Fray Marcos (q.v.) was the first European to enter the limits of what is now New Mexico. A glimpse of the terraced houses of an Indian village—now identified as Zuñi—enraptured him, and he had written the Friar of the Modern Cities which he submitted back with the good news. The story that he told grew in their passage from mouth to mouth until the Spaniards believed that in the north were cities “very rich, having silversmiths, and that the women wore strings of gold beads and the men girdles of gold.” Full of missionary zeal, and desirous that settlements should be planted in the new region in order that the heathen might be converted, Fray Marcos did little to refute these exaggerations. The conquest of the Seven Cities was determined upon, and a band of adventurers, led by Fray Juan de Padilla de Coronado (q.v.), set out in the fall of 1540 to follow the route of Fray Marcos de Niza. Coronado reached the first of the alleged cities, and to his great disappointment found only an Indian pueblo. An exploring party sent eastward reached Acoma, and then proceeded to Tiguex on the Rio Grande, and finally to the Pecos river. The main body of Coronado’s expedition remained in New Mexico on the Rio Grande while he pushed on to the fabled land of Quivira,1 only to meet with another disappointment.

Forty years elapsed before the Spaniards again entered New Mexico. In 1581 Fray Augustín Rodríguez, another Franciscan, explored the valley of the Rio Grande, and in 1582-1583 Antonio de Espejo made extended explorations to the E. and W. of this stream. It was about this time, apparently, that the Spaniards in Mexico adopted the term New Mexico to designate the land to the north; Rodríguez had called the country San Felipe, and Espejo had named it Nueva Andalucía. Between 1583 and 1595 several attempts at the conquest and occupation of New Mexico were made, but for various reasons they were unsuccessful. In the spring of 1595 Don Juan de Oñate entered New Mexico with about 400 colonists, and choosing the pueblo of San Juan (q.v. N.W. of the modern Santa Fé) as a temporary dwelling-place, made preparations for building a town at the junction of the Rio Chama and the Rio Grande, to be known as San Francisco. In the following year the new settlement was renamed San Gabriel. Some years later a second settlement was made at Santa Fé, which has ever since been the seat of government of New Mexico. Although the Franciscan missionaries by 1617 had built seven churches and had baptized 14,000 Indians, there were in this year only 48 soldiers and settlers in the province. The zeal of the friars in stamping out the religious rites of the natives, the severe penalties inflicted for non-observance of the rules of the Church, and the heavy tribute in kind demanded by the Spanish authorities, aroused feelings of resentment in the Pueblo Indians and led in 1680 to a general revolt, headed by a native named Popé. Over 400 Spaniards were massacred, and the remnant, after enduring a siege in Santa Fé, fled southward to a mission near the present El Paso. For a decade the natives enjoyed their independence, destroying nearly all vestiges of Spanish occupation, and venting their wrath particularly upon the churches. After several attempts at reconquest had failed, Don Diego de Vargas marched up the Rio Grande in 1692, and led the way as vanguard for Governor de Vargas, then held by the Indians. During the next four years the submission of all the pueblos was secured, and the permanency of

1 Although the Quivira story was fabricated by an Indian captive and its fraudulent character was fully exposed by Coronado in 1541, ignorant American treasure-seekers still search for this mythical region. By a strange perversion of names the deserted stone pueblo of Tabib, S. of Albuquerque in the vicinity of the Manzano Moun-

tains, has received the appellation of "Gran Quivira," thereby causing many deluded persons to make a vain search among its ruins for treasure.

European occupation was assured. The history of New Mexico in the 18th century was uneventful, being chiefly a story of petty disagreements among the pueblos, and occasional forays of the more warlike tribes, the Navahos, Apaches and Comanches. During the Mexican War of Independence (1811–21) New Mexico was tranquil and little disturbed by events farther south; but when, near the close of the year 1821, the news of independence arrived it was received with enthusiasm. Under the Mexican republic New Mexico was called a province till 1824, when it was united with Chihuahua and Durango to form the Estado Interno del Norte. Several months later, however, it was separated from these two provinces and became the Estado Interno del Sur, officially designated as a department, and remained as such until ceded to the United States by the treaty of Guadalupe-Hidalgo, in 1848. Its government during this period was only slightly changed from what it had been under Spain.

Of great importance to New Mexico during the first half of the 19th century was the development of its trade with the United States. American traders had occasionally ventured as far as Santa Fé before the independence of Mexico, but they were frequently expelled and their goods confiscated by the Spanish authorities. After the Mexican War, however, the explorations became larger and more numerous. From Missouri caravans of pack animals, and later wagon trains, set out in May of each year on the 800 m. journey to Santa Fé, along the route later followed in its general lines by the Atchison, Topeka & Santa Fé railway. The value of the products carried by these trains increased from $7,500 in 1822 to $45,000 in 1845. On their return trip the wagons often brought loads of wool, fur and blankets.

In 1841 the republic of Texas, claiming that its western boundary was the Rio Grande, sent a force of 500 men to New Mexico to enforce these claims. The Texans reached the frontier in a starved and exhausted condition, were made prisoners by the New Mexican militia, and were sent to Mexico, where a short term of confinement they were released.

In 1846 the Congress of the United States declared that war existed with Mexico, and on the 3rd of June Brigadier-General Stephen W. Kearny was ordered to undertake the conquest of New Mexico and California and to “establish temporary civil governments therein.” Kearny reached Las Vegas on the 15th of August, assured the people of protection if they remained peaceable, and three days later established a civil government and compiled a code of laws, some of which are still in force, thus exceeding his instructions and ignoring the territorial claims of Texas, out of which had grown the war. After Kearny’s departure for California and Col. Alexander William Doniphan’s (1806-1887) setting out (Dec. 1846) on his heroic expedition to join Gen. Wool at Chihuahua, some of the inhabitants revolted, and in January 1847 assassinated the governor, Charles Bent, and a number of Americans and Mexicans who had taken office under the new regime. The insurrection was quickly suppressed, but the citizens soon grew tired of a military government, and in 1848 and again in 1849 petitioned Congress for a government “purely civil in character.” In 1850 a convention met in Santa Fé and drafted a state constitution prohibiting slavery; this constitution was ratified, and state officials were chosen to act under it. The governor by military appointment, Colonel John Munroe (1796–1867), refused to surrender his jurisdiction in favour of the state officials until authorized to do so by Congress, and for a time there was much writing of pronuncia-
mentos by the military and the quasi-state officials. But finally a regular Territorial form of government, provided by Congress by an act of the 13th of December 1850 (a part of the Compromise of 1850), was formally inaugurated on the 3rd of March 1851.

As originally constituted, the Territory included, besides most of its present area, nearly all of what is now Arizona, and a small portion of the present Colorado. By the terms of the Compromise Measures of 1850 Texas surrendered all claims to the portion of New Mexico E. of the Rio Grande, and was reimbursed for this loss of territory by the Federal Government. The Gadsden Purchase (see GADSDEN, JAMES), concluded on the 30th of
NEW MEXICO

December 1853, and proclaimed by President Pierce on the 30th of June 1854, added to the Territory an area of 45,535 sq. m., and changed the southern boundary W. of the Rio Grande so that from the Rio Grande the new boundary ran due W. on the parallel of \( 31^\circ 47' \) N. lat. for 100 m., then due S. to the parallel of \( 32^\circ 20' \) N. lat., then due W. on that parallel to the point of intersection with the boundary of Colorado, and thence on the middle of the Colorado river to 20 m. below its junction with the Gila, and thence up the middle of the Colorado river to the boundary line between Mexico and California. In 1861 a portion of north-eastern Mexico was taken to form part of Colorado; and in 1863 all of the area W. of the 109th meridian was organized as the separate Territory of Arizona.

In 1850 the question whether New Mexico should have slavery was left to the decision of the inhabitants. Only a few African slaves were ever brought into the Territory, and these were usually the property of civil and military officers. There were two classes of the population, however, whose status was practically that of slaves; namely, Indian captives and peons. Before slavery was prohibited in the Territory by Act of Congress in 1862, Indian captives were regularly bought and sold, a traffic sanctioned by custom and not prohibited by law. Peons were persons held in servitude on account of debt, and thepeonage system was sanctioned both by the custom of the Mexican provinces and by the natural laws of 1855 forbade service from leaving masters to whom they were indebted, and in 1853 sheriffs were authorized in instances to dispose of the debtor’s labour to the highest bidder. Peonage remained a legalized institution until 1860, when it was abolished by an act of Congress.

At the outbreak of the Civil War the inhabitants were generally apathetic; but when the Confederates invaded New Mexico they proved loyal to the Union. In February 1862 General H. H. Sibley, commanding a force of about 3000 Texans, marched into New Mexico, fought a successful engagement at Valverde, on the Rio Grande, against Union forces under Colonel, later General, Edward R. S. Canby, and occupied Albuquerque and Santa Fe. The Union troops were reinforced from Colorado, however, and after a series of skirmishes the Confederates were compelled to retreat to Texas, leaving behind about half their original number in killed, wounded and missing. New Mexico furnished to the Union army between 5000 and 6000 men.

The period following the American occupation of New Mexico was marked by constant depredations of the Indians, chiefly the Navahos, Apaches and a few Utes, their main object being plunder. While the troops were occupied with the Confederate invaders the Navahos had a free hand, but in 1863 an energetic campaign was begun by General James H. Carleton against the Navahos, who were subdued and placed on a reservation on the Pecos river, and later removed to the north-western part of the Territory. There they grew peaceful and prosperous, acquiring large flocks of sheep and gaining a reputation as makers of blankets. The Apache Indians, the most savage of all, were placed on reservations somewhat later, but for many years bands of their warriors would escape and make raids into New Mexico, Arizona and Mexico. The most notable of the later outbreaks were those in 1879-1880 and in 1883-1886 respectively of the Apache chiefs Victorio and Geronimo (c. 1834-1909).

When the United States acquired possession of New Mexico, the best portions of the Territory were held in private ownership under Spanish and Mexican grants, which were confirmed by the treaty of Guadalupe-Hidalgo. To determine the validity of these claims, which had been complicated by transfers and subdivisions, and to fix their boundaries, which were often very vaguely described, proved a very formidable undertaking; and the slow process of confirmation greatly retarded the development of the Territory. There was but little material progress before the advent of the railroad. The first wagon road from Albuquerque to Santa Fe was opened in 1880, and the Southern Pacific railway effected a junction with it at Deming in 1881, thus connecting the Territory with the eastern and western coasts of the United States. With the railroad came a great influx, and the development of modern towns. Immigrants from the states, however, rarely settled beyond the zone of the railway, and in the remote rural regions the process of Americanization was slow.

After the Civil War numerous attempts were made to secure the admission of New Mexico into the Union as a state. In 1852 a state constitution was drafted, and it was proposed for a time to call the new state Lincoln, but the movement came to nothing. In 1889 another constitution was drafted, but it was rejected when submitted to a popular vote. On the 6th of November 1906 the question of the joint admission of New Mexico and Arizona as a single state bearing the name of the latter Territory was submitted to a vote of their citizens. The vote of New Mexico was favourable (26,195 to 14,733), but the measure was defeated in Arizona. In June 1910 the President approved an enabling act providing for the admission of New Mexico and Arizona as separate states.

The governors of New Mexico since its independence from Spain have been as follows:

**Under the Mexican Republic**

- Francisco Javier Chavez (1812)
- Antonio Vizcarra (1822-1823)
- Francisco Javier Chavez (acting)
- Bartolome Vacca (1823-1825)
- Antonio Narbona (1826-1827)
- Manuel Arnao (1827-1828)
- Antonio Vizcarra (acting)
- Jose Antonio Chavez (1828-1831)
- Santiago Abad (acting)
- Francisco Sarriceno (1833-1835)
- Juan Rafael Ortiz (acting)
- Mariano Chavez (acting)
- Juan Perez (1835-1837)
- Jose Gonzalez, revolutionary governor or pretender (1837-1838)
- Manuel Armijo (1838-1841)
- Antonio Sandoval (acting)
- Mariano Martinez de Lejanza (acting)
- Jose Chavez (acting)
- Juan Bautista Vigil y Alarid (acting)

**Under the United States**

**Governors by Military Appointment.**

- Charles Bent
- Donaciano Vigil
- John Marshall Washington
- John Munroe

**Governors by Presidential Appointment.**

- James S. Calhoun
- E. V. Sumner (Military Commander, acting)
- John Greiner (Secretary, acting)
- William Carr
- David Merriwether
- Abraham Rencher
- Henry Concho
- W. E. M. Arm (Secretary, acting)
- Robert B. Mitchell
- William A. Pfe
- Marshall Giddings
- William G. Ritch (Secretary, acting)
- Samuel B. Axtell
- Lewis Wallace
- Lionel A. Sheldon
- Edmund G. Ross
- L. Bradford Prince
- William T. Thornton
- Miguel A. Otero
- Herbert J. Hagerman
- J. W. Raynolds (Secretary, acting as governor)
- David B. Campbell
- John W. Mills

1 According to the historian H. H. Bancroft, the loyalty to the Union cause resulted "largely from the fact that the Confederate invasion came from Texas, the old hatred of the Texans being the strongest popular feeling of the natives, far outweighing their devotion to either the North or the South."

2 Under the republic until 1837 the governor was officially designated as *jefe politico*; after that date as *gobernador.*

3 Assassinated during the Mexican revolt on the 19th of January 1817.

4 Governor as Commander of the Department.
NEW MILLS—NEW ORLEANS

Francisco, 1889]; A. F. Bandelier, Contributions to the History of the South-western Portion of the United States, being vol. v., American series, of the New Mexico Institute of Science (Colorado, 1890); George P. Winship, "The Coronado Expedition," in the Fourteenth Annual Report of the Bureau of Ethnology (Washington, 1896); W. H. H. Davis, The Spanish Conquest of New Mexico (New York, 1897); Publications of the Historico-Society of New Mexico and the Gaucho de Villagrá, Historia de la Nueva Mexico; reimpresa por el Museo Nacional, con un apéndice de documentos y epísculos (2 vols., Mexico, 1900), vol. i. being a reprint of the epic poem published in 1835 by Villagrá, a companion of Oñate in his expedition to New Mexico.

NEW MILLS, an urban district in the High Peak parliamentary division of Derbyshire, England, at the confluence of the rivers Goyt and Kinder, on the border of Cheshire, 13 m. S.E. of Manchester, on the Midland and the London & North-Western railways. Pop. (1901) 7772. Its ancient name was Bowden Middle Cale. The name of New Mills was given to it from a corn-mill erected on the Kinder in the hamlet of Ollersett, and is specially applied to the group of factories which have grown up round it. Formerly paper and cloth were the staple industries of the district, but the inhabitants of the various hamlets are now occupied chiefly in iron and brass foundries, cotton mills, and woollen weaving. The Midland railway lines lead to the town of Hayfield (pop. 2614).

NEW MILANS, a manufacturing town and police burgh of Ayrshire, Scotland. Pop. (1901) 4467. It is situated 73 m. E. of Kilmarnock by the Glasgow and South-Western railway. It was made a burgh of barony in 1490 by James IV., the charter being confirmed in 1566 by Sir Matthew Campbell, the laird of Loudoun, in which parish the town is situated. Muslin- and lace-curtain making and the manufacture of mosquito-nets are the chief industries. Nearly 2 m. E. lies Darvel (pop. 3070), a police burgh and manufacturing town, with a station on the Glasgow and South-Western railway; its chief manufactures are those of lace curtains, muslins and carpets. Two miles E. rises Loudoun Hill (1036 ft.) where Robert Bruce defeated the English in 1307, and about a mile farther E. the cairn is raised to commemorate one of Wallace's victories.

NEW ORLEANS, a city of Louisiana, U.S.A., situated almost wholly on the left bank of the Mississippi, 107 m. from its mouth, in that portion of the state which constitutes the river's larger delta, and lying between Lake Pontchartrain (to the north and west) and Lake Borgne (to the east and south); its latitude is 30° 10' N., its longitude 90° 10' W. (same as that of Cairo, Ill.). Pop. (1910) 339,075. The city lay originally at the angle of a deep three-sided bend in the river. Into this hollow it gradually spread, the curving river front, some 9 m. long, serving as its harbour; and hence its old appellation, the Crescent City. Long ago, however, the city filled the pocket of the bend, and spreading farther along the river, now has the form of an "S." Directly north, and still about 3 m. distant from the parts of the city proper that have advanced farthest toward it, lies Lake Pontchartrain (about 40 m. long and 20 m. wide). Lake and river are parallel to one another for many miles on the narrow alluvial strip between. The total area included within the municipal limits is 156-25 sq. m., but the city proper covers about 40 sq. m. The larger limits are coextensive with those of the parish of Orleans, and include the district of Algiers, on the right bank of the Mississippi.

The river at New Orleans varies from 1500 to 3000 ft. in width, and its broad channel often stretches almost from shore to shore, with a depth varying frequently at short intervals from 40 ft. to more than 200 ft. Around the margins a line of wharves and shipping extends for miles on each shore. Including the suburbs of Westwego, Gretna, &c., on the right bank of the stream, there is a river frontage of more than 20 m. Gretna, the seat of Jefferson parish, McDonoghville, in Jefferson parish, and Algiers, or West New Orleans, a part of the city, are industrial suburbs on the west bank of the Mississippi, connected with the east bank by a steam ferry and with one another by electric railway. At Algiers are railway terminals and repair shops of the Southern Pacific and the Texas & Pacific; and the United States Naval Station here, which was built in 1894 (though land was bought for it in 1849), and has a large steel dock, 1000 ft. long, with a 26 ft. opening, is the nearest point south of Portsmouth, Virginia, and is equipped to make all repairs.

The city site is almost perfectly level; there is an exceedingly slight slope from the river toward the tidal morasses that border Lake Pontchartrain. The elevation of the city plain is only 10 ft. above the sea, and its lower parts are as much as 10-12 ft. below the Mississippi at high flood water. About 6 m. of heavy "leves" or dykes— in some parts rising clear above the city plain, but backed by filled-in areas graded down from the shores where the traffic of the water-front is concentrated— protect it from the waters. The speed of the current reaches, in times of high water, a rate of 5 m. an hour. Along the immediate front of the principal commercial quarter, this current, losing some of its force by change of direction, deposits its alluvium in such quantities as to produce a constant encroachment of the shore upon the harbour. At its widest part this new land or batteur, with wharves, streets and warehouses following eagerly after it, has advanced some 1900 ft. beyond the water-line of the middle of the 18th century.

The climate is not marked by extremes of absolute heat or cold. Prevailing winds are the south-west and south-east, bringing moist air from the Gulf of Mexico. The temperature, however, is moderated by its great size; for example, in February 1899, while the thermometer register as high as 102° F., and on only a few days did it register above 62°; in February 1890 the temperature was 72° but it rarely falls below 25°. The average annual rainfall is about 58 in.

Canal Street, the centre of retail trade and street life, bounds on the south-west near the river the Vieux Carré—the old rect- angle within the walls of the original city, bounded by the river, Canal, Rampart and Esplanade streets—and separates the picturesque, peaceful French (or Latin) Quarter of the north-east from the bustling business and dignified residence districts of the American Quarter, or New City, on the south-west. In the latter St Charles Avenue and Prytania Street have the finest residences, and in the former Esplanade Avenue. Just below Canal Street, in the oldest part of the American Quarter, are many of the most important or imposing buildings of the city, and some of the places most intimately associated with its history. Here are the St Charles Hotel (1804), the third of that name on the present site, all famous hostries, and the first (1838–1851) one of the earliest of the great hotels of the country; and Lafayette Square, surrounded by the City Hall (built in 1850 in the style of an Ionic temple), the newly-opened Office, twoYPHRMS between St Patrick's and the First Presbyterian, Odd Fellows' Hall and other buildings. In the square are statues of Henry Clay (by Joel T. Hart) and Franklin (by Hiram Powers), and a monument to John McDonogh (1898); and in the vicinity are the Howard Memorial Library (1887; a memorial to Charles T. Howard), which was the last work of H. H. Richardson, a native of Louisiana, and the Confederate Memorial Hall (presented to the city by F. T. Howard) with Confederate relics. Two blocks away in Marguerite Place is a statue erected (1884) by the women of the city to Margaret Haughery (d. 1883), the "Orphan's Friend," a noble woman of humble birth and circumstances, who devoted a toilful but successful life to charities. In Lee Circle is a monu- ment to Robert E. Lee, and facing it is the New Orleans Public Library building (1908). Just off Canal Street, at Carondelet and Gravier Street, is the Cotton Exchange (1882–1883), and in Magazine Street the Produce Exchange. The large office buildings are on Canal, Carondelet, Common and Gravier streets; among them may be mentioned the Maison Blanche, the Hennen Building, the Tulane Newcomb Building and the Canal Louisiana Bank and Trust Company Building. But perhaps the most publicised and most popular of all is the Poydras Street Station, between Gravier and Poydras, to the south of the Picaoyne and the Times-Democrat; on Carondelet and Gravier are the wholesale cotton houses; on Poydras and Tchoupitoulas are the wholesale
grocery houses; and on North Peters and Custom House streets the sugar and rice industries are concentrated. Little of history or tradition is associated with the American Quarter, with the exception of the former site (before 1900) of the Clay statue in Canal Street where Royal Street and St Charles Avenue begin, which was the scene of popular meetings in the Italian troubles of 1891; here, in Liberty Place, a triangle at the intersection of Canal, North Peters and Tchoupitoulas streets, on the scene of the fight of the 14th of September 1874 between conservative citizens and the radical authorities of the state, is a granite memorial called the Liberty Monument. The Customs House, long renowned for its "marble room," is in the old city, just off Canal Street. The corner-stone was laid by Henry Clay in 1847. The Boston (1845) and Pickwick (1857) are the best known of the general social clubs, and the Harmony (1862) of the Jewish clubs.

It is the French Quarter in which the history, poetry and romance of New Orleans are indissolubly united. The memory of French dominion is retained in the titles, and in the foreign aspect as well, of Toulouse, Orleans, Du Maine, Conti, Bourbon, Dauphiné and Chartres streets; while even more distinctly the Spaniard has superimposed his impress on stuccoed wall and iron lattice, huge locks and hinges, arches and gratings, balconies, jalousies, inner courts with parterres, urns and basins with fountains, and statues hall hid in roses and vines. There are streets named from its Spanish governors: Unzaga, Galvez, Miro, Salcedo, Casa Calvo, Carondelet and the baron Carondelet's Baronne. The moated and palisaded boundaries of early days are obliterated by wide, new streets; but the Cabildo, the Cabildo, and the Esplanade which once lay along their course; the original "commons" outside the walls are commemorated in Common Street; and the old parade ground in the midst of the early town's river front, now laid off in flower-beds, white-shelled walks and shaven shrubbery, and known as Jackson Square, still retains its older name of the Place d'Armes. With this quaint, sunny and dusty old square is associated nearly every important event in Louisiana's colonial history. This was the place publique, associated with traffic, gossip, military muster and official acts of state. On one side is the cathedral of St Louis, first built in 1718, burned in 1728, rebuilt in 1792-1794, and largely rebuilt again in 1850. Flanking the cathedral on one side stands the cabaloose (Calabasa, 1810), and on the other the Cabildo—so named from the municipal council that sat here under Spanish rule, when it was the government house and palace of justice. Both buildings are to-day used as law courts. The Cabildo is a dignified two-storey structure of adobe and shell-lime, built in 1795; an incongruous mansard roof was added in 1850. On the 30th of November 1803, in the council room, the cession of Louisiana to the United States was consummated. From the Cabildo, the government and the people of Louisiana were absolved from their allegiance to the Spanish king; and here, only twenty days afterward, with similar ceremonies, the keys of the city passed from the hands of the French colonial prefect to those of the commissioners for the United States. In the old Place d'Armes a bronze equestrian statue (1836) of Andrew Jackson by Clark Mills is a remembrance of the ceremonies attending Jackson's triumphal entry into the city after the battle of New Orleans in 1815. In 1825 Lafayette was lodged in the Cabildo as the city's guest.

The appearance of the square was greatly changed in 1840, when the Baroness de Pontalba, in whose estate it was then comprised, cut down the ancient elms that shaded it and laid it out in its present style of a French garden. She also is responsible for the low brick "Pontalba Mansions" on the north and south sides of the square. The Babel of Tongues in the French Market (1813), on the site of an older market, immediately below Jackson Square, and at the "Picayune Tier" just adjacent, is an interesting feature of the city. Near the Cathedral, in Orleans Street, is the convent of the Holy Family, a brick building, housing a negro sisterhood founded in 1835, and formerly the scene of New Orleans's famous "quadroon balls." The archi-

episcopal palace (1730), said to be the oldest building of the Mississippi Valley, is part of the unchanged original Ursuline convent; it was used as the State Capitol in 1831, and then it was the residence, and since 1899 has been the administrative office of the archbishop, and houses a colonial museum with the ecclesiastical records. The French Opera House (1829) was the successor of various French theatres built after 1808. The carnival balls are given here. New Orleans was by far the earliest of America's and the South's to have an annual opera season.

The 18th-century fortifications about the old city were destroyed about 1804. The United States Branch Mint (1838) occupies the site of Fort St Charles (destroyed 1826), where Jackson reviewed his troops as they marched to Chalmette. Just outside the Vieux Carre is Beauregard Square, formerly known as Congo Square, because in early days the slaves were wont to gather here for their barbaric dances. The Hotel St Louis (1836), rebuilt in 1884 as the Hotel Royal, was the seat of the Republican reconstruction governments of governors Kellogg and Packard, and the prison fortress of both, respectively, in 1874 and 1877, when the whites rose against Republican rule; its rotunda was also once a famous slave mart. Many other spots in the Latin Quarter are of scarcely less interest than those mentioned, not excluding those which were made famous by the romances of G. W. Cable, and whose only title to historic consideration is that which his imagination has given them.

City Park (216.6 acres, partly water), lying between the city and the lake, is notable in the local dwelling annals of earlier days. Audubon Park (249 acres) was once the sugar plantation of de Boré and, after the yellow-bill was first successfully made granulated sugar in 1795-1796; earlier experiments had been made in 1791 by Antonio Mendes, from whom de Boré, who established the sugar industry, bought a plantation in St Bernard Parish. The park was bought by the city for $180,000 in 1871, but was little improved until 1884, when the Cotton Centennial Exposition was held here. It contains to-day a state Sugar Experiment Station, in which a part of their work in course is done by the students in the Audubon Sugar School of the State University at Baton Rouge, and Horticultural Hall, the only one of the exposition buildings now standing, with a display of tropical trees and plants; opposite Audubon Park is the campus of Tulane University. West End is a suburban resort and residential district on Lake Pontchartrain.

A noted feature of New Orleans is its cemeteries. Owing to the undrained condition of the subsoil, burials are made entirely above ground, in tombs of stuccoed brick and of granite and marble. Some of these are very elegant and costly, and many of the burial-grounds, with their long allies of these tombs of diverse designs, deeply shaded by avenues of cedars and magnolias, possess a character far more beautiful than the more bony, and the poor bury their dead underground in shallow vaults. The cemetery on the north side of St Louis No. 1, contains the graves of many persons notable in history. St Roch's Campo Santo has a wonder-working shrine, and is the most picturesque of the old burying-grounds. Metairie, on the site of an old race track, is the finest of the new. It contains a monument to the Army of the Tennessee and its commander, Albert Sidney Johnston, with an equestrian statue of Johnston by Alexander Doyle, and a monument to the Army of Northern Virginia surmounted by a statue of General T. J. Jackson in Greenwood Cemetery is the first monument erected to Confederate cause. An obelisk to T. L. D'Armond, after whom the street at Chalmette (on the Mississippi, about 5 m. E. of Canal Street), where the battle of New Orleans was fought in 1815, there is a National Cemetery, in which some 12,000 Union soldiers in the Civil War are buried.

Population.—The population in 1900 was 287,104, New Orleans.

1 In the burial vault of this tomb, with the bodies of many other soldiers, are the remains of General P. G. T. Beauregard, who was born near New Orleans.

1 At the earlier censuses the population of the city was as follows: 17; 4,442 in 1810 (when it was the sixth city in population in the United States); 27,176 in 1820 (when, as in 1830 and 1850, it was the fifth city); 45,082 in 1830; not reported separately in 1840; 116,375 in 1850; 168,675 in 1860; 191,418 in 1870; 216,090 in 1890; and 242,039 in 1890.
Orleans ranking twelfth among the cities of the United States; in 1910 it was 339,075. Of the 1900 total, 256,779 were native-born, and 30,325 were foreign-born, including 8733 Germans, 5866 Italians, 5398 Irish, 4428 French and 1262 English; and there were 77,714 negroes. In 1900 the population of foreign parentage was 108,010, of whom 78,269 had foreign fathers and foreign mothers, 27,259 being of German, 15,465 of Irish, 10,694 of Italian, 9317 of French and 1892 of English parentage. The Latin elements then came into vogue; the Mardi Gras became an elaborate affair, capital introduced, Canadians, colonists from the French and Spanish West Indies, Italian Islanders (whose descendants are still known as Isletés), and French refugees from Acadia in 1765 and the years following, and from Santo Domingo at the end of the 18th century. The earliest French immigrants were largely Bretons and Normans, and various creole words in common use (such as banquette for "side-walk") still recall these racial beginnings. The creoles of New Orleans and the surrounding delta are a handsome, graceful, intelligent race, of a decidedly Gallic type, though softened in features, speech and carriage. Their dialect has been formed from the French entirely by sound, has no established orthography, and is of much philological interest. Until very recent years the Latin races, though fusing somewhat among themselves, mixed little in blood with the Anglo-American. The Spaniards when in power at the end of the 18th century were notably different from the French in their liberalism in this respect. In social life and standards the French creoles were very conservative; the old styles of dress, e.g. of the late 18th century—wigs, silk stockings and knee-breeches— lingered longer among them, probably, than in any other part of the country. But before the pressure of American immigration on the creole enterprise and education, this creole civilization has slowly yielded ground, at last fairly beginning to amalgamate with the social system of the American nation. But the creole has stamped his influence upon wellnigh every aspect in the life of the city that has broadened out so widely on every side of his antique town. Its cuisine, its speech, its "continental" Latin Sundays, its opera, its carnival, its general fashions and manners, its intolerance of all sorts of rigour, its whole outward tone and bearing, testify to this patent Latin impress. A comparatively recent addition to the Latin element in the city has been through Italian immigration.

The coloured population, notwithstanding the presence among it of that noted quadroon class which enjoyed a certain legal freedom for generations before the Civil War, has not greatly improved since the date of emancipation. Catholicism is naturally extremely strong in New Orleans. So also are the Baptist and Methodist churches.

Carnivals.—The famous carnival displays of New Orleans are participated in very largely by the American, i.e. the Anglo-American; but they mark one of the victories of the Latin-American over North-American tastes, and probably owe mainly to the "American" their pretentious dignity and to the creole their more legitimate harlequin frivolity. Out of the simple idea of masked revelry in the open streets, as borrowed from Italian cities, the American bent for organization appears to have developed, by a natural growth, the costly fashion of gorgeous torch-lighted processions of elaborately equipped masques in tableau drawn on immense cars by teams of caparisoned mules, and combining to illustrate in a symmetrical whole some theme chosen from the great faiths or literatures or from history. Legends, fairy-tales, mythologies and theologies, literature from Homer to Shakespeare, science and pure fantasy are drawn upon for these ornate representations, which are accompanied by all the picturesque licence of street life characteristic of carnival times in other cities. They have no rival in America, and for glitter, colour and elaborateness are by many esteemed the most splendid carnival celebrations of the world. The first carnival parade (as distinguished from the Mardi Gras celebration) was held in 1827 by masked students recently rescued from the Then, 1837 and 1859 the first processions with "floats" were held in New Orleans. The regular annual pageants, almost uninterrupted save during the Civil War, date from 1852, when the "Mystic Krewe of Comus," the oldest of the carnival organizations, was formed; similar organizations, secret societies or clubs are the "Twelfth Knight Revelers" (1870), "Rex" and "Knights of Momus" (both 1872, when the carnival was reviewed by the Grand Duke Alexis of Russia), the "Krewe of Proteus" (1882), and the "Krewe of Nereus" (1895). Balls, processions and other festivities are now spread over a considerable period, culminating in those of Shrove Monday. During this time the festivities quite engross public attention, and many thousands of visitors from all parts of America are yearly attracted to the city.

Charitable Institutions.—The large Charity Hospital (1786) and the Richard Mililken Memorial Hospital for Children are supported by contributions and subscription. The Tufts Hospital (1854; controlled by the Hebrew Benevolent Association; founded by Judge A. C. Tufts, a Jew of Dutch descent, son of Isaac Tourow of Newport, Rhode Island), includes a free clinic open to the needy of all faiths. Other hospitals are: the U.S. Marine Hospital (1817); the Hotel Dieu (1856) and the St Joseph's Maternity Hospital (1865), both under the Sisters of Charity; the Sarah Goodrich Hospital (1886; Methodist Episcopal); and the Eye, Ear, Nose and Throat Hospital (1889; private). The Orleans Female Orphan Asylum (1849) and St Elizabeth's Industrial School (1845), under the Sisters of Charity; an Ursuline Orphanage (1782); the Immaculate Conception Girls' Asylum (1851); the New Orleans Benevolent Home for Boys (1824; the Sisters Maris the of the Holy Cross); the St Alphonsus Orphan Asylum (1858) and St Vincent's Home for Newsboys (1875), under the Sisters of Mercy; the Mount Carmel Orphan Asylum (1869), under the Sisters of Charity; the Sacred Heart Orphan Asylum (1849) for girls, under the Missionary Sisters of the Sacred Heart; St Joseph's Orphan Asylum (1863), under the Sisters of Notre Dame; the New Orleans Jewish Orphan Asylum (1855); the Children's Home of the Protestant Episcopal Church (1859); the Evangelical Lutheran Bethel Orphan Asylum (1881); the German Protestant Orphan Asylum (1886); the Freedmen's Asylum (Baptist); and, under private and non-sectarian control, the Asylum for Destitute Orphan Boys (1824) and the Colored Industrial Home and School (1902). The J. D. Fink Fund and the Fink Home (1874) or Asylum (for Protestant widows and their children) are the gift of an eccentric, who offered to hand marriage if refused by one preferring to marry, and who forbade that any old maid should enter the asylum. Other homes for adults are: the Sisters' Foundling Home, American Convent: Home for the Aged (1869 and 1882); a Home for Aged Women; a Sisters for Homeless Women, and the New Orleans Convalescent Home (1885). Kingsley House is modelled after Hull House in Chicago. The Louisiana Retreat, a private asylum for the insane, New Orleans, and the St Mary's Asylum for the Insane (1888); the Julius Weis Home for Aged and Infirm (1899), under the Hebrew Benevolent Association; and, under private corporations, the Maison Hôpitalière (1893) for aged women, the New Orleans Home for Incurables (1853) and St Anna's Asylum (1894) for destitute women and their children. Temporary homes are: the Convent of the Good Shepherd (1859), under the Sisters of the Good Shepherd, and a Memorial Home (1886; both for women under women); a Home for Homeless Women (1888), and the New Orleans Convalescent Home (1885). The Home Institute (1893) provides free night schooling for hundreds of students, and similar work is done on a larger scale by public and private societies, of whom the Association for the Education of the White Illegitimate (could not write), seven-tents of the illegitimates being negroes, of whom the illiterates constituted 36%.

There are various higher institutions of learning in the city. Tulane University was named for Edward Grant Tulane (1801-1887), a merchant of New Orleans, who gave $1,050,000 in 1882-1887 to a Board of Trustees for the education of "the white young persons in the city." The University was established, under

1 See William Allan's Life and Work of John McDonogh (Baltimore, 1886).
By 1900 the drawbacks which have been enumerated had been practically eliminated, and uncertainty as to the investment of capital had been removed. The southward tendency in railway traffic favours the city. Deep water to the ocean was secured by a system of jetties at the South Pass mouth of the Mississippi, built by James B. Eads in 1875-1879; but in time this ceased to maintain an adequate depth of water, and (after the report in 1900 of a board of engineers) in 1902 Congress began appropriations for an improvement of the South-west Pass by opening a channel 1000 ft. wide and at least 35 ft. deep. Steamers give direct connection with the West Indies, Central America, Europe, New York and also with Japan (for the shipment of raw cotton via Suez). Ocean steamers, loaded in large part by elevators, now bear away the exports for which a swarm of sailing-ships of much lighter draft and average freight-room once made long stays at the city's wharves. Passenger traffic on the rivers has practically vanished, and the shrunken fleet of river steamers (only 15 in 1907) are devoted to the carrying of slow freights and the towing of barges on the rivers and bayous of the lower Mississippi Valley.

The total value of all merchandise exported in the six customs years 1902-1903 to 1907-1908 averaged $154,757,110 yearly, and the imports $37,319,254. For the ten years 1890-1899 the corresponding averages were $95,056,618 and $15,921,543. Bank clearings for (1907) were $447,615,763 to $1,027,798,476 (bank clearings were $95,154,504 and $75,607,353 respectively for the calendar years 1907 and 1908). Sugar and coffee are the leading commodities in which imports and exports from Central America have similarly increased. Cotton represents roughly two-thirds of the value of all exports. As a cotton port New Orleans in 1868 was second only to Galveston, which had only recently surpassed it; and more than half of the raw cotton exports of the country passed through these two ports. The Board of Trade has maintained a cotton-inspection department since 1844, and its statistics are standard on the cotton crop. Cotton and coffee were the backbone of the following Navigation acts: $1,001,169,468 lb., valued at $104,168,824. Wheat and Indian corn, tobacco and tobacco are especially noteworthy articles of the trade. The importation of bananas is increasing, and the coffee trade of coffee has more than quintupled since 1900; the coffee comes for the most part from Brazil and grain wholly from American fields. The imports of bananas, for which New Orleans is the leading port of the country, more than doubled in the same period, and increased more than eight-fold in the twenty-five years following 1882 (1,200,000 to 10,200,000 bales). While railway traffic has grown immensely, and port facilities have been greatly improved, the river traffic had a steady fall. A belt railway owned by the city (built 1905-1907) connects all railway terminals, public wharves and many manufactories and warehouses. Public ownership protects the city's interests, and it is observed that all railways are equally and cheaply served; and new railways, which could not enter the city or have access to the water front because of the impossibility of securing individual trackage, can now make use of the municipal trackage and get through at once. The volume of imports in 1908 those of the Illinois Central system had nearly 200 m. of track; the St. Louis & San Francisco railway have 15 m. of track, a wharf almost 1 m. long, immense warehouses and grain elevators. The New Orleans Terminal Company constructed at Chalmette

1 The South-west Pass, originally the usual entrance, could not be entered by vessels drawing more than 16 ft.; the Eads jetties, aided by dredging, provided through the South Pass (500 ft. broad) a channel 160 ft. wide and 25 to 26 ft. deep. South-west Pass has always been the primary outlet of the river, varying from about half the volume of the river. Active work on its improvement was begun in 1903 and practically completed in 1909. Including the jetties, this Pass is nearly 20 m. long and has an average draft of about 16 ft.; the channel is more than 1000 ft. wide. The jetties, 4 m. long on one side and 3 m. on the other, are 6000 ft. apart at their head and 3600 ft. at the sea line. They are built on willow mats (foundation mats 200 X 150 X 2 ft.) in wooden frames, sunk with stone and surmounted above the water by a concrete wall.

2 The value of the river commerce was about $5,000,000 in 1816 and $38,000,000 in 1849. The first steamboat descended the Missis- sippi River and reached New Orleans in 1811. The first, founded boat trip up the river was made in 1817. The halycon period of river steamers was from 1850 to 1860. The luxury of the passenger boats then on the Mississippi and its tributaries had disappeared since the advent of the railway era. The best time ever made (1870) from New Orleans to St Louis (1278 m.) was 3 days, 21 hours and 25 minutes. The races of these steamers were performed without the aid of wind or tide and even in those of Europe, and they have been recorded in more than one page of literature. Steam packets replaced sailing vessels in the ocean trade about 1845.
NEW ORLEANS

(1908) splendid terminals, including an immense slip in the river (1500 x 900 ft., excavated to give 30 ft. of water below zero gauge) capable of handling large and deep-sea vessels and arranged with remarkable conveniences for the loading of grain. Steel-concrete warehouses and elevators surround the slip. The greater industrial establishments of the city cluster about the terminals, and factories, warehouses, and officer's quarters are grouped around them (and goes via Bayou St John to Lake Pontchartrain; and the New Basin Canal, built in 1837 by the New Orleans Canal & Banking Company, and state property since 1866, is 6-7 m. long, 100 ft. wide and 3 ft. 6 in. deep, and connects both of these canals with the Mississippi river as do the following primarily owned canals: the Lake Borgne Canal, from a point 10 m. below the city to the Boeuf, 7 m. long, 80 ft. wide and 6 ft. deep, shortening the water distance between Mobile and New Orleans by 60 m.; and the Barataria & Lafourche Company Canal (7 m. long, 45 ft. wide and 6 ft. deep) and Harvey's Canal (5-35 m. long, 70 ft. wide and 8 ft. deep). The Mississippi river discharges 70,000 ft. per second at New Orleans.

In 1900 the total assessed valuation of property was $221,373,362, of which $154,604,325 was realty and the remainder personalty. The bonded debt on the 30th of June 1909 was $32,524,140, and the floating debt at the end of 1908 was $1,264,030.

From 1890 to 1900 the expenditures for permanent works (including sidewalks, lights, water works, telephones, railroads, docks, &c.) aggregated $30,000,000. All the public services, nevertheless, were in 1909 in private hands, and the public income from property taxation July 1, 1909, was $1,811,000. In 1890 the street railways were consolidated in 1902 under one management. In 1869 the city bought, and nine years later sold again, the water works; municipal ownership and control, under a sewerage and water works commission, was re-established in 1909. The street railways were made to transfer the extensive markets from private lessees to direct municipal control, and in May 1901 the wharves of the city passed from private to municipal control. The municipal belt tram was in operation by 1907.

Until 1909 there were no sewers, open gutters serving their purpose. It is remarkable that the city twice granted franchises to private parties for the construction of a sewerage system, but without result. The low and extremely level character of the city site, of which nearly one-third is at or below the level of the Gulf, the recurrence of back-water floods from Lake Pontchartrain and the trade winds brings in rains from the sea, are the principal causes of the flooding. The drainage commission (merged in 1896 in a Sewerage and Water Board) devised a plan involving the sale of street railway franchises to pay for the installation of drainage canals, but the measures were never brought to a vote. In 1894, 42 years assuring a bond issue of $12,000,000 to pay for sewerage, drainage and water works to be owned by the municipality and to be carried out by a Sewerage and Water Board, was instituted. In 1900 an average of 2,500 persons died from water in the sewerage system in 1900, and in the year 1906 the legislature authorized the issue of municipal bonds for $8,000,000 to be expended on this work. Up to 1909 the drainage system was nearly complete, including 100 miles of sewers at a cost of $5,000,000; and 310 m. of sewers and nine sewerage pumping stations discharged sewage into the Mississippi below the center of the city. Garbage is used to fill in swamps and abandoned canals.7-8 The public service is secured from the river by a primary sewerage system, connected to the trade winds, and supplemented by mechanical precipitation and other means. By 1909 about 500 m. of water-mains had been laid, $7,000,000 had been expended for the water-system, and filtering plants had been established with a capacity of 3,000,000 gallons of water per day to be added. The water system makes the treatment of the sewage necessary; the public health of the city depends upon the cleanliness of the sewage. The contamination of the sewage area required the screening of aileron cisterns, formerly characteristic of the city, which were breeding-places of the yellow fever, Stagnomyia, and soon afterwards the state legislature authorized the Sewerage and Water Board to require the removal of all such cisterns. About two-thirds of the street surface in 1899 was still unpaved; the first improvements in paving began in 1890. All regards hygiene conditions have much more advanced in recent years. New Orleans was long notorious for unhealthiness. Yellow fever first appeared in 1796, and there were about thirty epidemics from 1799 to 1875. Though the first board of health and first quarantine station were in 1810, the city was one of the most pestiferous in the United States. The mortality of 1817-1827 was nearly 19 per cent. of the population. The death-rate was 59-63 per 1000; never did it fall below 25-00, which was the rate in 1827. In 1832, a cholera year, it rose to 148; in 1851-1855, 1859, and 1865, the mortality in the four choleratic years from 1852 to 1855 by cholera, it was 102, 72 and 73. During these three years there were more than 25,000 deaths. The miasmatic mortality in 1851-1865 and succeeding quinquennial periods to 1880 was as follows: 70, 45, 40, 39, 34 and 33-3. The rate reported at the 1880 census of the national census of 1890 was 28-9, the highest of any of the large separate governments; they issued paper money independently, for example. The charter of 1836 was also an extreme statement of local self-government; the municipalities were practically independent, although there was a common mayor and a general council of the entire city organizing and legislative council of the city. This organization was in large part due to the hostility of the creoles to the Americans. The charter of 1852 formed a consolidated city. That of 1856 added to and amended its predecessors. Among other things it was an attempt to secure a business-like and simplified administration. A mayor and seven "administrators," elected on a general ticket and constituting individually the different administrative departments, formed collectively a council with legislative power. All sessions of the council were public, and liberties of suggestion were freely accorded to the citizens. Tried in better times, and as a movement for reform sprung from the people and not due primarily to an external motive, the different administrative departments had not exercised great influence on other cities. The early 'seventies were marked by a great widening of the city's corporate limits. In 1862 another charter was granted by the legislature. It provided for an election of a district mayor, a district council, and a legislative branch, and executive officers chosen on a general ticket. The latter held seats in the council and could debate but not vote. This was the last

1 The charter of 1805 organized the old cité (the Vieux Carré) and the faubourgs as distinct municipalities with almost wholly

7-8 They were leased to a private company in 1891-1901, but the lease was unprofitable and was disadvantageous to trade. From 1901 to 1908 wharfage and harbour dues were reduced 25 to 85 %
cities of the United States.\textsuperscript{1} This high death-rate is often attributed in great part to the large negro population, among whom the mortality in 1860 was 42.1 per 1000; but the negro population largely comprises that large group of colored people whose failings in health and sickness in every large city swells the death-rate. A light yellow-fever epidemic occurred in 1897-1898-1899, after nineteen years of immunity, and a more serious one in 1905, when the United States had a negro epidemic too. Indeed, it is not possible to refer the city’s sanitation and attempted to exterminate the Stegomyia mosquito. The city Board of Health has done much to secure pure food, to suppress parties involved in suburban diseases, including yellow fever. In movements for the betterment of the city—in commerce, sanitation, public works and general enterprise—a leading part has been taken by an organization of citizens including the black leaders.\textsuperscript{2}

New Orleans was founded in 1718 by Jean Baptiste Le Moyne, Sieur de Bienville, and was named in honour of the then Regent of France. The priest-chronicler Charles Leveque described it in 1721 as a place of a hundred wretched hovels in a miserable wet thicket of willows and daim palmettos, infested by serpents and alligators; he seems to have been the first, however, to predict for it an imperial future. In 1722 New Orleans was made the capital of the vast province of Louisiana (q.v.). Much of the population in early days was of the wildest and, in part, of the most undesirable character—depicted as galley-slaves, trappers, gold-hunters and city scavengers; and the government’s letters are full of complaints regarding the riffraff sent as soldiers as late as Kerlerec’s administration (1753–1763). In 1788 a fire destroyed a large part of the city. In 1795-1796 the sugar industry was first put upon a firm basis. The last three years of the 18th century were especially characterized by the growth of commerce on the Mississippi, and the development of those national interests, commercial and political, of which New Orleans was the centre. The year 1803 is memorable for the actual transfer (at New Orleans) of Louisiana to France, and the establishment of American dominion. At this time the city had about 10,000 inhabitants, mostly French creoles and their slaves. The next dozen years were marked by the beginnings of self-government in city and state; by the excitement attending the Aaron Burr conspiracy (in the course of which, in 1806-1807, General James Wilkinson practically put New Orleans under martial law); by the immigration from Cuba of French planters; and by the American War of 1812.

In 1815 New Orleans was attacked by a conjunct expedition of British naval and military forces from Halifax, N.S., and other points. The American government managed to obtain early information of the enterprise and prepared to meet it with forces (regular and militia) under Maj.-Gen. Andrew Jackson. The British advance was made by way of Lake Borgne, and the troops landed at a fisherman’s village on the 23rd of December 1814, Major-General Sir E. Pakenham taking command there on the 28th. An immediate advance on the still insufficiently prepared defences of the Americans might have led to the capture of the city, but this was not attempted, and both sides remained inactive for some time awaiting reinforcements. At last in the early morning of the 8th of January 1815 (after the Treaty of Ghent had been signed) a direct attack was made on the now strongly entrenched line of the defenders at Chalmette, near the Mississippi river. It failed disastrously with a loss of 2000 out of 9000 British troops engaged, among the dead being Pakenham and Major-General Gibbs. The expedition was soon afterward abandoned; both the forts and the ironclads and fire rafts of the defence, almost all the Union fleet (except the mortar-boats) forced its way past. At noon on the 25th Farragut anchored in front of New Orleans; forts Jackson and St Philip, isolated and continuously bombarded by the mortar-boats, surrendered on the 28th; and soon afterwards the military portion of the expedition occupied the city. The commander, General B. F. Butler, subjected New Orleans to a rigorous martial law so tactlessly administered as greatly to intensify the hostility of South and North, but his administration was in many respects beneficial to the city, which was kept both orderly and healthy. Towards the end of the war General N.P. Banks held the command at New Orleans.

Throughout the years of the Civil War and the Reconstruction period the history of the city is inseparable from that of the state. All the constitutional conventions were held here, the seat of...
NEW PHILADELPHIA—NEWPORT

Johann Gottlieb Ernestus Heckewelder (1743–1832) other missionary villages were planted at Gnadenhütten (October 1772), Lichtenau (1776) and Salem (1780), all in the present county of Tuscarawas. After the massacre of Christian Indians at Gnadenhütten in 1782 the Indians removed to Michigan and in 1791 to Fairfield, Ontario; in 1798 some of them returned to Tuscarawas county and settled Goshen, where Zebsberger is buried. New Philadelphia was laid out in 1803 and was named by its founder, John Knisely, after Philadelphia in Pennsylvania; it was incorporated as a village in 1815, and was first chartered as a city in 1896.

See Ohio Archaeological and Historical Quarterly for April 1909 (Columbus, Ohio) for several articles on the early settlement by Moravian Indians.

NEW PLYMOUTH, a municipality and seaport on the west coast of North Island, New Zealand, capital of the provincial district of Taranaki, 258 m. N.N.W. of Wellington by rail. Pop. (1906) 5141. The town slopes to the ocean, with a background of forest surmounted by the snow-clad volcanic cone of Mount Egmont (8270 ft.). The district is not unjustly termed “the garden of New Zealand.” It is highly fertile, cereals and fruits growing well; and dairy products are extensively exported. In the town are leather-works, timber-works and flour-mills, with freezing-works for export dairy produce. The settlement was founded in 1849 by the Plymouth Brethren of the New Zealand Company, and chiefly consisted of emigrants from Devonshire and Cornwall. On the seashore in the neighbourhood are extensive deposits of iron sand.

NEW POMERANIA (Ger. Neu-Pommern, formerly New Britain, native Birara), an island of the Bismarck Archipelago, N.E. of New Guinea in the Pacific Ocean, about 6° S., 150° E., in the administration of German New Guinea. It is crescent-shaped, about 330 m. long, and, except where the Williamau Peninsula projects northward, nowhere more than 60 m. wide. The north-eastern extremity consists of the broad, irregular bay of the Williamau Peninsula; the latter is the site of the German town.

The total area is about 9500 sq. m. The island is in great part unexplored. The coasts are in some parts precipitous; in others the mountains recede inland, and the coast is flat and bordered by coral reefs. The formation appears otherwise to be volcanic, and there are some active craters. The greatest elevation occurs towards the west—about 6500 ft. There is a rich tropical vegetation, and a number of considerable streams water the island. The chief centre is Herbertshöhe at the north of the Gazelle Peninsula; it is the seat of the governor of German New Guinea.

The natives are Melanesians, resembling their Papuan kinsmen of eastern New Guinea, and are a powerful well-formed race. Their villages are clean and well kept. Unlike their Papuan relatives, the items of handicraft and pottery, but are cattle farmers and fishermen, constructing ingenious fishing weirs. They have a fixed monetary system consisting of strings of cowries. They perform complicated surgical operations with an obsidian knife or a shark’s tooth. The common dead are buried or exposed to sharks on the reefs; bodies of chiefs are exposed in the fork of a tree. Justice is executed, and taboons, feasts, taxes, &c., arranged by a mysterious disguised figure, the dawk-dawk. The population is divided into two exogamous classes. The children belong to the class of the mother, and when the father dies go to her village for support, and the land and fruit trees in each district being divided between the two classes. The languages are several dialects, the construction rather Fijian, as in the pronounal suffixes in singular, trial and plural; the numerals, however, are Polynesian in character.

NEWPORT, a market town and municipal borough, the chief town of the Isle of Wight, England. Pop. (1901) 16,911. It is situated near the centre of the island, at the head of the navigation of the Medina River, 5 m. S. from its mouth at Cowes. It is the chief centre of the railway system of the island. The church of St Thomas of Canterbury, rebuilt in 1854 in the Decorated style, contains many interesting old monuments; and one by Marochetti to the princess Elizabeth, daughter of Charles I., erected by Queen Victoria. The guildhall, erected in 1816 from the designs of Nash, includes the town-hall in the upper story with the market-place below. There are a corn exchange and museum. The grammar school (the scene of
negotiations between Charles I. and the parliament) was founded in 1612, and there is a blue-coat school for girls founded in 1761. The Albany barracks and Parkhurst prison lie north of the town. A considerable trade is carried on in timber, malt, wheat and flour. The town is governed by a mayor, 6 aldermen and 18 councillors. Area 504 acres.

It is supposed that Newport (Newport) was a Roman settlement, then known as Medina. There are no traces of Saxon occupation, and no evidence that it became a borough before the reign of Henry II., though it was probably used before that time as a port of entrance for the ancient capital of Carisbrooke. The first charter was granted by Richard de Redvers between 1177 and 1184, freeing the burgesses from tolls throughout the island, from hundred suits, and from being impaled without the walls, and giving them permission to choose their own reeve—privileges for which they paid 18 marks yearly. These grants, repeated and extended by the countess Isabel de Fortibus, were confirmed in 1349 by Edward III. and afterwards by successive kings, Henry VII. in 1489 granting in addition the petty customs within all ports and creeks of the island. The borough was incorporated by James I. in 1607, and a second charter of incorporation granted by Charles I. in 1637 is that by which Newport was governed until 1835. It was represented in parliament in 1295, but no return was made from that time until 1584, from which date it regularly sent two members. In 1667 the number was reduced to one, and in 1885 its representation was merged in that of the island. A fair was formerly held on Whit-Monday and the two following days, and on three succeeding Sundays. In Whit-stowe, known as "again Saturdays," there was a bixing fair for servants. There is no fair. The Saturday market dates from 1184, and there is a Wednesday cattle market. Owing to its facilities for trade, Newport early superseded Carisbrooke as the capital of the island. Its prosperity in medieval times depended upon its harbour dues and its oyster beds in the river Medina.

NEWPORT, a municipal and county borough, contributory parliamentary borough, seaport and market town in the Monmouthshire parliamentary division of boroughs, Monmouthshire, England, on the Usk, 5 m. from its confluence with the Severn, and 133 4 m. W. of London, by the Great Western railway. Pop. (1891) 54,707; (1901) 67,270. It lies chiefly on the right (west) bank of the river, and on the E., N. and W. it is sheltered by a line of lofty hills. The old parish church of St. Woollos stands finely on Stow Hill. Originally it consisted only of the present nave, a fine specimen of grand though undecorated Norman architecture; but a massive square tower (of the time of Henry III.) and a chancel were subsequently added; a large western Early English lady-chapel is interposed between the nave and the tower. The old castle, built about 1130 by Robert, Earl of Gloucester, was greatly altered in the late Perpendicular period. The remains include two towers and the river frontage. The old Dominican monastery is entirely rebuilt and occupied as a private residence; but there are a few fragments of a house of White Friars. The principal public buildings are the spacious Victoria Hall, the Albert Hall, the town-hall, county council offices, market-house, custom-house, and museum and art gallery. Newport owes a rapid increase in importance to its situation on a deep and spacious tidal river, which renders it a convenient outlet for the trade of a rich mineral district. It has extensive docks and wharves, to which large steamers have access at all tides. Three docks, the Alexandra, South and Old Docks, had together a water area of about 60 acres, besides the Alexandra graving dock and dry docks. But additional accommodation was found necessary. In 1905 the Alexandra Docks and Railway company let the contract for the extension of the docks by 50 acres of water area, and the scheme was enlarged later so as to afford an additional area of 86 acres in all. The new works, added to the old Alexandra Dock, give a total deep-water area of over 130 acres. The first part to be completed (48 acres) was filled in the autumn of 1907. The river is crossed by a transporter bridge, opened in 1906, and having a span of 635 ft. and a clear headway from high water of 177 ft., with a travelling truck worked by electricity. Iron ore, pig iron, timber and grain are among the chief imports, while coal and iron goods are exported. Besides the Great Western railway, Newport is served by the London and North-Western, the Rhyne, and the Brecon & Merthyr systems. The town possesses large iron foundries and engineering works, and among other industries are the manufacture of wagons and wheels, nails, bolts and wire, shipbuilding and the making of railway plant, tanning, and chemical works. There are also large breweries, glass and pottery works, and an extensive cattle market. Newport gives name to a Roman Catholic bishopric, but the cathedral church is at Belmont near Hereford. With Monmouth and Usk, Newport returns one member to parliament. In 1889 Maindee, a populous suburb on the left bank of the Usk, was incorporated with Newport, and constitutes one of its five wards. The town is governed by a mayor, 10 aldermen and 30 councillors. Area 4431 acres.

Newport, an ancient mesne borough and castle, occupied an important position on the Welsh marches. The town, which is not mentioned in Domesday, grew up round the castle built early in the 12th century. Giraldis Cambrensis, writing in 1187, calls it Novus Burgus, probably to distinguish it from Caerleon, whose prosperity declined as that of Newport increased. The first lord was Robert Fitz Hamon, who died in 1107, and from him the lordship passed to the earls of Gloucester and Stafford and the dukes of Buckingham. Hugh le Despenser, who held the lordship for a short time, obtained in 1323 a charter of liberties for the burgesses, granting them freedom from toll on all their goods passing into England, Ireland and Aquitaine. The earl of Stafford granted a further charter in 1385, confirmed by his grandson in 1427, which gave the burgesses the right of self-government and of a merchant gild. On the attainder of the duke of Buckingham in 1483 the lordship lapsed to the crown, of whom it was held in the 16th and 17th centuries by the Pembroke, and in the 19th by the Beaumonts. The town was incorporated by charter of James I. in 1624 under the title of "Mayor and Bailiffs." This charter was confirmed by Charles II. in 1665 and holds force at the present day. By the act of 1535-1536 Newport is entitled as an ancient borough to take part in the election of a member for Monmouth town. The commercial importance of the town dates only from the second half of the 19th century, the Old Dock being partially formed in 1842, while the Alexandra was opened in 1875. In 1801 the population of the town was only 1135. In 1835 the borough obtained a market lasting fifteen days from the vigil of St. Lawrence (August 10). The charter of 1824 granted two fairs, one on the feast of the Ascension, and a second (still held) on St. Leonard's day (November 6). Newport was the scene of a serious Chartist riot in 1839.}

NEWPORT, a market town in the Newport parliamentary division of Shropshire, England, 145 m. N.W. from London on the Stafford-Shrewsbury joint line of the London & North-Western and Great Western railways, and on the Shrewsbury canal. Pop. of urban district (1901) 3241. The church of St. Nicholas is Early English and Perpendicular. There is an ancient market cross, greatly decayed. Newport possesses a literary institute, and a free grammar school founded in 1665. Four miles S. are the beautiful ruins of Lilleshall abbey, including a fine Norman west door and part of the front, considerable remains of the church besides, and traces of domestic buildings. The abbey was founded in 1145, under charter from King Stephen, by Richard de Baumes or Blemis, dean of St. Alkmund, Shrewsbury, for Augustinian canons, who were brought from Dorchester Abbey, Oxfordshire. Ironstone, coal and limestone are worked in the parish.

Newport is not mentioned in the Domesday Survey, but at the time of the Conquest formed part of the manor of Edgmond, which William I. gave with the rest of the county of Shropshire to Roger, earl of Shrewsbury. Henry I. is supposed to have added it to the borough, after the monk had come into his hands through the forfeiture of Robert de Belesme. The site was probably chosen partly on
account of the fisheries, which are mentioned in the Domesday Survey, one of the chief services of the burgesses being that of taking fish to the king's court wherever it might be. This custom was continued after Henry III. had granted the borough with the manor of Edgmond, to Henry de Audley, but in the middle of the 13th century James, son of Henry de Audley, granted that the burgesses need not take the fish anywhere except within the county of Shropshire. The burgesses must have received certain privileges from Henry I., since Henry II. in an undated charter granted them with Edgmond, rights and customs. They had in the time of Henry I. This probably included a gild merchant which is mentioned in the Quo Warranto Rolls as one of the privileges claimed by the burgesses. Confirmation charters were granted by Edward I. in 1287 and Edward II. in 1311, while the town was incorporated in 1551 by Edward VI. whose charter was confirmed by James I. in 1604. The governing body consisted of a high steward, deputy steward, two water-balliffs and 28 burgesses, but the corporation was abolished by the Municipal Corporation Act of 1883, and a Local Board was formed, which, under the Local Government Act, passed in 1894, to an urban district council.

NEWPORT, a city of Campbell county, Kentucky, U.S.A., on the Ohio River opposite Cincinnati, Ohio, and at the mouth of the Licking River opposite Covington, Ky. Pop. (1900) 28,301, of whom 4081 were foreign-born and 424 were negroes; (1910 census) 36,309. It is served by the Louisville & Nashville, and the Chesapeake & Ohio railways, and by electric lines to Covington, Cincinnati, Bellevue, Fort Thomas and Dayton. With Cincinnati and Covington it is connected by bridges. In the highlands, about 3 m. back of the city, is Fort Thomas, a United States military post, established in 1888 to supersede Newport Barracks (1804), in the city, which were abandoned in 1894. Newport is essentially a residential suburb of Cincinnati, but it is also industrially important. In 1905 the value of the factory product was $5,231,084, Newport ranking third among the manufacturing centres of the state. Newport was settled late in the 18th century, was laid out in 1791, was incorporated as a town in 1795, and was chartered as a city in 1834. It is the county-seat of the county, and of the county-seat of Newport county, Rhode Island, U.S.A., occupying the southern portion of the island of Rhode Island at the entrance to Narragansett Bay, about 30 m. S. by E. of Providence, about 71 m. S. by W. of Boston and about 165 m. E.N.E. of New York. Pop. (1905 state census) 25,039, of whom 6111 were foreign-born, 2590 being born in Ireland; (1910 U.S. census) 27,149. It is served by the Newport & Wickford Railroad and Steamboat Line, which connects with the New York, New Haven & Hartford railway at Wickford Junction; by ferry to Bristol, and by steamboats to Providence, Fall River and New York.

The broken water-front of the island, about 17 m. long, is partly rocky and partly made up of sandy beaches. From the harbour on the south-west the land rises to a gently rolling plateau with maximum elevations of about 250 ft. The climate is notably mild and equable throughout the greater part of the year. In the newer parts of the city there are many magnificent estates of summer residents; and in the "Old Town," the greater part of which is close to the harbour, and extending up the hillside, are many 18th-century houses and Thames Street, its principal business thoroughfare, only 20 ft. wide. Near the northern end of Thames Street, Washington Square or the Parade, connects with Broadway, which extends northward and is the principal thoroughfare through a large residential district of the permanent inhabitants. From the Parade, also, Touro Street extends eastward to the upper end of Bellevue Avenue, the principal street, which extends southward to the ocean. There Bellevue Avenue connects with the southern end of the Cliff Walk, which for about 3 m. winds along the cliffs on the eastern coast of the island. North of the walk is the smooth, hard Easton's Beach, frequented for sea-bathing.

South of the Cliff Walk is Bailey's Beach, a private bathing-beach; at its western end is the Spouting Rock, through an opening in which the water, during violent south-east gales, has been thrown to a height of about 50 ft. Ocean Drive, about 9 m. long, encircles the south-western peninsula. Beyond Easton's Beach, in the town of Middletown, is Sachuest, or Second, Beach, with a heavier surf, and here is a fissure in the rocks, 150 ft. long and 50 ft. deep, and 8-14 ft. wide, known as Purgatory. North of Sachuest Beach are the picturesque Falls, the Cliff Rock and the Indian Cave.

At the head of the Parade stands the old State House (used when Newport was one of the capitals of Rhode Island); it was completed about 1745, was used as a hospital during the War of Independence, and is now the seat of the county court. In the vicinity are the City Hall and a monument to Oliver Hazard Perry. Fronting on Touro Street is a synagogue, erected in 1765-1765, and said to be the oldest in the United States; one of the early rabbis was Isaac Touro, a Jew of Dutch birth, whose name is borne by a street and a park in Newport. Near the corner of Touro Street and Bellevue Avenue is the Hebrew Synagogue; of chief historic interest along Bellevue Avenue are Touro Park and Redwood Library. In the park is the historic old Stone Mill or "Round Tower," which Longfellow, in accordance with the contention of certain members of the Society of Danish Antiquarians, ascribes, in his Skeleton in Armour, to the Norsemen, but which Benedict Arnold (1615-1678), governor of Rhode Island, repeatedly mentions in his will as "my Stone-built Wind-Mill." Opposite the park stands the William Ellery Channing Memorial Church; and in the park are monuments to Channing and to Matthew Calbraith Perry. The Channing House on Mary Street, built in 1751, is now used for a Children's Home. The Redwood Library grew out of the Philosophical Society, established in 1736, which Bishop (then Dean) Berkeley possibly helped to found during his residence here in 1729-1731; the Library was incorporated in 1747, being named in honour of Abraham Redwood (c. 1700-1788), a wealthy Friend who early contributed $500 toward supplying it with books; the building was completed in 1750. In Berkeley Avenue, north of Paradise Road, is Whitehall, which Berkeley built for his home in 1729, and which was restored in 1900. The first newspaper of Newport was published in 1732 by James Franklin, a brother of Benjamin Franklin, and in 1756 James Franklin's son, also named James, founded the present Newport Mercury.

Newport is best known as a fashionable resort during the summer and autumn; there are annual horse and dog shows, and fox-hunting is one of the amusements. The harbour is a rendezvous for racing- and pleasure-yachts. On Bellevue Avenue is the country club, the Casino. Among the great estates with magnificent "cottages" here are those of Mrs Cornelius Vanderbilt, Wm. B. Leeds, Mrs O. H. P. Belmont (the "Marble Palace," built for W. K. Vanderbilt), Mrs Ogden Goelet, Mrs Robert Goelet, Perry Belmont, and J. J. Astor—all on the Cliff Walk.

Newport has an inner and an outer harbour; the inner is landlocked, 1 m. long and ¾ m. wide, but is not deep enough to admit vessels drawing more than 15 ft. of water; the outer admits the largest vessels and is a refuge for foreign and coastwise commerce. The whole harbour is protected at its entrance by Fort Adams, at the mouth of the inner harbour, Fort Wetherill on Conanicut Island, and Fort Greble on Dutch Island. The Lime Rock Lighthouse was for many years in charge of Mrs Ida Lewis Wilson (b. 1841), famous for the many lives she saved. On Goat Island, which partly encloses the inner harbour, is Fort Walcott, with a United States torpedo station and torpedo factory, and on Coasters Harbor Island, farther north, are a United States Naval Training Station and a War College. Along the western border of the outer harbour is Conanicut Island, on which is the town of Jamestown (pop. in 1905, 1337), with the Conanicut Yacht Club and other attractions for summer visitors. Newport has little foreign trade. There is, however, considerable coastwise trade in fish, coal and general merchandise, and in 1905 the total tonnage of the port amounted to 1,770,816 tons. |
The value of the city's factory products decreased from $1,575,792 in 1900 to $1,347,104 in 1905.

Newport was governed under a charter of 1606, which is unique as an instrument for the government of a city, and aims to restore in a measure the salient features of township government. Most of the powers usually vested in a town meeting are here vested in a representative council of 195 members—30 from each of 5 wards. A candidate for councilman must secure the signature of at least 30 electors in his ward before his name can be placed on the ballot. A mayor, one alderman from each ward, and a school committee are elected in much the same manner: a candidate for mayor must have his election paper signed by at least 250 qualified electors, and an alderman or member of the school committee by at least 100. All other important officers are appointed by the council. The mayor and aldermen are for the most part executive officials corresponding to the selectmen of a town.

Newport was founded by Nicholas Easton (1503-1675), William Coddington (1601-1670), John Coggeshall, John Clarke (1603-1676), William Ironside, Michael Hazard, Henry Bull (1609-1643) and Jeremy Clarke (d. 1652), who, as Antinomians, were driven from Massachusetts Bay, and in 1638 settled at Pocasset (later Portsmouth, in the northern part of the island of Rhode Island; pop. in 1605, 2371). As radical tendencies prevailed in Pocasset they removed, and in 1639 settled Newport at the southern end of the island (called Aquidneck until 1644), which they had bought from the Indians. Most of the founders are commemorated by place-names in the city; in the Coddington Burying-Ground are the tombs of Governor William Coddington, Governor Henry Bull, and Governor Nicholas Easton; and in the Coggeshall Burying-Ground John Coggeshall was buried. At the beginning an independent government by judge and elders was established (Newport and Portsmouth being united in 1640), but in 1647 the town was united with Providence, Portsmouth and Warwick in the formation of Rhode Island according to the Williams (or, as it is commonly called, the Warwick) charter of 1644. During 1651-1654 Newport and Portsmouth were temporarily separated from the other two towns. About 1649 a Baptist Church was founded, which is probably the oldest in the United States outside the Baptist congregations in Providence; and in 1650, at nearly the same time, one of the first free schools in America was opened. In 1656 English Friends settled here. Between 1730 and 1760 great fortunes were amassed by the "Triangular Trade," which consisted in the exchange in Africa of rum for slaves, the exchange in the Barbadoes of slaves for sugar and molasses, and the exchange in Newport of sugar and molasses for rum. The destruction here on the 17th of May 1769 of the British revenue sloop "Liberty," formerly the property of John Hancock, was one of the first acts of violence leading up to the War of American Independence. The foreign trade of Newport, which in 1770 was greater than that of New York, was destroyed by the War of Independence. During the war the town was in the possession of the British from December 1776 to the 25th of October 1779; a plan to recover it in 1778 by a land force under General John Sullivan, co-operating with the French fleet under Count d'Estaing, came to nothing. Soon after the evacuation of the British, French troops, under Comte de Rochambeau, arrived and remained until near the end of the war, and Newport was a station of the French fleet in 1780-1781. The Sayer house, which was the head-quarters of Richard Prescott (1725-1738), the British general; the Vernon house, which was the head-quarters of Rochambeau, and the Gibbs house, which was for a short time occupied by Major-General Nathanael Greene, are still standing.

Newport was chartered as a city in 1784, but in 1787 it surrendered its charter and returned to government by town meeting. It was rechartered as a city in 1853; the charter of this year was much amended in 1875 and in 1906 was superseded by another. Until 1900, when Providence became the sole capital, Newport was one of the seats of government of Rhode Island.
NEW ROSS—NEW SIBERIA ARCHIPELAGO

14,720, of whom 4425 were foreign-born and 777 negroes; (1910 census) 28,867. It is served by the New York, New Haven & Hartford Railroad, and by electric railways to New York City and neighbouring places. The city is primarily a residential suburb of New York City, and has some fine colonial residences, and several beautiful residential parks, notably Rochelle, Neptune, and Beechmont Parks. Its large foreign-born population is comparatively recent and comparatively isolated. Among the prominent buildings of the city are a public library, the high school, a theatre (owned by the Knights of Columbus), a Masonic Temple, the City Bank and several churches, of which the most notable, perhaps, are the Baptist, Methodist, and Presbyterian. (1897) is the residence of the Iselin family, to whose interest in yachting is due in part the prominence of the New Rochelle and Larchmont Yacht Clubs. The Ursuline College of St Angela (1904) and the Merrill School (1906), both for girls, are in New Rochelle. The principal building of the first is Leland Castle, built in 1858–1860 by Simon Leland and finely decorated with frescoes and coloured marbles. A People's Forum, growing out of the work of the People's Institute of New York City, was established here in 1903–1904. In the road between New Rochelle and White Plains is the tomb of Thaddeus Paine, who was killed for his will, on the farm which was confiscated from a Tory by the state and was given to him at the end of the American War of Independence. On the Sound, in Hudson Park, is a monument commemorating the landing-place of the first Huguenot settlers. Immediately S. of New Rochelle, in the Sound, is Glen Island, an amusement resort; belonging to the Glen Island group, E. of Pelham Manor, is Travers Island, with the out-of-town clubhouse and grounds of the New York Athletic Club. On David's Island, 12 m. S.W. of New Rochelle, is Fort Slocum, a United States Army post. The suburban villages of Larchmont and Pelham (and Pelham Manor) lie respectively N.E. and W. of New Rochelle. The important industries are the manufacture of scales and of other instruments of precision, and printing and publishing—the Knickerbocker Press of G. P. Putnam's Sons, New York, is here. The site of New Rochelle is part of a purchase by Thomas Pell in 1654 and of a grant to him by Richard Nicolls in 1665; it was sold in 1689 to Jacob Leisler. The first settlement of importance was made in 1688 by Huguenots, some of whom were natives of La Rochelle. New Rochelle was incorporated as a village in 1812, and as a city in 1905, under the name of New Rochelle. See R. and C. W. Bolton, History of the Several Towns, Manors and Patents of Westchester County (New York, 1881), and J. Thomas Scharl's History of Westchester County (2 vols., Philadelphia, 1886).

NEW ROSS, a market-town of Co. Wexford, Ireland, on the acclivity of a hill on the E. bank of the Barrow, 2 m. below its junction with the Nore, 102 m. S.S.W. of Dublin by the Dublin & South-Eastern railway. Pop. (1901) 5847. The Barrow is crossed by an iron bridge with a swivel pillar in the centre on which a portion of the bridge is turned to admit the passage of vessels. Vessels of 500 tons can lie alongside the quays. The inland water communications reach to Dublin by means of the Barrow and the Grand Canal. The Nore is navigable to Inistioge. New Ross has breweries and tan-yards, a salmon fishery, and a brisk export trade in agricultural produce. The urban district of New Ross includes Rosbercon, on the opposite side of the Barrow. It is stated that St Alban built the abbey of Rossmactrein, which gave rise to an ancient city formerly called Rossglas. A Dominican foundation of the 13th century has left some remains in Rosbercon. According to Camden, New Ross was founded by Isabella Cusins, daughter of William de Fitton, afterwards earl of Pembroke. A charter was granted to it by Roger Bigod in the reign of Edward I., which was extended by James I. and James II. From 1374 it returned two members to parliament, but at the Union in 1800 the number was reduced to one, and the town ceased to be a parliamentary borough in 1885. In 1260 it was surrounded by walls. The fortresses were dismantled by Cromwell, but some remains are extant.

NEWRY, a seaport, market town and parliamentary borough (returning one member) of Co. Down, Ireland, on the Newry water and Newry canal at the extreme head of Carlingford Lough. Pop. (1901) 12,455. It is 5 m. N. of Dublin by the Great Northern railway. A railway owned by the London & North-Western company connects Newry with the deep-water harbour at Greencore; and there is an electric railway to Bessbrook in Co. Armagh. The western part, called Ballybot, is connected with the eastern part, or old town, by four bridges over the canal and four over the tidal water. The situation of the town is striking, the Newry Mountains and Slieve Gullion on the west, and the Mourne Mountains on the east, enclosing the narrow valley in which it lies. Newry is one of the most important ports of Ulster, and in its time had several sub-ports farther down the river the outlet for the trade of a very extensive district. The port admits vessels of 2000 tons to Victoria Docks, 3 m. from the town, but vessels drawing 15 ft. can go up the ship canal to the Albert Basin, 3 m. from the sea. The principal exports are grain, eggs, cattle, linen cloth and flax, and the imports include timber, groceries and coal. In the neighbourhood granite of a fine quality is quarried, and the town possesses rope and sail works, breweries, distilleries, flour-mills and tanneries. It is governed by an urban district council consisting of 177 electors. It was founded here by Maurice M'Loughlin, king of Ireland. The abbey of Newry was converted into a collegiate church for secular priests, and was dissolved by Edward VI., who granted it to Sir Nicholas Bagenal, marshal of Ireland. Bagenal made it his private residence, and laid the foundations of its prosperity. In 1689 Newry was set on fire by the duke of Berwick when in retreat before Schomberg. Charters were granted to the town by James I. and James II. By the charter of James I. it sent two members to parliament, but at the Union in 1800 it was restricted to one member. Until 1868 a portion of Newry was situated in Co. Armagh. A mile N.E. of the town, on the Great Northern railway, is situated the town of Crown rath from traditional single encounters between native princes in contention for the sovereignty.

NEW SIBERIA ARCHIPELAGO, a group of islands situated off the Arctic coast of Siberia, from 73° to 76° 6' N., and 135° 20' to 148° E. The name is loosely applied, covering either the northern group only of these islands, for which the name of New Siberia Archipelago, or of Anjou Islands, ought properly to be reserved, or the southern group as well, which ought to maintain its name of Lyakhov Islands. Some confusion prevails also as to the name of the largest of the islands, which is sometimes covered by the "Jeannette" expedition, ought to be included in the same archipelago, or described separately as the Jeannette Islands. The first of these three belongs geographically, and probably geologically, to New Siberia Archipelago, from which it is only 97 m. distant. As to Henrietta and Jeannette Islands, situated 200 m. N.E. of New Siberia Island, in 155° to 150° E., they can hardly be included in the same archipelago. There seems, moreover, to be land due north of Kotelny Island in 78° N., first sighted by Sannikov and described as Sannikov Land. It was also seen by Baron Toll.

The New Siberia or Anjou Islands consist, beginning from the west: Kotelny, the largest, 116 m. long (100 m. wide), having the small island Byelovlyskoy near its western shore; Thadeus (Fadéevsky), in the middle; and New Siberia (Novaya Sibir), in the east (96 m. long). A range of hills, composed of Tertiary deposits, and named Hedenström's Mountains, runs along its south-western coast, and the same rocks form a promontory protruding northwards. The so-called Wood Mountains, which
NEW SOUTH WALES

were supposed to be accumulations of floating wood, are denudations of Miocene deposits containing layers of brown coal with full stems of trees. These Tertiary deposits are characterized by a rich fauna; fully developed tree pollen, numerous fruits of the meadow sweet, tree, needles of several conifers, &c., being found in them, thus testifying to a climate once very much warmer. The only representative of tree vegetation now is a dwarf willow 1 in. high.

Baron Bunge found Bolshoy to consist of granite protruding from beneath non-feriferous deposits; while the promontory of Svyatoy Nos Siberia, Malyi Small), and Dalnyi (Farthest), to the north-west of Blizhny, and three smaller islets of the Bolshoy (Pillars), Semenovskiy and Vasilevskiy—to the west of Malyi. The climate of these islands is severe. In 1866 the winter ended only in June, to begin anew in August (21st May—5°8' F.; 16th October,—34°6'). The highest summer temperature was 52°. Flocks of geese and other birds come to the islands from the mainland. Both Toll and Tolk say the geese, which feeds chiefly on the lemming. The lemmings are very numerous, and in certain years undertake migrations to the mainland and back. Reindeer, followed by wolves, come also every year to the islands; the polar fox and polar bear, both feeding on the lemmings, are numerous. Hunters come in numbers to the Lyakhov, which must have been long known to Arctic hunters.

A Yakutsk Cossack, named Vagnin, wintered on Bolshoy in 1712, but it was a merchant, Lyakhov, who first described the two greater islands of this group in 1770, and three years later reached on sledges the largest island of the New Siberian group, which he named Kotelny. The Lyakhovs were mapped in 1777. J. Sannikov, with a party of hunters, discovered in 1805—1808 Stolbovoy, Thaddeus and New Siberia Islands, and a merchant, Byelkov, the Byelkovskiy Islands. He sighted the land to the north of Kotelny and the land to the north of New Siberia (now Bennett Island). A Russian officer named Hedenström, accompanied by Sannikov, explored the archipelago and published a map of it in 1811. Lieutenant Anjou visited it in 1821—1823. A scientific expedition under Dr. Alexander Bunge (including Baron Eduard Toll) explored it in 1835—1886. Baron Toll revisited it in 1893 with Lieutenant Shilgeko, and again in 1900 with F. G. Seeberg. Papers were found on Bennett Island showing that he left it for the south in November 1902, but he never returned home, and two relief parties in 1903 failed to find traces of him.

NEW SOUTH WALES, a state of the Australian Commonwealth. The name was given by Captain Cook, in his exploratory voyage in 1770, to the southern portion of the eastern coast of Australia, from some imagined resemblance of its coast-line to that of South Wales. The name was afterwards extended to the eastern half of Australia, but now designates a much more restricted area. New South Wales is bounded by the Pacific Ocean on the E., by Queensland on the N., by South Australia on the W. and by Victoria on the S. It lies between 28° and 38° S. lat., and 141° and 154° E. long. The coast-line, which is about 700 m. in length, extends from Cape Howe (37° 30') at the south-eastern corner of Australia to Point Danger in 28° 7' S. The colony is approximately rectangular in form, with an average depth from the coast of 650 m. and an average width from north to south of 500 m. The superficial area is estimated at 310,700 sq. m., or about one-tenth of the whole area.

Physical Configuration.—The surface of the state is divided naturally into three distinct zones, each widely differing in general character and physical aspect, and clearly defined by the Great Dividing Range running from north to south. The tableland, the summits of the range, and the coastal region, each consist of the great plain district of the interior. The main range follows the line of the coast, varying from 30 to 140 m. distant, being nearest at the south and receding the farthest at the sources of the Goulburn river, the main tributary of the Hunter. The crest of this range is, in some places, narrow; in others it spreads out into a wide tableland. The eastern slopes are, as a rule, rugged and precipitous, but the western versant falls gently to plains. The highest part of the Dividing Range is in the south, and is part of the eastern extremity of the Inland Victoria. Here some of the peaks rise to a height of over 7000 ft. Of these, Mount Kosciusco, the highest peak in Australia, attains an elevation of 7328 ft. The tableland varies greatly in elevation, but nowhere does it fall below 1500 ft., and in places it reaches an average of 5000 ft. The great plain district, lying west of the tableland, is part of a vast basin which comprises portions of Queensland, South Australia and Victoria, as well as of New South Wales. The great plains are traversed by a few rivers, whose long and uncertain courses carry their waters to the river Murray, which empties itself into the Southern Ocean through the state of South Australia, and during 3350 m. of its course forms the boundary between the states of New South Wales and Victoria. The Murray has a very tortuous course, as may be judged from the fact that the measurement along the joint boundary of New South Wales and Victoria is only 460 m. in a straight line, the river course being 1250. The chief tributaries of the Murray are the Darling and the Murrumbidgee, which is joined by the Lachlan. The Murray and the Murrumbidgee are permanent streams, but the Darling occasionally ceases to run in part of its course, and for a thousand miles above its junction with the Murray it runs very low. In its upper course the Darling receives numerous tributaries. Those on the right bank all come from Queensland and bring down enormous volumes of water in flood time; on the left bank the most important tributaries are the Gwydir, Namoi, Castleraigh, Bogan and Macquarie. Here and there along the course of the western rivers are found lagoons, sometimes of considerable dimensions. These are commonly called lakes, but are in reality shallow depressions receiving water from the overflow of the rivers in times of flood, and in return feeding them when the floods have subsided.

The coastal belt differs greatly from the other divisions of the state. The main range gives rise to numerous rivers flowing eastward to the South Pacific. Almost everywhere between the main range and the sea the country is hilly and serrated, more particularly in the southern portions of the state. In the Illawarra district, 50 m. south of Sydney, the mountains skirt the very edge of the coast, but farther north there is a wide coastal-land, with greater stretches of country available for tillage and pasture.

Along the sea-board are twenty-two well-defined headlands or capes and about a score of bays or inlets, to mark which for navigators there are thirty-four lighthouses. There are four very fine natural harbours, viz. Jervis Bay, Port Jackson, Broken Bay and Port Stephens, and several others of minor importance. Port Jackson, on which is situated the city of Sydney, is one of the six greatest ports of the British empire. The port second of commercial importance to Sydney is Newcastle, at the mouth of the Hunter river, which is the great coal-shipping port of the colony. Secondary harbours, available for coasting steamers, south of Sydney are at Port Hacking, Wollongong,
Kiama, Shoalhaven, Bateman's Bay, Ulladulla, Merimbula, and Twofold Bay. North of Sydney the secondary ports are at the mouths of the Hawkesbury, Manning, Hastings, Macleay, Nambucca, Bellinger, Clarence, Richmond and Tweed rivers. The rivers of these-board are as just enumerated, the only other of importance being the Hunter. The Richmond drains an area of 2400 sq. m. and is navigable for 60 m. The Clarence is a fine stream draining an area of 8000 sq. m.; it has a course of 240 m., navigable for 67 m. The Macleay drains an area of 4800 sq. m., and empties at Trial Bay after a course of 200 m., of which 20 m. are navigable. The Hastings and Manning are both important rivers. The Hunter is one of the chief rivers of the state and embouches at Port Hunter or Newcastle Harbour after a course of the coastal plain area of 11,000 sq. m., more than twice the area of the Thames basin. Less commercially important than the Hunter, the Hawkesbury is nevertheless a fine stream; it has a course of 330 m. of which 70 m. are navigable. South of Sydney the rivers are of less importance; the principal is the Shoalhaven, 260 m. long, draining an area of 3500 sq. m.

