Two, containing decrees passed during the supremacy of Pericles, the one proclaiming a holy truce of three months for the votaries that came from any Greek community,1 the other bidding the subject allies and inviting the independent states to send ἄραργυος or tithe-offerings of corn to Eleusis,2 record the favored sight of Periclean Athens, her determination to find a religious support for her hegemony.

At least from the 5th century onwards, the external control and all questions of the organization of the mysteries were in the hands of the Athenian state, the rule holding in Attica as elsewhere in Hellas that the state was supreme over the Church. The head of the general management was the king-archon (archon basileus) who with his ἀρχιερεῖα and the four "πρεσβείαι" formed a general committee of supervision, and matters of importance connected with the ritual were decided by the Boule or Ecclesia. But the claim of Eleusis as the religious metropolis was not ignored. The chief of the two priestly families, in whose hands lay the mystic celebration itself and the formal right of admission, was the Eleusinian "gens" of the Eumolpidæ; it was to their ancestor that Demeter had entrusted her ἄργυρα, and the recognition of their claims maintained the principle of apostolic succession. To them belonged the hierophant (ἱεροφάνης), the high priest of the Eleusinia, whose function alone it was to "reveal the orgies," to show the sacred things, and warn one—or perhaps with his consort-priestesses could indubitably enter into the Eleusinian temple, was the impressive figure, so sacred in person that no one could address him by his personal name, and bound, at one period at least, by a rule of celibacy. We hear also of two "hierophantides,"3 female attendants on the older and younger goddesses. In fact, while the male priest predominates in this ritual, the women play a prominent part: as we should expect, considering that the sister-festival of the Thesmophoria was wholly in their hands.

The other old priestly family was that of the "Kerykes," to whom the διδύμοι belonged, "the holder of the torch," the official second in rank to the ἱεροφάνης. It is uncertain whether this family was of Eleusinian origin; and in the 4th century it seems to have died out, and the office of the διδύμοι passed into the hands of the Lycomideæ, a priestly family by Pylæ, suspected of being devotees of Orphism.

Turning now to the celebration itself, we can only sketch the more salient features here. On the 15th of Boedromion, on the Attic month corresponding roughly to our September, the Ephæi (q.v.) marched out to Eleusis, and returned to Athens the next day bringing with them the "holy things" (ἱερά) to the Eleusinion in the city; these ἱερά probably included small images of the goddesses. The 16th was the day of the ἄγρυψ, the gathering of the catechumens, when they met to hear the address of the hierophant, called the προφάνης. This was no sermon, but a proclamation bidding those who were disqualified or for some reason unworthy of initiation to depart. The legally qualified were all Hellenes and subsequently all Romans above a certain—very youthful—limit of age, women, and as it appears even slaves; barbarians, and those uncleaned of some notorious guilt, such as homicide, were disqualified. We are sure that there was no dogmatic test, nor would time allow of any searching moral scrutiny, and only the Samothracian rites, in this respect unique in the world of classical religion, possessed a system of confessional. The hierophant appealed to the conscience of the multitude; but we are not altogether sure of the terms of his proclamation, which can only be approximately restored from the aforesaid and many other Christian writers. We know that he demanded of each candidate that he should be "of intelligible speech (i.e. an Hellene) and pure of hand"; and he catechized him as to his condition of ritualistic purity—the food he had eaten or abstained from. It appears also from Libanius that in the later period at least he solemnly proclaimed that the catechumen should be "pure of soul," and this spiritual conception of holiness had arisen already in the earlier periods of Greek religious thought. On the other hand we must bear in mind the criticism that Diogenes is said to have passed upon the Eleusinia, that many bad characters were admitted to communion, thereby securing a promise of higher happiness than an uninitiated Ἐπάμινον might aspire to. An essential preliminary was purification and lustration, and

1 Corp. inscr. att. i. 1.
2 Dittenberger, Sylloge, 15.
3 Or. Corinth, iv. 356.
after the assembly the "mystae" went to the sea-shore (ἄλατος μύσται) and purified themselves with sea-water, and probably with sprinkling of pigs' blood, a common cathartic medium. After their return from the sea, a sacrifice of some kind was offered as an essential condition of μύσις, but whether as a sacrament or a gift-offering to the goddesses it is impossible to determine. On the 19th of Boedromion the great procession started along the sacred way bearing the "fair young god" Iacchus; and as they visited many shrines by the way the march must have continued long after sunset, so that the 20th is sometimes spoken of as the day of the exodus of Iacchus. On the way each wore a saffron band as an amulet; and the ceremonial reviling to which the "mystai" were subjected as they crossed the bridge of the Cephissus answered the same purpose of averting the evil eye. Upon the arrival at Eleusis, on the same night or on the following, they celebrated a midnight revel under the stars with Iacchus, which Aristophanes glowingly describes.

The question of supreme interest now arises: What was the mystic ceremony in the hall? what was said and what was done? We can distinguish two grades in the celebration; the greater was the τέαμα and ἑσπόρια, the full and satisfying celebration, to which only the public was admitted; but passages from the lesser stage at least a year before. As regards the actual ritual in the hall of the mystae, much remains uncertain in spite of the unwearying efforts of many generations of scholars to construct a reasonable statement out of fragments of often doubtful evidence. We are certain at least that something was acted there in a religious drama or passion-play, the revelation was partly a pageant of holy figures; the accusations against Aeschylus and Alcibiades would suffice to prove this; and Porphyry speaks of the hierophant and the διδοὺχος acting divine parts.

What the subject of this drama was may be gathered partly from the words of Clement—Deo (Demeter) and Kore became the personages of a mystic drama, and Eleusis with its διδοὺχος celebrates the wandering, the abduction and the sorrow (Protrept., p. 12 Potter), partly from Psyche's appeal to Demeter in Apuleius (Metamorph. 6)—"by the unspoken secrets of the mystic chest, the winged chariots of thy dragon-ministers, the bridal descent of Proserpine [Persephone], the torch-lit wanderings to find thy daughter and all the other mysteries that the shrine of Attic Eleusis shrouds in secret." We may believe then that the great myth of the mother's sorrow, the loss and the partial recovery of her beloved was part of the Eleusinian passion-play. Did it also include a λεπός γάμος? We should naturally expect that the sacred story acted in the mystic pageant would close with the scene of reconciliation, such as a holy marriage of the god and the goddess. But the evidence that this was so is mainly indirect, a fact from a doubtful passage in Asterius, a writer of questionable authority in the 4th century a.d. (Econom. marty. p. 194, Combe). At any rate, if a holy marriage formed part of the passion-play, it may well have been acted with solemnity and delicacy. We have no reason to believe that even to a modern taste any part of the ritual would appear coarse or obscene; even Clement, who brings a vague charge of obscenity against all mysteries in general, does not try to substantiate it in regard to the Eleusinia, and we hear from another Christian writer of the scrupulous purity of the hierophant.

It would be interesting to know if the birth of a holy child, a babe Iacchus, for example, was a motive of the mystic drama. The question seems at first sight to be decided by a definite statement of Hippolytus (Philosoph. 5, 8), that at a certain moment in the mysteries the hierophant cried aloud: "The lady-goddess Brimo has borne Brimos the holy child." But a careful consideration of the context almost destroys the value of his authority. For he does not pretend to be a first-hand witness, but admits that he is drawing from Gnostic sources, and he goes on at once to speak of Attis and his self-mutilation. The formula may then refer to the Sabazian-Phrygian mystery, which the Gnostics with their usual spirit of religious syncretism would have no scruple in identifying with the Eleusinian. And the archaeological evidence that has been supposed to support the statement of Hippolytus is deceptive.

Finally, we must not suppose that there could be any very elaborate scenic arrangements in the hall for the representation of Paradise and the Inferno, whereby the rewards of the faithful and the punishments of the damned might be impressively brought home to the mystae. The excavations on the site have proved that the building was without substructures or under-ground passages. A large number of inscriptions present us with elaborate accounts of Eleusinian expenditure; but there is no item for scenic expenses or painting. We are led to suppose that the pageant-play produced its effect by means of gorgeous raiment, torches and stately figures.

But the mystic action included more than the pageant-play. The hierophant revealed certain holy objects to the eyes of the assembly. There is reason to suppose that these included certain primitive idols of the goddesses of immemorial sanctity; and, if we accept a statement of Hippolytus (loc. cit.) we must believe that the ἐποπλαί were also shown "that great and marvelous mystery of perfect revelation, a cut corn-stalk." The value of this definite assertion, which appears to be an explicit revelation of the secret, would be very great, if we could trust it; but uncritically we cannot accept it, at least in this context as the Brimo-Brimos formula, and we again suspect the same uncritical confusion of Eleusinian with Phrygian ritual, for we know that Attis himself was identified in his mysteries with the "reaped corn," the στάχυς ἄμπρος, almost the very phrase used by Hippolytus. Only, it is in the highest degree probable, whether Hippolytus knew anything or not, that a corn-token was shown among the sacred things of a mystery which possessed an original agrarian significance and was intended partly to consecrate and foster the agricultural life. But to say this is by no means the same as to admit the view of Lenormant 1 and Dr Jevons 2 that the Eleusinians worshipped the actual corn, or revered it as a clan-totem. For of direct corn-worship or of corn-totemism there is no trace either at Eleusis or elsewhere in Greece.

Among the δώραμα or "things done" may we also include a solemn sacraiment, the celebration of a holy communion, in which the votary was united to the divinity by partaking of some holy food or drink? We owe to Clement of Alexandria (Protrept. p. 18, Potter) an exact transcription of the pass-word of the Eleusinian mystae; it ran as follows (if we accept Lobeck's emendation of ἐγγαγάμενοι for ἐγαγάμενοι): "I have fasted, I have drunk the barley-drink, I have taken [the things] from the sacred chest, having tasted thereof I have placed them into the basket and again from the basket into the chest." We gather from this that some kind of sacrament was at least a preliminary condition of initiation; the mystae drank of the cup as the goddess drank in her sorrow, partly—as we say—"in memory of her," partly to unite themselves more closely with her. We know also from an inscription that the priest of the Samothracian mysteries broke sacred bread and poured out drink for the mystae (Arch. epigr. Milh. 1882, p. 8, No. 14.) But neither in these nor in the Eleusinian is there any trace of the more mystic sacramental conception, any indication that the votaries believed themselves to be partaking of the actual body of their divinity; for there is no evidence that Demeter was identified with the corn, still less with the barley-meal of which the Κυνόδωρ was compounded. Nor is it likely that the sacrament was the pivot of the whole mystery or was part of the essential act of the μύσις itself. In the first place we have an almost certain representation of the Eleusinian sacrament on an archaic vase in Naples, probably of Attic provenance, and the artistic reproduction of a holy act would have been impious and dangerous, if this had belonged to the inner circle of the mystery. Again, there is no mention of sacrament or sacrifice among the five essential parts of μύσις given by Theo 3 Daremberg et Saglio, Dictionnaire, 1, p. 1666.

3 Introduction to the Study of Religion.
4 This is Dr Jevons's supposition—op. cit.—on which he bases an important theory of the whole Eleusinian mysteries and their intrinsic attraction.

5 Farnell, Cults. vol. iii. pl. xiv.
Mysteries

Smyrnaeus, nor in the imaginary narrative of the late rhetorician Sophatros, who supposes the strange case of a man being initiated by the goddesses in a dream: they admit him to their full communion merely by telling him something and showing him something.

Besides the ὅρωμα, then, there were also certain things said in the hall, or in the earlier stages of initiation, which we would gladly discover. Part of these were mystic formulæ, one of which has been discussed already, the pass-word of the votaries. We gather also from Proclus and Hippolytus that in the Eleusinian rites they gazed up to heaven and cried aloud "rain"—φανερωτετε—"and gazed down upon the earth and cried "conceive"—κάιξαι. This ritual charm—we cannot call it prayer—descends from the old agrarian magic which underlay the primitive mystery. What else the votaries may have uttered, whether by way of thanksgiving or solemn litany, we do not know.

But there was also a certain ἴδιος μάρτυς, some exposition accompanying the unfolding of the mysteries; for it was part of the prestige of the hierophant that he was chief spokesman, "who poured forth winning utterance and whose voice the catechumens ardently desired to hear" (Ανθικ. Παλ., app. 246); and Galen speaks of the rapt attention paid by the initiated to "the things done and said in the Eleusinian and Samothranian mysteries" (De usu part. 7, 14). But we have no trustworthy evidence as to the real content of the μάρτυς of the hierophant. We need not believe that the whole of his discourse was taken up with corn-symbolism, as Varro seems to imply (Aug. De civ. Dei. 20), or that he taught natural philosophy rather than theology; or again, the special doctrine of Euhemerus, as two passages in Cicero (De natur. deor. 1. 42; Tusc. 1. 13) might prompt us to suppose. His chief theme was probably an exposition of the meaning and value of the ἱππαξ, as in an Australian initiation rite it is the privilege of the elders to explain the nature of the "churingas" to the youths. And his discourse on these may have been coloured to some extent by the theories current in the philosophic speculation of the day. But though in the time of Julian he appears to have been a philosopher of Neo-platonic tendencies, we ought not to suppose that the hierophant as a rule would be able or inclined to rise above the anthropomorphic religion of the times. Whatever symbolism attached to the ἱππαξ, the sacred objects shown, was probably simple and natural; for instance, the Baphian, as it is called, a cylinder with an eschatological, the token of the growing corn may have served as an emblem—though not a proof—of man's resurrection. The doctrine of the continuance of the soul after death was already accepted by the popular belief, and the hierophant had no need to preach it as a dogma; the votaries came to Eleusis to ensure themselves a happy immortality. And in our earliest record, the Homeric hymn, we find that the mysteries already hold out this higher promise. How, we may ask, were the votaries assured? M. Foucart in Les grands mystères d'Eleusis has maintained that the object of the mysteries was much the same as that of the Egyptian Book of the Dead; to provide the mystic with elaborate rules for avoiding the dangers that beset the road to the other world, and for attaining to last to the happy regions; that for this purpose the hierophant recited magic formulæ whereby the soul could repel the demons that it might encounter on the path; and that it was to seek this delivery from the terrors of hell that all Greece flocked to Eleusis. This is in accord with his whole "egyptizing" theory concerning the Eleusinian, a theory which, though Egyptian influence cannot be a priori be ruled out, is not found in harmony with the facts of the two religious systems. And the particular hypothesis just stated is altogether wanting in direct evidence, or—we may say—in vraisemblance. There is no hint or allusion to be found in the ancient sources suggesting that the recital of magic formulæ was part of the ceremony. The μάρτυς, whatever it was, was comparatively unimportant. And the Greek public in general, in its vigorous period when the Eleusinian religion reached its zenith, was not tormented, as modern Europe has at times been, by ghostly terrors of judgment.

The influence of the Eleusinian mysteries was obtained by the feeling of friendship and mystic sympathy, established by mystic contact, with the mother and the daughter, the powers of life after death. Those who won their friendship by initiation in this life would by the simple logic of faith regard themselves as certain to win blessing at their hands in the next.

It is obvious that the mysteries made no direct appeal to the intellect, nor on the other hand revolted it by any oppressive dogmatism. As regards their psychic effect, we have Aristotle's invariable judgment: 'The initiated do not learn anything so much as feel certain emotions and are put into a certain frame of mind' (Synes. Dion. p. 482). The appeal was to the eye and to the imagination through a form of religious mesmerism working by means that were solemn, stately and beautiful. To understand the quality and the intensity of the impression produced, we should borrow something from the modern experiences of Christian communion-service, mass, and passion-play, and bear in mind also the extraordinary susceptibility of the Greek mind to an artistically impressive pageant.

That the Eleusinia reached a higher morality than that of the current standard is not proved. That they exercised a direct and elevating influence on the individual character is nowhere explicitly maintained, as Diodorus (v. 49) maintains concerning the Samothracian. But on general grounds it is reasonable to believe that such powerful religious experience as they afforded would produce moral fruit in many minds. The genial Aristophanes (Frogs, 455) intimates as much, and Andocius (De myst. p. 36, § 31; p. 44, § 125) assumes that those who had been initiated would take a juster and sterner view of moral innocence and guilt, and that such conduct was a greater sin when committed by a man who was in the official service of the mother and the daughter.

Besides the greater mysteries at Eleusis, we hear of the lesser mysteries of Agra in the banks of the Ilissos. Established, perhaps, originally by Athens herself at a time when Eleusis was independent and closed her rites to strangers, they became wholly subordinated to the greater, and were put under the same management and served merely as a necessary preliminary to the higher initiation into them. Sacrifice was offered to the same great goddesses at both; but we have the authority of Duris (Athenea, 253d), the Samian historian, and the evidence of an Attic painting, called the πίναξ of Nannion,4 that the predominant goddess in the mysteries at Agra was Kore. And this agrees with the time of their celebration, in the middle of Anthesterion, when Kore was supposed to return in the young corn. Stephanus (s.v. Ἀγρᾶ), drawing from an unknown source, declares that the Dionysiac story was the theme of their mystic drama. Hence theorists have supposed that their content was wholly Orphic or that their central motive was the marriage of Dionysus and Kore. The theory has no archaeological or literary support except the passage in Stephanus, nor have we reason for believing that the marriage of these two divinities was recognized in Attic state ritual.

The influence of Eleusis in early times must have been great, for we find offshoots of its cult, whether mystic or not, in other parts of Greece. In Boeotia, Laconia, Arcadia, Crete and Thrace, Demeter brought with her the title of "Eleusinia"; and no other explanation is so probable as the obvious one that the same designation was given to the goddess of Eleusis; and though there may have been other places called "Eleusis," the only famous religious centre was the Attic. The initiation rites of Demeter at Cелеe near Phlius, at Lerna in Argolis, and at Naples, were organized after the pattern of the Eleusinian. But of these and the other Demeter mysteries in the Greek world,
there is little to record that is certain and at the same time of primary importance for the history of religion. The Arcadian city of Pheneus possessed a mystery that boasted an Eleusinian character and origin, yet in the record of it there is no mention of Kore, and we may suspect that, like other Demeter-worships in the Peloponnesse, it belonged to a period when the earth-goddess was revered as a single personality and Kore had not yet emanated from her. We know much more of the details of the great Andanian mysteries in Messenia, owing to the discovery of the important and much-discussed Andanian inscription of 91 B.C. But what we know are facts of secondary importance only. We gather from Pausanias (4. 33. 4; cf. 4. 1. 5, and 4. 26. 8; 4. 27. 6) that the rites, which he regards as secondarily solemn in nature and yet to the Eleusinian alone, were consecrated to the Meγάλα θεία, ... the great goddesses, ... and that Kore enjoyed the mystic title of Hagnē, "the holy one." The inscription has been supposed to correct and to refute Pausanias, but it does not really controvert his statements, which are attested by other evidence; it proves only that other divinities came at a later time to have a share in the mysteries, such as the Meγάλα θεία who were probably the Caberei (q.v.). It is clear that the Andanian mysteries included a sacred drama, in which women personated the goddesses. The priestesses were married women, and were required to take an oath that they had lived "in relation to their husbands a just and holy life." We hear also of grades of initiation, purification-ceremonies, but of no sacrament or eschatologic promise; yet it is probable that these mysteries, like the Eleusinian, maintained and secured the hope of future happiness.

The Eleusinian faith is not wholly unattested by the grave-inscriptions of Hellas, though it speaks but rarely on these. The most interesting example is the epitaph of a hierophant, who proclaims that he has found that "death was not an evil, but a blessing." Of equal importance for the private religion of Greece were the Orphic mystic societies, bearing a Thracio-Phrygian tradition into Greece, and associated originally with the name of Dionysus, and afterwards with Sabazius also and the later cult-ideas of Phrygia. The full account of the Dionysiac mysteries would demand a critical study of the Dionysiac religion as a whole, as well as of the private sects that sprang up under its shadow. It is only possible here to indicate the salient characteristics of those which are of primary value for the history of religion.

Of the Orphic teachings, it is certain that its head-god was the Thracian-Phrygian stock, powerful over all vegetation and especially revealing his power in the vine, Dionysus was forcing his way into Greece at least as early as the Homeric period, and by the 6th century was received into the public cults of most of the Greek communities. We can gather with some certainty or probability his aboriginal characteristics and the form of his worship. Being a god of the life of the earth, he was also a nether divinity, the lord of the world of souls, with whom the dead votary entered into privileged communion; his rites were mystic, and nightly celebrations were frequent, marked by wild ecstasy and orgiastic self-abandonment, in which the votary became at one with the god. The Orphic myth of the Chthonian Orpheus, so much played a prominent part in the ritual; a savage form of sacramental communion was in vogue, and the animal victim of whose flesh and blood the votaries partook was at times regarded as the incarnation of the divinity, so that the god himself might be supposed to die and to rise again; finally we may regard certain cathartic ideas as part of the primeval tradition of this religion. Admitted among the soberer cults of the Greek communities, it lost most of its wildness and savagery, while still retaining a more emotional ecstatic character than the rest. But this cooling process was arrested by a new wave of Dionysiac fervour that spread over Greece from the 4th century onwards, with bringing it the name of Orpheus, and engendering at some later date the Orphic brotherhoods. This religious movement may have started like the earlier one from the lands north of Greece; but Crete and even Egypt are supposed to have contributed much to the Orphic doctrine and ritual. Our earliest authority for the proceedings of the mystery-practitioner who used the name of Orpheus is the well-known passage in Plato's Republic (p. 364a), in which he speaks contemptuously of the itinerant ritualists who knock at the doors of the rich, the vendors of magic incantations, who promise absolution from sins and happiness in the next world to be attained by a ritual of purification and mystic initiation. This record brings to our notice a phenomenon unknown elsewhere in Greek religion; the missionary spirit, the impulse to preach to all who would hear, which foreshadows the breaking down of the genial religious barriers of the ancient world. And it is probable that some kind of "Orphic" propaganda, whether through books or itinerant mystery-priests, or both, had been in vogue some time before Plato. We may fairly conjecture that it has to some extent inspired the glowing eschatology of Pindar, who describes the next world as a place of penance and purification from ancestral or personal taint and of final reward for the purified soul, and who unites this belief with a doctrine of reincarnation. In the Hippolytus of Euripides, Theseus taunts his son with cloaking his immorality under hypocritical "Orphic" pretensions to purity, the phalic sacrifice, for instance, of a vegetarian diet (952-954). Still more important is the fragment of the Cretans of Euripides, attesting the strength of the antiquity of these mystic Dionysiac associations in Crete. The initiated votary proclaims himself as sanctified to Zeus of Ida, to Zagreus—the Orphic name of the nether-world Dionysus—and to the mountain-goddess Rhea-Cybele; he has fulfilled "the solemn rite of the banquet of raw flesh," and henceforth he "robes himself in pure white and avoids the taint of childbirth and funerals and abstains from meat." And—what is most significant—he calls himself by the very name of his god—he is himself Bάσιν. In spirit and in most of its details the passage accords well with the Ἐπιθυμεῖα of Euripides, which reflects not so much the public worship of Greece, but rather the mystic Dionysiac brotherhoods. Throughout this inspired drama the votary rejoices to be one with his divinity and to call himself by his name, and this mystic union is brought about partly, though Euripides may not have known it, through "the meal of raw flesh" or the drinking of the blood of the goat or the kid or the bull. The sacramental intention of this is confirmed by abundant proof; even in the state-cult of Tenedos they dressed up a bull-calf as Dionysus and reverently sacrificed it (Ael. Nat. 12. 34); those who partook of the flesh were partaking of what was temporarily the body of the god. The oldest and greatest single source of this rite is found in the Life of Dionysius, at the end of his history of the god (364), and it is a sacred hymn that has been in vogue at least as early as the 3rd century B.C., and which was inscribed in order to

3. The best account of the origin and development of the Dionysiac religion is Le Bas, Voyage archéol. 2. No. 320; see also A. von Harnack, christliche Religion, II, 1. for Orphic ritual and doctrine, and see article on Orpheus in Roscher's Ausführliches Lexikon der griechischen und römischen Mythologie; Miss Harrison, Prolegomena to the Study of Greek Religion, pp. 455-469, with critical appendix by G. Murray on the Orphic tablets discovered in Crete, near Rome, and in south Italy.
4. The name Orphēs first occurs in Ibycus, Frag. 10: ὁμαλοπλήθος Ὀρφής.
be buried with the defunct, as an amulet that might protect him from the dangers of his journey through the under-world and open to him the gates of Paradise. The verses have the power of an incantation. The initiated soul proclaims its divine descent: "I am the son of Earth and Heaven"; "I am perishing with thirst, give me to drink of the waters of memory"; "I come from the pure"; "I have paid the penalty of unrighteousness"; "I have flown out of the weary, sorrowful circle of life." His reward is assured him: "O blessed and happy one, thou hast put off thy mortality and shalt become divine." The strange formula ἐρείπω οὖς γάλα τεσσαρα, "I a kid fell into the milk," has been interpreted by Dieterich (Eine Milkarst-Liturgie, p. 174) with great probability as alluding to a conception of Dionysus himself as ἐρείπω, the divine kid, and to a ritual of milk-baptism in which the initiated was born again.

We discern, then, in these mystic brotherhoods the germs of a supreme, all-pervading, and indwelling power, in whom all things are one. Hence the speculative utterances of mysticism are always more or less pantheistic in character. On the practical side, mysticism maintains the possibility of direct intercourse with this Being of beings—intercourse, not through any external media such as an historical revelation, oracles, answers to prayer, and the like, but by a species of ecstatic transfusion or identification, in which the individual becomes in very truth "partaker of the divine nature." God ceases to be an object to him and becomes an experience. In the writings of the mystics, ingenuity exhausts itself in the invention of phrases to express the closeness of this union. Mysticism differs, therefore, from ordinary pantheism in that its inmost motive is religious; but, whereas religion is ordinarily occupied with a practical problem and develops its theory in an ethical reference, mysticism displays a predominatingly speculative bent, starting from the divine nature rather than from man and his surroundings, taking the symbolism of religious feeling as literally or metaphysically true, and straining after the present realization of an ineffable union. The union which sound religious teaching represents as realized in the submission of the will and the ethical harmony of the whole life is then reduced to a passive experience, to something which comes and goes in time, and which may be of only momentary duration. Mysticism, it will be seen, is not a name applicable to any particular system. It may be the outgrowth of many differing modes of thought and feeling. Most frequently it appears particularly in relation to some definite system of belief, as a reaction of the spirit against the letter. When a religion begins to ossify into a system of formulas and observances, those who protest in the name of heart-religion are not unfrequently known by the name of mystics. At times they merely bring into prominence again the ever-fresh fact of personal religious experience; at other times mysticism develops itself as a powerful solvent of definite dogmas.

A review of the historical appearances of mysticism will serve to show how far the above characteristics are to be found, separately or in combination, in its different phases.

In the East, mysticism is not so much a specific phenomenon as a natural deduction from the dominant philosophic systems, and the normal expression of religious feeling in the lands in which it appears. Brahmanic pantheism and Buddhist nihilism alike teach the unreality of the seeming world, and preach mystical absorption as the highest goal; in both, the sense of the worth of human personality is lost. India consequently has always been the fertile mother of practical mystics and devotees. The climate itself encourages to passivity, and the very luxuriance of vegetable and animal life tends to blunt the feeling of the value of life. Silent contemplation and the total deadening of consciousness by perseverence for years in unnatural attitudes are among the commonest forms assumed by this mystical asceticism. But the most revolting methods of self-torture and self-destruction are also practised as a means of rising in sanctity. The sense of sin can hardly be said to enter into these exercises—that is, they are not undertaken as penance for personal transgression. They are a despite done to the principle of individual or separate existence.

The so-called mysticism of the Persian Sufis is less intense and practical, more airy and literary in character. Sufism (q.v.) appears in the 9th century among the Mahomedans of Persia as a kind of reaction against the rigid monotheism and formalism of Islam. It is doubtless to be regarded as a revival of ancient habits of thought and feeling, and as the same which underlay the Koran, not by affinity, but by compulsion. Persian literature after that date, and especially Persian poetry, is full of an ardent natural pantheism, in which a mystical apprehension of the unity and divinity of all things heightens the delight in natural and in human beauty. Such is the poetry of Hafiz and Saadi, whose verses are chiefly devoted to the praises of wine and women. Even the most licentious of these have been fitted by Mahomedan theologians with a mystical interpretation.
The delights of love are made for standing to the raptures of union with the divine, the tavern symbolizes an oratory, and intoxication is the bewildernent of sense before the surpassing vision. Very often, if not most frequently, it cannot be doubted that the occult religious significance depends on an artificial exegesis; but there are also poems of Hafiz, Saadi, and other writers, religious in their first intentions. These are unequivocally pantheistic in tone, and the desire of the soul to escape and rest with God is expressed with all the fervour of Eastern poetry. This speculative mood, in which nature and beauty and earthly satisfaction appear as a vain show, is the counterpart of the former mood of sensuous enjoyment.

For opposite reasons, neither the Greek nor the Jewish mind lent itself readily to mysticism: the Greek, because of its clear and sunny naturalism; the Jewish, because of its rigid monothelism and its turn towards worldly realism and statutory observance. It is only with the exhaustion of Greek and Jewish civilization that mysticism becomes a prominent factor in Western thought. It appears, therefore, contemporaneously with Christianity, and is a sign of the world-weariness and deep religious need that mark the decay of the old world. Whereas Plato's main problem had been the organization of the perfect state, and Aristotle's intellect had ranged with fresh interest over all departments of the knowable, political speculation had become a mockery with the extinction of free political life, and knowledge as such had lost its freshness for the Greeks of the Roman Empire. Knowledge is nothing to these men if it does not show the way to a truly important end. Man's true end is void within. Accordingly, the last age of Greek philosophy is theosophical in character, and its ultimate end is a practical satisfaction. Neoplatonism seeks this in the ecstatic intuition of the ineffable One. The systematic theosophy of Plotinus and his successors does not belong to the present article, except so far as it is the presupposition of their mysticism; but, inasmuch as the mysticism of the medieval Church is directly derived from Neoplatonism through the speculations of the pseudo-Dionysius, Neoplatonic mysticism fills an important section in any historical review of the subject.

Neoplatonism owes its form to Plato, but its underlying motive is the widespread feeling of self-despair and the longing for divine illumination characteristic of the age, in which it appears. Before the rise of Neoplatonism proper we meet with various mystical or semi-mystical expressions of the same religious craving. The contemplative asceticism of the Essenes of Judea may be mentioned, and, somewhat later, the life of the Therapeutae on the shores of Lake Mocis. In Philo, Alexandrian Judaism had already seized upon Plato as "the attic Moses," and done its best to combine his speculations with the teaching of his Jewish prototype. Philo's God is described in terms of absolute transcendency; his doctrine of the Logos or Divine Sophia is a theistical transformation of the Platonic world of ideas; his allegorical interpretation of the Old Testament represents the spiritualistic dissolution of historical Judaism. Philo's ethical ideal is renunciation, contemplation, complete surrender to the divine influence. Apollonius of Tyana and the so-called Neopythagoreans drew similar ethical consequences from their ecstatic study of Plato. Wonder-workers like Alexander the Paphlagonian exhibit the grosser side of the longing for spiritual communion. The traits common to Neoplatonism and all these speculations are well summed up by Zeller (Philos. der Griechen, iii, 2, 213) as consisting in: (1) the dualistic opposition of the divine and the earthly; (2) an abstract conception of God, excluding all knowledge of the divine nature; (3) contrary to the Platonic, it cannot be reduced to a combination of Platonic doctrines of matter and of the descent of the soul from a superior world into the body; (4) the theory of intermediate potencies or beings, through whom God acts upon the world of phenomena; (5) the requirement of an ascetic self-emancipation from the bondage of sense and faith in a higher revelation to man when in a state called "enthusiasm." Neoplatonism appears in the first half of the 3rd century, and has its greatest representative in Plotinus. He develops the Platonic philosophy into an elaborate system by means of the doctrine of emanation. The One, the Good, and the Idea of the Good were identical in Plato's mind, and the Good was not therefore deprived of intelligible essence. It was not separated from the world of ideas, of which it was represented as either the crown or the sum. By Plotinus, on the contrary, the One is explicitly exalted above the νοῦς and the "ideas"; it transcends existence altogether (ἐκθέσας τὸν θεὸν), and is not cognizable by reason. Remaining itself in repose, it rays out, as it were, from its own fullness an image of itself, which is called νοῦς, and which constitutes the system of ideas of the intelligible world. The soul is in turn the image or product of the νοῦς, and the soul by its motion begets corporeal matter. The soul thus faces two ways—towards the νοῦς, from which it springs, and towards the material life, which is its own product. Ethical endeavour consists in the repudiation of the sensible; material existence is itself estrangement from God. (Porphyry tells us that Plotinus was unwilling to name his parents or his birthplace, and seemed ashamed of being in the body.) Beyond the καθαροῦς, or virtues which purify from sin, lies the further stage of complete identification with God (ἀφ’ ἑαυτοῦ ἡμέρας ἄριστον; ἀλλα θεὸν ἡμᾶς). To reach the ultimate goal, thought itself must be left behind; for thought is a form of motion, and the desire of the soul is for the motionless rest which belongs to the One. The union with transcendent deity is not so much knowledge or vision as ecstasy, coalescence, the "flowering," to use the popular Hebraic phrase. Our present state of existence the moments of this ecstatic union must be few and short; "I myself," says Plotinus simply, "have realized it but three times as yet, and Porphyry hitherto not once."

It will be seen from the above that Neoplatonism is not mystical as regards the faculty by which it claims to apprehend philosophic truth. It is first of all a system of complete rationalism; it is assumed, in other words, that reason is capable of mapping out the whole system of things. But, inasmuch as a God is affirmed beyond reason, the mysticism becomes in a sense the necessary complement of the would-be all-embracing rationalism. The system culminates in a mystical act, and in the sequel, especially with Iamblichus and the Syrian Neoplatonists, mystical practice tended more and more to overshadow the theoretical groundwork.

It was probably about the end of the 5th century, just as ancient philosophy was dying out in the schools of Athens, that the speculative mysticism of Neoplatonism made a definite lodgment in Christian thought through the literary forgeries of the pseudo-Dionysius (see DIONYSIUS THE AREOPA- GITUS). The doctrines of Christianity were by that time so firmly established that the Church could look upon a symbolic or mystical interpretation of them without anxiety. The author of the Θεολογία mystica and the other works ascribed to the Areopagite proceeds, therefore, to develop the doctrines of Proclus with very little modification into a system of esoteric Christianity. God is the nameless and supra-essential One, elevated above goodness itself. Hence "negative theology," which ascends from the creature to God by dropping one after another every determinate predicate, leads us nearest to the truth. The return to God (ἐνυποστασις, ἔννοιας) is the consummation of all things and the goal indicated by Christian teaching. The same doctrines were preached with more of earthly fervour by Maximus the Confessor (580-622). St Maximus represents almost the last speculative activity of the Greek Church, but the influence of the pseudo-Dionysian writings was transmitted to the West in the 9th century by Eriugena. In whose work the spirit both the scholasticism and the mysticism of the middle ages have their rise. Eriugena translated Dionysius into Latin along with the commentaries of Maximus, and his system is essentially based upon theirs. The negative theology is adopted, and God is stated to be predicateless Being, above all categories, and therefore not improperly called Nothing. Out of this Nothing or incomprehensible essence the world of ideas or
MYSTICISM

primordial causes is eternally created. This is the Word or Son of God, in whom all things exist, so far as they have substantial existence. All existence is a theophany, and as God is the beginning of all things, so also is He the end. Erfigena teaches the institution of all things under the form of the Dionysian adunatio or deficiatio. These are the permanent outlines of what may be called the philosophy of mysticism in Christian times, and it is remarkable how little variation they are repeated from age to age.

In Erfigena mysticism has not yet separated itself in any way from the dogma of the Church. There is no revulsion, as later, from dogma as such, nor is more stress laid upon one dogma than another; all are treated upon the same footing, and the whole dogmatic system is held, as it were, in solution by the philosophic medium in which it is presented. No distinction is drawn, indeed, between what is reached by reason and what is given by authority; the two are immediately identical for Erfigena. In this he agrees with the speculative mystics everywhere, and differentiates himself from the scholastics who followed him. The distinguishing characteristic of scholasticism is the acceptance by reason of a given matter, the truth of which is independent of rational grounds, and which remains a presupposition even when it cannot be understood. Scholasticism aims, it is true, in its chief representatives, at demonstrating that the content of revelation and the teaching of reason are identical. But what was matter of immanent assumption with Erfigena is in them an equating of two things which have been dealt with on the hypothesis that they are separate, and which, therefore, still retain that external relation to one another. This externality of religious truth to the mind is fundamentally in scholasticism, while the opposite view is equally fundamental in mysticism. Mysticism is not the voluntary demission of reason and its subjection to an external authority. In that case, all who accept a revelation without professing to understand its content would require to be ranked as mystics; the fierce sincerity of Tertullian's credo quia absurdum, Pascal's reconciliation of contradictions in Jesus Christ, and Bayle's half-sneering subordination of reason to faith would all be marks of this standpoint. But such a temper of mind is much more akin to scepticism than to mysticism; it is characteristic of those who either do not feel the need of philosophizing their beliefs, or who have failed in doing so and take refuge in sheer acceptance. Mysticism, on the other hand, is marked on its speculative side by even an overweening confidence in human reason. Nor need this be wondered at if we consider that the unity of the human mind with the divine is its underlying presupposition. Hence where reason is discarded by the mystic it is merely reason overlapping itself; it occurs at the end and not at the beginning of his speculations. Even then there is no appeal to authority; nothing is accepted from without. The appeal is still to the individual, who, if not by reason then by some higher faculty, claims to realize absolute truth and to taste absolute blessedness.

Mysticism first appears in the medieval Church as the protest of practical religion against the predominance of the dialectical spirit. It is so with Bernard of Clairvaux (1090-1153), who condemns Abelard's distinctions and reasonings as externalizing and degrading the faith. St Bernard's mysticism is of a practical cast, dealing mainly with the means by which man may attain to the knowledge and enjoyment of God. Reason has three stages, in the highest of which the mind is able, by abstraction from earthly things, to rise to contemplatio or the vision of the divine. More exalted still, however, is the sudden ecstatic vision, such as was granted to a nun at Paris, for example. But the German mind was a peculiarly fruitful soil for mysticism, and, in connexion either with the Beguines or the Church organization, a number of women appear about this time, combining a spirit of mystical piety and asceticism with sturdy reformatory zeal directed against the abuses of the time. Even before this we hear of the prophetic visions of Hildegard of Bingen (a contemporary of St Bernard) and Elizabeth of Schönenau. In the 13th century
Elizabeth of Hungary, the pious landgravine of Thuringia, assisted in the foundation of many convents in the north of Germany. (For an account of the chief of these female saints see the first volume of W. Preger's Geschichte der deutschen Mystik.) Mechthild of Magdeburg appears to have had a mystical temperament, and their book Das Rätselnde Licht der Gottheit is important as the oldest work of its kind in German. It proves that much of the terminology of German mysticism was current before Eckhart's time. Mechthild's clero-political utterances show that she was acquainted with the "eternal gospel" of Joachim of Floris. Joachim had proclaimed the doctrine of three world-ages—the kingdom of the Father, of the Son, and of the Spirit. The reign of the Spirit was to begin with the year 1260, when the abuses of the world and the Church were to be effectually cured by the general adoption of the monastic life of contemplation. Very similar to this in appearance is the teaching of Amalric of Bena (d. 1207); but, while the movements just mentioned were reformatory without being heretical, this is very far from being the case with the mystical pantheism derived by Amalric from the writings of Eriegena. His followers held a progressive revelation of God in the ages of the Father, Son, and Holy Spirit. Just as the Mosaic dispensation came to an end with the appearance of Christ, so the sacraments of the new dispensation have lost their meaning and efficacy since the incarnation of God as Holy Spirit in the Amalrians. With this opposition to the Church they combine a complete antinomianism, through the identification of all their desires with the impulses of the divine Spirit. Amalric's teaching was condemned by the Church, and his heresies led to the public burning of Eriegena's De divisione naturae in 1225. The sect of the New Spirit, or of the Free Spirit as it was afterwards called, spread widely through the north of France and into Switzerland and Germany. They were especially numerous in the Rhineland in the end of the 13th and during the 14th century; and they seem to have continued the original orthodox communities of Beghards, for Beghards and Brethren of the Free Spirit are used henceforward as convertible terms, and the same immoralities are related of them. Such was the seed-ground in which what is specifically known as German mysticism sprang up.

In Meister Eckhart (?1260–1327) the German mind definitively asserts its pre-eminence in the sphere of speculative mysticism. Eckhart was a distinguished son of the Church; but in reading his works we feel at once that we have passed into quite a different sphere of thought from that of the churchly mystics; we seem to leave the cloister behind and to breathe a freer atmosphere. The scholastic mysticism was, for the most part, practical and psychological in character. It was largely a devotional aid to the realization of present union with God; and, so far as it was theoretical, it was a theory of the faculties by which such a union is attainable. Mysticism was placed on somewhat incongruously to a scholastically accepted theology; the feelings and the intellect were not brought together. But in Eckhart the attitude of the churchman and traditionalist is entirely abandoned. Instead of systematizing dogmas, he appears to evolve a philosophy by the free exercise of reason. His system enables him to give a profound significance to the doctrines of the Church; but, instead of the system being accommodated to the doctrines, the doctrines—and especially the historical facts—acquire a new sense in the system, and often become only a mythical representation of speculative truth. The freedom with which Eckhart treats historical Christianity allies him much more to the German idealists of the 19th century than to his scholastic predecessors.

The political circumstances of Germany in the first half of the 14th century were in the last degree disastrous. The war between the rival emperors, Frederic of Austria and Louis of Bavaria, and the interdict under which the latter was placed in 1324 inflicted extreme misery upon the unhappy people. From some places the interdict was not removed for twenty-six years. Men's minds were pained and disquieted by the conflict of duties and the absence of spiritual consolation. The country was also visited by a succession of famines and floods, and in 1348 the Black Death swept over Europe like a terrible scourge. In the midst of these unhappy surroundings religion became more inward in men of real piety and the desire grew among them to draw closer the bonds that united them to one another. This need gave rise to the society of the Gottesfreunde ("Gottesfreunde") in the south and west of Germany, spreading as far as Switzerland on the one side and the Netherlands on the other. They formed no exclusive sect. They often took opposite sides in politics and they also differed in the type of their religious life; but they uniformly desired to strengthen one another in living intercourse with God. Among them chiefly the followers of Eckhart were to be found. Such were Heinrich Suso of Constance (1295–1366) and Johann Tauler of Strassburg (1300–1361), the two most celebrated of his immediate disciples. Nicolas of Basel, the mysterious layman from whose visit Tauler dates his true religious life, seems to have been the chief organizing force among the Gottesfreunde. The society counted many members among the pious women in the convents of southern Germany. Such were Christina Ebner of Engelthal near Nuremberg, and Margaretha Ebner of Medingen in Swabia. Laymen also belonged to it, like Hermann of Fritzlar and Rulman Merswin, the rich banker of Strassburg (author of a mystical work, Buch der neuen Felsen, on the nine rocks or upwards steps of contemplation). It was doubtless one of the Friends who sent forth anonymously from the house of the Teutonic Order in Frankfort the famous handbook of mystical devotion called Eine deutsche Theologie, first published in 1516 by Luther.

Jan van Ruysbroeck (1294–1381), the father of mysticism in the Netherlands, stood in connexion with the Friends of God, and Tauler is said to have visited him in his seclusion at Groenendal (Vauvert, Grünthal) near Brussels. He was decisively influenced by Eckhart, though there is noticeable occasionally a shrinking back from some of Eckhart's phraseology. Ruysbroeck's mysticism is more of a practical than a speculative cast. He is chiefly occupied with the means whereby the unio mystica is to be attained, whereas Eckhart dwells on the union as an ever-present fact, and dilates on its metaphysical implications. Towards the end of Ruysbroeck's life, in 1378, he was visited by the fervid lay-preacher Gerhard Groel (1400–1534), who was so impressed by the life of the community at Groenendal that he conceived the idea of founding a Christian brotherhood, bound by no monastic vows, but living together in simplicity and piety with all things in common, after the apostolic pattern. This was the origin of the Brethren of the Common Lot (or Common Life). The first house of the Brethren was founded at Deventer by Gerhard Groel and his youthful friend Florentius Radewyn; and here Thomas à Kempis (q.v.) received his training. Similar brother-houses soon sprang up in different places throughout the Low Countries and Westphalia, and even Saxony.

It has been customary for Protestant writers to represent the mystics of Germany and Holland as precursors of the Reformation. In a sense this is true. But Mysticism it would be false to say that these men protested against the doctrines of the Church in the way the Reformers themselves called upon to do. There is no sign that Tauler, for example, or Ruysbroeck, or Thomas à Kempis had felt the dogmatic teaching of the Church jar in any single point upon their religious consciousness. Nevertheless, mysticism did prepare men in a very real way for a break with the traditional system. Mysticism instinctively recedes from formulas that have become stereotyped and mechanical. On the other hand its claim for spiritual freedom was soon to be found in opposition also to the Reformers.

The wild doctrines of Thomas Münzer and the Zwickau prophets, merging eventually into the excesses of the Peasants' War and the doings of the Anabaptists in Münster, first roused Luther to the dangerous possibilities of mysticism as a disintegrating force. He was
MYSTICISM

also called upon to do battle for his principle against men like Caspar Schwenkfeld (1490–1561) and Sebastian Franck (1500–1559), the latter of whom developed a system of pantheistic mysticism, and went so far in his opposition to the letter as to declare the whole of the historical element in Scripture a mythical representation of eternal truths. (cf. Calvinitism). Caleb Wiigel (1545–1588), who stands under manifold obligations to Franck, represents also the influence of the semi-mystical physical speculation that marked the transition from scholasticism to modern times. The final breakdown of scholasticism as a rationalized system of dogma may be seen in Nicolas (or Nicolaus) of Cusa (1401–1464), who distinguishes between the intellectus and the discursively active ratio almost precisely in the style of later distinctions between the reason and the understanding. The intellect combines what the understanding separates; hence Nicolas teaches the principle of the coincidentia oppositorum. If the results of the understanding go by the name of knowledge, then the higher teaching of the intellectual intuition may be called ignorance—ignorance, however, that is conscious of itself, docta ignorantia. "Intuitio," "speculatio," "visio sine comprehensione," "comprehensio incomprensibilis," "mystica theologia," "tertius caelus," are some of the terms he applies to this knowledge above knowledge; but in the working out of his system he is remarkably free from extravagance. Nicolas’s doctrines were of influence upon Giordano Bruno and other physical philosophers of the 16th and 17th centuries. All these physical theories are blended with a mystical theosophy, of which the most remarkable example is, perhaps, the thechem-astrological speculations of Paracelsus (1493–1541). The influence of Nicolas of Cusa and Paracelsus mingled in Valentin Weigel with that of the Deutsche Theologie, Andreas Osiander, Schwenkfeld and Franck. Weigel, in turn, handed on these influences to Jakob Boehme (1575–1624), philosophus teutonicus, and father of the chief developments of theosophy in modern German philosophy (see Boehme).

Mysticism did not cease within the Catholic Church at the Reformation. In St Theresa (1515–1582) and John of the Cross (1542–1591), and the counter-reformation can boast of saints second to none in the calendar for the austerity of their mortifications and the capture of the visions to which they were admitted. But, as was to be expected, their mysticism moved in that comparatively narrow round, and consists simply in the bearing up of these sensuous experiences. The speculative character has entirely faded out of it, or rather has been crushed out by the tightness with which the directors of the Roman Church now held the reins of discipline. Their mysticism represents, therefore, no widening or spiritualizing of their theology; in all matters of belief they remain the docile children of their Church. The gloom and harshness of these Spanish mystics are absent from the tender, contemplative spirit of Francois de Sales (1567–1622); and in the quietism of Mme Guyon (1649–1717) and Miguel de Molinos (1627–1696) there is again a sufficient implication of mystical doctrine to seize the suspicion of the ecclesiastical authorities. Quietism, name and thing, became the talk of all the world through the bitter and protracted controversy to which it gave rise between Fénelon and Bossuet.

In the 17th century mysticism is represented in the philosophical field by the so-called Cambridge Platonists, and especially by Henry More (1614–1687), in whom the influence of the Kabbalah is combined with a species of Christianized Neoplatonism. Pierre Poiret (1646–1719) exhibits a violent reaction against the mechanical philosophy of Descartes, and especially against its consequences in Spinoza. He was an ardent student of Tauler and Thomas a Kempis, and became an ardent injected into the teaching of Mme Guyon. His philosophical works emphasize the passivity of the rational faculty. The first influence of Boehme was in the direction of an obscure religious mysticism. J. G. Gichtel (1638–1710), the first editor of his complete works, became the founder of a sect called the Angel-Brethren. All Boehme’s works were translated into English in the time of the Commonwealth, and regular societies of Boehmenists were formed in England and Holland. Later in the century he was much studied by the members of the Philadelphian Society, John Fordage, Thomas Bromley, Jane Lead, and others. The mysticism of William Law (1686–1761), of Louis Clauris (1713–1774), and of Franz Schelling, (1743–1805), who were also students of Boehme, is of a much more rationalized and spiritual type. The "Cherubic Wanderer," and other poems, of Johann Scheffler (1624–1677), known as Angelus Silvius, are more closely related in style and thought to Eckhart than to Boehme.

The religiosity of the Quakers, with their doctrines of the "inner light" and the influence of the Spirit, has decided affinities with mysticism; and the autobiography of George Fox (1624–1691), the founder of the sect, proceeds throughout on the assumption of supernatural guidance. Stripped of its definitely miraculous character, the doctrine of the inner light may be regarded as the familiar mystical protest against formalism, literalism, and scripture-worship. Swedenborg, though selected by Emerson in his Representative Men as the typical mystic, belongs rather to the history of spiritualism than to that of mysticism as understood in this article. He possesses the cool temperament of the man of science rather than the fervid Godward aspiration of the mystic proper; and the speculative impulse which lies at the root of this form of thought is almost entirely absent from his writings. Accordingly, his supernatural revelations resemble a course of lessons in celestial geography more than a description of the beatific vision.

Mysticism had never in any case been a perfect, unadulterated system as a set method. From the 18th century, there was a frequent shown a tendency to diverge into mysticism. This has been especially so in Germany. The term mysticism is indeed often extended by popular usage and philosophical partisanship to the whole activity of the spiritualist, whether or not he is an intellectual mystic. Schelling's definition of "theology," for instance, which is more equivalent to the more recent and scarcely less abused term, transcendentalism, and as such it is used even by a sympathetic writer like Carlyle; but this looseness of phraseology only serves to blur important distinctions. Though abstract, mystical thinking may, be, is erroneously styled a mystic if he moves towards his conclusions only by the patient labour of the reason. Hegel, therefore, to take an instance, can no more fitly be classed as a mystic than as a rationalist; and both can not hold the same place as types of a thoroughgoing rationalism. In either case it is of course open to anyone to maintain that the apparent completeness of synthesis really rests on the subtle intrusion of elements of feeling into the rational process. But in that case it might be difficult to find a systematic philosopher who would escape the charge of mysticism; and it is better to remain by long-established and explicitly recognized distinctions. When, however, we take the term mysticism as "the tendency to draw near to the Absolute in moral union by symbolic means," the definition, as developed by him, is one which would apply to the philosophy of Kant. Récellé’s interesting essay, "Analyse critique des impressions et des concepts," (1789), though it touches mysticism at various points, and quotes from mystic writers, is in fact a protest against the limitations of experience to the data of the senses and the pure reason to the exclusion of the moral consciousness and the deliverances of "the heart." But such a position is not describable as mysticism in any recognized sense. On the other hand, where philosophy despairs of itself, exults in its own overthrow, and yet revels in the "mysteries" of a speculative Christianity, as in J. G. Hamann (1730–1788), the term mysticism may be fitly applied. So, again, it is in place where the movement of revaluation from a mechanical philosophy takes the form rather of immediate assertion than of reasoned demonstration, and where the writer is simply putting up his hands in despair, on the basis of phenomena, either leave the position without further definition or expressly declare that the ultimate problems of philosophy have been reduced to symbolic formulas. Examples of this are men like Novalis, Carlyle, and Emerson; whereas the writer may be said to be impatient of its own task. Schelling’s explicit appeal in the Identitäts-philosophie to an intellectual intuition of the Absolute as the eidos of the entire world, or one of the elements of rational faculty and as a claim not merely to know but to realize God. The opposition of the reason to the understanding, as formulated by S. T. Coleridge, is not free from the first of these faults. The method of the philosophers of the eighteenth century—Leibnitz, Baader, both largely founded upon Boehme, belonging rather to theosophy (q.v.) than to mysticism proper.

AUTHORITIES.—Besides the sections on mysticism in the general literature of philosophy, especially in the history of the philosophy of religion, and in works on church history and the history of dogma, reference may be made for the medieval period to Heinrich Schmid, Der Mysticismus in seiner Entwicklungsperiode (1824); Charles Schmidt, Essai sur les mystiques du 17ème siècle (1836); Ad. Höllerich, Die christliche Mystik (1842); L. Noack, Die christliche Mystik des
Mythology (Gr. μυθολογία, the science which examines μύθος, myths or legends of cosmogony and of gods and heroes. Mythology is also used as a term for such legends themselves. Then when we speak of "the mythology of Greece," we mean the whole body of Greek divine and heroic and cosmogonic legends. When we speak of the "science of mythology" we refer to the various attempts which have been made to explain these ancient narratives. Very early indeed in the history of human thought men awoke to the consciousness that their religious stories were much in want of explanation.

The myths of civilized peoples, as of Greeks and the Aryans of India, contain two elements, the rational and what to modern minds seems the irrational. The rational myths are those which represent the gods as beautiful and wise beings. The Armenis of the Odyssey taking her pastime in the chase of boars and swift deer, while great birds and wild wood-tyne of Zeus at Olympia, or in the Homeric conception of Zeus as a god who "turns everywhere his shining eyes" and beholds all things. But the Zeus whose grave was shown in Crete, or the Zeus who played Demeter an obscene trick by the aid of a ram, or the Zeus who, in the shape of a swan, became the father of Castor and Pollux, or the Zeus who was merely a rough stone, or the Zeus who deceived Hera by means of a feigned marriage with an inanimate object, or the Zeus who was afraid of Attes, is a being whose myth is felt to be unnatural and in great need of explanation. It is this irrational and unnatural element— as Max Müller says, "the silly, savage and senseless element"—that makes mythology the puzzle which men have so long found it.

Early Explanations of Myths.—The earliest attempts at a crude science of mythology were efforts to reconcile the legends of the gods and heroes with the religious sentiment which recognized in these beings objects of worship and respect. Closely as religion and myth are intertwined, it is necessary to hold them apart for the purposes of this discussion. Religion may here be defined as the conception of divine, or at least supernatural powers entertained by men in moments of gratitude or of need and distress, in hours of weakness, when, as Homer says, "all folk yearn after the gods." Now this conception may be rude enough, and it is nearly related to certain mythical ideas, to efforts to secure supernatural aid by magical ceremonies. Still the roughest form of spiritual prayer has for its basis the hypothesis of beneficent beings, visible or invisible. The senseless stories or myths about the gods are soon felt to be at variance with this hypothesis. As an example we may take the instance of Cing, the Bushman hunter. Omg, when first he met white men, he asked about his religion. He began to explain, and mentioned Cagn. Mr. Orpen, the chief magistrate of St. John's Terri- tory, asked: "Is Cagn good or malicious? how do you pray to him?" Answer (in a low imploring tone): "O Cagn! O Cagn! are we not your children? do you not see our hun- gry? give us food:; and he gives us both hands full." (Cape Monthly Magazine, July 1874.) Here we see the religious view of Cagn, the Bushman god. But in the mythological account of Cagn given by Qing he appears as a kind of grass- hopper, supernaturally endowed, the hero of a most absurd cycle of senseless adventures. Even religion is affected by these irrational notions, and the gods of savages and of many civilized peoples are worshipped with cruel, obscene, and irrational emotions.

But on the whole, the attempt to reconcile the mythical conceptions of the gods, and is shocked and puzzled by the mythical narratives. As soon as this sense of perplexity is felt by poets, or by priests, or by most men in an age of nascent criticism, explanations of what is most crude and absurd in the myths are put forward. Men ask themselves why their gods are worshipped in the form of beasts, birds, and fishes; why their gods are said to have prosecuted their amours in bestial shapes; why they are represented as lustful and passionate—thieves, robbers, murderers and adulterers. The answers to these questions sometimes become myths themselves. Thus both the Mangaians and the Egyptians have been puzzled by their own gods in the form of beasts. The Egyptians invented an explanation— it is a myth—that in some moment of danger the gods concealed themselves from their foes in the shapes of animals. The Mangaians, according to W. W. Gill, hold that "the heavenly family had taken up their abode in these birds, fishes, and reptiles."

A people so curious and refined as the Greeks were certain to be greatly perplexed by even such comparatively pure mythological narratives as they found in Homer, still more by the coarser legends of Hesiod, and above all by the ancient local myths preserved by local priesthoods. Thus, in the 6th century before Christ, Xenophon of Colophon severely blamed the poets for their unbecoming legends, and boldly called certain myths "the fables of men of old." Theaegenes of Rhegium (520 B.C.), according to the scholiast on iliad, xx. 67,1 was the author of a very ancient system of mythology. Admitting that the fable of the battle of the gods was "unbecoming," if literally understood, Theaegnes represented it as an allegorical account of the war of the elements. Apollo, Helios, and Hephaestus were fire, Hera was air, Poseidon was water, Artemis was the moon, kai η λακων δαμων. Or, by another system, the names of the gods represented moral and intellectual qualities. Heraclitus, too, disposed of the myth of the bondage of Hera as allegorical philosophy. Socrates, in the Crito of Plato, expresses a philosophy which came to him all in an instant: an explanation of the divine beings based on crude philological analyses of their names. Metrodorus, rivaling some recent flights of conjecture, resolved not only the gods but even heroes like Agamemnon, Hector and Achilles “into elemental combinations and physical agencies.” Euripides makes Pentheus (but he was notoriously impious) advance a “rationalistic” theory of the story that Dionysus was stitched up in the thigh of Zeus.

When Christianity became powerful the heathen philosophers evaded its satire by making more and more use of the allegorical and non-natural system of explanation. That method has two faults. First (as Arnoldus and Eusebius reminded their heathen opponents), the allegorical explanations are purely arbitrary, depend upon the fancy of their author, and are all equally plausible and equally unsupported by evidence. Secondly, there is no proof at all that, in the distant age when the myths were developed, men entertained the moral notions and physical philosophies which are supposed to be “wrapped up,” as Cicero says, “in impious fables.” Another system of explanation is that associated with the name of Hermeus (316 B.C.). According to this author, the myths are history in disguise. All the gods were once men, whose real feats have been decorated and distorted by later fancy. This view suited Lucan, St. Augustine and other early Christian writers.

very well. They were pleased to believe that Eueumerus "by historical research had ascertained that the gods were once but mortal men." Precisely the same convenient line was taken by Sahagun in his account of Mexican religious myths. As there can be no doubt that the ghosts of dead men have been worshipped in many lands, and as the gods of many faiths are tricked out with attributes derived from ancestor-worship, the system of Eueumerus retains some measure of plausibility. While we need not believe with Eueumerus and with Herbert Spencer that the god of Greece or the god of the Hottentots was once a man, we cannot deny that the myths of both these gods have passed through myth-coloured by the imaginations of men who practised the worship of real ancestors. For example, the Cretans showed the tomb of Zeus, and the Phocians (Pausanias x. 5) daily poured blood of victims into the tomb of a hero, obviously by way of feeding his ghost. The Hottentots show many tombs of their god, Tsui-Goab, and tell tales about his death; they also pray regularly for aid at the tombs of their own parents. We may therefore say that, while it is rather absurd to believe that Zeus and Tsui-Goab were once real men, yet their myths are such as would be developed by people accustomed, among other forms of religion, to the worship of their ancestors. Portionary, the legends of real men have been attracted into the mythic accounts of gods of another character, and this is the element of truth at the bottom of Eueumerism.

Later Explanations of Mythology.—The ancient systems of explaining what needed explanation in myths were, then, physical, ethical, religious and historical. One student, like Theagenes, would see a physical philosophy underlying Homeric legends. Another, like Porphyry, would imagine that the meaning was partly moral, partly of a dark theosophic and religious character. Another would detect moral allegory alone, and Aristotle expresses the opinion that the myths were the inventions of legislators "who persuade the many, and to be used in support of law" (Met. xi. 8, 10). A fourth, like Eueumerus, would get rid of the supernatural element altogether, and find only an imaginative rendering of actual history. When Christians approached the problem of heathen mythology, they sometimes held, with St Augustine, a form of the doctrine of Eueumerus. Some later philosophers, especially of the 17th century, misled by the resemblance between Biblical narratives and ancient myths, came to the conclusion that the Bible contains a pure, the myths a distorted, form of an original revelation. The abbe Banier published a mythological compilation in which he systematically reduced the ancient myths to their ethnographic bases. He published (1774) A New System, or an Analysis of Ancient Mythology, wherein an Attempt is made to divert Tradition of Fable, in which he talked very learnedly of "that wonderful people, the descendants of Cush," and saw everywhere symbols of the ark and traces of the Noahian deluge. Thomas Taylor, at the end of the 18th century, indulged in much mystical allegorizing of myths, as in the notes to his translation of Pausanias (1794). At an earlier date (1760) De Brosses struck on the true line of interpretation in his little work Du Culte des dieux fétiches, ou parallèle de l'ancienne religion de l'Égypte avec la religion actuelle de Nigritie. In this tract De Brosses explained the animal-aship of the Egyptians as a survival among a civilized people of ideas and practices springing from the intellectual condition of savages, and actually existing among negroes. A vast symbolical explanation of myths and mysteries was attempted by Friedrich Creuzer. The learning and sound sense of Lobec, in his Aglaophamus, explained the idea that the Eleusinian and other mysteries revealed or concealed matter of momentous religious importance. It ought not to be forgotten that Lafatou, a Jesuit missionary in North America, while inclined to take a mystical view of the secrets concealed by Iroquois myths, had also pointed out the savage element surviving in Greek mythology.

Recent Mythological Systems.—Up to a very recent date students of mythology were hampered by orthodox traditions, and still more by ignorance of the ancient languages and of the natural history of man. Only recently have Sanskrit and the Egyptian and Babylonian languages become books not absolutely sealed. Again, the study of the evolution of human institutions from the lowest savagery to civilization is essentially light on the human element branch of research, though ideas derived from an unsystematic study of anthropology are at least as old as Aristotle. The new theories of mythology are based on the belief that "it is man, it is human thought and human language combined, which naturally and necessarily produced the strange conglomerate of ancient fable." But, while there is now universal agreement so far, modern mythologists differed essentially on one point. There was a school (with internal divisions) which regarded ancient fable as almost entirely "a disease of language," that is, as the result of confusion arising from misunderstood terms that have survived in speech after their original significance was lost. Another school (or "divisions of a divided school") believes that a misunderstood language played but a very slight part in the evolution of mythology, and that the irrational element in myths is merely the survival from a condition of thought which was once common, if not universal, but is now found chiefly among savages, and to a certain extent among children. The former school considered that the state of thought out of which myths were developed was produced by decaying language; the latter maintains that the corresponding phenomena of language were the reflection of thought. For the sake of brevity we might call the former the "philological system," as it rests chiefly on the study of language, while the latter might be styled the "historical" or "anthropological" school, as it is based on the study of man in the sum of his manners, ideas and institutions.

The System of Max Müller.—The most distinguished and popular advocate of the philological school was Max Müller, whose views may be found in his Selected Essays and Lectures on Language. The problem was to explain what he calls "the silly, savage and senseless element" in mythology (Sci. Ess., i. 578). Max Müller says (speaking of the Greeks), "their poets had an instinctive aversion to everything excessive or monstrous, yet they would relate of their gods stories as the prodigies of nature, and even incredible stories, as the shudder "—stories, that is, of the cannibalism of Demeter, of the mutilation of Uranus, the cannibalism of Cronus, who swallowed his own children, and the like. Among the lowest tribes of Africa and India we hardly find anything more solid and revolting.

Max Müller refers the beginning of his system of mythology to the discovery of the connexion of the Indo-European or, as they are called, "Aryan" languages. Celts, Germans, speakers of Sanskrit and Zend, Latins and Greeks, all prove by their languages that their tongues may be traced to one family of speech. The comparison of the various words which, in different forms, are common to all Indo-European languages must inevitably throw much light on the original meaning of these words. Take, for example, the name of a god, Zeus, or Athene, or any other. The word may have no intelligible meaning in Greek, but its counterpart in the ancient tongues, especially in Sanskrit or Zend, may reveal the original significance of the term. To understand the origin and meaning of the names of the Greek gods, and to enter into the original intention of the fables told of each, we must take into account the collateral evidence supplied by Latin, German, Sanskrit and Zend philosophy (Lect. on Lang., 2nd series, p. 406). A name may be intelligible in Sanskrit which has no sense in Greek. Thus Athene is a divine name without meaning in Greek, but Max Müller advances reasons for supposing that it is identical with Indra or Varuna, and the Persian, Latin, and German names, etc., of the same deity. It is his opinion, apparently, that whatever story is told of Athene must have originally been told of the dawn, and that we must keep this before us in attempting to understand the legends of Athene. Just as the Sanskrit Agni, the Greek Agni, "fire," and the Latin's "fire," etc., correspond to the original idea of fire. It is his opinion, apparently, that whatever story is told of Athene must have originally been told of the dawn, and that we must keep this before us in attempting to understand the legends of Athene. This system is simply this: the original meaning of the names of gods must be ascertained by comparative philology. The names, as a rule, will be found to denote elemental phenomena. And the silly,
savage and senseless elements in the legends of the gods will be shown to have a natural significance, as descriptions of sky, storms, sunset, water, fire, dawn, twilight, the life of earth, and other celestial and terrestrial phenomena. Stated in the barest form, these results do not differ greatly from the conclusions of Theagene of Rhegium, who held that "Hephaestus was fire, Hera was air, Poseidon was water, Artemis was the moon, and Odysseus was dawn." But Max Müller’s statement about Zeus is more significant. He has demonstrated that the whole of mythology is supported by a theory of the various processes in the evolution of myths out of language.

It is no longer necessary to give an elaborate analysis of this theory, because neither in its philological nor mythological side has it any advocates who need be reckoned with. The attempt to disengage the history of times forgotten and unknown, by means of analysis of roots and words in Aryan languages, has been undertaken in various branches of science, and a great deal of material and labor has been spent. Max Müller’s system was a result of the philological theories that indicated the linguistic unity of the Indo-European or "Aryan" peoples, and was founded on an analysis of their language. But myths precisely similar in origin and repulsive character, even in minute details, to those of the Aryan races, exist among Australians, South Sea Islanders, Eskimo, Bushmen in Africa, among Solomon Islanders, Iroquois, and so forth. The facts being identical, an identical explanation should be sought, and, as the languages in which the myths exist are essentially different, an explanation founded on the Aryan language is likely to prove too narrow. Once more, even if we discover the origin of a myth, the name of its original will be unknown, and it will be impossible to explain by aid of the significance of the name the myths about the god. For nothing is more common than the attraction of a more ancient story into the legend of a later god or hero. Myths of unknown origin are a commonplace. Hence, Max Müller’s theory of Charlemagne, just as the "bonds of mott of old win" are transferred to living humorists. Therefore, though we may ascertain that Zeus means "sky" and Agni "fire," we cannot assert, with Max Müller, that the name Zeus was originally the name of a deity of fire and sky. When these gods became popular they inevitably inherited any current exploits of earlier heroes or gods. These exploits would thereby be connected erroneously if regarded as of a different origin. In other words, we cannot prove Max Müller’s proposition "there was nothing told of the sky that could not in some form or other be ascribed to Zeus" into there was nothing analogously told not at least at some time in the story of fire and sky." This is also, perhaps, the proper place to observe that names derived from natural phenomena—sky, clouds, dawn and sun—habitually assigned by Brazilians, Ojibways, Australians and others to certain gods, it may be supposed, is partly the result of the names being halfway between beings by earthly processes. And when even we discover an elemental meaning in a god’s name, that meaning may be all unlike what the word suggests to civilized men. A final objection is that there is no evidence that Max Müller’s theory of "mythicism" is justified in the divine names. For example, connects Kronos (Zëbut) with xboros, "time"; Peller with xelevu, "I fulfill," and so forth. The mythologized men of the Mythoic age were not aged, as Max Müller held, to believe that all phenomena were persons, because the words which denoted the phenomena had gender-terminations. On the other hand, the gender-terminations of phenomena may have been derived from an early stage of thought in which personal characteristics, including sex, had been attributed to all phenomena. This condition of thought is demonstrated to be, and to have been, until comparatively recent times, and it is highly probable that primitive peoples, being fond of bodies and passions. Thus, even when we discover an elemental meaning in a god’s name, that meaning may be different from what the god suggests to civilized men. A final objection is that there is no evidence that Max Müller’s theory of "mythicism" is justified in the divine names. For example, connects Kronos (Zëbut) with xboros, "time"; Peller with xelevu, "I fulfill," and so forth.

Theory of Herbert Spencer.—The system of Herbert Spencer, as explained in Principles of Sociology, has many points in common with that of Max Müller. Spencer attempts to account for the state of mythology as a whole. He contends that, by a process of misinterpretation, the more primitive races are gradually led to believe in the personality of phenomena. He too notes the "defect in early speech"—that is, the lack of words free from implications of vitality, which "favour personalization." Here, of course, we have to ask Spencer, with Max Müller, why words in early languages "imply vitality." These words must reflect the thought of the men who use them before they react upon that thought and confirm it in its misconceptions. So far Spencer seems at one with the philological theory of Max Müller, but he is wrong in the fact that the meaning of language in his system is "different in kind, and the erroneous course of thought is opposite in direction." According to Spencer (and his premises, at least, are correct), the names of human beings are fixed for the most part by a race of men who have demonstrated that they have a tradition that they came to their actual seats from this mountain, or that lake or river, or from lands across the sea. They will mistake this tradition of local origin for one of actual parentage, and will come to believe that, like certain Homeric heroes, they are the sons of a river (now personified), or of a mountain, or, like a tribe mentioned by Garcilasso de la Vega, that they are descended from the sea. Once more, if their old legend told them that they were the sons of a god of fire and sky, and that the fire and sky are actually the children of the sun. By this process of misinterpretation, mountains, rivers, lakes, sun and sea would receive human attributes, while men would degenerate from a more primitive type of being than they are. Thus, the mythologists of Charlemagne, just as the "bonds of mott of old win" are transferred to living humorists. Therefore, though we may ascertain that Zeus means "sky" and Agni "fire," we cannot assert, with Max Müller, that the name Zeus was originally the name of a deity of fire and sky. When these gods became popular they inevitably inherited any current exploits of earlier heroes or gods. These exploits would thereby be connected erroneously if regarded as of a different origin. In other words, we cannot prove Max Müller’s proposition "there was nothing told of the sky that could not in some form or other be ascribed to Zeus" into there was nothing analogously told not at least at some time in the story of fire and sky." This is also, perhaps, the proper place to observe that names derived from natural phenomena—sky, clouds, dawn and sun—habitually assigned by Brazilians, Ojibways, Australians and others to certain gods, it may be supposed, is partly the result of the names being halfway between beings by earthly processes. And when even we discover an elemental meaning in a god’s name, that meaning may be all unlike what the word suggests to civilized men. A final objection is that there is no evidence that Max Müller’s theory of "mythicism" is justified in the divine names. For example, connects Kronos (Zëbut) with xboros, "time"; Peller with xelevu, "I fulfill," and so forth.

Preliminary Problems.—We have stated and criticized the more prominent modern theories of mythology. It is now necessary first to recapitulate the chief points in the problem, and then to attempt to explain them by a comparison of the myths of various races. The difficulty of mythology is to account for the following among other apparently irrational elements in myths: the wild and senseless stories of the
beginnings of things, of the origin of men, sun, stars, animals, death, and the world in general; the infamous and absurd adventures of the gods; why divine beings are regarded as incestuous, adulterous, murderous, thievish, cruel, cannibals, and addicted to wearing the shapes of animals, and subject to death in some stories; the myths of metamorphosis into plants, beasts and stars; the repulsive stories of the state of the dead; the descents of the gods into the place of the dead, and their return thence. It is extremely difficult to keep these different categories of myths separate from each other. If we investigate myths of the origin of the world, we often find gods in animal form active in the work of world-making. If we examine myths of human descent, from animals, we find gods busy there, and if we try to investigate the myths of the origin of the gods, the subject gets mixed up with the mythical origins of things in general.

Our first question will be, Is there any stage of human society, and of the human intellect, in which facts that appear to us to be monstrous and irrational are accepted as ordinary occurrences of every day life? E. W. Lane, in his preface to the Arabian Nights, says that the Arabs have an advantage over us as story-tellers. They can introduce such incidents as the change of a man into a horse, or of a woman into a dog, or the instantaneous transfiguration from one state to another, without our feeling that they are not told in the same way as the following kind of stories:

Our own novelists feel in describing a duel or the concealment of a will. Among the Arabs the actions of magic and of spirits are regarded as at least as probable and common as duels and concealments of wills in European society. It is obvious that we need look no farther for the explanation of the supernatural events in Arab romances. Now let us apply this system to mythology. It is admitted that Greeks, Romans, Aryans of India in the age of the Sanskrit commentators, Egyptians of the Ptolemaic and earlier ages, were as much puzzled as we are by the mythical adventures of their gods. But is there any known stage of the human intellect in which these divine and monstrous phenomena, being introduced into animals, trees, stars, and converse with the dead, and all else that puzzles us in the civilized mythologies, are regarded as possible incidents of daily human life? Our answer is that everything in the civilized mythologies which we regard as irrational seems only part of the accepted and rational order of things (at least in the case of "medicine-men" or magicians) to contemporary savages, and in the past seemed equally rational and natural to savages concerning whom we have historical information. Our theory is, therefore, that the savage and senseless element in mythology is, for the most part, a legacy from ancestors of the civilized races who were in an intellectual state not higher than that of Australians, Bushmen, Red Indians, the lower races of South America, Mincopies, and other worse than barbaric peoples. As the ancestors of the Greeks, with the Aryans of India, the Egyptians, and others advanced in civilization, their religious thought was shocked and surprised by myths (originally dating from the period of savagery, and natural in that period) which were preserved down to the time of Pausanias by local priesthoods, or which were stereotyped in the ancient poems of Hesiod and Homer, or in the Brahmanas and Vedas of India, or were retained in the popular religion of Egypt. This theory recommended itself to Lobeck. We may believe that ancient and early tribes and races, with their gods having themselves in action and in experience, and that the allegorical element in myths is the addition of later peoples who had attained to purer ideas of divinity, yet dared not reject the religion of their ancestors" (Aglaoph. i. 153). The senseless element in the myths would by this theory be for the most part a "survival." And the age and condition of human thought from which it survived would be one in which our most ordinary ideas about the nature of things and the limits of possibility did not yet exist, when all things were conceived of in quite other fashion—the age, that is, of savagery. It is universally admitted that "survivals" of this kind do account for many anomalies in our institutions, in law, politics, society, even in dress and manners. If isolated fragments of an earlier age abide in these, it is still more probable that other fragments will survive in anything so closely connected as mythology with the conservative religious sentiment.

If this view of mythology can be proved, much will have been done to explain a problem which we have not yet touched, namely, the distribution of myths. The science of mythology has to account, if it can, not only for the existence of certain stories in the legends of certain races, but also for the presence of stories practically the same among almost all races. In the long history of mankind it is impossible to deny that stories may conceivably have spread from a single centre, and been handed on from races like the Indo-European and the Semitic to races as far removed from them in every way as the Zuñi, the Australians, and the Eskimo, the natives of the South Sea Islands. But, while the possibility of the diffusion of myths by borrowing and transmission must be allowed for, the hypothesis of the origin of myths in the savage state of the intellect supplies a ready explanation of their wide diffusion. Archaeologists are acquainted with objects of early art and craftsmanship, rude clay pipkins and stone weapons, which can only be classed as "human," and which do not bear much impress of any one national taste and skill. Many myths may be called "human" in this sense. They are the rough products of the early human spirit, which were afterwards modified by the differentiations of race and culture. Such myths might spring up as the inventions of some untutored men, and anywhere might survive into civilized literature. Therefore where similar myths are found among Greeks, Australians, Egyptians, Mangaians and others, it is unnecessary to account for their wide diffusion by any hypothesis of borrowing, early or late. The Greek "key" pattern found on objects in Peruvian graves was not necessarily borrowed from Greece, nor did Greeks necessarily borrow from Aztecs the "wave" pattern which is common to both. The same explanation may be applied to Greek and Aztec myths of the deluge, to Australian and Greek myths of the original theft of fire. Borrowed they may have been, but they may as probably have been independent inventions.

It is true that some philologists deprecate as unscientific the comparison of myths which are found in languages not connected with each other. The objection rests on the theory that myths are a disease of language, a morbid offshoot of language, and that the legends in unconnected languages must therefore be kept apart. But, as the theory which we are explaining does not admit that language is more than a subordinate cause in the development of myths, as it seeks for the origin of myths in a given condition of thought, which is the result of the races' previous history, we need do no more than record the objection.

The Intellectual Condition of Savages.—Our next step must be briefly to examine the intellectual condition of savages, that is, of races varying from the condition of the Andaman Islanders to that of the Solomon Islanders and the ruder Red Men of the American continent. In a developed treatise on the subject of mythology it would be necessary to criticize, with a minuteness which is impossible here, our evidence for the very peculiar mental condition of the lower races. Max Müller asked (when speaking of the mental condition of men when myths were developed), "was there a period of temporary madness through which the human mind had to pass, and was it a madness identically the same in the south of India and the north of Iceland?" To this we may answer that the human mind had to pass through the savage stage of thought, that this stage was for all practical purposes "identically the same" everywhere, and that to civilized observers it does resemble "a temporary madness." Many races are still abandoned to that temporary madness; many others which have escaped from it were observed and described while still labouring under its delusions. Our evidence for the intellectual ideas of man in the period of savagery we derive partly from the reports of voyagers, historians, missionaries, partly from an examination of the customs, institutions, and laws in which the lower races gave expression to their notions.

As to the first kind of evidence, we must be on our guard against several sources of error. Where religion is concerned, travellers in general and missionaries in particular are biased in several distinct
ways. The missionary is sometimes anxious to prove that religion can only come by revelation, and that certain tribes, having received no revelation, have no religion or religious myths at all. Sometimes the missionary, on the other hand, is anxious to demonstrate that the gods of his tribe have the same prejudices, or may be a sect of revealed religion. In the former case he neglects the study of savage myths; in the latter he unconsciously accommodates what he hears to what he calls "the truth." The traveller who is not a missionary may either have the same prejudices, or may be a sceptic about revealed religion. In the latter case he is perhaps unconsciously moved to put lurid scenes of Biblical stories into the mouths of his savage informants, or to represent the savages as ridiculing the Biblical mythology, or as in some way showing that they are "unconscious savages." We again must remember that the leading questions of a European inquirer may furnish a savage with a thread on which to string arguments which would be quite unsuited to the surroundings in which you ever had a great flood?" "Yes" "Was any one saved?"

The question starts the invention of the savage on a deluge-myth, of which, perhaps, the idea has never before entered his mind. There still remain the difficulties of all conversation between civilized men and unacquainted savages, the tendency to hoax, and other sources of error and confusion. By this time, too, almost every explorer of savage life is a theorist. He is a Spencerian, or a believer in the universal prevalence of the faith in an " All-Father," or he looks everywhere for gods who are "spirits of vegetation." In receiving this kind of evidence, then, we need to know the character of our informant, his means of communicating with the heathen, how near he is to the traveller, and his ends. The Indian will will have additional weight if supported by the "undesigned coincidences" of other evidence, ancient and modern. If Strabo and Herodotus and Pomponius Mela, for example, describe a custom, ritual or change notion in the Old World, and if missionaries and missioners find the same notion or custom or rite in Polynesia or Australia or Kamchatka, we can scarcely doubt the truth of the reports.

The evidence is best when given by ignorant men, who are astonished and pained by the translation which ethnologists are familiar with in other parts of the world.

Another method of obtaining evidence is by the comparative study of savage laws and institutions. Thus we find in Asia, Africa, America and Australia that the marriage laws of the lower races are connected with a belief in kinship or other relationship with animals. The evidence for this belief is thus entirely beyond suspicion. The Indian or Australian and Melanesian ideas are based on the ideas of magic, of metamorphosis, and of the power which certain men possess to talk with the dead and to visit the abodes of death. All these ideas are the stuff of which myths are made, and the evidence of savage institutions, in every part of the world, proves that these ideas are the universal inheritance of savages.

Savage men are like ourselves in curiosity and anxiety causa cogitare rerum, but with our curiosity they do not possess almae ideae. Our powers of attention. They are as easily satisfied with an explanation of phenomena as they are eager to fabricate an explanation of their own, and to shape the few ideas which they possess for the expression of their needs. They are content with a theory which is not original with themselves and they transmute their scanty stock of acquired ideas, and these ideas and general conceptions seem almost imbecile to civilized men. Curiosity and credulity, then, are the characteristics of the savage intellect. When a phenomenon presents itself the savage requires an explanation, and that explanation he makes for himself, or receives from tradition, in the shape of a myth. The basis of these myths, which are just as much a part of early conjunctural science as of early religion, is naturally the experience of the savage as constituted by himself. Man's craving to know "the reason why" is already "among rude savages an intellectual appetite," and the "habit of the intellect" has its germ in actual experience." How does he try to satisfy this craving? E. B. Tylor replies, "When the attention of a man in the myth-making stage of intellect is drawn to any phenomenon or custom which has to him no obvious reason, he invents and tells a story to account for it." Against this statement he has been urged that men in the lower stages of culture are not curious, but take all phenomena for granted. If there were no direct evidence in favour of Tylor's opinion, it would be enough to point to the nature of savage myths themselves. It is not arguing in a circle to point out that almost all of them are nothing more than explanations of intellectual difficulties. The ordinary savage, when presented with a mystery, came to and movements? How are the motions of sun and moon to be accounted for? Why has this tree a red flower, and this bird a black mark on the tail? What was the origin of the tribal dances, or of this or that law of custom or etiquette? Savage mythology, which is also savage science, has a reply to all these and all similar questions, and that reply is always found in the shape of a story. The answers cannot be accounted for without the previous existence of the questions.

We have now shown how savages come to have a mythology. It is their way of satisfying the early form of scientific curiosity, their way of realizing the world in which they move. But they frame their stories, necessarily and naturally, in harmony with their general theory of things, with what we may call "savage metaphysics." Now early man, as Max Muller says, "not only did not think as we think, but did not think as we suppose he ought to have thought." The chief distinction between the mode of conceiving the world and ours is his vast extension of the theory of personality. To the savage, and apparently to men more backward than the most backward peoples we know, all nature was a congeries of animated personalities. The savage's notion of personality is more a universally diffused feeling than a reasoned conception, and this feeling of a personal self he impartially distributes all over the world as known to him. One of the Jesuit missionaries in North America thus describes the Red Man's philosophy: "The savages believe that our earth is peopled by men, and that every tree, and every bird, and every animal, as well as every cloud and your face, is inhabited. They are of the opinion that all the beasts have priests (sorcerers and doctors) like themselves." This opinion we may name personification, and it is the necessary condition of savages (and, as will be seen, of civilized) mythology. The Jesuits could not understand how spherical bodies like sun and moon could be mistaken for human beings. Their catechumsen put them off with the answer that the drawn bows of the heavenly bodies gave them their round appearance. "The wind was formerly a person; he became a bird," says the Bushmen, and "that bird, that is to say, the Bushmen, and their stories, and the savage, and the savage philosophy, that he is an animated person, that the beasts have priests, and that they are inhabited by priests, like ourselves, and like the Bushmen." These are examples of the animistic theory applied to what, in our minds, seems one of the least personal of natural phenomena. The sky (which appears to us even less personal) has been regarded as a personal being by Samoyeds, Red Indians, Zulus, and traces of this belief survive in Chinese, Greek and Roman religion.

We must remember, however, that to the savage, Sky, Sun, Sea, Wind, are not only persons, but they are savage persons. Their conduct is not what civilized men would attribute to characters so august; it is what uncivilized men think probable and befitting among beings like themselves.

The savage regards all animals as endowed with personality. "Is tienne les poissons raisonnables, comme aussi les serfs," says a Jesuit father about the North-American Indians (Relations, loc. cit.). In Australia the Aborigines believe that the wild dog has the power of speech, and can tell the story of the world. Spectator. The Breton peasants, according to P. Sébillot, credit all birds with language, which they have even attempted to invent. The Old English and the Arab superstitions about the language of beasts are examples of this opinion surviving among civilized races. The bear in Norway is regarded as almost a man, and his dead body is addressed and his wrath deprecated by Samoyeds and Red Indians. "The native bear..."
"the usual prayers demand for the deceased the power of going from and to everywhere, under any form they like." 1 Thus, a trace of this opinion may be noticed in the Aeneid. The serpent that appeared at the sacrifice of Aeneas was regarded as possibly a "manifestation" of the soul of Anchises (Aeneid, v. 84)—

"Dixert haru aditya the luminous anguis ab imis Septem ingens gyros, septena volumina, traxit," 2 and Aeneas is

"Incercus, geniium loc, famulum parentis
Patronos popiut." 3

On the death of Plotinus, as he gave up the ghost, a snake glistened from his right hand in the hollow of the wall. 4 Compare Pliny 5 on the cave "in quo manes Scipionis Africani majoris custodire draco dicitur."

The last peculiarity in savage philosophy to which we need call attention here is the belief in spirits and in human intercourse with the shades of the dead. With the savage natural death is not a universal and inevitable metaphysical event. "All men must die" is a generalization which he has scarcely reached; in his philosophy the proposition is more like this—"all men who die by violence." A natural death is explained as the result of a sorcerer's spiritual violence, and the disease is attributed to magic or to the action of hostile spirits. After death the man survives as a spirit, sometimes taking an animal form, sometimes invisible, sometimes to be observed "in his habit as he lived" (see APPARITIONS). The philosophy of the subject is shortly put in the speech of Achilles (IIIiad, xxiii. 103) after he has beheld the dead Patroclus in a dream: "Ay me, there remaineth then even in the house of Hades a spirit and phantom of the dead, for a glorious night long hath the ghost of hapless Patroclus stood over me, wailing and making bitter cries." It is always significant to quote here the voluminous evidence for the intercourse with spirits which savage chiefs and medicine men are believed to maintain. They can call up ghosts, or go to the ghosts, in Australia, New Caledonia, New Zealand, North America, Zululand, among the Eskimo, and generally in every quarter of the globe. The men who enjoy this power are the same as they who can change themselves and others into animals. They too command the weather, and, says an old French missionary, "are regarded as very Jupiters, having in their hands the lightning and the thunder" (Relations, loc. cit.). They make good or bad seasons, and control the vast animals who, among ancient Persians and Aryans of India, as among Zulus and Iroquois, are supposed to grant or withhold the rain, and to thunder with their enormous wings in the region of the clouds.

Another fertile source of myth is magic, especially the magic designed to produce fertility, vegetable and animal. From the natives of northern and central Australia to the actors in the ritual of Adonis, or the folk among whom arose the customs of crowning the May king or the king of the May, all peoples have done magic to encourage the breeding of animals as part of the food supply, and to stimulate the growth of plants, wild or cultivated. In the opinion of J. G. Frazer, the human representatives or animal representatives, in the rites, of the spirit of vegetation: of the corn spirit; of the changing seasons, winter or summer, have been developed into many forms of gods, with appropriate myths, explanatory of the magic, and of the sacrifice of the chief performer. In the same way the adoration of living human beings, the deification of living kings—whose title survives in our king or queen of the May, and in the rex nemorensis, the priest of Diana in the grove of Arcia—has been most fruitful in myths of divine beings. These human beings are often sacrificed, for various reasons, actual or hypothetical, and gods and heroes are almost as likely to be explained as spirits of vegetation now, as they were likely to become solar mythological figures in the system of Max Müller. It is certainly true that the same beings in mythology are apt to acquire solar with other elemental attributes, including vegetable attributes. But that the origins of such mythical beings were, ab initio, either solar or vegetable, or, for that matter, animal, it would often be hard to prove.

Frazer's ideas are to be found in a work of immense erudition, The Golden Bough (London, 1900). Two studies by him, pursuing

MYTHOLOGY
MYTHOLOGY

the same set of ideas in more detail, are Adams, Atis, Osiris (1906) and Lectures on the Early History of the Kingship (1905). See A. Lang, Magic and Religion (London, 1901), for a criticism in detail of the general theory as set forth in The Golden Bough. Whatever may be said, Frazer has certainly made the greatest contribution to the study of mythology. He has fixed the attention of students on a mass of early ideas, previously much neglected save by W. Mannhardt, and on the facts of ritual, which preserve these ideas and represent them in a kind of mystery play.

We are now in a position to sum up the ideas of savages about man's relations to the world. We started upon this inquiry because we found that savages regarded sky, wind, sun, earth and so forth as practically men, and we had then to ask, what sort of men, men with what powers? The result of our examination, so far, is that in savage opinion sky, wind, sun, sea and many other phenomena have, being personal, all the powers attributed to real human persons. These powers and qualities are: (1) relationship to animals and ability to be transformed and to transform others into animals and other objects; (2) magical accomplishments, as—(a) power to visit or to procure the visits of the dead; (b) other magical powers, such as control over the weather and over the fertility of nature in all departments. Once more, the great forces of nature, considered as personal beings, are found as personalities. Often the sky is a great god, endowed with all the characteristics of man, and with such supernatural powers as a man has. There are also the prototypes of such human beings as the sky-god or the sun-god. Oftentimes the opposite sex, women, are shown as the sky, the sun, and all the phenomena of the world, which are regarded as the products of the disease of the mind, and which are attributed to real human beings. This is the philosophy of savage life, and it is on these principles that the savage constructs his myths, while these, again, are the scientific explanations of the universe with which he has been able to supply himself.

Examples of Mythology.—Myths of the origin of the world and man are naturally most widely diffused. Man has everywhere asked himself whence things came and how, and his myths are his earliest extant form of answer to this question. So confused and inconsistent are the mythical answers that it is very difficult to classify them according to any system. If we consider the myths of the world as a whole, we find that the origin of the world is sometimes represented as pre-existent to the divine race. If we try beginning with myths of the origin of the world, we find that the mytho-sacred being is the idea of a being who is not the product of evolution but is regarded as an independent form of thought, independent of and unformed from human beings, or the mytho-sacred being of the world.

It is important to note that the All-Father belief in the lowest culture is to be recognized. R. H. experimenting in Australia. Under the names of Baime, Pundelji, Malkuri, Daramuli and many others, the south-eastern tribes (both those who reckon descent in the female and those who reckon the descent in the male line) have this faith in an All-Father, this sacred being, with attributes varying in various communities. The most highly developed All-Father is the Baime or Byamee of the Euahlayi tribe of north-western New South Wales, to whom prayers for the dead are offered and who is thought to dwell in the hills and to watch over human conduct, but this is by no means invariably the case. Sometimes he, like the Atmatu of the Kaitish tribe of central Australia, is only vigilant in matters of ritual, such as circumcision, subincision and the use of the sacred bull-roarer, the Greek boiōs. As an almost universal rule, in the lowest culture, no prayers are addressed to this being; he has no sacrifices, no dwelling made with hands; and the images of him, in clay, that are made round the house or at the tribal ceremonies of initiation, are destroyed at the close of the performances. If the name "god" is denied to such beings because they receive little cult, it may still be admitted that the belief might easily develop into a form of theism, independent of and unformed from animism, or the ghost theory.

The best account of this All-Father belief in the lowest culture is to be found in R. H. experiments in Australia. Under the names of Baime, Pundelji, Malkuri, Daramuli and many others, the south-eastern tribes (both those who reckon descent in the female and those who reckon the descent in the male line) have this faith in an All-Father, this sacred being, with attributes varying in various communities. The most highly developed All-Father is the Baime or Byamee of the Euahlayi tribe of north-western New South Wales, to whom prayers for the dead are offered and who is thought to dwell in the hills and to watch over human conduct, but this is by no means invariably the case. Sometimes he, like the Atmatu of the Kaitish tribe of central Australia, is only vigilant in matters of ritual, such as circumcision, subincision and the use of the sacred bull-roarer, the Greek boiōs. As an almost universal rule, in the lowest culture, no prayers are addressed to this being; he has no sacrifices, no dwelling made with hands; and the images of him, in clay, that are made round the house or at the tribal ceremonies of initiation, are destroyed at the close of the performances. If the name "god" is denied to such beings because they receive little cult, it may still be admitted that the belief might easily develop into a form of theism, independent of and unformed from animism, or the ghost theory.

It is plain that the All-Father belief, in favourable circumstances, emerges as the most abstract of all gods, and may be regarded as the first step in the formation of a god, a spirit, or a being capable of surviving bodily death. The spirit of the dead may transform a material object, a "fairy," or may roam hungry and comfortless and need propitiation by food, for unpropitiated it is dangerous, or may be reincarnated, or may go "to its own herd"
MYTHOLOGY

Century, 1892) have not been successful (see Lang, Magic and Religion, "The Gods of the Bushmen" and N. W. Thomas in Modern Mythology, seq. The All-Father belief is most potent among the lowest races, and always tends to become obsolete under the competition of serviceable ancestral spirits, or gods made in the image of such spirits, who are often kept alive by sacrifices or induced by prayers to help man in his various needs.

The belief in the All-Father in southern Australia is concealed from the women and children who, at most, know his exoteric aspects only, and is only revealed to the initiate, among whom are a very few white men, like Howitt. Mrs Langloh Parker, of course, was not inititated (indeed, no white man has gone through this actual and very difficult process), but was made to her with great secrecy. The All-Father, even at his best, in among the Kurnai, Kamilaroi and Eungalyi, is the centre of many grotesque and sportive myths. He usually has a wife and children. One of these children is usually his mediator with men, and has the charge of the rites and the mystic bull-roarer. The relation is that of Apollo to Zeus in Greek myth.

Thus coastal conditions have no causal influence on the development of the All-Father belief. If they had, the natives of Australia would, reasoning the case, have no All-Father (Mulkari), and the natives of northern and northeastern coasts should have an All-Father, who is still to seek. The Arunta of Messrs Spencer and Gillen may have possessed and deposed the Altjira superior being of the Arunta known to Mr Strehlow, like the Atluna of the adjacent Kaitish, or the All-Father of the neighbouring Luritja; or these beings may be more recent divergences of doctrine, departures from pure Alcheringaism with no All-Father present, at least, it is premature to dogmatize on these problems.

The chief being among the supernatural characters of Bushman mythology is the insect called the Mantis. Cagn or Ikaggen, the Mantis, is sometimes represented with religious respect as a beneficent god. But his adventures are the mere nightmares of puerile fancy. He has a wife, an adopted daughter, whose real father is the “swallower” in Bushman swallowing myths, and the daughter has a son, who is the Ichneumon. The Mantis made an eldant out of the shoe of his son-in-law. The moon was also created by the Mantis out of his shoe, and it is red, because he would not put it in his mouth, as Zeus did with the ants in Argelia.

The Mantis is defeated in an encounter with a cat which had been singing a song about a lynx. The Mantis (like Poseidon, Hades, Metis and other Greek gods) was once swallowed, but dissipated himself in the belly of the monster. Like a cat when he leaped into the belly of the monster which was about to swallow Hesione, the Mantis once jumped down the throat of a hostile elephant, and so destroyed him. The heavenly Mantis, or the Mantis of the Bushmen, must be described in the myths of other suns, moon and stars. As a creator Cagn is sometimes said to have “given orders, and caused all things to appear to be made.” He struck snakes with his staff and caused them to swell, as Zeus did with the ants in Argelia. But the Bushmen’s mythical theory of the origin of things must, as far as possible, be kept apart from the fables of the Mantis, the Ichneumon and other divine beings. Though animals, these gods have human passions and character, and possess the usual magical powers attributed to sorcerers.

Concerning the mythology of the Hottentots and Namas, we have g a great variety of information, but no one can say how much of the spiritual life that has been discovered by Messrs Spencer and Gillen, from whom the tribes north, and among the tribes north by east of the Arunta, no such belief has been discovered by Messrs Spencer and Gillen, from whom the tribes north keep no secrets, or by Mr Sebert, a missionary among the now all extinct people of the north coast, but is thought to be a divine being, Arawotja, possibly an all but obliterated survival of an All-Father. Howitt speaks too of the Dieri Kutchi, who inspires medicine-men with ideas, but about him our information is scanty. Arunta medicine-man, taking another line, has a supernatural race of Titan-like beings, with no superiors, who were the first dwellers on earth; who possessed powers far exceeding those of the medicine-men of to-day; and who, in one way or another, were connected with, or developed from, the totem animals, vegetables and other objects. These beings modified the face of the country; in Arunta belief rocks and trees arose to mark the places where these gods had worked. These spirits still haunt certain places such as these; and are reincarnated in native women who pass by. These beings, in Arunta called "the people of the Alcheringa, or dream time" (but cf. Streloeh in Globus, 1884), originated the ritual rite in which the thong which the Dieri they are called Mura-Mura, and to them prayers are made for rain, accompanied by rain-making magic ceremonies, which in this case may be a symbolic expression of the prayers. There is a large group of other totems (see Spencer and Gillen, Native Tribes of Central Australia, Native Tribes of Northern Australia, and Howitt, Native Tribes of South-

The drawback to knowledge is the rarity of full acquaintance with native languages. Streloeh, Roth and Ridley seem best equipped of all for the examination of these questions. It seems possible that they have a colloquial knowledge of any Australian language. Gason, author of a work on the Dieri tribe, knew their language imperfectly. If this is correct, all the statements appear to be inaccurate. Mrs Langloh Parker describes their methods of checking and controlling native statements made in English.

The belief in these Mura-Mura or Alcheringa folk may be obviously devotional. They have the same origin and shade away into the folk beliefs of the Inuit Eskimos. The Hans Grund, the loop-wrench, the amorous and adventurous of the gods, myths ignored by Homer, are parallel to the adventures of the Alcheringa people, and the fable of the mutilation of Osiris and the search for the lost organ by Isis, according to these Alcheringa among the Arunta, is a more extreme version of the myth. According to the Arunta, the Alcheringa folk are part of a strangely elaborate theory of evolution and of animism, which leaves no room for a creative being, or for a future life of the spirit, which is so dear to the Bushman. Thus the doctrines of evolution and of creation, or the making of things, stand apart, or blend, in the metaphysics and religion of the Bushman. As has been seen above, the question of the datum, which theory came first, whether Alcheringaism was a scientific effort that swept away All-Fatherism, or whether All-Fatherism is a religious reaction in despair of science and of the evolutionary doctrine, is an open one. It has been argued that All-Fatherism is an advance, conditioned by coastal influences—more rain and more food—concurrent with a social advance to individual marriage, and reckon-
represented as at war (in the usual crude dualism of savages) with "their" husbands. These are typically plump and affectionate, and the adoration of the New Hebrides for Tootah is simple and natural in character, the "private ejaculations" of men in moments of need or distress. As usual, religion is more advanced than mythology. It appears that, by some accounts, Tootah is the sky-god by whose smooth and ample body the neighbouring race of Namase has another old chief for god, a being called Heiti Eibib. His graves are shown in many places, like those of Osiris, which, says Plutarch, abounded in Egypt. He is propitiated by sacrifices by his septah, which have intimate relations in peace and war with a variety of animals whose habits are sometimes explained (like those of the serpent in Genesis) as the result of the curse of Heiti Eibib. Heiti Eibib was born in a mysterious way. He was born in the "upper air." So spoke the sage Bough. He was born from the womb of a being also more a cow. The *Rig-Veda* (v. 18, 1) remarks, "His mother, a cow, bore Indra, an underling of the host of gods." It was a period of metempsychosis. Heiti Eibib, like countless other gods and heroes, is also said to have been the son of a virgin who tasted a particular plant, and so became pregnant, as in the German and Gallophrygian märchen of the bird is born for the sake of the F, which is used by him in the feats of Heiti Eibib. Tsai-Goab, in the opinion of his worshippers, as we have seen, is a defiled dead sorcerer, whose name means Wounded Knee, the sorcerer having been injured in the knee by an enemy. Or to take it in Latin (by philological convention) and call the name really means "red dawn," and is a Hottentot way of speaking of the infinite. The philological arguments advanced are extremely weak, and by no means convincing. If we grant, however, that it is a divine conception, it does not follow that it shipped the infinite under the figure of the dawn, and that, by forgetting their own meaning, they came to believe that the words which really meant "red dawn" meant wounded knee we must still ask what he does that he has associated the "red dawn" with the attributes of an ancestral sorcerer. In short, "their Red Dawn," if red dawn he is, is a person, and a savage person, adored exactly as the ancient fathers and grandfathers of the Hottentots are adored. What the Hottentots mean by sorcery, therefore, is as much an allegory of the dawn as the dawn appears to civilized people. About Gaunab (the Abriman to Tsai-Goab's Ormuzd) Dr Hahn gives two divergent opinions. Gaunab was at first a ghost, a monstrous snake, and evil-doer" (op. cit. p. 85). But Gauab de claims to be the "night-sky" (p. 120). Whether we regard Gauab, Heiti Eibib and Tsai-Goab as original mythological representations of nature, or the soul of comatose men, or as defied dead men, it is plain that they are now venerated as non-natural human beings, possessing the customary attributes of sorcerers. Thus of Tsai-Goab it is said, "he could do wonderful things which no other man could do, because he was very wise." He could tell what would happen in future times. He died several times, and several times he rose again" (statement of old Kxarab in Hahn, p. 61).

The mythology of the Zulus as reported by H. Callaway (Unkülünkulu) is thin and interesting. The Zulus are great worshipers of ancestors (who appear to man in the form of snakes), and they regard a being called Unkülünkulu as their first ancestor, and sometimes as the creator, or at least as the maker of man. Unkülünkulu may be connected with "the lord of heaven," which, who, like Indra, causes the thunder. The word answering to our lord is also applied, even to beasts, as the lion and the elephant. The thunder is the "lord of heaven," which, in its popular signification, the "storm god," who gives rain. The Zulus think much of the weather and of the thunder. But to the west coast the "anazi" or spider takes the place of the mantis insect among the Bushmen. For some of his exploits Daset's "Tales from the Noot (2nd ed., Appendix) may be consulted. For South African religion see Lang, *Magic and Religion*; Donnell, *The Back of the Black Man's Mind*; Junod, *Les Barotsi*; Spieh, *Die Ewe-Slämme*; Frazer, *The Golden Bough*. Stories of living, farming, and herding, from Europe, Asia, and Africa are given by *Anthropol. Inst.* (Feb. 1881) by the Rev. R. H. Codrington. The article contains a critical description of the difficulty with which missionaries obtain information about the precreed. The people of the Melanesian Islands are chiefly ancestor-worshipers, but they also believe in a deity, who is kind and generous, and who is sometimes associated with a human race endowed with supernatural powers who here, as elsewhere, do good as gods. Here is an example of a prayer to Qat—the devotee is supposed to be in danger with his canoe: "Qat! Marawal! look at his canoe which will run away. I want to boil it; but one man came to me, beat down for me the crests of the tide-rip; let the tide-rip set down away from me, beat it down level that it may sink and roll away, and I may come to a quiet landing-place. Compare the prayer of Odysseus to the river, whose mouth he had reached after three days' swimming on the tempestuous sea. "*Hear me, O king, whose thou art, unto thee I come as to one to whom prayer is made . . . nay, pity me, O king, for I avow myself thy servant*" (Odys. v. 450). The prayer of the Melanesian is on a rather lower religious level. The myths of Qat's adventures, however, are very crude, though not as wild as some of the Scandinavinan myths about Odin and Loki, while they are less immoral than the adventures of Indra and Zeus. Qat was born in the isle of Lesotho; he was born there in the morning. From Qat he received the first fire, he taught the people the arts of life, and he taught them to worship and pray to Qat. He first made Marawa's acquaintance when he was cutting down a tree for a canoe. Every night (as in the common European story, about bridge-building and church-building) the work was all undone by Marawa, whom Qat found means to conciliate. In all his future adventures the spider was as serviceable as the cat in *Fuss in Boots* or the other grateful animals in European legend. Qat's great enemy, Qasvura, was dashed against the hard sky, and was turned into a stone. The stone is called the "stone of Qat's wife," and has the name Levu, like the stone which was Zeus in Laconia. Qat, like so many other "culture-heroes," disappeared mysteriously, and white men arriving in the island have been mistaken for Qat. His departure marks the beginning of a new period in the social development of the Zulu nation. The oral tradition of the Beagare, in the New Hebrides, Tagar takes the rôle of Qat, and Supe of the bad principle, Loki, Ahriman, Tungaro Loloqong, the Australian Crow and so on. The Zulu also have two idols, and the Jackals and the Birds. For their All-Fathers see Holmes, *J. A. I.,* vol. xxxv., and O'Farrell, *J. A. I.,* vol. xxiv., with Sundeman in Warneck's *Allgemeine Missionszeitlschrif*., vol. xi. 1884.

Levu is the name of a mountain. Vana Levu to Vancouver Island, and ethnologically, the Ahts of the latter region are extremely remote from the Papuans with their mixture of Malay and Polynesian blood. The Ahts, however, differ but little from the American Musqueam and their relatives on the American coast, from European races of various degrees of culture, to the Papuan inhabitants of Melanesia and other parts of the world. Wherever tribes of African origin are found, whether in India, Africa, or Australia, wherever we find that mythological ideas are scarcely on a higher level, an excellent account of the myths of the Banks Islanders is given by *Manchester Geographical Journal* (Dec. 1880).
alain, met a friendly dolphin, which advised him to swallow a pebble and a little sea-water. The birth of Yehl was the result. In his youth he shot a supernatural crane, and can always fly about in its feathers, like Odin and Loki in Scandinavian myth. He is usually, however, represented as a bird, a raven, and water, in his bird-like aspects, as Odin stole "Suttung's mead" when in the shape of an eagle. 1 Yehl's powers of metamorphosis and of flying into the air are the characteristics of his being. This is a rather crude form of first father, "culture-hero" and creator. 2

Among the Karok Indians we find the great hero and divine benefactor in the shape of, not a raven, nor an eagle-hawk, nor a wolf, but a demiurge, which is more like a magical agent. Among both Karok and Navaho the coyote is the Prometheus Purphoros, or, as the Aryans of India call him, Matarisvan the fire-stalker. Among the Papagos, on the eastern side of the Gulf of California, the coyote or prairie wolf is the creative hero and chief supernatural being. In Oregon the coyote is also the "demijure," but most of the myths about him refer to his creative exploits, and will be more appropriately treated in the next section.

Moving on to the coast of British Columbia, we find the musk-rat taking the part played by Vishnu, when in his avatar as a boar he fished up the earth from the waters. Among the Tinnch a miraculous dog, who, like an enchanted fairy prince, could assume the form of any animal, was the chief of the mythological men of gods. He too is chiefly a creative or demiurgic being, answering to Purusha in the Rig Veda. So far the peculiar mark of the wilder American Indian myths is the legendary character of the dogs. This is also illustrated in Australia and Africa, where the bestial clothing, feathers, or drops, but slowly off Indra, Zeus and the Egyptian Ammon, and the Scandinavian Odin. All these are more or less anthropomorphic, but retain, as will be seen, numerous relics of a theriomorphic condition.

Maori and Polynesian Cultures.—Passing from the lower savage myths, of which space does not permit us to offer a larger selection, we turn to races in the upper strata of barbarism. Among these: the Maoris of New Zealand, and the Polynesian people generally, are remarkable for a mythology largely intermixed with early astrological-philosophical ideas, and which is the heritage of the ancient Aryans and the Biblical Magoni, and others, have had spectators among them not very removed from the mental condition of the earliest Greek children. What remains now of these myths is the product of a process from the view of nature which we call personalism to the crudest theories of the physicist was apparently begun in New Zealand before the arrival of Europeans. In Maori mythology it is more usual to dignify the early fire-stealer, Tawhirimatea, as the Supreme being, and as the benefactor and sustainer of the whole creation, and the origin and nature of the gods. Long traditional hymns give an account of the "becoming out of nothing" which resulted in the evolution of the gods and the world. In the beginning (as in the Great Myth) one of the gods (Tangaroa) alone came forth; a being, without speech, so that all men were indissolubly united to his wife Earth (Tapa), and between them they begat gods which necessarily dwelt in darkness. These gods were some in vegetable, some in animal form; some traditions place among these gods Tiki the demijure, the most ancient of the Prometheus) made men out of clay. The offspring of Rangi and Papa (kept in the dark as they were) held a council to determine how the world was to be adorned, and the heavens, and the earth, to what use shall we separate them? In the Hesiodic fable, Cronus and his heavenly pair by mutilating his oppressive father Uranus. Among the Maoris the god Tungtangahana cut the sinews which united the earth (Papa) and the sky (Rangi). This myth may also have been borrowed from the ancient Indian gods, and Asuras of the Vedas, there were many wars in the divine race, and as the incarnations of the Indian Brahmanas are derived from those old experiences of the Vedic gods, so are the incarnations of the New Zealand gods, especially in the water god. Here again may be called "departmental": each person who is an elementary force is also the god of that force. As Te Heu, a powerful chief, says: "I have nine sons, seven men, and so there is among gods. "One made this, another that with the trees, tannins, Tanga-roa fish, and so forth." The "departmental" arrangement prevails among the polytheism of civilized peoples, and is familiar to all from the Greek examples. Leaving the high gods whose functions are so large, while their forms (as of lizard, fish and tree) are often so mean, we come to Maui, the great divine hero of the supernatural race in Polynesia. Maui in some respects answers to our own chief, Cronus, and in others to Qat, Quawteaht, and other savage divine personages. Like the son of the Vedic Adit, 2 Maui is a rejected and abortive child of his mother, but afterwards attains to the highest reputation. As Maui was left by his mother, he dwelt with the birds, and grew and mooned in their proper courses. He induced the sun to move orderly by giving him a violent beating. A similar feat was performed by the Sun-trapper, a famous Red Indian chief. These stories are usually thought to be formed by the wandering thoughts of the metalepsis, and the sun, but the sun could hardly give the sun a dumbing. Maui stole monkeys, invented bananas, and discovered tattoo. He was also a great inventor, as Prometheus Purphoros the fire-stalker, drew a whole island up from the bottom of the deep; he was a great sorcerer and magician. Had Maui succeeded in his attempt to pass through the body of Night, he would have been immortal. But a little bird which sings at sunset wakened Night, she snapped up Maui, and men die. This has been called a myth of sunset, but the sun does what Maui failed to do; he passes through the body of Night unharmed. The adventure is one of the myths of the origin of death, which are almost universally diffused. Maui, though regarded as a god, is not often addressed in prayer.

The whole system, as far as it can be called a system, of Maori mythology is the obvious expression of the religious conceptions of the world which have already been explained. The Polynesian system differs mainly in detail; we have the separation of heaven and earth, the animal-shaped gods, the fire-steeing the exploits of Maui, and evidently the supposed differentiation of the central empire of the Polynesians, in the researches of W. Ellis, of Williams, in G. Turner's Polynesia, and in many other accessible works.

The Mexican and Peruvian civilizations were far ahead of the Maori culture, in so far as they possessed the elements of a much more settled and highly-organized society. Their religion had their fine lucid intervals, but their mythology and ritual were little better than the mythical rather than the actual. Their mythology was saturated in cruelty and superstitious piety. In cruelty the Aztecs surpassed perhaps all peoples of the Old World, except certain Semitic stocks, and their gods, of course, surpassed almost all other gods in blood-thirstiness. But in grotesque and savage points of faith the ancient Egyptians, the Greeks, and the Vedic Indians ran even the Aztecs pretty close.

Bernal Diaz, the old "conquistador," has described the hideous aspect of the idols which Cortez destroyed, "idoles in the shape of hideous dragons, as large as calves," idols half in the form of men, half of dogs, and serpents which were worshipped as divine. The Mexican and Peruvian civilizations are far ahead of the Maori and of the Polynesians, and are the only genuine examples of a mythology more or less accurately founded on a knowledge of the real world. The only mythology that can be compared to the ideal theories of the ancient Egyptians, the Greeks, and the Vedic Indians ran even the Aztecs pretty close.

2 The New Zealand myths are the old traditional priestly hymns, collected and translated in the works of Sir George Grey, in Taylor's New Zealand, in Shortland's Traditions of New Zealand (1842), in Bastian's Heilige Sage der Polynesier, and in W. H. E. Another Ancient Polynesian Myth, p. 592.
MYTHOLOGY

gods, not to symbolism (Zeus was a cuckoo), but to survivals from that quality of early thought which draws no line between man and god and beast and fish and bird. If spiders may be great gods, why not the more attractive humming-birds? Like many other gods, Huitzilopochtli was associated with his namesake. He is analogous to Δείδας and Φοίβος: Tylor (Primitive Culture, ii. 307) calls Huitzilopochtli an "inextricable compound partheno- genetic" god. His sacra, in which the past idols of him were eaten by the current occupants (Müller, op. cit. p. 305). As a humming-bird, Huitzilopochtli led the Aztecs to a new home, as a wolf he led the Hiranip, and as a woodpecker led the Sabines. Quetzalcoatl, the Toltec deity is as much a swallow (or similar small bird) as Huitzilopochtli is a humming-bird, and they both always be found in connection with a statue. For the composite character of Quetzalcoatl as a "cultures hero" (a more polished version of Qat), as a "nature-god" and as a theriomorphic god see Müller (op. cit. pp. 383-384), Müller Iran, and the Communist of European and Near Eastern origins. At the "departmental" god belonging to some other polytheisms; there is an Aztec Ceres, an Aztec Lucina, an Aztec Vulcan, an Aztec Floran, an Aztec Venus. The creative myths and the legends of the Aztec Gaelic and the Aztec pyramid seem more obscure than Egyptian mythology. Writers are apt to speak of Egyptian religion as if it were a single phenomenon of which all the aspects could be observed at a given time. In point of fact Egyptian religion (conservative though it was) lasted through perhaps five thousand years; was subject to innumerable influences, historical, ethnological, and philosophic, and was variously represented by various schools of priests. We cannot take the Plutonic speculation of a full-fledged, or the Greek, for the native Egyptian theology, and trace it. In the "millennium" in which it is found to be a godhead as evidence for the belief of the peoples who first worshipped the Egyptian gods an innumerable series of ages before lamblichus and Plutarch. Nor can the esoteric and pantheistic theories of priests be taken as evidence for the native religion. It is the god who forms the key to all the manifestations of the divine essence) be received as an historical account of the origin of the local animal-worships. It has already been suggested that the development of the cults is the result of animal worship, and the stock having its parent bird, beast, fish, or even plant, or inanimate object. It has also been shown that these backward peoples recognize a non-natural race of men or animals as the fittest fashions of themselves. Such ideas are consonant with, and may be traced to the confused and nebulous condition of, savage thought. Precisely the same ideas are found at various periods among the ancient Egyptians. If we are to believe their own writings, the idea of Osiris was a god, a godshape, and about the non-natural superhuman heroes, and their wars and loves, as esoteric allegories devised by civilized priests, perhaps we should also explain Pand-jel, Qat, Quwacht, the Mantis god, and the Great Goddess of the Canaanite country, and her inventions, put forth in a civilized age, and retained by Australians, Bushmen, Hotentots, Abts, Thlinkeats, Papuans, who preserve no other vestiges of high civilization. Or we may take the opposite view, and recognize the site of Osiris as an image and him up in a box and mutilated him) as a dualistic myth, originally on the level of the battle between Gauanab and Tswi-Gob, or between Tagar and Suq. We may regard the local beast- and plant-gods of Egypt as the idea of totem- and totemic-gods like those of the Toda to India, America, Africa, Siberia and other countries. In this article the latter view is adopted. The beast-gods and dualistic and creative myths of Egypt, as they stand, are as fragmentary as those of any people. They are not pictorially represented, and we have not obtained from these records any description of Osiris byd mourning for the burial of his dead son, Anubis, and after the Christian era is described at full length by Plutarch. Whether the same myth was current in the far more distant days of Mycerinus, it is, of course, impossible to say with diagnostic certainty. The religious history of Egypt, perhaps Dynasty X. to Dynasty XX., is interrupted by an invasion of Semitic conquerors and Semitic ideas. Prior to that invasion the gods, when mentioned in monuments, are always represented by animals, and these animals are the object of strictly local worship. The name of each god is spelled in hieroglyphs beside the image of the animal they held sacred, not far from the image. The custom with savage totemism is absolute. Of all the explanations, then, of Egyptian animal-worship, that which regards the practice as a survival of totemism and of savagery seems the most satisfactory. Even the numerous survivals of a human-like, theriomorphic shape: Beasts also appeared in the royal genealogies, as if the early Egyptians had filled up the measure of totemism by regarding themselves as actually descended from animals.

The idea that the theriomorphic (or animal) figures of gods known in the civilised parts of Egypt are on the granite obelisk of Bes as in the Fayum, erected by Usertesen I. of Dynasty XII., and here we find the forms all full-blown at once. The first examples of deities belongs to a period a little before. Recent "Ibis and The dog Anubis" with the rest of the semi-theriomorphic deities. These survived even their defeat by the splendid human gods of Rome, and only fled from the folding stage.

Though Egypt was rich in gods, her literature is not fertile in myths. The religious compositions which have survived are, as a rule, hymns and litanies, the funereal service, the Book of the Dead, and such like; with these the Egyptians seem to be content. We are alluded to in the course of addresses to the divine beings, but, naturally, are not told in full. As in the case of the Vedas, hymns and litanies of gods are put together, and are being taken or granted for them. The Church would throw little light on the incidents of the gospel story or of the Old Testament. The "sacred legends" which the priests or temple servants freely communicated to Herodotus are largely supplying the blanks in an epic which is by no means an Epic in the ordinary sense. Though Osiris is not a real Osiris, the "Osiris" figure of god is used in Egypt. Osiris is, therefore, a myth and not a god, and his name is an Egyptian mystery. Osiris is a god, a Semitic one, and an Egyptian one, as well. Used in the midst of certain types of growth, it is possible to use Osiris as a means of developing the philosophy of the Semite, of the earth, or of the sun. Osiris is one of the chief Egyptian deities, and is the symbol of the resurrection of the dead. His name means "the living one," and is used in connection with the words "Osiris" and "Osirian." Osiris is the god of the underworld, and is the god of the dead. His myth, to be afterwards narrated, is found pictorially represented in a tomb and in the temple of Philae, and is frequently added to in the litanies of the dead about 1200 B.C., is indicated with reverence awed by Herodotus, and after the Christian era is described at full length by Plutarch. Whether the same myth was current in the far more distant days of Mycerinus, it is, of course, impossible to say with diagnostic certainty. The religious history of Egypt, perhaps Dynasty X. to Dynasty XX., is interrupted by an invasion of Semitic conquerors and Semitic ideas. Even the numerous survivals of a human-like, theriomorphic shape: Beasts also appeared in the royal genealogies, as if the early Egyptians had filled up the measure of totemism by regarding themselves as actually descended from animals.
some great moral or physical mystery. But we apply no such explanation to similar savage legends, and our theory is that the Osirian myth is one of these retained to the time of Pytharch by the Egyptians, with the addition of the sun-god Osiris, preserved in full vigour most of the practices of totemism. As a slight confirmation of the possibility of this theory we may mention that Greek mysteries retained two of the features of savage mysteries. The first is that of the mother goddess, which custom prevails in African mysteries, in Guiana, among Australians, Papuans, and Andaman Islanders. The other custom is the use of the toruudus, as the Australians call a little fish-shaped instrument, which worshipping Indians wet with boiling and whirring noise and keep away the profane, especially women. It is employed in New Mexico, South Africa, New Zealand and Australia. We have no more than the names of these mysteries. 3 Neither the use of the 

3 Demosthenes, De corone, pp. 315, καλουμενος των γυμνοσωομαν καλομενος των τηρουσαντων τη νεα σαραντομα κατακεραυνωμας πολε την δε τηζωνη. Quoted by Lobeck, Agiostrophus, i. 700, from Bastiaud et Gregoire's Latin, in which the etymology is discussed. 4 cf. Arnobius, v. c. 19, where the word turbines is the Latin term. 5 Wilkinson, iii. 62, see note by Dr Birch. A more detailed account of Egyptian religion is given under Egypt. Unfortunately Egyptian literature is not written in a wide language, but the anthropologists are sordid or never Egyptians.

3 For examples of the lofty morality sometimes attributed to the gods, see Max Müller, Hibbert Lectures, p. 284; Rig-Veda, lii. 28; iv. 12. 4; viii. 93 seq.; Mun, Sanskrit Texts, v. 218. poet recalls the noblest aspirations and regrets of the Hebrew

enemy. Indra cut him in two, and made the moon out of half of his body. This serpent was a universal devourer of everything and everybody, like Kwai Heman, the all-devourer in Bushman my- thology. The Indian Matsya yajurveda (an early date), as edited into the Satapatha-Brahmana must have reverted to the intellectual condition of Bushmen. In the fight with Vrittra, Indra lost his energy, which fell to the earth and produced plants and shrubs. In such a way, the sacred cow, the cloven-hoofed animals, whose manes, four pieces knocked off Chokanipok in his fight with Manabozho, Vines, in particular, are the entrails of Chokanipok. In Egypt, wine was the blood of the enemies of the gods. The Aryan versions of this sensible legend will be found in Satapatha-Brahmana. The civilized mind soon wearies of this stuff, and perhaps enough has been said to prove that, in the traditions of Vedic devotees, Indra was not a god without an irrational element in his myth. Our argument is, therefore, that Vrittra and Indra, as presented in India by the Satapatha-Brahmana, have no necessary connexion with the worship of a pure nature-god as a nature-god would now be constructed by men. The legends are survivals of a time in which natural phenomena were regarded, not as we regard them, but as persons, and savage persons, Alcheringa folk, in fact, and became the centres of the savage manner. Space does not permit us to recount the equally puerile and barbarous legends of Vishnu, Agni, the houses of Vivasvan in the form of a horse, the adventures of Soma, nor the Vedic amours (paralleled in several savage mythologies) of Pururavas and Urvashi.

Divine Myths of Greece.—If any ancient people was thoroughly civilized in the true sense of the word, it was the Greeks, probably the oldest of the Egyptian religion of Greece we find abundant survivals of savage manners and of savage myths. As to the religion, it is enough to point to the traces of human sacrifice and to the worship of rude fetish stones. The process of the primitive past, however, was not at an end. Phthision may be said to have continued almost to the conversion of the empire (Grote i. 125, ed. 1869). Pausanias seems to have found human sacrifices to Zeus still lingering in Arcadia in the 2nd century. The vast majority of all Greek gods were of the worship of Zeus in a manner that may not be spoken, and little liking had I to pry far into that sacrifice. But let it be as it is, and as it hath been from the beginning. Now " from the beginning " the sacrifice, according to all ancient traditions, was held with great human veneration; other places there were manifest communions of human sacrifice, as at the altar of Artemis the Impalatable at Patrae, where Pausanias saw the wild beasts being driven into the flames. Many other examples of human sacrifices in ancient Greece might be quoted, but I give full and interesting details of the worship of rude stones, the oldest worship, he says, among the Greeks. Almost every temple of Zeus, a horse, a serpent, a panther, a hare, a lion, which is the Poseidon of the Mangaians. The Argives had a large stone called Zeus Cappotas. The oldest idol of the Thespians was a rude stone. Another has been found beneath the pedestal of Apollo in Delos. In Achaea Phare was thirty square stones, each named by the name of a god. Among monstrous images of the gods which Pausanias, who saw them, regarded as the oldest idols, were the three-headed Artemis, each head being that of an animal, the Demeter the crowded, turned, the horse-headed Zeus, of which Zeus with three eyes, the ithyphallic Hermes, represented after the fashion of the Priapic figures in paintings on the walls of caves among the Bushmen. We also hear of the bull and the bull-footed Dionysus. The primitive objects of Zeus, as he is worshipped in processions at Attica both by women and men. The Greek custom of daubing people all over with clay in the mysteries results as we saw in the mysteries of negroes, Australians and Americans.

2 It is difficult to get a clear conception of the ancient Sanskrit Texts, with translations, Ludwig's translation of the Rig Veda, the version of the Satapatha-Brahmana already referred to, and the translation of the Aslareya-Brahmana by Haug, are the sources most open to English readers. (See Professor Preller's 'The Greek Mythology,' who unfortunately only deals with the hymns to the Maruts. The Indian epics and the Puranas belong to a much later date, and are full of deities either unknown to or undeveloped in the Rig Veda and the Brahmanas. The Asvamedha is contained in the Atharva-Veda, which contains the magical formulae and incantations of the Vedic Indians, is still untranslated, though, by the very nature of its theme, it must contain matter of extreme antiquity and interest.
3 Preller, Griechische Mythologie, i. 126, note 1, for this and other classical authorities.
4 The derivation of Άνθρωπος remains obscure. The derivation of Leto from καινός, and the conclusion that her name means " the concealer "—that is the night, whence the sun is born—is disputed by Mr. A. W. H. Armstrong (noted above, note 4). The derivation of Poseidon is discussed by Max Müller (Selected Essays, i. 386) Latinos being derived from the same root as Leto, Latona, the night.
5 Aristotle, H. A. n. 6; Aelian, N. A. iv. 4. The name, as usual, is variously interpreted by various etymologists.
6 We learn from the Odyssey (xix. 209) that this was the custom of sons on the death of their father.
of primogeniture, while Hesiod (Hymn, lines 141-145) claims Zeus the youngest of the sons of Cronus. Among the other gods Dionysus is but slightly alluded to in Homer as the son of Zeus and Demeter, as the object of persecution, and as connected with the myth of Attis. The more sacred episodes, and the more elaborate and often unexpected, are those of the gods of love and life. Venus is the more personal element, the product of the union of Aphrodite from θεία and φυή, or, by Max Müller, the name is connected with Sarameya (Sky). If he had originally an elemental character, it is now difficult to distinguish, though interpreters connect him with ocean, and the sea-goddess (a mixed creature) with the sea, fortune, luck, and the conductor of men’s souls down the dark ways of death. In addition to the great Homerian gods, the poet knows a whole "Olympian consistory of deities, nympha, nereids, oceanids, and sea-gods, the rainbow goddess, Sleep, Demeter who lay with a mortal, Aphrodite the goddess of love, wife of Hephaestus and leman of Ares, and so forth. As to the origin of the gods, Hesiod says: ‘We know not why the gods were 3 the first to be born, of an older dynasty now deposed, the dynasty of Cronus and the Titans. In the IIiad (vii. 478) Zeus says to Hera, "For thine anger rack I not, not even though thou go to the nethermost bounds of earth and of hell, were born of the loves of vaticus-Eumetral is round about them." ‘The gods below that are with Cronus " are mentioned (II. xiv. 274; xv. 225). Romulus of old wars dive echo in the IIiad, as (i. 400) where it is said that when the other immortals revoluted against and bound Zeus, he brought to his aid Aegaeon of the hundred arms. The streams of Oceanus (II. xiv. 246) are spoken of as the source of all the gods, and in the same book (290) Oceanus and mother Tethys are regarded as the parents of the sea-gods. (It is usual to call Tethys the mother of Oceanus, which Homer certainly understood to mean "son of Cronus," yet it is expressly stated that Zeus "imprisoned Cronus beneath the earth and the unapproachable vault of heaven," and it is only in these cases that Oceanus is called a son of Cronus. On the whole it may be said that the Homeric deities are powerful anthropomorphic beings, departmental rulers, united by the ordinary social and family ties of the Homeric age, capable of a variety of forms, and yet not connected with any one of the sacrifices of men (Od. v. 100, 102), able to assume all forms at will, and to intermarry and propagate the species with mortal men and women. Their past has been stormy, and their ruler has attained power after defeating and mediating a more ancient dynasty of his own kindred. From Hesiod we receive a much more elaborate—probably a more ancient, certainly a more barbaric—story of the gods and their depositions. (By looking at the IIiad, and attempting to denote an early non-natural race) were begotten by Earth and Heaven, conceived of as beings with human parts and passions (Hesiod, Theog. 45). This idea recurs in Maori, Vedic and Chinese mythology. Heaven and Earth, united in an endless embrace, produced children never which saw the light. In New Zealand, Chinese, Vedic, Indian and Greek myths the past had to be s bunded. Hesiod enumerates the children whom Earth bore "when he was joined with Heaven," Ceres, Ceres, Cybele, Cythera, Hyperion, Iapetus, Thela, Rhea, Themis, Mnemosyne, Phoebe, Tethys and the youngest, Cronus, "and he hated his glorious father." Others of the ancient deities who developed into the principal gods, with their three children of enormous strength, Cottus, Briareus (Aegaeon) and Gyes, each with one hundred hands and fifty heads. Uranus detested his offspring, and hid them in crannies of Earth. Earth exists without their knowledge. The fact that the children were known to all men is a sign that learning has by no means settled the questions of relative purity and antiquity in the myths. The Edda songs, according to F. Y. Powell, one of the editors of the Corpus peonicum septentrionale cronicorum, was an earlier work on the mythology before the present form "than the 9th century," and may be vaguely placed between A.D. 800-1100. The collector of the Edda probably had the old poems recited to him in the 13th century, and where there were gaps in the memory of the reciters the lacuna was filled up in prose. "As one goes through the poems, one is ever and anon face to face with a myth of the most childish and barbaric type, which carries one back to pre-Aryan days. Side by side with these old stories some fragments of a different strain of thought, Christian ideas, the belief in a supreme God, the notion of Doomsday. The Scandinavian cosmogonic myth (with its "earthly" and "Heavenly" worlds, and the origin of the stars) is the oldest of all the myths. The most important god is Odin, the son of Besla and Bor, the husband of Frigg, the father of Balder and many other sons, the head of the Asir stock of gods. Odin's name is connected with the Teutonic wotan = meares, cum imperia ferri (Grimm, Teut. Myth., Eng. trans.), and "Zeus the ancient of days" became "Zeus the son of Cronus." Having thus got a Cronus, the Greeks—and the misunderstanding could have happened in Greece only—needed a myth of Cronus. They therefore invented or adapted the swallow-trick so as to bring them to fruition, as Bushmen and Cossacks make it. This savagery itself needs some explanation. But the hypothesis that Cronus is a late derivation from Koqohe, and Koqohe by no means universally accepted. Others derive Koqohe from spaio, say, so as to bring them to fruition. But the hypothesis that Schwartz (Prřehistorisch-anthropologišchen Studien) readily proves Cronus to be the storm, swallowing the clouds. Perhaps we may say of Schwartz's view, as he says of Feller's "das ist Gedanken- spiel, aber nimmermehr Mythologie."
Odin would thus (if we admit the etymology) be the swift goer, the “ganger,” and it seems superfluous to make him (with our modern ideas of him) a living entity or something abstract and scarcely an early conception. Odin’s brethren (in Gylf’s Mocking) are Vile and Ve, who with him slew Ymir the giant, and made all things out of the fragments of his body. They also beheld the first birds and birds—some of the first birds—took upon himself most of the attributes of the medicine-man. In Loka Senna, Loki, the evil god, says that “Odin dealt in magic in Samsey.” The goddess Frigg remarks, Ye should never talk of your old dealings before men, of what ye Asir went through in old times.” But many relics of these “old times,” many traces of the medicine-man and the “skin-shifter,” survive in the myth of Odin. When he stole Suttung’s mead (which answers somewhat to the drinking-bird of Tannatorg), he took, not in the plain, but with the egg which floated on the waters, perhaps a fragment of soil fished up out of the floods by a beast or a god. But this conception does not exclude the idea that many of the things in the world—minerals, rocks, plants, and what not—are fragments of the frame of an animal or non-natural magnetized man, or are excretions from the body of a god. We proceed to state briefly the various forms of these ideas. The most backward races usually assume the prior existence of the car. Ye have believed in it.

The aborigines of the northern parts of Victoria (Australia) believe that the earth was made by Pund-jel, the bird-creator, who cut the valleys with a knife. Another Australian theory is that the men of a previous race, the Kooralie (very old ones), made the earth.

The problem of the origin of the world seems scarcely to have troubled the minds of many of the Indians. People do not say much about the making of the world. Among people a little more advanced, the earth is presumed to have grown out of the waters. In the most famous myth of a tribe of the Zend Avesta, the earth was tossed out of heaven, and fell on a turtle, which developed into the world. Another North-American myth assumes a single island in the midst of three waters, and this island grew into the world. The Navaho and the Zunis believe that earth was granted as a starting-point in their myths. The Winnebagos, not untouched by Christian doctrine, do not go farther back. The Maoris represent Creation of themselves according to God, Creation of his body and a piece of earth and made a man. Here the existence of earth is assumed (Bancroft iv. 228). Even in Guatemala, though the younger sons of a divine race succeed in making the world, the whole of the earth, and the sons of God, is made of clay as first material. The Pima, a Central-American tribe, say the earth was made by a powerful being, and at first appeared like a spider’s web. This reminds one of the Ananzi or spider creator of West Africa. The more metaphysical Tauculties of British Columbia say that in the beginning nought but earth was made, the water and a musk-rat. The musk-rat sought his food at the bottom of the water, and his mouth was generally filled with mud. By wrapping up the soil into a sort of ball, and sucking and blowing it into the world. Among the Timneh, the frame of a dog (which could assume the form of a handsome young man) became the first man. The British dog breed of dogs, like Osiris, Dionysus, Purusha and other gods, was born to pieces by the gods, and engaged in making some of the things in the world (Bancroft i. 106). Even here the existence of earth for the dog to live in is assumed.

The races of the New World, when they are studied, we find the New Zealanders in possession of ancient hymns in which the origin of things is traced back to nothing, to darkess, and to a metaphysical process from nothing to something, from being to becoming. The hymns may be found in Dr. T. Kears’ ‘Polynesian Mythology’ and in Taylor’s New Zealand. It has been suggested that these hymns bear traces of Buddhist and Indian influence; in any case, they are rather metaphysical than mystical. Myth comes in when the ancestors of the first tribe appear, when the gods themselves appear, and is the form of the gods, male and female, united in a secular embrace, and finally severed by their children, among whom Tane Mahuta takes the part of Cronus in the Greek myth. The gods were partly elemental, and partly personifications in children. The idea in children’s minds that human crime was fiercely attributed to them. In the South Sea Islands, generally, the fable of the union and separation of Heaven and Earth, and the recurrence of the two forms will be found in Gill’s ‘Myths and Songs from the South Pacific.’

The cosmogonic myths of the Aryans of India are peculiarly interesting, as we find in the Vedas and Brahmanas and Puranas the story of the creation of the world, the origin of the gods, the creation of man, the origin of the world, and the origin of the deities. The ideas of the origin of things are not abstract metaphysical speculations. We have the theory that earth grew, as in the Iroquois story of the turtle, from a being named Utanapad (Muir v. 335). We find that Brahmanaspati, the first of the gods and the father of Purusha and Tvashtrih, the mechinac among the deities, is credited with having fashioned the earth and the heaven (Muir v. 354). The Purusha, the god of the tenth book of the Rig Veda, gives us the Indian version of the theory that all things were made out of the mangled limbs of Purusha, a magnified non-natural man, who was sacrificed by the gods. As this hymn gives an account of the origin of the castes (which elsewhere are scarcely recognized in the
Rig Veda, it is sometimes regarded as a late addition. But we can scarcely avoid the conclusion that the Rig Veda contains stars which form a group of "familiar" stars, such as is the case with many other constellations. It is not to be presumed, therefore, that it means to us most myths, including those of Chaldæa and Egypt, and various North-American tribes. Not satisfied with this myth, the Aryans of India accounted for the origin of the stars in the following manner. The Brahma-Purusha was alone in the world. He differentiated himself into two beings, husband and wife. The wife, regarding union with her producer as incest, fled from his embraces as Nemesis did from those of Zeus. The purpose of the Nordic and the Brahmanic myth differs, according to Acosta) by which beasts and anthropomorphic gods and stars are all jumbled together. The Rig Veda contains examples of the idea that the good become stars.

As a rule, destruction by a deluge is the most favourable myth, but destruction by fire and wind and by the wrath of a god are common in Australian, Peruvian and Egyptian tradition. The idea of a god in the shape of a bear, fish, or bull, up a fish of earth, which subsequently became the world, out of the waters, is very well known to the Aryans of India, and recalls the feats of American musk-rats and coyotes already described. The tortoise from which the stars come is also common in Australian myths. The husband pursued in the form of the male of each animal, and from these unions sprang the various species of beasts (Satapatha-Brahmana, ii. 12. 3; Mâli. i. 25). The idea of the world being formed from all things being of the Lunar style is also current in the Brahmanas. In the Puranas we find the legend of many successive creations and destructions of the world a myth of world-wide distribution.

As a rule, reconstruction by a deluge is the most favourable myth, but destruction by fire and wind and by the wrath of a god are common in Australian, Peruvian and Egyptian tradition. The idea of a god in the shape of a bear, fish, or bull, up a fish of earth, which subsequently became the world, out of the waters, is very well known to the Aryans of India, and recalls the feats of American musk-rats and coyotes already described. The idea of the world being formed from all things being of the Lunar style is also current in the Brahmanas. In the Puranas we find the legend of many successive creations and destructions of the world a myth of world-wide distribution.

The Greek and Māgian myth of the marriage of Heaven and Earth and its dissolution is found in the Aitareya-Brahmana (Haeg's trans. ii. 308; Rig Veda, i. 33.). The marriage of Ehe and Earth was in the Brahmanas associated with the idea that the world would be destroyed and then re-created.

A Scandinavian cosmogonic myth starts from the abyss, Ginnungagap, a chaos of ice, from which, as it thawed, was produced the giant Ymir. Ymir is the Scandinavian Purusha. A man and woman appeared from the body of Ymir, a cow licked the hoar-frost, whence rose Bur, whose children, Odin, Vile and Ve, slew the giant Ymir. "Of his flesh they formed the earth, of his blood seas and waters, of his bones mountains, of his teeth rocks and stones, of his hair all manner of plants. This is the story in the Prose Edda, derived from older songs, such as the Grimmiurmal. However the distortion of this singular myth may be explained, its origin can scarcely be sought in the imagination of some primitive man. But the idea that women, dogs and men are the thermomorphic form of Purusha or Ymir is common in the Indo-European world. It is the Indian, Persian, Greek, and Germanic idea. In each case the myth has been changed from a myth of the world to a myth of the family, and the myth of the family has been changed at times to a myth of the society. That is how the "familiar" myth is preserved.

**Myths of the Origin of Man.**—These partake of the conceptions of evolution and of creation. Man was made out of clay by a supernatural being. Australians: was made by Kundel. New Zealand: man was made by Tiaki; he took red clay, and kneaded it with this oil, and his hands, in the manner of the Tongans. Man was made by the Sun-goddess. The position of the gods is also related to the myth of the Icelanders. The Cyprian myth reminds us of the Iroquois turtle. The Greek and Māgian myth of the marriage of Heaven and Earth and its dissolution is found in the Aitareya-Brahmana (Haeg's trans. ii. 308; Rig Veda, i. 33.). The marriage of Ehe and Earth was in the Brahmanas associated with the idea that the world would be destroyed and then re-created.

The Greek myth of the descent of the Arcadians, Myrmidons, children of the swan, the cow, and the sow, may be compared. Yet again, men came out of trees or plants or rocks: as on the Australian wattle-gum, the Zulu bed of reeds, the great tree of the Ovahereros, the rock of the tribes in Central Africa, the cave of Bushman and North-American and Peruvian myth. "from tree or stone?" (Odyssey, xix. 163.). This view was common among the Greeks, who boasted of being autochthonous. The Cyprian marsh was one scene of man's birth according to a fragment of Pindar, who mentions Egyptian and Libyan legends of the same descent. The story of the Arts of Life.**—These are almost unanimously attributed to "culture-heroes," beings theriomorphic or anthropomorphic, who, like Kundel, Qaï, Quawt, etc., Prometheus in Hesiod, Aesop in Iceland, were men who were made after many efforts, in which the experimental beings did not harmonize with their environment, by Prajapati. In another class of myths, man was evolved out of the lower animals —men from sharks, the man from the hare in Persia, the man from the bird in America. The Greek myths of the descent of the Arcadians, Myrmidons, children of the swan, the cow, and the sow, may be compared. Yet again, men came out of trees or plants or rocks: as on the Australian wattle-gum, the Zulu bed of reeds, the great tree of the Ovahereros, the rock of the tribes in Central Africa, the cave of Bushman and North-American and Peruvian myth. "from tree or stone?" (Odyssey, xix. 163.). This view was common among the Greeks, who boasted of being autochthonous. The Cyprian marsh was one scene of man's birth according to a fragment of Pindar, who mentions Egyptian and Libyan legends of the same descent.

**Stars.**—"The stars came otherwise," says Browning's Caliban. In savage and civilized myths they are usually meta-
morphic heroes, but in some myths they are discussed as human. As in Greece, were girls. Castor and Pollux in Greece, as in Australia, were young men. Our Bear was a bear, according to Charlesvoix and Lafaite, among the North-American Indians; the Eskimo, ram, etc. The story is also quoted by Lactantius from Hesiod.

MYXOEDEMA—MYZOSTOMIDA

ments of a rather limited set of incidents. These incidents have been roughly classified by Von Hahn.1 We may modify his arrangement.

There is (1) the story of a bride or bridegroom who transgresses a commandment of a mystic nature, and disappears as a result of the sin. The bride sins as in Eros and Psyche, Freja and Oddur, Purusha and Adverse, Ching-chou and the sun; the bridegroom sins as their husbands—naked in the latter case. The sin was against "the manner of women." Now the rule of etiquette which forbids seeing or naming the husband (especially the latter) is of the widest distribution. The offence in the Welsh form of the story is to the partner—a thing forbidden among early Greeks and modern Zulus. Presumably the tale (with its example of the sanction) survives the rule in many cases. (2) "Fenelope formula." The man leaves his spouse adrift. Another comes to the aid of the celestial family. A good deal occurs in Chinese legend. (3) Formula of the attempt to avoid fate or the prophecy of an oracle. This incident takes numerous shapes, as in the story of the fatal marriage of Phrixus, Paris, Creusa, and other characters. This up to the present, the birth of Oedipus. (4) Slaughter of a monster. This is best known in the case of Andromeda and Perseus. (5) Flight, by aid of an animal usually, from cannibalism, human sacrifice, or incest. The Greek example is Phrixus, Helle, and the ram of the golden fleece. (6) Flight of a lady and her lover from a giant father or wizard father. Jason and Medea furnish the Greek example. (7) The youngest brother takes over the family property. This family, as has been noted the example of Greek mythic illustrations of "Jüngsterecht," or supremacy of the youngest, in the Hesiodic myth of Zeus, the youngest child of Cronus. (8) Bride given to whoever with taller growth or due attention. A girl is put to serve a pious life. A custom of giving a bride without demanding bride-price, in reward for a great exploit, is several times alluded to in the Iliad. In Greek heroic myth Jason thus wins Medea, and in the race Millian with the papyrus plants. In the legends of the Phrixus, Paris, Phlegyas, this part, recurs. The rider through the fire wins Brunnihild but this may belong to another cycle of ideas. (9) The grateful beasts, who, having been aided by the hero, aid him in his adventures. His appearance in the Greek heroic epic is often so different that, Jason has conditions like these, as had Ilmarinen and Heracles, the Greek "strong man." (11) Adventure with an ogre, who is blinded and deceived by a pious old woman. " enormously tall" and "a person who vanquishes ogres" is the Greek ex.

example. (12) Descent into Hades of the hero. Heracles, Odysseus, Wainamoinen in the Kalevala, are the best-known examples in epic literature. These are twelve specimens of the incidents, to which we may add (13) "the false bride," as in the poem of Beric aux grand Pârs, and (14) the legend of the bride said to produce beast-children. The belief in the latter phenomenon is very common in Africa, and in the Arabian Nights, and we have seen it in America. Of the stories of these "bride" legends—(1) is a sanction of barbarous nuptial etiquette; (2) is an obvious ordinary incident; (3) is moral, and both (3) and (1) may pair off with all the myths of the origin of death from the inordinate passion for the nuptial contract; whatever, as on the West Coast of Africa, human victims have been offered to sharks or other beasts; (5) the story of flight from a horrible crime, occurs in some stellar myths, and is an easy maturating of the myth of (6) flight from wizard father or husband, is found in Bushman and Namaqua myth, where the husband is an elephant; (7) success of youngest brother, may have been an explanation and sanction of "Jüngsterecht" —Maui in New Zealand is an example, and Herodotus found the same thing. The story of the boy who went adventuring as a child, and who was successful in his efforts, only to return, but in the life of an elephant—(8) the bride given to successful adventurier, is consonant with heroic manners as late as Homer; (9) is no less consonant with the belief that beasts have human sentiments and supernatural powers; (10) the damsel and the ogre, who if they are not in the West Coast of Africa, human victims have been offered to sharks or other beasts; (11) the baffled ogre, is found among Basques and Irish; (12) descent into Hades, is the natural result of the savage conception of Hades, and the tale is told of actual people living in the Solomon Islands and in New Caledonia; Eskimo Angeokoks can and do descend into Hades—it is the prerogative of the necromantic magician; (13) "the false bride," found among the Zulus, does not permit of such easy explanation—naturally, in Zululand, the false bride is an animal; (14) the bride accused of bewitching a husband; of all these "bride" legends, the one that is inseparable in an inevitable where no distinction worth mentioning is taken between men and animals. English folk-lor has its woman who bore rabbit.

The formulæ here summarized, with others, are familiar in the märchen of Samoyeds, Zulus, Bushmen, Hottentots and Red Indians. For an argument intended to show that Greek heroic myths may be adorned and classified märchen, in themselves survivals of savage fancy, see Fortnightly Review, May 1872, "Myths and Mährchen," p. 410. A rather old explanation was that märchen are degenerate heroic myths. This does not explain the märchen of African, and perhaps not of Siberian races. In this sketch of mythology that of Rome is not included, because its treatment of the subject is confined to the family märchen and by a slide into harmony with the mythology of Greece. Greece, India and Scandinavia will supply a fair example of Aryan mythology (without entering on the difficult Slavonic and Celtic fields). (A. L.)

MYXOEDEMA (or athyreos), the medical term for a constitutional disease (see Metabolic Diseases) due to the degeneration of the thyroid gland, and occurring in adults; it may be contrasted with cretinism, which is a condition appearing in early childhood. There are two forms, myxoedema proper and operative. The question of the "Gull’s" disease.

(1) Myxoedema has been termed "Gull’s Disease" from Sir William Gull’s observations in 1873. Women are more often the victims than men, in a ratio of 6 to 1. It frequently affects members of the same family and may be transmitted through the mother, and it has been observed sometimes to follow exophthalmic goitre. The symptoms are a marked increase in bulk and weight of the body, puffy appearance of skin which does not pit on pressure, the line of the features becoming obliterated and getting coarse and broad, the lips thick and nostrils enlarged, with loss of hair, subnormal temperature and marked mental changes. There is striking slowness of thought and action, the memory becomes defective, and the patient becomes irritable and suspicious. For want of expression the term myxoedema is often used for dementia. The thyroid gland itself is diminished in size, and may become completely atrophied and converted into a fibrous mass. The untreated disease is progressive, but the course is slow and the symptoms may extend over 12 to 15 years, death from asthma or tuberculosis being the most frequent ending. (2) Symptoms similar to the above may follow complete removal of the thyroid gland. Kocher of Bern found that, in the total removal of the gland by operation, out of 408 cases operated myxoedema occurred in 69, but it is thought that if a small portion of the gland is left, or if accessory glands are present, these symptoms will not develop. The treatment of myxoedema is similar to that of cretinism.

MYZOSTOMIDA, a remarkable group of small parasitic worms which live on crinoid echinoderms; they were first discovered by Leuckart in 1827. Some species, such as Myzostoma curritum, move about on the host; others, such as M. glabrum, remain stationary with the pharynx inserted in the mouth of the crinoid. M. deformator gives rise to a "gall" on the arm of the host, one joint of the pinnule growing round the worm so as to enclose it in a cyst (see fig. E); whilst M. pulvinar lives actually in the alimentary canal of a species of Antedon.

A typical myzostomid (see A, B, C) is of a flattened rounded shape, with a thin edge drawn out into delicate radiating cirri. The skin is ciliated. The dorsal surface is smooth; there are five pairs of parapodia, armed with spiked setae, by means of which the worm adheres to its host. Beyond the parapodia are four pairs of organs, often called suckers, but probably of sensory nature, and comparable to the lateral sense organs of Capitellids (Wheeler). The mouth and cloacal aperture are generally at opposite ends of the ventral surface. The former leads to a protrusible pharynx (B). The duct of the excurrent system opens into a wide intestinal chamber with branching lateral diverticula. There appears to be no vascular system. The nervous system consists of a circumsophageal nerve, with scarcely difference in the nervous system, joining below a large gангlion mass no doubt representing many fused ganglia (B). The dorsoventral and the parapodial muscles are much developed, whilst the coelom is re-duced mostly to branched spaces in which the genital products The external branches of the coelomic ducts (C) consists of a branched sac opening to the exterior on each side. The paired ovaries discharge their products into a median coelomic chamber with lateral branches (C), often called the "antennae." The "antennae" open into the coelomic ducts through a dorsoventral pore into the terminal region of the rectum (cloaca). Into this same cloacal chamber open ventrally a pair of ciliated tubes communicating by funnels with the coelom (Nansen and Wheeler); these are possibly nephridia, and excretory in function.

The Myzostomida are protandric hermaphrodites, being functional males when small, spermatophore later, and finally

1 Griechische und altenberische Märchen, i. 45.
2 Tenth Book of Rig Veda and "Brahmana" of Yajur-Veda; Müller, Selected Essays, i. 410.
functional females (Wheeler). Small "males" are in some species constantly associated with large hermaphrodites, but according to Beard there are in some cases true dwarf males, comparable to the complementary males described by Darwin in the Cirripedia. The embryology of Myzostoma has been studied by Metchnikoff and Beard. Cleavage leads to the formation of an epibolic gastrula and ciliated embryo which hatches as a free-swimming larva remarkably like that of a Polychaete worm (D). The larva is provided with postoral and perianal ciliated bands, and on either side with a bunch of long provisional setae. The mesoderm becomes segmented, and the parapodia subsequently develop from before backwards; but almost all internal traces of segmentation are lost in the adult. The structure and development of the Myzostomida seem to show that they are nearly related to Polychaeta (see CHAETOPTERA), though highly modified in relation to their parasitic mode of life.

**MZABITES,** or BENI-MZAB, a confederation of Berber tribes, now under the direct authority of France. Of all the Berber peoples the Mzabites have remained freest from foreign admixture. Their own country is a region of the Algerian Sahara, about 100 m. south of El-Aghuat. It consists of five oases close together, viz. Ghardaia, Beni-Isguen, El-Atyah, Melika and Bu Nara, and two isolated oases farther north, Berrian and Guerrara. The total population numbered at the 1906 census 45,996, of whom about 100 were Europeans and a very small proportion Arabs and Jews. The Mzabites are of small and slender figure, with very short necks and under-developed legs. Their faces are flat, with short nose, thick lips and very deep-set eyes, and their complexion pale. Their dress is a shirt of thick wool, usually many-coloured. They are agriculturists, and are also famed as traders. The butchers, fruiters, bath-house keepers, road-sweepers and carriers of the African littoral from Tangier to Tripoli are nearly all Mzabites. Their industries, too, are highly organized. The Mzabite burnouses and carpets are found throughout North Africa. Their commercial honesty is proverbial. Nearly all read and write Arabic, though in talking among themselves they use the Zenata dialect of the Berber language, for which, in common with other Berber peoples, they have no written form surviving. They are Mahommedans, of the Ibadite sect, and are regarded as heretics by the Sunnites.

According to tradition the Ibadites, after their overthrow at Tiaret by the Fatimites, took refuge during the 10th century in the country to the south-west of Wargla, where they founded an independent state. In 1012, owing to further persecutions, they fled to their present quarters, where they long remained invulnerable. After the capture of El-Aghuat by the French, the Mzabites concluded with the Algerian government, in 1853, a convention by which they engaged to pay an annual contribution of £1,600 in return for their independence. In November 1882 the Mzab country was definitely annexed to Algeria. Ghardaia (pop. 7,688) is the capital of the confederation, and next in importance is Beni-Isguen (4,016), the chief commercial centre. Since the establishment of French control, Beni-Isguen has become the dépôt for the sale of European goods. French engineers have rendered the oases much more fertile than they used to be by a system of irrigation works. (See also Algeria.)

A letter which regularly follows M in the alphabet, and, like it in its early forms has the first limb longer than the others; thus, written from right to left, N. The Semitic languages gradually diminish the size of the other two limbs, while the Greek and Latin alphabets tend to make all three of equal length. The earliest name of the symbol was *Nun*, whence comes the Greek ν (nv). The sound of n varies according to the point at which the contact of the tongue with the roof of the mouth is made; it may be dental, alveolar, palatal or guttural. In Sanskrit these four sounds are distinguished by different symbols; the last two occur in combination with stops or affricates of the same series. The French or German n when standing by itself is dental, the English alveolar, *i.e.* pronounced like the English t and d against the sockets of the teeth instead of the teeth themselves. The guttural nasal is written in English ng as in ring; for the palatal n as in lynx there is no separate symbol. The sound of n stands in the same relation to d as m stands to b; both are ordinarily voiced and the mouth position for both is the same, but in pronouncing n the nasal passage is left open, so that the sound of n can be continued while that of d cannot. This is best observed by pronouncing syllables where the consonant comes last as in and id. When the nasal passage is closed, as when one has a bad cold, m and n cannot be pronounced; attempts to pronounce moon result only in bood. Two important points arise in connexion with nasals: (1) sonant nasals, (2) nasalization of vowels. The discovery of sonant nasals by Dr Karl Brugman in 1876 (Curtius, *Studien*, (9), pp. 285-338) explained many facts of language which had heretofore seemed obscure and elucidated many difficulties in the Indo-European vowel system. It had been observed, for example, that the same original negative prefix was represented in Sanskrit by a, Greek by a, in Latin by in and in Germanic by un, and these differences had not been accounted for satisfactorily. Dr Brugman argued that in these and similar cases the syllable was made by the consonant alone, and the nasal so used was termed a sonant nasal and written g. In most cases Sanskrit and Greek lost the nasal sound altogether and replaced it by a vowel a, a, while in Latin and Germanic a vowel was developed independently before the nasal. In the accusative singular of consonant stems Sans. *pādam*, Gr. ῥόθα, Lat. *pudem*, Sanskrit and Greek did not, as generally, agree, but it was shown that in such cases there were originally two forms according to the nature of the sound following the next word in the sentence. Thus an original Indo-European *pēdga*, would not be treated precisely in the same way if the next word began with a vowel as it would when a consonant followed. Sanskrit had adopted the form used before vowels, Greek the form before consonants and each had dropped the alternative form. The second point—the nasalizing of vowels—is difficult for an Englishman to understand or to produce, as the sounds do not exist in his language. Thus in learning to pronounce French he tends to replace the nasalized vowels by the nearest sounds in English, making the Fr. on a nasalyzed vowel (ō), into Eng. ong, a vowel followed by a guttural consonant. The nasalyzed vowels are produced by drawing forward the uvula, the "tab" at the end of the soft palate, so that the breath escapes through the nose as well as the mouth. In the Frenchnasalyzed vowels, however, many phoneticians hold that, besides the leaving of the nasal passage open, there is a change in the position of the tongue in passing from a to o. The nasalyzed vowels are generally written with a hook below, upon the analogy of the transliteration of such sounds in the Slavonic languages, but as the same symbol is used for both nasalized and *open* sounds derived from a "closed" one, the use is without ambiguity. On the other hand, it is not admissible to write 4 for the nasalyzed vowel in languages which have accent signs, e.g. Lithuanian. It is possible to nasalize some consonants as well as vowels; nasalized spirants play an important part in the so-called "Yankee" pronunciation of Americans.

**NAAS** (pron. Nace, as in place), a market town of Co. Kildare, Ireland, 20 m. S.W. from Dublin on branches of the Great Southern and Western railway and of the Grand Canal. Pop. (1901) 2036. It is situated among the foothills of the Wicklow Mountains, close to the river Liffey. The town is of great antiquity, and was a residence of the kings of Leinster, the place of whose assemblies is marked by a neighbouring rath or mound. Naas returned two members to the Irish parliament from 1559 until the union in 1800. Of a castle taken by Cromwell in 1650, and of several former abbeys, there are no remains. Punchestown racecourse, 23 m. S.E., is the scene of well-known steeplechases.

**NABATAEANS**, a people of ancient Arabia, whose settlements in the time of Josephus (*Ant.* i. 12, 4; comp. Jerome, *Quaest. in Gen. xxv.*.) gave the name of Nabatene to the border-land between Syria and Arabia from the Euphrates to the Red Sea. Josephus suggests, and Jerome, apparently following him, affirms, that the name is identical with that of the Ishmaelite tribe of Nêbâlîoth (*Gen. xxv.* 13; Isa. ix. 7), which in later Old Testament times had a leading place among the northern Arabs, and is associated with Kedar (Isa. ix. 7) much as Pliny v. 11 (12) associates *Nabataeae* and *Cedren*. The identification is rendered uncertain by the fact that the name Nabataean is properly spelled with t not s (on the inscriptions, *cf.* also Arabic Nabawf, Nabahf, etc.). Thus the history of the Nabataeans cannot certainly be carried back beyond 312 B.C., at which date they were attacked without success by Antigonus I. *Cyklops* in their mountain fortress of Petra. They are described by Diodorus (xix. 94 seq.) as being at this time a strong tribe of some 10,000 warriors, pre-eminent among the nomadic Arabs, eschewing agriculture, fixed houses and the use of wine, but adding to pastoral pursuits a profitable trade with the seaports in myrrh and spices from Arabia Felix, as well as a trade with Egypt in bitumen from the Dead Sea. Their arid country was the best safeguard of their cherished liberty; for the bottle-shaped cisterns for rain-water which they excavated in the rocky or argillaceous soil were carefully concealed from invaders. Petra (ρη) or Selâ was the ancient capital of Edom; the Nabataeans must have occupied the old Edomite country, and succeeded to its commerce, after the Edomites took advantage of the Babylonian captivity to press forward into southern Judaea. This migration, the date of which cannot be determined, also made them masters of the shores of the Gulf of 'Akaba and the important harbour of Elath. Here, according to Agatharchides (*Geog. Gr. Min.*, i. 178), they were for a time very troublesome, as wretches and pirates, to the reopened commerce between Egypt and the East, till they were chastised by the Greek sovereigns of Alexandria.

The Nabataeans had already some tincture of foreign culture when they first appear in history. That culture was naturally Aramaic; they wrote a letter to Antigonus "in Syriac letters," and Aramaic continued to be the language of their coins and inscriptions when the tribe grew into a kingdom, and profited by the decay of the Seleucids to extend its borders northward over the more fertile country east of the Jordan. They occupied Haurân, and about 85 B.C. their king Aretas (Hiráthå) became lord of Damascus and Coeles-Syria. Allies of the first Hasmonaean in their struggles against the Greeks (1 *Macc.* v. 25, ix. 35; 2 *Macc.* v. 8), they became the rivals of the Judaean dynasty in the period of its splendour, and a chief element in the disorders which invited Pompey's intervention in Palestine. The Roman arms were not very successful, and King Aretas retained his whole possessions, including Damascus, as a Roman

---

1 See *Edom*, and (for the view that Mal. i. 7-5, refers to the expulsion of Edomites from their land) *Malachi.*
NABBES—NACHMANIDES

vassal. As "allies" of the Romans the Nabataeans continued to flourish throughout the first Christian century. Their power extended far into Arabia, particularly along the Red Sea; and Petra was a meeting-place of many nations, though its commerce was diminished by the rise of the Eastern trade-route from Myos Hormos to Coptos on the Nile. Under the Roman peace their kings, however, were but nominal vassals. Their position was acquisitive, orderly people, wholly intent on trade and agriculture (Strabo xvi. 4). They might have long been a bulwark between Rome and the wild hordes of the desert but for the short-sighted cupiditv of Trajan, who reduced Petra and broke up the Nabataean nationality (105 A.D.). The new Arab invaders who soon pressed forward into their seats found the remnants of the Nabataeans transformed into jelādān, and speaking Aramaic like their neighbours. Hence Nabataeans became the Arabic name for Aramaeans, whether in Syria or Iraq, a fact which has been incorrectly held to prove that the Nabataeans were originally Aramaeans. Their independence is now known, however, that they were true Arabs—as the proper names on their inscriptions show—who had come under Aramaic influence.

See especially on this last point (against Quatremère, Journ. asiat. xvi., vol. ii., 1835). Nöldeke in Zeit. d. morgenländ. Gesell. xvii. 705 seq., xxv. 122 seq. The so-called "Nabataean Agriculture" (Pankevitch, 1884) is probably an Arabic translation by Ibn Walibshiya from an ancient Nabataean source, is a book of the 10th century (see A. von Gutschmid, Z. d. morgenländ. Gesell. xi. seq.; Nöldeke, ib. xxix. 445 seq.). Complete bibliographical information is given in P. Schürer, History of the Jewish People in the Time of Jesus Christ (1907). See also the Academy's Répertoire d'épig. sém.; and the discussions, &c., in the writings of Clermont-Ganneau (Rec. d'archéol. Orient.) and M. Lidzbarski (Handbuch d. nord-semit. Epig.; Ephemeris f. sem. Epig., 1890). For English readers the selection in G. A. Cooke, North-Semitic Inscriptions (Oxford, 1903) is the most useful.

NABBES, THOMAS (b. 1605), English dramatist, was born in humble circumstances in Worcestershire. He entered Exeter College, Oxford, in 1621, but left the university without taking a degree. He subsequently acted as a manager of a London theatre.

His works include: Covent Garden (acted 1633, printed 1638), a prose comedy of small merit; Tottenham Court (acted 1634, printed 1638), a comedy the scene of which is laid in a holiday resort of the London tradesmen; Hannibal and Scipio (acted 1635, printed 1637), a historical tragedy; The Bride (1638), a comedy; The Unfortunate Mother (1640), an unacted tragedy; Microcosmus, or Morall Maske (printed 1637); two other masques, Spring's Glory and Presentation intended for the Prince his Highness on his Birthday (printed together in 1638); and a continuation of Richard Knoles's General Historie of the Turks (1638). His verse is smooth and musical, and if his language is sometimes coarse, his general attitude is moral. The masque of Microcosmus—a really a morality play, in which Phusynder after much error is reunited to his wife Bellanima, who personifies the soul—is admirable in its own kind, and the other two masques, slighter in construction but ingenious, show Nabbes at his best.

Nabbes's plays were collected in 1639; and Microcosmus was printed in Dodson's Old Plays (1744). All his works, with the exception of his continuation of Knoles's history, were reprinted by H. Bullen in his Old English Plays (second series, 1878). See also F. G. Fleay, Bng. Chron. of the English Drama (1891).

NABA, a native state of India, within the Punjab. Area, 660 sq. m. Pop. (1901) 207,949. Its territories are scattered; one section, divided into twelve separate tracts, lies among the territories of Patiala and Jind, in the east and south of the Punjab; the other section is in the extreme south-east. The whole of the territories belongs physically to a plain; but they vary in character from the great fertility of the Panwad region to the aridity of the Rajputana desert. Naba is one of the Sikh states, founded by a member of the Phulkian family, which established its independence about 1763. The first relations of the state with the British were in 1807-1808, when the raja obtained protection against the threatened encroachments of Ranjit Singh. During the Mutiny in 1857 the raja showed distinguished loyalty, and was rewarded by grants of territory to the value of over £10,000. The imperial service troops of the raja Hira Singh (b. c. 1843; succeeded in 1871) did good service during the Tirah campaign of 1897-98. The chief products of the state are wheat, millets, pulses, cotton and sugar. The estimated gross revenue is £1,00,000; no tribute is paid. The territory is crossed by the main line and also by several branches of the North-Western railway, and is irrigated by the Sirhind canal.

The town of Naba, founded in 1755, has a station on the Rajpura-Bhatinda branch of the North-Western railway. Pop. (1901) 18,468.

See Phulkian States Gazetteer (Lahore, 1900).

NABIGHA DHUBYĀNĪ [Zīyād ibn Muṣʿawlyā] (6th and 7th centuries), Arabian poet, was one of the last poets of pre-Islamic times. His tribe, the Bani Dhubyān, belonged to the district near Mecca, but he himself spent most of his time at the courts of Hira and Ghassān. In Hira he remained under Mundhir (Mundhir) III, and under his successor in 562. After a sojourn at the court of Ghassān, he returned to Hira under Numa. He was, however, compelled to flee to Ghassān, owing to some verses he had written on the queen, but returned again about 600. When Nu'mān died some five years later he withdrew to his own tribe. The date of his death is uncertain, but he does not seem to have known Islam. His poems consist largely of eulogies and satires, and are concerned with the strife of Hira and Ghassān, and of the Bani Abis and the Bani Dhubyān. He is one of the six eminent pre-Islamic poets whose poems were collected before the middle of the 2nd century of Islam, and have been regarded as the standard of Arabian poetry. Some writers consider him the first of the six.

His poems have been edited by W. Ahwardt in the Diwan of the six ancient Arabic Poets (London, 1870), and separately by H. Denenberg (Paris, 1869, a reprint from the Journal asiatique for 1868).

NABOB, a corruption of the Hindustani naūbah, originally used for native rulers. In the 18th century, when Clive's victories made Indian terms familiar in England, it began to be applied to Anglo-Indians who returned with fortunes from the East.

NABUA, a town in the province of Camarines, Luzon, Philippine Islands, on the Bicol river, about 22 m. S.S.E. of Nueva Caceres, the capital. Pop. (1903) 18,893. Nabua is in the district known as La Rincónada—a name originally given to it on account of its inaccessible. It is connected by road, railway and the Bicol river (navigable for light-draft boats) with Nueva Caceres. Nabua is the centre of an agricultural region, which produces much rice and some Indian corn, sugar and pepper. The language is Bicol.

NACAIRE, NAKER, NAQUAIRE (Arab. naqādra), the medieval name for the kettledrum, the earliest representation of which appears in the unique MS. known as the Vienna Genesis (5th or 6th century). The name was, according to Thomas, derived from initials used at the triumphal entry of Edward III. into Calais. The Chronicles of Joinville describe the instrument as a kind of drum: "Lor il fist sonner les tabours que l'on appelle nacaires." Chaucer, in his description of the tournament in the Knight's Tale, line 1653, also refers to this early kettledrum.

NACHMANIDES (Nahmanides), the usual name of Moses ben Nahman (known also as Ramban), Jewish scholar, was born in Gerona in 1140 and died in Palestine c. 1270. His chief work, the Commentary on the Pentateuch, is distinguished by originality and charm. The author was a mystic as well as a philologist, and his works unite with peculiar harmony the qualities of reason and feeling. He was also a Talmudist of high repute, and wrote many controversial Tractates. Metaon and other legal works. Though not a philosopher, he was drawn into the controversy that arose over the scholastic method of Maimonides (q.v.). He endeavoured to steer a middle course between the worshippers
NÁCHOD—NADIA

and the excomunicators of Maimonides, but he did not succeed in healing the breach. His homiletic books, Epistle on Sanctity (1ggereth ha-qodesh) and Law of Man (Torath ha-Adam), which deal respectively with the sanctity of marriage and the solemnity of death, are full of intense spirituality, while at the same time treating of ritual customs—a combination which shows essential Rabbinism at its best. He occupies an important position in the history of the acceptance by medieval Jews of the Kabbala (q.v.); for, though he made no fresh contributions to the philosophy of mysticism, the fact that this famous rabbi was himself a mystic induced a favourable attitude in many who would otherwise have rejected mysticism as Maimonides did. In 1263 Nahmanides was forced to enter into a public disputation with a Jewish-Christian, Pablo Christiani, in the presence of King James of Aragon. Though Nachmanides was assured that perfect freedom of speech was conceded to him, his defence was pronounced blasphemous and he was banished for life. In 1267 he went to Palestine and settled at Acre. He died about 1270.

See S. Schechter, Studies in Judaism, first series, pp. 120 seq.; Graetz, History of the Jews (English translation vol. iii. ch. xvi. and xviii.). (I. A.)

NÁCHOD, a town of Bohemia, Austria, 109 m. E.N.E. of Prague by rail. Pop. (1900) 8999, mostly Czech. It is situated on the Mettau river, at the entrance of the Léwin-Náchod pass. The old castle contains a collection of historical paintings and archives, and there are several old churches, of which that of St Lawrence is mentioned as the parish church in 1350. The town originally gathered round the castle of Náchod, of which the first lord was a member of the powerful family of Hron, in the middle of the 13th century. It suffered much during the Hussite Wars, and in 1437 was captured by the celebrated robber knight Kolda of Zampach, and retaken by George of Podebrad in 1456 and included in his estates. It was sold in 1624, and in 1632 it was given to Ottavio Ficcolomini; finally, after many changes of ownership, the castle and titular lordship came in 1840 to the princes of Schaumburg-Lippe. The important engagements fought near the town on the 27th and 28th of June 1860 opened Bohemia to the victorious Prussians.

NÁCHTGAL, GUSTAV (1834-1885), German explorer in Central Africa, son of a Lutheran pastor, was born at Eichstedt in the Mark of Brandenburg, on the 23rd of February 1834. After medical study at the universities of Halle, Würzburg and Greifswald, he practised for a few years as a military surgeon. Finding the climate of his native country injurious to his health, he went to Algiers and Tunis, and took part, as a surgeon, in several expeditions into the interior of Africa, and in 1855 was sent thither as consul-general for the German empire, and remained there until 1884, when he was despatched by Prince Bismarck to West Africa as special commissioner, ostensibly to inquire into the condition of German commerce, but really to annex territories to the German flag. As the result of his mission Togoland and Cameroon were added to the German empire. On his return voyage he died at sea off Cape Palmas on the 20th of April 1885, and was buried at Grand Bassam.

Nachtigal's travels are summarized in Gustav Nachtigal's Reisen in der Sahara und im Sudan, by Dr Albert Frankel (Leipzig, 1887). A translation of the first volume of the work concerning Wadai, was published in the Bull. du comité de l'Afrique française for 1903 under the title of "Le Voyage de Nachtigal au Ouaddi." Nachtigal died before transcribing his notes on Wadai, and they were edited in the German edition by E. Groduck.

NÁDÁSY, TAMÁS I., Count, called the great palatine (1498-1562), Hungarian statesman, was the son of Francis I. Nádasy and was educated at Graz, Bologna and Rome. In 1521 he accompanied Cardinal Cajetan (whom the pope had sent to Hungary to preach a crusade against the Turks) to Buda as his interpreter. In 1525 he became a member of the council of state and was sent by King Louis II. to the diet of Spires to ask for help in the imminent Turkish war. During his absence the Mohács catastrophe took place, and Nádasy only returned to Hungary in time to escort the queen-widow from Komárom to Pressburg. He was sent to offer the Hungarian crown to the archduke Ferdinand, and on his coronation (Nov. 3rd, 1527) was made commandant of Buda. On the capture of Buda by Suleiman the Magnificent, Nádasy went over to John Zapolya. In 1530 he successfully defended Buda against the imperialists. In 1533 his jealousy of the dominant influence of Ludovic Gritti caused him to desert John for Ferdinand, to whom he afterwards remained faithful. He was endowed with enormous estates by the emperor, and from 1537 onwards became Ferdinand's secret but most influential counsellor. Subsequently, as ban of Croatia-Slavonia, he valiantly defended that border province against the Turks. He did his utmost to promote education, and the school which he founded at Új-Sziget, where he also set up a printing-press, received a warm eulogy from Philip Melanchthon. In 1540 Nádasy was appointed grand-justiciar; in 1547 he presided over the diet of Nagysombat, and finally, in 1559, was elected palatine by the diet of Pressburg. In his declining years he aided the heroic Miklós Zrínyi against the Turks.

See Mihály Horváth, The Life of Thomas Nádasy (Hung.) (Buda, 1873); The Nádasy, Family correspondence of Thomas Nádasy (Hung.) (Budapest, 1882). (R. N. B.)

NADEN, CONSTANCE CAROLINE WOODHILL (1858-1888), English author, was born at Edgbaston, on the 24th of January 1858, her father being an architect. Her mother died just after the child's birth, and Constance was brought up in the home of her grandfather. In 1871 she began to study physical science at Mason College, Birmingham. In 1881 she published Songs and Sonnets of Springtime; in 1887, A Modern Apostle, and other Poems. Her poems made such an impression on W. E. Gladstone that he included her, in an article in the Speaker, among the foremost English poetesses of the day. After her grandfather's death Miss Naden found herself rich, and she travelled in the East and then (1888) settled in London. She died on the 3rd of December 1889. After 1876 she had paid increasing attention to her friendship with her friend Dr Robert Lewins, and the two had formulated a system of their own, which they called "Hylo-Idealism." Her main ideas on the subject are contained in a posthumous volume of her essays (Induction and Deduction, 1890), edited by Dr Lewins.

NADIA, or NUDDEA, a district of British India, in the Presidency division of Bengal. The administrative headquarters are at Krishnagar. Area, 2793 sq. m.; pop. (1901) 7,667,401. It is a district of great rivers. Standing at the head of the Gangetic delta, its alluvial surface, though still liable to periodical inundation, has been raised by ancient deposits of silt sufficiently high to be permanent dry land. Along the entire north-eastern boundary flows the main stream of the Ganges or Padma, of which all the remaining rivers of the district are offshoots. The Bhagirathi on the eastern border, and the Jalangi and the Matabanga meandering through the centre of the district, are the chief of those offshoots, called distinctively the "Nadia rivers." But the whole surface of the country is interlaced with a network of minor streams, communicating with one another by side channels. All the rivers are navigable in the rainy season for boats of the largest burthen, but during the rest of the year they dwindle down to shallow streams, with dangerous sandbanks and bars. In former times the Nadia rivers afforded the regular means of communication between the upper valley of the Ganges and the seaboard; and much of the trade of the district still comes down to Calcutta by this route during the height of the rainy season. But the railways,
with the main stream of the Ganges and the Sundarbans route, now carry by far the larger portion of the traffic. Rice is the staple crop; but the district is not as a whole fertile, the soil being sandy and the methods of cultivation backward. It is traversed by the main line and also by several branches of the Eastern Bengal railway. The battlefield of Plassey was situated in this district, but the floods of the Bhágirathi have washed away part of it.

NADIA or NARADWP, an ancient capital of Bengal, was formerly situated on the east bank of the Bhágirathi, which has since changed its course. Pop. (1901) 10,886. It is celebrated for the sanctity and learning of its pundits, and as the birthplace of Chaitanya, the Valshnav reformer of the 16th century. Its Sanskrit schools, called tos, are well known and of ancient foundation.

NADIM [Abularrāj Mahommēd ibn Ṭsist ibn abide Ya'qūb un-Nadīm] (d. 902), of Bagdad, was the author of one of the most interesting works in Arabic literature, the Fihrist al-Ūlam ("the list of the books of all nations that were to be found in Arabic") with notices of the authors and other particulars. Aided down to 508 it is continued in the Leiden MS. places the death of the author eight years later. Of his life we know nothing. His work gives us a complete picture of the most active intellectual period of the Arabien empire. He traces the rise and growth of philology and belles-lettres, of theology, orthodox and heretical, of law and history, of mathematics and astronomy, of medicine and alchemy; he does not despise the histories of knights errant, the fables of Kalila and Dimna, the facetiae of the "boon companions," the works of magic and divination. But to us no part of his work is more interesting than his account of the beliefs of sects and peoples beyond Islam. Here, fortunately, still more than in other parts of his work, he goes beyond the functions of the mere cataloguer; he tells what he heard of China from a Christian missionary of Nejrān, of India from a description of its religion compiled for the Barmecide Yahya; his full account of the Sabians of Harran and of the doctrines of Mani are of the first importance for the historian of Asiatic religions.

NADIR [Arabic nadīr, "opposite to," used elliptically for naḍīr es-semt, "opposite to the zenith"], a term used in astronomy for the point in the heavens exactly opposite to the zenith, the zenith and nadir being the two poles of the horizon. It is thus used figuratively for the lowest depth of a person's spirits or the lowest point in a career.

NAEGELI, KARL WILHELM VON (1817-1891), Swiss botanist, was born on the 27th of March 1817 near Zurich. He studied botany under A. P. de Candolle at Geneva, and graduated with a botanical thesis at Zurich in 1840. His attention having been directed by M. J. Schleiden, then professor of botany at Jena, to the microscopical study of plants, he engaged more particularly in that branch of research. Soon after graduation he became Privat dozent and subsequently professor extraordinary, in the university of Zurich; in 1832 he was called to fill the chair of botany in the university of Freiburg-in-Breisgau; and in 1837 he was promoted to Munich, where he remained as professor until his death on the 11th of May 1891. Among his more important contributions to science were a series of papers in the Zeitschrift für wissenschaftliche Botanik (1844-1846); Die neuen Algensysteme (1847); Gattungen einzigeliger Algen (1849); Pflanzenphysiologische Untersuchungen (1855-1858), with C. E. Cramer; Beiträge zur wissenschaftlichen Botanik (1859-1868); a number of papers contributed to the Royal Bavarian Academy of Sciences, forming three volumes of Botanische Mitteilungen (1861-1881); and, finally, his volume, Mechanisch-physiologische Theorie der Abstammunglehre, published in 1884.

The more striking of his many and varied discoveries are embodied in the Zeitschr., f. wiss. Bot. In this we begin with Naegeli's extension to the vegetable kingdom of Schleiden's idea of the origin of the Cryptogams, and the assertion of its universal occurrence in plants, together with the recognition of its vesicular structure. There is much of Naegeli's investigation in the discovery of a thread-like cell-substance forming the wall of all normal cells, where he shows that it consists of granular "mucus," which, at an earlier stage, filled the cell-cavity, and which differs chemically from the cell-wall in that it is nitroso-vitriolic. This layer he proved to be never thrown from the protoplasm, and, in fact, itself the living part of the cell, a discovery which was simultaneously (1846) made by Hugo von Mohl (1805-1872), who gave to the living matter of the plant-body the name "protoplasm.

In connection with these discoveries, Naegeli contended for Schleiden's view of the universality of free-cell-formation as the mode of cell-multiplication, and showed that in the vegetative organs, at least, new cells are formed by division. In the Zeitschrift, too, is Naegeli's most important allogical work—such as the paper on Calystegia, which brought to light the remarkable unseparate structure of the Siphonae, and his research on Delesserie, which resulted in the discovery of growth by a single apical cell. This discovery led Naegeli on to the study of the growing-point in other plants. He consequently gave the first accurate account of the apical cell, and of the mode of growth of the stem in various Mosses and Liverworts. Subsequently he observed that in Lycopodium and in Angiospermas the growing-point has no apical cell, but consists of a small-celled meristem, in which the first differentiation of the permanent tissues can be traced. One of the most remarkable discoveries recorded in his works is that of Hainhainia mellea, an inhabitant of Arderea, and of Pilaquaria. The Beiträge zur wiss. Botanik consists almost entirely of researches into the anatomy of vascular plants, while the main feature of the Pflanzenphysiologische Untersuchungen is the work on the growth of the ferns and the structure of the various forms of starch-grains. The Botanische Mitteilungen include a number of papers in all departments of botany, many of them continuations and extensions of his earlier work. In his Theorie der Abstammungsgeschichte Naegeli introduced the idea of a definite material basis for heredity; the substance he termed "idiplasm." His theory of evolution is that the idiplasm of any one generation is not identical with that of either its progenitors or its progeny: it is always increasing in complexity, and the result that each successive generation marks an advance upon its predecessor. Hence variation takes place determinately, and in the higher direction only; but the affinity is not limited to the family, and it is often a matter of play, but a small part in evolution. Whereas, on the Darwinian theory, all organization is adaptive, according to Naegeli the development of higher organisation is the outcome of the spontaneous evolution of the idiplasm.

More detailed accounts of Naegeli's life and work are to be found in Nature, 16th October 1891, and in Proc. Roy. Soc., vol. lii. (S. H. V.)

NAESTVED, a town of Denmark, in the amt (county) of Præstø, near the S.W. coast of Zealand, 59 m. by rail S.W. of Copenhagen. Pop. (1901) 7167. From 1740 to the Reformation it was the mercantile centre of the northern part of the country, dependent upon the monastery of St Peter (founded here in 1135). North of the town (1½ m.) lies Herlufsholm, where Admiral Herluf Trolle founded a Latin school in 1567, still extant.

NAEVIIUS, GNAEUS (c. 264-7 104 B.C.), Latin epic poet and dramatist. There is great uncertainty in regard to his life. From the expression of Gellius (li. 24. 1) characterizing his epiphant as written in a vein of "Campanian arrogance" it has been inferred that he was born in one of the Latin communities settled in Campania. But the phrase "Campanian arrogance" seems to have been used proverbially for "gasconade" and; as, there was a plebeian tribune named Naevius of Rome in 296 B.C., it is even possible that he may have been a Roman citizen. He served either in the Roman army or among the socii in the first Punic War, and thus must have reached manhood before 241. His career as a dramatic author began with the exhibition of a drama in or about the year 235, and continued for thirty years. Towards the close he incurred the hostility of some of the nobility, especially, it is said, of the Metelli, by the attacks which he made upon them on the stage, and at their instance he was imprisoned (Plautus, Mil. Glor. 211). After writing two plays during his imprisonment, in which he is said to have apologized for his former rudeness (Gellius iii. 3. 19), he was liberated through the interference of the tribunes of the commons; but may still afterwards to retire from Rome (in or about 204) to Utica. It may have been during his exile, when withdrawn from his active career as a dramatist, that he composed or completed his
NAEVUS—NAGA HILLS

poem on the first Punic war. Probably his latest composition was the epigraph already referred to, written like the epic in Saturnian verse:

"Immortales mortales si foret fas flere,
Ferent divae Camenae Naevium poetam;
Itaque in pois credo divas Artis
Obliti sunt Romai loquere lingua Latina." 1

If these lines were dictated by a jealousy of the growing ascendency of Ennius, the life of Naevius must have been prolonged considerably beyond 204, the year in which Ennius began his career as an author in Rome. As distinguished from Livius Andronicus, Naevius was a native Italian, not a Greek; he was also an original writer, not a mere adapter or translator. If it was due to Livius that the forms of Latin literature were, from the first, moulded on those of Greek literature, it was due to Naevius that much of its spirit and substance was of native growth.

Like Livius, Naevius professed to adapt Greek tragedies and comedies to the Roman stage. Among the titles of his tragedies are Aegisthus, Lycus, Andromache or Hector Profectus, Equus Trojana. The poet was one continuous work, but was divided into nine books. The national cast of his genius and temper was shown by his deviating from his Greek originals, and producing at least twenty-five lines of verse, which is more artistic than a rude copy of them, as those of Livius probably were, or an artistic copy like those of Terence. The titles of most of them, like those of Plautus, and unlike those of Caecilius and Terence, are Latin, not Greek. He drew from the writers of the old political comedy of Athens, as well as from the new comedy of manners, and he attempted to make the stage at Rome, as it had been at Athens, an arena of political and personal warfare. A strong spirit of partisanship is recognized in more than one of the fragments; and this spirit is thoroughly popular and adverse to the senatorial ascendency which became more and more confirmed with the progress of the senatorial party, the distinction of his position as a member of the aristocracy, the great Scipio is the object of a censorious criticism on account of a youthful escapade attributed to him. Among the few lines still remaining from his lost comedies, we seem to recognize the presence of that virulence of manner and of expression characteristic of the style of Plautus. There is also found that love of alliteration which is a marked feature in all the older Latin poets down even to Lucetius. In one considerable comic fragment attributed to him—the description of a croquet—there is great truth and shrewdness of observation. But we find no trace of the exuberant comic power and originality of his great contemporaries.

He was not only the oldest native dramatist, but the first author of an epic poem (Bellum Punicum)—which, by combining the representation of actual contemporary history with a mythical background, may be said to have created the Roman type of epic poetry. The poem was one continuous work, but was divided into seven books by a grammarian of a later age. The earlier part of it treated of the mythical adventures of Aeneas in Sicily, Carthage and Egypt; the later part was founded from the interview of Zeus and Themis in the first book of the Iliad the idea of the interview of Jupiter and Venus; which Virgil has made one of the cardinal passages in the Aeneid. The later part treated of the events of the first Punic war in the style of the Iliad, with all the grandeur of composition and vivid imagination which the flow of the native Saturnian verse, in contradistinction to the weighty and complex structure of the hexameter, was naturally adapted.

The impression we get of the man is that, whether or not he actually enjoyed the full rights of Roman citizenship, he was a

1 If it were permitted that immortals should weep for mortals, the divine Camenae would weep for Naevius the poet; for since he hath passed into the treasure-house of death men have forgotten at Rome how to speak in the Latin tongue.
tribes on the North-West Frontier. Since 1892, however, little trouble has been experienced.

See Nagah Hills District Gazetteer (Calcutta, 1905).

NAGAR, formerly Bednur, a village and ruined city of Mysore, India; pop. (1901) 715. About 1675 the seat of government of the rajas of Keladi was transferred to this place. When taken by Hyder Ali in 1763, it is said to have yielded a plunder of twelve millions. In 1783 it surrendered to a British detachment under General CARTER, but being shortly after invested by Tippoo Sultan, the garrison capitulated on condition of safe conduct to the coast. Tippoo violated the stipulation, put General CARTER and the principal officers on board a prison, and imprisoned the remainder of the force.

NAGARJUNA, a celebrated Buddhist philosopher and writer. He is constantly quoted in the literature of the later schools of Buddhism, and a very large number of works in Sanskrit is attributed to him. None of these has been critically edited or translated; and there is much uncertainty as to the exact date of his career, and as to his opinions. The most probable date seems to be the early part of the 3rd century A.D. He seems to have been born in the south of India, and to have lived under the patronage of a king of southern Kosala, the modern Chattisgarh. Chinese and Tibetan authorities differ as to the name of this monarch; but it apparently is meant to represent an Indian name Sattavāhana, which is a dynastic title, not a personal name. Of the works he probably wrote one was a treatise advocating the Mahāyānaka views of which he is the reputed founder; another a long and poetical prose work on the stages of the Bodhisattva career; and a third a voluminous commentary on the Mahāprajñāpāramitā Sūtra. Chinese translators had the benefit of him, and to him special knowledge of herbs, of astrology, of alchemy and of medicine. Two medical treatises, one on prescriptions in general, the other on the treatment of eye-disease, are said, by Chinese writers, to be by him. Several poems of a didactic character are also ascribed to him. The best known of these poems is the Friendly Epistle addressed to King Udayana. A translation into English of a Tibetan version of this piece has been published by Dr. Wenzel.

NAGASAKI, a town on the south-west of the island of Kyushu, Japan, in 30° 44' N., 130° 51' E., with 163,324 (1905) inhabitants, and about 5,800,000 (1901) within its limits (including Chinese). The first port of entry for ships coming from the south or the west to Japan, it lies at the head of a beautiful inlet some 3 m. long, which forms a splendid anchorage, and is largely used by ships coming to coal and by warships. Marine products, coal and cotton goods are the chief exports, and raw cotton, iron, as well as other metals and materials used for shipbuilding, constitute the principal imports. The value of imports approaches £4,000,000 annually. That of exports has fluctuated considerably. In 1889 it was £1,000,307, but in 1894 it was only £4,448,389, and does not generally exceed £450,000. The most important industries of the town are represented by the engine works at Kakashima, the large docks and a patent slip, the property of the Mitsui Bishi Company. Steamers of over 6000 tons have been constructed at these docks, which, as well as the engine works, are situated on the western shore of the inlet. The brisk atmosphere of business that pervades them does not reach the town on the eastern side, which lies under the shadow of forests of tomstone that cover the over-looking hills. Nagasaki is noted as a coaling station. The coal is obtained chiefly from Takashima, an island 8 m. S.E. of the entrance to the harbour, and in lesser quantities from two other islets, Naka-no-shima and Ha-shima, which lie about 1 m. farther out. These sources of supply, however, show signs of exhaustion. There are several favourite resorts in the neighbourhood of Nagasaki, notably Unzen, with its sulphur springs.

Nagasaki owed its earliest importance to foreign intercourse. Originally called Fukae-no-ura (Fukae Bay), it was included in the fief of Nagasaki Kotaro in the 12th century, and from him it took its name. But it remained an insignificant village until the 16th century, when, becoming the headquarters of Japanese Christianity, and subsequently the sole emporium of foreign trade in the hands of the Dutch and the Chinese, it developed considerable prosperity. The opening of the port of Mojiki for commerce destroyed Nagasaki of its monopoly as a coaling station, and the visits of war vessels to the port of Nanking acquired Port Arthur, Great Britain Wei-hai-wei and Germany Kiaochow. On the north side of the channel by which the harbour is entered there stands a cliff called Taksaboko, which, under the name of Pappenberg, has long been rendered notorious by a tradition that thousands of Christians were precipitated from it in the 17th century because they refused to trample on the Cross. It has been conclusively proved that the legend is untrue.

NAGAUR or NAGORE, a town in India, in Jodhpur state of Rajputana, with a station on the Jodhpur-Bikaner railway. Pop. (1901) 13,372. Nagaur is surrounded by a wall more than 4 m. in circuit. It has given its name to a famous breed of cattle.

NÄGELSCHACH, Carl Friedrich (1806-1859), German classical scholar, was born at Währing near Nuremberg on the 28th of March 1806. After studying at Erlangen and Berlin, he accepted in 1827 an appointment at the Nuremberg gymnasium, and was professor of classics at Erlangen from 1842 till his death on the 21st of April 1859. Nägelsbach is chiefly known for his excellent Lateinische Stilistik (1846; 9th ed. by Ivan Müller, 1905). Two other important works by him are Die Homeriche Theologie (1849; 3rd ed. by G. Autenrieth, 1886) and Die Nachhomeriche Theologie (1857).

See J. L. Doelscher, Gedächtnissrede für Herrn K. F. Nägelsbach (1890); article by G. Autenrieth in Allgemeine Deutsche Biographie, xxiii. (1886).

NAGINA, a town of British India, in Bijnor district of the United Provinces, on the Oudh & Rohilkhand railway, 48 m. N.W. of Moradabad. Pop. (1901) 21,412. There is considerable trade in sugar, besides manufactures of guns, glassware (especially bottles for the use of pilgrims carrying the sacred water of the Ganges from Hardwar), ebony wares, hemp-sacking and cotton cloth.

NAGODE, a native state of Central India, in the Baghelkhand agency. Area, 501 sq. m. Pop. (1901) 67,092, showing a decrease of 20% in the decade, due to famine; estimated revenue, £11,000. The chief, whose title is raja, is a Rajput of the Parhar clan. The town of Nagode is 17 m. W. of the British station of Sutna. Pop. (1901) 3887. It was formerly a military cantonment, and has an Anglo-vernacular school and dispensary. The former capital (until 1720) was Unchhara.

NAGOYA, the capital of the province of Owari, Japan, on the great trunk railway of Japan, 235 m. from Tokyo and 44 m. from Kioto. Pop. (1903) 284,829. It is the fifth of the chief cities in Japan. It lies near the head of the shallow Isenumi Bay, about 30 m. from the port of Yokkaichi, with which it communicates by light-draught steamers and by rail. The castle of Nagoya, erected in 1610, never suffered in war, but in modern times became a military depot; the interior contains much splendid decoration. The tower-like building of the castle is a remarkable structure, covering close upon half an acre, but rapidly diminishing in each of its five storeys till the top room is only about 12 yds. square. Gabled roofs and hanging rafters break the almost pyramidal outline; and a pair of gold-plated dolphins 8 ft. high form a striking finial. Both were removed in 1872, and one of them was at the Vienna Exhibition in 1873; but they have been restored to their proper site. The religious buildings of Nagoya include a very fine Buddhist temple, Higashi Hongwanji. Nagoya is well known as one of the great seats of the pottery trade; 173 m. distant are the potteries of Seto, where the first glazed pottery made in Japan was produced by Kato Shoshin, after whom is named the town of Shoshin, in 1729. From Kato's time Seto continued, during several centuries, to be the chief centre of ceramic production in Japan, the manufacture of porcelain being added to that of pottery in the 19th century. All the
NAGPUR—NAGY-VÁRAD

products of the flourishing industry now carried on there and at other places in the province are transported to Nagoya, for sale there or for export. Cotton mills have been established, and an extensive business is carried on in the embroidery of handkerchiefs. Another of its celebrated manufactures is arimatsu-shibori, or textile fabrics (silk or cotton), dyed so as to show spots in relief from which the colour radiates. It is further distinguished as the birthplace of dei sonnete enamelling in Japan, all work of that nature before 1385—when a new departure was made by Kaji Tsunekichi—having been for purposes of subordination and decoration. Quantities of dei sonnete enamels are now produced in the town.

NAGPUR, a city, district and division of British India, in the Central Provinces. The city is 1125 ft. above the sea; railway station, 520 m. E. of Bombay. Pop. (1901) 127,734. The town is well laid out, with several parks and artificial lakes, and has numerous Hindu temples. The prettily wooded suburb of Sitabdi contains the chief government buildings, the houses of Europeans, the railway station and the cantonments, with fort and arsenal. In the centre stands Sitabudi Hill, crowned by the fort. Beyond the station lies the broad sheet of water known as the Jama Talao, and farther south, within the city, completely hides the fortified town of Hamira. Handsome tanks and gardens constructed by the Mahrratta princes, lie outside the city. The palace, built of black basalt and profusely ornamented with wood-carving, was burnt down in 1864, and only the great gateway remains. The garrison consists of detachments of European and native infantry from Khandi. Nagpur is the headquarters of two corps of rifle volunteers. It is the junction of two important railway systems—the Great Indian Peninsula to Bombay and the Bengal-Nagpur to Calcutta. The large weaving population maintains their reputation for producing fine fabrics. There are steam cotton mills and machinery for ginning and pressing cotton. The town contains an important printing establishment and Education provided by two aided colleges—the Hislop and the Morris, called after a missionary and a former chief commissioner; four high schools; a law school; an agricultural school, with a class for the scientific training of teachers; a normal school; a zenna mission for the management of girls' schools; an Anglican and two Catholic schools for Europeans. There are several libraries and reading rooms, and an active Anjuman or Mohommedan society.

The District of Nagpur has an area of 384 sq. m. Pop. (1901) 751,844. It lies immediately below the great tableland of the Sâtpura range. A second line of hills shuts in the district on the south-west, and a third runs from north to south, paring the country into two plains of unequal size. These plains are all of the basaltic Sâtpuras, and nowhere attain any great elevation. Their heights are rocky and sterile, but the valleys and low lands yield rich crops of corn and garden produce. The western plain slopes down to the river Wardhâ, is watered by the Jam and Madâr, tributaries of the Wardhâ, and contains the most highly-tilled land in the district, abounding in fruit trees and the richest garden cultivation. The eastern plain (six times the larger), stretching away to the confines of Bhandâra and Chânda, consists of a rich undulating country, luxuriant with mango groves and dotted towards the east with countless small tanks. It is watered by the Kanhàn, with its tributaries, which flows into the Waimangâ beyond the district. The principal crops are millets, wheat, oil-seeds and cotton. There are steam factories for ginning and pressing cotton at the military cantonment of Kâmpi, which was formerly the chief centre of trades. An important new industry is manganese mining. The district is traversed by two lines of railway which meet at Nagpur city, and several branches are under construction.

The Division of Nagpur comprises the five districts of Nagpur, Bhandâra, Chânda, Wardhâ and Balaghat. Area, 23,521 sq. m. Pop. (1901) 3,728,653, showing a decrease of 9% in the decade. See NAGPUR District Gazetteer (Bombay, 1908).

NAGYKÁNIZSA, a town of Hungary, in the county of Zala, 137 m. S.W. of Budapest by rail. Pop. (1900) 25,255. It possesses distilleries and brick-making factories, and has trade in cereals and cattle. Nagykániizza once ranked as the second fortress of Hungary, and consequently played an important part during the wars with the Turks, who, having gained possession of it in 1600, held it until, in 1690, after a siege of two years, it was recovered by the Austrian and Hungarian forces. In 1702 the fortifications were destroyed.

NAGYKIKINDA, a town of Hungary, in the county of Torontál, 132 m. S.E. of Budapest by rail. Pop. (1900) 24,543, of which about 60% are Servians. Being one of the centres of production of the famous wheat of the Banat, its flour industry is important. Fruit-farming and cattle-rearing are extensively carried on in the neighbourhood.

NAGYSZEZEBEN (Ger. Hermannstadt, Rumanian Sibiul), a town of Hungary, in Transylvania, the capital of the county of Szeben, 122 m. S.S.E. of Kolozsvár by rail. Pop. (1900) 26,077, of whom 16,141 were Saxons (Germans), 7106 Rumanians, and 5747 Magyars. It is beautifully situated at an altitude of 1411 ft. in the fertile valley of the Cibin (Hungarian, Szeben), encircled on all sides by the Transylvanian Alps. It is the seat of a Greek Orthodox (Rumanian) archbishop, and of the superintendent of the Protocentist for the Transylvanian circle. Some parts of Nagyszeben have a picturesque appearance, with houses hidden in the old German style. The most notable public buildings is the handsome Protestant church, begun in the 14th century and finished 1520, in the Gothic style, containing a beautiful cup-shaped font, cast by Melzer Leonhardus in 1438, and a large mural painting of the Crucifixion by Johannes von Rosenau (1445). In the so-called New Church, comprising the west part of the whole building, which is an addition of the 16th century, are many beautiful memorials of Saxon notables. Other buildings are: the Roman Catholic parish church, founded in 1726; the church of the Ursuline nuns, built in 1474; the town hall, an imposing building of the 15th century, purchased by the municipality in 1545 and containing the archives of the "Saxon nation." The Brukenthal palace, built in 1777-1779 by Baron Samuel von Brukenthal (1727-1803), governor of Transylvania, contains an interesting picture-gallery with good examples of the Dutch school, and a library. The museum contains a natural history section with the complete fauna and flora of Transylvania, and a rich ethnographical section. Nagyszoben has a law academy, a seminary for Greek Orthodox priests, a military academy and several secondary schools. There are manufactures of cloth, linen, leather, caps, boots, soap, candles, ropes, as well as breweries and distilleries.

The German name of the town is traceable to Hermann, a citizen of Nuremberg, who about the middle of the 12th century established a colony on the spot. In the 13th century it bore the name of Villa Hermanni. Under the last monarchs of the native Magyar dynasty Hermannstadt enjoyed exceptional privileges, and its commerce with the East rose to importance. In the course of the 15th and 16th centuries it was several times besieged by the Turks. At the beginning of 1849 it was the scene of several engagements between the Austrians and Hungarians; and later in the year it was several times taken and retaken by the Russians and Hungarians.

NAGYZOMBAT (Ger. Tyrau), a town of Hungary, in the county of Pozsony, 115 m. N.W. of Budapest by rail. Pop. (1900) 12,422. It is situated on the Tnava, and has played an important rôle in the ecclesiastical history of Hungary. It gained prominence after 1543, when the archbishop of Esztergom and primate of Hungary made it his residence after the capture of Esztergom by the Turks. In consequence numerous churches and convents were built, and the town acquired the title of "Little Rome." It possesses a Roman Catholic seminary for priests, and was the seat of a university founded in 1635, which was transferred to Budapest in 1777. In 1820 the archbishop's residence was again removed to Esztergom. It has an active trade in cereals and cattle.

NAGY-VÁRAD (Ger. Grosswardein), a town of Hungary, capital of the county of Bihar, 153 m. E.S.E. of Budapest by rail. Pop. (1900) 47,018. It is situated in a plain on both banks of the river Szebes-kó, and is the seat of a Roman Catholic
and of a Greek (Old-United) bishopric. Among its principal buildings are the St Ladislaus parish church, built in 1733, which contains the remains of the king St Ladislaus (d. 1055), the Roman Catholic cathedral, built in 1752-1770, the Greek cathedral, the large palace of the Roman Catholic bishop, built in 1778 in the rococo style, the archaeological and historical museum, with an interesting collection of ecclesiastical art, and the county and town hall. Among the educational establishments are a law academy, a seminary for priests, a modern school, a Roman Catholic and a Calvinistic gymnasium, a commercial academy, a training school for teachers and a secondary school for girls. Nagy-Várád is an important railway junction; it possesses extensive manufactures of pottery and large distilleries, and carries on a brisk trade in agricultural produce, cattle, horses, fruit and wine. About 8 m. S. of the town is the village of Hajó, which contains the Püspök Fürdô or Bishop's Baths, with warm saline and sulphurous waters (92° to 105°F.), used both for drinking and bathing in cases of anaemia and scrofula.

Nagy-Várád is one of the oldest towns in Hungary. Its bishopric was founded by St Ladislaus in 1080. The town was destroyed by the Tatares in 1241. Peace was concluded here on the 24th of February 1358 between Ferdinand I. of Austria and his rival John Zápolya, voivode of Transylvania. In 1556 it passed into the possession of Transylvania, but afterwards reverted to Austria. In 1598 the fortress was unsuccessfully besieged by the Turks, but it fell into their hands in 1660 and was recovered by the Austrians in 1692. The Greek Old-United or Catholic bishopric was founded in 1776.

NAHE, a river of Germany, a left-bank tributary of the Rhine, rises near Selbach in the Oldenburg principality of Birkenfeld. For some distance it forms the boundary between the Bavarian Palatinate and the Prussian Rhine Province, and it falls into the Rhine at Bingen. Its length is 78 m., but it is too shallow and rocky to be navigable. Its picturesque valley, through which runs the railway from Bingerbrück to Neunkirchen, is largely visited by tourists.

See Schneegans, Geschichte des Nahetals (Kreuznach, 1890).

NAHUATLAN STOCK, a North and Central American Indian stock. Nahua or Nahuatlacaz was the collective name for the dominant Indian peoples of Mexico at the time of the Spanish conquest, and the Nahuatl stock consisted of the Nahua (or Aztecs) and a few scattered tribes in Central America.

NAHUM (Hebrew for "rich in comfort [is God]"), an Old Testament Book (after the book of Nahum in Nehemiah vii. 7 it is a scholiastic error for "Rehum.") Of the prophet himself all that is known is the statement of the title that he was an Elkoshite. But the locality denoted by the designation is quite uncertain. Later tradition associated Nahum with the region of Nineveh, against which he prophesied, and hence his tomb has been located at a place bearing the name of Alkush near Mosul (anc. Ninweh) and is still shown. According to Jerome, the prophet was a native of a village in Gallisce, which bore the name of Elkési in the 4th century A.D. (the Gallisean town of Capernaum, which probably means "village of Nahum,") may also point in the same direction; but cf. John vii. 27, who implies that in the time of Christ no prophet was supposed to have come out of Galilee. E. Nestle has proposed to locate Elkési "beyond Betogabra" (i.e. Eleutheropolis, mod. Beit Jibrin) in the tribe of Simeon (cf. Pal. Expl. Fund Quart. Statement, 1870, pp. 136-138).

BOOK OF NAHUM.—The original heading of Nahum's prophecy is contained in the second part of the superscription: "The book of the vision of Nahum the Elkoshite" (cf. the similar headings in Isaiah, Obadiah and Habakkuk). The first part: ("Oracle concerning Nineveh") is a late editorial insertion, but correctly describes the main contents of the little book.

Contents of the Book. (1) Chapters i. and ii.—The prophecy against Nineveh in its present form really begins with chap. ii. 1, followed immediately by ii. 2, and runs into iii. 1. vizi. (a) ii. 1, 3-10; (b) ii. 11-13; and (c) iii. Here (a) describes in language of considerable descriptive power the assault on Nineveh—

1 Jonah's grave has been located similarly in Nineveh itself.
NAIL VIOLIN—NAIRNE

the method of manufacture nails fall into four principal classes: (1) hand-wrought nails; (2) machine-wrought and cut nails; (3) wire or French nails; and (4) cast nails.

The nailer handicraft was formerly a great industry in the country around Birmingham. The nails are forged from nail-rods heated in a small smith's hearth, hammered on an anvil, the nail length cut off on a chisel and the head formed by dropping the spike into a hole in a "bolster" of steel, from which enough of the spike is left projecting to form the head. In the case of chisel nails the head is formed with two strokes of the hammer, while rose nails require four. The heads of the larger-sized nails are made with an "oilier" or mechanical hammer, and for ornamental or stamped heads "swages" or dies are employed. The conditions of life and labour among the hand nailers in England were exceedingly unsatisfactory: married women and young children of both sexes working long hours in small filthy sheds attached to their dwellings; their employment was controlled by middle-men or nail-masters, who supplied them with the nail-rods and paid for work done, sometimes in money and sometimes in kind on the truck system. Machine-wrought and cut nails have supplanted most corresponding kinds of hand-made nails. Horse nails are still made by strides made against its upper portion of the usual charcal iron, hammered out to a sharp point. They must be tough and homogeneous throughout, so that there may be no danger of their breaking over and leaving portions in the hoof.

In 1617 Sir D. Bulmer devised a machine for cutting nail-rods, and in 1700 T. Clifford patented a device for shaping the rods, but the credit of perfecting machine mainly belongs to American enterprise (the first American patent appears to be that of Ezekiel Reed, dated 1786). The machine, fed with heated (to black heat only) strips of metal, usually mild steel, having a breadth and thickness sufficient for the nail to be made, shears off by its slicer the "nail blank," which, falling down, is firmly clutched at the neck till a heading die strikes against its upper end and forms the head, the completed nail passing out through an inclined shoot. In large nails the taper of the shank and point is secured by the sectional form to which the strips are rolled; brads, sprgs and small nails, on the other hand, are cut from uniform strips in an angular direction from head to point, the strip being turned over after each blank is cut so that the points and heads are taken from opposite sides alternately, and a uniform taper on two opposite sides of the nail, from head to point, is secured. The machines turn out nails with wonderful rapidity, varying with the size of the nails produced from about 100 to 1000 per minute. Wire or French nails are made from round wire, which is unwound, straightened, cut into lengths and headed by a machine either by intermittent blows or by pressure, but the pointing is accomplished by the pressure of dies. Cast nails, which are cast in sand moulds by the ordinary process, are used principally for horticultural purposes, and the hobs-nails or tacks of shoemakers are also cast.

See Peter Barlow, Encyclopaedia of Arts, Manufactures and Machinery (1848); Bucknall Smith, Wire, Its Manufacture and Uses (New York, 1851).

NAIL VIOLIN (Ger. Nagelgeige, Nagelharmonica), a musical curiosity invented by Johann Wilde, a musician in the imperial orchestra at St. Petersburg. The nail violin or harmonica consists of a wooden soundboard about 14 ft. long and 1 ft. wide hinged into a semicircle. In this soundboard are fixed a number of iron or brass nails of different lengths, tuned to give a chromatic scale. Sound is produced by friction with a strong bow, strung with black horsehair. An improved instrument, now in the collection of the Hochschule in Berlin, has two half-moon sound-chests of different sizes, one on the top of the other, forming terraces. In the rounded wall of the upper sound-chest are two rows of iron staples, the upper giving the diatonic scale, and the lower the intermediate chromatic semitones. History records the name of a single virtuoso on this instrument, which has a sweet bell-like tone but limited technical possibilities; he was a Bohemian musician called Sena'l, who travelled all over Germany with his instrument about 1780-1790.

NAINI TAL, a town and district of British India, in the Kumaon division of the United Provinces. The town is 6400 ft. above sea-level. Pop. (1901) 7000. Naini Tal is a popular sanatorium for the residents in the plains, and the summer headquarters of the government of the province. It is situated on a lake, surrounded by high mountains, and is subject to landslides; a serious catastrophe of this kind occurred in September 1880. The approach from the plains is by the Rohilkhand and Kumaon railway from Bareilly, which has its terminus at Kathgodam, 22 m. distant by cart road. There are several European schools, besides barracks and convalescent depot for European soldiers.

The District of Naini Tal comprises the lower hills of Kumaon and the adjoining Tarar or submontane strip. Area, 2677 sq. m. Pop. (1901) 311,237, showing a decrease of 15.4% in the decade. The district includes the Gagar and other foothills of the Himalayas, which reach an extreme height of nearly 9000 ft. The Bahbar tract at their base consists of boulders from the mountains, among which the hill streams are swallowed up. Forests cover vast tracts of the hill-country and the Bahbar. Beyond this is the Tarai, moist and extremely unhealthy. Here the principal crops are rice and wheat. In the hills a small amount of tea is grown, and a considerable quantity of fruit. The only railway is the line to Kathgodam.

See Naini Tal District Gazetteer (Allahabad, 1904).

NAIRN, a royal, municipal and police burgh and county town of Nairnshire, Scotland. Pop. of the royal burgh (1901) 5089. It is situated on the Moray Firth, at the mouth of the Nairn and on its left bank, 151 m. N.E. of Inverness by the Highland railway. The town, though of immemorial age, shows no signs of its antiquity, being bright, neat and modern. It attracts many summer visitors by its good sea bathing and excellent golf-course. The industries include salmon fishing, deep-sea fishing, the making of rope and twine and the freestone quarries of the neighbourhood. There is a commodious harbour with warehouses and piers. Nairn has also a group of parliamentary burghs (Forres, Fortrose, Inverness and Nairn). Nairn was originally called Invermarne (the mouth of the Nairn). It was made a royal burgh by Alexander I. (d. 1124), but this charter having been lost it was confirmed by James VI. in 1580.

NAIRNE, CAROLINA, BARONNESS (1766-1845), Scottish song writer, was born in the "auld hoose" of Gask, Perthshire, on the 16th of August 1766. She was descended from an old family which had settled in Perthshire in the 13th century, and could boast of kinship with the royal race of Scotland. Her father, Laurence Oliphant, was one of the foremost supporters of the Jacobite cause, and she was named Carolina in memory of Prince Charles Edward. In the schoolroom she was known as "pretty Miss Car," and afterwards her striking beauty and pleasing manners earned for her the name of the "Flower of Strathearn." In 1806 she married W. M. Nairne, who became Baron Nairne (see below) in 1824. Following the example set by Burns in the Scots Musical Museum, she undertook to bring out a collection of national airs set to appropriate words. To the collection she contributed a large number of original songs, adopting the signature "B. B."—"Mrs Bogan of Bogan." The music was edited by R. A. Smith, and the collection was published at Edinburgh under the name of the Scottish Minstrel (1821-1824). After her husband's death in 1830 Lady Nairne took up her residence at Enniskerry, Co. Wicklow, but she spent much time abroad. She died at Gask on the 26th of October 1845.

Her songs may be classed under three heads: (1) those illustrative of the characters and manners of the old Scottish gentry, such as "The Laird o' Cockpen," "The Fife Laird," and "John Tod"; (2) Jacobite songs, composed for the most part to gratify her kinsman Robertson, the aged chief of Strowan, among the best known of which are perhaps "Wha 'll be King but Charlie!" "Charlie is my darling," "The Hundred Pipers," "He's owre the Hills," and "Bonnie Charlie's noo awa;" and (3) songs not included under the above heads, ranging over a variety of subjects from " Caller Herrin" to the "Land o' the
Nairnshire—Nairobi 155

Leal." For vivacity, genuine pathos and bright wit her songs are surpassed only by those of Burns. Lady Nairne's husband, William Murray Nairne (1737-1830). He was descended from Sir Robert Nairne of Strathord (c. 1630-1683), a supporter of Charles II., who was created Baron Nairne in 1681. After his death without issue the barony passed to his brother and William Murray (c. 1655-1750), the husband of his only daughter Margaret (1669-1747) and a younger son of John Murray, 1st marquess of Athole. William, who took the name of Nairne and became 2nd Baron Nairne, joined the standard of the Jacobites in 1715; he was taken prisoner at the battle of Preston and was sentenced to death. He was, however, paroloned, but his title was forfeited. His son John (c. 1691-1770), who but for this forfeiture would have been the 3rd Baron Nairne, was also taken prisoner at Preston, but he was soon set at liberty. In the rising of 1745 he was one of the Jacobite leaders, being present at the battles of Prestonpans, of Falkirk and of Culloden, and consequently he was attainted in 1746; but escaped to France. His son John (d. 1782) was the father of William Murray Nairne, who, being restored to the barony of Nairne in 1824, became the 5th baron. The male line became extinct when his son William, the 6th baron (1808-1837), died unmarried. The next heir was a cousin, Margaret, Baroness Keith of Stonehaven Marischal (1788-1867), wife of Auguste Charles Joseph, comte de Flahaut de la Billarderie, but she did not claim the title. In 1874, however, the right of her daughter, the wife of the 4th marquess of Lansdowne, was allowed by the House of Lords.

For Lady Nairne's songs, see Lay's from Strathearn, arranged with Symphonies and Accompaniments for the Pianoforte by Finlay Dun (1845); vol. i. of the Modern Scottish Minstrel (1857); Life and Songs of the Baroness Nairne, with a Memoir and Poems of Caroline Oliphant the Younger, edited by Charles Rogers (1860, new ed. 1890); also T. L. Kington-Ohlphant, Jacobite Lairs of Gaid (1870).

NAIRNSHIRE, a northern-eastern county of Scotland, bounded W. and S. by Inverness-shire, E. by Elginshire and N. by the Moray Firth. It has an area of 163,429 acres or 161-6 sq. m., and a coast line of 9 m. and is the fourth smallest county in Scotland. The seaboard, which is skirted by sandbanks dangerous to navigation, is lined by low dunes extending into Elginshire. Parallel with the coast there is a deposit of sand and gravel about 6 ft. thick, stretching inland for 2 miles. The undulating plain behind are a continuation westward of the fertile Laigh Moray. From this region southward the land rises rapidly to the confines of Inverness-shire, where the chief heights occur. Several of these border hills exceed 2000 ft. in altitude, the highest being Carn Glas (2162 ft.). The only rivers of importance are the Findhorn and the Nairn, both rising in Inverness-shire, the Findhorn after it leaves that county takes a mainly north-easterly direction down Strathearn for 17 m. and enters the sea to the north of Forres in Elginshire after a total course of 70 m. The Nairn, shortly after issuing from Strathnairn, flows towards the N.E. for 12 m. out of its complete course of 38 m. and falls into the Moray Firth at the county town. There are eight lochs, all small, but the loch of Clans is of particular interest because of its examples of crannogs, or lake-dwellings. Nairnshire contains many beautiful woods and much picturesque and romantic scenery.

Geology.—The county is divided geologically into two clearly-marked portions. The southern and larger portion is composed of the eastern, Dalradian or younger Highland schists with associated granite masses; this forms all the higher ground of the county. The northern part of the county bordering Moray Firth is occupied by Old Red Sandstone. The schistose rocks are mainly thin bedded mica-schists, greenstone and slate, and beds of Dallaichyle and Creag an Dainn a more massive higher horizon appears in the form of a synclinal fold. Porphyritic gneiss is found on the flanks of Carn nan tri-tighenan. The schists are frequently intersected by dikes of granite, amphibolite, and greenstone. The granite has been found penetrating the schists; the largest lies on the eastern boundary and extends from about Lethen Bar Hill southward by Ardclach and Glenfearsness to the Bridge of Dulsie. The second mass on the opposite side of the county belongs mainly to Inverness but the granite reaches into Nairn on the slopes of Bein nan Creagan and Ben Buide Mhor. A smaller mass near Rait Castle, with large pink crystals of orthoclase, has been employed as a building stone. One of the alleged sources of the schists of the Old Red Sandstone is the mediaeval castle of Nairn, and the supposed Granito de la Kylt is the name given to a deposit and formerly doubtless covered most of the county; outlying patches still remain near Drynanach Lodge and near Highland Boath in Muckie Burn. The Lower Old Red rocks are covered by a deposit of sands and gravels, followed by an outcrop of gravels and sands, followed by an Upper Boulder Clay, above which comes a series of gravel deposits forming ridges on the moorland between the Nairn and Findhorn rivers. A fine kame, resting on the deposits of sands and gravels, lies between Muckle Kiln and Loch Fleming, south of the railway. Traces of the old marine terraces at 100 ft., 50 ft. and 25 ft. are found near the coast, as well as considerable accumulations of blown sand.

Climate and Industries. The climate is moderate and equable. The temperature for the year averages 47° F., for January 38° F., and for July, 58° F. The mean annual rainfall is 25 in. The soil of the alluvial plain, or Laigh, is light and porous and careful cultivation has rendered it very fertile; and there is some rich land on the Findhorn. Although the most advanced methods of agriculture are in use, but a small proportion of the surface is capable of tillage, only one-fifth of the whole area being under crops. The hills are mostly covered with heath and pastures, suitable for sheep, and cattle are kept on the lower lying ground. The county enjoys many facilities for sport. A few distilleries, some sandstone and granite quarries and lime-kilns, and sawmills and sawyards are the industries of the shire, apart from agriculture. The Highland Railway from Forres to Inverness crosses the north of the shire.

Population and Government.—In 1891 the population numbered 91,181, of whom 15,901 persons were returned for the county town of Nairn (pop. 5089), there are the parishes of Ardciach (pop. 772), and Auldearn (pop. parish 1292, of village 313). Nairn and Elgin shires combine to return one member to parliament, and the county town belongs to the Inverness district group of parliamentary burghs (Forres, Fortrose, Inverness and Nairn). The shire forms a sheriffdom with Inverness and Elgin and a sheriff-substitute sits alternately at Nairn and Elgin.

History.—The country was originally possessed by the Gaelic or northern Picts. Stone circles believed to have been raised by them are found at Moyness, Auldearn, Urchany, Ballinravit, Dalcross and Croy, the valley of the Nairn being especially rich in such relics. To the north of Dulsie Bridge is a monolith called the Princess Stone. A greater number of the mysterious prehistoric stones with cup-markings occur in Nairn than anywhere else in Scotland. Mote hills are also common. Whether there was any effective Roman occupation of the land so far north is an open question, but there is little evidence of it in Nairn, beyond the occasional finding of Roman coins. Columba and his successors made valiant efforts to Christianize the Picts, and large numbers of Northmen who settled here in the long by are doubtless the saint's name was preserved late in the 10th century at the annual fair at Auldearn called "St. Colm's Market," while his biographer Adamnan—corrupted into Evan or Wean—was dedicated the church at Cawdor, where an old Celtic bell also bears this name. By the dawn of the 16th century the Picts had been subdued with the help of the Norsemen, and Nairn, which was one of the districts colonized by the Scandinavians, as part of the ancient province of Moray, soon afterwards became an integral portion of the kingdom of Scotland. Macbeth was one of the kings that Moray gave to Scotland, and his name and memory survive to the present day. Hardmuir, between Brodie and Nairn, is the reputed heath where Maccbeth met the witches. In the 13th century Moray possessed a bishopric and thenceforward the history of Nairn merges in the main that of the bishopric and earldom of Moray (see ELGON). The thane of Cawdor was constable of the king's castle at Nairn, and when the heritable sheriffdom was established towards the close of the 14th century this office was also filled by the thane of the time.

Nairobi, capital of the British East Africa protectorate and of the province of Ukamba, 327 m. by rail N.W. of Mombasa and 257 m. S.E. of Port Florence on Victoria Nyanza. Pop.
NAJIBABAD, a town of British India, in the Bijnor district of the United Provinces, 31 m. S.E. of Hardwar. Pop. (1901) 19,568. It was founded in the middle of the 18th century by a Rohilla chief, and still contains several architectural monuments of Rohilla magnificence. It has a station on the Oudh & Rohilkhand railway, with a junction for the branch to Kotdwara. There is considerable trade in timber, sugar and grain, and manufactures of metal-ware, shoes, blankets and cotton cloth.

NAKCHEVAN, or NAKCHEVAR, a city of Russian Armenia, in the government of Erivan, 85 m. S.E. of the town of Erivan. It is situated on the brow of a spur of the Kara-baghi mountains, 2040 ft. above the sea, and looks out over the valley of the Aras. Pop. (1863) 6251, (1897) 8845. Built and rebuilt again and again, Nakchichevan is full of half-obiterated evidences of former prosperity. The present houses have for the most part been quarried from ancient ruins; of the palace of the princes of Azerbaijan there remains a gateway with a Persian inscription, flanked by two brick towers; and at a little distance stands the so-called Tower of the Khans, a richly decorated twelve-sided structure, 102 ft. in circumference and 75 ft. in height, dating, to judge by the inscription which runs around the cornice, from the 12th century. There are also ruins of a large mosque, erected on the height of Tabriz and bearing the name of a Persian governor; and there is a large transit trade. In the Persian period the city is said to have had 40,000 inhabitants; the population now consists chiefly of Tatars and Armenians, who carry on gardening, make wine and produce silk, salt and milkstoves.

Armenian tradition claims Noah as the founder of Nakchichevan (the Naxwana of Ptolomy), and a mound of earth in the city is still visited by many pilgrims as his grave. Laid waste by the Persians in the 14th century, Nakchichevan sank into comparative insignificance, but by the 16th century it had recovered its prosperity. In 1646 it was taken by Alp Arslan, sultan of the Seljuk Turks, and in the 17th century it fell a prey to the Mongols of Jenghiz Khan. It afterwards suffered frequently during the wars between the Persians, Armenians and Turks, and it finally passed into Russian possession by the peace of Turkman-chai in 1828.

NAKCHEVAN-ON-THE-DON, a town of southern Russia, in the Don Cossacks territory, 6 m. by rail N.E. of the town of Rostov and on the right bank of the Don. Pop. (1897) 30,885. It was founded in 1780 by Armenian immigrants. It soon became a wealthy place, and still is the administrative centre of the "Armenian district," a narrow strip along the banks of the Don, with a population of 27,730. The town has tobacco and wadding factories, tallow-melting works, soap-works, brickworks and tanneries. There is a large trade in cereals and timber.

NAKHON SRI TAMMARAT (also known as LAKHON and formerly as Ligor), a town of southern Siam, in the division of the same name, about 380 m. S. of Bangkok, on the east coast of the Malay Peninsula. It is one of the most ancient cities of Siam, and contains many buildings and ruins of antiquarian interest. The trade consists chiefly of the export of rice. In the bay, a short distance off, ships can lie safely at all seasons. The population (7000) is chiefly Siamese, but there is an admixture of Burmese, the descendants of prisoners of war and of refugees from Tenasserim. The town is the headquarters of a governor under the high commissioner at Singora. It has for long been a centre of the American Presbyterian Mission to Siam. It was once the capital of a feudatory state, the chief of which ruled the greater part of the Malay Peninsula in the name of the kings of Siam and bore the brunt of all the wars with Malacca and other Malay states. It lies, however, north of the limit of Malay expansion, and has never at any time come under Malay rule. With the fall of the Siamese capital of Ayuthia in 1767 it became independent, but returned to its allegiance on the founding of Bangkok. In the 17th century British, Portuguese and Dutch merchants had factories here and carried on an extensive trade.