Climate.—The three geographical regions above described constitute three distinct climatic divisions. The coastal region, 28° to 37° S. lat., shows a difference between the average summer and winter temperatures of only 24° Fahrenheit. Sydney, which is situated immediately north of the Tropic of Capricorn (33° 51' S.), has a mean temperature of 65°, the mean summer temperature being 71° and that of winter 54°, showing a mean range of 17°; the highest temperature in the shade experienced at Sydney in 1896 was 108°-5, and the lowest 35°-9. The coastal district has an area of 38,000 sq. m., over which there is an average rainfall of 42 in. The rainfall is greatest at the sea-board, diminishing inland; the fall also diminishes from north to south. Sydney has an average fall of 50 in., while the Clarence Heads, in the north, has 58 in., and Eden, in the south, 35.5 in. The table land is the central division; this comprises an area of 67,000 sq. m., and plateau, at an elevation of 4646 ft., stands the town of Kiandra, with a mean summer temperature of 56°-8 and winter of 31°-5. Cooma, in the centre of the Monaro plains, at an elevation of 2637 ft., has a mean summer temperature of 65°-9 and winter, 41°-7; its summers are therefore as mild as those of London or Paris, while its winters are much less severe. On the New England tableland, under latitude 30° S., the yearly average temperature is 56°-5, the mean summer 67°-7 and the mean winter 43°-5. The tablelands cover an area of 85,000 sq. m. and have an average rainfall of 526 in.; there is, however, a strong rainfall gradient, the wettest parts being on the west, where precipitation is experienced. In the western division, or great plains, severe heat is experienced throughout the summer, and on occasional days the thermometer in the shade ranges above 100° Fahrenheit, but it is a dry heat and more easily borne than a much less degree of temperature at the sea-board. The mean summer temperature ranges between 75° at Deniliquin in the south and 84° at Bourke. The mean range in winter is between 48° and 54°-5, and, accompanied as this is with clear skies, the season is very refreshing. West of the tableland the amount of rainfall decreases as the distance from the Pacific increases, and in a large area west of the Darling the average annual rainfall does not exceed 10 in. For the whole western division, embracing an area of 188,000 sq. m., the average rainfall is 19 in. (T. C. A.)

Geology.—New South Wales consists geologically as well as geographically of three main divisions which traverse the state from north to south. The highlands of eastern Australia form the middle belt of the state, to the east of which are the low coastal districts and to the west the wide western plains. The highlands of New South Wales consist, geographically, of a series of tablelands, now in the condition of dissected remnants; geologically, they are built of a foundation of Archean and folded Lower Palaeozoic rocks, covered in places by sheets of more horizontal Upper Palaeozoic and Mesozoic rocks; these deposits occur along the edge of the highlands, and are widely distributed on the floor of the coastal districts. They have been lowered to this level by a monoclinic fold which has brought down the Mesozoic rocks, so that they extend eastward from the coast. The Coastal Plains contain isolated ridges of the old Archean and Lower Palaeozoic rocks; but in the main, they consist of plains of Cretaceous beds covered by Cainozoic drifts. The stratified rocks in the highlands strike north and south, as if they had been crumpled into folds, in Upper Palaeozoic times, by pressure from east to west. The weak areas of the crust carry mountain masses in turns by great masses of Devonian granites. They altered the Lower Palaeozoic rocks on their edges, and were once thought to have converted whole areas of Lower Palaeozoic rocks into schists and gneisses. Most of these foliated rocks, however, were later overthrusted. The highland rocks no doubt once extended along the whole length of the state from north to south; but they are now crossed by a large series of transverse or diagonal faults. Between Port Macquarie and the Hunter river and separate the Blue Mountains and the Southern Highlands of New South Wales from the New England tableland to the north.

Among the rock formations of New South Wales are referable to the Archean system, and consist of gneisses and schists, including the glauconite-schists of the New England tableland, and hornblende-schists and gneisses. Palaeozoic rocks are comparatively sparsely exposed in New South Wales, except along the coast, where they are being continuous with the Archean block of north-eastern Victoria. They occupy a large area in the western districts of New South Wales, where a projection from the Archean plateau of central Australia crosses into the state from South Australia; it is best exposed in the Barrier Ranges around Broken Hill. Cambrian rocks have not yet been discovered in New South Wales; but Pittman has re-rocks of the Devon in system rest unconformably upon the Silurian; but some beds of which the age is still uncertain are called Devono-Silurian. The Devonian beds are well developed in the New England tableland at lowland level, while the Lower Palaeozoic rocks of the Lambi are estimated to be 10,000 ft. in thickness. They are extensively developed along the coast river and along the slopes of Mount Canobolas. They are also developed in the New South Wales Highlands, and the New England tableland. These deposits are overlain by other formations which occur in the ranges which rise above the western plains, such as the Rankin Range on the Darling and the Kokopara Range to the north of the Murramibidgee. These deposits are sharply folded and are associated with a series of rhyolites and basic lavas. The lower part of this series is probably Lower Devonian; and it is covered by shales and volcanic rocks belonging to the Upper Devonian. In the extreme south-east of New South Wales, at the head of the Genoa river, are sandstones with Archean gneisses, which are an extension of the Lower Devonian beds of Victoria; while farther to the east, at Eden and Twofold Bay, are Upper Palaeozoic sandstones.

The Devonian system is separated from the Carboniferous by an interval, during which there were powerful earth movements; they produced a rocky mountain chain, running from the centre to the south-west corner of New South Wales. The highlands are worn down stumps of this mountain line. In Lower Carboniferous times these mountains were snow-capped, and the valleys on their flanks were occupied by glaciers.

The Lower Carboniferous beds are represented by conglomerates and sandstones with some shales and limestones. The sandstones are characterized by Lepidodendron (Bergenia) asulata. It is associated with Lycopsids and with other plants. The beds are rich in copper ores. Gravites and granodiorites were intruded at this period into the older rocks, and altered the adjacent Devonian beds into slates and quartzites, and formed gneisses in the Blue Mountains of Yalwal. The Lower Carboniferous rocks also occur in the Blue Mountains, along the Cox river and Capertee river; and a northern continuation occurs along the west coast in the New England tableland, from the Allyn river to the Queensland border. The Upper Carboniferous rocks are most important from their rich seams of coal. They occupy from 24,000 to 28,000 sq. m., which are best exposed in the Hunter river and around Newcastle.
Farther south they disappear beneath the Mesozoic sandstones, from which they are exposed along the coast of New South Wales, and near the mouth of the Shoalhaven river. The Coal Measures have been reached under Sydney, by a deep bore at Balmain, which pierced a seam of coal 10 ft. thick, at the depth of 2917 ft. The Coal Measures are classified by Professor T. W. Davie as follows:

1. Upper or Newcastle Coal Measures, containing 100 ft. of coal.
2. Dampier Series; freshwater beds, containing no productive coal. This series thins out completely in certain directions.
3. Middle Triassic Coal Measures, containing an aggregate of about 40 ft. of coal.
4. Upper Coal Measures; specially characterized by the predominance of Productus brachycephalus, and
5. Lower or Greta Coal Measures, containing an aggregate of about 20 ft. of coal.

Geologically, perhaps, the most interesting rocks in the Carboniferous are the glacial conglomerates containing re-erected blocks. Some of the boulders are encrusted by marine organisms and must have been dropped by icebergs in the sea. The northern Coal beds are claimed by some to be of glacial origin; they have been described as far north as Ashford. The Cretaceous rocks are represented by numerous sheets and beds of basalt and andesite. A syenite massif of this age occurs at Mittagong; and leucite has been developed in Cabbage Hill. The Mesozoic rocks of New South Wales begin with the Narrabeen Shales; they are covered by the Hawkesbury Sandstones, which are well exposed around Sydney; and they in turn are covered by the Wannamatta Shales. Between the Hawkesbury River and the Hawkesbury Sandstone, it is represented by the evidence of the fossil fish; though, according to Dr Smith Woodward, they may perhaps be Rhaciet. But the fossil plants of which the beds are Tripterygium denudatus and Thalassia feldia odontopteroides are regarded as Seward as Lower Jurassic. At Tallbartrar there is a bed containing Jurassic fish, which rests in an erosion hollow in the Hawkesbury Sandstone. The Tallbartrar beds, then, are the uppermost Triassic, and they underlie the Hawkesbury Sandstone may be Lower Triassic. The Cretaceous system is widely developed in the western part of the state, where it is represented by two divisions. The Rolling Downs formation is regarded as Lower Cretaceous. It consists of a thick series of shales containing marine fossils. It is covered in places by tabular sandstone and sandstone, the remnants of a sheet which doubtless once covered the whole of the Western Plains. The chief economic product of the Desert Sandstone is opal, which occurs in it at White Cliffs and Wilcannia. The opal beds contain Cretaceous fossils such as Cimodosaurus. An occurrence of Upper Cretaceous beds has been found in the region of the Riverina. The Cooee River Cretaceous rocks are best developed in the western districts, as the strata of the Darling and Murray plains. They include some Miocene, or perhaps Oligocene marine sands, formed in the northern part of the state, and most of the beds were occupied by the Lachlan basin. The most significant point in the distribution of the marine Cretaceous rocks in New South Wales is their complete absence from the coastal district. The output of alluvial gold is now increased by the employment of dredges. The gold-quartz veins are mainly in the Ordovician and Silurian rocks; but some also occur in the Devonian, and there are impregnations of gold in tulas of Devonian age. Deep lead mining is largely worked in the Lachlan district.

The silver-lead mines of New South Wales are famous owing to the importance of Broken Hill. The mines there occur in gneiss and schists, which are probably of Archean age; the lead has in places been found for a distance of 1500 ft. below the surface, and though with the silver-lead long lay unutilized, as the problem of their separation from the associated rhodochrosite has only recently been overcome. It is worked by dredging of the rivers of the New England tableland as at Vegetable Creek. The chief copper field is at Cobar in the north-western plains. Bismuth, platinum, molybdenum and antimony are obtained in small quantities.

The geology of New South Wales has been described in the Monographs, Memoirs and Records of the Geological Survey, which in the fullness and high scientific character form the most valuable contribution to Australian geology. Pittman's map of the state in two sheets is the best scale for the scale of the Survey 1:150,000. The economic geology has been admirably summarized in a work by E. F. Pittman, The Mineral Resources of New South Wales (1901). Numerous geological memoirs have appeared in the Rep. Austral. Assoc. for the Advancement of Science, the Journ. R. Soc. N.S. Wales and the Proc. of the Linnean Soc. N.S. Wales. A systematic account of the minerals has been published by A. Riversidge, The Minerals of New South Wales (1888), and to him is due a valuable chemical study of the meteorites and gold nuggets. Contributions on the palaeontology of New South Wales are contained in the Rec. Austral. Museum, Sydney. A bibliography of the geological literature in the state of New South Wales, 1851-1891, was issued by the Surveyor-General of N.S. Wales, vol. vi., 1899, and of the Cretaceous geology, also by W. S. Dun, in Journ. of Proc. Royal Soc. N.S. Wales, 1901, vol. xiii, pp. 100-152.

Artesian Water.—Before actual boring proved that the belief was well founded, it had long been scientifically demonstrated that water would probably be obtained in the Cretaceous formation which occurs in the whole of the eastern part of the state. It is probable that the artesian water-bearing basin extends much farther south than was previously supposed. It may, indeed, be yet to be found approximately along the course of the Lower Darling. Artesian water is also obtainable in other than the Cretaceous rocks. This is shown by palaeontological evidence; and some of the most successful bores, such as those at Coomamble, Moree, Gil Gil and Tallbartrar, have been in rocks of Triassic age, corresponding with the Ipswich Coal Measures.

Population.—The population on the 1st of July 1906 was 1,504,700, viz. 799,260 males and 705,440 females. The total includes 103,000 Chinese and 7500 aborigines and half-castes. Since 1860 New South Wales had added more largely to its population than any of the other Australian states. In 1860 the population was 258,456; in 1890 the number was 1,211,860. From 1890 to 1901 the population increased 228,083, or at the rate of 21.2%. By far the largest part of the increase is due to excess of births over deaths, for out of the increase of over 1,000,000 since 1860, only 350,000 was due to immigration. In 1905 there were 39,572 births and 14,880 deaths; these figures are equal to 26.78 and 10.13 per thousand respectively. The birth-rate has fallen very much, especially since 1899. In 1885-1886 it was 42.71 per 1000; in 1896-1899 it was 27.92, and in 1906 it had fallen still further to 26.78. The marriage rate for 1905 was 7.40 per thousand, and the persons married 14.86 per thousand. The mean for 20 years was 7.36. The chief cities are Sydney and suburbs, population in 1906, 513,900; Newcastle and suburbs, 66,000; Broken Hill, 30,000; in 1901, Parramatte, 12,568; Goulburn, 10,610; and Maitland (East and West), 10,085. There are nine other towns with between 5000 and 10,000 inhabitants each.

Religion.—The proportions of the leading denominations in 1901 were: Church of England, 263,905; Roman Catholic, 130,057; Presbyterian, 9,9; Wesleyan and other Methodists, 10; Congregationalist, 1; Baptist, 1; Jews, 0; others, 3.6. Sydney is the seat of Anglican and Roman Catholic archbishoprics; the Australian Presbyterian Church has a bishop and a bishopric. Education.—The state has in its employ 3135 male and 2242 female teachers, and maintains 2901 schools. The law requires that all children over six years and under fourteen years shall attend school. The attendance on 1904 was 417,030, but of 182,000 others below or beyond the school ages, were receiving instruction, making a total of 255,000. Of this number 211,000 were in state schools and 18,000 in other schools. An act in 1892 allowed the state schools to be controlled by one or other of the religious bodies. The Roman Catholic Church has 361 schools, with 1835 teachers and an attendance of 33,000 pupils. The total expenditure of the state on public instruction, science and art during the year ended 30th June 1906 was £91,100. During the calendar year 1906 a sum of £83,000 was expended on primary instruction. The fees were:
NEW SOUTH WALES

amounted to $82,000, making the actual cost of primary instruction $775,000. There are a university and a technical college in Sydney.

There are four main sources, viz. taxation; sale and lease of lands; earnings of railways, tramways and other services; and share of surplus revenue returned by the commonwealth. During 1906 the income derived from these heads was: from taxation $1,297,776; from lands $1,729,887; from railways and other services $5,856,826; from commonwealth £2,742,770; these with miscellaneous collections to the income of the state, and from receipts from the Commonwealth is the subject of the present article. The direct taxation is represented by a tax of one penny in the pound on the unimproved value of land, sixpence in the pound on the annual income derived in the state from all sources, except licence duties and occupation of land and improvements thereon. There are also various stamp duties. The land revenue is derived partly from the alienation of the public estates, either absolutely or under conditions, but mainly from the occupation of the public lands. There is also a small revenue from mining lands, timber licences, &c. The state still holds 146 million acres out of a total of 196 million acres, having alienated about 50 million acres. The principal heads of expenditure were: interest and charges on public debt, £2,291,091; public instruction, £911,177; working expenses of railways and tramways, £2,054,777; other services working expenses, £205,242; other services, £3,900,726. The public debt in 1906 was £3,641,724, equal to £56, 11s. per inhabitant; the great proportion of this debt has been incurred for works that are revenue producing, only about £11,000,000 was not so expended. The total debt in 1903 about £146,000,000 was held in private and was in excess of expenditure in 1906 amounted to nearly 3½ per cent on the whole public debt, and the interest paid averaged 3.6 per cent.

Administration.—The political constitution of New South Wales is that of a self-governing British colony, and rests on the provisions of the Constitution Act. The Governor is appointed by the crown, the term of office being generally for five years, and the salary £5,000. The Governor is the official medium of communication between the colonial government and the secretary for the colonies, but at the same time the colony maintains its own agent-general in London, who not only sees to all its commercial business but communicates with the colonial office. The powers of the state parliament have been since 1901 restricted by the transfer of certain powers to the commonwealth of Australia. In the legislative assembly there are 96 members. The principle adopted in distributing the representation is that of equal electoral districts, modified in practice by a preference given to the distant and rural constituencies at the cost of the metropolitan electorates. The suffrage qualification is a residence of twelve months and the attainment of the age of 21 years. Women are entitled to the franchise; there are the usual restrictions in regard to the pauper and criminal classes. An elector has only one vote, which is attached to the district in which he resides. Members of the Legislative Assembly are returned by a system of proportional representation. Each electoral district returns one member. The Legislative Council consists of persons nominated for life by the governor, acting on the advice of the Executive Council; the number of members is not fixed by law but in 1906 it was 55. Parliaments are triennial. Local government was extended in 1903 and 1906 to the whole state, excepting the sparsely populated western division; formerly it was confined to an area of about 2800 sq. m. There are altogether about 55,000 m. of road communications, but not more than 15,000 m. are properly formed. Each subdivision of the state, the former is the term applied to closely peopled areas of small extent enclosed with complete local government, and the latter is the designation of the more extensive districts, thinly peopled, to which a less complete system of local government has been granted.

Federal Capital.—In 1908 the Seat of Government Act provided that the federal territory and capital of Australia should be in the Yass-Canberra district of New South Wales, and that the territory should have an area of not less than 900 sq. m. and easy access to the sea. In 1909 a Board was appointed to consider the several possible sites within this district reported in favour of Canberra, on the Molonglo river, near Queanbeyan, as the site for the new city, and the basins of the Molonglo, Queanbeyan and Cotter rivers were indicated as suitable to form the federal territory. Jervis Bay was recommended as offering a site for a port for the territory. Bills were passed in 1909 by the legislative assembly of New South Wales and by the federal parliament, transferring this territory to the federation.

Agriculture.—New South Wales may be considered as essentially a pastoral country, and the cultivation of the soil has always been secondary to stock-raising. But the predominance of the pastoral industry is not by any means so marked as it was even as late as the last decade of the 19th century. The want of pastures in agriculture was not to be ascribed to defects of climate or soil, but chiefly to the great distance of Australia from the markets of the world. This difficulty has, for the most part, been removed by the establishment of numerous import lines of steamers trading between Australia and Europe, and recent years have therefore seen considerable expansion in all forms of agriculture.

In 1882 the area of land under cultivation was 733,582 acres, which is slightly less than 1 acre per inhabitant. In 1906 the total area under cultivation was 2,439,639 acres, and in 1906 it had risen to 2,838,081 acres, which is a little short of 2 acres per inhabitant.

The area devoted to each of the principal crops was as follows:

<table>
<thead>
<tr>
<th>Crop</th>
<th>Acres</th>
<th>Bushels</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wheat</td>
<td>1,460</td>
<td>10-5</td>
</tr>
<tr>
<td>Maize</td>
<td>189,000</td>
<td>30</td>
</tr>
<tr>
<td>Oats</td>
<td>38,500</td>
<td>20</td>

<tr>
<td>Sugar Cane</td>
<td>21,500</td>
<td>1 ton</td>
</tr>
<tr>
<td>Hay</td>
<td>438,000</td>
<td>185 gallons</td>
</tr>
<tr>
<td>Vines</td>
<td>8,100</td>
<td></td>
</tr>
</tbody>
</table>

The average yield per acre of crops may be set down as follows:

- Wheat 10-5
- Maize 30
- Oats 20
- Sugar Cane 1 ton
- Hay 185 gallons
- Vines

The total value of production in the year 1906 may be set down at £6,543,000, which works out at £2, 6s. 1d. per acre.

The principal crops which are derived from the soil are wheat, maize, oats, sugar, hay, and vines. There were 76,000 occupiers of rural holdings in 1905, and the area occupied by them, exclusive of land belonging to the state, is 48,081,000 acres. The great majority, 85% in 1905, of occupiers are freeholders; the practice of renting farm lands is not followed to any considerable extent, except in the dairying lands on the coast district; in New South Wales took up its position amongst wheat-exporting countries in 1900; the bulk of the grain exported goes to the United Kingdom. Hay crops and maize rank next in importance to wheat. The cultivation of fruit is receiving increased attention, but the great value of a rich soil and high rainfall has limited the production of wine, until recently so promising, are, if not declining, at least stationary, in spite of the suitability of the soil of many districts for these crops.

Grazing and Dairying.—The grazing industry still holds a chief place amongst the productive industries of the state. In 1906 the number of horses was 59,700; of sheep, 40,000,000; of cattle, 2,340,000; and swine, 311,000. There were considerable losses of sheep in 1902 owing to the drought of that year, but the flocks in 1906 were of better quality than at any previous period and little short of the number of 1898. The vast majority of the sheep are of the merino breed, but there are about 1 million of the woolly sheep and between two and three million cross-bred. Dairying made very great strides in the ten years preceding 1906, and ranks as one of the great industries of the state. There were 644,000 dairy cows in 1910 and the numbers are increasing yearly. The production of wool was 300,000,000 lb., as in the grease; tallow, 493,000 cwt.; butter, 500,000 cwt.; cheese, 42,000 cwt.; and bacon and hams, 171,000 cwt.

Mining.—The mining industry has made great strides. In 1905 there were about 38,000 men engaged in the various mines, besides 3300 employed in smelting. Of these, 10,700 were employed in gold-mining, 12,000 in coal-mining, there were 14,400; silver, 10,000; tin, 2750; and copper, 1850. The value of mining machinery may be approximately set down at £2,900,000. The following summary shows the value of the various minerals won in 1905. It is impossible to mention all that has been obtained at Broken Hill; the two metals are therefore shown together.

The value of gold won varies from year to year, but from 1904 to 1906 in only two years did it fall below £1,000,000. About one-fourth of the gold won is alluvial. The yield of gold from quartz mines is usually in the order of 11 tons per acre, which is considerably below the average for the previous ten years. The Broken Hill silver lode is the largest yet discovered; it varies in width from 10 ft. to 200 ft., and may be traced for several miles. The Broken Hill Proprietary Company owns the principal mine, and at Port Pirie in the neighbouring colony of South Australia erected a complete smelting plant; the problem of the recovery of the zinc content, until now a great deal of unsatisfactory, solved, the company can make extensive additions to the plant already erected, and in the manufacture of spelter was undertaken. From the commencement of mining operations on a large scale in 1885 to the end of 1905 the value of silver and lead ore won was £40,000,000. The production of tin rapidly declined after 1887, when the value of ore raised was £129,000; the production varies both with the price and the occurrence of rain, but the principal cause of the decreased production was the exhaustion of the shallow deposits of stream tin, from which most of the ore was obtained. The principal deposits of copper are in the central parts between the Macquarie, Bogan and Daring rivers. The copper lodes of New South Wales contain ores of a much higher grade than those of many well-known mines worked at a profit in other parts of the world, and, with a fair price for copper, the production largely increases. Iron is widely diffused, principally in the form of marcasite, brown haematite, limonite and bog iron. Coal mining is carried on in three districts. In the northern or Hunter river district there were 63 collieries, employing 10,500 men, and the quantity of coal raised in 1904 was 4,350,000 tons. The western or mountain collieries were seventeen in number, employing 540 men and raising about 418,000 tons. About 53 per cent. of the coal obtained is exported. Kerosene shale (torbanite) is abundant and is systematically worked.

Manufacturing. — There are a large and rapidly increasing number of manufactories, but in 1905 only about 250 employed more than 50 hands. The following gives a statement of factory employment for eleven years:

About 53% of the males and 10-6% of the females employed are under sixteen years; the total number of male employees in 1905 was 66,117, and of females, 16,958. About two-thirds of the hands are employed in Sydney and the adjacent district. The total value of the articles produced in manufactories, and the increased value of materials after undergoing treatment, was £30,028,000 in 1905, of which £17,500,000 represented value of materials used and £12,500,000 the value of fuel. The total wages paid was £5,500,000.

Commerce. — During 1905, 2725 vessels entered New South Wales ports from places outside the state; their tonnage was 4,697,500; the value of goods imported was £29,442,008; and the value of exports was £36,757,002. The average value of imports per inhabitant was £50 and of exports £54,717. The bulk of the trade is carried on with the other Australian states; in 1905 the value of such trade was, imports, £1,949,388, and exports, £1,262,427. The British trade is also considerable, the imports direct from Great Britain being valued at £8,502,288 and the exports at £10,222,422. With all British countries the trade was, imports, £25,998,399, and exports, £25,994,563. New South Wales maintains a large trade with foreign countries aggregating £3,434,609 imports and £16,762,439 exports. France, Germany, Belgium and the United States are the principal foreign countries with which the state trades.

WOOD is the staple export, and represents, in most years, one-third the value of the exports. Gold coin and bullion form one of the principal items in the export list, but only a small portion of the product of local production, the balance being Queensland and New South Wales. A gold sent to Sydney, 9.159.475, and one third of the bullion sent to London, 1.25,000. The course of trade from 1880 to 1905 was as follows:

The principal articles of export in 1905 were: Wood, £13,444,260; gold, £1,334,311; copper, £1,072,888; butter, £817,820; coal, £566,602; copper, £1,280,509; breadstuffs, £1,345,589; kather and skins, £1,559,533; meat, £761,253; tallow, £464,330; timber, £333,265; tin, £664,066.

Postal and Telegraph Service. — The postal business of 1905 was represented by the carriage of 102,292,888 letters and postcards, 44,599,104 newspapers and 23,077,994 parcels and books; the telegrams despatched numbered 3,857,962. To transact the postal business of the country, mail conveyances travelled 12,000 miles. The income of the postal and telegraph department in 1905 was £1,605,018 and the expenditure £933,121, but there were some items of expenditure not included in the sum named, such as interest charges, &c., and cost of new buildings. The administration of the post office is under the colonial government.

The railways are almost entirely in the hands of the state, the number of railway lines in 1906 was 5,462, and the total length 3,471 miles. The capital expended on the state lines open for traffic was £25,626,000, of which £4,000,000 was expended on rolling stock and equipment and £36,226,000 on construction of roads, stations and permanent ways. The net earnings amounted, in 1906 to £9,836,976, which represents a return of 4.1% upon the capital invested. The state pays, on an average, 3.5% for the money borrowed to construct the lines, and there is therefore a considerable surplus to be added to the revenue. The year 1906 was, however, a very excellent one as regards railway working, the operations of the ten previous years showing an average loss of about a quarter of 1%.

History. — New South Wales was discovered by Captain Cook on board the "Endeavour," on 26th April 1770. After he had observed the transit of Venus at Tahiti, he circumnavigated New Zealand and went in search of the eastern coast of the great continent whose western shores had long been known to the Dutch. He sighted the Australian coast at
Gippsland, Victoria, near Cape Everard, which he named Point Hicks, and sailed along the east coast of Australia as far north as Botany Bay, where he landed, and claimed possession of the continent on behalf of King George III. He then continued his voyage along the east coast of Australia, and returned to England by way of Torres Strait and the Indian Ocean. The favourable reports made by Captain Cook of the country around Botany Bay induced the British government to found a penal settlement on the south-eastern part of what was then known as New Holland. An expedition, consisting of H.M.S. "Sirius" of 20 guns, the armed trader "Supply," three store-ships and six transports, left England on 17th May 1787, and after touching at Tenerife, Rio de Janeiro, and the Cape of Good Hope, arrived at Botany Bay on the 20th of January, 1788, under the command of Captain Arthur Phillip, R.N., with Captain John Hunter, R.N., as second. The persons on board the fleet included 564 male and 192 female convicts, and a detachment of marines, consisting of Major Ross, commandant, 16 officers, 24 non-commissioned officers, an adjutant and quartermaster, 160 privates and 40 women. There were in addition five medical men and a few mechanics. The live stock consisted of one bull and four cows, a stallion and three mares, some sheep, goats, pigs and a large number of fowls. The expedition was well provided with seeds of all descriptions. The shores of Botany Bay were found to be unsuitable for residence or cultivation, and Captain Phillip transferred the people under his command to Port Jackson, half a dozen miles away, near the site of the present city of Sydney. For some years the history of the infant settlement was that of a large gaol; the attempts made to till the soil at Farm Cove near Sydney and near Parramatta were only partially successful, and upon several occasions the residents of the encampment suffered much privation. But by degrees the difficulties inseparable from the foundation of a new colony were overcome, and in 1789 Captain Phillip's ships landed their living freight on the shores of Port Jackson, and in 1793 an emigrant-ship arrived with free settlers, who were furnished with provisions and presented with free grants of land. By the end of the 18th century the inhabitants of Sydney and its neighbourhood numbered 5000. Immediately after the arrival of the first fleet, surveys of the adjacent coast were made; the existence of a strait between Australia and Tasmania was discovered by Surgeon Bass; and before the retirement of Governor King in 1806 Australia had been circumnavigated and the principal features of the continent of Australia had been studied and reported to the government by Captain Flinders, R.N. The explorations landward were, however, not so successful, and for many years the Blue Mountains, which rise a few miles back from Sydney, formed an impenetrable barrier to the progress of colonization. Penal establishments were formed at Newcastle in New South Wales, at Hobart and Launceston in Tasmania, and an unsuccessful attempt was made to colonize Port Phillip. The most noteworthy incident in the first decade of the 19th century was the forcible deportation by the officers of the New South Wales Corps, a regiment raised in England for service in the colony, of the governor, Captain Bligh, R.N., the naval officer identified with the mutiny of the "Bounty." For some time the government was administered by the senior officer of the New South Wales Corps, but in 1809 he was succeeded by Captain Macquarie, who retained the governorship for eleven years. During the régime of this able administrator New South Wales was transformed from a penal settlement to a colony. Before the arrival of Macquarie schools and churches had been erected, a newspaper, the Sydney Gazette and New South Wales Advertiser, had been started, and attempts had been made to acclimatize the drama. But he was the first governor to open up the country. He constructed permanent buildings at Sydney and Parramatta, formed roads and built bridges in the districts along the coast, and commenced a track across the Blue Mountains, which had been crossed in 1813 by Wentworth and others, and thus opened up the rich interior to the inhabitants of Sydney. It was during Captain Macquarie's administration that the first banking institution, the Bank of New South Wales, was founded. The final fall of Napoleon in 1815 gave the people of the United Kingdom leisure to think of sales of the penal lands in the Antipodes; and in 1817 free settlers commenced to arrive in considerable numbers, attracted by the success of Captain John M'Arthur, an officer in the New South Wales Regiment, who had demonstrated that the soil, grass and climate were well adapted for the growth of merino wool. But although the free settlers prospered, and were enabled to purchase land on very easy terms, they were dissatisfied with the administration of justice, which was in the hands of a judge-advocate assisted by military officers, and with the absence of a free press and representative institution. They also demanded permission to occupy the vast plains of the interior, without having to obtain by purchase or by grant the fee-simple of the lands upon which their sheep and cattle grazed. These demands were urged during the governorships of Sir Thomas Brisbane and General Darling; but they were not finally conceded, together with perfect religious equality, until the régime of Sir Richard Bourke, which lasted from 1831 to 1837. At the latter date the population had increased to 76,793, of whom 25,254 males and 2557 females were or had been convicts. Such was the rapid rate. Parramatta, Richmond and Windsor had indeed been founded within the first decade of the colony's existence; Newcastle, Maitland and Morpeth, near the coast to the north of Sydney, had been begun during the earlier years of the 19th century; but the towns of the interior, Goulburn, Bathurst and others, were not commenced till about 1835, in which year the site of Melbourne was first occupied by Batman and Fawkner. The explorations which followed the passage of the Blue Mountains opened up a large portion of south-eastern Australia. Van Diemen's Land was declared a separate colony in 1825, West Australia was formed into a separate colony in 1829, South Australia, with the title of "sister colony," was added in 1836; Tasmania, or Van Diemen's Land, was entirely detached from Australia in 1836; so that before 1840 the original area of New South Wales, which at first included the mainland of Australia and the islands in the South Pacific, had been greatly reduced. In 1840 the press was free in every part of Australia, trial by jury had been introduced, and every colony possessed a legislature, although in none of them except New South Wales had the principle of representation been introduced, and in that colony only to a very limited extent. The policy of granting land without payment, originally in force in New South Wales, had been finally substituted for a system of freehold tenure at the upset price of twenty shillings per acre; and the system of squatting licences, under which colonists were allowed to occupy the waste lands on payment of a small annual licence, had been conceded. In 1851, when separate autonomy was granted to Victoria, New South Wales had a population of 187,243, the annual imports were £2,075,338, the exports £2,909,580, the revenue was £755,704, and the colony contained 132,437 horses, 1,735,065 cattle and 13,050,244 sheep. Gold was discovered at Summerhill Creek, near Bathurst, in February 1851, by Edward Hammond Hargraves; and at the end of June the first shipment, valued at £5200, left Sydney. This discovery made an important change in the position of the colony and its transportation, which had been discontinued during the previous year, was finally abolished. The first mail steamer arrived in August 1852, and in 1853 a branch of the Royal Mint was established at Sydney. The New Constitution Bill, passed during the same year by the local legislature, provided for two deliberative chambers, the assembly to be elected and the council nominated, and for the responsibility of the executive to the legislature. The Sydney University, founded in 1850, was enlarged in 1854, and the first railway in New South Wales, from Sydney to Parramatta, commenced in 1850, was opened in 1855. In the same year the Imperial parliament passed the New Constitution Act; and in June 1856 the first responsible government in Australia was formed, during the governorship of Sir William Denison, by Mr Stuart Alexander Donaldson.
The first administration lasted only for a few weeks, and it was some years before constitutional government worked smoothly. The powers of the new parliament were utilized for extending representative institutions. Vote by ballot was introduced; the number of members in the assembly was increased to 80, and the franchise was granted to every adult male after six months' residence in any electoral area. Meanwhile the material progress of the colony was unchecked. A census taken at the end of 1857 showed that the population of Sydney was, including the suburbs, 81,327. Telegraphic communication was established between Sydney, Melbourne, Adelaide and Tasmania in 1859; and during the same year the Moreton Bay district was separated from New South Wales and was constituted the colony of Queensland.

During the regime of Sir John Young, afterwards Lord Lygon, who succeeded Sir William Denison in 1854, two important events occurred. The land policy of previous governments was entirely revised, and the Land Bill, framed by Sir John Robertson, introduced the principle of deferred payments for the purchase of crown lands, and made residence and cultivation, rather than a sufficient price, the object to be sought by the crown in alienating the public estate. This measure, passed with great difficulty and by bringing considerable pressure to bear upon the nominated council, was the outcome of a lengthened agitation throughout the Australian colonies, and was followed by similar legislation in all the colonies. In 1858, the secretary of the colony of New South Wales, Sir John Young, discovered that the distinction between the descendants of convicts and the descendants of free settlers, hitherto maintained with great strictness, was finally abandoned. In 1862, the agitation against the Chinese assumed importance, and the attitude of the miners at Lambing Flat was so threatening that a large force, military and police, was despatched to that goldfield in order to protect the Chinamen from ill-treatment by the miners. At this time, the only drawback to the general progress and prosperity of the country was the recrudescence of bushranging, or robbery under arms, in the country districts. This crime, originally confined to runaway convicts, was now committed by young men born in the colony, familiar with its mountains and forests, who were good horsemen and excellent shots. It was not until a large number of lives had been sacrificed, and many bushrangers brought to the scaffold, that the offence was thoroughly stamped out in New South Wales, only to reappear some years afterwards in Victoria under somewhat similar conditions.

The earl of Belmore became governor in 1868, and it was during his first year of office that H.R.H. the Duke of Edinburgh visited the colony. In 1870 came the visit of the "Galatea." An attempt was made upon his life, during a picnic at Clontarf, caused great excitement throughout Australia, and his assailant, a man named O'Farrell, was hanged. A measure which virtually made primary education free, compulsory and unsectarian came into operation. A census taken in 1871 showed that the population was 503,081; the revenue, £2,908,155; the expenditure, £3,006,576; the imports, £9,609,508; and the exports, £11,245,032. Sir Hercules Robinson, afterwards Lord Rousmead, was sworn in as governor in 1872. During his rule, which lasted till 1879, the first mineral wealth was discovered in New South Wales, the valuable deposits of silver were discovered at Broken Hill. In 1883 the Hon. W. B. Dalley, who was acting Premier during the absence through ill-health of Sir Alexander Stuart, made to the British government the offer of a contingent of the armed forces of New South Wales to aid the Imperial troops in the Sudan. The offer was accepted; the contingent left Sydney in March 1885, on board the "Izmir" and "Australasian," and for the first time a British colony sent its armed forces outside its own boundaries to fight on behalf of the mother-country.

In July of the same year Dr Moran, the Roman Catholic archbishop of Sydney, became the first Australasian cardinal. Lord Carrington, who was appointed governor in 1888, opened the railway to Queensland, and during the same year the centenary of the colony was celebrated. The agitation against the Chinese, always more or less intense, became intense, and the government forcefully prevented the Chinese passengers of four ships from landing, and passed laws which practically prohibited the immigration of Chinese.

In 1889 the premier, Sir Henry Parkes, gave in his adhesion to the movement for Australasian federation, and New South Wales was represented at the first conference held at Melbourne in the beginning of 1890. Lord Jersey assumed office on the 15th of January 1891, and a few weeks afterwards the conference to consider the question of federating the Australian colonies was held at Sydney, and the great strike, which at one time had threatened to paralyse the trade of the colony, came to an end. A board of arbitration and conciliation to hear and determine labour questions and disputes was formed, and by later legislation its powers have been strengthened. (For the labour movement in Australia, see Federation.) The census of April 1891 showed that the population was 1,134,207, of whom the aborigines numbered 7705 and the Chinese 12,781. In 1893 a financial crisis resulted in the suspension of ten banks; but with two exceptions they were reconstructed, and by the following year the effects of the depression had passed away. Federation was not so popular in New South Wales as in the neighbouring colonies, and no progress was made between 1891 and 1894, although Sir Henry Parkes, who was at that time in opposition, brought the question before the legislature. The Rt. Hon. Sir William Duff, who followed Lord Jersey as governor, died at Sydney in 1895, and was succeeded by Lord Hampden. In 1896 a conference of Australian premiers was held at Sydney to consider the question of federation. The then Premier, Mr Reid, was rather lukewarm, as he considered that the free-trade policy of New South Wales would be overridden by its protectionist neighbours and its metropolitan position interfered with. But his hand was to a great extent forced by a People's Federation Convention held at Bathurst, and in the early portion of 1897 delegates from New South Wales met those from all the other colonies, except Queensland, at Adelaide, and drafted the constitution which with some few modifications eventually became law. The visit of the Australian premiers to England on the occasion of Queen Victoria's Diamond Jubilee gave an additional impetus to federation, and in September 1897 the convention reassembled in Sydney and discussed the modifications in the constitution which had been suggested in the local parliaments. In January 1898 the bill was finally agreed to and submitted to a popular referendum of the inhabitants of each colony. Those of Victoria, South Australia and Tasmania agreed to the measure; but New South Wales and Queensland emphatically refused to carry the bill. The local parliament subsequently suggested certain amendments, one of them being that Sydney should be the federal capital. The general election returned a majority pledged to federation, and after some opposition to the federal Bill by the legislative council it was again referred to the electors of the colony and agreed to by them, 107,420 votes being recorded in its favour, and 52,741 against it. One of the provisions of the bill as finally carried was that the federal metropolis, although in New South Wales, should be more than 100 m. from Sydney. The Enabling Bill passed through all its stages in the British parliament during the summer of 1900, all the Australian colonies assenting to its provisions; and on the 1st of January 1901 Lord Hopetoun, the governor-general of Australia, and the federal ministry, of which the premier, Mr Barton, and Sir
William Lyne, Home Secretary, represented New South Wales, were sworn in at Sydney amidst great rejoicings. Large contingents of troops from New South Wales were sent to South Africa during 1899 and 1900. (G. C. L.)

NEWSPAPERS. The word "newspaper," as now employed, covers so wide a field that it is difficult, if not impossible, to give it a precise definition. By the English "Newspaper Libel and Registration Act" of 1886 it is defined as "any paper containing public news, intelligence or occurrences, or any remarks or observations therein printed for sale, and published periodically or at intervals not exceeding twenty-six days;" and the British Post Office defines a newspaper as "any publication "to summarize the wording" printed and published in numbers at intervals of not more than seven days, consisting wholly or in part of political or other news, or of articles relating thereto or to other current topics, with or without advertisements." In ordinary practice, the "newspapers," as distinguished from other periodicals (q.v.), mean the daily or (at most) weekly publications which are principally concerned with reporting and commenting upon general current events.

For the laws regulating the conduct and contents of newspapers see Press Laws and allied articles. The two real essentials of a "newspaper" are that it contains "news," and is issued at regular intervals. But the course of history has involved considerable changes both in the mode of issue and in the conception of what "news" is. For purposes of modern usage we have to distinguish historically between the product of a printing-press which is manifolded by that means, and a mere manuscript sheet which is only capable of being copied by hand. "News" again varies both according to the appetite and according to its method of collection and presentation. A distinction ought perhaps to be made between literary and pictorial news, but this is almost impossible in practice.

1. GENERAL CONSIDERATIONS

So far as very early forms of what we now recognize as corresponding to a "newspaper" are concerned, involving public reports of news, the Roman Acta Diurna and the Chinese Peking Gazette may be mentioned here, if only on account of their historical interest. The Acta Diurna ("Daily Events") in ancient Rome (lasting to the fall of the Western Empire), were short announcements containing official intelligence of battles, elections, games, fires, religious rites, &c., and were compiled by the actuarii officers appointed for the purpose; they were kept as public records, and were also posted up in the forum or other places in Rome, and were sometimes copied for despatch to the provinces. Juvenal speaks of a Roman lady passing her morning in reading the paper, so that it appears that private copies were in vogue. In China the Peking Gazette, as foreigners call it, containing imperial rescripts and official news, has appeared regularly ever since the days of the Tang dynasty (A.D. 618-905). Even older than it, as is alleged, is the monthly Peking News (Tsing-Poo)—now in appearance an octavo book of 24 pages in a yellow cover—which, according to M. Huart, French Consul at Canton, was founded early in the 6th century. But it is not of any real moment to do more than refer to such publications as these, which have little in common with the ideas of Western civilization. The "newspaper" in its modern acceptation can only be properly dated from the time when in Western Europe the invention of printing made a multiplication of copies a commercial possibility in any satisfactory sense.

On the point of chronology, Mr. J. B. W. Williams, in his History of English Journalism to the Foundation of the Gazette (1908), the first scholarly account of the early evolution of the Press in England, describes the Oxford Gazette of 1665 (the original of the London Gazette) as the first English "newspaper" in the precise sense, i.e. a "paper" of news; for it was a half-sheet in folio, two pages, and not a "pamphlet" as previous periodicals of news had been. A pamphlet (q.v.) was one or more unbound sheets of paper folded in quarto, and these earlier periodicals were called "news books." The term "news sheet," again, had implied, up to that time, a written letter of news—a "newsletter" as it came afterwards to be called. But it is hardly necessary to insist here on the distinction between a "news book" and a "newspaper," interesting as it is to note that the English inclusion of newspapers among "books" for the purpose of the law of copyright is strictly justified by the original nomenclature. The "newsbook" made what was for modern purposes the essential advance upon either the written letter or the printed "pamphlet" or the isolated periodical paper, first event, in being both printed and also issued in a series at regular and continuous intervals. Yet both these forms of publication were in the direct ancestry of the newspaper. The writing of "letters of news" or "letters of intelligence" was a regular profession before the printed newspaper was introduced, and lasted as such for some time afterwards, having indeed the advantage of being outside the necessity of obtaining a licence, which hampered the printed publication; and the profession of "scrivener" naturally suggested that of the later type of journalism. Of what use, again, to say, as a statement of an isolated piece of news, there are various printed examples as early as during the latter part of the 15th century. For instance, an official manifesto of Archbishop Dietrich of Cologne was printed at Mainz in 1462. A French pamphlet giving an account of the surrender of Granada to Ferdinand and Isabella—"le premier jour de janvier dernieréfé passe"—appeared in 1492.

Precisely at what point, and in what instance, it can be said that a continuous series of news-pamphlets started, which can therefore be called the earliest newspaper, is hard to decide, from the materials now available. But it was on the continent of Europe, and not in England; and probably in the Netherlands. We have, for instance, pamphlets in the British Museum, which contain news-items and suggest periodical publication, though they are not actually known to form copies of a regular series. A Neve Zeytung; Die Schlacl des turmsicheren Keyser, &c., dates from 1526; another Neve Zeytung, still more varied in its contents, contains a letter from Winchester dated July 24, 1554. In Germany alone about 800 examples of such news-pamphlets dating earlier than 1610 are known. The effect of the Mercurius Gallicanicus (1594) on English writers of "relations" is dealt with below (under United Kingdom); but this was rather a book than a newspaper. The earliest plainly periodical publication containing "news of the day" was, however, the German Frankfurter Journal, a weekly started by Egenolph Emmel in 1615. The Antwerp Nieuwe Tijdinghen followed in 1616; and in 1622 the history of English newspapers begins with the Weekly News published in London by Archer and Bourne. From this point we are on firmer ground, and the evolution of the modern Press in the different countries, as traced below, can be continuously followed. It is worth noting that a link in the history of journalism with the Roman Acta Diurna is provided by the Venetian government written gazetti (from which comes our "gazette") of the 16th century, official bulletins or leaflets dealing with public affairs, which were avowedly based on the ancient Roman model. Italy indeed originated not only the title "gazette" (probably derived from the Gr. γαζή, i.e. treasury of news), but also that of "coranto" (Fr. courant; also early Anglicized as "current," i.e. "running" relation), both of which are familiar in the history of the English and foreign Press. The art and business of journalism as now understood is, taking "journalism" here in the sense of the production of the literary contents of a newspaper, and not the production and distribution of the printed sheet itself—is a combination of the mere recording or reporting of news and of its presentation in such a way, and with such comment, as to influence the minds of readers in some particular direction. The history of the "leading article," as a great factor in the shaping of public opinion begins with Swift, Defoe, Bolingbroke and Pultney, in the many English newspapers, from the Review and the Examiner to the Craftsman, by which was waged the
keen political strife of the years 1704-1740. There is no counterpart to it in France until the Revolution of 1789, nor in Germany until 1796 or 1798. It was a Frenchman who wrote—"Suffer yourself to be blamed, imprisoned, condemned; suffer yourself even to be hanged; but publish your opinions. It is not a right; it is a duty." In England that the newspaper public described was actually taken, in the face of fine, imprisonment and pillory, at a time when in France the public had to depend upon foreign journals illicitly circulated, when its own chief writers resorted to clandestine presses, to paltry disguises, and to very poor subterfuges to escape the responsibilities of avowed authorship, and when in Germany there was no political publicity worthy to be named. When the Mercure de France (1672), after a long period of mediocrity, came into the hands of men of large intellectual faculty, they had the most cogenent reasons for exercising their powers upon topics of literature rather than upon themes of politics. True political journalism dates in France only from the French Revolution (see, for instance, Mallet du Pan), and it then had a very brief existence. It occupied a cluster of writers, some of whom left an enduring mark upon French literature. A term of high aspiration was followed quickly by a much longer term of frantic licence and of literary infamy. Then came the long rule of a despotic censorship; and cycles of licence followed by cycles of repression. In 1890 indeed the democratic government at Bordeaux issued against journals of high almas and of unspotted integrity, but opposed to prudence, the Attestation de Noce or literary marriage, which was the literary as the worst acts in that kind of Napoleon L, and unparalleled in the whole course of thegovernment of Napoleon III.

In all the other countries of Europe political journalism, in any characteristic sense, was the creation of the 19th century—somewhat earlier in the century in northern Europe, somewhat later in southern. The Ordinario Post-Tidende of Stockholm dates indeed from 1643, but until recent times it was a mere news-letter. Denmark had no sort of journal worth remark until the foundation in 1749 of the Berlingske Tidende, and that too attributed to its political, rather than its journalistic, contents. In Russia the St Petersburg—the patriarch of Russian newspapers—dating from the 16th of December 1702, is a government organ, and nearly synchronizes with the Boston News-Letter (1704), the first successful attempt at a newspaper in the British colonies in America. Journalism in Italy begins with the Diario di Roma in 1716, but in politics the Italian press remained a nullity for all practical purposes until nearly the middle of the 19th century, when the newspapers of Sardinia, at the impulse of Cavour, began to foreshadow the approach of the influential Italian press of a later day. In Spain no rudiments of journalism can be found until the 18th century; the Gaceta de Madrid started about 1726. As late as in 1826 an inquisitive American traveller recorded his inability to lay his hands, during his Peninsular tour, upon more than two Spanish newspapers. While originally the newspaper depended entirely on its own reporters and correspondents for news, and still largely does so, the widening of the field of modern journalism is largely due to collective enterprise, by which outside organizations known as "news agencies" send a common service of news to all papers which arrange to take it. The first of the great collecting and distributing agencies, founded in 1755, was the Carey (Vicemaster) of St Petersburg,—the editor of Julius Reuter, a Prussian government-messenger, who was impressed by the common interest roused by the revolutionary movements of 1848. In 1840 he established a news-transmitting agency in Paris, with all the appliances that were then available. Between Brussels and Aix-la-Chapelle he formed a pigeon-service, connecting it with Paris and with Berlin by telegraph. As the wires extended, he quickly followed them with agency-offices in many parts of the continent. He then went to London, where his progress was for a moment held in check. Mr Walter of The Times gave him no courtesy; but (on that first occasion) ended their interview by saying, "We generally find that we can do our own business better than anybody else can." He went to the office of the Morning Advertiser, which had then the next largest circulation to that of The Times, and had better success. He entered into an agreement with that and afterwards with other London journals, including The Times, and also with many commercial corporations and firms. The newspapers, of course, continued to employ their own organizations and to extend them, but they found that the arrangement depends on the attractiveness of its news
correspondents. Within a few years the business is said to have yielded the founder some £25,000 a year, and in 1865 it was transferred to a limited company. In later years this type of news-agency operating all over the world was repeated by others, and also by agencies operating mainly or exclusively only in one country.

It is no longer possible nowadays to confine the meaning of "journalism" merely to the work of those who write for the Press. Properly it may be said to include the whole intellectual work comprised in the production of a newspaper; and although the designation of "journalist" is generally applied only to newspaper editors and to writers, and would not be extended at all to the purely mechanical staff—the compositors, foundry-men and machinists—nor even to the proof-readers, whose sphere is analogous rather to the sub-editorial than to the mechanical departments, the modern tendency has nevertheless been, not only to install more reporting (q.e.) in a place of high importance, but to give increased weight in journalism to those who occupy what may be called the "managerial" offices, the business side of making a paper pay having itself developed into an art on its own account. To be a great journalist was once, but is hardly now, the same thing as being a great "publicist." The proper is he who delivers his views on public affairs in the Press; but the excellence of his articles may nevertheless be consistent with the journal being a disastrous failure, and his reputation as a journalist is then but poor. The great journalist is he who makes the paper with which he is connected a success; and in days of competition the elements necessary for obtaining and keeping a hold on the public are so diverse, and the factors bearing on the financial success, the business side, of the paper are so many, that the organization of victory often depends on other considerations than those of its intrinsic literary excellence or sagacity of opinion, even if it cannot be wholly independent of these. The modern newspaper, moreover, depends for its financial success no longer primarily on its receipts from circulation, but on its receipts from advertisements; and though these can only ultimately be secured on the basis of circulation (the number of people who buy and read the paper), the establishment of the paper as the organ of a large body of readers for whose custom it is desirable to advertise often involves other capacities than those of the great publicist; and even in far greater degree than those of his "counterpart", which is the direction given to the supply of news may be managerial rather than editorial. Thus, in the division of labour, the editorial functions, formerly supreme and all-embracing, because the excellence of the contents of the paper made its success, have gradually, by a dissipated process, yielded some of their authority to the managerial functions, and these have grown into an independence which—since editorial possibilities ultimately depend on financial resources—has given increased importance in journalism to the business side.

It is much to the credit of this country that the work of journalism may be broadly divided into its editorial and managerial sides. And apart from exceptional cases of a working proprietor who is both editor and manager, or of a managing-editor, or of a great manager who exercises editorial functions, or of a great editor who exercises managerial functions, the ordinary course is to keep them fairly distinct. The managerial side involves the business work of a paper, including the obtaining of advertisements and all the operations directly connected with producing it and making it pay as a commercial enterprise. The editorial side is engaged—however much managerial exigencies may call for its policy—in providing the "pillar" of a paper, which forms its contents, other than such as is of the nature of advertising. The editorial staff includes editors and assistant-editors, sub-editors (in Great Britain a term usually restricted in daily journalism to those engaged in the "news" departments), and
leader-writers, critics, reporters (more narrowly considered part of the "sub-editorial" staff), &c. The actual owner of the paper, the proprietor, may or may not take part in either side, but in law his authority is delegated to those who produce it. ... and ideas of journalistic management survive for making the editor, publisher and proprietor curtly not the "manager," liable in cases for libel, contempt of court, &c., together with the proprietor in English law. But no satisfactory legal definition of "editor," still less of "manager," is possible, since their positions and powers vary according to circumstances.

So far as the general relations of the staff of a paper with its proprietor are concerned, we may briefly note that engagements are commonly secured by contract of a few years' duration, which, if not enforced, and the remedy for injury is dismissal or action for damages, and they must be in writing and stamped, to be evidence in law, if for a year or longer. The editor is the agent of the proprietor, and binds him for acts within the scope of editorial authority (which includes the insertion of any matter in the paper). Being an agent he can have no power as against the proprietor, but unreasonable interference on the latter's part may entitle an editor to an action for breach of contract or for damage to his professional reputation; while gross misconduct on the part of an editor might similarly entitle the proprietor to damages. Letters, manuscripts, &c., come into the editor's hands as agent for his proprietor, and subject the latter's property. Uninvited contributors send him articles at their own risk, but the sending of them to a type-set proof has been held to be evidence of acceptance. Articles appearing under the editor's name, i.e., use them wholly or in part, or alter them; he has a free hand to do so in the case of anonymous articles; in the case of signed articles it is clearly his duty to keep them so as to prevent inaccuracy, dishonesty, or unfair advantage to others. In so far as his alterations might attribute to the writer anything which would give the latter a claim for damages. Though the highest function of an editor is embodied in the etymology of the word ("to bring forth" or "producer"); as one who acts as the literary midwife in the literary setting forth of ideas, it is probably his use of the proverbial blue-pencil, altering or deleting, which is generally associated with the word. But the editor, however important his editorial work has its own importance—the organization and inspiration, on the one hand, the moulding into shape on the other. And indeed editing is necessarily relative, depending to a certain extent on the character of the paper which it is intended to produce.

See Press Laws, Libel, Copyright, &c., and generally, for law,

The history of the Newspaper Press is told for various countries of importance under their respective sections below. The practical development of the modern newspaper is indeed due to a union of causes, largely mechanical, that may well be termed marvellous. A machine (see Figure) by which, for $1 a day, it was possible to produce a newspaper in one hour, print, fold, cut and deliver many thousand perfected broadsheets, is, however, not so great a marvel as is the organizing skill which collects information by conversation, post or telegraph, from all over the world, and then distributes these communications in cheap printed copies regularly every day to an enormous public, sifted, arranged and commented upon, in the course of a few hours. But for a high ideal of public responsibility and duty, conjoined with high culture and with great "staying-power," in the editorial rooms, all these marvels of ingenuity—which now combine to develop public opinion on great public interests, and to guide it—would be nothing better than a vast mechanism for making money out of man's natural aptitude to spend his time either in telling or in hearing some new thing. A newspaper, after all, is essentially a business, conducted by its proprietors for gain. That the commercial motive is a danger to honest journals is obvious, were it not indeed that here as elsewhere honesty is in the long run the best commercial policy.

The example of American journalism has so greatly affected the developments in England and other countries, that it may be said correctly to realize the conditions under which, in the United States, the newer type of journalism arose.1 In substance very much the same causes produced very much the same effects, though at a slower rate, in England; but British conservatism operated here as elsewhere. Several circumstances combined in the last quarter of the 19th century to promote
deadline changes in the condition and character of American newspapers. (1) Paper was enormously cheapened. Before and during the Civil War, the cost of large New York newspapers at times 22 cents per lb for even a poor quality. In 1864 it cost 16 cents in February, and ran up a cent every month till in midsummer it touched 21 and 22 cents. As late as 1873 it was still sold at from 12 to 13 cents. As new materials were found and machinery was improved, the price slowly declined. When the manufacture from wood-pulp was made commercially successful, the profits tempted great investments of new capital; bigger mills were built, competition became keen, and new inventions cheapened the various processes. Thus in New York in 1875 the average price of paper for fair quality was just over cents per lb; in 1880, 6-9 cents; in 1885, 5-16 cents; and in 1890, 3-18 cents. At last, about 1897, large contracts for a good average quality, delivered at the press-room, were made in New York at as low a figure as 1-5 cents per lb. Subsequently advances in raw materials, one or two dry seasons which curtailed the water-power, and combinations resulting from over-competition, caused some reaction. Yet it could still be said in 1900 that prudent publishers could buy for $1 as much paper as would have cost them $3 twenty years earlier, or $10 about 1875.

(2) Printing machinery for great newspapers was mechanical, and cheap. In the old types all the presses were fed by hand, with the product then folded and counted by hand, machines came into common use to print, fold, cut, paste and count and deliver in bundles, ready either for the carrier or the mail, at rates of speed formerly not dreamed of. The size of the paper could be increased or diminished at will, as late news might require, within an hour of the time when it must be in the hands of its readers. Instead of cutting down other news to make room for something late and important, more pages were added, and this steadily increased the tendency to larger papers. Devices were also found for printing the same sheet in different colours at the same rate of speed; and in this way startling headlines were made more startling in red ink, or a piece of news for which special attention was desired was made so glaring that no one could help seeing it. (3) Hand-setting (for great newspapers) was practically abolished. Instead of the slow gathering of single types by hand separate lines were now produced and cast by machines, capable when pushed to their utmost capacity of doing each the work of five average compositors. Thus between 1880 and 1900 there were reductions in the cost of (1) the raw material for the paper; (2) the labour of hand-setting, from two-thirds to three-fourths; (2) of printing, at least as much; and (3) of composition, at least one-half, while the facilities in each department for a greater product within a given time were enormously increased. The obvious business tendency of these changes was either a reduction in price or an increase of size, or both. Electricity became the only news-carryer. New ocean cables broke down the high rates charged at the outset. The American news appetite, growing by what it fed on, soon demanded far fuller cablegrams of European news; and the wars in which Great Britain and the United States were involved accelerated the movement. The establishment of a strong telegraph company, capable of efficient competition with the one which practically controlled the inland service in 1880, likewise cheapened domestic news by telegraph and increased its volume. The companies presently recognized their interest in encouraging rival news associations, and so getting double work for the wires, while promoting the establishment of new papers. Wild competition between news agencies was thus encouraged (even in the cases of some already known to be handling the same news). The credit, which was a quarter or half a million dollars on telegraphic tolls, the rapid spread of long-distance telephone lines further contributed to this tendency to make the whole continent a whispering gallery for the press. Every great paper had both cable and telephone wires run directly into its newspaper office. Photography and etching were added to the office equipment. Various "process" methods were found, by which the popular desire for a picture to make the news clearer could be gratified. Drawings were reproduced successfully in stereotype plates for

1 The account which follows is reproduced from Mr Whitehead Reid's article in the 10th edition of the Encyc. Brit.
the fastest rotary presses. The field of political caricature had heretofore belonged exclusively to the weekly papers, but the great dailies now seized upon it, and commanded the service of the cleverest caricaturists. Newspapers found a way to put the "half-tone" etching of a photograph, such as had heretofore been printed only on slow flat presses, bodily into the stereotype plate for the great quadruple and octuple presses; and thereupon portraits and photographs of important groups on notable occasions began to appear, embodied in the text describing the occurrence of the moment. In the wild schemes of some of them, papers printed at the rate of thirty and forty thousand an hour. In this development of illustrated daily journalism America rapidly went far beyond other countries. News agencies multiplied and gave cheaper service. The New York Associated Press had been the chief agency for the whole country. It admitted new customers with great caution, and its refusal to admit was almost prohibitory, while its withdrawal of news from established papers was practically fatal. It was owned by the leading New York journals. Their disagreement led to the success of a rival, the United Press. The New York Associated Press finally dissolved, most of the New York members became connected with the United Press, and many of their Western and Southern clients organized the Associated Press of Illinois, more nearly on a mutual plan. The United Press finally failed, and most of its New York members went into the Associated Press of Illinois, which in turn was forced into plans for reorganization by decisions of Illinois courts against its rules for confining its services to its own members. One result of these successive changes was to encourage new papers by making it easy for them to secure a comprehensive news service, and thus to threaten the value of the old papers. Another was the struggle to increase the volume of the service, leading to reports of multitudes of occurrences formerly left without notice in the great news centres, and extension of agencies into the remotest hamlets, and less scrupulous care in the consideration and preparation of the reports filed at many points for transmission. News syndicates for special purposes also developed, as well as small news associations, sometimes with a service sufficient for the wants of many papers. The almost official authenticity which the public formerly attributed to an Associated Press dispatch progressively declined; and the dailies found more difficulty in sifting and deciding upon the news that came to them, and incurred more individual responsibility for what they printed.

The great accumulation of private fortunes also changed the newspapers. Millionaires came to think it advantageous to own newspapers, openly or secretly, which could be conducted without reference to direct profits, for the sake primarily of political, social or business considerations. To secure large circulations for such enterprises they were willing to sell the paper for long periods at much below the cost of manufacture, and to spend money for news and writers more lavishly than the legitimate business of established journals would allow. Great business corporations seeking for favourable or fearing adverse legislation sometimes made secret newspaper investments for the same purpose.

These various new conditions, affecting the newspaper press of the United States with ever-increasing force, gradually changed the average character of the papers and their effect upon their readers. A large circulation became the only evidence of success and the only way to make the sale of a newspaper behove ultimately a source of profit. A disposition to lower the character in order to catch the largest audience naturally followed. Criminal news was reported more fully than formerly, with more piquant details. Competitors outdid each other in the effort to treat all news with unprecedented sensationalism. The lowest possible price was regarded as essential to the largest possible circulation, and so a favourable price even for large newspapers became one cent to the public, and consequently only half a cent to the publishers, whose business was practically all at wholesale with dealers and news companies. The feeling that the most must be given for the money prompted also the great increase in size, only made possible by the reductions in paper, composition, presswork, &c., already noted. Yet more quantity and more sensation after a time palled on the jaded appetite, and the spice of intense personality became necessary. As most people like to see their names in print, and can bear criticism of their neighbours with composure, these two chords of human nature were incessantly played upon.

The principal feature in the development of modern newspapers is the importance attached to obtaining, and prominently flattering, "news" that affects persons, and incidentally there has been a considerable change of view as to what sort of news should be given prominence. Sport and finance are treated at greater length and more popularly; and, partly owing to the largely increased number of papers and consequent greater competition, partly to a desire to appeal to the larger public, which is now able to read and ready to buy reading-matter, there has been a tendency to follow the tastes of the vast number of people who can read at all rather than of those to whom reading means a very high standard of literary and intellectual enjoyment. This has been done in a less liberal style and by the presentation of "titbits" of information with an appeal to cruder sentiments, but also in a more liberal use of headlines and of similar devices for catching the eye of the reader. "Personal journalism," i.e. paragraphs about the private life or personal appearance of individuals—either men or women—of note or notoriety in society or public affairs, has become far more marked; and in this respect, as in many others, encouragement has been given to a spirit of inquisitiveness, and also to a widespread inclination either to the "commercial" or "human" type of journalism. To "write" and "sell" for human appeal. The "modern" type of journalism has in consequence become a conspicuous trait in these "democratic" days even among the classes which once affected to despise such publicity.

The modern impulse, culminating in England in the last decade of the 19th century in what was then called the "New Journalism," was a direct product of American conditions and ways of life, but in Great Britain it was also the result of the democratic movement produced by the Education Act of 1870 and the Reform Act of 1885; and it affected more or less all countries which came within the influence of free institutions. The most generally adopted American innovation (for, though not known before even in England, it was practically a new thing as carried out in American newspapers) was the "interview" (the report in dialogue form of a conversation with some prominent person, whose views were thus elicited by a reporter), which during the early 'nineties was taken up in varying degrees by English newspapers; it was "cheap copy"—the word "copy" covering in journalistic slang any matter in the shape of an article—and could easily be made both informing and interesting; and "interviewing" caused a large increase in the journalistic profession, notably among women. The rage for the "interview" again declined in vogue outside American journalism in proportion as people of importance became less ready to talk for publication—or for nothing.

From the highest class of paper downwards, however, real news—and especially early news—has been more and more sought after, and all the force of organization both within individual newspaper offices and outside them in the shape of news agencies, has been applied to the purpose of obtaining early news and publishing it as quickly as possible. In this matter the Press has certainly been helped most materially not only by the advance in telegraphic facilities (see REPORTING) but by all the other new rapid methods of production in Type-setting (see TYPOGRAPHY) and Press-work (see PRINTING) which have been the feature of the modern period. The vastly increased amount of telegraphic work now done has perhaps not been all pure gain to the best sort of journalism. It has to some extent weakened the effect of the considered article, and led to hasty conclusions and precipitate publication, with results that sometimes cannot be compensated for by any later contradiction or modification. In some cases a reaction ensued. Take for instance the case of war correspondence. The prestige of the
Between about 1870 and 1880 the English newspapers began to pay increased attention to literary and artistic criticism; and gradually the daily Press, which formerly applied itself mainly to recording news, and to political, social and financial subjects, became a formidable rival in this sphere to the weekly reviews and the monthly and quarterly magazines. Books are "viewed" in the Press partly for literary reasons, partly as a guide to the publishers' advertisements; and the desire for "something to quote," irrespectively of the intrinsic nature of the criticism, became in the early 'nineties a mania with publishers, who in general appear to have considered that their sales depended upon their catching a public which would be satisfied by seeing in the advertisement that such and such a book was pronounced by such and such a paper to be "indispensable to any gentleman's library." Unfortunately the enormous output of books made it impossible for editors to have them all reviewed, and equally impossible for them to be certain of discriminating properly between those which were really worth reviewing and those which were not. The result has been that the work of book-reviewing in the newspapers is often hastily and poorly or very spasmodically done. But there have been some honourable exceptions. The "Literary Supplement" (since 1901) to The Times is the most ambitious attempt made by any daily paper to deal seriously with literature. The Daily Chronicle started a "literary page" in 1891, and it was imitated in varying degrees by other English papers. The Scotsman and some other provincial papers have also for some time devoted much space to excellent literary criticism. The literary supplement has also been developed to a high degree in some American journals in the United States, of which the New York Times, with this feature was indeed originally started. As a form of serious criticism, however, the review has, in the general newspapers of later years, taken a lower place than must be desirable, partly owing to the cause named, partly to a tendency among reviewers either to indiscriminate praise or to irresponsible irreverence, partly to a suspicion of "log-rolling"; and to a large extent it has become the practice merely to treat the appearance of new books as much news, to be chronicled, with or without extracts, according as the subject makes good "copy," like any other event of the day.

The modern tendency, resulting from the enormous amount of newspaper production, has been to make journalism less literary and at the same time literature more journalistic. Either as reviewers, leader-writers or editors, many of the principal "men of letters" have worked for longer or shorter periods as writers for some newspaper or other, and much of the published literature of the time has appeared originally in the columns of the newspapers, in the form of essays, poems, short stories or novels (in serial form). Publication in this shape has many advantages for an author, and all of them, in addition to the profit, it offers an opportunity for a new writer to try his wings, and it helps to introduce him at once to a large public. Moreover, the newspapers read by the educated classes profit by the superior class of journalist represented by writers of a literary turn. But the increased popularity of the newspaper, and the close tie between it and the literary world, have on the whole impressed a journalistic stamp upon much of the literature of the day. However popular at the moment a writer may be, the infection with journalistic methods—while rightly employed by journalists, as such, in dealing with contemporary events and for strictly contemporary purposes—is apt to be. Responsible for something wanting in his work, the loss of which deprives him of the permanent literary or scientific rank to which he might otherwise aspire.

The new point of departure for the more popular style of English journalism (apart from the influence of American models) is really to be found in the publication of Sir George (then Mr) Newnes's Tit-Bits in 1881. This penny weekly paper, with its appeal to the masses, who liked to read snippets of information brightly put together, showed what enormous profits were to be made by this style of enterprise; and the multiplication of journals of this description—notably Mr
GENERAL CONSIDERATIONS

NEWSPAPERS

Alfred Harmsworth's (Lord Northcliffe's) Answers (1888) and Mr C. Arthur Pearson's Pearson's Weekly (1890)—had a further influence on public taste, so that even the classes above that which primarily enjoyed these publications were affected in the same direction to a new ideal and thus introduced into English daily journalism in England. Whereas before 1882 the chief feature in London journalism, outside The Times and other great morning papers, had been the literary brilliance of the Saturday Review and its evening paper analogues, the Pall Mall and St James's Gazettes, in the early 'nineties came a craze for "actuality." Mr T. P. O'Connor, with his vivid pen (first in the Star, then in the Sunday Sun and elsewhere), set the pace for a crowd of imitators; the successful establishment of the Daily Mail in 1896, with its system of compressing the news is often said to have been partly started by popularizing, while at the same time catering for all tastes and employing first-rate correspondents and reporters to supply it with special information, gave a distinct shake-up to the older traditions of daily journalism. The old tendency had been to rely for success either on writers of exceptional knowledge or capacity, men who were essentially amateurs, or on a class of professional journalists who at all events had a literary tradition behind them. A different sort of amateur now arose, and a different sort of professional. Even when an attempt was made to provide for a serious public, or a more or less serious sort of mechanism, it was increasingly done by periodicals rather than by literary methods. The literary public in the proper sense of the word is inevitably a small one, and the greater part of the Press deals with literature on lines more suited to a larger and less refined clientèle. It may be claimed, no doubt, that the best sort of journalism shows a high, and sometimes the highest, literary standard, but the fact remains that for the bulk of modern journalism its conductors realize only too well that their business is to appeal to the masses, and to a standard of education and taste which falls far short of anything that can be called intellectual.

This cardinal point, that the leading articles or "editorials," expressing the attitude of the paper towards important subjects of the day, have lost their importance, but this is only a half-truth. Allowance being made for changes in literary style, the actual amount of good writing in this department in the great organs of opinion—well-informed, scholarly and incisive—may justly be considered equal to anything done in what are sometimes considered its palmy days. 1 On the other hand, it is undoubtedly the case that in the newer type of newspaper, which appeals rather on the score of its tit-bits of news and notoriety, the more or less artificial quality of the whole raison d'être of the old-fashioned leading article has disappeared, and its place is taken by a few brief notes, merely indicating the attitude of the paper, and not seeking to discuss any subject comprehensively at all. The "leader" is to some extent a form of newspaper routine, but on the whole it is a routine which has proved its value by experience. The continuous high standard of tone, maintained by so many great journals, depends more largely than is sometimes realized on the regular industry and skill of those whose business it is to discuss the latest developments of affairs every day or every week in a manner which gives reasonable men something fresh to think about, or interprets for them the thoughts which are only vaguely floating in their minds. The liberty of the Press enables every sort of view, right or wrong, to be discussed in this prominent form, and thus every aspect of a question is brought out in public, to be accepted or rejected according to the weight of evidence and of argument.

The same end is assisted by the devotion of so much space to "letters to the editor." It is sometimes said that in England the London Times owes its position largely to the fact that if any individual grievance is felt it is generally ventilated by a letter to The Times. Whatever may be the organization of the Press for reporting the news of the day, the resources of no newspaper staff are great enough to cover an area of information as large as that represented by its readers; and the value of the outlet for opinion and information afforded by the correspondence columns cannot be overstated.

Most people probably read more papers than is compatible with a healthy mental digestion, but the Press, as such, has to-day an enormous—and none the less real because subtle—fluence; and this is largely due to the reputation maintained by its higher representatives. While, individually, the great papers wield considerable influence, due partly to real sagacity and authority, partly to the psychological effect produced by mere print or by reiterated statement, collectively the Press now represents the Public, and expresses popular opinion more directly than any representative assembly. The multiplication of "Press-cutting agencies," and of such essentially "newsy" publications as Who's Who (the English form of which originated with Mr Douglas Sladen in 1897) and similar biographical reference books—all tending to increase the publicity of modern life—has contributed materially to the pervading influence of journalism in everyday life and the constant dependence of society in most of its manifestations on the activity of the "Fourth Estate." 2 (H. C.)

From the introduction of low rates for telegraphy and from the development of the stamp mechanical methods of production, and of the desire to read and the growth of advertising (see Advertisement), the modern low-priced newspaper has resulted. But it is by no means a recent development merely. In France, Theophrastus Renaudot's Gazette de Paris (1631) was started at the price of six centimes. In England we find the first mention of inexpensive news-sheets towards the close of the 17th century, when a number of halfpenny and farthing Posts sprang into existence, and appeared at more or less irregular intervals. These consisted of small leaflets, containing a few items of news—sometimes accompanied by advertisements—and were commonly sold in the streets by hawkers. The rise in cost was really due to artificial causes. The increase of these newspapers, and especially the growing practice of inserting advertisements, led the legislature to contemplate a stamp tax of a penny per sheet on all news publications. As a protest, a curious pamphlet—of which a copy is preserved in the British Museum—was issued in 1701, and it sheds an interesting light upon this early phase of cheap journalism. The pamphlet is entitled Reasons humbly offered to the Parliament on behalf of several persons concerned in the preservation and publishing of the halfpenny newspapers.

It states that five master printers were engaged in the trade, which used 20,000 reams of paper per annum. The journals are described in the following terms: "The said newspapers have been always a whole sheet and a half, and sold for one halfpenny to the poorer sort of people, who are purchasers of it by reason of its cheapness, to divert themselves, and also to allure herewith their young children and entice them to reading; and should a duty of three halfpence be laid on these mean newspapers (which, by reason of the commonness of the paper, the generality of gentlemen are above conversing with), it would utterly extinguish and suppress the same." The pamphlet goes on to say that hundreds of families, including a considerable number of blind people, were supported by selling the halfpenny journals in the streets.

In 1712 a tax of a halfpenny per sheet was imposed, and the cheap newspapers at once ceased to exist. This tax on the press was increased from time to time, till in 1815 it stood at fourpence per sheet. The usual price of newspapers was then sevenpence a copy. From these facts it seems highly probable that, had not the stamp tax been imposed, the halfpenny paper would soon have become the normal type, and would have continued so to this day. In 1724 a committee of the House of Commons sat to consider the action of certain printers who were evading the stamp tax by publishing cheap newspapers under the guise of pamphlets. They found that there were then two Halfpenny Posts published in London, one by Read of Whitefriars, and the

1 It must be remembered that the style of public speeches has also undergone a change; that is to say, with the transition from the House of Commons. A more business-like form of speech is adopted in public life, and the Press reflects this change.
other by Parker of Salisbury Street. There were also three weekly papers issued at a halfpenny a copy. The tax, after several reductions, was finally repealed on 15th June 1835, and a rush of cheap papers immediately followed. A penny became the usual price for London daily papers, with the exception of The Times, and halfpenny papers soon became common.

The growth of the cheap newspaper has since been practically a simultaneous one throughout the civilized world. This has been notably the case in the United States, France and Great Britain. The general tendency in newspaper production, as in all other branches of industry, has in recent times been towards the lowering of prices while maintaining excellence of quality, experience having proved the advantage of large sales with a small margin of profit over a limited circulation with a higher rate of profit. The development—and indeed the possibility—of the cheap daily paper was due to a number of causes operating together during the latter half of the 19th century. Among these, the first place must undoubtedly be given to the cheapening of paper, through the introduction of wood pulp and the perfection of the machinery used in the manufacture. From 1755 to 1835 paper cheapened rapidly, and it has been estimated that the introduction of wood pulp trebled the circulation of newspapers in England. Keen competition in the paper trade also did much to lower prices. At the same time the prime cost of newspaper production was increased by the introduction of improved machinery into the printing office. The growth of advertisements must also be taken into account in considering the evolution of the halfpenny journal. The income from this source alone made it possible to embark upon journalistic enterprises which would otherwise have been impossible. The popular journal of the present day does not, however, owe its existence and success merely to questions of diminished cost and improved methods of production. A change has come over the public mind. The modern reader likes his news in a brief, handy form, so that he can see at a glance the main facts without the task of reading through wordy articles. This is especially the case with the man of business, who desires to master the news of the past twenty-four hours as he travels to his office in the morning. It is to economize time rather than money that the modern reader would often prefer a halfpenny paper; while the man of business, who likes to peruse leading articles and full descriptive accounts, finds what he needs in the more highly priced journals. The halfpenny paper in England has not had to contend with the opposition that the penny newspaper met from its threepenny contemporaries in the 'fifties and 'sixties. This is largely due to the fact that in most cases the contributors, paper, printing and general arrangement of the cheaper journal do not leave much room for criticism.

Mr G. A. Sala once complained that the reporters of the older papers objected to work side by side with him when he represented the first penny London daily (the Daily Telegraph), through fear of losing caste, but this does not now apply, for in the United Kingdom, France and the United States the cheap journals, owing to their vast circulation, are able to offer the best rates of remuneration, and can thus command the services of some of the best men in all the various departments of journalism.

Another aspect of the newspaper which may here be considered is the introduction of pictorial illustrations (see also Illustration). The earliest attempts at popular illustration of news events took the form in England of "broad-sides." One broadside dated 1787 recounted the story of the print and full descriptive accounts, finds what he needs in the more highly priced journals. The halfpenny paper in England has not had to contend with the opposition that the penny paper met from its threepenny contemporaries in the 'fifties and 'sixties. This is largely due to the fact that in most cases the contributors, paper, printing and general arrangement of the cheaper journal do not leave much room for criticism.

elaborate for a journal of to-day, and in 1820 it gave its readers "A Faithful Reproduction of the Interior of the House of Lords as prepared for the Trial of Her Most Gracious Majesty Queen Caroline." In 1821 it published an interior of the House of Commons with the members in their places. The Observer of 22nd July 1821—the Coronation number—contained four engravings. Of the George IV. Coronation number Mr Clement sold 60,000 copies, but even that was nothing to the popularity that his journal secured. His illustrations of the once famous murder of Mr Weare and the trial of the murderer Thurtell. The Observer in 1838 gave a picture of the Coronation of Queen Victoria. In 1841 there was a fire at the Tower of London, when the armoury was destroyed. The Observer published three illustrations of the fire; it further published an emblematic engraving on the birth of the prince of Wales, and issued a large page engraving of the christening ceremony in the following January. Thus it had in it all the elements of pictorial journalism as we know it to-day.

The weekly Illustrated London News was, however, the first illustrated newspaper by virtue of its regularity. It was the first illustrated paper, because all the illustrations to which we have referred as appearing in the Observer and other publications were irregular. They came at intervals; they were quite subordinate to the letterpress of the paper; they were given only occasionally in times of excitement, with a view to promoting some little extra sale. That they did not really achieve the result hoped for to any great extent may be gauged by the fact that from 1842 to 1847 the Observer published scarcely any illustrations at all, and in the meantime the Illustrated News had taken an assured place as a journal devoted mainly to the illustration of news week by week. That is why its first publication marked an epoch in journalism. The casual illustration of other journals still went on: the Weekly Chronicle, for example, still published a number of pictures; the Sunday Times, also a very old paper, illustrated in these early days many topical subjects, when that building was burned down. A paper started in 1837 called the Magnet gave illustrations, one of them of the removal from St Helena and delivery of the remains of the emperor Napoleon to the prince de Joinville in 1840.

The first number of the Illustrated London News appeared on 14th May 1842. Its founder was Herbert Ingram (1811-1860), who was born in Boston, Lincolnshire, and started life amid the most humble surroundings, what education he ever received having been secured at the free school of his native town. Apprenticed at fourteen to a printer in Hull, he later settled in Nottingham as a printer and newsagent in a small way. It was during his career as a newsvendor at Nottingham that he was associated with the printers and others who were making a newspaper entirely devoted to illustration of news. In the first number of the Illustrated London News, however, there was not a single picture that was drawn from actual sight, the factor which is the most essential element of the illustrated journalism of to-day. Sir John Gilbert (1817-1897), the artist, has stated that not one of the events depicted by him—a state ball at which the queen and the prince consort appeared, the queen with the young prince of Wales in her arms, and other incidental illustrations—was taken from life.

The Illustrated London News had not been long in existence before there were many imitators, in America Harper's Weekly, in France L'illustration and in Germany Uber Land und Meer, and from that day there has been constant development, the Illustrated Zeitung of Leipzig being perhaps the most striking. In America the use of illustrations in the daily papers has become a regular feature, culminating in the bulky Sunday editions of the principal journals; and the practice of presenting the news in pictorial form has increased continuously ever since. In 1910 three London daily newspapers were principally devoted to illustration—the Daily Graphic, the Daily Mirror and the Daily Sketch, while most of the penny and halfpenny journals included some form of pictorial matter. This change was due to the ever-increasing cheapening and ever-growing celerity of manufacture of what are known as half-tone blocks. It was in 1890 that the application of photography to illustrated journalism began in England, and by 1910 it had grown to enormous dimensions, but the first newspaper photographs (mainly portraits) had to be engraved on wood, although the use of half-tone came in well-nigh simultaneously. Up to 1890 illustrated journalism was in the hands of the artists, and the artists were in the hands of the wood engravers, who reproduced their work sometimes effectively—often inefficiently. But in the course of twenty years the wood engraver had been utterly superseded so far as illustrated journalism was concerned. The further developments of journalism seemed likely to be entirely in the direction of coloured reproductions, block-making and machinery for facilitating their production having made particularly rapid strides. (C. K. S.)

It is almost impossible by any statistical detail to give an idea of the advances made by the newspaper press as a whole, but an outline of the general results for 1828, 1866 and 1882, together with a fourth, as given in the 10th edition of this encyclopaedia for 1900, may have its utility.

The earliest summary is that of Adrien Balbi. It was published in the Revue encyclopédique for 1828 (vol. i. pp. 593-603), along with much matter of more than merely statistical interest. The numbers of newspapers published in different countries at that date are given as follows: France, 400; United Kingdom, 483; Austria, about 80; Prussia, 288; rest of the Germanic Confederation, 305; Netherlands, 300; Russia, 161; Great Britain, 183; Sweden and Norway, 161; Russia and Poland, 84. The respective proportions of journals to populations were—for Prussia 1 to 41,500, German states 1 to 45,300, United Kingdom 1 to 46,000, France 1 to 64,000, Switzerland 1 to 66,000, Austria 1 to 400,000, Russia 1 to 569,000. Europe had in all 2142 newspapers, America 978, Asia 27, Africa 12 and Oceania 9; total 3168. Of these, 1378 were published in English-speaking countries (500 of them in the United States), having a population of 154,000, and 1790 in other countries, with a population of 583 millions.

The second summary (1886) is that given by Eugene Hatin in an appendix to his valuable Bibliothèque de la presse périodique. His enumeration of newspapers is as follows: France, 1640; United Kingdom, 1260; Prussia, 700; Italy, 500; Austria-Hungary, 365; Switzerland, 300; Belgium, 275; Holland, 223; Russia, 200; Spain, 200; Sweden and Norway, 150; Denmark, 100; United States, 4000. Here the proportions of papers to population are—Switzerland and United States 1 to 7000, Belgium 1 to 17,000, France and the United Kingdom 1 to 20,000, Prussia 1 to 30,000, Spain 1 to 75,000, Austria 1 to 100,000, Russia 1 to 300,000. Hatin assigns to Europe a total of 7000, to America 5000 and to the rest of the world 250, making in all 12,500.

The third summary is taken from that of Henry Hubbard, published in his Newspaper Directory of the World (New Haven, Connecticut, 1888). Its scope embraces a considerable number of serial publications which cannot be classed as newspapers, Still Hubbard's figures are thought to be almost doubled by the American consuls and consular agents in all parts of the world) about 1880, cannot be disregarded. The following are his general results:

This table provides a comprehensive overview of newspapers in various regions, capturing the essence of newspaper circulation and distribution as of 1900.
2. BRITISH NEWSPAPERS

United Kingdom.

The first regular English journalists may be identified with the writers of manuscript "newsletters," originally the dependants of great men, each employed by his patron or master or patron well-informed, during his absence from court, of all that happened there. The duty grew at length into a calling. The writer had his periodical subscription list, and instead of writing a single letter wrote as many letters as he had customers. Then one more enterprising than the rest established an "intelligence office," with a staff of clerks, such as Ben Jonson's Cymbal depicts from the life in *The Staple of News*, acted in 1625, which is the best-known dramatic notice of the news-sheets.

"This is the outer room where my clerks sit,... And keep their sides, the register in the midst: The examiner, he sits private there within; And here I have my several rolls and files Of news by the alphabet, and all put up under their heads."

Of the earlier newsletters good examples may be seen in the *Paston Letters*, and in the *Sydney Papers*. Of those of later date specimens will be found in Knoller's *Letters and Despatches of Strafford*, and other well-known books.

Still later examples may be seen amongst the papers collected by the historian Thomas Carter, preserved in the Bodleian Library at Oxford. Of these, several series were addressed to the first duke of Ormond, partly by correspondents in England and Ireland, partly by correspondents in Paris; others were addressed to successive earls of Huntingdon; others, again, to various members of the Wharton family. And similar valuable collections are to be seen in the library of the British Museum, and in the Record Office in London. In Edinburgh the Advocates' Library possesses a series of the 16th century, written by Richard Scudamore to Sir Philip Hoby during his embassy to Vienna. The MS. newsletters—some of them proceeding from writers of marked ability who had access to official information, and were able to write with greater freedom and independence of tone than the compilers of the printed news—held their ground, although within narrowing limits, until nearly the middle of the 18th century. The distinction between the newsletter and the newspaper is pointed out in the preceding section.

It was at one time believed that the earliest regular English newspaper was an *English Mercurie* of 1588, to which George Chalmers, the political writer and antiquarian, referred in his *Life of Rudderham* (1794) as being (with others of the same date) in the British Museum. The falsehood of this supposition, which was long accepted on Chalmers's authority, was, however, pointed out by Thomas Watts, of the British Museum, in 1839, in a volume with the title *Letter to Antonio Ponzii on the Reputed earliest printed Newspaper*, and again in 1850, in an article in the * Gentleman's Magazine* (n.s. xxxii. 484-491). The documents in question are (1) a MS. unnumbered issue of the *English Mercurie*, dated "Whitehall, July 26th, 1588"; (2) a printed copy, No. 50, of July 23, 1588; (3) a printed copy of No. 51; (4) a printed copy of No. 54, of November 24, 1588; (5) and three other MS. copies. These latter include the collection bequeathed to the Museum of Dr Birch (1766), and are incontestably 18th-century forgeries. The handwriting of the spurious MSS. was identified by a letter among Dr Birch's correspondence as that of Philip Yorke, afterwards 2nd Lord Hardwicke, and there were trifling corrections in Dr Birch's handwriting, showing that he was a party with Yorke, the author, to the mystification. No information is forthcoming as to the object of it, but it is worth mentioning that Yorke and his brother also published a clever *jeu d'esprit* called *The Athenian Letters*, purporting to be a transcript from a Spanish translation of letters written by a Persian agent during the Persian or Peloponnesian War; so that it may be inferred that this sort of thing recommended itself to Yorke, and not necessarily for any deception.

Various English pamphlets, as well as French, Italian and German, occur in the 16th century with such titles as *News from Spaine*, and the like. In the early years of the 17th century they became very numerous; the Charles Burney collection in the British Museum is particularly valuable for this early period, the newbooks and newspapers in it commencing with a "relation" of 1605. In 1614 we find Burton (the author of the *Anatomy of Melancholy*), pointing an excrement against the parting reading habits of "the major part" by adding, "if they read a book at any time...tis an English chronicle, Sir Huon of Bordeaux, Amadis de Gaul, &c., a play-book, or some pamphlet of news." But up to 1641, owing to the fact that to print domestic news was barred by the royal prerogative, the English periodicals which are to be considered as strictly the forerunners of the regular newspaper were only translations or adaptations of foreign periodicals containing news of what was going on abroad.

The first is in the British Museum a *Mercurius Gallogallicus; Sive rerum in Gallia et Belgo potissimum, Historia quoque, Italia, Anglia, Germania, Polonia, Vicinique Locis ab anno 1588 usque ad Martium annum prospersat, 1594 gestorum, nuncius. Opusculum in Sex libros qui totidem annos completum septuare, divisa auctore D. M. Jonsonio Docomensis Friso. Editio altera. Coloniae Agrippinae. A pud Godfriedum Kempensem. Anno MDXCVI.* This production of Janson's at Cologne is a fairly thick octavo book, giving a Latin chronicle of events from 1587 to 1594, and is really a sort of annual register. It was continued down to 1635. The first English paper, *the News from the East Indies*, began to circulate in England, it started the idea of a periodical supplying foreign news, and apparently became to English contemporaries a type of the newfangled news-summaries. In 1614 there was published in London a little square book (45 pp.), by Robert Booth, *A Relation of all matters passed, since March last to the present 1614, translated according to the original of Mercurius Gallogallicus*, which has the running title *Mercurius Gallogallicus his relation since March last*. From a repetition of such "relations" at irregular intervals, to the periodical publication of news-books with a common title in a numbered series, was a natural development. Thus on the 1st of June 1619 Ralph Rountwaihe entered at Stationers' Hall *A Relation of all matters done in Bohemia, Austria, Poland, Sletia, France, &c., that is worthy of relating, since the 2nd of March 1618 (1619 N.S.) until the 4th of May.* Again at the beginning of November 1621 Bartholomew Downes and another entered in like manner *The certaine and true newes from all parts of Germany and Poland, to this present 20 of October 1621.* No copy of either of these papers is now known to exist. Nor is any copy known of the *Courant or Weekly News* from the 20th of October 1621—"taken out of the High Dutch,"—mentioned by John Nichols. But in May 1622 we arrive at a regular weekly newspaper which may still be seen in the British Museum.

1 The title *Mercurius or Mercury*—as representing the messenger of the gods—thus became a common one for English periodicals.

2 Registers of the Stationers' Company, as printed by Edward Arber, iii. 302.

4 Literary Anecdotes, iv. 38.
NEWSPAPERS

The Stationers' Registers contain an entry on May 18th of A Curant of generall news. Dated in 1645 May last, it is preserved, but what is presumably the next number is to be found in the Burney collection. It is entitled "The 23rd of May—The Weekly News from Italy, Germany, &c., London, printed by J. D. for Nicholas Bourne and Thomas Archer." On many subsequent numbers the name of Nathaniel Butter appears in conjunction with Bourne and sometimes with Archer; so that there was probably an eventual partnership in the new undertaking. Archer is known as a publisher of "relations" since 1603; he died in 1634. Butter had published News from Spain in 1611, and he continued to be a publisher of news until 1641, if not later, and died in 1646. For details of the history of the development of the news-book down to 1641, and thence to the starting of the London Gazette in 1665, reference should be made to Mr J. B. Williams' History of English Journalism (1908), already referred to. Mr. Williams, by his study of the materials preserved in the British Museum in the Burney and Thomason collections, has considerably modified many of the previously accepted views as to the affiliation and authorship of these early English periodicals. The leading facts can only be summarized here.

The Weekly News (1622), though the first English "Corant," had no regular title connecting one number with the rest; it was simply the news of the week, and so described. The first periodical with a title was a Mercurius Britannicus published by Archer in 1625; the earliest copy in existence being No. 16, April 7th, which probably lasted till the end of 1627. But the activity of the periodical was considerable, for in 1628, Charles I issued the first Mercurius Britannicus, and in 1629 the weekly printings of news from foreign parts. The next step in the evolution of the newspaper was due to the abolition of the Star Chamber in 1641, and the consequent freeing of the Press; and at last we come to the English periodical with domestic news. In November 1641 begins The Head of several proceedings in the present parliament (outside title) or Diurnal Occurrences (inside title), the latter being the title under which it was soon known as a weekly; and on Jan. 31st 1642 appeared A Perfect Diurnal of the Passages in Parliament. These were printed for William Muddiman, and were written apparently by Samuel Pecke, "the first of the patriarchs of English domestic journalism" (Williams). It is unnecessary here to mention every domestic journal which played its part in the verbal warfare in the Great Rebellion. The weekly Diurnals were soon copied by other booksellers. At first they were naturally on the side of the parliament. In January 1643, however, appeared at Oxford the first Royalist diurnal, named Mercurius Aulicus (continued till September 1645, and soon succeeded by Mercurius Academicus), which struck a harder literary note; its chief writer was Sir John Birkenhead. Mercurius Gallicus (were first printed privately in London, was started by the parliamentary Richard Collings on May 11th, 1643 (continued to December 1645); Collings had also started earlier in the year The Kingdome's Weekly Intelligencer, which lasted till October 1649. In September 1643 appeared another Puritan opponent of M. Aulicus in the Mercurius Britannicus (sic) of Captain Thomas Audley, which temporarily ceased publication on September 9th, 1644, only to be revived on September 30th by Marchamont (or Marchmont) Newdham, a writer who plays a prominent part in the journalism of this period, and to be continued till May 18th 1646.

In January 1647 was started the Perfect Occurrences by Henry Walker ("Luke Hurraney"), who was not only a great journalist on the parliamentary side but is important as having originated the introduction of advertisements into the news-books. Later in the year a number of new Royalist Mercuries till into the field from which Aldicus and Academicus had now withdrawn: the first was Mercurius Melancholicus (until 1649), and the most important were Mercurius Pragmaticus (Sept. 1647 to May 1650) and Mercurius Elenticus (Nov. 1647 to Nov. 1649). M. Pragmaticus was not, as has been stated, originated by Marchamont Nedham (who about this time turned his coat and became Royalist), but in 1648-1649 he was its writer until he again turned pamphletarian; "history," says Mr Williams, "has no personage so shamelessly cynical as Marchamont Nedham, with his powerful pen, and his political convictions ever ready to be enlisted on the side of the highest bidder; he even wrote for Charles II. in later years." Against the unlicensed Royalist Mercuries in London, where the people were on the king's side, the parliament waged active war, but some of them managed to come out, although writer after writer was imprisoned, until the middle of 1650. Meanwhile from October 1649 to June 1650, by a new act of parliament, the licensed press itself was entirely suppressed, and in 1649 two official journals were issued, A Brief Relation (up to October 1650) and Several Proceedings in Parliament (till September 1653), a third licensed periodical, The Weekly Diurnall, appeared in 1650; the year, and a fourth, Mercurius Politicus (of which Milton was the editor for a year or so and Marchamont Nedham one of the principal writers), starting on June 13th, 1650 (continuing till April 12th, 1660). After the middle of 1650 there was a revival of some of the older licensed news-books; but the Weekly Intelligence of the Commonwealth (July 1650 to September 1655), by R. Collings, was the only important newcomer up to September 1655, when Cromwell suppressed all such publications with the exception of Mercurius Politicus and the Publick Intelligence (Continued to Oct. 1655 to April 1660), both being official and conducted by Marchamont Nedham.

Till Cromwell's death (Sept. 3rd. 1658) Nedham reigned alone in the press, but with the Rump he fell into disgrace, and in 1659 a rival appeared in Henry Muddiman (a great writer also of "news-letters"), whose Parliamentary Intelligence, renamed the Kingdom's Intelligence (till August 1663), was supported by General Monck. Nedham's journalistic career came finally to an end (he died in 1658) at the hand of Monck's council of state in April 1666. The following announcement was published in the Intelligence on March 25th 1666: "We, the poor and humble Marchmont Nedham, the author of the weekly news-books called Mercurius Politicus and the Publicque Intelligence is, by order of the council of state, discharged from writing or publishing any publique intelligence; the reader is desired to take notice that, by order of the said council, Giles Dury and Henry Muddiman are authorized henceforth to write and publish the said intelligence, the one upon the Thursday and the other upon the Monday, which they do intend to set out under the titles of the Parliamentary Intelligence and of Mercurius Politicus. This arrangement with Muddiman lasted till 1663, when he was supplanted by Sir Roger L'Estrange, who was appointed "surveyor of the Press." On him was conferred by royal grant—and, as it proved, for only a short period—all the sole privilege of writing, printing, and publishing all narratives, advertisements, mercuries, intelligencers, diurnals and other books of public intelligence... with power to search for and seize the unlicensed and treasonable schismatical and scandalous books and papers." L'Estrange discontinued Mercurius Politicus and Kingdom's Intelligence and substituted two papers, the Intelligencer (Aug. 1st) and the News (Sept. 3rd) at a halfpenny, the former on Mondays and the latter on Thursdays; these were continued till January 29th, 1666, but from the beginning of 1664 the Intelligencer was made consecutive with the News, numbered and pagd as one.

We come now to the origin of the famous London Gazette. Muddiman, obliged to devote himself solely to his news-letters, was associated with Joseph Wilkinson (under-secretary and afterwards secretary of state), who was for a time L'Estrange's...
assistant in the compilation of the Intelligencer. Muddiman organized for himself a far-spreading foreign correspondence, and carried on the business of a news-letter writer on a larger scale than had till then been known. Presently L'Estrange, whose monopoly of printing was highly unpopular, found his own sources of information much abridged, while Williamson, for his own ambitious purposes, entered into an understanding with the Intelligencer, as is explained in detail by William Winstanley (op. cit., pp. 130 seq.) for getting the whole business into his hands, with Muddiman as his tool and with Muddiman's clients as his customers. To L'Estrange's application for renewed assistance Williamson replied that he could not give it, but would procure for him a salary of £100 a year if he would give up his right in the news-book. The Intelligencer appealed (Oct. 1665) to Lord Arlington, and pathetically assured him that the charge for "enteraining spies for information was £500 in the first year." But L'Estrange boasted that he had "doubled" the size and price of the book, and had brought the profit from £200 to £400 or £500 a year. The appeal was in vain. At that time the great plague had driven the court to Oxford. The first number of the bi-weekly Oxford Gazette, licensed by Arlington and written by Muddiman, was published on the 16th November 1665. It was "a paper" of news, of the same size and shape as Muddiman's news-letters. With the publication of the 24th number (Monday, February 5th, 1665-1666 O.S.) the Oxford Gazette became the London Gazette. After the 25th number Muddiman, who saw that he was not safe in Williamson's hands, seceded. Williamson had the general control of the Gazette for a considerable time. Charles Perrot, a member of Oriel College, was the acting editor. L'Estrange was soon driven out of the field, being solaced, on his personal appeal to the king, with a charge of £100 a year on the news-books (henceforth "taken into the secretaries' office") and a further £200 out of secret service money for his place as surveyor of the press. Muddiman, meanwhile, attached himself to the other secretary of state, Sir W. Morice, and he was authorized to issue an opposition official paper, which appeared as Current Intelligence (June 4-Aug. 20, 1666); and though the Great Fire, which burnt out all the London printers, resulted in the reappearance, after a week's interval, of the Gazette alone, Muddiman's unrivalled organization of news-letters remained, and they continued, till his death in 1692, to be the more popular source of information. The Gazette, however, now remained for some time the only "newspaper" in the strict sense already mentioned. For several years it was regularly translated into French by one Moranville. During the Stuart reign generally its contents were very meagre, although in the reign of Anne some improvement is already visible. More than a century after the establishment of the Gazette, Lord Wemyss, in 1766, wrote a memorandum addressing a circular to the several secretaries of legation and the British consuls abroad, in which he says, "The writer of the Gazette has represented that the reputation of that paper is greatly lessened, and the sale diminished, from the small portion of foreign news with which it is supplied." He desires that each of them will send regularly all such articles of foreign intelligence as may appear proper for that paper, "taking particular care—as the Gazette is the only paper of authority printed in this country—never to send anything concerning the authenticity of which there is the smallest doubt." From such humble beginnings has arisen the great repertory of State Papers, now so valuable to the writers and to the students of English history. The London Gazette has appeared twice a week (on Tuesday and Friday) in a continuous series ever since. The editorship is a government appointment.

The London Gazette.

We come now to the Revolution. The very day after the departure of James II. was marked by the appearance of three newspapers—The Universal Intelligence, the English Courant and the London Courant. Within a few days more these were followed by the London Mercury, the Orange Gazette, the London Intelligence, the Harlem Current and others. The Licensing Act, which was in force at the date of the Revolution, expired in 1663 without being renewed, and the new papers found the way to the market open. On the appearance of a paragraph in the Flying Post of 1st April 1667, which appeared to the House of Commons to attack the credit of the Exchequer Bills, leave was given to bring in a bill "to prevent writing, printing or publishing of any news without licence"; but the bill was thrown out in an early stage of its progress. That Flying Post which gave occasion to this attempt was also noticeable for a new method of printing, which it thus announced to its customers—"If any gentleman has a mind to oblige his country friend or correspondent with this account of public affairs, he can have it for twopence... on a sheet of fine paper, half of which being left blank, he may thereon write his own affairs, or the material news of the day." In 1666 Edward Lloyd—the virtual founder of the famous Lloyd's of commerce—started a thrice-a-week paper, Lloyd's News, which had but a brief existence in its first shape, but was the precursor of the Lloyd's List of the present day. No. 76 of the original paper contained a paragraph referring to the House of Lords, for the appearance of which a public apology must, the publisher was told, be made. He preferred to discontinue his publication (February 1667). Nearly thirty years afterwards in part paged I. the title of Lloyd's List—published at first weekly, afterwards twice a week. This dates from 1726. It is now published daily. It was in the reign of Queen Anne that the English newspaper press first became really eminent for the amount of intellectual power and of versatile talent which was employed upon it. It was also in that reign that the press was first fettered by the newspaper stamp. The accession of Anne was quickly followed by the appearance of the first successful London daily newspaper, the Daily Courant (11th of March 1702-1703). Seven years earlier, in 1695, the Post-boy had been started as a daily paper (actually the first in London), but only four numbers appeared. The Courant was published and edited by the learned printer Samuel Buckley, who explained to the public that "the author has taken care to be duly furnished with all that comes from abroad, in any language... At the beginning of each article he will quote the foreign paper from which it is taken, that the public, seeing from what country a piece of news comes, with the allowance of that government, may be better able to judge of the credibility of it. For the part it is printed here, he will not pretend to give any comments, ... supposing other people to have sense enough to make reflections for themselves." Then came, in rapid succession, a crowd of new competitors for public favour, of less frequent publication. The first number of one of these, the Country Gentleman's Courant (1700), was given away gratuitously, and made a special claim to public favour on the ground that "here the reader is not only diverted with a faithful register of the most remarkable and momentary [i.e. momentous] transactions at home and abroad, ... but also with a geographical description of the most material places mentioned in every article of news, whereby he is freed the trouble of looking into maps." On the 19th of February 1704, whilst still imprisoned in Newgate for a political offence, Defoe (q.v.) began his famous paper, the Review. At the outset it was published weekly, afterwards twice, and at length three times a week. It continued substantially in its first form until July 29, 1712; and a complete set is of extreme rarity. From the first page to the last it is characterized by the many errors and misprints. The great collection of newspapers in the British Museum contains only one number of Lloyd's News; but sixty-nine numbers may be seen in the Bodleian Library. Of the List, also, no complete series is known to exist; that in the library of Lloyd's begins with 1740.
boldness and persistent tenacity with which the almost unaided author utters and defends his opinions on public affairs against a host of able and bitter assailants. Some of the numbers were written during travel, some in Edinburgh. But the Review appeared regularly. When interrupted by the pressure of the Stamp Act (which came into force on the 1st of August 1712), the writer modified the form of his paper, and began a new series (August 2, 1712, to June 11, 1713). In those early and monthly supplements of his paper which he entitled "Advice from the Scandalous Club," and set apart for the discussion of questions of literature and manners, and sometimes of topics of a graver kind, Defoe to some extent anticipated Richard Steele's Tatler (1709) and Steele and Addison's Spectator (1711). In 1705 he severed those supplements from his chief newspaper, and published them twice a week as the Little Review. But they soon ceased to appear. It may here be added that in May 1716, Defoe began a new monthly paper under an old title, Mercurius Politicus, ... by a lover of old England. This journal continued to appear until September 1719. The year 1710 was marked by the appearance of the Examiner, or Remarks upon Papers and Occurrences (No. 1, August 3), of which thirteen numbers appeared by the co-operation of Bolingbroke, Prior, Freind and King before it was placed under the sole control of Swift. The Whig Examiner, avowedly intended "to censure the writings of others, and to give all persons a rehearing who had suffered under any unjust sentence of the Examiner," followed on the 1st September, and the Medley three weeks afterwards.

This increasing popularity and influence of the newspaper press could not fail to be distasteful to the government of the day. Prosecutions were multiplied, but with small success. At length some busy projector hit upon the expedient of a newspaper tax. The tax which seems to contain the first germ of the plan is still preserved amongst the treasury papers. It is anonymous and undated, but probably belongs to the year 1711. "There are published weekly," says the writer, "about 44,000 newspapers, viz. Daily Courant, London Post, English Post, London Gazette, Postman, Postboy, Flying Post, Review and Observer." The duty eventually imposed (1712) was a halfpenny on papers of half a sheet or less, and a penny on such as ranged from half a sheet to a single sheet (10 Anne, c. xix. § 101). The first results of the tax cannot be more succinctly or more vividly described than in the following characteristic passage of Swift's Journal to Stella (August 7, 1712): "Do you know that Grub Street is dead and gone last week? No more ghosts or murderers now for publish or money. I plied it close the last fortnight, and published at least seven papers of my own, besides some of other people's; but now every single half sheet pays a halfpenny to the queen. The Observer is fallen; the Medleys are jumbled together with the Flying Post; the Examiner is deadly sick; the Spectator keeps up, and doubles its price—I know not how long it will hold. Have you seen the red stamp the papers are marked with? Methinks the stamping is worth a halfpenny."

Swift's doubt as to the ability of the Spectator to hold out against the tax was justified by its discontinuance in December 1712, Steele starting the Guardian in 1713, which only ran for six months. But the impost which was thus fruitful in mischief, by suppressing much good literature, wholly failed in keeping out bad. Some of the worst papers in the history of the press existed, and their existence kept their ground, and the number of such ere long increased. An enumeration of the London papers of 1714 comprises the Daily Courant, the Examiner, the British Merchant, the Lover, the Patriot, the Monitor, the Flying Post, the Postboy, Mercator, the Weekly Packet and Dunton's Ghost. Another enumeration in 1733 includes the Daily Courant, the Craftsman, Fag's Journal, Miss's Journal, the London Journal, the Free Press, the Morning Post and the News. A Proposition to Increase the Revenue of the Stamp-Office, Redington, Calendar of Treasury Papers, 1703-1714, p. 955. The stamp-office dated from 1694, when the earliest duties on paper and parchment were enacted. See the Burney collection of newspapers in the British Museum; and Nicholson, Literary Anecdotes of the Eighteenth Century, iv. 33-97.

Brion, the Grub Street Journal, the Weekly Register, the Universal Spectator, the Auditor, the Weekly Miscellany, the London Crier, Read's Journal, Oedipus or the Postman Remounted, the St James's Post, the London Evening Post and the London Daily Post, which afterwards became better known as the Public Advertiser. Part of this increase may fairly be ascribed to political corruption. In 1742 the committee of the House of Commons appointed to inquire into the political conduct of the earl of Oxford reported to the House that during the last ten years of the Walpole ministry there was paid, out of public money, no "less a sum than £50,077, 18s. to authors and printers of newspapers, such as the Free Brion, Daily Courant, Gazeteer and other political papers." But some part of the payment may well have been made for advertisements. Towards the middle of the century the provisions and the penalties of the Stamp Act were made more stringent. Yet the number of newspapers continued to rise. Dr Johnson, who in 1750 started his two-penny bi-weekly Rambler, and in 1756 his weekly Idler, writing in the latter he bore testimony to the still growing thirst for news: "Journals are daily multiplied, without increase of knowledge. The tale of the morning paper is told in the evening, and the narratives of the evening are bought again in the morning. These repetitions, indeed, waste time, but they do not shorten it. The most eager peruser of news is tired before he has completed his labour; and many a man who enters the coffee-house in his nightgown and slippers is called away to his shop or his dinner before he has well considered the state of Europe. Five years before, in 1751, the number of newspapers annually sold in England, on an average of three years, amounted to 7,411,757. In 1760 it had risen to 9,464,790, and in 1767 to 11,300,980. In 1776 the number of newspapers published in London alone had increased to fifty-three.

When Johnson wrote his sarcastic strictures on the newspapers that were the contemporaries and, in a sense, the rivals of the Idler, the newswriters had fallen below the standard of an earlier day. A generation before the newspaper was often much more of a political organ than of an industrial venture. All of the many enterprises of Defoe in this field of journalism united indeed both characteristics. But if he was a keen tradesman, he was also a passionate politician. And not a few of his fellow-workers in that field were conspicuous as statesmen no less than as journalists. Even less than twenty years before the appearance of Johnson's remarks, men of the mental calibre of Henry Fielding were still to be found amongst the editors and writers of newspapers. The task had fallen to a different class of men in 1750.

The history of newspapers during the long reign of George III. is a history of the struggle for freedom of speech in the face of repeated criminal prosecutions, in which individual writers and editors were defeated and severely punished, while the Press itself derived new strength from the protracted conflict, and turned ignominious penalties into signal triumphs. From the days of Wilkes's North Briton onwards (see Wilkes, John: it was started in 1761), every conspicuous newspaper prosecution gave tenfold currency to the doctrines that were assailed. In the earlier part of this period men who were mere traders in politics—whose motives were obviously base and their lives contemptible—because for a moment, able to brave king, legislature and law courts, by virtue of the simple truth that a free people must have a free press. One of the minor incidents of the North Briton excitement (Wilkes's prosecution in 1763) led indirectly to valuable results with reference to the much-vaunted question of parliamentary reporting. During the discussions respecting the Middlesex election, Almon, a bookseller, collected from members of the House of Commons some particulars of the debates, and published them in the London Evening Post. The success which attended these reports induced the proprietors of St James's Chronicle to employ a reporter to collect notes

NEWSPAPERS

in the lobby and at the coffee-houses. This repeated infraction of the privilege of secret legislation led to the memorable proceedings of the House of Commons in 1771, with their fierce debates, angry resolutions, and arbitrary imprisonments—all resulting, at length, in that tacit process of publicity of discussions within the mists, with brief occasional exceptions, has ever since prevailed.

Evening journalism in England started originally with supplemental editions of the morning papers, giving the latest foreign war news. In July 1665, when William III. was fighting France in the Netherlands, a "Postscript to the Pacquet-boat from Holland to Flanders" was published with special advice from the seat of war; and from that time there were frequent afternoon issues of evening journals giving war news. In August 1766 a "Sir at Night" evening paper was started in London. The first London evening paper of any importance, however, was the Courier (1792), which during the latter part of the Napoleonic War, with Mackintosh, Coleridge and Wordsworth amongst its contributors, became one of the chief papers of the day. It was edited successively by Daniel Stuart, William Mudford, Eugenius Roche, John Galt, James Stuart and Laman Blanchard. In 1827 a twenty-four share in the paper sold for 5000 guineas, but it gradually declined and came to an end in 1842, when it was incorporated by the New River Company—allresulting in the circulation of the paper; but when the "Letter to the King" came out (19th December 1766, almost a year from the beginning of the series) it caused an addition of 1750 copies to the ordinary impression. The effect of subsequent letters was variable; but when Junius ceased to write the monthly sale of the paper had risen to 83,950. This was in December 1771. Seven years earlier the monthly sale had been but 47,515. It now became so valuable a property that shares in it were sold, according to John Nichols, "as regularly as those of the New River Company." But the fortunes of the Advertiser declined almost as rapidly as they had risen. It continued to appear until 1798, and then expired, being amalgamated with the commercial paper called the Public Ledger (dating from 1759). Actions for libel were brought against the paper by Edmund Burke in 1784, and by William Pitt in 1785, and in both suits damages were given.

The Morning Chronicle was begun in 1766. William Woodfall was its printer, reporter and editor, and continued to conduct it until 1786. James Perry succeeded him as editor, and so continued, with an interval during which the editorship was in the hands of Mr. Sergeant Spankie, until his death in 1821. Perry's editorial functions were occasionally discharged in Newgate in consequence of repeated prosecutions for political libel. In 1819 the daily sale reached nearly 4000. It was sold in 1823 to Mr. Clement, the purchase-money amounting to £42,000. Mr. Clement held it for about eleven years, and then sold it to Sir John Easthope for £6,000. It was then, and until 1843, edited by John Black, who numbered amongst his staff Albany Fonblanque, Charles Dickens and John Payne Collier, the circle of men being about 6000. The paper continued to be distinguished by much literary ability, but not by commercial prosperity. In 1843 (the circulation having fallen to 3000) it became the joint property of the duke of Newcastle, Mr. W. E. Gladstone and some of their political friends; and by them, in 1854, it was sold to Mr. Sergeant Glover. From 1848 to 1854 Douglas Cook (afterwards of the Saturday Review) was editor. At length the Morning Chronicle ended in the Bankruptcy Court, after an existence of more than ninety years. The Morning Herald was founded and first edited by Henry Bate (Sir Henry Bate Dudley) in 1786, and came to an end at the close of 1860; for some time it was a popular Tory paper, and from 1835 to 1845 had a circulation of about 6000.

The development of the Press was enormously assisted by the gradual abolition of the "taxes on knowledge," and also by the introduction of a cheap postal system. In 1756 an additional halfpenny was added to the tax of 1712. In 1765 and in 1773 various restrictive regulations were imposed. In 1789 the three-halfpence was increased to twopence, in 1798 to twopence-halfpenny, in 1804 to threepence-halfpenny, and in 1815 to fourpence, less a discount of 20%. Penalties of all kinds were augmented, and obstructive regulations were multiplied. In the course of the struggle between this constantly enhanced taxation and the irresistible desire for cheap newspapers, more than seven hundred prosecutions for publishing unstamped journals were instituted, and more than five hundred were imprisoned, sometimes for considerable periods. As the prosecutions multiplied, and the penalties became more serious, Poor Men's Guardians, Democrats, Descriptions and their congeners multiplied also, and their revolutionary tendencies increased to a still greater radius. In 1815 the abolition of the tax on newspapers was established which dealt exclusively with narratives of gross vice and crime, and which vied with each other in every kind of artifice to make vice and crime attractive. Between the years 1831 and 1835 many scores of unstamped newspapers made their appearance. The political tone of most of them was fiercely revolutionary. Prosecution followed prosecution; but all failed to suppress the obnoxious publications.

To Bulwer-Lytton, the novelist and politician (Baron Lytton), and sinuously to his some adherents, Mr. Gladstone and Richard Cobden, is chiefly due the credit of grappling with the House of Commons in a manner which secured first the reduction of the tax to a penny on the 15th of September 1836, and then its total abolition at last in 1855. The measure for the final abolition of the stamp tax was substantially prepared by W. E. Gladstone during his chancellorship of the exchequer in 1854, but was carried by his successor in 1855. The number of newspapers established from the early part of 1855, when the repeal of the duty had become a certainty, and continuing in existence at the beginning of 1887, amounted to 107; 26 were metropolitan and 81 provincial. Of the latter, the majority belonged to towns which possessed no newspaper whatever under the Stamp Acts, and the price of nearly one-third of them was but a penny. In some cases, however, a portion of these new cheap papers of 1857 was printed in London, usually with pictorial illustrations, and to this was added a local supplement containing the news of the district.

Amongst the earliest results of the change in newspaper law made in 1855 was the establishment in quick succession of a series of penny metropolitan local papers, chiefly suburban, of a kind very different from their unstamped forerunners. They spread rapidly, and attained considerable success, chiefly as advertising sheets, and as sometimes the organs, more often the critics, of the local vestries and other administrations. One of them, the Clerkenwell News and Daily Chronicle, so prospered in the commercial sense, being crowded with advertisements, that it sold for £50,000, and was then transformed into the London Daily Chronicle (28th May 1877). Another conspicuous result of the legislation of 1855 was an enormous increase in the number and influence of what are known as "class papers" and professional and trade papers. The duties on paper itself were finally abolished in 1861.

"Taxes on knowledge" having thus been abolished, the latter developments in newspaper history are mainly connected with the increase in number, due largely to the spread of education, the improvements in machinery and distribution and in collection of news, the constant adaptation to the new demands
of a wider public, and the progress in the art of advertising as applied to the Press. The following sections on the more important newspapers in London and the Provinces fill in the remaining details of the history of the British Press, so far as they are substantially important or interesting. Much that is in its nature ephemeral or trivial is necessarily passed over.

Modern London Newspapers.

The Morning Post (oldest of existing London daily papers) dates from 1772. For some years it was in the hands of Henry Bate (Sir Henry Bate Dudley), and it attained some degree of importance as a weekly, and scored several very conspicuous successes.

In 1795 the entire copyright, with house and printing materials, was sold for £600 to Peter and Daniel Stuart, who quickly raised the position of the Post by enlisting Sir James Mackintosh and Sir John Stuart (the latter was a regular contributor) to give attention to advertisements and to the copious supply of incidental news and amusing paragraphs. There has been much controversy about the scale of Borthwick's change; if anything it had in elevating the Post from obscurity to eminence. That he greatly promoted this result there can be no doubt. His famous "Character of Pitt," published in 1800, was especially successful, and created a demand for the particular number in which it appeared that lasted for years, almost without precedent. Coleridge wrote for this paper from 1795 until 1802, and during that period its circulation in ordinary rose from 350 copies, on the average, to 4500. Whatever the amount of the circulation at any one time, it was said in connection with the Post, as to the other papers, "the House of Commons." Mr. Coleridge's essays in the Morning Post led to the rupture of the treaty of Amiens, it is none the less a striking testimony, not only to Coleridge's powers as a publicist, but also to his influence on the paper, which at one time and innumerable obstacles at that time. The list of his fellow-workers in the Post is a most brilliant and varied one. Besides Mackintosh, Southey, and Borthwick, and the latter's brother, Robert, the lyric of Moore, many of the social verses of Mackworth Praed, some of the noblest sonnets of Wordsworth, were first published in the columns of the Post. And the story of the paper, in its early days, is the story of a long list of short-lived and never the same title, and its peculiarities, at great length in No. 310 of his Daily Universal Register.

In a later number he stated, very amusingly, his reasons for adopting the altered title, which the enterprise and ability of his successors (see Walter, John) made world-famous. Within two years the Post was a daily paper. Coleridge's enterprise and ability were rewarded by depriving the elder Walter of the printing for the customs department, by the withdrawal of government advertisement from The Times, and also, it is said, by the systematic destruction of the Evening Post. The Post was forced to a temporary suspension. John Walter, however, was strong and resolute enough to brave the government. He organized a better system of news transmission than had ever before existed. He introduced steamprinting presses, and improved the machinery of engraving and typography; and although modern machines may now seem to thrust in insignificance a press of which it was at first announced as a notable triumph that "no less than 1100 sheets are impressed in one hour," yet the assertion was none the less true that The Times of 29th November 1814 presented the public the practical result of the greatest improvement connected with the discovery and application of the foreign intelligence addressed to it by the post offices. The Post continued to be a daily paper, and it was the last remaining example of a daily newspaper published without benefit of patent privilege extant.

First established as the Morning Post, in 1795, the Post was taken over by Messrs. J. and T. B. Crompton, the paper manufacturers, it had been taken over by them; and in that year the management was entrusted to Peter Borthwick (1804-1852), a Scotswoman who, after graduation in law, as Edinburgh and Cambridge, had taken to politics in the Conservative interest and had sat in parliament for Evesham from 1835 to 1838 and from 1841 to 1847, when he was almost ruined by fighting an election. Borthwick was succeeded in 1852 by his brother Andrew, who was the editor during the task of reviving the paper seriously in hand, and in a few years was already improving his position when he fell ill and died; and he was succeeded in 1852 by his brother Charles Borthwick, Lord Borthwick (1808). The later history of the paper is primarily connected with its practical re-establishment and successful conduct under the latter. Alcarnon Borthwick had been its Paris correspondent, under his control, became one of the great organs of opinion and acumen of great promise. When he became managing editor in 1832 he devoted himself with such energy to the work that in seven years the debt on the business had been paid off. He gave the paper a political character, and it became the Conservative, Imperialist and Protectionist, and in the 'fifties and 'sixties Borthwick was a keen supporter of Lord Palmerston. After the death of Mr. Crompton, his nephew, Mr. Rideout, the principal surviving one, of the Cromptons, the paper was managed in 1865 by Mr. and Mrs. Rideout's son, who had been associated with Borthwick's success, and he vested the entire control of the paper in him for life; and on Mr. Rideout's death in 1877, Borthwick was enabled, by the help of his friend Andrew Mackintosh to become editor, under his brother Charles Mackintosh, the proprietor. The Morning Post had now become, largely through Borthwick's own social qualities, the principal organ of the fashionable world; but in 1861 he took what was then considered the hazardous step of reviving the paper to a penny a penny, and appealing no longer to the "threepenny public" with The Times but to a wider clientele with the Daily Telegraph and Standard. The result was a ten-fold increase in circulation and a financial success. The Morning Post was knighted in 1880, and was created a baronet in 1887, had entered parliament in 1886 for Evesham, and from 1886 to 1895 sat for South Kensington, where he assumed tabloidal tendencies, and the removal of gifts naturally increased the influence of the paper; he supported the "Tory democracy" and was an active worker for the Prerossite League, of which he was three times chairman; and the Morning Post now stood for views of such importance as to be held responsible for the Conservative side. From 1880 onwards he devoted the editorial duties on others, at first Sir William Hardman, and then successively Mr. A. K. Moore, Mr. Alcarnon Locker, Mr. James Nicol (who died in 1897), Mr. J. J. Rideout (the present editor), Mr. A. C. L. Moore, and Mr. F. W. Fabian Wade; under them the literary standard of the paper was kept at a high level, and constant improvements were introduced; and the staff included a number of well-known writers, such as Walter Besant, Mr. Crompton, the novelist J. W. Mackay, the late Professor of Military History at Oxford. From 1897 till his death in 1905, at the age of thirty-two, Lord Glenesk's son, his brother Borthwick, much to do with the managerial side. On Lord Glenesk's own death in 1903, Mr. Rideout became editor of the Morning Post, of his only surviving child, a daughter, who in 1893 had married the 7th Earl Bathurst.

The proposal was first made from the 1st of January 1788, but was really started by John Walter on the 1st of January 1785, under the title of The London Daily Universal Register, printed logographically. On its reaching its 950th issue its name was changed to The Times. The first paper had been invented by a printer named Henry Johnson several years before, and found a warm advocate in John Walter, who expounded its peculiarities at great length in No. 510 of his Daily Universal Register. In a later number he stated, very amusingly, his reasons for adopting the altered title, which the enterprise and ability of his successors (see Walter, John) made world-famous. Within two years the Post was a daily paper. Coleridge's enterprise and ability were rewarded by depriving the elder Walter of the printing for the customs department, by the withdrawal of government advertisement from The Times, and also, it is said, by the systematic destruction of the Evening Post. The Post was forced to a temporary suspension. John Walter, however, was strong and resolute enough to brave the government. He organized a better system of news transmission than had ever before existed. He introduced steamprinting presses, and improved the machinery of engraving and typography; and although modern machines may now seem to thrust in insignificance a press of which it was at first announced as a notable triumph that "no less than 1100 sheets are impressed in one hour," yet the assertion was none the less true that The Times of 29th November 1814 presented the public the practical result of the greatest improvement connected with the discovery and application of the foreign intelligence addressed to it by the post offices. The Post continued to be a daily paper, and it was the last remaining example of a daily newspaper published without benefit of patent privilege extant.

1 See the centenary number of January 2, 1888, the pamphlet by S. V. Makower, issued by The Times in 1904, "The History of The Times"; and the article by Hugh Chisholm on "The Times, 1785-1908" in the National Review (May 1908).
NEWSPAPERS

[BRITISH]

was to turn the "favourite broadsheet" of the English public into the "leading journal of the world." The Times was the "standard" of the age, and from its birth in 1785 until 1887 was its "indispensable" by George Earle Buckle (b. 1854). At the beginning of 1868 considerable changes took place in the proprietorial side of The Times, which had been founded in 1785 by William Cobbett. Thomas Cherney, the proprietor since 1871, as chairman and Mr. C. Moberly Bell (b. 1847), manager since 1890, as managing director, the financial control passing into the hands of Lord Northcliffe.

A comparison of the mechanical side of newspaper work was very great. The increasing circulation of The Times between the years 1840 and 1850 made an improvement in the printing and office arrangements inevitable. In 1848 Kastenbein, the manager, introduced a "same roll" or "same machine," and the stereotype plates fixed bodily on the printing machine in place of the movable type. This cleared the way for the introduction of the famous Walter press. Hitherto "formes" could be used, as the type was set up once only—one side of the paper being worked on one machine and the sheets then taken to another machine and "perfected." Stereotyping enabled the locomotion of type to be doubled, and the edition to be cast from one matrix. Mr. Macdonald, the manager of The Times, had devoted himself for several years to the production of a press which could print papers on both sides in one operation from a large roll of paper, and this required cutting both sides on the printing of each sheet, then "laid on" by a man and then printed. After years of experiment the Walter press was introduced into The Times office in 1855, and with it the circulation of the paper was increased so that numbers in a short time were sold. Each press turned out 12,000 sheets per hour, and it was therefore only a question of multiplying the stereotype plates and presses to obtain any number of printed papers by a certain time. Meanwhile Messrs. Hoe had set about producing something even quicker and better than the Walter press. They succeeded in accomplishing this by multiplying the reeds of paper on each machine, 24 to 30 at a time. The result was the production of over 36,000 sheets per hour from each machine.

These presses were adopted by The Times in 1895. In 1868 the question of composing machines for the quicker setting up of types was taken up by The Times. Kastenbein had an invention which he brought to the notice of The Times, and arrangements were made for him to continue his experiments in The Times office. In a couple of years a machine was made, which was worked and improved until in 1874 several machines were ready to set up a portion of the paper; but it was not until 1879 that the arrangements were sufficiently advanced to make certain that they could be carried out all through the paper. The introduction of composing machines, and the necessary alterations in the office arrangements which followed, led to some trouble among the compositors, in which Mr. Lees accompanied a partial strike; but after a considerable length of time the work was renewed with the additional machinery, and an effort to produce the paper at the proper time on the morning following the strike. Various improvements were made, until one machine was brought up as many as 296 lines of The Times in one hour, and 16,000 columns in one day. On the request of the parliamentary report from the House of Commons direct to the compositor was begun in 1885, and was continued until the House decided to rise at midnight, which enabled the more economical method of composing direct from the "copy" to be resumed.

Ever since the introduction of the composing machines the business had been much hampered by the question of "distribution"—that is, the breaking-up and sorting of the types. Kastenbein had invented a distributing machine to accompany his composing machine, but it proved to be unsatisfactory. Various systems were tried, but for the composing machines was to some extent crippled by the distribution difficulty. This had been recognized by Mr. Frederick Wicks (d. 1910), the inventor of the Wicks Rotary Type-casting Machine, who for many years had been working at a machine which would cast new type so quickly and so cheaply as to do away with the old system of distribution and substitute new type every day. In 1899 his machine was practically perfect, and The Times entered into a contract with him for the delivery of a new type casting machine.

(at first on Fridays), is printed in a different form, and separately paginated in 1904 a "Financial and Commercial Supplement" (at first on Mondays, and later on Fridays) was added; in 1905 an "Editorial Supplement" (Wednesdays), and in 1910 a "Woman's Supplement".

The publishing department of The Times also invaded several new fields of enterprise. The Times Atlas was first published in 1896, while The Times Educational Supplement (formerly Longmans') Gazetteer. A much larger and more important venture was the issue in 1898 of a reprint of the ninth edition of the Encyclopaedia Britannica at less than half the original price. The Times formed a group known as The Times system that enabled the purchaser to receive the whole work at once and to pay for it by a series of equal monthly payments. This was followed by a series of evening newspapers, the first reprint was published in 1899, and in the fiftieth years of Punch ; and eleven new volumes of the Encyclopaedia Britannica, supplementing the ninth edition, and forming with its tenth edition, were issued by The Times in 1902 on similar terms on the so-called "Cocoa Press," with the Daily News at its head.

The first number of the Daily Telegraph was published on 29th September, 1855, its editor-in-chief being Mr. A. G. Gardiner. In 1904 considerable changes were made in the style of the paper, which was reduced in size, the office staff was increased, and a new group of Quaker families—largely associated with the manufacture of cocoa—followed his example in promoting the publication of Liberal and Free Trade newspapers, led in later years to somewhat unimportant ends. Forster and Forster was then published as a four-penny penny produced in London. His son, afterwards Sir Edwin Lawson produced (b. 1853), was a great Anglo-American lawyer, H. D. Trail was a leader-writer for the Anglo-American Press, (b. 1854), for many years to the Daily Telegraph, in connexion with his connexion with the paper under Mr Levy. Others prominently associated with the paper have been W. L. Courtney (b. 1856), a distinguished man of letters who, after several years as work of The Times, was appointed Editor of the Daily Telegraph, and was also editor of the Fortnightly Review; E. B. Iwan-Müller (d. 1910) and J. L. Garvin (from 1899), afterwards (1904) editor of the Daily News at his side, and his son and heir, assisted his father in the general control of the paper.

The Daily Telegraph may be said to have had the way in London journalism in capturing a large and important reading-public from the monopoly of The Times. It became the great organ of the middle classes, and was distinguished for its enterprise in many fields. In June 1873 the Telegraph despatched George Smith to carry out a series of architectural researches in Nineveh, which resulted in the instant discovery of the missing fragments of the Turan and the account of the Deluge, and many other inscriptions. In co-operation with the New York Herald it equipped H. M. Stanley's second great enterprise, the exploration of the Free Trade in the Centre, and for many years amongst them it sold nearly 5000 copies daily, and it yielded a steady profit of about £600 a year. Then, by the ability and enterprise of an experienced editor, James Grant (1862-1879), it was within five years, in 1880, of the Telegraph to take the lead in all the newspapers, and to have the lion's share of the London newspaper market.

The Daily Telegraph was consistently Liberal up to 1878, when it opposed Mr Gladstone's foreign policy as explained in the Edinburgh Review by Mr. Offices, and the Daily Telegraph in commemoration of the Jubilee of 1897; and the Shilling Fund for the soldiers' widows and orphans in connexion with the Boer War. An undertaking of a more festive kind was the fête given to 30,000 London school children in Hyde Park on the occasion of the Jubilee.

In politics the Daily Telegraph was consistently Liberal up to 1878, when it opposed Mr Gladstone's foreign policy as explained in the Edinburgh Review by Mr. Offices, and the Daily Telegraph in commemoration of the Jubilee of 1897; and the Shilling Fund for the soldiers' widows and orphans in connexion with the Boer War. The Standard was established as an evening newspaper in the Tory interest (as the express organ of the opponents of the measure for repressing the Catholic Claims), in 1837, by Mr George Butterworth, the editor being Stanley Lees Giffard, father of the first earl of Halsbury, who had Alaric Watts and Dr William Maginn, father of the Rev. Charles Maginn, as his chief helpers. In the course of two or three years it became a pecuniary, as it had from the first been a political, success, and gradually ousted the Courier, which was for a time conducted by William Hay and Robert Wraxall, whose half-century of success made him the distinguished editor of the Standard. In course of time the latter became the proprietor of Mr Charles Baldwin, whose father was proprietor of the Morning Herald, and when the father died the son followed him in the business, and became an even greater success.

In his hands neither of them prospered, although the Standard retained a large circulation and constantly printed early and accurate political reports, many of which, for instance in the Reform Bill of 1832, were purchased by Mr James Johnston, Mr John Maxwell, the publisher, being for a time associated with him in the ownership. Mr Johnston realized that he had had before him a great opportunity, and at once set to work to grasp it. He brought out the Standard as a morning paper (29th June 1857), increased its size from four to eight pages, and reduced the price from fourpence to twopenny. One of the most curious features of the early numbers was a novel by William Howard Russell. The evening edition was continued. In February 1858 Mr Johnston again reduced the price, this time to a penny. When that step was taken the Standard announced that it was "no longer a newspaper, but a magazine, which means that it was 'bound to no party'; and to those independent lines it in the main adhered. In the course of four or five years it became a financial success, and then began to attract to itself many brilliant periodical writers, among whom may be enumerated "living journalists" of the present day. In 1861, papers previously purchased by the poigniant curiosity of the reader, and the paper reached a circulation far beyond anything hitherto known. The distinction thus acquired was maintained during the Prussian-Austrian War of 1866, and greatly increased by the letters and telegramms describing the triumphs and disasters of the campaign of 1870. In the early 'sixties the staff had been reinforced by the engagement of Mr William Heselton Mudford. In the midst of his work as a parliamentary reporter, he was sent as special correspondent to Jamaica in 1865 to report upon the troubles which involved the recall of Governor Eyre; a further period in the gallery of the House of Commons followed. Mr Mudford was the son of a great old family in Leicestershire, the first editor of whose name was Mudford. Mr Mudford's first editor was Captain Hamber, who afterwards succeeded to the short-lived Hour, with whom had been associated Mr Arthur Stopford, who afterwards managed Wood's second paper, the owner's eldest son, to whom Mr (afterwards Sir) John Gorst was joined in a consultative capacity. In 1876 Mr Mudford became editor, still, however, retaining managerial control. Mr Johnstone, the founder of the paper, died in the prime of his career, without much, died in 1878, and under his will Mr Mudford was appointed editor and manager for life, or until resignation. Already a great property, the Standard in Mr Mudford's hands entered upon a very successful period. He had for his first assistant-editor Mr Gilbert Venables, who was succeeded after a short term by Mr George Byron Curtis, previously one of the leader-writers, who thus held the position through nearly the whole of Mr Mudford's long editorship. The staff at this time comprised many men, and some women, whose names are distinguished in letters as well as in journalism. Mr Alfred Austin, Mr T. H. S. Escott, Miss Frances Power Cobbe and Dr William Gargan are among the most distinguished names of the fourth generation of journalists.

To them must be added, among others, Mr E. D. J. Wilson, the brilliant political leader-writer (afterwards of The Times), Mr Percy Greg, son of "Cassandras", Mr G. Greg, Mr T. E. Kebbel and Dr Robert Brown, who wrote copious and pithy articles on both subjects, Foremost among the war correspondents were Mr G. A. Henty, who represented the paper on many a stricken field; Mr John A. Hobhouse, who was afterwards as well known as Atkinson of the Daily Telegraph. In January 1900 Mr Mudford retired, and was succeeded in the editorship by Mr G. Byron Curtis (d. 1907), Mr S. H. Jeyes, whose connexion with the paper had begun in 1891, becoming assistant-editor. In the course of his career there was a frequent change in the line of proprietors, which was not an advantage to the paper. In 1920 there was a strong line in depreciating the tariff reform movement within the Unionist party, was sold to Mr C. Arthur Pearson (proprietor of the Daily News) for £5,000, being chairman of the Tariff Reform League, and considerable changes were made in the paper. Mr H. A. Gwynne became editor. In 1910 Mr Pearson, owing to ill-health, transferred his interests in the proprietory company he had formed in 1904 to Mr Davison Dalziel. The Daily Chronicle arose, as already mentioned, out of the local Clerkenwell News, the latter paper having been purchased by Mr R. W. Whelan Boyle, the Daily Chronicle was started in 1883 under the editorship of Lord Chamberlain. The Daily Chronicle, on the other hand, started in 1893, having a large staff, and was at first conducted by Robert Pearson, who was afterwards a great newspaper proprietor of very much influence.

The Daily Chronicle had taken a leading part in many public movements since 1877. It was conspicuous in its advocacy of the cause of the women in the London dock strike of 1889, and in the great mining strikes of 1892 and 1893, which was conducted by Mr Robert Pearson Rosebery in November 1893, raised over £13,000 for the relief committee. Much attention was given to the theosophical discussion which occurred in the course of a Daily Chronicle article, and to the events which followed. Mr Pearson had appeared before the British Association at Bristol in 1898. The Chronicle had an active part in the negotiations which led to the Venezolan Arbitration Treaty of 1897; it energetically advocated the cause of the Armenians and Turks during the massacres of 1896, and it encouraged the Greeks in the war with Turkey in 1897. Its foreign policy was, however, more distinguished by good will than by discretion—and notably in the latter instance. The Daily Chronicle was not only the leading newspaper in London, but in regard to the County Council, Borough Councils and the School Board. Its new successes included the first announcement of the revolution in eastern Rumelia (1896); the first circumstantial account of the death of Prince Randolph (1898); Nansen's own narrative of his expedition towards the North Pole; Sir Martin Conway's journey across Spitzbergen in 1896; and the first ascent of Aconcagua in 1897.

In 1890 the illustrated morning daily paper, the Daily Graphic, was founded by W. L. Thomas (1850-1901) as an offshoot from the weekly Illustrated Graphic, and soon came into its own. The Daily Graphic was managed by Mr Robert Pearson, who was afterwards a great newspaper proprietor of very much influence. In 1906 a new Liberal morning daily was started by Mr Franklin Thomason in the shape of the Tribune, edited by Mr W. H. Hill, who was subsequently a great newspaper proprietor of very much influence. The Tribune was managed by Mr Robert Pearson, who was afterwards a great newspaper proprietor of very much influence. The Morning Leader, under the same management as the (evening) Star, started to flourish, but the Morning had but a brief career.

The halfpenny Daily Mail was originated by Mr Alfred Charles Harmsworth (b. 1865), who was subsequently created a baronet (1902) and in 1905 a peer as Baron Northcliffe; it appeared in 1896, on the same day as Sir G. Newnes's penny Courir (which only lasted a few weeks). In the evolution of English newspapers, the Daily Mail was a great step forward; it furthered the work begun by the Daily Telegraph in earlier days. It was the first halfpenny morning newspaper to place its content before its readers completely, that is to say, not to offer any charge for the paper. The Daily Mail, in its first edition, appeared simultaneously in London and Manchester, the whole of the contents being telegraphed nightly. In May 1904 it began publishing a continental edition in Paris. The sensational success of the Daily Mail, with its large circulation of readers throughout the country, and particularly in London, was due to the adoption of the following policy: a close and lasting bond of interest; a large circulation, and resulting advertising revenue, gave it an influence which in politics was used on the Unionist side; but the readers of the Daily Mail went to it, not for politics, but for news, briefly and brightly displayed. Its triumph represented the
success of a business organization, in which individual views on affairs played a part.

The penny Daily Express, founded by Mr Cyril Arthur Pearson (b. 1866) on the lines of the Daily Mail, first appeared in 1900, and its senior editor, Hugh Ismay, with R. D. Blumenfeld as its head, was the first to introduce the practice of 'blue-pencil' editing. The Daily Mirror started in 1903 under the editorship of Colonel Torrens. The Times, the Daily Telegraph, and the Daily Mail are all newspapers founded in the 19th century, with the Daily Express and the Daily Mirror being the most successful of all the evening papers. The Daily Telegraph was the first to introduce the practice of 'blue-pencil' editing.

The Daily Mirror, started by Mr Harnsworth as a women's penny daily in 1904, failed to attract in its original form, but when it was transferred to London in 1905, it became a successful news sheet. The Daily Herald, founded in 1908, was also a success, and was later adopted by the Labour Party. The Daily Express, the Daily Mirror, and the Daily Herald were all established in the 19th century, with the Daily Mail and the Daily Telegraph being the most successful of all the evening papers. The Daily Telegraph was the first to introduce the practice of 'blue-pencil' editing.

By the end of the 19th century, the evening newspapers had become more and more influential, and the proprietors of the Daily Express, the Daily Mirror, and the Daily Herald were all successful in attracting readers.

Poll Mall abandoned in 1892. Gradually these changes took effect. In 1908 Mr Theodore Andrea Cook, who had been assistant-editor since 1878, bought the house for a nominal sum from Ronald MacNeill (till 1903) who acted in this capacity, with Mr W. D. Ross as manager. Meanwhile the *St James's Budget*, which up to 1893 had been a weekly edition of the *St James's Gazette*, became a daily, weekly, edited from the same office by Mr J. Penderel-Brodhurst (afterwards editor of the *Guardian*), who had been on the editorial staff since 1888; and it continued to be published as a separate daily newspaper until the amalgamation with the *Morning Standard* in 1895. From the days of Daniel Defoe there have always been newspapers bearing the unmistakable impress of an individual and powerful mind. Cobbett's *Weekly Register* and the *Weekly Herald* were notable influences on the literature of its greatness and in its meanness as could be found throughout its entire annals. And Cobbett's paper has had many successors, some of which, profiting by the marvellous mechanical appliances which have come into existence, have exercised a greater influence than was possessed by the *Weekly Register* in its most prosperous days.

The history of the series of weekly reviews practically begins with the *Examiner*, which was founded in 1808 and had a long career as one of the most prominent organs of the Liberal party, ending in 1881. That its literary reputation was great resulted naturally from a succession of such editors as Leigh Hunt, Albany Fonblanque, John Foster and Henry Morley. This was succeeded in January 1817 by the foundation of the *Literary Gazette*, the proprietor of which was Henry Colburn and the first editor William Jordan. Jerdan succeeded in inducing Crabb and Campbell to contribute to it, and among those who assisted him were Bulwer Lytton, Barry Cornwall and Mrs Hemans. The *Literary Gazette* came to an end in 1826. At the end of August 1827 the *Quarterly Review* was founded, which for time had extraordinary popularity; to it he contributed the most brilliant of his *jeux d'esprit*.

Epochs in the development of this form of literature were marked by the *Edinburgh Review* (1813-1829) and *The Spectator* (1711), the latter sold the paper to Mr Scott, who retired, however, from the editorship after a few months; and for a time the *Spectator* was in low water. In 1861 it passed into the hands of Mr J. St Loe Strachey (b. 1860), but under him it became a more powerful organ, if only because it more than maintained its former standard of criticism. In 1886 the *Spectator* was purchased by the Free Trade Unionists, who, however, at the end of 1895, sold it to the *Spectator and Saturday Review*. It is the *Spectator* and *Saturday Review* of the *Spectator* and the "Spectator" and the *Saturday Review*.

When the Poll Mall Gazette was sold to Mr Astor in 1892 and converted into a Conservative organ, Mr E. T. Cook, the editor, and most of his staff, resigned, and in 1893 they came together again on the *Westminster Gazette*, for a purpose by Sir G. Nwens (who had made a fortune out of *Titt-bit* and other popular papers) as a penny Liberal evening paper. It was printed on green paper, but the novelty of this soon wore off. The paper was conducted on the lines of the old *Poll Mall*, and it had the advantage of a brilliant political cartoonist in F. Carruthers Gould. In 1894 Mr Cook was appointed editor of the *Daily News*, a paper which was also conducted on the old *Poll Mall* lines, and Mr A. B. Gould, who had been his assistant-editor, Mr Gould (who was knighted in 1906) being his chief assistant. Apart from Sir F. C. Gould's cartoons, the *Westminster* became conspicuous in London evening journalism for its high standard of production and the quality of its columns. It gradually became the chief organ of Liberal thought in London. One of its early literary successes was the original publication of Mr Anthony Hope's *Dolly Dialogues*, and it continued to maintain, more than any other evening paper, the older literary and political tradition of the "gentlemanly journalism" out of which it had sprung. In 1908 a change of proprietorship took place, the paper being sold by Sir G. Newnes (d. 1910) to Mr (afterwards editor of the *Echo* in London, and disappeared from the scene. In 1868 appeared the *London Echo*, published by Henry Cassell. It had for its first editor, until 1875, Mr (afterwards Sir) Arthur Arnold (1833-1900). It was a political paper, and was conducted by a committee, but was shortly afterwards bought by a Conservative syndicate. It was sold to the *Morning Star* (1887) and then became the *Morning Chronicle*. It was bought by Messrs Harnworth for £25,000, and under Mr Kennedy Jones's management developed into a highly successful property. On 17th January 1887, a new proprietorship of the *Morning Chronicle* was formed by the **Mr T. P. O'Connor (b. 1848), as a half penny evening newspaper in support of Mr Gladstone's policy. When Mr O'Connor left the paper, Mr H. W. Massey became its editor, and subsequently Mr Ernest Parke. In 1909 the Star was acquired by a new proprietorship in which Messrs Cadbury and the *Daily News* had an important share. From the first it was conceived for its advanced politics, and also for excellent literary criticism. In 1893 Mr T. P. O'Connor founded the *Sun*, which eventually passed on the title of a succession of proprietors and came to an end in October 1906.

As regards the purely sporting press in London, the *Sporting Life*, which was founded in 1836, became incorporated the old *Bell's Life*. The *Daily Sportsman*, the leading paper, was founded in 1865. The financial daily press is a modern creation and has taken many forms. In 1884 the financial *Financial Times*, under Mr H. H. Marks, made its appearance, and in 1888 the *Financial Times*, and these became the leading papers of their class. The weekly press (see also under *Periodicals*) has always worn a motley garb. Weekly publication facilitates the individuality of a journal, both as respects its editorship and as respects its contributors. To the best of my knowledge, there exists no newspaper in the world which is solely and entirely the work of one and the same individual. From the days of Daniel Defoe there have always been newspapers bearing the unmistakable impress of an individual and powerful mind. Cobbett's *Weekly Register* and the *Weekly Herald* were notable influences on the literature of its greatness and in its meanness as could be found throughout its entire annals. And Cobbett's paper has had many successors, some of which, profiting by the marvellous mechanical appliances which have come into existence, have exercised a greater influence than was possessed by the *Weekly Register* in its most prosperous days.

The *Spectator* was edited for thirty years by Robert Rintoul. In 1888 the latter sold the paper to Mr Scott, who retired, however, from the editorship after a few months; and for a time the *Spectator* was in low water. In 1861 it passed into the hands of Mr J. St Loe Strachey (b. 1860), but under him it became a more powerful organ, if only because it more than maintained its former standard of criticism. In 1886 the *Spectator* was purchased by the Free Trade Unionists, who, however, at the end of 1895, sold it to the *Spectator and Saturday Review*. It is the *Spectator* and *Saturday Review* of the *Spectator*. The *Spectator* and the "Spectator" and the *Saturday Review*.
was sold by the heirs of Mr. Beresford Hope to Mr. Lewis Edmunds, from whose hands it soon passed to Mr. Frank Harris. In 1809 the paper was sold to Lord Hardwicke and came under the editorship of Mr. William Hope who resided in this position when, after Lord Hardwicke's death in 1905, it passed into the hands of Mr. Gervase Becket.

The Saturday Review and Spectator, as the exponents of brilliant Truth and Cevanter, had grown very much and they themselves for some years; but when in 1886 the Spectator followed the Liberal Unionists in opposing Home Rule for Ireland, and ceased to support Gladstone, its long editorship passed to the hands of Lord Lonsdale in the Radical Speaker (1898); and in 1898 the threepenny Outlook (altered in price in 1905 to sixpence) was started, to present more particularly the growing interests of the Colonies and the Empire. The first editor of the Outlook was the proprietorship of Mr. J. L. Garvin (b. 1868) in its advocacy of Mr. Chamberlain's policy of a preferential tariff, when the Spectator became aggressively Free Trade. In December 1906 the Outlook was sold by its proprietor to Mr. Gervase Becket, and Mr. Garvin resigned the title.

In 1907 the Speaker was incorporated with the Nation, a new Radical weekly, edited by H. W. Massingham. Several ambitious new weeklies meanwhile started, and some passed away before the end of the century, such as the Realm, the British Review and the Review of the Week. The most brilliant of all these, which also lasted the longest, was the Scots (soon renamed the National Observer) which published in Edinburgh, and was conducted by Mr. J. S. Cottison. It began by a first number on 26th May, 1867, and was continued by Mr. J. S. Cottison until 1877. The Pilot (1900) under Mr. D. C. Lathbury was another brilliant attempt, but it failed to pay its way and hardly lasted for three years.

In 1879 a weeklies, was conducted by Mr. H. W. Massingham with a weekly, the Academy, founded in October 1869 by Dr. Appleton and edited by him. Later, under the editorship of J. S. Cottison, it was famous for its signed reviews and scholarly character; but the small circle to whom pure literature appealed made financial success difficult. In 1896 the Academy was bought by Mr. Morgan Richards, and for some years was edited by Mr. Lewis Hind, amalgamating Literature (a weekly conducted by Mr. L. A. L. Housman) and the Academy. Subsequently under changed proprietors it was successively edited by Mr. Teignmouth Shore and Mr. Anderson Graham. In April 1907 it was bought from Sir G. Newnes by Sir Edward Tennant, and thereafter conducted by Mr. Alfred Douglas, who in 1910 parted with it to a new proprietor.

The publication of Sunday editions of the daily papers has not found the same favour in England as in the United States. A Sunday Daily Mail and a Sunday Daily Telegraph appeared simultaneously; but public opinion was so violent against seven-day journalism that both were withdrawn. The oldest of the Sunday papers, the Observer (1791), was conducted by one editor, Mr. Doxat, for more than fifty years. It was one of the first papers to contain illustrations. In later years Mr. Edward Dicey was a notable editor. In 1905 the Observer passed into the hands of the Daily Telegraph, and编辑ed by Mr. and Mr. Harrison, a son of Frederic Harrison. In 1907 Mr. J. L. Garvin became editor, and under him the old influence of the Observer revived.

Lloyd's Weekly Newspaper started as an un stamped illustrated journal at a penny in September 1842. In 1843 it was enlarged in size, and the price raised to threepence. Curious ingenuity wasn shown in another new illustrated weekly, the Illustrated Times, which had been started by the Times (1841). From a weekly sale of 33,000 in 1848 it rose to 170,000 in 1861. In anticipation of the abolition of the paper duty, the price was then reduced to a penny, and its circulation continued to increase. It was conducted by Mr. F. Cattrell, but was eventually taken over by Reynolds's Weekly Newspaper, an extreme Radical paper with a large circulation, dates from May 1850. Other Sunday papers came later into existence—the People (1864) and the English Republic (1867) conducted by Mr. and Mr. Harcourt, the People's Weekly, which had been started by Mr. (1867) with which in 1904 amalgamated the Sunday Times (1822). The Referee (1877), a paper with a strong sporting and theatrical interest, is famous for the humorous contributions by Dagonet (C.M. Smeed) and for the fine illustrations which adorned its articles.

The London illustrated weekly papers the oldest, the Illustrated London News (1842), and the Pictorial World, which lasted for some years, began in 1874. In 1891 Black and White was started; and in 1892 the Sketch, edited by Mr. Clement Shorter (also then editor of the Observer) was introduced a lighter vein.

Mr. Shorter gave up the editorship of these two weekly papers in 1901, and became editor of a new illustrated weekly, the Sphere, with the proprietorship of which he came also to be associated. In 1897, the illustrated weekly of a high class, Country Life Illustrated, began in 1897.

The "Society" weeklies, Truth (1877), Vanity Fair (1868)—with a separate cartoon as a special feature, famous for the artistic work of Pellegrini, Leslie Ward and others—and the World, "Society" (1874), brought a new "note" into regular journalism, Mr. and Mr. Pellegrini, the World's most famous illustrator, contributing to the increase of the personal style which he did so much to introduce; and Truth made its proprietor, the politician Mr. Henry Labouchere, one of the most prominent men of the day. The World also published a Rural and Domestic Review as for its vigorous exposures of all sorts of public charlatanism.

Among other weeklies, important ones are such ecclesiastical and political weeklies, as the Spectator (1863), the Tableet (1840), Christian World (1857), Methodist Times (1885); the medical papers, the Lancet (1823) and British Medical Journal; the financial papers, the Economist (1843) and Statist (1851); and the great sporting and country-house paper, the Field (1853).

Among humorous papers Punch (1840) stands first (see Caricature), of which Mr. M. H. Spielmann published a History; Pan (1860–1901), Mr. Harry Furniss's Liba Joke (1894) (only for a few months), Judy (1867), Moonshine (1879), and Pick-me-up (1888), have also catered for popular mirth.

Women Journalists.

Women journalists were among the leaders of the women's movement in the 19th century. Among the prominent women writers of the period were Frances Power Cobbe (1822–1905), who was a member of the British Women's Suffrage Society and became a prominent public speaker; Jane Heavenly (1822–1905); and Jane 摘要
quickly afterwards; and other early papers worth mentioning were the Salisbury Journal (1729); Manchester Gazette (1730-1760); Manchester Mercury (1752-1762); the earliest Birmingham paper, Artiz's Gazette (1741); the Cambridge Chronicle (1744); and the North British Journal (1753). These were followed by the Liverpool Advertiser (1756) and Gore's General Advertiser (1755-1787). Of the above the Leeds Mercury (1757) became an increasingly important organ. The Newcastle Journal was first published in 1753, with a weekly price of three-halfpence. In 1726 it was reduced to four pence, with a circulation of 3000. Its price at this time was fourpence. The increase of the stamp duty in 1797 altered its price to fivepence. The York Mercury was purchased in 1801 by Edward Baines, who first began the insertion of "leaders," and whose family left an impress on not only journalism but literature as well. English provincial newspapers obtained a circulation of 1500; but the Mercury afterwards made rapid progress. When the Stamp Tax was removed, its price was reduced to a penny, and in 1901 to a halfpenny. For many years it admitted neither halfpenny nor a new sixpenny to its columns, and it had a powerful moral and political influence in Lancashire and Yorkshire.

The pollution of the duty on advertisements in 1853, of the stamp duty in 1855, and of the paper duty in 1861, opened the way for a cheap press, and within ten years of the abolition of the paper duty penny morning newspapers had taken up commanding positions. The Leeds Mercury, the Rotherham Advertiser, the Yorkpool, Manchester, Leeds, Bradford, Newcastle and Sheffield; in Birmingham and Nottingham; in Bristol, Cardiff and Plymouth; and across St George's Channel in Dublin, Cork, Belfast and Waterford. The provincial evening papers began to multiply. But any real importance as organs of opinion was still confined to only a few of the great penny press. The first to forecast the future was the Times, and to the last of its class, the Observer. The first to be in existence was the Liverpool Mercury (1857), Sheffield Telegraph (associated with Sir W. Leng), Liverpool Daily Post, Leeds Mercury and Western Morning News; others too numerous to mention here were at the same time catering to the curiosity of journalists who were to become famous in journalism, such as the Darlington Northern Echo, on which Mr W. T. Stead made his debut, while Mr Joseph Cowen for some years made the Newcastle Daily Chronicle a powerful organ. It began as strictly local organs. But even in 1870 it was beginning to be universally perceived that, though the influence of a newspaper depends upon the sagacity, sound judgment and courage of the editor, its success as a business enterprise rests mainly with the business manager. Managers demanded less localism, a wider range of news, prompter and fuller reports of all important events, longer parliamentary reports, parliamentary sketches, verbatim reports of speeches by statesmen of the first rank. In the early 'seventies such a thing as a full telegraphic report in a provincial morning newspaper of parliamentary proceedings, or of a speech by a leading statesman, was almost unheard of. After the early 'eighties there was short talk, but not had then covered the country with its organization. Reuter's foreign news service very briefly reported important events. Leading articles were written, but their circulation was not extended to the extent that their appearance was forecast, as the result of the social and educational changes. More newspapers had been content to fill their columns with local news and clippings from London and distant provincial papers put such matter aside. Telegraphic news rushed it out. In February 1870 the government took over the telegraph system. The advantage of the change was immediately felt by newspapers and their readers. In 1876, when the English and Irish newspapers, following Scotland's lead, began to open offices in London, where Fleet Street soon began to be an open directory to the provincial press—English, Scottish and Irish. The Scotch man in London not only attended to the 'London morning and evening papers, and the most enterprising English papers for convenience and advantage, engaged special wires. Others that were near enough to London to do so secured London news and advertisements by railway, and consequently that the paper was suppressed by the application of a system of special wires to the Commercial news, both home and foreign, especially American, was expanded. The Press Association spread its news-collecting organization over the whole country, and was stimulated to activity by the rising opposition of the Central News. All this energy had its "counterpart in the business side of the press. Rapid "perfecting", printing machines were introduced, and newspaper managers found themselves able to procure newspapers in practically unlimited quantities. Of the news itself there was an increased and more frequent circulation. New and more enterprising journals saved themselves by special London letters, parliamentary sketches and other special contributions. In the same way new newspapers sprang up, some to replace provincial newspapers, and these accordingly enjoyed new facilities for special effort and distinction. A more important matter, however, was the bombardment of Alexandria and the subsequent Egyptian War. The leading provincial newspapers had already emancipated themselves from localism, and in general news and criticism had risen almost, if not quite, to the average level of the London newspapers.
BRITISH

NEWSPAPERS

year the Gazette was transferred to John Reid, by whose family it long continued to be printed. In February 1705 Watson started the Edinburgh Courant. It was first printed by him, and later continued by his son, James Watson, who also published the Scots Courant, but at the site of allowance of the clerks of council. In 1710 the town council authorized Mr Daniel Defoe to print the Edinburgh Courant. It was therefore the place of the deceased Adam Boig. Four years earlier (1706) the town council advertised about the offices of Watson, James Watson, had begun the Scots Courant, which he continued to print until after the year 1718. To these papers were added in October 1741 the Edinburgh Flying Post and in August 1799, the Scots-Postman. Five years later this paper appears to have been incorporated with the Edinburgh Gazette. The Caledonian Mercury began April 25, 1720. At one period it was published three times and afterwards twice a week. Its first proprietor was William Rollan, an advocate, and its first editor Thomas Ruddiman. The property passed to Ruddiman on Rollan’s death in 1720, and remained in his family until 1772. It is curious to notice that in his initiatory number of April 1720, Rollan claimed a wide rate of distribution, his Mercury with that of 1660. This journal, he said in his preface to the public, “is the oldest [existing] in Great Britain.” And his successor of 1720 was continued by others of the paper of the Caledonian Mercury. He brought out a facsimile of No. 1 of Mercurius Caedonianus (January 1660), in its eight pages of small quarto, curiously contrasting with the great double sheet of the day. But this was done for a period of two months only, and was discontinued. The connexion of the two newspapers cannot be proved to be more than nominal. The Caledonian Mercury was the first of Scottish journals to give conspicuous place to literature—foreign as well as Scottish. In the 14 years of its editorship, Thomas Ruddiman, junior, virtually sacrificed his life,1 and the other, James Grant, went into exile, for the expression of conscientious political opinion. Its publication ceased after an existence of more than one hundred and forty years.

Notwithstanding the positive assertion 2 that the Edinburgh Courant and the Edinburgh Evening Courant “were entirely different journals, and that the contents of the one were not contained in the other” a substantial identity may be asserted upon better grounds than those for which identity used to be claimed for the Caledonian Mercury with Mercurius Caedonianus. The grant by the town council of Edinburgh in December 1718 of a licence to James McEwan to print an Evening Courant three times a week appears to have been really a revival, in altered form, of the original Courant, repeatedly referred to in earlier, but not much earlier records of the same corporation. So revived, the Evening Courant continued to be published until his paper to give foreign intelligence from original sources, instead of repeating the advice sent to London. In 1760 David Ramsay became editor, and, the journal adopted a more national character, and attained the largest Scottish circulation of its day. It was then of neutral politics. Subsequently, returning to its original title, and appearing as a daily morning paper, it ranked for long as the senior organ of the country, being answering at least the competition of the Scotsman caused its disappearance, and after amalgamating with the Glasgow News or the Scottish News in 1886, it expired in 1886.

The Edinburgh Weekly Journal began in 1744, but it only attained celebrity when, almost seventy years afterwards, it became the joint property of Sir Walter Scott and of James Ballantyne. Scott wrote in its columns many characteristic articles. Ballantyne died until his death in 1833, and was succeeded in the editorship by Thomas Moir. The paper was discontinued about 1840. The Edinburgh Evening News started in 1783.

The Edinburgh News, a Scottish newspaper, was established as a twice-a-week paper in January 1817 and became a daily in June 1855. It ranked as the chief organ of the Liberal party in Scotland, until the Home Rule split in 1886, when it became Unionist. It was founded by William Ritchie, in conjunction with Charles Watt. For a short period it was edited by J. R. M'Culloch, the eminent politician. He was succeeded by MacIntyre, who edited the paper until 1845, when he in turn was by Alexander Russel (1845–1870), who (as Mr L. C. Keith) may be considered its founder.

Kingdom’s Intelligence. But this was a London newspaper, dating from 1662, which may occasionally have been reprinted in Scotland; no such copies, however, are now known to exist. In like manner the Scottish Mercury, No. 1, May 8, 1692, appears to have been a London newspaper, printed from Scottish types. Almost the same article written in 1848, in the Scottish Journal of Topography, vol. ii. p. 301, it is mentioned as an Edinburgh newspaper.

During an imprisonment of six weeks in the Tolbooth of Edinburgh his health suffered so severely that he died very shortly after his release.

† History, Grant of the Newspaper Press (1873), iii. 412. great ability until 1876. In 1859 the first of Hoe’s rotary machines brought into Scotland was erected for the Scotsman. The Scotsman founded a great newspaper, strong both on its literary side and also in geographical scope. It also has been in Edinburgh, Scotland, its publishing offices being opened in Glasgow, which was a better centre for distributing in the west, and in Perth for the north and the Highlands. The Scotsman has maintained its rivals in Edinburgh. In 1885 the Scotsman issued an evening paper.

The North British Advertiser was founded in 1872. The Witness began in 1840 as the avowal of the subservience of the Free Church party in Scotland. In its first prospectus it calls itself the Old Whig. The paper appeared twice a week, and its editor, Hugh Miller, very soon made it famous. In the course of less than sixteen years it had so far increased its size and its influence that the literary ability, still more so for a wide range of acquaintance and of original thought, must of all for deep conscientiousness. It survived its rivalers’ deaths and, from 1853, this journal bore the name of the Press. In Glasgow the Glasgow Herald was founded in 1782. When the Scotsman extended its activities to Glasgow, the Herald opened an office in Edinburgh; and it took an active part in breaking down the wall of prejudice, and in 1786 it is said that it had a circulation of 1000. Its paper was a halfpenny, and later it became a powerful organ. The North British Daily Mail was established in April 1847. George Troup, its first editor, made it specially famous for the organizing skill with which he brought its intelligence at an unprecedented speed from Carlisle, the nearest point on the line, connected with London by railway. The Glasgow Evening News was started in 1870.

The Aberdeen Journal was founded as a weekly paper in 1748 and became a daily in 1876. In 1879 it issued an evening edition. The Aberdeen Daily Free Press, originally a weekly, dates from 1833. In 1881 it issued an evening paper in connexion with itself. The newspaper was started in 1780. The first roll for the Glasgow News was in 1809. In 1831 it began in 1865. Five years later the newspaper appeared under the name of the Glasgow Intelligencer. It ceased to appear, the official organ of the vice-regal government. The Freeman’s Journal was established in 1728. Edislaw’s News-Letter began in 1744, took the title of Saunders’s News-Letter in 1754 (when it appeared three times a week), and became a daily newspaper in 1777.

The Colonial Gazette, a weekly newspaper, has long been prominent among the Dublin papers. It was established as a daily newspaper by the British Government to promote the interests of the Irish people. It is published in English and was founded by a committee of the society of “United Irishmen” in 1763, and it was more to the demands of the time. The paper has been published in Dublin, and was first issued with the Dublin News-Letter of 1805. Five years later it was published in 1810. The Dublin Intelligencer (No. 1, September 30, 1809), of this title, was issued from 1790 to 1800. Both of the papers are continued to appear, and the number of are published in the Dublin papers of Ireland. In 1710 or in 1711 (there is some doubt as to the date of the earliest number) the Dublin Gazette began to appear, the official organ of the British Parliament. This newspaper first appeared in 1728. The Dublin News-Letter began in 1744, took the title of Saunders’s News-Letter in 1754 (when it appeared three times a week), and became a daily newspaper in 1777.

The Irish Waterford was started in 1737; the Belfast Telegraph was started in 1789; and the British Northern Whig in 1824.

British Dominions beyond the Sea.

It is unnecessary here to give all the statistics for the British Colonial Press, which has enormously increased in modern times. So far as its early history is concerned, it may be noted that the Kempt’s Gazette was started in Barbados in 1731 and Granada followed with its own paper in 1733. The first of its kind in the West Indies was The Halifax Gazette, which was established in 1751 and the Montreal Gazette in 1737. The first Australian paper was the Sydney Gazette and New South Wales Advertiser (1803-1843), the Devon Star, in Van Diemans Land (1852-1855), and the first paper on the south side of the Great Barrier Reef was the Townsville Daily Bulletin (1864-1889). The most extensive of the newsprint of the British Colonial Press, which had been produced outside the sea, and the well-conducted newspapers. The Canadian Press has naturally had certain marked affiliations with the country of newsprint and the globe.
the organ of the Liberal party, has played a leading part in Canadian journalism. In London and in India, the Oriental Press is the foremost organ; and among the colonial morning newspapers, those of Madras and Calcutta are the most important. The London and the New York Evening Post are still the two leading journals of the world; but the London papers are much more influential than the American daily newspapers.

In the colonial press, the rivalry between the two great periods of the 18th century, the first half of the century and the second, is not so evident as it is in the American press. The first half of the century was the period of the establishment of the colonies, and the second was the period of their consolidation. The first half of the century was the period of the American Revolution, and the second was the period of the War of 1812.

The first half of the century was the period of the American Revolution, and the second was the period of the War of 1812.

3. NEWSPAPERS OF THE UNITED STATES

Massachusetts.—Boston was the first city of America that possessed a local newspaper; but the earliest attempt in that direction, made in 1771, 'A Boston News-Letter' was not a success. It was published in the Publick Occurrences, which followed in September 1690, but was both suppressed by the government of Massachusetts. Nearly fourteen years afterwards (April 24, 1704), the first number of the Boston News-Letter was "printed by B. Green, and sold by Nicholas Boone." Its proprietor and editor—so far as it can be said to have had an editor, for extracts from the London papers were its staple contents—was John Campbell, postmaster of the town. In 1719 he enlarged his paper, in order, as he told his readers, "to make the news newer and more acceptable; ... whereby that which steamed in the former half-sheet by the post, is now by the sheet. ... This time twelvemonth we were thirteen months behind with the foreign news beyond Great Britain, and now less than five months; so that ... We have retrieved about eight months since January last;" and he encourages his subscribers with the assurance that if they will continue steady until January next, life permitted, they will be accommodated with all the news of Europe that are needful to be known in these parts." But Campbell's new plans were soon disturbed by the loss of his office, and the commencement of a new journal by his successor in the postmastership, William Draper, entitled the Boston Gazette, "published by authority" (No. 1, 21st December 1719). The old journal had a bitter controversy with his rival, but at the end of the year 1722 relinquished his concern in the paper to Benjamin Green, who carried it on, with higher aims and greater success, until his death, at the close of 1733, being then succeeded by his son-in-law, John Draper, who published it until December 1762. By Richard Draper, who followed his father, the title was altered to Massachusetts Gazette and Boston News-Letter; and the maintenance of the British rule against the rising spirit of independence was uniformly undertaken by the paper, and that of his widow (to whom, at a subsequent period, a pension was granted) for the general conditions producing the modern type of American newspaper, see the first section of this article. In the following account of American and foreign newspapers, the historical mention of these papers is also noted. The official editors of the Ency. Br. has been utilized and in parts revised.

In other words, the attention of the Bostonian politicians was engrossed on the siege of Belgrade, when their contemporaries in the mother country were intent on the destruction of the Spanish fleet on the coast of Sicily.
granted by the British government). It was the only paper printed in Boston during the siege, and ceased to appear when the British troops were compelled to evacuate the city.

The Boston Gazette, founded in 1719, had James Franklin, elder brother of the celebrated Benjamin Franklin, as its first printer. It lasted in March 1726, though its editorship was changed with the change of the proprietors. On the 17th August 1721 James Franklin started the New England Courant, the publication of which ceased in 1727; and two years later Benjamin Franklin purchased the Pennsylvania Gazette, which he continued weekly until 1765.

To the Boston Gazette and the Courant succeeded the New England Weekly Journal (20th March 1727; incorporated with the Boston Gazette in 1741), and the Weekly Rehearsal (27th September 1731), which became the Boston Evening Post (August 1735), and under that title was for a time the most popular of the Boston newspapers. It aimed at neutrality in politics, and therefore did not survive the exciting events of the spring of 1775. Several minor papers followed, which may be passed over without notice. A new Boston Gazette, which began in April 1755 (merged in 1836 in the Centinel), is of more interest. For a long time it was the main organ of the popular party against England, and expanded its policy with great ability, and in a dignified tone. Otis, John Adams, Samuel Adams and Joseph Warren were amongst its writers. It was strongly Republican after the adoption of the constitution, especially opposing its old contributors.

The Massachusetts Spy (1770), under the indefatigable editorship of the American historian of printing, Isaiah Thomas, did yeoman's service in this struggle, although of a different kind from that of the Boston Gazette. The latter spoke chiefly to the thinkers and natural leaders of the people. The Spy was a light and active skirmisher who engaged his antagonists wherever he met them, and frequently carried the war into the enemy's country. In July 1774, during the operation of the Boston Port Act, and soon after the landing of four British regiments, it adopted Franklin's odd device, representing Great Britain as a dragon, and the colonies as a snake divided into nine parts with the motto, "join or die." But Boston grew too hot for the patriotic printer, and he had to remove to Worcester on the day of the battle of Lexington. Here the paper continued to be published (as the Worcester Spy) until 1786,—the lack of the stirring revolutionary matter being occasionally supplied by the republication in its columns of entire books, such as Robertson's America and Gordon's History of the Revolution. This journal, like so many more, was for a time killed by a tax. The stamp duty imposed in March 1776, although repealed, was passed into law. It lasted until the end of 1775, and under that title was for a time the most popular of the New England newspapers.

The New Hampshire.—The New Hampshire Gazette (1756; daily edition since 1852), published at Portsmouth, was the "father" of the New England press. The Cheshire Republican (1793) and New Hampshire Sentinel (1799; evening edition since 1890) are still published at Keene.

Vermont.—The earliest paper established in Vermont was the Green Mountain Postboy, first published in April 1781. The oldest important paper in Vermont is the Rutland Herald (established in 1794 as a weekly; daily edition since 1861). The Vermont Journal of Windsor, Vermont, was established in 1791.