NAKSKOV, a seaport of Denmark, in the amt (county) of Maribo, on a wide bay of the Laalands belt at the west end of the island of Laaland, 31 m. by rail W. of Nykjobing. Pop. (1901) 8310. The church dates from the beginning of the 12th century. There is a large sugar factory. A great dike,
extending S.E. to Röðby (20 m.), protects the coast against inundation, a serious inroad of the sea having occurred in 1872.

NAMAQUALAND, a region of south-western Africa, extending along the west coast over 600 m. from Damaraland (22° 43' S.) on the north to 31° S., and stretching inland 80 to 350 m. It is divided by the lower course of the Orange river into two portions—Little Namaqualand in the interior and Great Namaqualand to the north. Little Namaqualand forms part of Cape Colony (q.v.), and Great Namaqualand is the southern portion of German South-West Africa (q.v.). The people of Namaqualand are the purest surviving type of Hottentots, and number some twenty to thirty thousand.

NAMASUDRA, the name adopted by the great caste or tribe who inhabit the swamps of Eastern Bengal, India, whom the higher castes are wont to designate by the opprobrious term of Chandal. Their number in 1901 exceeded 2 millions; but if the cognate Ponds and also the Mahomedans of the same ethnical stock were to be added, the total would probably reach 11 millions.

NAME (O. Eng. nama; cognate forms in Teutonic languages are Dutch naam, Ger. Name, &c., but the word is common to all Indo-European languages; cf. Gr. ὄνομα, Lat. nomen, Sans. nāman, &c.), the distinguishing appellation by which a person, place, thing or class of persons or things is known.

Local Names.—The study of names and of their survival in civilization enables us in some cases to ascertain what peoples inhabited districts now tenanted by races of far different speech. Thus the names of mountains and rivers in many parts of England are Celtic—for example, to take familiar instances, Usk, Esk and Avon. There are also local names (such as Mona, Monmouth, Mynyw and others) which seem to be relics of tribes even older than the Celtic stocks, and "vestiges of non-Aryan people, whom the Celts found in possession both on the Continent and in the British Isles." The later English name is sometimes the mere translation, perhaps unconscious, of the earlier Celtic appellation, often added to the more ancient word. Penpole Point in Somerset is an obvious example of this redoubling of names. The pre-Aryan place-names of the Aegean are much discussed by philologists. Such a name as Corinthos, with all other words in athos, is hyaccinths, is thought to be pre-Hellenic. The river-names Gade, Ver, Test and many other monosyllabic river-names in the home counties, appear to be neither English nor Celtic, but have been neglected, being known to few but anglers and rustics. As to the meaning and nature of ancient local names, they are as a rule purely descriptive. A river is called by some word which merely signifies "the water"; a hill has a name which means no more than "the point," "the peak," "the castle." Celtic names are often of a more romantic tone, as Ardnamurchan, "the promontory by the great ocean," an admirable description of the bold and steep headland which breast the wash of the Atlantic. As a general rule the surviving Celtic names, chiefly in Ireland, Wales and Scotland, all contain some wide meaning of poetic appropriateness. The English names, on the other hand, commonly state some very simple fact, and very frequently do no more than denote property, such and such a town or hamlet, "ton" or "ham," is the property of the Billings, Uffings, Tootings, or whoever the early English settlers in the district may have been. The same attachment to the idea of property is exhibited in even the local names of petty fields in English parishes. Occasionally one finds a bit of half-humorous description, as when a sour, starred and weedy plot is named "starvacre"; but more usually fields are known as "Thompson's great field," "Smith's small field," "the fouracre," or the like. The name of some farmer or peasant owner or squatter of ancient date survives for centuries, attached to what was once his property. Thus the science of local names has an historical value. The names indicate the various races (Celtic, Roman and English in Great Britain) who have set in the form of names the seal of their possession on the soil. Again, the meanings of the names illustrate the characters of the various races. The Romans have left names connected with camps (castra, chesters) and military roads; the English have used simple descriptions of the baldest kind, or have exhibited their attachment to the idea of property; the Celtic names (like those which the red men have left in America, or the blacks in Australia) are musical with poetic fancy, and filled with the historical value of the mission of the race.

The British race carries with it the ancient names of an older people into every continent, and titles perhaps originally given to places in the British Isles by men who had not yet learned to polish their weapons of flint may now be found in Australia, America, Africa and the islands of the farthest seas. Local names were originally imposed in a handy local manner. The settler or the group of cave-men styled the neighbouring river "the water," the neighbouring hill "the peak," and these terms often still survive in relics of tongues which can only be construed by the learned.

Personal Names.—The history of personal names is longer and more complex, but proceeds from beginnings almost as simple. But in personal names the complexity of human character, and the gradual processes of tangling and disentangling the threads of varied human interest, soon come in, and personal names are not imposed once and for all. Each man in very early societies may have many names, in different characters and at different periods of his life. The oldest personal names which we need examine here are those which indicate, not an individual, but a group, held together by the conscious sense or less conscious sentiment of kindred, or banded together for reasons of convenience. An examination of customs prevalent among the most widely separated races of Asia, Africa, Australia and America proves that groups conceiving themselves to be originally of the same kin are generally styled by the name of some animal or other object (animate or inanimate) from which they claim descent. This object is known as the "totem" (see Totemism). The groups of supposed kin, however widely scattered in local distribution, are known as wolves, bears, turtles, suns, moons, cockatoos, reeds and what not, according as each group claims descent from this or that stock, and sometimes wears a mark representing this or that animal, plant or natural object. Unmistakable traces of the same habit of naming exist among Semitic and Teutonic races, and even among Greeks and Romans. The names chosen are commonly those of objects which can be easily drawn in a rude yet recognizable way, and easily expressed in the language of gesture. In addition to the totem names (which indicate, in each example, supposed blood-kindred), local aggregates of men received local names. We hear of the "hill-men," "the cave-men," "the bush-men," "the coast-men," "the men of the plain," precisely as in the old Attic divisions of Aktaoi, Pediaioi and so forth. When a tribe comes to recognize its own unity, as a rule it calls itself by some term meaning simply "the men," all other tribes being regarded as barbarous or inferior. Probably other neighbouring tribes also call themselves "the men" in another dialect or language, while the people in the neighbourhood are known by an opprobrious epithet, as Rakshasas among the early Aryan dwellers in India, or Eskimo (raw-eaters) in the far north of the American continent. Tribal names in Australia are often taken from the tribal term for "yes" or "no"; cf. Languedoc.

Leaving social for personal names, we find that, among most uncivilized races, a name (derived from some incident or natural object) is given at the time of birth by the parents of each newborn infant. Occasionally the name is imposed before the child is born, and the proud parents call themselves father and mother of such an one before the expected infant sees the light. In most cases the name (the earliest name) denotes some phenomenon of nature; thus Dobridzhofer met in the forests a young man who had a Gold-flower of clay, that is, "Dawn," his father having been named "Sun." Similar names are commonly given by the natives of Australia, while no names are more common among North-American Indians than those derived from sun, moon, cloud and wind.

The names of savage persons are not permanent. The name

first given is ordinarily changed (at the ceremony answering to confirmation in the church) for some more appropriate and descriptive nickname, and that, again, is apt to be superseded by various "honor-giving names" derived from various exploits. The common superstition against being "named" has probably produced the custom by which each individual has a secret name and is addressed, when possible, by some wide term of kinship, "brother," "father," and the like. The bad luck which is said to occur to Zulu customs as in Vedic myths attends the utterance of the real name is evaded by this system of addresses. Could we get a savage—an Iroquois, for example—to explain his titles, we would find that he is, say, "Morning Cloud" (by birth-name), "Hungry Wolf" (by confirmation name), "He that raises the white fellow's scalp" (by honor-giving name), of the Crane totem (by kinship and hereditary name, as understood by ourselves). When society grows so permanent that male kinship and paternity are recognized, the custom of patronymics is introduced. The totem name gives place to a gentile name, itself probably a patronymic in form; or, as in Greece, the gentile name gives place to a local name, derived from the deity. Thus a Roman is called Cæcilius; Julius is his gentile name (of the Julian clan); Caesar is a kind of hereditary nickname. A Greek is Thucydides (the name usually derived from the grandfather), the son of Olorus, of the deme of Halimius. This system of names answered the purposes of Greek and Roman civilization. In Europe, among the Teutonic races, the stock-names (conceivably totemistic in origin) survive in English local names, which speak of the "son" or "ham" of the Billings or Tootings. An examination of these names, as collected in Kemble’s Anglo-Saxons, proves that they were frequently derived from animals and plants. Such English names as: "noble Wolf," (Ethelewulfa), "Win," of "Var," and so forth clearly testify to a somewhat primitive and freer usage of society. Then came more vulgar nicknames and personal descriptions, as "Long," "Brown," "White" and so forth. Other names are directly derived from the occupation or craft (Smith, Fowler, Sadler) of the man to whom they were given, and yet other names were derived from places. The noble and landowner was called "of" such and such a place (the German von and French de), while the humbleman was called not "of" but "at" such a place, as in the name "Attewell," or merely by the local name without the particle. The "de" might also indicate merely the place of a person’s birth or residence; it was not a proof of noblesse. If we add to these names patronymics formed by the addition of "son," and terms derived from Biblical characters (the latter adopted after the Reformation as a reaction against the names of saints in the calendar), we have almost exhausted the sources of modern English and European names. A continual development of custom can be traced, and the analysis of any man’s family and Christian names will lead us beyond history into the manners of races devoid of literary records.

Greeks: Names.—The Greeks had only one, and no family, name; hence the name of a child was left to the discretion of the parents. The eldest son generally took the name of his paternal grandfather, girls that of their grandmother. Genuine patronymics (Phocion, son of Phocus), analogous compounds (Theophrastus, son of Theodorus), or names of similar meaning (Philomenus, son of Eros) also occur. Athenaeus divides names generally into (1) θεοπόρος, chiefly derivatives or compounds of the names of gods (Demetrius, Apollonius, Theodorus, Diodotus, Heracleitus, Diogenes); (2) ἄφες, simple or variously compounded names, especially such as were of good omen for a son’s future career (Aristides, Pericles, Sophocles, Alexander), although such hopes were frequently belied by the results. Instances of a subsequent change of name are not uncommon; thus, Plato and Theophrastus were originally Aristocles and Tyrtæus.

To avoid the ambiguity and confusion arising from the use of a single name, various expedients were adopted, the commonest being to add the father’s name—Διομεθεοτός Δημοτεόκρος, Ἀλκιβίδης ὁ Κλεονιοῦ. Sometimes the birthplace was added.
and any praenomen they pleased: L. Livius Andronicus, freedman of M. Livius Salinator. In the time of Caesar, the freedman took the praenomen L. and added in addition to his name one of the names of the latter; thus, Cicero calls his slave Dionysius M. Pomponius Dionysius as a token of friendship for T. Pomponius Atticus.

(J. H. F.)

Law.—The Christian name, i.e. the name given to a person at baptism, was transferred into the Christian church, dates from the earliest history of the Church. It is held that the practice of giving a name at baptism was possibly imitated from the Jewish custom of giving a personal name at circumcision. In England individuals were for long distinguished by Christian names only, and the surname (see below) or family name is still totally ignored by the Church. As population increased and intercourse became general, it became necessary to employ some further name by which one man might be known from another, and in process of time the use of surnames became universal, the only exceptions in England being the members of the royal family, who sign by their baptismal names only.

Where the ecclesiastical law does not conflict with the common law or has not been changed by it, it still prevails, and therefore it may be said that the name given at baptism may be regarded as practically unalterable. But that a baptismal name is not, in truth, of categorical force, is shown by the act of constitution of Archbishop Peckham (ob. 1292) directs that "ministers shall take care not to permit wanton names to be given to children baptized, and if otherwise be done, the same shall be changed by the bishop at his pleasure," whereas the Register of the Office for Confirmation must have contemplated the possibility of such a change, as the bishop is directed therein to ask the child's name before anointing him with the chrism, and afterwards, naming him according to the name granted by the bishop. But in the second and subsequent Prayer-books all mention of the name in the Office for Confirmation is omitted. Lord Coke was of opinion that such a change was permissible and gives examples (1 Inst. p. 5), but Dr Burn (Ecc. Law, i. 41) held a contrary opinion. Phillimore, however, gives several instances when such a change was made, one, in the diocese of Liverpool, on the 11th of June 1886 (see Phillimore, Ecc. Law, t. 517, 518; and Acts and Queries, 4th ser. vol. vi. p. 17, 717, etc.).

In the case of the adoption of a Christian name, a name (other than a surname) given them by their parents, such a name acquires force only by repute. The Registration of Births Act, 1875, does not provide for the insertion of a name, but such provision is purely permissive, and the only object of entering a name on the register is to have an authoritative record of the commencement of repute.

A clergyman of the Church of England is compelled to perform the ceremony of baptism when required by a parishioner, and to give whatever name or names the godparents select, but although the rubrics do not expressly say so, he can object to any name on religious or moral grounds.

The freedom enjoyed in England and the United States as to the kind of Christian name which may be given to a child is somewhat limited in France and Germany. In France, by a decree of the 11th September 1858, names or cognoms recorded as Christian names (prénom) of children were those of saints in the calendar and the names of personages known in ancient history. Even at the present day an official list is issued (revised from time to time) containing a selection of forenames of a Christian name of a child will be registered unless it occurs in this list. A limitation more or less similar prevails in Germany and other European countries.

As regards the surname (Fr. surnom, name in addition), custom has universally decreed that a man shall be known by the name of his father. But in England and the United States, at least, this custom has been transcended; thus, the surname, preventable from taking whatever name he has a fancy for, nor are there any particular formalities required to be observed on adopting a fresh surname; but, on the other hand, if a man has been known for a considerable time by the name of his father, or by a name of repute, and he changes it for another, he cannot compel others to address him or designate him by the new one. Neither does the English law recognize the absolute right of any person in any particular name to its use against all comers. Lord Brougham in his suit of Boulay v. Du Boulay, 1869, L. R. 2 P. C. 430, held that a person adopts a new name and wishes to have it publicly noticed and recognized as his own, he must assume it volitionally, and it is that by royal licence. This is by petition, prepared and presented through the Heralds' Office. If granted, the royal licence is given under the sign manual and privy seal of the sovereign, counter-signature is required thereon. In the United States, the distinction is often inserted whereby a testator or settler imposes upon the takers of the estate an obligation to assume his name and bear his arms. The stamp duty payable for a royal licence in this case is fifty pounds, but if the application is made for a voluntary, the stamp duty is ten pounds. Where there is a more formal adoption of a surname, it is usual, for purposes of publicity and evidence, to advertise the change of name in the newspapers and to execute a deed poll setting out the change, and enrol the same in the central office of the Supreme Court.

Both in France and Germany official authorization must be obtained before a change of name may be made. If the right to a new name is disputed by another or his interest is injured thereby, the person entitled can compel the abandonment of the new name.

A wife on marriage adopts the surname of her husband, disregarding entirely her maiden surname; in Scotland the practice usually is for the wife to retain her maiden name for all legal purposes, adding the name of her husband as an alias. On remarriage the rule applies unless to the contrary the act of parliament or the registration of the marriage by the certificate of registration, or some other exception to this is tacitly recognized in the case of a title acquired by marriage when the holder remarries a commoner. This exception was very fully discussed in Cowley v. Cowley, 1901, A.C. 450.

In England the United Kingdom when signing their names use only their surnames or peerage designations. It is merely a privileged custom, which does not go back further than the Stuart period. Peeresses sign by their Christian names or initials followed by their peerage designation. Bishops sign by their initials followed by the name of the see. In Scotland it is very usual for landowners to affix to their names the designation of their lands, and this was expressly sanctioned by an act of 1672.

(N. A. T.)

NAMUR, one of the nine provinces of Belgium. It lies between Hainault on the one side and Liège and Luxemburg on the other, and extends from Brabant up the Meuse valley to the French frontier. Area, 1,414 sq. m.; pop. (1904) 357,759. The north part of the Meuse is very fertile, but the rest is covered with forest and is little suited for agriculture. There are a few iron and coal-mines between the Sambre and Meuse, and the quarries are of great importance. Arboriculture, and especially fruit-tree plantation, is on the increase. The province is divided into the three arrondissements of Namur, Dinant and Philippeville, and there are fifteen cantons for judicial purposes.

NAMUR (Flemish, Namen), a town of Belgium, capital of the province of Namur. Pop. (1904) 31,940. It is most picturesquely situated at the junction of the rivers Sambre and Meuse, the town lying on the left banks of the two rivers, while the rocky promontory forming the fork between them is crowned with the old citadel. This citadel is no longer used for military purposes, and the hill on which it stands has been converted into a public park, while the crest is occupied by an enormous hotel to which access is gained by a cogwheel railway. Namur is connected with the citadel by two bridges across the Sambre, and from the east side of the promontory there is a fine stone bridge to the suburb of Jambes. This bridge was constructed in the 11th century and rebuilt in the reign of Charles V. It is the only old bridge in existence over the Meuse in the Belgian portion of its course. The cathedral of St Aubain or Albin was built in the middle of the 18th century. The church of St Loup is a century older, and is noticeable for its columns of red marble from the quarry at St Rémy near Rochefort. There is a considerable local industry in cutlery, and there are numerous tanneries along the river-side.

The site of the citadel is perhaps identical with Adaticum, the fortified camp of the Adatuci and destroyed by Julius Caesar after the defeat of the Nervii, although many authorities incline to the plateau of Hastédon, north of the Sambre and of Namur itself, as the more probable site of the Belgic position. Many antiquities of the Roman-Gallic period have been discovered in the neighbourhood and are preserved in the local archaeological museum. Here also are deposited the human fossils of the Stone Age discovered at Furfouze on the Loess. In the feudal period Namur was always a place of some importance, and long formed a marquisate in the Courtenay family. One institution of the medieval period came to modern times in the form of the confraternity of the religious of this name; the confraternity, however, has ceased to exist, and the Pope's dispensation to it was generally accompanied. This was the annual encounter on the Place d'Armes of rival parties mounted on stils. Galliot, the historian of Namur, says the origin of these jousts is lost in antiquity, but considers the use of stils was due
to the frequency with which the town was flooded before the rivers were embanked. Don John of Austria made Namur his headquarters during the greater part of his stay in the Netherlands, and died here in 1578. As a fortress Namur did not attain the first rank until after its capture by Louis XIV. in 1692, when Vauban endeavoured to make it impregnable; but it was retaken by William III. in 1695. The French recaptured it in 1702 and retained possession for ten years. In 1815 Marshal Grouchy on his retreat into France fought an action here with the Prussians under General Pirch. In 1888, under the new scheme of Belgian defence, the citadel and its detached works were abandoned, and in their place nine outlying forts were constructed at a distance of from 3 to 5 m. round the town. All these forts are placed on elevated hills, and are in their order, beginning on the left bank of the Meuse and ending on the right bank of the same river: (1) St Heribert, (2) Malonne, (3) Suarlée, (4) Emines, (5) Cognée, (6) Gélbressée, (7) Maizeret, (8) Andoy and (9) Davre. The whole position is correctly described as the "tête de pont" of Namur, and in addition to its strong bomb-proof forts it possesses great natural advantages for the defence of the intervals.

NANA FARNAVIS (1741–1800), the great Mahratta minister at Poona at the end of the 18th century. His real name was Babaji Janardhan Bhanu; but, like many other Mahrattas, he was always known by the name of Nana. Janardhan Bhanu was a maternal grandfather; Farnavis is the official title of the finance minister, derived from fard=an account and navis=a writer. He was born at Satara on the 4th of May 1741, and was the son of a Chitpavan Brahman, of the same class as the Peshwa, who held the hereditary office of Farnavis. He escaped from the fatal battle of Panipat in 1761; and from about 1774 was the leading personage in directing the affairs of the Mahratta confederacy, though never a soldier. This was the period when Peshwas rapidly succeeded one another, and there was more than one army acting under the name of Mahratta. Farnavis held together the confederacy against both internal dissensions and the growing power of the British. He died at Poona on the 13th of March 1800, just before the Peshwa placed himself in the hands of the British and thus broke up the Mahratta confederacy. In an extant letter to the Peshwa, the Marquess Wellesley thus describes him: "The able minister of your state, whose upright principles and honourable views and whose zeal for the welfare and prosperity both of the dominions of his own immediate superiors and of other powers were so justly celebrated."

See Captain A. Macnald, Memoir of Nana Farnavas (Bombay 1851).

NANAIMO, a city of British Columbia, on the east coast of Vancouver Island. Pop. (1906) about 6,500. It is connected with Victoria by the Esquimalt and Nanaimo railway, and has a daily steamer service to Vancouver, as well as to Comox, Sydney and other points on the coast. It is favourably situated for growing fruit, and mixed farming is carried on to a considerable extent. There is a large export trade in coal from the neighbouring mines, which is sent chiefly to San Francisco.

NANA SAHIB, the common designation of Dandu Panth, an adopted son of the ex-peshwa of the Maharratas, Baji Rao, who took a leading part in the great Indian Mutiny, and was proclaimed peshwa by the mutineers. Nana Sahib had a grievance against the British government because they refused to continue to him the pension of eight lakhs of rupees (£80,000) which was promised to Baji Rao by Sir John Malcolm on his surrender in 1818. This pension, however, was only intended to be a life grant to Baji Rao himself. For this refusal the Nana bore the British a lifelong grudge, which he washed out in the blood of women and children in the massacres at Cawnpore. In 1859, when the remnants of the rebels disappeared into Nepal, the Nana was among the fugitives. His death was reported some time afterwards, but his real fate remains obscure.

NANCY, a town of north-eastern France, the capital formerly of the province of Lorraine, and now of the department of Meurthe-et-Moselle, 219 m. E. of Paris on the railway to Strassburg. Pop. (1906), town, 98,322; commune (including troops), 110,370. Nancy is situated on the left bank of the Meurthe 6 m. above its junction with the Moselle and on the Marne-Rhine canal. The railway from Paris to Strasbourg skirts the city on the south-west side; other railways—to Metz, to Épinal, in l'Est, to Châlons, to Main and the Meuse, and the Ville-Vieille in the north-west between the Our Lady and the Pépinière gardens, with narrow and winding streets, and the Ville-Neuve. A large number of streets, allowing views of the hills around the city. Between the two hills, the Place Stanislas, a square worthy of a capital city: in the centre stands the statue of Stanislas Leczinski, ruler of Lorraine, and on all sides rise imposing buildings in the 18th century style—the town hall, an episcopal palace, theatre, etc. A fine triumphal arch erected by Stanislas in honour of Louis XV leads from the Place Stanislas to the Place Carrière, which forms a beautiful tree-plant promenade, containing at its further end the government palace (1766) now the residence of the general commanding the XX. army corps, and adjoins the so-called Pépinière (nursery) established by Stanislas. Other open spaces in the city are the Place d’Alliance (formed by Stanislas, with a fountain in memory of the alliance between Louis XV. and Maria Theresa in 1756), the Place de l’Académie, the Place Dombasle and the Place de Thiers, the two latter embellished with the statues of Mathieu Dombasle, the agriculturist, and Adolphe Thiers. The cathedral in the Ville-Vieille, built in the 18th century, has a wide façade flanked by dome-surmounted towers, and a somewhat frigid and sombre interior. Of particular interest is the church of the Cordeliers, in the old town, built by René II. about 1482 to commemorate his victory over Charles the Bold. Pillaged during the Revolution period, but restored to religious use in 1825, it contains the tombs of Stanislas de Vaudémont and of René the Younger, Philippe de Gueldres, second of René II., Henry III., Count of Vaudémont, and Isabella of Lorraine his wife, René II. (a monument ruined by his widow in 1512) and Cardinal de Vaudémont (d. 1587). Here also is a chapel built at the beginning of the 17th century to receive the tombs of the princes of the house of Lorraine. The church of St Évre, rebuilt between 1864 and 1874 on the site of an old church of the 13th, 14th and 15th centuries, has a fine spire and belfry and good stained glass windows. Bonsecours Church, at the end of the St Pierre Faubourg, contains the mausoleums of Stanislas (by Gobert) and his wife Catherine, and the tombs of his daughter Marie, queen of France, as well as the statue of Notre-Dame de Bonsecours, the object of a well-known pilgrimage. Of the old ducal palace, begun in the 15th century by Duke Raoul and completed by René II., there remains but a single wing, partly rebuilt after a fire in 1871. The entrance to this wing, which contains the archaeological museum of Lorraine, is a beautiful specimen of the late Gothic of the beginning of the 16th century. One of the greatest treasures of the collection is the tapestry found in the tent of Charles the Bold after the battle of Nancy. Of the old gates of Nancy the most ancient and remarkable is the Porte de la Craffe (1463). The town hall contains a museum of painting and sculpture, and there is a rich municipal library. A monument to President Carnot, and statues of Jacques Callot, the engraver, and of General Drouot, both natives of Nancy, and of Claude Gellée stand in various parts of the town.

Nancy is the seat of a bishop, a prefect, a court of appeal and a court of assizes, headquarters of the XX. army corps, and centre of an académie (educational division) with a university comprising faculties of Law, Medicine, Science and Letters, and a higher school of pharmacy. There are also tribunals of first instance and of commerce, a board of trade-arbitrators, lycées and training colleges for both sexes, a higher ecclesiastical seminary, a school of agriculture, the national school of forestry, a higher school of commerce, a technical school (école professionnelle), a school of arts and crafts (école préparatoire des arts et métiers), a chamber
of commerce and a branch of the Bank of France. The industries of Nancy include printing, brewing, cottage and woollen spinning and the weaving of cotton and woollen goods, and the manufacture of tobacco (by the State), of boots and shoes, straw hats, pottery, casks, embroidery, machinery, engineering material, farm implements and iron goods.

At the close of the 11th century Odoric of Nancy, brother of Gerard of Alsaee, possessed at Nancy a castle which enabled him to defy the united assaults of the bishops of Metz and Treves and the count of Bar. In the 12th century the town was surrounded with walls, and became the capital of the dukes of Lorraine; but its real importance dates from the 15th century, when through the marriage in 1477 Charles the Bold was defeated by René II. and perished at its gates.1 Enlarged, embellished and admirably refortified by Charles III., it was taken by the French in 1633 (Louis XIII. and Richelieu being present at the siege). After the peace of Ryswick in 1697 it was restored and Duke Leopold set himself to repair the disasters of the past. He founded academies, established manufactures and set about the construction of the new town. But it was reserved for Stanislas Leczinski, to whom Lorraine and Bar were assigned in 1736, to carry out the plans of improvement in a style which made Nancy one of the palatial cities of Europe, and of himself. The Prussians in 1870 wanted the last of the dukes of Lorraine. The city, which became French in 1766, was occupied by the allies in 1814 and 1815, and put to ransom by the Prussians in 1870. After the Franco-German war the population was greatly increased by the immigration of Alsation and of people from Metz and its district.

NANDAIR, or NANDAI, a town of India, in the state of Hyderabad, on the left bank of the Godavari, with a station on the Hyderabad-Godavari valley railway, 174 and 255 ft. above sea level. In 1822 it was the residence of the Nizam of Nurnur, a native prince, who was the hereditary chief of a powerful tribe of Warley or Lumbwa Indians. The present Nandair is a small town containing about 12,000 inhabitants. In 1681 it was captured from the Nandi-Lumbwa people, who were the original inhabitants of the district, and the town was rebuilt and the fortifications strengthened.

NANDGAON, a feudatory state of India, in the Chhattisgarh division of the Central Provinces. Area, 871 sq. m.; pop. (1901) 126,356, showing a decrease of 31% in the decade, due to famine; estimated revenue £25,000; tribute £4,000. The state has a peculiar history. Its foundation is traced to a religious celibate, who came from the Punjab towards the end of the 8th century, and of himself. The territory is ceded to the British in 1857, when it was formed into the state of Nandgaon, assigned to the Naidi family. The state has been feudatory to the British since that date, and has been occupied by the British in 1879, when the British government recognized the ruler as an hereditary chief and afterwards conferred upon him the title of Raja Bahadur.

NANDI, an East African tribe of mixed Nilotic, Bantu and Hamitic origin. With them are more or less closely allied the Lumbwa, correctly Lumbwa, Buret or Pure and L. or (Soot) tribes, as well as the Elgonyi (properly Kony) of Mount Elgon. They have also affinities with the Masai tribes. The Nandi-Lumbwa peoples inhabit the country stretching south from Mount Elgon to about 1° S. and bounded east by the escarpment of the eastern rift-valley and west by the territories of the tribes, such as the Kavirondo, dwelling round the Victoria Nyanza. They have given their name to the Nandi plateau. The Hamitic strain in these allied tribes is derived from the Galla; they also exhibit Pigmian elements. Their original home was in the north, and they probably did not reach their present home until the beginning of the 19th century. They differ considerably in physical appearance; some resemble the Masai, being men of tall stature with features almost Caucasian, other are dwarfish with markedly negro features. Like the Masai, Turkana and Suk, the Nandi-Lumbwa tribes were originally nomadic, but they have become agriculturists. They own large herds of cattle. They have a double administrative system, the chief medicine man or Orkoiot being supreme chief and regulating war affairs, while representatives of the people, called Kirughi, manage the ordinary affairs of the tribe. The medicine men are of Masai origin and the office is hereditary. The young men form a separate warrior class to whom is entrusted the care of the country. A period of about 7½ years is spent in this class, and during this time they are taught the art of making the cloak of the warriors, from which the succeeding "age" is of great importance. The arms of the warriors are a stabbing spear, shield, sword and club. Many also possess rifles. All the Nandi are divided into clans, each having its sacred animal or totem. They have no towns, each family living on the land it cultivates. The nuts are of circular pattern. The Nandi believe in a supreme deity—Aisia—who takes a benevolent interest in their welfare, and to whom prayers are addressed daily. They also worship ancestors and consider earthquakes to be caused by the spirits moving in the underworld. They practise circumcision, and girls undergo a similar operation. Spiritualism is a sign of blessing. Their scarcity clothing consists chiefly of dressed skins. The tribal mark is a small hole bored in the upper part of the ear. Their language is Nilotic and in general construction resembles the Masai. It has been slightly influenced by the Somali tongue. The primitive hunting tribe as the Wandorobo speak a dialect closely resembling Nandi. The Nandi at one time appear to have been subject to the Masai, but when the country was first known to Europeans they were independent and occupied the plateau which bears their name. Hardy mountainers and skilful warriors, they closed their territory to all who did not get special permission, and thus blocked the road from Mombasa to Uganda alike to Arab and Swahili. Caravans that escaped the Masai frequently fell victims to the Nandi, who were adepts at luring them to destruction. When the railway to the Victoria Nyanza was built it had to cross the Nandi country. The tribesmen, who had already shown hostility to the whites, attacked both the railway and the telegraph line and raided other tribes. Eventually (1903-1906) the Nandi were removed by the British to reserves somewhat north of the railway zone (see British East Africa). The present reserve is very small, and farther south still are the reserves of the Buret and Sotik.

See A. C. Hollis, The Nandi: Their Language and Folk-lore, with introduction by Sir Charles Eliot (Oxford, 1909), and the works there cited.

NANDIDRUG, a hill fortress of southern India, in the Kolar district of Mysore, 4851 ft. above the sea. It was traditionally held impregnable, and its storming by Lord Cornwallis in 1791 was one of the most notable incidents of the first war against Tipoo Sultan. It was formerly a favourite resort for British soldiers during the hot season.

NANGA, the most primitive form of the ancient Egyptian harp. The nanga consisted of a boat-shaped or vaulted body of wood, the back of which was divided down the centre by a sound bar built into the back; on this bar was fixed a cylindrical stick round which one end of the strings was wound, the soundboard or parchment being stretched over the back without interfering with the stick. The other end of the strings was fastened to pegs set in the side of a curved neck, so that the strings did not lie directly over the soundboard. There were but 3 or 4 strings, one note only being obtained from each. Some of these nangas are to be seen at the British Museum.

NANKEEN, a cotton cloth originally made in China, and now imitated in various countries. The name is derived from Nanking, the city in which the cloth is said to have been originally manufactured. The characteristic yellowish colour of nankeen is attributed to the peculiar colour of the cotton from which it was originally made.
NANKING ("the southern capital"), the name by which Kiang-ning, the chief city in the province of Kiangsu, China, has been known for several centuries. Pop. about 140,000. The city stands in 32° 5' N., 118° 47' E., nearly equidistant between Canton and Peking, on the south bank of the Yangtsze Kiang. It dates only from the beginning of the Ming dynasty (1368), although it is built on the site of a city which for more than two thousand years figured under various names in the history of the empire. The site of the third capital of China was chosen by Kao-tung; under the Han dynasty (206 B.C.-9 A.D.) its name was converted into Tan-yang; by the T'ang emperors (A.D. 618-907) it was styled Kiang-nan and Sheng Chow; by the first sovereign of the Ming dynasty (A.D. 1368-1644) it was created the "southern capital" (Nan-kung), and was given the distinctive name of Ying-t'ien; and since the accession to power of the present Manchu rulers it has been officially known as Kiang-ning, though still popularly called Nan-king. It was the seat of the imperial court only during the reigns of the first two emperors of the Ming dynasty, and was deserted for Shun-t'ien (Peking) by Yu Chien, third sovereign of the line, who in 1405 captured the town and usurped the crown of his nephew, the reigning emperor. The T'ai-p'ing rebels, who carried the town by assault in 1853, swept away all the national monuments and most of the more conspicuous public buildings it contained, and destroyed the greater part of the magnificent wall which surrounded it. This wall is said by Chinese topographers to have been 66 li, or 32 m., in circumference. This computation has, however, been shown to be a gross exaggeration, and it is probable that 60 li, or 20 m., would be a more accurate and trustworthy estimate. The outer walls, rising 8 ft. and 9 ft., and containing 28 gates, were nearly 30 ft. thick. The encircling wall of the inner city was about 60 ft. thick, measured at the base, and was pierced by thirteen gates. The north-east corner of the city contains the imperial palace reared by Hung-wu, the founder of the modern city. After suffering mutilation at the overthrow of the Ming dynasty, this magnificent building was burnt to the ground on the recapture of the city by the T'ai-p'ing rebels in 1864. But beyond comparison the most conspicuous public building at Nanking is the famous porcelain pagoda, 75 ft. high, erected by the emperor Yung-lo (1425-1428) to commemorate the virtues of his mother. Twelve centuries previously an Indian priest deposited on the spot where this monument afterwards stood a relic of Buddha, and raised over the sacred object a small pagoda of three stories in height. During the disturbed times which heralded the close of the Yuan dynasty (1368) this pagoda was utterly destroyed. It was doubtless out of respect to the relic, which then perished that Yung-lo chose this site for the erection of his "token-of-gratitude" pagoda. The building was begun in 1415. But before it was finished Yung-lo had passed away, and it was reserved for his successor to see the final pinnacle fixed in its place, after nineteen years had been consumed in carrying out the designs of the imperial architect. In shape the pagoda was an octagon, and was about 260 ft. in height, or, as the Chinese say, with that extraordinary love for inaccurate accuracy which is peculiar to them, 32 chang (a chang equals about 170 in.) 8 ft. 4 in. and 9/8 of an inch. The outer walls were cased with bricks of the finest white porcelain, and each of the nine stories into which the building was divided was marked by overhanging eaves composed of green glazed tiles of the same material. The summit was crowned with a gilt ball fixed on the top of an iron rod, which in its turn was encircled by nine iron rings. Hung on chains which stretched from this apex to the eaves of the roof were five large pearls of good augury for the safety of the city. One was supposed to avert floods, another to prevent fires, a third to keep dust-storms at a distance, a fourth to allure tempests, and a fifth to guard the city against disturbances. From the eaves of the several stories there hung one hundred and fifty-two bells and countless lanterns. In bygone days Nanking was one of the chief literary centres of the empire, besides being famous for its manufacturing industries. Satin, crape, nankeen, cloth, paper, pottery, and artificial flowers were among its chief products. At Nanking, after its capture by British ships in 1842, Sir Henry Pottinger signed the "Nanking treaty." It was made a treaty port by the French treaty of 1858, but was not formally opened. Its proximity to Chinkiang, where trade had established itself while Nanking was still in the hands of the rebels, made its occupation of little advantage, and the point was not pressed. In 1859 it was voluntarily thrown open to foreign trade by the Chinese government, and in 1900 it was connected by railway (192 m. long) with Shanghai. Since 1880 Nanking has been slowly recovering from the ruin caused by the T'ai-p'ing rebellion. Barely one-fourth of the area within the walls has been reoccupied, and though its ancient industries are reviving, no great progress has been made. As the seat of the provincial government of Kiang-nan, however, which embraces the three provinces of Kiang-su, Kiang-si, and N'gan-hai, Nanking is a city of first-class importance. The approach to Nanking is the most pleasant of all the provincial satraps, as he controls a larger revenue than any other, and has the command of larger forces both naval and military. He is also superintendent of foreign trade for the southern ports, including Shanghai, a position which gives him great weight in all political questions. The city contains an arsenal for the manufacture of munitions of war, also powder-mills. A naval college was opened in 1890, and an imperial military college a few years later under foreign instructors. The only foreign residents are missionaries (mostly American), and employees of the Imperial Government. The walls of Nanking are 16 ft. thick in some points, 12 ft. in others, and about 9 ft. in most parts, and are on a level with the top of the houses outside. The worst part of Nanking is the so-called Ming Tombs, being the mausolea of Hung-wu, the founder of the Ming dynasty, and of one or two of his successors, which lie outside the eastern wall of the city. They are ill cared for and rapidly going to decay. Since 1899 the foreign trade has shown a steady increase.

NANNING a treaty port in the province of Kwangsi, China, on the West river, 250 m. above Wuchow and 470 m. from Canton. Pop. about 40,000. It is the highest point accessible for steam traffic on the West river. From Canton to Wuchow the river has a minimum depth of 8 ft., but on the section from Wuchow to Nanning, as the most populous of all the provincial capitals, the river is under 8 ft. at times during the winter. The town is the chief market on the southern frontier. Its opening was long opposed by the French government, who had acquired the right to build a railway to it from Tongking, by which they hoped to divert the trade through their own possessions. Navigation by small native boats is open westwards as far as Paise.

NANSEN, FRIDTJOF (1861-- ), Norwegian scientist, explorer and statesman, was born at Froen near Christiania on the 10th of October 1861. His childhood was spent at this place till his fifteenth year, when his parents removed to Christiansaas, where he went to school. He entered Christiania university in 1880, where he made a special study of zoology; in March 1882 he joined the sealing-ship "Viking" for a voyage to Greenland waters. On his return in the same year he was appointed curator of the Bergen Museum, under the eminent physician and zoologist Daniel Cornelius Danielssen (1815-1894). In 1886 he spent a short time at the zoological station at Naples. During this time he wrote several papers and memoirs on zoological and histological subjects, and for one paper on "The Structure and Combination of the Histological Elements of the Central Nervous System" (Bergen, 1887) the Christiania university conferred upon him the degree of doctor of philosophy. But his voyage in the "Viking" had indicated Greenland as a possible field for exploration, and in 1887 he set about preparations for a crossing of the great ice-field which covers the interior of that country. The possibility of his success was discountenanced by many Arctic authorities, and a small grant he had asked for was refused by the Norwegian government, but was provided by Augustin Gamel, a merchant of Copenhagen, while he paid from his private means the greater part of the expenses of the expedition. As companions Nansen had Otto Neumann (overtrup (b. 1855),
Captain O. C. Dietrichson (b. 1856), a third compatriot, and two Lapps. The expedition started in May 1888, proceeding from Leith to Iceland, and there joining a sealing-ship bound for the east coast of Greenland. On the 17th of July Nansen decided to leave the ship and force a way through the ice-belt to the land, about 10 m. distant, but the party encountered great difficulties owing to ice-pressures, went adrift with the ice, and only reached the land on the 29th, having been carried far to the south in the interval. They made their way north again, along the coast inside the drift ice, and on the 16th of August began the ascent of the inland ice. Suffering severely from storms, intense cold, and other hardships, they reached the highest point of the journey (6920 ft.) on the 3th of September, and at the end of the month struck the west coast at the Amearkik Fjord. On reaching the settlement of Godthaab it was found that the party must winter there, and Nansen used the opportunity to study the Eskimos and gather material for his book, *Eskimo Life* (English translation, London, 1893). The party returned home in May 1889, and Nansen's book, *The First Crossing of Greenland* (English translation, London, 1890), demonstrates the valuable scientific results of the journey. A report of the scientific results was published in *Petersmanns Mitteilungen* (Gotha, 1892). On his return from Greenland Nansen accepted the curatorship of the Zoological Museum of Christiania university. In September 1889 he married Eva, daughter of Michael Sars of Christiania university, and a noted singer (d. 1907).

In 1890 he propounded his scheme for a polar expedition before the Norwegian Geographical Society, and in 1892 he laid it before the Royal Geographical Society in London (see "How can the North Polar Region be crossed?" *Geogr. Journal*, vol. i.), by which time his preparations were well advanced. His theory, that a drift-current sets across the polar regions from Bering Strait and the neighbourhood of the New Siberia Islands towards the east coast of Greenland, was based on a number of indications. Doubtless the discovery (1854) of the ice off the south-west coast of Greenland, of relics of the American north polar expedition in the ship "Jeannette," which sank N.E. of the New Siberia Islands in 1851. His intention was therefore to get his vessel fixed in the ice to the north of Eastern Siberia and let her drift with it. His plan was adversely criticized by many Arctic authorities, but it succeeded. The Norwegian parliament granted two-thirds of the expenses, and the rest was obtained by subscription from King Oscar and private individuals. His ship, the "Fram" ("i.e. "Forward"), was specially built of immense strength and peculiar form, being pointed at both ends and having a sloping side, so that the vessel, pressing together, should tend, not to crush, but merely to slip beneath and lift her. She sailed from Christiania on the 24th of June 1893. Otto Sverdrup was master; Sigurd Scott Hansen, a Norwegian naval lieutenant, was in charge of the astronomical and meteorological observations; Henrik Greve Blessing was doctor and botanist; and among the rest was Frederik Hjalmar Johansen, lieutenant in the Norwegian navy, who shipped as fireman. On the 22nd of September the "Fram" was made fast to a floe in 78° 59' N., 138° 37' E.; shortly afterwards she was frozen in, and the long drift began. The pressure of the ice perfectly. During the winter of 1894-1895 it was decided that an expedition should be made northward over the ice on foot in the spring, and on the 14th of March 1895 Nansen, being satisfied that the "Fram" would continue to drift safely, left her in 84° N., 101° 55' E., and started northward accompanied by Johansen. On the 8th of April they turned back from 86° 14' N., the highest latitude then reached by man; and they shaped their course for Franz Josef Land. They suffered many hardships, including shortage of food, and were compelled to winter on Frederik Jackson Island (so named by Nansen) in Franz Josef Land from the 26th of August 1895 to the 19th of May 1896. They were uncertain as to the locality, but, after having reached 80° N. on the south coast of the islands, they were travelling westward to reach Spitsbergen, when, on the 17th of June 1896, they fell in with Frederick Jackson and his party of the Jackson-Harmsworth expedition, and returned to Norway in his ship, the "Windward," reaching Vardø on the 13th of August. After a stay of two months in London ("Fram" returned to Norway in safety. She had drifted north after Nansen had left her, to 85° 57', and had ultimately returned by the west coast of Spitsbergen. An unprecedented welcome awaited Nansen. In England he gave the narrative of his journey at a great meeting in the Albert Hall, London, on the 8th of February 1897, and elsewhere. He received a special medal from the Royal Geographical Society, honorary degrees from the universities of Oxford and Cambridge, and a presentation of books (the "Challenger" Reports) from the British government, and similar honours were paid him in other countries. The English version of the narrative of the expedition is entitled *Northwest Passage* (London, 1897), and the scientific results are given in *The Norwegian North Polar Expedition 1893-1896; Scientific Results* (London, &c., 1900 seq.).

In 1905, in connexion with the crisis between Norway and Sweden, which was followed by the separation of the kingdoms, Nansen for the first time actively intervened in politics. He issued a manifesto and many articles, in which he adopted an attitude briefly indicated by the last words of a short work published later in the year: "Any union in which the one people is restrained in exercising its freedom is and will remain dangerous." (*Norway and the Union with Sweden*, London, 1905). On the establishment of the Norwegian government in 1905, he was appointed minister to England (1906), and in the same year he was created G.C.V.O.; but in 1908 he retired from his post, and became professor of oceanography in Christiania university.

**Nansen, Hans** (1598-1667), Danish statesman, son of the burgher Evert Nansen, was born at Flensburg on the 28th of November 1598. He made several voyages to the White Sea and to places in northern Russia, and in 1621 entered the service of the Danish-icelandic Company, then in its prime. For many years the whole trade of Iceland, which he frequently visited, belonged to the Danes, and he became equally well known at Gläckstadt, then the chief emporium of the Iceland trade, and at Copenhagen. In February 1644, at the express desire of King Christian IV., the Copenhagen burgesses elected him burgomaster. During his northern voyages he had learnt Russian, and was employed as interpreter at court whenever Muscovite embassies visited Copenhagen. His travels had begotten in him a love of geography, and he published in 1633 a "Kosmografi," previously revised by the astronomer Longomontus. During the siege of Copenhagen by the Swedes in 1658 he came prominently forward. At the meeting between the burgess members of the Norwegian department of the States, Nansen urged the necessity of an obstinate defence. It was he who on this occasion obtained privileges for the burgesses of Copenhagen which placed them on a footing of equality with the nobility; and he was the life and soul of the garrison till the arrival of the Dutch fleet practically saved the city. These eighteen months of storm and stress established his influence in the capital once for all and at the same time knitted him closely to Frederick III., who recognized in Nansen a man after his own heart, and made the great burgomaster his chief instrument in carrying through the anti-aristocratic Revolution of 1656. Nansen used all the arts of the agitator with extraordinary energy and success. His greatest feat was the impassioned speech by which, on October 8th, he induced the burgesses to accede to the proposal of the magistracy of Copenhagen to offer Frederick III. the realm of Denmark as a purely hereditary kingdom. How far Nansen was content with the result of the Revolution—absolute monarchy—it is impossible to say. It appears to be pretty certain that, at the beginning, he did not want absolutism. Whether he subsequently regarded the victory of the monarchy and its corollary, the admittance of the middle classes to all offices and dignities, as a satisfactory equivalent for his original demands; or whether he was so overborne by royal favour as to sacrifice cheerfully the political liberties of his country, can only be a matter for conjecture. After the Revolution Nansen continued in high honour, but
he chiefly occupied himself with commerce, and was less and less consulted in purely political matters. He died on the 12th of November 1667.

NANTERRE, a town of northern France, with a port on the Seine, in the department of Seine, at the foot of Mount Valenier, 8 m. N.W. of Paris on the railway to St Germain. Pop. (1906), town, 11,874; commune, 17,434. The principal manufactures are chemicals, tallow and aluminium; stone quarried in the vicinity; the town is noted also for its cakes. The combined prison and mendicity depot for the department is a large institution, about 2 m. from the town. Nanters (the ancient Nemplidurum or Nematodurum) owes its origin to the shrine of the patron-saint of Paris, whose name is still associated with various places in the town and district. The shrine is the object of a pilgrimage in September.

NANTES, a city of western France, capital of the department of Loire-Inférieure, on the right bank of the Loire, 35 m. above its mouth, at the junction of the Orleans, Western and State railways, 55 m. W.S.W. of Angers by rail. In population (town, 118,244; commune, 153,427, in 1906) Nantes is the first city of Brittany. The Loire here divides into several branches forming islands over portions of which the city has spread. It receives on the left hand the Sèvre Nantaise, and on the right the Erdre. Both rivers hamper the navigation, and the port is consequently not large. The Erdre is navigable by river craft for the whole length of the river. The principal river port is Le Grand-Port. The Nantes Port is situated at the mouth of the Erdre. The Erdre, extending between the island of Nantes and the peninsula of St. Malo, is divided into two branches, the Saint-Félix and the Madeleine. The Erdre and the Loire are navigable for a distance of 27 miles. In the port are two quays, the Port Saint-Nicolas, and the Port Saint-Michel. The Erdre is navigable for 12 miles, and the Loire for 180 miles, above Nantes. Nantes and its port were of considerable importance in the 15th and 16th centuries, and the manufacture of coal (a vast granite building now used as a bonded warehouse) are of interest. Nantes has two great hospitals—St. Jacques on the left bank of the Loire, and the Hotel-Dieu in Gloriette Island. It is the seat of a bishopric and a court of assizes, and headquarters of the XI. army corps; it has tribunals of first instance and of commerce, a board of trade-arbitrators, a chamber of commerce and a branch of the Bank of France. The educational institutions include lycées for both sexes, a training college for girls, schools of medicine and pharmacy and law, a preparatory school for both instruction in letters and science, schools of music, art and navigation, technical and commercial schools, and a school for deaf-mutes and the blind.

Among the more important industries of Nantes are sugar-refining, flour-milling, rice-husking, the manufacture of oil, soap, flour pastes and biscuits, and the preparation of tinned provisions (sardines, vegetables, &c.); the manufacture of tin boxes, tins, chemical manures, acid from chestnut bark, tobacco, leather, wood-pulp for paper, rope, boots and shoes, brushes and glass; saw-milling, shipbuilding, metal founding, and the construction of engineering material; and wool and cotton-spinning, and the manufacture of cotton goods (other fabrics, hosiery and knitted goods). Coal and patent fuel (chiefly from Great Britain) are the most important imports; next come phosphates and pyrites; other imports are timber and pulp-wood. The principal exports are bunker-coal (to French colonies), pyrites, slate, hoops and provisions. In the ten years 1898-1907 the average annual value of the imports was £2,657,000; of the exports £795,000. In 1907 there entered from foreign countries 738 vessels (209 British) with tonnage of 384,350, and cleared 778 with 154,720 tons of cargo, and 458,538 tons of ballast. Reckoning ships carrying cargo only the figures for the first and last years of the decade 1898-1907 were: 1898, ships entered, French 209 (tonnage 75,249), foreign 250 (tonnage 154,936); ships cleared, French 173 (tonnage 32,951), foreign 97 (tonnage 27,836). 1907, ships entered, French 186 (tonnage 127,633), foreign 419 (tonnage 361,002); ships cleared, French 126 (tonnage 81,299), foreign 128 (tonnage 45,181).

Before the Roman occupation Nantes was the chief town of the Namnetes and consisted of Condivodium, lying on the hills away from the river, and of Portus Nonnatum, on the river. Under the Romans it became a great commercial and administrative centre, though its two parts did not coalesce till the 3rd or 4th century. In the middle of the 3rd century Christianity was introduced by St. Clair. Clotaire I. got possession of the city in 560, and placed it under the government of St. Felix the bishop, who executed enormous works to cause the Loire to flow under the walls of the castle. After being several times subdued by Charlemagne, Brittany revolted under his successors, and Nominod, proclaimed king in 842, ordered the fortifications of Nantes to be razed because it had sided with Charles the Bald. The Franks and Bretons met at Nantes in 943, under Charles the Fat. Another time began the rivalry between Nantes and Rennes, whose contests disputed the sovereignty of Brittany. Pierre de Dreux, declared duke of Brittany by Philip Augustus, made Nantes his capital,
NANTICOKE

surrounded it with fortifications and defended it valiantly against John of England. During the Breton wars of succession Nantes took part first with Jean de Montfort, but afterwards with Charles of Blois, and did not open its gates to Montfort till his success was assured and his English allies had retired. In 1560 Francis II. granted Nantes a communal constitution. In the course of the 15th and 16th centuries the city suffered from several epidemics. Averse to Protestantism, it joined the League along with the duke of Mercur, governor of Brittany, who helped to raise the country into an independent duchy; and it was not till 1598 that it opened its gates to Henry IV., who granted the city the edict of Nantes at the accession of Henry IV. in 1589 was followed by deep depression, when it was found that not only did he adopt the Roman Catholic faith, but that his efforts to repress their grievances were singularly ineffectual. In 1594 they took determined measures to protect themselves; in 1597, the war with Spain being practically over, long negotiations took place between the king and his representatives, prominent among whom was the historian J. A. de Thou, and at last the edict was drawn up. It consisted of 95 general articles, which were signed by Henry at Nantes on the 15th of September, 1598, and 96 other supplementary articles, signed on the end of May. The main provisions of the edict of Nantes may be briefly summarized under six heads: (1) It gave liberty of conscience to the Protestants throughout the whole of France. (2) It gave to the Protestants the right of holding public worship in those places where they had had it in the year 1576 and in the earlier part of 1577; also in places where this freedom had been granted by the edict of Poitiers (1577) and the treaties of Nérac (1579) and of Félix (1580). The Protestants could also worship in two towns in each bailliage and sub-duchy. The greater nobles could hold Protestant services in their houses; the lesser nobles could do the same, but only for gatherings of not more than thirty people. Regarding Paris, the Protestants could conduct worship within five leagues of the city; previously this prohibition had extended to a distance of ten leagues. (3) Full civil rights were granted to the Protestants. They could trade freely, inherit property and enter the universities, colleges and schools. All official positions were open to them. (4) To deal with disputes arising out of the edict a chamber was established in the parliament of Paris (le chambre de l'édit). This was to be composed of ten Roman Catholic, and of six Protestant members. Chambers for the same purpose, but consisting of Protestants and Roman Catholics in equal numbers, were established in connexion with the provincial parlements. (5) The Protestant pastors were to be paid by the state and to be freed from certain burdens, their position being made practically equal to that of the Roman Catholic clergy. (6) A hundred places of safety were given to the Protestants for eight years, the expenses of garrisoning them being undertaken by the king.

NANTES, EDICT OF

NANTES, EDICT OF NANTICOKE

In many ways the terms of the edict were very generous to the Protestants, but it must be remembered that the liberty to hold public worship was made the exception and not the rule; this was prohibited except in certain specified cases, and in this respect they were less favourably treated than they were under the arrangement made in 1576.

The edict was greatly disliked by the Roman Catholic clergy and their friends, and a few changes were made to conciliate them. The parlement of Paris shared this dislike, and succeeded in reducing the number of Protestant members of the chambre de l'édit from six to one. Then cajled and threatened by Henry, the parlement registered the edict on the 25th of February 1599. After similar trouble it was also registered by the provincial parlements, the last to take this step being the parlement of Rouen, which delayed the registration until 1600.

The strong political position secured to the French Protestants by the edict of Nantes was very objectionable, not only to the ardent Roman Catholics, but also to more moderate persons, and the payments made to their ministers by the state were viewed with increasing dislike. Thus about 1660 a strong movement began for its repeal, and this had great influence with the king. In 1685 another edict was drawn up, which deprived the Protestants of their rights under the edict; their position was rendered intolerable by a series of persecutions which culminated in the dragonnades, and at length an edict of 1683 Louis revoked the edict, thus depriving the Protestants in France of all civil and religious liberty.

This gave a new impetus to the emigration of the Huguenots, which had been going on for some years, and England, Holland and Brandenburg received numbers of thrifty and industrious French families.

The history of the French Protestants, to which the edict of Nantes belongs, is dealt with in the articles FRANCE; HISTORY, and HUGUENOTS. For further details about the edict see the papers and documents published as Le Troisième centenaire de l'édit de Nantes (1898); Arr. Pau, Histoire du Protestantisme français (Paris, 1894); H. M. Baird, The Huguenots and the Revocation of the Edict of Nantes (London, 1895); C. Benoist, La Condition des Protestants sous le règne de l'édit de Nantes et après sa révocation (Paris, 1900); A. Lods, L'édit de Nantes devant le parlement de Paris (1899); and the Bulletin historique et littéraire de la Société de l'Histoire du Protestantisme Français.

NANTEUIL, ROBERT (1623-1675), French line-engraver, was born about 1623, or, as other authorities state, in 1630, the son of a merchant of Reims. Having received an excellent classical education, he studied engraving under his brother-in-law, Nicholas Regnasson; and, his crayon portraits being noticed, he was appointed engraver to the cabinet by Louis XIV. He was also appointed designer and engraver of the cabinet to that monarch. It was mainly due to his influence that the king granted the edict of 1660, dated from St Jean de Luz, by which engraving was pronounced free and distinct from the mechanical arts, and its practitioners were declared entitled to the privileges of other artists. He died at Paris in 1678. The plates of Nanteuil, several of them approaching the scale of life, number about three hundred. In his early practice he imitated the technique of his predecessors, working with straight lines, strengthened, but not curved, in the style of Regnasson; but he then went on in other prints cross-hatching like Regnasson, or stippling in the manner of Jean Boulanger; but he gradually asserted his full individuality, modelling the faces of his portraits with the utmost precision and completeness, and employing various methods of touch for the draperies and other parts of his plates. Among the finest works of his fully developed period may be named the portraits of Pomponne de Bellièvre, Gilles Ménage, Jean Loret, the duc de la Meilleraye and the duchess de Nemours. A list of his works will be found in Dumesnil's Le Peintre-graveur français, vol. iv.

NANTICOKE, a borough of Luzerne county, Pennsylvania, U.S.A., on the North Branch of the Susquehanna river, opposite West Nanticoke, and 8 m. S.W. of Wilkes-Barre. Pop. (1880), 3884; (1890), 10,044; (1900), 12,116, of whom 5955 were foreign-born; (1910 census) 18,877. It is served by the Pennsylvania, the Delaware, Lackawanna & Western and the
Central of New Jersey railways, and by an interurban electric line. Nantucket is situated in the antarctic coal region, is surrounded by mines, and its Industries consist chiefly in mining and shipping coal; it also has various manufacturing establishments, and in 1905 the factory product was valued at $32,500. Nantucket was laid out in 1793, and was incorporated as a borough in 1874. The name is that of a Algonquin tribe of Indians, conspicuous for their dark complexion, who originally lived in Maryland, were conquered by the Iroquois in 1678 and subsequently scattered; the main body removed to lands along the eastern branch of the Susquehanna, where some of them became merged with the Iroquois, and others removed to the Ohio and became merged with the Delaware.

**NANTUCKET** is a city and township (coextensive) of Massachusetts, U.S.A. Its principal part is an island of the same name, 28 m. S. of Cape Cod peninsula; it also includes the island of Tuckernuck, which has an area of 1.97 sq. m., and is used for sheep grazing; Muskeget Island, which has excellent hunting, and of which about one-half is a public park; and the Gravel Islands and other islets. Pop. of the county (1905 state census), 3930; (1910) 2962.

The island, with a minimum length of 15 m., an average width of 2.3 m., and an area of about 47 sq. m., has a coast-line of 88 m. of shore, separated by a narrow channel, but is separated from the mainland by Nantucket Sound, which 2 to 3 m. and has a maximum depth of 50 ft. The surface of Nantucket Island is open, nearly treeless, with a few hills, the highest being 91 ft. above sea-level. The soil is sandy but affords good pasture in some places, and has been farmed with some success; the flora is rich, and includes some rare species. There are a score of fresh-water ponds, the largest being Hummock (320 acres). Copan (21 acres) was, at the time of the first settlement, a bay and the commonly used harbour, but the present harbour (6 m. long) is that formed by Coatue Beach, a long narrow tongue of land, which, with the island, is separated from the mainland. Coatue Beach is known as Coskata Beach, and curves to the N.W.; near its tip is Great Point, where a lighthouse was first built in 1784. There have been many terrible wrecks on the coast, and there are life-saving stations on Muskeget Island, near Maddaket, at Surfside and on Coskata Beach. At the W. end of the island is Tuckernuck Bank, a broad submarine platform, on whose edge are the island of Tuckernuck, on which is a village of the same name, and Muskeget Island. In the S.E. extremity of Nantucket Island is Siasconset (locally 'Sconset'), a summer resort, and it has a station, connecting with incoming steamers, the Nantucket shallop lightship and the mainland. On a bluff on the S. is the small village of Surfside. Other hamlets are Maddaket, at the W. end of the island; and Polpis, Quidnet and Wauwinet (at the head of Nantucket harbour) in its E. part.

The principal settlement and summer resort is the town of Nantucket (on the S.W. end of the harbour), which is served by steamers from New Bedford, Martha's Vineyard and Wood's Hole, and is connected with Siasconset by a primitive narrow-gauge railway. Here there are large summer hotels, old residences built in the prosperous days of whaling, old lean-to houses, old graveyards and an octagonal towered windmill built in 1746. There are two libraries; one founded in 1836, and now a public library in the Athenaeum building; and the other in what is now the School of Industrial and Manual Training (1904), founded in 1827 as a Lancastrian school by Admiral Sir Isaac Coffin (1759-1839), whose ancestors were Nantucketmen. The Jethro Coffin House was built in 1686, according to tradition; the Old North Vestry, the first Congregational meeting-house, built in 1711, was moved within the 19th century, and again in 1834 to its present site on Benjamin Hill. The old South Church Tower, a steeple and clock tower, 144 ft. above sea-level, has a fine Portuguese bell, made in 1810. Another old house, built in 1725, was the home of Elihu Coleman, an anti-slavery minister of the Society of Friends, who were very strong here until the close of the first quarter of the 19th century. Near the old Friends' School is the building of the Nantucket Historical Society, which has a collection of relics. Nantucket was the home of Benjamin Franklin's mother, Abiah, whose father, Peter Folger, was one of the earliest settlers (1663); of Maria Mitchell, and of Lucretia Mott, prominent in the women's rights movement. The northern part of Coskata Island is being used for a whaling museum, and only drift- and shore- or boat-whaling had been carried on—the shore fishery died out about 1760. In 1757 whaling was the only livelihood of the people of Nantucket; and in 1750-1775, although whaling fleets were in repeated danger from French and Spanish privateers, the business, with the allied cooperers and other trades, steadily increased. In 1775 the Nantucket fleet numbered 150, and the population was between 5000 and 6000, about 96% being Quakers; but by 1785 the fleet had been shattered, 134 ships being destroyed or captured during the war. Though Nantucket was a subject for whaling, it had been a point on the Dutch Antwerp-Rotterdam-Hamburg trade, and the British market was closed by a duty of £18 a ton on oil; a bounty offered by the Massachusetts legislature (£5 on white and £3 on yellow or brown spermaceti, and £2 on whale-oil per ton) was of slight assistance. During the war of 1812 the Nantucket fleet was the only one active; it suffered severely during the war, and in the decade 1820-1830 Nantucket lost its primacy to New Bedford, whose fleet in 1830 was twice as large. Nantucket's last whaler sailed in 1869. Subsequently the island has been chiefly important as a summer resort.

Title to Nantucket and the neighbouring islands was claimed under grants of the Council for New England both by William Alexander, Lord Stirling, and by Sir Ferdinando Gorges. Lord Stirling's agent sold them in 1641 to Thomas Mayhew (1592-1682) of Watertown, Mass., and his son Thomas (c. 1616-1657) for £40, and a little later the elder Mayhew obtained another deed for Martha's Vineyard from Gorges. In 1659 the elder Mayhew sold a joint interest in the greater part of the island of Nantucket for £20 and two beaver hats to nine partners; early in the following year the first ten admitted ten others as partners, and the island was divided into 'runs'. Some special grants were made to the runners; but in 1672, after the Revolution, special half-grants were offered to tradesmen. The original twenty proprietors, however, endeavoured to exclude the tradesmen from any voice in the government, and this caused strife. Both factions appealed to the governor of New York, that province having claimed jurisdiction over the islands under the grant to the duke of York in 1664, and, becoming increasingly dissatisfied with that government, sought a union with Massachusetts until the islands were annexed to that province by its new charter of 1691. The town of Nantucket was settled in 1661 and was incorporated in 1711. By order of Governor Francis Lovelace it was named Sherburne in 1673, but in 1755 the present name was adopted. Its original site was Maddaket on the W. end of the island; in 1672 it was moved to its present site, then called Wescooe. When counties were first organized in New York, in 1683, Nantucket and the neighbouring islands were erected into Dukes county, but in 1695, after annexation to Massachusetts, Nantucket Island, having been set apart from Dukes county, constituted Nantucket county, and in 1713 Tuckernuck Island was annexed to it.

NANTWICH—NAPHTHALENE

NANTWICH, a market town in the Crewe parliamentary division of Cheshire, England, 161 m. N.W. of London, on the London & North-Western and Great Western railways. Pop. of urban district (1901) 7772. It lies on the river Weaver, in the upper part of its flat, open valley. The church of St Mary is a remarkable building, containing the Decorated and Perpendicular periods, with a central octagonal tower. The fine old carved stalls are said to have belonged to Vale Royal Abbey, near Winsford in this county. Nantwich retains not a few old timbered houses of the 16th and 17th centuries, but the town as a whole is modern in appearance. The grammar school was founded in 1611. The salt industry, still the staple of several towns lower down the vale of the Weaver, was so important here in the time of Henry VIII. that there were three hundred salt-works. Though this industry has lapsed, there are brine baths, much used in cases of rheumatism, gout and general debility, and the former private mansion of Shrewbridge Hall is converted into a hotel with a spa. Nantwich has tanneries, a manufacture of boots and shoes, and clothing factories; and corn-milling and iron-founding are carried on. The town is one of the best hunting centres in the county, being within reach of several meets.

From the traces of a Roman road between Nantwich and Middlewich, and the various Roman remains that have been found in the neighbourhood, it has been conjectured that Nantwich was a salt-town, and that much of this town was once a salt-works. The Domesday Survey contains a long account of the laws, customs and values of the town at that period, which were by far the most profitable in Cheshire. The town is sometimes divided into the two liberties of Chester and certain resident freemen of the neighbourhood. The name of the town appears variously as Wych Manbank, Wie Malbank, Nantwich, Lache Mauban, Wysmanbank, Wych Manbous, Napatich, Naptewiche. About the year 1190 William Malbedeng or Malbank was created baron of Nantwich, which barony he held of the earl of Chester. In the 13th century the barony fell to three daughters and co-heiresses, and further subdivisions followed. The lands of these heiresses accounts for the large estates belonging to Nantwich as a corporate town. The only town charter is one of 1557-1568, in which Queen Elizabeth confirms an ancient privilege of the town that they should not be upon assizes or juries with strangers, relating to matters outside the town. It is stated that the charter which the right to this privilege had been proved by an inquisition taken in the 14th century, and had then already been held from time immemorial. There was a gild merchant and also a town bailiff, but the latter office was of little real significance and was soon dropped. There is documentary evidence of a castle at Nantwich in the 13th century. There is a weekly market on Saturday, held in the market-place. In 1583 a three-days fair to be held at the feast of St Bartholomew was granted to Robert Burrell, bishop of Bath and Wells (then holder of a share of the barony of Nantwich). The market and fair take place the first week in September. Earl Cholmondeley received a grant of two fairs in 1732. Fairs are now held on the first Thursday in April, June, September and December, and a cheese fair on the first Thursday in each month except January. The salt trade declined altogether in the 18th century, with the exception of one salt-works, which was kept open until 1856. There was a shoe trade in the town as early as the 17th century, and gloves were made from the end of the 16th century until about 1863. Weaving and stocking trades also flourished in the 18th century. The one corn-mill of Nantwich was converted into a cotton factory in 1789, but was closed in 1874. See James Hall, A History of Nantwich or Wich Malbank (1883).

NAOBOJI, DADABHAI (1825-1897), Indian politician, was born at Nasik on the 4th of September 1825, the son of a Parsi priest. During a long and active life, he played many parts: professor of mathematics at the Elphinstone college (1854); founder of the Rast Gafr newspaper; partner in a Parsi business firm in London (1855); prime minister of Baroda (1874); member of the Bombay legislative council (1885); M.P. for Central Finsbury (1892-1895); being the first Indian to be elected to the House of Commons; three times president of the Indian National Congress. Many of his numerous writings are collected in a Festschrift and Un-British Rule in India (1901).

NAP, a soft fibre obtained from the stems, leaves, and fruits of certain plants, and from the milk of sheep and goats. Naphtha, naphthrene, naphta, or napthene is the modern name of this substance. Small samples of it have often been used for the treatment of ulcers, with自称; but the whole power of the word was applied to the roughness on textiles before shaving. "Nap" in this sense appears in many Teutonic languages, cf. Ger. Noppe, Dutch nap, Nor. nopp; the verbal form is noppa or noppa, to trim, cut short. The word nap also means a short sleep or doze (O. Eng. hosepien). In "napkin," a square of damask or other linen, used for wiping the hands and lips or for protecting the clothes at meals, the second part is a common English suffix, sometimes of diminutive force, and the first part is from "nap." 1 Low Lat. naphe, naphe, a corrupt form of nap, table-cloth. Nape still survives in "napery," a name for household linen in general.

NAPHTALI, in the Bible, the name of an Israelite tribe, the "son" of Jacob by Bilhah, Rachel's maid, and the uterine brother of Dan (Gen. xxx. 8). It lay to the south of Dan in the eastern half of upper Galilee (Josh. xix. 32-39), a fertile mountainous district (cf. Gen. xlix. 21; Deut. xxxiii. 23), open to the surrounding influences of Phoenicia and Aram. Apart from its share in the war against Sisera (Judg. iv. seq., see Deborah), little is known of it. It evidently suffered in the bloody conflicts of Damascus with Israel (1 Kings xv. 20), and was depopulated by Tiglath-pileser IV. (2 Kings xv. 29; Isa. ix. 1). Naphtali and Dan are "brothers," perhaps partly on geographical grounds, but Dan also had a seat in the south (south-west of Ephraim), and the name of the "mother" Bilhah is apparently connected with Bilhan, an Edomite and also a Benjamite name (Gen. xxxvi. 27; 1 Chron. vii. 10).

The view connecting Naphtali (perhaps a geographical rather than a tribal term), or rather its Israelite inhabitants, with the south (then Palestine) is discussed by H. W. Hogg, Ency. Bib. iii. col. 3332 seq. with references.

NAPHTHA, a word originally applied to the more fluid kinds of petroleum, issuing from the ground in the Baku district of Russia and in Persia. It is the naphtha of Dioscorides, and the naphtha, or bitumen liquidum candidum of Pliny. By the alchemists the word was used principally to distinguish various highly volatile, mobile and inflammable liquids, such as the ethers, sulphuric ether and acetic ether having been known respectively as naphtha sulphurici and naphtha acetic.

The term is now seldom used, either in commerce or in science, without a distinctive prefix, and we thus have the following:

1. Coal-tar Naphtha.—A volatile commercial product obtained by the distillation of coal tar (see COAL-TAR).

2. Shale Naphtha.—Obtained by distillation from the oil produced by the destructive distillation of bituminous shale (see PARAFFIN).

3. Petroleum Naphtha.—A name sometimes given (e.g. in the United States) to a portion of the more volatile hydrocarbons distilled from petroleum (see PETROLEUM).

4. Wood Naphtha.—Methyl alcohol (q.v.).

5. Bone Naphtha.—Known also as bone oil or Dippel's oil. A volatile product of offensive odour obtained in the carbonization of bones for the manufacture of animal charcoal.

6. Coal-tar or coal-tar naphtha, a volatile product obtained by the destructive distillation of rubber.

(B. R.)

NAPHTHALENE, C₆H₅, a hydrocarbon discovered in the "carbolic" and "heavy oil" fractions of the coal-tar distillate (see COAL-TAR) in 1819 by A. Garden. It is a product of the action of heat on many organic compounds, being formed when the vapours of ether, camphor, acetic acid, ethylene, acetylene, &c., are passed through a red-hot tube (M. Berthelot, Jahresr., 1851), or when petroleum is led through a red-hot tube packed with charcoal (A. Letny, Ber., 1878, 11, p. 1210). It may be synthesized by passing the vapour of phenyl butyline bromide over heated soda line (B. Aronheim, Ann., 1874, 171, p. 219), and by the action of ortho-xylene on sodium ethylene tetrahydroxystyrene see the final distillation of tetrahydroxystyrene. The resulting tetrahydroxystyrene being hydrolysed and heated, when it yields hydroxystyrene diacetyl acid, the silver, salt of which decomposes on distillation into napthylene and other products (A. v. Baeyer and W. H. Perkin, junr., Ber., 1884, 17, p. 515):
It is a colourless solid, which melts at 86°C, and boils at 218°C. It crystallizes in the monoclinic system; it is to be noted that a- and β-naphthol assume almost identical forms, so that these three compounds have been called isomeric naphthols. It is insoluble in water, but is readily soluble in alcohol, and other organic solvents. A characteristic smell, and is very volatile, distilling readily in a current of steam. It acts as a weak antiseptic. It is used for enriching coal gas, as a vermin killer, in the manufacture of certain azo dyes, and in the preparation of phthalic acid (q.v.). When passed through a red-hot tube packed with carbon it yields β-quinonyl (C₆H₄O₂). It forms a crystalline compound with picric acid. It readily forms addition products with chlorine and with hydrogen; the dichloride, C₆H₅Cl₂, is obtained as a yellow liquid by acting with hydrochloric acid and potassium chloride. The solid, formed from C₂H₅OH and C₆H₅Cl, remains when chlorine is passed into naphthalene dissolved in chloroform. Numerous hydrides are known; they are used with red phosphorus and hydriodic acid the hydrocarbon yields mixtures of hydrates of composition C₆H₄H₂ to C₆H₄H₆. Sodium in boiling ethyl alcohol gives the α-dihydrate, C₆H₅OH (E. Bamberger, Ber., 1887, 20, p. 1705); and with boiling amyl alcohol the β-tetrahydric, C₆H₄H₆ (E. Bamberger, Ber., 1890, 23, p. 1501). The α-tetrahydro-naphthalene is formed when naphthalene is heated with phosphoric iodide at 170°-190° (A. v. Bayer). Structurally naphthalene may be represented as a fusion of two benzene nuclei, the hydrogen atoms being numbered as in the inset.

\[

\end{array}
\]

1-5 or 4-8 di-derivatives are known, whilst 1-8 or 4-5 are peri (see Chemistry, Organic).

α-Nitro-α-naphthylamine, C₆H₅NO₂, is formed by the direct nitration of naphthalene. For further preparation see O. Witt, Die Chemische Industrie, 1887, 10, p. 215. It crystallizes in yellow needles, which melt at 61°C, and are readily soluble in alcohol. By the action of nitro-sulphuric acid it is converted into a mixture of 1,5- and 1,8-dinitronaphthalenes (P. Friedlander, Ber., 1899, 32, p. 3531). When heated with aniline and its salts it yields phenylresorcinol (German patent 67339 (1888)). α-Nitroα-naphthylamine is prepared by acting with ethyl nitrite on an alcoholic solution of 2-nitro-α-naphthylamine in the presence of sulphuric acid (E. Lellmann and A. Remy, Ber., 1886, 19, p. 237), or with freshly prepared potassium cupronitrite on β-naphthalene diazoniun sulphate (A. Hantzsch, Ber., 1895, 28, p. 355). α-Naphthylamine is a crystalline solid which melts at 78°C and is volatile in steam.

**Sulphonic Acids.**—Two monosulphonic acids (α and β) result by acting with sulphuric acid on the hydrocarbon, the α-acid predominating (Essig and coworkers), and the β-acid at higher temperatures (170°-200°C). They are crystalline, hydroscopic compounds and are employed for the manufacture of the naphthols. Numerous di- and tri-sulphonic acids are known. α-Naphthylbenzene-sulphonic acid, C₆H₅C₆H₄-SO₃H, is formed by the oxidation of many α-derivatives of naphthalene with chromic acid. It crystallizes in yellow needles which melt at 125°C. It sublimes readily, is volatile in steam and reduces to the corresponding dihydroxy-naphthalene. β-Naphthoquinone is formed by oxidizing 2-amino-α-naphthol (from β-naphthol-orange by reduction) with ferric chloride. It crystallizes in red needles, which melt at 115°C; it has no smell and is non-volatile (cf. phenantrenequinone). Alizarin black, C₆H₄(OH)-O-Na₂SO₄, the sodium bisulphite compound of 7,8-dioxo-naphthelenedicarboxylic acid (Allen and coworkers), is a dyestuff used for printing on cotton in the presence of a chromium mordant. The naphthoquinone is prepared by the action of zinc and concentrated sulphuric acid on α-dinitronaphthalene. 6-6 sulphonates on oxidizing 2-6-dihydronaphthalene with lead peroxide.

**Naphthols, or Hydroxynaphthalenes,** C₆H₅OH, the naphthalene homologues of the phenols. The hydroxy group is more reactive than in the phenols, the naphthols being converted into naphthylamines by the action of ammonia, and forming ethers and esters much more readily.

α-Naphthol may be prepared by fusing sodium-α-naphthylate sulphonate with caustic soda; by heating α-naphthylamine sulphate with water to 200°C (English Patent 143501 (1892)); and by heating phenyl isocrotonic acid (R. Fitting and H. Erdmann, Ann., 1885, 227, p. 243): C₆H₅CH:CH₂CO₂H = C₆H₅OH + H₂O. It forms colourless needles which melt at 94°C; and is readily soluble in alcohol, ether, chloroform, and caustic alkalis. It is volatile in steam. With ferric chloride it gives a dark-blue precipitate of α-dinitophenol, HO-C₆H₅-C₆H₅-OH. It melts potassium permanganate and oxidizes it to phenyl-glyoxyl-ortho-carboxylic acid, HO₂C-C₆H₅-CO₂H. It is reduced by sodium in boiling amyl alcohol solution to "aromatic" tetrahydro-α-naphthol (reduction occurring in the ring which does not contain the hydroxyl group). When heated with hydrazine hydrate at 160°C it gives α-naphthyl hydrazine, C₆H₅-NH-NH₂ (L. Hoffmann, Ber., 1898, 31, p. 2906). Nitric acid converts it into nitro-compounds, which are occasionally used for dyeing silk and wool.

**Martius yellow,** C₆H₅(NO₂)₂-ONa·H₂O, the sodium salt of 2,6-dinitro-α-naphthol (for notation see *Naphthaleine*), is prepared by the action of nitric acid on α-naphthol-2,4-disulphonic acid. It forms orange-yellow plates and dyes wool a golden yellow (from an acid bath). Naphthylamine, C₆H₅(NH₂)ONa, prepared by the action of nitric acid on α-naphthol-2,4,7-trisulphonic acid, is an orange-yellow powder which dyes wool and silk yellow (from an acid bath).

Numerous mono- and disulphonic acids of β-naphthol are employed in the preparation of azo dyes. The most important is *Neville and Wetnir's acid,* C₆H₅(OH)·SO₃H·(1:4), formed when diazotized naphtholic acid (α-naphthylamine-α-sulphonic acid) is boiled with dilute sulphuric acid (Nevile and Wetnir, Ber., 1880, 13, p. 1949), or when sodium naphtholate is heated with concentrated caustic soda solution under pressure at 240°-260°C (German patent 86550 (1883)). It melts at 170°C, and is readily soluble in water. With ferric chloride it gives a blue coloration.

β-Naphthol, C₆H₅OH, prepared by fusing sodium β-naphthylate sulphonate with caustic soda, crystallizes in plates which melt at 122°C. With ferric chloride it gives a green colouration, and after a time a white flocculent precipitate of a naphthol. With sodium in boiling amyl alcohol solution it mixes a mixture of alicyclic and aromatic tetrahydro-β-naphthols (E. Bamberger, Ber., 1890, 23, p. 197). When heated with ammonium formate to 150°C it forms β-naphthylamine. With nitrosodimethylaniline hydrochloride it forms Meldola's Blue (dimethyldi- or dimethylbenzoxazolyl chloride), C₆H₅N₂Cl (R. Meldola, Ber., 1870, 12, p. 2065).

The β-naphthol sulphonic acids find extensive application in the colour industry. The most important members are shown in the table:

Nitroso-naphthols or nitrosoquinone-oximes, C₆H₅OH(NO)₂ or C₆H₅(NO)₂-ONa·H₂O. Two are known, namely 4-nitroso-α-naphthol or...
NAPHTHYLAMINES—NAPIER, SIR C. J.

**α-naphthoquinone-oxime**, formed by the action of nitrous acid on α-naphthol or of hydroxylamine hydrochloride on α-naphthoquinone (H. Goldschmidt and H. Schmidt, Ber., 1884, 17 p. 2064); and 2-nitro-α-naphthol (β-naphthoquinone-oxime), formed by the action of hydroxylamine hydrochloride on β-naphthoquinone.

**NAPHTHYLAMINES**, or AMINONAPHTHALENES, C₁₈H₁₈N₂, the naphthalene homologues of aniline, in contrast to which they may be prepared by heating the naphthols with ammonium-zinc chloride.

α-**Naphthylamine** is prepared by reducing α-nitronaphthalene with hydrochloric acid at about 70° C., the reaction mixture being neutralized with milk of lime, and the naphthylamine steam-distilled. It may also be prepared (in the form of its acetyl derivative) by heating α-naphthol with sodium acetate, ammonium chloride and acetic acid (A. Calm, Ber., 1882, 15, p. 616); by heating α-naphthol with calcium chloride-ammonia to 270° C.; and by heating pyromuric acid, aniline, zinc chloride and lime to 300° C. (F. Canzonomi and V. Oliveri, Gazz., 1886, 16, p. 493). It crystallizes in colourless needles which melt at 50° C. It possesses a disagreeable faecal odour, sublimes readily, and turns brown on exposure to air. Oxidizing agents (ferric chloride, etc.) give a blue precipitate with solutions of its salts. Chronic conversion converts it into α-napthoquinone. Sodium in boiling amyl alcohol reduces it to aromatic tetrahydro-α-naphthylamine, a substance having the properties of an aromatic amine, for it can be diazotized and does not possess an ammoniacal smell. Since it does not form an addition product with bromine, reduction must have taken place in one of the nuclei only, and on account of the aromatic character of the compound it must be in that nucleus which does not contain the amino group. This tetrahydro compound yields acidic acid, (CH₂)₃(CO₂H), when oxidized by potassium permanganate. The nitro-naphthylamine sulphonates are used for the preparation of azo dyes, these dyes possessing the important property of dyeing unmordanted cotton. The most important is **naphthonic acid**, α-amino-4-sulphonic acid, produced by heating α-naphthylamine and sulphuric acid to 170-180° C. with about 3% of crystallized oxalic acid. It forms small needles, very sparingly soluble in water. With diazotized benzidine it gives Congo red.

β-**Naphthylamine** is prepared by heating β-naphthol with zinc chloride-ammonia to 200-210° (V. Merz and W. Welth, Ber., 1880, 13, p. 130); or in the form of its acetyl derivative. By heating β-naphthol with ammonium acetate to 270-280° C. It forms odourless, colourless plates which melt at 131-132° C. It gives no colour with ferric chloride. When reduced by sodium in boiling amyl alcohol solution it forms alicyclic tetrahydro-β-naphthylamine, which has most of the properties of the aliphatic amines; it is strongly alkaline in reaction, has an ammoniacal odour and cannot be diazotized. On oxidation it yields ortho-sulpho-carboxydicyanimic acid, HO₄C-C₆H₄-CH₂-C₆H₄-CO₂H. Numerous sulphonic acids derived from β-naphthylamine are known, the more important of which are the β- or Badische, the 2- or Døhler, the 2- or Døhler, and the 2- or Døhler. Of these, the β- and Bronner's acid are of more value technically, since they combine with ortho-tetradecydytol to produce fine red dye-stuffs.

**NAPIER, SIR CHARLES** (1786-1860), British admiral, was the second son of Captain the Hon. Charles Napier, R.N., and grandson of Francis, fifth Lord Napier. He was born at Merchiston Hall, near Falkirk, on the 6th of March 1786. He became a midshipman in 1800, and was promoted lieutenant in 1805. He was appointed to the "Courageux" (74), and was present in her at the action in which the squadron under Sir J. B. Warren took the French "Marengo" (60) and "Telle Poupée" (40), on the 13th of March 1806 in the West Indies. After returning home with Warren he went back to the West Indies in the "St George" and was appointed acting commander of the "Pultusk" brig. The rank was confirmed on the 30th of November 1807. In August 1808 he was moved into the "Re- cru" (18), and in her fought an action with the "Diffident" (18), in which his thigh was broken. In April 1809 he took part in the capture of the "Hautpoul" (74), and was promoted acting post captain. His rank was confirmed, but he was put on half-pay, when he came home with a convoy. He spent some time at the university of Edinburgh, and then went to Portugal to visit his cousins in Wellington's army. In 1811 he served in the Mediterranean, and in 1813 on the coast of America, and in the expedition up the Potomac. The first years of his leisure he spent in Italy and in Paris, but speculated so much in a steamboat enterprise that by 1827 he was quite ruined. In that year he was appointed to the "Galatea" (42), and was at the Azores when they were held by the count de Villa Flor for the queen of Portugal. He so much impressed the constitutional leaders that they begged him to take command of the fleet, which offer he accepted in February 1834. With it he destroyed the Miguelite fleet off Cape St Vincent on July 5, and on the demand of France was struck off the English navy list. Continuing his Portuguese services, he commanded the land forces on the successful defense of Lisbon in 1834, when he was made Grand Commander of the Tower and Sword, and Count Cape St Vincent in the peacetime of Portugal. On his return to England he was restored to his former rank in the navy 1836, and received compensation in the form of the "Herald" (44). When the war broke out in Syria he was appointed second in command, and distinguished himself by leading the storming column at Sidon on September 26, 1840, and by other services, for which he was made a K.C.B. He went on half-pay in 1844, and was in 1842 elected M.P. for Marylebone in the Liberal interest, but lost his seat in 1846. He was promoted rear-admiral the same year, and commanded the Channel fleet from 1846 to 1848. On the outbreak of the Russian War he received the command of the fleet destined to act in the Baltic, and hoisted his flag in February 1854. He refused to attack Cronstadt, and a great outcry was raised against him for not obeying the orders of the Admiralty and attempting to storm the key of St Petersburg; but his inaction has been thoroughly justified by posterity. On his return in December 1854 he was not again offered a command. He was elected M.P. for Southwark in February 1855, and maintained his seat, though broken in health, until his death on the 6th of November 1860. Sir Charles Napier was a man of undoubted energy and courage, but of no less eccentricity and vanity. He caused great offence to many of his brother officers by his behaviour to his superior, Admiral Stopford, in the Syrian War, and was embroiled all his life in quarrels with the Admiralty. See Major-General E. Napier's *Life and Correspondence of Admiral Sir Charles Napier, K.C.B.* (2 vols., London, 1862); Napier's own *War in Syria* (2 vols., 1842); *The Navy: its past and present state, in a series of letters, edited by Sir W. F. F. Napier* (1851); and the *Letters on the Battle of the Dardanelles and other matters furnished by Vice-Admiral Sir C. Napier, K.C.B.* (1857). See also *The Life and Exploits of Commodore Napier* (1841); and *Life of Vice-Admiral Sir C. Napier* (1854).

**NAPIER, SIR CHARLES JAMES** (1782-1853), British soldier and statesman, was born at Whitehall, London, in 1782, being the eldest son of Colonel George Napier (a younger son of the fifth Lord Napier), and of his wife, the Lady Sarah Lewin, who had charmed King George III. After the custom of those times Charles Napier had been gazetted an ensign in the 33rd regiment in 1794, and in 1797 his father secured for him the appointment of aide-de-camp to Sir James Duff, commanding the Limerick district. Longing for more active service, Napier obtained a commission as lieutenant in the 95th Manneding's Rifles (Rifle Brigade) in 1800. This newly formed corps was designed to supply a body of light troops for the English army fit to cope with the French voltigeurs and tirailleurs, and was specially trained, at first under the eye of Colonel the Manneding, and then at Shorncliffe under the immediate supervision of Sir John Moore. Moore speedily perceived the military qualities of the Napiers, and inspired the three brothers—Charles of the Rifles, George of the 52nd and William of the 43rd—with an enthusiasm which lasted all their lives; but, though happy in his general, Charles Napier quarrelled bitterly with William Stewart, the lieutenant-colonel, and in 1803 left the regiment to accompany General H. E. Fox to Ireland as aide-de-camp. The great influence of his uncle, the duke of
Richmond, and of his cousins, Charles James Fox and the general, procured him in 1804 a captaincy in the staff corps, and in the beginning of 1806 a majority in the Cape regiment. On his way to the Cape, however, he exchanged into the 50th regiment, with which of the patriot party. From Corfu he went to Lord Cathcart in 1807. Shortly after his return from Denmark the 50th was ordered to Portugal, and in command of it Napier shared all the glories of the famous retreat to Corunna. At the battle of Corunna, one of the last sights of Sir John Moore before he fell mortally wounded was the advance of his own old regiment under the command of Charles Napier and Edward Stanhope, and almost his last words were "Well done, my majors!" The 50th suffered very severely and both the majors were left for dead upon the field. Napier's life was saved by a French drummer nothwithstanding. From Corunna he went to the headquarters of Marshal Soult. Soult treated him with the greatest kindness, and he was allowed by Ney to return to England to his "old blind mother" instead of being interned. After about a year he heard that his exchange had been arranged, and, volunteering for the Peninsula, he joined the light division before Ciudad Rodrigo. As a volunteer he served in the actions on the Coa, and again at Busaco, where he was badly wounded in the face. He was ordered to England, but refused to go, and in March 1811, though barely recovered, he hurried to the front to take part in the pursuit of Masséna. After the battle of Fuentes d'Onor, he received the command of the 12th regiment, which had become entirely demoralized at Botany Bay, and when he joined it at Guernsey in 1811 was one of the worst regiments in the service. When he left it in 1813 it was one of the best. He accompanied it in June 1812 from Guernsey to Bermuda, where he wrought a wonderful change in the spirit both of officers and men. By treating his men as friends he won their love and admiration, and became in a peculiar degree the hero of the British soldiers. After seeing further active service against the United States in September 1813 he exchanged back into the 50th regiment, and in December 1814, believing all chance of an active service to be at an end, went on half-pay. He was gazetted one of the first C.B.'s on the extension of the order of the Bath in 1814, and was present as a volunteer at the capture of Cambrai, but he just missed the great battle of Waterloo. Though an officer of some experience and more than thirty years of age, he now entered the military college at Farnham, and completed his military education. In 1819 he was appointed inspecting field officer at Corfu, in 1820 was sent on a mission to Ali Pasha at Iannina, and in 1821 visited Greece, where he became an ardent supporter of the young nation. He landed at Meeanee in 1822 to Cephalonia, where he remained for eight years as governor and military resident. He was the model of an absolute colonial governor, and showed all the qualities of a benevolent despot. He made good roads and founded great institutions, but everything must be done by him, and he showed himself averse to interference, whether from the high commissioner of the Ionian Islands, whom it was his duty to obey, or from the feudal magnates of his own little colony, over whom it was his duty to exercise strict supervision. An interesting episode in his command was his communication with Lord Byron when he touched at Cephalonia on his way to take part in the Greek War of Independence. Byron sent a letter to the Greek committee in London recommending Napier's appointment as commander-in-chief. But after many negotiations the scheme came to nothing. In 1827 Napier, who had two years before been made a colonel in the army, quarrelled with Sir Frederick Adam, the new high commissioner, and in 1830, when Napier was in England on leave, Adam seized his papers and forbade him to return. Napier thereupon, refusing promotion to the residency of Zante, retired in disgust, living for some years in the south of England and, after the death of his wife in 1833, in Normandy. Here he wrote his work on the colonies, and also an historical romance on William the Conqueror. Another work, entitled Harold, has disappeared. In 1834 he refused the governorship of Australia, still hoping for military employment. In 1837 he was promoted major-general with his brother George, in 1838 he returned to England and was made a K.C.B.; but he was to wait till 1839 before he received an offer of employment. In that year he was made commanding officer in the northern district, and found his command no shewy, owing to the turbulent state of the Chartists and the work of the destruction of the Midland. His behaviour during the tenure of his command is described by William Napier in his life of his brother, and his inability to hold a command which did not carry supreme authority is plainly portrayed. In this particular instance his sympathies were on the popular side, and, though he maintained law and order with the necessary rigour, he resigned as soon as the crisis had passed, and went to India. He was stationed at Poona, and in September 1842, when troubles were expected there, was ordered to Sind. His conduct in Sind from 1842 till August 1847 is the period of his life during which, according to his brother, he made good his title to fame, but his acts, more especially at first, have been most severely criticized. There can be little doubt that from the moment he landed in the province he determined to conquer the amirs, and to seek the first opportunity of doing so. He was to be accompanied by James Outram (q.v.), who had been resident in Sind during the Afghan War, and who felt a great admiration for him, but who had also a warm affection for the amirs, and believed that he could put off the day of their destruction. On the 15th of February 1843, Outram was treacherously assailed at Hyderabad, and on the 17th Napier attacked the Baluch army 50,000 strong with but 2800 men. With these 2800 men, including the 22nd regiment, which would do anything for him, he succeeded in winning the brilliant and decisive victory of Meeanee, one of the most amazing in the history of the British army, in which generals had to fight like privates, and Sir Charles himself engaged in the fray. In the March following, after marching without transport in the most intense heat, he finally destroyed the army of the amirs at the battle of Hyderabad. His success was received with enthusiasm both by the governor-general, Lord Ellenborough, and by the English people, and he was at once made a G.C.B. Whether or not the conquest of Sind at that particular period can be justified, there can be no doubt that Charles Napier was the best administrator who could be found for the province when conquered. Sind, when it came under English rule, was in a state of utter anarchy, for the Baluchis had formed a military government not unlike that of the Mamelukes in Egypt, which had been extremely tyrannical to the native population. This native population was particularly protected by Sir Charles Napier, who bore more respect for their existence than for the Afghan supremacy which he had commenced with the victory of Meeanee. The labour of administration was rendered more difficult by the necessity of repressing the hill tribes, which had been encouraged to acts of lawlessness by the licence which followed the Afghan War. The later years of his administration were made very stormy by the attacks on the policy of the conquest which had been made in England. He left Sind, after quarrelling with every authority of the presidency of Bombay, and nearly every authority of the whole of India, in August 1847, and received a perfect ovation on his return from all the hero-worshippers of the Napiers, of whom there were many in England. His short stay in England was occupied with incessant struggles with the directors of the East India Company; but the news of the indecisive victory of Chillianwalla created a panic in England, and the East India Company was obliged by public opinion to summon the greatest general of the day to command its armies. Sir Charles started almost at a moment's notice, but on reaching India found that the victory of Gujarat had been won and the Sikh War was over. No taint of envy was in his nature, and he rejoiced that he had not had to supersede Lord Gough in the moment of defeat. His restless and imperious spirit was met by one equally imperious in the governor-general, Lord Dalhousie. The two men were good friends until, in the absence of Dalhousie at sea, Napier took upon himself to alter the regulations regarding the allowances to native troops; the occasion was urgent, as the troops were in a state of mutiny, but on his return Dalhousie
reprimanded the commander-in-chief and reversed his decision. Napier immediately handed in his resignation, and when the duke of Wellington supported Lord Dalhousie and repeated the reprimand he returned to England. He had been credited with foreseeing the Mutiny of 1857, and on the whole with justice. On one occasion he wrote that mutiny was "one of the greatest, if not the greatest, danger threatening India—a danger that may come unexpectedly, and if the first symptoms be not carefully treated, with a power to shake Leadenhall." On the march he left behind with his troops the last remaining of it, and handed its colours over to a Gurkh regiment, thus showing that he distrusted the high-class Brahman, and recognized the necessity of relying upon a more warlike and more disciplined race. His constitution was undermined by the Indian climate, especially by his fatiguing command in Sind, and on the 29th of August 1853 he died at Portsmouth. The bronze statue of him by G. G. Adams, which stands in Trafalgar Square, London, was erected by public subscription, by far the greater number of the subscribers being, as the inscription records, private soldiers.

The chief authority for Sir Charles Napier’s life is his Life and Opinions by his brother (1857); consult also MacColl, Career and Character of C. J. Napier (1857); M’Dougall, General Sir C. J. Napier, Conqueror and Governor of Scinde (1866); W. N. Bruce, Sir Charles Napier, K. G., (1875); and Tawse, The British Army in the Crimea and India (1889). His own works are Memoir on the Roads of Ceylon (1852); The Colonies, treating of their value generally and of the Indian. Edinburgh (1853); The Administration of India, by Sir F. Adam (1853); Colonization, particularly in Southern Australia (1853); Remarks on Military Law and the Punishment of Flogging (1857); A Dialogue on the Poor Laws (1858); A Letter on the Defence of England by Corps of Volunteers and Militia (1852); Lights and Shadows of Military Life (trans. from the French, 1849); and A Letter to the Right Honourable Sir J. C. Hobhouse on the Baggage of the Indian Army (1849); Defects, Civil and Military, of the Indian Government (1851); William the Conqueror, a Historical Romance, edited by Sir W. Napier (1858). On Sind, consult primarily Sir W. Napier, The Conquest of Scinde (1843); The Administration of Sind, by Sir W. Napier (1850); and Outram, The Conquest of Scinde, a Commentary (1846). For his command-in-chief, and the controversy about his resignation, consult J. Mawson, Records of the Indian Command of General Sir C. J. Napier (Calcutta, 1851); Minutes on the Resignation of the late General Sir C. J. Napier, by Field-Marshal the Duke of Wellington, &c. (1854); Comments by Sir W. Napier on a Memorandum of the Duke of Wellington (1854); Sir William Napier, General Sir C. Napier and the Conquest of Scinde, Anecdotes of the East India Company (1857); Sir W. Loc. Warner, Life of Lord Dalhousie (1904).

NAPIER, JOHN (1550–1617), Scottish mathematician and inventor of logarithms, was born at Merchiston near Edinburgh in 1550, and was the eighth Napier of Merchiston. The first Napier of Merchiston, "Alexander Napare," acquired the Merchiston estate before the year 1438, from James I. of Scotland. He was provost of Edinburgh in 1437, and was otherwise distinguished. The subject of this article, who succeeded him in 1454, was provost of Edinburgh in 1455, 1457 and 1499; he was knighted and held various important court offices under successive monarchs; at the time of his death in 1473 he was master of the household to James III. His son, John Napier of the Rursky, the third of Merchiston, belonged to the royal household in the lifetime of his father. He also was provost of Edinburgh at various times, and it is a remarkable instance of the esteem in which the lairds of Merchiston were held that three of them in immediate lineal succession repeatedly filled so important an office during perhaps the most memorable period in the history of the city. He married a great-granddaughter of Duncan, 8th earl of Lenvenax (or Lennox), and besides this relationship by marriage the Napiers claimed a lineal male cadency from the ancient family of Lenvenax. His eldest son, Archibald Napier of Edinbelie, the fourth of Merchiston, belonged to the household of James IV. He fought at Flodden and escaped with his life, but his eldest son Alexander, (fifth of Merchiston) was killed. Alexander’s eldest son (Alexander, sixth of Merchiston) was born in 1513, and fell at the battle of Pinkie in 1547. His eldest son was Archibald, seventh of Merchiston, and the father of John Napier, the subject of this article.

In 1549 Archibald Napier, at the early age of about fifteen, married Janet, daughter of Francis Bothwell, and in the following year John Napier was born. In the criminal court of Scotland, the earl of Argyll, hereditary justice-general of the kingdom, sometimes presided in person, but more frequently he delegated his functions; and it appears that in 1561 Archibald Napier was appointed one of the justice-deputies. In the register of the court, extending over 1563 and 1564, the justice-deputies are named as "Archibald Napier of Merchistome, Alexander Bannatyne, burgess of Edinburgh, James Stirling of Keir and Mr Thomas Craig." About 1565 he was knighted at the same time as James Stirling, his colleague, whose daughter John Napier subsequently married. In 1582 Sir Archibald was appointed master of the mint in Scotland, with the sole charge of superintending the mines and minerals within the realm, and this office he held till his death in 1608. His first wife died in 1593, and in 1572 he married a cousin, Elizabeth Mowbray, by whom he had three sons, the eldest of whom was named Alexander.1

As already stated, John Napier was born in 1550, the year in which the Reformation in Scotland may be said to have commenced. In 1563, the year in which his mother died, he matriculated at St. Salvator’s College, St. Andrews. He early became a Protestant champion, and the one extant anecdote of his youth occurs in his address "to the Godly and Christian reader" prefixed to his Plaine Discovery. He writes:

"In my tender yeares, and barneage in Sanct-Androis at the Schools, having, on the one parte, contracted a loving familiaritie with the Archbishop of Edinburgh, and the late Lord Provost of the same City, who, being attentive to the sermons of that worthy man of God, Master Christopher Goodman, teaching upon the Apocalypse, I was so moved in admiration, against the blindnes of Papists, that could not most evidently see their seven armed little Rome, painted out there so lively by Saint John, as the mother of all spiritual whoredome, that not onely bursted I out in continual reasoning against my said familiaritie, but also fromthenceforth, I determined with my selfe (by the assistance of Gods spirit) to employ my studie and diligence to search out the remanent mysteries of that holy Book: as to this houre (praised be the Lorde) I have bin doing at al such times as conveniently I might have occasion."

The names of nearly all Napier’s classfellows can be traced as becoming determinants in 1566 and masters of arts in 1568; but his own name does not appear in the lists. The necessary inference is that his stay at the university was short, and that only the groundwork of his education was laid there. Although there is no direct evidence of the fact, there can be no doubt that he left St. Andrews to complete his education abroad, and that he probably studied at the university of Paris, and visited Italy and Germany. He did not, however, as has been supposed, spend the best years of his manhood abroad, for he was certainly in Scotland by 1571, when he was created one of the Lords of the Privy Council arranged at Merchiston; and in 1572 he married Elizabeth, daughter of Sir James Stirling of Keir. About the end of the year 1570 his wife died, leaving him one son, Archibald (who in 1627 was raised to the peerage by the title of Lord Napier), and one daughter, Jane. A few years afterwards he married again, his second wife being Agnes, daughter of Sir James

1 The descent of the first Napier of Merchiston has been traced to "Johan le Naper del Contele de Dunbretan," who was one of those who swore fealty to Edward I. in 1296 and defended the castle of Levenax against him in 1304; but there is no authority for this genealogy. The legend with regard to the origin of the name Napier was given by Sir Alexander Napier, eldest son of John Napier, in 1625, in these words: "One of the ancient earls of Lennox in Scotland had issue three sons: the eldest, that succeeded him to the earldom of Lennox; the second, whose name was Donald; and the third, named Gilchrist. The then king of Scotland having wars, did convocate his sires to parliament, whereupon Donald was elected in consequence of Lennox, who, keeping his eldest son at home, sent his two sons to serve him with the forces that were under his command. . . . After the battle, as the manner is, every one drawing and setting forth his particulars, the same said Sir Donald said amongst the rest, but there is one amongst you who hath Na-Peer (i.e., no equal); and calling Donald into his presence commanded him, in regard to his worthy service, and in augmentation of his honour, to change his name from Lennox to Napier, and gave him the lands of Gosford and lands in Fife, and made him his own servant, which discourse is confirmed by evidences of mine, wherein we are called Lennox alias Napier."
NAPIER, JOHN

Chisholm of Cromlix, who survived him. By her he had five sons and five daughters.

In 1588 he was chosen by the presbytery of Edinburgh one of its commissioners to the General Assembly.

On the 17th of October 1593 a convention of delegates was held at Edinburgh at which a committee was appointed to follow the advice given to him by Robert, insisting on certain instructions relating to the punishment of the rebellious Popish earls and the safety of the church. This committee consisted of six members, two barons, two ministers and two burgesses—the two barons selected being John Napier of Merchiston and James Maxwell of Calderwood. The delegates found the king at Jedburgh, and the mission, which was a dangerous one, was successfully accomplished. Shortly afterwards another convention was held at Edinburgh, and it was resolved that the delegates sent to Jedburgh should again meet the king at Linlithgow and repeat their former instructions. This was done accordingly, the number of members of the committee being, however, doubled. These interviews took place in October 1593, and on the 29th of the following January Napier wrote to the king the letter which forms the dedication of the Plaine Discovery.

The full title of this first work of Napier's is given below.1 It was written in English instead of Latin in order that "hereby the simple of this Iland may be instructed"; and the author apologizes for the language and his own mode of expression in the following sentences:

"...of certaine things threadst, is here rudely and in base language set downe, I doubt not to be pardoned thereof by all good men, who, considering the necessittie of this time, will esteeme it more meete to make hast to prevent the rising againe of Anti-christian treacheries within this Iland, then to prolong the time in painting of language"; and "I graunt indeede, and am sure, that in the style of words and utterance of language, we shall greatlie differ, for therein I do judge my selfe inferior to all men: so that scarce any of the highest of high matters could I with long deliberation finde words to expresse my minde."2 Napier's Plaine Discovery is a serious and laborious work, to which he had devoted years of care and thought. In one sense it may be said to stand to theological literature in Scotland in something of the same position as that occupied by the Canon Mirificus with respect to the scientific literature; for it is the first published original work relating to theological interpretation, and it was done without a predecessor in its own field. Napier lived in the very midst of fiercely contending religious factions; there was but little theological teaching of any kind, and the work related to what were then the leading political and religious questions of the day.

1 A Plaine Discovery of the whole Ralevation of Saint John: set downe in two treatises: The one searching and proving the true interpretation thereof: The other applying the same paraphrastically and historically in the text. Set forth by John Napier L. of Marchtichtoun youngere, Whereunto are annexed certaine Oracles of Sibylce, agreeing with the Revelation and other places of Scripture. Edinburgh, printed by Robert Walde-grafe, printer to the King's Majestie, 1593. Cam pm 9 Regali.

2 A Dutch translation was published at Middelburg in 1600 and a second edition in 1607. The work was translated into French by George Thomson, a naturalized Scotman residing in La Rochelle, and published by him at that town in 1602, under the title Outserre de tous les secrets de l'Apocalypse. . . . Par Jean Nepure (c. a. d.) Nonpoirel, Sieur de Merchison, reussse par lui-mesme, et mise en Francois par Georges Thomes de L'lle. Five subsequent editions were published in 1603, 1605 and 1607. German translations were published at Gera in 1611 and at Frankfort in 1605 and 1627. The second edition in English appeared at Edinburgh in 1641, and another was published at Edinburgh in 1654, which was a literal translation of the Latin text. A third edition was published in Latin soon after the original publication in 1593, but that, as the work had now been made public by the French and Dutch translations, and the original edition, which was a literal translation of the Latin, was confined to the first two Edinburgh editions, copies were issued bearing the London imprint and dates 1624 and 1611.

After the publication of the Plaine Discovery, Napier seems to have occupied himself with the invention of secret instruments of war, for in the Bacon collection at Lambeth Palace there is a document, dated the 7th of June 1596 and signed by Napier, giving a list of his inventions for the defence of the country against the anticipated invasion by Philip of Spain. The document is entitled "Secret Inventions, professed all time in their days for defence of this Iland, and withstanding of strangers, enemies of God's truth and religion," and the inventions consist of (1) a mirror for burning the enemies' ships at any distance, (2) a piece of artillery destroying everything round an arc of a circle, and (3) a round metal chariot, so constructed that its occupants could move it rapidly and easily, while firing out through small holes in it. It has been asserted (by Sir Thomas Urquhart) that the piece of artillery was actually tried upon a plain in Scotland with complete success, a number of sheep and cattle being destroyed.

In 1614 appeared the work which in the history of British science can be placed as second only to Newton's Principia. The full title is as follows: Mirifici Logarithmorum Canonis descrip,io, Ejusque usus, in utraque Trigonometria; ut etiam in omnis Logistica Mathematica, Amplissimis, Facillimis, & expeditissimis explicationi. Authore ac Inventore Ioanne Nepere, Barone Merchisoni, &c., Scotia. Edinburgi, ex officiis Andreae Hart Bibliopolae, CIO.DC.XIV. This is printed on an ornamental title-page. The work is a small-sized quarto, containing fifty-seven pages of explanatory matter and ninety pages of tables. The nature of logarithms is explained by reference to the motion of points in a straight line, and the principle upon which they are based is that of the correspondence of a geometrical and an arithmetical series of numbers. The table gives the logarithms of sines for every minute to seven figures. This work contains the first announcement of logarithms to the world, the first table of logarithms and the first use of the name logarithm, which was invented by Napier. In 1617 Napier published his Rabdologia;4 a duodecimo of one hundred and fifty-four pages; there is prefixed to it as preface a dedicatory epistle to the high chancellor of Scotland. The method which Napier terms "Rabdologia" consists in the use of certain numerating rods for the performance of multiplications and divisions. These rods, which were commonly called "Napier's bones," will be described further on. The second method, which he calls the "Promptuarium Multiplicationis" on account of its being the most expedite of all for the performance of multiplications, involves the use of a number of lamellae or little plates of metal disposed in a box. In an appendix of forty-one pages he gives his third method, "local arithmetic," in which an abacus or chess-board is employed as a means of the expression of numbers in the scale of radix 2. In the Rabdologia he gives the chronological order of his inventions. He speaks of the canon of logarithms as "a me longo tempore elaboratum." The other three methods he devised for the sake of those who would prefer to work with natural numbers; and he mentions that the promptuary was his latest invention. In the preface to the appendix containing the local arithmetie he states that, while devoting all his leisure to the invention of these abbreviations of calculation, and to examining by what method the toil of calculation might be removed, he addition of the logarithms, rabdologia and promptuary, he had hit upon a certain tabular arithmetic, whereby the more troublesome operations of common arithmetick are performed on an abacus or chess-board, and which may be regarded as an amusement.

4 Rabdologiae seu Numerationis per virgulas Libri duo: Cum Appendice de expeditissimis Multiplicationis promptuariis. Quibus accessor & Arithmeticae Localis Liber unus. Authore & Inventore Ioanne Nepere, Barone Merchisoni, &c., Scotia. Edinburgi, Escu- debel Andreas Hart (1617). Foreign editions were published in Italian at Verona in 1623, in Latin at Leiden in 1626 and 1628, and in Dutch at Gouda in 1626. In 1625 Ursinus published Rabdologiae Neporissa at Berlin, and the rods or bones were described in several other works.
rather than a labour, for, by means of it, addition, subtraction, multiplication, division and even the extraction of roots are accomplished simply by the motion of counters. He adds that he has appended it to the Raddolegio, in addition to the promptuaries, because he did not wish to bury it in silence nor to publish so small a matter by itself. With respect to the calculating rods, he mentions in the dedication that they had already found so much favour as to be almost in common use, and even to have been carried to foreign countries; and that he has been advised to publish his little work relating to their mechanism and use, lest they should be put forth in some one else's name.

Napier died on the 4th of April 1617, the same year as that in which the Raddolegio was published. His will, which is extant, was signed on the fourth day before his death. No particulars are known of his last illness, but it seems likely that death came upon him rather suddenly at last. In both the Canonis descriptio and the Raddolegio, however, he makes reference to his ill-health. In the dedication of the former he refers to himself as "mihi jam morbis penè confecto," and in the "Admonitio" at the end he speaks of his "inha ira valetudo;" while in the latter he says he has been obliged to leave the calculation of Napierian logarithms to others "ob invisam corporis nostris valetudinem."

It has been usually supposed that John Napier was buried in St Giles' church, Edinburgh, which was certainly the burial-place of some of the family, but Mark Napier (Memoirs, p. 246) quotes Professor William Wallace, who, writing in 1832, gives strong reasons for believing that he was buried in the old church of St Cuthbert.

Professor Wallace's words are—

"My authority for this belief is unquestionable. It is a Treatise on Trigonometry, by a Scotsman, James Hume of Godscroft, Berwickshire, a place still in possession of the family of Hume. The title-page of this work is dated Paris, and has the date 1636 on the title-page, but the royal privilege which secured it to the author is dated in October 1635, and it may have been written several years earlier. In his treatise (page 116) Hume says, speaking of logarithms, 'L'inventeur estoit un Seigneur de grande condition, et duquel la posterité est aujourd'hui en possession de grandes dignités dans le royaume, qui estant sur l'age, et grandement trouaillé des gouttes ne pouvait faire autre chose que de se d'adonner aux sciences, et principalement aux mathematiques et à la logistique, à quoy il se plaisoit infiniment, et avec extrême peine, a construit ses Tables des Logarymes, imprimées à Paris en l'an 1614... Il mourut l'an 1616, et fut enterré hors la Porte Occidentale d'Edinbourg, dans l'Eglise de Saint Cudbert."