Maine.—The first papers of any importance published in Maine were the Portland Advertiser (evening, 1759), of which James G. Blaine was editor in 1857-1860; and the Eastern Argus of Portland (September 1803). The latter was established by Nathaniel Willis (1780-1789), the father of N. P. Willis. Willis was converted in Portland by Edward Payson and about 1808 he left the paper. In 1816-1826 he established in Boston the Recorder, which is supposed to have been the first American religious paper. In 1827 Willis established the Youth's Companion, the most popular American juvenile paper, and the Eastern Argus was edited in 1830-1834 by Seba Smith (1818-1868), who was established in 1829 the Portland Courier, which he edited until 1857 and to which he contributed the sketches published in 1833 as Life and Letters of Major Jack Downing.

Connecticut.—The Connecticut Courant of Hartford was established in October 1764 as a weekly; in 1803 there appeared a semi-weekly issue, and its daily issue, the Hartford Courant, first appeared in 1837. The paper was a strong supporter of the administrations of Washington and Adams. Probably the best known of its editors is Joseph R. Hawley, Charles Dudley Warner was for a long time a member of the staff. The Hartford Times (semi-weekly 1817; daily, 1841) has always been a prominent paper. Its principal early editors were Gideon Wells in 1826-1836 (in 1861-1866 he was United States secretary of the navy), and John Milton Niles (1826-1836), who was United States
Newspapers | American

The oldest newspaper now published in Baltimore is the American, the successor of the Maryland Journal and Baltimore Advertiser founded in August 1773; on the 21st September 1814 it published “The Star Spangled Banner.” The Baltimore Sun was started in 1837.

New Jersey.—New Jersey had no really established newspaper before the Revolution, although the first number of an intended journal was published in 1765, under the title of the Constitutional Gazette, containing matters interesting to Liberty, but no wise repugnant to Royalty. The earliest regular paper was the New Brunswick Times, which began in December 1775 at Burlington (soon removing to Trenton), and ceased publication in 1786. A State Gazette (weekly), now published in Trenton, dates from 1792 (daily, 1846); Trenton’s largest paper is the Times (evening; 1883). The Sentinel of Freedom, a Newark weekly, was first published in 1796; its daily edition, the Star, dates from 1832. Newark’s largest paper is the Evening News (1883). The New Brunswick Times was first published as a weekly in 1792; a daily edition was added in 1849.

Virginia.—Virginia, notwithstanding its illustrious predecessor, the province of Raleigh, the cradle of Washington, never produced either periodical or newspaper printed in 1780 by, so that (as respects one-half at least of the wish) there was once a prospect that the devout aspiration of Sir William Berkeley might be realized. “Thank God,” said this Virginia governor in 1671, “we have neither free school nor printing press, and I hope may not have for a hundred years to come.” The earliest newspaper established in the state was the Virginia Gazette, commenced in 1736. It was still published at Williamsburg in 1766, when a second paper of the same name was established there. This second paper, backed by Thomas Jefferson, was afterwards called the American Advertiser and then the Commercial Advertiser, and stopped in 1822. The Richmond Enquirer, which started in 1808, succeeding the Examiner, early attained a leading position as a Democratic organ; it was discontinued in 1880. The Alexandria Gazette (1816) is still published.

Washington, D.C.—The first “administration organ” (i.e. expressing the political views of the administration, but not officially a government paper), was the National Intelligencer (1800); this position it held until 1829, when it became an opposition paper. In Jackson’s administration the United States Telegraph, which he published himself, ceased. A new paper, the Daily Madisonian, President Tyler’s organ, and in 1845 the Union became the organ of President Polk. To the Union in 1845 the Globe sold out, but only as a party organ. In 1846 to 1871 the Globe was the publisher of the Congressional debates. President Taylor’s organ during his administration was the newly established Republican. During President Fillmore’s presidency the National Intelligencer, which was a Webster-Whig organ, returned to power, and during Pierce’s administration the Union was again the administration organ, with the Evening Star (1852) a close second. In Buchanan’s administration the influence of the Union continued. During the Civil War most of these papers died off, except the Star and the National Intelligencer, which in 1870 removed to New York, where it stayed as a semi-weekly for some time. The Washington Post, now the leading paper, was founded in 1877. The National Era, the organ of the American and Foreign Anti-Slavery Society, first published in Washington in 1844 (the Cincinnati Philanthropist was merged with it in 1847) by Gamaliel Bailey, is known principally because Uncle Tom’s Cabin ran in its columns as a serial in 1851–1852. A New
NEWSPAPERS

National Era (1859), was conducted in Washington by Frederick Douglass and his sons. The New York Gazette (which started in New York City on the 16th of October 1725) was followed by the Weekly Journal (No. 1, 5th November 1733), still memorable for the publication free of subscription which it established in 1781, on its front page, the New York Mercury, first headed by John Peter Zenger, and for the masterly defence of the accused by Andrew Hamilton. "The trial of Zenger," said Gouverneur Morris, "was the germ of American freedom." Gaine's New York Mercury was published from 1752 to 1783. James Rivington (1724-1802) in 1773 published the New York Gazette as a loyalist sheet, but his press was destroyed in 1775 and he went to England; in 1777 he returned and published Rivington's New York Loyal Gazette (semi-weekly), renamed first the Royal Gazette and then Rivington's New York Universal and Advertiser, which came—a and in 1785 (q.v). The semi-weekly Independent Journal was one of the papers of New York City in which, between October 27th, 1787, and April 2nd, 1788, the Federalist essays were published; in 1788 it became part of the New York Gazette, and then in 1806 was consolidated with the Journal of Commerce. The first daily newspaper published in the city or state of New York was the New York Journal and Register, commenced in 1788. In 1802 the Morning Chronicle, edited by Peter Irving (1771-1838), a brother of Washington Irving, was established as Aaron Burr's organ; in 1805 it was merged in the Poughkeepsie Journal. Another political paper was the New York Commercial Advertiser, under Noah Webster, which had its own weekly edition, the Herald. These in 1797 became the Commercial Advertiser and New York Spectator respectively. The former (surviving as the Globe and Commercial Advertiser) was edited in 1820-1844 by W. L. Stone and in 1867 by Thurlow Weed.

In 1801 the aggregate number of papers published within the state was 66, of which 14 belonged to New York City. Ten years later the city press included 8 daily journals, with an aggregate daily circulation of 10,000 copies. No one paper circulated more than 2,000, and but two—the Evening Post (1801) and the Commercial Advertiser (1797)—attained that number.

The New York Evening Post was at first strongly Federalist and practically an organ of Alexander Hamilton, with which John Jay assisted in founding it. Its first editor was William Coleman (1766-1829). In the years immediately following 1810 John Rodman Drake contributed to the Post the "Croaker" pieces, in which FitzGreene Halleck joined. William Cullen Bryant began to write for the Post in 1826, and became its editor-in-chief in 1828. John Bigelow, Parke Godwin, Carl Schurz, Horace Greeley, E. L. Godkin, editor from 1876 to 1881, and Henry Villard, were among the important names in its history. Rollo Ogden became editor in 1903. Closely connected with the Post was the weekly Nation, long edited by E. L. Godkin (q.v.). The Post was strongly Federalist until the War of 1812; it opposed the Hartford Convention; until 1860 it was consistently Democratic; it supported Lincoln in 1860 and in 1864 and Grant in 1868; in later years it was an advocate of free trade and of civil service reform. There were earlier Evening Posts in 1746-1747 and in 1794.

The cheap (two-cent) press of America (the previous price had been usually one and one-half cents) began in New York in the shape of the Morning Post (1st January 1833), which only lasted for a few weeks; the real pioneer was the Daily Sun (No. 1, 23rd September 1833), written, edited, set up, and worked off by Benjamin Henry Dury, a journeyman printer. It sold at one cent till the Civil War, when it charged two cents, the price remaining at that figure. The New York Sun was acquired in 1868 by Charles Anderson Dana (q.v.), who made it a powerful organ, and under his successor William M. Laffan (1849-1860) it remained one of the great dailies.

The New York Herald followed in May 1835, founded and edited by James Gordon Bennett (q.v.), and his efforts and those of his son gave it an enormous commercial success. The New York Tribune was established in 1841 by Horace Greeley (q.v.), who remained its editor and one of its proprietors until his death, shortly after his defeat for the presidency in 1872. He was succeeded as editor and proprietor by Whitelaw Reid (b. 1837), who had joined the staff in 1868 and afterwards became U.S. Ambassador in London. Directed by two such men the Tribune became a powerful organ.

The New York Times, which was once sunk with the Tribune and Sun among the best modern American daily papers, was established by Henry J. Raymond (q.v.) in September 1851; and, though absent at times in the discharge of his duties as lieut.-governor of New York and member of Congress, he continued its editor and chief proprietor until his death in June 1869. At the end of the century, under the control of Mr Adolph S. Ochs (b. 1858), it was prominent in American journalism for the excellence of its news service and literary character.

The New York World was founded in 1866 as a highly moral and religious sheet with immeasurably larger circulation. It was taken until 1861 the Morning Courier and the Enquirer were merged into it. In 1864 it and the Journal of Commerce were suppressed for several days by the Federal authorities because each had been tricked into publishing a forged presidential proclamation of a draft and of a general fast day. In 1869 it became the sole property of Manton Marble (b. 1834), who retired from its editorship in 1875; in 1876 it was sold to a syndicate and came under the control of Jay Gould; in 1883 it was purchased by Joseph Pulitzer (b. 1847), and its modern activity began. It worked hard for Grover Cleveland, especially in its first obtaining munificence Worth Bryan and his policies.

The journals owned by W. R. Hearst (b. 1863) all over America represent perhaps more conspicuously than any others the popular developments which at the end of the 19th century were associated with the nickname of the "Yellow Press." His papers in New York in 1910 were the American (originally Journal; morning except Sunday); the Evening Journal, the American and Journal (Sunday) and Das Morgen Journal. Starting in the 'nineties as proprietor of the San Francisco Examiner, Mr Hearst had a large fortune to enable him to carry out his creed of a thoroughly democratic journalism, appealing particularly to the least literate masses and supplying all sorts of sensational news. The class prejudice often underlying the policy of his papers was bitterly criticized and resented by sober American opinion, but their passionate appeal to the masses, combined with their audacious and lively presentation of news, gave Mr Hearst nevertheless a position of considerable power; and no secret was made of his ambition to reach the highest political positions, both in New York itself and in the Republic. Dangerous as his social influence was considered by important sections of the community, and because of his obtaining municipal office or presidential nomination, it remained the fact that, in the type of journalism so indefatigably conducted under him, he represented a serious force in American social and political life, and his journalistic methods were a remarkable outcome of the conditions of a modern free press in a democratic country, where a large public exists for the consumption of the sort of newspaper fare which he was ready to provide.

The New York Press (1887) is a morning Republican paper of the strictest party type.

An important commercial paper of long standing in New York is the Journal of Commerce and Commercial Bulletin, founded in 1827 as the Journal of Commerce by Arthur Tappan (1786-1865) and his brother Lewis Tappan (1788-1873), and in 1893 consolidated with the Commercial Bulletin (1865). The Journal of Commerce in 1829-1830 was the first American paper to send out news schooners which intercepted packet ships which brought news especially of the French Revolution of 1830. Arthur Tappan, who was one of the founders of Oberlin College, established in 1833 the Emancipator, an abolitionist paper, of which in 1837-1838 Elizur Wright (1804-1885), and in 1837-1840 Joshua Leavitt (1794-1873), were editors. Leavitt took the paper to Boston. It was the weekly organ of the American Anti-Slavery Society.

The New York Evening Mail (1833), for a time the Mail
and Express, was bought in 1888 and reorganized by Elliott Fitch Shepard (1833–1893). The Express was established in 1830 by John Graham and Isaac Ingraham, and was bought by the firm of Hall, Shepard, & Company in 1851, and continued under the name of the New York Daily Express. The Daily Express was founded by James G. Gordon, who later became editor and publisher of the New York Times. The Daily Express was first published in 1812; in 1843; and later in 1853. The Daily Express was a daily newspaper, and its circulation was more than 40,000 in 1862.

In 1856, the Daily Express was bought by the Daily News, which was established in 1847. The Daily News was the first daily newspaper in New York City, and its circulation was more than 50,000 in 1862. The Daily News was a daily newspaper, and its editor was William A. Riker, who later became editor and publisher of the New York World. The Daily News was first published in 1849, and its circulation was more than 40,000 in 1862.

In 1858, the Daily News was bought by the Daily Tribune, which was established in 1848. The Daily Tribune was a daily newspaper, and its circulation was more than 50,000 in 1862. The Daily Tribune was a daily newspaper, and its editor was A. T. Ticknor, who later became editor and publisher of the New York Times. The Daily Tribune was first published in 1850, and its circulation was more than 40,000 in 1862.

In 1864, the Daily Tribune was bought by the New York Times, which was established in 1851. The New York Times was a daily newspaper, and its circulation was more than 50,000 in 1862. The New York Times was a daily newspaper, and its editor was John W. Hays, who later became editor and publisher of the New York Times. The New York Times was first published in 1851, and its circulation was more than 40,000 in 1862.

In 1865, the New York Times was bought by the New York Daily Graphic, which was established in 1863. The New York Daily Graphic was a daily newspaper, and its circulation was more than 50,000 in 1862. The New York Daily Graphic was a daily newspaper, and its editor was J. W. Hays, who later became editor and publisher of the New York Times. The New York Daily Graphic was first published in 1863, and its circulation was more than 40,000 in 1862.

In 1866, the New York Daily Graphic was bought by the New York World, which was established in 1861. The New York World was a daily newspaper, and its circulation was more than 50,000 in 1862. The New York World was a daily newspaper, and its editor was A. T. Ticknor, who later became editor and publisher of the New York Times. The New York World was first published in 1861, and its circulation was more than 40,000 in 1862.

In 1867, the New York World was bought by the New York Daily News, which was established in 1849. The New York Daily News was a daily newspaper, and its circulation was more than 50,000 in 1862. The New York Daily News was a daily newspaper, and its editor was W. A. Riker, who later became editor and publisher of the New York World. The New York Daily News was first published in 1849, and its circulation was more than 40,000 in 1862.

In 1868, the New York Daily News was bought by the New York Tribune, which was established in 1842. The New York Tribune was a daily newspaper, and its circulation was more than 50,000 in 1862. The New York Tribune was a daily newspaper, and its editor was A. T. Ticknor, who later became editor and publisher of the New York Times. The New York Tribune was first published in 1842, and its circulation was more than 40,000 in 1862.

In 1869, the New York Tribune was bought by the New York Daily Graphic, which was established in 1863. The New York Daily Graphic was a daily newspaper, and its circulation was more than 50,000 in 1862. The New York Daily Graphic was a daily newspaper, and its editor was J. W. Hays, who later became editor and publisher of the New York Times. The New York Daily Graphic was first published in 1863, and its circulation was more than 40,000 in 1862.

In 1870, the New York Daily Graphic was bought by the New York World, which was established in 1861. The New York World was a daily newspaper, and its circulation was more than 50,000 in 1862. The New York World was a daily newspaper, and its editor was A. T. Ticknor, who later became editor and publisher of the New York Times. The New York World was first published in 1861, and its circulation was more than 40,000 in 1862.

In 1871, the New York World was bought by the New York Daily News, which was established in 1849. The New York Daily News was a daily newspaper, and its circulation was more than 50,000 in 1862. The New York Daily News was a daily newspaper, and its editor was W. A. Riker, who later became editor and publisher of the New York World. The New York Daily News was first published in 1849, and its circulation was more than 40,000 in 1862.

In 1872, the New York Daily News was bought by the New York Tribune, which was established in 1842. The New York Tribune was a daily newspaper, and its circulation was more than 50,000 in 1862. The New York Tribune was a daily newspaper, and its editor was A. T. Ticknor, who later became editor and publisher of the New York Times. The New York Tribune was first published in 1842, and its circulation was more than 40,000 in 1862.

In 1873, the New York Tribune was bought by the New York Daily Graphic, which was established in 1863. The New York Daily Graphic was a daily newspaper, and its circulation was more than 50,000 in 1862. The New York Daily Graphic was a daily newspaper, and its editor was J. W. Hays, who later became editor and publisher of the New York Times. The New York Daily Graphic was first published in 1863, and its circulation was more than 40,000 in 1862.

In 1874, the New York Daily Graphic was bought by the New York World, which was established in 1861. The New York World was a daily newspaper, and its circulation was more than 50,000 in 1862. The New York World was a daily newspaper, and its editor was A. T. Ticknor, who later became editor and publisher of the New York Times. The New York World was first published in 1861, and its circulation was more than 40,000 in 1862.

In 1875, the New York World was bought by the New York Daily News, which was established in 1849. The New York Daily News was a daily newspaper, and its circulation was more than 50,000 in 1862. The New York Daily News was a daily newspaper, and its editor was W. A. Riker, who later became editor and publisher of the New York World. The New York Daily News was first published in 1849, and its circulation was more than 40,000 in 1862.

In 1876, the New York Daily News was bought by the New York Tribune, which was established in 1842. The New York Tribune was a daily newspaper, and its circulation was more than 50,000 in 1862. The New York Tribune was a daily newspaper, and its editor was A. T. Ticknor, who later became editor and publisher of the New York Times. The New York Tribune was first published in 1842, and its circulation was more than 40,000 in 1862.

In 1877, the New York Tribune was bought by the New York Daily Graphic, which was established in 1863. The New York Daily Graphic was a daily newspaper, and its circulation was more than 50,000 in 1862. The New York Daily Graphic was a daily newspaper, and its editor was J. W. Hays, who later became editor and publisher of the New York Times. The New York Daily Graphic was first published in 1863, and its circulation was more than 40,000 in 1862.

In 1878, the New York Daily Graphic was bought by the New York World, which was established in 1861. The New York World was a daily newspaper, and its circulation was more than 50,000 in 1862. The New York World was a daily newspaper, and its editor was A. T. Ticknor, who later became editor and publisher of the New York Times. The New York World was first published in 1861, and its circulation was more than 40,000 in 1862.
The larger papers of Columbus are the Ohio State Journal (morning, 1831), the Post-Press (evening, 1827), the Citizen (evening, 1890), and the Express and Westbote (weekly, 1880; Sunday, 1878; daily, 1890—the different editions being under different names). The News of Springfield has a weekly edition, the Weekly Republic, which was founded in 1817. The Toledo Blade (daily, 1848; weekly, 1839) before and during the Civil War contained the attacks on slavery and on political abuses written by Petroleum V. Nasby, i.e. David Ross Locke (1833–1888). The first of these letters (signed "Rev. Petroleum Vosnous Nasby") appeared in the Jeffersonian of Findlay, Ohio, in 1860, when he was its editor. He had edited small papers in Plymouth and Mansfield (O.) before his connexion with the Blade; in 1871 he became managing editor of the Evening Mail of New York City, Will Carleton (b. 1845) was a member of the Blade's staff, and contributed to the Blade his first "ballads." The News-Bee (evening) of Toledo was formed in the consolidation in 1903 of the Times (1846), News (1888) and Bee (1804), and has a morning edition called the Times and a Sunday edition called the Times-Bees. The Zanesville Gazette (Republican; daily, 1840) has a weekly edition dating from 1809 (originally the Muskingum Messenger).

Among the smaller newspapers of Ohio the following are more than 100 years old: the Western Star of Lebanon (weekly, 1806); the Ohio Patriot of Lisbon (weekly, 1808; daily and semi-weekly, 1868) and the Evening Democrat of Worthington.

Illinois.—The first newspaper in Illinois was the Illinois Herald (1814; succeeded in 1815 by the Illinois Intelligencer) of Kaskaskia (then the seat of government); it removed to Vandalia, which then became the capital, in 1820; it became the Vandalia Whig and Illinois Intelligencer in 1832; and it ceased publication about 1839, when Springfield became the capital.

The principal papers in Illinois are naturally those of Chicago. The Chicago Tribune (morning; 1847) succeeded The Gem of the Prairie (1844), and a weekly edition was for a time continued under that name. In August 1848 John Locke Scripps (1818–1866) bought a third interest in the Tribune and became its managing editor. In 1852 he sold it to a syndicate of Whig politicians. A part (in 1853) and eventually the whole (in 1874) was bought by Joseph Medill (1823–1899). Horace White (b. 1834) was a reporter on the Tribune in 1856, and was its editor and one of its proprietors in 1864–1874; from 1883 to 1903 he was editor-in-chief of the New York Evening Post. In 1858 the Daily Democratic Press, which J. L. Scripps had established in 1852 with William Bros, was consolidated with the Tribune as the Press and Tribune; in 1860 the name became the Tribune. The era of the old Chicago Tribune was inaugurated in 1861, with J. L. Scripps as its president. The first newspaper published in Chicago, the Democrat (November 1833), was merged with the Daily Tribune in 1861. The Inter-Ocean (morning; 1872), under the editorship (from 1897) of George Wheeler Hinman (b. 1863), has made a specialty of foreign affairs. The News (evening; 1875) was founded and developed by Melville E. Stone (b. 1848) as a one-cent evening paper. After 1883 Eugene Field contributed to this paper his column "Sharps and Flats," including much verse. In 1888 Victor Fremont Lawson (b. 1850), who had been associated with Stone, acquired the paper. The Record (morning; 1881), started by Lawson, was consolidated in 1901 with the Herald (1881) as the Record-Herald. The Evening Post dates from 1888. In 1900 W. R. Hearst established in Chicago two papers, Hearst's Evening American and the Examiner (the name assumed in 1902 for his morning American).

The Chicago German papers include the Freie Presse (evening and weekly; 1871), the Staats-Zeitung (daily, 1847, weekly—Wien und Doheim—1845; evening edition, the Abernd Presse) and Abendpost (1899). The Skandinaven (semi-weekly, 1866; daily, 1871) is an important Norwegian-Danish paper; and there are large Bohemian and Italian dailies.

In Springfield, the state capital, there are two party journals, the Illinois State Journal (Republican; semi-weekly, 1831; daily, 1848) and the Illinois State Register (Democratic; weekly, 1836; daily, 1848).

Michigan.—The Detroit Free Press (morning, 1835; with a weekly agricultural edition, Farm and Live Stock Journal, 1831) was particularly known in 1869–1891 for the humorous sketches of Charles Herrold and L. C. Schurz, Mr. Charles, an Irishman who had worked on the Kentucky Gazette in Lexington; it was called first the Missouri Gazette, then (1869) the Louisiana Gazette, then (1872) the Missouri Gazette and again, and then (1872) the Missouri Republican, and in 1886–1888 the St. Louis Republican; the present name was adopted in 1888. Its first daily issue was in September 1836 and the first Sunday issue in 1837. The Jeffersonian (Democratic paper; it opposed Thos. H. Benton; it was founded by W. P. Haggard, and Wm. Harrison in 1840, and became a Whig organ; and from 1856 was a Democratic paper. A cause célèbre was the trial in 1830 for the impeachment of Judge James H. Peck of the 31st District Court for Missouri, who had suspended from practice for 18 months and had imprisoned for 24 hours an attorney, Luke Edward Lawless, who had criticized in the Republican Judge Peck's decision in a Splechian law; a grant case, which was adverse to Lawless, attorney for the plaintiff. William Wirt appeared for Peck, and he was acquitted. Since 1837 the paper has been almost continuously the property of the Knapp and Faschall families. In 1871 the Republicans reorganized a Whig party; but in 1888 it introduced stereotyping in 1860, probably before any other newspaper. The Globe-Democrat (morning; Republican, 1852) of St. Louis became part owner of the St. Louis Globe-Democrat (morning; Republican, 1868; consolidated 1872) and has published a Sunday edition, Mississippi Blätter, and a semi-weekly and weekly edition, Anzeiger des Westens. Carl Schulz was editor of the Westlicher Anzeiger (morning, 1867). Another German newspaper in St. Louis is Amerika (morning; 1872).

The two principal dailies of Kansas City are the Star (morning, 1850–1881; with a morning edition, the Times, 1858, and a Weekly edition, the Times, 1859–1861) and the Journal (morning, 1854; with a weekly edition). The News-Press (News, 1878; Press, 1902; evening) is the principal paper of St. Joseph.

North Carolina.—The Observer (weekly; 1817; daily, 1860) of Fayetteville. The News Observer (daily; News, 1872; Observer, 1876) and North Carolina (weekly, 1892) of Raleigh.

South Carolina.—The News and Courier of Charleston (Courier, established in 1803 by T. C. and J. C. Gazley; Gazley, 1816–1901; Gazette, 1822–1875; Daily News, 1865; consolidated, 1872). The City Gazette of Charleston (founded in 1783 as the South Carolina Weekly Gazette) was edited by W. G. Simms in 1826–1853, but then failed, after bravely attempting to be the Advocate of Nullification. The Charleston News and Courier (1883; semi-weekly; 1885) was purchased by the Southern Argus in 1891. The State of Columbia (1861) is one of the most influential papers in the South.

Alabama.—The News (evening, 1887) and Age-Herald (morning, 1849; of Birmingham. The Mercury of Huntsville (weekly, 1816; daily, 1885). The Register of Mobile (weekly, 1821). The Advertiser of Montgomery (1828). The Morning Times of Selma (weekly edition, 1865).

Georgia.—The Constitution of Atlanta (daily, 1868; weekly, 1870; Henry W. Grady (1851–1889), the orator, was its editor and proprietor-in-part from 1880 until his death; Joel Chandler Harris was an editor (1900–1901) and contributed the Uncle Remus sketches; Frank Lebov Stanton (b. 1857) is well known as a contributor of humorous paragraphs and excellent verse. The Journal of Atlanta (1834; semi-weekly, 1885); its proprietor in 1887–1898 was Hoke Smith (b. 1863). (In 1901 it became the Atlanta Journal; governor of Georgia in 1907–1909. The Chronicle of Augusta (1878, semi-weekly; now semi-weekly and, since 1837, daily; originally the Augusta Chronicle and Gazette of the State, in 1831 it became the Chronicle and Georgia Gazette (then Advertiser); in 1835, the Augusta Chronicle; in 1837, when it incorporated the State's Rights Sentinel—edited for about a dozen years by Judge Augustus Longstreet, and a large weekly, the Augusta Chronicle established by Wm. E. Longstreet, and a large daily, the Augusta Chronicle.—In 1852 it became the Augusta Chronicle and Sentinel; in 1877, after merging with the Constitutionalist (founded before 1800), the Chronicle and Constitutionalist; James M. Peck, editor since 1879, was an editor (1883–1899) of the English language, and a senior editor of the Chronicle for some time, having been connected with the Constitutionalist after 1866. The Enquirer-Sun of Columbus (weekly, 1828; daily, 1858). The Atlanta Constitution (1877). The Union-Recorder of Milledgeville (the Federal Union, 1829, and the Southern Recorder, 1819, united in 1872). The Tribune of Rome (1843). The Morning News of Savannah (1890).
NEWSPAPERS

The Review was published in 1850-1853, and of the Federal census in 1853-1855. The Review was especially Southern in tone and is a most important "source for the economic history of the South; from it De Bow extracted material for the Southern Review the States and Western States (3 vols. New Orleans, 1852-1853). Florida.—The Florida Times Union and Citizen (1865), with daily and semi-weekly editions; and the Metropolis (1869), both at Jacksonville. The Morning Tribune (weekly, 1870; daily, 1894) of Tampa.

Texas.—The Statesman of Austin (1871). The Morning News of Dallas, established in 1855 by Alfred H. Belo (1839-1901), who in 1875 bought the Galveston News (established 1842) and built upon these two papers. The Post (1886) and the Chronicle and Herald (1901) of Houston.

Tennessee.—The Journal and Tribune (Journal, 1839, and Tribune, 1816, consolidated in 1898) of Knoxville. The Commercial Appeal (Appeal, 1840; Nashville, 1857; Commercial, 1899; consolidated 1894); and the News-Seminar (Evening Seminar, 1851, and News, 1851, consolidated 1894) were both the Baltimore (1874) and the American (1830), both of Nashville. The first paper published in the state was the Gazette (1791) of Rogersville, which remained the only paper in Tennessee, when, in 1798, Andrew Jackson, the "Nature America" was established in 1806; in 1816 Amos Kendall (1789-1869) became part owner and co-editor, and under him the Argus was a political power; it was succeeded in 1840 by the Yeoman. The first paper in Indiana was the Gazette (January 1822), which in 1820 was consolidated with (and took the name of) the Indiana Democrat; in 1840 it was reorganized as the Indiana Sentinel. The first paper published in Kentucky was the Lexington Beacon, established in 1806; in 1816 Amos Kendall (1789-1869) became part owner and co-editor, and under him the Argus was a political power; it was succeeded in 1840 by the Yeoman. Wisconsin.—The principal papers are those of Milwaukee: the Evening Wisconsin (1847); the Sentinel (morning, 1837), edited in 1845-1861 by Rufus King (1814-1876), who was U.S. minister to the Pontifical States in 1863-1867, and a brigadier of volunteers in the Civil War; the News (evening, 1866); the Free Press (morning, 1901); the Germania-Abend-Post (1872, with a large weekly edition); and the Kuryer Polski (evening, 1888).

Mississippi.—The Journal (evening, 1878); the Tribune (morning, evening and weekly, 1867); and the Tidende (daily, 1887; weekly, 1891; Norwegian-Danish) are the principal papers of Mississippi. In Natchez the Pioneer Post (founded in 1843; daily since 1843), and the Mississippi Pioneer was the first paper printed in the state, and in 1855 it was consolidated with the Mississippi Democrat under the name of Pioneer and Democrat; in 1855 the Daily Times-Democrat (1872) and the Daily Minden Press united with it took the name of the Pioneer Press. The other papers are the Dispatch (evening, 1868); the News (evening, 1900) and the Volks Zeitung (weekly, 1859; daily, 1857).

Kansas.—The Emporia Gazette (evening, 1860) is one of the notable smaller city papers of the country; its reputation being due to its editor and proprietor William Allen White (b. 1868). Other papers of note are the Emporia Evening and Topeka Capital (1872; daily, 1872); the Emporia News (daily, 1872); the Tribune (1898); the Santa Fe (evening, 1868); the Capital (daily, weekly, 1879); the State Journal (evening and weekly, 1872); the Herald (evening, 1917); and in Wichita, the Eagle (morning, 1884, and weekly, 1872).

Nebraska.—The News (evening, 1890), the World-Herald (morning and evening, weekly and semi-weekly, 1866), and the Omaha Bee (morning and evening, 1871) are all of Omaha. The Bee was established by Edward Rosewater (1841-1906); his son Victor (b. 1871) succeeding him in 1895 as managing editor. The Rosewaters were prominent in the Republican party and headed the opposition in the state to William Jennings Bryan, who was in 1894-1896 editor of the World-Herald. Bryan also founded at Lincoln the Lincoln Courier, a weekly, and served as its editor and chairman of the Republican committee in Nebraska, and in advancing his candidacy for the presidency. The Lincoln dailies are the Nebraska State Journal (morning, 1879; Evening News, semi-weekly, 1869; the Star (evening, 1902); and the evening Post (1896).

Iowa.—The Des Moines papers are the Capital (evening, 1883), the News (evening, 1881), and the Register and Leader (morning, Leader, 1864; Register, 1869). In the Quad Cities the Times (1879) was published for 11 years; at Burlington is the Hawk Eye (evening, 1839), to which Robert Jones Burdette (b. 1844), associate editor in the 'seventies, contributed humorous squibs. The Burlington Evening Gazette, originally the Wisconsin Territorial Gazette, is one of the oldest in the state. Arkansas.—The Arkansas Gazette (Democratic; morning and weekly) was first published at Arkansas Post in 1819, then removed to Little Rock.

Colorado.—At Denver are the Republican (morning and weekly, 1866); the Post (evening, 1893; weekly, 1901); and the Rocky Mountain News (morning, 1889; evening, The Times, 1872; and a weekly edition).

Arizona.—At Tombstone, the county-seat of Cochise county, is the well-known Epitaph (1882), a Sunday edition of the Prospector (daily, 1880). At Salt Lake City are the Deseret Evening News (daily and semi-weekly, 1850), controlled by the Mormons; the Salt Lake Tribune (daily, 1870; semi-weekly, 1864), founded by Godbe and others; the Tribune (morning, 1864), owned by George Young; and the Salt Lake Herald (daily, 1874; semi-weekly, 1864), the first named was the principal—and for a time the only—Democratic paper in Utah; in 1901 it was purchased by Senator W. A. Clark, who promptly sold it for a large sum to the Liberal Emigrant. California.—At San Francisco are the Call (morning, 1856), owned by John D. Spreckels (b. 1853), principal owner of the Oceanic Steamship Company; and son of Claus Spreckels the "sugar-king"; the Examiner (morning, 1868), founded by Senator George Hearst (1829-1901), the inheritance of which started his son, William Randolph Hearst, in the newspaper business; the Bulletin (morning, 1853); the Chronicle (morning, 1865; weekly, 1874); the Evening Post (1871; weekly edition 1875); and the California Democrat (morning, 1853; consolidated in 1902 with the Abend Post; weekly edition, California Staats-Zeitung, 1854). The Argonaut (1877) is an old weekly.

In Los Angeles the large dailies are the Times (morning, 1881 weekly edition, Saturday Times and Weekly Mirror, 1873); the Herald (morning, 1873); the Express (evening, 1871); the Record (evening, 1871); and the Los Angeles Examiner (morning, 1902)

Oregon.—At Portland are the Oregonian (morning, 1861; weekly edition, 1864) which has a great reputation on the Pacific Coast; and the Oregonian (morning, 1861; weekly and semi-weekly, 1902); and the Oregon Telegraph (1868).

Washington.—At Seattle are the Post Intelligencer (morning, 1867); and the Times (evening and weekly, 1861).

4. NEWSPAPERS OF FRANCE

The annals of French journalism begin with the Gazette (afterwards called Gazette de France), established by Théophraste Renaudot in 1631, under the patronage of Richelieu, and with his active co-operation. Its price was six centimes. Much of its earliest foreign news came direct from the minister, and not seldom in his own hand. Louis XIII. took a keen, perhaps a somewhat childish, interest in the progress of the infant Gazette, and was a frequent contributor, now and then taking his little paragraphs to the printing office himself, and seeing them put into type. Renaudot was born at Loudun in 1584, studied medicine in Paris and at Montpellier, established himself in the capital in 1612, and soon became conspicuous both within and beyond the limits of provence. Endowed by nature with great energy and versatility, he seems at an early period of his career to have attracted the attention of the great cardinal, and to have obtained permission to establish a sort of general agency office, under the designation of "Bureau d'Adresses et de Rencontre." An enterprise like this would, perhaps, naturally suggest to such a mind as Renaudot's the advantage of following it up by the foundation of a newspaper. According to some French writers, however, the project was formed by Pierre d'Harcourt, genealogist, who carried on an extensive correspondence both at home and abroad, and was thus in a position to give valuable help; according to others by Richelieu himself. Be this as it may, Renaudot put his hand zealously to the work, and brought out his first weekly number in May 1631. So much, at least, may be inferred from the date (4th July 1631) of the sixth number, which was the first dated
publication, the five preceding numbers being marked by "signatures" only—A to E. Each number consists of a single sheet (eight pages) in small quarto, and is divided into two parts—the first simply entitled Gazette, the second Nouvelles ordinaires de divers endroits. For this division the author assigns two reasons—(1) that two persons may thus read his journal at the same time, and (2) that it facilitates a division of the subject-matter, the Nouvelles containing usually intelligence from the northern and western countries, the Gazette from the southern and eastern. He commonly begins with foreign and ends with home news, a method which was long and generally followed, and which still obtains, for the Gazette published a supplement, under the title of Relation des nouvelles du monde, reçues dans tout le mois. In October 1631 Renaudot obtained letters patent to himself and his heirs, conferring the exclusive privilege of printing and selling, where and how they might please, "the gazettes, news and narratives of all that has passed or may pass within and without the kingdom." His assailants were numerous, but he steadily pursued his course, and at his death in October 1653 left the Gazette to his sons in flourishing circumstances. In 1752 the title Gazette de France was first used. Under this designation it continued to appear until the 24th August 1789. During the five days following that date it was suspended; on the 30th it was resumed as Le Peuple français, journal de l'appel à la nation, and again modified on the 14th September to L'Étoile de la France, journal des droits de tous. On the 25th October it became Gazette de France, journal de l'appel à la nation; and under this title it continued. Jean Loret's rhymed Gazette (1650 to March 1665) will always have interest in the eyes of students who care less for the "dignity" of history than for the fidelity of its local colouring and the animation of its backgrounds. It was vain to look for there for any deep appreciation of the events of stormy times; but it abounds in vivid portraits of the men and manners of the day. It paints rudely, yet to the life, the Paris of the Fronde, with all its effervescence and depression, its versatility and fickleness, its cowardice and its courage.

Of the Mercure galant, established by Donnexe de Vizé in 1672, with Thomas Cornelle for its sub-editor, it may be said that it sought to combine the qualities of the Gazettes, both grave and gay. Like the Gazette de France, it contained the permitted state news and court circulars of the day. Like L'Étoile de France, its aim was to please with satirical verses, and with sketches of men and manners, which, if not always true, were at least well invented. Reviews and sermons, law pleases and street airs, the last reception at the Academy and the last new fashion of the milliners, all found their place. De Vizé carried on his enterprise for more than thirty years, and at his death (1710) it was continued by Rivière du Frasny. The next editor, Léfèvre de Fontenay, altered the title to Nouveau Mercure, which in 1728 was altered to Mercure de France, a designation retained, with slight modification, until 1853. The Mercure passed through many hands before it came into those of Panckoucke, at the end of the Revolution. Amongst its more conspicuous writers, immediately before this change, had been Raynal and Marmontel. The latter, indeed, had for many years been its principal editor, and in his Mémoires he has left us a very interesting record of the views and aims which governed him in the performance of an arduous task. He there narrates the curious fact that it was Madame de Pompadour who contrived the plan of giving pensions to eminent men of letters out of the profits of the Mercure. To one of Marmontel's predecessors the "privilege," or patent, had been worth more than the Gazette, its amended title. This revenue was now to be shared amongst several, and to become a means of extending royal "patronage" of literature at a cheap rate. It is to this pension scheme, too, that we owe the Contes Moraux. Marmontel, who had long before lost his "patent" by an act of high-minded generosity, continued to share in the composition of the literary articles with Chamfort and La Harpe, whilst Mallet du Pan, a far abler writer than either, became the most prominent of the political writers in the Mercure. In 1789 he contributed a series of remarkable articles on the well-known book of de Robine; and in the same year he penned some comments on the "Declaration of the Rights of Man," very distasteful to violent men of all parties, but which forcibly illustrate the pregnant truth they begin with: "The gospel has given the simplest, the shortest and the most comprehensive "Declaration of the Rights of Man," in saying, 'Do unto others as you would that they should do unto you. All polities hinge upon this.'

In 1790 the sale of the Mercure rose very rapidly. It attained for a time a circulation of 13,000 copies. Mirabeau styled it in private "the most able of the newspapers." Great pains were taken in the collection of statistics and state papers, the absence of which from the French newspaper press had helped to depress its credit as compared with the political journalism of England and to some extent of Germany. But, as the Revolution marched on towards a destructive democracy, Mallet du Pan evinced more and more unmistakably his rooted attachment to a constitutional monarchy. And, like so many of his compatriots, he soon found the tide too strong for him. The political part of the Mercure (in 1791 its title was altered to Mercure français) changed hands, and after the 10th August 1792 the "literary" part of it was suspended.

All this time the Moniteur (Gazette nationale, ou le moniteur universel), founded in 1780, was under the same general management. The first idea, indeed, of this famous official journal appears to have been Panckoucke's, but it did not firmly establish itself until he had purchased the Journal de l'assemblée nationale, and so secured the best report of the debates. The Moniteur, however, kept step with the majority of the assembly, the Mercure with the minority. So marked a contrast between two journals, with which it conferred a leverage to the republicans not to be turned to good account. Camille Desmoulins depicted him as Janus—one face radiant at the blessings of coming liberty, the other plunged in grief for the epoch that was rapidly disappearing.

When resumed, after a very brief interval, the Mercure français became again Mercure de France—its political importance diminished, whilst its literary worth was enhanced. During the later days of the Revolution, and under the imperial rule, its roll of contributors included the names of Geoffroy, Glingandé, Morelet, Lefebvre, Pluchart, for whom Bonaparte gave the journal no less than upon the individual writers who made them. Resumed by other hands, the Mercure continued to appear until January 1820, when it was again suspended. In the following year it reappeared as Le Mercure de France, au dix-neuvième siècle, and in February 1835 it finally ceased.

The only other newspaper of a date anterior to the Revolution which needs to be noticed here is the first French daily, the Journal de Paris, which was started on New Year's Day of 1777. It had but a feeble infancy, yet lived till 1819. Its Romanesque, however, did not save it from the "suspensions" of its predecessors. After the Revolution such men as Garat, Condorcet and Regnault de St Jean d'Angély appear amongst its contributors, but those of earlier date were obscure. Its period of highest prosperity may be dated about 1792, when its circulation is said to have exceeded 20,000.

The police adventures of the writers of the MS. news-letters, or Nouvelles à la main, were still more numerous, and, if we
NEWSPAPERS

Under Napoleon the *Moniteur* was the only political paper that was really regarded with an eye of favour. Even as respects the nation at large, the monstrous excesses into which the Revolutionary press had plunged left an enduring stigma on the class. When Bertin acquired the *Journal des débats* from Baudouin, the printer, for 20,000 francs, he had to vanquish popular indifference on the one hand, as well as imperial mistrust on the other. The men he called to his aid were Geoffroy and Fieville; and by the brilliancy of their talents and the keenness of his own judgment he converted the *Débats* into a paper having 32,000 subscribers, and producing a profit of 200,000 francs a year.

When the imposition of a special censorship was threatened in 1805, at the instance of Fouché, a remarkable correspondence took place between Fieville and Napoleon himself, in the course of which the emperor wrote that the only means of preserving a newspaper from suspension was "to avoid the publication of any news unfavourable to the government, until the truth of it is so well established that the publication becomes needless." The censorship was avoided, but Fieville had to become the responsible editor, and the title was altered to *Journal de l'empire*—the imperial critic taking exception to the word *Débats* as "inconvenient." The old title was resumed in August 1815. The revolution of July did but enhance the power and the profit of the paper. It had held its course since with uniform dignity, as well as with splendid ability, and may still be said, in the words which Lamartine applied to it in an earlier day, to have "made itself part of French history."

Standing as it did, *Journal de l'empire* was not only the champion of the first Napoleon, but the successor of the *Moniteur*. At the time, it was said, that "the Journal des débats (in 1815) a severance occurred amidst both the writers and subscribers. It led to the foundation of the *Constitutionnel*, which at first and for a short time bore the title of *L’Indépendant*. The former became, for a time, the organ of the royalists par excellence, the latter the leader of the opposition. In 1824, however, both were in conflict with the government of the day. At that date, in a secret report addressed to the ministry, the aggregate circulation of the opposition press of Paris was stated at 41,330, while that of the government press amounted only to 14,544."

The rapid rise of the *Constitutionnel* was due partly to the great ability and influence of Jay, of Étienne, of Béranger and of Saint Albin (who had been secretary to Carnot in his ministry of 1815), all of whom co-operated in its early editorship, and partly to its sympathy with the popular reverence for the memory of Napoleon, as well as to the vigorous share it took in the literary quarrel between the classicists and romanticists. Its part in bringing about the revolution of 1830 raised it to the zenith of its fortunes. For a brief period it could boast of 23,000 subscribers at 80 francs a year. But the invasion of cheap newspapers, and that temporary lack of enterprise which so often follows a brilliant success, lowered it with still greater rapidity. When the author of the *Mémoires d’un bourgeois*, Dr Véron, purchased it, the sale had sunk to 3000. Véron gave 100,000 francs for the *Juit errant* of Sue, and the Sue fever rewarded him for a while with more than the old circulation. Afterwards the paper passed under the editorship of Césena, Granier de Cassagnac, and La Guérinmontre.

The cheap journalism of Paris began in 1836 (1st July) with the journal of Costard, *La Presse*, followed instantly by *Le Sûte*, under the management of Dutacq, to whom it is said—not incredibly—the original idea was really due. The first-named journal attained a circulation of 10,000 copies within three months of its commence-ment of and soon doubled that number. *Le Sûte* prospered even more strikingly, and in a few years had reached a circulation (then without precedent in France) of 38,000 copies.

The rapid growth of the newspaper press of Paris under

1. *Le Constitutionnel*, 16,250; *Journal des débats*, 13,000; *La Quotidienne*, 5800; *Le Courrier français*, 2975; *Journal de commerce*, 2360; *l’Aristographe*, 925.
2. *Journal de Paris*, 4175; *L’Étoile*, 2749; *Gazette de France*, 2370; *Le Moniteur*, 2250; *Le Droitsu1 Blanc*, 1900; *Le Pilote*, 900.
Louis-Philippe will be best appreciated from the fact that, while in 1828 the number of stamps issued was 28 millions, in 1836, 1843, 1845 and 1846 the figures were 42, 61, 65 and 70 millions respectively. At the last-mentioned date the papers with a circulation of 40,000 and 50,000 were (besides the Moniteur, of which the circulation was increased almost immediately) as follows: Le Siècle, 31,000; La Presse and Le Constitutionnel, between 20,000 and 25,000; Journal des Débats and L’Époque, between 10,000 and 15,000.

If we cast a retrospective glance at the general characteristics (1) of the newspaper press of France, and (2) of the legislation concerning it, we may say that the rise of the newspapers was due mainly to the revolution of 1793-1794 and the scarcely less destructive revolution of 1830, which, with certain intermediate fluctuations, continued until 1848, when it was found to be the result of a lower status for the press; that is to say, the removal of the press from the ranks of the privileged to that of common citizens. From this point onward the history of newspapers is inextricably connected with the development of the press, and the press of newspapers. The press not only was the organ of every great event in the government, but was the chief instrument of public opinion.

The year 1819 is marked by a virtual cessation of the arbitrary power of suppression lodged till then in the government, and by the substitution of a graduated system of preliminary bonds and suretyships for the previous summary arrest and imprisonment or shackles and the penalty for convicted press-offences on the other. This initiative attempt of 1819 became, in 1828, a measure of substantial yet regulated freedom, which for two years worked, in the main, alike with equity towards the author and to the public. By 1830 a large development towards the public of its capabilities as a great factor in the growth of civilization. Those two years were followed by a widely contrasted period of five years. That was a term of entire liberty often grossly abused, and fifty ending with the just and necessary restrictions of September 1835. But that period of 1830-1835 was also signalized by some noble attempts to use the powers of the press as a means of carrying out the social and political interests of France. Not least memorable amongst these was the joint enterprise of Montalembert and Lamennais—soon to be added by Lacordaire,—when, by the establishment (October 1830) of the newpaper L’Avenir, both of them succeeded in the "loi bonapartiste," just part in the liberties acquired by the country," and asserted for the sacred symbols of Christianity their lawful place, alike above the tricolor and above the lilies. "Dieu et la liberté " was the motto which afterwards came to fix its name to, on penalty of a fine of 500 francs for the first offence, and of 1 000 francs for its repetition. Every false or feigned signature was to be punished by a fine of 1 000 francs, and to claim for a newspaper the name of the author and the editor." The practical working of this law lay in the fact that a new functionary in the more important newspaper offices, who called "secrétaire de la rédaction," and was, in fact, the secpreatot general of the giornale; it gained, however, a permanent influence on French journalism in the continued prevalance of signed articles, and the consequent prominence of individual writers as compared with the same class of work in other countries. In February 1842 all other French journals, incorporated, with increased stringency, into a "Décret organique sur la presse." The stamp duty for each sheet was fixed at 6 centimes, within certain dimensions, and a proportional increase in case of excess.

In 1838 the order of the six leading Parisian papers in point of circulation was (1) Le Siècle, (2) La Presse, (3) Le Constitutionnel, (4) Patrie, (5) Le Débat, (6) L’Assemblée Nationale. The number of provincial papers was no less than 15,000; the daily newspapers, seven hundred. "L’Avenir," with a circulation of nearly 70,000, and its proprietor, in a petition to the National Assembly, declared that it gave subsistence to more than one thousand persons, measured by the amount of its circulation. In August the system of sureties was restored. On the 13th July 1839, the regime of the republic suspended Le Peuple, La Révolution Démocratique et Sociale, La Vraie République, La Réforme Civile, Le Journal des Deux Mondes, and the Giraud’s Observation (l’Observation), all of which is called the "Loi Tinguy" (from the name of the otherwise obscure deputy who proposed it), by which the author of every newspaper article on any subject, political, philosophical or religious, was liable to be punished by a fine of a fine of 500 francs for the first offence, and of 1000 francs for its repetition. Every false or feigned signature was to be punished by a fine of 1 000 francs, and to claim for a newspaper the name of the author and the editor." The practical working of this law lay in the fact that a new functionary in the more important newspaper offices, who called "secrétaire de la rédaction," and was, in fact, the secpreatot general of the giornale; it gained, however, a permanent influence on French journalism in the continued prevalance of signed articles, and the consequent prominence of individual writers as compared with the same class of work in other countries. In February 1842 all other French journals, incorporated, with increased stringency, into a "Décret organique sur la presse." The stamp duty for each sheet was fixed at 6 centimes, within certain dimensions, and a proportional increase in case of excess.

The aggregate daily issue of the Parisian "dailies" had increased to about 350,000 copies, but the evening paper, Le Petit Moniteur, alone issued nearly 130,000 of these. The average circulation of Le Siècle had fallen from 85,000 to 45,000 copies; that of Le Patrie was reduced by one-half (32,000 to 16,000); that of Le Constitutionnel from 24,000 to 13,000; of L’Opinion Nationale from 18,000 to 15,000; whilst the chief journal of all—with grand antecedents and with a brilliant history of public service rendered—had for a time descended, it is said, from 120,000 to 15,000. And yet almost over the whole of this very period the brilliant "Lundin" of Sainte-Beuve were making their punctual appearance in Le Moniteur, to be continued by the "Moniteur" of Le Figaro, and daily from 1860 onwards helping to make frivolous petty "paragraphs" on matters of literature almost everywhere take the place of able and well-elaborated arguments. Well might the Latins say, "Les journaux sont les trompeurs; les journaux sont les parlementaires."

8 Or, to speak more precisely, to farm a certain conspicuous page of each newspaper, in perpetuity.
collectively with receiving bribes, both from the government of Prussia and from that of Italy—upon the faith, as it afterwards appeared, of statements made by another newspaper, not of France, but of Belgium, La Finance. An elaborate inquiry, presided over by M. Caremeau, one of the most acute of the i.a.s., cleared the case absolutely. There were 2,566,000 copies of the respective journals, and an aggregate weekly issue of 2,800,000 copies.

In 1787 the total number of newspapers published in France was approximately 2,200. Of these, 120 were political, or of a military character, 66 were established in Paris, 16 in other cities, and the rest in the provinces. The total number of newspapers published in France in 1798 was 2,391. The largest number of newspapers was printed in Paris, where the total number of newspapers published in 1798 was 2,000. Of these, 120 were political, or of a military character, 66 were established in Paris, 16 in other cities, and the rest in the provinces. In 1814, there were 1141 (including 71 religious, 104 legal, 153 commercial, 134 technological, 98 scientific and medical, 59 artistic). At that date Le Figaro had a circulation of about 70,000; Le Petit Journal at a halfpenny one of about 650,000.

The principal Parisian newspapers in 1883 may be classified thus—

(a) Organ of the Legitimists and of the Church of France: Gazeau de France, Le Monde, L'Union, La Défense, La Civilisation, L'Universe.

(b) Orleanist organs: Le Moniteur Universel, Le Constitutionnel, Le Français (under the auspices of the Duc de Broglie), Le Soir, Le Corse, (an organ of the papists: Le Pays (edited at one time by Lamartine).

(c) Republican organs: Journal des Débats, Le Temps (founded 1860), which has a circulation of about 17,000; Le Journal, Le Figaro, Le Monde, Le Petit Journal, La Revue Mystique, Paris, La République (founded 1861 by Gambetta), Le Peuple (founded by Dufau), the Socialist Le Petit État de la République (1875).

The sale of the principal organs was, of course, limited, and the newspaper received, for July 29, 1881, abolished salesout for newspapers, and transferred their registration from the ministry of justice at Paris to the local representative of the attorney-general (le parquet) in each town respectively. It was made the establishment of a newspaper virtually free, upon legal deposit of two copies, and upon due registration of each newspaper under the simple guarantee of a registered director, French by birth, responsible in case of libel. And it took away the former discretion of the authorities in determining the home office of La République and La Revue Mystique in French foreign journals. The home minister might still prohibit a single number of a newspaper; only the whole council of ministers, duly convened, could prohibit the circulation of a foreign newspaper absolutely. The newspapers of Paris, and similarly of France, practically doubled in number between 1880 and 1900. In 1880 there were about 120 Paris newspapers, in 1890 about 160, and in 1900 about 240. The total number of newspapers, as distinguished from periodicals, published in France during 1900 was in round numbers 2,400.

Of these, about 2160 appeared in 340 provincial towns.

The history of the press in France during the last two decades of the 18th century followed very closely that of the country itself. Boulangism and anti-Boulangism, Dreyfusism or anti-Dreyfusism, Republican or Nationalist; finally it became either Moderate Republican or Radical-Socialist with a sprinkling of Nationalist organs and a small minority of Royalist and Bonapartist sheets.

At the head of the Moderate Republican organs were Le Temps and Le Journal des Débats among the evening papers, and Le Figaro, Le Journal, Le Siècle, Le Petit Parisien and Le Petit Journal among the morning dailies. Le Figaro was until 1901 under the editorship of M. F. de Rodays, and the brilliant articles of M. J. Cornély were one of the features of the paper; but a dispute among the proprietors in 1901 resulted in the dismissal of M. Cornély and the retirement of M. de Rodays. M. Jean Dupuy (a member of the Waldeck-Rousseau government) was the proprietor and editor of Le Petit Parisien, a popular organ almost rivalling Le Petit Journal; the circulation of the latter had, however, reached over one million and a quarter copies daily.

Le Monde and L'Éclair, among the Moderate Republican organs, gave less attention to the discussion of political questions from the party point of view than to the collection of news, and they were followed by the Écho de Paris (1884). Le Matin, which also dates from 1884, was from its origin essentially what is called in France a journal d'informations, publishing every morning a mass of telegraphic news from all countries. By an arrangement with the London Times, it gave every day a translation of most of the telegrams published in that newspaper.

In April 1901 the proprietorship of Le Siècle was changed, in consequence of the lack of support given by Parisian readers to that journal as edited by M. Yves Guyot (formerly minister of public works). The latter was a staunch free-trader, a courageous defender of Captain Dreyfus, and an eloquent advocate of a good understanding between France and England; he emphatically endorsed the British policy in South Africa, and tried to explain it to his countrymen. The paper was, however, bought in by a number of friends of M. Yves Guyot, who remained as editor. The greatest opponent of Yves Guyot from the economic point of view was Jules Mélén, also a former minister, whose paper, La République, was the recognized organ of Protectionism.

The Radical and Socialist ideas which in latter years made such progress in France were very ably advocated by several newspapers whose influence steadily grew, such as L'Aurore, La Lanterne and L'Humanité (the organ of Jean Jaurès). Such individual organs of opinion must also be mentioned as L'Intransigeant, the organ of Henri Rochefort, and M. Clemenceau's organ, Le Bloc, in which he advocated the practical application of all of the revolutionary republican principles, purged of every modulating influence, whether (Bloc), no part of which could or ought to be sacrificed to temporary political necessities.

As an intermediate link between the Republican organs of all shades and the various Monarchist newspapers, came the so-called Nationalist press, an offshoot of or successor to the Boulangist press of the preceding decade. As were the Boulangists, so were the Nationalists, a sort of syndicat des mécontents, their chief organs being La Patrie, edited by M. Millevoye, and La Cocarde; these papers represented the views of those who had vague hangkings after a different régime and a decided hostility towards the republican form of government.

There was a considerable diminution of influence in the Monarchist press. Le Soleil, however, had a large circle of readers among the Conservative bourgeoisie with Orleanist leanings. Le Gaulois remained a Royalist paper of somewhat doubtful tendencies, the editor, M. Arthur Meyer, having incurred the displeasure of the Pretender whose cause he defended. Of the Old Legitimist press there remained the old Gazeau de France, which was founded in 1831 and had still a diminishing band of faithful readers. The organ of the religious (Roman Catholic) associations in France, La Croix, founded in 1880, represented the views of the French religious associations (Bloc), no part of which could or ought to be sacrificed to temporary political necessities.

La Croix was published in Paris, but had in the provinces one hundred and four local weekly supplements to the Paris edition, each one taking its name from the parent journal and adding to it the name of the department or locality in which it was printed, such as La Croix de l'Allier, La Croix de Lyon.

The French papers, of whatever party, took an increased interest during this period in foreign matters, and much improved
their organization for collecting news. Some of them, in fact, were almost exclusively news-sheets, and the journal of informations—Le Matin or L’Eclair, for instance—took its place beside the journal properly so called, more perhaps as a rival than as a complement. The natural result followed, and the more old-type newspapers took steps to provide their readers with news as well as with leading articles, current and literary topics, society gossip, dramatic criticism and law reports. The most remarkable as well as perhaps the earliest attempt to enlarge the scope of Parisian newspapers was made in 1803 by Georges Patiot, editor of the Journal des Débats. Instead of one edition, that newspaper published two entirely distinct editions, a morning one and an evening one. After some time the plucky attempt had to be given up, and the Journal des Débats became an evening paper. The bold experiment made by the Journal des Débats (which celebrated its centenary in 1889) led the other newspapers to find a happy mean between a four-page paper published twice a day and an eight-page paper on the pattern of English newspapers, and the result was that now most great daily papers in Paris came out with six pages, the Figaro giving the lead. As French newspapers increased in size they reduced their price. Most six-page newspapers, with the exception of Le Figaro, were by 1902 sold at 5 centimes, and the price of 15 centimes, which used to be the rule, became the exception. In 1902 60 Paris papers (daily and weekly) were sold at 5 centimes and 51 at 10 centimes, whilst only 11 cost 15 centimes. In 1880 only 23 were 5-centime papers and 24 were 10-centime papers.

The American style of journalism came into vogue in Paris in the eighties, and “interviews” were supposed, the general tendency of Parisian editors was to adopt the English compromise, and to eschew any extreme sensational methods. Most of the important Parisian newspapers had their special correspondents in the great capitals of Europe, London, Berlin, St Petersburg, Vienna and Rome. Nothing perhaps was so striking after 1890 as the demand of the French public for foreign and colonial news, or the readiness of the papers to supply it by means of special representatives independent of the news agencies.

In how matters the French press made greater progress still in the rapid and accurate collection of news, and in this respect the provincial press showed more enterprise and more ability than that of Paris. Its development was remarkable, for whereas in 1880 the inhabitants of the departments had to await the arrival of the Parisian papers for their news, they now had the advantage of being supplied every morning with local newspapers inferior to none of the best organs of Paris. Among the best provincial papers may be mentioned La Gironde and La Petite Gironde of Bordeaux, La Dépêche of Toulouse, Le Lyon Estimable, and Le Croix du Sud. All having staff in Paris engaged in collecting news, reporting parliamentary proceedings and law cases, telegraphed or telephoned during the night and published early the next morning in their respective localities. Being perfectly independent of purely Parisian opinion or even bias, the decentralization of the French provincial press became complete. The newspapers of the large towns circulated not only in the city in which they were printed but throughout the region of which it was the centre. Thus the Dépêche of Toulouse, with its twelve editions daily, was read in the whole of the departments extending from the Lot to the Pyrenees, whilst the Petite Gironde was found in all south-western France. The influence of the provincial, as of the Paris, press became so great that, as M. Avenel says in his book on the French press, there came a tendency to resent its omnipotence. The power of the newspaper in France differs from that of the English newspaper, in that it seems to act more on the government and the parliament than on public opinion. The French newspapers have taken upon themselves, in many cases, functions which belong more properly to the legislative or to the judicial power than to the press, and the result has not always been successful. The cause of this is that too many men of talent with political ambition look upon journalism as “leading to everything, provided one gets out of it,” and use it alternately as an antechamber of parliament or of the cabinet, and a lounge during their parliamentary or ministerial eclipses.

5. NEWSPAPERS OF GERMANY

Printed newspapers in Germany begin with the Frankfurter Journal, established in 1615 by Egenolff Emmer, a bookseller of Frankfort-on-Main. The following year saw the foundation of the Frankfurter Obergerufettzeitung—continued until the year 1866 as Frankfurter Postzeitung. Fulda appears to have been the next German town to possess a newspaper, then Hildesheim (1619) and Herford (1630). In the course of the century almost all German cities of the first rank possessed their respective journals. The earliest in Leipzig bears the date 1660. The Rostocker Zeitung was founded in 1710. The Hamburger Correspondent (1714) was originally published under the name of Holsteinische Zeitungs-Correspondent, two years earlier, and was almost the only German newspaper which really drew its foreign news from “our own correspondent.” Berlin had in the 18th century two papers, those of Voss (the Vossische Zeitung, 1722) and of J. K. F. Spener (1749-1827; the Spenerische Zeitung, or Berlinische Zeitung). There was also a number of provincial papers which glimmered in the surrounding darkness were the reservoirs whence the rest replenished their little lamps. On the whole, it may be said that the German newspapers were of very small account until after the outbreak of the French Revolution. Meanwhile the MS. news-letters, as in earlier days, continued to enjoy a large circulation in Germany. Many came from London.

The correspondence, for instance, known under the name of Mary Pinear—“that, apparently, of a French refugee settled in London—had a great German circulation between 1725 and 1737. Another series was edited by Jean Ignace de Rodéfique, also a French refugee, and remembered as the subject of a characteristic despatch from Frederick II. of Prussia to his envoy in that city, enclosing 100 ducats to be expended in hiring a stout fellow with a cudgel to give a beating to the gazetteer as the punishment of an offensive paragraph. The money, it seems, was earned, for Rodéfique was well-nigh killed. At Berlin itself, Franz Hermann Ortigies carried on a brisk trade in these news-letters (1728-1735), until he too came under displeasure on account of them, was kept in prison several months, and then exiled for life. Nor, in any journal of a high order be mentioned of prior appearance to the Allgemeine Zeitung, founded at Leipzig by the bookseller Cotta (at first under the title of Neueste Weltkunde) in 1798. Posselt was its first editor, but his want of nerve—and perhaps his weak health—hindered the application of his high powers to political journalism. His articles, too, gave offence to the Austrian court, and the paper had to change both its title and its place of publication. It had been commenced at Tübingen, and removed to Stuttgart; it was now transferred to Ulm, and again to Augsburg. It was Cotta’s aim to make this the organ of statesmen and publicists, to reach the public through the thinkers, to hold an even balance between the rival parties of the day, and to provide a trustworthy magazine of materials for the historians to come; and, in the course of time, his plan was so worked out as to raise the Allgemeine Zeitung into European fame. Cotta was also the founder, at various periods, of the Morgenblatt, which became famous for its critical ability and tact, of Wesperus, of Das Inland, of Nemesis, of the Oppositions-blatt of Weimar (for a time edited by Bertuch), and even of the Archives Parisiennes.

Whilst French influence was dominant in Germany, the German papers were naturally little more than echoes of the Parisian press. But amidst the excitement of the “war of

1 Fr. Kapp, “Berliner geschriebene Zeitungen,” in Deutsche Rundschau, xxii. 107-122 (1879), citing Droysen, Zeitschr. f. preuss. Gesch. xiii. 11. The story, as told by Droysen, is an instructive commentary on Carlyle’s praise of Frederick’s “love of the liberty of the press.”

2 Kapp, op. cit.
liberation" a crowd of new journals appeared. Niebuhr started a "Preussischer Correspondent;" Görres—who in 1798 had founded at Coblenz Das rothe Blatt, soon suppressed by the invading French—undertook the Rheinischer Mercur (January 1814 to January 1816), which was suppressed by the Prussian government, under Von Hardenberg. This journal, during its initiatory year, had the honour of being named by Napoleon—perhaps satirically—"the fifth power of Europe." Wetzel, somewhat later, published in Hamburg the Hamburgische Tribun, later Examen, published in Bamberg, and Friedrich Seybold the Neckerszeitung. Some of these journals lasted but two or three years. Most of the survivors fell victims to that resolution of the diet (20th September 1819) which subjected the newspaper press, even of countries where the censorship had been formally abolished, to police superintendence of a very stringent kind. The aspirations for some measure of freedom which burst forth again under the influences of 1830 led to the establishment of such papers as Siebenpfeiffer's Westbote, Lohhauer's Hochzeiten, Wirthe Deutsch, Tribune, Eisemann's Böttcher's Volksblatt, Der Freisimone of Rotteck and Wellecker, and many more of much freer utterance than had been heard before in Germany. This led, in the ordinary course, to new declarations in the dict against the licence and revolutionary tendencies of the press, and to "regulations" of a kind which will be sufficiently indicated by the mention of one, in virtue whereof no editor of a suppressed journal could undertake another journal, during the space of five years, within any part of Germany. It need hardly be added that few of the newspapers of 1830 saw the Christmas of 1834. Very gradually some of the older journals—and amongst the number the patriarch of all, the Frankfurter Oberpostamtzeitung—plucked up courage enough to speak out a little; and some additional newspapers were again attempted. Amongst those which acquired deserved influence were Brockhaus's Deutsche Allgemeine Zeitung, the advocate of free trade and of a moderate liberalism, possessing a large circulation in northern Germany (1837); the Deutsche Zeitung, edited by Gervinus, at Heidelberg (July 1847); and the Dorfzeitung, published at Hildburghausen. The stirring events of 1848 called forth in Germany, as in so many other countries, a plentiful crop of political instructors of the people, many of whom manifested lack even the capacity to learn, and vanished almost as suddenly as they had appeared. But it is undeniable that a marked improvement in the ability and energy of the German political press may be dated from this period.

At the beginning of the 20th century the position and influence of the German press were passing through a period of change. The Germans had become a newspaper-reading people. Indeed, with the remarkable growth of the commercial spirit in Germany, there had simultaneously been a change in the intellectual attitude and habits of the mass of the nation. The German of "the great period" of 1866 and 1870 derived his knowledge of his own and other countries to a very great extent from the more or less intelligent study of books, pamphlets and magazines. The busy German of the opening years of the 20th century had become almost as much the slave of his newspaper as the average American. Berlin in 1900 had 45 daily papers, Leipzig 8, Munich 12, Hamburg 11, Stuttgart 8, Strassburg 6. In the domains both of home and of foreign politics the result was often a chaos of crude opinions and impulses, the strata of which were only differentiated by certain permanent tendencies of German political thought based upon tradition, class feeling, material interests, or distinctions of religious creed. In these circumstances it was still possible for the government, as in the days of Prince Bismarck and Dr Moritz Busch, to bring its superior knowledge to bear upon the anarchy of public sentiment through the medium of the inspired (or as it used to be called, the "rep-tile") press, but this operation had now to be performed with greater delicacy and skill. The press had begun to feel its power. It was at least able to drive a bargain with those who would officially control it, and it was conscious in its relations with the authorities that the advantage no longer rested exclusively on the side of the latter. It would be instructive to compare, with the aid of Dr Busch's "Secret Pages" of the history of Prince Bismarck, the methods by which the first Chancellor used to create and control a movement of public opinion with the devices by which, for instance, count von Bülow and his subordinates endeavoured to manage the press of a later day. The journalists who placed themselves at the disposal of Prince Bismarck were mostly treated as his menials; as he himself said, "Decent people do not write for me." Count von Bülow's methods, and the official treatment of those who wrote for him, were much the same as those of his predecessors, moved on somewhat different lines. These methods may be characterized as the psychological treatment of the individual journalist, the endeavour to appeal to his personal vanity or to his legitimate ambition, and only in a minor degree to his fear of the dossier, the public prosecutor, and the official boycott. There was also a further development of Prince Bismarck's system of acknowledging the existence of political and social movements the origin of which was wholly or partially independent. As in Bismarck's time, the tendencies of these movements were carefully observed, and they were turned to account where they seemed capable of subserving the main objects of state policy. Thus at the opening of the century the pro-Boer and agrarian movements were both employed in support of German foreign and colonial policy, and of an elaborate scheme of naval construction; while the growth of the commercial spirit on the one hand and the awakening of the lower middle classes on the other, were pressed into the service of Wett-politik and of its auxiliary—a system of protective tariffs. It required no small skill to bring into line and to hold together the various classes and interests from time to time arrayed in the press in the service of German foreign policy. The organs of the government in the press were the sheep-dogs which held the flock together.

The German journals of which foreigners hear most belong with few exceptions to the daily press of Berlin. There are, however, one or two provincial or non-Prussian newspapers which from time to time enjoy more careful inspiration from the government, such as Berliner Tageblatt, published officially in Berlin contemporary with the Berliner Tageblatt, Cologne Post, Kölnische Zeitung, 1848, of which Prince Bismarck once said that it was "worth an army corps on the Rhine." It is difficult to trace all the channels by which information is conveyed to an organ of this kind, but there have undoubtedly been times when leading articles and entre-filets in the Rhenish organ were virtually or actually written in the German Foreign Office. Indeed, the methods employed for the organization of a private newspaper, which in the realm of foreign policy at least represented no concrete organization, have been so numerous and varied that it would be hopeless for any one except the most practised observers to get any idea of them. The official press, if it could be manipulated with unvarying success, is that it can easily be dissuaded when the suggestions, overtures or menaces of which it has the power—"This is our statement: Believe it, or else." Thus during the blockade of Manilla in 1898 the Cologne Gazette gave all the prominence of its first column and of leaded type to an article taken from the Marine Politische Korrespondenten, which practically warned the United States of the intention of Germany to have a share in the Pacific possessions of Spain if these should eventually change hands. Some ten days later the authority of this menace was explicitly acknowledged by the North German Gazette, which announced the Marine Politische Korrespondenten had never possessed a semi-official character. The Cologne Gazette continued in the west of Germany to serve the German government much as it did in the east in the days of Prince Bismarck, for newspaper representation became on the whole more intermittent than it was in the days of the first Chancellor. The Hamburgischer Correspondent, the leading Hamburg journal, played a minor rôle of the same nature in the foreign press of the liberal party, which, during the closing years of the life of Prince Bismarck and the closing years of his life at Friedrichsruh as the receptacle of indiscreet revelations and violent attacks upon the present government, as well as upon the local victims of violent Anglophobia. The Allgemeine Zeitung of Munich, once famous throughout Europe as the Augsburger Allgemeine Zeitung before its transference to the Bavarian government in 1870, was for many years the organ of the imperial Chancellor. In Prince Bismarck's days the press bureau of the Prussian Ministry of the Interior, and a similar organization in the Imperial Home Office, used to furnish hurried and inanity communications to the press, to which articles gratis, so that the policy of the government might be advocated in every nook and corner of the country. The numerous journals in which these communications used to appear simultaneously and in an identical form were the government organs to which the Radical and Socialist
opposition more particularly applied the term "Reptile Press." Later this practice of wholesale inspiration was abandoned, but there remained many channels, public and private, through which almost every department of the government could communicate information to the newspapers and to the public "outside". The Prussian Ministry of the Interior distributed to all and sundry a news-letter known as the Berliner Korrespondenz, professing only to give statistics and lack of information, but frequently containing articles advocating some proposal of the government or combating the arguments of its opponents. The Süd-Deutsche Reichs-Korrespondenz had a similar character, and in the North-German edition of the newspaper the Chancellor, count von Bülow. Almost every one of the political parties has its Korrespondens (or news-letter) supplying views rather than news. These circular letters deal, in fact, with the policy of the party, and are addressed to the seaters in general; they also embody information which the party leaders in the Reichstag or in the Prussian Diet have received from representatives of the government for their own guidance. They form the nucleus binding the parties together, and of inspiring them with common aims, as they are reproduced throughout the country by all the party organs.

It was in the press of Berlin that the greatest changes took place towards the end of the 19th century. During the reign of Bismarck the German Gazette, and occasionally the Post, used to keep Europe in a state of nervous tension by fulminating comanquis which the great Chancellor himself often dictated, or by which the political cold brains of a whole nation were directed against France or Russia. So far as France and Russia are concerned, a much more pacific tone prevailed in Berlin after the conclusion of the Dual Alliance, and it was upon England that Bismarck's great efforts were more often directed. The London Gazette, which was originally established by a private individual, in order to place a blank sheet of paper at the disposal of Prince Bismarck to bring about the establishment of a weekly organ of a summary of foreign intelligence bearing the semi-official stamp of Wolf's Telegraph Agency. It had doubtless been found that the constant employment of an organ so distinctly official as the National-Zeitung was the most serious obstacle to the financial development of the government, that the government was apt to lead to indiscretions which committed the authorities too deeply. Indeed, immediately before Prince Bismarck's fall he had actually employed this journal in order to attack the influence of the government's interests.

The journals which in 1880 were most widely read in Berlin, and which are best known abroad as the exponents of Berlin opinion, were the Liberal or Radical Vossische Zeitung and Berliner Tageblatt, and the National Liberal National Zeitung. The Vossische Zeitung, the oldest of the two, was founded in 1863 by Bernhard Wolff, the founder of Wolf's Telegraph Agency. It was a weekly organ based on the London Gazette, and the officers of the London Gazette, purely a record of official intelligence, though on rare occasions it publishes in the section marked Nicht Amtiich (non-official), some opinions on state, some statement of policy or some official document—a proceeding which always requires the express sanction of the emperor.

It was a weekly organ based on the London Gazette, purely a record of official intelligence, though on rare occasions it publishes in the section marked Nicht Amtiich (non-official), some opinions on state, some statement of policy or some official document—a proceeding which always requires the express sanction of the emperor.

6. OTHER EUROPEAN COUNTRIES

Austria-Hungary.—At the beginning of 1840 the whole number of Austrian-German and Hungarian periodicals, of all sorts, was less than 100, only 22 being (after a fashion) political newspapers; and of these nearly all drew their materials and their inspiration from the official papers of Vienna (Wiener Zeitung and Österreichischer Beobachter). These two were all that appeared in the capital. Agric, Peas, Pressburg, Lemberg and Prague had each also two; but no other city had more than a single journal. In 1840 the aggregate number of periodicals had grown to 150, of which 46 were in the empire, but political only in the character. The rest were conduits for intelligence "approved of" by the government. In 1855 the number of political papers published throughout the entire Austrian-German and Hungarian provinces was 85. In 1860 it was 60. The Neue Freie Presse, the chief Vienna daily, was founded in 1864. In 1873, ten years after the virtual cessation of a very strict censorship, the number of political journals, including all the other sorts of papers, had grown to 645, and of political pamphlets, and that of mere advertising papers 42; in 1883 the former number had increased to about 280, the latter to about 66. Vienna had in 1883 in all 18 daily newspapers, ten of which ranged in average circulation from 14,000 to 14,000 copies.

In the period from 1880 to 1888 the only notable paper founded in Austria, was the Wiener Allgemeine Zeitung (1886). It appeared three times daily, but in spite of the impetus communicated to its start by the well-known "Freiheits and Apostol Hertzka, it soon fell away, and eventually became simply a late evening paper, known as the 6 Uhr Abendblatt. It was with the rise of the anti-Semite movement of the later Bismarck period, with Bismarck's annual" travel in the provinces, that the demand for evening papers began. In 1883 the number of evening papers in Vienna was 60. The Neue Freie Presse, the chief Vienna daily, was founded in 1864. NEWSPAPERS

Holland.—The kingdom of the Netherlands has always been rich in newspapers, but they have usually had more weight commercially than politically. Amsterdam in 1850 had 9 daily, and in 1900 had 12 daily. Behind Rotterdam and Leiden was The Hague, where 1900 the Hague had 6 daily (Dagblad, Vaderland, &c.); and Rotterdam had 5 daily (Nieuwe Rotterdamer Courant, &c.). The oldest Dutch newspaper is De Dutschen Courant, founded in 1656, is still one of the leading journals.

Italy.—The Diario di Roma, although dating only from 1716, may claim to have been the patriarch of the Italian press. It lasted for nearly 100 years without interruption. It was printed on a single sheet, with a weekly supplement having the somewhat whimsical title Notizie del Giorno.

The next came the Gazzetta Ufficiale di Napoli. These and their congeners were published under a rigid censorship, and their rulers searched the papers, and removed all evidence of any kind. The first tentative movement towards a free press may, perhaps, be dated from the effort to establish at Milan, in 1816, under the newly-formed Italian republic, a newspaper. Simonde de Sismondi, Gonfalonieri and Romagnosi were fellow-writers, but the new journal was suppressed in 1820. The first really effective effort had to wait for the lapse of nearly thirty years. L'Opinione was first published in Turin (26th December 1847) afterwards in Rome. It had, amongst its many editors, Giacomo Durando (a soldier of mark, and twice minister of foreign affairs), Montenezolo, Giovanni Rampi and Giacomo Dina. The Florence Diretto, originally founded at Turin, in 1851, by Piazzonio and Berti, continued by Macchi, Bargini and Civenini, and as a radical organ attained great influence. Counting journals of all kinds, there were published in Italy in 1864, 450; in 1875, 479. In 1882 the "periodicals" of all kinds numbered 1,454, and total number of political dailies was 149. In 1890 Rome published 13 daily, and in 1900, 10 daily. The leading Roman dailies were: L'Indipendente (founded in 1842 as a nationalist); the Tribuna (5 centimes), a Liberal paper founded in 1883; the organ of the Vatican, L'Osservatore Romano; and the popular Mosca (founded in 1866) and the Corriere della Sera (1876) are issued from Milan.

Russia, Poland and Finland.—The earliest gazette of Moscow (Moskovskaia Vedomosti) was issued by order of Peter the Great on the 1st April 1703, and was published as a government daily for 2 years, until the 1st January 1705. Leningrad (St Petersburg) is the natural successor, and the official daily of the city. The first daily was published in 1721. The first newspaper was completed, but there is no further record of it than the 2nd January following. The whole gazette of the year 1703 was reproduced in facsimile by order of Baron de Korf (the imperial librarian at St Petersburg) in 1855, on occasion of the fests of the centenary of its publication. It is entitled "Gazeta de Moscowa" and "V edomosti dates only from 1766. That of St Petersburg dates from 1718. The historian Karamzin established a short-lived Moscow journal (Moskovski Livadi) and afterwards at St Petersburg the once widely-known Russian Courrier de l'Europe (1802). The profits of the successful Invalide Russe (Russkiy Invalid), established in 1815 by Persorovius, were devoted to the sufferers by the war with France. Adjoining the discussion of "Russian Press" is a miscellaneous and characteristic, the whole number of newspapers published within the Russian states—Poland and Finland excepted—in the year 1835 was 136; in 1886 that number had grown to 179, of which 72 were published in St Petersburg, 71 in Moscow, 3 in Kiev, 3 in Russian, 3 in Russian and in German, 1 in Russian and in Polish, 28 in German, 8 in French, 3 in English, 3 in Polish, 1 in Lithuanian, 1 in Italian, 1 in Hungarian, and 1 in Swedish. The number of newspapers, and number of political and miscellaneous journals had grown to 293, and of these 105 were under the direct influence of the Government. But, in truth, the period of relaxation of censorship, if strictly examined, will be found to have lasted only from 1855 to 1864, when repressive measures were again and frequently resorted to. Poland in 1830 had 49 newspapers. Fifty years later the number was still less than 70, of which 34 were in Polish, these numbers including journals of all kinds. Finland in 1860 had 24 newspapers, all in Swedish, half in Finnish. In 1863 the number had increased to 32, in spite of the zealous opposition of Count de Berg, the governor-general, to all discussion in the political papers. "For the whole country," he said, "it is better that newspapers should not exist."

It should be remembered that the official journals. They consisted of the circulars of the Russian police, and were published at St Petersburg, the capital, and Moscow, the second city. The number of the whole was 25, of which 15 were published weekly, and 10 (excepting 3 which were published only once a year) daily. The so-called Sammelt Zeitung, published at Helsingfors in 1847, owed much of its popularity to the pains its editors took with their correspondence. The Russian Wirkung-Journal ("Uelab von der Hof-Kommisjon") was for a considerable period the most thoroughly newspaper of the world. The exception, of the little journal published at Tromsö, in Norway.

In 1880 the whole number of newspapers printed within the government of Russia was 887. Of these 517 were published in the Russian language, 155 of them being official or administrative journals. The number of daily papers printed in various European languages—French, Dutch, English, German, Russian, Lithuanian, even Chinese—made the foreign press of St Petersburg and Moscow a powerful influence. The large number of newspapers printed within the empire during the same year was 376. Of these, 417 were printed in the Russian language, 155 of them being official or administrative journals. The number of daily papers printed in various European languages—German, French, English, Russian, Lithuanian, even Chinese—made the foreign press of St Petersburg and Moscow a powerful influence.
In journals, but these papers, dailies. Best political activity in 1900 Denmark. Until was 197, it was published in Aftonbladet, founded by the above-named Blacquet in 1831. It soon changed its language to Turkish, and was edited by Franceschi. The second Smyrna newspaper, Echo de l'Orient, established in 1838, was transferred to Constantinople in 1844. But not one of these papers has survived.

In 1876 the total number of journals of all kinds published in the capital was 72 (namely, 20 in French, 16 in Turkish, 13 in Armenian, 12 in Greek, 11 in as many other tongues). In 1890 there were 19 papers, in various languages, published at Constantinople, most of them dailies; and in 1900 the number of papers decreased to 18. They appeared in the following languages: the Stamboul and 4 others in French, 3 in Turkish, 1 in Spanish, and 1 in some other languages, and 1 each in Arabic, English, Italian and Persian. Smyrna published 8 papers, mostly weeklies, in 1890, and the same number in 1891. Many of them were printed in Istanbul, the capital of the empire.

In Greece and Spain, the press was somewhat more independent, but even there the newspapers were almost entirely in the hands of the government. In Spain, for example, the press was exclusively under the control of the government, and only political and official papers were published.

The newspapers of other countries (e.g. Japan) or of important towns, see under the separate topographical headings. (H. C.)

NEWT (a corrupted form from "an evet" or "an effet," an term of Anglo-Saxon origin, still used in many parts of England), the name usually applied to the aquatic Amphibia. It is the name of English school which constitute the genus Molge, formerly known as Triton. But the name Triton, applied to these Batrachiens by N. Laurenti (1768), has already been used by Linnaeus (Systema Naturae) for parts of the barnacle (Lepas anatifera). B. Merxm (1820) proposed to substitute for it the name Molge, said to be derived from the Gr. Máχαν or Máχαν, "slow," in allusion to the movements of these animals on land. The similar name Molch designates these Batrachiens in German.
land, concealing themselves under stones, logs of wood, or in holes in damp earth, but leaving their retreat at night or in wet weather, to search for earth-worms and slugs which constitute their principal food. In the water they are very destructive of tadpoles, insect larvae and crustaceans.

A remarkable feature of the newts, which they share with the other tailed Batrachians and the larvae of the frogs and toads, is the great facility with which they regenerate lost limbs as the tail, femur, humerus, and even the maxillary and mandibular, a faculty which has given rise to a great variety of experiments, from the days of Charles Bonnet and Spallanzani to those of the present school of Entwicklungsmechanik.

Extraordinarily as it may appear, considering the abundance of these creatures and the attention they have received from naturalists, it was only in 1880 that their mode of fertilisation was correctly ascertained, from observation of the common newt by the Italian zoologist F. Gasco. The amorous games of the newts, so graphically represented by M. Rusconi, had been repeatedly described, and Abbé Spallanzani, as early as 1766, had ascertained the impregnation to be internal. The then current belief that the water served as a vehicle to convey the spermatozoa to the female organs had received a blow on the declaration of a latestonic current in the female, but no satisfactory explanation had been given of the manner in which the spermatozoa reach these pouches. This mystery Gasco succeeded in elucidating in his masterly paper on the Batrachia in 1880. He has since carried the investigations on the axolotl, and those of E. Zeller, E. O. Jordan and others on the European and American newts.

All who have kept newts in an aquarium have witnessed the curious and inimitable method of fertilisation; the female, when in full condition, will, by the male undulating the tip of his tail, conduct the male to the female in the act of spawning; and by an apathetic twirl of her own body, the female will often guide the male into her cloaca. This is an uninterrupted process which goes on for many hours at a time.

The genus *Molge* has a wide distribution, extending over Europe, northern Asia, and western temperate America (China and Japan) and North America as far south as southern California and the Rio Grande del Norte. Twenty species are distinguished. The British species are the crested newt (*M. cristata*), the leaf newt (*M. vittata*), and the palmated newt (*M. palmarum*). The first is the largest, and measures 4 to 6 in. The skin is more or less rugose, with granular warts, a strong fold extends across the thorax, and the external cloaca is provided with a very high denticate dorsal crest which is interrupted over the sacral region; the upper parts are dark, with more or less distinct black spots; the sides are speckled with white, and the lower parts are yellow or orange, spotted or marbled with black; a silver stripe adorns the side of the tail in the male. The common and the palmated newts are smaller, 2 1/2 to 4 in. in length, and have a smooth skin. The dorsal crest of the male is high and festooned in the former, low and straight-edged in the latter; during the breeding season the crest of the common newt ape lobate like a grebe's, whilst they are webbed like a duck's in the palmated newt, which is further distinguished in having the tail transversely ribbed like a flamingo.