There can be no doubt that Napier's devotion to mathematics was not due to old age and the gout, and that he died in 1617 and not in 1616; still these sentences were written within eighteen years of Napier's death, and their author seems to have had some special sources of information. Additional probability is given to Hume's assertion by the fact that Mercilston is situated in St Cuthbert's parish. It is nowhere else recorded that Napier suffered from the gout. It has been stated that Napier's mathematical pursuits led him to dissipate his means. This is not so, for his will (Memoirs, p. 427) shows that besides his large estates he left a considerable amount of personal property.

The Canonis Descriptio on its publication in 1614, at once attracted the attention of Edward Wright, whose name is known in connexion with improvements in navigation, and Henry Briggs, then professor of geometry at Gresham College, London. The former translated the work into English, but he died in 1615, and the translation was published by his son Samuel Wright in 1616. Briggs was greatly excited by Napier's invention and visited him at Merchiston in 1615, staying with him a whole month; he repeated his visit in 1616 and, as he states, "would have been glad to make him a third visit if it had pleased God to spare him so long." The logarithms introduced by Napier in the Descriptio are not the same as those now in common use, nor even the same as those now called Napierian or hyperbolic logarithms. The change from the original logarithms to common or decimal logarithms was made by both Napier and Briggs, and the first tables of decimal logarithms were calculated by Briggs, who published a small table, extending to 1000, in 1617, and a large work, Arithmetica Logarithmica, containing logarithms of numbers of 30,000 and from 50,000 to 100,000, in 1624. (See LOGARITHM.)

Napier's Descriptio of 1614 contains no explanation of the manner in which he had calculated his table. This account he kept back, as he himself states, in order to see from the reception met with by the Descriptio, whether it would be acceptable. Though written before the Descriptio it had not been prepared for press at the time of his death, but was published by his son Robert in 1619 under the title Mirifici Logarithmorum Canonis Constructio. In this treatise (which was written before Napier had invented the name logarithm) logarithms are called "artificial numbers."

The different editions of the Descriptio and Constructio, as well as the reception of logarithms on the continent of Europe, and especially by Kepler, whose admiration of the invention almost equalled that of Briggs, belong to the history of logarithms (q.v.). It may, however, be mentioned here that an English translation of the Constructio of 1619 was published by W. R. Macdonald at Edinburgh in 1859, and that there is appended to this edition a translation of Napier's Mirifici Logarithmorum Canonis Constructio, as well as translations of some of the latte's writings,English and foreign, all the works being carefully collated, and references being added to the various public libraries in which they are to be found.

Napier's priority in the publication of the logarithms is unquestioned and only one other contemporary mathematician seems to have conceived the idea on which they depend. There is no anticipation or hint to be found in previous writers, and it is very remarkable that a discovery or invention which was to exert so important and far-reaching an influence on astronomy and every science involving calculation was the work of a single mind.

The more one considers the condition of science at the time, and the state of the country in which the discovery took place, the more wonderful does the invention of logarithms appear. When algebra had advanced to the point where exponents were introduced, nothing would be more natural than that their utility as a means of performing multiplications and divisions should be remarked; but it is one of the surprises in the history of science that logarithms were invented as an arithmetical improvement years before their connexion with exponents was known. It is also surprising that the invention was not the result of any happy accident. Napier deliberately set himself to abbreviate multiplications and divisions—operations of so fundamental a character that it might well have been thought that they were in rerum natura incapable of abbreviation; and he succeeded in devising, by the help of arithmetic and geometry alone, the one

1 The title runs as follows: Arithmetica Logarithmica, sive Logarithmorum chilias undecies triinginta... Hos numeros primus inventi clarissimus vir Iohannes Naperus Baro Merchistonii; eos eum ex usu communi sententia mutavit, corumque eum et usum illustravit Henricus Briggsius... 2 The full title was: Mirifici Logarithmorum Canonis Constructio... Et eorum ad naturales ipsorum numerorum habitudines; una cum Appendice, de alla edique praestantiori Logarithorum species contenta. Quibus accessisse Propositiones ad triangula sphærica factiore calculo resolvendas: Unda cum Annotationibus aliquo doctissimi D. Henrici edque praestantiori Logarithorum species contenta. Edidit... Auctore & Inventore Ioanne Nepere, Barone Merchistonii, &c. Scoto. Edinburghi, Excudebat Andreas Hart, Anno Domino 1619. There is also preceding this title-page an ornamental title-page, similar to that of the Descriptio of 1614; the words are different, however, and run—Mirifici Logarithmorum Canonis Descriptio... Accesserunt Opera Posthuma: Primò, Mirifici ipsiis canonis constructio, & Logarithmorum ad naturales ipsorum numerorum habitudines. Secundò, Appendicem, &c. Tertio, Propositiones quaedam eminensissimæ, ad Triangula sphærica mira facilitate resolvenda... It would appear that this title-page was intended for the first page of the Descriptio of 1614 by those who bound the two books together.

3 The work of Justus Byrgius is described in the article LOGARITHM. In that article it is mentioned that a Scotsman in 1594 in a letter to Tycho Brahe he held out some hope of logarithms; it is likely that the person referred to is John Craig, son of Thomas Craig, who has been mentioned as one of the colleagues of John Napier's father as justice-depute.
NAPIER, JOHN

great simplification of which they were susceptible—a simplification to which nothing essential has since been added.

When Napier published the Canonis Descriptio England had taken no part in the advance of science, and there is no British author of the time except Napier whose name can be placed in the same rank as those of Copernicus, Tycho Brahe, Kepler, Galileo, or Stevin. In England, Robert Recorde's book, where he published his mathematical treatises, but they were of trifling importance and without influence on the history of science. Scotland had produced nothing, and was perhaps the last country in Europe from which a great mathematical discovery would have been expected. Napier lived, too, not only in a wild country, which was in a lawless and unsettled state during most of his life, but also in a cedulous and superstitious age. Like Kepler and all his contemporaries he believed in astrology, and he contended for the existence of a sort of faith in the power of magic, for there is extant a deed written in his own handwriting containing a contract between himself and Robert Logan of Restalrig, a turbulent baron of desperate character, by which Napier undertakes "to serche and sik out, and be al craft and ingyne that he dow, to tempt, tye, and find out" some buried treasure supposed to be hidden in Logan's fortress at Fastcastle, in consideration of receiving one-third part of the treasure found by his aid. Of this singular contract, which is signed, "Robert Logane of Restarlige and ' Jhonne Neper, Fear of Merchiston," and is dated 20 February 1594, a facsimile is given in Mark Napier's Memoirs. As the deed, so singularly described but no is extant, it may be presumed that the terms of it were not fulfilled; but the fact that such a contract should have been drawn up by Napier himself affords a singular illustration of the state of society and the kind of events in the midst of which logarithms had their birth. Considering the time in which he lived, Napier is singularly free from superstition: his Plaine Discovery relates to a method of interpretation which belongs to a later age; he shows no trace of the extravagances which occur everywhere in the works of Kepler; and none of his writings contain allusions to astrology or magic.

After Napier's death his manuscripts and notes came into the possession of his second son by his second marriage, Robert, who edited the Constructio; and Colonel Milliken Napier, Robert's lineal male representative, was still in the possession of many of these private papers at the close of the 18th century. On one occasion when Colonel Napier was called from Paris to London to see the King, these papers, together with a portrait of John Napier and a Bible with his autograph, were deposited for safety in a room of the house at Milliken. When the Colonel went away, there was absence the other's absence the loss of the book burned to the ground, and all the papers and relics were destroyed. The manuscripts had not been arranged or examined, so that the extent of the loss is unknown. Fortunately, however, Robert Napier had abstracted the Logarithmorum Canonis and De Logistica Logarithmica, and the copy escaped the fate of the originals in the manner explained in the following note, written in the volume containing them by Francis, seventh Lord Napier: John Napier of Merchiston, inventor of the logarithms, left his manuscripts to his son Robert, who appears to have caused the following pages to have been written out fair from his father's notes, for Mr Briggs, professor of geometry at Oxford. They were given to Francis, the fifth Lord Napier, by William Napier of Culcreugh, Esq., heir-male of the above-named Robert. Finding them in a neglected state, amongst my family papers, I have bound them together, in order to preserve them entire.—NAPIER, 7th March 1801.

An account of the contents of these manuscripts was given by Mark Napier in the appendix to his Memoirs of John Napier, and the many extracts which they contained were edited by him in 1839 under the title De Arte Logistica Joannis Naperi Merchistonis Baronis Libri qui superstant Impressum Edinburgi M.DCCC.XXII, as one of the publications of the Bannatyne Club.

The treatise occupies one hundred and sixty-two pages, and there is an introduction by Mark Napier of ninety-four pages. The Arithmetica consists of three books, entitled—(1) De Computationibus Quantitatis; (2) De Logistica Logarithmica; (3) De Logistica Arithmetica. The only parts of the logarithm principle contained in the first book of this book occurs the note,—"I could find no more of this geometrical paint amongst all his fragments." The Algebra Joannis Naperi consists of three books, the first of which is De Numeris a Natura Algebrice; the second, De positiva sive cosseca Algebrice parte; and the conclusions with the words, "There is no more of his algebra orderlie set down." The transcripts are entirely in the handwriting of Robert Napier himself, and the two notes that have been quoted prove that they were made from Napier's own papers. The title, which is written on the first leaf, and is also in Robert Napier's writing, runs thus: "The Baron of Merchiston his booke of Arithmetica and Algebra. For Mr Henrie Briggs, Professor of Geometric at Oxford." These treatises were probably composed before Napier had invented the logarithms or any of the apparatuses described in the De Logistica Logarithmica. For the logarithmic straight line, the principle of logarithms, even where we should expect to find such a reference, and the one solitary sentence where the Rabdologia is mentioned ("sive quadratura qua quadrantibus, secundum Rabdologiae nescet") was probably added afterwards. It is worth while to notice that the reference occurs in a chapter "De Multiplicationis et Partitionis comprehendis miscellaneis," which, supposing the treatise to have been written in 1594, and considering the number of copies which may have been held in the public library of the subject over which his subsequent labours were to exert so enormous an influence.

Napier uses abundantes and other forms for positive and negative, distinctus and nominatus as containing no less than nothing ("Abundantes sunt quotitates majores nihil: definitae sunt quotitates minores nihil"). The same definitions occur also in the Canonis Descripti (1614), p. 5: "Logarithmum sinuum, qui semper majores nihil sunt, abundantes vocamus, et hoc signo +, aut minus prae- tamen. Logarithmos autem minores nihilos definitivos vocamus, praenotantes eis hic signum —."

Napier may thus have been the first to use the expression "quantity less than nothing." He uses "radicatum" for power (for root, power, exponent, his words are radix, radicatum, index).

Apart from the interest attaching to these manuscripts as the work of Napier, they possess independent value as affording evidence of the exact state of his algebraical knowledge at the time when logarithms were invented. There is nothing to show whether the logarithms were intended for the purpose of simplification, or whether they were not sent to him. Amongst the papers is a thin quarto volume in Robert Napier's writing containing a digest of the principles of alchemy; it is addressed to his son, and begins with the words, "First let us look out the greatest treasure in our charter-chest and be kept secret except from a few. This treatise and the manuscripts seem to be the only manuscripts which have escaped destruction.

The principle of "Napier's bones" may be easily explained by imagining ten rectangular slips of cardboard, each divided into nine squares. In the top squares of the slips the digits of each number are represented, and each slip contains in its nine squares the first nine multiples of the digit which appears in the top square. With the exception of the top squares, every square is divided into two parts by a diagonal, the units being written to one side and the tens on the other; so that when a multiple consists of two figures they are separated by the diagonal.

Fig. 1 shows the slips corresponding to the numbers 2, 0, 8, 5 placed in contact with each other, and next to them is placed another slip containing, in squares without diagonals, the first nine digits. The slips thus placed still leave the multiples of 0, 8, 5 remaining, and it is in this manner the multiples corresponding to 0, 6, 7, and set down the digits as they are obtained, from right to left, shifting them back one place and adding up the columns as in ordinary multiplication, viz., the figures as written down are:

<table>
<thead>
<tr>
<th>2</th>
<th>0</th>
<th>8</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>0</td>
<td>6</td>
<td>2</td>
</tr>
<tr>

<td>8</td>
<td>4</td>
</tr>
</tbody>
</table>

Napier's rods or bones consist of ten oblong pieces of wood or other material with square ends. Each of the four faces of each rod contains 18 numbers, such that to the left of the slips just described, the first rod containing the multiples of 0, 1, 9, 8, the second of 2, 3, 9, 7, the third of 3, 6, 9, 6, the fourth of 0, 4, 9, 5, the fifth of 1, 2, 8, 7, the sixth of 3, 7, 8, the seventh of 2, 9, 7, 6, the eighth of 0, 5, 4, 8, the ninth of 1, 8, 9, 5, and the tenth of 3, 4, 6, 5. Each rod therefore contains on two of its faces multiples of digits which are complementary to those on the other face, and the multiples of a digit and of its complement are reversed in position. The arrangement of the numbers on the rods will be evident from fig. 2, which represents the four faces of the fifth rod. The set of ten rods is thus equivalent to four sets of slips as described above, or 2085; for by their means we may multiply every number less than 11,111, and also any number (consisting of course

12510
6255
14959

153460

153460
of not more than ten digits) which can be formed by the top digits of the bars when placed side by side. Of course two sets of rods may be used, and we shall see that the rules may apply equally well with less than 1111111111 and so on. It will be noticed that the rods only give the multiples of the number which is to be multiplied, or of the divisor, when they are used for division, and it is evident that the highest number which can be used for division is less than 1010101010.

In multiplications or divisions of any length it is generally convenient to begin by forming a table of the first nine multiples of the multiplicand or divisor, and Napier's bones at best merely provide such a table, and in an incomparable shape, and in a form in which, after the first, in the same parallelogram have to be performed each time the rods are used. The Rabdologia attracted more general attention than the logarithms, and two more editions, in the same form, as well as a book of the same name in a more digested form, were published, and there were several editions on the Continent. Nothing shows more clearly the rude state of arithmetical knowledge at the beginning of the 17th century than the universal satisfaction with which Napier's invention was welcomed by all classes and regarded as a real aid to calculation. Napier also describes in the Rabdologia two other larger rods to facilitate the extraction of square and cube roots. In the Rabdologia the rods are called "vurgulae," but in the passage quoted above from the manuscript on arithmetic they are referred to as "bones" (ossa).

Besides the logarithms and the calculating rods or bones, Napier's name is attached to certain rules and formulae in spherical trigonometry. Napier's "Circular Sine Rule" is a complete system of formulae for the solution of right-angled triangles may be enunciated as follows. Leaving the right angle out of consideration, the sides including this angle are the circumference of the hypotenuse, and the complements of the other angles are called the circular parts of the triangles. Thus there are five circular parts, a, b, 90° - a, 90° - c, 90° - b, and these are supposed to be arranged in this order, i.e. the order in which they are arranged when round a circle. Selecting any part and calling it the middle part, the two parts next it are called the adjacent parts and the remaining two the opposite parts. The rules then are:

These rules were published in the Canonis Descriptio (1614), and Napier has there given a figure, and indicated a method, by means of which they may be proved directly. The rules are curious and interesting, but of very doubtful utility, as the formulae are best remembered by the practical calculator in their unconnected form.

"Napier's analogies" are the four formulae—

\[
\tan(A + B) = \frac{\sin A \cos B + \cos A \sin B}{\cos A \cos B - \sin A \sin B},
\]

\[
\tan(A - B) = \frac{\sin A \cos B - \cos A \sin B}{\cos A \cos B + \sin A \sin B},
\]

\[
\tan(A + B) = \frac{\sin(A + B)}{\cos(A + B)},
\]

\[
\tan(A - B) = \frac{\sin(A - B)}{\cos(A - B)}.
\]

They were first published after his death in the Constructio among the formulae in spherical trigonometry, which were the results would have been impossible had he attempted to attack this subject in the several analogies is actually given by Napier, the other three being added by Briggs in the remarks which are appended to Napier's results. The work left by Napier is, however, rough and unfinished, and it is uncertain whether he knew of the other formulae or not. They are, however, so simply deducible from the results he has given that all the four analogies may be properly ascribed to his name. An analysis of the formulae contained in the Descriptio and Constructio is given by Delambre in vol. I, of his Histoire de l'Astronomie Moderne.

To Napier seems to be due the first use of the decimal point in arithmetic. Before him, the first figures after the point were denoted by the prefix "significand," but such numerals of which Napier gives an extended use, the division of 860104 by 432. The quotient is written 1993.273 in the work, and 1993.2733 in the text. This single instance of the use of a decimal point in the midst of an arithmetical process, if it stood as a significant departure from the usual way of notation and treatment of fractions, and used it as a permanent notation and not merely in the course of performing an arithmetical operation. The decimal point is, however, used systematically in the Constructio (1619), there being perhaps two hundred decimal points altogether in the book.

The original point is defined on p. 6 of the Constructio in the words: "The point, or period, in this notation, signifies, quicquid post numerum signumificantem, is not the beginning of the cyphris post se, quom significat periodum postumum. Ut 10000000-00 valet idem, quod 10000000.

Item 25.803, idem quod 25.803. Item 9999998-0005021, idem valet quod 9999998. & sic de casibus duorum, trinorum, &c. multipliorum; (2) he used the point after the decimal point and preceding the first significant figure; and (3) he had no objection to a decimal standing by itself without any integer. Napier thus had complete command over decimal fractions and the use of the decimal point. Briggs also used decimals, but in a form not quite so convenient as Napier. Thus he prints 63.0957379 as 630957379. He prints a bar under the decimals, this notation first appears without any explanation in his Logarithmorum Canonis Epitome, 1617, but afterwards he used merely a small line just high enough to fix distinctively which two figures it was intended to separate. Thus he may have written 63,095,7379. The very first use was printed by Oughtred and some of Briggs' successors. It was a long time before decimal arithmetic came into general use, and all through the 17th century exponential marks were in common use. The notation itself little after that point did it follow that a decimal point was used as a decimal separator, and it is curious that the separator which he used, the point, should be that which has been ultimately adopted, and is now the universal one.

The hereditary office of king's poulterer (Pultris Regis) was for many generations in the family of Merichston, and descended to John Napier. The office, Mark Napier states, is repeatedly mentioned in the family proofs that the family has been near the village of Dene in the shire of Linlithgow. The duties were to be performed by the possessor or his deputy; and the king was expected to give the yearly homage of a present of poultry from the feudal holder. The charter was granted by John Napier in 1610 for 1700 marks. With the exception of the outbuildings all the estates he inherited descended to his posteriority.

Napier was entrusted to the production of the tables, and it is certain that among the manuscript papers there exist a great many documents signed by John Napier. His usual signature was "Jhone Nepur," but in a letter written in 1608, and in all deeds signed after that date, he wrote "Jhone Nepair." His letter to the Constructio Briggs seems to have used the notation all his life, but in writing it, as appears from manuscripts of his, he added also a small vertical line just high enough to distinguish between these two figures it was intended to separate, thus he may have written 63,095,7379. The very first use was printed by Oughtred and some of Briggs' successors. It was a long time before decimal arithmetic came into general use, and all through the 17th century exponential marks were in common use. Napier's three mathematical works are reprinted by N. L. W. A. Gravelhau in Verhandelingen der Kon. Akad. van Wet te Amsterdam, 1. sectie, deel 6 (1899).

NAPIER, SIR WILLIAM FRANCIS PATRICK (1785-1860), British soldier and military historian, third son of Colonel George Napier (1751-1804), and brother of Sir Charles James Napier (see above), was born at Celbridge, near Dublin, on the 17th of December 1785. He became an ensign in the Royal Irish Artillery in 1800, but at once exchanged into the 62nd, and was put on half-pay in 1802. He was afterwards made a cornet in the Blues by the influence of his uncle the duke of Richmond, and for the first time did actual military duty in this regiment, but he soon fell in with Sir John Moore's suggestion that he should exchange into the 52nd, which was about to be trained in the famous camp of Shorncliffe. Through Sir John Moore he soon obtained a company in the 43rd, joined that regiment at Shorncliffe and became a great favourite with Moore. He served in Denmark, and was present at the engagement of Kjoge, and, his regiment being shortly afterwards sent to Spain, he bore himself nobly through the retreat to Corunna, the hardships of which permanently impaired his health. In 1809 he became
aide-de-camp to the duke of Richmond, Lord Lieutenant of Ireland, but joined the 43rd when that regiment was ordered again to Spain. With the light brigade (the 43rd, 2nd, and 9th), under the command of General Craufurd, he marched to Talavera in the famous forced march which he has described in his History, and had a violent attack of pleurisy on the way. He, however, refused to leave Spain, was wounded on the Coa, and shot near the spine at Cazal Nova. His conduct was so conspicuous during the pursuit of Masséna after he left the lines of Torres Vedras that he was almost overshadowed himself. He became major, and was commissioned to review his soldiers before General Soult. He lived when and as he wished, and his career was a model of energy, determination, and the brevet majority. He became brigade major, was present at Fuentes d'Onor, but had so bad an attack of ague that he was obliged to return to England. In England he married Caroline Amelia Fox, daughter of General Henry Fox and niece of the statesman Fox. Three weeks after his marriage he again started for Spain, and was present at the storming of Badajoz, where his great friend Colonel M’Leod was killed. In the absence of the new lieutenant-colonel he took command of the 43rd regiment (he was now a substantive major) and commanded it at the battle of Salamanca. After a short stay at home he again joined his regiment in the Pyrenees, and did his greatest military service at the battle of the Nivelle, where, with instinctive military insight, he secured the most strongly fortified part of Soult’s position, practically without orders. He served with his regiment at the battles of the Nive, where he received two wounds, Orthes, and Toulouse. For his services he was made brevet lieutenant-colonel, and one of the first C.B.’s. Like his brother Charles he then entered the military college at Farnham. He commanded his regiment in the invasion of France after Waterloo, and remained in France with the army of occupation until 1819, when he retired on half-pay. As it was impossible for him to live on a major’s half-pay with a wife and family, he determined to become an artist, and took a house in Sloane Street, where he studied with George Jones, the academican.

The years he had spent in France he had occupied in improving his general education, for, incredible as it seems, the author of the History of the War in the Peninsula could not spell or write respectable English till that time. But his career was to be great in literature, not in art. The tendency appeared in an able review of Jomini’s works (Edinburgh Rev.) in 1821, and in 1823 Mr Bickersteth (afterwards Lord Langdale) suggested to him the desirability of writing the Peninsula. Mr Bickersteth, at some time he did not take kindly to the suggestion, but at last determined to become an author in order to defend the memory of Sir John Moore, and to prevent the glory of his old chief being overshadowed by that of Wellington. The duke of Wellington himself gave him much assistance, and handed over to him the whole of Joseph Bonaparte’s correspondence which had been taken at the battle of Vittoria; this was all in cipher, but Mrs Napier, with great patience, discovered the keys. Marshal Soult also took an active interest in the work and arranged for the French translation of Maitche Dumas. In 1828 the first volume of the History appeared. The publisher, John Murray, indeed, was disappointed in the sale of the first volume and published the remainder himself. But it was at once seen that the great deeds of the Peninsula War were about to be fitly commemorated. The excitement which followed the appearance of each volume is proved by the innumerable pamphlets issued by those who believed themselves to be attacked, and by personal altercation with many distinguished officers. But the success of the book was proved still more by the absence of competition than by those bitter controversies. The histories of Southey and Lord Lonsderry fell still-born, and Sir George Murray, Wellington’s quartermaster-general, who had determined to produce the history, gave up the attempt in despair. This success was due to a combination of qualities which have justly secured for Napier the title of being the greatest military historian England has produced. When in 1840 the last volume of the History was published, his fame not only in England but in France and Germany was safely established.

His life during these years had been chiefly absorbed in his History, but he had warmly sympathised with the movement for political reform which was agitating England. The Radicals of Bath and many other cities and towns pressed him to enter parliament, and Napier was actually invited to become the military chief of a national guard to obtain reforms by force of arms. He refused the dangerous honour on the ground that he was in bad health and had a family of eight children. In 1830 he had been promoted colonel, and in 1842 he was made a major-general and given the lieutenant-governorship of Guernsey. Here he found plenty of occupation in controlling the relations between the soldiers and the inhabitants, and in working out proposals for a complete scheme of reform in the government of the island. While he was at Guernsey his brother Charles had conquered Sind, and the attacks made on the policy of that conquest brought William Napier again into the field of literature. In 1845 he published his History of the Conquest of Scinde, and in 1853 the corresponding History of the Administration of Scinde—books which in style and vigour rivalled the great History, but which, being written for controversial purposes, were not likely to maintain enduring popularity. In 1847 he resigned his government appointment, and in 1853 was made a K.C.B. and chaplains at Scinde House, Clapham Park. In 1851 he was promoted lieutenant-general. His time was fully occupied in defending his brother, in revising the numerous editions of his History which were being called for, and in writing letters to The Times on every conceivable subject, whether military or literary. His energy is the more astonishing when it is remembered that he never recovered from the effects of the wound he had received at Cazal Nova, and that he often had to lie on his back for months together. His domestic life was shadowed by the incurable affliction of his only son, and when his brother Charles died in 1853 the world seemed to be darkening round him. He devoted himself to writing the life of that brother, which appeared in 1857, and which is in many respects his most characteristic book. In the end of 1853 his younger brother, Captain Henry Napier, R.N., died, and in 1855 his brother Sir George (see below). Inspired by his work, he lived on till the year 1860, when, broken by trouble, fatigue and ill-health, he died (February 12) at Clapham. Four months earlier he had been promoted to the full rank of general.

As a military historian Sir William Napier is incomparably superior to any other English writer, and his true competitors are Thucydides, Caesar and Livy. All four had been soldiers in the wars they describe; all four possessed a peculiar insight into the feelings of actual combatants, and all four approached a peculiar and inimitable style. Napier always had a fire blazing in his heart, and he was bursting with an inextinguishable desire to express what he was feeling, which gives his style a peculiar spontaneity, and yet he never lost the balance of his History, no less than six times. His descriptions of sieges and of battles are admirable by themselves, and his analyses of the peculiarly intricate Spanish intrigues are even more remarkable, while the descriptions and analyses are both lit up with flashes of political wisdom and military insight. It is to be noted that he displays the spirit of the partisan, even when most impartial, and defends his opinions, even when most undoubtedly true, as if he were arguing some controversial question. If his style was modelled on anything, it was on Caesar’s commentaries, and a thorough knowledge of the writings of the Roman general will often explain allusions in Napier’s. The portraits of Sir John Moore and John M’Leod are admirable; the last paragraphs descriptive of the storming of Badajoz, may be taken as examples of his great natural eloquence.

His brother, SIR GEORGE THOMAS NAPIER (1784-1859), entered the army in 1800, and served with distinction under Moore and Wellington in the Peninsula—and lost his right arm at the storming of Badajoz. He became major-general in 1837, K.C.B. in 1838 and lieutenant-general in 1846. He was governor and commander-in-chief of Malta, and during the time the abolition of slavery and the expulsion of the Boers from Natal were the chief events. He was offered, but declined, the chief command in India after Chillianwalla, and also that of the Sardinian army in 1849. He became full general in 1854. He died at Geneva on the 16th of September 1855. His autobiography, Passages in the Early Military Life of General Sir G. T. Napier, was published by his surviving son, General W. C. E. Napier (the author of an important work on outpost duty), in 1855.
NAPIER AND ETTRICK—NAPIER OF MAGDALA

The youngest brother, Henry Edward Napier (1759–1853), served in the navy during the Napoleonic wars, retired as a captain, and wrote a learned Florilegium Historiae from the earliest authentic Records to the Accession of Ferdinand III. of Tuscany (1846–1847).

For Sir William Napier's life, see his Life and Letters, edited by the Right Honourable H. A. Bruce (Lord Aberdare) (2 vols., 1862).

NAPIER AND ETTRICK, FRANCIS NAPIER, BARON (1819–1878), was born in Edinburgh on 18 March 1819, second son of John, 3rd Lord Napier of Merchiston, and Ettrick, youngest son of Alexander Napier (d. c. 1473) being the elder son of Alexander Napier (d. c. 1454), provost of Edinburgh, who obtained lands at Merchiston early in the 15th century. Sir Alexander was comptroller of the household of the king of Scotland, and was often sent to England and elsewhere on public business. Of his descendants one Napier of Merchiston was killed at Sauchieburn, another fell at Flodden and a third at Pinkie. The seventh Napier of Merchiston was Sir Archibald Napier (1534–1668), master of the Scottish mint, and the eighth was John Napier (q.v.) the inventor of logarithms. John's eldest son, Sir Archibald Napier (c. 1576–1645), was treasurer-depute of Scotland from 1622 to 1631, and was created Lord Napier of Merchiston in 1627. He married Margaret Graham, sister of the great marquis of Montrose, whose cause he espoused, and he wrote some Memoirs which were published in Edinburgh in 1703. His son Archibald, the 2nd lord (1625–1638), fought under Montrose at Auldearn, at Alford, at Kilsyth and at Philippaugh, and was afterwards with his famous uncle on the continent of Europe. His son, Archibald, the 3rd lord (d. 1683), was succeeded by his grandson Sir Robert Napier (1697–1765), who married Margaret Nicolson (1669–1686), a son of his sister Jean and her husband Sir Thomas Nicolson, Bart. (d. 1670), and then by his sister Margaret (d. 1706), the widow of John Brisbane (d. 1684). The 6th lord was Margaret's grandson Francis Scott (c. 1702–1773), a son of Sir William Scott, Bart., of Thirlestane (d. 1725). Francis Scott, who took the additional name of Napier, had a large family, his sons including William, the 7th lord, and Colonel George Napier (1751–1804). His famous grandsons are dealt with above. Another literary member of the family was Mark Napier (1798–1870), called by Mr. Andrew Lang "the impetuous biographer of Montrose," who wrote Memoirs of John Napier of Merchiston (1834), Memoirs of Montrose and the Covenanters (1838), Memoirs of Montrose (1856), Memoirs of Graham of Claverhouse (1859–1862), and a valuable legal work, The Law of Prescription in Scotland (1839 and again 1854). William, 7th Lord Napier (1730–1775), was succeeded as 8th lord by his son Francis (1732–1832), who, after serving in the English army during the American War of Independence, was lord high commissioner to the general assembly of the Church of Scotland, and compiled a genealogical account of his family which is still in manuscript. His son William John, the 9th lord (1786–1834), who was present at the battle of Trafalgar, was the father of Francis Napier, Lord Napier and Ettrick.

Born on the 15th of September 1819 Francis entered the diplomatic service in 1840, and was employed in successive posts at Vienna, Constantinople, Naples, Washington and the Hague. During this time he earned the highest opinions both at home and abroad. In 1860 he became ambassador at St. Petersburg, and in 1864 at Berlin. In 1866 he was appointed governor of Madras, and was at once confronted with a serious famine in the northern districts. In dealing with this and other problems he showed great activity and practical sense, and he encouraged public works, particularly irrigation. In 1872 he acted for a few months as Viceroy, after Lord Mayo's assassination; and on Lord Northbrook's appointment to the office he returned to England, being created a baron of the United Kingdom (Baron Ettrick of Ettrick) for his services. He continued, both in England and in Scotland, to take great interest in social questions. He was for a time a member of the London School Board, and he was chairman of the Crofters' Commission in 1883, the result of which was the appointment of a permanent body to deal with questions affecting the Scottish crofters and cottars. He died at Florence, on the 19th of December 1898, leaving a widow and three sons, the eldest of whom, William John George (b. 1846), succeeded to his titles.

NAPIER OF MAGDALA, ROBERT CORNELIS NAPIER, 1ST BARON (1810–1890), British field-marshall, son of Major Charles Frederick Napier, who was wounded at the storming of Meester Cornelis (Aug. 26, 1810) in Java and died some months later, was born at Colombo, Ceylon, on the 6th of December 1810. During his youth he was joined by Bengal Engineers from Addiscombe College in 1826, and after the usual course of instruction at Chatham, arrived in India in November 1828. For some years he was employed in the irrigation branch of the public works department, and in 1838 he laid out the new hill station at Darjeeling. Promoted captain in January 1841, he was appointed to Sirhind, where he laid out covenants on a new principle—known as the Napier system—for the troops returning from Afghanistan. In December 1845 he joined the army of the Sutlej, and commanded the Engineers at the battle of Musulki, where he had a horse shot under him. At the battle of Perozeshah on the 31st December he again had his horse shot under him, and joining the 31st Regiment on foot, was severely wounded in storming the entrenched Sikh camp. He was present at the battle of Sobraon on 11th February 1846, and in the advance to Lahore; was mentioned in despatches for his services in the campaign, and received a brevet majority. He was chief engineer at the reduction of Kot-e-Kargar by Brigadier-General Wheeler in May 1846, and received the thanks of government. He was then appointed consulting engineer to the Punjabs and Afrs, and was present at the passage of the Jhelum, the surrender of the Sikh army, and the surprise of Attock. For his services he was mentioned in despatches and received a brevet lieutenant-colonelcy. At the close of the war Napier was appointed civil engineer to the board of administration of the annexed Punjab province, and carried out many important public works during his tenure of office. In December 1852 he commanded a column in the first Hazara expedition, and in the following year against the Bories; and for his services in these campaigns was mentioned in despatches, received the special thanks of government and a brevet-colonelcy. He was appointed military secretary and adjutant-general to Sir James Outram's force for the relief of Lucknow in the Indian Mutiny in 1857, and was engaged in the actions which culminated in the first relief of Lucknow. He directed the defence of Lucknow until the second relief, when he was severely wounded in crossing a very exposed space with Outram and Havelock to meet Sir Colin Campbell. He was chief of the staff to Outram in the defence of the Ambagh position, and drew up the plan of operations for the attack of Lucknow, which was approved by Sir Colin Campbell and carried out by Napier, as brigadier-general commanding the engineers, in March 1858. On the fall of Lucknow Napier was most favourably mentioned in despatches, and made C.B. He joined Sir Hugh Rose as second-in-command in his march on Gwalior, and commanded the and brigade at the action of Morar on the 16th June. On the fall of Gwalior he was entrusted with the task of pursuing the enemy. With only 700 men he came up with Tantia Topi and 12,000 men on the plains of Jaora Alipur, and completely defeated him, capturing all his guns (29), ammunition and baggage. On Sir Hugh Rose's departure he took command of the Gwalior division, captured Paori in August, routed Ferozeshah, a prince of the house of Delhi, at Ranode in December, and, in January 1859, succeeded in securing the surrender of Man Singh and Tantia Topi, which ended the war. For his services Napier received the thanks of parliament and of the Indian government, and was made C.B.
In January 1860 Napier was appointed to the command of the 2nd division of the expedition to China under Sir Hope Grant, and took part in the action of Sinho, the storm of the Pelio forts, and the entry to Peking. For his services he received the thanks of parliament, and was promoted major-general for distinguished services. In the Bay of Naples the next four years Napier was military member of the council of the governor-general of India and, on the sudden death of Lord Elgin, for a short time acted as governor-general, until the arrival of Sir W. T. Denison from Madras. In January 1865 he was given the command of the Bombay army, in March 1867 he was promoted lieutenant-general, and, later in that year, appointed to command the expedition to Abyssinia, selecting his own troops and making all the preparations for the campaign. He arrived at Annesley Bay in the Red Sea early in January 1868, reached Magdalna, 420 m. from the coast, in April; stormed the stronghold, freed the captives, razed the place to the ground, returned to the coast, and on the 18th June the last man of the expedition had left Africa. He received for his services the thanks of parliament, a pension, a peerage, the G.C.B. and the G.C.S.I. The freedom of the cities of London and Edinburgh was conferred upon him, with presentation swords, and the universities bestowed upon him honorary degrees. In 1869 he was elected a fellow of the Royal Society. He held the command-in-chief in India for six years from 1870, during which he did much to benefit the army and to encourage good shooting. He was promoted general in 1871, and appointed the last commanding officer of the Royal Engineers. In 1876 he was the guest of the German crown prince at the military manœuvres, and from that year until 1883 held the government and command of Gibraltar.

In the critical state of affairs in 1877 he was nominated command-in-chief of the force which it was proposed to send to Constantinople. In 1879 he was a member of the royal commission on army organization, and in November of that year he represented Queen Victoria at Madrid as ambassador extraordinary on the occasion of the second marriage of the king of Spain. On the 1st of January 1883 he was promoted to field marshal, and in December 1886 appointed Constable of the Tower of London. He died in London on the 14th of January 1890. His remains received a state funeral, and were buried in St Paul's Cathedral on the 21st of January. He was twice married, and left a large family by each wife, his eldest son, Robert William (b. 1843), succeeding to his barony. A statue of him on horseback by Boehm was erected at Calcutta when he left India, and a replica of it was afterwards set up to his memory in Waterloo Place, London.

Naples.

The south-eastern point of North Island, New Zealand, capital of the provincial district of Hawke's Bay, 200 m. by rail N.E. of Wellington. Pop. (1906) 9454. The main portion of the town stretches along the flat shoreland of Hawke's Bay, while the suburbs extend over the hills to the north. The site consists of a picturesque peninsula known as Scinde Island. The harbor (Port Ahuriri) is sheltered by a breakwater. The cathedral church of St John (1888) for the bishopric of Waiapu, is one of the finest ecclesiastical buildings in New Zealand, imitating the Early English style in brick. An asylum, a small hospital, a lunatic asylum, a philosophical society and association, and a number of other public institutions. The town (named after Sir Charles James Napier) is under municipal government, and returns a member to the New Zealand House of Representatives. The district is agricultural, and large quantities of wool and tinned and frozen meats are exported. There is railway communication with Wellington, New Plymouth, and the Wairarapa, Wanganui and Manawatu districts. Numerous old native pa or fortified villages are seen in the neighbourhood.

NAPLES (Ital. Napoli, and Lat. Neapolis), formerly the capital of the kingdom of the Two Sicilies, and since 1860 the chief town of the province which bears its name, the smallest province in the kingdom of Italy. It is the largest city in the country, containing 547,593 inhabitants in 1901. It is a prefecture; the see of a cardinal archbishop; the residence of the general commanding the tenth Army Corps and of the admiralty commanding the second Naval Department of Italy; and it possesses also an ancient and important university.

Naples disputes with Constantinople the claim of occupying the most beautiful site in Europe. It is situated on the northern coast of the Bay of Naples, at the mouth of the river Stagno, in 40° 52' N., 14° 15' 45" E., as taken from the lighthouse on the point. By rail it is distant 151 m. from Rome, but the line is circuitous, and a direct electric line was contemplated in 1907, to run nearer the coast and shorten the distance from the capital by more than 30 m. (For map, see ITALY.) The circuit of the bay is about 35 m. from the capo di Miseno on the north-west to the Punta della Campanella on the south-east, or more than 52 m. if the islands of Ischia, at the north-west, and of Capri, at the south entrance, are included. At its opening between these two islands it is 14 m. broad; while another 4 m. separates Capri from the mainland at the Punta della Campanella, and from the opening to its head at Portici the distance is 15 m. It affords good anchorage, with nearly 7 fathoms of water, and is well sheltered, except from winds which blow from points between south-east and south-west. In the latter winds Sorrento should be especially avoided, as no safe anchorage can be found there at less than 15 fathoms, and the same remark applies to Capri with winds from S.W. to N.W. There is a perceptible tide of nearly 0 in.

On the north-east shore east of Naples is an extensive flat, forming part of the ancient Campania Felix, and walled by the small stream Sinus Parus, of the entrance of which the modern town of Portici is the port of Pompeii. From this flat, between the sea and the range of the Apenines, rises Mount Vesuvius, at the base of which, on or near the modern town of Sorrento, are the ruins of the ancient city of Herculaneum and Pompeii.

The south-east extremity of the plain, 3 m. beyond the outlet of the Sarno, a great town was formerly built, the Apenines, branching from the main range near the sea, and projecting as a peninsula more than 12 m. west, divides the Bay of Naples from the bay of Salerno (Sinus Paestanus), and ends in the bold promontory of the Punta della Campanella (Promontorium Posilippo), separated by the island of Ischia, from which there is a fine view of the city. On the north slope of this peninsula, where the plain ends and the coast abruptly bends to the west, stands the town of Castellammare, the site of Stabiae, the seat of Monte Sant' Angelo, which rises suddenly from the sea to a height of 472 ft. Further west, and nearly opposite to Naples across the bay, are Vico, Meta, Sorrento, Massa and many villages.

The north-west shore to the west of Naples is more broken and irregular. The promontory of Posilippo, which projects due south, divides this part of the bay into two smaller bays—the eastern, with the city of Naples, and the western, or Bay of Baia, which is sheltered by the island of Procida, a small island 2244 ft. long, and in some places as much as 70 ft. high, possibly constructed by Marcus Agrippa in 27 B.C., forms the so-called grotto of the Sirens, and is known by the name of Lunga. Beyond Posilippo is the small island of Nisida (Nesis); and at a short distance inland are the extinct craters of Solfatara and Astroni, and the lake of Agnano. Further west, on the coast, and provided with a convenient harbour, stands Pozzuoli (Pulei), a city containing many Roman remains, but now chiefly remarkable for the large works erected by Messrs Armstrong & Co.; and beyond it, round the Bay of Baiae, are Monte Nuovo, a hill thrown up in a single night in September 1538; the classic site of Baiae; the Lucrin or Lake; Lake Avernus; the Lake of Fusaro (Acherusia Palus); the Elysian Fields; and the port and promontory of Misenum. Still farther to the south-west lies the islands of Procida (Prociceus) and Ischia (Pithecusae, Aenaria or Inarime), which divide the Bay of Naples from the extensive Bay of Gaeta. All this country was comprised in classical times under the title of the Phlegrean Fields, and was cursed then more especially with volcanic eruptions, although the severe shock of earthquake which occurred in the island of Ischia in 1883 completely destroyed Casamicciola, and did serious damage to Forio, Lacco Ameno and Serrara Fontana, shows that there is great seismic activity in the locality. The whole region abounds with fissures from which steam highly charged with hydrochloric acid is continually issuing, and in many places boiling water is found at the surface.

The city of Naples is built at the base and on the slopes of a range of volcanic hills, and rising from the shore like an amphitheatre, is seen to best advantage from the sea. From the summit occupied by the castle of St Elmo a transverse ridge runs south to form the promontory of Pizzofalcone, and divides the city into two natural crescents. The western crescent, known as the Chiaja ward, though merely a long narrow strip between the sea
NAPLES

Naples is the see of a Roman Catholic archbishop, always a cardinal. The cathedral has a chapter of thirty canons, and of the numerous religious houses formerly existing very few have in whole or in part survived the suppression in 1868. The city is divided into fifty parishes purely for ecclesiastical purposes, and there are 237 Roman Catholic churches and 57 chapels.

The city is remarkable rather for richness in internal decoration than for architectural beauty, and is dedicated to St. Januarius, occupying the site of temples of Apollo and Neptune, and still containing some of their original granite columns, was built by the popes of Nicolaus II., and Gregory X. Owing to frequent restorations occasioned by earthquakes, it now presents an incongruous mixture of different styles. The general plan is that of a basilica with a nave and two (Gothic vaulted) aisles, and is divided by a series of arcades which was completed in 1606. Beneath the high altar is a subterranean chapel containing the tomb of St. Januarius (San Gennaro), the patron saint of the city; in the right aisle there is a chapel (Cappella del Tesoro) built between 1668 and 1673 in popular recognition of his having saved Naples in 1527 "from famine, war, plague, and the fire of Vesuvius"; and in a silver tabernacle behind the high altar of this chapel are preserved the two phials partially filled with his blood, the periodical liquefaction of which forms a prominent feature in the religious life of the city. Accessible by a door in the left aisle of the cathedral is the church of Sta Restituota, a basilica of Carolingian origin, which contains the tombs of Charlemagne and Pepin II. (901). Of the church of the Certosa (Carthusian monastery) of San Martino, on the hill below St. Elmo's castle, has now become in name, as so many of the churches are in reality, a museum. Dating from the 14th century and restored by Fossega in the 17th, it is a building of extraordinary richness of decoration, with paintings and sculpture by Guido Reni, Lanfranco, Caravaggio, D'Arpino, Solimene, Luca Giordano and notably a "Descent from the Cross" by Ribera, considered the finest work of this master. The monastery has been transformed into a medieval museum, where many pictures illustrating the modern history of Naples may be studied, and some of the sanatoriums of the monks are available for patients to be inspected. The view from the south-western balcony is incomparable. The marble cloister by Fossega, though rather flamboyant in character, is one of the finest of its kind in existence. Other churches of great architectural interest include the Santa Maria della Mercede, dating from 1311 by Guerello Origlia, which contains some splendid marble sculpture, especially Rosello's "Nativity" in the Cappella Piccola. The church of the Annunziata is the chief rival of the church of San Lorenzo (at Pozzuoli), the joint work of Donattello and Michelozzo, San Giovanni a Carbonara, built in 1344 and enlarged by King Ladislaus in 1400, which contains among much other remarkable sculpture the tomb of the king, the masterpiece of Domenico di Bartolo (1414), and that of Sergianni Caracciolo, the favourite of Joanna II., who was murdered in 1432 (the chapel in which it stands is paved with one of the earliest majolica pavements in Italy); San Lorenzo (1234), the Royal Church of the House of Anjou; and, for purely archaeological interest, the Church of Sant' Aspro, thought to be the oldest Christian church in Italy, in the crypt of the new Borsa or exchange. The church of Sant' Anna is also visited in the excavations at the back of the church of S. Maria Donna Regina and those in the cloister of S. Severino and Sossio. A more ancient Christian monument than any of the convents or churches is the catacombs, a great underground complex and in many respects finer than those at Rome. The entrance is at the Ospizio dei Poveri di San Gennaro (see Schulze's monograph, Jena, 1877).

Of the secular institutions in Naples none is more remarkable than the National Museum, formerly known as the Museo Borbonico. The building, begun in 1586 for vice-regeal stables, and remodelled in 1615 for the university, was put to its present use in 1790, when Ferdinand IV. proclaimed it his private property independently of the crown, placed in it the Farnese collection which had been acquired by his father, and the library of Count Ercole von Herculaneum, Pompéi, Stabia, Tarquinia, Paestum, &c., which till then had been housed in the palace at Portici, and gave it the name of Real Museo Borbonico. In 1860...
Garibaldi, when dictator at Naples, proclaimed the museum and the territory devoted to excavation to be the property of the nation, since which time it has been called the National Museum. Vast numbers of specimens have since been added to it both by purchase and from excavations, and it is now unique as a treasure house of Italo-Greek and Roman antiquities, besides containing a fine library and an important collection of coins.

A large additional space for exhibits was made in 1904, when the western half of the second floor was added, and the building as now arranged contains the large bronze and statues on the ground floor; a gallery of Pompeian frescoes in the exedra; the library, picture gallery, and richly adorned bronze vases, and four excellent stucco and painting exhibits of them being the seated Mercury and the dancing Faun; the marbles reckon among their vast number the Psyche, the Capuan vases, the portraits of Homer and Julius Caesar, as well as the huge group called the Torso Farnese (Amphion and Zethus dying Iris to its horns), the Farnese Hercules, the excellent though late statues of the Balbi on horseback and a very fine collection of ancient portrait busts.

Modern Buildings.—The Galleria Umberto I. is a large nucleus formed by the building erected in 1880, in which there is greatly an octagon in the centre, with a cupola. It is thus highly ornamented with gilt and stucco. A music-hall occupies the basement. The Galleria Principe di Napoli is in a smaller arcade opposite to the National Museum, mainly occupied by shops where reproductions from the museum are sold. The Galleria Vittoria, opened in 1907, is a circular building with a handsome dome, situated near the main entrance of the Villa Communale. It is in great part occupied by offices and shops. The Anglican church in Vico San Pasquale was built in 1862 on land given to the British community by Garibaldi when dictator. It was the first Protestant church erected in Italy. Since the granting of religious liberty, evangelical churches have been built by the Presbyterians, Wesleyans, French, Germans and Italians. A Greek church and a Jewish synagogue have also been opened. The Borsa (or exchange) is a fine building in the Piazza of the same name, built over the remains of the very ancient church of Sant' Aspreno, which are still preserved in the crypt. In front of it is the fine 16th-century Fontana Medina.

The National Library of Naples is one of the oldest in Italy, having been founded by Frederick II. in the first half of the 13th century. It had fallen to insignificance under the Bourbons, but since 1860 it has rapidly recovered. It contains 300,000 volumes (apart from the medical, scientific and technical) and is well equipped with zoological, mineralogical and geological museums, a physiological instrument, a cabinet of anthropology, and botanical gardens. Of particular interest is the herbarium of the Society of Sciences, which contains more than 30,000 specimens. The national art gallery and museums are regarded as the best work of Marco di Pino; the quadrangle, surrounded by a simple but effective peristyle, contains statues of the two patron saints of the town, Thomas Aquinas and Giordano Bruno. The new building, the shell of which was completed in 1906, faces the Rettifilo, a wide street which leads from the Borsa in a straight line to the railway station; at the back it joins the former building, which is at a higher level. On the other or north side of the ancient building, and at the back of the Strada Constantinopoli, a very long gallery of ancient works is attached, at which foundling boys are educated and taught trades. The principal hospitals are the Incurabili, Gesu Maria, Santa Maria della Pace and a hospital for poor priests, which are all under the direction of the Jesuits. The Meteorological Institute of Naples, of which the director is the very able Professor Pasquale Gennaro, is also a national hospital for the treatment of others than Italians, which was built by Lady Harriet Bentinck and is managed by an international committee; a German hospital; and a hospital erected by the representatives of Baron Adolph de Rothschild. There are two public lunatic asylums in the city, and another at the neighbouring town of Aversa; and many private asylums, among which those of Donatello, Miano and Pons-Rossi may be mentioned.

Harbour.—At a very early date the original harbour at Naples, now known in its greatly reduced state as Porto Piccolo, and fit only for boats and lighters, became too small. In 1302 Charles II. of Anjou and his wife, by extending the embankments of the old town from the southern end of the mole of Molo Grande or San Gennaro, which stretched eastward into the bay, and was terminated by a lighthouse in the 15th century. By the addition of a new pier running north-east from the lighthouse, the entrance of the Tiber was formed, and the city of Naples was but it was not until 1884 that the growth of the city and the width of the entrance were much increased by the laying out of Vigna Romana, and the formation of the new kingdom of Italy attention was called to the insufficiency of the harbour for modern wants; and new works were begun in 1862. Besides the lengthening of the Molo San Vincenzo, a new mole was carried out as a canal. The whole work has been executed with great rapidity, and the new and spacious Capitaneria di Porto, on the eastern side of which is a new
harbour used mainly for the coal trade, and piers such that the largest liner can lie alongside the jetty. The outer mole of this harbour runs out from the Castel del Carmine towards the south for some 1,500 ft, and a breakwater was constructed in 1906 in which the breakwater was completed in 1906 fell in on the farther side, and had to be reconstructed. The depth of this new harbour is from 25 to 30 ft. There are two projecting moles, one to the inner harbour and the second to the dry dock. In 1910 the total tonnage of 5,397,918 tons was reported to have been loaded and unloaded, and the French 245,206 tons in 161 vessels. Naples is the principal port for emigration, chiefly to North and South America; 261 emigrant ships sailed in 1905, carrying 216,103 emigrants. The annual revenue from the port is about £3,676,805. The articles dealt in are wine, oil, spirits, drugs, tobacco, chemicals, hemp, cotton, wool, silk, timber, paper, leather and hides, metal, glass, earaes and live animals. The largest export was to the United States (264,562), the next to Great Britain (£701,387), while the largest imports were from Great Britain (£1,253,410) and the United States (£807,564). The speciality of the port is macaroni, and the imports of which amounted to 1,200,000 lbs. in 1906.

Water Supply.—Since 1884 Naples has had as fine a water supply as any city in Europe. It is derived from the hills in the neighbourhood of Avellino, and is thought to be the effluent of an underground lake. It rushes out from the hillside and is received in a cove, and again spills down into the bay, until it meets five enormous reservoirs constructed just opposite to the entrance gate of the royal palace at Capodimonte. Hence it comes by natural gravitation into the city. It was carried by pipelines and through an asphalt conduit to the most distant parts of the city. It supplies the highest parts of the town with abundant water. The water is so cold that in the hottest summer the most perishable articles can be preserved by merely securing them in a closed vessel and allowing the water to drip upon it. The supply was brought into the town just after the terrible cholera outbreak of 1884, and as each new standpipe was erected in the streets every well within 200 yds. of it was closed, so that in a short time no well remained in the town, and thus a fertile source of infection was eliminated. Every house in the town and suburbs is now supplied with a constant supply of pure water. The effect on the health of the city has been extraordinary. About 110,000 people can be frequently seen attached to it, and it has become things of the past, and there is now abundant water for public fountains, washing the streets and watering gardens both public and private. The old sewers were found quite inadequate to carry off the large increase of water, and besides they all led directly into the bay, causing a terrible odour and rendering the water near the town unwholesome for bathing. This has been remedied by a system of sewers, which after passing by a tunnel through the hill of Posilipo across the plain beyond and discharge their contents into the open sea on the deserted coast of Cumae, 17 m. from the city of Naples. The old aqueduct, which was constructed in the 17th century by Cardinal Spada and supplied water to Goli, is still available to a certain extent, but its water was never very wholesome, and as it was not laid on to houses but only supplied fountains and house eisterns which have since been filled up, no account is taken of it. The only modern public fountains are those which supplied drinking water to the west end of the town, has been dry for many years.

Modern Growth.—Naples, the most densely peopled city in Europe, has increased in modern times at an enormous rate. On the large areas reclaimed from the sea, vast hotels and mansions let in flats have been erected. The gardens at the west end of the town are all built over. The Vomero, once merely a scattered village, is now an important suburb, and a large workmen's quarter has sprung up beyond the railway station to house the populace which was turned out from the centre of the town when the works of the risanamento were undertaken. The increase in population between the census of 1881, when it was 461,069, and the census in 1901 was 85,521. The commune, which includes not only the urban districts (sezioni) of San Ferdinando, Chiaia, San Giuseppe, Monte Calvario, Avvocata, Stella, Massimo, Posillipo, Fuorigrotta, San Martino, San R. Villarosa, San Giorgio a Nilo, Posillipo and Porto, but also the suburban districts of Vomero, Posilipo, Fuorigrotta, Miano and Piscinola, has been built over in every direction, one great incentive being the creation of an industrial zone to the eastward of the city. This zone has been set aside for the purpose of industrial development, and all persons or companies who set up industrial concerns on it have grants of land at a nominal price, are free of taxes for ten years and have electric force supplied to them at a very low figure. The law came into force in 1906, and was immediately followed by the erection of a large number of factories, for spinning silk, cotton, jute and wool, and the making of railway plant, automobiles, the building of ships, and in fact almost every kind of industry. After the cholera epidemic of 1884, M. Depretis, then premier, visited Naples, and in the course of a public speech gave vent to the famous dictum “Bisogni sventare Napoli.” “Naples must be disembowelled!” Plans were at once made to pull down all the worst slums, and as these lay between the centre of the town and the railway station, a wide street was planned along the course of the town. On each side of it were to be cleared to afford building sites for shops and offices. The funds for this vast undertaking were found partly by the state, which voted £5,000,000, and as to the rest by the Risanamento Company, which had a capital of £1,250,000. Before beginning operations demolition was obviously necessary to provide homes for the poor people who would be turned out, and a large working-class quarter was erected to the north and beyond the railway station. This quarter has wide airy streets and lofty houses, and though perhaps the houses were let at prices which were beyond the purses of the lowest class, the result of their erection was to cause a number of the poorer houses in the old town to be vacated, thus giving an opportunity to the lowest class to be at any rate better housed than they were before. The quarter described above is known as the Rione Vasto. There are also new middle-class quarters at Santa Lucia, Vomero Nuovo and Sant' Efremo, and better houses in the Via Sirignano, on the Riviera di Chiaja, Via Elena and Via Caracciolo at Mergellina, Via Partenope near the Chiatamone, and an aristocratic quarter in the large extensions made in the Rione Amedeo. The narrow alleys of Porto, Pendino and Mercato have nearly all disappeared, and old Naples has been vanishing day by day. One notable result of the widening of the streets has been the spread of the electric tramways, which traverse the town in various directions and are admirably served by a Belgian company. The city is mainly lighted by electricity, which has found its way into all the public edifices and most private houses.

Folk-lore.—The attention of antiquarians to the charms against the Evil Eye used by the inhabitants of the Neapolitan provinces was first drawn in 1888, when it was observed that they were all derived from the survival of ancient classical legends which had sprung from various sources in connexion with classical sites in the neighbourhood. These may be divided into three classes: first, the charms which are in use in the southern half of the peninsula in the towns of Campi Phlegraei, which refer to the worship of Diana, whose shrine at Capua was of considerable importance; secondly, the serpent charms, which formed part of the worship of Aesculapius, and were no doubt derived largely from the ancient island of Surrentum, and which are derived from the legends of the Sirens. A special caution is given in this case, as the Siren is represented mounted on her sea-horse crossing the Styx upon the vase of Pilo and Prospero in the collection of the Naples Museum. This vase dates about 250 B.C., and the Siren represents her in the same way, but usually mounted on two sea-horses. The sea-horse and the Siren alone are commonly found as charms; the Siren being sometimes in her fashial form and sometimes in the form of a harpy.

History.—All ancient writers agree in representing Naples as a Greek settlement, though its foundation is obscurely and differently narrated. The earliest Greek settlement in the neighbourhood was at Pithecusa (Ischia), but the colonists, being driven out of the island by the frequent earthquakes, settled on the mainland at Cumae, where they found a natural acropolis of great strategic value. From Cumae they colonized Dikearchia (Pozzuoli) and probably subsequently Palearopoli. The site of Palearopoli has given rise to much discussion, but the present view is that they sprang from the colony of Euboeans and seem to be the correct solution of the problem. He places Palearopoli at Gaia Point and has discovered the remains of the harbour, the town hall and various other rudiments of the ancient city. This site, moreover, corresponds with Livy's testimony, and would account for his statement that the towns of Palearopoli and Neapolis were near together and identical in language and government. This opinion about the site of Palae-ropoli has been based on the very considerable alterations which are known to have taken place in the level of the land, and the
extensive submerged foundations of buildings off the southern ex-

tremity of Posilipo have been identified with those of the old city.

Parthenope, as well as Dikearchia, was formed as a new colony
from Cumae, and was so called from a legendary connexion of
the locality with the siren of that name, whose tomb was still
shown in the time of Strabo. Parthenope was situated where
Naples now stands, upon the splendid natural acropolis formed
by the hill of Pizzofalcone, and defended on the land side by a
fosse which is now the Strada di Chiaja, and a massive wall, of
which remains may still be traced at the back of the existing
houses. handfuls of Parthenope there came afterwards
considerable addition from Athens and Chalcis, and they
built themselves a town which they called Neapolis, or the “new
city,” in contradistinction to the old settlement, which in con-
sequence was styled Palaeopolis or the “old city.” The name of
Parthenope became lost, and the city of Palaeopolis fell into
gradual decadence.

In 326 B.C. the Palaeopolitans having provoked the hostility
of Rome by their incursions upon her Campanian allies, the
council Publilius Philo marched against them, and having taken
their garrison between the old and the new city, laid regular siege
to Palaeopolis. By the aid of a strong Samnite garrison which
they received, the Palaeopolitans were long able to withstand
the attacks of the consul; but at length the city was betrayed into
the hands of the Romans by two of her citizens. Neapolis
possibly surrendered to the consul without any resistance, as it
was received on favourable terms, had its liberties secured by a
采购， and obtained the chief authority, which previously
seems to have been enjoyed by the older city. From that time
Palaeopolis totally disappeared from history, and Neapolis
became an allied city (federata civitas)—a dependency of Rome,
whose alliance it retained constantly faithful, even in the most
trying circumstances. In 82 B.C. Pyrrhus unsuccessfully
attacked its walls; and in the Second Punic War Hannibal was
deterred by their strength from attempting to make himself
master of the town. During the civil wars of Marius and Sulla
a body of partisans of the latter, having entered it by treachery
(82 B.C.), made a general massacre of the inhabitants; but
Neapolis soon recovered, as it was again a flourishing city in the
time of Cicero. It became a municipium after the passing of the
lex Julia; under the empire it is noticed as a colonia, but the
time when it first obtained that rank is uncertain—possibly
under Claudius.

Though a municipal town, Neapolis long retained its Greek
culture and institutions; and even at the time of Strabo it
had gymnasia and quinquennial games, and was divided into
phratriae after the Greek fashion. When the Romans became
masters of the world, many of their upper classes, both before
the close of the republic and under the empire, from a love of
Greek manners and literature or from indolent and effeminate
habits, resorted to Neapolis, either for the education and the
cultivation of gymnastic exercises or for the enjoyment of music
and of a soft and luxurious climate. Hence we find carols
variously styled—by Horace olima Neapolis, by Martial docta
Parthenope, by Ovid in otia natum Parthenopen. It
was the favourite residence of many of the emperors; Nero made his
first appearance on the stage in one of its theatres; Titus assumed
the office of its archon; and Hadrian became its demarch. It
was chiefly at Neapolis that Virgil composed his Georgics; and
he was buried on the hill of Paestum, the modern Posilipo, in
its neighbourhood. It was also the favourite residence of the
poets Statius (d. 99) and Silius Italicus (A.D. 25), the former of
whom was a Neapolitan by birth.

After the fall of the Roman Empire, Neapolis suffered severely
during the Gothic wars. Having espoused the Gothic cause in
the year 536, it was taken, after a protracted siege, by Belisarius,
who turned aside an aqueduct, marched by surprise into the city
through its channel, and put many of the inhabitants to the
sword. In 542 Totilla besieged it and compelled it to surrender,
but being soon after recovered by Narses, it remained long a
dependency of the exarchate of Ravenna, under the immediate
government of a duke, appointed by the East Roman emperors.

When the Lombards invaded Italy and pushed their conquests
in the southern provinces, the limits of the Neapolitan duchy
were considerably narrowed. In the beginning of the 8th century,
at the time of the iconoclastic controversy, the emperor Leo
the Isaurian having forced compliance to his edict against the
worshiping of images, the Neapolitans, encouraged by Pope
Gregory III., threw off their allegiance to the Eastern emperors,
and established a republican form of government under a duke
of their own appointment. Under this régime Neapolis retained
independence for nearly four hundred years, though constantly
struggling against the powerful Lombard dukes of Benevento, who
twice unsuccessfully besieged it. In 1027, however, Pandulph IV.,
the Lombard prince of Capua, succeeded in making himself
master of it; but he was expelled in 1030 by Duke Sergius,
chieflly through the aid of a few Norman adventurers. The
Normans, in their turn, gradually superseded all powers, whether
Greek, Lombard or republican, which had previously divided
the south of Italy, and furthermore checked the Saracens in the
advances they were making through Apulia.

From the date at which the south of Italy and Sicily were
subjugated by the Normans, the fortunes of Naples cease to be
an integral part of the history of a republic or a city, and becomes that of a kingdom,
sometimes separate, sometimes merged, with the kingdom
of Sicily, in that of the Two Sicilies. The city of Naples hence-
forth formed the metropolis of the kingdom to which it gave its
name, owing this pre-eminence to its advantageous position on
the side of Italy towards Sicily, and to the favour of successive
princes (see NAPLES, KINGDOM OF).

NAPLES, KINGDOM OF, the name conventionally given to
the kingdom of Sicily on the Italian mainland (Sicily beyond the
Pharos), to distinguish it from that of Sicily proper (Sicily on
this side of the Pharos, i.e. Messina), the title of “King of
Naples” having only actually been borne by Philip II., of Spain
in the 16th century (“King of England and Naples”) and by
Joseph Bonaparte and Joachim Murat in the 19th. The history
of the Kingdom of Naples is intimately interwoven with that of
Sicily, with which for long periods it was united as the kingdom
of the Two Sicilies.

For the earlier history of Naples and its territory, as a republic
and a dukedom, see NAPLES above, and for the coming of the
Normans see SICILY and NORMANS. It is sufficient here to state
that the leaders of the house of Hauteville, Robert Guiscard and
Richard of Aversa, in 1059 did homage to Pope Nicholas II. (q.v.)
for all conquests they had made both in the island and upon the
mainland, and that in 1130 Roger de Hauteville (Roger II. as
“great count” of Sicily) assumed the style of king as Roger I.
In this way the south of Italy, together with the adjacent island
of Sicily, was converted into one political body, which, owing to
the peculiar temper of its Norman rulers and their powerful
organization, assumed a more feudal character than any other
part of the peninsula. The regno, as it was called by the Italians,
constituted a state apart, differing in social institutions, foreign
relations, and type of home government, from the commonwealths
and tyrannies of upper Italy. The indirect right acquired by
the popes as lords paramount over this vast section of Italian
territory gave occasion to all the most serious disturbances of
Italy between the end of the 13th and the beginning of the 16th
centuries, by the introduction of the house of Anjou into Naples
and the disputed succession of Angevin and Aragonese princes.

Roger I. was succeeded in 1154 by William I. “the Bad,”
who died in 1166, being succeeded by his son William II. “the
Good,” on whose death in 1189 the crown passed to his illegitimate son Tancred. After the death
of Tancred the emperor Henry VI., of the house of
Hohenstaufen, who by his marriage with Constance
or Costanza d'Altaiva, daughter of Roger I. (d. 1154), was

The

Hohen- staunese.
Tancred's rival for the kingdoms of Naples and Sicily, descended into Italy in 1194. He easily conquered both the mainland and the island, and Tancred's only son William III, surrendered the crown to him. But with the excuse of a pretended plot he put a number of the most conspicuous persons in the kingdoms to death, and had William himself blinded. He then returned to Germany, and during his absence an agitation broke out, propped by the cruelty of his lieutenants and encouraged by his Norman wife. He hurried back to Italy, and repressed the movement with his usual ferocity, but died in 1197. Costanza then had her son Frederick (b. 1194) proclaimed king, and obtained the support of the Holy See on condition that the kingdom should be once more recognized as a fief of the church. The whole history of the ensuing period of south Italian history turns on the claims of the papacy over the kingdoms of Naples and Sicily, based on the recognition of papal suzerainty in 1053. The Hohenstaufen kings refused to admit this claim; hence the persistent hostility of the popes and the calling in of foreign potentates and armies. Costanza died in 1198, leaving Pope Innocent III. regent and tutor to her son; the pope's authority was contested by many nobles, but in 1200 Frederick married Costanza, daughter of the king of Aragon, with whose help he succeeded in reducing a large part of Sicily to obedience. Two years later he was elected king of the Romans at the diet of Nuremberg in opposition to Otto IV., and in 1220 he was crowned emperor in Rome by pope Honorius III., but continued to reside in Sicily. He quelled a rising of Sicilian barons and Saracens, and confined 60,000 of the latter at Luccara in Capitulacum, where they were borne by a mere levée en masse. After the death of Frederick's wife Pope Innocent III. arranged a marriage for him with Yolande, daughter of John of Brienne (1225). But in 1227 Gregory IX. excommunicated him because he delayed the crusade which he had promised to undertake; and although he sailed the following year, and concluded a treaty with the sultan of Egypt whereby the kingdom of Jerusalem was re-established, the pope was not satisfied and sent an army into Neapolitan territory. On his return Frederick defeated the pontificals, and in 1230 peace was made at San Germano and the excommunication withdrawn. In 1231 he issued the celebrated Constitutions of the Sicilian fiefs, by which he reduced the pope to an actual vassal of the crown, and regulated the parliament of Melia. He had further quarrels with successive pontiffs, and was excommunicated more than once. In 1246 a number of his own barons and officials of the mainland conspired against his rule, but were crushed with great ferocity, and even his faithful secretary, Pietro della Vigna, fell a victim to the emperor's suspicions. Frederick's last years were embittered by the hostilities following on the crusade which the pope proclaimed against him and by rebellions in Naples and Sicily. He died in 1250. His policy was anti-feudal and tended to concentrate power into his own hands; hence the frequent risings of the barons. His court at Palermo had been one of the most brilliant in Europe, and attracted learned men from all over the then known world; his somewhat pagan philosophy was afterwards regarded as marking the beginnings of modern rationalism. He opened schools and universities, and he himself wrote poetry in Sicilian dialect.

His son Conrad IV. succeeded to the empire, while to his illegitimate son Manfred he left the principality of Taranto and the regency of the southern kingdom, to be held in Conrad's name. By his political sagacity and moderation Manfred won from a strong nation to Sicily his land, and Conrad to subjugate the rebellious barons. The emperor died in 1254, leaving an infant son, Conradin (b. 1252), and Manfred was appointed vicar-general during the latter's minority. Manfred, too, encountered the hostility of the popes, against whom he had to wage war, generally with success, and of some of the barons whom the popacy encouraged to rebel; and in 1258, on a rumour of Conradin's death, he was offered and accepted the crown of Naples and Sicily. The rumour proved false, but he retained the crown, promising to leave the kingdom to his death and to defend his rights. He now became head of the Gibellines or Imperialists of Italy, and his position was strengthened by the marriage of his daughter Costanza to Peter, son of King James of Aragon. But he met with opposition from the turbulent nobility and the clergy, who had been deprived of many privileges, and he failed to conciliate the communions, which were oppressed by taxes and beginning to aspire to autonomy. Innocent IV., in his determination to crush the Hohenstaufens, offered the kingdom in turn to Richard, earl of Cornwall, to Edward, son of Henry III. of England, and to Charles of Anjou, son of the last French monarch. After long negotiations with successive popes, Charles was finally induced by Clement IV. to come to Italy in 1265, agreeing to accept the kingdom of the Two Sicilies as a fief of the church, and in 1266 he marched southward with the privileges of a crusader (see Charles I., king of Naples and Sicily).

The defection of many cities and nobles facilitated his task, and Manfred was forced to retire on Benevento, where, on the 26th of February, owing to the treachery of a part of his troops, he was defeated and killed. As a result of this victory Charles was soon master of almost the whole kingdom, and he entered Naples, which now became the capital instead of Palermo. He persecuted the nobles who had sided with Manfred, and established a military despotism which proved more oppressive than that of the Hohenstaufen. But Charles I. rose to the head of a small army collected in Germany, and he found many supporters; but King Charles on hearing of his arrival abandoned the siege of Lucera and came to intercept him. A battle took place at Tagliacozzo (August 23rd, 1268), in which the Imperialists were defeated, and Conradin himself was subsequently caught and handed over to Charles, who had him tried for high treason and beheaded at Benevento, August 12th, 1266. All who had assisted the unfortunate youth were cruelly persecuted, and the inhabitants of Agosta put to the sword. Thus ended the power of the Hohenstaufen. Although the picturesque figures of Manfred and Conradin awakened sympathy among the people of the kingdom, their authority was never really consolidated and their German knights were hated; which facts rendered the enterprise of another foreigner like the Angevin comparatively easy.

In Sicily, however, Charles's government soon made itself odious by its exactions, the insolence and cruelty of the king's French officials and favourites, the depreciation of the currency, and the oppressive personal services, while the nobles were incensed at the violation of their feudal constitution. Just as Charles was contemplating an expedition to the East, the Sicilians rose in revolt, massacring the French throughout the island. The malcontents were led by the Salernitan noble Giovanni da Procida, a friend of the emperor Frederick and of Manfred, who had taken refuge at the court of Peter III. of Aragon, husband of Manfred's daughter Costanza. He had induced Peter to make good his somewhat shadowy claims to the crown of Sicily, but while preparations were being made for the expedition, the popular rising known as the Sicilian Vespers, which resulted in the massacre of nearly all the French in the island, broke out at Palermo on Easter Day 1282. Peter reached Palermo in September, and by the following month had captured Messina, the last French stronghold. Pope Martin IV. now proclaimed a crusade against the Aragonese, and the war continued for many years. The Sicilian fleet under Ruggiero di Lauria defeated that of the Angevins at Malta in 1283, and 1284 in the Bay of Naples, where the king's son, Charles the Lame, was captured. Charles I. died in 1286, and, his heir being a prisoner, his grandson, Charles
Martel (d. 1295), assumed the regency. Peter died the same year, leaving Aragon to his son Alphonso III, and Sicily to his son James, who was consecrated king in spite of the interdict. The war went on uninterrupted, for the popes had died in attempts to arrive at an understanding, as they were determined that the rights of the church should be fully recognized. Charles the Lame, who had been liberated in 1288, having renounced his rights on Sicily, was absolved from his oath by Pope Nicholas IV., who crowned him king of the Two Sicilies and excommunicated Alphonso. The latter's successor James made peace with Boniface VIII. by renouncing Sicily (in exchange for Sardinia and Corsica and the hand of Charles's daughter) and promising to help the Angevins to reconquer the island. But the Sicilians, led by James's brother, Frederick III., who had been governor of the island and was now proclaimed king, determined to resist. The war went on with varying success, until Charles of Valois, summoned by the pope to conduct the campaign, landed in Sicily and, his army being decimated by disease, made peace with Frederick at Caltabellotta (1302). The Angevins renounced Sicily in favour of Frederick, who was recognized as king of Trinacria (a name adopted so as not to mention that of Sicily), and he was to marry Leonora, daughter of Charles of Valois; at his death the island was to revert to the Angevins, but his children would receive compensation elsewhere. In 1305 the pope unwillingly ratified the treaty. (See CHARLES II., king of Naples and Sicily, and FREDERICK III., king of Sicily.)

Charles II. died in 1309 and was succeeded by his second son Robert. (His eldest son had predeceased him, leaving a son, Charles Robert, of Caroberto, at this time king of Hungary.) Robert now became leader of the Guelphs in Italy, and war between Naples and Sicily broke out once more, when Frederick allied himself with the emperor Henry VII. on his death in 1313, and his illegitimate son Robert, his heir to the throne. Robert led or sent many devastating expeditions into Sicily, and hostilities continued under King Peter even after Frederick's death in 1337. Peter died in 1342, leaving an infant son Louis; but just as Robert was preparing for another expedition he too died in the same year. Robert had been a capable ruler, a scholar and a friend of Petrarch, but he lost influence as a Guelph leader owing to the rise of other powerful princes and republics, while in Naples itself his authority was limited by the rights of a turbulent and rebellious baronage (see Charles of Valois). At his death the island passed to Louis, his son by Leonora, who died in 1328 and he was succeeded by his granddaughter Joanna, wife of Andrew of Hungary, but the princes of the blood and the barons stirred up trouble, and in 1345 Andrew was assassinated by order of Catherine, widow of Philip, son of Charles II., and of several nobles, not without suspicion of Joanna's complicity.

Andrew's brother Louis, king of Hungary, now came to Italy to make good his claims on Naples and avenge the murder of Andrew. With the help of some of the barons he drove Joanna and her second husband, Louis of Taranto, from the kingdom, and murdered Charles of Durazzo; but as Pope Clement refused to recognize his claims he went back to Hungary in 1348, and the fickle barons recalled Joanna, who returned and carried on desultory warfare with the partisans of Louis of Hungary. Louis of Taranto and Joanna were crowned at Naples by the pope's legate in 1352, but Niccolò Acciaiuoli, the sensual, became the real master of the kingdom. In 1374 Joanna made peace with Frederick of Sicily, recognizing him as king of Trinacria on condition that he paid her tribute and recognized the pope's suzerainty; at his death she nominated Louis of Anjou her heir, but while the latter was recognized by the antipope Clement VII., Pope Urban VI. declared Charles of Durazzo (great-grandson of Charles II.) king of Sicily at di quaolo del Faro [i.e. of Naples]. Charles conquered the kingdom and took Joanna prisoner in 1381, and had her murdered the following year. Louis, although assisted by Amadeus VI. of Savoy, failed to drive out Charles, and died in 1384. Charles III. died two years later and the kingdom was plunged into anarchy once more, part of the barons siding with his own favourite year-old son Ladislas, and part with Louis II. of Anjou. The latter was crowned by the antipope Clement, while Urban regarded both him and his rival as usurpers. On Urban's death in 1389 Boniface IX. crowned Ladislas king of Naples, who by the year 1400 had expelled Louis and made himself master of the kingdom. In 1407 he occupied Rome, which Gregory XII. could not hold. But Alexander V., elected pope by the council of Pisa, turned against Ladislas and recognized Louis. Ladislas was defeated in 1411 and driven from Rome, but reoccupied the city on Louis's return to France. He died in 1414, and was succeeded by his sister Joanna II. (q.v.), during whose reign the kingdom sank to the lowest depths of degradation. In 1415 Joanna married James of Bourbon, who kept his wife in a state of semi-confinement, murdered her lover, Pandolfo Alopo, and imprisoned her chief captain, Sforza; but his arrogance drove the barons to rebellion, and they made him renounce the royal dignity and abandon the kingdom. The history of the next few years is a maze of intrigues between Joanna, Sforza, Giovanni Visconti, Aragon (who occupied Sicily), and the Valois; Joanna adopted as her heir, and Louis III. of Anjou, whom she had pitted against each other in every possible combination. Louis died in 1434 and Joanna in 1435 (see JOANNA II., queen of Naples). The succession was disputed by René of Anjou and Alphonso, but the former eventually renounced his claims and Alphonso was recognized as king of Naples by Pope Eugenius IV. in 1443.

Under Alphonso, surnamed "the Magnanimous," Sicily was once more united to Naples and a new era was inaugurated, for the king was at once a brilliant ruler, a scholar and a patron of letters. He died in 1456, leaving Naples and Sicily to his illegitimate son Alphonso (q.v.), and died in 1458. The latter was crowned king of Naples and Sicily, Sardinia and Aragon to his brother John. Ferdinand found, however, that Alphonso had not really consolidated his power, and he had practically to reconquer the whole country. By 1464 he was master of the situation, in spite of the attempt of Pope Callixtus III. to enforce the claims of the papacy, and that of John of Anjou to enter into the heritage of his ancestors. In alliance with Pope Sixtus IV. and the Milanese he waged war on Lorenzo de' Medici in 1479; but that astute ruler, by recognizing Alfonso and his illegitimate brother Ferdinand of Spain, made peace (1479). In 1485 the disaffection of the barons, due to the king's harshness and the arrogance and cruelty of his son, found vent in a revolt led by Roberto Sanseverino and Francesco Coppola, which was crushed by means of craft and treachery. Ferdinand died in 1494 full of forebodings as to the probable effects of the invasion of Charles VIII. of France, and was succeeded by Alphonso (see FERDINAND I., king of Naples). The French king entered Italy in September 1495, and conquered the Neapolitan kingdom without much difficulty. Alphonso abdicated, his son Ferrandino and his brother Frederick withdrew to Ischia, and only a few towns in Apulia still held out for the Aragonese. But when the pope, the emperor, Spain and Venice, alarmed at Charles's progress, formed a defensive league against him, he quitted Naples, and Ferrandino, with the help of Ferdinand II. of Spain, was able to reoccupy his dominions. He died much regretted in 1496 and was succeeded by Frederick. The country was torn by civil war and brigandage, and the French continued to press their claims; and although Louis XII. (who had succeeded Charles VIII.) concluded a treaty with Ferrandino of Spain for the partition of Naples, France and Spain fell out in 1502 over the division of the spoils, and with Gonzalo de Cordoba's victory on the Garigliano in December 1502, the whole kingdom was in Spanish hands.

On the death of Ferdinand in 1516, the Habsburg Charles became king of Spain, and three years later was elected emperor as Charles V.; in 1522 he appointed John de Lannoy viceroy of
NAPLES, KINGDOM OF

Naples, which became henceforth an integral part of the Spanish dominions. The old divisions of nobility, clergy and people were maintained and their mutual rivalry encouraged; the nobles were won over by titles and by the splendour of the viceregal court, but many persons of low birth who showed talent were raised to high positions. The viceroy was assisted by the Collateral Council and the Sacred College of Santa Chiara, composed of Spanish and Italian members, and there was an armed force of the two nationalities. Spanish rule in the whole was oppressive and tyrannical, and based solely on the idea that the dependencies must pay tribute to the dominant kingdom. During the rule of Don Pedro de Toledo (one of the best viceroyes) Naples became the centre of a Protestant movement which spread to the rest of Italy, but was ultimately crushed by the Inquisition. In Sicily Spanish rule was absolute, for the island had not been conquered, but had given itself over voluntarily to the Aragonese; and the parliament, formed by the three braccì or orders (the militare consisting of the nobility, the ecclesiasticà, of the clergy, and the demanìale, of the communes), imposed certain limitations on the viceroy, who had to pay the three in exchange for each other. But the oppressive character of the government provoked several rebellions. In 1598 an insurrection, headed by the philosopher Tommaso Campanella, broke out in Calabria, and was crushed with great severity.

In 1647, during the viceroyalty of the marquis of Los Leros in Sicily, bread riots in Palermo became a veritable revolution, and the people, led by the goldsmith Giovanni d'Alessio, drove the viceroy from the city; but the nobles, fearing for their privileges, took the vicerey's part and turned the people against d'Alessio, who was murdered, and Los Leros returned. On the 7th of July 1647, tumults occurred at Naples in consequence of a new fruit tax, and the viceroy, Count d'Arcos, was forced to take refuge in the Castelnuovo. The populace, led by Amalfi fisherman, known as Masaniello (g.o.), obtained arms, erected barricades, and, while professing loyalty to the king of Spain, demanded the removal of the oppressive taxes and murdered many of the nobles. D'Arcos came to terms with Masaniello; but in spite of this, and of the assassination of Masaniello, whose arrogance and ferocity had made him unpopular, the disturbances continued, and again the viceroy had to retreat to Castelnuovo and make new braccì against them. Even at the arrival of reinforcements from Spain failure to restore order, and the new popular leader, Gennaro Annese, now sought assistance from the French, and invited the duke of Guise to come to Naples. The duke came with some soldiers and ships; but failed to effect anything; and after the recall of d'Arcos the new viceroy, Count d'Ognate, having come to an arrangement with Annese and got Guise out of the city, proceeded to punish all who had taken part in the disturbances, and had Annese and a number of others beheaded.

In 1670 the insurrection broke out at Messina. They began with a riot between the nobles and the burghers, but ended in an anti-Spanish movement; and while the inhabitants called in the French, the Spaniards, who could not crush the rising, called in the Dutch. Louis XIV. sent a fleet under the duc de Vivonne to Sicily, which defeated the Dutch under de Ruyter in 1676. But at the peace of Nimwegen (1679) Louis treacherously abandoned the Messinese, who suffered cruel persecution at the hands of the Spaniards and lost all their privileges. An anti-Spanish conspiracy of Neapolitan nobles, led by Macchia, with the object of proclaiming the archduke Charles of Austria king of Naples, was discovered, but in 1707 an Austrian army conquered the kingdom, and Spanish rule came to an end after 203 years, during which it had succeeded in thoroughly demoralizing the people.

In Sicily the Spaniards held their own until the peace of Utrecht in 1713, when the island was given over to Duke Victor of Savoy, who assumed the title of king. In 1718 he had to hand back his new possession to Spain, who, in 1720, surrendered it to Austria and gave Sardinia to Victor Amadeus. In 1733 the treaty of the Escurial between France, Spain and Savoy against Austria was signed. Don Carlos of Bourbon, son of Philip V. of Spain, easily conquered both Naples and Sicily, and in 1738 he was recognized as king of the Two Sicilies, Spain renouncing all her claims.

Charles was well received, for the country now was an independent kingdom once more. With the Tuscan Bernardo Tanucci as his minister, he introduced many useful reforms, improved the army, which was thus able to repel an Austrian invasion in 1744, embellished the city of Naples and built roads. In 1749 Charles III. having succeeded to the Spanish crown, abdicated that of the Two Sicilies in favour of his son Ferdinand, who became Ferdinand IV. of Naples and III. of Sicily. Being only eight years old, a regency under Tanucci was appointed, and the young king's education was purposely neglected by the minister, who wished to dominate him completely. The regency ended in 1767, and the following year Ferdinand married the masterful and ambitious Maria Carolina, daughter of the empress Maria Theresa. She had Tanucci dismissed and set herself to the task of making Naples a great power. With the help of John Acton, an Englishman whom sympathized with the plains of Tanucci, she freed Naples from Spanish influence and secured a rapPROCUREMENT with England and Austria.

On the outbreak of the French Revolution the king and queen were not at first hostile to the new movement; but after the fall of the French monarchy they became violently opposed to it, and in 1793 joined the first coalition against France, instituting severe persecutions against all who were remotely suspected of French sympathies. Republicanism, however, gained ground, especially among the aristocracy. In 1796 peace with France was concluded, but in 1798, during Napoleon's absence in Egypt and after Nelson's victory at Aboukir, Maria Carolina induced Ferdinand to go to war with France once more. Nelson arrived in Naples in September, where he was enthusiastically received. He, after a somewhat farcical occupation of Rome, which had been evacuated by the French, hurried back to Naples as soon as the French attacked his troops, and although the lazaroni (the lowest class of the people) were devoted to the dynasty and ready to defend it, he fled with the court to Palermo in a panic on board Nelson's ships. The wildest confusion prevailed, and the lazaroni massacred numbers of persons suspected of being friends of the crown, and the soldiers and the clergy, finding themselves abandoned by their king in this cowardly manner, began to contemplate a republic under French auspices as their only means of salvation from anarchy. In January 1799 the French under Championnet reached Naples, but the lazaroni, ill-armed and ill-disciplined as they were, resisted the enemy with desperate courage, and it was not until the 20th that the invaders were masters of the city. On the 23rd the Papal republic was proclaimed. The Republicans were men of culture and high character, but doctrinaire and impractical, and they knew very little of the lower classes of their own country. The government soon found itself in financial difficulties, owing to Championnet's demands for money; it failed to organize the army, and met with scant success in its attempts to "democratize" the provinces. Meanwhile the court at Palermo sent Cardinal Fabrizio Ruffo, a wealthy and influential prelate, to Calabria, to organize a counter-revolution. He succeeded beyond expectation, and with his "Christian army of the Holy Faith" (Esercito Cristiano della Santa Fe) consisting of brigands, convicts, peasants and some soldiers, marched through the kingdom plundering, burning and slaughtering. An English squadron approached Naples and occupied the island of Procida, but after a few engagements with the Republican fleet commanded by Caracciolo, an ex-officer in the Bourbon navy, it was recalled to Palermo, as the Franco-Spanish fleet was expected. Ruffo, with the addition of some Russian and Turkish allies, now marched on the capital, whence the French, save for a small force under Méluzin, withdrew. The scattered Republican detachments were defeated, only Naples and Pescara holding
out. On the 13th of June Ruffo and his horses reached Naples, and after a desperate battle at the Ponte della Maddalena, entered the city. For weeks the Calabresi and lazararoni continued to pillage and massacre, and Ruffo was unable, even if willing, to restrain them. But the Royalists were not masters of the city, for the French in Castel Sant' Elmo and the Republicans in Castelnuovo and Castel dell' Uovo still held out and bombarded the streets, while the Franco-Spanish fleet might arrive at any moment. Consequently Ruffo was desperately anxious to come to terms with the Republicans for the evacuation of the castles, in order to prepare the way for the appearance of the Russian and Turkish commandants and by the British captain Foote, it must be respected, and on Nelson's refusal he said that he would not help him to capture the castles. On the 26th Nelson changed his attitude and authorized Sir William Hamilton, the British minister, to inform the cardinal that he (Nelson) would do nothing to break the armistice; while Captains Bell and Troubridge wrote that they had Nelson's authority to state that the latter would not oppose the embarkation of the Republicans. Although these expressions were equivocal, the Republicans were satisfied and embarked on the vessels prepared for them. But on the 28th Nelson received despatches from the court (in reply to his own), in consequence of which he had the vessels brought under the guns of his ships, and many of the Republicans were arrested. Caracciolo, who had been caught whilst attempting to escape from Naples, was tried by a court-martial of Royalist officers under Nelson's auspices on board the admirals' flagship, condemned to death and hanged at the yard-arm. For the part played by Nelson in these transactions see the articles CARACCILO and NELSON.

On the 8th of July, King Ferdinand arrived from Palermo, and the state trials, conducted in the most arbitrary fashion, resulted in wholesale butchery: hundreds of persons were executed, including some of the best men in the country, such as the philosopher Mario Pagano, the scientist Cirillo, Manthoné, the minister of war under the republic, Massa, the defender of Castel dell' Uovo, and Ettore Caraffa, the defender of Pescara, who had been captured by treachery, while thousands of others were immured in horrible dungeons or exiled.

War with France continued until March 1801, when peace was made, and after the peace of Amiens in 1802 the court returned to Naples, where it was well received. But when the European war broke out again in the following year, Napoleon (then first consul) became very exacting in his demands on King Ferdinand, who consequently played a double game, appearing to accede to these demands while negotiating with England. After Austerlitz Napoleon revenged himself by declaring that "the Bourbon dynasty had ceased to reign," and sent an army under his brother Joseph to occupy the kingdom.

Ferdinand and Maria Carolina fled to Palermo in January 1805; in February 1806 Joseph Bonaparte entered Naples as king, and cultivated, well-meaning, as this not very intellligent man, he introduced many useful reforms on a basis of benevolent despotism, abolished feudalism and built roads, but the taxes and forced contributions which he levied proved very burdensome. Joseph's authority did not exist throughout a large part of the kingdom, where royalist risings, led by brigand chiefs, maintained a state of anarchy, and a British force under Sir John Stuart, which landed in Calabria from Sicily, defeated the French at Maida (July 6th, 1806). Both the French and the royalists committed atrocities, and many conspirators in Naples were tried by the French state courts and shot.

In 1808 Napoleon conferred the crown of Spain on Joseph, and appointed Joachim Murat king of Naples. Murat continued Joseph's reforms, swept away many old abuses and reorganized the army; and although he introduced the French codes and conferred many appointments and estates on Frenchmen, his administration was more or less native, and he favoured the abler Neapolitans. His attempts to attack the English in Sicily ended disastrously, but he succeeded in crushing brigandage in the Calabrian and Sicilian mountains, and then, after several failures, had to resort to methods of severity in order to do so. The king, owing to his charm of manner, his handsome face, and his brilliant personality, gained many sympathes, and began to aspire to absolute independence. He gradually became estranged from Napoleon, and although he followed him to Russia and afterwards took part in the German campaign, he secretly opened negotiations with Austria and Great Britain. In January 1814 he signed a treaty with Austria, each power guaranteeing the dominions of the other, while Sicily was to be left to Ferdinand. The following month he proclaimed himself King of Naples and Sicily and as Ferdinand VII, and March 1814, he re-entered Naples. Ferdinand and Maria Carolina had continued to reign in Sicily, where the extravagance of the court and the odious Neapolitan system of police espionage rendered their presence a burden instead of a blessing to the island. The king obtained a subsidy from Great Britain and allowed British troops to occupy Messina and Agosta, so that they might operate against the French on the mainland. A bitter conflict broke out between the court and the parliament, and the British minister, Lord William Bentinck, favoured the opposition, forced Ferdinand to resign his authority and appoint his son regent and introduced many valuable reforms. The queen perpetually intrigued against Bentinck, and even negotiated with the French, but in 1812 a more liberal constitution on British lines was introduced, and a Liberal ministry under the princes of Castelnuovo and Belmonte appointed, while the queen was exiled in the following year. But after the fall of Napoleon Sicily ceased to have any importance for Great Britain, and Bentinck, whose reputation is still cherished in the island, departed in 1814. Ferdinand succeeded in getting a reactionary ministry appointed, and dissolved parliament in May 1815, after concluding a treaty with Austria—now freed by Murat's defection from her engagements with him— for the recovery of his mainland dominions by means of an Austrian army paid for by himself. On the 9th of June Ferdinand re-entered Naples and bound himself in a second treaty with Austria not to introduce a constitutional government;1 but at first he abstained from persecution and received many of Murat's old officers into his army on a broad and noble scale. In October 1815 Murat, believing that he still had a strong party in the kingdom, landed with a few companions at Pizzo

1 The secret article of the treaty of June 12, 1815, runs as follows: "H.M. the King of the Two Sicilies, in re-establishing the government of the kingdom, will not agree to any changes irreconcilable either with the ancient institutions of the monarchy or with the principles adopted by H.I. and R. Austrian Majesty for the governmental régime of his Italian provinces." It is to be noted that this did not involve the obligation of interfering with the ancient constitution of Sicily, which Metternich desired to see remain undisturbed.

NAPLES, KINGDOM OF
di Calabria, but was immediately captured by the police and the peasantry, court-martialed and shot.

Ferdinand to some extent maintained French legislation, but otherwise reorganized the state with Metternich's approval on Bourbon lines; he proclaimed himself king of the Two Sicilies at the congress of Vienna, incorporating Naples and Sicily into one state, and abolished the Sicilian constitution (December 1816). In 1818 he concluded a Concordat with the Church, by which the latter renounced its suzerainty over the kingdom, but was given control over education, the censorship and many other privileges. But there was much dissatisfaction throughout the country, and the Carbonarist lodges, founded in Murat's time with the object of freeing the country from foreign rule and obtaining a constitution, had made much progress (see CARBONARI). The army indeed was honeycombed with Carbonari, and General Pepe, himself a member of the society, organized them on a military basis.

In July 1820 a military mutiny broke out at Caserta, led by two officers and a priest, the mutineers demanding a constitution although professing loyalty to the king. Ferdinand, feeling himself helpless to resist, acceded to the demand, appointed a ministry composed of Murat's old adherents, and entrusted his authority to his son. The ultra-democratic single-chamber Spanish constitution of 1812 was introduced, but proved utterly unworkable. The new government's first difficulty was Sicily, where the people had risen in rebellion demanding their own charter of 1812, and although the Neapolitan troops quelled the Outbreak of cholera in 1837 led to disorders in Sicily, which, having assumed a political character, were repressed by Del Carrubia, the great minister. As the government became more and more autocratic and to rely wholly on the all-powerful police, the spies and the priests; and, although the king showed some independence in foreign affairs, his popularity waned; the desire for a constitution was by no means dead, and the survivors of the old Carbonari gathered round Carlo Poerio, while the Giovane Italia society (independent of Mazzini), led by Benedetto Musolino, took as its motto "Unity, Liberty and Independence." But as yet the idea of unity made but little headway, for southern Italy was too widely separated by geographical conditions, history, tradition and custom from the rest of the peninsula, and the majority of the Liberals—their majority of the population—merely aspired to a constitutional Neapolitan monarchy, possibly forming part of a confederation of Italian states. The attempt of the Giovane Italia to bring about a general revolution in 1843 only resulted in a few sporadic outbreaks easily crushed. The following year the Venetian brothers Bandiera, acting in concert with Mazzini, landed in Calabria, believing the whole country to be in a state of revolt; they met with little local support and were quickly captured and shot, but their death saved the revolution, which was of high significance as being the first attempt made by north Italians to promote revolution in the south. In 1847 a pamphlet by L. Settembrini, entitled "A Protest of the People of the Two Sicilies," appeared anonymously and created a deep impression as a most scathing indictment of the government; and at the same time the election of Pius IX., a pope who was believed to be a Liberal, caused widespread excitement throughout Italy. Conspiracy was now rife both in Naples and Sicily, but as yet there was no idea of deposing the king. Many persons were arrested, including Carlo Poerio, who, however, was not arrested. On the 12th of January 1848 a revolution under the leadership of Ruggiero Settimo broke out at Palermo to the cry of "independence or the 1812 constitution," and by the end of February the whole island, with the exception of Messina, was in the hands of the revolutionists. These events were followed by demonstrations at Naples; the king summoned a meeting of generals and members of his family on the 27th of January, and on the advice of Filangieri (q.v.), who said that the army was not to be relied upon, he assumed the Piamonte ministry and Del Canto, and summoned the duke of Serracapriola to form another administration. On the 28th he granted the constitution, and the Liberals Bazzoni and Carlo Poerio afterwards joined the cabinet. The
popular demand was now that Naples should assist the Lombards in their revolt against Austria, for a feeling of Italian solidarity was growing up. The ministry of Carlo Troya succeeded to that of Serracapriola, and after the parliamentary elections, in which many extreme Radicals were elected, Ferdinand declared war against Austria (April 7th, 1848). After considerable delay a Neapolitan army under General Pepe marched towards Lombardy in May, while the fleet sailed for Venice. But a dispute between the king and the parliament concerning the form of the royal dynasty arising, a group of demagogues with criminal folly provoked disturbances and erected barricades (May 14th). The king refused to open parliament unless the barricades were removed, and while the moderate elements attempted to bring about conciliation, the ministry acted with great weakness. A few shots were fired—it is not known who fired first—on the 15th, the Swiss regiments stormed the barricades and street fighting lasted all day. By the evening the Swiss and the royalists were masters of the situation. A new ministry under Prince Carati was appointed. Parliament was dissolved, the National Guard disbanded, and when the Neapolitans from the Po. Fresh elections were held and the new parliament met on the 15th of July, but it had the king, the army and the mob against it, and anti-constitutionalist demonstrations became frequent. After a brief session it was prorogued to the 1st of February 1849, and when it met on that date a deadlock between king and parliament occurred. The Austrian victories in Lombardy had strengthened the court party, or Camarilla as it was called, and on the 13th of March the assembly was again dissolved, and never summoned again. The king was at Gaeta, whether the grand-duke of Tuscany and Pius IX. had also repaired to escape from their rebellious subjects, and the city became the headquarters of Italian reaction.

In Sicily the revolutionists were purely insular in their aspirations and bitterly hostile to the Neapolitans, and the attempts at conciliation, although favoured by Lord Minto, failed, for Naples wanted one constitution and one parliament, whereas Sicily wanted two, with only the king in common. The Sicilian assembly met in March 1848, and Settimo in his inaugural speech declared that the Bourbon dynasty had ceased to reign, that the throne was vacant and that Sicily united her destinies to those of Italy. Settimo was elected president of the government, but the administration was lacking in statesmanship, the treasury was empty, and nothing was done to raise an army. After the Austrian victories King Ferdinand sent a Neapolitan army of 20,000 men under Filangieri to subjugate the island. The troops landed at Messina, of which the citadel had been held by the royalists throughout, and after three days' desperate fighting the city itself was captured and sacked. The British and French admirals imposed a truce with a view to conciliation, and the king offered the Sicilians the Neapolitan constitution and a separate parliament, which they refused. The Sicilian troops were now levied throughout the island and the chief command given to the Pole Mierslawski, but it was too late. Filangieri marched forward taking town after town, and committing many atrocities. In April he reached Palermo while the fleet appeared in the bay; tumults having broken out within the city, the government surrendered on terms which granted amnesty for all except Settimo and forty-two others.

For a few months after the dissolution of the Neapolitan parliament the government abstained from persecution, but with the crushing of the Italian revolution its bands were free; and when the commission on the affair of the 15th of May had completed its labours the state trials and arrests began. The arrest of S. Faucitano for a demonstration at Gaeta led to the discovery of the Unita Italiana society, whose object was to free Italy from domestic tyranny and foreign domination. Thousands of respectable citizens were thrown into prison, such as L. Settembrini, Carlo Poerio and Silvio Spaventa. The trials were conducted with the most scandalous contempt of justice, and moral and physical torture was applied to extort confessions. The abominable conditions of the prisons in which the best men of the kingdom were immured, linked to the vilest common criminals, was made known to the world by the famous letters of W. E. Gladstone, which branded the Bourbon régime as "the negation of God erected into a system of government." The merest suspicion of unorthodox opinions, the possession of foreign newspapers, the wearing of a beard or an anonymous denunciation, sufficed for the arrest and condemnation of a man to years of imprisonment, while the attiders, or persons under police surveillance liable to arrest on any charge were numerous. The Neapolitan government numbered 50,000.

The remembrances of Great Britain and France met with no success. Ferdinand strongly resented foreign interference, and even rejected the Austrian proposal for a league of the Italian despots for mutual defence against external attacks and internal disorder. In 1856 his life was unsuccessfully attempted by a soldier, and the same year Baron Bentivegna organized a revolt near Palermo, which was quickly suppressed. In 1857 Carlo Piscacane, an ex-Neapolitan officer who had taken part in the defence of Rome, fitted out an expedition, with Mazzini's approval, from Genoa, and landed at Napo in Calabria, where he hoped to raise the flag of revolution; but the local police assisted by the peasantry attacked the band, killing many, including Piscacane himself, and capturing most of the rest. The following year, at the instance of Great Britain and France, Ferdinand commuted the sentences of some of the political prisoners to exile. (See FERRANDINO II., king of the Two Sicilies).

In May 1859 Ferdinand died, and was succeeded by his son, Francis II., who came to the throne just as the Franco-Sardinian victories in Lombardy were sounding the death-knell of Austrian predominance and domestic despotism in Italy (see ITALY: HISTORY). But although there was much activity and plotting among the Liberals, there was as yet no revolution. Victor Emmanuel, king of Sardinia, wrote to the new king proposing an alliance for the division of Italy, but Francis refused. In June part of the Swiss Guard mutinied because the Bernese government not having renewed the convention with Naples the troops were deprived of their cantonal flag. The mutinous regiments, however, were surrounded by loyal troops and shot down; and this affair resulted in the disbanding of the whole force—the last support of the autocracy. Political amenities were now decreed, and in September 1859 Filangieri was made prime minister. The latter favoured the Sardinian alliance and the granting of the constitution, and so did the king's uncle, Leopold, count of Syracuse. But Francis rejected both proposals and Filangieri resigned and was succeeded by A. Statella. In April 1860 Victor Emmanuel again proposed an alliance whereby Naples, in return for help in expelling the Austrians from Venetia, was to receive the Marche, while Sardinia would annex all the rest of Italy except Rome. But Francis again refused, and in fact was negotiating with Austria and the Pope for a simultaneous invasion of Modena, Lombardy and Romagna.

In the meantime, however, events in Sicily were reaching a crisis destined to subvert the Bourbon dynasty. The Sicilians, unlike the Neapolitans, were thoroughly alienated from the Bourbons, whom they detested, and after the peace of Villafranca (July 1859) Mazzini's emisaries, F. Crispi and R. Pilo, had been trying to organize a rising in favour of Italian unity; and although they merely succeeded in raising a few squadre, or armed bands, in the mountainous districts, they persuaded Garibaldi (q.v.), without the magic of whose personal prestige they knew nothing important could be achieved, that the revolution which he knew to be imminent had broken out. The authorities at Palermo, learning of a projected rising, attacked the convent of La Gangia, the headquarters of the rebels, and killed most of the inmates; but in the meanwhile Garibaldi, whose hesitation had been overcome, embarked on the 5th of May 1860, at Quarto, near Genoa, with 1000 picked followers on board two steamers, and sailed for Sicily. On the 11th the expedition reached Marsala and landed without opposition. Garibaldi was somewhat coldly received by the astonished population; but he set forth at once for
Garibaldi on the mainland. He continued his march towards Palermo, where the bulk of the 30,000 Bourbon troops were concentrated, gathering numerous followers on the way. On the 15th he attacked and defeated 3000 of the enemy under General Landi at Calatafimi; the news of this brilliant victory revived the revolutionary agitation throughout the island, and Garibaldi was joined by Pilo and his bands. By a cleverly devised ruse he avoided General Colonna's force which expected him on the Monreale road, and entering Palermo from Milisirri received an enthusiastic welcome. The Bourbonists, although they bombarded the city from the citadel and the warships in the harbour, gradually lost ground, and after three days' street fighting their commander, General Lanza, not knowing that the Garibaldians had scarcely a cartridge left, asked for and obtained a twenty-four-hours' armistice (May 30th).

Garibaldi went on board the British flagship to confer with the Neapolitan generals Letizia and Chrétién; Letizia's proposal that the municipality should make a humble petition to the king was ignominiously rejected by Garibaldi, who visited the citizens daily to the extension of the armistice until next day. Then he informed the citizens by means of a proclamation of what he had done, and declared that, knowing them to be ready to die in the ruins of their city, he would renew hostilities on the expiration of the armistice. Although unarmed, the people rallied to him as one man, and Lanza became so alarmed that he asked for an unconditional extension of the armistice, which Garibaldi granted. The dictator now had time to collect ammunition, and the Neapolitan government having given Lanza full powers to treat with him, 15,000 Bourbon troops embarked for Naples on the 7th of June, leaving the revolutionists masters of the situation.

The Sardinian Admiral Persano's salute of nineteen guns on the occasion of Garibaldi's official call constituted a practical recognition of his dictatorship by the Sardinian (Piedmontese) government. In July further reinforcements of volunteers under Cosenz and Medici, assisted by Cavour, arrived at Palermo with a good supply of arms furnished by subscription in northern Italy. Garibaldi's forces were now raised to 12,000 men, besides the Sicilian squadre. Cavour's attempt to bring about the annexation of Sicily to Sardinia failed, for Garibaldi wished to use the island as a base for an invasion of the mainland and the alliance now been evacuated by the Bourbonists, but Messina and a few other points still held out, and when the Garibaldians advanced eastward they encountered a force of 4000 of the enemy under Colonel Bosco at Milazzo; on the 20th of July a desperate battle took place resulting in a hard-won Garibaldian victory. The Neapolitan government then decided on the evacuation of the whole of Sicily except the citadel of Messina, which did not surrender until the following year.

The news of Garibaldi's astonishing successes entirely changed the situation in the capital, and on the 25th of June 1860 the king, after consulting the ministers and the royal constitution, granted a constitution, and appointed A. Spinelli prime minister. Disorders having taken place between Liberals and reactionaries, Libero Romano was made minister of police in the place of Aiosa. Sicily being lost, the king directed all his efforts to save Naples; he appealed to Great Britain and France to prevent Garibaldi from crossing the Straits of Messina, and only just failed (for this episode see under La CARRIA, G.). Victor Emmanuel himself wrote to Garibaldi urging him to abandon his attack on Naples, but Garibaldi refused to obey, and on the 10th of August he crossed with 4500 men and took Reggio by storm. He was soon joined by the rest of his troops, 15,000 in all, and although the Neapolitan government had 30,000 men in Calabria alone, the army collapsed before Garibaldi's advance, and the people rose in his favour almost everywhere. Francis offered Garibaldi a large sum of money if he would abstain from advancing farther, and 30,000 men to fight the Austrians and the pope; but it was too late, and on the 6th of September the king and queen sailed for Gaeta. The 40,000 Bourbon troops between Salerno and Avellino fell back panic-stricken, and on the 7th Garibaldi entered Naples alone, although the city was still full of soldiers, and was received with delirious enthusiasm. On the 11th a part of the royalists capitulated and the rest retired on Capua. Cavour now decided that Sardinia must take part in the liberation of southern Italy, for he feared that Garibaldi's followers might induce him to proclaim the republic and attack Rome, which would have provoked French hostility; consequently a Piedmontese army left the Marches and Umbria, and entered Neapolitan territory with Victor Emmanuel as its head. On October 2nd and 2nd of October 1860 a battle was fought on the Volturino victory between 20,000 Garibaldians, many of them raw Emmanuels and levies, and 35,000 Bourbon troops, and although the first a Garibaldian division under Turré was repulsed, Garibaldi himself arrived in time to turn defeat into victory. On the 26th he met Victor Emmanuel at Teano and hailed him king of Italy, and subsequently handed over his conquests to him. On the 3rd of November a plebiscite was taken, which resulted in an overwhelming majority in favour of union with Sardinia under Victor Emmanuel. Garibaldi departed for his island home at Caprera, while L.C. Farini was appointed viceroy of Naples and M. Cordero viceroy of Sicily. The last remnant of the Bourbon army was concentrated at Gaeta, the siege of which was begun by Cialdini on the 5th of November; on the roth of January 1861 the French fleet, which Napoleon III. had sent to Gaeta to delay the inevitable fall of the dynasty, was withdrawn at the instance of Great Britain; and although the garrison fought bravely and the king and queen showed considerable courage, the fortress surrendered on the 14th of February 1861, the royal family dejected by sea. (See FRANCIS II., King of the Two Sicilies.) The citadel of Messina capitulated a month later, and Civitella del Tronto on the 21st of March. On the 18th of February the first Italian parliament met at Turin and proclaimed Victor Emmanuel king of Italy. Thus Naples and Sicily ceased to be a separate political entity and were absorbed into the united Italian kingdom.

Althini, Di Cesare regnum Neapol. ab Aragonia (Naples, 1858); several chapters in the Storia politica d'Italia (Milan, 1875-1882); F. Lanzani, Storia dei comuni Italiani (Florence, 1882); E. Cipolla, Storia delle signorie italiane dal 1313 al 1431 (Florence, 1885); E. Lanza, Storia d'Italia, 1799-1861, (Turin, 1889); A. Franchetti, Storia d'Italia dal 1789 al 1799; G. de Castro, Storia d'Italia dal 1799 al 1814; F. Bertolini, Storia d'Italia dal 1814 al 1848. For the more recent history F. Celleri's Storia del regno di Napoli (Palermo, 1879), is not without bias, and G. Pepe's Memorie (Paris, 1847) are also important, both authors having played an important part in the events of 1847 and 1848; F. Napolitani, Vita e reame di Napoli (Naples, 1889). On the subject of the revolution of 1799 and the Nelson episode there is quite a library. The documents are mostly to be found in Nelson and the Neapolitan Jacobins (Navy Records Society, London, 1903), edited by H. C. Gurrutty, with an introduction, where Nelson's action is defended, and a bibliography. A. T. Mahan in his Life of Nelson (2nd ed., London, 1899), and in the English Historical Review for July 1899 and October 1899 gives the same view; for the other side see C. Gippoliti, Storia di Napoli in 1799 (London, 1903), which is impartial and well written; F. P. Badham, Nelson at Naples (London, 1900); P. Villari, " Nelson, the Neapolitan War, and the French Revolution," in the Conquest of Naples, February 16, 1809; A. Maresca, Gli avvenimenti di Napoli dal 3 giugno al 13 luglio, 1799 (Naples, 1900); B. Croce, Studi storici sulla rivoluzione Napoletana del 1799 (Rome, 1897); Freiherr von Helfert has written a very interesting and impartial history of the events in "Helfert's Die neapolitalische Republik des Jahres 1799 (Leipzig, 1884). For a general account of the French period see C. Auriol, La France et l'Italie (Paris, 1888), and R. de Cassez, La Fance et l'Italie (Città di Castello, 1900), both based on documents. For the latest period see N. Nisco, Gli ultimi 33 anni del reame di Napoli (Naples, 1889); H. R. Whitehouse, The Collapse of the Kingdom of the Two Sicilies (New York, 1884), and R. de Cassez, La Fance et l'Italie (Città di Castello, 1900), which contains much information but is not always accurate. For the British occupation of Sicily see G. Bianco, La Sicilia durante l'occupazione Inglese (Palermo, 1902); and for
NAPOLEON I. (1769–1812), Emperor of the French. Napoleon Bonaparte (or Buonaparte, as he almost always spelt the name down the year 1796) was born at Ajaccio in Corsica on the 15th of August 1769. The date of his birth has been disputed, and certain curious facts have been cited in proof of the assertion that he was born on the 7th of January 1768, and that his brother Joseph, who passed as the eldest surviving son, was in reality his younger brother. The late Voltairine de Cleyre, however, explained his information about that a son born on the earlier date received the name Napolione (Napoleon). The father, Carlo Maria de Buonaparte (Charles Marie de Bonaparte), had resolved to call his three first sons by the names given by his great-grandfather to his sons, namely Joseph, Napoleon and Lucien. This was done; but on the death of the eldest (Joseph) the child first baptized Napolione received the name Joseph; while the third son (the second surviving son) was called Napoleon. The baptismal register of Ajaccio leaves no doubt as to the date of his birth as given above. For his parents and family see Buonaparte. The fathers literate, Napoleon was a descendant of the Ramolino and Pietra Santa families; the force reappeared in Napoleon, who, however, derived from his mother Letizia (a descendant of the Ramolino and Pietra Santa families) the force of will, the power of forming a quick decision and of maintaining it against all odds, which made him so terrible an opponent both in war and in diplomacy. The stern strain in the mother’s nature may be traced to intermarriage with the families of the wild interior of Corsica, where the vendetta was the unwritten but omnipotent law of the land. The Bonapartes, on the other hand, had long concerned themselves with legal affairs at Ajaccio or in the coast towns of the island. They traced their descent to ancestors who had achieved distinction in the political life of medieval Florence and Sarzana; Francesco Buonaparte of Sarzana migrated to Corsica early in the 16th century. What is equally noteworthy, as explaining the characteristics of Napoleon, is that his descent was on both sides distinctly patrician. He once remarked that the house of Bonaparte dated from La cour d'état de Brumaire (November 1799); but it is certain the de Buonapartes had received the title of nobility from the republic of Genoa which, during the 18th century, claimed to exercise sovereignty over Corsica.

It was in the midst of the strife resulting from those claims that Napoleon Bonaparte saw the light in 1769. His compatriots had already freed themselves from the yoke of Genoa, thanks to Pasquale Paoli; but in 1764 that republic appealed to Louis XV. of France for aid, and in 1768 a bargain was struck by which the French government succeeded to the nearly bankrupt sovereignty of Genoa. In the campaigns of 1768–69 the French gradually overcame the fierce resistance of the islanders; and Paoli, after sustaining a defeat at Ponte-Novò (30th of May 1769), fled to the mainland, and ultimately to England. Napoleon’s father was at first sided with Paoli, but after the disaster of Ponte-Novò he went over to the conquerors, and thereafter solicited places for himself and for his sons with a skill and persistence which led to a close union between the Bonapartes and France. From the French governor of Corsica, the comte de Marbeuf, he procured many favours, among them being the nomination of the young Napoleon to the military school at Brienne in the east of France.

Already the boy had avowed his resolve to be a soldier. In the large playroom of the house at Ajaccio, while the others amused themselves with ordinary games, Napoleon delighted most in beating a drum and wielding a sword. His elder brother, Joseph, a mild and dreamy boy, had to give way before him; and it was a perception of this difference of temperament which decided the father to send Joseph into the church and Napoleon into the army. Seeing that the younger boy was almost entirely ignorant of French, he took him with Joseph to the college at Autun at the close of the year 1778. After spending four months at Autun, Napoleon entered the school at Brienne in May 1779. The pupils at Brienne, far from receiving a military education, were grounded in ordinary subjects, and in no very efficient manner, by brethren of the order, or society, of Minims. The moral tone of the school was low; and Napoleon afterwards spoke with contempt of the training of the “monsks” and the manner of life of the scholars. Perhaps his impressions were too gloomy; his whole enthusiasm had been for the Corsicans, who still maintained an unequal struggle against the French; he deeply resented his father’s espousal of the French cause; and dislike of the conquerors of his native island made him morose and solitary. Apart from decided signs of proficiency in mathematics, there was no hint of genius or ability. Languages he disliked, but he spent much of his spare time in reading history, especially Plutarch. The firmness of character which he displayed caused him to be recommended in 1782 for the navy by one of the inspectors of the school; but a new inspector, who was appointed in 1783, frustrated this plan. In October 1784 Bonaparte and three other Briennais were authorized, by a letter signed by Louis XVI., to proceed as gentlemen cadets to the military school at Paris. There the education was more thorough, and the discipline stricter, than at Brienne. Napoleon applied himself to the study of mathematics, and so speedily qualifying himself for the artillery. In this he succeeded; and the result of an examination conducted in September 1785 by Laplace, Bonaparte was included among those who entered the army without going through an intermediate stage.

At the end of October 1785 he closed a scholastic career which had been creditable but not brilliant. He now entered the artillery regiment, La Fère, quartered at Valence, and went through all the duties imposed on privates, and thereafter those of a corporal and a sergeant. Not until January 1786 did he actually serve as junior lieutenant. A time of furlough in Corsica from September 1786 to September 1787 served to strengthen his affection for his mother, and for the island which he still hoped to free from the French yoke. The father having died of cancer at Montpellier in 1785, Napoleon felt added responsibilities, which he zealously discharged. In order to push forward a claim which Letizia urged on the French government, he proceeded to Paris in September 1787, and toyed for a time with the pleasures of the Palais Royal, but failed to make good the family claim.

After gaining a further extension of leave of absence from his regiment he returned to Ajaccio and spent six months more in the midst of family and political affairs. Rejoining his regiment, then in the garrison at Auxonne, after a furlough of twenty-one months, the young officer went through a time of much privation, brightened only by the study of history and cognate subjects. Many of the notes and essays written by him at Auxonne bear witness to his indomitable resolve to master all the details of his profession and the chief facts relating to peoples who had struggled successfully to achieve their liberation. Enthusiasm for Corsica was a leading motive prompting him to this prolonged exertion. His notes on English history (down to the time of the revolution of 1688) were especially detailed. Of Cromwell he wrote: "Courageous, clever, decisive, distorting his early principles of lofty republicanism yielded to the devouring flames of his ambition; and having tasted the sweets of power, he aspired to the pleasure of reigning alone." At Auxonne, as previously at Valence, Napoleon commanded a small detachment of troops sent to put down disturbances in neighbouring towns, and carried out his orders unflinchingly. To this period belongs his first crude literary effort, a polemic against a Genevese pastorc who had criticized Rousseau.

In the latter part of his stay at Auxonne (June 1788–September 1789) occurred the first events of the Revolution which was destined to mould anew his ideas and his career. But his preoccupation about Corsica, the privations to which he and his family were then exposed, and his bad health, left him little energy to expend on purely French affairs. He read much of the pamphlet literature then flooding the country, but he still preferred the more general studies in history and literature, Plutarch, Caesar, Corneille, Voltaire and Rousseau being his favourite authors. The plea of the last named on behalf of Corsica served
to enlist the sympathy of Napoleon in his wider speculations, and so helped to bring about that mental transformation which merged Buonaparte the Corsican in Bonaparte the Jacobin and Napoleon the First Consul and Emperor.

Family influences also played their part in this transformation. On proceeding to Ajaccio in September 1789 for another furlough, he found his brother Joseph enthusiastic in the democratic cause and acting as secretary of the local political club. Napoleon seconded his efforts, and soon they had the help of the third brother, Lucien, who proved to be most eager and eloquent. Thanks in part to the exertions of Saliceti, one of the two deputies sent by the tiers état of Corsica to the National Assembly of France, that body, on the 30th of November 1789, declared the island to be an integral part of the kingdom with right to participate in all the reforms then being decreed. This event decided Napoleon to give his adhesion to the French or democratic party; and when, in July 1790, Paoli returned from exile in England (receiving on his way the honours of the sitting by the National Assembly) the claims of nationality and democracy seemed to be identical, though the future course of events disappointed these hopes. But before his return, in the early weeks of 1791 he indited a letter inveighing in violent terms against Matteo Buattafooco, deputy for the Corsican noblesse in the National Assembly of France, as having betrayed the cause of insular liberty in 1768 and as plotting against it again.

The experiences of Bonaparte at Auxonne during his second stay in garrison were again depressing. With him in his poorly furnished lodging was Louis Bonaparte, the fourth surviving son, whom he carefully educated and for whom he predicted a brilliant future. For the present their means were very scanty, and, as the ardent royalist of his brother officers lived at the social circle, he plunged into work with the same ardour as before, frequently studying fourteen or fifteen hours a day. Then it was, or perhaps at a slightly later date, that he became interested in the relations subsisting between political science and war. From L’Esprit des lois of Montesquieu he learnt suggestive thoughts like the following: "L’objet de la guerre, c’est la victoire; celui de la victoire, la conquête; celui de la conquête, l’occupation." Machiavelli taught him the need of speed, decision and unity of command, in war. From the Traité de tactique (1772) of Guibert he caught a glimpsing of his power which a patriotic and fully armed nation might gain amidst the feeble and ill-organized governments of that age.

External events served to unite him more closely to France. The reorganization of the artillery, which took place in the spring of 1791, brought Bonaparte to the rank of lieutenant in the regiment of Grenoble, then stationed at Valence. He left the regiment La Fère with regret on the 14th of June 1791; but at Valence he renewed former friendships and plunged into politics with greater ardour. Most of his colleagues refused to take the oath of obedience to the Constituent Assembly, after the attempted escape of Louis XVI. to the eastern frontier at midsummer. Bonaparte took the oath on the 4th of July, but said later that the Assembly ought to have banished the king and proclaimed a regency for Louis XVII. In general, however, his views at that time were republican; he belonged to the club of Friends of the Constitution at Valence, spoke there with much acceptance, and was appointed librarian to the club.

At Valence also he wrote an essay for a prize instituted by his friend and literary adviser, Raynal, at the academy of Lyon. The subject was "What truths and sentiments is it most important to inculcate to men for their happiness?" Bonaparte’s essay bore signs of study of Rousseau and of the cult of Lycurgus which was coming into vogue. The Spartans were happy, said the writer, because they had plenty of good, suitable clothing and lodging, robust women, and were able to meet their requirements both physical and mental. Men should live according to the laws and dictates of nature, not forgetting the claims of reason and sentiment. The latter part of the essay is remarkable for its fervid presentiment of the charms of scenery and for vigorous declamation against the follies and crimes of ambitious men. The judges at Lyons placed it fifteenth in order of merit among the sixteen essays sent in.

Thanks to the friendly intervention of the maréchal du camp, baron Duteuil, Bonaparte once more gained leave of absence for three months and reached Corsica in September 1791. Opinion there was in an excited state, the priests and the populace being inflamed against the anti-clerical decrees of the National Assembly of France. Paoli did little to help on the Bonapartes; and the advancement of Joseph Bonaparte was slow. Napoleon’s admiration for the dictator also began to cool, and began to attempt to get the republic deposed. Lucien Bonaparte, the recognized head of the family, having placed property at the disposal of the sons, they bought a house, which became the rendezvous of the democrats and of a band of volunteers whom they raised. In the intrigues for the command of this body Napoleon had his rival, Morati, carried off by force—his first coup d’état. The incident led to a feud with the supporters of Morati, among whom was Pozzo di Borgo (destined to be his life-long enemy), and opened a breach between the Bonapartes and Paoli. Bonaparte’s imperious nature also showed itself in all matters, which he ruled with a high hand. No one, said his younger brother Lucien, liked to thwart him.

Further discords naturally arose between so masterful a lieutenant as Bonaparte and so autocratic a chief as Paoli. The beginnings of this rupture, as well as a sharp affray between his volunteers and the townsfolk of Ajaccio, may have quickened Bonaparte’s resolve to return to France in May 1792, but there were also personal and family reasons for this step. Having again exceeded his time of furlough, he was liable to the severe penalties attaching to a deserter and an émigré; but he saw that the circumstances of the time would help to enforce the appeal for reinstatement which he resolved to make at Paris. His surmise was correct. The Girondin ministry then in power had brought Louis XVI. to declare war against Austria (20th of April 1792) and against Sardinia (15th of May 1792). The lack of trained officers was such as to render the employment and advancement of Bonaparte probable in the near future, and on the 30th of August, Servan, the minister for war, issued an order appointing him to be captain in his regiment and to receive arrears of pay. During this stay at Paris he witnessed some of the great “days” of the Revolution; but the sad plights of his sister, Elisa, and Marianne Élisa, on the dissolution of the convention of St Cydr, where she was being educated, compelled him to escort her back to Corsica shortly after the September massacres.

His last time of furlough in Corsica is remarkable for the failure of the expedition in which he and his volunteers took part, against la Maddalena, a small island off the coast of Sardinia. The breach between Paoli and the Bonapartes now rapidly widened, the latter having now definitely espoused the cause of the French republic, while Paoli, especially after the execution of Louis XVI., repudiated all thought of political appeal with the regicides. Ultimately the Bonapartes had to flee from Corsica (11th of June 1793), an event which clinched Napoleon’s decision to identify his fortunes with those of the French republic. His ardent democratic opinions rendered the change natural when Paoli and his compatriots declared for an alliance with England.

The arrival of the Bonapartes at Toulon coincided with a time of acute crisis in the fortunes of the republic. Having declared war on England and Holland (1st of February 1793), and against Spain (4th of March), France was soon girdled by foes; and the forces of the first coalition invaded her territory at several points. At first the utmost efforts of the republic failed to avert disaster; for the immensely royalist district of la Vendée, together with most of Brittany, burst into revolt, and several of the northern, central and southern departments rose against the Jacobin rule. The struggle which the constitutionalists and royalists of Marseilles made against the central government furnished Bonaparte with an occasion for writing his first important political pamphlet, entitled "Le Souverain de Beauchu.

It purports to be a conversation at the little town of Beauchu
NAPOLEON I.

between a soldier (obviously the writer himself) and three men, citizens of Marseilles, Nîmes and Montpellier, who oppose the Jacobinical government and hope for victory over its forces. The officer points out the folly of such a course, and the certainty that the republic, whose troops had triumphed over those of Prussia and Austria, will speedily disperse the untrained levies of Provence. The pamphlet closes with a passionate plea for national unity.

He was now to further the cause of the republic one and indivisible in the sphere of action. The royalists of Toulon had admitted British and Spanish forces to share in the defence of their stronghold (29th of August 1793). To bring the republican cause was most serious: for from Toulon as a centre the royalists threatened to raise a general revolt throughout the south of France, and Pitt cherished hopes of dealing a death-blow to the Jacobins in that quarter. But fortune now brought Bonaparte to blight those hopes. Told off to serve in the army of Nice, he was detained by a special order of the commissioners of the Convention, Saliceti and Gasparin, who, hearing of the severe wound sustained by Dommartin, the commander of the artillery of the republican forces before Toulon, ordered Bonaparte to go and procure a surgeon for him. He set off for Toulon, and, finding his way into the chief battery quarters, then at Ollioules on the north-west of Toulon, on the 16th of September; and it is noteworthy that as early as September 19th the commissioners had seen the need of attacking the allied fleet and had paid some attention to the headland behind l’Eguillette, which commanded both the outer and the inner harbour. But there is no doubt that Bonaparte brought to bear on the execution of this as yet vague and general proposal powers of concentration and organization which ensured its success. In particular he soon put the artillery of the besiegers in good order. Carteaux, an ex-artist, at first held the supreme command, but was superseded on the 23rd of October. Doppet, the next commander, was little better fitted for the task; but his successor, Dugommier, was a brave and experienced soldier who appreciated the merits of Bonaparte. Under their direction steady advance was made on the side which Bonaparte saw to be all important; a sortie of part of the British, Spanish and Neapolitan forces on the 30th of November was beaten back with loss, General O’Hara, their commander, being severely wounded and taken prisoner. On the night of the 16th–17th December, Dugommier, Bonaparte, Victor and Muiron headed the sortie, Bonaparte, who fitted its way into the chief battery, threw up by the besieged on the height behind l’Eguillette; and on the next day Hood and Langara set sail, leaving the royalists to the vengeance of the Jacobins. General du Teil, the younger, who took part in the siege, thus commented on Bonaparte’s services: “I have no words in which to describe the merit of Bonaparte: much science, as much intelligence and too much bravery... It is for you, Ministers, to consecrate him to the glory of the republic.” At Toulon Bonaparte made the acquaintance of men who were to win renown under his leadership—Desaix, Junot, Marmont, Muiron, Suchet and Victor.

It is often assumed that the fortunes of Bonaparte were made at Toulon. This is an exaggeration. True, on the 22nd of December 1793 he was made general of brigade for his services; and in February 1794 he gained the command of the artillery in the French army about to invade Italy; but during the preliminary work of fortification along the coast he was placed under arrest for a time owing to his reconstruction of an old fort at Marseilles which had been destroyed during the Revolution. He was soon released owing to the interposition of the younger Robespierre and of Saliceti. Thereafter he resided successively at Toulon, St Tropez and Antibes, doing useful work in fortifying the coast and using his spare time in arduous study of the science of war. This he had already begun at Auxonne under the inspiring guidance of the baron du Teil. General du Teil, younger brother of the baron, had recently published a work, L’Usage de l’Artillerie nouvelle; and it is now known that Bonaparte derived from this work and from those of Guibert and Bourcet that leading principle, concentration of effort against one point of the enemy’s line, which he had advocated at Toulon and which he everywhere put in force in his campaigns.

On or about the 20th of March 1794 he arrived at the headquarters of the army of Italy. At Colmars, on the 21st of May 1794, he drew up the first draft of his Italian plan of campaign for severing the Piedmontese from their Austrian allies and for driving the latter out of their Italian provinces. A secret mission to Genoa enabled him to inspect the pass north of Savona, and the knowledge of the peculiarities of that district certainly helped him in maturing his plan for an invasion of Italy, which he put into execution in 1796. For the present he experienced a sharp blow of fortune, when he met with his usual misfortune: he was suddenly placed under arrest owing to intrigues or suspicions of the men raised to power by the coup d’état of Thermidor 9-10 (July 27–28) 1794. The commissioners sent by the Convention, Albitte, Laporte and Salicet, suspected him of having divulged the plan of campaign, and on the 6th of August ordered his arrest as being the “maker of plans” for the younger Robespierre. On a slighter accusation than this many had perished; but an examination into the details of the mission of Bonaparte to Genoa and the new instructions which arrived from Carnot, at once confirmed his innocence. It was, in fact, his time to enable him to share in the operations of the French army against the Austrians that led to the battle of Dego, north of Savona (21st of September), a success largely due to his skillful combinations. But the decline in the energies of the central government at Paris and the appointment of Schérer as commander-in-chief of the army of Italy frustrated the plans of a vigorous offensive which Bonaparte continued to develop and advocate.

Meanwhile he took part in an expedition fitted out in the southern ports to drive the English from Corsica. It was a complete failure, and for a time his prospects were overclouded. In the spring of 1795 he received an order from Paris to proceed to la Vendée in command of an infantry brigade. He declined on the score of ill-health, but set out for Paris in May, along with Marmont, Junot and Louis Bonaparte. At the capital he found affairs quickly falling back into the old ways of pleasure and luxury. “People,” he wrote, “remember the Terror only as a dream.” That he still pursued his studies of military affairs is shown by the compilation of further plans for the Italian campaign. The news of the ratification of peace with Spain brought at once the thought that an offensive plan of campaign in Italy was thenceforward inevitable. Probably these plans gained for him an appointment (20th of August) in the topographical bureau of the committee of Public Safety. But, either from weariness of the life at Paris, or from disgust at clerical work, he sought permission to go to Turkey in order to reorganize the artillery of the Sultan. But an inspection of his antecedents showed the many irregularities of his conduct as officer and led to his name being erased from the list of general officers (September 15th).

Again the difficulty of the republic was to be his opportunity. The action of the Convention in perpetuating its influence by the imposition of two-thirds of its members on the next popularly elected councils, aroused a storm of indignation in Paris, where the “moderate” and royalist reaction was already making headway. The result was the massing of some 30,000 National Guards to coerce the Convention. Confronted by this serious danger, the Convention entrusted its defence to Barras, who appointed the young officer to be one of the generals assisting him. The vigour and tactical skill of Bonaparte contributed very largely to the success of the troops of the Convention over the Parisian malcontents on the famous day of 15 Vendémiaire (October 5th, 1793), when the defenders of the Convention, sweeping the quays and streets near the Tuileries by artillery and musketry, soon paralysed the movement at its headquarters, the church of St Roch. The results of this day were out of all proportion to the comparatively small number of casualties. With the cost of about 200 killed on either side, the Convention crushed the royalist or malcontent reaction, and imposed on France a form of government which ensured the perpetuation of
democracy though in a bureaucratic form—the first of those
features which paved the way to power for Bonaparte. For
the constitution of the year 1795 which inaugurated the period of
the Directory (1795-1799) see FRENCH REVOLUTION. Here we
may notice that the perpetuation of the republic by means of
the armed forces tended to exalt the army at the expense of the
civil authorities. The repetition of the same tactics by Bonaparte
in Fructidor, 1797, served still more decidedly to tilt the balance
in favour of the sword, with results which were to be seen at the
coup d'état of Brumaire 1799.

The events which helped the disgraced officer of August 1795
to win his bold and brilliant campaign in November 1799 now claim
attention. The services which he rendered to the republic at
Vendémiaire brought as their reward the hand of Josephine de
Beauharnais. The influence of Barras with this fashionable lady helped on the match. At the outset she felt some repugnance
for the thin sallow-faced young officer, and was certainly terrified
by his ardour and by the imperious egoism of his nature; but
she consented to the union, especially when she received the
promise of the command of the French army of Italy. The story
that he owed this promotion solely to the influence of Barras and
Josephine is, however, exaggerated. It is true that he had
drawn up for that army which had enlisted the far more influential support of Carnot on his behalf. In January 1796 he drew up another plan for the
conquest of Italy, which gained the assent of the Directory.
Vendémiaire and the marriage with Josephine (9th of March
1796) were but stepping-stones to the attainment of the end
which he had kept steadily in sight since the spring of the year
1794. For the events of this campaign in Italy see FRENCH
REVOLUTIONARY WARS. The success at the bridge of Lodri (10th of
May) seems first to have inspired in the young general dreams of a
greater career than that of a successful general of the Revolution;
while his narrow escape at the bridge of Arcola in November
strengthened his conviction that he was destined for a great
future. The means whereby he engaged the energies of the
Italians on behalf of the French Republic and yet refrained from
persecuting the Roman Catholic Church in the way only
too common among revolutionary generals, bespoke political
insight of no ordinary kind. From every dispute which he had
with the central authorities at Paris he emerged victorious;
and he took care to assure his ascendancy by sending presents
to the Directors, large sums to the nearly bankrupt treasury;
and works of art to the museums of Paris. Thus when, after
the crowning victory of Rivoli (14th of January 1797), Mantua
surrendered and the Austrian rule in Italy for the time collapsed,
Bonaparte was virtually the idol of the French nation, the
master of the Directory and potentially the protector of the
Holy See.

It may be well to point out here the salient features in Bonaparte's conduct towards the states of northern Italy. While
avoiding the enthusiasm of their inhabitants on behalf of France,
he in private spoke contemptuously of them, mercilessly sup-
pressed all outbreaks caused by the exactions and plundering
of his army, and carefully curbed the factions which the new
political life soon developed. On his first entry into Milan
(15th of May 1796) he received a rapturous welcome as the
liberator of Italy from the Austrian yoke; but the instructions of
the Directory allowed him at the outset to do little more than
effect the organization of consultative committees and national
guards in the chief towns of Lombardy. The successful course
of the campaign and the large sums which he sent from Italy to
the French exchequer served to strengthen his hold over the
Italians. His constructive policy grew more decided;
Thus, when the men of Reggio and Modena overthrew the rule
of their duke, he at once accorded protection to them, as also to
the inhabitants of the cities of Bologna and Ferrara when they
broke away from papal authority. He even allowed the latter
to send delegates to confer with those of the duchy at Modena,
with the result that a political union was decreed in a state
called the Cispadane Republic (16th of October 1796). This
action was due in large measure to the protection of Bonaparte.

The men of Lombardy, emboldened by his tacit encouragement,
prepared at the close of the year to form a republic, which
assumed the name of Transpadane, and thereafter that of
Cisalpine. Its constitution was drawn up in the spring of 1797 by committees appointed, and to some extent supervised,
by him; and he appointed the first directors, deputies and chief
administrators of the new state (July 1797). The union of these
republics took place on the 15th of July 1797. The bounds of the thus enlarged Cisalpine Republic were afterwards ex-
tended eastwards to the banks of the Adige by the terms of the
treaty of Campo Formio; and in November 1797 Bonaparte
(formed by the district of the Valtelline, north-east of Lake Como, to its territory. Much of this work of reorganiza-
tion was carried on at the castle of Montebello, or Mombello,
near Milan, where he lived in almost viceroyal pomp (May–July,
1797). Taking advantage of an outbreak at Genoa, he over-
threw that ancient oligarchy, replaced it by a form of government modelled on that of France (June 6th); and subsequently it
adopted the name of the Ligurian Republic.

Concurrently with these undertakings, he steadily prepared to
strengthen his position in the political life of France; and it
will be instructive to discuss the methods by which he ensured the defeat of the royalists in France and the propping up of his
reign in the coup d'état of Fructidor 1797. The unrest in France in the years 1795–1797 resulted mainly from the harshness, incom-
petence and notorious corruption of the five Directors who,
after the 13th of Vendémiaire 1795, practically governed France.
All those who wished for peace and orderly government came
degrees to oppose the Directors; and, seeing that the latter clung
to Jacobinical catchwords and methods, public opinion tended
to become "moderate" or even royalist. This was seen in the
elections for one-third of the 750 members composing the two
councils of the nation (the Anciens and the Council of Five
Hundred); they gave the moderates a majority alike in that
of the older deputies and in that of the younger deputies (April
1797), and that majority elected Barthélémy, a well-known
moderate, as the fifth member of the Directory. Carnot, the
ablest administrator, but not the strongest man, soon joined
Barthélémy in opposing their Jacobinical colleagues—Barras,
Rewbell and La Farellevière-Lépaulx. Time was on the side of
the moderates; they succeeded in placing General Pichegru,
already known for his tendencies towards constitutional monarchy,
in the presidential chair of the Council of Five Hundred; and
they proceeded to agitate, chiefly through the medium of a
powerful club founded at Clichy, for the repeal of the revolu-
tionary and persecuting laws. The three Jacobinical Directors
thereupon intrigued to bring to Paris General Lazare Hoche
and his army destined for the invasion of Ireland for the purpose of
courting their opponents; but these, perceiving the danger,
ordered Hoche to Paris, rebuked him for bringing his army
nearer to the capital than was allowed by law, and dismissed
him in disgrace.

The failure of Hoche led the three Directors to fix their hopes
on Bonaparte. The commander of the ever-victorious army of
Italy had recently been attacked by one of the moderates in the
councils for proposing to hand over Venice to Austria. This
cession was based on political motives, which Bonaparte judged
to be of overwhelming force; and he now decided to support
the Directors and overthrow the moderates. Prefacing his action
by a violent tirade against the royalist conspirators of Clichy,
he sent to Paris General Augereau, well known for his brusque
behaviour and demagogic Jacobinism. This officer rushed to
Paris, breathing out threats of slaughter against all royalists,
and entered into close relations with Barras. In order to dis-
court the chances of failure, Bonaparte warned the three Directors
that Augereau was a turbulent politician, not to be trusted over-
much. Events, indeed, might readily have gone in favour of
the moderates had Carnot acted with decision; but he relapsed
into strange inactivity, while Barras and his military tool
prepared to coerce the majority. Before dawn of September
the 4th (18 Fructidor) Augereau with 2000 soldiers marched
against the Tuileries, where the councils were sitting, dispersed
their military guards, arrested several deputies and seized Barthélemy in his bed. Carnot, on receiving timely warning, fled from the Luxembourg palace and made his way to Switzerland. The remembrance of the fatal day of Vendémiaire 1795 perhaps helped to paralyse the majority. In any case, exile, and death in the prisons of Cayenne, now awaited the timid champions of law and order; while parliamentary rule sustained a shock from which it never recovered. The Councils allowed the elections to be annulled in forty-nine departments of France, and re-enacted some of the laws of the period of the Terror, notably those against non-juring priests and returned émigrés. The electors, for the accumulation of power, were to elect the Directors, in place of Carnot and Barthélemy, gave to that body a compactness which enabled it to carry matters with a high hand, until the hatred felt by Frenchmen for this soulless rebuilding of a moribund Jacobinism gradually endowed the Chambers with life and strength sufficient to provoke a renewal of strife with the Directory. These violent oscillations not only weakened the fabric of the Republic, but brought about a situation in which Bonaparte easily paralysed both the executive and the legislative powers so ill co-ordinated by the constitution of the year 1795.

In the sphere of European diplomacy, no less than in that of French politics, the results of the coup d'état of Fructidor were momentous. The Fructidorian Directors contemptuously rejected the overtures for peace which Pitt had recently made through the medium of Lord Malmesbury at Lille; and they further illustrated their desire for war and plunder by initiating a forward policy in central Italy and Switzerland which opened up a new cycle of war. The coup d'état was favourable to Bonaparte; it ensured his hold over the Directors and enabled him to impose his own terms of peace on Austria; above all it left him free for the prosecution of his campaign in a field of action which now held the first place in his thoughts—the Orient. Having rivalled the exploits of Caesar, he now longed to follow in the steps of Alexander the Great.

At the time of his first view of the Adriatic (February 1797) he noted the importance of the port of Ancona for intercourse with the Sultan's dominions; and at that city fortune placed in his hands Russian despatches relative to the designs of the Tsar Paul on Malta. The incident reawakened the interest which had early been aroused in the young Corsican by converse with the savant Volney, author of Les Ruines, ou méditation sur les révolutions des empires. The intercourse which he had with Monge, the physicist and ex-minister of marine, during the negotiations with Austria, served to emphasize the orientation of his thoughts. This explains the eagerness with which he now insisted on the acquisition of the Ionian Isles by France and the political extinction of their present possessor, Venice. That city had given him cause for complaint, of which he made the most uncourteous use. Thanks to the blind complaisance of its democrats and the timid subserviency of its once haughty oligarchs, he became master of its fleet and arsenal (10th of May 1797). Already, as may be seen by his letters to the Directory, he had laid his plans for the barring away of the Queen of the Adriatic to Austria; and throughout the lengthy negotiations of the summer and early autumn of 1797 which he conducted with little interference from Paris, he adhered to his plan of gaining the fleet and the Ionian Isles; while the house of Habsburg was to acquire the city itself, together with all the mainland territories of the Republic as far west as the River Adige. In vain did the Austrian envoy, Cobenzl, resist the cession of the Ionian Isles to France; in vain did the Directors intervene in the middle of September with an express order that Venice must not be ceded to Austria, but must, along with Friuli, be included in the Cisalpine Republic. To the subtle tenacity of Cobenzl he opposed a masterful violence: he checkmated the Directors, when they sought to thwart him in this and in other directions, by sending in once more his resignation with a letter in which he accused them of "horrible ingratitude." He was successful at all points. The Directors feared a rupture with the man to whom they owed their existence; and the house of Austria was lain to make peace with the general rather than expose itself to harder terms at the hands of the Directory.

The treaty of Campo Formio, signed on the 17th of October 1797, was therefore pre-eminently the work of Bonaparte. Already at Cherasco and Leoben he had dictated the preliminaries of peace to the courts of Turin and Vienna quite independently of the French Directory. At Campo Formio he showed himself the first diplomatist of the age, and the arbiter of the destinies of Europe. The terms were on the whole unexpectedly favourable to Austria. In Italy she was to acquire the Venetian lands already named, along with Dalmatia and Venetian Istria. The territories occupied by the French army (the Cisalpine Republic, the Lombard and the Adige) went to the newly constituted Cisalpine republic; France gaining the Ionian Isles and the Venetian fleet. The Emperor Francis renounced all claims to his former Netherland provinces, which had been occupied by the French since the summer of 1794; he further ceded the Breisgau to the dispossessed duke of Modena, agreed to summon a congress at Rastatt for the settlement of German affairs, and recognized the independence of the Cisalpine republic. In secret articles the emperor bound himself to use his influence at the congress of Rastatt in order to procure the cession to France of the Germanic dominions of the Rhine, while France promised to help him to acquire the archbishopric of Salzburg and a strip of land on the eastern frontier of Bavaria.

After acting for a brief space as one of the French envoys to the congress of Rastatt, Napoleon returned to Paris early in December and received the homage of the Directors and the acclaim of the populace. The former sought to busy him by appointing him commander-in-chief of the Army of England, the island power being now the only one which contested French supremacy in Europe. In February 1798 he inspected the preparations for the invasion of England and then proceeded to the northern point. He found that they were wholly inadequate, and summed up his views in a remarkable letter to the Directory (23rd of February), wherein he pointed out two possible alternatives to an invasion of England, namely, a conquest of the coast of the north-west of Germany, for the cutting off of British commerce with central Europe, or the undertaking of an expedition to the Orient which would be equally ruinous to British trade. The inference was inevitable that, as German affairs were about to be profitably exploited by France in the bargains then beginning at Rastatt, she must throw her chief energies into the Egyptian expedition. One of the needful preliminaries of the enterprise had already received his attention. In November 1797 he sent to Malta Pousssielgue, secretary of the French legation at Genoa, on business which was ostensibly commercial but (as he informed the Directory) "in reality to put the last touch to the design that we have on that island." The intrigues of the French envoy in corrupting the knights of the order of St John were completely successful. It remained, however, to find the funds needful for the equipment of a great expedition. Here the difficulties were great. The Directory, after the coup d'état of Fructidor, had acknowledged a state of bankruptcy by writing off two-thirds of the national debt in a form which soon proved to be a thin disguise for repudiation. The return of a large part of the armed forces from Italy and Germany, where they had lived on the liberated inhabitants, also threw new burdens on the Republic; and it was clear that French money alone would not suffice to fit out an armada. Again, however, the financial situation was improved by conquest. The occupation of Rome in February 1798 enabled Berthier to send a considerable sum to Paris and to style himself "treasurer to the chest of the Army of England." The invasion of Switzerland, which Bonaparte had of late persistently pressed on the Directory, proved to be an equally lucrative device, the funds in several of the cantonal treasuries being transferred straightway to Paris or Toulon. The conquest of north and central Italy also placed great naval resources at the disposal of France, Venice alone providing nine sail of the line and twelve frigates (see Bonaparte's letter of the 15th of November 1797), Genoa, Spezzia, Leghorn, Civita Vecchia and Ancona also supplied their quota in warships, transports,
stores and sailors, with the result that the armada was ready for sea by the middle of May 1798. The secrecy maintained as to its destination was equally remarkable. The British government inclined to the belief that it was destined either for Ireland or for Naples. As the British fleet had abandoned the Mediterranean since November 1796 and had recently been disorganized by two serious mutinies, Bonaparte's plan of conquering Egypt was by no means so rash as has sometimes been represented.

The ostensible aims of the expedition, as drawn up by him, and countersigned by the Directory on the 12th of April, were the seizure of Egypt, the driving of the British from all their possessions in the East, and the establishment of an Egyptian republic. Apart from these public aims there were private motives which weighed with Bonaparte. His relations to the Directors were most strained. They feared his ability and ambition; while he credited them with the design of poisoning him. Shortly before his starting, an open rupture was scarcely averted; and he and his brothers allowed the idea to get abroad that he was being virtually banished from France. It is certain, however, that his whole heart was in the expedition, which appealed to his love of romance and of the gigantic. His words to Joseph Bédet to kindle by entertaining the masses of Paris with the tales of a republic were youthful illusions. Since the 9th of Thermidor, the republican instinct has grown weaker every day. To-day all eyes are on me: to-morrow they may be on another. . . . I depart for the Orient with all the means of success at my disposal. If my country needs me, if there are additions to the number of those who share the opinion of Talleyrand, Sieyès and Roederer, that war will break out again and that it will be unsuccessful for France, I will return, more sure of the feeling of the nation."

He added, however, that if France waged a successful war, he would remain in the East, and do more damage to England than by mere demonstrations in the English Channel. But the Toulon fleet set sail on the 19th of May; and when the other contingents from the ports of France and Italy joined the flag, the armada comprised thirteen sail of the line, fourteen frigates, many smaller warships and some three hundred transports. An interesting feature of the expedition was the presence on board of several savants who were charged to examine the antiquities and develop the resources of Egypt. The chief had lately become a member of the Institute, and did his utmost to inculcate in France that love of art and science which he had helped to kindle by enunciating the mandate of the Republic with the treasures of Italy. By good fortune the armada evaded Nelson and arrived safely off Malta. Thanks to French intrigues, the Knights of Malta offered the stamest defence of their capital. During the week which he spent there, Bonaparte displayed marvellous energy in endowing the city with modern institutions; he even arranged the course of studies to be followed in the university. Setting sail for Egypt on the 19th of June, he again had the good fortune to elude Nelson and arrived off Alexandria on the 2nd of July. For an account of the Egyptian and Syrian campaigns see French Revolutionary Wars. But here we may point out the influence of the expedition on Egypt, on European politics and on the fortunes of Bonaparte. The chief direct result in the life of the Egyptian people was the virtual destruction of the governing caste of the Mamelukes, the Turks finding it easy to rid themselves of their surviving chiefs and to re-establish the authority of the Sultan. As for the benefits which Bonaparte and his savants helped to confer on Egypt, they soon vanished. The great canal was not begun; irrigation works were started but were soon given up. The letters of Kitchin and Menou (the successors of Bonaparte) show that the expenditure on public works had been so recklessly that the colony was virtually bankrupt at the time of Bonaparte's departure; and William Hamilton, who travelled through Egypt in 1802, found few traces, other than military, of the French occupation. The indirect results, however, were incalculably great. Though for the present the Sultan regained his hold upon Egypt, yet in reality Bonaparte set in motion forces which could not be stayed until the ascendency of one or other of the western maritime powers in that land was definitely decided.

The effects of the expedition in the sphere of world-politics were equally remarkable and more immediate. The British government, alarmed by Bonaparte's attempt to intrigue with Tippoo Sahib, put forth all its strength in India and destroyed the power of that ambitious ruler. Nelson's capture of Malta (5th of September 1800) also secured for the time a sure base for British fleets in the Mediterranean. A Russo-Turkish fleet wrested Corfu from the French; and the Neapolitan Bourbon, emboldened by the news of the battle of the Nile, began hostilities with France which precluded the war of the Second Coalition. In the domain of science the results of the expedition were of the highest importance. The British Museum furnished the key to Egyptian hieroglyphics; and archaeology, no less than the more practical sciences, acknowledges its debt of gratitude to the man who first brought the valley of the Nile into close touch with the thought of the West.

Finally, it should be noted that, amid the failure of the national aims which the Directory and Bonaparte set forth, his own desires received a startlingly complete fulfilment. The war of the Second Coalition having brought about the expulsion of the French from Italy, the Directors were exposed to a storm of demonstrations demanding the restoration of the Bourbons. A Stone furnished the key to Egyptian hieroglyphics; and archaeology, no less than the more practical sciences, acknowledges its debt of gratitude to the man who first brought the valley of the Nile into close touch with the thought of the West.

In order to understand the sharp swing of the political pendulum back from republicanism to autocracy which took place at Brumaire, it is needful to remember that the virtual failure of the Egyptian Expedition was then unknown. The news of Bonaparte's signal victory over the Turkish army at Aboukir on the 2nd of July had been relayed with all speed through the Empire, and it was commonly understood that the experiment had foundered. With the success of the expedition, his policy was scarcely noticeable in the eyes of men. The Directory had been the instrument brought into existence by the revolution of 1789; the re-establishment of the Ancients was ready to support Sieyès and make drastic changes in the constitution; but in the Council of Five Hundred the prevalent feeling was democratic or even Jacobinical. The aim of Sieyès was to perpetuate the republic, but in a bureaucratic or autocratic form. With this aim in view he sought to find a man possessing ability in war and probity in civil affairs, who would act as figure-head to his long projected constitution. For a time affairs moved as he wished. The Jacobin Club was
closed, thanks to the ability of Fouché, the new minister of Police; but the hopes of Sieyès were dashed by the death of General Joubert, commander of the Army of Italy, at the disastrous battle of Novi (15th of August). The deaht of army among the generals left in France (Kléber and Desaix were in Egypt) was now painfully apparent. Moreau was notoriously lethargic in civil affairs. Bernadotte, Jourdan and Augereau had chibletly lost themselves by close association with the Jacobins. The soldiery had never forgiven Masséna his peculations after the capture of Rome. One name, and one alone, leaped to men's thoughts, that of Bonaparte.

He arrived from Egypt at the psychological moment, and his journey from Fréjus to Paris resembled a triumphant procession. Nevertheless he acted with the utmost caution. A fortnight passed before he decided to support Sieyès in effecting a change in the constitution; and by then he had capitivated all men except Bernadotte and a few intrusissigeni Jacobins. Talleyrand, Roederer, Cambacérès and Réal were among his special confidants, his brothers Joseph and Lucien also giving useful advice. Of the generals, Murat, Berthier, Lannes and Leclerc were those who prepared the way for the coup d'état. Fouché, pulling the wires through the police, was an invaluable helper. The conduct of Barras was known to depend on material considerations.

All being ready, the Ancients on the 18 Brumaire (9th of November) decreed the transference of the sessions of both Councils to St Cloud, on the plea of a Jacobin plot which threatened the peace of Paris. They also placed the troops in Paris and its neighbourhood under the command of Bonaparte. Thereupon Sieyès and Ducos resigned office. Barras, after a calculating delay, followed suit. Gohier and Moulin, on refusing to retire, were placed under a military guard; and General Moreau showed his political incapacity by discharging this duty, for the benefit of Bonaparte.

Nevertheless the proceedings of St Cloud on the day following bade fair to upset the best-laid schemes of Bonaparte and his coadjutors. The Five Hundred, meeting in the Orangerie of the palace, had by this time seen through the plot; and, on the entrance of the general with four grenadiers, several deputies rushed at him, shook him violently, while others vehemently demanded a decree of outlawry against the new Cromwell. He himself lost his nerve, staggered, nearly fainted, and was dragged out by the soldiers in a state of mental and physical collapse. The situation was saved solely by the skill of his brother Lucien, then president of the Council. He refused to put the vote of outlawry, uttered a few passionate words, cast off his official robes, declared the session at an end, and made his way out under protection of a squad of grenadiers. The coup d'état seemed to have failed. But Bonaparte saw in the episode the moment for striking on the other side. Stung to action by some words of Sieyès, Bonaparte appealed to the troops of the line in terms which provoked a ready response. Imprecations uttered by Lucien against the brigands and traitors in the pay of England decided the grenadiers of the Council to march against the deputies whom it was their special duty to protect. Drums beat the charge. Murat led the way through the corridors of the palace to the Orangerie, and levelled bayonets ended the existence of the Council. Within the space of ten and a half years from the summoning of the States-General at Versailles (May 1789), parliamentary government fell beneath the sword.

Lucien now consolidated the work of the soldiery by procuring from the Ancients a decree which named Bonaparte, Sieyès and Ducos as provisional consuls, while a legislative commission was appointed to report on necessary changes in the constitution. Lucien also gathered together a small group of the younger deputies to throw the cloak of legality over the events of the day. The Rump proceeded to expel sixty-one Jacobins from the Council of Five Hundred, adjourned its sessions until the 19th of February 1800, and appointed a commission of twenty-five members with power to act in the meantime. Clearly the success of the coup d'état of Brumaire was due in the last resort to Lucien Bonaparte.

The Parisians received the news of the event with joy, believing that freedom was now at last to be established on a firm basis by the man whose name was the synonym for victory in the field and disinterestedness in civil affairs. "People are full of mirth" (wrote Madame Reinhard, wife of the minister for Foreign Affairs, four days later) "believing that they have regained liberty." She added that all the parties except the Jacobins were full of confidence; and that the nobles now cherished hopes of a reaction, seeing that the reduction of the number of rulers from five to three pointed towards monarchy. Her comment on this delusion is instructive. Three consuls had been appointed, she remarked, precisely in order that power might not be vested in the hands of one man.

Only by degrees did the events of the 19th of Brumaire stand out in their real significance; for the new consuls, installed at the Luxembourg palace, and somewhat later at the Tuileries, took care that the new constitution, which they along with the two constitutional acts had secretly drawn up, should not be promulgated until Paris and France had settled down to the ordinary life of pleasure and toil. In the meantime they won credit by popular measures such as the abolition of forced loans and of the objectionable habit of seizing hostages from the districts of the west where the royalist ferment was still strongly working.

The feelings of surprise at the clemency and moderation with which the victors used their powers predisposed men everywhere to accept their constitution. Sieyès now sketched its outlines in vaguely republican forms; thereupon Bonaparte freely altered them and gave them strongly personal touches. The theorist laid before the joint commission his projet, the result of five years of cogitation, only to have it ridiculed by the great soldier. In one respect alone did it suit him. While restoring the principle of universal suffrage, which had been partially abrogated in 1795, Sieyès rendered this system of election practically a nullity. The voters were to choose one-tenth of their number (notabilities of the commune); one-tenth of these would form the notabilities of the department; while by a similar decimal sifting, the notabilities of the nation were selected. The final and all-important act of selection from among these men was, however, to be made by a personage, styled the proclamateur-électeur, who chose all the important functionaries, and, jointly with the notabilities of the nation, chose the members for the Council of State (wielding the chief executive powers), the Tribunate and the Senate. The latter body would, however, have the power to "absorb" the head of the state if he showed signs of ambition. Against this power of absorption Bonaparte declined vehemently, asserting also that the proclamateur-électeur would be a mere cocohen à l'engraiss. In vain did Sieyès propound schemes for infusing some principle of liberty into the chief executive powers for war, the other for peace. This division of powers was equally distasteful to Bonaparte: he formed a kind of cabal within the joint commission, and there intimidated the theorist, with the result already foreseen by the latter. Sieyès, conscious that his political mechanism would merely winnow the air, until the profoundly able and forceful man at his side adapted it to the work of government, relapsed into silence; and his resignation of the office of consul, together with that of Ducos, was announced as imminent. Bonaparte further brushed aside a frankly democratic constitution proposed by Daunou, and intimidated his opponents in the joint commission by a threat that he would himself draft a constitution and propose it to the people in a mass vote.

This was what really happened. They looked on helplessly while he refashioned the scheme of Sieyès. Keeping the electoral machinery almost unaltered (save that the lists of notables were to be permanent) Bonaparte entirely altered the upper parts of the constitutional pyramid reared by the philosophes. Improving upon the procedure of the Convention in Vendémiaire 1795, Bonaparte procured the nomination of three consuls in an article of the new constitution; they were the first Consul (First Consul), Cambacérès and Lebrun. The latter two, uniting with the two retiring consuls, Sieyès and Ducos, were to form the
nucleus of the senate and choose the majority among its full complement of sixty members, the minority being thereafter chosen by co-optation. To the senate, thus chosen "from above," was allotted the important task of supervising the constitution, and of selecting, from among the notabilities of the nation, the members of the Corps Législatif and the Tribunate. These two bodies nominally formed the legislature, the Tribunate merely discussing the bills sent to it by an important body, the Council of State; while the Corps Législatif, sitting in silence, heard them declared by councillors of state and criticized by members of the body; its new constitution was promulgated on the 15th of December 1799 and in a plébiscite held during January 1800 it received the support of 3,011,007 voters, only 1,552 persons voting against it. The fact that the three new consuls had entered upon office and set the constitutional machinery in motion fully six weeks before the completion of the plébiscite, detracts somewhat from the impressiveness of the vox populi on that occasion.

Bonaparte selected his ministers with much skill. They were Talleyrand, Foreign Affairs; Berthier, War; Abrial, Justice; Launay, Bouche, members of local administrative bodies and ex-commissioners of government attached to the tribunals. He names all the judges for criminal and civil cases, other than the juges de paix (magistrates) and the judges of the Cour de cassation, without having the power to discharge them."—As for the second and third consuls, their functions were almost entirely consultative and formal, their opposition being recorded, but having no further significance against the fiat of the First Consul. Bonaparte's powers were subsequently extended in the years 1802, 1804 and 1807, but it is clear that autocracy was practically established by his own action in the secret commission of 1799. This constitution was promulgated on the 15th of December 1799 and in a plébiscite held during January 1800 it received the support of 3,011,007 voters, only 1,552 persons voting against it. The fact that the three new consuls had entered upon office and set the constitutional machinery in motion fully six weeks before the completion of the plébiscite, detracts somewhat from the impressiveness of the vox populi on that occasion.

In our survey of the career of Napoleon, we have now reached the time of the Consulate (November 1799-May 1804), which marks the zenith of his mental powers and creative activity. Externally, and in a personal sense, the period falls into two parts. The former of these extends to August 1802, when the powers of the First Consul, which had been decreed for ten years, were prolonged to the duration of his life. But in another and wider sense the Consulate has a well-defined unity; it is the time when France gained most of her institutions and the essentials of her machinery of government.

For an article FRANCE (Law and Institutions) for the information respecting the various codes dating from this period, and to the article CONCORDAT for the famous measure which Napoleon re-established official relations between the state and the church in France. More pressing even than that question was the regulation of local government. Bonaparte's action in this matter was so characteristic as to deserve close attention. Under the Old Regime the government was divided into districts, departments, cantons, divisions, districts, and finally the arrondissements of the Empire, namely, the Legion of Honour (19th of May 1802), Napoleon intended it as a protest against the spirit of equality which pervaded revolutionary thought. In one respect the new institutions marked an enormous advance on titles of nobility, which had been granted nearly always for warlike exploits, or merely as a mark of the favour of the sovereign. The First Consul, on the
other hand, sought to recognize and reward merit in all walks of life. Nevertheless his proposal met with strong opposition in the Corps Législatif and Tribunate, where members saw that it portended a revival of the despotic tendency which had been abated by the Constituent assembly, titles of nobility were virtually restored by Napoleon in 1806 and legally in 1808. Side by side with them there continued to exist the Legion of Honour. It was organized in futuro as a means of rewarding officers, members of the Constituent assembly, thirty officers and 350 legionaries. A stipend, ranging from 3000 francs a year to 250 francs, was attached to each grade of the institution. The benefits attaching to membership were numbered, and were increased during the Empire, when the average number somewhat exceeded thirty thousand. Napoleon's aim of bidding for the support of all able men is disagreeably prominent in this part of his career. The advantages the government offered were summed up by Moreau in his address to Hohenlinden (December 2nd, 1800) brought the court of Vienna to a state of despair. By the treaty with Austria, signed by Joseph Bonaparte at Lunéville on the 9th of February 1801, France regained all that she had won at Campo Formio, much of which had been lost for a time in the war of the Second Coalition. True, she now agreed to recognise the independence of the Cispitane, Ligurian, Helvetic and Batavian (Dutch) republics; but the masterful acquisitiveness of the First Consul and the weak conduct of Austrian and British affairs at that time soon made that clause of the treaty a dead letter. Bonaparte meanwhile, by dexterous behaviour to Paul I. of Russia, had won the friendship of that potentate, whose resentment against his former allies, Austria and England, facilitated a re-grouping of the Powers. The new Franco-Russian entendre helped on the formation of the Armed Neutrality League and led to the concession of schemes for the driving of the British from India. But these undertakings were thwarted in March–April 1801 by the murder of the tsar Paul and by Nelson's victory at Copenhagen. The advent of the more peaceful and Angliophile tsar, Alexander I. (q.v.), brought about the dissolution of the League, and the abandonment of the oriental schemes which Bonaparte had so closely at heart. Another disappointment befell him in the same quarter, the surrender of the French forces in Egypt to the British expedition commanded first by General Abercromby and afterwards by General John Hely-Hutchinson (30th of August 1801). These events disposed both Bonaparte and the British cabinet towards peace. He was all powerful on land, they on the sea; and for the present each was powerless to harm the other. Bonaparte in particular discerned the advantages which peace would bring in the consolidation of his position. The beginning of negotiations had been somewhat facilitated by the resignation of Pitt (4th of February 1801) and the advent to office of Henry Addington. Bonaparte, perceiving the weakness of Addington, both as a man and as a minister, pressed him hard; and both the Preliminaries of Peace, concluded at London on the 1st of October 1801, and the terms of the treaty of Amiens (27th of March 1802) were such as to spread through the United Kingdom a feeling of annoyance. In everything which related to the continent of Europe and to the resumption of trade relations between Great Britain and France, Bonaparte had his way; and he abated his demands only in a few questions relating to India and Newfoundland.

The terms of the treaty of Amiens may be thus summarized: Great Britain restored to France the colonial possessions (almost the whole of the French colonial empire) conquered in the late war. Of their many maritime conquests the British retained only the Spanish island of Trinidad and the Dutch settlements in Ceylon. Their other conquests at the expense of these allies of France were restored to them, including the Cape of Good Hope, the Dutch East Indies, and also the recognition of the integrity of the Turkish Empire and promised an indemnity to the House of Orange exiled from the Batavian (Dutch) Republic since 1794. She further agreed to evacuate the papal states, Taranto and other towns in the Mediterranean coasts which she had occupied. The independence of the Ionian Isles (now reconstituted as the Republic of the Seven Islands) was guaranteed. As to Malta, the United Kingdom was to restore it to the order of St John (its possessors previous to 1798) when the Great Powers had guaranteed its independence. It was to receive a Neapolitan garrison for a year, and, if necessary, for a longer time.

No event in the life of Bonaparte was more auspicious than the conclusion of this highly advantageous bargain. By retaining nearly all the continental conquests of France, and by recovering every one of those which the British had made at her expense beyond the seas, he achieved a feat which was far beyond the powers even of Louis XIV. The gratitude of the French for this triumph found expression in a proposal, emanating from the Tribunate, that the First Consul should receive a pledge of the gratitude of the nation. When referred to the senate, the matter underwent secret manipulation, largely through the influence of Cambacérès; but the republican instinct even in the senate was sufficiently strong to thwart the intrigues of the second consul; and that body on the 8th of May merely re-elected Bonaparte for a second term of ten years after the expiration of the first decennial term for which he was chosen. This fell far short of his desires, and he now dexterously referred the whole question to the nation at large. The Council of State, acting on a suggestion made by Cambacérès, now intervened with telling effect. It altered the wording of the senatorial proposal in such a way that the nation was asked to vote on the question: "Is Napoleon Bonaparte to be made Consul for Life?" France responded by an overwhelming affirmative, 3,568,885 votes being cast for the proposal and only 8374 against it.

Napoleon (who now used his Christian name instead of the surname Bonaparte) thereupon sent proposals for various changes in the constitution, which were at once registered by the obsequious Council of State and the Senate on the 4th of August (16 Thermidor) 1802. Besides holding his powers for life, he now gained the right of nominating his successor. He alone could ratify treaties of peace and alliance, and on his nomination fifty-four senators were added to the senate, which thereafter numbered one hundred and twenty members appointed by him alone. This body received the right of deciding by senatus consulto all questions not provided for by the constitution; the Corps Législatif and Tribunate might also thenceforth be dissolved at its bidding. In short, the First Consul now became the irresponsible ruler of France, governing the country through the ministry, the Council of State and the Senate. As for the chambers, based avowedly on universal suffrage, their existence thenceforth was ornamental or sepulchral. The constitutional changes of August 1802, initiated solely by Bonaparte, made France an absolute monarchy, while that of the Empire was not adopted until nearly two years later; but the change then brought about was scarcely more than titular.

In order to understand the utter inability of the old republican party to withstand these changes, it is needful to retrace our steps and consider the skilful use made by Bonaparte of plots and disturbances as they occurred. As was natural, when he sought to steer a clear course between the two elements of reaction, the Jacobins and the Girondins, disturbances were to be expected on both sides of the consular ship of state. The first of these was an unimportant affair, probably nurtured by the agents provocateurs of Fouche's ubiquitous police. It purported to be an undertaking entered into by a few
on Napoleon I. 199

Jacobins, among them Aréna, a Corsican, for the murder of Bonaparte, which act caused his dismissal from the legislative body (10th of October 1800); and that was virtually the beginning and the end of the plot. Far more serious was the danger to be apprehended from the royalists. Enraged by Bonaparte’s contemptuous reference to the Directory as a “turn of the screw,” the royalists began to compass the death of the man whom they had at first naïvely looked on as a potent General Monk to their Charles II. These royalists, called the “royalists,” brought to a head plans long talked over by the confidants of the Comte d’Artois (the future Charles X. of France) in London. The outcome of it was the despatch on 4 November of an expert French surgeon to Paris, that gentleman having explored an internal machine close to Bonaparte’s carriage in the narrow streets near the Tuileries (3rd of November 1800). Bonaparte and Josephine escaped unharmed, but several bystanders were killed. The vendetta was ended at a stroke.

On 21st of April 1802 he issued a decree which constituted Piedmont as a military district dependent on France; for various reasons he postponed the final act of incorporation to the 21st of September 1802. The Genoese republic a little earlier undertook to act at his hands changes which made its doge all-powerful in local affairs, but a mere puppet in the hands of Bonaparte. For three years Italy the influence of the First Consul was paramount; for in 1802 he transformed the monarchy of the kingdom of Etruria for the duke of Parma; and, seeing that that promotion added lustre to the fortunes of the duchess of Parma (a Spanish infant), Spain consented lamely enough to the cession of Louisiana to France. The effect of these extraordinary changes, then, was the carrying out of Napoleon’s satrapies in the north and centre of Italy in a way utterly inconsistent with the treaty of Lunéville; and the weakness with which the courts of London and Vienna looked on at these singular events confirmed Bonaparte in the belief that he could do what he would with neither courting states. The policy of the French revolution had been to surround France with free and allied republics. The policy of the First Consul was to transform them into tributaries which copied with chameleonic fidelity the political fashions he himself set at Paris.

Of all these interventions the most justified and beneficial, perhaps, was that which related to the Swiss cantons. Whether his agents did, or did not, pour oil on the flames of civil strife, which he thereupon quenched by his Act of Mediation, 1st of February 1803, is a complex question. The settlement which he, having purchased the claims, made was, in every way excellent, but it was dearly purchased by the complete disappearance of Bonaparte in all important affairs, and by the claim for the services of a considerable contingent of Swiss troops which he thereafter rigorously enforced.

The re-occupation of Switzerland by French troops in October 1802 wrought English opinion to a state of indignation against the autocrat who was making conquests more quickly in time of peace than he had done by his sword; and the irritation increased when, on the 29th of January 1803, he publicly stated: “It is recognized by Europe that Italy and Holland, as well as Switzerland, are provinces of France, and France has said at that time made still more strongly for war. On the 30th of January he caused the official French paper, the Moniteur, to publish in extenso a confidential report sent by Colonel Bastiani describing his so-called commercial mission to the Levant. In it there occurred the threatening phrase: “Six thousand French would at present be enough to conquer Egypt.” An equally significant hint, that the Ionian Isles might easily be regained by France, further helped to open the eyes of the purblind Addington ministry to the resolve of Napoleon to make the Mediterranean a French lake. Ministers were also deeply concerned at the continued occupation of Holland by French troops, which made that country and, therefore, the Cape of Good Hope, absolutely dependent on France. They accordingly resolved not to give up Malta unless Lord Whitworth, the British ambassador at Paris, “received a satisfactory explanation.”
relative to the Sebastiani report. Napoleon's refusal to give this, and his complaint that Great Britain had neglected to comply with some of the provisions of the treaty of Amiens, brought Anglo-French relations to an acute phase. By great dexterity he succeeded in turning public attention almost solely to the fact that Britain had not evacuated Malta. This is probably the new government in which he may interpret his misfortunes in that land. Lord Whitworth at the diplomatic circle on the 13th of March. While not using threats of personal violence, as was generally reported at the time, his language was threatening and offensive. Annoyed by Whitworth's imperturbable demeanour, he ended with these words: "You must respect treaties, then: woe to those who do not respect treaties. They shall answer for it to all Europe." The news of the strengthening of the British army and navy lately announced in the king's speech had perhaps annoyed him; but seeing that his outbursts of passion were nearly always the result of calculation—he once stated, pointing to his chin, that temper only mounted that high with—his design, doubtless, was to set men everywhere talking about the perfidy of Albion. If so, he succeeded. His own violations of the treaties of Lunéville and Amiens were overlooked; and in particular men forgot that the weakening of the Knights of St John by the recent confiscation of their lands in France and Spain, and the protracted delay of Russia and Prussia to guarantee their tenure of power in Malta, furnished England with good reasons for keeping her hold on that island. On the 4th of April the Addington government proposed a new and more compromising view of counsels. In return for the great accession of power to France since the treaty of Amiens (Elba, it may be noted, was annexed in August 1802) Great Britain was to retain Malta for ten years and to acquire the small island of Lampedusa in perpetuity. French troops were also required to withdraw from Holland and Switzerland, as well as the British government sent a secret offer to withdraw from Malta as soon as the French evacuated Holland. To this also Napoleon demurred. The rupture, therefore, took place in the middle of May; and on a flimsy pretext the First Consul ordered the detention in France of all English persons. The reasons for his annoyance are now well known. It is certain that he was preparing to renew the struggle for the mastery of the seas and of the Orient, which must break out if he held to his present resolve to found a great colonial empire. But he needed time in order to build a navy and to prepare for the execution of the schemes for the overthrow of the British power in India, which he had lately outlined to General Decaen, the secretary of war. He hastened during the spring to the same and sailed Decaen's squadron early in March 1803 had alarmed the British ministers and doubtless confirmed their resolve to have the question of peace or war settled speedily. Whitworth also warned them on the 20th of April that "the chief motives for delay are that they (the French) are totally unprepared for a naval war." This was quite correct. Napoleon wished to postpone the rupture for fully eighteen months, as is shown by his secret instructions to Decaen. The British government did not know the whole truth; but, knowing the character of Napoleon, it was easy to guess his secret intentions. The British government knew that the British government was aware of the proposals of the 4th of April in order to test the sincerity of his recent offer of compensation to England. He refused them, mainly, it would seem, because he could not believe that the British consular ministry could be firm; and in his rage at the discovery of his error he revenged himself ignobly on British tourists and traders in France. He now threw all his energies into the task of marshalling the forces of France and his vassal states for the overthrow of "perfidious Albion." Naval preparations went on apace at all the dockyards, and numbers of flat-bottomed boats were built or repaired at the northern harbours. Disregarding the neutrality of the Germanic System, Napoleon sent a strong French corps to overrun Hanover, while he despatched General Gouvion St Cyr to occupy Taranto and other dominating positions in the south-east of the kingdom of Naples. Exactions at the expense of Hanover and Naples helped to lighten the burdens of French finance; Napoleon's sale of Louisiana to the United States early in 1803 for 60,000,000 francs brought further relief to the French treasury; and by pressing hard on his ally, Spain, he compelled her to exchange the armed help which she had given in 1800, for an indemnity of 3,000,000. Through Spain he then threatened Portugal with extinction unless she too paid a heavy subsidy, a demand with which the court of Lisbon was fain to comply.

Thus the first months of the war served to differentiate the two belligerents. England made short work of the French squadrons and colonies, particularly in the West Indies, while Napoleon became more than ever the master of central and southern Europe. The whole course of the war was to emphasize this distinction between the Sea Power and the Land Power; and in this fact lay the success of Napoleon's ascendancy in France and neighbouring lands, as also of his final overthrow.

Napoleon's utter disregard of the neutrality of neighbouring states was soon to be revealed in the course of a royalist plot which helped him to the imperial title. Georges Cadoudal, General Pichegru and other devoted royalists had concocted with the comte d'Artois (afterwards Charles X. of France) in London a scheme for the kidnapping (or more probably the murder) of the First Consul. The French police certainly knew of the plot, allowed the conspirators to come to Paris, arrested or straightened them to the house of the comte d'Artois, to the house of the young duc d'Enghien, to the house of General Moreau, with whom Pichegru had two or three secret conferences. This was much; for Moreau, though indolent and incapable in political affairs, was still immensely popular in the army (always more republican than the civilians) and might conceivably head a republican movement against the autocrat. But far more was to follow. Falling through his police to lure the comte d'Artois to land in Normandy, Napoleon punched on a scion of the House of Bourbon who was within his reach. The young duc d'Enghien was then residing at Ettenheim in Baden near the bank of the Rhine. He had served in the army of his grandfather, the prince of Conde, during the recent war; and Bonaparte believed for a time that he was an accomplice to the Cadoudal-Pichegru plot. He therefore sent orders to have him seized by French soldiers and brought to Vincennes near Paris. The order was skillfully obeyed, and the prince was hurried before a court-martial hastily summoned at that castle. Before they passed the verdict, Napoleon came to see that his victim was innocent of any participation in the plot. Nevertheless he was executed (21st of March 1804). It is noteworthy that though Napoleon at times sought to shift the responsibility for this deed on Talleyrand and on the military, the court adjourned and this so in his will, he frankly avowed his responsibility for it and asserted that in the like circumstances he would do the same again.

The horror aroused by this crime did not long deaden the feeling, at least in official circles, that something must be done to introduce the principle of heredity, as the surest means of counteracting the aims of conspirators. The senate, as usual, took the lead in suggesting some such change in the constitution; and it besought Napoleon to complete his work by rendering it, as his glory, immortal." Other official addresses of the same kind were made to him, but he had a right to return the last speech. He made it clear that the imperial dignity should be hereditary in the family of Bonaparte (3rd of May). Napoleon thereupon invited the senate to "make known to him its thoughts completely." The senate and the tribunate each appointed a commission to deal with the matter, with the result which every one foresaw. Carnot alone in the tribunate protested against the measure. The other councils adopted it almost unanimously. The Senatus Consultum of the 18th of May 1804 awarded to Napoleon the title of emperor, the succession (in case he had no heir) devolving in turn upon the descendants of Joseph and Louis Bonaparte (Lucien and Jerome were for the present excluded from the succession owing to their having contracted marriages displeasing to Napoleon). In a plébiscite taken on the subject of the imperial title and the law of succession, there were
NAPOLEON I.

3,572 affirmative votes and only 2569 negatives. In this vote lay the justification of the acts of the First Consul and the pledge for the greatness of the emperor Napoleon. The republics in nearly every case voted for him: and it is significant of the curious trend of French thought that the new imperial constitution of the 18th of May 1804 opened with the words: "The government of the Republic was transferred to an emperor, who took the title Emperor of the French."

The changes brought about by this constitution were mainly titular. Napoleon's powers as First Consul for Life were so wide as to render much extension both superfluous and impossible: but we have seen that the Senate, at its second session, gained a further accession of authority at the expense of the two legislative bodies; and practically legislation rested with the emperor, who sent his decrees to the senate to be registered as laws. Napoleon's empire was also divided into three sections, dealing with legislation, home affairs and finance—a division which precluded its entire suppression in 1807. More important were the titular changes. Napoleon, as we have seen, did not venture to create an order of nobility until 1808, but he at once established an imperial hierarchy. First came the French princes, namely, the brothers of the emperor; six grand imperial dignities were also instituted, viz. those of the grand elector (Joseph Bonaparte), arch-chancellor of the empire (Cambacérès), arch-chancellor of state (Eugène de Beauharnais), arch-treasurer (Lebrun), grand master of the order of the empire, and grand marshal (Ségur). Next came the marshals, namely, Berthier, Murat, Masséna, Augereau, Lannes, Jourdan, Ney, Soult, Brune, Davout, Bessières, Moncey, Mortier and Bernadotte. Four generals—Kellermann, Lefebre, Marmont and René de Robefroy—held the titles of grand marshals. Next came dignities of a slightly lower rank, such as those of grand almoner (Fesch), grand master of the palace (Duroc), grand chamberlain (Talleyrand), grand master of the horse (Caualier), grand master of the court of admirals (Talleyrand), grand master of the court of cancer (Ségur). These with a host of lesser dignities built up the imperial hierarchy and enabled the court quickly to develop on the lines of the old monarchy, so far as rules of etiquette and self-conscious efforts could reproduce the courtly graces of the ancien régime.

Meanwhile Napoleon was triumphing over the last of the republican generals. Moreau's trial for treason promised to end with an acquittal, but the Bonapartists were determined to win the judges (one of whom he dismissed), with the result that the general was declared guilty of participating in the royalist plot. Thereupon Napoleon, in order to give the new régime a firmer act of regency, had the constable Moreau, it is understood, that he must leave France. He left immediately for the United States. Sentence of death was passed on the royalist conspirators. On Josephine's entreaties, the emperor commuted the sentence for eight of the well-connected among them; Cadoudal and others of lower extraction were executed on the 24th of June. The brave Breton peasant thus summed up the results of his plot: We meant to give France a king and we have given her a consul. Thereupon, since really true, the field were not more effective in consolidating Napoleon's power than were his own comp d'état and the supremely skilful use which he made of conspiracies directed against him. He naturally seduced the enemies's suspicion and succeeded in exploiting the royalist plot of 1803-1804 by reconstituting the ministry of police and bestowing on it upon him. Thenceforth plots were few. Would-be plotters resorted either to the power of his and his intimate friends, or to a conviction that conspiracies redounded to his advantage.

Napoleon was now able by degrees to dispense with all republican forms (the last to go was the Republican Calendar, which ceased on the 1st of January 1806), and the scene at the coronation in Notre Dame on the 2nd of December 1804 was frankly imperial in splendour and in the egotism which led Napoleon to wave aside the pope, Pius VII., at the supreme moment and crown himself. It is worthy of note that Josephine then won a triumph over Joseph Bonaparte and his sisters, who had been intriguing to effect a divorce. Napoleon, though he did not bar the door absolutely against such a proceeding, granted her her heart's desire by secretly going through a religious ceremony on the evening before the coronation. It was performed by Fesch, now a cardinal; but Napoleon could afterwards urge the claim that all the legal formalities had not been complied with; and the motive for the marriage may probably be found in the refusal of the pope to appear at the coronation unless the former civil contract was replaced by the religious rite.

As happened at every stage of Napoleon's advancement, the coup d'état of 1804 enabled him to raise an army, request a new constitution, and to grant the establishment of a new order of merit. The most important of these was the erection of monarchy in North Italy. The Italian republic (formerly the Cisalpine republic) became the kingdom of Italy.

At first Napoleon desired to endow Joseph, or, on his refusal, Louis, with the crown of the new kingdom. They, however, refused to place themselves out of the line of direct succession in France, as Napoleon required, in case they accepted this new dignity. Finally, he resolved to take the title himself. The obsequious authorities at Milan at once furthered his design by sending an address to him, by requesting the establishment of his own crown, and on the 15th of March 1805 by offering the crown to him. On the 26th of May he crowned himself in the cathedral at Milan with the iron crown of the old Lombard kings, amidst surroundings of the utmost splendour. On the 7th of June he issued a decree conferring the dignity of viceroy on Eugène de Beauharnais, his stepson; but everything showed that Napoleon's will was to be law; and the great powers at once saw that Napoleon's promise to keep the crowns of France and Italy separate was meaningless. The matter was of international importance; for by the treaty of Lunéville (February 1801) he had bound himself to respect the independence of the two republics of North Italy, the Cisalpine and the Ligurian. The defiance to Austria was emphasized when, on the 4th of June, he promised a deputation from Genoa that he would grant their request (prompted by his agents) of incorporating the Genoese (or Ligurian) republic in the French empire. In the same month he erected the republic of Lucca into a principality for Bacciochi and his consort, Elisa Bonaparte.

These actions proclaimed so unmistakably Napoleon's intention of making Italy an annexe of France as to convince the great powers that the barrier of Italy was a barrier of no avail. The tsa in, as protector of the German System, had already been so annoyed by the seizure of the duc d'Enghien on German territory, and by other high-handed actions against the Hanse cities, as to recall his ambassador from Paris. Napoleon showed his indifference to the opinion of the tsar by ordering the seizure of the British envoy at Hamburg, Sir George Bumbold (24th of October); but set him free on the remonstrance of the king of Prussia, with whom he then desired to remain on friendly terms. Nevertheless, the general trend of his policy was such as powerfully to help in the formation of the Third Coalition against France—a compact which Pitt (who returned to power in May 1804) had found it very difficult to arrange. Disputes with Russia respecting Malta and the British maritime code kept the two states apart for nearly a year; and Austria was too timid to move. But Napoleon's actions, especially the annexation of Genoa, at last brought the three powers to accord, with the general aim of re-establishing the status quo ante in Germany, Holland, Switzerland and Italy, or, in short, of restoring the balance of power which Napoleon had completely uprooted.

Military affairs in this period are dealt with under NAPOLEONIC CAMPAIGNS. But it is here an alternative was then the bloody days which Napoleon spent at the camp of Boulogne in the second and third weeks of August 1805, uncertain whether to risk all in an attack on England in case Villeneuve should arrive, or to turn the Grand Army against Austria, the only step which he took to avert a continental war was the despatch of General Duroc to Berlin to offer Hanover to Prussia on consideration of her framing a close alliance with France. It was very unlikely that that peace-loving Court would take up arms against its powerful neighbours on behalf of Napoleon, and his proceedings had in the previous months been so recklessly provocative as to arouse doubts whether he intended to invade England and did not welcome the outbreak of a continental war. But in the case of a man so intensely ambitious, determined and egotistic as Napoleon, a decision on this interesting question is hazardous. Little reliance can be placed on his subsequent statements (as, for instance, to Metternich in 1810) that the huge preparations at Boulogne and the long naval campaign of Villeneuve were a mere ruse whereby to lure the Austrians into a premature declaration of war. It is, however, highly probable that he meant to strike at London if naval affairs went well, but that he was forced to abandon his maritime plan by military counterblasts. If so, he succeeded. His habit was, as he said, faire son theme en deux fagon, and he
NAPOLEON I.

now took the second alternative. On or about the 25th-27th of August he resolved to strike at Austria. He did so with masterly skill and swiftness, and the triumphs of Ulm and Austerlitz hid from view the disaster of Trafalgar; and the only official reference to that crushing defeat was couched in these terms: "Storms caused us to lose some ships of the line after a fight imprudently engaged" (speech to the Legislature, 2nd of March 1806).

The glamour of Austerlitz had very naturally dazzled all France. Its results indeed were not only astounding at the time, but were such as to lead up to a new cycle of wars. By the peace of Presburg (26th of December 1805) Napoleon compelled Austria to recognize all the recent changes in Italy, and further to cede Venetia, Istria and Dalmatia to the new kingdom of Italy. The Swabian lands of the Habsburgs went to the South German states (allies of Napoleon), while Bavaria also received Tirol and Vorarlberg. The Electors of Bavaria and Württemberg were recognized as kings.

Nor was this all. Napoleon pressed almost equally hard upon Prussia. That power had been on the point of offering her armed mediation in revenge for his violation of her territory of Anspach; but she was fain to accept the terms which he offered at the sword's point. When modified in February 1806, after Prussia's demobilization, they comprised the occupation of Hanover by Prussia, with the proviso, however, that she should exclude British ships and goods from the whole of the north-west coast of Germany. To this demand (the real commencement of the "Continental System") the Berlin government had to accede, though at the cost of a naval war with England, and the ruin of its maritime trade. Anspach and Bayreuth were also to be handed over to Bavaria, it now being the aim of Napoleon to aggrandize the South German princes who had fought on his side in the late war. In order to strengthen this compact, he arranged a marriage between the daughter of the king of Bavaria and Eugène Beauharnais; and he united the daughter of the Elector of Württemberg in marriage to Jerome Bonaparte, who had now divorced his wife, formerly Miss Paterson of Baltimore, at his brother's behests. Stéphanie de Beauharnais, niece of Josephine, was also betrothed to the son of the duke (now grand duke) of Baden. By these alliances the new Charlemagne seemed to have founded his supremacy in South Germany on sure foundations.

Equally striking was his success in Italy. The Bourbons of Naples had broken their treaty engagements with Napoleon, though in this matter they were perhaps as much sinned against as sinning. After Austerlitz the conqueror fulfilled against them, and sent southwards a strong column which compelled an Anglo-Russian force to sail away and brought about the flight of the Bourbons to Sicily (February 1806). This event opened a new and curious chapter in the history of Europe, that of the fortunes of the *Napoleoni*, i.e., to his Corsican instinct of attachment to the family, and contempt for legal and dynastic claims, he now began to plant his brothers and other relatives in what had been republics established by the French Jacobins. Eugène Beauharnais had been established at Milan. Joseph Bonaparte was now advised to take the throne of Naples, and without any undue haggling as to terms, for "those who will not rise with me shall no longer be of my family. I am making a family of kings attached to my federative system." At the end of March 1806 Joseph became king of the Two Sicilies. A little later the emperor bestowed the two papal enclaves of Benevento and Ponte-Corvo on Talleyrand and Bernadotte respectively, an act which emphasized the hostility which had been growing between Napoleon and the papacy. Because Pius VII. declined to exclude British goods from the Papal States, Napoleon threatened to reduce the pope to the level merely of bishop of Rome. He occupied Ancona and seemed about to annex the Papal States outright. That doom was postponed; but Catholics everywhere saw with pain the harsh treatment accorded to a defenceless old man. The prestige which the First Consul had gained by the Concordat was now lost by the overweening emperor.

But it was on the banks of the Rhine that the Napoleonic system received its most signal developments. The duchy of Berg, along with the eastern part of Cléves and other annexes, now went to Murat, brother-in-law of Napoleon (March 1806); and that melodramatic soldier at once began to round off his eastern boundary in a way highly offensive to Prussia. She was equally concerned by Napoleon's behaviour in the Dutch Netherlands, where her influence used to be supreme. On the 5th of June 1806 the Batavian republic completed its chrysalis-like transformation into a kingdom, with Louis Bonaparte as king. "Never cease to be a Frenchman" was the pregnant advice which he gave to his younger brother in announcing the new dignity to him. In that sentence lay the secret of all the disagreements between the two brothers. Louis resolved to govern for the good of his subjects. Napoleon determined that he, like all the Bonapartist rulers, should act merely as a Napoleonic satrap. They were to be to him what the counts of the marches were to Charlemagne, warlike feudatories defending the empire or overawing its prospective foes.

For Russia served to show the extent of his ambition. She was to be conquered. On the 17th of July Napoleon signed at Paris a decree that reduced to subservience the Germanic System, the chaotic weakness of which he had in 1797 foreseen to be highly favourable to France. He now grouped together the princes of south and central Germany in the Confederation of the Rhine, of which he was the protector and practically the ruler in all important affairs. The logical outcome of this proceeding appeared on the 1st of August, when Napoleon declared that he no longer recognized the existence of the Holy Roman Empire. The head of that venerable organism, the emperor Francis II., bowed to the inevitable and announced that he thenceforth confined himself to his functions as Francis I., hereditary emperor of Austria, a title which he had taken just two years previously. This tame acquiescence of the House of Habsburg in the reorganization of Germany seemed to set the seal on Napoleon's work. He controlled all the lands from the Elbe to the Pyrenees, and had Spain and Italy at his beck and call. Power such as this was never wielded by his prototype, Charlemagne.

But now came a series of events which transcended all that the mind of man had conceived. As the summer of 1806 wore on, his policy perceptibly hardened. Negotiations with England and all the efforts of Austria to extricate itself from the Napoleonic System, which had been induced to take part in the war by the emperor Francis II., had come to nothing. His secret offer to the British Hanover (that gilded hook by which he caught her eagles in the year) was now resolved to avenger was the last of several insults. Napoleon was surprised by the news of Prussia's mobilization; he had come to regard her as a negligible quantity, and now he found that her unexpected sensitiveness on points of honour was about to revive the Third Coalition against France.

The war which broke out early in October 1806 (sometimes known as the war of the Fourth Coalition) ran a course curiously like that of 1805 in its main outlines. For Austria we may read Prussia; for Ulm, Jena-Auerstädt; for the occupation of Vienna, the Battle of Trafalgar; for Ligny, Friedland, which again was disposed of the belated succour given by Russia. The parallel extends even to the secret negotiations; for, if Austria could have been induced in May 1807 to send an army against Napoleon's communications, his position would have been fully as dangerous as before Austerlitz if Prussia had taken a similar step. Once more he triumphed owing to the timidity of the central power which had the game in its hands; and the folly which marked the Russian tactics at Friedland (14th of June 1807), as at Austerlitz, enabled him to close the campaign in a blaze of glory and shiver the coalition in pieces.
Now came an opportunity far greater than that which occurred after Austerlitz. The Peace of Presburg was merely continental. That of Tilsit was of world-wide importance. But before referring to its terms we must note an event which indicated the lines on which Napoleon's policy would advance. After occupying the Prussian capital he launched against England the famous Berlin Decree (12th of November 1806), declaring her coasts to be in a state of blockade, and prohibiting all commerce with them. No ship coming thence was to be admitted into French or allied harbours; ships transgressing the decree were to be good prize of war; and British subjects were liable to imprisonment if found in French or allied territories. This decree is often called the basis of the Continental System, whereby Napoleon proposed to ruin England by ruining her commerce. But even before Trafalgar he had begun to strike at that most vulnerable form of wealth, as the Jacobins had done before him. Nelson's crowning triumph rendered impossible for the present all other means of attack on those elusive foes; and Napoleon's sense of the importance of that battle may be gauged, not by his public utterances on the subject, but by his persistence in forcing Prussia to close Hanover and the whole coastline of north-west Germany against British goods. That proceeding, in February 1806, constitutes the basis of the Continental System. The Berlin Decree gave it a wide extension. By the mighty blow of Friedland and the astonishing diplomatic triumph of Tilsit, the conqueror hoped speedily to overwhelm the islanders; but from the mass of the world's opposition Napoleon at Tilsit resembles Polyphemus seeking to destroy Ulysses. The crags which he flung at Britannia did indeed graze the stern and graze the prow of her craft.

The triumph won at Friedland marks in several respects the climax of Napoleon's career. The opportunity was unique; and he now put forth his utmost endeavours to win over to his side the conquered but still formidable tsar. In their first interview, held on a raft in the middle of the river Niemen at Tilsit on the 25th of June, the French emperor, by his mingled strength and suppleness of intellect, gained an easy mastery over the impressionable young potentate. Partly from fear of a national Polish rising which Napoleon held in reserve as a last means of coercion, and partly from a subtle resolve to use the French alliance as a means of securing rich domains at the expense of Turkey, Prussia, Sweden and England, Alexander decided to throw over his allies, Prussia and England, and to seize the spoils to which the conqueror pointed as the natural sequel of a Franco-Russian alliance. Napoleon, therefore, had Prussia completely at his mercy; and his conditions to that power bore witness to the fact. The prayers of Queen Louisa of Prussia failed to prevent the Russian monarch rescinding his former tariff request for Magdeburg. At a later time he reproached himself for not having dethroned the Hohenzollerns outright; but it is now known that Alexander would have forbidden this step, and that he dissuaded Napoleon from withdrawing Silesia from the control of the House of Hohenzollern. Even so, Prussia was bereft of half of her territories; those west of the river Elbe went to swell the dominions of Napoleon's vassals or to form the new kingdom of Westphalia for Jerome Bonaparte; while the spoils which the House of Hohenzollern had won from Poland in the second and third partitions were now to form the duchy of Warsaw ruled over by Napoleon's ally, the elector (now king) of Saxony. Danzig became nominally a free city, but was to be occupied by a French garrison until the peace. The tsar, after acquiring a frontier district from Prussia, recognized the changes brought about by Napoleon in Germany and Italy, and agreed by a secret article that the Cattaro district on the east coast of the Adriatic should go to France. Equally important was the secret treaty of alliance between France and Russia signed on that same day. By it Napoleon brought the tsar to agree to make war on England in case that power did not accept the tsar's mediations. England was now in the Russian ally's, the elector's, and Napoleon's, the great man of the hour's, power; and other changes placed in high standing men who were remarkable for docility rather than originality and power. Napoleon also suppressed the Tribunate; and in the year 1808 instituted an order of nobility. During the course of a tour in Italy in December 1807 he gave a sharp turn to that world-compelling screw, the Continental System. By the Milan Decree of the 17th of December 1807, he ordained that every ship which submitted to the right of search now claimed by Great Britain would be considered a lawful prize. The imperious terms in which this decree was couched and its misleading title of antipathy against India had recently occupied his thoughts. Napoleon may have believed in the imminent collapse of his sole remaining enemy. This was natural. Britain, it was true, acting on the initiative of George Canning, had seized the Danish fleet, thus forestalling
an action which Napoleon certainly contemplated; but on the other hand Denmark now allied herself with him; and while in Lombardy he heard of the triumphant entry of his troops into Lisbon—an event which seemed to prelude his domination in the Iberian Peninsula and thereafter in the Mediterranean.

The occupation of Lisbon, which led on to Napoleon's intervention in Spanish affairs, resulted naturally from the treaty of Tilsit. The coercion of England's oldest ally had long been one of Napoleon's most cherished aims, and was expressly provided for in that compact. To this scheme he turned with a zeal whetted by consciousness of his failure respecting the Danish fleet. On the 27th of October 1807 he signed with a Spanish envoy, his brother-in-law Godoy, a secret convention for the partition of Portugal between France and Spain. Another convention of the same date allowed him to send 28,000 French troops into Spain for the occupation of Portugal, an enterprise in which a large Spanish force was to help them; 40,000 French troops were to be cantonned at Bayonne to support the first corps. Seeing that Godoy, the all-powerful minister at Madrid, had given mortal offence to Napoleon early in the Prussian campaign of 1806 by calling on Spain to arm on behalf of her independence, it passes belief how he could have placed his country at the mercy of Napoleon at the very moment of his defeat. The emperor, however, successfully gilded the hook by awarding Algarve, the southern province of Portugal, to Godoy. The north of Portugal was to go to the widow of the king of Etruria (a Spanish Infanta); her realm now passing into the hands of Napoleon. Thus Portugal in 1807, like Venice in 1797, was to provide the means for wideely extending the operations of his statecraft.

The natural result followed. Portugal was easily overrun by the allies; but Junot's utmost efforts failed to secure the Portuguese fleet, which, under the protection of a British squadron, sailed away to Brazil with the royal family, the Spanish ministers and chief grandees of the realm. In other respects all went well. The French reinforcements which entered Spain managed to secure some of the strongholds of the northern provinces; and the disgraceful feuds in the royal family left the country practically at the emperor's mercy.

The situation was such as to tempt Napoleon on to an undertaking on which he had probably set his heart in the autumn of 1806, that of dethroning the Spanish Bourbons and of replacing them by a Bonaparte. Looking at the surface of the life of Spain, he might well believe in its decay. At the death of Charles IV., the throne devolved on his son Ferdinand, a man of weak character; and thereupon the antagonism to the interests of Spain and the Indies was likely to bring about an event which might disinherit Charles's brother, José, who was titular king of Portugal at this time. Napoleon, already a year or more engaged in the partition of Spain, might now make a bold dash for Portugal.

The emperor would clear up the situation. The same prospect was held out to Charles IV.; the queen and Godoy, with the threat that the rivals for the throne proceeded to the north of Spain to meet the arbiter of their destinies. Napoleon journeyed to Bayonne and remained there. The claimants, each not knowing of the movements of the other, crossed the Pyrenees, and Ferdinand on his arrival at Bayonne found himself to be virtually a prisoner in the hands of the emperor. Napoleon had little difficulty in disposing of the father, whose rage against his son blunted his senses in every other direction. As for Ferdinand, the emperor, on hearing the news of a rising in Madrid on the 2nd of May, overwhelmed him with threats, until he resigned his crown to his son, who had already bargained it away to Napoleon in return for a pension (5th of May 1808). Princely abodes in France and annuities (the latter to be paid by Spain)—such was the price at which Napoleon bought the crown of Spain and the Indies. Naturally nothing more was heard of the partition of Portugal. According to outward appearance nothing was wanting to complete the emperor's triumph. He is said to have remarked with an oath after Jena that he would make the Spanish Bourbons pay for their recent bellicose proclamation. If the story is correct, his acts at Bayonne and Madrid show that he might well have pursued on his schemes regardless of everything in order to take an overwhelming revenge. That the sense of a Corsican notary should have been able to dispose of the Spanish Bourbons in this contemptuously easy way is one of the marvels of history.

But even in this crowning triumph the crumbling egoism of his nature—a mental vice which now grew on him rapidly—fatally narrowed his outlook and led him to commit an irretrievable blunder. In his contempt for the rulers of Spain he forgot the Spanish people. In all the genuine letters of the spring of 1808—that of March 20th to Murat, no. 13,666 of the French archives—there is not one that he regarded the Spaniards as of any account. On the 27th of March he offered the crown of Spain to his brother Louis, king of Holland, in these terms: "The climate of Holland does not suit you; besides Holland can never rise from its ruins. I think of you for the throne of Spain. You will be the sovereign of a generous nation of eleven millions of men and of important colonies." On Louis declining the honour, it devolved on Joseph, king of Naples, who vacated that throne for the benefit of Murat—a source of disappointment and annoyance to both. The emperor pressed on his schemes regardless of everything. The first signs of the rising ferment in Spain were wasted on him. He believed that the arrival of so benevolent a king as Joseph, and the promulgation of a number of useful reforms based on those of the French Revolution, would soothe any passing irritation. If not, then his troops could deal with it as Murat had dealt with the men of Madrid on the 2nd of May. He, therefore, pressed on the march of a corps of French and Swiss troops under Dupont towards Cadiz, in order to take possession of the French sail of the line, five in number, which had been in that harbour since Trafalgar. The importance which he was assigned to naval affairs appears in many letters of the months May to June 1808. He intended that Spain should very soon have ready twenty-eight sail of the line—"ce qui est certes bien peu de chose"—so as to drive away the British squadrons, and then he would strike "de grands coups" in the autumn. Evidently then the Spanish dockyards and warships (when vigorously organized) were to count for much in the schemes for assuring complete supremacy in the Mediterranean and the ultimate overthrow of the British and Turkish empires, which he then had closely at heart.

The Spanish rising of May—June 1808 ruined these plans irretrievably. The men of Cadiz compelled the French warships to surrender, and the levies of Andalusia, closing around Dupont, compelled him and some 23,000 men to lay down their arms at Baylen (23rd of July). This disaster, the most serious suffered by the French since Rossbach, sent a thrill through the Napoleonic vassal states and aroused in Napoleon transports of anger against Dupont. "Everything is connected with this event,"
NAPOLEON I.

205

he wrote on the 2nd of August: "Germany, Poland, Italy." Indeed, along with other serious checks in Spain, which involved the conquest of that land, it cut through the wide meshes of his policy both in Levantine, Central European and commercial affairs. The partition of Turkey had to be postponed; the financial collapse of England could not be expected now that she framed an alliance with the Spanish patriots and had their markets and those of their colonies opened to her; and the discussions with the tsar Alexander, which had not gone quite smoothly, now took a decidedly unfavourable turn. The tsar saw his chance of improving on the terms arranged at Tilsit; and obviously Napoleon could not begin the conquest of Spain until he felt sure of the conduct of his fortress of the Oder. At the latter place was the prospect of Sir Arthur Wellesley with a British force landed in Portugal, gained the battle of Vimeiro (21st of August), and brought the French commander, Junot, by the so-called convention of Cintra, to agree to the evacuation of the country by all the French troops. The sea power thus gained what had all along been wanting, a sure basis for the exercise of its force against the land power, Napoleon. Still more important, perhaps, was the change in moral which the Spanish rising brought about. Napoleon's perfidy at Bayonne was so flagrant as to strip him the mask of a champion of popular liberty which had previously been worth the world Emperor of all the world as an unscrupulous aggressor; moral force, previously marshallled on the side of France, now began to pass to the side of his opponents. The value of that unseen ally he well knew; "Once again, let me tell you," he wrote to General Clarke on the 10th of October 1809, "in war moral and opinion are more than half of the reality."

Such were the discouraging conditions which weighed him down at the time of the interview with the tsar at Erfurt (September 27th-October 12th, 1809). That event was so important as to require some preliminary explanation of some circumstances among the two emperors that had been exchanging their views as to the future of the world. Stated briefly they were these. Napoleon desired to press on the partition of Prussia, Alexander that of Turkey. The tsar, however, was determined to save Prussia if he could; and Napoleon after the first disasters in Spain saw it to be impossible to uproot the Hohenzollerns; while it was clearly in his interest to postpone the partition of Turkey until he had conquered Spain and Sicily. Austria meanwhile had begun to arm as a precautionary measure; and Napoleon, shortly after his return from Bayonne to Paris, publicly declared vain, if her ministers went on, he would wage against her a war of extermination. The threat naturally did not tend to reassure statesmen at Vienna; and the tsar now resolved to prevent the total wreck of the European system by screening the House of Habsburg from the wrath of his ally. For the present Napoleon's ire fell upon Prussia. A letter written by the Prussian statesman, Baron vom Steim, had fallen into the hands of the French and revealed to the emperor the ferment produced in Germany by news of the French reverses in Spain. In that letter Stein urged the need of a national rising of the Germans similar to that of the Spaniards, whom the inevitable struggle ensued between Napoleon and Austria. The revenge of the autocrat was characteristic. Besides driving Stein from office, he compelled Prussia to sign a convention (8th of September) for the payment to France of a sum of 140,000,000 francs, and for the limitation of the Prussian army to 42,000 men.

Apart from this advantage, placed in his hands by the imprudence of Stein, Napoleon was heavily handicapped at the Erfurt interview. In vain did he seek to dazzle the tsar by assembling about him the vassal kings and princes of Germany; in vain did he overawe all intellectual gifts which he had captivated the tsar at Tilsit; in vain did he conjure up visions of the future conquest of the Orient; external display, diplomatic finesse, varied by one or two outbursts of calculated violence—all was useless. The situation now was utterly different from that which obtained at Tilsit. Alexander had succeeded in pacifying Finland, and his troops held the Danubian provinces of Turkey—a pledge, as it seemed, for the future conquest of Constantinople. Napoleon, on the other hand, had utterly failed in his Spanish enterprise; and the tsar felt sure that his rival must soon withdraw French garrisons from the fortresses of the Oder to the frontier of Spain. These facts, and not, as has often been assumed, the treachery of Talleyrand, decided Alexander to assume at Erfurt an attitude of jealous reserve. He refused to join Napoleon in any proposal for the coercion of Austria or the limitation of her armaments. Finally he agreed to join his ally if he (Napoleon) were attacked by the Habsburg power. Napoleon on his side succeeded in adjourning the question of the partition of Turkey; but he awarded the Danubian provinces and Finland to his ally and agreed to withdraw the French garrisons from the fortresses of the Oder as soon as the war with Spain was concluded. Both of these nationalities opened an appeal to George III. to accord peace to the world on the basis of uti possidetis. Canning asssented, provided that envoy of all the states and peoples concerned took part in the negotiations. Whereupon a reply came from Paris (28th of November) that the French emperor refused to admit the envos of "the king who reigns in Brazil, the king who reigns in Sicily or the king who reigns in Sweden." The "Spanish insurgents" were equally placed out of court. Clearly, then, Napoleon's desire for peace was conditional on his being allowed to dictate terms to the rulers and peoples concerned.

Already he had shown that the sword must decide affairs in Spain. After spending a short time in Paris in order to supervise the transfer of his forces from Germany to the Pyrenees, he journeyed swiftly southwards, burst upon the Spaniards, and on the 3rd of December received the surrender of Madrid. There, on the 14th of December, he issued a decree (omitted from the official Correspondence) declaring le nommé Stein an enemy of France and confiscating his property in the lands allied to France. The great statesman barely succeeded in escaping to Austria, a land in which his hopes of German power were to be encouraged by the sympathy of all patriotic Germans and the newly found energy of its own subjects, the House of Habsburg now began to prepare for war. Napoleon was then in the midst of operations against Sir John Moore, whose masterly march on Sahagun (near Valladolid) had thwarted the emperor's plans for a general "drive" to Lisbon. Hoping to punish Moore for his boldness, Napoleon struck quickly north at Astorga, but found that he was too late to catch his foe. At that town he also heard news of the 1st of January 1809, which portended trouble in Germany and perhaps also at Paris. Austria was continuing to arm and the emperor perceived that the diplomatic failure at Erfurt was now about to entail on him another and more serious struggle. His anxiety was increased by news of sinister import respecting frequent interviews between those former rivals, Talleyrand and Fouché, in which Murat was said to be concerned. Handing over the command to Soult, he hurried back to Paris to trample on the seeds of sedition and to overwhelm Austria by the blows which he showered upon her in the valley of the Danube. Sir John Moore and the statesmen of Austria—the heroic Stadion at their head—failed in their enterprise; but at least they frustrated the determined effort of Napoleon to stamp out the national movement in the Iberian Peninsula. Thereafter he never entered Spain; and the French operations suffered incalculably from the want of one able commander-in-chief.

In the Danubian campaign of 1809 he succeeded; but the stubborn defence of Austria, the heroic efforts of the Tiroleses and the spasmodic efforts which forebode a national rising in Germany, showed that the whole aspect of affairs was changing; even in central Europe, where rulers and peoples had hitherto been as wax under the impress of his will. The peoples, formerly so apathetic, were now the centre of resistance, and their efforts failed owing to the timidity or sluggishness of governments and the incompetence of some of their military leaders. The failure of the archduke John to arrive in time at Wagram (5th of July), the lack of support accorded by the Spaniards to Wellesley before and after the battle of Talavera (28th of July), and the slowness with which the British government sent forth its great armada against Flushing and Antwerp, a fortnight after
Austria sued for an armistice from Napoleon, enabled that superb organizer to emerge victorious from a most precarious situation. The hatred felt for him by Germans found expression in a daring attempt to murder him made by a well-bred youth named Staps on the 12th of October.

Two days later Napoleon, by means of unworthy artifices, hurried the Austrian plenipotentiaries into signing the treaty of peace at Schönbrunn. The House of Habsburg now ceded Salzburg and the Inn-Viertel to Napoleon (for his ally, the king of Bavaria); a great portion of the spoils which Austria had torn from Poland in 1795 went to the grand duchy of Warsaw, or Russia; and the cession of her provinces Carnithia, Carniola and Istria to the French empire cut her off from all access to the sea. After imposing these harsh terms on his enemy, the conqueror might naturally have shown clemency to the Tirolean leader, Andreas Hofer; but that brave mountaineer, when betrayed by a friend, was sentenced to death at Munich in order to the arrival of a special message to that effect from Napoleon.

In other quarters he achieved for the present a signal success. It was his habit to issue important decrees from the capitals of his enemies; and on the 17th of May 1809 he signed at Vienna an edict abolishing the temporal power of the pope and annexing the Papal States, which the French troops had occupied early in the previous year. On the 6th of July 1809 Fius VII. was arrested at Rome for presuming to excommunicate the successor of Charlemagne, and was deported to Grenoble and later on to Savona. The same year witnessed the downfall of Napoleon's puppetland, are now known to have been insincere. Fouche, for meddling in the negotiations through an agent of his own, was promptly disgraced; and, when neither England was moved by diplomatic cajolery nor Louis Bonaparte by threats, French troops were sent against the Dutch capital. Louis fled from his kingdom, and on the 9th of July 1810 Holland became part of the French empire. In the next months Napoleon promulgated a series of decrees for effecting the ruin of British commerce, and in December 1810 he decreed the annexation of the north-west coast of Germany, as also of Canton Valais, to the French empire. This was followed by the evacuation of Brest, the cession of Istria and Carinthia to the Habsburgs; while another arm (only nominally severed from the empire by the Napoleonic kingdom of Italy) extended down the eastern shore of the Adriatic to Ragusa and Cattaro, threatening the Turkish empire with schemes of partition always imminent but never achieved.

It is time now to notice two important events in the life of the emperor, namely his divorce of Josephine and his union with Marie Louise of Austria. The former of these had long been foreseen. The Bonapartes had intrigued for it with their usual persistence; and Napoleon was careful never to make it impossible. His triumph over Austria in 1809, and especially the attempt of Staps to murder him, clinched his determination to found a dynasty in his own direct line. From Josephine he could not expect to have an heir. Accordingly, on his return to Paris he caused the news to be broken to her that reasons of state of the most urgent kind compelled him to divorce her. An affecting scene took place between them on the 30th of November 1809; but Napoleon, though moved by her distress, remained firm; and though the clergies made a difficulty about dissolving the religious marriage of the 1st of December 1804, the formalities of which were complete save that the parish priest was absent, yet the emperor instituted a chancery for the archbishop of Paris, with the result that that body pronounced the divorce (January 1810). Josephine retired to her private abode, Malmaison, where her patience and serenity won the admiration of all who saw her.

Meanwhile the deliberations respecting the choice of her successor had already begun. Opinions were divided in the emperor's circle between a Russian and an Austrian princess; but the marked coolness with which overtures for the hand of the tsar's sister were received at St Petersburg, and the skill with which Count Metternich, the Austrian chancellor, let it be known that a union with the archduchess, Marie Louise, would be welcomed at Schönbrunn, helped to decide the matter. The reasons why the emperor Francis acquiesced in the marriage alliance are well known. Only so could his empire survive. A marriage between Napoleon and a Russian princess would have implied the permanent subjection of Austria. By the proposed step he would weaken the Franco-Russian alliance. But why did Napoleon fix his choice on Vienna rather than St Petersburg? Mainly, it would seem, because he desired hurriedly to screen the marriage, which now might be expected, under the appearance of a voluntary choice of an Austrian archduchess. Further, an alliance with the House of Habsburg might be expected to weaken the Germans from all thought of gaining succour from that quarter. The wedding was celebrated first at Vienna by proxy, and at Notre Dame by the emperor in person on the 2nd of April. Though based on merely political grounds, the union was for the time a happy one. He advised his courtiers to marry Germans—"they are the best wives in the world, good, naive and fresh as roses." Metternich, on visiting Campagne and Paris, found the emperor thoroughly devoted to his bride. Napoleon told him that he was now beginning to live, that he had always longed for a home and now at last had one. Metternich thereupon wrote to his master: "He (Napoleon) has possibly more weaknesses than many other men, and if the empress continues to play upon them, as she begins to realize the possibility of doing, she can render the greatest services to herself and all Europe." The surmise was too hopeful. Napoleon, though he never again worked as he had done, soon freed himself from complete dependence on Marie Louise; and he never allowed it to intrude into political affairs, for which, indeed, she had not the least aptitude. His real concern for her was evidently before the birth of their son, the king of Rome, when he gave orders that if the life of both mother and child could not be saved, that of the mother should be saved if possible (20th of March 1811). This event seemed to place Napoleon's fortunes on a sure basis; but already they were being undermined by events. The marriage negotiations of 1809-1810 had somewhat offended the emperor Alexander; his resentment increased when, at the close of 1810, Napoleon dethroned the duke of Oldenburg, brother-in-law of the tsar; and the breach in the Franco-Russian alliance was repaired when the French emperor was promised the Russian penance to the duke or to give to the Russian government an assurance that the kingdom of Poland would never be reconstituted. The addition of large territories to the grand duchy of Warsaw after the war of 1809 aroused the fears of the tsar respecting the Poles; and he regarded all Napoleon's actions as inspired by hostility to Russia. He, therefore, despite Napoleon's repeated demands, refused to subject his empire to the hardships imposed by the Continental System; at the close of the year 1810 he virtually allowed the entry of colonial goods (all of which were really British borne) and little by little broke away from Napoleon's system. These actions implied war between France and Russia, unless Napoleon allowed such modifications of his rules (e.g. under the license system) as would
NAPOLEON I.

207

avert ruin from the trade and finance of Russia; and this he refused to do.

The campaign of 1812 may, therefore, be considered as resulting, firstly, from the complex and cramping effects of the Continental System on a northern land which could not deprive itself of colonial goods; secondly, from Napoleon's refusal to mitigate the anxiety of Alexander on the Polish question; and thirdly, from the annoyance felt by the tsar at the family matters noticed above. Napoleon undoubtedly entered on the struggle with reluctance. He spoke about it as one that lay in the course of destiny. In one sense he was right. If the Continental System, which was the inevitable war with Russia was inevitable. But that struggle may more reasonably be ascribed to the rigidity with which he carried out his commercial decrees and his diplomacy. He often prided himself on his absolute consistency, and we have Chaptal's warrant for the statement that, after the time of the Consulate, his habit of following his own opinions and rejecting all advice, even when he had asked for it, became more and more pronounced. It was so now. He took no heed of the warnings uttered by those wise counsellors, Cambrézec and Talleyrand, against an invasion of Russia, while "the tsar's fury" was supporting the strength of the empire at the other extremity. He encased himself in fatalism, with the result that in two years the mightiest empire reared by man broke under the twofold strain. His diplomacy before the war of 1812 was less successful than that of Alexander, who skilfully ended his quarrel with Turkey and gained over to his side Sweden. That state, where Bernadotte had latterly been chosen as crown prince, decided to throw off the yoke of the Continental System and join England and Russia, gaining from the latter power the promise of Norway at the expense of Denmark.

Napoleon on his side coerced Prussia into an offensive alliance and had the support of Austria and the states of the Rhenish Confederation. At Dresden he held court for a few days in May 1812 with Marie Louise: the emperor Francis, the king of Prussia and a host of lesser dignitaries were present—a sign of the power of the modern Charlemagne. It was the last time that he figured as master of the continent.

The military events of the years 1812-1814 are described under NAPOLEONIC CAMPAIGNS; and we need therefore note here only a few details personal to Napoleon or some considerations which influenced his policy. Firstly we may remark that the Austrian alliance and had the support of Austria and the states of the Rhenish Confederation. considered as a definitive treaty, and on the 2nd of April gave
instructions that the one of the refractory cardinals should be
carried off nightly by night from Fontainebleau, while the pontiff
was to be guarded more closely than before. On these facts
becoming known, a feeling of pity for the pope became wide-
spread; and the opinion of the Roman Catholic world gradually
turned against the emperor while he was fighting to preserve
his supremacy in Germany. "I am following the course of
events: I have always marched with them." Such were his
words uttered shortly before his departure from Paris (15th of
April). They proved that he misread events and misunderstood
his own position.

So far Napoleon's ensuing campaigns was to reveal the harden-
ing of his mental powers. Early in April he sought to gain the
help of 100,000 Austrian troops by holding out to Francis of
Austria the prospect of acquiring Silesia from Prussia. The offer
met with no response, Austria having received from the allies
vaguely alluring offers that she might arrange matters as she
desired in Italy and South Germany. Napoleon began to suspect
his father-in-law, and still more the Austrian chancellor,
Metternich; but instead of humouring them, he resolved to
stand firm. The Austrian demands, first presented to him on the
16th, were the addition of the Confederation of the Rhine
(1), the evacuation of Paris (2), and the cession of France from the
lands of north-west Germany annexed in 1810 and (3) the cession to Austria of the Illyrian provinces
wrested from her in 1809. Other terms were held in reserve to
be pressed if occasion admitted; but these were all that were
put forward at the moment. On this basis Austria was ready to
offer her armed mediation to the combatants. Napoleon would
not hear of the terms. "I will not have your armed mediation.
You are only confusing the whole question. You say you cannot
act for me; you are strong, then, only against me." This out-
burst of temper was a grave blunder. His threats alarmed the
Austrian court. At bottom the emperor Francis, perhaps also
Metternich, wanted peace, but on terms which the exhaustion
of the combatants would enable them to dictate. Yet during the
armistice which ensued (June 4th–July 20th; afterwards pro-
longed to August 10th) Napoleon did nothing to soothe the
Viennese government, and that, too, despite the encouragement
which the allies received from the news of Wellington's victory
at Vittoria and the entry of Bernadotte with a Swedish con-
tingent on the scene. Austria now proposed the terms named above, and, as Napoleon showed that the Confederation of the
Rhine must be dissolved, and that Prussia should be placed in a position
as good as that which she held in 1805, that is, before the
campaign of Jena. On the 27th of June she promised to join
the allies in case Napoleon should not accept these terms.

He was now at the crisis of his career. Events had shown
that, even after losing half a million of men in Russia, he was
a match for her and Prussia combined. Would he now accept
the Austrian terms and gain a not disadvantageous peace, for
which France was yearning? These terms, it should be noted,
would have kept Napoleon's empire intact except in Illyria;
while the peace would have enabled him to reorganize his army
and recover a host of French prisoners from Russia. His
signing of the armistice seemed to promise as much. To give
his enemies a breathing space when they were hard pressed was an
insane proceeding unless he meant to make peace. But there is
nothing in his words or actions at this time to show that he
desired peace except on terms which were clearly antipathetic.
His letters breathe the deepest resentment against Austria, and
show that he burned to chastise her for her "perfidy as a
betrayed friend". His enemy was reorganized. His actions at this time
have been ascribed to righteous indignation against Metternich's
double-dealing; and in a long interview at the Marcolini palace
at Dresden on the 26th of June he asked the chancellor point
blank how much money England had given him for his present
conduct. As for himself he cared little for the life of a million of
men. He had married the daughter of the emperor: it was a
mistake, but he would bury the world under the ruins. Talk in this Ossian-like vein showed that Napoleon's brain no
longer worked clearly; it was a victim to his egotism and passion.
July and the first decade of August came and went, but brought
no sign of pacification. The emperor's last efforts were directed to
influence his son-in-law through Marie Louise. It was in vain.
Nothing could bend that cast iron will. Nothing remained but
to break it. On the expiration of the armistice at midnight of
August 10th-11th Austria declared war.

After the disastrous defeat of Leipzig (17th–19th October
1813), when French domination in Germany and Italy vanished
like an exhalation, the allies gave Napoleon another opportunity
to come to terms. The overtures known as the Frankfort terms
were ostensibly an answer to the request for information which
was conveyed by Maret to Napoleon (20th of March) that, having
attained the tsar and the king of Prussia to make a declaration that the
allies would leave to Napoleon the "natural boundaries" of
France—the Rhine, Alps, Pyrenees and Ocean. The main object
of the Austrian chancellor probably was to let Napoleon once
more show to the world his perversity obstinacy. If this was his
aim, he succeeded. Napoleon on his return to St Cloud inveighed
against his ministers for talking so much about peace and declared
that he would never give up Holland; France must remain
a great empire, and not sink to the level of a mere kingdom. He
the discussion at the Congress of Frankfort by a blunder.
It would be a grave blunder that, having
the dykes and give back that land to the sea. Accordingly on the
16th of November he sent a vague and unsatisfactory reply to the
allies; and though Caulaincourt (who now replaced Maret as foreign minister) was on the 2nd of December charged
to give a general assent to their terms, yet that assent came
too late. The allies had now withdrawn their offer. Napoleon
certainly believed that the offer was insincere. Perhaps he was
right; but even in that case he should surely have accepted
the offer so as to expose their insincerity. As it was, they were
able to contrast their moderation with his wrongheadedness,
and thereby seek to separate his cause from that of France.
In this they only partially succeeded. Murat now joined the
allies; Germany, Switzerland and Holland were lost to Napoleon;
but when the allies began to invade Alsace and Lorraine, they
found the French staunch in his support. He was still the
peasants' emperor. The feelings of the year 1792 began to revive.
Never did Napoleon and France appear more united than in
the campaign of 1814.

Nevertheless it led to his abdication. Once more the allies
consented to discuss the terms of a general pacification; but at
the Congress of Frankfort (2nd of March) Murat's declaration
(19th of March) had no result except to bring to light a proof
of Napoleon's insincerity. Thereupon the allies resolved to have
no more dealings with him. As his chances of success became
more and more desperate, he ventured on a step whereby he
hoped to work potently on the pacific desires of the emperor
Francis. Leaving Paris for the time to its own resources, he
struck eastwards in the hope of terrifying that potentate and of
detaching him from the coalition. The move not only failed, but it had the fatal effect of uncovering Paris to the northern
forces of the allies. The surrender of the capital, where he had
centralized all the governing powers, was a grave disaster. Equally fatal was the blow struck at him by the senate, his own
favoured creation. Convoked by Talleyrand on the 1st of
April, it pronounced the word abdication on the morrow. For this
Napoleon cared little, provided that he had the army behind
him. But now the marshals and generals joined the civilians.
The defection of Marshal Marmont and his soldiery on the 4th
of April rendered further thoughts of resistance futile. To
continue the strife when Wellington was firmly established on
the line of the Garonne, and Lyons and Bordeaux had been
restored the Bourbon fleur de lys, was seen by all but Napoleon to be sheer
madness; but it needed the pressure of his marshals in painful
interviews at Fontainebleau to bring him to reason.