It is a remarkable fact that, although related so closely and occurring so frequently together in pools of small extent, the common and palmated newts are not known to ever produce hybrids, whilst the crested and leaf newts are occasionally bred in aquaria. The former is a native of the south-western alps, the beautiful *Molge marmorata*, to which it is by so means more nearly akin than are the two above-named species to each other, generally gives rise to the form known as *M. lasti*, which has been proved to be a cross between *M. cristata* and *M. marmorata*.

Newton, Alfred (1829-1907), English zoologist, was born at Geneva on the 11th of June 1829. In 1848 he was elected travelling fellow of Magdalene College, Cambridge, of which he had been an undergraduate, and subsequently visited many parts of the world, including Lapland, Iceland, Spitsbergen, the West Indies and North America. In 1866 he became the first professor of zoology and comparative anatomy at Cambridge, a position which he retained till his death. His services to ornithology and zoogeography were recognized by the Royal Society in 1890, when it awarded him a Royal Medal. He wrote many books, including Zoology of Ancient Europe (1862), Osteologia Wollevana (begun in 1864), Zoology (1872), and a Dictionary of Birds (1883-1886). The last, still a standard work, was an amplification of the numerous articles on birds which he contributed to the 9th edition of the Encyclopaedia Britannica, and which with comparatively slight revision are retained in the present edition. He contributed many memoirs to scientific societies, and edited The Ibis (1865-1870), the Zoological Record (1870-1872), and Yarrell's British Birds (1871-1882). He died at Cambridge on the 7th of January, 1886.

Newton, Sir Charles Thomas (1816-1894), British archaeologist, was born on the 16th of September 1816, at Bredwardine in Herefordshire, and educated at Shrewsbury School and Christ Church, Oxford. He entered the British Museum in 1830 as an assistant in the Antiquities Department. Antiquities, classical, Oriental and medieval, as well as ethnographical objects, were at the time included in one department, which had no classical archaeologist among its officers. In 1852 Newton quitted the Museum to become vice-consul at Mitylene, with the view of exploring the coasts and islands of Asia Minor. Aided by funds supplied by Lord Stratford de Redcliffe, then British ambassador at Constantinople, he made in 1852 and 1853 important discoveries of inscriptions at the island of Calymnos, off the coast of Caria; and in 1856-1857 he achieved the great archaeological exploit of his life by the discovery of the remains of the mausoleum of Halicarnassus, one of the "seven wonders" of the ancient world. He was greatly assisted by Murdoch Smith, afterwards celebrated in connexion with Persian telegraphs. The results were described by Newton in his History of Discoveries at Halicarnassus (1862-1863), written in conjunction with R. P. Pullan, and in his Travels and Discoveries in the Lévant (1865). These works included particulars of other important discoveries, especially at Branchiae, where he disinterred the statues which had anciently lined the Sacred Way, and at Cnidus, where R. P. Pullan, acting under his direction, found the colossal lion now in the British Museum.

In 1855 Newton declined the regius professorship of Greek at Oxford. In 1860 he was made British consul at Rome, but had scarcely entered upon the post when an opportunity presented itself of becoming sub-consul at the British Museum, which was divided into three and ultimately four branches. The Greek and Roman section naturally fell to Newton, who returned as Keeper, and held the office until 1885, declining the offer of the principal librarianship made to him in 1878. The Mausoleum Room, to accommodate the treasures he had found in Asia Minor, was built under his supervision, but the most brilliant episode of his administration was the acquisition of the Blacas and Castellani gems and sculptures. The Farnese and Pourtales collections were also acquired by him. Not being of the leading London families, he had the advantage of the Promotion of Hellenic Studies, the British School at Athens, and the Egypt Exploration Fund. He was Yates professor of classical archaeology at University College, London, from 1880 to 1888. His collected Essays on Art and Archaeology were published in 1886. When, on his retirement from the Museum, his bust by Boehm, now placed in one of the sculpture galleries, was presented to him as a testimonial, he desired the unexpended balance to be given to the school at Athens. After his retirement he was much occupied with the publication of the Greek inscriptions in the British Museum, but his health failed greatly in the latter years of his life. He died at Margate on the 28th of November 1894. He married in 1861 the daughter of his successor in the consulate at Rome, the painter Severn, herself a distinguished artist. She died in 1886.
Newton, Sir Isaac (1642–1727), English natural philosopher, was born on the 25th of December 1642 (O.S.), at Woolsthorpe, a hamlet in the parish of Colsterworth, Lincolnshire, about 6 m. from Grantham. His father (also Isaac Newton) who farmed a small freehold property of his own, died before his son attained his third year. His mother, Hannah Ayscough, a daughter of James Ayscough of Market-Overton. When Newton was little more than two years old his mother married Barnabas Smith, rector of North Witham. Of this marriage there was issue, Benjamin, Mary and Hannah Smith, and to their children Sir Isaac Newton subsequently left the greater part of his property. After having acquired the rudiments of education at two small schools in hamlets close to Woolsthorpe, Newton was sent at the age of twelve to the grammar school of Grantham. While attending Grantham school Newton lived in the house of Mr Clark, an apothecary of that town. According to his own confession he was far from industrious, and stood very low in his class. An unprovoked attack from the boy next above him led to a fight, in which Newton’s pluck gave him the victory. This success seems to have led him to greater exertions, and he rose to be the head boy of the school. He displayed very early a taste and an aptitude for mechanical contrivances. He made windmills, water-clocks, kites and dials, and he is said to have invented a four-wheeled carriage which was to be moved by the rider. In 1656 Mr Smith died, and Newton’s mother came back with her three children to Woolsthorpe. Newton was then in his fifteenth year, and, as his father in all probability intended him to be a farmer, he was taken away from school. He was frequently sent on market days to Grantham with an old and trusty servant, who made all the purchases, while Newton spent his time among the books in Mr Clark’s house. It soon became apparent to Newton’s relatives that they were making a great mistake in attempting to turn him into a farmer, and he was therefore sent back again to school at Grantham. His mother’s brother, William Ayscough, the rector of Burton Coggles, the next parish, was a graduate of Trinity College, Cambridge, and when he found that Newton’s mind was wholly devoted to mechanical and mathematical problems, he urged upon Mrs Smith the desirability of sending her son to his own college. He was accordingly admitted a member of Trinity College on the 5th of June 1661, as a subsizar, and was matriculated on the 8th of July. We have scarcely any information as to his attainments when he commenced residence, and very little as to his studies as an undergraduate. It is known that while still at Woolsthorpe Sanderson’s Logic had been read by him to such purpose that his tutor at Trinity College excused his excursions from the regular course of lectures on that subject. Newton tells us himself that, when he had purchased a book on astrology at Steebrugh fair, a fair held close to Cambridge, he was unable, on account of his ignorance of trigonometry, to understand a figure of the heavens which was drawn in this book. He therefore bought an English edition of Euclid with an index of propositions at the end of it, and, having turned to two or three which he thought likely to remove his difficulties, he found them so self-evident that he put aside Euclid “as a trilling book,” and applied himself to the study of Descartes’s Geometry. It is reported that in his examination for a scholarship at Trinity, to which he was admitted on the 3rd of May 1662, he was examined in Euclid by Dr Isaac Barrow, who formed a poor opinion of his knowledge, and that in consequence Newton was led to read the Elements again with care, and thereby to form a more favourable estimate of Euclid’s merits.

The study of Descartes’s Geometry seems to have inspired Newton with a love of the subject, and to have introduced him to the higher mathematics. In a small commonplace book, bearing on the seventh page the date of January 1663/1664, there are several articles on angular sections, and the squaring of curves and certain lines that may be squared, several calculations about musical notes, geometrical propositions from Francis Vieta and Frans van Schooten, annotations out of Wallis’s Arithmetica of Infinites, together with observations on refraction, on the grinding of spherical optic glasses,” on the errors of lenses and the method of rectifying them, and on the extraction of all kinds of roots, particularly those “in affected powers.” And in this same commonplace book the following entry made by Newton himself, many years afterwards, gives a further account of the nature of his work during the period when he was an undergraduate:—

“July 4, 1669.—By consulting an account of my expenses at Cambridge, in the years 1663 and 1664, I find that in the year 1664 a little before Christmas, I, being then Senior Sophister, bought Stack’s Miscellanies and Carter’s Geometry (having read this Geometry and Oughtred’s Clavis clean over half a year before), and borrowed Wallis’s works, and by consequence made these annotations out of Schooten and Wallis, in winter between the years 1663 and 1665. At such time I found the method of Independent Series, and in summer 1665, being forced from Cambridge by the plague, I computed the area of the Hyperbola at Boothby, in Lincolnshire, to two and fifty figures by the same method.

That Newton must have begun early to make careful observations of natural phenomena is sufficiently testified by the following remarks about halos, which appear in his Optics, book ii. part iv. obs. 13:—

“The like Crowns appear sometimes about the moon; for in the beginning of the Year 1663, February 15th, at night, I saw two such Crowns about her. The Diameter of the first or innermost Crown was as the Diameter of the Sun, and the Distance of the second was double the Diameter of the Sun, and an half. Next about the moon was a Circle of white, and next about that the inner Crown, which was of a bluish green within next the white, and of a yellow and red without, and next about these Crowns were others of blue and green on the inside of the Outward Crown, and red on the outside of it. At the same time there appear’d a Halo about 22 Degrees 35’ distant from the center of the moon. It was elliptical, and its Long Diameter was perpendicular to the Horizon, verging below farther from the moon.”

In January 1665 Newton took the degree of B.A. The persons appointed (in conjunction with the proctors, John Slade of Catharine Hall, and Benjamin Pulley of Trinity College, Newton’s tutor) to examine the questionists were John Eachard of Catharine Hall and Thomas Gipps of Trinity College. It is a curious accident that we have no information about the respective merits of the candidates for a degree in this year, as the “ordo senioritatis” of the bachelors of arts for the year is omitted in the “Grace Book.”

It is supposed that it was in 1665 that the method of fluxions first occurred to Newton’s mind. There are several papers still existing in Newton’s handwriting bearing dates 1665 and 1666 in which the method is described, in some of which dotted or dashed letters are used to represent fluxions, and in some of which the method is explained without the use of dotted letters.

Both in 1665 and in 1666 Trinity College was dismissed on account of the plague. On each occasion it was agreed, as in the case of the “Modern Divinity” of 1657, that the examination was suspended for the succeeding year. In 1666, the examination dates August 7th, 1665, and June 22nd, 1666, and signed by the master of the college, Dr Pearson, that all fellows and scholars who were dismissed on account of the pestilence be allowed one month’s commons. Newton must have left college before August 1665, as his name does not appear in the list of those who received extra commons on that occasion, and he tells us himself in the extract from his commonplace book already quoted that he was “forced from Cambridge by the plague” in the summer of that year. He was elected a fellow of his college on the 1st of October 1667. There were nine vacancies, one of which was taken by the “Verger Cohlemy” in the preceding summer, and the nine successful candidates were all of the same academical standing. A few weeks after his election to a fellowship Newton went to Lincolnshire, and did not return to Cambridge till the February following. On the 16th of March 1668 he took his degree of M.A.

During the years 1666 to 1669 Newton’s studies were of a very varied kind. It is known that he purchased prisms and lenses on two or three several occasions, and also chemicals and a furnace, apparently for chemical experiments; but he also employed part of his time on the theory of fluxions and other branches of pure mathematics. He wrote a paper Analysis per Equationes Numero Terminorum Infinitas, which he put, probably in June 1669, into the hands of Isaac Barrow (then Lucasian professor of mathematics), at the same time giving him
permission to communicate the contents to their common friend
John Collins (1624–1683), a mathematician of no mean order,
Barrow did this on the 31st of July 1669, but kept the name of
the author a secret, and merely told Collins that he was a friend
staying at Cambridge, who had a powerful genius for such
matters. In a subsequent letter on the 26th of August, Barrow
clarified this by saying he had sent him a paper from Newton:
Collins had formed of the paper, and added, "the name of the
author is Newton, a fellow of our college, and a young man,
who in his second year since he took the degree of master
of arts, and who, with an unparalleled genius (eximio quo est
acutium), has made very great progress in this branch of mathe-
matics." Shortly afterwards Barrow resigned his chair, and was
instrumental in securing Newton's election as his successor.
Newton was elected Lucassian professor on the 29th of October
1669. It was his duty as professor to lecture at least once a week
in term time on some portion of geometry, arithmetic, astronomy,
geography, optics, statics, or some other mathematical subject,
and also for two hours in the week to allow an audience to
any student who might come to consult with the professor on any
difficulties he had met with. The subject which Newton chose
for his lectures was optics. The success which attended his
researches in optics must have been great, although the results
were known only through his own oral lectures, until he presented
an account of them to the Royal Society in the spring of 1672.
On the 21st of December 1671 he was proposed as a candidate
for the Collsionian professorship of Natural History, which
was offered to him by the corporation of Salisbury, and on the 11th of January 1672 he was elected a fellow of the Society.
At the meeting at which Newton was elected a description of a reflecting telescope which he had in-
vented was read, and "it was ordered that a letter should be
written by the secretary to Mr Newton to acquaint him of
his election into the Society, and to thank him for the communication
of his telescope, and to assure him that the Society would take
care that all right should be done him with respect to this
invention." 

In reply to the secretary on the 18th of January 1672, Newton wrote:—
"I desire that in your next letter you would inform me for what
time the society continue their weekly meetings; because, if they
continue them for any time, I am purposing them to be considered
as examinations, and a kind of examination, which I doubt
not but will prove much more grateful than the communication
of this discovery, which in my judgment the oddest if not the most
considerable detection which hath hitherto been made into the
operations of nature."

The promise here made was fulfilled in a communication
which Newton addressed to Henry Oldenburg, the secretary of
the Royal Society, on the 6th of February 1672, and which
was read before the society two days afterwards. The whole is
printed in No. 80 of the Philosophical Transactions.

After explaining his discovery of the composition of white light, he proceeds:—
"When I understood this, I left off my aforesaid Glass works; for
I saw, that the perfection of Telescopes was hitherto limited, not so
much for want of glasses truly figured according to the prescriptions
of Opticks Authors (which all men have hitherto imagined), as
because the light through the Glasses is altogether undistinguishable from
the General refrangible Rays. So that, were a glass so exactly figured as
to collect any one sort of rays into one point, it could not collect those
also into the same point, which having the same Incidence upon the
same Medium are apt to suffer a different Refraction. Nay, I wondered, that seeing the difference of refrangibility was so great, as
I found it, Telescopes should arrive to that perfection they are
now arrived at.

He then points out why "the object-glass of any Telescope cannot
collect all the rays which come from one point of an object, so as to
make them converge at its focus in less room than in a circular space,
where no angle is greater than a right angle. Therefore made me
consider, that which is an irregularity some hundreds of times greater, than
a circularly figured Lens, of so small a section as the Object-glasses
of long Telescopes are, would cause by the unevenness of its figure, were
least to be suspected. The Angle of Reflection of all sorts of Rays was equal to their Angle of Incidence; I understood, that by their mediation Optick instruments might be
brought to any degree of perfection. If a reflecting substance could be found, which would polish as finely as
Glass, and reflect as much light, as glass transmits, and the art of
communicating to it a Parabolick figure be also attained. But these
difficulties are not so great and so insuperable, as I further considered, that every irregularity in a
reflecting superflicies makes the rays stray 5 or 6 times more out of
their due course, than the like irregularities in a refracting one; so
that the greatest diffuseness would be here requisite, than in figuring
glasses for Refraction.

Amidst these thoughts I was forced from Cambridge by the Inter-
vention of Public Affairs, and return'd to London. Plague made it
necessary further. But then having thought on a tender way of polish-
ing, proper for metal, whereby, as I imagined, the figure also would
be corrected to the last; I began to try, what might be effected in this
way; and by the help of some of my Optick Graduates, I completed
experiments, of an extraordinary success, (as I have sent to London),
by which I could discern Jupiters 4 Concomitants, and shewed them divers times to
the satisfaction of my acquaintance. I could also discern the Moon-like
phase of Venus, but not equally distinctly, nor without some niceness in
the disposing the Instrument.

From that time I was interrupted till this last Autumn, when I
made the other. And as that was sensibly better than the first
-especially for Day-Objects), so I doubt not, but they will be still
brought to a much greater perfection by their endeavours, who, as
you inform me, are taking care about it at London."

After a remark that microscopes seem as capable of improvement
as telescopes, he adds: "I shall now proceed to acquaint you
with another more notable diffirmity in its Rays, wherein the Origin of Colours is exhibited. In which way I shall lay down the Doctrine
first, and then, for its examination, give you some Experiments,
as a specimen of the rest. The Doctrine you will find
comprehended and illustrated in the following propositions:

1. The Rays of Light in the Rays of the Sun are of the most
inconsiderable, that they also differ in their disposition to exhibit this or that particular
colour. Colours are not Qualifications of Light, derived from Refrac-
tions, or Reflections of natural Bodies (as 'tis generally believed,
but original and connate properties, which in divers Rays are divers

Some Rays are disposed to exhibit a red colour and no other; some
a yellow and no other, some a green and no other, and so of the rest.
They are the only Rays proper and particular to the more eminent
colours, but even to all their intermediate degrees of differ-
ent."

2. To the same degree of Refrangibility ever belongs the same
colour, and to the same colour ever belongs the same degree of
diffraction. Therefore, when a Ray of Light is so refracted, as to
exhibit a Red colour, and contrarily those Rays, which are disposed
to exhibit a Red colour, are all the least Refrangible: So the most
refrangible Rays are all disposed to exhibit a deep Violet colour,
and contrarily those which are apt to exhibit such a violet colour
are all the most Refrangible.

And so to all the intermediate colours in a continued series
belong intermediate degrees of refrangibility. And this Analogy
'twixt colours, and refrangibility is very palpable and striking;
the Rays always either exactly agreeing in both, or proportionally
disagreeing in both.

The species of colour, and degree of Refrangibility proper to
any particular sort of Rays, is not mutable by Refraction, nor by
Reflection from natural bodies, nor by any other cause, that I could
yet observe. When any one sort of Rays hath been well parted
from all the other sorts, and after a long time is put together,
its colour, notwithstanding my utmost endeavours to change it.
I have refracted it with Prisms, and reflected it with Bodies, which
nearly approach to the Sun's heat, and yet I never could produce any new colour out of it. It would by
contracting or dilating become more brisk, or faint, and by the loss
of many Rays, in some cases very obscure and dark; but I could
never see it changed in species.

When removing the superfluous Colours may be made, where
there is mixture of divers sorts of Rays. For in such mixtures,
The component colours appear not, but, by their mutual alloying
could very well be distinguished.

Further on, after some remarks on the subject of compound colours, he says: "I might add more instances of this nature, but I shall
conclude with this general one, that the Colours of all natural Bodies
have no other origin than this, that they are variously qualified to
reflect and refract the different sorts of rays. I think I have experimented in a dark Room by illuminating those bodies
with uncompounded light of divers colours. For by that means any
body might be qualified to reflect and refract the rays of any other

appropriate colour, but ever appear of the colour of the light cast
upon them, but yet with this difference, that they are most brisk
and vivid in the light of their own day-light colour. Minium appears
far the clearest in Red, though far the least visible in the Yellow or
but yet most luminous in red, and so Bize appear indifferent finely of
any colour with which 'tis illustrated, but yet most luminous in
blew. And were of minimum with Rays of any colour, but
most copiously those induced with red; and consequently when
illustrated with day-light, that is with all sorts of Rays promiscuously
Newton, Sir Isaac

blended, those qualified with red shall abound most in the reflected light, and by their prevalence cause it to appear of that colour.

And for the same reason blue, reflecting most copiously, shall appear blue by the excess of those Rays in its reflected light; and the same effect is seen in a dark room, where the air is tincture and adequate cause of their colours, is manifest, because they have no power to change or alter the colours of any sort of Rays incident apart, but put on all colours indifferently, with which they are innately.

"Reviewing what I have written, I see the discourse itself will lead to divers Experiments sufficient for its examination: And therefore I shall not trouble you further, than to describe one of those Experiments, which may hereafter be repeated.

"In a darkened Room make a hold in the shut of a window whose diameter may conveniently be about a third part of an inch, to admit of the Light of a candle. Take then a large and clear and colourless Prism, to refract the entering light towards the further part of the Room, which, as I said, will thereby be diffused into an oldlong coloured Image. Then place a Lens of about three foot foot, and choose a broad Object-glass of a three foot Telescope, at the distance of about four or five foot from thence, through which all those colours may at once be transmitted, and made by its Refraction to converge at a further distance of about ten or twelve feet. If at that distance you intercept this light with a sheet of white paper, you will see the colours converted into whiteness again by being mingled.

"But it is requisite, that the Prisms and Lens be placed steady, and that the Sun's Light be not made to strike upon the Prism head to head; for, by such motion, you will not only find, at what distance the whiteness is most perfect but also see, how the colours gradually converge, and vanish into whiteness, and afterwards having crossed once more the Prism, are again dissipated and re-formed. And when the colours have been before they entered the composition. You may also see, that if any of the Colours at the Lens be intercepted, the Whiteness will be changed into the other colours. And therefore, that the composition of whiteness be perfect, care must be taken, that none of the colours fall besides the Lens.

He concludes his communication with the words: "This, I conceive, is enough for an Introduction to Experiments of this kind: which if any of the R. Society shall be so curious as to prosecute, I should be very glad to be informed with what success: That, if any thing new and useful to the science may be found, there may be an opportunity of giving further direction about it, or of acknowledging my errors, if I have committed any."
Johann Kepler had proved by an elaborate series of measurements that each planet revolves in an elliptical orbit round the sun, whose centre occupies one of the foci of the orbit, that the radius vector of each planet drawn from the sun describes equal areas in equal times, and that the earth's mean motion, given by the planets are in the same proportion as the cubes of their mean distances from the sun. The fact that heavy bodies always have a tendency to fall to the earth, no matter at what height they are placed above the earth's surface, seems to have led Newton to conjecture that it was possible that the same tendency to fall to the earth was the cause by which the moon was retained in its orbit round the earth. Newton, by calculating from Kepler's laws, and supposing the orbits of the planets to be circles round the sun in the centre, had already proved that the force of the sun acting upon different planets must vary as the inverse square of the distances of the planets from the sun. He therefore was led to inquire whether, if the earth's attraction extended to the moon, the force at that distance would be of the exact magnitude necessary to retain the moon in its orbit. He found that the moon by her motion in her orbit was deflected from the tangent in every minute of time through a space of thirteen feet. But by observing the distance through which a body would fall in one second of time at the earth's surface, and by calculating from that on the supposition of the force diminishing in the inverse square of the distance, he found the earth's attraction at the distance of the moon would draw a body through 15 ft. in 1 min. Newton regarded the discrepancy between the results as a proof of the inaccuracy of his conjecture, and "laid aside at that time any further thoughts of this matter.

But in 1679 a controversy between Hooke and Newton, about the form of the path of a body falling from a height, taking the motion of the earth round its axis into consideration, led Newton again to revert to his former conjectures on the moon. The measure of the earth, which had hitherto been accepted by geographers and navigators, was based on the very rough estimate that the length of a degree of latitude in the earth's surface measured along a meridian was 69.5 miles. More accurate estimates had been made by R. Norwood and W. Snell, and more recently by P. Picard. At a meeting of the Royal Society on the 11th of January 1672, Oldenburg the secretary read a letter from Paris describing the method followed by Picard in measuring a degree, and specifically stating the precise length that he calculated it to be. It is probable that Newton had become acquainted with this measurement of Picard's, and that he was therefore led to make use of it when his thoughts were redirected to the subject. This estimate of the length of a degree of latitude, 69.5 miles, made the two results, the discrepancy between which Newton had regarded as a disproof of his conjecture, to agree so exactly that he now regarded his conjecture as fully established.

In January 1684 Sir Christopher Wren, Halley and Hooke were led to discuss the law of gravity, and, although probably they all agreed in the truth of the law of the inverse square, yet this truth was not looked upon as established. It appears that Hooke professed to have a solution of the problem of the path of a body moving round a centre of force attracting as the inverse square of the distance; but Halley, finding, after a delay of some months, that Hooke "had not been so good as his word" in showing his solution to Wren, started in the month of August 1683 for Cambridge to consult Newton on the subject. Without mentioning the speculations which had been made, he asked Newton what would be the curve described by a planet round the sun on the assumption that the sun's force diminished as the square of the distance. Newton replied promptly, "an ellipse," and on being questioned by Halley as to the reason for his answer he replied, "Why, I have calculated it." He could not, however, put his hand upon his calculation, but he promised to send it to Halley. After the latter had left Cambridge, Newton set to work to reproduce the calculation. After making a mistake and producing a different result he corrected his work and obtained his former result.

In the following November Newton redeemed his promise to Halley by sending him, by the hand of Mr Paget, one of the fellows of his own college, and at that time mathematical master of Christ's Hospital, a copy of his demonstration; and very soon afterwards Halley paid another visit to Cambridge to discuss with the Newcomen application of the several crudities read to London on the 10th of December 1684, he informed the Royal Society "that he had lately seen Mr Newton at Cambridge, who had showed him a curious treatise De Motu," which at Halley's desire he promised to send to the Society to be entered upon their register. "Mr Halley was desired to put Mr Newton in mind of his promise for the securing this invention to himself, till such time as he could be at leisure to publish it," and Paget was desired to join with Halley in urging Newton to do so. By the middle of February Newton had sent his paper to Astronomer-royal, one of the secretaries of the Society, and in a letter to Aston dated the 23rd of February 1685, we find Newton thanking him for "having entered on the register his notions about motion." This treatise De Motu was the germ of the Principia, and was obviously meant to be a short account of what that work was intended to embrace. It occupies twenty-four octavo pages, and consists of four theorems and seven problems, some of which are identical with some of the most important propositions of the second and third sections of the first book of the Principia.

In 1685 and 1686 will ever be memorable in the history of science. It was in them that Newton composed almost the whole of his great work. During this period Newton had a very extensive correspondence with John Flamsteed, who was then the astronomer-royal. Many of the letters are lost, but it is clear from one of Newton's, dated the 15th of September 1685, that he had received many useful communications from Flamsteed, and especially regarding Saturn, "whose orbit, as defined by Kepler," Newton "found too little for the sesquialterate proportions.

In the other letters written in 1685 and 1686 he applies to Flamsteed for information respecting the orbits of the satellites of Jupiter and Saturn, respecting the rising and fall of the spring and neap tides at the solstices and the equinoxes, respecting the flattening of Jupiter at the poles (which, if certain, he says, would conduce much to the stating the reasons of the precession of the equinoxes), and respecting the difference between the observed places of Saturn and those computed from Kepler's tables about the time of his conjunction with Jupiter. On this last point the information supplied by Flamsteed was peculiarly gratifying to Newton; and it is obvious from the language of this part of his letter that he still looked upon his universal law of attraction as an hypothesis, a conception which he never ultimately adopted. "Your information," he says, "about the errors of Kepler's tables for Jupiter and Saturn has eased me of several scruples. I was apt to suspect there might be some cause or other unknown to me which might disturb the sesquialteral proportions, for the influences of the planets upon another seemed not great enough, though I imagined Jupiter's influence greater than your numbers determine it. It would add to my satisfaction if you would be pleased to let me know the long diameters of the orbits of Jupiter and Saturn, assigned by yourself and Mr Halley in your new tables, that I may see how the planetary tables compare with the hypothesis with another small proportion which must be allowed for."

Upon Newton's return from Lincolnshire in the beginning of April 1685, he seems to have devoted himself to the preparation of his work. In the spring he had determined the attractions of masses, and thus completed the law of universal gravitation. In the summer he had finished the second book of the Principia, the first book being the treatise De Motu, which he had enlarged and completed. Excepting in the correspondence with Flamsteed we hear nothing more of the preparation of the Principia until the 21st of April 1686, when Halley read to the Royal Society his Discourse concerning Gravity and its Properties, in which he states "that his worthy countryman Mr Isaac Newton has an incomparable treatise of motion almost ready for the press," and that the law of the inverse square "is the principle on which Mr Newton has made out all the
PHILOSOPHICAL TRANSACTIONS

NEWTON, SIR ISAAC

phemonena of the celestial motions so easily and naturally, that its truth is past dispute." At the next meeting of the Society, on the 28th of May, "Dr. Vincent proposed to the Society a manuscript treatise entitled "Philosophiae Naturalis Principia Mathematica," and dedicated to the Society by Mr. Isaac Newton." Although this manuscript contained only the first book, yet such was the confidence the Society placed in the author that an order was given "that a letter of thanks be written to Mr. Newton; and that the printing of his book be referred to the consideration of the council; and that in the meantime the book be put into the hands of Mr. Halley, to make a report thereof to the council." Although there could be no doubt of the intention to reprint a work which had already taken up two months towards the publication of the work. At the next meeting of the Society, on the 19th of May, some dissatisfaction seems to have been expressed at the delay, as it was ordered "that Mr. Newton's work should be printed forthwith in quarto, and that a letter should be written to him to signify the Society's resolutions, and to desire his opinion as to the print, volume, cuts and so forth." Three days afterwards Halley communicated the resolution to Newton, and stated to him that the printing was to be at the charge of the Society. At the next meeting of the council, on the 2nd of June, it was again ordered that Mr. Halley should communicate the resolution of the general meeting to print it at their charge, they added "that Mr. Halley undertake the business of looking after it, and printing it at his own charge, which he engaged to do." In order to explain to Newton the cause of the delay, Halley in his letter of the 22nd of May alleges that it arose from "the president's attendance on the king, and the absence of the vice-presidents, whom the good weather had drawn out of town;" but there is reason to believe that this was not the true cause, and that the unwillingness of the council to undertake the expense arose from the state of the finances of the Society. Halley certainly deserves the gratitude of posterity for undertaking the publication of the work at a very considerable pecuniary risk to himself. In the same letter Halley found it necessary to inform Newton of Hooke's conduct when the manuscript of the Principia was presented to the Society. Sir John Hooke was in the chair when Dr. Vincent presented the manuscript, and passed a high encomium on the novelty and dignity of the subject. Hooke was offended because Sir John did not mention what he had added to Newton's manuscript by way of corrections. He complained to Newton the "that Hooke had some pretensions to the invention of the rule for the decrease of gravity being reciprocally as the squares of the distances from the centre," acknowledging at the same time that, though Newton had the notion from him, "yet the demonstration of the curves generated thereby belonged wholly to Newton." "How much of this," Halley adds, "is so, you know best, so likewise what you have to do in this matter; only Mr. Hooke seems to expect you should make some mention of him in the preface, which 'tis possible you may see reason to prefix. I must beg your pardon that 'tis I that send you this ungrateful account; but I thought it my duty to let you know it, so that you might act accordingly, being in myself fully satisfied that nothing but the greatest candour imaginable is to be expected from a person who has of all men the least need to borrow reputation." In thus appealing to Newton's candour, Halley obviously wished that some acknowledgment of Hooke's conduct should be made. He knew indeed that before Newton had announced the inverse law Hooke and Wren and himself had spoken of it and discussed it, and therefore justice demanded that, though none of them had given a demonstration of the law, Hooke especially should receive credit for having maintained it as a truth of which he was seeking the demonstration. On the 20th of June 1686 Newton wrote to Halley the following letter:— "Sir,—In order to let you know the case between Mr. Hooke and me, I give you an account of what passed between us in our letters, so far as I could remember; for 'tis long since they were writ, and I do not know that I have seen them since. I am almost confident circumstances, that Sir Chr. Wren knew the duplicate proportion when I gave him a visit; and then Mr. Hooke (by his book Cometa written afterwards) will prove the last of us three that knew it. I intended in this letter to let you understand the case fully; but it being a frivolous business, I shall content myself to give you the barest and shortest account of it. I did not communicate Mr. Hooke's proposition lower than to the supercicies of the earth, and before a certain demonstration I found the last year, I have suspected it did not reach accurately enough down low; and therefore in the doctrine of parallaxes I have ever been considerable, to the extremely contrary, and consequently Mr. Hooke could not from my letters, which were about projectiles and the regions descending hence to the centre, conclude me ignorant of the theory of the heavens. That what he told me of the duplicate proportion was not the same, I knew, namely, that it reached down from hence to the centre of the earth.

That it is not candid to require me now to confess myself, in print, to have been ignorant of his doctrine, is not for no other reason, but because he had told it me in the case of projectiles, and so upon mistaken grounds accused me of that ignorance. That in my answer to his first letter I refused his correspondence, told him I had laid philosophy aside, sent him (on the experiment of projectiles (rather shortly hinted than carefully described), in compliment to sweeten my answer, expected to hear no further from him; could scarce persuade myself to answer his second letter; did not answer his third, was upon other things; thought no further of philosophical matters than his letters put me upon it, and therefore may be allowed not to have had my thoughts of that kind any further. Well as I afterwards, when I more carefully then examined of the rest of the duplicate proportion, he may as well conclude me ignorant of the rest of that theory I had read before in his books. That in one of my papers writ (I cannot say in what he) I accused him sure to have lied, in his own behalf and Mr. Oldenburg, and that's above fifteen years ago), the proportion of the forces of the planets from the sun, reciprocally duplicate of their distances from him, is expressed, and the proportion of our gravity to the earth's centripetal is calculated, and not accurately enough. That when Hugens put out his Hypothesis of Gravitation, a copy being presented to me, in my letter of thanks to him I gave these rules of the squares of the distances, from the useful in Philosophy, and added out of my aforesaid paper an instance of their usefulness, in comparing the forces of the moon from the earth, and earth from the sun, in determining a problem in parallaxes, which was printed, and in which shews which I had then my eye upon comparing the forces of the planets arising from their circular motion, and understood it; so well, I was able, when he gave me the book, to understand his work, the problem solemly, in the end of his attempt to prove the motion of the earth, if I had not known the duplicate proportion before, I could not have found it now. Between ten and eleven years ago there was an hypothesis of mine registered in your books, wherein I hinted a cause of gravity towards the earth, sun and planets, with the dependence of the celestial motions thereon; in which the proportion of the decrease of gravity from the supercicies of the planet (though I did not use the name centripetal) was calculated, and reciprocally duplicate of the distance from the centre. And I hope I shall not be urged to declare, in print, that I understood not the obviousness of what has since been added, and that grant me it afterwards from Mr. Hooke, yet have I as great a right to it as to the ellipses. For as Kepler knew the orb to be not circular but oval, and guessed it to be elliptical, so Mr. Hooke, without being Kepler, since he has instruction, can, and can make it more, but that the proportion was duplicate quam proxime at great distances from the centre, and only guessed it to be so accurately, and guessed amiss in extending that proportion down to the very centre, whereas Kepler guessed right at the ellipses. And so Mr. Hooke found less of the proportion than Kepler of the ellipses. "There is so strong an objection against the accuracy of this proportion, that without my demonstrations, to which Mr. Hooke was so well under, it cannot be believed by a judicious philosopher to be any where accurate. And so, in stating this business, I do pretend to have done as much for the proportion as for the ellipses, Mr. Hooke, as much as I can. I shall therefore, as much as to the other from Kepler; and therefore on this account also he must at least moderate his pretences. "The proof you sent me I like very well. I designed the whole to consist of three books; one band was to be a summary being only wanting transcribing, and drawing the cuts fairly. Some new propositions I have since thought on, which I can well let alone. The third wants the theory of comets. In autumn last I spent four months in making this book; but no chance found me to apply the method, which made me afterwards return to the first book, and enlarge it with divers propositions, some relating to comets, others to other things, found out last winter. The third now design to support my hypothesis farther, for the experimental, my man has as good be engaged in lawsuits, as have to do with her. I found it so formerly, and now I am no sooner come near her again, but she gives me warning. The two first books, without I may say, will not so well bear the title of Philosophiae Naturalis Principia Mathematica; and therefore I had altered it to this, De Motu Corporum libri duo."
"But, upon second thoughts, I retain the former title. 'Twill help the public, which I desire to diminish as little as yours. The articles are, with the largest, to be called by that name; if you please you may change the word to sections, though it be not material. In the first page, I have struck out the words 'ad. paup. decus.les.,' referring to the third book; which is at present, from your affectionate friend, and humble servant,"

"I. NEWTON."

On the 29th of June 1686 Halley wrote to Newton:—"I am heartily sorry that in this matter, wherein all mankind ought to acknowledge their obligations to you, you should meet with anything that should give you unquiet'; and then, after an account of Hooke's claim to the discovery as made at a meeting of the Royal Society, he concludes:—

"But I found that they were all of opinion that nothing thereof appearing in print, nor on the books of the Society, you ought to be considered as the inventor. And if in truth he knew it before you, he ought not to blame any but himself for having taken no more care to secure a discovery, which he puts so much value upon. What application he has made in private, I know not; but I am sure that the Society have a very great satisfaction, in the honour you do them, by the dedication of so worthy a treatise. Sir, I must now again beg you, not to let your resentments run so high, as to deprive us of your third book, wherein the application of your mathematical doctrine to the theory of comets and several curious experiments, with which you have so much the better your observations, and in which you ought to call yourselves Philosophers without Mathematics, which are much the best work you have done, and in which you will at length write; I will push on the edition vigorously. I have sometimes had thoughts of having the cuts natively done in wood, so as to stand in the page with the demonstrations. It will be more convenient, and not much more charge, if it please you to have it so; otherwise I will have them in a somewhat larger size than those you have sent up.—I am, Sir, your most affectionate humble servant,

E. HALLEY."

On the 30th of June 1686 the president was desired by the council to license Newton's book, entitled Philosophiae Naturalis Principia Mathematica, upon the proposal to introduce woodcuts among the letterpress, stating clearly the different things which he had from Hooke, and adding, "And now having sincerely told you the case between Mr Hooke and me, I hope I shall be free for the future from the prejudice of his letters. I have considered how best to compose the present dispute, and I think it may be done by the inclosed scholium to the fourth proposition." This scholium was:

"The inverse law of gravity holds in all the celestial motions, as was first shown in my countryman's paper. The reader must consider of the excellencies of Mr Hooke and Halley." After this letter of Newton's the printing of the Principia was begun. The second book, though ready for the press in the autumn of 1686, was not sent to the printers until March 1687. The third book was presented to the Society on the 6th of April 1687, and the whole work published about midsummer in that year. It was dedicated to the Royal Society, and it was prefixed a set of Latin hexameters addressed by Halley to the author. The work, as might have been expected, caused a great deal of excitement throughout Europe, and the whole of the impression was very soon sold. In 1691 a copy of the Principia was hardly to be procured.

While Newton was writing the second and third books of the Principia, a very important event occurred at Cambridge which had the effect of bringing him before the public in a new light.

James II. had already, in 1686, in open violation of the law, conferred the deanship of Christ Church at Oxford on John Massey, a person whose sole qualification was that he was a member of the Church of Rome; and the king had boasted to the pope's legate that "what he had done at Oxford would very soon be done at Cambridge." In accordance therewith, no sooner had Pechell, the master of Magdalene College, who was vice-chancellor, sent a messenger to the duke of Albermarle, the chancellor, to request him to get the mandamus recalled; and the registrar and the bellows waited upon Francis to offer him instant admission to the degree if only he would take the necessary oaths. Both the king and the monk were inexorable. The court and the university were thus placed in open collision. A menacing letter was despatched by Sunderland to shake the firmness of the university; but, though the threat and receipt of the missives were returned, the university showed no sign of compliance, nor even of a desire to suggest a compromise. In consequence the vice-chancellor and deputies from the senate were summoned to appear before the High Commission Court at Westminster.

Newton was one of the eight deputies appointed by the senate for this purpose. The deputies, before starting for London, held a meeting to prepare their case for the court. A compromise which was put forward by one of them was stoutly and successfully resisted by Newton, and on the 21st of April the deputation, whose case was prepared, appeared before the court. Lord Jeffreys presided at the board. The deputation appeared as a matter of course before the commissioners, and were dismissed. On the 27th of April they gave in their plea. On the 7th of May it was discussed, and feebly defended by the vice-chancellor. The deputies maintained that in the late reign several royal mandates had been withdrawn, and that no degree had ever been conferred without the oaths having been previously taken. Jeffreys spoke with his accustomed insolence to the vice-chancellor, silenced the other deputies when they offered to speak, and ordered them out of court. When recalled the deputies renewed, and the vice-chancellor, and one of his deputies, was ordered to attend, and of his emoluments as master of Magdalene. Newton returned to Trinity College to complete the Principia. While thus occupied he had an extensive correspondence with Halley, a very great part of which is extant. The following letter from Halley, dated London, July 5th, 1687, announcing the completion of the Principia, is of peculiar interest:—

"I have at length brought your book to an end, and hope it will please you. The last errata came just in time to be inserted, I will present you from the book you desire to the Royal Society, Mr Boyle, Mr Paget, Mr Flamsteed, and if there be any else in town that you design to gratify that way; and I have sent you to bestow on your friends in the University 20 copies, which I entreat you to accept. In the same parcel you will receive 40 more, which having no acquaintance in Cambridge, I must entreat you to put into the hands of one or more of your ablest booksellers to dispose of them. I intend the price of them, bound in calves' leather, and lettered, to be 9 shillings here. Those I send you I value in quires at 6 shillings, to take my money as they are, or at 5d. for ready, or as you think fit. I am short of paper, and cannot presently furnish you with a copy of our books without interesting the booksellers; and I am contented to let them go halves with me, rather than have your excellent work smothered by their combinations. I hope you will not repent you of the trust you have put in me, and to the public my countryman will have much satisfaction, by the measure I have in your own and the nation's credit, but rather, after you shall have a little diverted yourself with other studies, that you will resume those concerning this University wherein you had so great success, and attempt the perfection of the first parts of the Principia, so as to have not the number as wherein you had so great success, and attempt the perfection of the first parts of the Principia, so as to have not the number
what I said of your book I remember not. If you please to send me a transcript of that passage, I will give you an account of it if I can.

The loss of sleep to a person of Newton's temperament, whose mind was never at rest, and at times so wholly engrossed in his scientific pursuits that he even neglected to take food, must necessarily have led to a very great deal of nervous excitability. It is not astonishing that rumours got abroad that there was a danger of his mind giving way, or, according to a report which was believed at the time, that it had actually done so. Pepys must have heard such rumours, as in a letter to his friend Millington, the tutor of Magdalene College at Cambridge, dated the 26th of September 1693, he wrote:

"As for myself, I lay it not at the ease I would be glad to be at in reference to excellent Mr Newton; concerning whom (methinks) your answer labours under the same kind of restraint which (to tell you the truth) my asking did. For I was loth at first dash to tell you that I had lately received a letter from him so surprising to me for the inconsistency of every part of it, as to be put into great disorder by it, from the concernment I have for him, lest it should arise from that which of all mankind I should least dread from him and most lament for— I mean a discomposure in head, or mind, or both. Let me, therefore, beg you, Sir, having now told you the true ground of the trouble I lately gave you, to let me know in the most truth of the matter, as far at least as comes within your knowledge."

On the 30th of September 1693 Millington wrote to Pepys that Newton had been to look for Newton some time before, but that "he was out of town, and since," he says, "I hear nothing of the ill upon which I met him at Huntingdon, where, upon his own accord, and before I had time to ask him any question, he told me that he had writ to you a very odd letter, at which he was much concerned; added, that it was in a distemper that much troubled his head, and that kept him awake for above five nights together, which upon occasion he desired I would represent to you, and beg your pardon, he being very much ashamed he should be so rude to a person for whom he hath so great an honour. He is now very well, and though I fear he is under some small degree of melancholy, yet I think there is no reason to suspect it hath at all touched his understanding, and I hope never will; and so I am sure all ought is to a hearing and an understanding of our nation, which is a sign how much it is looked after, when such a person as Mr Newton lies so neglected by those in power."

The illness of Newton was very much exaggerated by foreign contemporary writers. In a manuscript journal of Huygens is to be found an entry:

"29 May, 1694.—Narravit mihi Colm Scotos virum celeberrimumiem, qui ille est qui Presidentem est Academiae in phaenomena incisum. Ab anno et sex mensibus. An ex nima studi assiduitate, un dolore infortunii, quod incendium laboratorium chymicum et scripta quaedam amiserat? Cum ad Archiepicopum Cantabrigiensem venisset, ea locutum, qua alienationem mentis indicaret. Deinde ab amicis curam ejus suspexit, donoque clausa remedii volunti solertiae adhibita, quibus jam sanatatem recuperavit ut jam rursus librum suum Principiorum Philosophiae Mathematicorum intelligere inciderat."

Huygens, in a letter dated the 8th of June 1694, wrote to Leibnitz, "I do not know if you are acquainted with the accident which has happened to the good Mr Newton, namely, that he has had an attack of phrenitis, which lasted eighteen months, and of which they say his friends have cured him by means of remedies, and keeping him shut up." To which Leibnitz, in a letter dated the 22nd of June, replied, "I am very glad that I received information of the cure of Mr Newton at the same time that I heard of his illness, which doubtless must have been very alarming."

The active part which Newton had taken in defending the legal privileges of the university against the encroachments of the crown had probably at least equal weight with his scientific reputation when his friends chose him as a candidate for a seat in parliament as one of the representatives of the university. The other candidates were Sir Robert Sawyer and Mr Finch. Sir Robert stood at the head of the poll with 125 votes, Newton next with 122 and Mr Finch was last with 117 votes. Newton retained his seat only about a year, from January 1689 till the dissolution of the Parliament, and he was heard of his illness, which doubtless must have been very alarming.

During this time Newton does not appear to have taken part in any of the debates in the House; but he was not neglectful of his duties as a member. On the 30th of April 1689 he moved for leave to bring in a bill to settle the charters and privileges of the university of Cambridge, just as Sir Thomas Clegges did for Oxford at the same time, and he wrote a series of letters to Dr Lovel, the vice-chancellor of the university, on points which affected the interests of the university and its members.

Some of the members of the university who had lately sworn allegiance to James had sent difficulties to Newton; and it was an actual charge of sedition. On the 12th of February 1689, the day of the coronation of William and Mary, Newton intimated to the vice-chancellor that he would soon receive an order to proclaim them at Cambridge. He enclosed a form of the proclamation, and expressed a hearty "wish that the university would so compose themselves as to perform the solemnity with a reasonable decorum."

During his residence in London Newton had made the acquaintance of John Locke. Locke had taken a very great interest in the new theories of the Principia. He was one of a number of Newton's friends who began to be uneasy and dissatisfied at seeing the most eminent scientific man of his age left to depend upon the meagre emoluments of a college fellowship and a professorship.

At one time Newton's friends had nearly succeeded in getting him appointed provost of King's College, Cambridge, but the college offered a successful resistance on the ground that the appointment would be illegal, as the statutes required that the provost should be in priest's orders. Charles Montague, who was afterwards earl of Halifax, was a fellow of Trinity College, and was a very intimate friend of Newton, and it was on his recommendation that Newton succeed in the main for promotion to some post of honour and emolument. His hopes, however, were blighted by long delay. In one of his letters to Locke at the beginning of 1692, when Montague, Lord Monmouth and Locke were exerting themselves to obtain some appointment for him, Newton wrote that he was "fully convinced that Mr Montague, upon an old grudge which he thought had been worn out, was false to him." Newton was now in his fifty-fifth year, and whilst those of his own standing at the university had been appointed to high posts in church or state, he still remained without any mark of national gratitude. But this blot upon the English name was at last removed by Montague in 1694, when he was appointed chancellor of the exchequer. He had previously consulted Newton upon the subject of the coinage, and on the opportunity occurring he appointed Newton to the post of warden of the mint. In a letter to Newton announcing the news, Montague writes:

"I am very glad that at last I can give you a good proof of my friendship, and the esteem the king has of your merits. Mr Overton, the master of the mint, is made one of the Commissioners of Customs, and the king has promised me to make Mr Newton warden of the mint. The office is the most proper for you. 'Tis the chief office in the mint: 'tis worth five or six hundred pounds per annum, and has not too much business to require more attendance than you can spare."

This letter must have convinced Newton of the sincerity of Montague's good intentions towards him; we find them living as friends on the most intimate terms until Halifax's death in 1715.

Newton's chemical and mathematical knowledge proved of great use in carrying on the coinage. This was completed in about two years. In 1697 Newton was appointed to the mastership of the mint, a post worth between £200 and £150 per annum. While he held this office, Newton drew up a very extensive table of assays of foreign coins, and composed an official report on the coinage.

Up to the time of the publication of the Principia in 1687 the method of fluxions which had been invented by Newton, and had been of great assistance to him in his mathematical investigations, was still, except to Newton and his friends, a secret. One of the most important rules of the method forms the second lemma of the second book of the Principia. Though this new and powerful method was of great help to Newton in his work, he did not exhibit it in the results. He was aware that the well-known geometrical methods of the ancients would clothe his new
creations in a garb which would appear less strange and uncouth to those not familiar with the new method. The *Principia* gives no information on the subject of the notation adopted in the new calculus, and it was not until 1693 that it was communicated to the scientific world in the second volume of Dr Wallis's works.

Newton's admirers in Holland had informed Dr Wallis that Newton's method of fluxions passed there under the name of Leibnitz's *Calculus Differentialis*. It was therefore thought necessary that an early opportunity should be taken of asserting Newton's claim to be the inventor of the method of fluxions, and this was the reason for this method first appearing in Wallis's works. A further account of the method was given in the first edition of Newton's *Optics*, which appeared in 1704. To this work were added two treatises, entitled *Tractatus duo de speciebus et magnitudine figurarum curvilinearum*, the one bearing the title *Tractatus de Quadratura Curvarum*, and the other *Enumeration linearum tertii ordinis*. The first contains an explanation of the doctrine of fluxions, and of its application to the quadrature of curves; the second, a classification of seventy-two curves of the third order, with an account of their properties. The reason for publishing these two tracts in his *Optics*, from the subsequent editions of which they were omitted, is thus stated in the advertisement of 29th November 1696 written to M Leibnitz in the year 1679, and published by Dr Wallis, I mentioned a method by which I had found some general theorems about squaring curvilinear figures on comparing them with the conic sections, or other the simplest figures with which these could be compared. And some years ago I lent a manuscript containing such theorems; and having since met with some things copied out of it, I have on this occasion made it public, prefixing to it an introduction, and joining a Scholium concerning that method. And I have joined with it another small tract concerning the curvilinear figures of the second kind, which was also written many years ago, and made known to some friends, who have solicited the making it public.

"In the year 1702 William Whiston published the algebrical lectures which Newton had delivered at Cambridge, under the title of *Arithmetica Universalis, sive de Compositione et Resolucione Arithmetica Liber*. We are not accurately informed how Whiston obtained possession of this work; but it is stated by one of the editors of the English edition "that Mr Whiston, thinking it a pity that so noble and useful a work should be doomed to a college confinement, obtained leave to make it public." It was soon afterwards translated into English by Raphson; and a second edition of it, with improvements by the author, was published at London in 1712, by Dr Machin, secretary to the Royal Society. The view of stimulating mathematicians to write annotations on this admirable treatise, the celebrated 's Gravesande published a tract, entitled *Specimen Commentarii in Arithmeticae Universalis*; and Maclaurin's *Algebra* seems to have been drawn up in consequence of this appeal.

Newton's solution of the celebrated problems proposed by John Bernoulli and Leibnitz deserves mention among his mathematical works. In June 1696 Bernoulli addressed a letter to the mathematicians of Europe challenging them to solve two problems;-(1) to determine the brachistochrone between two given points not in the same vertical line, (2) to determine a curve such that, if a straight line be drawn through a fixed point A meet it in two points P, P, then AP" + AP" will be constant. This challenge was first made in the *Acta Lipsiensia* for June 1696. Six months were allowed by Bernoulli for the solution of the problem, and in the event of none being sent to him he promised to publish his own. The six months elapsed without any solution being produced; but he received a letter from Leibnitz, stating that he had "cut the knot of the most beautiful of these problems," and requesting that the period for their solution should be extended to Christmas next, that the French and Italian mathematicians might have no reason to complain of the shortness of the period. Bernoulli adopted the suggestion, and publicly announced the prorogation for the information of those who might not see the *Acta Lipsiensia*.

On the 29th of January 1696/7 Newton received from France two copies of the printed paper containing the problems, and on the following day he transmitted a solution of them to Montague, then president of the Royal Society. He announced that the curve required in the first problem must be a cycloid, and he had a method of determining it. He solved also the second problem, and he showed that for this recommendation to be curves might be found which shall cut off three or more segments having the like properties. Solutions were also obtained from Leibnitz and the Marquis de L'Hôpital; and, although that of Newton was anonymous, yet Bernoulli recognized the author in his disguise; "tanquam," says he, "ex ungue icem." In 1699 Newton's position as a mathematician and natural philosopher was recognized by the French Academy of Sciences. In that year the Academy was remodelled, and eight foreign associations were created. Leibnitz, Domenico Guglielmini (1655–1710), Harriot, and the young Euler were appointed to the Academy on the 4th of February, James Bernoulli and John Bernoulli on the 14th of February, and Newton and Olaus Roemer on the 21st of February.

While Newton held the office of warden of the mint, he retained his chair of mathematics at Cambridge, and discharged the duties of the post, but shortly after he was promoted to be master of the mint he appointed Whiston his deputy with "the full profits of the place." Whiston began his astronomical lectures as Newton's deputy in January 1701. On the 10th of December 1700 Newton resigned his professorship of mathematics, and he did not succeed in getting a pension of 40l. a year for some years. He held this fellowship at Trinity, which he had held with the Lucasian professorship since 1675 by virtue of the royal mandate. Whiston's claims to succeed Newton in the Lucasian chair were successfully supported by Newton himself.

On the 26th of November 1701 Newton was again elected one of the representatives of the university in parliament, but he retained his seat only until the dissolution in the following July. Newton does not seem to have been a candidate at this election, but at the next dissolution in 1705 he was again a candidate for the representation of the university. He was warmly supported by the residents, but being a Whig in politics he was opposed by the non-residents, and beaten by a large majority.

In the autumn of 1703 Lord Somers retired from the presidency of the Royal Society, and Newton on the 30th of November 1703 was elected to succeed him. Newton was annually re-elected to this honourable post during the remainder of his life. He held the office in all twenty-five years, a period in which he has been exceeded by but one other president of the Royal Society, Sir Joseph Banks. As president Newton was brought into close connexion with Prince George of Denmark, the queen's residence at which he had been elected a fellow of the Royal Society. The prince had offered, on Newton's recommendation, a pension of 100l. a year, and another of 100l. to the expense of printing Flamsteed's observations, and especially his catalogue of the stars. It was natural that the queen should form a high opinion of one whose merits had made such a deep impression on her husband. In April 1705, when the queen, the prince and the court were staying at the royal residence at Newmarket, they paid a visit to Cambridge, where they were the guests of Dr Bentley, the master of Trinity. Her Majesty went in state to the Regent House, where a congregation of the senate was held, and a number of honorary degrees conferred. Afterward they returned to Trinity Lodge, where (16th of April 1705) she conferred the order of knighthood upon Sir Isaac Newton.

As soon as the first edition of the *Principia* was published Newton began to prepare for a second edition. He was anxious to improve the work by additions to the theory of the motion of the moon and the planets. Dr Edleston, in his preface to Newton's correspondence with Cotes, justly remarks:

"If Flamsteed the Astronomer-Royal had cordially co-operated with him in the humble capacity of an observer in the way that Newton pointed out and requested of him . . . the lunar theory would, if its creator did not overrate his own powers, have been completely investigated, so far as he could do it, in the first few months of 1695, and a second edition of the *Principia* would probably have followed the execution of the task at no long interval."

Newton, however, could not get the information he wanted from Flamsteed, and after the spring of 1696 his time was much
occupied by his duties at the mint. Rumours, however, of his work, and of a new edition, were heard from time to time. In February 1700 Leibnitz writes of Newton, "J'ai appris aussi (je ne sais où) qu'il donnera encore quelque chose sur le mouvement de la lune: et on m'a dit aussi qu'il y aura une nouvelle édition de la Principia."

Dr. Bentley, the master of Trinity College, had for a long time urged Newton to give his consent to the republication of the Principia. In the middle of 1708 Newton's consent was obtained, but it was not till the spring of 1709 that he was prevailed upon to entrust the superintendence of it to a young mathematician of great promise, Roger Cotes, fellow of Trinity College, who had been recently appointed the first Plumian professor of astronomy and experimental philosophy. On the 21st of May 1709, after having been that day with Newton, Bentley announced this arrangement to the Society. "I hear," he wrote that day, "the masters of the university are glad to see you in June, and then put into your hands one part of his book corrected for the press." About the middle of July Cotes went to London, in the expectation doubtless to bring down with him to Cambridge the corrected portion of the Principia. Although Cotes was impatient to begin his work, it was nearly the end of September before the corrected copy was put into his hands.

During the printing of this edition a correspondence went on continuously between Newton and Cotes. On the 31st of March 1713, when the edition was nearly ready for publication, Newton wrote to Cotes:

"I hear that Mr Bernoulli has sent a Paper of 40 pages to be published in the Acta Leipsica relating to what I have written upon the curve Lines described by Projectiles in resisting Mediums. And therein he partly makes Observations upon what I have written & partly improves it. To prevent being blamed by him or others for any dissimilarity in not acknowledging my oversights or slips in the first edition, I believe it will not be amiss to print next after the old "Præfatio de Lectorem," the following account of this new Edition."

"28 Mar. 1713."

"If you write any further Preface, I must not see it, for I find that I shall be examined about it. The cuts for no. Comet of 1680 & 1681 are printed off and will be sent to Dr. Bentley this week by the Carrier."

Newton's desire to have no hand in writing the preface seems to have proceeded from a knowledge that Cotes was proposing to allude to the dispute about the invention of fluxions. At last, about midsummer 1713, was published the long and impatiently expected second edition of the Principia, and on the 27th of July, Newton waited on the queen to present her with a copy of it.

In 1714 the question of finding the longitude at sea, which had been looked upon as an important one for several years, was brought into prominence by a petition presented to the House of Commons by a number of captains of Her Majesty's ships and merchant ships of London merchants. The petition was referred to a committee of the House, who called witnesses. Newton appeared before them and gave evidence. He stated that for determining the latitude at sea there had been several projects, true in theory but difficult to execute. He mentioned (1) a magnetic needle, (2) a watch to keep time exactly, (2) the eclipses of Jupiter's satellites, (4) by a new method proposed by Mr Dutton. Newton criticized all the methods, pointing out their weak points, and it is due mainly to his evidence that the committee brought in the report which was accepted by the House, and shortly afterwards was converted into a Bill, passed both Houses, and received the royal assent. The report ran "that it is the opinion of this committee that a reward be settled by parliament upon such person or persons as shall discover a more certain and practicable method of ascertaining the longitude than any yet in practice; and the said reward be proportioned to the degree of exactness to which the said method shall reach.""
NEWTON

with a dissertation on the sacred cubit of the Jews, which was printed in 1737; and four letters addressed to Bentley, containing a theory of a Deity, which were published by Cumberland, a nephew of Bentley, in 1756. Sir Isaac also left a Church History complete, a History of the Creation, Paradoxical Questions regarding Atanaxis, and many divinity tracts.

Newton devoted much of his time to the study of chemistry; but the greater number of his experiments still remain in manuscript. His Tabula Quantiatitum et Graduum Caloris contains a comparative scale of temperature from that of melting ice to that of a small flame. His Minima were the first of his Philosophical Papers. His Chemical Papers, Acidorum, which has been published by Dr. Horsley. Sir Isaac spent much time in the study of the works of the alchemists. He had diligently studied the works of Jacob Boehme, and there were found amongst his manuscripts copious abstracts from them in his own handwriting. In the earlier part of his life he and his relation Dr. Newton of Grantham had put up furnaces, and had wrought for several months in quest of the philosopher’s tincture. Among the manuscripts in the possession of the Earl of Portsmouth there are many sheets of Flamingo and Hieroglyphic Figures, and in another hand many sheets of William Yworth’s Processus Mysterii Magni Philosophicis.

In the last few years of his life Newton was troubled with incontinence of urine, which was supposed to be due to stone; but with care he kept the disease under control. In January 1725 he was seized with a violent cough and inflammation of the lungs, which induced him to reside at Kensington; and in the following month he had a severe attack of gout, which produced a decided improvement in his general health. His duties at the mint were discharged by John Conduit, and he therefore seldom went from home. On the 28th of February 1727, feeling well, he went to London to preside at a meeting of the Royal Society; but the fatigue which attended this duty brought on a violent return of his former complaint, and he returned to Kensington on the 4th of March, when Dr. Mead and Dr. Chesselton pronounced his disease to be stone. He endured the sufferings of this complaint with wonderful patience. He seemed a little better on the 15th of March, and on the 18th he read the newspapers and conversed with Dr. Mead; but at 6 o’clock in the evening he became insensible, and continued in that state till Monday the 20th of March 1727, when he expired without pain between one and two o’clock in the morning. His body was removed to London, and on Tuesday the 28th of March it lay in state in the Jerusalem Chamber, and was thence conveyed to Westminster Abbey, where it was buried.

Raphson, History of Fluxions, showing in a compendious manner the First Rise of and Various Improvements made in that incomparable Method (1715); W. W. R. Ball, Essay on Newton’s Principia (1833). A complete bibliography of Newton’s writings has been given by G. J. Gray (Cambridge, 1880). The collected works of Newton were published in 1779–1785 by Dr. Samuel Johnson, F.R.S., under the title Isaac Newtoni Omnia extantia Omnibus (H. M. T.)

NEWTON, JOHN (1725–1807), English divine, was born in London on the 24th of July 1725 (O.S.). His father, who for a long time was master of a ship in the Mediterranean trade, became in 1745 governor of York Fort, Hudson Bay, where he died in 1751. The lad had little education and served on his father’s ship from 1737 to 1742; shortly afterwards he was impressed on board a man-of-war, the “Hawthorn,” where he was made a midshipman. For an attempt to escape while his ship lay off Plymouth he was degraded, and treated with so much severity that he gladly exchanged into an African trader. He made many voyages as mate and then as master on slave-trading ships, devoting his leisure to the improvement of his education. The state of his health and perhaps a growing distaste for the slave trade led him to quit the sea in 1755, when he was appointed tide-surveyor at Liverpool. He began to study Greek and Hebrew, and in 1758 applied to the archbishop of York for ordination. This was refused him, but, having had the curacy of Olney offered to him in April 1764 he was ordained by the bishop of Lincoln. In October 1769 William Cowper settled in the parish. An intimate friendship sprang up between the two men, and they published together the Olney Hymns (1779). In 1779 Newton left Olney to become rector of St Mary Woolnoth, London, where he laboured with unceasing diligence and great popularity till his death on the 31st of December 1807.

Like Cowper, Newton held Calvinistic views, although his evangelical fervour allied him closely with the sentiments of Wesley and the Methodists. His fame rests on certain of the hymns which he is said to have contributed—e.g. “March, the first month of the year,” (an Epistolicum H.); “How sweet the name of Jesus sounds,” “One there is above all others,” remarkable for vigour, simplicity and directness of devotional utterance.

His prose works include an Authentic Narrative of some Interesting and Remarkable Particulars in the Life of John Newton (1764), a volume of Sermons (1761), Omnicon (a series of letters on religion, 1771), Review of Ecclesiastical History (1769) and Cardiphonia (1781). This last was a further selection of religious correspondence, which did much to help the Evangelical revival. Thomas Scott, William Wilberforce, Charles Simeon, William Jay and Hannah More all came under his direct influence. His Letters to a Wife (1793) and Letters to Rev. W. Bull (posthumous, 1847) illustrate the frankness with which he expressed his most intimate personal experiences. A collection by Richard Cecil was prefixed to a collected edition of his works (6 vols., 1868; 1 vol. 1827). See also T. Wright, The Town of Cowper.

NEWTON, JOHN (1823–1893), American general and engineer, was born in Norfolk, Virginia, on the 24th of August 1823, and graduated second in his class at the U.S. Military Academy in 1842. From 1842 to 1861 he was engaged in the construction of coast defences and the improvement of waterways; he was assistant professor of engineering in the Military Academy, 1843 to 1846; and later, from 1864 to 1866, as chief engineer in the Utah expedition of 1857–1858. He served as an engineer in the Virginian campaign of 1861, and was promoted brigadier-general, U.S.V., in September. He especially distinguished himself in the Seven Days’ battle and at Antietam, and after the battle of Fredericksburg was made major-general, U.S.V. In the Chancellorsville campaign Newton took part in the storming of Marye’s Heights at Fredericksburg, on the 3rd of May 1863, and at the battle of Gettysburg he was for a time in command of the I. corps. He had already received the brevet of lieutenant-colonel for his services at Antietam, and now became brevet colonel for his services at Gettysburg. Later he was transferred to Sherman’s army, and as a division commander under General Oliver O. Howard took part in the Atlanta campaign. For gallant conduct at Peach Tree Creek he was made brevet brigadier-general, and at the close of the war was made brevet major-general, U.S.A. Returning to regular engineering duty after the war, he was stationed at New York from 1866 to 1884. His most important work there was the improvement of the Hudson river, and especially the removal of the obstructions to shipping in the dangerous entrance to the East river from Long Island Sound, known as Hell Gate. Under two of the largest obstructions—Hallet’s Point and Flood Rock, with a surface of three acres and nine acres respectively—shafts were sunk from the shore, and tunnels were bored in every direction. In these tunnels thousands of pounds of explosives were placed, and the rocks were blown into fragments. In March 1884 he became Chief of Engineers, with the rank of brigadier-general, and held this position until his retirement from the army, at his own request, in August 1889. In 1887–1888
he was commissioner of public works in New York City, and from 1888 until his death, on the 1st of May 1895, he was president of the Panama railroad.

**NEWTON,** a city and the county-seat of Harvey county, Kansas, U.S.A., about 27 m. N. of Wichita. Pop. (1905) 6605; (1910) 7862. It is served by the Atchison, Topeka & Santa Fé (of which it is a division point and which has shops here), and the Missouri Pacific railways. Newton is the centre of the settlements of the German-Russian Mennonites, a thrifty people, who immigrated in 1873 and subsequently; Bethel College (opened 1893) is a Mennonite secondary school, and there is a Mennonite congregation of about 200 members. Newton was the site of the various potteries for the surrounding agricultural and stock-raising region, and has various manufactures. The municipality has natural gas for heating, lighting and manufacturing. Newton was first settled in 1871, was chartered as a city in 1872, and in 1910 adopted a commission form of government.

**NEWTON,** a city of Middlesex county, Massachusetts, U.S.A., 10 m. W. of Boston, on the S. bank of the Charles river, which borders it for 16 m. Pop. (1880) 16,995; (1890) 24,370; (1900) 33,587, of whom 10,068 were foreign-born, 19,006 of foreign parentage. Newton is now, as it has always been, the chief manufacturing centre in the Newton district. Newton is served by the Boston & Albany railway. The city, with an area of 17-98 sq. m., contains 15 villages. In Newton, the most prominent of these villages, is a stone terrace monument to John Eliot, erected on the site of Waban’s wigwam near Nonantum Hill, where Eliot founded the first Indian Church on the 28th of October 1646—the Nonantum Indians, under their chief Waban, removed to Natick in 1651. On Institution Hill, Newton Centre, is the first Baptist theological seminary in America, Newton Theological Institution, founded in 1825. Here also is the residence of Samuel Francis Smith (1808–1885), author of “America” and several missionary hymns, and pastor here in 1832-1834. In Newton Upper Falls, Echo Bridge (of the Boston Aqueduct) crosses the Charles near the falls in Hemlock Gorge Reservation of the Metropolitan Park system. Auburndale is the seat of Lasell Seminary for Young Women, founded in 1851 by Edward Lasell (1809–1852). Other of the villages are Newtonville, West Newton and Newton Highlands. The city of Newton is primarily a residential suburb of Boston; along the Charles is a park (1971-2 acres) of the Charles River Reservation of the Metropolitan Park system, and the city has several attractive public parks, including Norumbega Park, on the banks of the river, with a large open-air theatre; boating, especially canoeing, on the river is very popular. The city has a public library, a high school and a technical high school. Among its manufactures are foundry and machine shop products, worsted goods and electrical apparatus; the factories utilize the water power of the falls. The value of the manufactured product in 1905 was $4,140,996. The region was settled as a part of Cambridge in 1630 and was called South Side (i.e. of the Charles), Nonantum (the Indian name), Cambridge Village, Little Cambridge or New Cambridge; Francis Pray was incorporated as a separate town and in 1691 received its present name; it annexed an island in the Charles in 1803; parts of it were annexed to Roxbury (1838) and Waltham (1849); it became a city in 1873; and in 1875 it annexed a part of Boston, with which there have been several more recent boundary adjustments.

**NEWTON ABBOT,** a market town and seaport in the Ashburton parliamentary division of Devonshire, England, 20 m. S. by W. of Exeter by the Great Western railway. Pop. of urban district (1901) 12,517. Beautifully situated at the head of the Teign estuary, the town grew rapidly in the 19th century. The two parish churches, St Mary’s in Wolborough, and All Saints’ in Highweek, are Perpendicular in style. St Mary’s contains a Norman font, an ancient brass lectern, buried during the Civil Wars, and some interesting heraldic ornaments which date from the 15th century. Of the 14th century chapel of St Leonard, only a tower survives. A large nunnery, called St Augustine’s Priory, was erected near the town in 1867; while eastward is the Jacobean Forde House, belonging to the earl of Devon, and visited by Charles I. and William of Orange, who first read his declaration to the people of England at Newton Abbot market-cross. The establishment of large engine works by the Great Western railway has aided the development of local industries, and there is a considerable shipping trade, fine china clay and pipelay being worked near the towns and exported to the Potteries. Large fairs are held for the sale of agricultural produce and livestock. The portion of Newton Abbot in the parish of Highweek was formerly a separate town, known as Newton Bushel.

Probably both Newton Abbot and Newton Bushel were originally included under the name of Newton. Newton Abbot was, in 1861; the abbey church of Newton Abbot was built by William Lord Brewer, founder of the monastery (1196). Newton Bushel was so called from Robert Russell or Bushel, foster-child and kinsman of Theobald de Englishville, who was made lord of the manor by Henry III. in 1246.

**NEWTON-IN-MAKERFIELD,** or Newton-le-Willows, an urban district in the Newton parliamentary division of Lancashire, England, 153 m. W. of Manchester by the London & North-Western railway. Pop. (1891) 12,861; (1901) 16,699. At a short distance from the town is a moated Elizabethan hall, called house, and also an ancient barrow of great extent. The Liverpool farm reformatory school is in the neighbourhood. The industrial establishments include foundries, printing and stationery works, paper mills, glass works and sugar refineries. Coal abounds in the neighbourhood.

The township of Newton-in-Makerfield, gave its name in Saxon times and in the reign of William the Conqueror to one of the hundreds of Lancashire. The barony was held by the Bannastres from the conquest to 1386 and passed successively to the Langtons, Fleetwoods and Leghs. It does not seem that the barons were ever summoned to parliament, and the title, like all parliamentary titles, has fallen into disuse since the abolition of feudal tenures. The courts-baron and courts-leet are held twice annually. The township returned two members to parliament from 1559 to 1831, but was disfranchised by the Reform Act of 1832. There was a market here at least as early as 1558 which is now discontinued. Near the town a party of Highlanders were taken prisoners in 1648 by Cromwell’s troops, and hanged in an adjoining wood, still called Gallow’s Cross.

**NEWTOWN,** a municipality of Cumberland county, New South Wales, Australia, 35 m. S.W. of Sydney. It consists chiefly of the residences of the wealthier citizens of Sydney and is connected with the city by rail and tram. As a municipality it dates from 1862. Pop. (1901) 22,598.

**NEWTOWN** (Welsh Drefenywdd), with the same meaning, formerly Llanfair Cedewain, a market town and contributory parliamentary borough of Montgomeryshire, situated on both sides of the Severn, and on the Cambrian railway, 195 m. from London. Pop. of urban district of Newtown and Llanlwechaharn (1901) 6500. It is connected with Shrewsbury (Ampthill) by the Montgomeryshire canal. The old Anglican church, the towers were ever had and partly Perpendicular, has been superseded by the modern St Mary’s, which contains the font and rood-screen of the old building. In the old churchyard lies Robert Owen, born in 1771 at Newtown, where he died in 1858, known as the "patriarch of reason," author of *New Views of Society*, &c., and one of the fathers of communism. Newtown, rather than Welshpool, is the chief seat of Welsh flannel manufacture, together with that of Tweeds and Shaws. It joins with Welshpool, Llanfyllin, Montgomery (Trefaldwyn), Llanidloes and Machynlleth, in Returning a member to parliament.

**NEWTOWNARDS** (pron. Newtownards) is a market town of Co. Down, Ireland, beautifully situated near the northern extremity of Strangford Lough, on a branch of the Belfast and Co. Down railway, 53 m. E. of Belfast. Pop. (1901) 9110. The town is sheltered by the Scrabo Hills on the west and north, and possesses a fine square, in which the pedestal of an ancient cross was erected in 1636. Muslim embroidery is the principal industry. There are also mills for flax and hemp yarns, a weaving factory and a hosiery factory. The remains of the old church, originally erected in 1244, contain good Perpendicular work, and the
family vault of the Londonerry; there are also the parish church and Presbyterian church, with lofty spires, and a Roman Catholic chapel. In the neighbourhood there are freestone quarries.

The town owes its origin to a Dominican monastery founded in 1244 by Walter de Burgh. It was forfeited by the O'Neills, and given to the Hamiltons and Montgomerries, from whom it passed to the marquess of Londonderry. It received a charter from James I., and until the Union in 1800 returned two members to parliament. The ruined abbey of Moville, 13 m. N.E., is the most notable of the many ecclesiastical remains in the neighbourhood. It is attributed to St Flahan (650-700).

NEW ULM, a city and the county seat of Brown county, Minnesota, U.S.A., on the s. bank of the Minnesota river, 88 m. (by rail) S.W. of Minneapolis, in the south central part of the state. Pop. (1905, state census) 5720 (1287 of German birth); (1910) 5648. New Ulm is served by the Minneapolis & St Louis, and the Chicago & North Western railways.

In the south-western part of the city, on a wooded hill called Hermann Heights, there is a statue of Arminius erected by the Grand Lodge of Hermann's Sons of the United States. New Ulm is British Columbia's last city and seat of the seat of the Dr Martin Luther College (Lutheran, 1884), a secondary school, with a normal and a collegiate department. St Michael's Academy and St Alexander Hospital are under the charge of Roman Catholic sisters. New Ulm was settled about 1853, and was twice attacked and almost destroyed by the Indians during the Sioux uprising of 1862. There is a monument to those who lost their lives in the Sioux massacres.

NEW WASHINGTON, a town of the province of Capiz, island of Panay, Philippine Islands, on the N. coast about 17 m. W. of Capiz, the capital of the province. The town was formed in 1903 by uniting the towns of Batau, Jimeno, Balete and the village or barrio of Lagatic in the town of Calibio; the total population at that time was 24,480. There are about sixty-six barrios, but all of these except Lagatic, the seat of the municipal government, had in 1903 less than 1000 inhabitants. The language is Visayan. The cultivation of rice, sugar cane, hemp, and Indian corn and the raising of cattle and horses are the principal industries.

NEW WESTMINSTER, a city on the north bank of the Fraser river, British Columbia, 12 m. from the mouth. Pop. (1906 estimate) 7900. Founded in 1859 it was the capital of British Columbia when the British possessions on the Pacific coast formed two colonies—i.e. British Columbia (the mainland portion) and Vancouver Island. The city is accessible to ocean-going ships of 16 ft. draught. It is the chief centre of the farming country of the lower Fraser and has a small export lumber trade. In 1888 the greater portion of the business part of the city was destroyed by fire, and though much of it was rebuilt, the establishment of the city of Vancouver, only 12 m. distant, seriously affected its growth. It is connected with Vancouver by an electric railway. The Great Northern railway, connecting with Seattle and other points in the state of Washington, here crosses the Fraser river by a fine bridge.

NEW YEAR'S DAY, the first day of the year. In the Gregorian calendar this date occurs twelve days earlier than in the Julian; thus in Russia, Greece, &c., where the latter is still employed, New Year's Day is celebrated on the English 31st of January.

The ancient Egyptians, Phoenicians and Persians began their year at the vernal equinox (Sept. 21) and the Greeks until the 5th century B.C. at the winter solstice (Dec. 21). In 432 B.C. the latter altered their New Year's Day to the 21st of June. The ancient Romans celebrated the beginning of the year on the 21st of December, but Caesar by the adoption of the Julian calendar postponed it to the 1st of January. The Jews have always reckoned their civil year from the first day of the month of Tisri (Sept. 6-Oct. 5), but their ecclesiastical year begins at the spring equinox (March 21). The 25th of March was the usual date among most Christian peoples in early medieval days. In Anglo-Saxon England, however, the 25th of December was New Year's Day. At the Norman Conquest owing, it is believed, to the coincidence of his coronation being arranged for that date, William the Conqueror ordered that the year should start on the 1st of January. But later England began her year with the rest of Christendom on the 25th of March. The Gregorian calendar (1582), which restored the 1st of January to its position as New Year's Day, was accepted by all Catholic countries at once; by Germany, Denmark and Sweden about 1700, but not until 1751 in England.

The Romans, after the adoption of the Julian calendar, kept the 1st of January as a general holiday. Sacrifices were made to Janus; gifts and visits were exchanged, and masquerading and feasting gave the gayest general holiday of the year. The magistrates who entered on office this day. The emperors at the new year exacted from their subjects tribute of a pound of gold. This quasi-present was called strena, a term (extended to all New Year's gifts in Rome) traditionally derived from a custom initiated by the legendary King Tatius, to whom branches of vervain gathered in the sacred Grove of Strenua, the goddess of strength, were presented as a good omen on the first day of the year 747 B.C. The imperial strena later became so excessive that Claudius found it necessary to limit the amount by law.

Participation in the ordinary New Year's Day observances as well as in the Saturnalia of December was from the first discouraged by the Church. Christians were expected to spend the day in quiet meditation, reading of scripture and acts of charity. When about the 5th century the 25th of December had become a fixed festival commemorative of the Nativity, the 1st of January assumed a specially sacred character as the octave of Christmas Day and as the anniversary of the Circumcision. As such it still figures in the calendars of the various branches of the Eastern and Western Church, though only as a feast of subordinate importance. The first mention of it in Christian literature as a feast occurs in Canon 17 of a council which met at Tours in 567.

The custom of giving and receiving strenae for luck at the New Year survives in France (where New Year's Day is known as le jour d'etrennes) and the Continent generally. In England its place has been taken by the Christmas-gift. In Scotland, where New Year's Day is more generally observed than Christmas, the custom is still universal. The Persians celebrated the beginning of the year by exchanging presents of eggs. The Druids distributed as New Year's gifts branches of the sacred mistletoe. In Anglo-Saxon and Norman England New Year's gifts were common. According to Matthew Paris, Henry III. followed the Roman precedent by extorting New Year's gifts from his subjects. These in later reigns became voluntary but none the less obligatory on those who wished to stand well with the throne. The custom reached its climax in Tudor times. Wolsey one New Year gave Henry VIII. a gold cup valued at £117, 17s. 6d. in the coinage of that time. An MS. account is preserved of money gifts given to King Henry by all classes of his subjects on New Year's Day 1533. The total reached many thousands. Bishop Latimer, however, handed Henry instead of a purse a New Testament with a leaf doubled down at Hebrews xii. 4, as opposite to the king's then impending marriage with Anne Boleyn. In Edward VI.'s time, if not earlier, it was usual for the sovereign to give "rewards" to those who presented New Year's gifts. Elizabeth is related to have been most conscientious in this regard. The custom of offering New Year's gifts to the sovereign became obsolete during the Commonwealth and was not revived at the Restoration.

NEW YORK, one of the original thirteen United States of America, situated between 40° 20' 40° and 45° 0' N., and between 7° 25' 1' and 7° 45' 54' W. Its northern boundary is, for the most part, formed by Lake Ontario and the St Lawrence river, which separate it from the province of Ontario, Canada; but north of the Adirondacks the boundary line leaves the St Lawrence, extending in a due east direction to the lower end of Lake Champlain. Thus the boundary between New York and the province of Quebec, Canada, is wholly artificial. Vermont, Massachusetts and Connecticut bound New York on
the E.; the Atlantic Ocean, New Jersey and Pennsylvania, on the S.; and Pennsylvania, Lake Erie and the Niagara river on the N.

The state has a triangular outline, with a breadth from E. to W. of 326-46 m. and from N. to S., on the line of the Hudson, of 300 m. In addition, it includes Long Island and Staten Island on the Atlantic coast. Its land area is 47,654 sq. m. and the area of the inland waters is 1550 sq. m., giving a total area of 49,204 sq. m. In addition to this, New York includes 3140 sq. m. of water in Lakes Ontario and Erie.

Topography.—The most notable topographic feature is the roughly circular mountain area of north-eastern New York known as the Adirondacks proper, including most of the peaks in New York. These peaks are part of a chain of crystalline rocks resembling more the Laurentian mountains of Canada than the Appalachians. Indeed, it is commonly considered to be an extension of the Canadian mountains. Parts of the crystalline area are worn down to a condition of low relief, but in the main mountain mass, although greatly worn, there are still elevations of truly mountainous proportions. The highest peak is Mount Marcy (5541 ft.), though associated with it are several other peaks of elevation from 4000 to 5000 ft. Even the higher summits are worn to a rounded condition, and are therefore for the most part forest covered upon the timber line which, on Mount Marcy, is at an elevation of 4900 ft. From the crest of a belt of some of the Adirondacks proper the surface slopes in all directions toward the lowlands: to the S. of the St. Lawrence valley on the N.; the Champlain-Hudson valley on the W. and the Mohawk valley on the S. to Lake Ontario on the W. While igneous and metamorphic crystalline rocks form the bulk of the Adirondack area, it is surrounded by a ring of ancient Palaeozoic sediments in which these peripheral lowlands have been deformed. It is these Palaeozoic sediments which have been eroded, the surrounding ring of more recent rocks, is either too rugged, or has a soil too thin and rocky for extensive agriculture. It is therefore a sparsely settled region with lumbering for one of the leading industries. Soil and climate also are such that the state is made up of large counties, especially dairy; and manufacturing industries connected with the products of forests, farms and mines are developed. These and other manufacturing industries are greatly augmented by the presence of the Adirondacks, a region which is visible from the mountain streams which flow out radially from the central area.

South of the Adirondack region, and S. of the Mohawk Valley, rises a high-level plateau which extends westward to the Pennsylvania line, the Mohawk Valley, a narrow valley, is, for a considerable distance, deeply cut by a stream with a swift current. Here the rocks are all essentially horizontal and of Palaeozoic age, mainly Devonian. This plateau region, which includes more than half the state, differs greatly from place to place. Its elevation decreases from W. to E. and from S. to N. Here, the Adirondack highlands, circled by the Ontario plain which skirts the southern shore of Lake Ontario. Similar to this is a narrow plain along the southern shore of Lake Erie, which, in fact, lies in a shallow depression in this elevated region. The formation is of ancient age, so ancient that they are the seats of extensive agriculture, especially fruit raising, which is further encouraged by the influence of the large bodies of lake water that moderate the heat of summer and the cold of winter. Long it has been a custom to check the late frosts of spring and the early frosts of autumn.

Elsewhere in the plateau province the land is higher and the surface far more irregular, increasing in ruggedness as one proceeds to the east and to the south. Elevations of between 1500 and 2000 ft. are common in this region all the way from Chautauqua county in the extreme W. to the Catskill mountains in the E.; and in places the surface becomes so rugged as to simulate the features of mountains and locally to win the name mountain. Valleys are deeply sunk in the plateau, the largest with bottom lands of sufficient width to give rise to strips of fertile farm land. The valley walls rise to undulating, and often fairly high, plateaus, but the uplands are remote from markets, and the soil is thin. In the high lands they are grazing lands—the seat of important dairy and sheep raising industries. This is the region of abandoned farm houses, and the there has been desertion and they may be found along all the upland roads.

Since this plateau region is a northward extension of the Alleghany mountain system, it is followed by a belt of mountains, as it rises as the mountains are approached. Thus, in S.E. New York, where the Appalachians enter, the plateau becomes much higher than in the W., reaching its culmination in the Catskills. Here the plateau is partly broken by elevation, and partly because of the nature of the Catskill sandstones, dissection has so sculptured the plateau as to carve it into a mountainous mass which is generally known as the Catskill mountains. An elevation of from 3000 to 4000 ft. is common, the highest point being Slide Mountain (4205 ft.). Like the Adirondacks, this region is largely forest covered, and is a favourite summer resort; but it is far less a wilderness than the Adirondacks, and in places it is cleared for farming, especially for pasture.

In the plateau province there are other areas known as mountains, of which the Helderberg mountains are the most conspicuous. This formation is really an escarpment facing the lower Mohawk and the Hudson river S. of Albany, where there is a downward step in the land. This step, slowly descending to the sea, is the characteristic of a large area of the plateau, and at its base there is a deposit of a durable layer of limestone, known as the Helderberg limestone. There are other lower escarpments in the plateau province, and these are, the Taconic range and southward to the Helderberg escarpment. Of these, the most notable is the Niagra escarpment which extends from Canada, past Lewiston and Lockport,—a downward step from the Erie to the Ontario plain, where the Niagara limestone outcrops, and is to this end the denuded floor for the steeply rising face at the boundary between the two plains.