At last, on the 11th of April, he wrote the deed of abdication.
On that night he is said to have tried to end his life by poison.
The evidence is not convincing; and certainly his recovery
was very speedy. On the 20th he bade farewell to his guard
and set forth from Fontainebleau for Elba, which the powers
NAPOLEON I.

had very reluctantly, and owing to the pressure of the tsar, awarded to him as a possession. He was to keep the title of emperor. Marie Louise was to have the duchy of Parma for herself and her son. She did not go with her consort. Following the advice of her father, she repaired to Vienna along with the little king of Rome. As for France, she received the Bourbons, along with the old frontiers.

Meanwhile Napoleon, after narrow escapes from royalist mobs in Provence, was conducted in the British cruiser "Undaunted," to Vienna. In July, on the 14th, he spent ten months in unhealthy retirement, watching with close interest the course of events in France. As he foresaw, the shrinkage of the great empire into the realm of old France caused infinite disgust, a feeling fed every day by stories of the tacitless way in which the Bourbon princes treated veterans of the Grand Army. Equally threatening was the general situation in Europe. The demands of the tsar Alexander were for a time so exorbitant as to bring the powers at the congress of Vienna to the verge of war. Thus, everything portended a renewal of Napoleon's activity. The return of French princes from Russia, Germany, England, etc., and the powerful new French army with which he had risen to fame in 1814, so threatening were the symptoms that the royalists at Paris and the plenipotentiaries at Vienna talked of deposing him to the Azores, while others more than hinted at assassination.

He solved the problem in characteristic fashion. On the 26th of February 1815, when the English and French guardships were absent, he slipped away from Porto Ferrajo with some 1,000 men and landed near Antwerp on the 1st of March. Except in royalist Provence he received everywhere a welcome which attested the attractive power of his personality and the popularity of the Bourbons. Firing no shot in his defence, his little troop swelled until it became an army. Ney, who had said that Napoleon ought to be brought to Paris in an iron cage, joined him with 6,000 men on the 14th of March; and five days later the emperor entered the capital, whence Louis XVIII. had recently fled.

Napoleon was not misled by the enthusiasm of the provinces and Paris. He knew that love of novelty and contempt for the gouty old king and his greedy courtiers had brought about this bloodless triumph; and he felt instinctively that he had to deal with a new France, which would not tolerate despotism. On his way to Paris he had been profuse in promises of reform and constitutional rule. It remained to make good those promises and to disarm the fear and jealousy of the great powers. This was the work which he set before himself in the Hundred Days (19th of March to 22nd of June 1815). Were his powers, physical as well as mental, equal to the task? This is doubtful. Certainly the evidence as to his health is somewhat conflicting. Some persons (as, for instance, Carnot, Pasquier, Lavalette and Thiébault) thought him prematurely aged and enfeebled. Others again saw no marked change in him; while Mollien, who knew the emperor well, attributed the lassitude which now and then came over him to a feeling of perplexity caused by his changed circumstances. This explanation seems to furnish a correct clue. The autocrat felt cramped and chafed on all sides by the necessity of posing as a constitutional sovereign; and, while losing something of the old rigidity, he lost very much of the old energy, both in thought and action. His mind was that worked wonders in well-worn grooves and on facts that were well understood. The necessity of devising compromises with men who had formerly been his tools fretted him both in mind and body. But when he left parliamentary affairs behind, and took the field, he showed nearly all the power both of initiative and of endurance which marked his masterpiece, the campaign of 1814. To date his decline, as Chaptal does, from the cold of the Moscow campaign is clearly incorrect. The time of lethargy at Elba seems to have been more unfavourable to his powers than the cold of Russia. At Elba, as Sir Neil Campbell noted, he became inactive and proportionately corpulent. There, too, as sometimes in 1815, he began to suffer intermittently from ischury, but to no serious extent. On the whole it seems safe to assert that it was the change in France far more than the change in his health which brought about the manifest constraint of the emperor in the Hundred Days. His words to Benjamin Constant—"I am growing old. The repose of a constitutional king may suit me. It will more surely suit my son"—show that his mind seized the salient facts of the situation; but his instincts struggled against them. Hence the malaise both of mind and body.

The attempts of the royalists gave him little concern: the duc d'Angoulême raised a small force for Louis XVIII. in the south, but at Valence it melted away in front of Grouchy's command; and at Lyons, given at last as a convention whereby they received a free pardon from the emperor. The royalists of la Vendée were later in moving and caused more trouble. But the chief problem centred in the convention. At Lyons, on the 13th of March, Napoleon had issued an edict dissolving the existing chambers and ordering the convocation of a national mass meeting, or Champ de Mai, for the purpose of modifying the constitution of the Napoleonic empire. That work was carried out by Benjamin Constant in concert with the emperor. The resulting Acte additionel (supplementary to the constitutions 26th of June) was set out for the future frontier. His peers and a chamber of representatives elected by the "electoral colleges" of the empire, which comprised scarcely one hundredth part of the citizens of France. As Châteaubriand remarked, in reference to Louis XVIII.'s constitutional charter, the new constitution—La Benjamine, it was dubbed—was merely a slightly improved charter. Its incompleteness displeased the liberals; only 1,532,527 votes were given for it in the plebiscite, a total less than half of those of the plebiscites of the Consulate.

Not all the gorgeous display of the Champ de Mai (held on the 1st of June) could hide the discontent at the meagre fulfilment of the promises. Napoleon ended his speech with the words: "My will is that of the people: my rights are its rights." The words rang hollow, as was seen when, on the 3rd of June, the deputies chose, as president of their chamber, Lanjuinais, the staunch liberal who had so often opposed the emperor. The latter was with difficulty dissuaded from quashing the election. Other causes of offence arose, and Napoleon in his last communication to them warned them not to imitate the Greeks of the later Empire, who engaged in subtle discussions when the ram was battering at their gates. On the morrow (1st of June) he set out for the northern frontier. His spirits rose at the prospect of rejoining the army. At St Helena he told Gourgaud that he intended in 1815 to dissolve the chambers as soon as he had won a great victory.

In point of fact, the sword alone could decide his fate, both in internal and international affairs. Neither France nor Europe took seriously his rather vague declaration of his contentment with the rôle of constitutional monarch of the France of 1815. No one believed that he would be content with the "ancient limits." So often had he declared that the Rhine and Holland were necessary to France that every one looked on his present assertions as a mere device to gain time. So far back as the 13th of March, six days before he reached Paris, the powers at Vienna declared him an outlaw; and four days later Great Britain, Russia, Austria and Prussia bound themselves to put 150,000 men into the field to end his rule. Their recollection of his conduct during the congress of Châtillon was the determining fact at this crisis; his professions at Lyons or Paris had not the slightest effect; his efforts to detach Austria from the coalition, as also the feelers put forth tentatively by Fouché at Vienna, were fruitless. The coalitions, once so brittle as to break at the first strain, had now been hammered into solidity by his blows. If ever a man was condemned by his past, Napoleon was so in 1815.

On arriving at Paris three days after Waterloo he still clung to the hope of concerted national resistance; but the temper of the chambers and of the public generally forbade any such attempt. The autocrat and Lucien Bonaparte were almost alone in believing that by dissolving the chambers and declaring himself dictator, he could save France from the armies of the powers now converging on Paris. Even Davout, minister of war, advised him that the destinies of France rested solely with
the chambers. That was true. The career of Napoleon, which had lured France far away from the principles of 1789, now brought her back to that starting-point; just as, in the physical sphere, his campaigns from 1796-1814 had at first enormously swollen her bulk and then subjected her to a shrinkage still more potenti-
ous. Clearly it was time to safeguard what remained; and that could best be done under Talleyrand's shield of legiti-
macy. Napoleon himself at last divined that truth. When Lucien pressed him to "dare," he replied "Alas, I have dared only too much already." On the 22d of June he abdicated in favour of his son, well knowing that that was a mere form, as his son was in Austria. On the 25th of June he received from Napoleon III. the suggestion of the appointment of him to an advisory government, an intimation that he must leave Paris. He retired to Malmaison, the home of Josephine, where she had died shortly after his first abdication. On the 29th of June the near approach of the Prussians (who had orders to seize him, dead or alive), caused him to retire westwards towards Rochefort, whence he hoped to reach the United States. But the passports which the provisional government asked from Wellington were refused, and as the country was declaring for the Bourbons, his position soon became precarious. On his arrival at Rochefort (3rd July), and in the face of cruisers cut off his hope of escape. On the 9th of July he received a note from the provisional government at Paris to leave France within twenty-four hours. After wavering between various plans, he decided on the 13th of July to cast himself on the generosity of the British govern-
ment, and dictated a letter to the prince regent in which he com-
pared himself to Themistocles seating himself at the hearth of his enemy. His counsellor, Las Cases, strongly urged that step and made overtures to Captain Maitland of H.M.S. "Bellerophon." That officer, however, was on his guard, and, while offering to convey the emperor to England declined to pledge himself in any way as to his reception. It was on this understanding (which Las Cases afterwards misrepresented) that Napoleon on the 15th of July mounted the deck of the "Bellerophon." No other course remained. Further delay after the 15th of July would have led to his capture by the royalists, who were now every-
where in the ascendant. In all but name he was a prisoner of Great Britain, and he knew it.

The rest of the story must be told very briefly. The British government, on hearing of his arrival at Plymouth, decided to send him to St Helena, the formation of that island being such as to give him the freedom of the world. The British government had no idea of sacrificing any of its ships to the adventure of 1815, with none of the perils for the world at large which the tsar's choice, Elba, had involved. To St Helena, then, he pro-
ceeded on board of H.M.S. "Northumberland." The title of emperor, which he enjoyed at Elba, had been forfeited by the adventure of 1815, and he was now treated officially as a general. Nevertheless, during his last voyage he enjoyed excellent health even in the tropics, and seemed less depressed than his associates, Bertrand, Gourgaud, Las Cases and Montholon. He landed at St Helena on the 17th of October. He resided first at the "Briars" with the Balcombes, and thereafter at Longwood, when that residence was ready for him. The first governor of the island, General Wilks, was soon superseded, it being judged that he was too amenable to influence from Napoleon; his successor was Sir Hudson Lowe.

Napoleon's chief relaxations at St Helena were the dictation of his memoirs to Montholon, and the compilation of monographs on military and political topics. The memoirs (which may be accepted as mainly Napoleon's, though Montholon undoubtedly touched them up) range over most of the events of his life from Toulon to Marengo. The military and historical works comprise pièces of the wars of Julius Caesar, Turenne and Frederick the Great. He began other accounts of the campaigns of his own age; but they are marred by his having had few trustworthy documents and statistics at hand. On a lower level as regards credibility stands the Mémorial de Sainte- Helène, compiled by Las Cases from Napoleon's conversations with the obvious aim of creating a Napoleonie legend. Never-
theless the Mémorial is of great interest—e.g. the passage (iv. 431-454) in which Napoleon reflects on the ruin wrought to his cause by the war in Spain, or that (iii. 190) dealing with the instructions he gave in the joint commission "in marrying an Austrian princess." There I stepped on to an abyss covered with flowers"; or that again (iii. 79) where he represented himself as the natural arbiter in the immense struggle of the present against the past, and asserted that in ten years' time Europe would be either Cossack or republican. It is noteworthy that in Gourgaud's Journal de Ste. Hélène there are very few reflections of this kind and the emperor appears in a guise far more life-like. But in the works edited by Montholon and Las Cases, where the political aim constantly obtrudes itself, the Napoleon reappears again and again to embroider on the theme that he had always been the true champion of orderly freedom. This was the mot d'ordre at Longwood to his companions, who set themselves deliberately to propagate it. The folly of the monarchs of the Holy Alliance in Europe gained for the writings of Montholon and Las Cases (that of Gourgaud was not published till 1899) a ready reception, with the result that Napoleon reappeared in the literature of the ensuing decades wielding an influence scarcely less potent than that of the grey-coated figure into whose arms France flung herself on his return from Elba. All that he had done in his last years was to have himself repeatedly declared insane, to have himself drunk poisoned wine, to have apparently procured his own execution—his tyrannical, his shocking waste of human life, his deliberate persistence in war when France and Europe called for a reasonable and last-

ing peace—all this was forgotten; and the great warrior, who died of cancer on the 4th of May 1821, was thereafter looked upon as a Prometheus condemned to a lingering agony for his devotion to the cause of humanity. It was this perversity of fact which rendered possible the career of Napoleon III. But it is not necessary in an introduction such as this to dwell on the personal qualities of "the Pineapple," the man, to show that the "Histoire de la Révolution françoise et de l'Empire" (many editions in French and English); *P. NAPOLEON II.—NAPOLEON III.

III. The Consulat and Empire (December 1799—April 1814). (a) The family of Napoleon and his court. George B. Miller, Bonaparte and his Times (London, 1891; New York, 1898); E. Boller, Le Rambaud, the *Lettres B. 1810 (Paris, 1893). *Napoléon et les femmes (3 vols., Paris, 1893—1895), Napoleon and his family (Paris, 1867); *Lettres de Napoléon à Joséphine (Paris, 1895); Napoléon et ses enfants politiques (3 vols., Paris, 1895); *A. Lévy, Napoléon intime (Paris, 1893); Baron C. F. de Ménestral, Napoléon et Marie Louise (3 vols., Paris, 1895); Baron A. du Casse, Les Rots, frères de Napoléon (Paris, 1891—1893); W. Le Bas, Memoirs of the Tuileries, as the official historians state. He was the third son of Louis Bonaparte (see Bonaparte), brother of Napoleon I., and from 1806 to 1810 king of Holland, and of Hortense de Beauharnais, daughter of General (de) Beauharnais and Josephine Tascher de la Pagerie, afterwards the empress Josephine; hence he was at the same time the nephew and the adopted grandson of the great emperor. Of the two other sons of Louis Bonaparte and Hortense, the elder, Napoleon Charles (1802—1807), died of typhoid at The Hague; the second, Napoleon Louis (1804—1841), was interred at the Monastery of St. Magno, leaving no children. Doubts have been cast on the legitimacy of Louis Napoleon; for the discord between Louis Bonaparte, who was ill, restless and suspicious, and his pretty and capricious wife was so violent and open as to justify all conjectures. But definite evidence, in the shape of letters and references in memoirs, enables us to deny that the Dutch Admiral Verhewel was the father of Louis Napoleon, and there is strong evidence of resemblance in character between King Louis and his third son. He early gave signs of a grave and dreamy character. Many stories have been told about his childhood, for example the remark which Napoleon I. is said to have made about him: "Who knows whether the future of my race may not lie in this child?" It is certain that, after the abdication and exile of Louis, Hortense lived in France with her two children, in close relation with the imperial court. During the Hundred Days, Louis Napoleon, then a child of seven, witnessed the presentation of the eagles to 50,000 soldiers; but a few weeks later, before his departure for Rochefort, the defeated Napoleon embraced him for the last time, and his mother had to receive Frederick William III. of Prussia and his two sons at the château of Saint-Leu; here the victor and the defeated spread the feast of Sedan met for the first time, and probably played together.

After Waterloo, Hortense, suspected by the Bourbons of having arranged the return from Elba, had to go into exile. The exiled Louis, who now lived at Florence, had compelled her by a scandalous law-suit to give up to him the elder of her two children. With her remaining child she wandered, under the name of duchesse de Saint-Just, from Geneva to Aix, Carlsruhe and Augsburg. In 1817 she bought the castle of Arenenburg, in the canton of Turgau, on a wooded hill looking over the Lake of Constance. Hortense supervised her son’s education in person, and tried to form his character. His tutor was Philippe Le Bas, son of the well-known member of the Convention and founder of Robespierre, an able man, imbued with the ideas of the Revolution, while Vieillard, who instructed him in the rudiments, was a democratic imperialist also inspired with the ideal of nationalism. The young prince also studied at the gymnasium at Augsburg, where his love of work and his mental qualities were gradually revealed; he was less successful in mathematics than in literary subjects, and he became an adept at physical exercises, such as fencing, riding and swimming. It was at this time that he acquired the slight German accent which he never lost. Those who educated him never lost sight of the future; but it...
was above all his mother, fully confident of the future destiny of the Bonapartes, who impressed on him the idea that he would be king, or at any rate, that he would accomplish some great works. "With your name," she said, "you will always count for something, Romans, in the old world of Europe or in the new." If we may believe Mme Cornu, he already at the age of twelve had dreams of empire.

In 1823 he accompanied his mother to Italy, visiting his father at Florence, and his grandmother Letitia at Rome, and dreaming with Le Bas on the banks of the Rubicon. He returned to Arenenberg to complete his military education under Colonel Armand and Colonel Dufour, who instructed him in artillery and military engineering. At the age of twenty he was a "Liberal," an enemy of the Bourbons and of the treaties of 1815; but he was dominated by the cult of the emperor, and for him the liberal ideal was confused with the Napoleonic.

The July revolution of 1830, of which he heard in Italy, roused all his young hopes. He could not return to France, for the law of 1816 banishing all his family had not been abrogated. But the liberal revolution knew no frontiers. Italy shared in the agitation. He had already met some of the conspirators at Arenenberg, and it is practically established that he now joined the associations of the Carbonari. Following the advice of his friend the Count Arese and of Menotti, he and his brother were among the revolutionaries who in February 1831 attempted a rising in Romagna and the expulsion of the partisans of Rome. They distinguished themselves at Civita Castellana, a little town which they took; but the Austrians arrived in force, and during the retreat Napoleon Louis, the elder son, took cold, followed by measles, of which he died. Hertoure hurried to the spot and took steps which enabled her to save her second son from the Austrian prisons. He escaped into France, where his mother, on the plea of his illness, obtained permission from Louis Philippe for him to stay in Paris. But he intrigued with the republicans, and Casimir-Périer insisted on the departure of all the non-commissioned officers. In May 1831, they went to London, and afterwards returned to Arenenberg.

For a time he thought of responding to the appeal of some of the Polish revolutionaries, but Warsaw succumbed (September 1831) before he could set out. Moreover the plans of this young and visionary enfant du siècle were becoming more definite. The duke of Reichstadt died in 1832. His uncle, Joseph, and his father, Louis, showing no desire to claim the inheritance promised them by the constitution of the year XII., Louis Napoleon henceforth considered himself as the accredited representative of the family. Those who ever knew him noticed a transformation in his character; he tried to hide his natural sensibility under an impassive exterior, and concealed his political ambitions. He became indeed "doux entête" (gentle but obstinate) as his mother called him, persistent in his ideas and always ready to return to them, though at the same time yielding and drawing back before the force of circumstances. He endeavoured to define his ideas, and in 1833 published his Réveries politiques, suivies d'un projet de constitution, and Considerations politiques et militaires sur la Suisse; in 1836, as a captain, in the Swiss service, he published a Manuel d'artillerie, in order to win popularity with the French army.

A phrase of Montesquieu, placed at the head of this work, sums up the views of the young theorist: "The people, possessing the supreme power, should do for itself all that it is able to do; what it cannot do well, it must do through its elected representatives." The supreme authority entrusted to the elect of the people was always his essential idea. But the problem was how to realize it. Louis Napoleon could feel vaguely the state of public opinion in France, the longing for glory from which it suffered, and the deep-rooted discord between the nation and the king. Louis Philippe, who though sprung from the national revolution against the treaties of 1815, was yet a partisan of peace at any price. Both Châteaubriand and Carrel had praised the prince's first writings. Bonapartists and republicans found common ground in the glorious tradition sung by Béranger. A military conspiracy like those of Berton or the sergeants of La Rochele, seemed feasible to Napoleon. A new friend of his, Fialin, formerly a non-commissioned officer and a journalist, an energetic and astute man and a born conspirator, spurred him on to action.

With the aid of Fialin and Eléonore Gordon, a singer, who is supposed to have been his mistress, and with the co-operation of certain officers, such as Colonel Vaudrey, an old soldier of the Empire, commanding the 4th regiment of artillery, and Lieutenant Laity, he tried to bring about a revolt of the garrison of Strassburg (October 30, 1836). The conspiracy was a failure, and Louis Philippe, fearing lest he might make the pretender popular either by the glory of an acquittal or the aureole of martyrdom, had him taken to Lorient and put on board a ship bound for America, while his accomplices were brought before the court of assizes and acquitted (February 1837). During his trial he was set free in New York in April; by the aid of a false passport he returned to Switzerland in August, in time to see his mother before her death on the 3rd of October 1837.

At any other time this attempt would have covered its author with ridicule. Such, at least, was the opinion of the whole of the family of Bonaparte. But his confidence was unshaken, and in the woods of Arenenberg the romantic-minded friends who remained faithful to him still honoured him as emperor. And now the government of Louis Philippe, by an evil inspiration, began to act in such a way as to make him popular. In 1838 the Court of Peers to five years' imprisonment for a pamphlet which he had written to justify the Strassburg affair; then it demanded the expulsion of the prince from Switzerland, and when the Swiss government resisted, threatened war. Having allowed the July monarch to commit himself, Louis Napoleon at the last moment left Switzerland voluntarily. All this served to encourage the mystical adventurer. In London, where he had taken up his abode, together with Arese, Fialin (says Persigny), Doctor Conneau and Vaudrey, he was at first well received in society, but his fondly entertained hopes of Napoleon I., in May 1839, he went to London, and afterwards returned to Arenenberg.

To cover the expenses of his various enterprises, and the large number of followers ("sacrificed to the cause") living on his bounty, he published his book: Des Idées napoléoniennes, a curious mixture of Bonapartism, socialism and pacifism, which he represented as the tradition of the First Empire. He also followed attentively the fluctuations of French opinion.

Since 1838 the Napoleonic propaganda had made enormous progress. Not only did certain newspapers, such as the Capitole and the Journal du Commerce, and clubs, such as the Culottes de peau carry it zealously; but the diplomatic humiliation of France at the affair of Magenta (May 4, 1849.) in 1840, with the outburst of patriotism which accompanied it, followed by the concessions made by the government to public opinion, such as, for example, the bringing back of the ashes of Napoleon I., all helped to revive revolutionary and Napoleonic memories.

The pretender, again thinking that the moment had come, formed a fresh conspiracy. With a little band of fifty-six followers he attempted to provoke a rising of the 42nd regiment of the line at Boulogne, hoping afterwards to draw General Magnan to Lille and march upon Paris. The attempt was made on the 6th of August 1840, but failed; he saw several of his supporters fall on the shore of Boulogne, and was arrested together with Montholon, Persigny and Conneau. This time he was brought before the Court of Peers with his accomplices; he entrusted his defence to Berryer and Marie, and took advantage of his trial to appeal to the supremacy of the people, which he alleged,
had been disregarded, even after 1830. He was condemned to detention for life in a fortress, his friend Aladenize being deported, and Montholon, Parquin, Lombard and Fialan being each condemned to detention without any of the crimes for which they had been condemned in 1814. The 15th of December, the very day that Napoleon's ashes were deposited at the Invalides, he was taken to the fortress of Ham. The country seemed to forget him; Lamartine alone foretold that the honours paid to Napoleon I. would shed lustre on his nephew. His prison at Ham was unhealthy, and physical inactivity was painful to the prince, but on the whole the régime imposed upon him was mild, and his captivity was lightened by Alexandrine Vergeot, "la belle saboteuse," or Mlle Badinquet (he was later nicknamed Badinguet by the republicans). His more intellectual friends, such as Mme Comn, also came to visit him and assisted him in his studies. He corresponded with Louis-Georges Sand and Proudhon, and collaborated with the journalists of the Left, Degeorge, Penauger and Souplet. For six years he worked very hard "at this University of Ham," as he said. We wrote some Fragments historiques, studies on the sugar-question, and on the recruiting of the army, and finally, in the Progrès du Peu-de-Calais, a series of articles on social questions which were later embodied in his Extinction du paupérisme (1844). But, resigned to this idea under the influence of his own conscience, he more closely the body is confined, he wrote, "the more the mind is disposed to indulge in flights of imagination, and to consider the possibility of executing projects of which a more active existence would never perhaps have left it the leisure to think."

On the 25th of May 1846 he escaped to London, giving as the reason for his decision the dangerous illness of his father. On the 27th of July his father died, before he could accomplish a journey undertaken in spite of the refusal of a passport by the representative of Tuscany.

He was again well received in London, and he "made up for his absence during the last years by multiplying his various pursuits of pleasure." The duke of Brunswick and the banker Ferrère interested themselves in his future, and gave him money, as did also Miss Howard, whom he later made comtesse de Beauregard, after restoring to her several millions. He was still full of plans and new ideas, always with the same end in view; and for this reason, in spite of his various enterprises, which were sometimes ridiculous, sometimes unpleasant in their consequences, and his unscrupulousness as to the means and ends he employed, he always had a kind of greatness. He always retained his faith in his star, his "meaning," his "plan," his work, and his "cats and dogs." He started to Taglioni the dancer; and again to Lady Douglas, who was counselling resignation, he replied, "Though fortune has twice betrayed me, yet my destiny will none the less surely be fulfilled. I wait." He was not to wait much longer.

As he well perceived, the popularity of his name, the vague "legend" of a Napoleon who was at once a democrat, a soldier and a revolutionary hero, was his only strength. But by his abortive efforts he had not yet been able to win over this immense force of tradition and turn it to his own purposes. The events which occurred from 1848 to 1852 enabled him to do so. He behaved with extraordinary skill, displaying in the heat of the conflict the all the abilities of an experienced conspirator, knowing, "like the snail, how to draw in his horns as soon as he met with an obstacle" (Thiers), but supple, resourceful and unscrupulous as to the choice of men and means in his obstinate struggle for power.

At the first symptoms of revolutionary disturbance he returned to France; on the 25th of February he offered his services to the Provisional Government, but, on being requested by it to depart at once, he turned himself to this course. But Persigny, Mocquard and all his friends devoted themselves to an energetic propaganda in the press, by pictures and by songs. After the 25th of May he had already shaken the strength of the young republic, he was elected in June 1848 by four departments, Seine, Yonne, Charente-Inférieure and Corsica. In spite of the opposition of the executive committee, the Assembly ratified his election. But he had learnt to wait. He sent in his resignation from London, merely hazard-
NAPOLEON III.

In fact, while trying to compass the destruction of the republican movement of the Left, he was taking careful steps to gain over all classes. "Prince, altesse, monsieur, monseigneur, citoyen" (he was called by all these names indifferently at the Elysée), he appeared as the candidate of the most incompatible interests, flattering the clergy by his compliments and formal visits, distributing cigars and sausages to the soldiers, promising the prosperous bourgeois "order in the street" and business, while repudiated as the "father of the workers," and on the hearts of the peasants. At his side were his accomplices, men ready for anything, whose only hopes were bound up with his fortunes, such as Morny and Rouher; his paid publicists, such as Romieu the originator of the "red spectre"; his cudgel-bearers, the "Ratapoll" immortalized by Daumier, who terrorized the republicans. From the Elysée by means of the mass of officials whom they had at their command, the conspirators extended their activities throughout the whole country.

He next entered upon that struggle with the Assembly, now discredited, which was to reveal to all the necessity for a change, and a change in his favour. In January 1851 he deprived Changarnier of his command of the garrison of Paris. "The Empire has come," said Thiers. The pretender would have preferred, however, that it should be brought about legally, the first step being his re-election in 1852. The Constitution forbade his re-election; therefore the Constitution must be revised. On the 19th of July the Assembly threw out the proposal for revision, thus signing its own death-warrant, and the coup d'état was resolved upon. He prepared for it systematically. The cabinet of the 26th of October 1851 gave the ministry for war to his creature Saint-Arnaud. All the conspirators were at their posts—Maupas at the prefecture of police, Magnan at the head of the troops in Paris. At the Elysée, Morny, adulterine son of Hortense, a hero of the Bourse and successful gambler, supported his half-brother by his energy and counsels. The ministry proposed to arrogate the electoral law of 1850, and restore universal suffrage; the Assembly by refusing made itself still more unpopular. By proposing to allow the president of the Assembly to call in armed force, the questioners revealed the Assembly's plans for defence, and gave the Elysée a weapon against it ("donnez-hure contre elle à l'Elysée"). The proposition was rejected (November 17), but Louis-Napoleon saw that it was time to act. On the 2nd of December he carried out his coup d'état.

But affairs developed in a way which disappointed him. By dismissing the Assembly, by offering the people "a strong government," and re-establishing "a France regenerated by the Revolution of '89 and organized by the emperor," he had hoped for universal applause. But both in Paris and the provinces he met with the resistance of the Republicans, who had re-organized in view of the elections of 1852. He struck at them by mixed commissions, deportations and the whole range of police measures. The décrets-lois of the year 1852 enabled him to prepare the way for the new institutions. On the 1st of December 1852 he became in name what he was already in deed, and was proclaimed Emperor of the French. He was then 44 years old. "The impassibility of his face and his lifeless glance" showed observers that he was still the obstinate dreamer that he had been in youth, absorbed in his Idea. His unshaken conviction of his mission made him conscious of the responsibility which rested on him, but hid from him the hopeless defect in the coup d'état. On carried out his conviction, he had still only a timid will, working through petty expedients; but here again his confidence in the future made him bold. In a people politically decimated and wearied, he was able to develop freely all the Napoleonic ideals. Rarely has a man been able to carry out his system so completely, though perhaps in these first years he had to take more disciplinary measures than he had intended against the Reds, and granted more favours than was fitting to the Catholics, his allies in December 1848 and December 1852.

The aim which the emperor had in view was, by a concentration of power which should make him "the beneficent motive force of the whole social order" (constitution of the 14th of January 1852; administrative centralization; subordination of the elected assemblies; control of the machinery of universal suffrage) to unite all classes in "one great national party" attached to the dynasty. His success, from 1852 to 1856, was almost complete. The nation was submissive, and a few scattered plots alone showed that republican ideas persisted among the masses. As "restorer of the overthrown altars," he won over the "men of God" among them Morny, chancellor of the "Uniter," and allowed them to get the University into their hands. By the aid of former Orleanists, such as Billault, Fould and Morny, and Saint-Simonians such as Talabot and the Pericres, he satisfied the industrial classes, extended credit, developed means of communication, and gave a strong impetus to the business of the nation. By various measures, such as subsidies, charitable gifts and foundations, he endeavoured to show that "the idea of improving the lot of those who suffer and struggle against the difficulties of life was constantly present in his mind." His was the government of cheap bread, great public works and holdings. The imperial court was brilliant. The emperor, having failed to obtain the hand of a Vasa or Hohenzollern, married, on the 29th of January 1853, Eugénie de Montijo, comtesse de Téba, aged twenty-six and at the height of her beauty.

France was "satisfied" in the midst of order, prosperity and peace. But a glorious peace was required; it must not be said that "France is bored," as Lamartine had said when the Napoleonic legend began to spread. The foreign policy of the Catholic party, by the question of the Holy Places and the Crimean War (1853-1856), gave him the opportunity of winning the glory which he desired, and the British alliance enabled him to take advantage of it. In the spring of 1855, as a definite success was still slow to come, he contemplated for a time the lead of the expedition in person, but his advisers dissuaded him from doing so, for fear of a revolution. In January 1856 he had the good fortune to win a diplomatic triumph over the new tsar, Alexander II. It was at Paris (February 25-March 30) that the conditions of peace were settled.

The emperor was now at the height of his power. He appeared to the people as the avenger of 1840 and 1848, and the birth to him of a son, Eugène Louis Jean Joseph, on the 16th of March 1856, assured the future of the dynasty. It was then that, strong in the esteem and admiration with which he was surrounded, and foreseeing a future full of hope for France, he dreamed of realizing the Napoleonic ideal in its entirety. This disciple of the German philologists, this crowned Carbonaro, the friend of the archaeologists and historians who were to help him to write the Histoire de César, dreamed of developing the policy of nationalism, and of organizing the peoples of all countries to enfranchise themselves.

From 1851 to 1856 he devoted his attention to the Rumanian nationality, and supported Alexander Cuza. But it was above all the deliverance of Italy which haunted his imagination. By this enterprise, which his whole tradition imposed upon him, he reckoned to flatten the amour-propre of his subjects, and rally to him the liberals and even the republicans, with their passion for propaganda. But the Catholics feared that the Italian national movement, when once started, would entail the downfall of the papacy; and in opposition to the emperor's Italian advisers, Arise and Prince Jerome Napoleon, they pitted the empress, who was frivolous and capricious, but an ardent Catholic. Napoleon III was under his wife's influence, and could not openly combat her resistance. It was the Italian Orsini who, by attempting to assassinate him as a traitor to the Italian nation on the 14th of January 1858, gave him an opportunity to impose his will indirectly by convincing his wife that in the interests of his own security he must "do something for Italy." Events followed each other in quick succession, and now began the difficulties in which the Empire was to be irrevocably involved. Not only did the Italian enterprise lead to strained relations with Britain, the alliance with whom had been the emperor's chief support in Europe, and compromised its credit; but the claims of parties and classes again began to be heard at home.
The Italian war aroused the opposition of the Catholics. After Magenta (June 4, 1859), it was the fears of the Catholics and the messages of the empress which, even more than the threats of Prussia, checked him in his triumph and forced him into the armistice of Villafranca (July 11, 1859). But the spread of the Italian revolution and the movement for annexation forced him again to intervene. He appealed to the Left against the Catholics, by the amnesty of the 17th of April 1859. His consent to the annexation of the Central Italian states, in exchange for Savoy and Nice (Treaty of Turin, March 24, 1860) exposed the emperor to the charge of selling out his uncle's slave he had practically been since 1848. At the same time, the free-trade treaty with Great Britain (January 5, 1860) aroused a movement against him among the industrial bourgeoisie.

Thus at the end of 1866, the very time when he had hoped that his personal policy was to rally round him once for all the whole of France, and assure the future of his dynasty, he saw, on the contrary, that it was turning against him his strongest supporters. He became alarmed at the responsibilities which he saw would fall upon him, and imagined that by an appearance of resilience he could be shifted on to others the responsibility for any errors he might commit. Hence the decrees of the 24th of November 1866 (right of address, ministers without portfolio) and the letter of the 14th of November 1861 (financial reform). From this time onward, in face of a growing opposition, anxiety for the future of his régime occupied the first place in the emperor's thoughts, and paralysed his initiative.

Placed between his Italian counsellors and the empress, he was ever of two minds. His plans for remodelling Europe had a certain grandeur and grandeur; but internal difficulties forced him into endless manoeuvre and temporization, which led to his ruin. Thus in October 1862, after Garibaldis attack on Rome, the clerical côte of the Tulleries triumphed. But the replacing of M. Thouvenel by M. Drouin de Lhuys did not satisfy the more violent Catholics, who in May 1863 joined the united opposition. Thirty-five opponents of the government were appointed, Republicans, Orleanists, Legitimists or Catholics. The emperor dismissed Persigny, and summoned moderate reformers such as Duruy and Béhic. But he was still possessed with the idea of settling his throne on a firm basis, and uniting all France in some glorious enterprise which should appeal to all parties equally, and "group them under the mantle of imperial glory." From January to June 1863 he sought this appearance of glory in Poland, but only succeeded in embroiling himself with Russia. Then, after Syria and China, it was the "great inspiration of his reign," the establishment of a Catholic and Latin empire in Mexico, enthusiasm for which he tried in vain from 1863 to 1867 to communicate to the French.

But while the strength of France was wasting away at Puebla or Mexico, Bismarck was founding German unity. In August 1864 the emperor, held back by French public opinion, which was favourable to Prussia, and by his idea of nationality, allowed Prussia and Austria to seize the duchies of Schleswig and Holstein. After his failure in Poland and Mexico and in face of the alarming presence of Germany, only one alliance remained possible for Napoleon III., namely with Italy. He obtained this by the convention of the 15th of September 1863 (involving the withdrawal of the French troops from Rome). But the Catholic party redoubled its violence, and the pope sent out the encyclical Quanta Curta and the Syllabus, especially directed against France. In vain the emperor sought in German affairs a definitive solution of the Italian question which should appeal to all parties equally, and the Franco-Prussian alliance of April 1866; and hoped to become, to his greater glory, arbiter in the tremendous conflict which was about to begin. But suddenly, while he was trying to rouse public opinion against the treaties of 1815, the news of the battle of Königgrätz came as a bolt from the blue to ruin his hopes. French interests called for an immediate intervention. But the emperor was ill, weary and aged by the life of pleasure which he led side by side with his life of work (as is proved by the letters to M'dlle Bellanger); he was suffering from a first attack of his bladder complaint. He knew, moreover, the insufficiency of his troops. After days of terrible suffering, he resigned himself to the annexation by Prussia of northern Germany.

"Now," said M Drouin de Lhuys, "we have nothing left but to weep."

Henceforth the brilliant dream, a moment realized, the realization of which he had thought durable, was at an end. The Empire had still an uncertain and troubled brilliancy at the Exhibition of 1867. But Berezowski's pistol shot, which accentuated the estrangement from the tsar, and the news of the death of a great friend at Quetetaró, cast a gloom over the latter fêtes. In the interior the industrial and socialist movement, born of the new industrial development, added fresh strength to the Republican and Liberal opposition. The moderate Imperialists felt that some concessions must be made to public opinion. In opposition to the absolutist "vice-emperor" Rouher, whose influence over Napoleon had become stronger and stronger since the death of Morny, Émile Ollivier grouped the Third Party. Anxious, changeable and distraught, the emperor made the Liberal concessions of the 10th of January 1867 (right of interpretation), and then, when Ollivier thought that his triumph was complete, exhorted him to "grant the promised laws concerning the press and public meetings till 1868. The opposition gave him no credit for these tardy concessions. There was an epidemic of violent attacks on the emperor; the publication of the Lanterne and the Baudin trial, conducted by Gambetta, were so many death-blows to the régime. The Internationale developed its propaganda. The election of May 1869 resulted in 4,438,000 votes for the government, and 3,355,000 for the opposition, who also gained 90 representatives.

The emperor, disappointed and hesitating, was slow to return to a parliamentary régime. It was not till December that he instructed Ollivier to "form a homogeneous cabinet representing the majority of the Corps Législatif" (ministry of the 2nd of January 1870). But, embarrassed between the Arcadiens, the partisans of the absolute régime, and the Republicans, Ollivier was unable to guide the Empire in a constitutional course. At the Tulleries Rouher's counsel still triumphed. It was he who inspired the ill and wearied emperor, now without confidence or energy, with the idea of resorting to the plebiscite.

To do away with the risk of a Revolution," "to place order and liberty upon a firm footing," "to ensure the transmission of the crown to his son," Napoleon III. again sought the approbation of the nation. He obtained it with brilliant success, for the last time, by 7,438,786 votes against 1,571,939, and his work now seemed to be consolidated.

A few weeks later it crumbled irrevocably. Since 1866 he had been pursuing an elusive appearance of glory. Since 1866 France was calling for "revenge." He felt that he could only rally the people to him by procuring them the satisfaction of their national pride. Hence the mishaps and imprudences of which Bismarck made such an insulting use. Hence the negotiations of Nikolsburg, the "note d'autochair" (innkeeper's bill) claiming the left bank of the Rhine, which was so scornfully rejected; hence the plan for the invasion of Belgium (August 1866), the Luxembourg affair (March 1867), from which M. de Moustier's diplomacy effected such a skilful retreat; hence the final folly which led this government into the war with Prussia (July 1870).

The war was from the first doomed to disaster. It might perhaps have been averted if France had had any allies. But Austria, a possible ally, could only join France if satisfied as regards Italy; and since Garibaldi had threatened Rome (Mentana, 1867), Napoleon III., yielding to the anger of the Catholics, had again sent troops to Rome. Negotiations had taken place in 1865. The emperor, bound by the Catholics, had refused to withdraw his troops. It was as a distant but inevitable consequence of his agreement of December 1848 with the Catholic party that in 1870 the emperor found himself without an ally.

His energy was now completely exhausted. Successive attacks of stone in the bladder had ruined his physique; while his hesitation and timidity increased with age. The influence of the empress over him became supreme. On leaving the
NAPOLeON—NAPOLEONIC CAMPAIGNS

council in which the war was decided upon the emperor threw himself, weeping, into the arms of Princess Mathilde. The empress was delighted at this war, which she thought would secure her son's inheritance.

On the 28th of July father and son set out for the army. They found it in a state of utter disorder, and added to the difficulties by their presence. The emperor was suffering from stone and could hardly sit his horse. After the defeat of Reichshoffen, when Bazaine was thrown back upon Metz, he wished to retreat upon Paris. But the empress represented to him that if he retreated it would be the end of a revolution. An advance was decided upon which ended at Sedan. On the 2nd of September, Napoleon III. surrendered with 80,000 men, and on the 4th of September the Empire fell. He was taken as a prisoner to the castle of Wilhelmshöhe, near Cassel, where he stayed till the end of the war. After the intrigues of Bazaine, of Bismarck, and of the empress, the Germans having held negotiations with the Republic, he was de facto deposed. On the 1st of March the assembly of Bordeaux confirmed this deposition, and declared him " responsible for the ruin, invasion and dismemberment of the Empire."

Restored to liberty, he retired with his wife and son to Chislehurst in England. Unwilling even now to despair of the future, he still sought to rally his friends for a fresh propaganda. He had at his service publicists such as Cassagnac, J. Amigues and Hugelmann. He himself also wrote unsigned pamphlets justifying the campaign of 1870. It may be noted that, true to his ideas, he did not attempt to throw upon others the responsibility which he had always claimed for himself. He dreamed of his son's future. But he no longer occupied himself with any definite plans. He interested himself in pensions for workmen and in remunerative stools. At the end of 1872 his disease became more acute, and a surgical operation became necessary. He died on the 4th of January 1873, leaving his son in the charge of the empress and of Rouher. The young prince was educated at Woolwich from 1872 to 1875, and in 1875 took part in the English expedition against the Zulus in South Africa, in which he was killed. By his death vanished all hope of renewing the extraordinary fortune which for twenty years placed the descendant of the great emperor, the Carbonaro and dreamer, at once obstinate and hesitating, on the throne of France.

BIBLIOGRAPHY.—The Générals de Napoléon III have been published in four volumes (1854—1857) and his Histoire de Jules César in two volumes (1865—1886); this latter work has been translated into English by T. Wright. Another preliminary book, Napoléon III. und sein Hof (1891—1894); H. Thiers, Napoléon III. avant l'Empire (1895); Sylvain-Blot, Napoléon III. (1899); Giraudou, Napoléon III. intime (1898); Sir W. A. Fraser, Napoléon III. (London, 1895); A. H. du Guesclin, Le Roi des Napoléon (1897). A. Duban, Les trois coups d'état de Louis Napoléon Bonaparte (1906); Louis Napoléon Bonaparte et la révolution de 1848 (1908); and F. A. Simpson, The Rise of Louis Napoléon (1899). General works which may be consulted are Taxile-Delord, Histoire du second Empire (1868—1875); P. de La Gorce, Histoire du second Empire (1894—1905); A. Thomas, Le Second Empire (1907); and E. Ollivier, L'Empire libéral (14 vols., 1890—1899).

NAPOLéON, a round game of cards (known colloquially as "Nap"). Any number may play. The cards rank as at whist, and five are dealt to each player. The deal being completed, the player to the dealer's left looks at his hand and declares how many tricks he would play to win against all the rest, the usual rule being that more than one must be declared; in default of declaring he says "I pass," and the next player has a similar option of either declaring to make more tricks or passing, and so on around. A declaration of five tricks is called "going Napoleon." The declaration is made to the banker to make them, and the others, but without consultation, to prevent him. The declaring hand has the first lead, and the first card he leads makes the trump suit. The players, in rotation, must follow suit if able. If the declarer succeeds in making at least the number of tricks he stood for he wins whatever stakes are played for; if not he loses. If the player declaring Nap wins he receives double stakes all round; if he loses he only pays single stakes all round. Sometimes, however, a player is allowed to go "Wellington" over "Nap," and even "Blucher" over "Wellington." In these cases the caller of "Wellington" wins four times the stake and loses twice the stake, the caller of "Blucher" receives six times and loses three times the stake. Sometimes a player is allowed to declare mièdre, i.e. no tricks. This ranks, as a declaration, between three and four, but the player pays double stake on three, if he wins a trick, and receives a single on three if he takes none.

NAPOLéONIC CAMPAIGNS.—1. The era of the Revolutionary and Napoleonic Wars falls into two main divisions, the first of which (1792—1801) is dealt with under the heading FRENCH REVOLUTIONARY WARS. In the present article are described the campaigns of the French army in 1812. The second division of the wars, that of the Restoration and the Empire, as Napoleon assumed the latter title in 1804, begins with the invasion of Italy in 1805. Henceforth the campaigns of the period are known as the Napoleonic Wars. The reader is referred to WATERLOO CAMPAIGN.

The campaigns described below are therefore:

(a) The Austrian War of 1809 (Ulum and Austerlitz).
(b) The Conquest of Prussia and the Polish Campaign (Jena, Auerstedt, Eylau and Friedland).
(c) The Austrian War of 1809 (Eckmühl, Aspern and Wagram).
(d) The Russian War of 1812 (Borodino and the retreat from Moscow).
(e) The German "War of Liberation," culminating in the Battle of the Nations around Leipzig.
(f) The last campaign of Napoleon, 1814.

The naval history of 1803—1815 includes the culmination and the sequel of the struggle for command of the sea which began in 1793 and reached its maximum intensity on the day of Trafalgar.

2. The Campaign of 1805 may be regarded as a measure of self-defence forced upon Napoleon by the alliance of Russia (April 11th), Austria (August 9th) and other powers with Great Britain. The first possible threat to the emperor's position had been the Empire under his son, and his intention in that event to march straight on Vienna by the valley of the Danube is clearly indicated in his reply (November 27th, 1803) to a Prussian proposal for the neutralization of the South German states. In this he says, "It is on the road from Strassburg to Vienna that the French must force peace on Austria, and it is this road which you wish us to renounce." When, therefore, on the 25th of August 1805, he learnt definitely that Villeneuve (see Naval operations below) had failed in his purpose of securing the command of the Channel, which was the necessary preliminary to the invasion of England, it was but the affair of a few hours to dictate the dispositions necessary to transfer his whole army to the Rhine frontier as the first step in its march to the Danube. On this date the army actually lay in the following positions:

I. Corps

The corps were, however, by no means fit for immediate service. Bernadotte's corps in Hanover was almost in the position of a beleaguered garrison, and the marshal could only obtain his transport by giving out that he was ordered to withdraw to France. Marmont and Davout were deficient in horses for cavalry and artillery, and the troops in Boulogne, having been drawn together for the invasion of England, had hardly any transport at all. As it was considered this want could be readily supplied on landing. The composition of the army, however, was excellent. The generals were in the prime of life, had not yet learnt to distrust one another, and were accustomed to work under the emperor and with one another. The regimental officers had all acquired their rank before the enemy and knew how to manage their men, and of the men themselves nearly two-thirds had seen active service. The strength of the army lay in its infantry, for both cavalry and artillery were short of horses, and the latter had not yet acquired mobility and skill.
in manœuvring. Napoleon's determination to undertake the invasion of England had often been disputed, but it is hard to imagine what other operation he contemplated, for the outbreak of hostilities with his continental enemies found him ill-supplied with intelligence as to the resources of the country he had then to traverse. To remedy this, Murat and other general officers as well as minor agents were sent ahead and instructed to travel through South Germany in plain clothes with a view to collecting information and mastering the topography. The emperor was, moreover, imperfectly acquainted with the degree of preparation of his adversaries' designs, and when he dictated his preliminary orders he was still unaware of the direction the Austrian army was about to take.

On the 26th of August, however, he learnt that 100,000 Russians were about to enter Bohemia thence to unite with an Austrian army of 80,000 near the junction of the Inn and Danube, and this information compelled him to alter the general direction of his advance so as to traverse the defiles of the Black Forest north of the Neckar, cavalry only observing the passes to the south.

3. Austrian Army.—The Austrians after the defeats of 1800 had endeavoured to reorganize their forces on the French model, but they were soon to learn that in matters of organization the spirit is everything, the letter very little. They had copied the organization of the French corps, but could find no corps commanders fit to assume the responsibility for these commands. As always in such conditions, the actual control of the smallest movements was still centralized in the hands of the army commanders, and thus the rate of marching was incredibly slow. They had decided that in future their troops in the field should live by requisition, and had handed over to the artillery, which needed them badly, a large number of horses thus set free from the transport service, but they had not realized that men accustomed to a regular distribution of rations cannot be transformed into successful marauders and pillagers by a stroke of the pen; and they had sent away the bulk of their army, 120,000 under their best general, the archduke Charles, into Italy, leaving Lieut. Field Marshal Mack von Leibnitz in Germany, nominally as chief of the staff to the young Prince Ferdinand, but virtually in command, to meet the onset of Napoleon at the head of his veterans. Mack was a man of unusual attainments. He had risen from the ranks in the most caste-ridden army in Europe, and had an adversary, was at any rate the outcome of the wrongs which were correct in principle, and needed only time to develop. It was his fate to be made the scapegoat for the disasters which followed, though they need no further explanation than that, at the head of 80,000 men and exercising only restricted powers of command, he was pitted against the greatest strategist of all ages who was responsible to no overlord and commanded, in the fullest sense of the term, an army considerably more than twice as strong.

4. The March on Ulm.—The outbreak of the campaign was hastened by the desire of the Austrian government to feed their own army and leave a bare country for Napoleon by securing the resources of Bavaria. It was also hoped that the Bavarians with their army of 25,000 men would join the allies. In the latter hope they were deceived, and the Bavarians under General Wrede slipped away to Bamberg in time. In the former, however, they were successful, and the destination they left in their wake almost wrecked Napoleon's subsequent combinations. Mack's march to Ulm was therefore a necessity of the situation, and his continuation in this exposed position, if foolishly, was an adversary against such an adversary, was at any rate the outcome of the high resolve that even if beaten he would inflict crippling losses upon the enemy. Mack knew that the Russians would be late at the rendezvous on the Inn. By constructing an entrenched camp at Ulm and concentrating all the available food within it, he expected to compel Napoleon to invest and besiege him, and he anticipated that in the devastated country his adversary would be compelled to separate and thus fall an easy prey to the Russians. For that blow he had determined to make his own army the anvil. But these views obviously could not be published in army orders, hence the discontent and opposition he was destined to encounter.

5. Movements of the French.—It was on the 21st that Napoleon learnt of Mack's presence in Ulm. On that date his army had crossed the Rhine and was entering the defiles of the Black Forest. It was already beginning to suffer. Boots were worn out, greatcoats deficient, transport almost unattainable and, according to modern ideas, the army would have been considered incapable of action.

brought over the river. Mack on the 8th had determined to commence his withdrawal, but fortune now favoured the French. The weather during the whole of October had been unusually wet, the swollen Danube overflowed the low ground and the roads had become quagmires. On the south bank, owing to better natural drainage and a drier subsoil, movement was fairly easy, but the Austrians found it almost impossible. On the 11th of October, when they began their march, the road along the Danube was swept into the river, carrying with it several guns and teams, and hours were consumed in passing the shortest distances. At length in the afternoon they suddenly fell upon Dupont’s isolated division at Albeck, which was completely surprised and severely handled. The road now lay completely open, but the Austrian columns had so opened out owing to the state of the roads that the leading troops could not pursue their advantage—Dupont rallied and the Austrians had actually to fall back towards Ulm to procure food.

8. Elchingen.—For three more days Mack struggled with an unwilling staff and despondent men to arrange a further advance. During these very three days, through a succession of staff blunders, the French failed to close the gap, and on the morning of the 14th of October both armies, each renewing their advance, came in contact at the bridge of Elchingen. This bridge, all but a few road-bearers, had been destroyed, but now the French gave an example of that individual gallantry which was characteristic of the old revolutionary armies. Running along the beams under a close fire a few gallant men forced their way across. The floor of the bridge was rapidly relaid, and presently the whole of the VI. corps was deploying with unexampled rapidity on the farther side. The Austrians, still in their quagmire, could not push up reinforcements fast enough, and though Mack subsequently alleged deliberate obstruction and disobedience on the part of his subordinates, the state of the roads alone sufficed to explain their defeat. Only the right column of the Austrians was, however, involved; the left under General Werneck, to whom some cavalry and the archduke Ferdinand attached themselves, did indeed succeed in getting away, but without trains or supplies. They continued their march, famished but unmolested, until near Heidenheim they suddenly found themselves confronted by what from the diversity of uniforms they took to be an overwhelming force; at the same time the French cavalry sent in pursuit appeared in their rear. Utterly exhausted by fatigue, Werneck with his infantry, some 8000 strong, surrendered to what was really a force of disembowed dragoons and foot-sore stragglers improvised by the commanding officer on the spot to protect the French treasure chests, which at
NAPOLEONIC CAMPAIGNS

that moment lay actually in the path of the Austrians. The young archduke with some cavalry escaped.

9. Mack surrounded.—The defeat at Elchingen on the 14th of October sealed the fate of the Austrians, though Mack was still determined to endure a siege. As the French columns came up from the south and west gradually surrounded him, he drew his troops under shelter of the fortress and its improvised entrenched camp, and on the 15th he found himself completely surrounded. On the 16th the French field-guns fired into the town, and Mack realized that his troops were no longer under sufficient control to endure a siege. When, therefore, next morning, negotiations were opened by the French, Mack, still feeling certain that the Russians were at hand, agreed to an armistice and undertook to lay down his arms if within the next twenty-one days no relief should arrive. To this Napoleon consented, but hardly had the agreement been signed than he succeeded in introducing a number of individual French soldiers into the fortress, who began rioting with the Austrian soldiery. Then, sending in armed parties to restore order and protect the inhabitants, he caused the guards at the gates to be overpowered, and Mack was thus forced into an unconditional surrender.

On the 22nd of October, the day after Trafalgar, the remnant of the Austrian army, 23,000 strong, laid down its arms. About 5000 men under Jellachich had escaped to Tirol, 2000 cuirassiers with Prince Ferdinand to Eger in Bohemia, and about 10,000 men under Werneck, had surrendered at Heilbronn. The losses in battle having been insignificant, there remain some 36,000 to account for—most of whom probably escaped individually by the help of the inhabitants, who were bitterly hostile to the French.

10. Napoleon's Advance to Vienna.—Napoleon now hastened to rejoin the group of corps he had left under Bernadotte in observation towards the Russians, for the latter were nearer at hand than even Mack had assumed. But hearing of his misfortune they retreated before Napoleon's advance along the right bank of the Danube to Krems, where they crossed the river and withdrew to an entrenched camp near Olmütz to pick up fresh Austrian reinforcements. The siege of Krems continued (near Krems) on the 11th, and of Hollabrunn on the 16th of November, in which Napoleon's marshals learned the tenacity of their new opponents, and the surprise of the Vienna bridge (November 14) by the French, were the chief incidents of this period in the campaign.

11. Campaign of Austerlitz.—Napoleon continued down the right bank to Vienna, where he was compelled by the condition of his troops to call a halt to refit his army. After this was done he continued his movement to Brühl. Thither he succeeded in bringing only 55,000 men. He was again for a time thrown back by heavy frost and his plan for cover of Murat's cavalry. The allies now confronted him with upwards of 86,000 men, including 16,000 cavalry. About the 20th of November this force commenced its advance, and Napoleon concentrated in such a manner that within three days he could bring over 80,000 French troops into action around Brühl, besides 17,000 or more Bavarians under Wrede. On the 28th Murat was driven in by the allied columns. That night orders were despatched for a concentration on Brühl in expectation of a collision on the following day; but hearing that the whole allied force was moving, the emperor ordered Murat to concentre south-east of Brühl, covering his front by cavalry on the Pratzen heights. Meanwhile he had also prepared a fresh line of retreat towards Bohemia, and, certain now of having his men in hand for the coming battle, he quietly awaited events.

The allies were aware of his position, and still adhering to the old "linear" system, marched to turn his right flank (see Austerlitz). As soon as their strategic purpose of cutting him off from Vienna became apparent, the emperor moved his troops into position, and in the afternoon issued his famous proclamation to his troops, pointing out the enemy's mistake and his plan for defeating them. At the same time he issued his orders for his first great battle as a supreme commander. The battle of Austerlitz began early next morning and closed in the evening with the thorough and decisive defeat of the allies.

12. Jena, 1806.—Around the Prussian army, and particularly the cavalry, the prestige of Frederick the Great's glory still lingered; but the younger generation had little experience of actual warfare, and the higher commanders were quite unable to grasp the changes in military tactics and in the conduct of operations which had grown out of the necessities of the French Revolution. The individual officers of the executive staff were the most highly trained in Europe, but there was no great leader to co-ordinate their energies. The total number of men assigned to the field army was 110,000 Prussians and Saxons. They were organized in corps, but their leaders were corps commanders only in name, for none were allowed any latitude for individual initiative. Ill-judged economies had undermined the whole efficiency of the Prussian army. Two-thirds of the infantry and half of the cavalry were allowed furlough for from ten to eleven months in the year. The men were unprovided with greatcoats. Most of the muskets had actually seen service in the Seven Years' War, and their barrels had worn so thin with constant polishing that the use of full charges at target practice had been forbidden. Above all, the army had drifted entirely out of touch with the civil population. The latter, ground down by feudal tradition and law, and at the same time permeated by the political doctrines of the late 18th century, believed that war concerned the governments only, and formed no part of the business of the "honest middle class." This idea of separation, which protected the civilian against the soldier, and forbade even in war-time the requisitioning of horses, provisions and transport, without payment. Up to the night of the battle of Jena itself, the Prussian troops lay starving in the midst of plenty, whilst the French everywhere took what they wanted. This alone was a sufficient cause for all the misfortunes which followed.

13. Outbreak of the War.—During the campaign of Austerlitz Prussia, furious at the violation of her territory of Anspach, had mobilized, and had sent Haugwitz as ambassador to Napoleon's headquarters. But on the 30th of November, and Napoleon, pleading business, put off his official reception till after the battle of Austerlitz. Of course the ultimatum was never presented, as may be imagined; Haugwitz returned and the king of Prussia demobilized at once. But Napoleon, well knowing the man he had to deal with, had determined to force a quarrel upon Prussia at the earliest convenient opportunity. His troops therefore, when withdrawn from Austria, were cantoned in south Germany in such a way that, whilst suspicion was not aroused in minds unacquainted with Napoleonic methods, they could be concentrated by a few marches behind the Thuringian forest and the upper Naab, and were thus in a position to use the Rhine valley. Having done this, the Grand Army was left to itself to recuperate and assimilate its recruits, and it is characteristic of the man and his methods that he did not trouble his corps commanders with a single order during the whole of the spring and summer.

As the diplomatic crisis approached, spies were sent into Prussia, and simultaneously with the orders for preliminary concentration the marshals received private instructions, the path of which cannot be better expressed than in the following two quotations from Napoleon's correspondence:—

"Mon intention est de concentrer toutes mes forces sur l'extrémité de ma droite en laissant tout l'espace entre le Rhin et Bamberg entièrement dégarni, de manière à avoir près de 200,000 hommes réunis sur un même champ de bataille; mes premières marches mentent le cœur de la monarchie prussienne." (No. 10,929.

"Avec cette immense supériorité de forces réunis sur un espace si étroit, vous sentez que je suis dans la volonté de ne rien hasarder et de me préparer à un ennemi qui me voue ses espérances à l'issue, que ce serait une belle affaire que de se porter sur cette place (Dresden) en un bataillon carré de 200,000 hommes." (Soul, No. 10,941).

14. Advance of the Grande Armée.—On the 7th of October the Grande Armée lay in three parallel columns along the roads leading over the mountains to Hof, Schleiz and Kronach; the right flank, composed of the Grand Army (Ney), moving on the B.M., took its cavalry in rear, and behind these the VI. corps (Ney) at Pegasus; in the centre, Bernadotte's I. corps from Nordhalben, with the
III. corps (Davout) Lichtenfels; Guard and headquarters, Bamberg. The left column was composed of the V. (Lannes)

JENA CAMPAIGN

at Hemmendorf, with the VII. (Augereau) extending south to the Main at Burgebrach.

Napoleon's object being surprise, all the cavalry except a few vedettes were kept back behind the leading infantry columns and these latter were ordered to advance, on the signal being given, in "masses of manoeuvre," so as to crush at once any outpost resistance which was calculated upon the time required for the deployment of ordinary marching columns. This order has never since found an imitator, but deserves attentive study as a masterpiece (see H. Bonnal, Manœuvre d'Iena).

To meet the impending blow the Prussians had been extended in a cordon along the great road leading from Mainz to Dresden, Blücher was at Erfurt, Rüchel at Gotha, Hohenlohe at Weimar, Saxons in Dresden, with outposts along the frontier. An offensive move into Franconia was under discussion, and for this purpose the Prussian staff had commenced a lateral concentration about Weimar, Jena and Naumburg when the storm burst upon them. The emperor gathered little from the confused reports of their purposeless manoeuvres, but, secure in the midst of his "battalion square" of 200,000 men, he remained quite indifferent, well knowing that an advance straight on Berlin must force his enemy to concentrate and fight, and as they would bring at most 127,000 men on to the battlefield the result could hardly be doubtful. On the 9th of October the cloud burst. Out of the forests which clothe the northern slopes of the Thuringer Wald the French streamed forth, easily overpowering the resistance of the Prussian outposts on the upper Saale, 1 and once the open country was reached the cavalry under Murat trotted to the front, closely followed by Bernadotte's corps as "general advance guard." The result of the cavalry scouting was however unsatisfactory. On the night of the ioth, the emperor was still unaware of the position of his principal foe, and Murat with Bernadotte behind him was directed on Gera for the 11th, the remainder of the army continuing along the roads previously assigned to them.

In the meanwhile, however, the Saxons had been moving from Naumburg through Gera on Jena, Hohenlohe was near Weimar, and all the other divisions of the army had closed in a march eastwards, the idea of an offensive to the southward which Napoleon had himself attributed to them having already disappeared.

Reaching Gera at 9 A.M. Murat reported the movement of the Saxons on the previous day, but admitting he could not follow them up on his own strength in pursuit. The traces of the Saxons were therefore lost, and Napoleon, little satisfied with his cavalry, authorized Lasalle to offer up to 6000 frs. reward for information of the Prussian point of concentration. At 1 A.M. of the 12th Napoleon issued his orders. Murat and Bernadotte via Zeitz to Naumburg; Davout (III. corps and a dragoon division) also to Naumburg; Lannes to Jena, Augereau following; Soult to Gera.

15. Prussian Movements.—In the meantime the Prussians were effecting their concentration. Rüchel, who with 15,000 men had been sent into the mountains as an advanced guard for the projected offensive, was recalled to Weimar, which he reached on the 13th. The main body were between Weimar and Apoklia during the 12th, and the Saxons duly effected their junction with Hohenlohe in the vicinity of Vierzehnheiligen, whilst the latter had withdrawn his troops all but some outposts from Jena to the plateau about Capellendorf, some 4 m. to the N.W. The whole army, upwards of 120,000 men, had been concentrated against Lannes and Augereau by the afternoon of the 13th, whilst Soult could only have intervened very late in the day, and Davout and Bernadotte were still too distant to reach the battlefield before the 14th. All the French corps, moreover, were so exhausted by their rapid marches over bad roads that the emperor actually ordered (at 1 A.M. on the 13th) a day of rest for all except Davout, Bernadotte, Lannes and Murat.

The Prussian headquarters, however, spent the 12th and 13th in idle discussion, whilst the troop commanders exerted themselves to obtain some alleviation for the suffering of their starving men. The defeats undergone by their outpost detachment had profoundly affected the nerves of the troops, and on the afternoon of the 11th, on the false alarm of a French approach, a panic broke out in the streets of Jena, and it took all the energy of Hohenlohe and his staff to restore order. On the morning of the 12th the Saxon commanding officers approached Hohenlohe with a statement of the famishing condition of their men, and threatened to withdraw them again to Saxony. Hohenlohe pointed out that the Prussians were equally badly off, but promised to do his best to help his allies. Urgent messages were sent off to the Commissary von Goethe (the poet), at Weimar for permission to requisition food and firewood. These requests, however, remained unanswered, and the Prussians and Saxons spent the night before the battle shivering in their miserable bivouacs.

16. The 13th of October.—During the early morning of the 13th the reports brought to Napoleon at Gera partially cleared up the situation, though the real truth was very different from what he supposed. However, it was evident that the bulk of the Prussians lay to his left, and instructions were at once despatched to Davout to turn westward from Naumburg towards Kösen and to bring Bernadotte with him if the two were still together. The letter, however, ended with the words "but I hope he is already on his way to Dornburg." Now Bernadotte
NAPOLEONIC CAMPAIGNS

had neglected to keep the emperor informed as to his whereabouts. He was still with Davout, but, concluding that he had missed an order directing him to Dornburg, he thought to conceal his error by assuming the receipt of the order evidently alluded to in the last words, and as a result he marched towards Dornburg, and his whole corps was lost to the emperor at the crisis of the next day's battle.

On the road from Gera to Jena Napoleon was met by intelligence from Lannes announcing his occupation of Jena and the discovery of Prussian troops to the northward. Knowing the emperor's methods, he wisely restrained the ardour of his subordinates and asked for instructions whether to attack or wait. The emperor rode forward rapidly, reached Jena about 3 P.M., and with Lannes proceeded to the Landgrafenberg to reconnoitre. From this point his view was, however, restricted to the immediate foreground, and he only saw the camps of Hohenlohe's left wing. At this moment the Prussians were actually on parade and ready to move off to attack, but just then the "evil genius" of the Prussian army, von Massenbach, an officer of the Headquarters Staff, rode up and claiming to speak with the authority of the king and commander-in-chief, induced Hohenlohe to order his troops back to camp. Of all this Napoleon saw nothing, but from all reports he came to the conclusion that the whole Prussian army was actually in front of him, and at once issued orders for his whole army to concentrate towards Jena, marching all night if need be. Six hours earlier his conclusion would have been correct, but early that morning the Prussians had been alarmed for the safety of their line of retreat on Berlitz by the presence of the French in Naumburg, decided to leave Hohenlohe and Rüchel to act as rear-guard, and with the main body to commence their retreat towards the river Unstrutt and the Eckhardtsberge where Massenbach had previously reconnoitred an "ideal" battlefield. This belief in positions was the cardinal principle of Prussian strategy in those days. The troops had accordingly commenced their march on the morning of the 13th, and now at 3 P.M. were settling down into bivouac; they were still but a short march from the decisive field.

17. Battle of Jena.—On the French side, Lannes' men were working their hardest, under Napoleon's personal supervision, to make a practicable road up to the Landgrafenberg, and all night long the remaining corps struggled through darkness towards the rendezvous. By daybreak on the 14th, the anniversary of Elchingen, upwards of 60,000 men stood densely packed on the narrow plateau of the mountain, whilst, below in the ravines on either flank, Soult on the right, and Augereau on the left, were getting into position. Fortunately a dense fog hid the helpless masses on the Landgrafenberg from sight of the Prussian gunners. Hohenlohe had determined to drive the French into the ravine at daybreak, but had no idea as to the numbers in front of him. For want of room, only a few Prussian battalions were sent forward, and these, delaying their advance till the fog had sufficiently lifted, were met by French skirmishers, and small columns, who rapidly overlapped their flanks and drove them back in confusion. Hohenlohe now brought up the remainder of his command, but in the meanwhile the French had poured across the neck between the Landgrafenberg and the main plateau, and the troops of Soult and Augereau were working up the ravines on either hand. In view of these troops the Prussian line, which had advanced faultlessly as if on parade, halted to prepare its bayonet attack by fire, and, once halted, it was found impossible to get them to go on again. The French who had thrown themselves into houses, copes, &c., picked off the officers, and the flanks of the long Prussian lines swayed and got into confusion. The rival artillery held each other too thoroughly to be able to spare attention to the infantry, whilst the Prussian cavalry, which had forgotten how to charge in masses of eighty or more squadrons, flitted away their strength in isolated efforts. By 10 A.M. the fourteen battalions which had initiated this attack were outnumbered by three to one, and drifted away from the battlefield. Their places were taken by a fresh body, but this was soon outnumbered and outflanked in its turn. By 2 P.M. the psychic moment had come, and Napoleon launched his guards and the cavalry to complete the victory and initiate the pursuit. Rüchel's division now arrived and made a most gallant effort to cover the retreat, but their order being broken by the torrent of fugitives, they were soon overwhelmed by the tide of the French victory and all organized resistance had ceased by 4 P.M.

Briefly summarized, the battle came to this—in four successive efforts the Prussians failed because they were locally outnumbered. This was the fault of their leaders solely, for, except for the last attack, local superiority was in each case attainable. Organization and tactics did not affect the issue directly, for the conduct of the men and their junior officers gave abundant proof that in the hands of a competent leader the "linear" principle of delivering one shattering blow would have proved superior to that of a gradual attrition of the enemy here, as on the battlefields of the Peninsula and at Waterloo, and this in spite of other defects in the training of the Prussian infantry which simultaneously caused its defeat on the neighbouring field of Auerstedt.

18. Battle of Auerstedt.—Here the superiority of French mobility, a consequence of their training and not necessarily of their system, showed its value most conclusively. Davout in obedience to his orders of the previous morning was marching over the Saale to Kösen, when his advanced guard came in contact with that of the Prussian main army. The latter with at least 50,000 men was marching in two columns, and ought therefore to have delivered its men into line of battle twice as fast as the French, who had to deploy from a single issue, and whose columns had opened out in the passage of the Kösen defile and the long ascent of the plateau above. But the Prussians
attacked at the old regulation speed of seventy-five paces to the minute, and the French manoeuvred at the quick or double of 120 or 150. The consequence was that the French always succeeded in reinforcing their fighting line in time to avert disaster. Nevertheless by mid-day their strength was well-nigh exhausted, whilst the Prussian reserve, eighteen battalions of guards under Kalckreuth, stood intact and ready to engage. But at the critical moment the duke of Brunswick fell mortally wounded, and Scharnhorst, his chief of the staff, was at the time absent on another part of the field. Meanwhile rumours from the battle-field at Jena, magnified as usual, began to reach the Prussians. For these the French had gathered from Kalckreuth, for when appealed to to attack with his eighteen battalions and win the day, he declined to move without the direct order of the commander-in-chief to do so, alleging that it was the duty of a reserve to cover the retreat and he considered himself personally responsible to the king for the guards entrusted to his care. Even then the day might have been saved had Blücher been able to find even twenty squadrons accustomed to gallop together, but the Prussian cavalry had been dispersed amongst the infantry commands, and at the critical moment it proved impossible for them to deliver a united and decisive attack.

Seeing further efforts hopeless, Scharnhorst in the duke's name initiated the retreat and the troops withdrew N.W. towards Buttelstedt, almost unmolested by the French, who this day had put forth all that was in them, and withstood victoriously the highest average punishment any troops of the new age of warfare had as yet endured. So desperate had been their resistance that the Prussians unanimously stated Davout's strength at double the actual figure. Probably no man but Davout could have got so much out of his men, but why was he left unsupported?

Bernadotte, we have seen, had marched to Dornburg, or rather to a point overlooking the ford across the Saale at the village of that name, and reached there in ample time to intervene on either field. But with the struggle raging before him he remained undecided, until at Jena the decision had clearly fallen, and then he crossed the river and arrived with fresh troops too late for their services to be required.

19. Prussian Retreat.—During the night the Prussians continued their retreat, the bulk of the main body to Sömmerda, Hiller's movement towards Nordhausen. The troops had got much mixed up, but as the French did not immediately press the pursuit home, order was soon re-established and a combined retreat was begun towards the mouth of the Elbe and Lübeck. Here help was expected to arrive from England, and the tide might yet have turned, for the Russian armies were gathering in the east. It was now that the results of a divorce of the army from the nation began to be felt. Instead of seizing all provisions and burning what they could not remove, the Prussian generals enforced on their men the utmost forbearance towards the inhabitants, and the fact that they were obeyed, in spite of the habits unchangeable and these may possibly have influenced the conduct of the campaign. Bernadotte's orders were re-established, and the French marched in pursuit were received with open arms, the people even turning their own wounded out of doors to make room for their French guests. Their servility awakened the bitterest contempt of their conquerors and forms the best excuse for the unparalleled severity of the French yoke. On the 26th of October Davout reached Berlin, having marched 166 m. in twelve days including two sharp rearguard actions, Bernadotte with his fresh troops having fallen behind. The inhabitants of Berlin, led by their mayor, came out to meet him, and the newspapers lavished adulation on the victors and abuse on the beaten army. On the 28th Murat's cavalry overtook the remnant of Prince Hohenlohe's army near Prenzlau (N. of Berlin) and invited its capitulation. Unfortunately the prince sent Massenbach to discuss the situation, and the latter completely lost his head. Murat boasted that he had 100,000 men behind him, and on his return Massenbach implored his chief to submit to an unconditional surrender, advice which the prince accepted, though as a fact Murat's horses were completely exhausted and he had no infantry whatever within call. Only Blücher now remained in the field, and he too was driven at length into Lübeck with his back to the sea.

20. Campaigns in Poland and East Prussia.—Hitherto the French had been operating in a rich country, untouched for half a century past by the ravages of war, but as the necessity for a campaign against the Russians confronted the emperor, he realized that his whole supply and transport service must be put on a different footing. After the wants of the cavalry and artillery had been provided for, there remained but little for horses and transport work. Executive orders to organize the necessary trains were duly issued, but the emperor seems to have had no conception of the difficulties the tracks—there were no metalled roads—of Poland were about to present to him. Moreover, it was one thing to issue orders, but quite another to ensure that they were obeyed, for they entailed a complete transformation in the mental attitude of the French soldier towards all that he had been taught to consider his duties in the field. Experience only can teach the art of packing wagons and the care of draught animals, and throughout the campaign the French troops and East Prussians learned these discipines for the first time. Horse fodder was broken down by thousands from over loading and unskilful packing.

21. The Russian Army formed the most complete contrast to the French that it is possible to imagine. Though clad, armed and organized in European fashion, the soldiers retained in a marked degree the traditions of their Mongolian forerunners, their transport wagons were in type the survival of ages of experience, and their care for their animals equally the result of hereditary habit. The intelligence of the men and regimental officers was very low, but on the other hand service was practically for life, and the regiment the only home the great majority had ever known. Hence obedience was instinctive and irrational almost undreamt of. Moreover, they were essentially a war-trained army, for even in peace time their long marches to and fro within the empire had most thoroughly inured them to hardship and privation. Napoleon might have remembered his own saying, "La misère est l'école du bon soldat." In cavalry they were weak, for the Russian does not take kindly to equitation and the horses were not equal to the accepted European standard of weight, while the Cossack was only formidable to strangers and wounded. Their artillery was numerous and for the most part of heavy calibre—18- and 24-pounders were common—but the strength of the army lay in its infantry, with its incomparable tenacity in defence and its blind confidence in the bayonet in attack. The traditions of Suvarov and his victories in Italy (see French Revolutionary Wars) were still fresh, but there was no longer a Suvarov to lead them.

22. Advance to the Vistula.—Napoleon had from the first been aware of the secret alliance between Prussia and Russia, sworn by their respective sovereigns over the grave of Frederick the Great, and this knowledge had been his principal reason for precipitating hostilities with the former. He remained, however, in complete ignorance of the degree of preparation attained on the Russian side, and since the seizure of Warsaw together with the control of the resources of Poland in men and material its occupation would afford, was the chief factor in his calculation, he turned at once to the eastward as soon as all further organized resistance in Prussia was ended by the surrender of Prenzlau and Lübeck. Scarcely leaving his troops time to restore their worn-out footgear, or for the cavalry to replace their jaded horses from captured Prussian resources, he set Davout in motion towards Warsaw on the 2nd of November, and the remainder of the army followed in successive echelons as rapidly as they could be despatched.

The cavalry, moving well in advance, dispersed the Russian depots and captured their horses, as far as the line of the Vistula, where at last they encountered organized resistance from the outposts of Lestocq's little corps of 15,000 men—all that was left of Frederick the Great's army. These, however, gave way before the threat of the advancing French and after a few trifling skirmishes. Davout entered Warsaw on the 30th of
NAPOLEONIC CAMPAIGNS

November, being followed by the V., IV. and Guard corps during the succeeding fortnight, whilst the VI. and VII. were echeloned to their left, and the VIII. (Mortier) and IX. (Jerome Napoleon) and X. (Lefebvre), all new formations since the outbreak of the war, followed some marches in the rear. Jerome's corps was composed of the Bavarians, Wurttembergers and Badeners. Behind these all Prussia was overrun by newly formed units, (3rd and 4th battalions) raised from depot companies, conscripts for 1807, and old soldiers rejoicing after sickness or wounds. Napoleon caused these to be despatched to the front immediately after their formation. He had much territory to occupy, and in the long march of an average 85 days, he considered that they could be organized, equipped and drilled en route.

23. Pultusk.—The Russians meanwhile had been moving slowly forward in two bodies, one under Bennigsen (50,000), the other under Buxhowden (25,000), and the French being at this time in Warsaw, they took up threatening positions about Pultusk, Plock and Prassnitz. From this triangle they harried the French communications with Berlin, and to secure a winter's rest for his men Napoleon determined to bring them to action. On the 23rd of December operations were commenced, but the difficulties of securing information and maintaining communication between the respective columns, so unlike what any of the French had previously encountered, led to a very partial success. The idea had been to induce the Russians to concentrate about Pultusk and, turning their position from its left, ultimately to cut them off from Russia, and if possible to surround them. But in this new and difficult country the emperor found it impossible to time his marches. The troops arrived late at their appointed positions, and after a stubborn rearguard action at Pultusk itself and indecisive fighting elsewhere (Soldau-Golyn) the Russians succeeded in retreating beyond the jaws of the French attack, and Napoleon for the first time found that he had exceeded the limit of endurance of his men. Indeed, the rank and file bluntly told him as much as he rode with the marching columns. Yielding to the inevitable, but not forgetting to announce a brilliant victory in a bulletin, he sent his troops into winter quarters along the Passarge and down the Baltic, enjoining on his corps commanders most strictly to do nothing to disturb their adversary.

24. Campaign of Eylau.—Bennigsen, now commanding the whole Russian army which with Lestocq's Prussians amounted to 100,000, also moved into winter quarters in the triangle Deutsch-Eylau-Osterode-Allenstein, and had every intention of remaining there, for a fresh army was already gathering in Russia, the 1st corps of which had reached Nur about 50 m. distant from the French right.

Unfortunately, Ney with his VI. corps about Gilgenberg had received the most poverty-stricken district in the whole region, and to secure some alleviation for the sufferings of his men he cautiously extended his cantonments till they came in contact with the Russian outposts. Apparently seeing in this movement a recommencement of hostilities, Bennigsen concentrated his troops towards his right and commenced an advance westwards towards Danzig, which was still in Prussian hands. Before his advance both Ney and Bernadotte (the latter, between Ney and the Baltic, covering the siege of Danzig) were compelled to fall back. It then became necessary to disturb the repose of the whole army to counter the enemy's intentions. The latter by this movement, however, uncovered his own command with Russia, and the emperor was quick to seize his opportunity. He received the information on the 28th of January. His orders were at once issued and compiled with with such celerity that by the 31st he stood prepared to advance with the corps of Ney, Ney's reserve and Auxonne, the Guard and the reserve cavalry (80,000 men on a front of 60 m.) from Myssenieck through Wollenberg to Gilgenberg; whilst Lannes on his right towards Ostrolenka and Lefebvre (X.) at Thorn covered his outer flank.

Bernadotte, however, was missing, and this time through no fault of his own. His orders and the despatch conveying Napoleon's instructions fell into the hands of the Cossacks, and just in time Bennigsen's eyes were opened. Rapidly renouncing his previous intentions, he issued orders to concentrate on Alletzen, but this point was chosen too far in advance and he was anticipated by Murat and Soult at that place on the 1st of February. He then determined to unite his forces at Jukendorf, but again he was too late. Soult and Murat attacked his rearguard on the 3rd, and learning from his Cossacks that the French corps were being directed so as to swing round and enclose him, he withdrew by a night march and ultimately succeeded in getting his whole army, with the exception of von Lestocq's Prussians, together in the strong position along the Alle, the centre of which is marked by Preussisch-Eylau. The opportunity for this concentration he owed to the time gained for him by his rearguard and Augereau, but for a day's delay was just long enough to induce the French columns to swing in to surround him, and the next day was thus lost to the emperor as his corps had to extend again to their manoeuvring intervals. The truth is that the days were too short and the roads too bad for Napoleon to carry out the full purpose his "general advanced guard" was intended to fulfil. It was designed to hold the enemy in position by the vigour of its attack, thus neutralizing his independent will power and compelling him to expend his reserves in the effort to rescue the troops engaged. But in forests and snowdrifts the French made such slow progress that no sufficient deployment could be made until darkness put a stop to the fighting. Thus, when late on the 7th of February 1807 Murat and Soult overtook the enemy near Eylau (g.r.) the fighting was severe but not prolonged. This time, however, Bennigsen, with over 60,000 men in position and 15,000 Prussians expected to arrive next morning, had no desire to avoid a battle, and deployed for action, his front protected by great batteries of guns, many of them of heavy calibre, numbering some 200 in all.

During the night Augereau and the Guards had arrived, and Ney and Davout were expected on either flank in the forenoon. This time the emperor was determined his enemy should not escape him, and about 8 a.m. ordered Soult and Augereau on the left and right respectively to assault the enemy, Murat and the Guards remaining in the centre as reserve. Napoleon's own forces thus became the "general advanced guard" for Ney and Davout, who were to close in on either side and deliver the decisive stroke. But here too the weather and the state of the roads operated adversely, for Ney came up too late, while Davout, in the full tide of his victorious advance, was checked by the arrival of Lestocq, whose corps Ney had failed to intercept,
and the attack of Augereau's corps (VII), made in a blinding snowstorm, failed with the appalling loss of over 40% killed and wounded. Augereau himself was severely wounded, and the remnants of his corps were subsequently distributed amongst the other corps. Bennigsen, however, drew off on Ney's arrival, and the French were too much exhausted to pursue him. Again the emperor had to admit that his troops could do no more, and bowing to necessity, he distributed them into winter quarters, where, however, the enterprise of the Cossacks, who were no strangers to snow and to forests, left the outposts but little repose.

A protracted period of rest followed, during which the emperor exerted himself unremittingly to re-equip, reinforce and supply his troops. Hitherto he had been based on the entrenched camp of Warsaw, but he had already taken steps to organize a new line of supply and retreat via Thorn, and this was now completed. At the same time Lefebvre was ordered to press the siege of Danzig with all vigour, and on the 5th of May, after a most gallant resistance, Kalckreuth, who redeemed here his failure of Auerstädt, surrendered. English assistance came too late. By the beginning of June the French had more than made good their losses and 210,000 men were available for field service.

25. Heilsberg and Friedland.—Meanwhile Bennigsen had prepared for a fresh undertaking, and leaving Lestocq with 20,000 Prussians and Russians to contain Bernadotte, who lay between Braunsberg and Spandau on the Passarge, he moved southwards on the 2nd, and on the 3rd and 4th of June he fell upon Ney, driving him back towards Guttstadt, whilst with the bulk of his army he moved towards Heilsberg, where he threw up an entrenched position. It was not till the 9th that Napoleon received tidings of his advance, and for the moment these were so vague that he contented himself by warning the remainder of his forces to be prepared to move on the 6th. The next day, however, all doubts were set at rest, and as the Russians advanced south of Heilsberg, he decided to wheel his whole force to the right, pivoting on the III. corps, and cut Bennigsen off from Königsberg and the sea. On the 8th the VI., VIII., and Guard corps, together with a new cavalry reserve corps under Lannes, in all 147,000, stood ready for the operation, and with Murat and Soulé, as general, advanced guard, who moved forward to re-drive the Russian outposts before them. Bennigsen, who was to have attacked Lestocq, again failed to receive his orders and took no part in the following operations.

Murat attacked the Russians, who had halted in their entrenched position, on the 11th and drove in their outposts, but did not discover the entrenchments. Meanwhile Soulé had followed with his infantry in close support, and the emperor himself arriving, ordered him to attack at once. Now the Russians uncovered their entrenchments, and in the absence of artillery prepared to fall upon Soulé's leading troops received most severe punishment. Fresh troops arriving were sent in to his support, but these also proved insufficient, and darkness alone put an end to the struggle, which cost the French 12,000 killed and wounded.

Bennigsen, however, learning that his right was threatened by the III. corps, and not having as yet completed his concentration, retraced in the night to Bartenstein, and the following day turned sharp to right towards Schippenbell. The emperor now pressed on towards Friedland, where he would completely control the Russian communications with Königsberg, their immediate base of supply, but for once the Russians out-marched him and covered their movement so successfully that for the next three days he seems to have completely lost all knowledge of his enemy's whereabouts. Lestocq in the meantime had been forced northwards towards Königsberg, and Soulé with Murat was in hot pursuit. The III., VI., VIII. and Guard corps followed the main road towards Königsberg, and the former had reached Mühhausen, the remainder were about Preussisch-Eylau, when Latour Maubourg's dragoons sent in intelligence which pointed to the presence of Bennigsen about Friedland. For the first time Napoleon was indeed the case. The Russians, after passing Schippenbell, had suddenly turned northwards, and on the evening of the 13th were taking up a strong position on the river Alle with Friedland as a centre.

What followed presents perhaps the finest instance of the Napoleonic method. The enemy lay direct to his right, and Murat, the IV. and III. corps had well overshadowed the mark. Lannes's reserve corps (cavalry), to whom Latour Maubourg reported, lay at Domnau some 10 m. to the right. The latter at once assumed the rôle of advanced guard cavalry and was ordered on down the central road of Friedland, Ney following in close support. Davout was turned about and directed on the enemy's right, and the VIII. corps (Mortier), the Guards and the reserve cavalry followed as main body. On the 14th (the anniversary of Marengo) Lannes carried out his rôle of fighting advanced guard or screen, the emperor's main body gradually came up, and the battle of Friedland (q.v.), notable chiefly for the display of the new artillery tactics of the French, ended with a general attack about 5 p.m. and the retreat of the Russians, after severe losses, over the Alle. Lestocq was, meanwhile, Chief of Staff and Bernadotte, commanding the 4th infantry corps, was pulled by the French method of skirmishers and columns, but as yet they had hardly reached the increased density necessary to be given to a line of battle to enable it to endure the prolonged nervous strain the new system of tactics entailed. Where formerly 15,000 men to the mile of front had been considered ample for the occupation of a position or the execution of an attack, double that number now often proved insufficient, and their front was broken before reinforcements could arrive. Much had been done to create an efficient staff, but though the idea of the army corps command was now no new thing, the senior generals entrusted with these commands were far from having attained the independence and initiative of their French opponents. Hence the extraordinary slowness of their manoeuvres, not because the Austrian infantry were bad marchers, but because the preparation and circulation of orders was still far behind the French standard. The light cavalry had been much improved and the heavy cavalry on the whole proved a fair match for their opponents.

26. The Austrian Army in 1809.—Ever since Austerlitz the Austrian officers had been labouring to reconstitute and reform their army. The archduke Charles was the foremost amongst many workers who had realized that numbers were absolutely needed to confront the new French methods. With these numbers it was impossible to attain the high degree of individual efficiency required for the old line tactics, hence they were compelled to adopt the French methods of skirmishers and columns, but as yet they had hardly reached the increased density necessary to be given to a line of battle to enable it to endure the prolonged nervous strain the new system of tactics entailed. Where formerly 15,000 men to the mile of front had been considered ample for the occupation of a position or the execution of an attack, double that number now often proved insufficient, and their front was broken before reinforcements could arrive. Much had been done to create an efficient staff, but though the idea of the army corps command was now no new thing, the senior generals entrusted with these commands were far from having attained the independence and initiative of their French opponents. Hence the extraordinary slowness of their manoeuvres, not because the Austrian infantry were bad marchers, but because the preparation and circulation of orders was still far behind the French standard. The light cavalry had been much improved and the heavy cavalry on the whole proved a fair match for their opponents.

27. The French Army.—After the peace of Tilsit the Grand Army was gradually withdrawn behind the Rhine, leaving only three commands, totalling 63,000 men, under Davout in Prussia, and it was the orders of the old Grande Armée and for a brief period Napoleon directed operations in person; and the Austrians took advantage of the dissemination and weakness of the French forces in Germany to push forward their own preparations with renewed energy.

But they reckoned without the resourcefulness of Napoleon. The moment news of their activity reached him, whilst still in pursuit of Sir John Moore, he despatched letters to all the members of the Confederation warning them that their contingents might soon be required, and at the same time issued a series of decrees to General Clarke, his war minister, authorizing him to call up the contingent of 1810 in advance, and directing him in detail to proceed with the formation of 4th and 5th battalions for all the regiments across the Rhine. By these
means Davout's, Oudinot's and Lefebvre's commands were augmented, whilst in February and March new corps were formed and rapidly pushed towards the front.

On his return from Spain, seeing war imminent, he issued a series of march orders (which deserve the closest study in detail) by which on the 15th of April his whole army was to be concentrated for manoeuvres between Regensburg, Landshut, Augsburg and Donauworth, and sending on the Guard in wagons to Strassburg, he despatched Berthier to act as commander-in-chief until his own arrival.

28. Austrian Offensive.—The position of assembly was excellently chosen, but unfortunately the Austrians took the initiative. On the 9th of April their main body of six corps crossed the Inn between Braunau and Passau, and simultaneously two additional corps moved from Pilsen in Bohemia on Regensburg. At this moment Davout was entering Regensburg with his leading troops, the remainder still some marches in rear, and it was evident that the whole concentration could no longer be carried out before the Austrians would be in a position to intervene. Berthier received the news while still on his way to the front, and quite failed to grasp the situation. Reaching Donauworth at 8 a.m. on the 13th of April, he ordered Davout and Oudinot to remain at Regensburg, whilst Lefebvre and Wrede (Bavarians) who had fallen back before the Austrians were directed to reoccupy Landshut. This was in direct contradiction with the instructions Napoleon had given him on the 28th of March in view of this very emergency. Davout obeyed, but remonstrated. On the 16th Berthier went on to Augsburg, where he learnt that Lefebvre's advanced troops had been driven out of Landshut, thus opening a great gap seventy-six miles wide between the two wings of the French army. Meanwhile Napoleon, who had left Paris at 4 a.m. on the 13th of April, was hastening towards the front, but remained still in ignorance of Berthier's doings until on the 16th at Stuttgart he received a letter from the Marshal dated the 15th, which threw him into consternation. In reply he immediately wrote: "You do not inform me what has rendered necessary such an extraordinary measure which weakens and divides my troops — and — I cannot quite grasp the meaning of your letter yet, I should have preferred to see my army concentrated between Ingolstadt and Augsburg, the Bavarians in the first line, with the duke of Danzig in his old position, until we know what the enemy is going to do. Everything would be excellent if the duke of Auerstädt had been at Ingolstadt and the duke of Rivoli with the Württembergers and Oudinot's corps at Augsburg, . . . so that just the opposite of what should have been done has been done" (C. N. to Berthier, Ludwigsburg, 16th April).

29. Napoleon takes command.—Having despatched this severe reprimand he hastened on to Donauworth, where he arrived at 4 a.m. on the 17th, hoping to find Berthier, but the latter was at Augsburg. Nevertheless, at 10 a.m. he ordered Davout and Oudinot to withdraw at once to Ingolstadt; and Lefebvre and Wrede on the right to support the movement. About noon Berthier returned and after hearing his explanation Massena received orders to move from Augsburg towards Ingolstadt.

"To-morrow will be a day of preparation spent in drawing closer together, and I expect to be able by Wednesday to manoeuvre against the enemy's columns according to circumstances."

Meanwhile the Austrians had approached so near that by a single day's march it would have been possible to fall upon and crush by superior numbers either wing of the French army, but though the Austrian light cavalry successfully covered the operations of the following troops they had not yet risen to a conception of their reconnoitering mission, and the archduke, in view of his opportunity and possessed, moreover, with the preconceived idea of uniting at Regensburg with the two corps coming from Bohemia, moved the bulk of his forces in that direction, leaving only a covering body against Davout altogether insufficient to retain him. Davout, however, had left a garrison of 1800 men in Regensburg, who delayed the junction of the Austrian wings until the 20th inst. and on the same day the emperor, having now reunited his whole right wing and centre, overwhelmed the covering detachments facing him in a long series of disconnected engagements lasting forty-eight hours, and the archduke now found himself in danger of being forced back into the Danube. But with the Bohemian reinforcements he had still four corps in hand, and Napoleon, whose intelligence service in the difficult and intersected country had lamentably failed him, had weakened his army by detaching a portion of his force in pursuit of the beaten right wing, and against the archduke's communications.

30. Eckmühl.—When, therefore, the latter, on the 22nd, marched southward to reopen his communications by the defeat of the enemy's army, always the surest means of solving this difficulty, he actually reached the neighbourhood of Eckmühl with a sufficient numerical superiority had it been prompt enough to seize his opportunity. But the French had been beforehand with him. Napoleon, who had personally taken part in the fighting of the previous day, and followed the pursuit as far as Landshut, whence he had despatched Massena to follow the retreating Austrians along the Isar, seems to have realized about 3 a.m. in the morning that it was not the main body of the enemy he had had before him, but only its left wing, and that the main body itself must still be northward towards Regensburg. Issuing orders to Davout, Oudinot and his cavalry to concentrate with all speed towards Eckmühl, he himself rode back along the Regensburg road and reached the battle-field just as the engagement between the two leading troops had commenced. Here the Austrians possessed mobility equal to that of the French the latter should have been overwhelmed in detail, but whilst the French covered 17 and 19 m. the Austrians only marched 10, and, owing to the defect in their tactical training alluded to above, the troops actually on the ground could not hold out long enough for their reserves to arrive. The retreat of the front lines involved the following ones in confusion, and presently the whole mass was driven back in considerable disorder. It seemed as if nothing could save the Austrians from complete disaster, but at the last moment, as the preparations of his corps commanders, who represented the excessive fatigue of their troops, stopped the pursuit, and the archduke made the most of his opportunity to restore order amongst his demoralized men, and crossed to the north bank of the Danube during the night.

31. Austrian Retreat.—On the following morning the French reached Regensburg and at once proceeded to assault its medieval walls, but the Austrian garrison bravely defended it till the last of the stragglers was safely across on the north bank. It was here that for the only time in his career Napoleon was slightly wounded. Then, leaving Davout to observe the archduke's retreat, the emperor himself rode after Massena, who with the major portion of the French army was following the Austrian weaker wing under Hiller. The latter was not so shaken as Napoleon believed, and turning to bay inflicted a severe check on its pursuers, who at Ebelsberg lost 4000 men in three
NAPOLEONIC CAMPAIGNS

fruitless assaults. Thus covered by his rearguard Hiller gained space and time to pass his troops over to the north bank of the Danube and remove all boats on the river. This left the direct road to Vienna open, and Napoleon, hoping to find peace in the enemy's capital, pushed the whole of his army down the right bank, and with Murat's cavalry entered the city on the 12th of May, after somewhat severe resistance lasting three days. Meanwhile the archduke and Hiller, both now unmolested, effected their junction in the vicinity of Wagram, picking the whole line of the Danube with their outposts and collecting all the boats.

Aspern and Wagram.—The reconnaissance of the river was at once taken in hand by the French upon their arrival in Vienna, and a point opposite the island of Lobau selected for this purpose. They then required four days to collect the necessary material to span the main branch of the river, here some 2000 yards across, and though Napoleon personally spurred on all to activity nearly four days more were required for its construction. It was not till the night of the 19th of May that orders for the passage were finally issued, and during the night the troops commenced to occupy the island of Lobau. Surprise, of course, was out of the question, but the Austrians did not attempt to dispute the passage, their object being to allow as many French as they felt they could deal with to pass over and then to fall on them. Thus on the 21st of May the bridge having been finished, Napoleon crossed the river the night of the 22nd with the complete defeat of Napoleon, the first ever inflicted upon him. The French retreated into the island of Lobau. By nightfall upwards of 100,000 men, encumbered with at least 20,000 wounded, were crowded together on the little island scarcely a mile square, short of provisions and entirely destitute of course of all hospital accessories. The question then arose whether the retreat was to be continued across the main stream or not, and for the second time in his career Napoleon assembled his generals to take their opinion. They, however, counseled retreat, but having heard them all replied, in substance: "If we leave here at all we may as well retire to Strassburg, for unless the enemy is held by the threat of further operations he will be free to strike at our communications and has a shorter distance to go. We must remain here and renew operations as soon as possible."

Immediate orders were despatched to summon every available body of troops to concentrate for the decisive stroke. Practically the lines of communication along the Danube were denuded of combatants, even Bernadotte being called up from Passau, and the viceroy of Italy, who driving the archduke Johann before him (action of Rashau) had brought up more than 36,000 men through Tirol, was disposed towards Pressburg within easy call. The arsenal of Vienna was ransacked for guns, stores and appliances, and preparations in the island pushed on as fast as possible. By the end of June 200,000 troops were stationed within call, and on the 4th July the French began to cross over to the left bank of the Danube. The events which followed are described under Wagram. The great battle at this place, fought on the 5th and 6th of July, ended in the retirement of the Austrians. The only other event which occurred before peace was made was an unimportant action at Znaym on the 11th of July.

The Russian War of 1812.—Whilst the campaign of 1809 had seriously shaken the faith of the marshals and the higher ranks in the infallibility of the emperor's judgment, and the slaughter of the troops at Aspern and Wagram had still further accentuated the opposition of the French people to conscription, the result on the fighting discipline of the army had, on the whole, been for good. The panics of Wagram had taught men and officers alike a salutary lesson.

Aware of the growing feeling against war in France, Napoleon had determined to make no allies, but bear the expenses of the coming campaign, but find the men as well, and he was so far master of Europe that of the 363,000 who on the 24th of June crossed the Niemen no less than two-thirds were Germans, Austrians, Poles or Italians. But though the battlefield discipline of the men was better, the discipline in camp and on the march was worse, for the troops were no longer eager to reach the battlefield, and marched because they were compelled, not of their own goodwill. The result was apparent in a sudden diminution in mobility, and a general want of punctuality which in the event very seriously, and delayed the course of the campaign. On the other hand, the Russians, once their fatherland was invaded, became dominated by an ever-growing spirit of fanaticism, and they were by nature too obedient to their natural leaders, and too well trained to the hardships of campaigning, to lose their courage in a retreat.

The Strategic Deployment.—By the middle of June 1812 the emperor had assembled his army along the line of the Niemen. On the extreme right stood the Austrian contingent under Schwarzenberg (34,000 men). Next, centring about Warsaw, which he had declared his chief base, were the troops of Napoleon's brother Jerome. Then the main army under Napoleon in person (220,000 men; with 80,000 more under the viceroy of Italy on his right rear); and on the extreme left at Tilsit a flanking corps, comprising the Prussian auxiliary corps and other Germans (in all 40,000 strong). The whole army was particularly strong in cavalry; out of the 450,000, 80,000 belonged to that arm, and Napoleon, mindful of the lessons of 1807, had issued the most minute and detailed orders for the supply service in all its branches, and the forwarding of reinforcements, no less than 100,000 men being destined for that purpose in three days.

Information about the Russians was very indifferent; it was only known that Prince Bagration with about 33,000 men lay grouped about Wolkowysk; Barclay de Tolly with 40,000 about Vilna; and on the Austrian frontier lay a small corps under Tormassov in process of formation, while far away on the Turkish frontiers hostilities with the sultan retained Tschitschagov with 50,000 more. Of the enemy's plans Napoleon knew nothing, but, in accordance with his usual practice, the position he had selected met all immediate possible moves.

Opening of the Campaign.—On the 24th of June the passage of the Niemen began in torrid heat which lasted for a few days. The main army, with the emperor in person, covered by Murat and the cavalry, moved on Vilna, whilst Jerome on his right rear at once threatened Bagration and covered the emperor's outer flank. From the very first, however, the inherent weakness of the vast army, and the vicious choice of time for the beginning of the advance, began to make itself felt. The crops being still green, and nothing else available as forage for the horses, an epidemic of colic broke out amongst them, and in ten days the mounted arms had lost upwards of one-third of their strength; men died of sunstroke in numbers, and serious straggling began. Still everything pointed to the concentration of the Russians at Vilna, and Jerome, who on the 5th of July had reached Grodno, was ordered to push on. But Jerome proved quite inadequate to his position, listening to the complaints of his subordinates as to want of supplies and even of pay; he spent four whole days in absolute inertia, notwithstanding the emperor's reprimands. Meanwhile the Russians made good their retreat—Barclay towards the entrenched camp of Drissa on the Dvina, Bagration towards Mohilev.

The emperor's first great coup thus failed. Jerome was replaced by Davout, and the army resumed its march, this time in the hope of surrounding and overwhelming Barclay, whilst Davout dealt with Bagration. The want of mobility, particularly in the cavalry, now began to tell against the French. With horses only just recovering from an epidemic, they proved quite unequal to the task of catching the Cossacks, who swarmed round them in every direction, never accepting an engagement but compelling a constant watchfulness for which nothing in their previous experience had sufficiently prepared the French.

The French army steadily retired, Barclay from Vilna via Drissa to Vitebsk, Bagration from Wolkowysk to Mohilev. Again arrangements were made for a Napoleonic battle; behind Murat's cavalry came the "general advanced guard" to attack and hold the enemy, whilst the main body and Davout were held available to swing in on his rear. Napoleon, however, failed to allow for the psychology
of his opponents, who, utterly indifferent to the sacrifice of life, refused to be drawn into engagements to support an advance or to extiricate a rearguard, and steadily withdrew from every position when the French gained touch with them. Napoleon found himself in a far worse position, numerically and materially, than at the outset of the campaign. Then he had stood with 420,000 men on a front of 160 m., now he had only 220,000 men on a front of 135; he had missed three great opportunities of destroying his enemy in detail, and in five weeks, during which time he had only traversed 200 m., he had seen his troops reduced numerically at least one-third, and, worse still, his army was now far from being the fighting machine it had been at the outset.

36. Smolensk.—Meanwhile the Russians had not lost a single gun and the moral of their men had been improved by the result of the many minor encounters with the enemy; further, the junction of Bagration and Barclay was now assured in the vicinity of Smolensk. Towards this place the French advance was now resumed, and the Russian generals at the head of a united force of 130,000 men marched forward to meet them. Here, however, the inefficiency of the Russian staff actually saved them from the disaster which must certainly have overtaken them had they realized their intention of fighting the French. The Russians marched in two columns, which lost touch of one another, and as it was quite impossible for either to engage the French single-handed, they both retired again towards Smolensk, where with an advanced guard in the town itself—which possessed an old-fashioned brick enceinte not to be breached by field artillery alone—the two columns reunited and deployed for action behind the unfordable Dnieper.

Murat and Ney as “general advanced guard” attacked the town in the morning of the 16th of August, and whilst they fought the main body was swung round to attack the Russian left and rear. The whole of the 17th was required to complete the movement, and as soon as its purpose was sufficiently revealed to the Russians the latter determined to retreat under cover of night. Their manœuvre was carried out with complete success, and then began a series of rearguard actions and nocturnal retreats which completely accomplished their purpose of wearing down the French army. The Russian government, however, failed to see the matter in its true light, and Marshal Kutusov was sent to the front to assume the chief command. His intention was to occupy a strong position and fight one general action for the possession of Moscow, and to this end he selected the line of the Kalatscha where the stream intersects the great Moscow road.

37. Borodino.—Here he was overtaken by Murat and Ney, but the French columns had straggled so badly that four whole days elapsed before the emperor was able to concentrate his army for battle and then could only oppose 128,000 men to the Russians' 110,000. About 6 a.m. the battle began, but Napoleon was suffering from one of those attacks of illness and depression which hitherto became such an important factor in his fate. Till about midday he followed the course of the action with his usual alertness; then he appears to have been overcome by a kind of stupor and allowed his marshals to fight by themselves. There was no final decisive effort as at Wagram and the Guard was not even called on to move. Ultimately the sun went down on an undecided field on which 25,000 French and 38,000 Russians had fallen, but the moral reaction on the former was far greater than on the latter.

38. Moscow.—Kutusov continued his retreat, and Murat with his see the matter in its true light, and Marshal Kutusov had fallen, but the moral reaction on the former was far greater than on the latter.

Moscow.—Kutusov continued his retreat, and Murat with his see the matter in its true light, and Marshal Kutusov had fallen, but the moral reaction on the former was far greater than on the latter.

Towards nightfall Napoleon reached the scene, and the Russians being now clear the troops began to enter, but already fires were observed in the farther part of the city. Napoleon passed the night in a house in the western suburb and next morning rode to the Kremlin, the troops moving to the quarters assigned to them, but in the afternoon a great fire began and, continuing for two days, drove the French out into the country again.
The emperor was now in the direst perplexity. Kutuzov was hovering on the outskirts of the city, his main body at Kaluga, some marches to the S.W., where he was in full communication with the richest portion of the empire; and now news arrived that St. Cyr, who had relieved MacDonald on his extreme left, had only 17,000 men left under arms against upwards of 40,000 Russians under Wittgenstein; and to the south Tschitschagov's army, being no longer detained on the Turkish frontier, peace having been made, was marching to join Tormassov about Brest-Litewski with forces which would bring the total of the two well over 100,000 men. Meanwhile Schwarzenberg's force opposing these had dwindled to a bare 30,000.

The French army was thus disposed almost in an equilateral triangle with sides of about 570 m., with 95,000 men at the apex at Moscow opposed to 120,000-30,000 about Brest; opposite 100,000, and 17,000 about Drissa confronted by 40,000, whilst in the centre of the base at Smolensk lay Victor's corps, about 30,000. From Moscow to the Niemen was 550 m. In view of this situation Napoleon on the 4th of October sent General Lauriston to the Russian headquarters to treat. Whilst waiting his return Murat was enjoined to skirmish with Kutusov, and the emperor himself worked out a scheme to assume the offensive with his whole army towards St. Petersburg, calling in Victor and St. Cyr on the way. This project was persisted with, until on the 18th of October the 24th of July (versus Tschitschagov in the cordon of Tarutino or Vinkovo). On the morning of the 19th the whole army moved out to accept this challenge, and the French were thoroughly worsted on the 24th in the battle of Maloyaroslavetz.

39. The Retreat from Moscovy.—Then began the celebrated retreat. It has generally been forgotten that the utter want of march discipline in the French, and not the climatic conditions, was responsible for the appalling disasters which ensued. Actually the frost came later than usual that year, the 27th of October, and the weather was dry and bracing; not till the 8th of November did the cold at night become sharp. Even when the Battle of Tarutino was fought on the 26th, the cold was not severe; for the slow and sluggish stream was not frozen over, as is proved by the fact that Eblé's pioneers worked in the water all through that terrible day. But the French army was already completely out of hand, and the degree to which the panic of a crowd can master even the strongest instinct of the individual is shown by the conduct of the fugitives who crowded over the bridges, treading hundreds under foot, whilst all the time the river was easily fordable and mounted men rode backwards and forwards across it to return to the actual sequence of events. Kutuzov had been very slow in exploiting his success of the 24th and indeed had begun the pursuit in a false direction; but about the 2nd of November, headquarters of the French being at Vyszma, the Cossacks became so threatening that the emperor ordered the army to march (as in Egypt) in hollow square. This order, however, appears only to have been obeyed by the Guards, with whom henceforward the emperor marched.

Kutuzov had now overtaken the French, but fortunately for them he made no effort to close with them, but hung on their flank, molesting them with Cossacks and picking up stragglers. Thus the wreck of the Grande Armée, now not more than fifty thousand strong, reached Smolensk on the 9th and there rested till the 14th. The march was then resumed, the Guard leading and Ney commanding the rearguard. Near Krasnoi on the 16th the Russian advanced guard tried to head the column off. Napoleon halted a whole day to let the army close up; and then attacked with his old vigour and succeeded in clearing the road, but only at the cost of leaving Ney and the rearguard to its fate. By a night march of unexampled daring and difficulty Ney succeeded in breaking through the Russian cordon, but when he regained touch with the main body at Orcha only 800 of his 6000 men were still with him (21st).

40. The Beresina.—From here Napoleon despatched orders to Victor to join him at Borisov on the Beresina. The cold now gave way and thaw set in, leaving the country a morass, and Information came that Tschitschagov from the south had reached Borisov. He now selected Visselovo as the point of passage and at 1 a.m. on the 23rd sent orders to Oudinot to march thither and construct bridges. In the execution of these orders Oudinot encountered the Russian advanced guard near Borisov and drove the latter back in confusion, though not before the bridges had destroyed the existing bridge there. This sudden reassertion of the offensive threw Tschitschagov into confusion. Thus time was gained for Victor also to come up and for Oudinot to construct the bridges at Studienka near the above-mentioned place, but a spot in many respects better suited for the purpose. Thither therefore Napoleon sent his pontonniers under General Eblé, but on their arrival they found that no preparations had been made and much time was lost. Meanwhile Victor, in doubt as to the real point of passage, had left the road to Studienka open to Wittgenstein, who had followed hard on his heels.

By 4 p.m. on the 26th the bridges were finished and the passage began, but not without resistance by the Russians, who were gradually closing in. The crossing continued all night, though interrupted from time to time by failures of the bridges. All day during the 27th stragglers continued to cross, covered by such combatants as remained under sufficient discipline to be employed. At 8 a.m. on the 28th, however, Tschitschagov and Wittgenstein moved forward on both banks of the river to the attack, but were held off by the splendid self-sacrifice of the few envoicable troops on both Napoleon's right and Victor's until about 1 p.m. the last body of regular troops passed over the bridges, and only a few thousand stragglers remained beyond the river.

The number of troops engaged by the French that day cannot be given exactly. Oudinot's and Victor's men were relatively fresh and may have totalled 20,000, whilst Ney can hardly have had more than 6000 of all corps fighting under him. How many were killed can never be known, but three days later the total number of men reported fit for duty had fallen to 8000 only.

41. Final Operations.—Henceforward the retreat of the army became practically a headlong flight, and on the 5th of December, hearing that the Cossacks were spread between Tauroggen (December 30) which deprived the French of their last support upon their left. Königsberg thus became untenable, and Murat fell back to Posen, where on the 10th of January he handed over his command to Eugène Beauharnais and returned to Paris.

The Russian pursuit practically ceased at the line of the Niemen, for their troops also had suffered terrible hardships and a period of rest had become an absolute necessity.

42. The War of Liberation.—The Convention of Tauroggen became the starting-point of Prussia's regeneration. As the news of the destruction of the Grande Armée spread, and the appearance of countless stragglers convinced the Prussian people of the reality of the disaster, the spirit generated by years of French domination burst out. For the moment the king and his ministers were placed in a position of the greatest anxiety, for they knew the resources of France and the boundless versatility of their arch-enemy far too well to imagine that the end of their
sufferings was yet in sight. To disavow the acts and desires of the army and of the secret societies for defence with which all north Germany was honeycombed would be to imperil the very existence of the monarchy, whilst an attack on the wreck of the Grand Army meant the certainty of a terrible retribution from the new armies now rapidly forming on the Rhine.

But the Russians and the soldiers were resolved to continue the campaign. They had determined upon an all-out bloody war, and were determined to commit the Rhine and the Rhine-Ruhr defile to the enemy. Yet it was apparent to the grand army of France that the enemy could not be overthrown in their own country. Moreover, Napoleon's policy was to be upheld as long as his army endured. He could not afford to lose the advantage of his numerical superiority.

43. Napoleon's Preparations.—Meanwhile the emperor in Paris had been organizing a fresh army for the reconquest of Prussia. Thanks to his having compelled his allies to fight for his battle, he had not as yet drawn heavily on the fighting resources of France, the actual percentage of men taken by the conscriptions during the years since 1806 being actually lower than that in force in continental armies of to-day. He had also created in 1811-1812 a new National Guard, organized in cohorts, and distinguished it from the regular army and for home defence only, and these by a skilful appeal to their patriotism and judicious pressure applied through the prefects, became a useful reservoir of half-trained men for new battalions of the active army. Levies were also made with rigorous severity in the states of the Rhine Confederation, and even Italy was called on for fresh sacrifices. In this manner by the end of March upwards of 200,000 men were moving towards the Elbe, and in the first fortnight of April they were duly concentrated in the angle formed by the Elbe and Saale, threatening on the one hand Berlin, on the other Dresden and the east.

44. Second Campaign of 1813.—The allies were aware of the gradual strengthening of their enemy's forces but themselves as yet unable to put more than 200,000 in the field, had left a small corps of observation opposite Magdeburg and along the Elbe to give timely notice of an advance towards Berlin; and with the bulk of their forces had taken up a position about Dresden, whence they had determined to march down the course of the Elbe and roll up the French from right to left. Both armies were very indifferently supplied with information, as both were without any reliable regular cavalry capable of piercing the screen of outposts with which each endeavoured to conceal his disposition, and Napoleon, operating in a most unfriendly country, suffered more in this respect than his adversaries.

45. Battle of Lützen.—About 9 a.m. on May 2nd he began an attack on the French advance guard in Lützen, whilst the remainder of his army was directed against Napoleon's right and rear only. As the French were moving off the heads of the French main body suddenly appeared, and at 11 a.m. Napoleon, then standing near the Gustavus Adolphus monument on the field of Lützen, heard the roar of a heavy cannonade to his right rear. He realized the situation in a moment, galloped to the new scene of action, and at once grouped his forces for decisive action—the gift in which he was supreme. Leaving the leading troops to repulse as best they might the furious attack of both Russians and Prussians, and caring little whether they lost ground, he rapidly organized for his own control a battle-reserve. At length when both sides were exhausted by their efforts he turned and retired over the Elbe, after blowing up the stone bridge. Case-shot fire the enemy's line and marched his reserve right through the gap. Had he possessed an adequate cavalry force the victory would have been decisive. As it was, the allies made good their retreat and the French were too exhausted for infantry pursuit.

Perhaps no battle better exemplifies the inherent strength of the emperor's strategy, and in none was his grasp of the battlefield more brilliantly displayed, for, as he fully recognized, "These Prussians have at last learnt something—they are no longer the woolly milk of France or of Dresden the Great, and on the other hand, the relative inferiority of his own men as compared with his veterans of Austerlitz called for far more individual effort than on any previous day. He was everywhere, encouraging and compelling his men—it is a legend in the French army that the persuasion even of the imperial boot was used upon some of his reluctant conscripts, and in the result his system was fully justified, as it triumphed even against a great tactical surprise."

46. Bautzen.—As soon as possible the army pressed on in pursuit. Ney being sent across the Elbe to turn the position of the allies at Dresden. This threat forced the latter to evacuate the town and retire over the Elbe, after blowing up the stone bridge across the river. Napoleon entered the town hard on their heels, but the broken bridge caused a delay of four days, there being no pontoon trains with the army. Ultimately on the 18th of May the march was renewed, but the allies had continued their retreat in leisurely fashion, picking up reinforcements by the way. Arrived at the line of the Spree, they took up and fortified a very formidable position about Bautzen (52°). Here, on the 20th, they were attacked, and after a two days' battle dislodged by Napoleon; but the weakness of the French cavalry conditioned both the form of the attack, which was less effective than usual, and the results of the victory, which were extremely meagre.

The allies broke off the action at their own time and retired in such good order that the emperor failed to capture a single trophy as proof of his victory. The enemy's escape annoyed him greatly, the absence of captured guns and prisoners reminded him too much of his Russian experiences, and he redoubled his demands on his corps commanders for greater vigour in the pursuit. This led the latter to push on without due regard to tactical precautions, and Blücher took advantage of their carelessness when at Hayingau (May 26), with some twenty squadrons of Russian cavalry, he surprised, routed, and almost destroyed Maisonne's division. The material loss inflicted on the French was not very great, but its effect in raising the moral of the raw Prussian cavalry and increasing their confidence in their old commander was enormous.

Still the allies continued their retreat and the French were unable to bring them to action. In view of the doubtful attitude of Austria, Napoleon became alarmed at the gradual lengthening of his lines of communication and opened negotiations. The enemy, having everything to gain and nothing to lose thereby, agreed finally to a six weeks' suspension of arms. This was perhaps the gravest military error of Napoleon's whole career,
and his excuse for it, "want of adequate cavalry," is the strongest testimony as to the value of that arm.

47. The Autumn Campaign.—As soon as a suspension of arms (to 15th of August) had been agreed to, Napoleon hastened to withdraw his troops from the dangerous position they occupied with reference to the passes leading over the mountains from Bohemia, for he entertained no doubt now that Austria was also to be considered as an enemy. Finally he decided to group his corps round Gruhlitz and Bautzen whence they could either meet the enemy advancing from Breslau or fall on his flank over the mountains if they attempted to force their way into Saxony by the valley of the Elbe. This latter manoeuvre depended, however, on his maintenance of Dresden, and to this end he sent the I. Corps up the Elbe to Pirna and Königstein to cover the fortifications of Dresden itself. His instructions on this point deserve the closest study, for he foresaw the inevitable attraction which a complete entrenched camp would exercise even upon himself, and, therefore, limited his engineers to the construction of a strong bridge head on the right bank and a continuous enceinte, broken only by gaps for counter attack, around the town itself.

Then he turned his attention to the plan for the coming campaign. Seeing clearly that his want of an efficient cavalry precluded all ideas of a resolute offensive in his old style, he determined to limit himself to a defence of the line of the Elbe, making only dashes of a few days' duration at any target the enemy might present.

Reinforcements had been coming up without ceasing and at the beginning of August he calculated that he would have 300,000 men available about Bautzen and 100,000 along the Elbe from Hamburg via Magdeburg to Torgau. With the latter he determined to strike the first blow, by a concentric advance on Berlin (which he calculated he would reach on the 4th or 5th day), the movement being continued thence to extricate the French garrisons in Küstrin, Stettin and Danzig. The moral effect, he promised himself, would be prodigious, and there was neither room nor food for these 100,000 elsewhere.

Towards the close of the armistice he learned the general situation of the allies. The crown prince of Sweden (Bernadotte), with his Swedes and various Prussian levies, 135,000 in all, lay in and around Berlin and Stettin; and knowing his former marshal well, Napoleon considered Oudinot a match for him. Blücher with about 95,000 Russians and Prussians was about Breslau, and Schwarzenberg, with nearly 180,000 Austrians and Russians, lay in Bohemia. In his position at Bautzen he felt himself equal to all his enemy's combinations.

48. Dresden.—The advance towards Berlin began punctually with the expiration of the armistice, but with the main army he himself waited to see more clearly his adversaries' plans. At length becoming impatient he advanced a portion of his army towards Blücher, who fell back to draw him into a trap. Then the news reached him that Schwarzenberg was pressing down the valley of the Elbe, and, leaving Macdonald to observe Blücher, he hurried back to Bautzen to dispose his troops to cross the Bohemian mountains in the general direction of Königstein, a blow which must have had decisive results. But the news from Dresden was so alarming that at the last moment he changed his mind, and sending Vandamme alone over the mountains, he hurried with his whole army to the threatened point. This march remains one of the most extraordinary in history, for the bulk of his forces moved, mainly in mass and across country, 90 m. in 72 hours, entering Dresden on the morning of the 27th, only a few hours before the attack of the allies commenced. For the events which followed see DRESDEN (battle).

Dresden was the last great victory of the First Empire. By noon on the 27th August the Austrians and Russians were completely beaten and in full retreat, the French pressing hard behind them, but meanwhile Napoleon himself again succumbed.
NAPOLEONIC CAMPAIGNS

231
to one of his unaccountable attacks of apparent intellectual paralysis. He seemed unaware of the vital importance of the moment, crouched shivering over a bivouac fire, and finally rode back to Dresden, leaving no specific orders for the further pursuit.

49. French Defeats.—The allies, however, continued to retreat, but unfortunately Vandamme, with his single column, unsupported, issued out of the left, around Dresden, and threw himself across their line of retreat near Kulm, and was completely overwhelmed by sheer weight of numbers (20th). In spite of this misfortune, Napoleon could claim a brilliant success for himself, but almost at the same moment news reached him that Oudinot at Grossbeeren near Berlin, and Macdonald on the Katzbach opposed to Blücher, had both been severely defeated.

50. Napoleon's Movements.—During the next two days the emperor examined his situation and dictated a series of notes which have been a puzzle to every strategical thinker ever since. In these he seems suddenly to have cut adrift from every principle the truth of which he had himself so brilliantly demonstrated, and we find him discussing plans based on hypothesis, not knowledge, and on the importance of geographical points without reference to the enemy's field army. From these reveries he was at length awakened by news which indicated that the consequences of Macdonald's defeat had been far more serious to the moral of that command than he had imagined. He immediately rode over to establish order, and his manner and violence were so improper that Caulaincourt had the greatest difficulty in concealing his embarrassment. His emperor again returned to Dresden, where for the rest of the month he remained in an extraordinary state of vacillation. On the 4th of October he again drew up a review of the situation, in which he apparently contemplated giving up his communications with France and wintering in and around Dresden, though at the same time he is aware of the distress amongst his men for want of food.

51. Campaign of Leipzig.—In the meanwhile Blücher, Schwarzenberg and Bernadotte were working round his flanks. Ney, who had joined Oudinot after Grossbeeren, had been detached to cover the Schwarzenberg's left flank. Wellington, hoping to cross the Elbe, was on the move, but Napoleon, in his impetuous movement, had hastened the advance of his troops and in consequence the French made another attempt to throw him from the road, and this time saw the emperor decided to throw the bulk of his force on Blücher, and, with his usual sureness and celerity, but whilst the French moved on Wittenberg, Blücher was marching to his right, indifferent to his communications as all Prussia lay behind him.

This move on the 14th brought him into touch with Bernadotte, and now a single march forward of all three armies would have absolutely isolated Napoleon from France; but Bernadotte's nerve failed him, for on hearing of Napoleon's threat against Wittenberg he decided to retreat northward, and not all the persuasions of Blücher and Gneisenau could move him. Thus if the French movement momentarily ended in a blow in the air, it was indirectly the cause of their ultimate salvation.

52. The "Battle of the Nations."—On the 19th Napoleon concentrated his forces to the east of Leipzig, with only a weak detachment to the west, and in the evening the allies were prepared to attack him. Schwarzenberg, with 160,000 men available at once and 60,000 on the following day; Blücher had about 60,000, but Bernadotte now could not arrive before the 20th.

Napoleon prepared to throw the bulk of his force upon Schwarzenberg and massed his troops south-east of the town, whilst Schwarzenberg marched concentrically against him down the valley of the Elster and Pleisse, the mass of his troops on the right bank of the latter and a strong column under Gudlay on the left working round to join Blücher on the north. The fighting which followed was most obstinate, but the Austrians failed to make any impression on the French positions, and indeed Gudlay felt himself compelled to withdraw to his former line. On the other hand, Blücher carried the village of Möckern and came within a mile of the gates of the town. During the 19th there was only indecisive skirmishing, Schwarzenberg waiting for his reinforcements coming up by the Dresden road, Blücher for Bernadotte to come in on his left, and by some extraordinary oversight Gudlay was brought closer in to the Austrian centre, thus opening for the French their line of retreat towards Erfurt, and no information of this movement appears to have been conveyed to Blücher. The emperor when he became aware of the movement, sent the IVth Corps to Lindenau to keep the road open. Bernadotte came up and closed the gap to the N.E. of the town between Blücher and the Austrians. At 2 p.m. the Saxons, who had remained faithful to Napoleon longer than his other German allies, went over to the enemy. All hope of saving the battle had now to be given up, but the French covered their retreat obstinately and by daybreak next morning one-half of the army was already flying out along the road to Erfurt which had so fortunately been left for them.

53. Retreat of the French and Battle of Hanau.—It took Blücher time to extricate his men, who were well protected, and it had been his plan within which the battle had thrown them, and the garrison of Leipzig and the troops left on the right bank of the Elster still resisted obstinately—hence no direct pursuit could be initiated and the French, still upwards of 100,000 strong, moving rapidly, soon gained distance enough to be reformed. Blücher followed by parallel and inferior roads on their northern flank, but Schwarzenberg knowing that the Bavarians also had forsaken the emperor and were marching under Wrede, 50,000 strong, to intercept his retreat, followed in a most leisurely fashion. Blücher did not succeed in overtaking the French, but the latter, near Hanau, found their way barred by Wrede with 50,000 men and over 100 guns in a strong position.

To this fresh emergency Napoleon and his army responded in most brilliant fashion. As at Krasnoi in 1812, they went straight for their enemy and after one of the most brilliant series of artillery movements in history, directed by General Drouot, they marched right over their enemy, practically destroying his whole force. Henceforward their march was un molested, and they reached Mainz on the 5th of November.

54. The Defensive Campaign.—When the last of the French troops marched across the Rhine, divided counsels made their appearance at the headquarters of the allies. Every one was weary of the war, and many felt that it would be unwise to push Napoleon and the French nation to extremes.
Hence a prolonged halt arose, utilized by the troops in renewing their equipment and so forth, but ultimately the Young German party, led by Blücher and the principal fighting men of the army, triumphed, and on the 1st of January 1814 the Silesian army (50,000) began its passage of the Rhine at Kaub. They were to be supported by Schwarzenberg with 200,000 men, who was to advance by Basel and Neu Breisich to the south, and Bernadotte with the Northern army, about 120,000, was to move in support on the right flank through the Netherlands and Lauen; this force was not yet ready and did not, in fact, reach the latter place till March.

To meet these forces the emperor could not collect 200,000 men in all, of whom upwards of 100,000 were held by Wellington on the Spanish frontier, and 20,000 more were required to watch the debouches from the Alps. Hence less than 50,000 remained available for the east and north-eastern frontier. If, however, he was weak in numbers, he was now again operating in a friendly country, able to find food almost everywhere and practically indifferent as to his communications.

On the 25th of January, Blücher entered Nancy, and, moving rapidly up the valley of the Moselle, was in communication with the Austrian advanced guard near La Rothière on the afternoon of the 26th, but his headquarters were surprised and he himself nearly captured by a sudden rush of French troops, and he learnt at the same time that the emperor in person was at hand. He accordingly fell back a few miles next morning to a strong position covering the exits from the Bar-sur-Aube defile. There he was joined by the Austrian advance guard, and together they decided to accept battle—indeed they had no alternative, as the roads in rear were so choked with traffic that retreat was out of the question. About noon the 2nd of February Napoleon attacked them, but the weather was terrible, and the ground so heavy that his favourite artillery, the mainstay of his whole system of warfare, was useless and in the drifts of snow which at intervals swept across the field, the columns lost their direction and many were severely handled by the Cossacks. At nightfall the fighting ceased and the emperor retired to Lesmont, and thence to Troyes, Marmont being left to observe the enemy.

55. Montmirail.—Owing to the state of the roads, more perhaps to the extraordinary lethargy which always characterized Schwarzenberg's headquarters, no pursuit was attempted. But on the 4th of February Blücher, chafing at this inaction, obtained the permission of his own sovereign to transfer his line of operations to the valley of the Marne; Pahlen's corps of Cossacks were assigned to him to cover his left and maintain communication with the Austrians.

Believing himself secure behind this screen, he advanced from Vitry along the roads leading down the valley of the Marne, with his columns widely separated for convenience of subsistence and shelter—the latter being almost essential in the terrible weather prevailing. Blücher himself on the night of the 7th was at Sézanne, on the exposed flank so as to be nearer to his sources of intelligence, and the rest of his army were distributed in four widely scattered corps at or near Épernay, Montmirail and Étôges; reinforcements also were on their way to join him and were then about Vitry.

In the night his headquarters were again surprised, and he learnt that Napoleon himself with his main body was in full march to fall on his scattered detachments. At the same time he heard that Pahlen's Cossacks had been withdrawn forty-eight hours previously, thus completely exposing his flank. He himself retreated towards Étôges endeavouring to rally his scattered detachments, but Napoleon was too quick for him and in three successive days he defeated Sacken at Montmirail, York at Champ Aubert and Blücher and his main body at Étôges, pursuing the latter towards Vertus. These disasters compelled the retreat of the whole Silesian army, and Napoleon, leaving Mortier and Marmont to deal with them, hurried back to Troyes with his main body to strike the flank of Schwarzenberg's army, which had meanwhile begun its leisurely advance, and again at Mormant on the 17th of February, Montceau the 18th and Méry the 21st, he inflicted such heavy punishment upon his adversaries that they fell back precipitately to Bar-sur-Aube.

56. Lauen.—In the meantime Blücher had rallied his scattered forces and was driving Marmont and Mortier before him. Napoleon, as soon as he had disengaged himself of Schwarzenberg, counter-marched his main body and moving again by Sézanne, fell upon Blücher's left and drove him back upon Soissons. This place had been held by a French garrison, but had capitulated only twenty-four hours beforehand, a fact of which Napoleon was naturally unaware. The Silesian army was thus able to escape, and marching northwards combined with Bernadotte at Lauen—this reinforcement bringing the forces at Blücher's disposal up to over 100,000 men.

On the 7th of March Napoleon fell upon the advance guard of this force at Craonne and drove it back upon Lauen, where a battle took place on the 9th. Napoleon was here defeated, and with only 30,000 men at his back he was compelled to renounce all ideas of a further offensive, and he retired to rest his troops to Reims. Here he remained unmolested for a few days, for Blücher was struck down by sickness, and in his absence nothing was done. On the 14th of March, however, Schwarzenberg, becoming aware of Napoleon's withdrawal to Reims, again began his advance and had reached Arcis-sur-Aube when the news of Napoleon's approach again induced him to retreat to Brienne.

57. The Allies March on Paris.—Thus after six weeks' fighting the allies were hardly more advanced than at the beginning. Now, however, they began to realize the weakness of their opponent, and perhaps actuated by the fear that Wellington from Toulouse might, after all, reach Paris first, they determined
to march to Paris (then an open city), and let Napoleon do his worst to their communications. Actually this was exactly what he was preparing to do. He had determined to move eastward to St. Dizier, rally what garrisons he could find, and raise the whole country against the invaders, and had actually started on the execution of this plan when his instructions fell into the enemy's hands and his projects were exposed. Regardless of the threat, the allies marched straight for the capital. Marmont and Mortier with what troops they could rally took up a position on Montmartre heights to oppose them, but seeing further resistance to be hopeless they gave way on the 31st of March, just as Napoleon, with the wreck of the Guards and a mere handful of other detachments, was hurrying across the rear of the Austrians towards Fontainebleau to join them.

This was the end of the First Empire. The story of the Waterloo Campaign is told under its own heading.

The Military Character of Napoleon.

No military career has been examined more often and more freely than that of Napoleon. Yet even so the want of complete documentary evidence upon which to base conclusions has vitiated all but the most recent of the countless monographs and histories that have appeared on the subject. Fortunately the industry and ability of the military history section of the French General Staff have rendered available, by the publication of the arguments and particularly of several of his campaigns, a mass of information which, taken in conjunction with his own voluminous correspondence, renders it possible to trace the growth of his military genius with a reasonable approach to accuracy. Formerly we could only watch the evolution of his powers of organization and the purely psychic gifts of resolution and command. The actual working of his mind towards that strategic and tactical ascendency that rendered his presence on the battlefield, according to the testimony of his opponents, equal to a reinforcement of 49,000 men, was entirely indiscernible.

The history of his youth reveals no special predilection for the military service—the best of his mind was political far more than military, but unlike the politicians of his epoch he consistently applied scientific and mathematical methods to his theories, and desired above all things a knowledge of facts in their true relation to one another. His early military education was the best and most practical then attainable, primarily because he had the good fortune to come under the influence of men of exceptional ability—Baron du Kellé, Bois Roger and others. From them he derived a sound knowledge of artillery and fortification, and particularly of the art of maneuver, the latter was destined to prove of inestimable service to him in his first campaigns of 1794–95 and 1796. In these, as well as in his most dramatic success of Marengo in 1800, we can discern no trace of strategical innovation. He was simply a master of the methods of his time. Ceaseless industry, energy and conspicuous personal gallantry were the principal factors of his brilliant victories, and even in 1805 at Ulm and Austerlitz it was still the excellence of the tactical instrument, the army, which the Revolution had bequeathed to him that essentially procured the success.

Meanwhile the mathematical mind, with its craving for accurate data on which to found its plans (the most difficult of all to obtain under the conditions of warfare), had been searching for expedients which might serve him to better purpose, and in 1805 he had recourse to the cavalry screen in the hope of such results. This proved a palliation of his difficulty, but not a solution. Cavalry can only observe, it cannot hold. The facts as to the position of an opponent accurately observed and correctly reported at a given moment, afford no reliable guarantee of his position at the hour, when the orders based on this information enter upon execution. This can only be calculated on the ground of reasonable probability as to what it may be to the best interest of the adversary to attempt. But what may seem to a Napoleon the best course is not necessarily the one that suggests itself to a mediocre mind, and the greater the gulf which separates the two minds the greater the uncertainty which must prevail on the side of the abler commander.

It was in 1806 that an improved solution was first devised. The general advanced guard of all arms now followed immediately behind the cavalry screen and held the enemy in position, while the remainder of the army followed at a day's march in a "bataillon carré" ready to manoeuvre in any required direction. The full reach of this discovery seems as yet scarcely to have impressed itself upon the emperor with complete conviction, for in the succeeding campaign in Poland we find that he twice departed from this form—at Pultusk and Heilsberg—and each time his enemy succeeded in escaping him. At Friedland, however, his success was complete, and henceforth the method recurs on practically every battlefield. When it fails it is because its inventor himself hesitates to push his own conception to its full development (Eckmühl 1809, Borodino 1812). Yet it would seem that this invention of Napoleon's was intuitive rather than reasoned; he never communicated it in its entirety to his marshals, and seems to have been only capable of exercising it either when in full possession of his health or under the excitement of action. Thus we find him after the battle of Dresden— itself a splendid example of its efficacy—suddenly reverting to the terminology of the school in which he had been brought up, which he himself had destroyed, only to revive again in the most brilliant and handle his forces strategically with all his accustomed brilliancy.

In 1814 and in 1815 in the presence of the enemy he again rises supremely to each occasion, only to lapse in the intervals even below the level of his old opponents; and that this was not the consequence of temporary depression naturally resulting from the accumulated load of his misfortunes, is sufficiently shown by the downright puerility of the arguments by which he seeks to justify his own successes in the St. Helena memoirs, which one may search in vain for any indication that Napoleon was himself aware of the magnitude of his own discovery. One is not surprised at the chronicler's inability to understand the brain a dual capacity—one the normal and reasoning one, developing only the ideas and conceptions of his contemporaries, the other intuitive, and capable only of work under abnormal pressure. At such moments of crisis it almost excelled human comprehension; the mind seems to have gathered to itself and summed up the balance of all human passions arranged for and against him, and to have calculated with unerring exactitude the consequences of each decision.

A partial explanation of this phenomenon may perhaps be found in the economy of nervous energy his strategic method entailed to him. May 1806 was ready to fight whenever his enemy might stand or move to meet him, his mind was relieved from all the hesitations which necessarily arise in men less confident in the security of their designs. Hence, when on the battlefield the changing course of events left his antagonists mentally exhausted, he was able to face them with will power neither bound nor broken. But this only explains a portion of the mystery that surrounds him, and which will make the study of his career the most fascinating to the military student of all times.

Amongst all the great captains of history Cromwell alone can be compared to him. Both, in their powers of organization and the mastery of the tactical potentialities of the weapons of their day, were immeasurably ahead of their times, and both also understood to the full the strategic art of binding and restraining the independent willpower of their opponents, an art of which Marlborough and Frederick, Wellington, Lee and Moltke do not seem even to have glimpsed the fringe.

NAVAL OPERATIONS

The French navy came under the direct and exclusive control of Napoleon after the 18th Brumaire. At the close of 1799 (see French Revolutionary Wars) he had three purposes to serve by the help of his fleet: the relief of the French garrison besieged by the British forces in Malta; the reinforcement of the army he had left in Egypt; and the distraction of Great Britain by the threat of invasion of England across the Channel, or of Ireland. The deficiencies both in number and in quality of its naval resources doomed him to fail in all three. Though he had control of what remained of the navies of Holland and Spain, as well as of the French, he was outnumbered at every point, while the efficiency of the British fleet gave it a majority which doubled its material superiority. All Napoleon’s efforts to support his troops in Malta and Egypt were necessarily made under the hampering obligation to evade the British forces barring the road. The inevitable result was that only an occasional blockade-runner could succeed in escaping detection and attack. The relief thus brought to Malta and Egypt was not sufficient. In February 1800, the “Généraux” (“74), one of the few ships which escaped from the Nile, sailed from Toulon with three corvettes, under Rear-admiral Perrée, to relieve Malta. On the 18th she was sighted by the blockading squadron, surrounded and captured. The British were unable to carry the Nile, where were 87 ships, the “Guillaume Tell” (“80), and two frigates, the “Diane” and the “Justice.” On the 29th of July the “Guillaume Tell” endeavoured to slip out in the night. She was sighted, pursued and overpowered, after a singularly gallant resistance. The frigates made an attempt to get off on the 24th of August, but only the “Justice,” a solitary survivor of the squadron which fought at the Nile, reached Toulon. Malta, starved out by the British fleet, surrendered on the 4th of September 1800. Very similar was the fate of the efforts to reach and reinforce the army of Egypt. In the spring of 1800, Bonaparte stopped the relieving forces at their point of departure, or baffled, when they did not take them, at their landingfall. A squadron of seven sail of the line, under Admiral Ganteaume, succeeded in slipping out of Brest, when a gale had driven the British blockading force off the coast. Ganteaume met with some measure of success in capturing isolated British men-of-war, one of them being a 74, the “Swiftsure.” But he failed to give effectual help to the Egyptian army. He sailed on the 23rd of January 1801, entered the Mediterranean and, his squadron being in a bad condition, steered for home, and was round up by the British in the Ceuta Roads. On the 10th of March he sailed again for Egypt, but was again driven back by the same causes on the 5th of April. On the 25th he was ordered out once more. Three of his ships had to be sent back as unfit to keep the sea. With the other four he reached the coast of Egypt, on the 7th of May, only to sight a powerful British force, and to be compelled to escape to Toulon, which he did not reach till the 22nd of July. The French in Egypt were in fact beaten before he reached the coast. At the beginning of 1801, a British naval force, commanded by Lord Keith, had sailed from Gibraltar, establishing an army of 18,000 men under General Abercromby. It reached Malta, with Sir J. J. Keith, on the 31st of January, to arrange a co-operation with the Turks, and after some delay the army was transported and landed in Egypt, on the 7th and 8th of March. Before the end of September the French army was reduced to capitulation. In the interval another effort to carry help to it was made from Toulon. On the 13th of June 1801 Rear-admiral Linois left Toulon with three sail of the line, to join a Spanish squadron at Cadiz and go on to Egypt. In the straits he was sighted by the British squadron under Sir J. Saumarez, and driven to seek the protection of the Spanish batteries at Algeciras. On the 6th of July he beat off a British attack, capturing the “Hannibal,” 74. On the 9th a Spanish squadron came to his assistance, and the combined force steered for Cadiz. During the night of the 12th/13th of July they were attacked by Sir J. Saumarez. Two Spanish three-deckers blew up, and a 74-gun ship was taken. The others were blockaded in Cadiz. The invasion scheme was vigorously pushed after the 3rd of March 1801. Flat-bottomed boats were gradually collected at Boulogne. Two attempts to destroy them at anchor, though directed by Nelson himself, were repulsed on the 13th and 19th. But it required no more than a threat made for diplomatic purposes. On the 1st of October 1801 an armistice was signed in London, and the Peace of Amiens followed, on the 27th of March 1802. (For the operations in the Baltic in 1801, see Copenhagen, Battle of.)

The Peace of Amiens proved to be only an uneasy truce, and it was succeeded by open war, on the 18th of May 1803. From that date till about the middle of August 1805, a space of some two years and two months, the war took the form of a most determined attempt on the part of Napoleon to carry out an invasion of Great Britain, met by the counter-measures of the British government. The scheme of invasion was based on the Boulogne flotilla, a device inherited from the old French royal government, through the Republic. Its object was to throw a great army ashore on the coast between Dover and Hastings. The preparations were made on an unprecedented scale. The Republic had collected some two hundred and forty vessels. Under the direction of Napoleon ten times as many were equipped. They were divided into: prames, ship-rigged, of 35 metres long and 8 wide, carrying 13 guns; chaloupes cannonières, of 24 metres long and 5 wide, carrying 5 guns and 100 men; and bateau cannoniers, of 30 metres long by 1-56 wide, carrying 2 guns and more boats. All were built to be rowed, were flat-bottomed, and of shallow draft so as to be able to navigate close to the shore, and to take the ground without hurt. They were built in France and the Low Countries, in the coast towns and the rivers—even in Paris—and were collected gradually, shore batteries both fixed and mobile being largely employed to cover the passage. A vast sum of money and the labour of thousands of men were employed to clear harbours for them, at and near Boulogne. The Boulogne flotilla met the coast more impossible for the British line-of-battle ships, or even large frigates, to press the attack on them. Smaller vessels they were able to beat off and so, in spite of the activity of the British cruisers and of many sharp encounters, the concentration was effected at Boulogne, where an army of 130,000 was encamped and was incessantly practised in embarking and disembarking. Before the invasion was taken in hand as a serious policy, there had been at least a profession of a belief that the flotilla could push across the Channel during a calm. Experience soon showed that when the needful allowance was made for the tide, it was impossible to bring them out of harbour (two tides) and for the influence which the Channel currents must have upon their speed, it would be extremely rash to rely on a calm of sufficient length. Napoleon therefore came
early to the conclusion that he must bring about a concentration of his seagoing fleet in the Channel, which would give him a temporary command of its waters.

He had a squadron at Brest, ships at L'Orient and Rochefort, some of his vessels had taken refuge at Ferrol on their way back from San Domingo when war broke out, one was at Cadiz, and he had a squadron at Toulon. All these forces were watched by British blockading squadrons. The problem was to bring them together before the British fleet could be concentrated to meet them. Napoleon's solution grew, as time went on and circumstances changed, in scope and complexity. In July 1804, he ordered the new ships of the line of the Channel to lay in the estuaries of the river, in order to take advantage of the opportunity when Nelson, who was in command of the blockade, was driven off by a northerly gale, to put to sea, with 10 sail of the line, pick up the French ship in Cadiz, join Villeneuve who was in the Aix roads, and then effect a junction with Ganteaume and the 21 sail of the line at Brest. He hoped that if the British ships in the North Sea concentrated with the squadron in the Channel, he would be able to make use of Dutch vessels from the Texel. The death of Latouche Tréville, 20th of August 1804, supplied an excuse for delay. He was succeeded by Villeneuve, who had been selected as the most suitable person for the command of the fleet without Tréville, and began laying elaborate plans by which French vessels were to slip out and sail for distant seas, to draw the British fleet after them, and then return to concentrate in the Channel. A further modification was introduced by the end of 1804. Spain, which was bound by treaty to join Napoleon, was allowed to preserve a show of neutrality by paying a monthly subscription. The British government, treating this as a hostile action—as it was—seized the Spanish treasure ships on their way from America, near Cape Santa Maria, on the 5th of October 1804, and Spain declared war on the 12th of December. New plans were now made including the co-operation of the Spanish fleet. Amid all the variation in their details, and the apparent confusion introduced by Napoleon's habit of suggesting alternatives and discussing probabilities, and in spite of the preparations ostensibly made for an expedition to Ireland, which was to have sailed from Brest and to have carried 30,000 troops commanded by Augereau, the real purpose of Napoleon was neither altered nor concealed. He worked to produce doubt and confusion in the mind of the British government by threats and attacks on its distant possessions, which should lead it to scatter its forces. On the other hand, he unhesitatingly carried out, however, securing the co-operation, or effecting the purpose he had in view. On the 11th of January 1805 Admiral Missiessy left Rochefort with 5 sail of the line, undetected by the British forces on the coast. Missiessy carried out a successful voyage of commerce-destroying, and returned safely to Rochefort on the 20th of May, from the West Indies. But the force sent in pursuit of him was small, and the British government was not deceived into weakening its hold on the Channel. It was in fact well supplied with information by means of the spy service directed by an exiled French royalist, the count d'Antraigues, who was established at Dresden as a Russian diplomatic agent. Through his correspondents in Paris, some of whom had access to Napoleon's papers, the British government was able to learn the emperor's real intentions. The blockade of Brest was so strictly maintained that Ganteaume was allowed no opportunity to get to sea. Villeneuve, who was to have co-operated with Missiessy, did indeed leave Toulon, at a moment when Nelson, whose policy it was to encourage him to come out by not staying too near the port, was absent, on the 17th of January 1805. The British admiral, when informed that the French were at sea, justified Napoleon's estimate of his probable course in such a contingency, by making a useless cruise to Egypt. But Villeneuve's ill-appointed ships, manned by raw crews, suffered loss of spars in a gale, and he returned to Toulon on the 21st. His last start came when he sailed, unseen by Nelson, on the 30th of March. Aided by lucky changes of wind, he reached Cadiz, was joined by 1 French and 6 Spanish ships under Admiral Gravina, which, added to the 11 he had with him, gave him a force of 18 sail. He left Cadiz on the night of the 9th/10th of April, and reached Fort de France in Martinique on the 14th of May. Here he was to have remained till joined by Ganteaume from Brest. On the 1st of June he was joined by a frigate and two line-of-battle ships sent with orders from Rochefort, and was told to remain in the West Indies till the 5th of July, and if not joined by Ganteaume to steer for Ferrol, pick up the French and Spanish ships in the port, and come on to the Channel. Villeneuve learnt on the 8th of June that Nelson had reached Barbadoes in pursuit of him on the 4th. The British admiral, delayed by contrary winds, had not been able to start from the entrance to the Straits of Gibraltar till the 14th. An order of the emperor in the West Indies would have the emperor's plan of concentration, and Villeneuve decided to sail at once for Ferrol. Nelson, misled by false information, ranged the West Indies as far south as the Gulf of Paria, in search of his opponent whom he supposed to be engaged in attacks on British possessions. By the 13th of June he had learnt the truth, and sailed for Gibraltar under the erroneous impression that the French admiral would return to Toulon. He sent a brig home with despatches; on the 19th of June, in lat. 33° 12' N. and long. 58° W., the French were seen by this vessel heading for Ferrol. When the British ships of war hurled home, and the information he brought was at once acted on by Lord Barham, the First Lord of the Admiralty, who took measures to station a force to intercept Villeneuve outside Ferrol. On the 22nd of July, 35 leagues N.W. of Finisterre, Villeneuve was met by the British admiral sent to intercept him, Sir Robert Calder. A confused action in a fog ended in the capture of 2 Spanish line-of-battle ships. But Sir R. Calder, who had only 15 ships to his opponent's 20 and was nervous lest he should be overpowered, did not act with energy. He retreated to join the blockading fleet off Brest. Villeneuve was now able to join the vessels at Ferrol. Nelson, who reached Gibraltar on the very day the action off Ferrol was fought, was too far away to interfere with him. But Villeneuve, who was closely controlled by the inefficiency of the ships of his fleet and especially of the Spaniards, and who was convinced that an overwhelming British force would be united against him in the Channel, lost heart, and on the 15th of August sailed south to Cadiz. By this movement he ruined the emperor's elaborate scheme. Napoleon at once broke up the camp at Boulogne and marched to Germany. The further movements of Villeneuve's fleet are to be found under Trafalgar.
NAPOLEONITE—NARA

BIBLIOGRAPHY.—Captain Mahan, *Influence of Sea Power upon the French Revolution and the Empire* (London, 1892); Chevalier, *Histoire de la marine française sous le consulat et l'empire* (Paris, 1886). All the operations connected with the successive invasion, weight, and other small permanent constituents such as calcite, sillimanite or corundum. (J. S. F.)

NAQUET, ALFRED JOSEPH (1834— ), French chemist and politician, was born at Carpentras (Vaucluse), on the 6th of October 1834. He became professor in the faculty of medicine in Paris in 1863, and in the same year professor of chemistry at Palermo, where he delivered his lectures in Italian. He lost his professorship in 1867 with his civic rights, when he was condemned to fifteen months' imprisonment for his share in a secret society. On a new prosecution in 1869 for his book *Sagnostique* he was galley-slave for he took refuge in Spain. Returning to France under the government of Napoleon III, he took an active share in the revolution of the 4th of September 1870, and became secretary of the commission of national defence. In the National Assembly he sat on the extreme Left, consistently opposing the opportunist policy of successive governments. Re-elected to the Chamber of Deputies he began the agitation against the marriage laws with which his name is especially connected. His proposal for the re-establishment of divorce was discussed in May 1879, and again in 1881 and 1882, and became law in 1884. In the same year he became, at the request of the government, a professor at the École Politique.
works of scarcely inferior excellence may be seen among the relics, and at the shrine of Kasuga is performed a religious dance called Kagura, in which the costumes and gestures of the dancers are doubtless the same as those of twelve centuries back. Kasuga-

miiya was founded in 767, and its chapels with their rough red-
painted log-work afford fine examples of primitive Japanese architecture. In the temple-park are herds of tame deer; and little images of deer and tinkrlets from deer’s horn are the favourite charms purchased by the pilgrims. Within the enclosure stands a curious old trunk of seven plants entwined, including a camellia, cherry and wisteria. Of the great Buddhist temple Kōbuku-ji, founded in 710, and burnt for the third time in 1717, there remains little save two lofty pagodas. A railway now gives access to the town, but every effort is made to preserve all the ancient features of Nara. A museum has been formed, where many antique objects of great interest are displayed, as well as works from the hands of comparatively modern artists. Nara in the days of its prosperity is said to have had a population of a quarter of a million.

**NARAINGANJ,** or **NARAYANGANJ,** a town of India, in the Dacca district of eastern Bengal and Assam, situated near the junction of two rivers with the Meghna, 10 m. by rail S. of Decca city. Pop. (1901) 24,472. As the port of Dacca, having steamer communication with both Calcutta and Chittagong, it has become the chief entrepôt for the jute trade of eastern Bengal. There are 75 jute-presses, employing 6,000 hands, and the annual export of jute exceeds 500,000 tons. It also ranks as the model market of the district.

**NARBONNE,** a city of France, capital of an arrondissement in the department of Aude, situated in a vine-growing plain 5 m. from the Mediterranean, on the railway from Toulouse to Céte, 37 m. E. of Carcassonne. Pop. (1906) 23,280. The Robine canal, a branch of the Canal du Midi, divides Narbonne into two distinct portions, the bourg and the cité. The latter is one of the oldest and most interesting of French towns. The former cathedral (St Just), which consists only of a choir 350 ft. high and transept, was begun in 1272, and the transept was still unfinished at the end of the 15th century. The towers (104 ft. high) at each extremity of the transept were built about 1480. Some additions towards the west were made early in the 18th century. An unusual effect is produced by a double row of crenellation taking the place of halfstrades on the roof of the choir chapels and connecting the pillars of the flying buttresses. Among the sepulchral monuments, which are the chief feature of the interior, may be noticed the alabaster tomb of Cardinal Guillaume Briponnet, minister of state under Charles VIII. The chapter-

house, of the 13th century, has a vaulted roof supported on four free pillars. The treasury preserves many interesting relics. The spire of the cathedral is the tallest in France and the highest of the archiepiscopal palace, and the two buildings are still con-

nected by a mutilated cloister of the 14th and 15th centuries. On the front of the palace are three square towers of unequal height. Between the Tour des Télégraphes (1318), crenellated and turreted at the corners, and that of St Martial (1374), machi-

nolated and pierced by Gothic openings, a new façade was erected in the style of the 13th century after the plans of Viollet-le-Duc. This portion of the building now serves as hôtel de ville, and its upper stories are occupied by the Narbonne museum of art and archaeology, which includes a collection of Roman monuments, sarcophagi, jute. The palace garden also contains many fragments of Roman work once built into the now dismantled fortifications; and the Musée Lapidaire in the Lamouguier buildings (formerly the church of a Benedictine convent) has a collection of Roman remains derived from the same source. The church of St Paul, though partly Romanesque, is in the main striking, and for the south of France a rare example of a building of the first half of the 13th century in the Gothic style of the north. It possesses some ancient Christian sarcophagi and fine Renaissance wood carving. Narbonne has a sub-prefecture, tribunals of first instance and of commerce, a central post-office, a station for the mail coaches of commerce, a communal college for boys and a school of commerce and industry. It has a good trade in wine and

spirituous liquors, and is famous for its honey. The industries include cooperage, sulphur-refining, brandy-distilling and the manufacture of bricks and tiles and verdigris.

Long before the Roman invasion of Gaul Narbonne was a flourishing city, being called Tauras Taurinorum or Tauraudum. It was there that Julius Caesar founded his first colony, and to the name of the town is attributed the name of Narbo Martius; they constructed great works to protect the city from inundation and to improve its port, situated on the river Aude, which is now called the Canal du Midi. The Capitoline of Gallia Narbonensis, the seat of a proconsul and a station for the Roman fleet, Narbo Martius became the rival of Massilia. But in A.D. 150 it suffered greatly from a conflagration, and the city was again caught in the eyes of the Saracens, who occupied the town, and in 1156-1163 it was captured by the Visigoths, who occupied it again for a time. In 1180, for two years, it was captured by the Saracens, and by them its fortifications were restored and extended. Charles Martel, after the battle of Poitiers, and Pippin the Short, in 723, were both repulsed from its walls; but on a new attempt, after an investment of seven years, and by aid of a traitor, the Franks managed again to force their way into Narbonne. Charlemagne made the city the capital of the duchy of Gothia, and divided it into three lordships—one for the bishop, another for a Frankish lord, and the third for the Jews, who, occupying their own quarter, possessed schools, synagogues and a university famous in the middle ages. The viscounts who succeeded the bishops and the Frankish lords, who supported the Visigothic viscount of Narbonne, often occupied the town. In 1180, however, deprived him of this dignity, receiving from Philip Augustus the duchy of Narbonne along with the county of Toulouse. By his expulsion of the Jews Philip the Fair hastened the decline of the city, and in the 15th century the city was occupied by the English, who had formerly been diverted by the Romans, ceased to flow towards Narbonne and the harbour was silted up, to the further disadvantage of the place. In 1645 Henri Marquis de Cinq-Mars was arrested at Narbonne for conspiring against Richelieu. United to the French crown in 1507, Narbonne was enclosed by a new line of walls under Francis I., but having ceased to be a garrison town it had the last persecution of its ramparts abandoned and the fortifications, which had been founded about the middle of the 3rd century, its first holder being Serius Paulus; it was suppressed in 1790.

**NARBONNE-LARA, LOUIS MARIE JACQUES AMALRIC, COMTE DE** (1753-1833). French soldier and diplomatist, was born at Colorno, in the duchy of Parma, on the 24th of August 1753.

He was the son of one of the ladies-in-waiting of Elizabeth, duchess of Parma, and his father was either a Spanish nobleman or—as has been alleged—Louis XVII. himself. He was brought up at Versailles with the princesses of France, and was made colonel at the age of twenty-five. He became maréchal-de-
dépôt in 1791, and, through the influence of Madame de Stael, was appointed minister of war. But he showed incapacity in this post, gave in his resignation, and joined the Army of the North. Incurred suspicion as a Feuillant and also by his policy at the war office, he emigrated after the 10th of August 1792, visited England, Switzerland and Germany, and returned to France in 1801. In 1809 he re-entered the army as general of division, and was subsequently minister plenipotentiary at Munich and aide-de-camp to Napoleon. In 1813 he was appointed French ambassador at Vienna, where he was engaged in an unequal diplomatic duel with Metternich (q.v.) during the fateful months that witnessed the defection of Austria from the cause of Napoleon to that of the Allies. He died at Torgau, in Saxony, on the 17th of November 1813.

**NARBOROUGH, SIR JOHN** (d. 1688). English naval commander, was descended from an old Norfolk family. He received his commission in 1664, and in 1666 was promoted lieutenant for gallantry in the action with the Dutch fleet off the Downs in June of that year. After the peace he was chosen to conduct a voyage of exploration in the Southern Seas. He set sail from Deptford on the 26th of November 1669, and entered the Straits of Magellan in October of the following year, but returned home in June 1671 without accomplishing his original purpose. A narrative of the public services of the aforementioned two commanders, under the title An Account of several late Voyages and Discoveries to the South and North. During the second Dutch War Narbo-

rough was second captain of the lord high-admiral’s ship the
"Prince," and conducted himself with such conspicuous valour at the battle of Solebay (Southwold Bay) in May 1672 that he won special approbation, and shortly afterwards was made rear-admiral and knighted. In 1675 he was sent to suppress the Tripoline pirates, and by the bold expedient of despatching gun-boats into the harbour of Tripoli at midnight and burning the ships he induced the dey to agree to a treaty. Shortly after his return he undertook a similar expedition against the Algerines. In 1680 he was appointed commissioner of the navy, an office he held till his death in 1688. He was buried at Knowlton church, Kent, where a monument has been erected to his memory.

See Charnock, Biog. Nav. 1; Hist. MSS. Comm. 12th Rept.

NARCISSUS, in Greek mythology, son of the river god Cephissus and the nymph Leirioppe, distinguished for his beauty. The seer Teiresias told his mother that he would have a long life, provided he never looked upon his own features. His rejection of the love of the nymph Echo (p.103) drew upon him the vengeance of the gods. Having fallen in love with his own reflection in the waters of a spring, he pinned away (or killed himself) and the flower that bears his name sprang up on the spot where he died. According to Pausanias, Narcissus, to console himself for the death of a favourite twin-sister, his exact counterpart, sat gazing into the spring to recall her features by his own. Narcissus, representing the early spring-flower, which for a brief space beholds itself mirrored in the water and then fades, is one of the many youths whose premature death is recorded in Greek mythology (cf. Adonis, Linus, Hyacinthus); the flower itself was regarded as a symbol of such death. It was the last flower gathered by Persephone before she was carried off by Hades, and was sacred to Demeter and Core (the cult name of Persephone), the great goddesses of the underworld. From its associations Wieseler takes Narcissus himself to be a spirit of the underworld, of death and rest. It is possible that the story may have originated in the superstition (alluded to by Artemidorus, Onetorrecitice, li. 7) that it was an omen of death to dream of seeing one's reflection in water.

See Ovid, Metam. iii. 341-510; Pausanias ix. 31; Conon, Narraerum M. Worpini, II. 3-9; Greve in Roscher's Lexicon der Mythologie; J. G. Frazer, The Golden Bough (1900), i. 293.

NARCISSUS, a genus of bulbous plants belonging to the family Amaryllidaceae, natives of central Europe and the Mediterranean region; one species N. Tazetta, extends through Asia to Japan. From these, or rather from some of these, by cultivation and hybridization, have arisen the very numerous modern varieties. The plants have long narrow leaves springing from the bulb and a central scape bearing one or more generally large, white or yellow, drooping or inclined flowers, which are enveloped, before opening, in a membranous spathe. The flowers are regular, with a perianth arising from above the ovary, tubular below, with spreading segments and a central corona; the six stamens are inserted within the tube. The most interesting feature botanically is the "corona" or "cup," which springs from the

There are five well-marked sections.

1. The hoop-petticoat narcissi, sometimes separated as the genus Corbularia, are not more than from 3 to 6 in. in height, and have grassy foliage and yellow or white flowers. These have the corona in the centre of the flower very large in proportion to the other parts, and much expanded, like the old hooped petticoats. They are now all regarded as varieties or forms of the common hoop-petticoat, N. Bulbocodium, which has comparatively large bright yellow flowers; N. tenuifolius is smaller and somewhat paler and with slender erect leaves; N. citrinus is pale lemon yellow and larger; while N. monophyllus is white. The small bulbs should be taken up in summer and replanted in autumn and early winter, according to the state of the season. They bloom about March or April in the open air. The soil should be free and open, so that water may pass off readily.

2. A second group is that of the Pseudonarcissi, constituting the genus Ajax of some botanists, of which the daffodil, N. Pseudo-

![Fig. 1.—Flowers of Narcissus.](image1)

![Fig. 2.—Daffodil](image2)

Fig. 1.—Flowers of Narcissus. Base of the flower-segments, (N. Tazetta) bursting from This gives the special char-
acter to the flower, and the members of the genus are classed according to the length of this organ as compared with that of the segments. The most probable supposition is that the cup is simply an excess or "nation" from the mouth of the flower-tube, and is connected with the fertilization of the flowers by insect agency.

thickets in most parts of the north of Europe, but is rare in Scotland. Its leaves are five or six in number, are about 1 ft. in length and 1 in. in breadth, and have a blunt keel and flat edges. The stem is about 15 in. long and the spathe single-flowered. The flowers are large, yellow, scented and a little drooping, with a corolla deeply cleft into six lobes and a bell-shaped corona which is crisped at the margin; they appear in March or April. In this species the corona is also very large and prominent, but is more elongated and trumpet-shaped, while the other members are regarded as subspecies or varieties of this. Of this group the most striking one perhaps is N. bicolor, which has the perianth almost white and the corona deep yellow; it yields a number of varieties, some of the best known being Empress, Horsfieldi, Grandee, Ellen Willmott, Victoria, Weardale Perfection, &c. N. moschatus, a native of the Pyrenees and the Spanish peninsula, is a cream-coloured subspecies of great beauty with several forms. N. cyclamineus is a pretty dwarf subspecies, native of Portugal, with narrow linear leaves and drooping flowers with reflexed lemon-yellow segments and an orange-yellow corona. N. major is a robust form with leaves 1/2 in. broad and bright lemon-yellow flowers 2-3 in. long; maximus is a closely-related but still finer form; obnivallaris (the Tenby daffodil) is an early form with
uniformly yellow flowers. N. minor and minimus are miniature representatives of the daffodil. All these flowers are good in good sunshine, and blossom from March onwards, coming in very early in genial seasons.

3. Another group, the mock narcissi or star daffodils, with coronae of different colors, and flowers of the various species of N. incomparabilis, one of which, with large, double flowers, is known as butter-and-eggs; N. odorata, known as the campanelle jonquille, has two to four uniform bright yellow flowers, and is sometimes otherwise described as hyacinthine and N. Preludia. A form with sweet-scented double flowers is known as Queen Ann’s jonquille; N. juncifolius, a graceful little plant from Spain, Portugal and south France, has small bright yellow flowers on stems or cymes. The hardier forms of this set thrive in the open border, but the smaller sorts, like Queen Ann’s jonquille, are better taken up in autumn and replanted in February; they bloom freely about April or May, and have pretty flowers of a golden yellow, or with white flowers about 1 in. long; in several of its varieties the flowers are a pale or deeper yellow; they make attractive pot plants.

4. The polyanthus or bunch narciss, another well-marked group, whose peculiarity of producing many flowers on the stem is indicated by the name. In these the corona is small and shallow, as compared with the perianth. Some of the hardier sorts, as N. Tazetta itself, the type of the group, succeed in the open borders in light well-drained soil, but the bulbs should be deeply planted, not less than 6 or 8 in. below the surface, to escape risk of injury from frost. Many varieties of this form of narcissus, such as Grand Marquise, are marked with a white centre, and the flowers being forced into early bloom, like the hyacinth and tulip, they vary with a white, creamy or yellow perianth, and a yellow, lemon, primrose, or deep or coronet; and are very much in favour among florists. Many of these flowers are exported from the Scilly Isles to the London markets in spring. The "Chinese sacred lily" or "joss flower" is a form of N. Odorus, and many other types of south Europe and Algeria, of which there are single and double flowered varieties, is also grown in pots for early flowering, but does well outside in a warm border.

5. There remains another little group, the poet’s or pheasant’s-eye narcissi (N. poeticus), in which the perianth is large, spreading and conspicuous, and the corona very small and shallow. These plants are of easy culture, and among the most well-marked varieties, as radiiflorus, poetarum, recurvus, &c., blossom in succession during April and May, and all do well in the open borders as permanent hardy bulbs. N. biflorus, the primrose peerless, a two-flowered whirly-yellow-capped species, equally hardy and easy of culture, is a natural hybrid between N. poeticus and Tazetta. N. gracilis, a yellow-flowered species, has also been regarded as a hybrid between N. Tazetta and N. juncifolius, and blooms later.

Of late years some remarkably fine hybrids have been raised between the various distinct groups of narcissi, and the prices asked for the bulbs in many cases are exceedingly high. One of the most distinct-eyed narcissi, of which there is a good show in N. poeticus and Tazetta, is known under the name of "Postcard." The best forms of poeticus ornatus have been crossed with the bunch-flowered Tazettas, and have resulted in producing varieties with large trusses of exquisite flowers, having, in some cases, a colour from the purest white to yellow, the rim of the corona being in most cases conspicuously and charmingly coloured with red or crimson. This is an excellent group for cutting purposes, but it will take a little longer to reach the market than the others.

For an account of the history and culture of the narcissus see F. W. Burbidge, The Narcissus (1875); a more recent scientific treatment of the genus will be found in J. G. Baker’s Handbook of Amaryllidaceae (1888); see also Nicholson, Dictionary of Gardening (1886); and J. Weathers, Practical Guide to Garden Plants (1901).
NARDI—NARES

The Umbrian Nequinum was taken by the Romans after a long siege in 290 B.C., and a colony planted there against the Umbrians, taking its name from the river. It was among the twelve colonies that were established for refugees from Samnium in 273 B.C. It was considered a suitable spot to oppose a threatened march of Hasdrubal on Rome. It stood on the Via Flaminia, the great bridge of which over the river lies below the town. The original main road extending from Rome to Naples ran over that bridge, and it was joined at Forum Flaminii. According to some authors, the emperor Nerva was born at Narnia. The town is mentioned in the history of the Gothic wars. Procopius (B.G. i. 17) describes the site of the town, the river and the bridge—the latter as built by Augustus, and as having the highest arches that he knew. In the middle ages Narni was under the papal power. It was the birthplace of a Sieno-born known courtier Erasmo Cavallarola.

See G. Eroli, Miscellanea Storica Narinese (2 vols., Narni, 1858–1862), and other works by the same author.

NARRAGANSETT, a township of Washington county, Rhode Island, U.S.A. on the W. shore of Narragansett Bay, about 25 m. S. of Providence and about 8 m. W.S.W. of Newport. Pop. (1890) 1408; (1900) 1523; (1905) 1490; (1910) 1259. Area about 15 sq. m. It is connected at Kingston Station (about 9 m. N.W.) by the Narragansett Pier railway with the shore line of the New York, New Haven & Hartford railway; an electric line with a trolley. The southern part of the township is a peninsula, lying between the Narragansett Bay and an inlet separating this part of the township from South Kingstown. Narragansett Pier, within the township, has a fine bathing beach, which extends along the indented coast between the village and the mouth of the Pataquisset river; the force of the surf is somewhat broken by Point Judith, about 5 m. S. (also in the township), on which there is a lighthouse.

On a ridge overlooking the ocean and commanding a fine view is the Point Judith Country Club, with golf courses, tennis courts and a polo-field, on which is held a horse show at the close of each season. Many of the summer visitors at Narragansett Pier are from New England, New York and Philadelphia, but there is a sufficient number from Baltimore, Washington, Richmond, Louisville and other Southern cities to give to its society a noticeably Southern tone. Narragansett Pier was so-named from the piers that were built here late in the 18th century and early in the 19th to provide a port for the Narragansett Country, or southern Rhode Island, and it still has a coal wharf, and a yacht landing at the Casino. The development of the place as a summer resort was begun about the middle of the 19th century by the erection of a bathing-house and the conversion of some farm houses into boarding houses. The erection of large hotels and private residences soon followed, and the completion of the railway to the pier in 1876 increased its popularity. The District of Narragansett (in the town of South Kingstown) was organized in 1888 and in 1901 was incorporated as a separate township.

The town is named from the Narragansett Indians, a once-powerful Algonquian tribe, which occupied much of the shore of Narragansett Bay. Under their chief Canonicus (d. 1647) they were friendly to the early Rhode Island settlers, and under Miantonomo (g.r.) entered into a tripartite treaty with the Connecticut colonists and the Mohicans; but after the execution of Miantonomo the Narragansets under Miantonomo’s son, Canochet or Nanuntennoo, were less friendly. Their loyalty to the whites was suspected at the time of King Philip’s War, and on the 19th of December 1675, at the Great or Cedar Swamp (Narragansett Fort) in the present town of South Kingstown (immediately west of the town of Narragansett), they were decisively defeated by the whites, under Governor Josiah Winslow of the Plymouth Colony. The site of the engagement is marked by a granite monument erected in 1866 by the Rhode Island Historical Society. The monument and the surrounding grounds were made a national monument in April 1919. Fort Narragansett was captured near Stonington, Connecticut, and on the following day was executed. Most of the survivors of the tribe were later settled among the Niantic, to whom the name Narraganset has been transferred. There are now few survivors of pure Indian blood.

NARES, Narsee, Narseus, king of Persia, son of Shapur I. He rose as pretender to the throne against his grand-nephew Bahram III. in A.D. 292, and soon became sole king. He attacked...
the Romans, but after defeating the emperor Galerius near Callinicum on the Euphrates in 296 was completely defeated in 297, and forced to conclude a peace, by which western Mesopotamia and five provinces on the left bank of the upper Tigris were ceded to the Romans and their sovereignty over the kingdom of Armenia was acknowledged. This peace, concluded in 297, lasted for forty years. Narses died in 383 and was succeeded by his son Hormizd II. (Ed. M.)

**NARES** (c. 478–573) an important officer of Justinian, in the 6th century. He was a eunuch, but we are nowhere distinctly informed that he was of servile origin. A native of Persarmenia (that portion of Armenia which was allotted to Persia by the partition of 384), he may have been prepared and educated by his parents for service in an oriental court. If the statement that he died at the age of ninety-five be correct, he was born about 478. He was probably brought young to Constantinople, and attained a footing in the *officia* of the grand chamberlain. He rose to one of the three (spectables) "chartulari," a position implying some literary attainment, and involving the custody of the archives of the household. Hence, probably in middle life, he became "praepositus sacri cubiculi," an "illustrius," and entitled along with the praetorian prefects and the generals to the highest rank at the imperial court. In this capacity, in 530, he received into the emperor's obedience another Nares, a fellow-countryman, with his two brothers, Aratus and Isaac. These Persarmenian generals, having formerly fought under the standard of Persia, now in consequence of the successes of Belisarius transferred their alliance to the emperor Justinian, came to Constantinople, and received costly gifts from the great minister.

In 532 the insurrection known as the Nika broke out in Constantinople, when for some hours the throne of Justinian seemed doomed to overthrow. It was saved partly by the courage of his wife, Theodora, and partly by the timely prodigality of Nares, who stole out into the capital, and with large sums of money bribed the leaders of the "blu" faction, which was aforetime loyal to the emperor, to shout as of old "Justiniame Auguste tu vincas."

The African and Italian wars followed. In the fourth year of the latter war (538) the splendid successes of Belisarius had awakened both joy and fear in the heart of his master. Reinforcements were sent into Italy, and Nares was placed at their head. Belisarius understood that Nares came to serve under him like any other officer of distinguished but subordinate rank, and he received a letter from Justinian which seemed to support this conclusion. But the friends of Nares continually plied him with suggestions that he, a great officer of the household, in the secrets of the emperor, had been sent to Italy, not to retain a subaltern, but to hold independent command and win military glory for himself. The truth probably lay between the two. Justinian could not deprive his great general of the supreme command, yet he wished to have a very powerful emissary of the court constantly at his side. He would have him watched but not hampered.

The two generals met (A.D. 538) at Fermo on the Adriatic coast. The first interference of Nares with the plans of Belisarius was beneficial. John, one of the officers highest in rank under Belisarius, had pressed on to Rimini, contrary to the instructions of his chief, leaving in his rear the difficult fortress of Osimo (Auxilia). Nares, on reaching the coast, informed the emperor Justinian, came to Constantineople, and induced them to raise the siege of Rome; but he himself was now shut up in Rimini, and on the point of being forced by famine to surrender. Belisarius and his followers were prepared to let him pay the penalty of his rashness and disobedience. But his friend Nares so insisted on the blow to the reputation of the imperial arms which would be produced by the surrender of Rimini that he carried the council of war with him, and Belisarius had to plan a brilliant march across the mountains, in conjunction with a movement by the fleet, whereby Rimini was relieved while Osimo was still untaken. When Belisarius and John met, the latter ostentatiously thanked Nares alone for his preservation.

His next use of his authority was less fortunate. Milan, which was holding out for the Romans, was also hard pressed by famine. The two generals who were sent to relieve it lostered disgracefully over their march, and, when Belisarius wished to despatch further reinforcements, the commanders of these new troops refused to stir till Nares gave them orders. Belisarius wrote to the eunuch pointing out the necessity of unity of purpose in the imperial army. At length, grudgingly, Nares gave his consent, and issued the required orders, but it was too late. Milan had been compelled by extremity of famine to surrender, and with it the whole province of Liguria fell into the hands of the enemy. This event forced Justinian to recognize the dangers of even a partially divided command, and he recalled Nares to Constantinople.

Twelve years elapsed before Nares returned to Italy. Meanwhile there had been great vicissitudes of fortune both for the Romans and the Goths. Italy, which appeared to have been won by the sword of Belisarius, had been lost again by the exactions and misgovernment of Alexander. Totila had raised up a new army, had more than kept Belisarius at bay in five difficult campaigns (544–548) and now held nearly all the country. Belisarius, however, in this his second series of campaigns, had never been properly seconded by his master. In the spring of 552 Nares set sail from Salona on the Dalmatian coast with a large and well-appointed army. It was a Roman army only in name. Lombards, Heruli, Huns, Gepidae and even Persians followed the standard of Nares, men equal in physical strength and valour to the Goths, and inspired by the liberal pay which their emperor did not think it beneath him to confer.

The eunuch seems to have led his army round the head of the Adriatic Gulf. By skilfully co-operating with his fleet, he was able to cross the rivers of Venetia without fighting the Gothic general Teias, who intended to dispute their passage. Having mustered all his forces at Ravenna, he marched southward. He refused to be detained before Rimini, being determined to meet the Gothic king as soon as possible with his army undiminished. The occupation of the pass of Furio (Petra Fertusa) by the Goths prevented his marching by the Via Flaminia, but, taking a short circuit, he rejoined the great road near Cagli. A little farther on, upon the crest of the Apennines, he was met by Totila, who had advanced as far as Tadini, called by Procopius Tagina. Parleys, messages and harangues by each general followed. At length the line of battle was formed, and the Gothic army, probably greatly inferior in number to the Byzantine was hopelessly routed (July 552), the king receiving a mortal wound as he was hurrying from the battlefield.

With Totila the last hopes of the Gothic kingdom of Italy. Telas, who was proclaimed his successor, protracted for a few months a desperate resistance in the rocky peninsula of Castellamare, overlooking the bay of Naples. At last the emperor forced him into the plain, and there by the river Sarno, almost in sight of Pompeii, was fought (553) a battle which is generally named from the overrunning range of Mons Lactarius (Monte Lettere). The actual site of the battle, however, is about half a mile from the little town of Angri, and its memory is still vaguely preserved by the name *Pezzo dei Goti* (well of the Goths). In this battle Telas was killed. He was the last king of the Ostrogoths.

The task of Nares, however, was not yet ended. By the invitation of the Goths an army of 75,000 warlike Alamanni and Franks, the subjects of King Theudibald, crossed the Alps under the command of two Alamannic nobles, the brothers Lothair and Buccelin (553). The great strategic talents of Nares were shown even more conspicuously in this, than in his previous and more brilliant campaigns. Against the small but gallant bands of Totila and Teias he had adopted the policy of rapid marches and imperious challenges to battle. His strategy in dealing with the great host from Gaul was of the Fabian kind. He kept them as long as he could north of the Apennines, while he completed the reduction of the fortresses of the peninsula. At the approach of winter he gathered his troops into the chief cities and declined operations in the field, while the Alamannic brothers marched through Italy, killing and
plundering. When the spring of 554 appeared, Lothaire with his part of the army insisted on marching back to Gaul, there to deposit in safety the plunder which they had reaped. In an unimportant engagement near Pesaropo he was worsted by the Roman generals, and this hastened his northward march. At Ceneda in Venetia he died of a raging fever. Pestilence broke out in his army, which was so wasted as to be incapable of further operations in Italy. Meanwhile his brother Buccellin, who had left the pontifical service and wandered in the desert, was induced by free indulgence in the grapes of Campania, encamped at Casilinum, the site of modern Capua. Here, after a time, Narses accepted the offered battle (554). The barbarians, whose army was in the form of a wedge, pierced the Roman centre. But by a most skilful manœuvre Narses contrived to draw his lines into a curve, so that his mounted archers on each flank could aim their arrows at the backs of the troops who formed the other side of the Alamannic wedge. They thus fell in whole ranks by the hands of unseen antagonists. Soon the Roman cohorts, which had been belated in its march, arrived upon the field and completed the work of destruction. Buccellin and his whole army were destroyed, though we need not accept the statement of the Greek historian (Agathias ii. 9) that only five men out of the barbaric host of 30,000 escaped, and only eighty out of the Roman 18,000 perished.

The only other important military operation of Narses which is recorded—and that indistinctly—is his defeat of the Herulian king Sindbal, who had served under him at Capua, but who subsequently revolted, was defeated, taken captive and hanged by the eunuch's order (563). In the main the thirteen years after the battle of Ceneda (554) were devoted to the subjugation of the north, partly during them Narses ruled Italy from Ravenna with the title of prefect.1 He rebuilt Milan and other cities destroyed in the Gothic War; and two inscriptions on the Salarian bridge at Rome have preserved to modern times the record of repairs effected by him in the year 564.

His administration, however, was not popular. The effect of the imperial organization was to wring the last solidus out of the emaciated and fever-striken population of Italy, and the belief of his subjects was that no small portion of their contributions was necessarily lost by the eunuch's agents.2 Hence came the invasion of Alboin (568), which wrested the greater part of Italy from the empire, and changed the destinies of the peninsula.

Narses, who had retired to Naples, was persuaded by the pope (John III.) to return to Rome. He died there about 573, and his body, enclosed in a leaden coffin, was carried to Constantinople and buried there. Several years after death the secret of the hiding-place of his vast stores of wealth is said to have been revealed by an old man to the emperor Tiberius II., for whose charities to the poor and the captives they furnished an opportunity.

Narses was short in stature and lean in figure. His free-handedness and affability made him very popular with his soldiers. Eunarius tells us that he was very, religious, and paid especial reverence to the Virgin, never engaging in battle till he conferred that she had given him the signal. Our best authorities for his life are his contemporaries Procopius and Agathias. See Gibbon, Decline and Fall, vols. iv. and v., edited by J. B. Bury (1895).

**NARSINGHARH, a native state of Central India, in the Bhopal agency. Area, 741 sq. m.; pop. (1901) 92,903; estimated revenue, £33,000; tribute to Holkar, £4,000. The chief, whose title is raja, is a Rajput of the Omat clan. The state was that of mango groves. The population in 1901 was 315,518, showing a decrease of 14.5% in the decade, due to famine. The principal crops are wheat, millets, rice, pulses, oil-seeds and cotton. There are manufactures of cotton, silk, brass and iron-ware. At Mohpani are coal-mines. The Great Indian Peninsula railway runs through the district, with a branch to Mohpani. See **Narsinghpur District Gazetteer (Bombay, 1906).

**NARTHEX** (Gr. ναρθῇς, the name of the plant giant-fennel, in Lat. *ferula*), the name applied in architecture, probably from the Greek *narkhos*, a person who announced the beginning of the service or prayer. A narthex is represented as saying, "that she shall not find the end of it in her lifetime"; and forthwith he sent messengers to the Lombards in Pannonia, bearing some of the fruits of Italy, and inviting them to enter the land which bore such goodly produce. Hence came the invasion of Alboin (568), which wrested the greater part of Italy from the empire, and changed the destinies of the peninsula.

1 Gibbon's statement that Narses was "the first and most powerful of the exarchs" is more correct in substance than in form. The title of exarch does not appear to be given to Narses by any contemporary writer. He is always "Praefectus Italiae," "Patricius" or "Dux Italae," except when he bears the style of his former office in the imperial household, "Ex-Præpositus Cibucilii" or "Chaputarius." 2 This celebrated story seems to be unknown to strictly contemporary authors. We find no hint of it in Agathias (who wrote between 560 and 566), Procopius (532-590), or in Gregory of Tours (540-594). The possibly contemporary Liber Pontificalis and Isidore of Seville (560-636) hint at the invitation to the Lombards. Fredegarus (so-called), who probably wrote in the middle of the 7th century, and Paul the Deacon, towards the close of the 8th, supply the saga-like details, which become more minute the farther the narrators are from the action. The truth, the transaction, though it is too well vouched for to allow us to dismiss it as entirely fabulous, cannot take its place among the unoubted facts of history.

242

**NARVA** (Rus. *Narva*), a sea-port and fortress of Russia, in the government of St Petersburg, 100 m. by rail W.S.W. of the city of St Petersburg. Pop. (1897) 16,577. It stands on the Narova river, which flows from Lake Peipus to Chudskoye, and enters the Gulf of Finland in Narva Bay, 5 m. below this town. The town was founded in 1225 by Danes, and changed hands between the Teutonic knights, Danes, Swedes and Russians until it was taken by Peter the Great in 1704, after the Russians had suffered a terrible defeat at the hands of Charles XII. of Sweden four years
before. Its fortress, built on the right bank of the river, and known as Ivangorod, has lost its importance, and was abandoned in 1864. The cathedral and the town hall (1683) contain interesting antiquities. There are here an arsenal, a small museum and a school of navigation. Several manufactories utilize the waterfalls of the Narova, e.g. cotton-mills, woollen cloth mills, flax and jute mills, saw-mills and steam flour mills. The total trade falls short of half a million sterling annually. A wintering-place of whalers is built up at Ust-Narova, or Hungerburg, at the mouth of the Narova.

NARVACAN, a town of the province of Ilocos Sur, Luzon, Philippine Islands, near the coast and on the main road 13 m. S.S.E. of Vigan, the capital. Pop. (1903) 19,575. It lies in a level valley surrounded by mountains, and has a cool and healthy climate. The soil, both in the valley and on the neighbouring mountain-sides, is very fertile, and produces rice, vegetables, Indian corn, indigo, cotton, tobacco, maguey and sugar-cane. Cotton fabrics are woven by the women and sold to the mountain tribes. The language of the town is Ilocano.

NARVAEZ, PÁNFILO DE (c. 1480–1528), Spanish adventurer, was an hidalgo of Castile, born at Valladolid about 1480. He was one of the subordinates of Velazquez in the reduction of Cuba, and, after having held various posts under his governorship, was put at the head of the force sent to the Aztec coast to compel Cortez to renounce his command; he was surprised and defeated, however, by his able and more active compatriot at Cempoallas, and made prisoner with the loss of an eye (1520). After his return to Spain he obtained from Charles V a grant of Florida as far as the River of Palms; sailing in 1527 with five ships and a force of about 600 men, he landed, probably near Pensacola Bay, in April 1528, and, striking inland with some 300 of his followers, reached "Apalache" on June 25. The prospects of fabulous wealth which had sustained them in their difficult and perilous journey having proved illusory a return to the coast was determined, and the Bahia de los Caballos, at or near St Mark's, was reached in the following month. Having built rude boats, the much-reduced company sailed hence for Mexico on September 22, but the vessel which carried Narvaez was driven to sea in a storm and perished. His lieutenant, Cabeza de Vaca, with the other adventurers who ultimately reached land, made his way across Texas to the Gulf of California. (See Florida.)

[See Prescott, Conquest of Mexico; H. H. Bancroft, Mexico (1882-1890); and the Naufragio of Alvaro Nuñez Cabeza de Vaca in the Biblioteca de Rivadeneyra, xxii.]

NARVAEZ, RAMON MARIA (1800–1868), Spanish soldier and statesman, was born at Loja, Granada, on the 4th of August 1800, entered the army at an early age, and saw active service under Mina in Catalonia in 1822. He was in his sympathies a Conservative, and could not go all lengths with the Radical opposition to Ferdinand VII., whom he served after his restoration. When the king died, Narvaez became one of the Conservative supporters of Isabel II. He achieved great popularity by his victory over Goméz, the Carlist general, near Arcos, in November 1836, and after clearing La Mancha of brigands by a vigorous policy of suppression in 1838 he was appointed captain-general of Old Castile, and commander-in-chief of the army of reserve.

In 1840, for the part he had taken at Seville in the insurrection against Espartero and the Progressists, he was compelled to take refuge in France, where, in conjunction with María Cristina, he planned the expedition of 1843 which led to the overthrow of his adversary. In 1844 he became prime minister, and was created field-marshal and duke of Valencia, but his policy was too reactionary to be tolerated long, and he was compelled to quit office in February 1846. He now held the post of ambassador at Paris, until again called to preside over the council of ministers in 1847; but misunderstandings with María Cristina led to his resignation in the following year. His ministry succeeded that of O'Donnell for a short time in 1856-1857, and he again returned to power for a few months in 1864-1865. He once more replaced O'Donnell in July 1866, and was still in office when he died at Madrid on the 23rd of April 1868.

Some very curious notices of Narvaez may be found in the letters of Prosper Merimée to Panizzi (1881). For his general political and military career see Gonzalez Baquedano, Geschichte Spaniens in Aufschreiben de französisch. Revol. bis auf unsere Tage (1866-1871); and the Historia Contemporanea of Antonio Pirala (1871-1879).

NARVIK or VICTORIAHAVN, a seaport on the Ofoten Fjord of the north-west coast of Norway, in Nordland amti (county), 68° 30' N. It is wholly modern, developed by the construction of the railway and canal (1903) of the Ofoten railway, the most northerly in the world. The station is 34 m. S.E. of Narvik, and on the branch, which runs on the iron ore from the rich districts traversed by the line. Narvik is 167 m. N.W. of Gellivara, and 82 m. W. of Stockholm by the railway. In summer express trains cover the whole distance in two days. Narvik is a convenient point from which to visit the beautiful Lofoten Islands.

NARWHAL, the Scandinavian name of a cetacean (Monodon monoceros), characterized by the presence in the male of a long horn-like tusk. In the adult of both sexes there are only two teeth, both in the upper jaw, which lie horizontally side by side, and in the male is of enormous size, and is hollowed out longitudinally and partly filled with a transparent mass, considered to be an organ of the reproductive system. Narwhals are found in the Arctic regions, and their tusks are eagerly sought after by dwellers in those parts for ornament of houses and furniture. The tusks, which are of an ivory-like material, are often more than 10 ft. long; they are white below, variously marbled and spotted with shades of grey.

The narwhal is an Arctic whale, frequenting the icy circumpolar seas, and rarely seen south of 65° N. lat. Four instances have, however, been recorded of its occurrence on the British coasts, one on the coast of Norfolk in 1388, one in the Firth of Forth in 1648, one near Boston in Lincolnshire in 1800, while a fourth entangled itself among rocks in the Sound of Weezeald, Shetland, in September 1808. Like most cetaceans it is gregarious and usually met with in "schools" or herds of fifteen or twenty individuals. Its food appears to be cuttlefishes, small fishes and crustaceans. The purpose served by the tusk—"horn"—is not known; and little is known of the habits of narwhals. Scoresby describes them as "extremely playful, frequently elevating their horns and crossing them with each other as in fencing." They have never been known to charge and pierce the bottom of ships with their weapons, as the swordfish does. The name "sea-unicorn" is sometimes applied to the narwhal. The ivory of which the tusk is composed is of very good quality, but owing to the central cavity, only fitted for the manufacture of objects of small size. The entire tusks are sometimes used for decorative purposes, and are of considerable, though fluctuating, value. (See CETACEA.)

[See Prescott, Conquest of Mexico; H. H. Bancroft, Mexico (1882-1890); and the Naufragio of Alvaro Nuñez Cabeza de Vaca in the Biblioteca de Rivadeneyra, xxii.]

NASCIMENTO, FRANCISCO MANOEL DE (1734–1819), Portuguese poet, better known by the literary name of Filinto Elsio, bestowed on him by the Marquesa de Alorna, was the reputed son of a Lisbon boat-owner. In his early years he acquired a love of national customs and traditions which his humanist education never obliterated, while, in addition, he learnt to know the whole range of popular literature (literatura de cordel)—songs, comedies, knightly stories and fairy tales, which were then printed in loose sheets (folhas volantes) and sold by the blind in the streets of the capital. These circumstances
explain the richness of his vocabulary, and joined to an ardent patriotism they fitted him to become the herald of the literary revival known as Romanticism, which was inaugurated by his distinguished follower Almeida Garrett. Nascimento began to write verses at the age of fourteen. He was ordained a priest in 1754, and shortly afterwards became treasurer of the Chagas church in Lisbon. He led a retired life, and devoted his time to the study of the Latin classics, especially Horace, and to the society of literary friends, among whom were numbered some cultivated foreign merchants. These men nourished the common ambition of the Portuguese, and half forgotten, to his rightful place as the king of the Portuguese Parnassus, and they proclaimed the cult of the Quinhentistas, regarding them as the best poetical models, while in philosophy they accepted the teaching of the French Encyclopaedists.

Nascimento's first publication was a version of one of Metastasio's operas, and his early work consisted mainly of translations. Though of small volume and merit, it suffered to arouse the jealousy of his brother bards. At this time the Arcadia was working to restore good taste and purify the language of July. He had received a man of this and sought to imitate the traditions of their own land in their desire to imitate the classics. Nascimento and other writers who did not belong to the Arcadia, formed themselves into a rival group, which met at the Ribeira das Ñ aos, and the two bodies attacked one another in rhyme without restraint, until the "war of the poets," as it was called, ended with the collapse of the Arcadia. Nascimento now conceived a strong but platonic affection for D. Maria de Almeida, afterwards Condesa de Ribeira, sister of the famous poetess the Marquesa de Alorna. This lady sang the chansonnette the wrote for her, and their poetical intercourse grew from him some lyrics of profound emotion. This was the happiest epoch of his life, but it did not last long. The accession of D. Maria I inaugurated an era of reaction against the spirit and reforms of Pombal, and religious succeeded to political intolerance. In June 1778 Nascimento was denounced to the Inquisition on the charge of having given vent to heterodox opinions and read "the works of modern philosophers who follow natural reason." The tribunal held a secret inquiry, and without giving him an opportunity of defence issued an order for his arrest, which was to take place early in the morning of the 14th of July. He had received a news of this and sought to escape to the house of a French merchant, Verdiere, where he lay hid for eleven days, at the end of which his friend the Marquesa de Marialva put him on board a French ship which carried him to Havre. Nascimento took up his residence in Paris, and in his first years there passed pleasantly enough. Soon, however, his circumstances changed for the worse. He received the news of the confiscation of his property by the Inquisition; and though he strove to support himself by teaching and writing he could hardly make both ends meet. In 1792 his admirer Antonio de Araujo, afterwards Conde de Barca, then Portuguese minister to Holland, offered the poet the hospitality of his house at the Hague, but neither the country, the people, nor the language were congenial, and when his host went to Paris on a diplomatic mission in 1797 Nascimento accompanied him, and spent the rest of his life in and near the French capital. He retained to the end an intense love of country, which made him wish to die in Portugal, and in 1796 a royal decree permitting his return there and ordering the restoration of his goods was issued, but delays occurred in its execution, and the flight of the court to the Brazils as a result of the French invasion finally dashed his hopes. In this the Conde de Barca had obtained him a commission from the Portuguese government to translate the De Rebus Emanueltis of Osorio; the assistance of some fellow-countrymen in Paris carried him through his last years, which were cheered by the friendship of his biographer and translator Alexandre Sané and of the Lusophil Ferdinand Dénis. Lamartine addressed an ode to him; he enjoyed the esteem of Chateaubriand; and his admirers at home, who imitated him extensively, were called after him Os Filíntistas. Exile and suffering had enlarged his ideas and given him a sense of reality, making his best poems those he wrote between the ages of seventy and eighty-five, and when he passed away, it was recognized that Portugal had lost her foremost contemporary poet.

Garrett declared that Nascimento was worth an academy in himself by his knowledge of the language, adding that no poet since Camoens had rendered it such valuable services; but his truest title to fame is that he brought literature once more into touch with the life of the nation. By his life, as by his works, Nascimento links the 18th and 19th centuries, the Neo-Classical period with Romanticism. The works of Chateaubriand's Martyrs opened a new world to him, and his contos or scenes of Portuguese life have a real romantic flavour; they are the most natural of his compositions, though his noble patriotic odes—those "To Neptune speaking to the Portuguese" and "To the liberty and independence of the United States"—are the most quoted and admired. On leaving Portugal, he abandoned the use of rhyme as cramping freedom of thought and expression; nevertheless his highly polished verses are generally robust to hardness and overdone with archaisms, and in part at least, but he retained a Faroese accent though harsh, and his renderings of Racine and the Fables of Lafontaine entirely lack the simplicity and grace of the originals. But Nascimento's blank verse translation of the Martyrs is in many ways superior to Chateaubriand's prose.

Bibliography.—The most useful edition of his collected works is that in 22 vols. Lisbon, 1836-1840. See Innocencio da Silva, in "Revista de Bibliografia," vol. II. Also see by the same author: also Filinto Elzio e a sua Época, by Pereira da Silva (Rio, 1891); Filinto Elzio, by Dr Theophilo Braga (Oporto, 1891).
the "Bluecoats," held out to the last, and was finally broken by a combined charge of Fairfax's regiment of foot, led by Cromwell, and the general's personal escort, led by Fairfax himself, who captured a colour with his own hand. The remnant of the king's army, re-formed by Rupert, stood inactive and irresolute while its infantry was being destroyed by Cromwell's "startling" cavalry and the king's private papers. But more important than trophies was the practical annihilation of the last field army of which the king disposed. Half the Royalists were captured, and about 1000 fell, in the battle and the pursuit which followed it. In addition all the artillery and the muskets (to the number of 8000) and ammunition with which the king could scarcely create a new army, fell into the hands of the victors.

NASH, RICHARD (1674–1762), English dandy, better known as "BEAU NASH," was born at Swansea on the 18th of October 1674. He was descended from an old family of good position, but his father from straitened means had become partner in a glass business. Young Nash was educated at Carmarthen grammar school and at Jesus College, Oxford. He obtained a commission in the army, which, however, he soon exchanged for the study of law at the Temple. Here among "wits and men of pleasure" he came to be accepted as an authority in regard to dress, manners and style. When the members of the Inns of Court entertained William III. after his accession, Nash was chosen to conduct the pageant at the Middle Temple. This duty he far exceeded in the satisfaction of the king that he was offered knighthood, but he declined the honour, unless accompanied by a pension. As the king did not take the hint, Nash found it necessary to turn gamerster. The pursuit of his calling led him in 1705 to Bath, where he had the good fortune almost immediately to succeed Captain Webster as master of the ceremonies. His qualifications for such a position were unique, and under his authority reforms were introduced which rapidly secured to Bath a leading position as a fashionable watering-place. He drew up a new code of rules for the regulation of balls and assemblies, abolished the habit of wearing swords in places of public amusement, and introduced gentlemen to adopt shoes and stockings in parades and assemblies instead of boots, reduced refractory chairmen to submission and civility, and introduced a tariff for lodgings. Through his exertions a handsome assembly-room was also erected, and the streets and public buildings were greatly improved. Nash adopted an outward state corresponding to his nominal dignity. He wore an immense white hat as a sign of office, and a dress adorned with rich embroidery, and drove in a chariot with six greyies, laced lackeys and French horns. When the king came to the city the satisfaction of the king that he was deprived of an easy though uncertain means of subsistence, but the corporation afterwards granted him a pension of six score guineas a year, which, with the sale of his snuff-boxes and other trinkets, enabled him to support a certain faded splendour till his death on the 3rd of February 1762. He was honoured with a public funeral at the expense of the town. Notwithstanding his vanity and impertinence, the tact, energy and superficial cleverness of Nash won him the patronage and notice of the great, while the success of his ceremonial duties, as shown in the increasing prosperity of the town, secured him the gratitude of the corporation and the people generally. He was a man of strong personality, and considerably more able than Beau Brummell, whose prototype he was.

NASH, THOMAS (1567–1601), English poet, playwright and pamphleteer, was born at Lowestoft in 1567. His father, a clergyman, moved to an old Herefordshire family, and is vaguely described as a minister. Nash spent nearly seven years, 1582 to 1589, at St John's College, Cambridge, taking his B.A. degree in 1585–1586. On leaving the university he tried, like Greene and Marlowe, to make his living in London by literature. It is probable that his first effort was The Anatomy of Absurditie (1589) which was perhaps written at Cambridge, although he refers to it as a forthcoming publication in his preface to Greene's Menaphon (1586). In this preface, addressed to the gentlemen students of both universities, he makes bitter ridicule of the Master of Arts, Thomas Kyd and the English hexametrist of Richard Stanburl, but there he forgets he is the author of many good books. Nash was really a journalist born out of due time; he boasts of writing "as fast as his hand could trot"; he had a brilliant and picturesque style which, he was careful to explain, was entirely original; and in addition to his keen sense of the ridiculous he had an abundance of miscellaneous learning. As there was no market for his gifts he fared no better than the other university wits who were trying to live by letters. But he found an opening for his ready wit and keen sarcasm in the Martin Marprelate controversy. His share in this war of pamphlets cannot now be accurately determined, but he has, with more or less probability, been credited with the following: A Counterfuce given to Martin Junior (1586), Martinis Mensch Minde (1586), The Returne of the renowned Cavallerio Pasquall and his Meeting with Marforius (1587), The First Parte of Pasquils Apologie (1590), and An Almond for a Parrat (1590). He edited an unauthorised edition of Sidney's poems with an enthusiastic preface in 1591, and A Wonderfull Astrologickal Prognostication, in ridicule of the almanac-makers, by "Adam Fouleweather," which appeared in the same year, has been attributed to him. Pierce Penniless, His Supplication to the Devil, published in 1592, shows us his power as a humorous critic of national manners, and tells incidentally how hard he found it to live by the pen. It seems to Pierce a monstrous thing that brainless drudges wax fat while the seven liberal sciences and a good leg will scarce get a scholar bread and cheese. In this pamphlet, too, Nash began his attacks upon the Harveys by assailing Richard, who had written contemptuously of his preface to Greene's Menaphon. Greene died in September 1592, and Richard's brother, Gabriel Harvey, at once attacked his memory in his Foure Letters, at the same time adversely criticizing Pierre Penniless. Nash retaliated, both for Greene and himself, in Strange News of the intercepting certaine Letters, better known, from the running title, as Foure Letters Confuted (1592), in which all the Harveys are violently attacked. The autumn of 1592 Nash seems to have spent at or near Croydon, where he wrote his satirical masque of Summers Last Will and Testament at a safe distance from London and the plague. He afterwards lived for some months in the Isle of Wight under the patronage of Sir George Carey, the governor. In 1593 he wrote Christis Tears over Jerusalem, in the first edition of which he made remarkable conjectures about Shakespeare. This was published in a second edition, published in the following year, replaced by a new attack, and two years later appeared the most violent of his tracts against Harvey, Have with you to Saffron-walden, or, Gabriell Harveyes Hunt is up (1596). In 1599 the controversy was suppressed by the archbishop of Canterbury. After Marlowe's death Nash prepared his friend's unfinished tragedy of Dido (1596) for the stage. In the next year he was in trouble for a play, now lost, called The Isle of Dogs, for only part of which, however, he seems to have been responsible. The excision and slandering matter contained in this play induced the authorities to close the theatre and, when it had been performed, and the dramatist was put in the Fleet prison. Besides his pamphlets and his play-writing, Nash turned his energies to novel-writing. He may be regarded as the pioneer in the English novel of adventure. He published in 1594 The Unfortunate Traveller, Or the Life of Jack Wilton, the history of an ingenious page who was present at the siege of Térouenne, and afterwards travelled in Italy with the earl of Surrey. It tells the story of the earl and Fair Geraldine, describes a tournament held by Surrey at Florence, and relates the adventures of Wilton and his mistress Diamante at Rome after the earl's return to England. The detailed, realistic manner in which Nash relates his improbable fiction resembles that of Defoe. His last work is entitled Lenten Stuffs (1599)
NASHUA—NASHVILLE

and is nominally "in praise of the red herring," but really a
description of Yarmouth, to which place he had retired after his
imprisonment, written in the best style of a "special corre-
spondent." Nash's death is referred to in Thomas Dekker's
Knight's Conjurings (1667), a kind of sequel to Pierce Penniless.
He is there represented as joining his boon companions in the
Elysian fields "still haunted with the sharp and satirical spirit
that followed him here upon earth." Had his patrons under-
stood their duty, he would, he said, have shortened his days
by keeping company with pickled herrings. It may therefore
be reasonably supposed that he died eating bad and in-
sufficient food. The date of his death is fixed by an elegy on
him prefaced to Fitzgerald's Astarthe (1690).
The works of Thomas Nash were edited by Dr A. B. Grosart in
1888-1889, and more recently by Ronald B. McKerrow (1904).
An account of his work as a novelist may be found in the English
Novel in the Time of Shakespeare, by J. J. Jusserand (Eng. trans.,
1890). The Unfortunate Traveller was edited with an introduction
by Edmund Gosse in 1892. See also "Nash's Unfortunate Traveller
and Head's English Rogue, die beiden Hauptvertreter des englischen
Schelmenromans," by W. Kolmann in Anglia (Halle, vol. xlvii., 1890,
pp. 81-140).

NASHUA, a city and one of the county seats of Hillsboro
county, New Hampshire, U.S.A., at the confluence of the Nashua
and Merrimack rivers, 33 m. S.S.E. of Concord and 40 m. N.W.
by rail. Pop. (1890) 19,311; (1900) 23,898, of whom 889 were
foreign-born. The first settlement was made in 1720. In 1790
the town was incorporated by the name Nashua, and was
served by the Boston & Maine railroad, whose several divisions
centring here give the city commercial importance, and by
electric lines to Hudson, Litchfield, Pelham, Dracut and
Tyngsboro. The area of the city in 1866 was 30-71 sq. m. To
the N., W. and S.W. of the city there are beautiful hills and
mountains. The church of Saint Francis Xavier and the First
Congregational church are architecturally noteworthy. The city has
a soldiers' monument, a public library, a court house and two
hospitals. There is a United States fish hatchery here, and until
after the close of the 19th century fishing was the principal
industry of the place. Manufacturing now is the principal
goods, shoes, boots, shoes, and foundry and machine-shop products.
The value of the city's factory products increased from $16,066,664
in 1900 to $12,858,382 in 1905, and 27½%, and in 1905 Nashua
ranked second among the manufacturing cities of the state.
Nashua is one of the oldest interior settlements of the state.
The first settlement here was established about 1665; and in 1673
the township of Dunstable was incorporated by the General Court
of Massachusetts-born; in 1741, when the boundary between Massa-
chusetts and New Hampshire was settled, the jurisdiction of this
portion of Dunstable was transferred to New Hampshire; five
years later it was incorporated under the laws of that state; and
in 1803 the settlement, originally known as Indian Head, was
incorporated as a village under the name of Nashua, and in 1836
the township of Dunstable also received the name Nashua.
The town of Nashua was set apart from the town of Nashua in 1842,
but the two towns were united under a city charter obtained in
1853. In 1795 the first stage coach was run through here from
Boston to Amherst, and at about the same time a canal was
built around Pawtucket Falls on the Merrimack at Lowell. In
1822 a manufacturing company was formed, which at once began
to develop the water-power and in 1825 erected the first cotton
mill. Thirty years later the Nashua & Lowell railroad (now
leased to the Boston & Maine) first reached Nashua.
See The History of the City of Nashua, edited by E. E. Parker
(Nashua, 1880).

NASHVILLE, the capital of Tennessee, U.S.A., and the
county-seat of Davidson county, on the Cumberland river, 186 m.
S.S.W. of Louisville, Kentucky. Pop. (1890) 76,168; (1900)
80,865, of whom 30,337 were foreign-born and 30,444 were negroes;
(1910 census) 110,624. Nashville is served by the Tennessee
Central, the Nashville & Louisville, and the Nashville, Chat-
anooga & St Louis railways, and by several steamboat lines.
The Cumberland river is crossed here by four foot-bridges.
Nashville is situated on and between hills and bluffs in an un-
dulating valley; its streets are paved with brick or granite
blocks in the business section and macadamized or paved with
asphalt in the residential sections. The city has fine public
buildings, many handsome residences, and several beautiful
parks. The principal building is the State House, a fine example
of pure Greek architecture, on the most prominent hill-top, with
a tower 205 ft. in height. On the grounds about it are a bronze
equestrian statue of Andrew Jackson, by Clark Mills (1815-1883),
and the tomb of President James K. Polk, who lived in Nashville.
Other prominent buildings and institutions are the United
States Government Building, the County Court House, the City
Hall, the Tennessee State University, the Belle Meade Church,
the State Normal School, the State Library, the Library of the State
Historical Society housed in Watkins Institute, a Carnegie library,
park buildings, the State Penitentiary, Vendôme Theatre, the Board
of Trade Building, the City Hospital, the St Thomas Hospital
(Roman Catholic), and, near the city, a Confederate Soldiers' Home
and a State Hospital for the Insane. Eleven miles east of
the city is the "Hermitage," which was the residence of President
Andrew Jackson.

The grounds of the Tennessee Centennial Exposition of 1897
(commemorating the admission of Tennessee into the Union
on the 15th day of June, 1796), now constitute Centennial Park,
in which still stand the reproduced Parthenon of Athens, the
History Building, which in general outline is a reproduction of
the Erectheum and contains a museum and an art gallery, and
a monument to the memory of James Robertson (1742-1814),
the founder of the city. Besides this there are four other parks:
Glenendale Park in the south section, a place of much natural beauty;Shelby Park, in the eastern part of the city, fronting the river;
Watkins Park, on the north; and Cumberland Driving Park.
In Mount Olivet Cemetery is a beautiful Confederate Soldiers' monument surrounded by the Bickel Coliseum, and a little to
the north of the city is a National Cemetery in which 16,643
Federal soldiers are buried, the names of 4711 of them being
unknown.

Nashville is one of the foremost educational centres in
the Southern states. In the western part of the city is Vanderbilt
University. This institution, opened in 1875, is under the
patronage of the Methodist Episcopal Church, South, and was
named in honour of Cornelius Vanderbilt, who contributed
$1,000,000 to its funds, and whose son, W. H. Vanderbilt, and
grandsons, W. K. Vanderbilt and Cornelius Vanderbilt II, to
the university about $850,000. It is coeducational and embraces
an academic department, a biblical department, and departments
of engineering, law, medicine, pharmacy and dentistry; in 1909
it had 125 instructors and 959 students. The University of
Vanderbilt is a non-sectarian institution embracing a college
department, a medical department, a preparatory department,
and the George Peabody College for Teachers; it was incorporated
under the laws of North Carolina as Davidson Academy in 1785
and under the laws of Tennessee as Cumberland College in 1806,
and the present name was adopted in 1856. The George Peabody
College for Teachers, an important part of the institution, was
opened as a normal school in 1873; in 1907-1908 it had an
enrolment (including the summer session) of 647 students.
In 1909 it received $1,000,000 from the Peabody Fund, later supple-
mented by $250,000 from the state, $200,000 from the city and
$100,000 from Davidson county. The University of Tennessee,
located mainly at Knoxville, has at Nashville its medical and
dental departments. Ward Seminary, opened in 1865, Boscosel
College, opened in 1880, and Buford, Belmont and Radnor colleges
are all non-sectarian institutions of Nashville for the higher edu-
cation of women. For the education of negroes the city has the
Fisk University (opened in 1866, incorporated in 1867), under the
auspices of the American Missionary Association and the Western
 Freedman's Aid Commission of the Congregational Church (noted
since 1871 for its Jubilee Singers, who raised money for Jubilee Hall,
finished in 1876); it embraces a college department, a preparatory
department, a normal department and departments of theology,
music and physical training; and Walden University, founded as
Central Tennessee College in 1866, under the auspices of the
Methodist Episcopal Church, and embracing a college department, a normal department, an industrial department, and departments of English, commerce, law, medicine, dentistry, pharmacy, music, Bible training, nurse training and domestic science. The Baptist, the Methodist Episcopal (South), the Cumberland Presbyterian, and the African Baptist and the African Methodist Episcopal churches have publishing houses in Nashville.

The leading manufactures of the city are flour and grist mill products (valued at $4,242,480 in 1905), lumber and timber products—Nashville is one of the greatest hard wood markets in the United States, and in 1905 the value of lumber and timber products was $1,119,162 and of planing-mill products, $1,299,069 —construction and repair of steam railway cars ($1,734,000 in 1905), tobacco ($1,311,019 in 1905), fertilizers ($84,571 in 1905), men's clothing ($720,227 in 1905), saddlery, harness, soap and candles. The total value of the products of the factories increased from $1,5,301,056 in 1900 to $2,169,661 (16.6% of the entire factory product of the state) in 1905, amounts greater than those of any other city in the state. Nashville has a large trade in grain, cotton, groceries, dry goods, drugs, and boots and shoes. The water-works and the electric lighting plant are owned and operated by the municipality.

Nashville was founded in 1780 as "the advance guard of western civilization" by a company of two hundred or more pioneers under the leadership of James Robertson, the nearest settlement being at the time about three hundred miles distant. While the first settlement was in South Carolina and in Abner Nash (1776-1780), who was at the time governor of North Carolina, or more probably in honour of the Revolutionary general, Francis Nash (1720-1777), a brother of Abner, killed at Germantown; but when, in 1784, it was incorporated as a town by the North Carolina legislature the present name was substituted. In 1806 Nashville was chartered as a city. Although it was not the capital of the state until 1843, the legislature met here from 1812 with the exception of the period from 1813 to 1826. Many of the pioneers of Nashville were slain by the Creek and Cherokee Indians, and at times the settlement was saved from destruction only by the heroism of Robertson, but in 1794 the savages were dealt a crushing blow at Nickajack on the lower Tennessee and much more peaceful relations were established.

On the 3rd of June 1830 a convention, known as the Southern or Nashville Convention, whose action was generally considered a threat of disunion, met here to consider the questions at issue between the North and the South. Since such a meeting had first been proposed by a state convention of Mississippi, the famous Compromise Measures of 1850 had been introduced in Congress and the support of the movement had been greatly weakened. The convention met here in honour of the statesman, whose influence would have been greater had he lived. Nine states, however, were represented by about 100 delegates, mostly Democrats, and the convention denounced the Wilmot Proviso, and, as "an extreme concession on the part of the South," promised to agree that, W. of Missouri, there should be slavery only in the territory S. of 36° 30' N. lat. At an adjourned meeting in November it expressed its dissatisfaction with the Compromise Measures of Congress, and asserted the right of the South to secede.

During the Civil War Nashville was at first held by the Confederates and mostly in 1862 it was occupied by the Federals, who retained possession of it to the end. The battle of Nashville was fought on the 15th and 16th of December 1864 between the Union army under Major-General G. H. Thomas and the Confederates under General J. B. Hood. The Union defences extended in a semicircle round Nashville, the flanks on the river above and below. Hood's army was to the south-east, lightly entrenched, with its flanks on two creeks which emptied into the Cumberland above and below Nashville. This position he desired to maintain as long as possible so as to gather recruits and supplies in safety. If Thomas, whose army was of motley composition, could be brought to a line west of him and between the two streams, he would have won his point. As it was, he was forced to retreat from Nashville on his heels. Thomas, however, would not strike until he had his army organized. Then, on the 15th, he emerged from the entrenchedments and by a vigorous attack on the Confederate left forced back Hood's line to a second position 1½ m. to the south. Hood, having detached a part of his army, desired to gain time to bring in his detachments by holding this line for another day. Thomas, however, gave him no respite. On the 16th the Union army deployed in front of him, again over-lapping his left flank, and although a frontal attack was repulsed, the extension of the Federal right wing compelled Hood to extend his own lines more and more. Then the Confederates broke the attenuated line of defence at its left centre, and Hood's army drifted away in disorder. The pursuit was vigorous, and only a remnant of the Confederate forces reassembled at Columbia, 40 m. to the south, whence they fell back without delay behind the Tennessee.

Nasi, Joseph (16th century), Jewish statesman and financier, was born in Portugal of a Jewish (Marano) family. Emigrating from his native land, he founded a banking house in Antwerp. Despite his financial and social prosperity there, he felt it impossible to be compelled to wear the gage of Catholicism, and determined to settle in a Mahomedan land. After two troubled years in Venice, Nasi betook himself to Constantinople. Here he proclaimed his Judaism, and married his beautiful cousin Reyna. He rapidly rose to favour, the sultana Suleiman promoting him to high office. He founded a Jewish colony at Tiberias which was to be an asylum for the Jews of the Roman Campagna. In 1566 when Selim ascended the throne, Nasi was made Duke of Nasi. He had deserved well of Turkey, for he had conquered Cyprus for the sultan. Nasi's influence was so great that foreign powers often negotiated through him for concessions which they sought from the sultan. Thus the emperor of Germany, Maximilian II., entered into direct correspondence with Nasi; William of Orange, Sigismund August II., king of Poland, also conferred with him on political questions of moment. On the death of Selim in 1574, Nasi recoiled from his political position, but retained his wealth and offices, and passed the five years of life remaining to him in honoured tranquillity at Belvedere (Constantinople). He died in 1579. His care was not productive of great moral importance. It was one of the tokens of the new era that was to dawn for the Jews as trusted public officials and as members of the state.

Nasi, a town and district of British India, in the central division of Bombay. The town is on the Godavari river, connected by a tramway (5 m.) with Nasik Road railway station, 107 m. N.E. of Bombay. Pop. (1901) 21,400. It is a very holy place of Hindu pilgrimage, being 30 m. from the source of the Godavari. Shrines and temples line the river banks, and some stand even in the river. In the vicinity there are a number of sacred caves, among which those of Pandu Lena are the most noteworthy. They are ancient Buddhist caves dating from the 3rd century before Christ to the 6th century after. There are numerous inscriptions of the highest historical value. Nasik has manufactures of cotton goods, brass-ware and mineral waters.

The District of Nasik has an area of 5550 sq. m. With the exception of a few villages in the west, the whole district is intersected by a table-land of 3000 ft. above sea-level. The western portion is hilly, and intersected by ravines, and only the simplest kind of cultivation is possible. The eastern tract is open, fertile and well cultivated. The Sahyadri range stretches from north to south; the watershed is formed by the Chander range, which runs east and west. All the streams to the south of that range are tributaries of the Godavari. To the north of the watershed, the Grina and its tributary the Mosam flow through fertile valleys into the Tapti. The district generally is destitute of trees, and the forests which formerly clothed the Sahyadri hills have nearly disappeared; efforts are now being made to reforest them. The Mahratta wars caused great destruction, and to replete some of the slopes. The district contains several old hill forts, the scenes of many engagements during the Mahratta wars. Nasik district
became British territory in 1818 on the overthrow of the peshwa. The population in 1901 was 816,504, showing a decrease of 3% in the decade. The principal crops are millet, wheat, pulse, oil-seeds, cotton and sugar cane. There are also some vineyards of old date, and much garden cultivation. Yeola is an important centre of weaving silks both of Indian and Chinese origin. There are railroads at Malegaon, railway workshops at Igatpuri, and cantonments at Deolali and Malegaon. At Sharanpur is a Christian village, with an orphanage of the C.M.S., founded in 1854. The district is crossed by the main line and also by the chord line of the Great Indian Peninsula railway.

NASIR KHOSRAU (Nasiri Khusru), Abū Mu‘in-ed-dīn Nasīr b. Khosrau (1004–1088), whose nom de plume was Hujjat, the first great didactic poet of Persia, was born, according to his own statement, A.H. 394 (A.D. 1004), at Kubdāyān, near Balkh in Khurāsān and was, according to the ordinary opinion of the life of the poet, in the east; we learn from incidental remarks of his that he was a Sunnite, probably according to the Ḥanifite rite, well versed in all the branches of natural science, in medicine, mathematics, astronomy and astrology, in Greek philosophy, and the interpretation of the Koran; that he was much addicted to worldly pleasures, especially to excessive wine drinking. He had studied Arabic, Turkish, Greek, the vernacular languages of India and Sind, and perhaps even Hebrew; he had visited Multān and Lahore, and the splendid Chaznavīde court under Sultan Mahmūd, Firdousī's patron. Later on he chose Merv for his residence, and is the owner of a building called the Unch (now a street) in that place. In A.H. 437 (A.D. 1045) he appears as financial secretary and revenue collector of the Seljuk sultan Toghru Beg, or rather of his brother Jāhār Beg, the emir of Khorāsān, who had conquered Merv in 1037. About this time, inspired by a heavenly voice (which he pretends to have heard in a dream), he abjured all the luxuries of life, and resolved upon a pilgrimage to the holy shrines of Mecca and Medina, hoping to find there the solution of all his religious doubts. The graphic description of this journey is contained in the Safarnāma, which possesses a special value among books of travel, since it contains the most minute account of the state of the Mussulman world in the middle of the 11th century. The minute sketches of Jerusalem and its environs are even now of practical value. During the seven years of his journey (A.D. 1045–1052) Nasir visited Mecca four times, and performed all the rites and observances of a zealous pilgrim; but he was far more attracted by Cairo, the capital of Egypt, and the residence of the Fatimite sultan Mostānsir bil-lāh, the great champion of the Shi‘a, and the spiritual as well as political head of the house of ‘Ali, which was just then waging a deadly war against the ‘Abbāsid caliph of Bagdad, and whose greatest supporter was the Great Seljuk Khalif at Sihjūk. At the very time of Nasir’s visit to Cairo, the power of the Egyptian Fatimites was in its zenith; Syria, the Hejaz, Africa, and Sicily obeyed Mostanṣir’s sway, and the utmost order, security and prosperity reigned in Egypt. At Cairo he became thoroughly imbued with Shi‘a doctrines, and their introduction into his native country was henceforth the sole object of his life. The hostility he encountered in the propagation of these new religious ideas after his return to Khorāsān in 1052 and Sunnite fanaticism compelled him at last to flee, and after many wandering journeys, first of all the house of a house and garden there. At Badakshān, where he spent as a hermit the last decades of his life, and gathered round him a considerable number of devoted adherents, who have handed down his doctrines to succeeding generations.

Most of Nasir’s lyrical poems were composed in his retirement, and their chief topics are—an enthusiastic praise of ‘Ali, his descendent, and Mostanṣir in particular; passionate outcries against Khorāsān and its rulers, who had driven him from house and home; the highest satisfaction with the quiet solitude of Yumgān; and utter despondency again in seeing himself despised by his former associates and forever excluded from participation in the glorious contest of life. But scattered through all these alternate outbursts of hope and despair we find precious lessons of purest morality, and solemn warnings against the tricks and perfidy of the world, the vanity of all earthly splendour and greatness, of all the hypocrisies, frivolity and viciousness of fashionable society and princely courts in particular. It is the same strain which runs, although in a somewhat lower key, through his two most important works of historical poetry, the Rashidunāma, or "book of enlightenment," and the Sa‘dādatnāma, or "book of felicity." The former is divided into two sections: the first, of a metaphysical character, reproduced in Persian verse, is based on Avicenna’s theories, but frequently intermixed both with the freer speculations of the well-known philosophical brotherhood of Basra, the Ḥikwān-es-safā’ī, and purely Shi‘ite or Isma’īlite maxims and ingenious thoughts on man’s good and bad qualities, on the necessity of shunning the company of fools and double-faced friends, and the deceptive allurements of the world and the secret shares of ambitious and corrupt men. The second section is composed with an imaginary vision of a beautiful world of spirits who have stripped off the fetters of earthly cares and sorrows and revel in the pure perfume of the wireless and ethereal. If we substitute for the alleged allegory in Nasir’s diwan, which culminates in the praise of Mostanṣir, we are fairly entitled to look upon it as a covert allusion to the eminent men who revealed to the poet in Cairo the secrets of the Isma’īlī faith, and showed him what he considered the "heavenly ladder" to superior knowledge and spiritual bliss. The passage, thus interpreted, lends additional weight to the correctness of Dr Ethè’s theory of Nasir’s conversion at the court of the Seljuk Sultan in 1052.

A similar series of excellent teachings on practical wisdom and the moral laws of a vanishing life, only of slight and occasional interest, is contained in the Sa‘dādatnāma; and, judging from the extreme bitterness of tone manifested in the "reproofs" of its emirs and the "memories" of the transtended sultan, who was still furious against the vile aspersions poured out upon Nāsir’s moral and religious attitude during those persecutions which drove him at last to Yumgān. Of all the other works of our author mentioned by Oriental writers there has as yet been found only one, the Zidd elmas‘ūdīn or "travelling provisions of pilgrims" (in the private possession of M. Schefler, Paris), a theoretical description of his religious and philosophical principles; and we can very well dismiss the rest as being probably just as apocryphal as Nāsir’s famous autobiography (found in several Persian tadkhīlas or biographies of poets), a mere forgery of the most extravagant description, which is mainly responsible for the confusion in names and dates in older accounts of our author.

NASIRABAD, or MYMENNSHG, a town of British India, headquarters of Mymensingh district in Eastern Bengal and Assam, situated on the left bank of the old channel of the Brahmaputra, which is only navigable during the rainy season. Pop. (1901) 14,668. It has a station on the branch of the Eastern Bengal railway from Dakca to Jagannathganj, on the Jamuna or main stream of the Brahmaputra. The earthquake of the 12th of June 1897 destroyed the church and the high school, and seriously damaged other public buildings.

NASIRABAD is also the name of a town and cantonment in the district of Patna, North Bengal, the headquarters of a brigade in the 5th division of the Southern army.

NASMUTH, ALEXANDER (1758–1840), Scottish portrait and landscape painter, was born in Edinburgh on the 6th of September 1758. He studied at the Trustees’ Academy under Runciman, and, having been apprenticed as an heraldic painter to a coachbuilder, he, at the age of sixteen, attracted the attention of Allan Ramsay, who took the youth with him to London, and employed him upon the subordinate portions of his works. Nasmuth returned to Edinburgh in 1788, and was soon largely patronized by one portrait painter. He also assisted Mr Miller of Delft as draughtsman, in his mechanical researches and experiments; and, this gentleman having generously offered the painter a loan to enable him to pursue his studies abroad, he left in 1792 for Italy, where he remained two years. On his return he painted...
the excellent portrait of Burns, now in the Scottish National Gallery, well known through Walker’s engraving. Political feeling at that time ran high in Edinburgh, and Nasmyth’s pronounced Liberal opinions, which he was too outspoken and sincere to disguise, gave offence to many of his aristocratic patrons, and led to the diminution of his practice as a portraitist. In his later years, accordingly, he devoted himself mainly to landscape work, and did not disdain on occasion to set his hand to scene-painting for the theatres. He has been styled, not unjustly, the "father of Scottish landscape art." His subjects are carefully finished and coloured, but are sagging in bosoms and sometimes are partially destroyed by the amateurish disposition of their estates, in which his fine taste rendered him especially skillful; and he was known as an architect, having designed the Dean Bridge, Edinburgh, and the graceful circular temple covering St. Bernard’s Well. Nasmyth died in his native city on the 20th of April 1840. His youngest son, James, was the well-known inventor of the steam-hammer. His six daughters all attained a certain local reputation as artists, but it was in his eldest son, Patrick (1875-1931), that the artistic skill of his family was most powerfully developed. He studied under his father, Patrick went to London at the age of twenty, and soon attracted attention as a clever landscapist. He was a diligent student of the works of Claude and Richard Wilson, and of Ruysdael and Hobbema, upon whom his own practice was mainly founded. His most characteristic paintings are of English domestic scenery, full of quiet tone and colour, and detailed and minute expression of foliage, and with considerable brilliancy of sky effect. They were executed with his left hand, his right having in early life been injured by an accident.