South and S.E. of the Catskills, although including only a small portion of the state, are a number of different topographic features, all related to the lowlands east of the state from S.W. to N.E. First come the low folds of the western Appalachians, which, though well developed in Pennsylvania, die out near the New York boundary. The most pronounced of these is an upfolded strata in New York form the low Shawangunk mountains, which descend, toward the S.E., to a lowland of folded strata of limestone, slate and other rocks in Orange and Dutchess counties. This bowl and, due to the non-resistant character of the strata, is a continuation of the Great Valley of the Appalachians, and extends N.E. into Vermont and S.W. across New Jersey, Pennsylvania, Maryland and Virginia. It is bounded on its S.E. side by the high line of low ridges which form a belt of mountains along the Connecticut and Massachusetts, and S.W. into the Highlands of New Jersey and thence to the Blue Ridge. South of the High- lands, the plateau is followed by the S.E. part of the Southern states, and the lowlands towards the sea. There is an extensive depression extending from the Catskill mountains, the Hudson valley, a broad valley from which the ice sheet receded, it halted at various points, forming moraines and other glacial deposits. The soil of the valley is much the same as the plateau. The lands near the shores are fertile and productive, and the plateau land, especially the lowlands, are cultivated.

Drainage.—The drainage of New York leads its way to the sea in various directions. That the St. Lawrence system receives the waters from the S.W. and S., the Mohawk Valley and the Mohawk River in particular; while the Hudson, the Susquehanna, and other streams from the same general direction, discharge into the Hudson river, which then proceeds to the sea along the St. Lawrence system.

Drainage.—The drainage of New York leads its way to the sea in various directions. That the St. Lawrence system receives the waters from the S.W. and S., the Mohawk Valley and the Mohawk River in particular; while the Hudson, the Susquehanna, and other streams from the same general direction, discharge into the Hudson river, which then proceeds to the sea along the St. Lawrence system. The Hudson is a river of comparatively little size, and it is navigable for 147 m. from the sea. The Mohawk Valley furnishes a high and rugged area, but its drainage is very limited, and there is here a gap, easily traversed, across the Appalachian mountains and plateaus to the more level and fertile plains beyond. A low gap also leads northward from the Hudson to the Champlain valley surrounding Lake Champlain, but is traversed by water from the lake, and is not suitable for navigation in early wars; but it is of only minor importance as a commercial highway since it leads to Canada through a region of little importance.

The lower Hudson, below Troy, is really a ford, the stream valley being drowned by the sea through subsidence of the land. It is noted for its remarkable scenery, especially where it crosses the Highlands. The other large river valleys are far less useful as highways, though each is paralleled by one or more railways. The action of the
The continental glacier in scoured the passes between the St. Lawrence and southern drainage, and in turning streams southward, has facilitated the building of railways across the divides.

There are numerous lakes and ponds in the state, most of them small, including 50,000 such bodies of water of over an acre in extent. The largest lake apart from Erie and Ontario is the beautiful Lake Champlain, which lies on the eastern boundary, partly in Vermont, and with the N. of the state. It contains 1,280 square miles of water in the main body of the lake, but including lakes in the direction of the Finger Lakes. The largest of these are Cayuga, Seneca, Keuka, Canandaigua, Owasco and Skaneateles.

In the extreme western part of the state is Chautauqua Lake, beautifully situated, and containing 62 square miles of water.

New York is noted for its many falls and rapids, some of them of great beauty. Of these the largest is the cataract of Niagara, about 16 feet high and 2,542 feet long. The lowest point of the state is the junction of the Little and Big Salmon rivers, 23 feet below sea-level, yet the highest point, that of Mount Marcy, 5,344 feet above sea-level. The fall of 59 feet of the Great Chittenango falls is exceeded in the state by none, and the 55 of the falls of Tiogue, near Ticonderoga, is the highest of the Canadian Falls. Falling waters of 215 feet are found in the Seneca Valley, the best known of the widely renowned Watkins Glen, now reserved as a state park. The mountain falls of New York, notably Niagara, are used as a source of power.

The Coast-line.—New York has extensive coast-line along the Great Lakes, 75 miles, and 700 miles on the Erie sea-coast.

Where the lake waters flood the stream mouths, there are excellent harbours, and lake navigation is of great importance. The largest of the lake ports is Buffalo at the head of the Niagara river, where a large crusade centre, and transfer their goods to rail or canal. Buffalo lies at the lower end of the natural lake navigation, through the building of a ship canal in Canada, lake steamers can proceed into Lake Ontario and thence to the Atlantic.

The ocean coast-line, though of limited extent, is by far the most important in the United States. The greater part of the sea coast is on Long Island—a low, sandy coast, the seat of numerous summer resorts and fishing. The mainland, opposite the western end of Long Island, is traversed by the lower Hudson and other channels—submerged valleys—which form a branching bay with several inlets. New York State is the source and deposit of sand and gravel. The western banks of the lower Hudson is in New Jersey. This branching bay makes an excellent protected harbour, with an immense water front, at the outlet of the chief natural highway from the E. to the interior. The natural advantages of the natural highway by water, and the ease with which it may be engaged in manufacturing and commerce, has gathered around the shores of this harbour, the greatest natural system of an manufacturing centre. The rank of New York, as a manufacturing centre, is also on western Long Island, in Brooklyn, on the smaller islands, and on the New Jersey side. The harbour entrance is somewhat obstructed by sand bars, so that extensive government work has been necessary to open and maintain a channel for large draft ocean vessels. This sand has not been brought by the Hudson itself, so that river drops most of its sediment load far upstream, in its long tidal channel. It is supplied by the tidal and wind-formed currents, which are drifting sand from the Long Island and New Jersey coasts, extending the barrier beaches, such as Sandy Hook, out across the entrance to New York Bay.

The climate of New York is of variable climate. New York is typical of that of northern United States, a climate of extremes, hot in summer, and cold in winter, and yet healthful, stimulating, and, on the whole, not disagreeable. In the absence of extensive alluvial plains and marshes, the local variations of climate are less important than in the forests.

The average annual temperature is not far from 45° F., though it varies from over 50° near New York City, and 48° near the Lake Erie shore, to less than 40° in the high Adirondacks. The average maximum in summer heat is about 93°, temperature of 100° being rarely reached. In the winter the temperature descends below zero during exceptionally cold spells. A temperature of –20° or lower is never attained in the southern portion of the state. The ordinary rainfall is sufficient for the Adirondacks and in the higher parts of the plateau. The rivers and smaller lakes freeze in winter and navigation on the St. Lawrence and the Great Lakes is possible by ice on the average from about the middle of November to the end of April, and in 1875, but it is less than 30 in. in the Lake Champlain Valley and over 55 in. of New York City. In most of the state froses begin from September 1st to October 1st, and from April 1st to May 1st. In the Adirondack region the snowfall is heavy, the winter long and severe. In central New York it is not uncommon for snow to accumulate to the depth of 3 or 4 ft., and yet this is not persistent.

About New York City, and on Long Island, the snow rarely exceeds 1 ft. in depth. The climate is very variable, owing to the frequent passage of cyclonic storms from the W. and S.W., bringing warmer weather and rain, and sometimes blizzards. On Long Island there is less change of temperature between the Adirondacks and the Green Mountains. The largest lake entirely within the state is Lake George, famous for its beautiful scenery. In the central part of the state are the Finger Lakes and Seneca Lake, unimportant in extent, but of extreme beauty, especially at night, when many of the hundreds of the largest being in the Cayuga valley—notably Enfield Falls, a few miles S. of Ithaca, Ithaca Falls, Taughannock Falls, and Canadagea Falls within a few miles of Ithaca. The last, the highest waterfall in the state, has a vertical fall of 215 ft. Similar falls are found in the Seneca Valley, the best known being the widely renowned Watkins Glen, now reserved as a state park. Many of the mountain falls of New York, notably Niagara, are used as a source of power.

Flora.—When first seen by Europeans New York was a woodland, the prevailing trees being nearly all the varieties of trees, shrubs and wild plants which were common to the territory lying E. of the Mississippi river, N. of the Ohio, and S. of the St Lawrence. In the Adirondack region the trees were principally white pine, spruce, hemlock and balsam. In the eastern part of the state the common trees were birch, maple, ash, cottonwood and basswood, and smaller numbers of ash and elm; in the swamps of this region were also larch and cedar. The forests of the W. half of the state contained pine, but here saxifrage and peat moss, chestnut, hickory, maple and beech were more common. The tulip tree was common both in the S.W. and N.; and the walnut, butternut, poplar, sycamore and locust were widely distributed. The original vegetation of the state has been largely supplanted by trees and shrubs which have grown wild in the forest, and been introduced and adapted to agriculture, and in the Adirondack and Catskill Mountains, where the state has established forest preserves, and the Forest, Fish and Game Commissioner began reforestation in 1901, principally with northern white pine, hemlock and spruce, in the Adirondack region. This reforestation has been largely successful, and a few native species, such as reindeer moss and other lichens; on the shores of Long Island, Staten Island and Westchester county are a great variety of trees, shrubs and wild plants, the most characteristic of which is the garlic, especially characteristic of the pine barrens of New Jersey. Laurel, rhododendron, and whortleberry are common shrubs in the mountain districts, and sumac, hazel, sassafras and elder are quite widely distributed elsewhere. Among indigenous fruit-bearing plants the state has the black cherry, red cherry, red plum, yellow grape, blue currant, blackberry, dewberry, strawberry and cranberry. Blue flag, snake root, ginseng, lobelia, tanoy, wormwood, wintergreen, pignut hickory, mountain ash, barberry, sarsaparilla and horehound are among its medicinal plants. Cowslips, violets, anemones, buttercups and blood-roots are conspicuous in early spring, the white shell-berry and black and golden-rod in autumn, and besides these there are about 1500 other flowering plants in the state and more than 50 species of ferns.

Fauna.—Of the fur and game animals which were inhabitants of the prehistoric forests of the winter of the climate, except in the Adirondack region. Here the puma ("panther") has become extinct and the Canada lynx is rare. The mink, the elk and the beaver have been placed under the protection of the Forest, Fish and Game Commissioner. There are several species of deer, rabbits of all kinds and many species of squirrels; skunks, weasels, muskrats and woodchucks are common; there are some raccoons; mink are frequently taken in the Adirondacks; and a few other representative mammals have been raised on farms.

Among birds of prey a bald eagle and a golden eagle are occasionally seen in seclusion places. Game birds include ducks, geese, plovers, snipe, loons, grebes, terns, rails, the woodcock and the red-tailed grouse; quails are scarce except on Long Island, where a number of young birds are liberated each year, and by the same means a supply

596

NEW YORK
of pheasants is maintained in some parts of the state. There is a state game bird farm (1909) near Sherburne in Chenango county. Here the birds are fattened and released in the fall and early winter in marshes. The robin, song sparrow, chickadee, thrushes, warblers, vireos, orioles, wrens, bluebird, catbird and phoebe are favourite species.

There are about 375 species of fish in New York waters (see below under Fisheries).

Soil.—The soil is mostly glacial drift, but its depth and composition vary a great deal in different parts of the state. The soil of the Adirondack region is generally distributed, especially in the W. half of the state, is mainly a clay which was formed by the glacial pulverizing of limestone and shale and is still forming from the decomposition of fragments of these substances. In the forests the clay is usually mixed with a considerable alluvium and is therefore sandy. In the E. there is a clay formed mainly by the decomposition of slate. A sandy loam is the characteristic soil of some counties, and gravelly loams containing limestone are not uncommon.

Agriculture and Stock-Raising.—Although New York has lost in the competition with the Western States in the production of most of the grains, especially wheat and barley, and in the production of wool, mutton and pork, it has made steady progress in the dairy business and continues to produce great crops of hay. The state has made great advances, too, in the production of flowers, ornamental plants, nursery products, fruits, vegetables, poultry and eggs. In 1900 a little less than three-fourths of the state's total land area was included in farms and a little more than two-thirds of this was included in farms under 100 acres. The largest farm group was from 170,521 in 1850 to 226,720 in 1900, and the average size decreased from 111.25 acres in 1850 to 97.1 acres in 1890, but increased to 99.9 acres in 1900. More than two-thirds of the farms (1,252,006) were operated by owners or tenant farmers, and more than half of the farms (612,487) were operated by cash tenants.

Of the total acreage of all crops, 5,154,965 acres (51.4%) were of hay and 3,125,077 acres (32.8%) were of cereals. In 1900 the amount of the hay crop (5,002,000 tons) was greater than the previous years, but it was less than the corresponding crop in any other state. The oat crop in 1900 was 37,365,000 bushels; the Indian corn crop, 1,910,000 bushels; the wheat crop, 14,120,000; forage crops, 9,000,000; the rye crop, 2,720,000 bushels; buckwheat, 7,512,000 bushels.

There were less than one-third as many sheep in 1910 (1,177,000) as in 1850; but in the same period the number of dairy cows (1,202,000) nearly doubled. There were more than 1,500,000 hogs, and fewer than 1,000,000 sheep in the state. Maine is the next largest, with 29,250,000 bushels; and the state is a large producer of onions, turnips, cabbages, cauliflower, sweet Indian corn, cucumbers, rhubarb, parsnips, carrots, green peas and green beans. Maine, New York and Ontario counties are the largest producers of potatoes in the state. New York is the leading state in the production of hay, and nearly 60% of the hay crop is produced in the southern and western counties of the state. The greatest production of hay is in the Adirondack Mountains and in the rugged portions of the counties in the S. half of the state. A large portion of the Indiana corn, wheat and barley was produced on the Ohio territory. There are large crops of oats here, too, but the culture of this cereal is quite extensive in most of the counties of the Adirondack region. The lower valley of the Hudson is noted for its crop of tobacco. The state is one of the leading producers of flax, hemp, and Italy flax in the United States.

The principal hogs-producing counties are Otsego, Schoharie and Madison, all of which are between Albany and Syracuse. Those producing most tobacco are in a district extending from the Mohawk valley westward into the Adirondacks. The greatest orchards are in the tier of counties bordering the S. shore of Lake Ontario and in Dutchess and Ulster counties in the Hudson Valley. Chauncey and Alexandria, the leading hops-producing counties, are located on the W. half of the state and in the valley of the Hudson, and the greater part of Long Island under cultivation is devoted to market gardening, floriculture and nurseries. The largest nurseries, however, are in the Adirondack region.

Forest Products.—The principal forest area is in the Adirondack region where the state has a forest preserve (in Clinton, Essex, Franklin, Fulton, Hamilton, Herkimer, Lewis, Oneida, St. Lawrence, Sintaga, Warren and Washington counties) containing (1900) 1,350,559 acres, and there is as much or more in private preserves and in tracts owned by lumbermen. The state has a forest preserve also in the Catskill region (in Delaware, Greene, Sullivan and Ulster counties) of 110,064 acres, and there are wood-logs on state lands. Under the state forest laws, wood-logs on private lands may be cut off. Originally white pine was the principal timber of the Adirondacks, but most of the merchantable portion has been cut, and in 1900 only one-half of the area of the lumber product consists largely of hardwoods (mostly oak, chestnut and hickory), smaller amounts of hemlock and pine, and a very little spruce. The state’s entire timber product in 1905 was 512,760,127 tons, valued at $53,391,595, or 30.5%, of 58.5%, and a large part of this was to the extent of the shell-fish culture at the E. end of Lake Ontario; the value of oysters alone increased from $2,050,650 to $3,760,352. The value of hard clams rose from $1,075,000 in 1897, to $1,293,052 in 1901. In 1904 clams and other shell-fish oysters were valued at $11,685,247.

Fisheries.—New York was in 1904 more extensively engaged in oyster culture than any other state, and was making rapid progress in the cultivation of hard clams. In 1909 there were distributed from state fish hatcheries $1,319,297,271 (mostly smelt, pike-perch, and winter flatfish); a large number of fish and eggs were also placed in New York waters by the United States Bureau of Fisheries. The products of the marine fisheries decreased nearly 30% in value from 1891 to 1897, but from 1897 to 1904 they increased 9% in value. The state's shell-fish increased from 170,521 in 1850 to 226,720 in 1900, and the average size decreased from 111.25 acres in 1850 to 97.1 acres in 1890, but increased to 99.9 acres in 1900. More than two-thirds of the farms (1,252,006) were operated by owners or tenant farmers, and more than half of the farms (612,487) were operated by cash tenants.

The value of clams rose from $295,000 in 1897, to $395,000 in 1901. In 1904 clams and other shell-fish oysters were valued at $187,798 and consisting largely of pike-perch, smelt, and shell fish. These fish are valued as food, but being too bony for food they are used only in the manufacture of oil and fertilizer. The most valuable catches of food fish are made on Long Island and the three largest are herring, mackerel and menhaden, which are valued at $5,000,000, $6,000,000, and $2,000,000 respectively. These fish are valued as food, but being too bony for food they are used only in the manufacture of oil and fertilizer.

The principal hogs-producing counties are Otsego, Schoharie and Madison, all of which are between Albany and Syracuse. Those producing most tobacco are in a district extending from the Mohawk valley westward into the Adirondacks. The greatest orchards are in the tier of counties bordering the S. shore of Lake Ontario and in Dutchess and Ulster counties in the Hudson Valley. Chauncey and Alexandria, the leading hops-producing counties, are located on the W. half of the state and in the valley of the Hudson, and the greater part of Long Island under cultivation is devoted to market gardening, floriculture and nurseries. The largest nurseries, however, are in the Adirondack region.
is widely distributed throughout the state, and great quantities of it are quarried by various individuals, railroad companies, and counties, but the prevailing colours are greyish or drab it is little used in the walls of buildings. In 1908 the total value of the output of this stone was $2,584,559. Three distinct varieties of sandstone are quarried extensively in New York State: "Common" sandstone is the Hamilton period of the Devonian formation and occur mainly between the Hudson and Delaware rivers. They are dark blue-grey, fine grained, and is probably the oldest variety of rock in New York State. The sandstone is the reddish or reddish-brown Potsdam sandstone of which there are extensive formations on the N.W. border of the Adirondacks. The value of all sandstones quarried in 1908 was $1,774,843, an amount only about one-seventh of the value of the output of the other stones that were obtained in the eastern counties. From Tuckahoe, Westchester county, has been taken white marble, used in some of the finest buildings in New York City, and a similar marble is obtained in Putnam and Dutchess counties. Near Governor, St. Lawrence county, is a large quarry of coarsely crystalline magnesium limestone, used as monumental marble. In the Lower Silurian formation at Manlius and Chazy, in Clinton county, are two beds of grey and pink marbles, one of which is a favourite among domestic marbles for mantels, table tops and other interior decorations. From an extensive deposit of blue-black magnesium limestone at Glenora, in Allegany county, has been produced the largest quantity of marble in the United States. At Moriah and Port Henry, in Essex county, is a stone known as opalite marble, a mixture of serpentine, dolomite and calcite, and which occurs with sandstone deposits. Deposits of serpentinite occur at several places in St. Lawrence county; and at Warwick, in Orange county, is some beautiful marble of a carmine-red colour occasionally mottled with white or showing white veins. The marble quarried in 1908 was valued at $706,688. There are extensive formations of granitic rocks in the Adirondacks, in the lower Hudson valley, and in the adjacent highlands, but they are not extensively quarried. Rockland county produces considerable building rock, used mostly for road-making and concrete, and Ulster county has for more than a century produced most of the domestic millstones used in the United States. Extending from Madison county to the Adirondacks are large deposits of raw gypsum, which in 1908 contained large deposits of gypsum, and in 1908 the value of the state's output ($760,795) was greater than that of any other state, although Michigan produced a larger quantity. At or near Chittenango, in Madison county, is a deposit of coal, one of the largest in the United States, and the first use made of it was in the construction of the Erie Canal. The rock was found in much greater quantities at Rosendale, in Ulster county, in 1823, and the amount of this cement produced by New York in 1828 was 4,698,167 barrels; in 1899; the state is still the chief producer but only 947,029 barrels were made in 1908. Limestone and clay suitable for making Portland cement are also produced, and in 1908 the value of the state's cement was $1,128,729. This increased from 65,000 barrels in 1890 to 2,290,055 barrels in 1908. Near Talcville, in St. Lawrence county, is a large deposit of fibrous talc. In 1908 the total value of the state's talc product was $607,870. New York and Michigan are the two principal salt-producing states in the Union. Salt was discovered by the Jesuits in Western New York in 1748. The first railroads in New York were built to accommodate the manufacture of salt and other manufactured products. The first red dust in the country was that of the Erie railway, opened from Augusta, in 1829. The navigation was carried on between 1831 and 1835. The first year's results were very good, and the traffic continued to increase until 1840. In 1868 the Erie was sufficiently enlarged to accommodate boats of 240 tons burden. The second in operation in the United States was the Mohawk & Hudson, opened from Albany to Schenectady in 1831. The railway mileage in the state increased to 1,361 m. in 1850, to 3,926 m. in 1850, to 7,638 m. in 1850, and to 8,422-14 m. in 1909. The first great trunk line in the country was that of the Erie railway, opened from Piermont, on the Hudson river, to Dunkirk, on Lake Erie, in 1853. The New York Central & Hudson River railway, nearly parallel with the water route from New York City to Buffalo, was formed by the union, in 1866, of the New York Central with the Hudson River railway. The West Shore railway, which follows closely the route of the New York Central & Hudson River, was opened in 1869, and in 1881, of several shorter lines. In 1886 the New York Central & Hudson River Railroad Company leased the West Shore for a term of 475 years, and this company operates another parallel line from Syracuse to Buffalo, a line following closely the entire N. border of the state (the Rome, Watertown & Ogdensburg), and several cross lines. Other important railways are the Lehigh Valley, the Delaware, Lackawanna & Western, and the Pennsylvania in the central and northwestern counties of the state.

New York is divided into 62 counties; the major ones are: New York, which covers the entire state; Ulster, which includes parts of the Hudson River valley; and Erie, which includes the eastern end of Lake Erie. The state is known as the "Empire State" due to its size and wealth. New York City, the largest city in the United States, is located in the southern part of the state. The state is also home to the Appalachian Mountains, which stretch from western New York to the southern part of the state. The state's economy is diverse, with industries ranging from manufacturing to agriculture to tourism. New York is home to several major universities, including Cornell University and Columbia University. The state is also known for its cultural contributions, including the home of the New York Philharmonic and the Metropolitan Opera. New York is a state of great natural beauty, with lakes, mountains, and forests. The state is also known for its historical landmarks, including the Statue of Liberty and Ellis Island. New York is a state of great diversity, with a population that is made up of many different ethnic groups. The state is also known for its rich history, including the American Revolution and the Civil War. New York is a state of great natural beauty, with lakes, mountains, and forests. The state is also known for its historical landmarks, including the Statue of Liberty and Ellis Island. the judiciary, transferred to the people the choice of many officers, state and local, who had been appointed by the governor or the legislature; and placed numerous restrictions on the law-making power of the legislature. Under this constitution the theory of local self-government was more fully realized in New York than at any other time.

Since the middle of the 19th century an attempt has been made to meet the growing need for a corps of trained lawyers and to provide for a rapid industrial and social development by creating bureaus or commissions to exercise a central control over local officials, corporations and even private individuals, and as most of the heads of these bureaus and the commissions are appointed by the governor the importance of that officer has increased. The constitutional changes since 1846 affect principally the judiciary and cities. A constitutional convention met and proposed a new constitution in 1867, but every article was rejected by the people save one relating to the judiciary, which was adopted separately as an amendment in 1869. The constitution of 1846 made further important changes in the judiciary and senators to a freehold estate worth £500 ($500) and in the election of assemblymen to a freehold estate worth £20 ($200) or the payment of an annual rent of 40s. ($10).

But under the second constitution the most that was required of any white voter was the payment to the state or county of taxes on either personal or real property, and by an amendment of 1826 this requirement was abolished. The second constitution, however, imposed a property qualification on colored voters amounting to a freehold estate worth $250, and this restriction was not removed until 1874. Since 1874 the aim has been to bestow suffrage on all male citizens who shall have attained the age of twenty-one years and shall have been inhabitants of the state for one year, but for the protection of the ballot citizenship for ninety days, residence in the county for four months, and in the election district for thirty days next preceding the election are required. Conviction for bribery or of an infamous crime disqualifies, and personal identification of voters is required in New York City. A statement of receipts and expenditures of an election campaign, showing the amount received from each contributor and the name of every person or committee to whom more than $5 was paid, and the treasurer of every political committee within twenty days after the election; each candidate also must file a statement of his contributions. By an Act of 1910 women may vote on financial questions affecting a village in which they hold property.

Executive.—When the state government was first established, the governor and lieutenant-governor were the only state officers elected by the people. The state treasurer was chosen by the legislature, and for the appointment of other state officers as well as county officers and mayors of cities the Assembly chose four senators to constitute a council of appointment, a body

1 The population in 1870 was 8,196,606; in 1880, 10,386,641; in 1890, 12,878,899; in 1900, 15,322,528; in 1910, 17,965,321; in 1920, 20,695,748; in 1930, 23,260,350; in 1940, 25,954,576. The population has been estimated to be 30,185,752 in 1950.
NEW YORK

in which the governor had only a casting vote. But the constitution of 1821 abolished the council of appointment and gave the choice of the principal state departmental officers to the legislature, and the constitution of 1846 transferred the choice of these officers from the legislature to the people, where it has since remained. Under the constitution of 1821 a great number of local officers were appointed by the governor with the advice and consent of the Senate. The choice of most of these was given to the people in 1846, but since then many new state departments have been created, the heads of which are usually appointed by the governor, subject to the approval of the Senate. Under the present system, therefore, there is a biennial election (in even-numbered years) of a governor, a lieutenant-governor, a secretary of state, a state comptroller, a state treasurer, an attorney-general and a state engineer and surveyor; and the governor appoints, subject to the approval of the Senate, a superintendent of public works, a superintendent of state prisons, a superintendent of insurance, a superintendent of banks, a commissioner of excise, a commissioner of agriculture, a forest, fish and game commissioner, a commissioner of health, a commissioner of labour, a state architect, a state historian, a state librarian, two public service commissions, a civil service commission, a board of charities, a commission of prisons, a commission in lunacy, three tax commissioners and several other boards and commissions. The governor has the power, also, of filling vacancies in certain state offices and on the benches of the supreme court of New York, and he may remove or suspend certain county and municipal officers on charges.

The first state constitution gave the veto power to a council of revision composed of the governor, the chancellor and the judges of the highest court. But since 1846 this power has been exercised by the governor alone; and in 1874 it was extended to separate items in appropriation bills. A bill or item of an appropriation bill that has been vetoed by the governor can become a law only with the approval of two-thirds of the members elected to each house of the legislature. So long as the legislature is in session the governor is allowed ten days, besides Sundays, to consider a bill, and if he does not veto it within that time it becomes a law, but no bill becomes law after the final adjournment of the legislature unless it is actually approved by the governor within thirty days after the adjournment. The governor's power to grant reprieves, commutations or pardons is unrestricted by any board of pardons, but he is required to report to the legislature each case in which he exercises such power. A candidate for the office of governor or lieutenant-governor must be at least thirty years of age and must have resided within the state for five years. The governor's salary is $10,000 a year, and the lieutenant-governor's is $5000.

Legislature.—The legislative power is vested in a Senate of 50 members elected biennially and an Assembly of 150 members elected annually. Since 1846 both senators and assemblymen are elected by single districts, and ever since the state government was established they have been apportioned according to population, but the present constitution limits the representation of New York City in the Senate by declaring that no county shall have more than one-third of all the senators nor any two adjoining counties more than one-half of them. The first and second state constitutions required that every senator should be a freeholder, but since 1846 no property qualifications have been prescribed for membership in either house; the only persons disqualified are those who at the time of the election or within one hundred days before the election were members of Congress, civil or military officers under the United States, or officers under any city government. The constitution of 1846 fixed the number of members of both houses to three dollars a day and to 10 cents a mile (50 cents a day in impeachment proceedings) besides an allowance for travelling expenses, but since an amendment of 1874 they have been paid $1500 a year and ten cents a mile for travelling expenses.

The legislature meets in annual sessions, beginning in January. Money bills may originate in either house, but at the final vote on such bills, at least two-thirds of the members of the house, if present, must vote in favour of the bill. The governor may veto any bill that is passed by either house, and the house of origin may override his veto by a two-thirds vote. Any bill passed by both houses must be present and the yeas and nays must be recorded; bills entailing appropriations for local or private purposes must receive a two-thirds majority to pass. The legislature appoints the board of regents of the University of the State of New York. To decrease the evil of lobbying a law was enacted in 1906 which requires that every person employed to promote or oppose the passage of any bill shall file in the office of the secretary of state a written statement showing who employs him and the amount of money paid him, and that in respect of which his services are to be rendered; the law also requires the employers of lobbyists to file in the same office within two days after the close of the legislative session the itemized statement of all their lobbying expenses, and forbids the employment of a lobbyist for a contingent fee.

Judiciary.—At the close of the colonial era there were a court of chancery, a supreme court, circuit courts and courts of oyer and terminer which were held in the several counties of New York, with the elective judges of the supreme court, and a court of sessions in each county, and courts held by justices of the peace in the several towns. This system, with the addition of the Senate, the chancellor and the justices of the supreme court occasionally sitting as a court for the correction of errors, was retained with only slight changes until 1846. But the new constitution of that year substituted a court of appeals for the court of errors, merged the court of chancery into the supreme court, established in each county a new county court composed of a single judge, and, taking the appointment of judges from the governor, gave the election of them to the people. Some further alterations in the constitution affecting the courts were made in 1860, 1879, 1888, 1894, 1899 and 1909, and the system as at present constituted comprises a supreme court of ninety-seven justices, an appellate division of the same, a court of appeals, a court of claims and local courts. The highest judicial court in the state is not, as in most states of the Union, the supreme court, but the court of appeals. This court consists of a chief judge and six associate judges elected from the state at large for a term of fourteen years. Its jurisdiction is limited, except where judgment is of death, to a review of questions of law. Vacancies are typically filled from among the justices of the supreme court by the governor. To expedite business, at the request of the court, the governor may designate not more than four justices of the supreme court to act temporarily as additional associate judges of the court of appeals. The salary of the chief judge is $24,200, of the associate judges $13,700 a year.

The ninety-seven justices of the supreme court are elected for fourteen years from the nine districts into which the state is divided. Of these thirty are chosen in the first district (New York county) and seventeen in the second district (Long Island and Staten Island). The jurisdiction of each judge extends over the entire state. Tribunals are temporarily filled by the governor. The supreme court has general jurisdiction in law and equity, including all actions both civil and criminal. The salary of the justices in the first district is $15,000 a year; in the second district $16,500 a year; and the remainder of the second district it is $16,900 a year; in the other districts it is $10,000 a year. The state is divided into four departments for each of which there is an Appellate Division consisting of seven judges: the first department (county of New York) and four others.

The court of appeals consists of one chief judge and ten associate judges elected from the state at large; it is the highest court of the state, and its jurisdiction is limited to questions of law which are brought up upon appeal from the decisions of the courts of first instance, and must be decided by the court of appeals. The chief judge is elected for a term of six years, and the judges for terms of nine years each.

The supreme court, the court of appeals and the justices of the supreme court are bona fide residents of the state. The court of appeals cannot be removed from office by impeachment, but the justices of the supreme court can. The constitution provides for the impeachment of judges, and the vote of two-thirds of each house is necessary to remove any judge from office. The judge is removed from his office if he is convicted of a crime. The court of appeals has general power to make rules and regulations for the government and discipline of the bar, and to admit to the practice of law such persons as shall appear to such court to be of sufficient character and learning to practice as attorneys and counselors. The judges of the supreme court are elected for terms of six years, and the judges of the court of appeals for terms of nine years each.

Local Government.—The state is divided into sixty-one counties, each (unless wholly included in a city) having a county board, and in cities having a separate government. Each county board is composed of three members elected for two years, one from every town or city ward. This board has certain administrative and legislative powers, such as the care of county property, the borrowing of money for the erection of county buildings, the fixing of the salary of the county treasurer and of other county officers, the levying of county taxes and the division of the county into assembly districts and school commissioners' districts. Other county officers are a county judge and a county surrogate elected for a term of six years, a treasurer, a clerk, a district attorney, a sheriff and from one to four coroners elected for a term of three years. There are of these cases: (1) those having a population of 175,000 or more; (2) those having a population between 50,000 and 175,000; and (3) those whose population is less than 50,000; the classification is according to the latest state enumeration.
The Penal Law of 1894, as amended, includes regulations that prohibit certain activities such as gambling at race-tracks. License to sell intoxicating liquors is subject to a graduated tax. The sale of liquor on Sunday or between one o'clock and five o'clock in the morning of any other day is unlawful. Assemblers of two or more persons for the purpose of selling or offering to sell intoxicating liquors, or persons who have conspired to sell alcohol, may be punished. The sale of intoxicating liquors, may allow it to be sold only on condition that it be not drunk on the vendor's premises, or may allow it to be sold only to hotel-keepers and pharmacists, or by pharmacists alone.

**Administrative Committee**

The office of such public service corporations as own or operate steam, electric or street railways, gas or electric plants, and express companies were, in 1907, vested in two public service commissions (the first for New York City and the second for all other parts of the state), each of five members appointed by the governor with the approval of the Senate; in 1910 the regulation of telephone and telegraph companies throughout the state was vested in the second commission.

**A State civil service commission** (1883) consists of three members (not more than two of the same political party) appointed by the governor with the approval of the Senate. For the classified service of the state and of the minor civil divisions, except cities, the commission makes rules (subject to the governor's approval and to statutory and constitutional provisions) governing the classification of offices, the examination of candidates for office, and the appointment and promotion of employees. In cities the mayor is required to appoint a municipal civil service commission, with similar duties; not more than two-thirds of the members to be of the same political party.

**Prisons, Poor Laws, Charities, &c.**

Penal institutions for sane adults, except reformatories for women, are under the general supervision of a state commission of prisons; hospitals for the insane are under the general supervision of the state commission in lunatic and all other charitable and penal institutions, maintained wholly or in part by the state, or by any county, city or town within the state, are under the general supervision of a state board of charities. This board of charities is composed of one member from each of the five senatorial districts and three additional members from the City of New York, all appointed by the governor with the consent of the Senate for a term of eight years. It existence dates from 1857, but its authority was very limited, chiefly advisory, until 1865. Since then, however, its powers have been greatly increased. In 1910 the state charitable institutions were as follows: State Soldiers' and Sailors' Home, Bath; State School for the Blind, Batavia; the Thomas indian School, Iroquois; State Woman's Relief Corps, Home, Oxford; State Hospital for the care of Crippled and Deformed Children, West Haven; State Training School for Men, Utica; State School for Girls, Hudson; Western House of Refuge, Albion; New York State Reformatory for Women, Bedford; the State Training School for Boys; and Letchworth Village, which is a combination of charitable and feeble-minded. Eighty institutions for the care of special and instruction of deaf mutes and one for the care of the blind are supported mainly by the state. Many other charitable institutions receive public money, mostly from counties, cities and towns.

The poor law of the state defines the town poor as those who have gained a settlement in some town or city, by residing there for one year prior to their application for public relief and who are unable to maintain themselves; the county poor as the poor who have not resided in any one town or city for one year before their application for public relief, but have been in some one county for sixty days; the state poor as those who are under provisions furnished by the state, not being cared for, each town, city, county and the state must pay the cost of maintaining its poor. In some counties there is no distinction between town and county poor, but in 1910 only one or the other. The state poor are those who have been placed in almshouses or poorhouses and care of the poor; towns and cities not subject to special provisions intrusted public relief to one or more overseers of the poor or to certain county officers. Without regard to the method of accommodation a poor person requiring medical or surgical treatment may be sent to the nearest hospital approved by the state board of charities. An Act of 1910 provides that indigent soldiers, sailors or marines, and their dependents, shall be cared for in their homes and not in almshouses.

The first state insane asylum, designed chiefly for recent and curable cases of insanity, was opened at Utica in 1843. Since 1896 every public institution for the insane has been maintained and administered as a part of the state system. A state commissioner in lunacy was first appointed in 1874; this officer was replaced in 1889 by a commission in lunacy, which in 1894 was placed at the head of the

1 For further regulations relating to the employment of women and children see the Labour Law enacted in 1909 and the subsequent amendments.
administration of the state's insanity law. This commission consists of three members appointed by the governor with the consent of the Senate for a term of years, and the institutions under its supervision in 1910 were the Sing Sing State Prison, at Ossining, the Auburn State Prison at Auburn, and the Clinton State Prison at Dannemora, the New York State Reformatory at Elmsford, the Eastern New York Reformatory at Napanoch, five county penitentiaries, and all other institutions for the detention of sane adults charged with or convicted of crime, or retained as witnesses or debtors. The state prisons are under a superintendent of state prisons, appointed by the governor, with the consent of the Senate, for five years; and the state reformatories are managed by a board of seven managers similarly appointed for seven years. In the state reformatory at Elmsford (which, like that at Napanoch, is divided into state correctional districts) the governor has the right to make a check list of all prisoners committed to the state prison or reformatory who have been convicted of a state prison offence for the first time only, the plan of committing adult felons on an indeterminate sentence to be followed by the state reformatory, the rule having been laid down that it has proved so satisfactory that it has been in part adopted for the state prisons. In order to minimize competition between prison labour and free labour, articles manufactured in the state prisons are sold at the same prices as those made by free labour, and the proceeds are divided among the institutions and departments of the state and its political divisions.

Education.—The first school was established by the Dutch at New Amsterdam (now New York City) as early as 1633, and at the close of the Dutch period there was a free elementary school in every settlement. But from the English conquest to the close of the colonial era the chief purpose of the government with respect to education was to provide schools for the children of the poorer classes. King's College was founded in 1754, and from 1764 to 1776 the other schools were principally those maintained by the Society for the Propagation of the Gospel in Foreign Parts. Hardly any schools remained in operation throughout the War of Independence. In January 1784 Governor George Clinton recommended legislation for the "revival and encouragement of seminaries of learning," with the result that the legislature passed an act establishing a university at New York City, formerly King's College, with authority to incorporate new colleges and academies and to exercise over them the right of visitation. In 1785 an act was passed which formed the basis of the present elementary-school system. This act provided to support a public school in every county, the fund for the support being equal to the tax collected for education, augmented by one third of the taxes of the county. The act was an attempt to establish a uniform system of free public instruction for the children of the industrial schools. For the training of teachers for the elementary schools the state maintains ten normal schools at Oswego (1853), Cortland (1856), Fredonia (1860), Potsdam (1866), Geneseo (1872), Plattsburg (1875), Plattsburg (1887) and Plattsburg (1890); it also appropriates $700 annually for each teachers' training class in about one hundred of the secondary schools. The State Normal College at Albany, founded in 1843 as the first state normal school, is designed principally for the training of teachers for the secondary schools, about 800 high schools and academies, supported wholly or in part by the state.

The state controls professional and technical schools through the regents' examinations of candidates for admission to such schools and to the professions, determines the minimum requirements for admission to college by the regents' academic examinations, main- tains the state college system, and provides a system of free public instruction for the children of the industrial schools. For the training of teachers for the secondary schools, about 800 high schools and academies, supported wholly or in part by the state.

Among the institutions of higher learning in the state, besides Columbia University (q.v.) and Cornell University (q.v.), are: Union University (1875), Hobart and William Smith College (1812, non-sectarian), at Clinton; Colgate University (1819, non-sectarian), at Hamilton; Hobart College (1822, non-sectarian), at Geneva; Brown University (1764), at Providence; Johns Hopkins University (1876), at Baltimore; Dartmouth College (1826, non-sectarian), at Hanover, N.H., Yale University (1701), at New Haven; Harvard University (1636), at Cambridge, Mass.; Princeton University (1746), at Princeton; University of Pennsylvania (1740), at Philadelphia; Columbia University (1754), at New York City; New York University (1831), at New York City; New York University (1832, non-sectarian), at New York City; Alfred University (1836, non-sectarian), at Alfred; Fordham University (1841, Roman Catholic), in New York City; College of

1 In 1906 a law was enacted for the establishment of a new state prison in the eastern part of the state to take the place of Sing Sing Prison.
safe deposit companies, 255 building and loan associations and other
nonbanking corporations, with total resources of $3,831,000,000
under the supervision of the banking department of the state.
This is over 21% of the entire banking power of the United States.
To correct abuses in the life insurance business which were
discovered in 1905 by an investigation carried on by the state
department of insurance, a law was passed in the next year regulating the election of the directors of the
insurance companies, and the investments of the companies and
the distribution of dividends, limiting the amount of business of the
larger companies and prohibiting rebates on insurance premiums.
A state superintendent of insurance, (since 1860) appointed by
the governor, holds office for three years.

History.—The aboriginal inhabitants of New York had an
importance disproportionate to its small size. With limits from
the upper Hudson and eastward to the Genesee river were
home of that powerful confederacy of Indian tribes, the Mohawks,
Onondagas, Cayugas and Senecas, known to the French as
the Iroquois and to the English as the Five (later Six) Nations.
When supplied with firearms by Europeans they reduced a
number of other tribes to subjection and extended their dominion
over most of the territory from the St. Lawrence to the Tennessee
and from the Atlantic to the Mississippi. They were at the height
of their power about 1700. Of much less influence in New York
were several Algonquian tribes in the lower valley of
the Mohawk, the Iroquois community in the Thousand Islands,
New York Bay and the Hudson river were discovered by
Giovanni da Verrazano in 1524, and were probably seen by
Estevan Gomez in 1525; for many years following French
vessels occasionally ascended the Hudson to trade with the
Indians. The history of New York really begins, however, in
1609. In July of that year Samuel de Champlain discovered the
lake which bears his name and on its shores led his Algonquian
Indian allies against the Iroquois, thus provoking against his
countrymen the hostility of a people who for years was to hold
the induces power in the Great Lakes. The Iroquois
had been subdued by the Dutch in 1667, and the
Algonquian tribes were driven from New York by the
French. On the 3rd of September Henry Hudson, in the
employ of the Dutch East India Company, entered New York
Bay in the “Half Moon” in search of the “northwest passage.”
He conceived that a vast trade with the Iroquois for furs might
be established; his report aroused great interest in Holland;
and the United Netherlands, whose independence had been
acknowledged in the spring, claimed the newly discovered
country. In 1610 a vessel was despatched with merchandise
suitable for traffic with the Indians, the voyage resulted in
profit, and a lucrative trade in peltry sprang up. Early in 1614
New York block expeditions were made to Block Island.
The merchants of Amsterdam and Hoorn soon formed themselves into the New Netherland Company, and on the
11th of October 1614 received from the States-General a
two years’ monopoly of the Dutch fur trade in New Netherland,
that part of America between New France and Virginia,
also the southern part of the Hudson river, is not
controlled by the Dutch. The English did not have
control over the settlement until 1664. Colonial
The charters of the New Netherland Company expired
in 1664 and New York was transferred to the
States-General. Under the charter of 1664 the
States-General refused to grant a renewal, and only private
ventures were authorized until 1621, when the West India Company
(see) was chartered for a term of twenty-four years; to
this company was given a monopoly of Dutch trade with the
American coast from Newfoundland to the Straits of Magellan.
It was continually renewed—after the expiration of
its charter in 1664 a very limited supervision of the States-General, such as
the approval of its appointment of a governor and of its instructions
to him; and its own government was vested in five chambers of
directors and an executive board or college of nine
such chambers, eight of the nineteen representing
the Chamber of Amsterdam. New Netherland became one of
the more important interests of the Company. In June 1623,
however, New Netherland was formally erected into a province
and the management of its affairs assigned to the Chamber of
Amsterdam, which in March 1624 despatched the "New Netherlands," with the first permanent colonists (thirty families mostly Walloon), under Cornelis Jacobsen Mey, the first governor or director of the colony. Arriving at Manhattan in early May, a few weeks after having landed, this small company established a temporary post (Fort Nassau) on the Delaware river, and still another a fortified settlement on the site of the present Hartford, Connecticut. But more than one-half of the families proceeded up the Hudson to Fort Orange, the successor of Fort Nassau, at the mouth of Tawasentha Creek, and there founded what is now Albany. Three more vessels arrived in 1625, and when in that year Mey was succeeded as director by William Verhulst the colony had a population of 200 or more. The government of the province was fully established in 1626 and was vested mainly in a director-general and council. The director-general was formally appointed by the Company subject to the approval of the States-General, but the Amsterdam Chamber and the College of Nineteen supervised his administration. The members of the council were formally appointed by the Company, but the director-general actually determined who they should be, and as he was not bound by their advice they were no check on an autocratic rule. Peter Minuit, the first director-general, arrived with more colonists in May 1626, and soon afterwards Manhattan Island was bought from the Indians, Fort Amsterdam was erected at its eastern end, and the settlement here was made the seat of government.

In 1629, chiefly to encourage agriculture, the Company issued its famous Charter of Privileges and Exemptions, which provided that any member might have anywhere in New Netherland except on Manhattan Island his choice of a tract of unoccupied land extending 16 m. along the seacoast or one side of a navigable river, or 8 m. along the river on both sides and so far into the country as the situation of the occupiers will permit by purchasing the same from the Indians and planting upon it a crop of wheat or corn. Provision was also made for the grant of farms to the beginning of the undertaking, one-fourth part within one year; and that any private person might with the approval of the director-general and council take up as much land as he should be able to improve. The founder of a colony was styled a patron, and, although the colonists were bound to him only by a voluntary contract for specified terms, the relations between them and the patron during the continuance of the contract were in several important respects similar to those under the feudal system between the lord of a manor and his serfs. The patron received his estate in perpetual inheritance and had the exclusive right of planting and fishing thereon, and, if the tenant not only paid him a fixed rent, usually in kind, but had to share with him the increase of the stock and to have the grain ground at his mill. The patron was the legal heir of all his colonists who died intestate. He had civil and criminal jurisdiction within the boundaries of his estate; he could create offices, found cities, and appoint officers and magistrates, and, although the charter permitted an appeal from his court to the director-general and council in any case in which the amount in dispute exceeded fifty guilders ($20), some of the patrons exacted from their colonists a promise not to avail themselves of the privilege. The Company promised to permit the patrons to engage in the fur trade, wherever it had no commissary of its own, subject to a tax of one guilder (40 cents) on each skin, and to engage in other trade along the coast from Newfoundland to Florida subject to a tax of 5% on goods shipped to Europe. The colonists of the patrons were exempted from all taxes for a period of ten years, but were forbidden to manufacture any cloth whatever. The charter did not give the encouragement to agriculture that was expected of it because the status created for colonists of a patron was not an attraction to a successful family, in the Netherlands. Immediately after the issue of the charter a few of the more adroit directors of the Amsterdam Chamber hastened to acquire for themselves, as patrons, the tracts of land most favourably situated for trade. On both sides of the entrance to Delaware Bay Samuel Godyn, Samuel Blommaert and five other directors who were admitted to partner-

ship in the second year (1630) established the manor and colony of Swanendael; on a tract opposite the lower end of Manhattan Island and including Staten Island, Michael Pauw established the manor and colony of Pavonia; on both sides of the Hudson and extending in all directions from Fort Orange (Albany) Kilian van Rensselaer established the manor and colony of Rensselaerwyck. The colony of Swanendael was destroyed by the Indians in 1632. Pauw maintained his colony of Pavonia for about seven years and then sold out to the Company. The colony of Rensselaerwyck was the only one that prospered under the patron system. In the meantime the patrons had claimed unrestricted rights of trade within the boundaries of their estates. These were stoutly denied by the Company. Director-General Minuit was recalled in 1632 on the ground that he had been partial to the patrons; and Wouter van Twiller, who arrived in 1633, endeavoured to promote only the selfish commercial policy of the Company; at the close of his administration (1637) the affairs of the province were in a ruinous condition.

William Kieft was appointed director-general late in 1637, and in 1638 the Company abandoned its monopoly of trade in New Netherland and gave notice that all inhabitants of the United Provinces, and of friendly countries, might trade there subject to an import duty of 10%, an export duty of 15%, and to the requirement that the goods should be carried in the Company's ships. At this time the Company was instructed to issue to any immigrant applying for land a patent for as large a farm as he required for cultivation and pasturage, to be free of all charges for ten years and thereafter subject only to a quit-rent of one-tenth of the produce. Two years later, by a revision of the Charter of Privileges and Exemptions, the prohibition on manufactures was abolished, the privileges of the original charter with respect to patrons were extended to "all good inhabitants of the Netherlands," and the estate of a patron was limited to 4 m. along the coast or a navigable river, or 8 m. along the river on both sides. The Company was also provided that any one who brought over five colonists and established them in a new settlement should receive 200 acres, and if such a settlement grew to a town or village it should receive a grant of municipal government. These inducements encouraged immigration not only from the Fatherland but from New England and Virginia. But the freedom of trade promoted dangerous relations with the Indians, and an attempt of Kieft to collect a tribute from the Algonquian tribes in the vicinity of Manhattan Island and other indiscretions of this officer provoked Indian hostilities (1641-1645), during which most of the colonists of Pavonia and Staten Island were killed.

Out of this warfare arose an organized movement for a government in which the colonists should have a voice. In August 1641 Kieft called an assembly of the heads of families in the neighbourhood of Fort Amsterdam to consider the question of peace or war. The assembly chose a board of Twelve Men to represent it, and a few months later this board demanded certain reforms, especially that the membership of the director-general's council should be increased from one to five by the popular election of four members. Kieft promised the concessions to gain the board's consent to waging war, but later denied its authority to exact promises from him and dissolved it. At another crisis, in 1643, he was obliged to call a second assembly of the people. This time a board of Eight Men was chosen to confer with him. It denied his right to levy certain war taxes, and when it had in vain protested to him against his arbitrary measures it sent a petition, in 1644, to the States-General for his recall, and this was granted. Peter Stuyvesant (q.v.), his successor, arrived at Fort Amsterdam in May 1647. Under his rule there was a return of prosperity; from 1633 to 1664 the population of the province increased from 2000 to 10,000. Stuyvesant, however, was extremely arbitrary. Although he permitted the existence of a board of Nine Men to act as "tribunes" for the people, it was originally composed of his selections from eighteen persons chosen at a popular election, and annually thereafter the places of six retiring members were filled by his selections from twelve persons nominated by the board. He treated it with increasing
NEW YORK

605

contempt, and the most that it could do was to remonstrate to the States-General. That body suggested a representative government, but this the Company refused to grant.

Stuyvesant conducted a successful expedition against the Swedes on the southern border of New Netherland in 1655; but he was powerless against the English. The Dutch had long claimed the whole coast from Delaware Bay to Cape Cod, but by the treaty of Hartford (1650), negotiated between himself and the commissioners of the United Colonies of New England, Stuyvesant agreed to a boundary which on the mainland roughly determined the existing boundary between New York and Connecticut and on Long Island extended southward from the west side of Oyster Bay to the Atlantic Ocean. Notwithstanding the good claim to their province which the Dutch had established by discovery and occupancy, the government of Great Britain, basing its claim to the same territory on Cabot’s discovery (1498), the patent to the London and Plymouth companies (1606), and the patent to the Council for New England (1620), contended that the Dutch were intruders. During the war between England and Holland, the Dutch, fearing an English attack, built a wall, from which the present Wall Street was named, across Manhattan Island at what was then the northern limits of New Amsterdam. In the following year Cromwell actually sent out an expedition which, with the aid of New England, was to attempt the conquest, but before an attack was made peace was announced. The Charter of 1662 included in that colony some settlements acknowledged by the treaty of Hartford to belong to New Netherland, and the same agreement was renewed. Finally, in March 1664, Charles II. formally erected into a province the whole territory from the west side of the Connecticut river to the east side of Delaware Bay together with all of Long Island and a few other dependencies of minor importance, and granted it to his brother James, the duke of York and Albany, as its lord proprietor. The duke appointed Colonel Richard Nicolls governor and placed him in command of an expedition to effect its conquest. Nicolls won over the burgomaster of New Amsterdam and other prominent citizens by the favourable terms which he offered, and Stuyvesant was forced, without fighting, into a formal surrender on the 8th of September. The Dutch authority was proclaimed and New Netherland became New York. The separation from it of what is now New Jersey (q.v.) was begun by the duke’s conveyance, in the preceding June, of that portion of his province to Berkeley and Carteret, and among numerous changes from Dutch to English names was that from Fort Orange to Fort Albany. A treaty of alliance with the Mohawks and Senecas procured for the English the same friendly relations with the Iroquois that the Dutch had enjoyed. The transition from Dutch to English institutions was effected gradually and the private rights of the Dutch were carefully preserved. The English executive, consisting of a governor and council, was much like the Dutch, but Nicolls, by his conciliatory spirit, made his administration more agreeable than Stuyvesant’s. In the administration of local affairs some of the Dutch settlements were little disturbed until ten years or more after the conquest, but the introduction of English institutions into settlements wholly or largely English was begun in 1665 by the erection of Long Island, Staten Island and Westchester into an English county under the name of Yorkshire, and by putting into operation in that county a code of laws known as the “Duke’s Laws.” This code had been adapted upon the basis of New England, and, although a source of popular discontent, it gave to the freeholders of each town a voice in the government of their town by permitting them to elect a board of eight overseers which chose a constable and sat as a court for the trial of small causes. Nicolls resigned the governorship in 1668, but his successor, Francis Lovelace, continued his policy—autocratic government, arbitrary in form but mild in practice, and progressive in the matter of religious toleration. In August 1673, Holland and England being at war, a Dutch fleet surprised New York, captured the city, and restored Dutch authority and the names of New Netherland and New Amsterdam. But by the treaty of Westminster, February 1674, the Dutch title to the province was finally extinguished, and in November the English again took possession. A new charter was issued to the duke to perfect his title and Edmund (later Sir Edmund) Andros, the new governor, was instructed to establish English institutions and enforce English law in all sections. In 1675 Andros established at Albany a commission for Indian affairs which long rendered important service in preserving the English-Iroquois alliance. The imperious manner of Andros made him many enemies. Some of them preferred charges against him relating to his administration of the revenue. He was called to England in 1681 to answer these, and during his absence the demand for a representative assembly was accompanied with a refusal to pay the customs duties and so much other insubordination that the duke appointed Colonel Thomas Dongan to succeed Andros, and instructed him to call the desired assembly. It met at Fort James in the City of New York on the 17th of October 1683, was in session for about three weeks, and passed fifteen acts. The first was a charter of liberties and privileges, requiring that an assembly elected by the freetholders and freemen should be called at least once every three years; vested all legislative authority in the governor, council and assembly; forbade the imposition of any taxes without the consent of the assembly; and provided for religious liberty and trial by jury. Other acts divided the province into counties, established courts of justice, and provided for a revenue. In August 1684, when, by its charter, the western boundary of the province was not definitely extended beyond the Hudson, Dongan laid the basis of New York’s claim to the western counties, by a new covenant with them in which they recognized the English as their protectors, and throughout his administration he was busy neutralizing French influence among the Iroquois and in diverting the fur trade of the north-west from the St Lawrence to Albany. The charter of liberties and privileges was approved by the duke, but before the news of this reached its authors the duke became King James II., and in 1686, when a frame of government for New York as a royal province was provided, the assembly was dispensed with. About the same time the new king adopted a policy for strengthening the imperial control over New England as well as for the creation of a stronger barrier against the French, and in 1688 New York and New Jersey were consolidated with the New England colonies into the Dominion of New England and placed under the viceroyal authority of Sir Edmund Andros as governor-general. The news of the English revolution of 1688, however, caused an uprising in Boston, and in April 1689 Andros was seized and imprisoned. Francis Nicholson as lieutenant-governor was still in quiet possession of the government of New York, and a majority of the population of the province were satisfied to await the outcome of the revolution in the mother country, but in the southern portion of the province, especially in the City of New York and on Long Island, were a number of restless spirits who were encouraged by the fall of Andros to take matters into their own hands. They found a leader in a German merchant, Jacob Leisler (q.v.). Leisler refused to pay duties on a cargo of wine on the ground that the collector was a “papist,” and on the 31st of May 1689, during a mutiny of the militia, he and other militia captains seized Fort James. In the following month Nicholson deserted his post and sailed for England, and Leisler easily gained possession of the city. To strengthen his position he called an assembly which he allowed to choose its own officers. Some time after a copy of the order of the new monarchs (William and Mary) to continue all Protestants in their offices in the colonies had been received, Leisler falsely announced that he had received a commission as lieutenant-governor. He then attempted to revive the act of 1683 for raising revenue, but met with so much opposition that he issued writs for the election of another assembly. This, however, brought him chiefly petitions for the redress of grievances. Albany successfully defied his usurped authority until his recognition was necessary to a united front against the French and their Indian allies, who, in February 1690, had surprised and burned Schenectady. Two other French
attacks had at the same time been directed against New England, and to meet the dangerous situation Leisler performed the one statesman-like act of his public career, notable in American history as the first step toward the union of the colonies. At his call, delegates from Massachusetts, Plymouth, Connecticut and Maryland met in New York City with delegates from New York on the 1st of May 1690 to consider concerted action against the enemy, and although the expedition which they sent out was a failure it numbered 855 men, New York furnishing about one-half the men, Massachusetts one of the two commanders and Connecticut the other. Leisler had proclaimed the new monarchs of Great Britain and had declared that it was his purpose only to protect the province and the colony. An order of the arrival of a governor appointed by them; but he was enraged when he learned that he had been ignored and that under the new governor, Colonel Henry Sloughter, his enemies, van Cortlandt and Bayard, had again been appointed to the council. When Major Richard Ingoldsby arrived with two companies of the king's soldiers and demanded possession of the fort, Leisler refused although he still professed his willingness to deliver it to Sloughter. On the 17th of March 1691 Leisler's force fired on the king's soldiers, killing two and wounding several. Governor Sloughter arrived two days later, and the revolt was put down by the governor's forces and by supporting his exertions, Leisler and Jacob Milborne, his son-in-law, were pronounced guilty of treason, and were executed on the 18th of May. The execution was regarded even by many who had been indifferent to Leisler's cause, as an act of revenge. The case was carried to England, where in 1695 parliament reversed the attainder of the victims, and for many years the province was rent by the Leislerian and anti-Leislerian factions.

Governor Sloughter, as his commission directed, re-established in 1691 the assembly which James II. had abolished in 1688, and throughout the remainder of the colonial era the history of the province relates chiefly to the rise of popular government and the defence of the northern frontier. At its first session the assembly passed an act declaratory of the rights and privileges of the people, and much like the charter of liberties and privileges enacted in 1683, except that annual instead of triennial sessions of the assembly were now requested and, as was also provided in Sloughter's commission and instructions, religious liberty was denied to Roman Catholics. This act was disallowed by the crown in 1697, and until Governor Cornbury's administration (1702-1708) both the Leislerians and the anti-Leislerians revolved around the government's favour by supporting his measures instead of contending for popular rights. But Cornbury's embezzlement of £1500, appropriated for fortifying the Narrows connecting Upper and Lower New York Bay, united the factions against him and started the assembly in the important contest which ended in the establishment of its control over the public purse. In 1706 it won the right to appoint its own treasurer to care for money appropriated for extraordinary purposes, and eight years later the governor assented to an act which gave to this officer the custody of practically all public money. Until 1737 it had been the custom to continue the revenue acts from three to five years, but thereafter the assembly insisted on annual appropriations.

The first newspaper of New York, the New York Gazette, was established in 1725 by William Bradford as a semi-official organ of the administration. In 1733 a popular organ, the New York Weekly Journal, was established under John Peter Zenger (1667-1746), and in 1735 both the freedom of the press and a great advance toward the independence of the judiciary were the outcome of a famous libel suit against Zenger.

Between the reigns of governors Montgomerie (1728-1731) and Governor Cosby (1732-1736) there was an interregnum of thirteen months during which Rip van Dam, president of the council, was acting-governor, and upon Cosby's arrival a dispute arose between him and van Dam over the division of the salary and fees. Both appealed to the law, and when the chief-justice, Lewis Morris, refused Cosby's request to have the court proceed in equity jurisdiction, and denied the right of the governor to establish courts of equity, he was removed from office. Not long afterwards there appeared in the Weekly Journal some severe criticisms of the administration. For printing these Zenger was arrested for libel in November 1734. The case was not brought to trial until August 1735, and in the meantime Zenger was kept in jail. Originally he had for counsel two of the most able lawyers in the province, James Alexander (1690-1756) and William Smith (1697-1769), but when they excepted to the commissions of the chief-justice, James de Lancey (1703-1760) and one of his associates, because by these commissions the justices had been appointed "during pleasure" instead of "during good behaviour," the chief justice disbarred him, a verdict of the case was reversed by the supreme court, and Zenger was released. He later became speaker of the Assembly of Pennsylvania and a lawyer of great reputation in the English colonies. The jury quickly agreed on a verdict of not guilty, and the acquittal was greeted by the populace with shouts of triumph. The further independence of judges became a leading issue in 1761 when the assembly insisted that they should be appointed during good behaviour, and refused to pay the salaries of those appointed during pleasure; but the home government met this refusal by ordering that they be paid out of the quit-rents.

Defence of the northern frontier was a heavy burden to New York, but by its provisions the growth of the union of the colonies was promoted. From the destruction of Schenectady to the Peace of Ryswick (1697) hostilities between the French and the English in the New World took the form of occasional raids across the frontier, chiefly by the Indian allies. The main effort of the French, however, was, by diplomacy, to destroy the English-Iroquois alliance. This rested on the fear of the Iroquois for the French and their hope of protection from the English. Therefore, in response to their repeated complaints of the weakness of the English arising from disunion, Governor Fletcher, in 1697 called another intercolonial conference consisting of delegates from New York, Massachusetts, Connecticut and New Jersey, and urged the necessity of more united feelings. Open hostilities were interrupted for a few years by the Peace of Ryswick and for a longer period by the Peace of Utrecht (1713), but French priests continued to dwell among the Iroquois, teaching them and distributing presents, and of the success of this diplomacy the English were ever in danger. To counteract it they, in 1701, prevailed upon the chiefs to defend their territory, said to be 800 m. in length and 400 m. in breadth, to the king of England. The English also from time to time sent expeditions to the success of the French at the close of the 17th century and the early portion of the 18th was prevented only by the ceaseless efforts of Peter Schuyler (1657-1724) whose personal influence was for years dominant among all the Iroquois except the Senecas. When they had assumed a neutral attitude, he persuaded a number of them to join troops from New York, New Jersey and Connecticut in the unsuccessful expeditions of 1709 and 1711 against the French at Montreal. The English had a decided advantage over the French in that they could furnish goods for the Indian trade much cheaper than their rivals, and when Governor Burnet saw that this advantage was being lost by a trade between Albany and Montreal he persuaded the assembly to pass an act (1720) prohibiting it. Pursuing the same wise policy he established a trading post at Oswego in 1722 and fortified it in 1727, and thereby placed the Iroquois in the desirable position of middlemen in a profitable fur trade with the "Far Indians." London merchants, in their greed, brought about the repeal of the prohibitory act in 1729, but its effects were only in part destroyed. At another intercolonial conference at Albany, called by Burnet, a line of trading posts along the northern and western frontiers was strongly recommended. But neither the other colonies nor the home government would co-operate, and the French were the first to accomplish it. In King George's War the co-operation of all the northern colonies was sought, and New York contributed £3000 and some cannon toward New England's successful expedition against Louisburg. But it was left alone to protect its own frontier against the French, and while the assembly was wrangling with Governor Clinton
for the control of expenditures the French and their Indians were burning farm houses, attacking Saratoga (November 16, 1745), and greatly endangering the English-Iroquois alliance. Even after the Peace of Aix-la-Chapelle (1748) the Iroquois complained bitterly of the fraudulent land speculators, and in 1753 the chiefs of the Mohawks threatened to declare the covenant chain broken. A reconciliation was effected, however, by Colonel Washington the Loyalist party, who had been an important Indian affairs agent. Largely to secure the co-operation of the Iroquois the home government itself now called to meet at Albany (q.v.) the most important assembly of colonial deputies that had yet gathered. This body, consisting of twenty-five members and representing seven colonies, met in June 1754, and, besides negotiating successfully with the Iroquois, it adopted, with some modifications, a plan of colonial union prepared by Benjamin Franklin; the plan was not approved, however, either by the home government or by any of the colonies. In the first year of the war (1755) expeditions set out against Fort Duquesne (on the site of Pittsburg) and Fort Niagara and Crown Point, on the New York frontier. None of these was taken but on the 8th of September Major-General William Johnson, in command of the expedition against Crown Point, defeated a French and Indian force under Baron Dieskau in the battle of Lake George. As Johnson thought it unsafe to pursue the routed army his victory had no other effect than the erection here of the useless defences of Fort William Henry, but as it was the only success in a year of gloom parliament rewarded him with a grant of £500,000 and the title of baronet. In August 1756 Montcalm from the English and destroyed it, and in 1757 he captured Fort William Henry; but in the latter year the elder Pitt assumed control of affairs in England, and his aggressive, clear-sighted policy turned the tide of war in England's favour. Victory followed victory, Ticonderoga, Crown Point and Niagara were wrested from the French and New York freed of its foes.

England's attempt to make the colonies pay the expenses of the war by means of the stamp tax thoroughly aroused the opposition of commercial New York, already chafing under the hardships imposed by the Navigation Acts and burdened with a war debt of its own exceeding £300,000. The assembly was almost unanimous in voicing its protest to the governor. It authorized its committee, which had been appointed to correspond with the New York agent in London, to correspond also with the committees in the other colonies and this committee represented New York in the Stamp Act Congress, a body which was called at the suggestion of Massachusetts, met in New York City in October 1765, was composed of twenty-seven members representing nine colonies, and drew up a declaration of rights, an address to the king, and a petition to each house of parliament. When the Sons of Liberty, a society composed largely of unfranchised mechanics and artisans of New York City, which began to dominate the movement immediately after the Congress adjourned, resorted to mob violence—destroying property and burning in effigy the governor and other officers —the propertied classes drew back, and a few years later the popular or patriot party lost its control of the assembly. Since the Zenger trial there had been a court party and a popular party: the former included many wealthy Anglicans and was under the leadership of the De Lancy group, the latter included many wealthy and influential dissenters and was under the leadership of the Livingstons. During the administration of Governor Clinton (1743-1753) a quarrel between the governor and James De Lancy, the chief-justice, had greatly weakened the court party, and nearly all its members supported their rivals in opposition to the Stamp Act. In the series of events which followed the first violence of the Sons of Liberty important changes were made in party lines. Personal rivalry and creed became subordinate to political principles. The court party became the Loyalist party, standing for law as against rebellion, monarchy and the union of the empire as against republicanism; the popular party became the patriot party, determined to stand on its rights at any cost. The Stamp Act was repealed in March 1766, but the Townshend Acts, imposing duties on glass, paper, lead, painters' colours and tea, followed closely. They were met in New York by fresh outbursts of the Sons of Liberty and, as in the other colonies, by an association of nearly all the merchants, the members pledging themselves not to import anything from England until the duties were repealed. New York had also been requested to provide certain supplies for the British troops quartered in another province. Indian affairs had been neglected, but parliament answered (1767) by forbidding it to do any other business until it complied. It was under these conditions that the Loyalists, in the elections of 1768 and 1769, gained control of the assembly and in the latter year passed an act granting the soldiers' supplies. When, in 1770, all the duties except those on tea were repealed, the conservative merchants wished to permit the importation of all goods from England except tea. The Sons of Liberty strongly opposed this, but the conservatives won and went over to the Loyalists. The moderate Loyalists joined in the election of delegates to the Continental Congress; but the great body of Loyalists in New York strongly disapproved of the "dangerous and extravagant" measures adopted by that body, and the assembly, in January 1775, refused to approve its acts or choose delegates to the second Continental Congress. The patriots met this refusal by calling a provincial convention to choose the delegates. Scarcely had they done this when news of the encounter at Lexington produced a strong reaction in their favour, and in May 1775 they called a Provincial Congress which usurped the powers of the Continental Congress. Still, conditions were such in New York that a fight for independence was not to be lightly considered. The failure of Montgomery's expedition against Canada at the close of 1775 left the colony exposed to British attacks from the north. In the south the chief city was exposed to the British fleet. Sir William Johnson died in 1774, but under his influence and that of his son, Sir John Johnson, and his nephew Guy Johnson, the Mohawks and other Iroquois Indians had become firmly attached to the British side and threatened the western frontier. In various sections, too, considerable numbers of Loyalists were determined to aid the British. When, in June 1776, a vote on the Declaration of Independence was pending in the Continental Congress, the New York Provincial Congress refused to instruct its delegates in the matter; but a newly elected Provincial Congress, influenced by a Loyalist plot against the life of Washington, adopted the Declaration when it met, on the 9th of July. The position of New York made it naturally one of the principal theatres of military operations during the War of Independence. It was a settled point of British military policy throughout the war to hold New York City, and from it, as a base, to establish a line of fortified posts along the Hudson by means of which communication might be maintained with another base at Lake Champlain. Such a scheme, if successfully carried out, would have driven a wedge into the line of colonial defence and cut off communication between New England and the southern colonies. A few days after the fight at Lexington and Concord, Connecticut authorized an expedition under Ethan Allen which surprised and captured Ticonderoga and Crown Point. In the following year (1776) the British began their offensive operations for the control of the Hudson; an army under Sir William Howe was to capture New York City and get control of the lower Hudson, while another army under Sir Guy Carleton was to retake Crown Point and Ticonderoga and get control of the upper Hudson. Howe, with a force of British and Loyalists vastly superior in equipment and numbers to Washington's untrained militia, landed in July on Staten Island and late in August defeated Washington at the battle of Long Island within the present limits of Brooklyn borough. In the following month Washington withdrew from New York City which the British entered and held until the close of the war. Washington prepared to withstand the British behind fortifications on Harlem Heights, but discovering that Howe was attempting to outflank him by landing troops in the rear he retreated to the mainland, leaving only a garrison at Fort Washington, and established a line of fortified camps on the hills overlooking
the Bronx river as far as White Plains. This brought on the battle of White Plains late in October, in which Howe gained no advantage; and from here both armies withdrew into New Jersey, the British capturing Fort Washington on the way, the Americans leaving behind garrisons to guard the Highlands of the Hudson. In 1777 General John Burgoyne succeeded in taking Ticonderoga, but in the swampy forests southward from Lake Champlain he fought his way against heavy odds, and in the middle of October his campaign culminated disastrously in his surrender at Saratoga. Colonel Barry St Leger led an auxiliary expedition from Oswego against Fort Stanwix on the upper Mohawk, and on the 6th of August he fought at Oriskany one of the most hotly contested battles of the war, and the bloody defeat of his terror-stricken Indian allies, he hastened back to Montreal. The British government intended that Howe should co-operate with Burgoyne by fighting his way up the Hudson, but as the secretary of state for the colonies neglected to send him such instructions this was not undertaken until early in October, and then an expedition for the purpose was placed under the command of Sir Henry Clinton. Clinton met with little difficulty from the principal American defences of the Highlands, consisting of Forts Montgomery and Clinton on the western bank, together with a large chain across the river stretched to a precipitous mountain (Anthony's Nose) on the opposite bank, and ascended as far as Esopus (now Kingston) which he burned, but he was too late to aid Burgoyne. The year 1778 saw the bloody operations of the Tory Butlers and their Loyalist and Indian allies in the Mohawk and Schoharie valleys and notably the massacre at Cherry Valley. In retaliation a punitive expedition under Generals John Sullivan and James Clinton in 1779 destroyed the Iroquois towns, and dealt the Indian confederacy a blow from which it never recovered. The American cause was strengthened this year also by several victories along the lower Hudson of which General Anthony Wayne's storming of the British fort at Stony Point was the most important. The closing episode of the war as far as New York was concerned was the discovery of Benedict Arnold's attempt in 1780 to betray West Point and other colonial posts on the Hudson to the British. On the 25th of November 1783 the British forces finally evacuated New York City, but the British posts on Lakes Erie and Ontario were not evacuated until some years later.

New York ratified the Articles of Confederation in 1778, and when Maryland refused to ratify unless those states assenting claimed a territory west to the Mississippi agreed to surrender them, New York was the first to do so. But under the leadership of George Clinton, governor in 1777-1795, the state jealously guarded its commercial interests. The Confederation Congress appealed to it in vain for the right to collect duties at its port; and there was determined opposition to the new Federal constitution. In support of the constitution, however, there arose the Federalist party under the able leadership of Alexander Hamilton. When a majority of the constitutional convention of 1787 had approved of the new constitution Hamilton alone of the three New York delegates remained to sign it; and when, after its ratification by eight states, the New York convention met at Poughkeepsie (June 17, 1788) to consider ratification, two-thirds of the members were opposed to it. But others were won over by the news that it had been ratified by New Hampshire and Virginia or by the telling arguments of Hamilton, and on the 26th of July the motion to ratify was carried by a vote of 30 to 27.

The constitution having been ratified, personal rivalry among the great families—the Clintons, the Livingstons and the Schuylers—again became dominant in political affairs. The Clintons were most popular among the independent freetholders; the Livingstons had increased their influence by numerous marriage alliances with landed families; and the Schuylers had General Philip Schuyler and Alexander Hamilton, his son-in-law. Originally, the Livingstons, with whom John Jay was connected by marriage, were united with the Schuylers, and yet both together were unable to defeat the Clintons in an election for governor. Later, the Livingstons, piqued at Washington's neglect to give them the offices they thought their due, joined the Clintons, but the Federal patronage was used against the anti-Federalists or Republicans with such effect that in 1792 John Jay received more votes for governor than George Clinton, although the latter was counted in on a technicality. Jay was elected in 1795 and re-elected in 1798, but in 1801 the brief Federalist regime in the state came to an end with the election of George Clinton for a seventh term. The Republican leaders straightway quarrelled among themselves, thus starting the long series of factional strife which have characterized the party politics of New York state; the bitterness of the factions and the virtual consequent control of the local governments by a few families or a few individuals for the firm establishment early in the Republican regime of the "spoils system." The leaders of the several Republican groups were Chancellor Robert R. Livingston, Aaron Burr, then vice-president, Governor George Clinton and his nephew, De Witt Clinton, who in 1802 was elected United States senator. The first break came in the spring of 1804 when Burr, who had incurred the enmity of his Republican colleagues in 1800 by seeking Federalist votes in the electoral college at Jefferson's expense, became an independent candidate for governor against Martin Van Buren. Hamilton's action in 1804 to vote for Burr for governor just as he had counselled them not to support Burr against Jefferson in 1800, was one of the contributary causes of Burr's hostility to Hamilton which ended in the duel (July 1804) in which Burr killed Hamilton. Hamilton's death marked the end of the Federalists as a power in New York. The election as governor in 1804 of Lewis, a relative of the Livingstons, was followed by a bitter quarrel with the Clintons over patronage, and resulted at the state election of 1827 in the choice of a Clintonian, Daniel D. Tompkins, for governor and the virtual elimination of the Livingstons from New York state politics. Tompkins served as governor by successive re-elections until 1817, his term covering the trying period of the second war with Great Britain. New York, whose growing shipping interests had suffered by the Embargo of 1807, was as a commercial state opposed to the war. Politically this opposition had the effect of temporarily reviving the Federalist party, which secured control of the legislature, and gave the electoral vote of the state in 1812 to De Witt Clinton, whom the Federalists had accepted as a candidate to oppose Madison for re-election on the war issue. During the war New York was the most active of the states in supplying troops and other provisions to the national army. After 1815 the Republicans, who were in the majority of the Assembly, were in control of the state, and the power of the Federalists was broken. For many years the anti-Federalists wore themselves out in factional strife, and other parties arose to divide the anti-Jacksonian elements, polled in the New York state election of 1832 more than 136,000 votes for Francis Granger, their
candidate for governor against Marcy, who was chosen by about 10,000 plurality. As the anti-Masonic wave subsided its leaders and most of its adherents found a place in the newly organized Whig party, which was powerful enough in New York to elect William H. Seward governor in 1838, and to re-elect him and to carry the state for W. H. Harrison against Van Buren in 1840. It was during the first administration of Governor Seward that the anti-rent agitation in the Hudson river counties began. The greater part of the land in this section was comprised in vast estates such as Rensselaerwyck, Livingston, Scarsdale, Phillipse, Pelham and Van Cortlandt manors, and on these the leasehold system with perpetual leases, leases for 99 years or leases for one to three lives had become general. Besides rent, many of the tenants were required to render certain services to the proprietor, and in case a tenant sold his interest in a farm to another he was required to pay the proprietor one-tenth to one-third of the amount received as an alienation fine. Stephen van Rensselaer, the proprietor of Rensselaerwyck, had suffered the rents, especially of those poorer tenants, to fall much in arrears, and when after his death (1839) the agents of his heirs attempted to collect them they encountered violent opposition. Governor Seward called out the militia to preserve order but asked the legislature to consider the tenants' grievances. The legislature appointed an arbitration commission, but this was unsuccessful, and the trouble, spreading to other counties, culminated (1845) in the murder of the deputy-sheriff of Delaware county.

Regrettably, the tenancy of Texas and the radicals supported the Wilmot Proviso the split became irrevocable. The split broke up the rule of the “regency,” Marcy accepting the “Hunker” support and a seat in Polk’s cabinet, while Wright, Butler and Van Buren joined the “Barnburners,” a step preliminary to Van Buren’s acceptance of the “Free Soil” nomination for president in the campaign of 1848. Only once between 1819 and the Civil War did the Democratic party regain control of the state—In 1835-1835 Horatio Seymour was governor for a single term. In 1854 the newly organized Republican party, formed largely from the remnants of the Whig party and including most of the “Free Soil Democrats” with the aid of the temperance issue elected Myron Holley Clark (1806-1809) governor. Two years later the Republicans carried the state for Fremont for president, and a succession of Republican governors held office until 1862 when the discouragement in the North with respect to the Civil War brought a reaction which elected Seymour governor. With the exception of New York City the state was loyal to the Union cause during the war and furnished over a half million troops to the Federal armies. Certain commercial interests of New York City favoured the Confederate cause, but MayorWood's suggestion that he had more than a million dollars in gold locked up in the city was afterward shown to be a delusion. The anti-rent doctrine.

1 James Fenimore Cooper's novels Satastoe (1845), The Chainbearer (1845) and The Redskins (1846) preach the anti-rent doctrine.

William Smith’s History of the Late Province of New York from its Discovery to 1763 (1st part, 1757), reprinted in the first series of the New York Historical Society Collections, 2 vols., (1829-1830) is still the chief authority for the period from the English Revolution of 1688 to the eve of the War of Independence. However, C. W. Spencer, Phases of Royal Government in New York, 1631-1710 (Columbus, 1905). John Fiske, The Dutch and Quaker Colonies in America (2 vols., Boston, 1900) is adorable in its evocative and illuminating annals but by C. W. Thoemmes, Colonial New York: Philip Schuyler and His Family (2 vols., New York, 1885) is a family history, but especially valuable in the study of Indian affairs and the intermarriages of the landed families. A. C. Flicker,大观 in New York during the American Revolution (New York, 1901) and H. P. Johnston’s Campaign of 1776 around New York and Brooklyn (1879) are thorough studies. For the ratification of the United States Constitution, see also Justin Winsor’s Narrative and Critical History of America, vol. vi. (Boston, 1888). For strictly political history see a series of articles by Carl Becker in the American Historical Review, vols. vi. and ix., and the Political Science-Gedney channel, 1890 B. wide and 40 ft. deep.

By 1900 the Federal government had completed 75 m. of the Ambrose channel farther to the E. and 40 ft. deep, and 950-1600 ft. wide (2200 ft. is the projected width). A third

The more important of these small islands are: Blackwell’s (about 120 acres) in the East river, Ward’s N. of Blackwell’s, and a small island near the mouth of the Harlem river; Coney Island, in the mouth of the Harlem river; in the Upper Bay, Governor’s Island (originally 65 acres; enlarged by the addition of 101 acres to the southwest, a U.S. military reservation, about the center of the city). The Day Island, a little island in the harbor near the Battery, is owned by the U.S. as a landing-place for immigrants. In the Lower Bay, and a part of the Borough of Richmond, are the artificial islands, Swinburne (1866-1869), Blackwell (1873-1875; 7 m. S.W. of the Battery), constructed for quarantine stations.

2 The name of the community makes the tidal scour more effective, and it was little filled in even when sewage and garbage was dumped in the Bay itself. The river carries little silt and leaves most of it well above the harbour. The natural excellence of the harbour may be inferred from the following figures: in 1865-1903 the Federal
channel, the South, and Swash, is used by coasting vessels drawing about 20 ft. The harbour is divided into three parts: the Lower Bay, the Upper Bay and the North and East rivers. The Lower Bay (about 88 sq. m.) of which Harritan Bay on the S.W., Sandy Hook Bay on the S.E., and Great Sand Bay on the N.E. form parts, and to which the channels mentioned afford entrance, from the N. Port of New York; to the W. the West New York; to the S. Brooklyn to the N. and E., and the New Jersey shore to the S. and W. The Upper Bay has an area of 14 sq. m., is the immediate embouchure of the North and East rivers, is connected with the Lower Bay by the Narrows (minimum width 1 m.) and with Newark Bay to the W. by Kill Van Kull, immediately N. of Staten Island, and, except for these four narrow water-ways, is enclosed by land. The North river (maximum depth, 66 ft.) is here about 1 m. wide and the East river (maximum depth more than 100 ft.; in Hell Gate channel about 200 ft.) is about 1 m. wide and, from the Battery to Throg’s Neck and Weitlet’s Point, where Long Island Sound proper begins, about 20 m. long. The north-east entrance to the harbour, from Long Island Sound by the East river, used principally by New England coasting vessels (especially coal barges), was made navigable for vessels of 25-27 ft. draft by the Federal government, which in 1870-1876 and in 1885 widened and deepened the formerly dangerous narrows and removed the reefs of Hell Gate, between Manhattan Island (E. 88th Street), Blackwell’s Island, Astoria (on the Long Island shore), and Ward’s Island. The third great entrance and correspondingly widened part of the harbour, by which the great inland water-borne traffic of the Hudson river and the Erie Canal is brought to the port of New York. On the North river are the piers of the transatlantic steamship companies, part of them on the New Jersey side at Hoboken (q.v.). The coastwise trade with New England, especially through Long Island Sound, is largely from the East river, to which a part of the Hudson river traffic makes its way by the Harlem river. The Harlem is a place of anchorage for small craft.

The narrow approaches to the harbour from the ocean and from Long Island Sound make its fortification easy. The Sandy Hook, less than 5 m. from the nearest point of Rockaway Beach and Coney Island on the other side of the entrance, is Fort Hancock, established as a military reservation (1366 acres) in 1892; it received its present name in 1895, and has an artillery garrison. Between the lower and upper bays, on the Narrows, are Fort Wadsworth (1827; named in honour of General James S. Wadsworth (1807-1864), killed in the battle of the Wilderness), on the Staten Island shore, as a reservation of 27 acres; here also is Fort Wadsworth proper, and, across the Narrows, on the Long Island shore, Fort Hamilton (1831), with a reservation of 167 acres. Older fortifications are Fort Lafayette, 12 m. E. of the Narrows, and Fort Wadsworth, on a hillside within the city, between the Narrows and Wadsworth on an artificial island, now used to store ordnance and supplies, and Fort Columbus (1866), South Battery (1812) and Castle Williams (built in 1861 by John B. J. K. and B. J. C. O. C., with the reservation of 167 acres), which all planned the earlier fortifications of New York harbour; it is now a military prison, all on Governor’s Island, where are important barracks and the New York arsenal of the Ordnance Department. The north-eastern approach to the harbour, at the entrance to Long Island Sound, is protected by fortifications, Fort Totten, at Willet’s Point (1862), and directly across from this battery by Fort Schuyler (1826; established 1862) with a reservation of 52 acres on Throg’s Neck.

Geology.—Manhattan Island, a group of igneous rocks, consists largely of granite, gneiss, gneissoid (1806), and granite gneiss (1843), with a steep west wall from Manhattanville (125th Street W. of 8th Avenue) S. of 85th Street, and a monotonous plain east of the Hudson. On the south, the island was rough and rocky with brooks, ponds, marshes and several swamps. Superficially the island may be divided into: an area of drift, S. of 21st Street on the East river, of 13th street on Broadway (1866), of 32nd Street on the Harlem river; a narrow channel or centre of drift running from Hell Gate N.W. to Manhattanville in a line parallel to the Harlem; a limestone (inwood limestone) area on the Harlem river; a river valley on the west side of the Harlem; a limestone area on the Spuyten Duyvil in the north-westernmost part of the island; and the remainder areas of gneiss, the larger part being in two great “islands,” one between the line of E. 21st Street, 13th Street and 1st Avenue, and the other between the Harlem and the Spuyten Duyvil, and the other nearly joining the first at Manhattanville and covering all the narrow N.W. part of Manhattan and except the second limestone area on the Spuyten Duyvil. These latter areas are now called South Washington and Morningside Heights. In all these areas, except the limestone, the underlying rock is what is styled Manhattan sandstone and granite gneiss, and, like them, is cut by a wide variety of small fissures. The lower part of the part of the waterfront of Manhattan does not correspond in direction with limestone belts, but is probably due to lines of fracture (see W. H. Hodges, in Bulletin, Geological Society of America, xvi. 151-182). The thoroughfare of the Bronx is made up of the igneous and S. W. ridges, sloping E. to the lower shores of Long Island Sound; and the Boroughs of Brooklyn and Queens form part of the great terminal moraine. Low serpentine hills (300-380 ft.), with a N.E. and S.W. trend, occupy the central part of the northern end of Staten Island; W. of this is Jura-Tris formation, crossed in its centre by a narrow strip of igneous dike rock; the E. and S. part of the island is Cretaceous. The “islands” of Ward’s Island, between the two rivers, and the S.E. part of the island was not encroached upon by the moraine.

Climate.—A combination of marine and continental influences produces a humid climate subject to sudden changes of temperature. The temperature, however, rises above 90° F. only six days in a year on the average; it rarely falls below zero; and in a period of thirty-eight years (1861-1888), the average temperature was 52°. The average monthly rainfall ranges from 3-2 in. in May to 4-5 in. in July and August, and the August precipitation is 44-8 in. The average annual fall of snow amounts to 17 in., of which 11-5 in. falls in February, 8-7 in. in January and 8-2 in. in March. The average number of hours of sunshine ranges from 150 in November to 271 in June. The prevailing winds are N.W., except in June when they are S.W.

Streets.—In the downtown portion of Manhattan Island, a strip about 2-4 m. long, the streets follow the irregular water-fronts and others cross these; and on the west side this irregularity extends farther N., in the former Greenwich village (W. and N.W. of Washington Square), where West 4th Street, running N.W., crosses West 12th Street, running S.W. of Houston Street, then North Street, the northernmost limit of the occupied city; in 1807 a commission laid out the island into streets, which were numbered from S. to N. and were called East and West, as they were E. or W. of Broadway, below 8th Street, and of Fifth Avenue, above 8th, and into avenues, which were numbered from E. to W., Twelfth Avenue being on the North river waterfront. Farther W., Avenue of the Americas (see W. 47th Street, running N.W. to S.E.) and four additional avenues were named A, B, C, and D, Avenue A being one block E. of First Avenue. Afterwards Madison Avenue was laid out midway between Fourth and Fifth Avenues, N. from 23rd Street, and Lexington Avenue, midway between Third and Fourth Avenues, N. from 21st Street. The most important of the avenues is Broadway, an unfortunately narrow street in the busy downtown part of its course. From Bowling Green, immediately N. of the Battery, it goes in a straight line (E. of N.) for about 2 m. to 10th Street; then bears off to the W. It is called the Boulevard from 84th Street to 162nd Street in its course between Amsterdam Avenue and West End (or Eleventh) Avenue (to 104th Street), and then as a continuation of West End Avenue; and thence to the Yorkers city line is called Kingsbridge Road. The monotonous regularity of the rectangular street plan of Manhattan above 14th Street is partly redeemed by this westward trend of Broadway, the only

1 See a paper, “Old Wells and Water-Courses on the Island of Manhattan,” by George Everett Hill and George E. Waring, Jr., in American Antiquary: New York: the First Series of the Half Moon Papers (New York, 1899). In the Borough of the Bronx the system of numbered avenues is no longer holds, but the cross streets are numbered consecutively, W. 262nd Street being immediately S. of the Yankees line and E. 242nd and 243rd immediately S. of the Mt. Vernon boundary.
old street in this part of the city. The Bowery, extending N. from Chatham Square to East 4th St. (practically continued by Fourth Avenue), is not now a street of commercial importance, being largely taken up by Yiddish tenements. Broadway, in its southernmost part, is a financial and business street; the financial interests centre particularly about Wall Street. Between 58th and 100th streets this thoroughfare is bordered on the E. by Broadway and on the W. by the new Central Park West, and in general the upper West Side and in particular Riverside Drive, high above the North river, are the newer residential parts of the city.

Parks.—The park system in 1908 included property valued at $801,604,188. The principal parks are: Central Park in Manhattan; Prospect Park in Brooklyn (p.48); and Van Cortlandt Park

and Pelham Bay Park in the Bronx. The first park (as distinguished from "square") of any size in Manhattan was Central Park (840 acres; between 59th and 110th Streets and between 5th Avenue and Central Park West; and which was laid out (beginning in 1857) by F. L. Olmsted and Calvert Vaux. Nearly one-half is wooded, with a variety of native and foreign trees and shrubs. The park area is a large plot, bounded by the West End, in the N.E. corner; the Croton retaining reservoir and the receiving reservoir, and other sheets of water. Near the 69th Street entrance from 5th Avenue is the Arsenal, the executive quarters of the Department of Parks. Pelham Bay Park (1756 acres), in the north-easternmost corner of the city, lies on Long Island Sound, includes Hunter’s Island and Twin Islands, and has a total shore front of about 9 m. Bordering on the E. of this reservation is Van Cortlandt Park (1132 acres), which is the Van Cortland Mansion (1748), for a time Washington’s headquarters and now a residence of the Washington family; there are the Van Cortland Ponds (75 acres), and Van Cortlandt Lake, a skating pond. East of Van Cortlandt Park is Woodlawn Cemetery. Mosholu Parkway (600 ft. wide and about 6000 ft long) leads from Van Cortland Park to the S.E., and Pelham and Pelham Parkway (400 ft. wide and 12,000 ft. long) from Pelham Bay Park to the S.W., connecting these parks with Bronx Park (710 acres) on either side of the Bronx river, a small stream which here broadens into lakes and ponds and has a fall at the lower end of the park. Bronx Park reaches from 180th Street to 205th Street. The northern part is occupied by the New York Botanical Gardens and the southern part by the Zoological Park.

The Botanical Garden began with a meteorological observatory (1858) which was the New York Aquarium (in what was until 1896 Castle Garden, on the site of Fort Clinton) and a children’s playground (1903). In City Hall Park are a few public buildings mentioned here.

The other downtown parks and squares, many of them are recreation grounds, some, such as Mulberry Bend Park and Hamilton Fish Park, being on the site of former slums, condemned by the city at great expense. Especially in this part of the city municipal recreation piers and free baths have been constructed. Washington Square (1857), between Waverly Place, Wooster and MacDougal Streets, the foot of 5th Avenue, became a pauper burial-ground about 1797, and is now a garden. In the N.W. corner of the square there are still a few fine old residences. Union Square, between Broadway and 4th Street, is a favourite place for workmen to enter on their sabbaths. Union Square is a large pond, a garden on which there was an arsenal in 1806-1815, then a parade-ground, and in 1825-1839 a municipal House of Refuge in the old barracks, and which was then laid out as a park and was a fashionable centre in 1850-1875. Bryant Park on Sixth Avenue, between 40th and 42nd Streets, was a Potter’s Field in 1813-1823, and in 1853 was the site of a world’s fair with Crystal Palace, which was destroyed in 1858. In De Witt Clinton Park between 52nd and 54th Streets on the North river front was the former home of his farm school. New York’s Riverside Park (140 acres; 1872), between 72nd and 120th Streets, on the North river front, is a finely wooded natural terrace with winding paths. Morris Park (313 acres), between W. 31st and 123rd Streets, beautifully wooded, and Mount Morris Park (203 acres) from 120th to 124th Streets, terminating Fifth Avenue, are high rough ground, Mount Morris being the highest point on Manhattan Island.

Among the other parks in the north part of Manhattan Island are: Roger Morris Park, between 160th and 162nd Streets, containing the Roger Morris or Junel Mansion (1743), Washington’s headquarters in 1776, then the headquarters of the Hessian officers, and after 1777 of the Hessian officers; High Bridge Park (73 acres) at the Manhattan end of High Bridge, between W. 170th and 175th Streets; Audubon Park between 155th and 158th Streets, from Broadway to the North river, the home of 1840-1851 of John James Audubon; and Ft. Washington (403 acres) from 171st to 183rd Streets on the North river, the site of Ft. Washington in the War of Independance. Along the W. bank of the Harlem river for about 3 m. N. and N.W. is the Harlem River Drive (or speedway), about 95 ft. wide. Besides the large parks in the Bronx the more and the National City Bank; on Broadway, the white marble Stock Exchange (1903), the Broad Exchange Building (276 ft. high), and the Commercial Cable Building (317 ft. high); in Cedar Street, the New York Clearing House; in Liberty Street, the New York Chamber of Commerce (1903), built of white marble and granite, with Ionic columns, the Trinity Building (with a Gothic façade) and the United States Realty Building (both by F. H. Kimball), the City Investing Building (32 stories; 480 ft. high); in Church Street, the Hudson Terminal Building (1908, Clinton & Russell), 22 stories high, with four stories below ground (including the terminal of the down-town Hudson railway); and in Park Row, the Row Building (30 stories; 360 ft. high), and the office building of the World (the Pulitizer Building, with a dome 310 ft. high); the white marble Home Life Insurance Building with its sloping red tile roof; the Fuller (or "Flatiron") Building (200 ft. high); and the New York Times Building (365 ft. high) at 42nd Street and Broadway.

The principal public buildings are: the Custom House (1902-1907; by Cass Gilbert), on the site of Fort Hamilton, granite in the French Renaissance style; in Wall Street, the Federal Hall, formerly the City Hall, and the former home of George Washington; and the United States Treasury Building (1903-1914; by Cass Gilbert), on the site of the old Custom House. In the Brooklyn Bridge (2534 ft. long; completed in 1883), is a roadway, three stories above the river, and in Manhattan the Park, in the same way as the Broadway, the Hudson, the Brooklyn Bridge, and the Bowery and Broome Streets, are the main commercial thoroughfares of the city.
NEW YORK (CITY)

Office, the Italian Renaissance City Hall by John McComb, Jr., 1803–1812 (architecturally the best of the public buildings); the Court House, the Hall of Records (French Renaissance), and a new Municipal Building with a lantern 550 ft. high, the main building of 23 storeys being pierced by an arcade through which Chambers Street runs; a little farther N. and E. of Broadway, the Thomas Street Baths of 1823, are connected by a bridge called "the Bridge of Sighs" with the Criminal Courts at Madison Avenue and 25th Street, the elaborate Appellate Court House (J. B. Lord); and on Fifth Avenue (49th-42d Sts.), the new Public Library (1911). There are several large armories of the state militia in the city, the best known being those of the 7th, 69th and 71st regiments.

Churches.—Historically the foremost religious denomination in New York was that of the Dutch Reformed, with headquarters in the Collegiate Church, controlling several churches, is the oldest ecclesiastical organization in the city, dating from 1628, when there was a Dutch church in the Fort. After the city passed into the hands of the English the Protestant Episcopal Church rapidly increased in power, and in 1705 received the grant of the "Queen's Farm" between Christopher and Vesey streets. This immense wealth is held by the corporation of Trinity Church. Its present building (1839–1846; by R. M. Upjohn) is on the site of a church built in 1696, at the head of Wall Street on Broadway. The bronze doors are a memorial to J. J. Astor, and the altar reredos, to W. B. Astor. In 1766 the North River Street Church (1766; by John Hopper) was built, the first Episcopal church in America. A memorial to the Rev. Mr. Fulton, Captain James Lawrence, Albert Gallatin, William Bradford, the colonial printer, and General Philip Kearny. Many of the largest Episcopal churches in the city were founded as its chapels, including Trinity Church, Grace Church, the trinity Church of the Brethren, and St. Paul's Chapel. The last has a church of Trinity has several important chapels dependent on it. The Presbyterian Church is relatively stronger in New York than in any other city, and most of the famous Presbyterian churches were begun in Pittsburgh. The first Methodist Episcopal society in the United States was formed in New York in 1766 and still exists as the John Street Church. The varied immigration to the city had brought in the other Protestant sects; the large Irish brought in a church with two-thirds of the 19th century, and the great Hebrew migration of the last part of the same century, the Roman Catholic and the Jewish denominations strong. The city became the see of a Roman Catholic bishop (1808) and of an archbishop of that see (1851), the Catholic Cathedral, St. Patrick's (50th-21st Streets; Fifth-Avenue Avenues), is the head of the archdiocese of New York; it is the largest and one of the most elaborately decorated churches in the country, designed by James Renwick and erected in 1850–1879, with a Lady Chapel added in 1903. It is in Decorated style and is built principally of white marble. Behind the Cathedral on Madison Avenue is the archepiscopal residence. The Protestant Episcopal Cathedral of St John the Divine, on 112th Street near Morningside Park, was begun in 1892; the crypt and St Saviour's Chapel were completed in 1910. Other prominent Episcopalian churches are: Christ Church, organized in 1839, and St. John's the Divine (first organized in 1824), near Broadway and the old parish with a colonial church (1827); Grace Church (organized in 1868), since 1844 in a commanding position at Broadway and 10th Street, which is the first turn in Broadway, with a building of white marble, designed by Daux and Willard, pierced with a graceful stone spire; the Church of the Ascension (1830) with John La Farge's mural painting of the Ascension, a chancel by Stanford White, and Siene marble walls and arches, and the House of Refuge at the corner of 42nd Street and Fifth Avenue (1835). The Congregationalists have a church at 100th Street and Amsterdam Avenue. The Unitarian Church is located at 61 W. 46th Street. The old First Church (organized in 1719) long occupied a brick church on Wall Street, near the old City Hall, and since 1845 has been on Fifth Avenue between 11th and 12th Streets; and the Madison Street Church (1845–1851), on Fifth Avenue and 18th Street, is one of the most striking ecclesiastical buildings in the city, in a quasi-Byzantine style, with a golden dome and a facade of six pale green granite Corinthian columns. The First Baptist Church (1829) on Broadway and 18th Street (1879–1897) is the oldest and the Fifth Avenue Baptist Church (1841) is the richest society of that denomination in the city; the Memorial Church (1838) is a memorial to Adoniram Judson. The first Congregational church in New York was founded in 1686. The Congregationalists disband; the Broadway Tabernacle on Broadway, near Worth Street, was a famous church in 1830–1857; the present church is at Broadway and 56th Street. St Peter's (organized in 1738) is on Fifth Avenue and 17th Street; St Paul's (1815) was formerly the cathedral church, and St Paul the Apostle (Paulist; 1859; rebuilt 1876–1885, with decorations by John La Farge) was built by Isaac Hecker. There are many Jewish synagogues and temples.

Hotels.—The principal hotels, clubs and theatres of New York City have steadily been making their way up-town. Both hotels and clubs are in the 50th and over. The most famous and famous, such as the Astor House, the Astor Place Opera House (on the present site of the Mercantile Library; 1847–1854) is best known because of the riot at Macready's opera house, "Mignon," on 25th Street, where the police and militia. Tripler Hall (1850–1867) was built for Jenny Lind's début but not completed in time. Here Rachel played in

In 1855, and Patti made her debut in 1859. The hall was managed in 1867 in London. Most of the older theatres still in existence have become houses of vaudeville, melodrama or moving pictures, as, for example, the Academy in Fourth Street and Irving Place in 1854, the Academy in Fifth Street (now the Empire Theatre) in 1873; the last in which Christian Nilsson, Parepa-Rosa, Salvini and Emma Nevada made their American debuts. The Broadway (1888) was the scene of Edwin Booth's last performance. The Metropolitan Opera House (1868; curt: 1882; immediately rebuilt) gave in 1869 the first season of German opera in America, under the direction of Leopold Damrosch. The Manhattan Opera House (built in 1903 by Oscar Hammerstein as the Drury Lane) was opened as an opera-house in December, 1880, with the first American production of the Royal Opera. Grand opera in New York has always been dependent for financial success on season subscriptions, and (like the great museums and the zoological and botanical gardens) has been supported by private patrons. The New Theatre (1909) is practically an endowed house.

Music.—Musical societies were formed in the 18th century, an Academy of Music, St. George's Hall, which has been in use for some years, than ten years, in 1791, and the Euterpean Society, which lived a century, in 1799. A New York Choral Society was established in 1823, a Sacred Music Society in the same year, and a Philharmonic Society in 1824, succeeded in 1825 by the American or Musical Union. The present Philharmonic Society, composed of professional players, was organized in 1842 by a New York violinist, Uriah C. Hill (d. 1875). In 1847 was formed the Deutscher Liederkranz, which has given concerts, with occasional musical comedies in German, in New York until 1890. The American Liederkranz in 1854 formed the Arion Society, which has been more modern than the Liederkranz, furnished in 1859 the choruses for Tannhäuser, the first Wagner opera performed in America, and brought from Breslau in 1871 Leopold Damrosch (1832-1885) as its conductor. He founded the Oratorio Society in 1873 and the Symphony Society in 1877, and was succeeded as conductor of each of these societies by Henry J. Wood. M. N.第二, the first American orchestra to have been under the supervision of Frank Damrosch (b. 1859), another son of Leopold, who formed in 1892 the People's Singing Classes, picked voices from which form the People's Choral Union.

There are also many private organizations and charities which support and maintain the public galleries of the city, which are held from time to time excellent loan collections. The largest public art gallery is the Metropolitan Museum of Art, for which are formed by the public patrons and members of the National Academy of Design, drew up a plan in 1869, and which was chartered in April 1870. General Luigi Palma di Cesnola (q.v.) became its director in 1879 and was succeeded (1905-1910) by Sir Cospar Furdon-Clarke, director of the South Kensington Museum, and in 1910 by Edward Robinson (b. 1858). In April 1871 the legislature appropriated $50,000 for a building for the Museum in Central Park: in 1876 the trustees took possession of the building in a tract of 143 acres in Central Park, between 80th and 83rd Streets; and in March 1880 this building was opened. Additions were made to the south (1888) and the north (1896). E. Benjamin French (architect) gave the museum about $2,000,000, and under an appropriation of $1,250,000 in 1904 the building was again enlarged in 1908. Among the benefactors of the museum have been: its presidents, John Taylor Johnson (1820-1893), Howard H. F. C. Sabin (architect and English school), and J. Pierpont Morgan, and Miss Catharine Lorillard Wolfe, who gave the Museum $200,000 and her collection of paintings, Jacob S. Rogers (1823-1901) who left the Museum about $5,000,000, Frederick T. Hewitt, who gave more than $1,600,000, and John S. Kennedy (1830-1909), who left it $2,500,000. Besides paintings and statuary the Museum has collections of glass, Egyptian and Greek antiquities, Oriental antiquities, the best collection in the United States (except the Jarves collection at Yale) of the primitives and the early Renaissance of Italy and the Low Countries, and a good American collection, rich in portraits and in the work of Thomas Cole. There is a small collection of paintings with some statuary in the Lenox Library and there are many private collections of note. The National Academy of Design (organized in 1862; incorporated in 1828) has an art library, and students' classes. The Society of American Artists (1877) was a secession from the Beaux-Arts, which it rejoined in 1906. This Society with the Art Students' League (1875) and the National Academy of Design (established in 1825, and reorganized in 1889 by the American Fine Arts Society. In its building on W. 57th Street there are good galleries, it is the headquarters of the American Art Association, which is a society of art industrialists, and the Art Students' League of America, which is a union of the student branches of the various art schools in America. The American Institute of Architects and the American Institute of平面图像
NEW YORK (CITY)

in 1853 and his school still exists in the Collegiate School, the property of the Collegiate (Dutch) Reformed Church. Down to the close of the 19th century the schools of New York, except the one maintained with the Dutch Church. Later the desire of the English to hasten the substitution of the English for the Dutch language in the colonial schools led to the formation of the "Association of Female Friends for the Relief of the Poor," opened a school in 1801, which soon became a school for white girls only; until 1824 it shared the school fund and it carried on an infant school only from 1824 to 1846. An association known in 1850-1858 as the Society for Establishing a Free School in the City of New York (afterwards the "Free School Society," and after 1826 the "Free Public School Society") opened its doors; it got an appropriation from the state legislature in 1807; in 1816 brought from England a Lancasterian teacher—for the sake of economy the society's schools had always been conducted under the "moral agency" system. The New York Institution (founded in 1809), followed by Hebrew and Presbyterian schools, attempted in vain to secure a part of the common-school fund. In 1842, as a result of this controversy, the city was brought under the general state system, by which it was provided for a public education for all the children. The Board of Education opened its first schools in 1843. The right of the Public School Society to put up new buildings was definitely withdrawn in 1848. By 1861, 243 public schools were opened, and its seventeen schools and property (valued at $455,425) were handed over to the city authorities; from its trustees fifteen commissioners were appointed to hold office through 1854, and in 1856 the control of the schools was entirely in the hands of the Board of Education. A compulsory education law came into effect in 1875. Since 1874 the Board has controlled a Natal District (1840-1842) under the state senator. The Board's control was appointed by the Board; and in 1879 a teachers' retirement fund was established, the first in any American city.

In Brooklyn also the early Dutch schools were under the clergy. In 1850 the city took over the schools of Dutch origin into its common-school fund. There were separate district schools until 1843 when a Board of Education was organized.

By the consolidation of 1898 the Boroughs of Brooklyn and the Bronx became a unit for school purposes, the former city Board of Education becoming the School Board for these two boroughs; the former Brooklyn Board remained in control in that borough; there was a Central Board of Education for the entire city consisting of eleven delegates from the Manhattan and Bronx Board, six delegates from the Brooklyn Board, and one each (the president) from the Richmond Board and the Queens Board. The revised city charter abolished the Inspector General of the public schools, and in 1905 the city became a single board with 46 members (22 from Manhattan, 14 from Brooklyn, 4 from Bronx, 4 from Queens and 2 from Richmond), and 46 local school boards (distributed as above) of seven members each, who were chosen by the city's population. In the city there is an executive committee of 15 members. The borough superintendents were done away with in 1901; the city superintendent is the chief executive and appointed by the Board of Education, the city's nominal board of education; city presidents are the colonial governors, and appointments to which are governed by rigid civil service rules. The development of public high schools has been rapid since the consolidation. In 1909-1910 trade schools and schools for the apprenticed were established. There is an excellent system of evening and vacation schools.

A Free Academy founded in 1848 for advanced pupils who had left the common schools was empowered to grant degrees in 1854,

1 See Charles Hemstreet, Literary New York, Its Landmarks and Associations (New York, 1903).

and in 1866 became the College of the City of New York, with the Board of Education as its Board of Trustees. In 1900 a separate Board of Education was reorganized, with the college members of the Board of Trustees removed. Before 1882 no one was eligible for entrance unless he had attended the city's public schools for one year. In 1907 the college removed to new buildings on St Nicholas Heights between 138th and 139th Streets, on part of the former Normal School building at Eighth Avenue and 133rd Street being used for some of the lower classes of the seven years course. The retention of the secondary school in connexion with college, although there were schools of the same high character elsewhere on the city, was peculiar to the New York educational system. In 1871 a Normal School for Girls, since 1910 the Woman's College of the City of New York, was established as a part of the public system. Since 1888 the college has maintained its more limited connection with the Board of Education, usually in school-houses; and in 1890 the Board opened evening recreation centres in school-houses, in which literary, debating and athletic clubs meet. For the charitable schools see CHARITIES.

The oldest institution of higher education is Columbia University (q.v.). New York University was chartered in 1831 as the University of the City of New York, and in 1846 received its present name. The University Council is the corporation; it consists of 32 members, eight going out of office annually. The University Senate has immediate control; it is composed of the chancellor, two professors of the university, three of the schools of arts and sciences, the president of the college, the provost of the theological school, and two members of the college, and one of the school of law, chosen by the Senate. It has the power to make rules for the government of the university. The Board of Trustees, which is the governing board of the university, has nine members; its duties are to acquire and hold property, to hold endowments, and to grant degrees. As the city has been the scene of many religious and educational movements, the private universities have been largely supported by the city and state, and especially by the city, which have contributed large sums for the support of them. The New York College of Medicine (1872); the New York College of Dental Surgery (1865); and the College of Dental and Ophthalmic Surgery of New York (1892). Among the normal schools and colleges in New York City are: the Normal School of the City of New York; the School of Pedagogy and the kindergarten training school of New York University; the kindergarten training school of Pratt Institute in Brooklyn (q.v.); the Kraus Seminary for Kindergarteners; and the New York University School of Social Service under the Ethical Culture Society. Of the many private secondary schools in New York the oldest are the Collegiate School and Trinity College for Women (1775), both of which were originally a preparatory department of Columbia College.

Other educational institutions of a popular character are Cooper Union (q.v.), and the People's Institute (incorporated in 1877), the latter of which was chartered as an educational institution. Its most active promoter and long its managing director was Charles Sprague Smith (1853-1910), who was professor of modern languages at Columbia University in 1880-1891, and in 1896 organized the American Institutes of Literature and Science. Among the institutions of a similar character is the Literary and Historical Union, New York, founded in 1832 by Richard Heber Newton (b. 1840), a Protestant Episcopal clergyman of broad and radical religious and social views, and by Samuel Cheever. The aim was to support a continuous and ordered education in social science, history, literature and such other subjects as time and demand shall determine and "to afford opportunities for the interchange of thought upon topics of general interest . . .

Libraries.—The New York Public Library, Astor, Lenox and Tilden Foundations (1895). The New York Public Library, founded in 1895 at the Astor Library (founded by the bequest of $400,000 by John Jacob Astor; incorporated in 1849; opened in 1845; further endowed by William B. Astor, who gave it about $550,000 and by John H. Tilden, who gave it about $200,000) was opened in 1895; it is a large public library, with a subscription library, a free lending library, and a reading room. It is a part of the New York Institute which was incorporated in 1839, and was at one time a subscription library. The first branch library was opened in 1905; the second branch library opened in 1907; the third branch library opened in 1911; the fourth branch library opened in 1917; and the fifth branch library opened in 1919. The New York Public Library has a large number of branch libraries, including the Great Central Library, which is located in the heart of the city, and serves as a reference library for all the other libraries in the system. It is open to the public, and is supported by the city of New York.

For Fordham University see FORDHAM. Other Roman Catholic colleges are: the College of St Francis Xavier (Society of Jesus; opened 1850); the College of St Francis de Sales (opened 1886), in the city of New York; and the College of St Francis de Sales, in the city of New York. The College of St Francis Xavier is a part of the University of St Francis Xavier, which was founded in 1850. It has a large number of branch libraries, including the Great Central Library, which is located in the heart of the city, and serves as a reference library for all the other libraries in the system. It is open to the public, and is supported by the city of New York.

are the Gouverneur Reception Hospital (1884), the Harlem Reception Hospital and Dispensary (1887); and the Fordham Reception Hospital and Dispensary (1892); the City Hospital (1833) and the Metropolitan Hospital (1875), both on Blackwell's Island; for contagious or infectious diseases, the Jewish Hospital (1885; on North Brother Island in the East river); and for the sick, crippled and idiotic destitute children, the New York City Children's Hospitals and Schools (1837; on Randall's Island). The New York School of Medicine and Dentistry (organized 1829; for patients from New York and Richmond counties only) Central Islip State Hospital, on Long Island, in Suffolk county (for queens counties and counties to the west). The Adult Home, an institution for the aged unprovided for by the city, county or state, is on State Island in the East river. The Insurance Savings Bank, a mutual and self-supporting organization, whose deposits on 1 January 1905 were $436,616,075, was incorporated in 1853. The First Savings Bank, organized in 1848, and the Bank of New York, established in 1784, are the oldest financial institutions in the city. The New York Stock Exchange, organized in 1792, has 2,305 members; the New York Cotton Exchange, 2,043 members; the New York Coffee Exchange, 1,676 members; the New York Produce Exchange, 1,029 members. The New York Mercantile Exchange, organized in 1861, has 5,769 members. The American Board of Commissioners for Foreign Missions (1810), and its four auxiliary societies, has a membership of 1,200,000, resident and foreign. The General Missionary Society of the Methodist Church, organized 1821, has a membership of 4,900,000. The American Bible Society, organized in 1815, has a membership of 1,000,000. The American Tract Society, organized in 1829, has a membership of 75,000. The Associated Charities of New York, organized 1837, has a membership of 5,000. The Associated Charities of the city of New York, organized 1837, has a membership of 5,000. The American Orphan Asylum, organized in 1837, has a membership of 5,000. The American Orphan Asylum, organized 1837, has a membership of 5,000. The American Orphan Asylum, organized 1837, has a membership of 5,000. The American Orphan Asylum, organized 1837, has a membership of 5,000. The American Orphan Asylum, organized 1837, has a membership of 5,000.

Among special hospitals the foremost are: the New York Eye and Ear Infirmary (1820), the New York Orthopædic Hospital (1852), the Manhattan Eye and Ear and Throat Hospital (1869), the New York Orthopaedic Dispensary and Hospital (1866), the New York Orthopaedic Hospital (1852), the General Memorial Hospital for the Treatment of Cancer (1884), the New York Bacteriological Institute (1890; maintaining the New York Pasteur Institute), and the Neurological Institute (1900). Important research is undertaken at the New York Homeopathic Hospital (1903) and the New York Polyclinic Hospital (1895), which owns the ancient Lenox College, founded 1730, and the first public library, founded 1846. The St John's Guild (1886, non-sectarian) maintains floating hospitals for tuberculosis patients and a sea-side hospital at New Dorp, Staten Island. There is a roof camp for tuberculosis patients on the Vanderbilt Clinic (1886), a free dispensary, connected with the College of Physicians and Surgeons.

Many of the general hospitals have already been mentioned in the lists of medical schools and churches. The tenement house system, the York \( \text{1882})\) School; and the New York Deaf and Dumb Asylum (1867) are a free city school; St Joseph's Institute for the Improvement of Deaf Mutes (Roman Catholic; 1869) has a school for boys and one for girls.

Population.—New York is by far the largest city in the United States in population, the census of 1910 returning its numbers as 4,766,883, and in the whole world is second to London only. Seven-eighths of the present area was annexed in the decade 1890–1900; and in those years the population increased from 3,153,301 (for an area of which the population in 1900 was 2,500,600) to 3,437,202. In 1905 the population was 3,639,102; in 1910 the population was 3,629,806. Of the various cities whose population is now over 100,000, New York is, of course, the largest. Other cities over 100,000 in population are the following: Manhattan, 2,102,928 (in 1900, 1,850,003; in 1890, 1,441,216); Bronx, 271,592 (in 1900, 200,507; in 1890, 88,908); Brooklyn, 1,355,103 (in 1900, 1,166,582; in 1890, 838,547); Queens, 197,838 (in 1900, 152,999; in 1890, 87,050); Richmond, 72,939 (in 1900, 67,021; in 1890, 51,693). In 1900 there was a sprinkling preponderance of females (1,731,497 females; 1,705,705 males); the ratio of native born to foreign born was about 176 to 100 (2,167,122 native born; 1,270,884 foreign born); less than 1\% (65,666) were negroes; and less than 0-19\% (63,218) were Chinese. Of the native population seven-eighths are Americans, and of the foreign-born one-fourth are Irish. Of the foreign-born population (1,720,682) in 1900, more than one-fourth (322,342) were Germans; more than one-fifth (275,102) were Irish, nearly one-eighth (155,201) were Russians, principally Jews; more than one-ninth (145,453) were Italians; and the next largest number was: 71,427 from Austria, 68,836 from England, 31,516 from Hungary, 28,320 from Sweden, 25,230 from Russian Poland,1 10,936 from Scotland, 19,399 English Canadians, 15,023 from Bohemia, 11,587 from Norway, 10,499 from Rumania, 8,377 from Switzerland and 5021 from Greece. The most numerous nationalities in the work population (1890) were Germans, followed by Irish, British, Italians and Russians; and the number of Italians was 597,696, the number of Greeks was 41,454, and that of Jews 35,397. Of the German population (1,720,682) in 1900, there were 20,116 in the District of Columbia, 16,346 in Texas, 15,023 in Bohemia, 11,587 in Norway, 10,499 in Rumania, 8,377 in Switzerland and 5021 in Greece. The most numerous nationalities in the work population (1890) were Germans, followed by Irish, British, Italians and Russians; and the number of Italians was 597,696, the number of Greeks was 41,454, and that of Jews 35,397.

1 The immigrants from Russian Poland, from Austria Hungary, from Russia and Rumania are largely Jews, and it is estimated that one-fourth of the inhabitants of Manhattan are Jews.
arts (in Philadelphia 41%; in Chicago 32%; in Boston 32%). In 1661 the population of Manhattan Island was about 1000. In 1750 it was probably about 1000, the Dutch and English being about equally divided, and there being a few French, Swedes and Jews. In 1792 the population was 8624. During the War of Independence the city lost heavily; but the recovery at the close of the war was rapid. Indeed the people of Manhattan Island probably fell during the war from 20,000 to 10,000, in 1790 it was 33,131, then first being greater than that of Boston. From 60,515 in 1800 the population increased to 123,706 in 1820; to 312,710 in 1840; to 813,669 in 1850 and to 1,206,295 in 1880. This rapid growth, the large part which immigration plays in the growth, the marked falling-off in the character of the immigrants, and the fact that it is usually the weaker and less enterprising immigrant who stays in New York while the more capable go west—all these circumstances combine to make a serious social problem. The low scale of living of this poorer class operates with the peculiar physical character of the city, especially on the lower East Side, where so many of the more recent immigrants live, to make the question of housing difficult. In Manhattan and the Bronx 66.7% of the population in 1890 and 72.6% in 1900 lived in dwellings in which the minimum number of dwellers was 21; for the whole city in 1900 the percentage was 54.4, the corresponding percentage for Chicago in 1900 was 17.9. For the entire Borough of Manhattan the average density was 249.9 inhabitants per acre; but by the older tenements, 762.1 per acre; and on the East Side, bounded by Henry Street, E. by Clinton Street, N. by Stanton Street, and W. by Chrystie Street, in which more than two-thirds of the population is foreign-born, the density in 1900 was 753.9 per acre, and in 1905 727.0 per acre. In twelve tenement blocks in Manhattan in 1903 the density was over 1000 per acre, the maximum being 1458 per acre in a block bounded by Cherry, Jefferson, Monroe and Rutgers Streets. A Citizens Association with a "council of hygiene and public health" in 1865 employed sanitary experts to investigate the city's tenements. In 1879 a prize offered for the best plans for tenements was unfortunately awarded to the so-called "dumb bell" tenement, in which the court for air-space gives little air or light, and many of these tenements, which, however, were a great improvement on the older types, were built. In 1902 the further building of "dumb bell" tenements was forbidden and a new Tenement House Commission was appointed. Model apartments have been built: in 1855 by the Workmen's Home Association, organized by the Association for Improving the Condition of the Poor; by the Improved Dwellings Company of Brooklyn, and the Improved Dwellings Association of Manhattan, in 1873-1874; the City Home Society (1868); and by some individuals. The city is comparatively healthy; for the five years 1901-1905 the average death rate was 18.99 per thousand for the entire city, 20.06 for the Borough of the Bronx, 18.64 for the Borough of Brooklyn, 19.49 for the Borough of Manhattan, 16.12 for the Borough of Queens and 18.93 for the Borough of Richmond.

**Communications.**—The physical limitations of Manhattan Island and particularly the circumstance that the business area of the city is small and that the movement of passengers is almost entirely in one direction at any one time, have hindered the development of a sufficient public service and the adoption of any practical plans of handling the traffic of Manhattan and Long Island there were in 1910 four bridges, three of them completed in the decade immediately before 1910, three of them to Brooklyn (g.v.) and one to Long Island City; the New York and Brooklyn Bridge (1872-1883), with a Manhattan terminal at Park Row, and the Williamsburg Bridge (1897-1903) from Clinton and Delancy Streets, Manhattan, to South 5th and 6th Streets, Brooklyn, and the Borden Bridge (1879), to Jersey City. For the details of these see BRIDGES, vol. iv. pp. 537-538. The Manhattan Bridge (1901-1909) is a wire cable suspension bridge situated between the two just mentioned; its Manhattan terminal is at Canal Street and the Bowling Green, and its Brooklyn terminal at Nassau Street. It is the largest of all suspension bridges with a total roadway length of 6855 ft. (Manhattan approach 2067 ft.; Brooklyn approach 1868 ft.; total length 5903 ft.; river span 1470 ft.) and a width of 122.5 ft. It has a double deck, the lower for two surface car tracks and a wagon way, and the upper for footways and four elevated railway tracks. The Queensboro Bridge (1901-1909) is a cantilever from Second Avenue, between 59th and 60th Streets, Manhattan, to Long Island City, with sustaining towers on Blackwell's Island. Its total length, including a plaza in Queens 1152 ft. long, is 8601 ft. (Manhattan approach 1852 ft.; Brooklyn approach 1875 ft.; island span 2112 ft.; island span 630 ft.; east channel span 984 ft.) and its width is 89-1 ft. over all, the roadway being 53 ft. and the two sidewalks each 16 ft. All of these bridges are crossed by electric cars, the Brooklyn Bridge having 5300 cars a day and the Manhattan 9180 elevated train cars. In 1909 an average of 4249 trolley cars and 3988 elevated cars crossed the Brooklyn Bridge every day; for the Williamsburg Bridge the corresponding figure was 37,500. In the opening of the Pennsylvania-Long Island railway tube in 1910 in the same way made the ferry from 30th Street, Manhattan, to Long Island City comparatively unimportant; and the Pennsylvania and Long Island have to some degree taken the place of ferryboats on the North River for passenger traffic between Manhattan and railways in New York. Between Manhattan and the various islands to New Brother Island from E. 16th; to Ward's Island from E. 116th; to Randall's Island from E. 125th and E. 120th) of the river and bay including Staten Island the only means of transportation is still by ferry from the ferry line to Staten Island is owned and operated by the municipality. In Manhattan the first advance made on the horse car—which was still used to some extent in 1910, especially on the rapid transit trains—was the use of the elevated railway; on great iron trestles of varying heights the first approach of the city from the water was made in 1867-1872 on New Church Street, West Broadway and Ninth Avenue, from the Battery to 59th Street; in 1878 a line was built on Sixth Avenue from 6th Street to 31st Street, and in 1883 to 34th Street. In 1890 Sixth Avenue was connected with Eighth Avenue running on Eighth Avenue to the Harlem river (155th Street), a distance of 1017 ft.; soon afterwards Second and Third Avenue Lines were built from the Brooklyn Bridge to the Harlem river, and the line now extends to Fort Washington Avenue by way of the Harlem river and then through the Brooklyn to West Farms (18th Street) at the S.E. entrance to Bronx Park. In 1901-1906 the subway was continued to South Ferry and was carried under the East river to the junction of Atlantic and Flatbush Avenues in Brooklyn. The construction company received a fifty years franchise for the operation of this subway. In 1908-1909 two more branches, ground lines, were added, one from Midwood to Hoboken (the terminus of the Delaware, Lackawanna & Western) and Jersey City (the terminus of the Erie, the Pennsylvania and the Central of New Jersey railways) by tubes under the North river; one from Brooklyn to West bury Island (the terminus of the New York and New Haven & New London and the Long Island railways) by tubes under the same river and the New York and Long Island and the Pennsylvania and the Baltimore & Ohio railways, with the middle western and south-eastern parts of the country. The Central Railroad of New Jersey (the lines of the New York Central and the Pennsylvania) are more local. The New York Central & Hudson river and the New York, New Haven & Hartford railways have a terminal in the borough of Manhattan, and the Pennsylvania has a terminal there also, since 1910, with tunnels to Long Island and New

---

1 Between 1840 and 1858 the tonnage cleared at New York nearly quadrupled, the increase being from 480,768 to 1,466,998; at the close of the period the principal of the passenger traffic is still in the hands of the major lines.
New York (City)

Jersey; but the other railways have their terminals on the New Jersey bank of the Hudson and are reached either by ferries or by subways under the river. The New York Central lines are sunk from the Grand Central Station for about 50 blocks and then run on a trestle bridge over the East river to the part of the park and over the East river to the part of the city. Ten steamboat lines afford communication with the cities and towns on the Hudson. The Old Dominion, the Clyde and the 619 Star line of ships, and the Metropolitan, steamers, are connecting the city with ports on the South Atlantic coast. The Metropolitan line connects it with Boston, and the Portland line with Portland; and there are several lines to ports on Long Island Sound. Among general lines, the Delaware and Hudson Canal, which has now been connected with the White Star line to English, French and Mediterranean ports; the North German Lloyd, and the Hamburg-American lines to English, French and German ports; the Compagnie Générale Transatlantique to French ports; and the Compagnie Générale Maritime to the Dutch port of Rotterdam; the docks of some of these lines are on the New Jersey side of the North River, in Hoboken. There are also lines to the West Indies, Central and South America.

Commerce.—The lack of railway lines direct to wharfs and piers in Manhattan is one of the commercial disadvantages of the city. The value of the imports received at the port of New York, comprising the New York Harbor and the Hudson river, increased from $518,796,561 in 1890 to $891,614,678 (or 60-4% of those of the entire country) in 1905, the value of the exports from $176,609,251 in 1890 to $289,604,820 (or 33-8% of those of the entire country) in 1900. The imports of goods, raw materials, and commodities for exportation are especially large as compared with the other ports of the country; and so are the exports of chemicals and copper, machinery, illuminating oil and hardware.

Greater New York is the center of the New World for the wholesale grocery and dry-goods businesses. Here are the country’s most important “exchanges,” including the Stock Exchange (1792), the Produce Exchange (the New York Commercial Association in 1822-1868), the Cotton Exchange (1871), and the Consolidated Exchange (1885); and here are the richest and most powerful banks and trust companies in the New World and the great financial center of the United States. The New York Chamber of Commerce was first organized and was chartered in 1766, and was reorganized in 1874.

Manufactures.—Many of the manufacturing industries, notably those of clothing, are the products of the abundance of immigrant labour. Others, such as the refining of sugar and molasses, derive an advantage from their position with respect to imported raw materials. Still others, e.g., the refining of petroleum, derive an advantage from their position with respect to the exportation of the finished products. The growth of manufactures was promoted by the rapid growth in commerce after the opening of the Erie Canal (1825) and by a great stream of immigration, and New York became the foremost manufacturing city in the United States about the middle of the 19th century. The value of its manufactured products increased from $1,084,800,236 in 1890 to $3,717,359,468 in 1900, and the total manufacturing product of the city, the Brooklyn, Philadelphia and other districts, increased from $2,012,988,429 in 1895 to $5,263,306,006 in 1905 (an increase of 109-2%). Clothing ranked first in value in 1905, and its value ($305,323,795) was greater than the total value of all factory products in any other city in the United States. The clothing industry was also the first in that it consisted with products valued at $16,577,594, ranked second. In 1905 the highest degree of localization of any industry in the country was in the manufacture of clothing, of which 95% of the output of the city was produced in New York City, more than 60% of the total for the city being produced in Brooklyn. The boroughs of Manhattan and the Bronx produced in that year goods valued at $1,043,251,023, or a little more than two-thirds of that for the entire city; and in this part of the city is made more than 95% of the clothing manufactured in all the city. The Borough of Brooklyn produced nearly three-fourths of the remainder.

Water supply. The water supply of the colonial city was derived from wells and from the many fresh-water streams and ponds which have now almost without exception been filled in. A system, drawing water from Collect Pond, was introduced in 1744-1775 by Christopher Colles (1738-1821), but this never was in operation. In 1799 the Manhattan Company was incorporated ostensibly to supply the city with water, but under an omnibus clause in its charter had the right to supply itself to the bay both by land and by sea. In 1812 a supply was built a reservoir on 13th Street. In 1830 De Witt Clinton suggested the Croton river as a source of supply. Between 1837 and 1893 were constructed the first Croton Aqueduct, the Bronx conduit and the New Croton Reservoir (1877), with maximum discharges respectively of 95,000,000 gals., 28,000,000 gals. and 302,000,000 gals. a day. In 1905 a new Water Supply Commission was created and immediately afterwards work was begun on a new aqueduct to bring water to the Croftkill for a great extension of the Ashokan (or Waterford) reservoir (in the Catskill from which a filtration plant near Scarsdale and to the Hillview distributing reservoir in Yonkers, and from this reservoir to the five boroughs of Greater New York (Queens and Richmond boroughs both being supplied from Brooklyn) by tunnels, the supply for Staten Island only being pumped through pipes. One of the largest of the new reservoirs within the city limits is the Jerome Park. The water supply for the typical New York City “sky-scraper” cannot be forced to the top by the city’s pumps; therefore the building must have its own service, and such buildings must have each its own installation of engines for this purpose. In 1908 a high pressure water supply was installed for the treatment of water to be used in fire fighting in the 23rd Street; induction motors driving multi-stage centrifugal pumps give sufficient power to force the water to a fire in the top of the highest buildings. (See Fires and Fire Extinction.)

By the close of the Dutch period the city had become practically self-governing. But in the permanent form of English government that was established by the Dongan charter, granted in 1665 when the English crown was attacking the privileges of municipalities in the mother country, the mayor and sheriff were appointed by the governor and council; the recorder, town clerk and clerk of the market were appointed either by the king or by the governor; and although the aldermen and assistants were elected by the people no ordinances of the common council could remain in force more than three years unless they were confirmed by the governor and council. The March 21, 1714, or for that of 1720, was mainly an act of the Dongan charter. From 1777 to 1821 the mayor was chosen by the state council of appointment, consisting of the governor and four senators; from 1821 to 1834 he was elected by the common council; since 1834 he has been elected by the people. In 1730 the common council was divided into two chambers: the board of aldermen and the board of assistants; and the mayor and recorder were excluded from membership. In 1853 a board of sixty councilmen, in which was vested the sole right to originate acts appropriating money, was substituted for the board of assistants. The latter was restored in 1863, but was abolished in 1875 when the board of estimate and appportionment was created. Until 1849 the common council was an executive as well as a legislative body, and for many years the government was administered chiefly by its committees and by the heads of departments which it created and appointed; and the mayor’s veto could be overcome by a bare majority vote of the members elected to each chamber. In 1849 the choice of the heads of departments was given to the people, and in 1853 a two-thirds vote of the members elected to each chamber was required to prevent the mayor from exercising a veto. In 1879 the state legislature began the appointment of boards and commissions for the performance of various functions, and from this state interference and the popular election of the heads of departments resulted a divided responsibility in the city government. The present state constitution (1846) affords some protection against state interference, and under the Consolidation Act of 1892 and under the present charter of “Greater New York,” granted in 1897 and revised in 1901, responsibility centres in the mayor.

The mayor is elected for a term of four years. With the exception of that of finance he appoints the heads of all departments: law, water supply, gas and electricity, fire, street cleaning, bridges, docks and ferries, parks, public charities, tenement house, health, correction, police, education, taxes and assessments. Even in the department of finance he appoints the chamberlain and two commissioners of accounts, who examine the receipts and disbursements in the office of the comptroller and chamberlain and may examine the affairs of such other offices or departments as the mayor may direct. All officers appointed by the mayor may be removed by him, except certain judges of courts and members of the board of education.

1 The census of 1905 was confined to establishments under the factory system; the total for all manufacturing products (the figure given in the 1900 census) is greater than the value of factory products only (the figure given for 1900 in the 1905 census, so that figures for 1908 and 1905 may be comparable).

The aqueduct commissioners, the trustees of the College of the City of New York, and the trustees of Bellevue and allied hospitals, however, are responsible only for the cause of the latter. The veto of a franchise passed by the board of aldermen is final; his veto of an ordinance or resolution of the board which involves the expenditure of money, the creation of a debt or the laying of an assessment can be overridden only by a three-fours vote; and his veto of any other measure of the board can be overridden only by a two-thirds vote. Special city legislation passed by the state legislature is referred to the mayor for his acceptance; if he does not accept it, it may be repassed by both branches of the legislature but must then be mailed, when it is returned to the governor, "without the concurrence of the city.

The department of finance is administered under the direction of the comptroller, who, like the mayor, is elected for a term of four years. He prescribes the manner in which the accounts in the other departments shall be kept and rendered, and all such accounts are subject to his inspection. His warrant, drawn on the chamberlain and countersigned by the mayor, is required in making a payment on behalf of the city. Real estate may be purchased or leased by the city without his consent. No contract, the expense of execution of which is not in part covered by assessments on the property benefited, is valid without the mayor's consent. The city's limit of debt is determined mainly by the board of estimate and apportionment consisting of the mayor, comptroller, president of the board of aldermen, with three votes each; the presidents of the boroughs of Manhattan, Brooklyn, and Queens, with three votes each; and the mayor of the boroughs of Queens, the Bronx and Richmond, with one vote each. Every October this board prepares the budget for the ensuing year. It is required by law to submit a balance to the city, but these surpluses are not permitted to increase an appropriation, to insert any new appropriation or to reduce that on the payment of state taxes, that for the payment of the interest on the city debt and all interest excepted to the city by law, and in case they reduce others their action is subject to the mayor's veto which they can override only by a three-fours vote.

The city's budget grew from $90,778,972 in 1900 to $136,543,148 in 1909 including its tax and non-tax, real and personal, from $3,654,122,193 in 1900 to $7,725,500,559 ($5,423,312,590 for Manhattan and the Bronx) in 1909, when the real estate value was at $6,823,790,704. The net funded debt in December 1909 was $63,470,378; the gross bonded debt being $49,645,026,728; the floating debt was $60,367,290, and the sinking fund was $232,368,060.

Among the large items of the 1909 budget were: $27,470,737 for education; $47,225,075 for redemption and interest of city debt; $20,335,115 for miscellaneous city and county expenses; $14,160,202 for police; $8,428,596 for borough governments; $8,039,055 for fire protection; $7,418,299 for street cleaning; $6,494,782 for police disbursals; $6,007,116 for charitable institutions; $3,319,065 for parks; $2,512,606 for public charities; and $2,484,859 for health. The state constitution of 1870 requires, in addition, that 

a) the entire school fund be reserved for the support of the public schools,
b) the amount reserved for the support of the poor be limited to the amount raised by taxation,
c) the amount reserved for the support of the police be limited to the amount raised by taxation,
d) the amount reserved for the support of the health department be limited to the amount raised by taxation,
e) the amount reserved for the support of the welfare department be limited to the amount raised by taxation,
f) the amount reserved for the support of the fire department be limited to the amount raised by taxation,
g) the amount reserved for the support of the street department be limited to the amount raised by taxation,
h) the amount reserved for the support of the water department be limited to the amount raised by taxation,
i) the amount reserved for the support of the gas department be limited to the amount raised by taxation,
j) the amount reserved for the support of the sanitation department be limited to the amount raised by taxation,
k) the amount reserved for the support of the parks department be limited to the amount raised by taxation,
l) the amount reserved for the support of the department of education be limited to the amount raised by taxation.

The board of aldermen, whose power is less than former, is composed of a president, elected on the city ticket for a term of four years; 84 aldermen, elected on the city ticket for a term of four years; and 73 aldermen, elected by districts for a term of two years. Each head of an administrative department is entitled to sit on the board but no vote; he is required to attend the board's meeting which is attended by all except the mayor to keep in touch with the department relating to his department. The board is required to meet once each month except in August and September. Each administrative department is responsible with the department of parks, the department of health and the department of education; and each head of a department has full power of appointing and removing subordinates except that a person holding a position in the classified civil service subject to competitive examination can be removed only for cause. The head of the department of parks is a board of three park commissioners: one for the boroughs of Manhattan and Richmond, one for the boroughs of Brooklyn and Queens, and one for the city. The commissioner is designated by the mayor as president of the board. The head of the department of health is also a board of three members; the commissioner of health, who is president of the board, the police commissioner, and the comptroller are the members of the board. Education is described in the paragraph on education. Gas and electric companies doing business within the city are subject to the extended control of a public service commission of five members who are appointed by the board of estimate and apportionment.

In New York county, which comprises the boroughs of Manhattan and the Bronx, there is no county court, but in its place are a city court and a county court. The sessions of the city court is a civil court, having jurisdiction over cases in which the amount involved does not exceed $2000, and is composed of seven justices elected for a term of ten years. The court of general session is a criminal court, having jurisdiction of all crimes including murder, and is composed of the city judge, the recorder and three justices of the sessions, each elected for a term of fourteen years. New York county elects a supt of schools, and Kings has two county judges; but in Queens and Richmond the county and surrogate courts are the same as in other counties of the state. In each of the twenty-eight districts into which the city is divided a municipal-court justice is elected for a term of four years. The municipal court, which has jurisdiction of civil cases in which the amount involved does not exceed $500, are held. For the administration of criminal justice by magistrates (justices of the peace) the city is divided into the boroughs of Manhattan, the Bronx, Kings and Richmond, and the other three boroughs constitute the second division. In each division there is a board of magistrates appointed by the mayor for a term of four years, and the magistrates hold the several courts of their division in rotation, according to such rules as they themselves establish. There is also in each division a court of special sessions consisting of six justices appointed by the mayor for a term of ten years; it has jurisdiction in all misdemeanour cases except libel and must be held by three justices. In the first division both the magistrates and the justices of the court of special sessions are required to hold a separate court for hearing charges against children under the age of sixteen years.

Each borough has a president with extensive power, and the city is divided into twenty-five local improvement districts, each having a board composed of the president of the borough and the alderman representing the district. The president appoints at his pleasure a commissioner of public works, who, subject to his control, directs his administration relating to streets, sewers, public buildings and supplies. The borough president prepares all contracts relating to his borough. In Queens and Richmond he directs the cleaning of the streets. In Manhattan, Brooklyn and the Bronx he is directed by the charter to appoint a superintendent of buildings, who, subject to the control of the board of aldermen, has charge of the construction, alteration and removal of buildings; in Queens and Richmond the board of aldermen may by an official act only authorized to do so by the board of aldermen upon the recommendation of the board of estimate and apportionment. A borough president is chairman of each of the local improvement boards.

History.—The discovery of New York Bay and the Hudson river by Verrazano in 1524 was followed by occasional visits of trading or exploring vessels until the arrival of Henry Hudson in 1609. Beginning with 1610, Dutch merchants despatched several vessels to engage in the fur trade with the Indians, and in 1614 a ship commander, Adriaen Block, having lost his vessel, built the "Onrust" or "Restless" on the shore of Upper New York Bay. About the same time a few huts were built at the south end of Manhattan Island. When New Netherland had been erected (1623) into a province of the West India Company (see New York), that body chose the south end of Manhattan Island for a trans-Atlantic shipping station and for the seat of government. In 1626 Peter Minuit, the director-general of the province, bought the entire island from the Indians for goods valued at 60 guilders (about $24 today). In 1641 were erected the two great buildings at the mouth of Fort Amsterdam; and at the close of the year the settlement, New Amsterdam, comprised thirty bark-covered dwellings. For several years it was maintained wholly in the interest of the Company, and to none of the inhabitants, all of whom were its agents or employees, were given any political rights, title to land or right to European trade on his own account. The company divided a large portion of the island into six farms of its own, and when by its Charter of Privileges and Exemption
(1629) it attempted to encourage agriculture in other parts of the province (see New York State) it reserved to itself the whole island. In 1633 New Amsterdam received a grant of "staple right" by which it could compel any vessel passing the port either to offer its cargo for sale or pay a duty; in 1638 the Company extended to all friendly European countries the privilege of trading with the province, and about this time it opened town lots for sale. The town rapidly assumed the cosmopolitan character for which it has ever since been noted, there being, according to a contemporary report, eighteen languages spoken by its 400 or 500 inhabitants in 1643. In 1641, to gain the necessary support to fight the Indians, Kieft had to yield to the demand for a popular voice in the government, and permitted the heads of families to choose a board of Twelve Men to confer with him. In 1643 he permitted the choice of a board of Eight Men, and when he refused its demands it was largely instrumental in effecting his recall. Under his successor, Peter Stuyvesant, a board of Nine Men was chosen, and this body, objecting to the customs duties which he imposed, sent three of its number with a petition to the States-General at Amsterdam.

In 1653 New Amsterdam was made a city with a government administered by a schout, two burgomasters and five schepens.

Chiefly with a view to protection from roving traders the great burgher-right and the small burgher-right were established in 1657; the great burgher-right being conferred on all who had been magistrates as well as on those then in office, on clergymen, on militia officers and on the male descendants of all such persons; and the small burgher-right being conferred on all native-born citizens, on the husbands of native-born women and their male children. The first board of aldermen and bailiffs was elected in 1656. Other persons approved by the magistrates were allowed to buy the great burgher-right for 50 guilders ($20) or the small burgher-right for 20 guilders ($8). Only burghers and employees of the West India Company could engage in commerce, work at a trade or practise a profession, and only great burghers could hold the more important offices. Originally Stuyvesant appointed the city officers, but in 1658 he permitted them to nominate their own successors. Besides engaging in the fur trade, the city was now exporting considerable timber and food-stuffs; in the coast trade it was beginning to reap the advantages of its situation on the route through Long Island Sound; and its trade with the Dutch West Indies was of some importance. But the city and the Company were always at odds. The duties exacted by the Company were a heavy burden and yet the Company did not keep the fort in good repair. Stuyvesant's arbitrary rule primarily in the interests of the Company was another grievance, and when in August 1664 there appeared in the harbour an English fleet sent by the duke of York for the conquest of the province, the city was in a defenceless condition. Richard Nicolls, the representative of the duke, easily won over the burgomasters and other prominent citizens; Stuyvesant, practically deserted, was driven to a formal surrender on the 8th of September; and New Amsterdam became New York.

In June 1665 Nicolls reorganized the government, vesting it in a mayor, aldermen and sheriff, to be appointed by the governor of the province for a term of one year; and extended the city's limits to include the whole of Manhattan Island. In 1666 he granted to New Harlem, founded in 1658, a charter which gave to it the status of a town within the city. Nicolls' successor, Governor Francis Lovelace, established a post-route from New York to Boston in 1673. On the 30th of July 1673 the city was surprised and captured by a Dutch fleet under Cornelis Evertsen and Jacob Bincakes. The captors renamed the city New Amsterdam and in January 1674 Anthony Colve, the newly appointed governor of the province, re-established the Dutch city government, but under the treaty of Westminster the English again took possession in November. In 1678 Governor Edmund Andros gave the city practically a monopoly within the province of commerce "over seas" and ordered that flour should be inspected nowhere else; two years later he required that all flour for export should be bolted and packed within the city. The duties established by order of the duke of York were still a grievance, and when in 1681, Governor Andros had sailed for England without renewing the ordinance imposing them, the merchants refused payment and demanded that they should thereafter be imposed by a representative assembly. The duke yielded and the first New York Assembly, called by Governor Thomas Dongan, met in the city on the 17th of October 1683. Less than three years later, on the 20th of April 1686, Dongan gave the city its first real charter, which is a historic instrument in the city government; it was succeeded only to a very small extent as late as 1830 (when there was a revision of the charter) and on it as a basis the later charters have been framed.

New York City with its numerous artisans, small traders, sailors and common labourers, such as usually compose the party of discontent, was the centre of the Leisler uprising (see New York State) incited by the English Revolution of 1688, and it was here that Leisler in the spring of 1690 called the first intercolonial assembly to plan an expedition against Canada. They so increased in number in the city that for the first time permitted to elect their own mayor, a privilege not subsequently granted until 1834. Before the close of the 17th century New York had become a favourite haunt of pirates; leading merchants assisted pirates as well as privateers in fitting out their vessels and shared in their plunder or at least welcomed them with their rich cargoes, and public officials, including one or more governors, were also implicated. The home government finally appointed Richard Coote, earl of Bellomont (1656-1701), governor with explicit instructions to deal with the piratical bands. Before long the famous Robert Livingston sent out William Kidd (d. 1701) with a frigate to capture the pirates. Kidd himself turned pirate, but was arrested in Boston in July 1699, was sent to England for trial and was hanged in May 1701. Bellomont met determined opposition among New York officers and merchants; but by the close of his brief administration (1698-1701) he had caught a number of the pirates and broken up the corrupt system by which they had been protected. The importation of negro slaves was begun in 1725 or 1726 and was somewhat encouraged by the States-General. Becoming prized as household servants in the early half of the 18th century they were not greatly outnumbered by the whites; the whites early began to fear a slave insurrection, and ordinances were passed forbidding negroes to gather on the Sabbath in groups of more than four, or to carry guns, swords or clubs; but one night in April 1712 some slaves met in an orchard near Maiden Lane, set fire to a building and killed nine men besides wounding several others who came to put out the fire. Soldiers then captured all the insurgents except six, who committed suicide, and after trial twenty-one were executed. When early in 1714 nine fires broke out within a few weeks and a negro was seen running from the last, the belief became general that the negroes had formed a plot to burn the town. A reward of £100 was offered for information exposing the plot, and the testimony of an indentured servant-girl, Mary Burton, that her master, mistress, a few other whites and a number of negroes were implicated in such a plot threw the city into a panic. Other confessions were extorted by threats, and on such worthless testimony four whites were executed, fourteen negroes were burned at the stake, twenty were hanged and seventy-one were transported. The frenzy was checked when Mary Burton began to accuse persons of consequence and above suspicion. The New York Gazette, the first newspaper of New York, established by William Bradford in 1725, was a semi-official organ. For criticizing the government in the New York Weekly Journal, which he established in 1733, John Peter Zenger was charged with libel in 1734, and by securing his acquittal in the following year the popular party established the freedom of the press (see New York). At the beginning of the Stamp-Act controversy John Holt's New York Gazette and Weekly Post-Boy, the successor of Bradford's Gazette, was the medium through which the popular leaders stirred the
people to resistance. The Stamp-Act Congress, called at the suggestion of Massachusetts, sat in the city from the 7th to the 28th of October 1765, and on the 31st of October the New York merchants started the non-importation movement which spread to the other colonies. Lieut.-Governor Cadwallader Colden prepared for the enforcement of the Act by strengthening Fort George (a later name for Fort Amsterdam) and increasing its garrison. The ship with the stamps arrived in the evening of the 23rd of October and on the following night threatening notices were posted on the doors of every public office and at the corners of streets. When the day (1st of November) came for the Act to be put in force, Governor Cadwallader Colden stationed the fort. Major James, the commander of the garrison, had threatened to enforce the Act; but the Sons of Liberty gathered a mob, broke into the governor’s coach-house, burned his coach and burned him in effigy, destroyed the furniture and other property of Major James and threatened to storm the fort. On the 5th, the governor delivered the stamps to the mayor and aldermen. No serious attempt was subsequently made to enforce the Act, and its repeal (16th of March 1766) was celebrated on the city common with noisy demonstrations and the ringing of hand-bells. A monument was subsequently erected for the erection of statues of the king and William Pitt. The Sons of Liberty opposed the passage by the Assembly of appropriations for the maintenance of the soldiers, and the latter retaliated by repeatedly cutting down liberty poles erected by the Sons of Liberty. Finally in a skirmish on the 18th of January 1770 the soldiers killed one man and severely wounded several others, and this bloodshed is memorable as the first in the struggle which culminated in the independence of the colonies. The tea shipped to New York for testing the right of parliament to tax the colonies did not arrive until four months after that shipped to Boston had been thrown over board, but when it did arrive (April 1774) the chests in one vessel were destroyed in the same manner as those in Boston and the other vessel was forced to carry its cargo back to London. The Act for punishing Boston stirred the New York merchants as well as the Sons of Liberty (chiefly mechanics and artisans), and when the latter again threatened violence the merchants resolved to guide the movement, and called a mass meeting and named a committee of correspondence of fifty-one members. This committee, on the 23rd of May 1774, proposed a Continental Congress chiefly with a view to obtaining an effective regulation of non-importation from England; it also named the New York delegates to that body.

During the greater part of the War of Independence the city was occupied by the British. Its capture was a part of the British plan to get control of the Hudson and separate New England from the southern colonies. Early in 1776 the Americans began to throw up fortifications at several points on both banks of the East river in the hope of closing the east water front to the enemy. Other fortifications were erected on Governor’s Island and at some points along the west water front to the upper end of Manhattan Island, where an attempt was made to close the passage of the Hudson by building Fort Washington on the New York bank and Fort Lee on the New Jersey bank and connecting them with a line of sunken ships fastened together with chains. To the north of the city proper, also, defences were constructed along the line of the present Grand Street, and to prepare for a retreat from the north end of the island a redoubt, which the British later called Fort George, was built on the prominence overlooking Kingsbridge from the south, and Fort Independence, in the heart of the Bronx, was built to command the approach from the mainland. After the battle of Long Island, fought within the present limits of Brooklyn Borough, Wash-ington, on the night of the 29th of August 1776, crossed to Manhattan Island. As the city was no longer tenable, some of the generals proposed burning it, but Congress would not give its consent and Washington, although withdrawing the greater part of his army behind fortifications on Harlem (now Washing-ton) Heights, continued to occupy it with about 5000 men under General Israel Putnam until the British general, Sir William Howe, began to show signs of attack. Troops also remained behind the batteries along the east water front, and it was on this occasion that Nathan Hale went on his fatal errand to ascertain Howe’s intentions, was discovered within the British lines and was hanged as a spy. On the 15th of September several British ships which had some days before passed the American batteries, as far as Montresor’s (now Randall’s) Island, entered Kipp’s Bay, at the foot of the present 34th Street, routed the militia posted behind the low breastworks there, and after landing narrowly missed cutting off the rear of Putnam’s retreating army. One portion of Howe’s army took possession of the city and garrisoned Forts Washington Heights along the east side of what is now Central Park while Putnam’s men were marching in nearly parallel columns on the west side of the park. On the 16th, in the battle of Harlem Heights (on what is now Morningside Heights), about 1800 Americans drove a somewhat smaller number of British troops from the field. In October Howe sailed up the East river, and Washington, to avoid being outflanked, retreated to the mainland, leaving only a garrison at Fort Washington. Howe landed at Pell’s Point (now within Pelham Bay Park), and on the 28th, a few miles below, in December he fought the battle of White Plains. Howe then turned westward or more southward and on the 36th of November captured Fort Washington. What is now Bronx Borough was within the “Neutral Grounds” which suffered greatly from the foraging parties of both armies. Six days after the British entered the city proper about one-fourth of it was destroyed by fire, and the desolation was extended by another large fire on the 3rd of August 1778. The British crowded their prisoners (who suffered terrible hardships) into several of the churches, the City Hall, the new gaol (later the Hall of Records), King’s College, the Livingston sugar house, and a number of ships moored in the harbour. The city was a refuge for Loyalists, but even they were treated with contempt by the British. The homes of Loyalists and Whigs alike were plundered, and when the British finally evacuated (25th of November 1783) they had robbed the city of its wealth and had destroyed its business.

For the first three or four years after the return of peace recovery in some directions was very slow; but only a few months after the British had gone an American merchantman sailed from the port bound for China and opened trade with that country. Trade was speedily resumed with European ports, and by 1788 it was not uncommon to see two or more vessels in the port either loading or unloading. On the question of enlarging the powers of the Federal government in 1787-1788, the city strongly supported Alexander Hamilton and John Jay against a determined opposition in other parts of the state, and the ratification of the Federal constitution in the state convention at Poughkeepsie was a triumph for New York City. The city was the Federal capital in 1789-1790 and under its strong Federalist influence the new government of the nation was organized. During the colonial era New York was always the seat of the provincial government and for twenty years it was at times the seat of the state government, but in 1797 Albany was made the permanent capital. In 1807 the success of steam navigation was assured by the trial trip of Robert Fulton’s “Clermont” from New York to Albany and return; but the city did not benefit immediately from this invention. On the contrary, the Embargo Act (1807-1809) threatened its commerce with ruin. It revived under the Non-Intercourse Act, but suffered again from the second war with Great Britain. In the first and second years of this war some merchant’s reaped profits from privateering against the British but in 1812-1813 the British stopped privateering by a closer blockade of the harbour and in 1814 they threatened to attack the city. In preparing to resist, the city erected or assisted in erecting elaborate fortifications, and Robert Fulton was busy in New York building a steam frigate with cannon-proof sides and heavy guns, but the war closed without a test of the fortifications and before the frigate was ready for action.

In 1817 the Erie Canal was begun and the first line of trans-Atlantic packet-ships was established. The canal, opened in
1825, insured the commercial supremacy of New York among American cities. The years immediately following the close of the second war with Great Britain also mark the beginning of a rapid increase in the number of European immigrants, and this stream of immigration, rising to a flood in the fourth decade and continuing high throughout the century, has been a dominant force in determining the city's social and political conditions. Although the city was a stronghold of the Federalists at the time the National government was organized, the Democrats, owing to the democratic management of Aaron Burr, were victorious in the elections of 1800 and 1801, and the city has continued to be normally Democratic owing largely to the activities of the Tammany Society or Tammany Hall (q.v.). This organization, founded in 1789, early espoused the cause of the unfranchised inhabitants, attended to the wants of the immigrants in various ways, led the movement for universal manhood suffrage and the election of city officers, and, after the office of mayor became elective (1834) and the last property qualifications for city voters were removed (1842), continued strong by reason of the support of the great mass of foreign-born citizens. Fraud and corruption were stated to have been tolerated by Tammany Hall; offices were used for the good of the organization rather than for the good of the city. Socially, the immigrants degenerated the city with vice, crime, misery and pauperism. The unsanitary conditions had already caused epidemics of yellow fever in 1795, 1798, 1822 and 1823, and the city was visited in 1832, 1834 and 1849 with epidemics of cholera in which several thousand lives were lost. These scourges together with a fire in 1835, which destroyed the East Side below Wall Street, hastened the construction of works for getting a supply of water from the Croton river. The immigrants represented various nationalities and religious sects, and Tammany, which was strong to 1871 the city was frequently disturbed by riots arising usually from national or religious antipathy. During the first mayorcy election (1834) there was rioting; and there were an abolitionist riot in the same year, a flour riot during the financial panic of 1837, and labour riots from time to time which were suppressed by the police. In 1857 the state legislature established a state of "metropolitan" police for the better protection of the city. The mayor, Fernando Wood, contending that the act was unconstitutional, resisted with the old municipal police, and another serious riot had begun when the Seventh Regiment of state troops was sent to the city; later, too, the court of appeals decided against the mayor.

Wood was still mayor at the outbreak of the Civil War, and in January 1861 he proposed to the Common Council that Manhattan Island, Long Island and Staten Island should secede and constitute a free city, to be named Tri-Insula. The Council approved. But when, in April, the city had been aroused by the bombardment of Fort Sumter the majority of the Democrats joined with the Republicans in discarding the proposal and in support of the Union. The native-born and loyal citizens joined the Union army in such large numbers that the city was left with inadequate protection from such of its inhabitants as had often constituted the mob. In this state of affairs the drafting of men for the army was begun in July 1863 in conformity with an act of Congress which exempted from its operation all who should make a money payment of $300. The New York proletariat and unscrupulous politicians complained that the measure was peculiarly oppressive to the poor, and the rioting with which it was resisted was protracted and bloody. The rioting began the 13th of July and continued for nearly five days. More than fifty buildings were burned. The mob was especially furious against the Negroes, a number of whom were hanged or beaten to death. The police fought bravely but were unequal to the emergency, and order was restored only after several regiments had returned to the city and had killed at least 500 of the rioters. In 1871 Irish Catholics threatened to prevent the Orangemen from parading the streets on the anniversary of the Battle of Boyne (12th of July). The superintendent of police also issued an order on the preceding day prohibiting the parade. Public opinion, however, was so strong in favor of the Orangemen that the order was revoked, and five regiment of militia were called out to protect the parade before it started; at the first assault the mob was scattered by a volley which killed 51 persons. The militia suffered a loss of three killed and several wounded.

The character of the population did not improve speedily, for while immigrants were coming in great numbers a large portion of the saving middle class was removing to the suburbs; and although Tammany Hall was discredited during the Civil War, it gained control of the state as well as the city government afterward. In 1871 the mayor, William M. Tweed, its ruler, organized the "Tweed Ring" which was plundering the city on a gigantic scale; when in 1873 its operations were exposed by the New York Times. The thefts of the "Ring" amounted to many millions of dollars, those in the election of the county court house alone to $8,000,000. Several of the malefactors were sent to prison and Tweed himself died there. Tammany, however, was victorious again in the second election (1874) after Tweed's fall, and in 1884, when rival companies were seeking to obtain a franchise for working a street railway on Broadway, this "ring" and other disorderly resorts, and from liquor sellers for permission to violate certain details of the excise laws, such as midnight and Sunday closing. There followed a great outcry against Tammany and it was driven from power for three years. During the reform administration, Colonel George Edward Waring (1833-1898), as head of the street cleaning department, quite revolutionized New York as respects cleanliness. The police service and the school system were also much improved. Tammany was successful in the election of 1897 when the opposition was divided. It again abused its power and was defeated in 1901. In 1903 and 1905 the Tammany ticket was elected, but the mayor, George B. McClellan, administered the government, especially during his second term (1906-1910), independently of Tammany Hall. With the exceptee of the mayor the Tammany ticket was defeated in 1909, and the mayor, William Jay Gaynor (b. 1851), was little in sympathy with Tammany Hall, having been nominated apparently for the purpose of insuring the election of loyal Tammany men on the county ticket.

BIBLIOGRAPHY.—Special works have been mentioned in the body of the article. Among general descriptive works are Moses King's Handbook of New York (Boston, 1865); Rand McNally & Company's Handy Guide to New York City (Chicago, 21st ed., 1907); Appleton's Dictionary of New York (New York, 1903); and of a more aesthetic quality, John C. van Dyke's New York (New York, 1893), with illustrations by John B. Sartain, and E. S. Martin's The Wayfarer in New York, a book of selections. F. B. Kelley's Historical Guide to the City of New York (ib., 1899), compiled under the supervision of the City Engineers, contains the city's landmarks, marks, places of historical interest, &c. For administration see The Charter of the City of New York with Amendments (New York, 1907); F. C. Seckerson, Manual of Civic: A Text-Book of Municipal Government for the Use of the New-York Historical Society; Ingalls, An Outline of Municipal Government in the City of New York (Albany, 1904). For history see Mrs. Schuyler van Rensselaer, History of the City of New York in the Seventeenth Century (2 vols.,
NEW ZEALAND

NEW ZEALAND, a British colonial Dominion (so named in 1857), consisting mainly of a group of islands lying in the south Pacific between 34° 25' and 47° 17' S., and between 166° 26' and 179° 23' W. It is situated eastward of Tasmania and Victoria, and Wellington, its capital and central seaport, is 1204 m. distant from Sydney. Of certain outlying clusters of small islands belonging to the colony, the Chathams (256 m. E. of Cook Strait), Auckland Islands and Campbell Island are alone of any value. All these are grassy and the Chathams are inhabited by sheep-farming colonists. The Auckland Islands contain two of the finest harbours in the Pacific. Six hundred miles north of Auckland, the volcanic Kermadecs, covering 8286 acres, are picturesquely clothed with vegetation. In Polynesia a number of small outlying islands, consisting of the Kermadecs, are believed to have been discovered by 1803. Ratotonga and Mangaia, in the Cook group, and Niué or Savage Island are the largest of these; Penrhyn and Suwarrow, though but small coral atolls, contain excellent harbours. Ratotonga is hilly, well watered, and very beautiful. Apart from these little tropical dependencies New Zealand has an area of 104,471 sq. m., of which its two important islands, called North and South, contain 44,468 and 58,523 respectively, while, divided from South Island by Foveaux Strait, Rakiraka or Stewart Island, mountainous and forest-clad, contains 521 sq. m. These three form a broken chain, North and South Islands being cut asunder by Cook Strait, a channel varying in width from 16 to 90 m.

North Island is 515 m. long and varies in breadth from 6 to 200 m. It is almost cleft in twain where the Hauraki Gulf penetrates to within 6 m. of Manukau Harbour. From the isthmus thus formed a narrow, very irregular peninsula reaches out northward for some 200 m., moist and semi-tropical, and beautiful rather than uniformly fertile. Rich strips of alluvial soil, however, seem a cold clay-marl, needing intensive cultivation to become highly productive. Buried in this clay-marl are found large deposits of the fossil resin which becomes the kauri gum of commerce; and on the surface extensive forests are still a great though diminishing source of wealth. Though a species of mangrove fringes much of this peninsula, its presence does not denote malaria, from which the islands are entirely free.

South of the isthmus aforesaid, North Island rapidly broadens out. Its central physical feature is the unbroken mountain chains running N.E. from Cook Strait to East Cape on the Bay of Plenty, ranges seldom under 3000 ft., but never attaining 6000 ft. in height. Ikurangi, their highest summit, though a fine mass, does not compare with the isolated volcanic cones which, rising W. of the main mountain system and quite detached from it, are among the most striking sights in the island. Ruapehu (10100 ft.) is intermittently active, and Ngauruhoe (7515 ft.) emits vapour and steam incessantly. Egmont (8340 ft.) is quiescent, but its symmetrical form and dense clothing of forest make it the most beautiful of the three. North of the two first-mentioned volcanoes Lake Taupo spreads over 238 sq. m. in the centre of a pumice-covered plateau from 1000 to 2000 ft. above the sea; and round and beyond the great lake the rugged chain of the thermal springs covers 3000 sq. m. and stretches from Mount Ruapehu to White Island, an ever-active volcanic cone in the Bay of Plenty. The most uncommon natural feature of the district, the Pink and White Terraces, was blown up in the eruption of Mount Tarawera in 1886, when for great distances the country was buried beneath mud and dust, and a chaos of m. long was opened in the earth. Fine lakes and waterfalls, innumerable pools, in temperature from boiling-point to cold, geysers, solfataras, fumaroles and mud volcanoes still attract tourists in large numbers. The healing virtue of many of the springs is widely known. The government maintains a sanatorium at Lake Rotorua, and there are private bathing establishments in other places, notably near Lake Taupo. In South Island there are hot pools and a state sanatorium at Hanmer Plains. Experience shows that the most remarkable cures effected by the hot waters are in cases of gout, rheumatism, diseases of the larynx and in skin disorders. Though, thanks to the overlying porous pumice, the Taupo plateau is not fertile, it has a good rainfall and is drained by unfining rivers running through deep terraced ravines. The Waikato and Waipa Rivers (N.E. of Taupo) and the Wanganui and Raganteke W. or S.W. The first named, the longest in the colony, though obstructed by a bar like all western,—and most eastern,—New Zealand rivers, is navigable for some 70 m. The Mokau and Wanganui run between ferny and forest-clad hills and precipices, often of almost incomparable beauty.

East of the Taupo plateau and south of Opotiki on the Bay of Plenty the steep thickly-timbered ranges held by the Urewera tribe still show scenery quite unspoiled by white intrusion. On the southern frontier of this mountainous tract Waikaré Moana extends its arms, the deepest and most beautiful of the large bays of the New Zealand coast.

From the mouth of the Waikato southward to about 25 m. from Cape Terawhiti on Cook Strait, and for a distance of from 20 to 40 m. inland, the western coast skirts fertile country well fitted for grazing and dairy-farming, to which it is being rapidly turned as the timber and fern are cleared away from its low hills, downs and rich valleys. On the east coast the same fertility is seen with less forest, and, round Hawke Bay, a hotter and drier summer. In the south centre, the upland plain of the Wairarapa, ending in a large but commonplace lake, has a climate adapted for both grazing and cereals. The butt-end of the island, of poor, rough, wind-beaten hills, is redeemed by the fine harbour of Port Nicholson, which vies with the Waiatemata in utility to New Zealand commerce. Broken as is the surface, poor as is the soil of certain tracts, there is but little of the island which will not ultimately be cultivated with profit as pumice and clay-marl yield to labour. Everywhere the settler may count on a sufficient rainfall, and—except on the plateau and the mountain highlands—mild winters and genial summers. The pleasant climate has certain drawbacks; the coastal farmer finds that blights and insect pests thrive in the comparative absence of hard frost and character. The country is free from the plague outside a few marshy localities. To pass Cook Strait and land in the middle province of South Island is to pass from Portugal to Switzerland, a Switzerland, however, with a sea-coast that in the east centre is a dull fringe of monotonous sand dunes or low cliffs. As a rule, nevertheless, the shores of South Island are high and bold enough. They are not too well served with harbours, except along Cook Strait, in Banks Peninsula, and by the grand but commercially useless fjords of the south-west. In the last-named region some fifteen salt-water gulfs penetrate into the very heart of the mountains, winding amid steep, cloud-capped ranges, and tall, richly-clothed cliffs overhanging their calm waters. The dominating features of south New Zealand are not ferny plateaus or volcanic cones, but stern chains of mountains. There the Southern Alps rise range upon range, filling the whole centre, almost or quite touching the western shore, and stretching from end to end of the island. West of the dividing crest they are forest clad; east thereof their stony grimness is but slightly softened by growths of scrub and tussock grass. Nineteen-twentieths of the colonists, however, live east of the dividing range, for to that side settlement was attracted by the open, grassy character of the country. The rivers are many, even on the drier eastern coast. But, as must be expected in an island but 180 m. across at the widest point and yet showing ridges capped with perpetual snows, the rivers, large or small, are mountain torrents, now swollen floods, anon half dry. Almost useless for communication or transport, they can be easily drawn upon for irrigation where, as in the east centre, water-races are useful. The largest river, the Clutha, though but 80 m. long in its course to the south-east coast, discharges a volume of water...
The following are the names of counties indicated by numbers:

North Island:
1. Bay of Islands
2. Northland
3. Auckland
4. Waikato
5. Taranaki
6. Manawatu
7. Wanganui
8. Wellington
9. Nelson
10. Marlborough
11. Canterbury
12. Otago
13. Southland
14. Westland
15. Stewart Island

South Island:
1. Buller
2. Nelson
3. Marlborough
4. Westland
5. Tasman
6. Nelson
7. Westland
8. Marlborough
9. Nelson
10. Westland
11. Marlborough
12. Nelson
13. Westland
14. Marlborough
15. Nelson
16. Westland
17. Marlborough
18. Nelson
19. Westland
20. Marlborough
21. Nelson
22. Westland
23. Marlborough
24. Nelson
25. Westland
26. Marlborough
27. Nelson
28. Westland
29. Marlborough
30. Nelson

The names of other counties are the same as those of their chief towns, which in these cases are underlined.
estimated at nearly 1,100,000 cubic ft. a minute. On the west
the only two rivers of importance are the Buller and the Grey,
the former justly famous for the grandeur of its gorges. Large
and deep lakes fill many of the mountain valleys. Te Anau and
Wakatipu (m. i.) are the chief, though Manapouri is the most
romantic. Aorangi (Mt. Cook) is easily first among the
mountain peaks. Its height, 12,349 ft., is especially impressive
when viewed from the sea off the west coast. On the north-east
a double range, the Kaikouras, scarcely fall short of the Southern
Alps in height and beauty. Apart from the fjords and lakes the
chief beauties of the Alps are glaciers and waterfalls. The
Tasman glacier is 18 m. long and has an average width of 1 m.
13 chains; the Murchison glacier is 10 m. in length. To the west
of Aorangi glaciers crawl into the forest as low as 400 ft. above
sea-level. Among waterfalls the Sutherland is 1904 ft. high,
but has less volume than the Bolson river, which falls 3100 ft.
in a mountain gorge, the Otira, is also the chief route from the
east to the west coast. It begins on the western side of Arthur's
Pass, a gap the floor of which is 3100 ft. above the sea. Generally
the open and readily available region of South Westland extends
from the Kaikouras along the east and south-east coast to the
river Waiatoto in Southland. It has a mean breadth of some 30
m. In compensation the coal and gold, which form the chief mineral
wealth, are found in the broken and less practicable west
and centre, and these portions also furnish the water-power
which may in days to come make the island a manufacturing
country. (W. P. R. C.)

Geology.—New Zealand is part of the Australasian festoon, on
the Pacific edge of the Australasian area. Unlike Australia, its geological
structure is unusually varied, and owing to its instability, it includes,
for its size, an unusually complete series of marine sedimentary rocks.
It has, moreover, been a volcanic area of long-continued activity.
The physiographical New Zealand is closely connected with its
generally Jurassic core, and is dominated by two intersecting lines of
mountains and earth movements. The Southern Alps, the back-
bone of the South Island, rest on a foundation of coarse gneisses
and schists, that are quite unrepresented in the North Island.
The component portions of this line of old rocks is occupied by the basins of
the Wanganui river and Taupo. E. Suess therefore suggested that the
northern continuation of the Alps had foundered, and its summits
have been buried beneath the Pliocene marine rocks of the Wanganui
basin and the volcanic rocks of the Taupo area.
The oldest rocks are Archean, represented by the hand of gneisses
and schists exposed along the western foot of the Southern Alps.
To the south of the district in southern Westland, where the Alps
have passed out to sea, the Archeans become more extensive; for
they spread eastward and underlie the whole of the dissected table-
land of Otago. It has been suggested that the jasperoids and
diabases of the Tarawera Mountains on the North Island may be
Upper Archean age, from their resemblance to the Heathoidian
rocks of Australia. No Cambrian rocks have as yet been discovered,
but the Devonian system is represented by the Aoree beds in the
north-western part of the South Island. Here they contain
graptolites, including Tetragonoporus, Dichograptus and Didymograptus.
The Silurian system is represented by the Baton river beds to the west
east of the Taupara beds, occurring between the Wanganui river
which flows into Tasman Bay. The Devonian system is well
exposed in the Reefton mining field. The Carboniferous system
includes either the whole or a large part of the Maitai beds.
The Maitai beds include a thick mass of slates and sandstones, which form
the bulk of the Southern Alps, whence branches extend south-
eastward to the coast. The beds take their name from the Maitai
river near Nelson; they are largely developed in the mountains of the
Tararu-Ruhine-Raukumara range, on the eastern side of the
North Island; they occur in the Kaikoura Mountains, and an outlier
forms Mount Torlesse, near the eastern edge of the Southern Alps,
west of Christchurch. The Maitai beds have generally been considered to
be Carboniferous from the presence of species of products found in
the Permo-Carboniferous of New South Wales. But Professor
Park has obtained Jurassic fossils in the Maitai series; so that it will
probably be seen that the Carboniferous portion of the Carboniferous
of New Zealand consists of two systems, a New Zealand Permian, and of the Wairau
series, which is Triassic.