For an account of the Nasmyth family see James Nasmyth’s Autobiography (1883).

NASMYTH, JAMES (1808-1890), Scottish engineer, was born in Edinburgh on the 19th of August 1808, and was the youngest son of Alexander Nasmyth, the "father of Scottish landscape art." He was sent to school in his native city, and then attended classes in chemistry, mathematics and natural philosophy at the university. From an early age he showed great fondness for mechanical pursuits, and the skill he attained in the practical use of tools enabled him to make models of engines, &c., which found a ready sale. In 1829 he obtained a position in Henry Macleod’s works in London, where he stayed two years, and then, in 1834, started business on his own account in Manchester. The beginnings were small, but they quickly developed, and in a few years he was at the head of the prosperous Bridgewater foundry at Patricroft, from which he was able to retire in 1856 with a fortune. The invention of the steam-hammer, with which his name is associated, was actually made in 1839, a drawing of the device appearing in his note-book, or "scheme-book," as he called it, with the date 24th November of that year. It was designed to meet the difficulty experienced by the builders of the Great Britain steamship in finding a firm that would undertake to forge the large paddle-wheel shaft required for that vessel, but no machine of the kind was constructed till 1842.

In that year Nasmyth discovered one in Schneiders’ Creuzot works, and he found that the design was his own and had been copied from his "scheme-book." His title, therefore, to be called the inventor of the steam-hammer holds good against the claims sometimes advanced in favour of the Schneiders, though apparently he was anticipated in the idea by James Watt. Nasmyth did much for the improvement of machine-tools, and his inventive genius devised many new appliances—a planeing-machine ("Nasmyth steam-arch"), a nut-shaping machine, steam pile-driver, hydraulic machinery for various purposes, &c., &c.

In his retirement he lived at Penshurst in Kent, and amused himself with the study of astronomy, and especially of the moon, on which he published a work, The Moon considered as a Planet, a World and a Satellite, in conjunction with James Carpenter in 1874. He died in London on the 7th of May 1890.

His Autobiography, edited by Dr Samuel Smiles, was published in 1883.
supported them against rebels. The end came when the weakness of Mahomm edan rulers in Morocco coincided with the rule of strong sovereigns in Castile. Frontier wars between Mahom medan and Christian borderers were incessant, and at long intervals the kings of Castile made invasions on a considerable scale, without, however, following up any successes they might gain. The comparative prosperity of Granada was due to the concentration of a large population driven from other parts of Spain, and the consequent necessity for the intensive cultivation of the rich valleys lying among the ranges of mountains which encircle the kingdom, and the extensive "Vega" or plain of Granada. The reputation for civilization which the agitated Mahomm edean state enjoys in history is based on the surviving parts of the highly decorated fortress palace of the Alhambra, which was mainly the work of three of the sultans, the founder, Mahomed el Ghallib, and his two successors.

See S. Lane-Poole, The Mahomm edean Dynasties (London, 1894); and Historia de Granada, by Don M. Lafuente Alcántara (Granada, 1884).

**NASSARAWA**

NASSARAWA, a province of the British protectorate of northern Nigeria, lying approximately between 6° 40' and 9° E. and between 7° 40' and 12° 40' N. It is situated on the northern bank of the river Benue, which in its windings forms the southern frontier of the province. Nassarawa is bounded E. by the province of Muri, N.E. by Bauchi, N. by Zaria and W. by Nupe and the trans-Nigerian portion of the province of Kabba. It has an area of 18,000 sq. m. and an estimated population of 1,500,000. The province, like that of Bauchi, is traversed by modern and native courts. It consists of a hilly plateau, interspersed with many fertile river valleys. Native products include rubber, palm kernels and beni seed. Cotton is grown extensively. Until the middle of the 18th century Nassarawa appears to have been peopled by many native tribes of a primitive type. About 1750 an important pagan tribe, the Igbara, came from the south-west across the Niger and established two rival kingdoms in the western portion of the province. Later the native inhabitants of Zaria, driven before the Fula, came from the north and occupied the central portion of Nassarawa. Later still (about 1840) certain Fula of Zaria themselves conquered portions of the province, founded Keffi, spread as far as the Benue in the south-west corner and occupied the town and district of Abuja in the west. Fula also made a settlement at the town of Nassarawa and at Darroro in the N.E. A colony from Bornu entered the province and founded the important town of Lafia Berefere in the eastern district. As a result of these movements the aboriginal tribes were driven into the hilly regions of the S.E. and N.E. The Musha, a truculent and hardy people, hold a portion of the northern bank of the Benue, and the Kagoro and Attakar tribes hold the hilly country to the N.E., through which the roads pass from Keffi and through the Bauchi high- lands. Before the British occupation the state of Nassarawa had become a partially subdued Fula emirate, exercising doubtful sway over the native pagans and paying a scarcely less doubtful allegiance on its own part to the Fula ruler of Zaria. The riverain tribes of Nassarawa were among the first to break into open aggression against the British administration established at Lokoja. In January 1900 they attacked a telegraph construction party in the Mushu country on the banks of the Benue. The result was the occupation of Keffi by British troops and the gradual subjugation of the province. In 1902 the first British resident, Captain Moloney, was murdered at Keffi by an official of the emir's court. The emir repudiated all responsibility for the crime, and the murderer fled to Kano, where his reception on friendly terms was among the incidents which determined the Sokoto-Kano campaign of 1903. The British were now recognized as the rulers of Nigeria, and the emir of Nassarawa threw in his lot with the British government. Slave raiding was abolished and the slave trade made illegal. A British court of justice was established at the provincial head- quarters and native courts in every district. Roads have been opened and trade is steadily increasing. In 1905 an expedition was required against the Kagoro people, who occupy a vast open plateau having an elevation of about 1800 ft. through which a short road to the Bauchi tin mines passes from the Benue. These people had been raiding the Fula for cattle and murdering traders upon the road. A splendid grazing country, healthy and also rich in rubber, was opened. The road to the tin mines was rendered safe and is now the Bauchi mail route. There is a cart road from Loko to the Benue to Keffi.

NASSAU, a territory of Germany, now forming the bulk of the government district of Wiesbaden, in the Prussian province of Hesse-Nassau, but until 1866 an independent and sovereign duchy of Germany. It consists of a compact mass of territory, 1830 sq. m. in area, bounded on the S. and W. by the Main and Rhine, on the N. by Westphalia and on the E. by Hesse. This territory is divided into two nearly equal parts by the river Lahn, which flows from east to west into the Rhine. The southern half is almost entirely occupied by the Taunus Mountains, which attain a height of 2000 ft. In the Great Feldberg, while to the north of the Lahn is the barren Westerwald, culminating in a hill 3000 ft.). The valleys and low-lying districts, especially the Rheingau, are very fertile, producing abundance of grain, flax, hemp and fruit; but by far the most valuable product of the soil is its wine, which includes several of the choicest Rheinisch varieties, such as Johannisberger, Marzobrunner and Assmannshütser. Nassau is one of the most thickly wooded regions in Germany, about 42% of its surface being occupied by forests, which yield good timber and harbour large quantities of game. The rivers abound in fish, the salmon fisheries on the Rhine being especially important. There are numerous salt springs of which formerly belonged to the duke, and afforded him a considerable part of his revenue. The best known are those of Wiesbaden, Ems, Soden, Schwalm, Schlangenbad, Gelna and Fachingen. The other mineral wealth of Nassau includes iron, lead, copper, building stone, coals, slate, a little silver and a bed of malachite. Its manufactures, including cotton and woollen goods, are unimportant, but a brisk trade is carried on by rail and river in wine, timber, grain and fruit. There are few places of importance besides the above-named spas; Höchst is the only manufacturing town. Wiesbaden, with 100,000 inhabitants, is the capital of the government district as it was of the duchy. In 1864 the duchy contained 466,117 inhabitants, of whom 242,000 were Protestants, 275,000 Roman Catholics and 7000 Jews. The ecclesiastical jurisdiction was in the hands of the Protestant bishop of Wiesbaden and the Roman Catholic bishop of Limburg. Education was amply provided for in numerous higher and lower schools. The annual revenue of the dukedom was about £400,000 and it furnished a contingent of 6000 men to the army of the German Confederation.

**History.**—During the Roman period the district enclosed by the Rhine, the Main and the Lahn was occupied by the Marcomanni and later by the Alamanni. The latter were subdued by the Franks under Clovis at the end of the 5th century, and at the partition of Verdun in 843 the country became part of the East Frankish or German kingdom. Christianity seems to have been introduced in the 4th century. The founder of the house of Nassau is usually regarded as a certain Druwin (d. 706), who, with his brother Dudo, count of Luxembourg, built a castle on a hill overlooking the Lahn, near the present town of Nassau. Druwin's descendant Walram (d. 1108) took the title of count of Nassau, and placed his hands under the immediate suzerainty of the German king, and the house had been a vassal of the archbishop of Trier. Then in 1255 Walram's grandsons, Walram and Otto, divided between them their paternal inheritance, which had been steadily increasing in size. Walram took the part of Nassau lying on the left bank of the Lahn and made Wiesbaden his residence; Otto took the part on the right bank of the river and his capital was Siegen. The brothers thus founded the two branches of the house of Nassau, which have flourished to the present time.

The emirs of the Ottonian, or younger, line belong mainly to the history of the Netherlands. The family was soon divided into several branches, and in the 15th century one of its members,
Count Engelbert I. (d. 1442), obtained through marriage lands in Holland. Of his two sons one took the Dutch, and the other the German possessions of the house, but these were united again in 1504 under the sway of John, count of Nassau-Dillenburg, the head of a branch of the family which, in consequence of a series of deaths, the last of which took place in 1561, was a few years later the sole representative of the descendants of Count Otto. John's son was Count William the Rich (d. 1559), and his grandson was the hero, William the Silent, who inherited the principality of Orange in 1544 and surrendered his prospective inheritance, in Nassau to his brother John (d. 1606). William and his descendants were called princes of Orange-Nassau, and the line became extinct when the English king William III. died in 1702. Meanwhile the descendants of Count John, the rulers of Nassau, were flourishing. They were divided into several branches, and in 1702 the head of one of these, John William Friso of Nassau-Dietz (d. 1711), whose ancestor had been made a prince of the Empire in 1654, inherited the title of prince of Orange and the lands of the English king in the Netherlands.

A few years later in 1743 a number of deaths left John William's son, William, the sole representative of his family, and as such he ruled over the ancestral lands both in Nassau and in the Netherlands. In 1866, however, these were taken from a succeeding prince, William VI., because he refused to join the Confederation of the Rhine. Some of them were given in 1815 to the other main line of the family, the one descended from Count Walram (see below). In 1815 William VI. became king of the Netherlands as William I., and was compensated for this loss in 1840 by the gift of parts of Luxembourg. William's eldest son, Otto, was again united in 1866 under Louis II. of Nassau-Weilburg (d. 1862). Soon, however, the family was again divided; three branches were formed, those of Saarbrücken, Idstein and Weilburg, the heads of the first two becoming princes of the Empire in 1868. Other partitions followed, but at the opening of the 19th century only two lines were flourishing, those of Nassau-Usingen and Nassau-Weilburg. In 1801 Charles William, prince of Nassau-Usingen, was deprived of France by his lands on the left bank of the Rhine, but both he and Frederick William of Nassau-Weilburg, who suffered a similar loss, received ample compensation. In 1815 both Nassau-Usingen and Frederick Augustus, the brother and successor of Charles William, joined the Confederation of the Rhine and received from Napoleon the title of duke, but after the battle of Leipzig they threw in their lot with the allies, and in 1815 joined the German Confederation. As a result of the changes of 1815 Frederick Augustus of Nassau-Usingen ceded some of his newly-acquired lands to Prussia, receiving in return the greater part of the German possessions of the Ottonian branch of the house of Nassau (see above). In March 1876 he died without sons and the whole of Nassau was united under the rule of Frederick William of Nassau-Weilburg as duke of Nassau. Already in 1814 Frederick William had granted a constitution to his subjects, which provided for two representative chambers, and under his son William, who succeeded in 1816, the first landtag met in 1818. At once, however, it came into collision with the duke about the ducal domains, and these dissensions were not settled until 1836.

In this year the duchy took an important step in the development of its material prosperity by joining the German Zollverein. In 1838 Duke Adolph, the son and successor of Duke William, was compelled to yield to the temper of the times and to grant a more liberal constitution to Nassau, but in the following years a series of reactionary measures reduced matters to their former unsatisfactory condition. The duke adhered steadfastly to his conservative principles, while his people showed their sympathies by electing one liberal landtag after another. In 1866 Adolph espoused the cause of Austria, sent his troops into the field and asked the landtag for money. This was refused, Adolph was soon a fugitive before the Prussian troops, and on the 3rd of October 1866 Nassau was formally incorporated with the kingdom of Prussia. The deposed duke entered in 1867 into a convention with Prussia by which he retained a few castles and received an indemnity of about £5,500,000 for renouncing his claim to Nassau. In 1869, on the extinction of the collateral line of his house, he became grand-duke of Luxembourg, and he died on the 17th of November 1905.

The town of Nassau (Lat. *Nasonga*) on the right bank of the Lahn, 15 m. above Coblenz, is interesting as the birthplace of the Prussian statesman, Freiherr von Stein. Pop. (1905) 2238. It has a Roman Catholic and an Evangelical church, while its main industries are brewing and mining. Near the town are the ruins of the castle of Stein, first mentioned in 1138, with a marble statue of Stein, while the ruins of the ancestral castle of the house of Nassau may also be seen.

**NAST, THOMAS** (1840–1902), American caricaturist, was born on the 27th of September 1840, in the military barracks of the city of Ansbach, in the electorate of Würtemberg, the son of a musician in the Ninth regiment of the Bavarian band. His mother took him to New York in 1846. He studied art there for about a year with Theodor Kaufmann and then at the school of the National Academy of Design. At the age of fifteen he became a draughtsman for Frank Leslie's *Illustrated Newspaper*; three years afterwards for *Harper's Weekly*. In 1860 he went to England for the *New York Illustrated News* to depict the prize-fight between Heenan and Sayers, and then joined Garibaldi in Italy as artist for *The Illustrated London News*. His first serious work in caricature was the cartoon "Peace," in 1862, directed against those in the North who opposed the prosecution of the Civil War. This and his other cartoons during the Civil War and Reconstruction days were published in *Harper's Weekly*; they attracted great attention, and Nast was called by President Lincoln "our best recruiting sergeant." Even more able were Nast's cartoons against the Tweed Ring conspiracy in New York city; his caricature of Tweed being the means of the latter's identification and arrest at Vigo. In 1873, 1885 and 1887 Nast toured the United States as lecturer and sketch-artist, but with the advent of new methods and younger blood his vogue decreased. He had been an ardent Republican in his earlier years; had bitterly attacked President Johnson and his Reconstruction policy; had ridiculed Greeley's candidature, and had opposed inflation of the currency, notably with his famous "rag-baby" cartoons, but his advocacy of civil service reform and his distrust of Blaine forced him to become a Mugwump and in 1884 an open supporter of the Democratic party, from which in 1892 he returned to the Republican party and the support of Harrison. He had lost practically all of his earnings by the failure of Grant and Ward, and in May 1902 was appointed by President Roosevelt commissary-general at Guaynabo, where he died on the 7th of December that year. He did some painting in oil and some book illustrations, but these were comparatively unimportant, and his fame rests on his caricatures and political cartoons. Nast introduced the donkey to typify the Democratic party, the elephant to typify the Republican party, and the tiger to typify Tammany Hall, and introduced into American cartoons the practice of modernizing scenes from Shakespeare for a political purpose.

NASTURTIUM—NATAL

NASTURTIUM, or Indian cress, Tropaeolum majus, a perennial climber, native of Peru, but in cultivation treated as a hardy annual. It climbs by means of the long stalk of the peltate leaf which is sensitive to contact like a tendril. The irregular flowers have five sepals united at the base, the corolla with its spurred development of the axis; of the five petals the two upper are slightly different and stand rather apart from the lower three; the eight stamens are unequal and the pistil consists of three carpels which form a fleshy fruit separating into three one-seeded portions. The flowers are sometimes eaten in salads, and the leaves and young green fruits are pickled in vinegar as a substitute for capers. The pungency of the nasturtium officinale, the water-cress, gave it its name nasi-tortium, that which twists the nose. The plant should have a warm situation, and the soil should be light and well eniriched; it may be sown in April, either near a fence or wall, or in an open spot, where it will require stakes 6 to 8 ft. high.

The dwarf form known as Tom Thumb (T. m. nanum), is an excellent bedding or border flower, growing about a foot high. Sow in April in the beds or borders; and again in May for a succession. Other fine annual Tropaeolums are T. Lobbianum with long spurred orange flowers and numerous varieties; and T. minus, a kind of miniature T. majus with yellow, scarlet and crimson varieties.

The genus Tropaeolum, native of South America and Mexico, includes about 35 species of generally climbing annual and perennial herbs, with either one or numerous petals; the irregular flowers, T. peregrinum is the well-known canary creeper. The flame nasturtium with brilliant scarlet blossoms is T. speciosum from Chile; it has tuberous roots, as have also such well-known perennials as T. polyphyllum, T. pentaphyllum. Of these T. speciosum should be grown in England in positions facing north; it flourishes in Scotland.

NATAL, a maritime province of the Union of South Africa, situated between 27° and 31° S., 29° and 33° E. It is bounded S. by the Indian Ocean, S.W. by the Cape province and Basutoland, N.W. by the Orange Free State province, N. and N.E. by the Transvaal and Portuguese East Africa. It has a coast line of 376 m.; its greatest length N. to S. in a direct line is 247 m.; its greatest breadth E. to W., also in a direct line, 200 m. Natal has an area of 35,371 sq. m., being nearly three-quarters the size of England. (For map see SOUTH AFRICA.)

The province consists of two great divisions, namely Natal proper and Zuulund (q.v.). Natal proper has a seaboard of 106 m. and an area of 24,010 sq. m., Zuulund, in which is included Amatongeland, a seaboard of 210 m. and an area of 10,461 sq. m. It lies north-east of Natal. In this article the description of the physical features, crops and industries of Natal proper only is considered.

Physical Features.—The terrace formation of the land characteristic of other coast regions of South Africa prevails in Natal. The country may be likened to a steep and gigantic staircase leading to a broad and level land lying beyond its borders. The rocky barrier which shuts off this land is part of the Drakensberg range. From the mountain sides flow many rivers which dash in magnificent waterfalls and through deep gorges to the sea. Falling 500 or more feet in little over 200 m., these streams are un navigable. The south-eastern sides of the mountains are in places overhung with heavy timber, while the semi-tropical luxuriance of the coast belt has earned for Natal the title of "the garden colony."

The coast trends in an almost unbroken line, from S.W. to N.E. It extends from the mouth of the Umntumvuna river (3º 4' S., 30º 12' E.), which separates Natal from the Cape, to the mouth of the Tugela (29º 15' S., 31º 30' E.), which marks the frontier between Natal and Zululand. The only considerable indentation is at Durban, about two-thirds of the distance from the Umntumvuna to the Tugela, where there is a wide and shallow bay, covering with its islands nearly 6 sq. m. The coast, though low and sandy in places, is for the most part rocky and dangerous. The warm Mozambique current sweeps down from the N.E. setting up a back drift close in shore. The southern entrance to Durban harbour is marked by a bold bluff, the Bluff of Natal, which is 250 ft. high and forested to the water's edge. Opposite the Bluff a low sandy spit called the Point forms the northern entrance to the harbour. North of Durban the coast belt, hitherto very narrow, widens out and becomes more flat. But the mountain belt on this side of the coast is less developed than in the Drakensberg, the ridge of 15 m., is broken and rugged. Ranges of hills lead to the first plateau, which has an average elevation of 2000 ft. and is of ill-defined extent. Here the land loses its semi-tropical character and resembles more the plains of the Orange Free State and the Transvaal. The second plateau, reached by a steep ascent, has an elevation of from nearly 4000 to fully 5000 ft. It is an undulating plain, grass-covered, but for the most part without trees or bush. It continues to the foot of the Drakensberg range, the mountains rising towards the S.W., with almost perpendicular sides, 6000 to 7000 ft. above the country at their base. North-west of the Drakensberg, the mountains are of lower elevation and the more rounded contours.

Mountains.—Although the division of the country into terraces separated by ranges of hills is clearly marked in various districts, as for instance between Durban and Colenso, the province is traversed by many secondary chains, as well as by spurs of the Drakensberg. As the highest points of that range, and the highest land in Africa south of the Equator, it is the escarpment of the Drakensberg, which runs from Majuba Hill on the N.W. to Bushman's Nek in the S.W., forming the front of the province, the crest of the range being generally near the coast. This is the case in the Montagu Mountains, the ridge of which is 11,170 ft. and Cathkin Peak or Champagne Castle (10,357 ft.); the top of the third great height, Giant's Castle (9657 ft.), is in Basutoland, but its seaward slopes are in Natal. From Giant's Castle to Mont-aux-Sources, in which, forsaking their general direction of direction, the Drakensberg run S.E. to N.W., the mountains attain an elevation of 10,000 to 11,000 ft., with few breaks in their face. North of Mont-aux-Sources the mountain range sinks to 8000 and 9000 ft., and here are several passes leading into the Orange Free State. Laing's Nek is a pass into the Transvaal. The chief heights in Natal between Mont-aux-Sources and Laing's are the Tintwa (7900 ft.), Inkwelo (6608 ft.) and the Niger Valley which the Drakensberg at right angles to the main range, cross the plateaus. The most northern, which runs E. from Majuba to the Lebombo Mountains, coincides roughly with the northern frontier of Natal. It is one of the chief drainage divisions for the Drakensberg range. The higher plateaux and the wider valleys, which it controls, is drained by the Umzimkulu river and its tributaries, and the wide valleys, though usually not navigable, are crossed by numerous passes which are marked by the names of the rivers. In a distance of 100 m., the Umzimkulu river is navigable and reaches the Indian Ocean between Illovo and Ballito. The Drakensberg range forms the main divide of the southern Drakensberg, and the eastern ranges are drained by the Kei and Tugela, and the western ranges by the Umzimkulu and Tugela. The latter river, rising in the Drakensberg south of the Umzimkulu, which it joins after a course of some 50 m. Below the junction the Umzimkulu forms for some distance the frontier between Natal and the Griqualand West, joined by the Tugela, which drains nearly 100 m. of rich volcanic soil, and which are almost entirely bounded by the escarpment of the Montagu Mountains. The coast of the Natal rivers is highly indented, and the coast is broken by the rivers, the coasts of the Tugela (120 m. long) is striking, in turns rugged and desolate, verdant and smiling, with patches of dense forest and heights wooded to western. The Transvaal is situated at the mouth of the river, which, like that of all others in Natal, is obstructed by a bar. As a
result of harbour works, however, a channel has been cleared and steamers can ascend the river for 6 m.

The Pongola rises in the Transvaal in high ground N.E. of Wakkerstroom and flows E., forming, for the greater part of its course, the eastern boundary of the province. After piercing the Lebombo Mountains, it turns N. and joins the Maputa, a river emptying into Delagoa Bay. The Umgeni, which rises in the Spion Kop hills some 30 m. E. of Giant’s Castle, flows through the central part of Natal and reaches the sea 4 m. N. of Durban. It flows alternately through magnificent pastoral and mountainous country, and is known for two magnificent waterfalls, both within 12 m. of Pietermaritzburg. The upper falls is clearly visible from a hill on the Umgeni leaps in a single sheet of water down a precipice over 350 ft. high, more than double the height of Niagara, forming, when the river is swollen by rains, a spectacle of rare magnificence.

Karkloof or Lower Falls, where in series of beautiful cascades the water descends to the plain. Other rivers of Natal which rise in the spurs of the Drakensberg or in the higher terraces are the Umvuma, which is nowhere navigable, the Tugela, which has cleared a path for steamers, and the Drakens River. The Drakens River flows between the Karroo spurs and the Drakensberg range of mountains, in the northern county division, the Umflaas (which gives Durban its main water supply), the Illovo, which traverse the country between the Umgeni and Umkomaas, and the Umtamatungu, noteworthy as forming the boundary between Natal and Pondoland. There are also seventeen distinct coast streams in the colony.

[Geology.]—The general geological structure of Natal and Zululand is one of a series of a series of plateaux formed on sedimentary rocks which mainly belong to three formations of widely separated ages, and which rest on a platform of granitic and metamorphic rocks.

The geological formations represented include:

- Post-Cretaceous
- Recent Cretaceous
- Pre-Cretaceous

Pre-Cape Rocks.

The granites and schists occur in close association. The series covers considerable areas in the lowest parts of the valleys and near the coast. The widest areas are in Zululand. In the Umzimkulu river and in the Tugela river below its junction with the Buffalo, metamorphic limestones are associated with schists, gneisses and granites. With increasing distance from the coast, the sequence of the formations changes. The Ecca Series, which is true and is auriferous, but the gold has not been met with in payable quantities.

Table Mountain Sandstone Series.

This rests unconformably on the pre-Cape rocks. Traced northwards, the series becomes thinner and finally dies out. As a rule denudation, which has acted on a magnificant scale, has removed all but a few hundreds feet of the basement beds. The maximum thickness of 2000 ft. occurs near Melmoth. The beds are usually thin false-bedded sandstones with an almost complete absence of shales. A conglomerate at the base contains traces of gneiss. Griesbach mentions the occurrence of some small bivalves in the shales of Greytown, but Anderson failed to find any fossils.

Ecca Glacial Series.—A great unconformity separates the Table Mountain and the Ecca Series. The thickness of the gap is represented by the Witteberg and Bokkeveld series. The Dwyka conglomerate rarely attains any great thickness though forming wide outcrops. It is usually a hard compact rock containing striated stones. The Umflaas series, where the rock is used for road-metal, furnishes the best exposures.

Ecca Series.—With the Beaufort series this occupies over two-thirds of the western portion of the province and has wide outcrops in Zululand and in the Vryheid districts. The Ecca shales contain some of the best coal of South Africa, but the seams contain much marketable coal. Around Dundee and Newcastle the coals are being mined in large quantities and are exported. There include several species of Glossopteris among them: Glossopteris browniana var. indica; Bubh. Phyllotheca Zeilleri eth. fl.; Estharia Greysi, Jones, indicating a Perm-Carboniferous age.

Beaufort Series.—The Ecca series grades upwards into the highly coloured sandstones and shales of the Beaufort series. Fossil remains are rare, but the sandstones in the vicinity of the Tugela river, near Port Alfred, contain the remains of the insect Pterophyllum.—A Nautilus series. This consists of sandstones and shales with thin seams of coal. The chief outliers occur around Biggarsberg and Vryheid. The highest formation is the Zululand sandstone. The basin is—Strati- 
 fielda odoniporioides, Morr. and a Pterophyllum—indicate a Rhetaeic age. No reptilian remains have been found.

Upper Karroo.—The Red beds and Cave sandstones occur along the shelf banks of the Gulf of Zululand.

Cretaceous.—Deposits of this age are confined to the littoral. They are exceedingly prolific in fossils which prove them to be of Cretaceous age. The bones of fossil has been obtained from Umkfilede Hill, Zululand. W. G. C.

Climate.—With a rise in level (not reckoning the mountain tops) of 3500 ft. in a distance of 170 m., Natal possesses several varieties of climate, and the temperature within the province varies from 70° F. at the coast in January to 74° at Durban at the coast in January. At Pietermaritzburg, 41 m. inland and 2200 ft. above the sea, the temperature is about 64°. In the uplands the heat of summer is often greater than on the coast, but the air is less humid and the climate is generally cooler. The temperatures of the months are increased by the great mass of water, the Mozambique current flowing south from the equatorial regions. At Durban the annual rainfall is 40 in. and at Pietermaritzburg 550 in. The average between the years 1893 and 1905 is 64 in. 1893 is the rainy season, and May, June and July the driest months of the year. The mean temperature at Durban, records taken at 260 ft. above the sea, is 70° F., varying from 42° in winter to 98° in the summer averaged over a hundred years. The winter season, from May to August, is the rainy season, and May, June and July the driest months of the year. The year is divided into two seasons, summer, which begins in October and ends in January; and winter, which begins in February and ends in May. The weather is settled during the summer season, and it is then that the It is a coastal region, characterized by a wide variety of vegetation including savannas, forests, and mangroves. The coastline is rugged, with numerous islands and rocky formations.

The landscape is characterized by a diversity of vegetation types and topography. The region is home to a rich array of plant species, including various types of grasses, shrubs, trees, and other vegetation. The climate is typically warm and humid, with temperatures ranging from mild to hot throughout the year. The region is known for its scenic beauty and biodiversity, attracting visitors and researchers alike.

In the context of the text provided, there is a mention of the "littoral" area, which is the coastline and its immediate surroundings. The coastline of Natal includes the Illovo, which traverses the country between the Umgeni and Umkomaas, and the Umtamatungu, noted for its role as the boundary between Natal and Pondoland. The coastline is marked by several distinct coast streams, with the Umzimkulu river and the Tugela river being particularly significant.

The geological structure of the region is rich, with the presence of various geological formations such as the Table Mountain Sandstone Series and the Ecca Glacial Series. These formations are significant in understanding the geological history of the area, providing insights into the past sedimentary processes and depositional environments.

The climate of the region is diverse, with a range of seasonal variations. The coastal regions experience milder temperatures, while inland areas may have more significant variations. The text highlights the importance of the Mozambique current in influencing the climate, with summer seasons bringing higher temperatures and increased precipitation.

In summary, the coastal region of Natal is characterized by its diverse vegetation, rugged coastline, and varied climatic conditions, making it a region of significant ecological and geological importance.
principally the yellow wood (Podocarpaceae), sneezeweed (Platystemon), wild olive (Olea europaea), blackwood (Olea lanceolata), white ironwood (Viburnum coccineum), and sandalwood (Eucalyptus africanus); all are very useful woods, and the yellow wood, sneezeweed, wild olive and ironwood when polished have a good, greyish bloom. The "rooibos" tree, a red pear and milkwood trees are used for boatbuilding. The Australian Eucalyptus and Casuarina in great variety, and many other imported tropical species are grown. Of the reeds, the common pink and white ribbon reeds are the most useful. These are used for the making of the large wicker baskets and vases. Sometimes, the reeds are planted near the coast and oak all thrive when properly planted and protected from grass fires. The black wattle has been extensively planted and flourishes at elevations of from 1000 to 3000 ft. It also forms a valuable timber in the interior.

Flowers which bloom in the early spring are abundant, especially on the edges of forests. Among these found throughout the country are many species of daisies and everlasting. The most common and beautiful flowers are the Naivasha lilies, red, pink and white ribbed bells, the fire-lily, with flame-coloured blooms, ixias, gladiolus, the Iaffa lily, with fuchsia-like clusters, and the arum lily. A conspicuous veld plant is the orange and crimson Jacobinia. Geraniums grow extensively throughout the district. Of the "skein," as it is called locally, the feather flower life is abundant; 125 species are indigenous, two being tree-ferns. One of these, Cytosia dregert, found in moist places and open land, has a stem 20 ft. high; and the Hemitheca, the redbush, is found in the hills. The fynbos are most common in the midland zone and in the heavy timber forests. Sixty different species have been identified in one valley not more than 1 m. long and about 100 m. in breadth. Among fruit trees, besides the wild fruits already mentioned, are the pineapple, mango, papaw, guava, grenadilla, rose apple, custard apple, soursop, loquat, naartjie, shaddock and citrus fruits.

The larger animals which abounded in Natal in the first half of the 19th century have been exterminated or driven out of the country. This fate has overtaken the elephant, giraffe, the buffalo, quagga and antelopes. The only large mammals which can now be excluded, the lion and rhinoceros may be added to this list; and the Vryheid district belongs geographically to Zululand. Hippopotami are still found in the Umgeni river and crocodiles in several of the coast streams. Leopards and panthers are found in thickly wooded kloofs. Hyenas, jackals, wild pig, polecat and wild dogs (Canis pictus) of different species are still found in or about bush jungles and forest dumps; clowns (Antilope aethiops) are preserved on game farms, but there are now some species of impala and elands. The most common of these species are now preserved. Ant-eaters (Orycteros capensis), porcupines, weasels, squirrels, rock rabbits, hares and cane rats are common in different localities. Baboons (Cynopithecus podicipus) and vervet monkeys are common throughout the interior. Antelopes are found in kloofs and bush and timber lands. The birds of Natal! are of many species; some have beautiful plumage, but none of them, with the exception of the cranes, are to be considered as game. Among the larger birds are cranes, herons, the ibis, storks, eagles, vultures, falcons, hawks, kites, owls, the secretary bird, pelicans, flamingoes, wild duck and geese, gulls, and of game birds, the pawaq, kori, phasian, partridge, guinea fowl and quail. The other game include parrots, toucans, gaudily coloured cuckoos, lories, swallows, shrines, sun-birds, kingfishers, weavers, finches, wild pigeons and cranes. The otter is found in some of the rivers, which are also frequented by the elephant. The crocodile and hippopotamus in the coast lagoons and sometimes are of great size. Iguanas, 4 and 5 ft. long, are found on the wooded banks of the rivers; small lizards and chameleons are common, and there are several varieties of tortoise.

Of snakes there are about forty distinct species or varieties. The most dreaded by the natives are called "imamba," of which there are at least eight different kinds; these snakes elevate and throw themselves forward, and have been known to pursue a horseman. One sort of imamba, named by the natives "indhloniho," is of the size of a dog, and is all of a bright flame colour. The sluggish puff-adder (Clotho aruatis) is very common and very dangerous. A hooded snake (Naja haemachetes), the imfazi of the natives, is dangerous, and spits or ejects its poison; besides this there are a few venomous species. About 50 different species of peabirds, or honey guides, are found in Natal; to the knowledge of the natives, however, is the python (Hortalis natalensis), called inhluvuti by the natives; its usual haunts are by streams amongst rocky boulders and in jungles, and instances are recorded of its strangling and crushing adult natives. It is common in the coast districts, and occasionally attacks man in gorges. They are the most troublesome and destructive being the tick (Ixodes natalensis), which infests the pasturage, and the white ant (Termes mandibulatus). Occasionally great armies of locusts, caterpillars advance over large tracts of country, devouring all vegetation. They are the "seed" of march. The fish moth, a steel-grey slimy fish-shaped insect, is found in every house and is very destructive. Fish of the sea, rivers, and streams abound in Natal, and are numerous. They include shad, rock cod, mackerel, mullet, bream and sole; sharks, stingrays, cuttlefish and the octopus are also common in the waters off the coast of Natal. Prawns, crayfish and oysters are also obtainable, and turtle (Cochleita mydas) are frequently captured. Freshwater scale-fish are mostly full of bones, but fine eels and barbel are plentiful in the rivers. Trout have been introduced into some of the higher reaches of the rivers.

Inhabitants.—At the census of 1901 the population of the province increased slightly to 1,088,734. Of this total 8.5%, or 97,109, were Europeans, 9%, or 101,288, Asians and the rest natives of South Africa, mainly of Zulu-Kaffir stock. Of the 824,063 natives, 203,373 lived in Zululand. The white and Asiatic population nearly doubled in the thirteen years since the previous census, allowance being made for the Utrecht and Vryheid districts, which in 1891 formed part of the Transvaal. Of the total population 985,167 live in rural areas, the average density for the whole country being 31.34 per sq. m. The white population is divided into 36,738 males and 40,351 females. Of the white inhabitants the great majority are British. Some 46,137 of Dutch extraction live in the districts of Utrecht and Vryheid. There are also about 4,900 Natalians of German extraction, settled mainly in the New Hanover and Umzimkulu districts. The Asiatics at the 1901 census were divided into 63,497 males and 37,421 females. They include a few high caste Indians, Arabs and Chinese, but the great majority are Indian coolies. The Asiatics are mainly congregated in the coast districts between the Umzimkulu and Tugela rivers. In this region (which includes Durban) the Asiatic population was 61,684. In none of the inland districts did the Asiatic population exceed 500. In the coast districts the number of Asiatic coolies employed chiefly on the sugar, coffee, cotton and other plantations, a small proportion being employed in the coal-mines.

The native inhabitants of Natal proper were almost exterminated by the Zulus in the early years of the 19th century. Before that period the natives of what is now Natal proper were estimated to number about 100,000. In 1835 when the Zulu power was first checked the natives had been reduced to about 19,000. The stoppage of intertribal wars by the British, aided by a great influx of refugees from Zululand, led to a rapid increase of the population. With the exception of a few Bushmen, who live in the steep slopes of the Drakensberg, all the natives are of mixed African and European stock. Before the Zulu devastations the natives belonged to the Ama-Xosa branch of the Kaffirs and are said to have been divided into ninety-four different tribes; to-day all the tribes have a large admixture of Zulu blood (see KAFFIRS, ZULULAND AND BANTU LANGUAGES).

The Natal natives have preserved their tribal occupation to a considerable extent. Nearly 30% live in special reserves or locations, the area set apart for native occupation being about 4000 sq. m. exclusive of Zululand. Most of the remainder are employed on or five upon farms owned by the British. The remainder are employed in the coast towns and the sugar and cotton plantations. The number of males was, however, in 1904, 69,746 male natives and 10,232 female natives in domestic service. Of the tribes who were in Natal before the Zulu invasion about 1812, the two largest are the Aphetamine (who are in five main divisions and number about 30,000) and the Amakwabe (seven divisions and about 20,000 people). Other large tribes are the Amanuseswa (ten divisions—35,000 people), the Amakuni (three divisions—26,000 people), and the Amabomvu (five divisions—25,000 people). The three last tribes are among those which sought refuge in Natal from Zulu persecution, before the establishment of British rule in 1843. The number of half-castes is remarkably small, at the census of 1904 the number of "mixed and others," which

1 See R. B. and J. D. Woodward, "Natal Birds" (Maritzburg, 1899).
includes Griquas and Hottentots and non-aboriginal negroes, was only 6856.

Natal.—The seat of the provincial government is Pietermaritzburg (q.v.), commonly called Maritzburg (or P.M.B.), with a population (1904) of 31,199. It is 71 m. by rail N.W. of Durban (q.v.), the seaport and only large city in Natal, pop. 67,582. LadySmith, N.W. of Pietermaritzburg (4800 ft. above sea-level), is the capital of a district of the same name, is famous for its investment by the Boers in 1899 and is an important railway junction. North-east of LadySmith are Dundee (29 m. by rail from Durban) and the Transvaal district. Dundee is also a mining town, and depends chiefly on its large trade in wool. It is named after the duke of Westminster, who was secretary for the colonies in 1858 and 1859. Its altitude is 1873; the climate is mild, grades from 29 to 75 degrees, and the altitude is 5152 ft., but on reaching Ladysmith, 191 m. by rail, the climate is colder and more humid, and the altitude is 3284 ft. The Orange Free State line, after leaving Ladysmith, ascends by steep gradients the whole of its own course in Natal territory, and when it gains the summit at Van Reenen's Pass it is 5500 ft. above sea-level. The descent from this point to Pietermaritzburg, 3284 ft. below, is the most precipitous in the world. Its average gradient is 1 in 40, and it is 450 m. long. The traffic on the line, to the year ending in 1903, exceeded 336,000,000. The total amount of freight and passenger traffic on the line was 1,173,000,000. The Oranje-Vrijheid line, following the Orange River, also of great importance, is 1143 m. long, from Pietermaritzburg to the river; the average daily traffic on it is about 10,000 passengers and 300,000 tons of freight.

There are about 5000 m. of high roads kept in repair by the government.

There is a well-organized postal and telegraphic service. Land lines and cable are used to connect with European telegraphic stations, and there are submarine cables from Durban to Zanzibar and Aden, whence there is communication with every quarter of the globe. The first telegraph line in Natal was opened in 1873; in 1878 communication was established with Cape Town and in the following year with Delagoa Bay.

Agriculture and Allied Industries.—The diversity of soil and climate leads to great diversification in agricultural pursuits. The chief drawback to farming in the midland and upper districts is the considerable proportion of stony ground, and, in some cases, the lack of running water. The area of land under tillage is less than a million acres. The chief crops are maize, sorghum, tobacco, barley, and potatoes. The maize crop in the lower districts is grown chiefly in the valley of the Tugela. In the midland and upper districts it is grown in the valleys of the Umzimkulu and the Mkuzi. The yield per acre of maize is over 1000 bushels, and the average yield in this province is over 730 bushels. The yield of sorghum is about 300 bushels per acre. The area planted to tobacco is about 110,000 acres, and the yield per acre is about 532 lbs. The area planted to potatoes is about 200 acres, and the yield per acre is 1000 bushels. The area planted to sugar-cane is about 10,000 acres, and the yield per acre is 1000 bushels. The area planted to tea is about 5000 acres, and the yield per acre is 6000 bushels.

The area under maize is about 10,000,000 acres, and the yield per acre is about 1000 bushels. The area under sorghum is about 5,000,000 acres, and the yield per acre is about 300 bushels. The area under tobacco is about 110,000 acres, and the yield per acre is about 5000 bushels. The area under barley is about 1000 acres, and the yield per acre is about 50 bushels. The area under potatoes is about 200 acres, and the yield per acre is about 1000 bushels. The area under sugar-cane is about 10,000 acres, and the yield per acre is about 1000 bushels. The area under tea is about 5000 acres, and the yield per acre is about 6000 bushels.

The area under maize is about 10,000,000 acres, and the yield per acre is about 1000 bushels. The area under sorghum is about 5,000,000 acres, and the yield per acre is about 300 bushels. The area under tobacco is about 110,000 acres, and the yield per acre is about 5000 bushels. The area under barley is about 1000 acres, and the yield per acre is about 50 bushels. The area under potatoes is about 200 acres, and the yield per acre is about 1000 bushels. The area under sugar-cane is about 10,000 acres, and the yield per acre is about 1000 bushels. The area under tea is about 5000 acres, and the yield per acre is about 6000 bushels.
Valuable timber is obtained from the forests. Stinkwood is largely employed in the making of oars, billhooks, etc., and is also used for furniture. Pine is also used in building wagons, while snaeewood is largely utilized for supports for piers and other marine structures, being impervious to the attacks of the Teredo navalis. Nottia, the name of the black locust tree (Acacia nollissima), which began in 1886, the bark being exported for tanning purposes, the wood also commanding a ready sale. This wattle thrives well in most localities, but especially in the highlands of Natal. By 1886 the production of wattle bark was 1,326,000 tons, and the area planted with the tree over 60,000 acres. Aloes and rameia are cultivated to some extent for their fibre.

The government has maintained vast farms and forestry plantations and a veterinary department to cope with lung sickness, rinderpest, East Coast fever and such like diseases. It also conducts campaigns against locusts and other pests and helps irrigation schemes. By means of an Agricultural Bank it affords assistance to farmers.

Mining.—There are several highly mineralized areas in the country. The existence of coal in the north-east districts on or near the surface of the ground was reported as early as 1839, but it was not until 1880 that steps were taken to examine the coalfields. This was done by F. W. North, who reported in 1881 that in the KwaZulu (Durban) district there was an area of 1,350 sq. m., that might be depended upon for the supply of coal, which is of all characters from lignite to anthracite. In 1889 the extension of the railway from Ladysmith through the coal area first made mining practicable. At the end of 1891 the production of coal was 165,056 tons (valued at £108,853 at the pit's mouth), in 1908 it had increased to 1,660,774 tons (valued at the pit's mouth at £73,156). There is a considerable export of coal and mineral water for medicinal purposes. In 1908 the coal landed at Durban, Middelburg and Ladysmith was 2,065,915 tons, valued at £118,740, in 1909 to 710,777 in 1908. In the last named year 446,915 tons of coal were exported. Besides the mines in the Newcastle and Dundee district there are extensive coal-fields in the district of Mount Low and north of the land (Lebombo). Iron ore is widely distributed and is found in the neighbourhood of all the coal-fields. There are extensive copper and gold-yielding areas, and in some districts these metals are mined near Umzimkulu, near Port Shepstone, marble is found in great quantities.

Commerce.—The chief exports, not all products of the province, are coal, wool, woollen and worsted goods, tobacco, tea, sugar, fruits and jams. The import trade is of a most varied character, and a large proportion of the goods brought into the country are in transit to the Transvaal and Orange Free State, Natal affording, next to Delagoa Bay, the shortest route to the Rand. Textiles, largely cotton goods, hardware, mining and agricultural machinery, tobacco and foodstuffs form the bulk of the imports. In 1896 the value of exports was £1,795,000; in 1908 the value was £6,622,000. In 1908 the imports were valued at £5,437,000, in 1908 at £8,330,000 (a decrease of £2,900,000 compared with 1905). The bulk of these exports are to the Transvaal and neighbouring countries, and general trade is carried on with the United States, the Mediterranean countries, and the British Empire. The foreign trade of the province is not large, and the bulk of the imports are first imported from the Transvaal. Over three-fifths of the imports are from Great Britain, and about one-seventh of the exports go to Great Britain. The shipping, which in 1874 was 126,883 tons and 187,826 tons in 1881, was in 1906, 1,426,535 tons, in 1908, 2,493,000; and in 1908, 5,028,000. Over six-sevenths of the shipping is British.

Government and Constitution.—Natal was from 1883 to 1910 a self-governing colony. It is now represented in the Union Parliament by eight senators and seventeen members of the House of Assembly. The qualifications for electors and members of the Assembly are the same, namely men of full age owning houses or land worth £50, or who rent such property of the yearly value of £10; or who, having lived three years in the province, have incomes of not less than £60 a year.

Coloured persons are not, by name, excluded from the franchise, but no persons "subject to special laws and tribunals," in which category all natives are included, are entitled to vote. Another law, directed against Indians, excludes from the franchise, natives, or descendants of natives in the male line, of countries not possessing elective representative institutions. Exemption from the scope of these provisions may be granted by the governor-general and under such exemption a few Kaffirs are on the roll of electors.

At the head of the provincial government is an administrator, appointed by the Union Ministry, who holds office for five years. He is assisted by an executive committee of four members elected by the provincial council. This council to which is entrusted the management of affairs purely provincial consists of 25 members, elected by the parliamentary voters and each representing a separate constituency. The council sits for a statutory period of three years. For local government purposes the cities of Durban and Pietermaritzburg are under separate charters; Zululand being under special jurisdiction. The chief towns of Durban, Maritzburg, Ladysmith, Newcastle and Dundee—are governed by municipal corporations and minor towns by local boards.

Revenue and Expenditure.—Revenue is derived chiefly from customs and excise, railways, land sales, posts and telegraphs and a capitation tax. The expenditure is largely on reproductive works (canals, roads, harbours), charitable purposes, education and military defence. The major services are, since 1910, managed by the Union Government, but the provincial council has power to levy direct taxation, and (with the consent of the Government) to incur debt for purely provincial purposes. Its revenues and powers are those pertaining to local government. Some particulars follow as to the financial position of Natal previous to 1910.

In 1846, the first year of Natal's separate existence, the revenue was £3,073 and the expenditure £6,905. In 1852 the revenue was £27,158 and the expenditure £24,296, and in 1862 the corresponding figures were £68,198 and £74,172. In 1893-94, expenditure was £180,499 and expenditure to £132,978. Ten years later the figures were, revenue £657,735, expenditure £659,351. The rise of Johannesburg and the opening up of the Dundee coal-fields, as well as the development of East London, caused the expenditure to rise to two sides of the account. In 1888 the revenue for the first time exceeded a million, the figures for that year being, revenue £1,130,614, expenditure £1,201,500. In 1909-10, the last year of Natal's existence as a colony, the revenue was £4,035,000, again exceeded the expenditure. The public debt, £2,101,500 in 1882, had risen at the close of the Boer War in 1902 to £14,000,000, and in 1908 was £16,000,000.

Defence.—A small garrison of imperial troops is quartered at Pietermaritzburg. The provincial force consists of a militia, fully equipped and armed with modern weapons. It is divided into mounted rifle-men, about 1,900 strong, four field battalions of 340 men and two infantry battalions, each of over 800 men. There is also an armed and mounted police force of 870 Europeans. Military training is compulsory on all lads over ten attending government schools. The boys are organized in cadet corps. A senior cadet corps is formed of youths between sixteen and twenty. There are also many rifle associations, the members of which are liable to be called out in time of emergency. The troops are furnished with modern guns. The batteries are manned by the naval corps (150 strong) of the Natal militia. Natal makes an annual contribution of £3,000 towards the upkeep of the British forces in South Africa.
In 1886 a new Dutch paper, De Afrikaner, was started at Maritzburg. The Kafris have their own organ, Lipa lo Hluga (the paper of grievances), issued at Maritzburg, and the Asiatics, Indian Opinion, a weekly paper started in 1903 and printed in English, Gujarati, Hindi and Tamil. Local papers are published weekly at Ladysmith, Durban, Greytown, Pietermaritzburg, and a Horizonal Journal, a government publication issued fortnightly, is of great service in the promotion of agricultural knowledge.

History.

Vasco da Gama on his voyage to India sighted the bluff at the entrance to the bay now forming the harbour of Durban on Christmas Day 1497 and named the country Terra Natalis. Da Gama made no landing here and, like the other Portuguese, was chiefly interested in the coast of South Africa, Natal was neglected by the Portuguese, whose nearest settlement was at the bay of Natal Bay. In 1575 Manuel de Mesquita Perestrello, commanded by King Sebastian to explore the coast of South Africa and report on suitable harbours, made a rough chart, even then of little use to navigators, which is of value as exhibiting the most that was known of the country by its discoverers before the advent of their Dutch rivals, who established themselves at Cape Town in 1652.

Perestrello states that Natal has no ports but otherwise he gives a fairly accurate description of the country—noting particularly the abundance of animals and the density of the population. The first detailed accounts of the country were received from shipwrecked mariners. In 1683 the English ship "Good Hope" went ashore near Delagoa Bay and the crew made a remarkable journey overland to Cape Town, passing through Natal, where they were kindly received by the natives. About the same time (in 1684) an English ship put into Port Natal (as the bay came to be known) and purchased ivory from the natives, who, however, refused to deal in slaves. In May 1685 another English ship the "Good Hope" was wrecked in crossing the bar at Port Natal and in February 1686 the "Stavenisse," a Dutch East Indianman, was wrecked a little farther south. Survivors of both vessels lived for a year at Port Natal and there lived a boat in which they made the voyage to Cape Town in twelve days. They brought with them 3 tons of ivory. This fact and their reports of the immense herds of elephants which roamed the bush led Simon van der Stell, then governor at Cape Town, to despatch (1686) the ship "Noord" to Port Natal, with instructions to her commander to open up a trade in ivory and to acquire possession of the bay. From the chief of the Amatuli tribe, who inhabited the adjacent district, the bay was " purchased " for £50 worth of goods. No settlement was then made and in 1705 the son of the chief repudiated the bargain. In 1717 the Cape government directed settlement in the bay, but it was soon afterwards abandoned. Thereafter for nearly a hundred years Natal was again neglected by white men. A ship now and again put into the bay, but the dangerous bar at its entrance militated against its frequent use. When in 1824 the next attempt was made by Europeans to form a settlement at the bay, Cape Colony had passed from the Dutch into the possession of Great Britain, while in Natal great changes had come over the land as a result of wars between the natives.

From the records of the 17th and 18th centuries it is apparent that the people then inhabiting Natal were Bantu-negroes of the Kafr (Ama Xosa) branch. There is no mention of Hottentots, and the few Bushmen who dwelt in the upper regions by the Drakensberg did not come into contact with Europeans. The sailors of the "Stavenisse" reported the most numerous and most powerful tribe to be the Zulus, while that which came in contact with the whites was the Amatuli, as it occupied a considerable part of the coast-land. These Kafris appear to have been more given to agriculture and more peaceful than their neighbours in Kaffraria and Cape Colony. But the quiet of the country was destroyed by the inroads of Chaka, the chief of the Zulus (see ZULULAND). Chaka between 1818 and 1820 ravaged the whole of what is now known as Natal, and after beating his foes in battle, butchered the women, children and old men, incorporating the young men in his impis. The population was greatly reduced and large areas left without a single
inhabitant. By right of conquest Chaka became undisputed master of the country.

Such was the situation when the first British settlement was made in Natal. In 1823 Francis George Farewell, formerly a lieutenant in the British navy, with other merchants of Cape Town, formed a company to trade with the natives of the south-east coast. In the brig "Salisbury," commanded by James S. King, who had been a midshipman in the navy, Farewell visited Port Natal, St Lucia and Delagou Bays. The voyage was not successful as a trading venture, but Farewell was so impressed with the possibilities of Natal both for trade and colonization that he decided to try his hand as a pioneer himself, vowing to take out ten companions, among them Henry Francis Fynn. All the rest save Farewell and Fynn speedily repented of their adventure and returned to the Cape, but the two who remained were joined by three sailors, John Cane, Henry Ogle and Thomas Holstead, a lad. Farewell, Fynn and the others went to the royal kraal of Chaka, and, having cured him of a wound and made him various presents, obtained a document, dated the 7th of August 1824, ceding to "F. G. Farewell & Company entire and full possession in perpetuity of a tract of land including the port or harbour of Natal." On the 26th of the same month Farewell and his party, under the name "Elizabeth and Susan," a small schooner built by the settlers, to Port Elizabeth. He appears to have been coldly received by the authorities, who were even unable to ascertain the nature of Chaka's embassy. Soon after his return to Natal King died, and in the same month (September 1828) Chaka was murdered by his brother Dingaan. In the December following Farewell went in the "Elizabeth and Susan" to Port Elizabeth. On this occasion the authorities were more hostile than before to the Natal pioneers, for they confiscated the schooner on the ground that it was unregistered, and drove the foreign-born Farewell and his crew away. The British governor, Lieutenant-Colonel Philip, capitulated the Cape in 1819, and the following year retired to England, leaving the place in charge of Lieutenant-Commander James Hope, who was succeeded by Captain John Linton in 1823, and by Captain John T. Despard in 1827. The British government determined to establish a settlement on the Natal coast.

The first British settlement.

The British Government saw in the Cape Colony the only real hope of securing the independence of the Transvaal and the Orange Free State. The establishment of settlements in Natal started with the hope that the coastal regions might be brought under British control.

In 1824, the year of Farewell's departure, the British government decided to establish a settlement in Natal. The first British settlement was founded by Captain Francis Gardiner, a naval officer, whose chief object was the evangelization of the natives. With the support of the traders he founded a mission station on the hill overlooking the bay. In 1837 Gardiner was given authority by the British government to exercise jurisdiction over the traders. They, however, refused to acknowledge Gardiner's authority, and from the Cape government he received no support. It was not until their hand was forced by the occupation of the interior by Dutch farmers that the Cape authorities at length intervened.

The British settlers had, characteristically, reached Natal mainly by way of the sea; the new tide of immigration was by land. In 1836, a party of Boers under Dr Fyn, under the leadership of a Dutch Voortrekkers, accompanied by Dr Fyn, led by his son, rode from the Drakensberg, bringing with them their wives and children and vast herds of cattle. The reasons which caused the exodus from the Cape are discussed elsewhere (see SOUTH AFRICA AND CAPE COLONY), here it is only necessary to point out that those emigrants who entered Natal shared with those who settled elsewhere an intense desire to be free from British control. The first emigrant Boers to enter the country were led by Pieter Retief (c. 1780-1838), a man of Huguenot descent and of marked ability, who had formerly lived in the Cape Colony and had suffered severely in the Kaffir wars. Passing through the interior, they entered the regions Retief arrived at the bay in October 1837. He went thence to Dingaan's kraal with the object of securing a formal cession of territory to the Dutch farmers. Dingaan consented on condition that the Boers recovered for him certain cattle stolen by another chief; this task Retief accomplished, and with the help of the Rev. F. Owen, a missionary then living at Dingaan's kraal, a deed of cession was drawn up in English and signed by Dingaan and Retief on the 4th of February 1838. Two days after the signature of the deed Retief and all of his party, 60 whites, besides Hottentot servants, were treacherously murdered by Dingaan's orders. The Zulu king then commanded his impis to kill all the Boers who had entered Natal. The Zulu forces crossed the Tugela the same day, and the most advanced parties of the Boers were massacred, many at a spot near where the town of Weenen now stands, its name (meaning wailing or weeping) commemorating the event. Other of the farmers hastily laagered and were able to repulse the Zulu attacks; the assailants suffering serious loss at a fight near the Bushman's river. Nevertheless in one week after the murder of Retief 100 Boers were killed on the Zululand border. On Sunday the 10th of December, while laagered near the Umzimkulu river, they were attacked by over 10,000 Zulus. The Boers had firearms, the Zulus their assegais only, and after a three hours' fight the Zulus were totally defeated, losing thousands killed, while the farmers' casualties were under
a dozen. (This memorable victory is annually commemorated by the Boers as Dingaan's Day, while the Umsatats, which ran red with the blood of the slain, was renamed Blood river.) Dingaan fled, the victorious Boers entered the royal kraal, gave decent burial to the skeletons of Retief and his party, and regarded themselves as now undisputed masters of Natal. They had recovered from a leather pouch which Retief carried the deed by which Dingaan ceded "to Retief and his countrymen the place called Port Natal together with all the lands annexed... as far as the land may be useful and in my possession." This was the 5th or 6th cession made by Chaka or Dingaan of the same territory to different individuals. In every case the overlordship of the British was recognised.

Returning south, Pretorius and his commando were surprised to learn that Port Natal had been occupied on the 4th of December by a detachment of the 72nd Highlanders sent thither from the Cape. The emigrant farmers had, with the assent of the few remaining Englishmen at Port Natal, in May 1838 issued a proclamation taking possession of the Port. This had been followed by an intimation from the governor of the Cape (Major-General Sir George Napier) inviting the emigrants to return to the colony, and stating that whenever he thought it desirable he should of December 1838, on a tribe of Kaffirs on the southern, of the occupation of the port the British government of the day had no intention of making Natal a British colony, but wished to prevent the Boers establishing an independent republic upon the coast with a harbour through which access to the interior could be gained. After remaining at the port just over a year the Highlanders were withdrawn, on Christmas Eve 1839. Meanwhile the Boers had founded Pietermaritzburg and made it the seat of their volksraad. They rendered their power in Natal absolute, for the time, in the following month, when they joined with Panda, Dingaan's brother, in another attack on the Zulu king. Dingaan was utterly defeated and soon afterwards perished, Panda becoming king in his stead by favour of the Boers.

At this time, the affairs of the Boer community been managed with prudence and sagacity they might have established an enduring state. But their impatience of control, reflected in the form of government adopted, led to disastrous consequences. Legislative power was vested, nominally, in the volksraad (consisting of twenty-four members), while the president and executive were changed every three months. But whenever any measure of importance was to be decided a meeting was called of "the people," that is, of all who chose to attend, to sanction or reject it. "The result," says Theal, "was utter anarchy. Decisions of one day were frequently reversed the next, and every one held himself free to disobey any law that he did not approve of. ... Public opinion of the hour in each section of the community was the only force in the land" (History of South Africa 1834-1843, chap. xlvii). While such was the domestic state of affairs during the period of self-government, the settlers cherished large territorial views. They were in loose alliance with and in quasi-supremacy over the Boer communities which had left the Cape and settled at Winburg and at Potchefstroom. They had declared themselves a free and independent state under the title of "The Republic of Port Natal and adjacent countries," and sought (September 1840) from Sir George Napier at the Cape an acknowledgment of their independence by Great Britain. Sir George, being without definite instructions from England, could give no decisive answer, but he was friendly disposed to the Natal farmers. This feeling was, however, changed by what Sir George (and many of the Dutch in Natal also) thought a wilful and unjustifiable attack (December 1840) on a tribe of Kaffirs on the southern, or Cape Colony, frontier by a commando under Andries Pretorius, which set out, nominally, to recover stolen cattle. Having at length received an intimation from London that the queen "could not acknowledge the independence of her own subjects, but that the trade of the emigrant farmers would be placed on the same footing as that of any other British settlement, upon their receiving a military force to exclude the interference with or possession of the country by any other European power," Sir George communicated this decision to the volksraad in September 1841. Under the arrangement proposed the Boers might easily have secured the benefits of self-government, subject to an acknowledgment of British supremacy, together with the advantage of military protection, for the British government was then extremely reluctant to extend its colonial responsibilities. The Boers, however, strongly resented the contention of the British that they could not shake off British nationality though beyond the bounds of any recognized British possession, nor were they prepared to see their only port garrisoned by British troops, and they rejected Napier's overtures. Napier, in the meantime, was on his way to Natal, and on his arrival towards the end of May 1842, he published a proclamation in which he stated that in consequence of the emigrant farmers refusing to be treated as British subjects and of their attitude towards the Kaffir tribes he intended resuming military occupation of Port Natal. This proclamation was answered in a lengthy minute, dated the 21st of February 1842, drawn up by J. N. Bosshof (afterwards president of the Orange Free State), by far the ablest of the Dutch who had settled in Natal. In this minute the farmers ascribed all their troubles to one cause, namely, the absence of a representative government, which was established for them by the British, and was still living in Cape Colony and as often denied or delayed, and concluded by a protest against the occupation of any part of their territory by British troops. An incident which happened immediately after these events greatly encouraged the Boers to persevere in their opposition to Great Britain. In March 1842 a Dutch vessel sent out by G. G. Ohrig, an Amsterdam merchant who sympathized warmly with the cause of the emigrant farmers, reached port Natal, and its supercargo, J. A. Smelkamp (a man who subsequently played a part in the early history of the Transvaal and Orange Free States), concluded a treaty with the volksraad assuring the protection of Holland. The Natal Boers believed the Netherlands to be one of the great powers of Europe, and were firmly persuaded that its government would aid them in resisting England.

On the 1st of April Captain T. C. Smith with a force of 263 men left his camp at the Umgazi, on the eastern frontier of Cape Colony, and marching overland reached Durban without opposition, and encamped, on the 4th of May, at the base of the Berea hills. The Boers, cut off from their port, called out a commando of 300 to 400 men under Andries Pretorius and gathered at Congella at the head of the bay. On the night of the 12th of May the Boers made an unsuccessful attack on the British camp, losing his guns and fifty men killed and wounded. On the 26th the Boers captured the harbour and settlement, and on the 31st blockaded the British camp, the women and children being removed, on the suggestion of Pretorius, to a ship in the harbour of which the Boers had taken possession. Meantime, an old Durban resident, Richard (commonly called Dick) King, had undertaken to convey tidings of the perilous position of the British force to the commandant at Graham's Town. He started on the night of the 24th, and escaping the Boer outposts rode through the dense bush and across the bridgeless rivers of Kaffirria at peril of his life from hostile natives and wild beasts, and in nine days reached his destination—a distance of 360 m. in a direct line, and nearly 600 by the route to be followed. This remarkable ride was accomplished with one change of mount, obtained from a missionary in Pondoland. A comparatively strong force under Colonel A. J. Cloete was at once sent by sea to Port Natal, and on the 26th of June Captain Smith was relieved. The besieged had suffered greatly from lack of food. Within a fortnight Colonel Cloete had received the submission of the volksraad at Pietermaritzburg. The burgheers represented that they were under the protection of Holland, but this plea was peremptorily rejected by the commander of the British forces.

The British government was still undecided as to its policy towards Natal. In April 1842 Lord Stanley (afterwards 14th earl of Derby), then secretary for the colonies in the second Peel Administration, wrote to Sir George Napier that the establishment of a colony in Natal would be attended with little prospect of
NATAL

advantage, but at the same time stated that the pretensions of the emigrants to be regarded as an independent community could not be admitted. Various measures were proposed which would but have aggravated the situation. Finally, in deference to the strongly urged views of Sir George Napier, Lord Stanley, in a despatch of the 15th of December, received in Cape Town on the 23rd of April 1843, consented to Natal becoming a British colony. The institutions adopted were to be as far as possible in accordance with the wishes of the people, but it was a fundamental condition "that there should not be in the eye of the law any distinction or disqualification whatever, founded on mere difference of colour, origin, language or creed." Sir George then appointed Mr Henry Cloete (a brother of Colonel Cloete) a special commissioner to explain to the Natal volksraad the decision of the government. There was a considerable party of Natal Boers still strongly opposed to the British, and they were reinforced by numerous bands of Boers who came over the Drakensberg from Winburg and Potchefstroom. Commandant Jan Mocke of Winburg (who had helped to besiege Captain Smith at Durban) and others of the "war party" attempted to induce the volksraad not to submit, and a plan was formed to murder Pretorius, Boshof and other leaders, who were now convinced that the only chance of ending the state of complete anarchy into which the country had fallen was by accepting British sovereignty. In these circumstances the task of Mr Henry Cloete was one of great difficulty and delicacy. He behaved with the utmost tact and got rid of the Winburg and Potchefstroomburgers by declaring that he should recommend the Drakensberg as the northern limit of Natal. On the 18th of August they agreed to the volksraad unanimously agreed to the terms proposed by Lord Stanley. Many of the Boers who would not acknowledge British rule trekked once more over the mountains into what are now the Orange Free State and Transvaal provinces. At the end of 1843 there were not more than 500 Dutch families left in Natal. Cloete, before returning to the Cape, visited Pinda and obtained from him a valuable concession. Hitherto the Tugela from source to mouth had been the recognized frontier between Natal and Zululand. Pinda gave up to Natal all the territory between the Buffalo and Tugela rivers, now forming Klip River county.

Although proclaimed a British colony in 1843, and in 1844 declared a part of Cape Colony, it was not until the end of 1845 that an effective administration was installed with Mr Martin West as lieutenant-governor, and the power of the volksraad finally came to an end. In that year the external trade of Natal, almost entirely with Cape Colony, was of the total value of £42,000—of which £32,000 represented imported goods.

The new administration found it hard to please the Dutch farmers, who among other grievances resented what they considered the undue favour shown to the Kaffirs, whose numbers had been greatly augmented by the flight of refugees from Pinda. In 1843, for instance, no fewer than 50,000 Zulus crossed the Tugela seeking the protection of the white man. The natives were settled in 1846 in specially selected locations and placed under the general supervision of Sir (then Mr) Theophilus Shepstone (q.v.). Sir Harry Smith, newly appointed governor of the Cape, met, on the banks of the upper Tugela, a body of farmers preparing to recross the Drakensberg, and by remedying their grievances induced many of them to remain in Natal. Andries Pretorius and others, however, declined to remain, and from that time Pretorius (q.v.) ceased his connexion with Natal. Although by this migration the white population was again considerably reduced, those who remained were contented and loyal, and through the arrival of 4,500 emigrants from England in the years 1848-1851 and by subsequent immigration from overseas the colony became overwhelmingly British in character. From the time of the coming of the first considerable body of British settlers dates the development of trade and agriculture in the colony, followed somewhat later by the exploitation of the mineral resources of the country. At the same time education was established and various churches began or increased their work in the colony. Dr Colenso, appointed bishop of Natal, arrived in 1854. In 1856 the dependence of the country on Cape Colony was put to an end and Natal constituted a distinct colony with a legislative council of sixteen members, twelve elected by the inhabitants and four nominated by the crown. At the time the white population exceeded 8000. While dependent on the Cape, ordinances had been passed establishing Roman-Dutch law as the law of Natal, and save where modified by legislation it remained in force.

The British settlers soon realized that the coast lands were suited to the cultivation of tropical or semi-tropical products, and from 1852 onward sugar, coffee, cotton and arrow-root were introduced, ten being afterwards substituted for coffee. The sugar industry soon became of importance, and the planters were compelled to seek for large numbers of labourers. The natives, at ease in their locations, did not volunteer in sufficient numbers, and recourse was had to coolie labour from India. The first coolies reached Natal in 1860. They came under indentures, but at the expiration of their contract were allowed to settle in the colony.1 This proved one of the most momentous steps taken in the history of South Africa, for the Indian population rapidly increased, the "free" Indians becoming market gardeners, farmers, hawkers, traders, and in time serious competitors with the whites. But in 1860 and for many years afterwards these consequences were not foreseen, and alone among the South Africa states Natal offered a welcome to Asians.

In 1866 the borders of the colony were extended on the southwest by the annexation of part of Kaffraria that had formerly been under the sway of the Fondo chief Faku, who had himself unable to maintain himself in a region occupied by many diverse tribes. The newly acquired territory was named Alfred county in memory of a visit paid to Natal by Prince Alfred (afterwards duke of Saxe-Coburg-Gotha). In 1867 R. W. Keate (1814-1873) became lieutenant-governor, a post which he filled until 1872. His administration is notable, not so much for internal affairs but from the fact that he twice acted as arbitrator in disputes in which the Boer states were involved. In a dispute between the Transvaal and the Orange Free State he decided (February 1870) that the Vaal river and not the upper Vaal was the frontier stream. A more famous decision, that known as the Keate Award, was given in October 1871. It concerned the southwestern frontiers of the Transvaal, and the award, which was against the Transvaal pretensions, had important effects on the history of South Africa (see TRANSVAAL and SOUTH AFRICA).

During all this time little was done to alter the condition of the natives. There was scarcely an attempt to copy the policy, deliberately adopted in Cape Colony, of educating and civilizing the black man. Neither was Natal faced with the Cape problem of a large half-caste population. The Natal natives were left very much in the state in which they were before the advent of the white men. While this opportunity of educating and training a docile people was in the main neglected, savage abuse of power by their chiefs was prevented. Under the superintendence of Shepstone the original refugees were quiet and contented, enjoying security from injustice and considerable freedom. This ideal lot, from the native point of view, drew such numbers of immigrants from disturbed districts that with the natural increase of population in thirty years the native inhabitants increased from about 100,000 to fully 350,000. New generations, as ignorant as any former fathers, did not wish the same sense of dependence upon the white men. In this way was sown the seed of future trouble between the two races. The first serious collision between the natives and the government occurred in 1873. The Amalubi, one of the highest in rank of the Bantu tribes of South Africa, fleeing from the cruelties of

1 Between 1860 and 1866 some 5000 Indians entered the colony. Immigration then ceased, and was not resumed until 1874. By that year the natives from Portuguese territory and elsewhere who had found employment in Natal had been attracted to the Kimberley diamond mines, and the Natal natives not coming forward (save under compulsion), the importation of Indian coolies was again permitted (see the Natal Blue Book, Report of the Indian Immigration Commission, 1869).
Panda, had been located by the Natal government under their chief Langalibalele (i.e. the great sun which shines and burns) in 1848 at the foot of the Drakensberg with the object of preventing the Bushmen who dwelt in the mountains plundering the upland farmers. Here the Amahlubi prospered, and after the diamond fields had been discovered by many of the young men who had been to Kimberley brought back firearms. These Langalibalele refused to register, and entered into negotiations with several tribes with the object of organizing a general revolt. Prompt action by Sir Benjamin Pine, then lieutenant-governor of the colony, together with help from the Cape and Bantuoland, prevented the success of Langalibalele's plan, and his own tribe, numbering some 10,000 persons, was the only one which rebelled. The chief was captured, and exiled to Cape Colony (August 1874). Permitted to return to Natal in 1886, he died in 1889.

This rebellion drew the attention of the home government to the native question in Natal. The colonists, if mistaken in their general policy of leaving the natives in a condition of mitigated barbarism, had behaved towards them with uniform kindness and justice. They showed indeed in their dealings both with them and the Umlungu, their rulers, and with the Zulus beyond the Tugela a disposition to favour the natives at the expense of their white neighbours in the Transvaal and Orange Free State, and their action against Langalibalele was fully justified and the danger of a widespread native revolt real. But there were, including Bishop Colenso, who thought the treatment of the Amahlubi wrong, and their agitation induced the British government to recall Sir Benjamin Pine, Sir Garnet Wolseley being sent out as temporary governor. Sir Garnet reported the natives as "happy and prosperous—weell off in every sense."

As a result of consultations with Shepstone certain modifications were made in native policy, chiefly in the direction of more European civilization. Meanwhile the colony had weathered a severe commercial crisis brought on in 1865 through over-speculation and the neglect of agriculture, save along the coast belt. But the trade over berg largely developed on the discovery of the Kimberley diamond mines, and the progress of the country was greatly promoted by the substitution of the railway for the ox wagon as a means of transport. There already existed a short line from the Point of Disembarkation to the Umgeni, and on the 1st of January 1876 Sir Henry Bulwer, who had succeeded Wolseley as governor, turned the first sod of a new state-owned railway which was completed as far as Maritzburg in 1880. At this date the white inhabitants numbered about 20,000. But besides a commercial crisis the colony had been the scene of an ecclesiastical dispute which attracted widespread attention. Bishop Colenso (q.v.), condemned in 1863 on a charge of heresy, ignored the authority of the court of South African bishops and was maintained in his position by decision of the Privy Council in England. This led to a division among the Anglican community in the colony and the consecration in 1869 of a rival bishop, who took the title of bishop of Maritzburg. Colenso's bold advocacy of the cause of the natives—which he maintained with vigour until his death (in 1883)—attracted almost equal attention. His native name was Usobantu (father of the people).

For some years Natal, in common with the other countries of South Africa, had suffered from the absence of anything resembling a strong government among the Boers of the Transvaal, neighbours of Natal on the north. The annexation of the Transvaal to Great Britain, effected by Sir Theophilus Shepstone in April 1877, would, it was hoped, put an end to the disorders in that country. But the new administration at Pretoria inherited many disputes with the Zulus, disputes which were in large measure the cause of the war of 1879. For years the Zulus had lived at amity with the Natalians, from whom they received substantial favours, and in 1872 Cetywayo (q.v.), on succeeding his father Panda, had given assurances of good behaviour. These promises were not kept for long, and by 1878 his attitude had become so hostile towards both the Natal and Transvaal governments that Sir Bartle Frere, then High Commissioner for South Africa, determined on his reduction. During the war (see ZULULAND) Natal was used as the British base, and the Natal volunteers rendered valuable service in the campaign, which, after opening with disasters to the British forces, ended in the breaking of the Zulu power. (F. R. C.)

Scarcely had the colony recovered from the shock of the Zulu War than it was involved in the revolt of the Transvaal Boers (1880–1881), an event which overshadowed all domestic concerns. The Natalians were intensely British in sentiment, and the attack dealt by the policy of retrocession adopted by the Gladstone administration on Zululand, Zogo, Majuba, and Laing's Nek, all of them situated within the colony, British forces had been defeated by the Boers. And the treaty of retrocession was never regarded in Natal as anything but a surrender. It was clearly understood that the Boers would aim to establish a republican government over the whole of South Africa, and that the terms of peace simply meant greater bloodshed at no distant date. The protest made by the Natalians against the settlement was in vain. The Transvaal Republic was established, but the prediction of the colonists, ignored at the time, was afterwards fulfilled to the letter. Justice, however, to the colonists of Natal it must be recorded that, finding their protest with regard to the Transvaal settlement useless, they made up their minds to shape their policy in conformity with that settlement. But it was not long before their worst fears with regard to the Boers began to be realized, and their patience was once more severely taxed. The Zulu power, as has been recorded, was broken in 1879. After the war quarrels arose among the petty chiefs set up by Sir Garnet Wolseley, and in 1883 some Transvaal Boers intervened, and subsequently, as a reward for the assistance they had rendered to one of the combatants, demanded and annexed 8000 sq. m. of country, which they styled the "New Republic." As the London Convention had stipulated that there should be no trespassing on the part of the Boers over their specified boundaries, and as Natal had been the basis for those operations against the Zulus on the part of the British in 1879, which alone made such an annexation of territory possible, a strong feeling was once more aroused in Natal. The "New Republic," reduced in area, however, to less than 2000 sq. m., was nevertheless recognized by the British government in 1886, and in 1888 its consent was given to the territory (the Vryheid district) being incorporated with the Transvaal. Meanwhile, in 1887, the remnant of Zululand had been annexed to Great Britain (see ZULULAND).

In 1884 the discovery of gold in De Kaap Valley, and on Mr Moodie's farm in the Transvaal, caused a considerable rush of colonists from Natal to that country. Railways were still far from the Transvaal border, and Natal not only sent her own colonists to the new fields, but also offered the nearest route for prospectors from Cape Colony or from Europe. Durban was soon thronged; and Pietermaritzburg, which was then practically the terminus of the Natal railway, was the base from which nearly all the expeditions to the goldfields were fitted out. The journey to De Kaap by bullock-waggon occupied about six weeks. "Kurveying" (the conducting of transport by bullock-waggon) in itself constituted a great industry. Two years later, in 1886, the Rand goldfields were proclaimed, and the tide of trade which had already set in with the Transvaal steadily increased. Natal colonists were not merely the first in the field with the transport traffic to the new goldfields; they became some of the earliest proprietors of mines, and for several years many of the largest mining companies had their chief offices at Benoni, Pretoria, or Durban. In this year (1886) the railway reached Ladysmith, and in 1891 it was completed to the Transvaal frontier at Charlestown, the section from Ladysmith northward opening up the Dundee and Newcastle coalfields. Thus a new industry was added to the resources of the colony.

The demand which the growing trade made upon the one port of Natal, Durban, encouraged the colonists to redound their efforts to improve their harbour. The question of a fairway

The Colenso Affair.
from ocean to harbour has been a difficult one at nearly every port on the African coast. A heavy sea from the Indian Ocean is always breaking on the shore, even in the finest weather, and at the mouth of every natural harbour a bar occurs. To deepen the channel over the bar at Durban so that steamers might enter the harbour was the cause of labour and expenditure for many years. Harbour works were begun in 1857, piers and jetties were constructed, dredgers imported, and controversy raged over the various schemes for harbour improvement. In 1881 a harbour board was formed under the chairmanship of Mr Harry Escombe. It controlled the operations for improving the sea entrance until 1893, when on the establishment of responsible government it was abolished. The work of improving the harbour was however continued with vigour, and finally, in 1896, youth success was achieved that vessels of the largest class were enabled to enter port (see DURBAN). At the same time the railway system was continually developing.

Self-government granted.

For many years there had been an agitation among the colonists for self-government. In 1882 the colony was offered self-government coupled with the obligations of self-defence. The offer was declined, but in 1883 the legislative council was remodelled so as to consist of 23 elected and 7 nominated members. In 1890 the elections to the council led to the return of a majority in favour of accepting self-government, and in 1893 a bill in favour of the proposition was passed by parliament and assented to by the Imperial government. At the time the white inhabitants numbered about 50,000. The electoral law was framed to prevent more than a very few natives obtaining the franchise. Restrictions in this direction dated as far back as 1865, while in 1896 an act was passed aimed at the exclusion of Indians from the suffrage. The leader of the party which sought responsible government was Sir John Robinson (1839–1903) who had gone to Natal in 1850, was a leading journalist in the colony, had been a member of the legislative council since 1853, and had filled various official positions. He became the first premier and colonial secretary with Sir Harry Escombe (q.v.) as attorney-general and Mr F. R. Moor as secretary for Native Affairs. The year that witnessed this change in the constitution was also notable for the death of Sir Theophilus Shepstone, Natal's most prominent citizen. In the same year Sir Walter Hely-Hutchinson became governor. His immediate predecessors had been Sir Charles Mitchell (1839–1893) and Sir Arthur Havelock (1836–1889). Sir John Robinson remained premier until 1897, a year marked by the annexation of Zululand to Natal. In the following year Natal entered the Customs Union already existing between Cape Colony and the Orange Free State. Sir John Robinson had been succeeded as premier by Mr Harry Escombe (February-October 1897) and Escombe by Sir Henry Binns, on whose death in June 1899 Lieut.-Colonel (afterwards Sir) Albert Hime formed a ministry which remained in office until after the conclusion of the Anglo-Boer War. Meanwhile (in 1901) Sir Henry McCallum had succeeded Sir Walter Hely-Hutchinson as governor.

For some years Natal had watched with anxiety the attitude of increasing hostility towards the British adopted by the Boers as a result of the events of 1881, gauged with accuracy the intentions of the Boers. So suspicious had the ministry become of the nature of the military preparations that were being made by the Boers, that in May 1899 they communicated their apprehensions to the High Commissioner, Sir Alfred Milner, who telegraphed on the 25th of May to Mr Chamberlain, informing him that Natal was uneasy. The governor expressed his views to the prime minister that the Natal government ought to give the British government every support, and Colonel Hime replied that their support would be given, but at the same time he feared the consequences to Natal if, after all, the British government should draw back. In July the Natal ministry learnt that it was not the intention of the Imperial government to endeavour to hold the frontier in case hostilities arose, but that a line of defence considerably south of the frontier would be taken up. This led to a request on their part that if the Imperial government had any reason to anticipate the breakdown of negotiations, such steps may be at once taken as may be necessary for the effectual defence of the whole colony." Sir William Penn Symons, the general commanding the British forces in Natal in September, decided to hold Glencoe. On the arrival of Lieut.-General Sir George White from India, he informed the governor that he considered it dangerous to attempt to hold Glencoe, and urged the advisability of withdrawing the troops to Ladysmith. The governor was strongly opposed to this step, as he was anxious to protect the coal supply, and also feared the moral effect of a withdrawal. Eventually Sir Archibald Hunter, then chief of staff to Sir Redvers Buller, was consulted, and stated that in his opinion, Glencoe being already occupied, "it was a case of balancing the drawbacks and advised that, under the circumstances, the troops be retained at Glencoe." This course was then adopted.

On the 11th of October 1899 war broke out. The first act was the seizure by the Boers of a Natal train on the Free State border. On the 12th Laiing's Nek was occupied by the Boer forces, who were moved in considerable force over the Natal border. Newcastle was next occupied by the Boers unopposed, and on the 29th of October occurred the battle of Talana Hill outside Dundee. In this engagement the advanced body of British troops, 3,000 strong, under Symons, received a heavy cavalry charge which, by being driven back towards Dundee by the Boers, prolonged the occupation. General Symons hoped to be able to hold the northern portion of Natal. There is no doubt that this policy strongly commended itself to the governor and ministers of Natal, and that they exercised considerable pressure to have it adopted. But from a military point of view it was not at all cordially approved by Sir George White, and it was afterwards condemned by Lord Roberts. Fortunately Symons was able to win a complete victory over one of the Boer columns at Talana Hill. He himself received a mortal wound in the action. Brigadier-General Yule then took command, and an overwhelming force of Boers rendering the further occupation of Dundee dangerous, he decided to retire his force to Ladysmith. On the 21st of October General Sir George White and General (Sir John) French defeated at Elandslaagte a strong force of Boers, who threatened to cut off General Yule's retreat. He again attacked the Boer forces at Rietfontein on the 24th of October, and on the 26th General Yule reached Ladysmith in safety. Ladysmith now became for a time the centre of military interest. The Boers gradually surrounded the town and cut off the communications from the south. Various engagements were fought in the attempt to prevent this movement, including the actions of Farquhar's Farm and Nicholson's Nek on the 30th (see TRANSVAAL). The investment of Ladysmith continued till the 28th of February 1900, when, after various attempts to relieve the beleaguered garrison, Sir Redvers Buller's forces at last entered the town. During the six weeks previous to the relief, 200 deaths had occurred from disease alone, and altogether as many as 8,242 were reported to have passed through the hospitals. The relief of Ladysmith soon led to the evacuation of Natal by the Boer forces, who retreated northwards.

The war of 1899-1902.

The war that was to be short and decisive became a long one. The Imperial government and the loyal colonists, constituting the great majority of the inhabitants of the colony, rendered the Imperial forces every assistance. A comparatively small number of the Dutch colonists joined the enemy, but there was no general rebellion among them. As the war progressed the Natal volunteers and other Natal forces took a prominent part. The Imperial Light Horse and other irregular corps were recruited in Natal, although the bulk of the men in the forces were Uitlanders from Johannesburg. As the nearest colony to the Transvaal, Natal was resorted to by a large number of men, women and children, who were compelled to leave the Transvaal on the outbreak of the war. Refugee and Uitlander committees were formed both at Durban and Maritzburg, and, in conjunction with the colonists, they did all in their power to assist in recruiting irregular corps, and also in furnishing relief to the sick and needy.
As one result of the war, an addition was made to the territory comprised in Natal, consisting of a portion of what had previously been included in the Transvaal. The Natal government originally made two proposals for annexing new territory. One was that the following districts should be transferred to Natal, viz. the district of Vryheid, the district of Utrecht and such portion of the district of Wakkerstroom as was comprised by the line drawn from the centre of Natal to the village of Volksrust in a northerly direction to the summit of the Drakensberg Range, along that range, passing just north of the town of Wakkerstroom, to the head waters of the Pongola river, and thence following the Pongola river to the border of the Utrecht district. In consideration of the advantage to Natal from this addition of territory, Natal should take over £700,000 of the Transvaal debt.

The Imperial government decided to sanction only the first of these two proposals. For this course there were many reasons, the Transvaal territory annexed, or the greater part of it (the Vryheid district), having been only separated from the rest of Zululand in 1853 by a raid of armed Boers. In handing over this district to the administration which controlled the rest of Zululand, His Majesty's government had decided to confine the territory to be transferred to the districts in the Transvaal.

The districts added to Natal contained about 6000 white inhabitants (mostly Dutch), and some 92,000 natives, and had an area of nearly 7000 sq. m., so that this annexation meant an addition to the white population of Natal of about one-tenth, to her native population of about one-tenth also, and to her territory of about one-fourth. An act authorizing the annexation was passed during 1902 and the territories were formally transferred to Natal in January 1903.

The punitive war in Zululand was succeeded by a commercial depression, though in Natal it was not so severely felt as in other parts of South Africa. The government met the crisis by renewed energy in harbour works, railway constructions and the development of the natural resources of the country. A railway to the Zululand coalfields was completed in 1903, and in the same year a line was opened to Vryheid in the newly annexed territories. Natal further built several railway lines in the eastern half of the Orange River Colony, thus opening up new markets for her produce and facilitating her trade to Natal. Mr Chamberlain, in his visit to South Africa early in 1903, came to Natal, where he landed in the last days of 1902, and conferred with the leading colonists. In August 1903 the Hime ministry resigned and was succeeded by a cabinet under the premiership of Mr (afterwards Sir) George Sutton, the founder of the wattle industry in Natal and one of the pioneers in the coal-mining industry. In May 1905 Sir George Sutton was replaced by a coalition ministry under Mr C. J. Smythe, who had been colonial secretary under Sir Albert Hime. These somewhat frequent changes of ministry, characteristic of a country new to responsible government, reflected chiefly the difficulty of adjusting questions of policy and the policy to be adopted towards the natives. Towards those Dutch colonists who had joined the enemy during the war lenity was shown, all rebels being pardoned.

The attitude of the natives both in Natal proper and in Zululand caused much disquiet. As early as July 1903 rumours were current that Dinizulu (a son of Cetywayo) was disaffected and the power he exercised as representative of the former royal house rendered his attitude a matter of great moment. Dinizulu, however, remained at the time quiescent, though the Zulus were in a state of excitement over incidents connected with the war, when they had been subject to raids by Boer commandoes, and on one occasion at least had retaliated in characteristic Zulu fashion. Unrest was also manifested among the natives west of the Tugela, but it was not at first cause for alarm. The chief concern of the Natal government was to remodel their native policy where it proved inadequate, especially in view of the growth of the movement for the federation of the South African Colonies. During 1903-1904 a Native Affairs' Commission, representative of all the states, obtained much evidence on the status and conditions of the natives. Its investigations pointed to the loosening of tribal ties and to the corresponding growth of a spirit of individual independence. Among its recommendations was the direct political representation of natives in the colonial legislatures on the New Zealand model, and the imposition of direct taxation upon natives, which should not be less than £1 a year payable by every adult male. The commission also called attention to the numerical insufficiency of magistrate and native commissioners in certain parts of Natal. With some of the recommendations the Natal commission disagreed; in 1905, however, an act was passed by the Natal legislature imposing a poll-tax of £1 on all males over 18 in the colony, except indented Indians and natives paying hut-tax (which was 14s. a year). Every European was bound to pay the tax. In 1906 a serious rebellion broke out in the colony, attributable ostensibly to the poll-tax, and spread to Zululand. It was suppressed by the colonial forces under Colonel (afterwards Sir) Duncan McKenzie, aided by a detachment of Transvaal volunteers. An incident which marked the beginning of this rebellion brought the Natal ministry into sharp conflict with the Imperial government (the Campbell-Bancroft crisis), subsequently repealed, and the home government to postpone the execution of the sentence. Early in the year a farmer who had insisted that the Kafrir on his farm should pay the poll-tax was murdered, and on the 8th of February some forty natives in the Richmond district forcibly resisted the collection of the tax and killed a sub-inspector of police and a trooper at Byrnetown. Two of the natives implicated were court-martialled and shot (February 15); others were subsequently arrested and tried by court martial. Nineteen were sentenced to death, but in the case of seven of the prisoners the sentence was commuted. On the day before that fixed for the execution Lord Elgin, then Secretary of State for the Colonies, intervened and directed the home governor to postpone the execution of the sentence. Thereupon the Natal ministry resigned, giving as their reason the importance of maintaining the authority of the colonial administration at a critical period, and the constitutional question involved in the interference by the imperial authorities in the domestic affairs of a self-governing colony. The action of the British cabinet caused both astonishment and indignation throughout South Africa and in the other self-governing states of the empire. After a day's delay, during which Sir George McCallum, the Home Secretary, had already made his well-known speech in London, in the justice of the sentence passed on the natives, Lord Elgin gave way (March 30). The Natal ministry thereupon remained in office. The guilty natives were shot on the end of April. It was at this time that Bambata, a chief in the Greytown district who had been deposed for misconduct, kidnapped the regent appointed in his stead. He was pursued and escaped to Zululand, where he received considerable help. He was killed in battle in June, and by the close of July the rebellion was at an end. As has been stated, it was ostensibly attributable to the poll-tax, but the causes were more deep-seated. Though somewhat obscure they may be found in the
growingsense of power and solidarity among all the Kafir tribes of South Africa—a sense which gave force to the "Ethiopian movement," which, ecclesiastical in origin, was political in its development. There were moreover special local causes such as undoubted defects in the Natal administration. Those Africans whose "nationalism" was greatest looked to Dinizulu as their leader, and he was accused by many colonists of having incited the rebellion. Dinizulu protested his loyalty to the British, nor was it likely that he viewed with approval the action of the republican chiefs of Zululand against the traditional chief. As time went on, however, the Natal government, alarmed at a series of murders of whites in Zululand and at the evidences of continued unrest among the natives, became convinced that Dinizulu was implicated in the rebellious movement. When a young man, in 1839, he had been convicted of high treason and had been exiled, but afterwards (in 1897) allowed to return. Now a force under Sir Duncan McKenzie entered Zululand. Thereupon Dinizulu surrendered (December 1907) without opposition, and was removed to Maritzburg. His trial was delayed until November 1908, and it was not until March 1909 that he was brought to court. He was acquitted on the minor charge of harbouring rebels. Meanwhile, in February, 1908, the governor—Sir Matthew Nathan, who had succeeded Sir Henry McCallum in August 1907—had made a tour in Zululand, on which occasion some 1,500 of the prisoners taken in the rebellion of 1906 were released.

The intercolonial commission had dealt with the native question as it affected South Africa as a whole; it was felt that a more local investigation was needed, and in August 1906 a strong commission was appointed to inquire into the condition of the Natal natives. The general election which was held in the following month turned on native policy and on the measures necessary to meet the commercial depression. The election, which witnessed the return of four Labour members, resulted in a ministerial majority of a somewhat heterogeneous character, and in November 1906 Mr Smythe resigned, being succeeded by Mr F. R. Moor, who in his election campaign had criticized the Smythe ministry for their financial proposals and for the "theatrical" manner in which they had conducted their conflict with the home government. Mr Moor remained premier until the following year, and during his administration a number of changes were made in the establishment of the Union of South Africa. In August 1907 the report of the Native Affairs' Commission was published. The commission declared that the chasm between the native and white races had been broadening for years and that the efforts of the administration—especially since the grant of responsible government—to reconcile the Kafirs to the changed conditions of rule and policy and to convert them into an element of strength had been ineffective. It was not sufficient to secure them, as the government had done, peace and ample means of livelihood. The commission among other proposals for a more liberal and sympathetic native policy urged the creation of a native advisory Board entrusted with very wide powers. "Personal rule," they declared, "supplies the keynote of successful native control"—a statement amply borne out by the influence over the natives exercised by Sir T. Shepstone. The unrest in Zululand delayed action being taken on the commission's report. But in 1909 an act was passed which placed native affairs in the hands of four district commissioners, gave to the minster for native affairs direct executive authority and created a council for native affairs on which non-official members had seats. While the district commissioners were intended to keep in close touch with the natives, the council was to act as a "deliberative, consultative and advisory body."

Concurrently with the efforts made to reorganize their native policy the colony also endeavoured to deal with the Asiatic question. The rapid growth of the Indian population from about 1890 caused much disquiet among the majority of the white inhabitants, who viewed with especial anxiety the activities of the "free," i.e. undunted Indians. An act of 1895, which did not become effective until 1901, imposed an annual tax of £3 on time-expired Indians who remained in the colony and did not reinstate. In 1897 an Indian Immigration Restriction Act was passed with the object of protecting European traders; in 1903 another Immigration Restriction Act among other things, permitted the exclusion of all would-be immigrants unable to write in the characters of some European language. Under this act nothing further was done in Natal until the establishment of the Union of South Africa, when all questions specially or differentially affecting Asians were withdrawn from the competence of the provincial authorities.

Not long after the conclusion of the war of 1899–1902 the close commercial relations between the Transvaal and Natal led to suggestions for a union of the two colonies, but these suggestions were not seriously entertained. The divergent interests of the various colonies threatened indeed a tariff and railway war when the Customs Convention (provisionally renewed in March 1906) should expire in 1908. But at the close of 1906 the Cape ministry formally reopened the question of federation, and at a railway conference held in Pretoria in May 1908 the Natal delegates agreed to a motion affirming the desirability of the early union of the self-governing colonies. The movement for union rapidly gained strength, and a National Convention to consider the matter met in Durban in October 1908. In Natal, especially among the older colonists, who feared that in a united South Africa Natal interests would be overborne, the proposals for union were met with suspicion and opposition, and the Natal ministry felt bound to submit the question to the people. A referendum act was passed in April 1909, and in June following the electors by 11,121 votes to 3701 decided to join the Union. (See SOUTH AFRICA.)

Natal was concerned not only with the political aspects of union, and with its natives and Indian problems, but had to safeguard its commercial interests and to deal with a revenue insufficient for its needs. In 1908 an Income Tax and a Land Tax Act was passed; the land tax being a halfpenny in the £ on the aggregate unimproved value. It brought in £3,000,000 in 1908–1909. Meanwhile it was agreed by the Cape, Transvaal and Natal governments that, subject to Natal entering the Union, its share of the Rand import trade should be 25% before and 30% after the establishment of the Union. Previously Natal had only 22½% of the traffic, and this agreement led to a revival in trade. Moreover, the development of its coal-mines and agriculture was vigorously prosecuted, and in 1910 it was found possible to abolish both the Income Tax and Land Tax and yet have a surplus in revenue. The closing months of Natal's existence as a separate colony thus found her peaceful and prosperous. The governor, Sir Matthew Nathan, had

1 The causes, both local and general, are set forth in a despatch by the governor of the 21st of June 1906 and printed in the Blue Book, Cd. 3247.
were negroes, (1910 census) 11,701. It is served by the Yazoo & Mississippi Valley, the St. Louis, Iron Mountain & Southern, the New Orleans & North-Western and the Mississippi Central railways, and by steamboats on the Mississippi river. The city, which has an area of 2-19 sq. m., is mostly on a bluff that rises 200 ft. above the river, the wharfs and landings, and a few old buildings being the only reminders of what was before the Civil War the principal business section. Among the city institutions are the Fisk Public Library, a charity hospital, two sanatoriums, three orphan asylums, Stanton College for girls (non-sectarian; opened in 1894 and lodged in the old Fisk mansion), St. Joseph's College for girls, the Jefferson Military College (1802), 6 m. from the city, and Natchez College for negroes. The city has four public parks, three on the river front, and one, Memorial Park, in honour of Confederate dead, in the heart of the city. On a neighbouring bluff is a national cemetery. Just outside the city limits, at Gloster, the former state of Winthrop Sargent, first governor of the Territory of Mississippi, are the graves of Sargent and S.S. Prentiss, who lived in Natchez for some years. In and near the city are many handsome old residences typical of ante-bellum Natchez, among them being: Mommon, General Quitman's estate; Somerset and Oakland, long in the Chotard family; and The Briars, the home during girlhood of Varina Howell, the wife of Jefferson Davis. A Roman Catholic cathedral (1847), Trinity Protestant Episcopal Church (1855) and a Presbyterian church (1829) are the principal church buildings. The Prentiss and the Elk and Savage and other clubs are among the city's most noted. The leading industries are the shipment of cotton (70,000 to 90,000 bales are handled annually) and the manufacture of cottonseed oil and cake—the first cottonseed-oil mill in the country was built here in 1834—cotton goods, rope and yarns, lumber, brick, drugs and ice. Natchez was the first city in the state to own municipal water-works and sewage system. The city was named from the Natchez Indians who lived on its site when the country was first settled. In 1716 on the bluff Le Moyne de Bienville built Fort Rosalie for the protection of some French warehouses, and later the French demanded a neighbouring hill for another settlement. This offended the Natchez, and on the 28th of November 1729 they massacred the French and destroyed the fort, which was immediately rebuilt, and in 1764 was handed over to the English in accordance with the treaty of Paris, and became Fort Pampern; in 1779 it was turned over to the Spanish, who held it until 1798, when they withdrew and United States troops occupied the place. Under Spanish rule Natchez was the seat of government of a large district, and from 1798 to 1802 and from 1817 to 1821 it was the capital of Mississippi. It was chartered as a city in 1802. On the 7th of November, 1817, a large part of the city was destroyed by a fire, but it was soon rebuilt, and at the outbreak of the Civil War was a place of considerable wealth and culture. For several years it was the home of General John Anthony Quitman (1799–1858). Natchez surrendered to Union forces during the Vicksburg campaigns, first on the 12th of May 1862, and again on the 13th of July 1863. On the 2nd of September 1862 the Union iron-clad "Essex," commanded by William David Porter, bombarded the city and put an end to the commercial importance of the river front section.

NATHANIEL, a character in the New Testament, who appears in John 1, 40-42, as one of the first disciples of Jesus. In John xxii. 2 he is described as belonging to Cana of Galilee. The account of his call reveals to us a man of a deeply spiritual and sincere nature. Otherwise we know nothing beyond the mention of his name as one of the seven to whom, after the Resurrection, Christ revealed himself at the sea of Tiberias (John xxii. 2). But the interest he has evoked is shown by the attempts to identify him with other New Testament characters. Of these the one which has found most favour seems to be the apostle Bartholomew (q.v.). The actual identification must remain a matter of opinion. There is no doubt that he be said for the attempts to find in Nathanael another name for the apostle Matthew, or for Matthias, or for Paul "the
apostle of visions," or even for the writer of the Fourth Gospel himself.

**BIBLIOGRAPHY**—For the story of Nathanael's call see Archbishop Trench, Sketches in the Gospels, No. 2, and on his character, J. J. Newman's Sermons for the Festivals of the Church, No. 27.

**NATHUBHOY, SIR MANGALDAS** (1832–1850), Seth or head of the Kapol Bania caste, well known for their thrift and keen commercial instincts. He was born on the 15th of October 1832, of a family whose ancestors emigrated from Diu to Bombay soon after Bombay came into British possession. His grand-uncle, Mangaldas, had accumulated a considerable fortune, which, owing to the premature death of his father, came into the sole possession of Mangaldas at the age of eleven. He had to take charge of the business in early life, though he gave some time to English studies. On the death of his wife he established a dispensary at Kalyan in her memory and also a special female ward in connexion with the David Sassoon hospital in Poona. As a merchant Mangaldas was upright and successful. In social matters he stood forth as a reformer, and to him the change to election from hereditary succession to the headship of the caste is due. In 1862 he founded a fellowship in Bombay university to allow graduates to spend some years in Europe. A bequest in his will enabled the university to establish seven similar scholarships. He took keen interest in learning, and in such institutions as the Asiatic and geographical societies. In 1866 he was nominated to the legislative council and sat till 1874. He was made C.S.I., and in 1875 the dignity of Knight Bachelor was conferred on him. Besides a large donation to the Indian Famine Fund, Sir Mangaldas is known to have embezzled £5,000 on charities. He died at Bombay on the 9th of March 1880.

**NATICK,** a township of S.E. Middlesex county, Massachusetts, U.S.A., on the S.E. end of Cochituate Lake. Pop. (1890) 9118; (1900) 9488, of whom 1788 were foreign-born; (1910 census) 9666. The area of the township is 12.375 sq. m. The township's largest village, also named Natick, lying 18 m. W.S.W. of Boston, is served by the Boston & Albany railroad; it has the Walnut Hill preparatory school, the Leonard Morse hospital, and a public library, the Morse institute, which was given by Mary Ann Morse (1821-1839) to the township in 1878. In the village of South Natick is the Bacon Free Library (1880), in which is housed the Historical, Natural History and Library Society. In 1905 the factory product was valued at $3,453,004; the boots and shoes manufactured in 1905 were valued at $2,896,110 or 83.6% of the town's total, the output of brogans being especially important. Other distinctive manufactures are shirts and base-balls. Natick is the Indian name, signifying "our land," or "hilly land," of the site (originally part of Dedham) granted in 1650 to John Eliot, for the "praying" Indians. There was an Indian church in Natick, at which is now called South Natick or "Oldtown," from 1660 to 1716; and for some years the community was governed, in accordance with the eighteenth chapter of Exodus, by "rulers of tens," "rulers of fifties," and "rulers of hundreds." Until 1710 the Indians held the land in common. In 1735 the few Indians remaining were put under guardianship. The township owns a copy of Eliot's Indian Bible. An Eliot monument was erected in 1847 on the Indian burying-ground near the site of the Indian church, now occupied by a Unitarian church. Of the Eliot oak, made famous by Longfellow's sonnet, one was cut down in recent years; there are said to be 6,000 other trees about the place. In the village of North Natick, or "Smitty," the house of Paul Revere, who was born there in 1735, there is an elm tree, which is said to be 400 years old. Nearby, in the presidential campaign in 1840 gained the sobriquet of the "Natick cobbler." By the colonial authorities Natick was considered a "plantation" until the establishment of the church; in 1762 the parish (erected in 1745) became a district, and in 1781 this was incorporated as a town.

See "Natick," by S. D. Hosmer, Daniel Wright and Austin Bacon, in vol. 2 of A. Drake's History of Middlesex County (Boston, 1886); and Oliver N. Bacon, History of the Town of Natick (Boston, 1892).

**NATIONAL ANTHEMS OR HYMNS.** The selection of some particular songs, words and music, as the formal expression of national patriotism, is a comparatively modern development of ceremonial usage. In the Europe the chief national anthems are: The United Kingdom: "God save the King" (see below); France: "The Marseillaise," by Rouget de Lisle; Germany: "Hoch im Lande," by Balthasar Gerhard Schumacher, music of "God save the King?"; Switzerland: "Rufst du, mein Vaterland," music of "God save the King?"; Italy: the "Royal March" by G. Gabetti; Austria: "Gott erhalte unser Kaiser," words by L. H. Haschka, music by Haydn; Hungary: "Isten ald meg a Magyart?"; Belgium: "La Brabançonne," by F. Camenhoupt; Holland: "Wien Niederlans"; Denmark: "Hai der dem Liebenden," words by H. Harries, music of God save the King," and King Kristian stod ved højen mast," words by Ewald, music by Hartman; Sweden: "Ur Svenska hjertan," Russia: "Bozhe Zarja chran," words by J. J. Canas, music by D. Jenko; Rumania: "Traescea Regale," words by V. Alexandru, music by E. A. Hliboc; Spain: "Himno de Riego," music by Herta. In the United States, the "Star Spangled Banner" (1814; words by F.S. Key, music by J. S. Smith) and "Hall Columbia" (1798; words by Joseph Hopkinson, music by Fyles) share the duties of a national anthem, while the tune of "God save the King" is sung to words beginning "My country, 'tis of thee," by Samuel F. Smith (1808-1895). The most celebrated national anthem in the English language is "The King," which is said to have been first sung as his own composition by Henry Carey in 1740; and a version was assigned by W. Chappell (Popular Music) to the Harmonia Anglicana of 1742 or 1743, but no copy exists and this is now doubted. Words and music were printed in the Gentleman's Magazine for October 1745. There has been much controversy as to the authorship, which is complicated by the fact that earlier forms of the air and the words are recorded. Such are an "Ayre" of 1619, attributed to John Bull, who has long been credited with the origin of the anthem; the Scottish carol, "O Remember, O thou man," in Raynecroft's Malestrom, 1611; the ballad "Franklin is fled away" (printed 1660; and a piece in Purcell's Choice Collection for the Harpsichord (1669). The words or part of them are also found in various forms from the 16th century. The question was discussed in Richard Clarke's Account of the National Anthem (1832), and has been re-investigated by Dr W. H. Cummings in his God save the King (1903). Carey and Bull, in the general opinion of musical historians, divide the credit; but in his Minstrelsy of England (1901) Frank Kidson introduced a new claimant, James H. Askey, a Scotman who sang all national anthems worked for the Harpsichord, the publisher of the early copies of God save the King, and who became chamber composer to George III. What appears to be certain is that 1745 is the earliest date assignable to the substantial national anthem as we know it, and that both words and music had been evolved out of earlier forms. Bull's is the earliest form of the air; Carey's claim to the re-modelling of the anthem rests on an unauthorized tradition; and, on general probabilities, Oswald is a strong candidate. The tune was adopted by Germany and by Denmark before the end of the 18th century.

**NATIONAL DEBT.** Details as to the recent figures of the national debts of individual countries are given under the heading of each country, and the reader is also referred to the article Finance. Here the subject is considered in its technical aspects—including the special character of the institution, the different classes of debt, the various methods of raising loans, interest, funding systems, comparative statistics of national debts and other points.

National debt is so universal that it has been described as the first stage of a nation towards civilization. A nation, so far as its finances are concerned, may be regarded as a corporate body or even as an individual. Like the one or the other it may borrow money at rates of interest, and with securities, general or special, proportionate to its resources, credit and stability. But, while in this respect there are certain points of analogy between a state and an individual, there are important points of difference so far as the question of debt is concerned. A state,
NATIONAL DEBT

267

for example, may be regarded as imperishable, and its debt as a permanent institution which it is not bound to liquidate at any definite period, the interest, unless specially stipulated, being thus of the nature of transferable permanent annuities. While an individual who borrows engages to pay interest to the lender personally, and to reimburse the entire debt by a certain date, a state may have an entirely different set of creditors every six months, and may make no stipulation whatever with regard to the principal. A state, moreover, is the sole judge of its own solvency, and is not only at liberty either to repudiate its debts or compound with its creditors, but even when perfectly solvent may materially alter the conditions on which it originally borrowed. These distinctions explain many of the peculiarities of national debts as contrasted with those of individuals—though nations, like an individual, may by reckless bad faith utterly destroy its credit and exhaust its borrowing powers.

A well-organized state ought to have within itself the means of meeting all its ordinary expenses; where this is not the case, either through insufficiency of resources or maladministration, and where borrowing is resorted to for what may be regarded as current expenses, a state imperils, not only its credit, but, when any crisis occurs, its very existence; in illustration of this we need only refer to the cases of Turkey in Europe and some of the states of Central and South America. Even for meeting emergencies it is not always inevitable that a state should incur debt; its ordinary revenue is generally proportioned so as not to exceed its ordinary expenses as to enable it to accumulate a fund for extraordinary contingencies. This, it would seem, was a method commonly adopted in ancient states. The Athenians, for example, amassed 10,000 talents in the interval between the Persian and the Peloponnesian wars, and the Lacedaemonians are said to have done the same. At Susa and Ecbatana Alexander found a great treasure which had been accumulated by Cyrus. In the early days of Rome the revenue from certain sources was accumulated as a sacred treasure in the temple of Saturn; and we know that this fund was used for the purpose of leaving behind him the public treasury, which fell into the hands of Caesar. In later times, also, the more prudent emperors were in the habit of amassing a hoard. We find that the method of accumulating reserves prevailed among some of the early French kings, even down to the time of Henry IV. This system long prevailed in Prussia. Frederick II., when he ascended the throne, found in the treasury a sum of 8,700,000 thalers, and it is estimated that at his death he left behind him a board of from 60 to 70 million thalers. And similarly, in our own time, of the five milliards of indemnity paid by France as a result of the Franco-German war, 150 millions were set apart to be invested in annuities to re-institute the traditional war-treasury. The German empire, apart from the individual states which comprise it, had in 1882 a debt of about £24,000,000, while its invested funds amounted to £37,350,000, including a war-treasure of £6,000,000. The majority of economists disapprove of such an accumulation of funds by a state as a bad financial policy, maintaining that the remission of a proportionate amount of taxation would be much more for the real good of the nation. At the same time the possession of a moderate war-fund, it must be admitted, could make a state a great advantage in the case of a sudden war. In the case of England, apart from the private hoardings of a few sovereigns, there does not seem to have existed any deliberately accumulated public treasure; before the time of William and Mary English monarchs borrowed money occasionally from Jews and from the city of London, but emergencies were generally met by “benevolences” and increased imposts.

All modern states, it may be said, have been compelled to have recourse to loans, either to meet war expenses, to carry out great public undertakings or to make up the recurrent deficits of a rapidly increasing public expenditure. Resources obtained in this way are what constitute national debt proper. Loans have been divided into forced and voluntary. Forced loans can, of course, only be raised within the bounds of the borrowing country; and, apart from the injustice which is sure to attend such an impost, it is always economically unwise.

Loans which the kings of England were wont to exact from the Jews were really of the character of forced loans, though the method has never been used in England in modern times so extensively as on the continent. There the mode sought to be adopted in this way has never been anything like realized. In 1703, for example, a loan of this class was imposed in France, on the basis of income; and of the milliard (francs) which it was sought to raise only 100 millions were realized. In Austria and Spain, also, recourse has been had at various times to forced loans, but invariably with unsatisfactory results. Other methods of a more or less compulsory character have been and are made use of in various states for obtaining money, which, as they involve the payment of interest, may be regarded as of the nature of loans; but the debt incurred by such methods is comparatively insignificant, and some of the methods adopted are peculiarly irritating and mischievous. On the other hand, it has occasionally been attempted to raise voluntary loans by appeals to a nation’s patriotism; the method has been confined almost exclusively to France. After the revolutions of 1830 and 1848 appeals were thus made to the patriotism of French capitalists to buy 5% direct from the government at par, at a time when the French 5% were selling at 80; but the results were quite insignificant. In short, the only economically sound method of meeting expenses which the ordinary resources of a state cannot meet is by borrowing in the open market on the most advantageous terms obtainable. On this normal method of borrowing loans are divided into different categories, though there are really only two main classes, which may be designated perpetual and terminable. Borrowing in quasi-perpetuity has hitherto been the mode adopted by most states in the creation of the bulk of their debt. Not that any state ever borrows with the avowed intention of never paying off debts; but either no definite period for reimbursement is fixed, or the limit has been so extended as to be practically perpetual, or in actual practice the debt has been got rid of by the creation of another of equal amount under similar or slightly differing conditions as to interest. Of course a state is not bound to retain any part of its debt as a perpetual burden; it is at liberty to liquidate whenever it suits its convenience. This quasi-perpetuity of debt in the case of a state in a sound financial condition involves no hardship upon its creditors, who may at any moment realize their invested capital by selling their titles as creditors in the open money market, it may be at the price they paid, or it may be a little below or a little above it, according to the state of the market at the time. Loans, again, contracted on the terminable principle are of various classes; the chief of these are (1) life annuities, (2) reversionary annuities, (3) loans repayable by instalments at certain intervals, (4) loans repayable entirely at a fixed date.