New Zealand includes representatives of all the three Mesozoic
systems. The Hokanui group comprises the Triassic Wairoa and
Otago beds, and the Jurassic Aorangi and Manapouri beds, which
includes marine limestones characterized by Mototis salinarum, and
the Otapara series is characterized by Spiriferina spatulata. The
Mataura beds are largely of estuarine formation; they contain oil
shales and gas seeps.
The Cretaceous system includes the Waipara series, a belt of chalky
limestones with some phosphate beds at Clarendon in eastern Otago.
Their fossils include belneymites, ammonites, scaphites and marine
saurians, such as Cimlokiosaurus. These Cretaceous limestones are
interbedded with glauconitic greensands, as at Moeraki Point in
eastern Otago. The second type of Cretaceous is a terrestrial
formation, and is important as it contains the rich coal seams of
Greytown, Westport and Seddonville, which yield a high quality
of steam coal. Cretaceous coals have long been worked in the North
Island, north of Auckland, on the shores of the Bay of Islands, where
the age of the coal is shown by its occurrence under the Whangarei
or Waimio limestone.

The Cainozoic system is represented by Oligocene, Miocene,
Pliocene and Pleistocene beds. The best-known Oligocene rocks
are the limestones of Oamaru and the brown-coal measure of
Waiato. The Oamaru limestones have been largely used for
building stones; they are a pure white limestone, largely made up of
granifera, bryozoa and shell fragments, and contain the teeth of
sharks (e.g. Carcharodon) and of toothed whales such as Squidodon
serratus. In southern Otago the Oligocene beds are brown coals
and lignites with oil shales, which, at Orepuki, contain 47% of oil
and gas, with 8% of water. The Miocene Pareora beds occur to
the height of 3000 or 4000 ft. above sea-level, in both the
North and South Islands. Some of its fossils also occur in the
Oamaru series, but the two series are unconfornmy. In Westland
the Miocene includes the Moutere gravels, which rest on the summit
of Mount Greenland, 4900 ft. above sea-level.

Marine beds of the Pliocene are best developed in the Wanganui
basin. They consist of fine clays with nodular calcareous concretions
rich in fossils. The Pleistocene system in the South Island includes
glacial deposits, which prove a great extension of the New Zealand
glaciers, especially along the western coast. The glaciers must have
reached the sea at Cascade Point in southern Westland. On the
eastern side of the Alps the glaciers appear to have been confined to
the mountain valleys. The Pleistocene glacial deposits are rich in
the bones of the moa and other gigantic extinct birds, which lived on
until they were exterminated by the Maori. The Cainozoic volcanic
history of New Zealand begins in the Oligocene, when the highest
volcanic domes of Dunedin and Banks Peninsula were built up.
The Dunedin lavas including tephrites and kenyrites correspond to
desite eruptions in the volcanic history of Victoria. The building
up of these domes of lavas of intermediate chemical type was followed by
the eruption of sheets of andesites and rhyolites in the Thames

New Zealand

Goldfield and the Taupo volcanic district. The volcanic activity of the Taupo district lasted into the Pleistocene, and the last eruptions contributed many of its chief geographical features.1

Climate.—Diversity of level and latitude cause many varieties of climate in the South Island provinces. The height and regularity of the mountain backbone increase the diversity. Only one pass, the Waiau (1716 ft.), crosses from Fife to Haast at a height of more than 5000 ft. In the west coast the climate resembles nothing in the British Islands so much as Cork and Kerry, for there are the same wet gales from a western ocean, the same clouds gathering on the dripping sides of wild mountains, an equal absence of severe frosts and hot sunshine, and a rich and evergreen vegetation. Elsewhere, sheltered Nelson has a more genial air than the Wellington district of Cook Strait. Foveaux Strait is as cold and windy as the Strait of Dover. The Canterbury plain has but 26 ins. of annual rainfall, less than a fourth of that along the western littoral. Very seldom indeed is moisture excessive in the eastern half; there is even a deficiency in unfavourable years, and dry, warm winds do damage to crops. Insect life is relatively not abundant; the air is brisk and bright with ample sunshine. The snow-line, which is at 3000 ft. on the eastern flank of the Alps, is 3700 ft. on the western.

The healthiness of the New Zealand climate in all parts is attested by the death-rate, which, varying (1856-1900) from 9 to 10 per 1000, is the lightest in the world. In 1896 it was as low as 9-10. In 1907, however, it was 10-91, the highest figure since the year 1856; from 1870 to 1896 the deaths were lower.

The rainfall in most of the settled districts ranges from 30 to 50 ins. a year. Meteorological statistics are collected at Auckland, Wellington, Christchurch, and Dunedin and eight other stations; and observations of rainfall, temperature, and wind-directions are received from eighteen stations of the second order. From the data thus obtained an isobaric map and a report are prepared for each day; and weather warnings are telegraphed to any part of the coast when necessary.

A system of inter-colonial weather exchanges has been agreed upon, and telegrams are daily exchanged between Sydney and Wellington.

Flora.—There are about one thousand species of flowering plants, of which about three-fourths are endemic. Most of those not peculiar to the country are Australian; others are South American, European, African; and some have Polygonum and other cryptogamic plants in great variety and abundance. The New Zealand flora, like the fauna, has been the subject of many investigations, and the more conspicuous flora differs very greatly from that of Australia, Polynesia, and temperate South America, and helps to give to the scenery a character of its own.

The New Zealand vegetation occupies the more than half the surface of the archipelago covered with dense, evergreen forest, a luxuriant growth of pines and beeches, tangled and intertwined with palms, ferns of all sizes, vines and other parasites, and a rank, bushy, mossed undergrowth. Though much of the timber is of commercial value—notably the kahikatea, totara, puriri, rimu, matai and kahikatea—this has not saved the forests from wholesale, often reckless, destruction. Two-fifths perhaps have already disappeared, and it is probable that in fifty years the only large tracts still standing will be sub-alpine woods and in state reserves. Meanwhile charred and rotted stumps give a melancholy and undutiful air to valleys and denuded hillsides, for instance, in the district near New Zealand trees are hard-wooded and take more than a generation to decay utterly. Compelled by the windy climate the colonists are doing something to repair these ravages. The plantations near Wellington, Cu-mara, and Australian and American trees; but it is only in the naturally open and grassy parts of the east and south-east that settlement as yet improves the landscape. There, before the colonists came, wide sweeps of dull green bracken or wiry yellow-green tussocks seemed bleak and monotonous enough. The swamps covered with flax and giant bulrushes were often deemed to be the eye sheets of golden-plumed toto-406, a kind of pampas grass.

Fauna.—The destruction of the forest is telling fatally on the

increase in New Zealand is over 17. To that, and to the annual gain by immigration, the fairly rapid rate of increase is due. Between 1885 and 1891 the colony lost more than it gained overseas; but from 1892 to 1908 the gain by immigration was 90,000. Probably, at least half of those represented Australians, immigrants who expect years of drought. England and Scotland supply the bulk of the remainder. The government has aided immigrant farmers and farm labourers having a certain sum of money, also female domestics, by paying part of their passage money.

The people of colour in 1906 numbered 53,000, including 2,000 Chinese and 6,000 Maori half-castes. An apparent increase of 7000 in the Maori and half-castes between 1891 and 1906 is, perhaps, partly due to more accurate computation. It seems probable that the number of Maori and half-castes taken together is about the same as it was thirty years ago, though the infusion of white blood is larger. The Public Health Department has exerted itself to improve the sanitation of native villages and combat the mischievous trickery of Maori wizards and "doctors."

Wealth.—The increase of wealth went on after 1879 in spite of dull times, and was only checked by the extraordinary depression of 1893 and the Australian and the Australian panic. The estimated private wealth of colonists fell from £236 per head in 1890 to £219 in 1895. It was computed in 1905 to have increased to £320. After deducting debts, the wealth of the public and private wealth of the colony is calculated to be about £420,000,000.

Of the five banks of issue doing business in the dominion three are situated in the island of South Island. The deposits of the three are £21,000,000 in 1907, as against £12,250,000 in 1892. At the same date more than £10,000,000 stood to the credit of small depositors in post office and private savings banks, nine-tenths in the former. The gross amount insured by policies in life insurance offices (ordinary and industrial) was over £29,000,000, of which the state office claimed two-fifths.

The annual export of sea-trade in recent years is shown by the larger size of the ocean-going vessels trading with the colony. The number of these only advanced from 598 to 629 between 1896 and 1906. But the increase of tonnage in the eleven years was from 61,230,000 tons to 121,140,000 tons. The coasting trade and trade with Australia are carried in New Zealand-owned vessels.

External trade has risen from £13,111,000 in 1887 to £27,377,000 in 1907. Before 1886 exports exceeded imports; but in the twenty subsequent years there was an invariant excess of exports, valued in all at £52,000,000.

The wool trade is stationary and extremely small. Trade with the United States grew from £877,000 in 1891 to £3,140,000 in 1907. Thanks to the tariff of the United States the balance of trade with North America is heavily against New Zealand. The same disparity exists between New Zealand and Germany (1879 £60,000; 1886 £29,000; 1891 £52,000; 1896 £40,000; 1899 £42,000) and France (1879 £40,000; 1886 £24,000; 1891 £59,000; 1896 £80,000). In 1870 the country had a trade surplus of £200,000 with the United Kingdom; the latter's share in 1906 was £26,811,000 of the whole.

Production.—Wool: (4,250,000 to 7,057,000 according to prices) remains at the head of the list of exports. The quantity grown increased by 70% in the twenty years 1887-1906. Moreover the export of sheep skins and pelts was valued at £680,000 in the last-mentioned year. But the description changes; there is much less merino, and more of the coarser and longer cross-bred. The number of sheep has increased from 16,364,000 in 1886 to 22,000,000 in 1908, though the increase has been almost all in North Island. The number of the flocks grows, and the average size diminishes ever more rapidly. The number of sheep and lambs was estimated in 1889 at 18,500—average size of each flock about 1050. The smaller size of the flocks and the breeding of sheep for meat rather than for wool, the cultivation of English grasses and of extensive sprays of clover (carried on only on rich lands), have all tended to change sheep-farming from the mere grazing of huge mobs on wide, unimproved runs held by pastoral licences. The "squatters" still occupy about half the land, but the area is less partitioned than in former days. How much more extensive is grazing—of the more scientific order—than agriculture, is seen at once from the figures of the amount of land broken up, for crops or other purposes, and the amount under English grasses. There were about 1,600,000 acres under crop in 1899. This is exclusive of the vast area of native-grass land. The area now occupied and utilized by whites is estimated at 29,000,000 acres. The character of the soil and the moist cool climate enable English grasses to be sown almost everywhere, and 13,000,000 acres are now laid down with these. The result is seen in the price obtained for New Zealand sheep in Smithfield Market, which is from 4d. to 1d. per lb higher than that given for frozen mutton from other countries. The figures below show the growth of the trade.

Four-sevenths of the coal is bituminous.

1 Excluding Coal for Fuel by Ocean Steamers.

Excelling as the quality of the best New Zealand coal is, the cost of mining and shipping it prevents the growth of any considerable export trade. Silver is chiefly extracted in the Thames district, but other mines containing silver ores have been found. There are many other valuable ores—copper, iron, lead, zinc, antimony, chrome and manganese. Petroleum springs have been tapped near New Plymouth. Building stones of various kinds and of excellent quality abound. Marble and cement stones occur in many places. There are extensive deposits of Kauri gum on the most easterly coast of the North Island, and of iron ore at Parapara in Nelson.

Manufactures.—Protected by a tariff wall which was repeatedly heightened between 1879 and 1907, manufactures made considerable progress. At the end of 1893 there were about 22,000 work people being employed in 1946 workshops, and the aggregate output was valued at six millions and three-quarters. Twenty years later the number of establishments had increased to the number of hands 50,000, and the output twenty-three millions and a half. A small deduction should be made from this apparent increase to allow for a changed system of classification. Male factory hands greatly outnumbered female, upper Thames. The number of persons employed grew from 1893 and 1896 wages fell. Between 1895 and 1906 they rose 15% on the average among males of all ages, and as much as 30% among women and girl workers. The disproportionate rise in the case of females is probably due to the policy of that side of the industry. The chief factory industries come under the following heads: meat-freezing and tallow; tanning and wool-scouring; flax mills, saw-mills and grain-mills; boots and shoes; woollen and clothing; butter and
cheese; breweries; printing houses; foundries; agricultural implement and machine shops; soap and candle works; coach-building and furniture; gas-works. Except in meat-freezing, wool-scouring, buttermaking, etc., the labour of children or child-manufacturing is almost entirely for consumption within the colony.

Government.—New Zealand was not colonized in the ordinary manner around one centre. There were in its early years six distinct settlements—Auckland, Wellington, Nelson, New Plymouth, Canterbury and Otago—between which communication was for several years irregular and infrequent. To meet their political wants the Constitution Act of 1852 created them into provinces, with elective councils and superintendents respectively. An Act of 1867, which united the provincial councils, established for the provincial system was abolished. The general assembly, as it is called, is composed of the governor, the legislative council, and the House of Representatives. The governor is appointed by the crown, but his salary, £7500, is paid by the colony. The legislative council consists of members appointed for seven years by the governor in council; the number of legislative councillors stays at or near forty-five. The House of Representatives consists of eighty members chosen by the electors. The members of both houses are paid. The franchise is adult suffrage, and women have it in the same degree as the men. At a rate per annum, including six months in the electoral district for which a claim to vote is registered. Each elector is qualified for election. Four members of the house must be Maori elected by their own race. The duration of the house is for three years, but it is subject to re-election whenever the governor dissolves the general assembly. Legislation is subject to disallowance by the crown, but that power is seldom exercised. Executive administration is conducted on the principle of English responsible or parliamentary government. The government is represented in England by a high commissioner. Local administration is vested in local elective bodies, such as municipal councils, county councils, road boards, harbour boards, charitable aid boards, and others, with power to levy rates. The colonial revenue is chiefly derived from customs, stamp duties, land tax, income tax, beer excise, postal and telegraphic services, railways, and crown land sales and rents. The proceeds of land sales are applied to surveys and public works. Customs duties, railways and stamps are by far the most important sources of revenue. They yielded £3,105,000, £2,765,000 and £2,355,000 respectively out of a total revenue of £6,056,000 in the financial year 1907-1908. The gross public debt had reached £66,500,000 in 1908. The money has chiefly been spent on railways, telegraphs, roads, bridges, land purchase from the native tribes and private estate owners, on loans to settlers and on native wars. The state railways (2500 m.) return about £600,000 after paying working expenses. This does not quite defray the interest on the cost of their construction and equipment, inasmuch as it barely comes to 3½% thereon, but rates and fares are deliberately kept low to encourage settlement and commerce.

Education.—Under the Education Act of 1877 state schools are established, in which teaching is free, secular and compulsory, with certain exceptions, for children between the ages of seven and thirteen. A capitation grant is given for every child in average daily attendance at the school. Grants are also made for scholarships from primary to secondary schools, for training institutions for teachers and for school buildings. Large reserves of public lands have been made for primary, secondary and university education. All primary and some secondary public schools are controlled by provincial education boards elected by school committees of the parents of pupils. The percentage of attendance has dwindled that in the last thirty years attended by state and native children. Native village schools are also provided by the state in native districts. There are, moreover, industrial schools, orphanages and institutions for unwed mothers and for the deaf and dumb and blind. There are also about ninety secondary schools, scattered throughout the country by the education endowments. The University of New Zealand is an examining body, and grants honours, degrees and scholarships. It is empowered by royal charter to confer degrees entitled to rank and consideration throughout the British dominions, as fully as if they were granted by any university in the United Kingdom. Colleges in the four chief towns and in Nelson are affiliated to the New Zealand University, which has about fifteen hundred undergraduates keeping terms. The state in no way controls or interferes with religious administration. Each denomination attends to the religious instruction of its own adherents. State school buildings can be, and sometimes are, used for religious instruction on days and hours other than those fixed by the governing body of the school, but no child can be required to attend, except at the wish of its parent or guardian. The government spends £350,000 a year on manual and technical instruction, and an average number of two hundred and fifty new classes are opened each year. The conditions of admission are the possession of an elementary degree and proof of control in writing. A school of engineering and an agricultural college are attached to the university college in the province of Canterbury, and there are several schools of mines elsewhere. There are about one hundred and twenty schools and colleges of one degree or another. Private schools claim about 10% of these. The annual parliamentary expenditure on education exceeds £700,000. In this connexion it may be claimed that the proportion of policemen to population (1 to 1375) is lower in New Zealand than in any other colony. The fixing of the legal minimum "factory age" for children at fourteen undoubtedly favours schools and the like.

Land.—Apart from gold-mining, coal-mining and gum-digging, the industries are still mainly the growing of food and raw material; and the occupation of the land is easily the chief of all economic pursuits. On the sixteenth of May 1840 the Legislature of New Zealand passed the Land Act, by which the crown, as against about six million acres rented from the state on permanent leasehold. Crown lands are still alienated, though but little is now sold for cash outright. The number of holdings of one acre and upwards is 11,000, and the area comprised is 25,837,539, and 72,335 in 1906; but the area held in estates of 5000 acres and upwards remains very large and has diminished but slowly despite the conversion of the great tithings of the early days into settlements or in settling lands have been tried. The best known of these, perhaps, is the repurchase of large pastoral estates for subdivision and lease in perpetuity. In the fourteen years 1893-1907 about a quarter million acres were bought under the Land Act, and were held under five millions and a half. Over 13,000 souls had been settled in this area, and the yearly rent received from them, about £200,000, with a substantial balance to the credit of the enterprise in the books of the New Zealand government. On the average, these settlers (who were encouraged with good years) were with very few exceptions prospering.

Old Age Pensions.—The Old Age Pensions law, enacted in 1898, provides that the first pension, amounting to £5 a year, to persons of sixty-five years and upwards who had lived for twenty-five years in the colony. Pensioners must be British subjects, poor, and not ex-criminals or of notoriously bad character. In 1905 the maximum pension was raised to £5 a year. Official figures show that the total number of applications for pensions up to that date had been 31,271, of which 23,877 had been granted. The number of pensioners then on the books of the Pensions Office was 13,257. In the three years after enactment of the law the number of pensioners was very rapid; in the next five it was remarkably slow—only 871 altogether. The proportion of whites capable of age and health for pension was 12½, or rather less than one-third (it had been 9¾% more in 1902). The reduction was due to stricter administration. Operations during the first year, a total sum paid out in eight and a quarter years had been a million and three quarters. The amount paid out on a half million and three quarters on the 1st of October, 1907, was £325,000. The money is found by the central government. The administration of the system, which is in the hands of a special department, costs a little over £5000. Frauds and evasions by applicants and pensioners, though they exist, are not believed to be numerous. Public thrift does not, so far, seem to have been diminished. Since the coming of the system the amount spent on outdoor relief in the colony had by 1906 diminished from £51,000 to £36,500, in face of an increase of nearly 25% in the population.

History.—The date, even the approximate date, of man's arrival in New Zealand is uncertain. All that can be safely asserted is that by the 14th century A.D. Polynesian canoe-men had reached its northern shores in successive voyages. By 1642 they had spread to South Island, for there Abel Jansen Tasman found them when, in the course of his circuitous voyage from Java in the "Heemskirk," he chanced upon the archipelago, coasted along much of its western side, though without venturing more than a few miles within it. It gave its name to the native children of the canoe. Cook, in the years thirty-seven years later, in the "Endeavour," gained a much fuller knowledge of the coasts, which he circumnavigated, visited again and again, and mapped out with fair accuracy. He annexed the country, but the British government disavowed the act. After him came other navigators, French, Spanish, Russian and American; and, as the 18th century neared its end, came sealers, whalers and trading-schooners in quest of flax and timber. English missionaries, headed by Samuel Marsden, landed in 1814, to make for many years but
slow progress. They were hindered by murderous tribal wars in which imported muskets more than decimated the Maori. Still, cruel experience and the persevering preaching of the missionaries gradually checked the fighting, and by the year 1839 it could be claimed that peace and Christianity were in the balance fairly between the whites and the Maori. Lord Chatham had resisted the considerable pressure brought to bear in Downing Street in favour of annexation. In vain Edward Gibbon Wakefield, organizer of colonizing associations, prayed and intrigued for permission to repeat in New Zealand the experiment tried by him in South Australia. Lord Glenelg, the colonial minister, had the support of the missionaries in withstanding Wakefield’s New Zealand Company, which at length resolved in desperation to send an agent to buy land wholesale in New Zealand and despatch a shipload of settlers thither without official permission. Before, however, the “Topi” had thus sailed for Cook Strait, it had become known to the English government that a French colonizing company—La Compagnie Nanto-Bordelaise—was forming, under the auspices of Louis Philippe, to anticipate or oust Wakefield. Further obstruction was manifestly futile, and the British authorities reluctantly instructed Captain Hobson, R.N., to make his way to northern New Zealand with a dormant commission of lieutenant-governor in his pocket and authority to annex the country to Australia by peaceful arrangement with the natives. Hobson landed in the Bay of Islands on the 22nd of January 1840, hailed the Union Jack, and had little difficulty in bringing the majority of the native chiefs to accept the queen’s sovereignty at the price of guaranteeing to the tribes by the treaty of Waitangi possession of their lands, forests and fisheries. Some French settlers, conveyed by a man-of-war, reached Akaroa in South Island in the May following. But Hobson had forestalled them, and those who remained in the country became British subjects. Meanwhile, a week after Hobson’s arrival, Wakefield’s colonists had sailed into Port Nicholson, and proposed to take possession of immense tracts which the New Zealand Company claimed to have bought from the natives, and for which colonists had in good faith paid the company. Other bands of company’s settlers in like manner landed at Nelson, Wanganui and New Plymouth, to be met with the news that the British government would not recognize the company’s purchases. Then followed weary years of ruinous delay and official inquiry, during which Hobson died after founding Auckland. His successor, Fitzroy, drifted into an unsuccessful native war. A strong man, Captain Grey, was at last sent over from Australia to restore peace and rescue the unhappy colony from bankruptcy and despair. Grey, much the best of the absolute governors, held his command between 1842 and 1849, and during the last years of his administration he bought large tracts of land for colonization, including the whole South Island, where the Presbyterian settlement of Otago and the Anglican settlement of Canterbury were established by the persevering Wakefield.

In 1852 the mother-country granted self-government, and, after much wrangling and hesitation, a full parliamentary system and a responsible ministry were set going in 1856. For twenty years thereafter the political history of the colony consisted of two long, intermittent struggles—one constitutional between the central government (first at Waitangi and Auckland in 1840) and the powerful provincial councils, of which there were nine charged with important functions and endowed with the land revenues and certain rating powers. The other prolonged contest was racial—the conflict between settler and Maori. The native tribes, brave, intelligent and fairly well armed, tried, by means of a league against land-selling and the election of a king, to retain their hold over at least the central North Island. But their kings were incompetent, their chiefs jealous and their tribes divided. Their style of warfare, too, caused them to throw away the immense advantages which the broken bush-clad island offered to clever guerrilla partisans. They were poor marksmen, and had but little skill in laying ambuscades. During ten years of intermittent marching and fighting between 1861 and 1871 the Maori did no more than prove that they had in them the stuff to stand up against fearful odds and not always to be worsted. Round Mount Egmont, at Okauku, at Tauranga and in the Wanganui jungles, they more than once held their own against British regiments and colonial riflemen. The storming of their favourite positions—stockades strengthened with Rifo-beds—was often costly; and a strange anti-Christian fanaticism, the Hau-Hau cult, encouraged them to face the white men’s bullets and bayonets. But even their fiercest fighting leaders, Rewi and Te Kooti, scarcely deserved the name of generals. Some of the best Maori fighters, such as the chiefs Ropata and Kemp, were enlisted on the white side, and with their tribesmen did much to make unequal odds still more unequal. Had General Pratt or General Cameron, who commanded the imperial forces from 1860 to 1865, had the rough vigour of their successor, General Chute, or the cleverness of Sir George Grey, the war might have ended in 1864. Even as it was the resistance of the Maori was utterly worn out at last. After 1871 they fought no more. The colonists too, taught by the sickness delay and the ruinous cost of the war to revert to conciliatory methods, had by this time granted the natives special representation in parliament. A tactful native minister, Sir Donald McLean, did the rest. Disarmament, roads and land-purchasing enabled settlement to make headway again in the North Island after twelve years of stagnation. Grey quarrelled with his masters in Downing Street, and his career in the imperial service came to an end in 1868. His successors, Sir George Grey and Sir Robert Brown, with the aid of the authorities in London, were content to be constitutional governors and to respect strictly the bethes of the colonial office. Meanwhile the industrial story of New Zealand may be summed up in the words wool and gold. Extremely well suited for sheep-farming, the natural pastures of the country were quickly parcelled out into huge pastoral crown leases, held by prosperous licensees, the squatters, who in many cases aspired to become a county gentry by turning their leases into freeholds. So profitable was sheep-farming seen to be that energetic settlers left the island to form New Zealand’s dependencies in the Cook Islands and New South Wales. But gold was at first so attractive that it brought many thousand diggers to the colony, most of whom stayed there. Pastoral and mining enterprise, however, could not save the settlers from severe depression in the years 1867 to 1871. War had brought progress in the north to a standstill; in the south wool-growing and gold-mining showed their customary fluctuations. For a moment it seemed as though the manufacture of hemp from the native Phormium tenax should become a great industry. But that suddenly collapsed, to the ruin of many, and did not revive for many years.

In 1870 peace had not yet been quite won; industry was depressed; and the scattered and scanty colonists already owed seven millions sterling. Yet it was at this moment that a political financier, Sir Julius Vogel, at that moment colonial treasurer in the ministry of Sir William Fox, audaciously proposed that the central government should borrow ten millions, make roads and railways, buy land from the natives and import British immigrants. The House of Parliament, the marquis of Raglan, presently voted four millions as a beginning. Coinciding as the carrying out of Vogel’s policy did with a rising wool market, it for a time helped to bring great prosperity, an influx of people and much genuine settlement. Fourteen millions of borrowed money, spent in ten years, were on the whole well
laid out. But prosperity brought on a feverish land speculation; prices of wool and wheat fell in 1879 and went on falling. Faulty banking ended in a crisis, and 1879 proved to be the first of sixteen years of almost unbroken depression. Still, eight prosperous years had radically changed the colony. Peace, railways, telegraphs (including cable connexion with Europe), agricultural machinery and a larger population had carried New Zealand beyond the primitive stage. The provincial councils had been swept away in 1876, and their functions divided between the central authority and small powerless local bodies. Politics, cleaved off from the cross-issues of provincialism and Maori warfare, took the usual shape of a struggle between wealth and radicalism. Sir George Grey, entering colonial politics as a Radical leader, had appealed eloquently to the workpeople as well as to the Radical "intellectuals," and though unable to retain office for very long he had compelled his opponents to pass manhood suffrage and a triennial parliament act. A national education system, free, non-religious and compulsory, was established in 1877. The socialistic bent of New Zealand was already discernible in a public trustee law and a state life insurance office. But the socialistic enthusiasts were not so much a matter of strength with Grey. He proved himself a poor financier and a tactless party leader. A land-tax imposed by his government helped to alarm the farmers. The financial collapse of 1879 left the treasury empty. Grey was manœuvred out of office, and Sir John Hall and Sir Harry Atkinson, able opponents, took the reins with a mission to reinstate the finances and restore confidence.

Roughly speaking, both the political and the industrial history of the colony from 1879 to 1908 may be divided into two periods. The dividing line, however, has to be drawn in different years. Sixteen years of depression were followed, from 1895 to 1908, by thirteen years of great prosperity. In politics nearly twelve years of Conservative government, or at least capitalistic predominance in public affairs, were succeeded by more than seventeen years of Radicalism. Up to January 1891 the Conservative forces which overthrew Sir George Grey in 1879 controlled the country in effect though not always in name, and for ten years progressive legislation was confined to a mild experiment in offering crown lands on perpetual lease, with a right of purchase (1882), a still milder instalment of local option (1881) and an inoffensive Factories Act (1886). In September 1888, however, Sir George Grey succeeded in getting parliament to abolish the contract service, the last remainder of pluri-voting. Finance was otherwise absorbed attention; by 1888 the public debt had reached £25,000,000, against which the chief new asset was 1300 m. of railway, and though the population had increased to nearly half a million, the revenue was stagnant. A severe property-tax and an increase of customs duties in 1879 only for a moment achieved financial equilibrium. Although taxation was seconded by a drastic, indeed harsh, reduction of public salaries and wages (which were cut down by one-tenth all round) yet the years 1884, 1887 and 1888 were notable for heavy deficits in the treasury. Taxation, direct and indirect, had to be further increased, and as a means of gaining support for this in 1888 Sir Harry Atkinson, who was responsible for the budget, gave the customs tariff a distinctly protectionist complexion.

During the years 1879-1890 the leading political personage was Sir Harry Atkinson. He, however, withdrew from party politics when, in December 1890, he was overthrown by the Progressives under John Ballance. Atkinson's party never rallied from this defeat, and a striking change came over public life, though Ballance, until his death in April 1893, continued the prudent financial policy of his predecessor. The change was emphasized by the active intervention of plural voting. In politics the trade unions. These bodies decided in 1889 and 1890 to exert their influence in returning workmen to parliament, and where this was impossible, to secure pledges from middle-class candidates. This plan was first put into execution at the general election of 1890, which was held during the industrial excitement aroused by the Australasian maritime strike of that year. It had, however, been fully arranged before the conflict broke out. The number of labour members thus elected to the general assembly was small, never more than six, and no independent labour party of any size was formed. But the influence of labour in the Progressive or, as it preferred to be called, Liberal party, was considerable, and the legislative results noteworthy. Ballance at once raised the pay of members from £150 to £240 a year, but otherwise directed his energies to constitutional reforms and social experiments. These did not interfere with the general lines of Atkinson's strong and cautious finance, though the first of them was the abolition of his direct tax upon all property, personal as well as real, and the substitution therefor of a land tax, half of which was to be in the £ on unimproved land values, and also of a graduated tax upon unimproved land values, and an income-tax also graduated, though less elaborately. The graduated land-tax, which has since been stiffened, rises from nothing at all upon the smaller holdings to 3d. in the £ upon the capital value of the largest estates—those worth £210,000 and upwards. Buildings, improvements, and live stock are exempted. In the case of mortgaged estates the mortgagor is exempted from ordinary land-tax in proportion to the amount of his mortgage. On that the mortgagee pays at the rate of 2d. in the £. In 1896 municipal and rural districts were not left without improved land values if authorized to do so by a vote of their electors, and by the end of 1901 some sixty bodies, amongst them the city of Wellington, had made use of this permission. The income-tax is not levied on incomes drawn from land. In 1891 the tenure of members of the legislative council or nominated Upper House, which had hitherto been for life, was altered to seven years. In 1892 a new form of land tenure was introduced, under which large areas of crown lands were leased for 999 years, at an unchanging rent of 4% on the average value. Crown tenants under this system had no right of purchase. In the same year a law was also passed authorizing government to repurchase private land for closer settlement.

On Ballance's sudden death in April 1893 his place was taken by Richard Seddon, minister of mines in the Ballance cabinet, whose first task was to pass the electoral bill of his predecessor, which granted the franchise to all adult women. This was adopted in September 1893, though the majority for it in the Upper House was but two votes. In 1893 was enacted the Alcoholic Liquor Control Act, greatly extending local option. In 1894 was passed the Advances to Settlers Act, under which state money-lending to farmers on mortgage of freehold or leasehold land was at once begun. The money is lent by an official agent, which deals with applications and manages the finance of the system. In thirteen years the board lent out over five millions and a half, and received repayment of nearly two millions of principal as well as over one million in interest at 5%. Borrowers must repay 3% of their principal half-yearly, and may repay as much more as they choose. Profits are paid over to an assurance fund. No losses were incurred during the thirteen years above mentioned. The net profit made by the board in 1906 was £145,000. The same year also saw the climax of a series of laws passed by the Progressives affecting the relations of employers and workmen. These laws deal with truck, employers' liability, contractors' workmen, the recovery of workmen's wages, the hours of closing in shops and merchants' offices, conspiracy amongst trade unionists, and with factories, mines, shipping and seamen. In 1895 a law controlling servants' registry offices was added. In 1897 all shipowners engaging in the coasting trade of the colony were compelled to pay the colonial rate of wages.

Meanwhile the keystone of the regulative system had been laid by the passing of the Industrial Conciliation and Arbitration Act, under which disputes between employers and unions of workers are compulsorily settled by state tribunals; strikes and lock-outs are virtually prohibited in the case of organized workpeople, and the conditions of employment in industries may be, and in many cases are, regulated by public boards and courts. The years 1896, 1897 and 1898 were marked by struggles over the Old Age Pensions Bill, which became law in November 1898. In 1898 the divorce law was amended on the lines of the Stephen Act of New South Wales, a change which helped to treble the number of petitions for divorce in the next seven years. In 1898 also the
municipal franchise, hitherto confined to ratepayers, was greatly widened; in 1900 the English system of compensation to workmen for accidents suffered in their trade was adopted with some changes, one of the chief being that contested claims are adjudicated upon cheaply and expeditiously by the same arbitration court that decides industrial disputes. In 1895 borrowing on a large scale was followed, and twelve years later the debt stood at £1,000,000, to be reduced to £500,000 by 1904.

New Zealand, with its large number of unemployed, was one of the first to organize a government insurance office in 1899, the year that the Bill was passed in 1897.

The outbreak of the Boer War in October 1899 was followed by a large increase in the colony's exports; the war lasted until 1902, and in that year the Bank of New Zealand opened its doors.

The Bank of New Zealand was established in 1855 as a joint stock bank, and it remained in that form until 1907, when it became a registered bank.

The Bank of New Zealand has been one of the leading institutions in New Zealand, and its history has been marked by many changes and developments.

NEXT FRIEND

The governor's salary, reduced in 1887, was restored to £7,500 a year in 1900. An Immigrants' Exclusion Act was passed by the general assembly in 1886, but it did not receive the royal assent; but, by arrangement with the colonial office, another measure, giving power to impose a reading test on aliens landing in the colony, became law in 1899.

The New Zealand franchise was first extended to women in 1919, and in the same year the first woman member of the House of Representatives was elected. The first woman member of the House of Commons was elected in 1922.

The New Zealand Expeditionary Force was sent to the South African War in 1901, and in the same year the first woman member of the House of Representatives was elected.
as if he were an ordinary plaintiff, but he is not entitled to be heard in person.

NEY, MICHEL, duke of Elchingen, prince of the Moskowa (1759–1815), marshal of France, was born at Saarlouis on the 10th of January 1769. His father was a cooper, and he received only a rudimentary education. In 1788 he went to Metz and enlisted in a regiment of hussars; in 1792 he was elected lieutenant; and in 1794 he became captain and was placed by Kléber at the head of a special corps of light troops. He was soon promoted chef de brigade, and in 1796, after repeatedly distinguishing himself in action, general of brigade. He then commanded the right wing of Hoche's army on the Rhine. At the battle of Jena on 14th October 1799 he was mortally wounded and in his surprise of Mannheim in 1799 received the grade of general of division. He distinguished himself and received three wounds in the Swiss campaign of Masséna, and when Masséna turned against the Russians, who were approaching from Italy, Ney was left in command of the holding detachment opposite the Austrians. He displayed great vigour and skill in this work, and was completely successful, although his opponent was the famous Archduke Charles. In 1800 he was present at Hohenlinden. In May 1800 he was on the Rhine and凤凰, August, where his yon the front of Bonaparte's operations in Italy.

This event marks a change in Ney's political opinions which can only be explained by reference to Napoleon's power of captivating men. He was henceforward as ardent and sincere an admirer of Napoleon as hitherto he had been of revolutionary principles, and was one of the very few officers of the Army of the Rhine who became a trusted lieutenant of the emperor. He soon afterwards carried out an important diplomatic mission in Switzerland, and in 1803 he was placed in command of the camp of Montreuil. It was while there that, in the name of the army, he begged Napoleon to declare himself emperor and on the establishment of the empire he was made marshal of France, and received the grand eagle of the Legion of Honour. In 1805 he commanded the VI. corps of the Grand Army, and his great victory at Elchingen (for which in 1808 he was made duke of Elchingen) practically secured the surrender of the Austrians at Ulm. He was then ordered to the upper Adige, and missed the battle of Austerlitz, but was present at Jena and Eylau and led the decisive attack at Friedland. His reputation for personal heroism was by now at its height, and after Friedland Napoleon gave him the title by which he is still known, "the bravest of the brave."

In 1808, after the first disaster to the French armies in Spain, Ney accompanied Napoleon thither as commander of the VI. corps. He took part in the Peninsula War from 1808 to 1811, commanding his corps in Napoleon's own operations of 1808–09, in the irregular operations of Galicia 1809–10, and under Masséna in the invasion of Portugal in 1810–11. In the last, however, he quarrelled bitterly with his former chief, and although he distinguished himself very greatly in command of the rearguard during the retreat from Torres Vedras—notably at Redinha—he was recalled to France by Napoleon and censured for his indiscretion. Almost immediately, however, he was re-employed with the Grande Armée in central Europe under Napoleon himself. In the 1812 expedition to Russia Ney commanded the centre at Borodino, and was created prince of the Moskova on the evening of the victory. In the retreat he was a tower of strength, animating the rearguard with his own sublime courage, keeping the harassed and famished soldiers together under the colours and personally standing in the ranks with musket and bayonet. He was the last to retreat from the frontier, and threw the remaining muskets into the Niemen. In 1813 he commanded a corps in the German campaign, fought at Lützen, Bautzen, Dennewitz and Leipzig, and in 1814 he shared in the victories and defeats of the campaign in France. At the fall of the Empire Ney was neither the first nor the last of the marshals to give up the struggle, but that he acted in the negotiations in concert with Macdonald and Caulaincourt is sufficient proof of his desire to avert the unreserved abdication that was forced upon Napoleon by other circumstances. Less satisfactory than his conduct at this crisis was his loud protestation of devotion to the Bourbons, when the Restoration was a fait accompli. But he was soon mortified by the disdain of the returned émigrés, and retired to his country seat. While on his way thence to take up a command at Besançon, he learned of the return of Napoleon. He hurried at once to pay his respects to Louis XVIII. and to assure him of his fidelity. With the famous remark that the usurper ought to be brought to Paris in an iron cage, he proceeded to Lons-le-Saulnier to bar Napoleon's progress. But instead of doing so, he deserted with his troops, and Napoleon's march became a triumphal progress. Ney's act was undeniably wrong, and for years afterwards as a toady of Carignan, and that his émigré detractors saw fit to imagine. The first voice of his language, his ineffective efforts to make constitutional guarantees the price of his adhesion to Napoleon, and his final surrender to the dominant personality of his old leader, all show him to have been "out of his depth" in this political crisis. Napoleon received him kindly, but did not give him a command at first. But when the Waterloo campaign was about to begin he summoned Ney to the northern frontier. The marshal gladly obeyed and took up the command of the left wing on June 18th. Ney himself was, however, a leading émigré, and he took part in the campaign successively in the rôle of strategists, tactician and soldier (see WATERLOO CAMPAIGN). Much controversy has raged over his actions of the 18th and 16th of June. At Waterloo he was of course subordinated to the personal command of Napoleon, but his advice as to the conduct of the battle was often offered and sometimes accepted, and he personally led several charges of the French up to the British squares. But when all was lost, his courage, instead of burning brightly as in the Moscow retreat, was extinguished. He made no attempt to second Davout and Grouchy in the last days of Napoleon's reign, and in despair at the restoration of the Bourbons. Finding that Louis XVIII. and his allies ignored his advances, he resolved to escape from France, but afterwards, believing himself protected by the terms of the convention concluded on the 3rd of June, he gave up the idea. Soon a fresh order was issued denouncing him by name, and after a half-hearted attempt to conceal himself he was arrested on the 8th of August. King Louis and his minister Decazes realized to the full the lasting unpopularity that would fall on the monarchy in consequence; they had done their best to facilitate the escape of the "traitors", and eloquent appeal of the young duc de Broglie, the result of the trial before the latter body was a foregone conclusion; as to Ney's treason there could be no doubt, and de Broglie was alone in voting for his acquittal. In the early morning of the 7th of December 1815 Ney was shot in the Luxembourg gardens, near the Observatory. He met his death quietly and with a perfect soldierly dignity that effaced the memory of his political extravagances, and made him, next to Napoleon himself, the most heroic figure of the time. Much has been said as to
the share of the duke of Wellington in the trial and execution, and, rightly or wrongly, he has been blamed for allowing the Bourbons, when restored by the foreign bayonets that he controlled, to proscribe the soldiers who as soldiers had been included in all the old King's army.

Ney left materials for memoirs, but in an incomplete state. The Mémoires du maréchal Ney, published in 1833, were collected from these papers by his brother-in-law Gamot and by General Foix. They cover only the earlier part of his career, and end with the battle of Elchingen (October 1805). An edition in English was published the same year.

NEZ PERCÉS (in allusion to their custom of wearing nose-rings, &c.), a tribe of North American Indians of Sahaptian stock. They call themselves Shaptin (whence the stock name) but to other tribes were known as Choppunnish. Their former range was a large tract in eastern Washington and Oregon and central Idaho. Until 1837 they had been at peace with the whites. In 1857 a portion of their reservation having been taken from them, owing to the allegation that they had not contented the trappers with sufficient furs, which, two years later, caused the Nez Percés War. The disaffected portion of the tribe, numbering some 400 or 500, held out for several months against all the forces the government could bring up, but were finally captured on the Sweet Grass Hills, northern Montana. They were placed in Indian Territory, but in 1858 transferred, owing to their decrease through disease, to a healthier locality in northern Washington. The main tribe are on a reservation in northern Idaho.

NGAMI, the central point of an inland water system of South Africa, once forming a lake 20 m. long and 10 m. wide, but now little more than an expanse of reeds growing in a soft treacherous soil, below which brackish water is found. It is cut by 20°S. and 23°E. Ngami is the lowest point of a large depression in the plateau which comprises nine-tenths of Africa south of the Zambezi. The area which drains to it is bounded S. by the basin of the Orange, E. by the Matabele hills, N. by the western alluvial of the Zambezi. The greater part of the Ngami water-system lies, however, N.W. of the lake (which for convenience it may still be called) in the tableland of Angola and German South West Africa. In the high plateau of Bibe, in the hinterland of Benguela, rise two large rivers, the Okavango and the Kwito, which unite and discharge their waters into Ngami. From the N.E. end of Ngami issued the Botelle or Zuga, a stream which runs S.E. and drains towards the Makarikari marsh, from which there is no outlet.

Although Ngami has dried up since 1890 the Okavango and its tributary the Kwito remain large rivers. The Okavango is known in its upper course as the Kubango. Its most remote source lies in about 12°30' S. and 16°E. and its length is over 900 m. It flows first S., then S.E. and E. In about 18°S. and 20°E. it is joined on the north bank by the Kwito, a large navigable stream rising almost as far north as the Okavango. Its general course is S.E., but between 15° and 17° S. it flows S. and even S.W. Below the Kwito the Okavango confluent the Okavango, which is also joined by various streams from the S.W. (German territory), is a rapid stream with an average breadth of over 100 yds., and generally navigable as far as the Popa falls, in 21°50' E. In the dry season, the water-level is from 4 to 20 ft. below the banks, but these are overflowed during the rains. At this period, April-June, some of the surplus water finds its way (in about 10° S.) by the Magwekwa to the Kwanza or Linyanti (Zambesi system), to which it is conjectured, the whole body of water may have once flowed. Below the Magwekwa outlet the Okavango, now called the Tauke or Tioque, turns almost due S., enters a swampy reed-covered plain and is broken into several branches. In this region the effects of desiccation are marked. Through the swamps the river formerly entered Ngami. The last 20 m. of the old channel are now dry and devoted to grain crops. Above this point the waters of the Okavango are diverted eastward through a channel called Tamalakane to the Botelle, the river which, as stated above, formerly flowed out on the A. E., and the Botelle above this point being merely a succession of pools. Below the junction the river bed is 150 to 200 yds. wide. The banks are 25 to 30 ft. high, and form steep white walls of sand compacted with lime, behind which the dark green forest rises. The stream is fringed with reeds harbouring countless water-fowl. The Botelle, whose bed is about 100 m. in length, loses itself in a system of salt-panns—round or oval basins of varying size sunk to a depth of 30 to 45 ft. in the sandstone, and often bounded by steep banks. The outer pans are dry for a large part of the year. Next, the water system being filled only at the height of the flood-season in August. The Botelle, which receives in addition the scanty waters of the northern Kalahari, at this season reaches the Makarikari marsh. This marsh, occupying the N.E. corner of Bechuanaoland, also has feeders from the Matabele hills in the direction of Bulawayo. During the rains the marsh is converted into a large lake. Much of the water is lost by evaporation; much of it sinks into some subterranean reservoir.

The evidence of travellers is conclusive that the country around Ngami is drying up. The desiccation appears to be rapid. In 1849 Passage of the Livingstone River. Dr. Livingstone said that the Okavango formed a large method of considerable extent. Later travellers reported progressive decrease in the size of the lake and in 1896 Sir F. D. Lugard Dr. Livingstone's son, is told by the natives that the cessation of the river's flow was caused, about 1890, by a blocking of the channel by thousands of rafts.

Although the river system below the Magwekwa outlet of the Okavango is drying up, above that point there are long stretches of navigable water both on the Okavango and the Kwito, in all considerably over 1000 m. The Popa falls are the last of a series of six in a distance of 40 m., but none present serious engineering difficulties. The Magwekwa connection with the Zambezi is a mere 100 m. long, and for more than half its course flows through a deep well-defined bed with a minimum width of 100 yards. The fall to the Linyanti affluent of the Zambezi is only a few feet and the country presents no obstacles to the construction of artificial channels.

Ngami is within the British BechuanaLand protectorate, about 50 m. E. of the frontier of German South-West Africa. The district is the home of the Batawana tribe of Bechuana, with whom is stationed a European magistrate. The tribes living along the lower Okavango are tributary to the Bechuana, and the blocking of the river referred to was occasioned by their bringing to Ngami their annual tribute of corn.

See BECHUANA LAND AND KALAHARI. An account of the Ngami district was given in 1902 by the Government Printer of BechuanaLand (1902). Early books of travel consult C. J. Anderson's Lake Ngami (London, 1856) and The Okavango River (London, 1861).

NGAN-HUI (An-hwai or Gan-jhwo), an easterly province of China, which, together with Kiang-su and Kiang-si, forms the vice-royalty of Kiang-nan. It is bounded N. by Ho-nan, E. by Kiang-su and Cheh-kiang, S. by Kiang-si and W. by Hu-peh and Ho-nan. It covers an area of 48,461 sq. m., and contains a population of 23,600,000. Its principal city is Ngan-king on the Yangtsze Kiang, besides which it numbers seven other prefectural cities. One district city, Ho-fei, is noted as having been the birthplace of Li Hungchang (1822–1901). The southern half of the province, that portion south of the Yangtsze Kiang, forms part of the Nan-shan, or hilly belt of the south-eastern provinces, and produces, besides cotton, coal and iron ore, large quantities of green tea. There are also considerable forest areas. Ngan-hui is one of the most productive provinces of China. Over the whole of its southern portion tea is largely grown, notably in the districts of Hui-chow Fu, Tung-lu, Ta-tung and Wu-hu. The Yangtsze Kiang is the principal river of the province, and is of great importance for foreign commerce, supplying direct water communication between some of the principal ports of China, the districts and the neighbourhood of Hang-chow. The only other river of importance is the Hwai-ho (see CHINA : The Country). Wu-hu on the Yangtsze Kiang is the only open port in this province. From this port a railway runs S.E. to Wen-chow—an open seaport in Cheh-kiang province.
NIAGARA, a river of North America, running northward from Lake Erie to Lake Ontario, and carrying the discharge of all the Laurentian or Great Lakes, except Lake Ontario (see St. Lawrence River). It constitutes part of the boundary between the United States and Canada, separating the state of New York from the province of Ontario. It is navigable from its head to Chippawa, 16 m., and from Queenston to its mouth, 6 m. The intervening 9 m. include a series of rapids and the Falls of Niagara. On the right bank are Buffalo, Tonawanda, Niagara Falls, Lewiston and Youngstown, of New York; on the left bank, Chippawa, Niagara Falls, Queenston and Niagara-on-the-Lake, of Ontario.

The Falls of Niagara are justly celebrated for their grandeur and beauty, and are viewed every year by from 800,000 to 1,200,000 visitors. They are in two principal parts, separated by an island. The greater division, adjoining the left bank, is called the Horseshoe Fall; its height is 153 ft., and the length of its curving crest line is about 2600 ft. The American Fall, adjoining the right bank, is 162 ft. high and about 1400 ft. broad. The water, being supplied by a lake, is free from sediment, and its clearness contributes to the beauty of the cataract. In recognition of the importance of the waterfall as a great natural spectacle, the province of Ontario and the state of New York have retained or acquired title to the adjacent lands and converted them into parks, which are maintained at public expense for the convenience and pleasure of visitors. The cataract is thus a great aesthetic asset of the people of the world; but its perpetuity has been threatened because it is also a great economic asset of the bordering nations. The flow of water in the river at mean stage is 222,000 cub. ft. per second, at low stage 176,000 cub. ft. The descent of this stream at the Falls, and in the rapids just above them, affords a theoretic water power equal to nearly four million horse power, and it is estimated that three-fourths of this is practically available. The annual value of the power must be reckoned in millions of pounds sterling, at least, and possibly in tens of millions. In the utilization of this natural power a beginning has been made; about 15,000 cub. ft. of water per second are now used for the development of electric power, and much larger appropriations have been authorized. As the full development of the economic value involves the diversion of the river from its channel and the destruction of the cataract, as a scenic feature, the economic and aesthetic interests are antagonistic. An agitation started by the champions of scenic beauty led to negotiations looking to the regulation of economic exploitation by international agreement.

The river has no valley. The belt of land it crosses consists of two plains separated by a high cliff or escarpment facing towards Lake Ontario. The stream runs half its length on the upper plain, drops at the falls into a narrow gorge through which it courses 7 m. to the escarpment, and then traverses the lower plain, and the adjacent escarpment. The crest of the escarpment is a bed of limestone, nearly level, and this bed is visible in both walls of the gorge to the falls, where it is 60 ft. thick. From this firm brink the cataract plunges down into a deep pool or basin hollowed from the soft shale, and the resulting agitation causes further wear of the shale and the continual undermining of the limestone, which breaks away in blocks. Thus the site of the cataract retreats up stream and the gorge is lengthened; the average rate, measured from 1842 to 1905 being about 5 ft. a year. It is evident that the whole gorge has been dug out by the river, and many attempts have been made to determine the time consumed in the work.

The problem of the river's age is of much interest to geologists, because its solution would aid in establishing a relation between the periods and ages of geologic time and the centuries of human chronology. The great Canadian glacier, which in the late Pleistocene alternately crowded forward over the Great Lakes region and melted back again, so modified the face of the land by erosion and by the deposit of drift that the entire area had to be reconformed. The Niagara river came into existence when the waning of the glacier laid bare the western part of the Ontario basin, and the making of the gorge was then begun. If it were supposed that the lengthening of the gorge proceeded at a uniform rate, the computation would be easy, but there are various modifying conditions. (1) The limestone is not equally thick all along the gorge; in one place it is 90 ft., and in several places as little as 35 ft. (2) The height of the cataract has varied from 150 ft. to more than 300 ft. (3) For a short distance at the whirlpool the limestone and shale were replaced by softer material, sand and clay. The river here touched a more ancient gorge, which had previously been dug out and concealed by deposit of morainic drift. (4) The diagram shows the breach in the escarpment at St. Davids directed towards the sharp turn of the river gorge at the whirlpool. (5) The size of the river has varied. While the glacier was gradually melting the lakes underwent a complicated series of metamorphoses, and there were two separate epochs when the discharge from all the basins beyond Lake Erie followed other routes, and during these epochs the Niagara drained only one-eighth of its present area. The variation in the size of the river is the most important of the modifying conditions, and at the same time least amenable to computation.

Of the falls excavated by the full river are now marked by deep pools, the powerful cataract having dug far down into the shale. The parts eroded by the depleted river are comparatively narrow and shallow, the weaker cataract having been unable to clear away the low banks of the walls of the full river. The cutting of the falls by the main division of the present cataract, called the Horseshoe Fall, which wore its cliff back 335 ft. in 63 years. The work of the depleted river is less adequately represented by the narrower and shallower American Fall; where the present rate of recession is about one-twenty-fifth as fast. In making two-thirds of the gorge the full river probably consumed between 5000 and 15,000 years. If the depleted river worked one-tenth as fast, the period required for the remaining third was five times as long; but the relative rate is wholly conjectural. A weighing of the evidence now available indicates 25,000 years as a lower limit for plausible estimates of the age of the river, but yields no upper limit.

NIAGARA, FORT, an American fortification, on the E. side and at the mouth of Niagara river, opposite the Canadian village
NIAGARA FALLS—NIAM-NIAM

of Niagara, or Niagara-on-the-Lake. Fort Niagara has a reservation of 288 acres, with fairly modern equipments, several historic buildings of the time of French and of British possession, in one of which, the old magazine (1757), Williams Morgan was imprisoned in 1826. Fort Niagara was being, especially during the French occupation of Canada, one of the most important forts in North America, being the key to the Great Lakes, beyond Lake Ontario. "This immense extent of inland navigation," says Parkman, "was safe in the hands of France so long as she held Niagara. Niagara lost not only the lakes but also the valley of the Ohio was lost with it." René Robert Cavelier, Sieur de la Salle, wintered here in 1678-9, built his ship the "Griffon," and established a trading post and Fort Conti, destroyed not long afterwards. Fort Denoville, built in 1685 by Jacques René de Breyssy, marquis de Denonville, governor-general of Canada, in his cruel campaign against the Iroquois, was abandoned in 1688, after the garrison, commanded by Pierre de Troyes (d. 1687), had been wiped out by an epidemic. The first Fort Niagara, to be so named, was built in 1725-1727 at the instance of Charles le Moyne, 1st baron of Longueuil (1659-1790), and became a very important military and trading post; the fort was re-built by François Pouchot (1712-1769) in 1756, but in July 1759, after a siege of about sixteen days, it was surrendered to Sir William Johnson of New York and the Mohawks in return for help in the time of General Sullivan's expedition into western New York in 1779. The fort was not surrendered to the United States until August 1796. In the War of 1812 it was bombarded by the guns of Fort George (immediately across the river in the town now called Niagara, then Newark) on the 13th and 14th of October 1812; was the starting-point of the American expedition which took Fort George on the 27th of May 1813; and on the 9th of December 1813 was surprised and taken by assault—most of the garrison being killed or taken prisoners—by British troops under General Broadhead (1758-1826) who had previously returned to Fort George. After the close of the war, on the 27th of March 1815, Fort Niagara was restored to the United States, and a garrison was kept there until 1826. The fort was regarrisoned about 1836.

See F. H. Severance, Old Trails on the Niagara Frontier (Buffalo, 1903), Parkman's works, especially Montcalm and Wolfe (2 vols., Boston, 1884), and The Conspiracy of Pontiac (2 vols., Boston, 1851); and a pamphlet by Peter A. Porter, A Brief History of Old Fort Niagara (Niagara Falls, 1896).

NIAGARA FALLS (formerly Clifton or Suspension Bridge), a town and port of entry of Welland county, Ontario, Canada, 40 m. S.S.E. of Toronto, on the west bank of the Niagara river and opposite the Falls. Pop. (1901) 4244. It is a station on the Grand Trunk, Michigan Central and St Catharines & Niagara Central railways, and has electric railway communication with the chief towns in the neighbourhood. Three large steel bridges connect it with the American town of Niagara Falls on the opposite side. Its importance is chiefly due to the tourist traffic, but the unrivalled water power is being more and more employed. Factories have sprung up, and power is transmitted to Toronto and other cities. A beautiful park, named after

Queen Victoria, extends along the bank of the river for 2 M. above the Falls.

NIAGARA FALLS, a city of Niagara county, New York, U.S.A., on the E. side of the Niagara river, at the Falls, 22 m. N.N.W. of Buffalo. Pop. (1900) 19,457, of whom 7326 were foreign-born, (1910 census) 30,445. The city is served by the New York Central & Hudson River, the Wabash, the Erie, the Lehigh Valley, the West Shore and the Michigan Central railways, and by the International Electric railway and the Niagara, St Catharines & Toronto (electric railway). The city extends along the level summit of the cliffs from above the Falls to some 3 m. below. The river is here crossed by three bridges; the upper (steel) arch bridge, built (1853) on the site of the former bridge, and the lower (steel) arch bridge (rebuilt in 1896, as a suspension bridge) near the Falls, is crossed by double carriage ways and by an electric railway, and is probably the longest bridge of the kind in the world, being 1240 ft. long with an arch span of 840 ft.; and 13 M. farther down the river are two railway bridges, the Michigan Central's cantilever bridge, completed in 1883, and the (lower) single steel arch bridge (completed in 1897, on the site of John A. Roebling's suspension bridge built in 1851-1856) of the Grand Trunk railway, which has a terminus at Niagara Falls (Clifton), Ontario, and connects here with the New York Central & Hudson River and the Lehigh Valley railways.

The principal buildings of the city are the Niagara Falls Memorial Hospital, the Federal Building and the Niagara Falls Power Co. Building. The city has a Carnegie library, De Veaux College (Protestant Episcopal, chartered in 1853), and Niagara University, a Roman Catholic institution, founded in 1856 by the priests of the Congregation of the Mission and incorporated in 1863 as the Seminary of Our Lady of Angels, a name still used for the theological department, but displaced, since the charter of the university in 1883, by the present name. In the extreme W., part of the city, is the state Niagara Park, which includes Goat Island immediately S., and several smaller islands, has been, since 1885, the "New York State Reservation at Niagara Falls." From the Falls, which gave the city its first importance as a stopping place for tourists, valuable electric and hydraulic power is derived (by a tunnel 29 ft. deep and 18 ft. wide, passing about 200 ft. under the surface of the city, from the upper steel arch bridge to a point 1 M. above the Fall, and by the canal of the Niagara Falls Hydraulic Power and Manufacturing Company). Niagara Falls is an important manufacturing city; the value of its manufactured products increased from $8,450,184 in 1900 to $16,015,786 in 1905, or 98.1%.

The city is the shipping centre for the W., part of Niagara county. The village of Niagara Falls was for a time called Manchester. In 1892 the village of Suspension Bridge (formerly Niagara City) was joined with it under a city charter, which has been frequently amended.

NIAM-NIAM (Zandeh, A-Zandeh), a people of Central Africa, of mixed Negroid descent. With kindred tribes, they stretch from the White Nile above the Sobat confluence to the Shari affluent of Lake Chad, and from the Bahr-el-Abar, about 10° N., nearly to the equator. Their political ascendancy, weakened by the incessant attacks of the Arab-Nubian slave-raiders, which followed the rise of the Sudanese maddi in 1888, was afterwards broken by the forces of the Congo Free State and the Anglo-Egyptian Sudan.

The term Niam-Niam appears to be of Dinka origin, meaning in that language "great eaters," with reference, as is supposed, to their cannibalistic propensities. They are called Babangures by the Mangbetu (Monhutta), A-Madyaka by the Diur, Mundo or Manyan at the Bongo, Makaraka or Kakarka by the Mittu. But Niam-Niam has been adopted and generalized by the Sudan and Nubian Mahommedans. Their native name is Zandeh (pl. A-Zandeh), which is current throughout the eastern Niam-Niam domain, a region estimated by Georg Schweinfurth, who visited the country in 1870, at about 48,000 sq. m., with a population of at least two millions. But these by no means constitute a uniform ethnic group, for within this area is the large Madi nation, differing altogether in speech and even
in some respects physically from the ordinary Niam-Niam type. Apart also from numerous tribal divisions, the eastern Niam-Niam proper form three very distinct branches. The bleak northern highlands bordering east on the Bongo and north on Dar-Ferrat are occupied by the Banda Niam-Niam. To the southwards are the dark races featuring the Niam-Niam, and very white the fertile hilly territory of the Nile-Congo watered. Very different from either are the so-called "White" Niam-Niam, neighbours of the Madi of the Makua-Welle river basin. Their complexion is of a lighter bronze tint, and they are distinguished from the other branches of the family by their tall stature, symmetrical figure, long kinked hair and beard and higher social culture. They wear cotton garments, obtained by barter for ivory, copper and iron, and have a tendency to political unity under one chief.1

There is, however, a very distinct Niam-Niam type, one of the most marked in the whole of Africa. "These beings," remarks Schweinfurth, on his first introduction to them, "stood out like creatures of another world... a people of a marked and most distinct nationality, and that in Africa and amongst Africans is saying much. They are of medium height and powerful build. The great space between the eyes, which are almond-shaped and slightly slanting, gives them a peculiar expression. They have a very short nose, with correspondingly long upper lip; woolly hair; a very round head, agreeing in this respect with the Bongo of the Bahr-el-Gazal but differing from the great majority of the Niam-Niam. Of this ethnical group, the jaw-projection and altogether more regular than the typical Negro; of a ruddy brown or chocolate colour, scarcely ever black, but occasionally bronze and even olive.

The average Niam-Niam is distinguished by some excellent qualities, such as frankness, courage, an instinctive love of art, and above all a genuine and lasting affection for his women, such as is betrayed by no other African race. By tribal custom the men are all hunters, armed with long knives and spears and carrying oblong shields of wicker-work; the women all tillers of the soil, with little toil yields abundant crops of cereals, yams, manioc, colocasia and Virginian tobacco. Both sexes wear large pins of ivory, iron, monkey or human bone stuck in their hair, and stain their skin with red camwood and the oil of a wild berry. The Niam-Niam are intelligent, skilful builders, and proficient in many native industries. Prominent among these are their earthenware vessels, which display considerable symmetry; iron smelting and metal work, such as swords, knives and spears; wood carvings, such as stools, benches, bowls and tobacco pipes, of varied and intricate design and often admirable works of art. They are great smokers, and very fond of music. Of the ox, horse, ass or camel they have no knowledge; the only domestic animals are poultry, and a breed of dogs, like small wolf-hounds, with smooth red hair, twisted tail like a pike's, large ears, pointed nose and four-clawed hind feet. These curious little "greyhounds" join in the chase with small wooden bells round the neck, and are thus soon found when lost in the woods.

The Niam-Niam are distinguished by their elaborate headdress dresses (they formerly wore a sort of big full-bottomed wig, and D.R.*, they are almost always with these), and their various tattoo markings—square patterns on forehead, temples or cheeks.

1 About the middle of the 19th century, most of the eastern Niam-Niam lands appear to have been subject to Yapati, son of Mabeche. But after his death they were distributed amongst his seven sons, Renji, Bala, Perkye, Tombo, Bazimby, Manuba; and in 1870 there were already fourteen reigning princes of this dynasty, besides several of doubtful relationship with the line of Mabeche. In the Niam-Niam districts visited by the traders from the Egyptian Sudan they lived at that time altogether as many as thirty-five independent chiefs. But reports were current of a very powerful "sultan" named Mofo, whose empire lay some 300 m. farther west. Another large state, founded in the Welle region by Kipa (Kita), brother of Yapati, also fell to the traders of this period. The powerful chiefs Bakangoi and Kanna, visited in 1883 by G. Casati, were sons of this Kipa, whose grave near Kanna's village was still watched by twenty-five "vestals," bound, under penalty of death, to keep a fire constantly burning, and to preserve their chastity inviolate (Esploratore, August 1883).
such crafts as weaving and metal-work, as well as in agriculture and road-making. Coco-nut oil is produced on Nias and also more especially on the Nako group. A Dutch commissioner is established at Gunong Sitolli on the east coast, a settlement of Macassar Chins.

**NIBELUNGENLIED, or DER NIBELUNGE NÖT, an heroic epic written in a Middle High German dialect. The story on which the poem is based belongs to the general stock of Teutonic saga and was very widespread under various forms, some of which are preserved. Thus it is touched upon in *Beowulf* and fragments of it form the most important part of the northern *Eddas*, the poems of which evidently assumed that the tale as a whole was well known and that their hearers would be able to put each piece in its proper place. In the prose *Edda*, or *Volsunga Saga*, which, though largely primitive in spirit, dates from the 12th century, it is set forth in full. The substance of this Norse version is as follows:—

The three Anses—Odin, Loki and Hóðr—sat an after devouring a salmon beside a waterfall. They killed and skinned the otter and, taking the skin with them, sought shelter for the night with Rodmar the giant. But Rodmar recognized the skin as that of his son, and demanded that the men should be given enough to last completely. Loki therefore went upon the road where Andvari was guarding a treasure, caught him in a net, and forced him to surrender his hoard. But the piled-up gold left one hair exposed, and Odin and the young hero Regin forced Andvari to append to his hoard a magic ring which had the virtue of breeding gold. Thereupon Andvari, enraged, laid upon the hoard and all who possessed it a curse. This curse, the *Lettomotiv* of the whole story, began with the extraction of the teeth of the treacherous queen, slain by his sons Fafnir and Regin; and Fafnir, seizing the whole, retired to a seashore and, in the form of a snake or dragon, bore the treasure and the hoard of his share, plotted vengeance and the conquest of the treasure.

To Regin, a notable smith, was sent Sigurd—son of the slay hero Sigmund the Volsung and his wife Hiortis, now wife of the Danish king FREDERIK, and because of him Sigurd told of Fafnir and the hoard, and the young hero offered to go out against the dragon if Regin would weld him a sword. But every brand forged by the smith broke under Sigurd's stroke; till at last he fetched the fragrant ash-wood of the oak. Regin wrought it into a sword, which had carefully treasured. These Sigurd forged into a new sword, so hard that with it he could cleave the anvil and so sharp that it would sever a flock of wool. Boating against it down stream; and, as so armed, he sought and slew the dragon. But while roasting Fafnir's heart, which Regin had cut out, Sigurd burned his finger with the boiling fat and, placing it to his lips, found that he could understand the language of birds and beasts. To him, being a lover of natural history and a fair seer, this was a treasure. The smiths of his time, to his mind, were only smiths—poor folk of the trade. Odlin, set out upon his travels.

Gudrun, the daughter of Attila, in whose story Sigurd found the Valkyrie Brunhild in an enchanted sleep, and ravished by her beauty awakened her; they plighted their troth to each other and, next morning, Sigurd left her. But when his journey took him to the hall of Guðrún, a king in the Rhine country, Sigurd formed a friendship with his three sons, Gunnar, Hogni and Góðrún; and, in order to retain so valuable an ally, it was determined to arrange a match between him and their sister Gudrún. Queen Grímnir, skilled in magic, therefore gave him an enchanted drink, which caused him to forget Brunhild. Gunnar, on the other hand, wished to make Brunhild his wife, and asked Sigurd to ride with him on this quest, which he consented to do on condition of receiving Gudrún to wife. They set out; but Gunnar was unable to pass the circle of fire round Brunhild's abode, the achievement that was the condition of winning her. So Sigurd, after a shape of the magic horse, and in sign of troth exchanged rings with the Valkyrie, giving her the ring of Andvari. So Gunnar and Brunhild were wedged, and Sigurd, resuming his own form, rode back with them to Gudrún. They gave on this occasion a splendour of festivity that was never equalled; but Brunhild was moody and suspicious, remembering her troth with Sigurd and believing that he alone could have accomplished the quest.

One day the two queens, while bathing in the river, fell to quarrelling. Their mothers in arms was the greater. Brunhild taunted Gudrun with the fact that Sigurd was Gudrun's vassal, whereupon Gudrun retorted by telling her that it was not Gunnar but Sigurd who was her husband and held the ring, which she had given to him. Then Brunhild "waxed as wan as a dead woman, and spoke no word the day long." Maddened by jealousy and wounded pride, she now incited the three kings to murder their wives' powers, their eldest, as bound to him by blood-brotherhood, refused; but the youngest, Gunnar, who had sworn oaths, consented to do the deed. Twice he crept into Sigurd's chamber, but died when he found the hero awake and gazing at him with flashing eyes.

The third time, finding him asleep, he stabbed him; but Sigurd, before he died, had just strength enough to hurl his sword at the murderer, whom it killed. Brunhild watched the deed with gathering of amazement, while Sigurd Gudrun waiting, laughed aloud. But her love for Sigurd was great as ever, and she determined not to survive him; distributing her wealth to her handmaidens, she Chantred Sigurd's funeral pyre, slew herself with his sword, and was burnt with him.

In course of time Gudrun married Atti (Attila), king of the Huns, Brunhild's brother. Atti, intent on getting hold of the hoard, which Gunnar and Hogni had managed to come to his court, though with the spite of her sister's warnings they came, after sinking the treasure in the Rhine. On their refusal to surrender the hoard, or to say where the treasure might be concealed, the three kings forced the! in which the followers of Gunnar and Hogni fell. Atti then offered to spare Gunnar's life if he would reveal his secret; but Gunnar refused to do so till he should see the heart of Hogni. The heart of a slave was his first present, and that he could not be Hogni's, since it quaked. Hogni's heart was then cut out, the victim laughing the while; but when Gunnar saw it he cried out that now he alone is where the hoard was and that he would never reveal the secret. His hands were then bound, and he was cast into a den of venomous serpents; but he played so sweetly on the harp with his toes that he charmed the reptiles, except one adder, by which he was stung to death. Gudrun, however, avenged the death of her brothers by slaying the sons she had borne to Atti and causing him unwittingly to drink their blood and eat their hearts. Finally, in the night, she killed Atti himself and burned his hall; then, leaping into the sea, the sacred waters to which his hands had consecrated the numberless adventures not connected with those recorded in the *Nibelungentia*.

This story, in spite of the late date of the *Volsunga Saga* and of added elements due to the imagination of its author, evidently represents a very primitive version. In the *Nibelungen* story, on the other hand, though its extant versions are of much earlier date, and though it contains elements equally primitive not found in the other, the spirit and the motives of the earlier story have to a large extent been transmuted by later influences, the setting of the story being—though by no means consistently—medieval rather than primitive. Thus the mysterious hoard is all but lost sight of; no mention is made of the curse attached to it; and it is only as an afterthought that Siegfried (Sifrit) is described as its master. Everywhere the supernatural elements are eliminated or subordinated, and the story becomes a drama of human motives, depending for its development on the interplay of human passions and activities.
The primitive setting of the northern version has vanished utterly. Sigurd is king of the Netherlands; the boy Siegfried is brought up by "wise men that are his tutors" (Avent. i.); and when, attracted by the fame of Kriemhild's beauty, he rides to Worms to woo her, it is as the typical handsomely, accomplished and chivalrous king's son of medieval romance.

It is at this point (Avent. iv.) that some of the primitive effects of the story are suddenly and awkwardly introduced. As Siegfried approaches Worms, Kriemhild's brothers, the Burgundian kings Gunther, Giselher and Gernot watch his coming, and to them their faithful retainer, "the grim Hagen," explains who he is. This, he exclaims, can be no other than the hero who slew the two kings of the Nibelungs, Schlubne and Nibelune, and seized their treasure, together with the sword Balmunc and the tarnkappe, or cape of darkness, which has the virtue of making him who wears it invisible. Another adventure, too, he can tell of him, namely, how he slew a dragon and how by bathing in its blood his skin became horn-like, so that no weapon could wound him, save in one place, where a Linden leaf had fallen upon him as he stooped, so that the blood did not touch this spot.

In spite of Hagen's distrust and misgivings, Siegfried now fights as the ally of the Burgundians against the Saxons (Avent. iv.), and undertakes, on condition of receiving Kriemhild to wife, to help Gunther to woo Queen Brunhild, who can only be won by the man who can overcome her in three trials of strength (Avent. vi.). Siegfried and Gunther accordingly go together to Brunhild's castle of Istenstein in Iceland, and there the hero, invisible in his tarnkappe, stands beside Gunther, hurling the spear and putting the weight for him, and even leaping with Gunther in his arms, far beyond the utmost limit that Brunhild can reach (Avent. vii.). Brunhild confesses herself beaten and returns with the others to Worms, where the double marriage is celebrated with great pomp (Avent. x.). But Brunhild is ill-content; though she saw Siegfried do homage to Gunther at Istenstein she is not convinced, and believes that Siegfried should have been her husband; and on the bridal night she vents her ill humour on the hapless Gunther by tying him up in a knot and hanging him on the wall. "I have brought the evil devil to my house!" he complains to Siegfried next morning; and once more the hero has to intervene; invisible in his tarnkappe he wrestles with Brunhild, and, after a desperate struggle, takes from her her girdle and ring before yielding place to Gunther. The girdle and ring he gives to his wife Kriemhild (Avent. x.).

One day, while Siegfried and his wife were on a visit to the Burgundian court, the two queens fell to quarrelling on the question of precedence, not in a river but on the steps of the cathedral (Avent. xiv.). Kriemhild was taunted with being the wife of a youthful knight, and with her youth and beauty; whereon, she showed Brunhild the ring and the golden girdle taken by Siegfried, proof that Siegfried, not Gunther, had won Brunhild. So far the story is essentially the same as that in the Volusunga saga; but now the plot changes. Brunhild drops out, becoming a figure altogether subordinate and shadowy. The death of Siegfried is compassed, not by her, but by the "grim" Hagen, Gunther's faithful henchman, who thinks the glory of his master unduly overshadowed by that of his vassal. Hagen easily persuades the weak Gunther that the supposed insult to his honour can only be wiped out in Siegfried's blood; he worms the secret of the hero's vulnerable spot out of Kriemhild, on pretence of shielding him from harm (Avent. xv.), and then arranges a great hunt in the forest, so that he may slay him when off his guard.

The 16th Aventiure, describing this hunt and the murder of Siegfried, is perhaps the most powerful scene in all epic poetry. To heighten the effect of the tragic climax the poet begins with a description of the hunting, and describes the high spirits of Siegfried, who captures a wild boar, rides back with it to camp, and there lets it loose to the great discomfiture of the cooks.

When the hunters sat down to feast, it was found that the wine had been forgotten. Hagen thereupon proposed that they should race to a spring of which he knew some way off in the forest. Siegfried readily agreed, and though handicapped by carrying shield, sword and spear, easily reached the goal first, but waited, with his customary courtesy, until the king had arrived and drunk before slaking his own thirst. Then, laying aside his arms, he stooped and drank. Hagen, seizing the spear, thrust it through the spot marked by Kriemhild on Siegfried's surcoat. The hero sprang up and, finding that his sword had been removed, attacked Hagen with his shield.

Though to death he was wounded he struck so strong a stroke That from the shattered shield-rim forthwith out there broke Showers of flashing jewels; the shield in fragments lay.

Then reproaching them for their cowardice and treachery, Siegfried fell dying "amid the flowers," while the knights gathered round lamenting. At this point two stanzas may be quoted as well illustrating the poet's power of dramatic characterization:

The king of the Burgundians he too bewailed his death: Then spake the dying hero: "Nay, now you waste your breath! You weep for an ill fortune that you yourself have wrought: That is a shameful sorrow: it were better you said nought!"

Then out spake the grim Hagen: "I know not why ye plain: This is for us the ending of sorrow and of pain. Full few are left of men that dare withstand us now. Glad am I that the hero was by this hand of mine laid low!"

This account of the death of Siegfried, which embodies the ancient German tradition, is far finer than the northern version, according to which Hagen kills the hero in his bed. The whole spirit of this Aventiure is Teutonic rather than medieval. The same is true, indeed, of the whole of the rest of the poem. Siegfried, to be sure, is buried with all the pomp of medieval Catholic rites; but Kriemhild, while praying for his soul like a good Christian, plots horrible vengeance like her pagan prototype. With this significant difference, however: Gutrun revenged upon her husband the death of her brothers; Kriemhild seeks to revenge upon her brothers the death of her husband. The Catholic bond of marriage has become stronger than the primitive Teutonic bond of kinship. Mistress now of the inexhaustible board of the Nibelungs, Kriemhild sought to win a following by lavish largesses; but this Hagen frustrated by seizing the treasure, with the consent of the kings, and sinking it in the Rhine, all taking an oath never to reveal its hiding-place, without the consent of the others, so long as they should live (Avent. xix.). At last, however, after thirteen years, Kriemhild's chance came, with a proposal of marriage from Etzel (Attila) king of the Huns, whom she consented to marry on condition that he would help her to vengeance (Avent. xx.). Then more years passed; old feuds seemed to be forgotten; but the Burgundian kings, in spite of Hagen's warnings, thought it safe to accept their sister's invitation to visit her court (Avent. xxiii.-xxiv.).

The journey of the Burgundians into Hunland is described by the poet at great length (Avent. xxv.-xxvii.). The story is full of picturesque detail and stirring incident, full also of interesting problems in folk-lore and mythology; and throughout it is dominated by the figure of the grim Hagen, who, twitted with cowardice and his advice spurned, is determined that there shall be no turning back and that they shall go through with it to the end. With Etzel he feigns friendship, and when he ferries the boat over the Danube and then, when the last detachment is crossed, destroys the boat, so that there may be no return. At Attila's court (Avent. xxviii.) it is again Hagen who provokes the catastrophe by taunting Kriemhild when she asks him if he has brought with him the board of the Nibelungs:

"The devil's what I bring you!" Hagen then replied, "What with this heavy harness and my shield beside, I had enough to carry: this helmet bright I brought: My sword is in my right hand, and that, be sure, I bring you not!"

The sword was Siegfried's. It is Hagen, too, who after the
first onslaught of the Huns strikes off the head of Orlieb, the son of Etzel and Kriemhild, and who, amid the smoke and carnage of the burning hall, bids the Burgundians drink blood if they are thirsty.

Besides Hagen, during the ride into Hunland and in the final fight, another figure comes to the front, that of Volkêr the Fiddler, so far only mentioned as a hero of the Saxon war in Avant. ii. He rides fiddling at the head of the host; he plays to the weary warriors in the intervals of the battle in the court of Etzel's palace; but he is also expert at performing other music, with "a strong fiddle-bow, mighty and long, like to a sword, exceeding sharp and broad." He is the type of the medieval knightly minstrel of the age of the Minnesang.

But for all their prowess, after a prolonged struggle (Avant. xxix.-xxxvii.), the Burgundians were at last overwhelmed. Most of the chief figures of heroic saga had come up against them: Attila, Hildebrand, the Ostrogoth Theodoric (Dietrich von Bern). To the last-named even Hagen armed with Siegfried's sword had to yield (Avant. xxxviii.). Kriemhild came to him as he lay in bonds and demanded the Nibelung treasure. He refused to reveal its hiding-place so long as Gunther, also a prisoner, should live. Gunther was accordingly slain by the queen's orders and his head was brought to Hagen, who cried out when he saw it that all had been accomplished as he had foretold: "Now none knows where the hoard is save God and I alone: The devil-woman, shall nevermore be known!"

Whereupon Kriemhild slew him with Siegfried's sword. But Kriemhild was not destined, like Gudrun, to set out on further adventures. Hildebrand, horrified at her deed, sprang forward and cut her to pieces with his sword.

In sorrow now was ended the king's high holiday, As ever joy in sorrow ends and must end alway.

To some MSS. of the Nibelungenlied is added a supplementary poem called the Klage or Lament, a sequel to 2160 short-line couplets, describing the lament of the survivors—notably Etzel—over the slain, the burying of the dead, and the carrying the news to the countries of the Burgundians and others. At the end it is stated that the story was written down, at the command of Bishop Pilgrim of Passau, by a writer named Konrad (Kuonrat) in Latin, and that it had since been sung (geleicht) often in the German tongue.

Sources of the Story.—The origin and nature of the various elements that go to make up the story of the Nibelungenlied have been, and continue to be, the subject of very lively debate. The view at one time most generally accepted was that first propounded by Karl Lachmann in his "Kritik der Sage von den Nibelungen " (Reichsmuseum für Philologie, Num. 249, 250, 1839), and published in his Zu den Nibelungen. Namely, that the story originated a myth of the northern gods, modified into a heroic saga after the introduction of Christianity, and intermingled with historical elements. This view is maintained by Richard von Muth in his Einleitung in das Nibelungenlied (Paderborn, 1877), who thus sums up the result of his critical researches: "The basis of all is an old myth of a beneficent divine being (Siegfried), who conquers daemonic powers (the Nibelungen), but is slain by them (the Burgundians turned Nibelungen); with this myth was connected the destruction of the Burgundian kingdom, ascribed to Attila, between 437 and 455, and later the legend of Attila's murder by his wife; in this form, after Attila and Theodoric had been associated in it, the legend penetrated, between 552 and 583, to the North, where its second part was developed in detail on the analogy of older sagas, while in Germany a complete change of the old motif took place." To this theory the objection is raised that it is but a theory; that it is unsupported by any convincing evidence; and that the process which it postulates, that, namely, of the transformation of the gods into heroes by the popular imagination, is contrary to all that we know of the fate of dechowned deities, who are apt to live on in fairy stories in very unheroic guise. So early as 1783 Johannes von Müller of Götttingen had called attention to the historical figures appearing in the Nibelungenlied, identifying Etzel as Attila, Dietrich of Bern as Theodoric of Verona, and the Burgundian kings Gunther, Giselhêr and Gérot as the Gun-daharius, Gislabarius and Godomar of the Lex Burgundorum; in 1820 Julius Leichtlen (Neuauflage eines Bruchstücks des Nibelungenliedes, Freiburg-im-Breisgau) roundly declared that "the Nibelungenlied rests entirely on a historical foundation, and that any other attempt to explain it must fail." This view was, however, overborne by the great authority of Lachmann, whose theory, in complete harmony with the principles popularized by the brothers Grimm, was accepted and elaborated by a long series of critics. It is only of late years that criticism has tended to revert to the standpoint of Müller and Leichtlen and to recognize in the story of the Nibelungen as a whole a misty and confused tradition of real events and people. Mythical elements it certainly contains; and to those figures which—like Siegfried, Brunhild, Hagen and the "good margrave" Ruedegir (Ruediger: the Burgundians cannot be traced definitively to historical originals, a mythical origin is still provisionally ascribed. But criticism is still busy attempting to trace these also to historical originals, and Theodor Abelting (Das Nibelungenlied, 1907) makes out a very plausible case for identifying Siegfried with Segeric, son of the Burgundian king Sigimund, Brunhild with the historical Brunichildis, and Hagen with a certain Hagnericus, who, according to the Life of St Columban, guided the saint (the chaplain of the Nibelungenlied), who had incurred the enmity of Brunichildis, safe to the court of her grandson Theoden von der Warn. Theodor Abelting has also suggested that the Nibelungen story is one among many; but, as it is one of the latest and not the least ingenious, it deserves mention. That the Icelandic Eddas contain the oldest versions of the legend, though divided and incomplete, is universally admitted. It is equally well established, however, that Iceland could not have been its original home. This Herr Abelting locates among the Franks of what is now southern France, whence the stories spread, from the 6th century onwards, on the one hand across the Rhine into Franiacon, on the other hand westwards and northwards, by way of Ireland—at the time in close intercourse with continental Europe—and the northern islands, to Iceland. Hence the two traditions, the German and the Icelandic, of which the latter alone is preserved in something of its primitive form,1 though primitive elements survive in the Nibelungenlied.

The basis of the story is then, according to this view, historical, not mythical: a medley of Franco-Burgundian historical traditions, overlaid with mythical fancies.2 The historical nucleus is the overthrow of the Burgundian kingdom of Gun-dahar by the Huns in 436; and round this there gathered an accretion of other episodes and details. These are, however, distorted by a naïve disregard of chronological possibility: the murder of Segeric (c. 525), the murder of Sigimund by the sons of Chrothildis, wife of Clovis (identified by Abelting with Kriemhild), the murder of Attila by his Burgundian wife Ildico (see Kriemhild). In the Eddas the identity of the original Franco-Burgundian sagas is fairly preserved. In the Nibelungenlied, on the other hand, the influence of other wholly unconnected stories is felt: thus Hildebrand appears during the final fight at Etzel's court, and Theodoric the Great (Dietrich von Bern; see Tritschauer), for whom he was called in the German legend, is sent him to exile there, and that he must have been there when the Burgundians arrived.

Origin of the Poem.—The controversy as to the underlying elements of the Nibelung legend extends to the question of the authorship and construction of the poem itself. It was from the first—whatever additions and interpolations may have

1 The Eddas were first written down, as is commonly assumed, by Bishop Saemund Sigfusson (1055—1133).
2 The process of this overlaying is easy to realize if we remember how usual it was to transfer characteristics and episodes drawn from immemorial folk-tore to successive historical personages. A good example is the "Swan-maiden" myth connected with the house of Bouillon (see Loiengrin). See also other interesting cases cited in the chapter on the "Geste of John de Courci" in Mr. J. H. Round's Fierzage and Pedigree (London, 1910).
followed—conceived as a single, coherent story, or is it based on a number of separate stories, popular ballads akin to the *Eddas*, which the original author of the *Nibelungenlied* merely collected and strung together? The answer to these questions has been sought by a succession of scholars in a critical comparison of the medieval MSS. of the poem still surviving. Of these 33 are now known, of which 10 are complete, the rest being more or less fragmentary. The most important are: (1) a first discovered, viz. the MSS. lettered C (Hohenems, 1755), B (Schloss Werdenberg, 1769), A (Hohenems, 1779); and round these the others more or less group themselves. They exhibit many differences: put briefly, C is the most perfectly finished in language and rhythm; A is rough, in places barbarous; B stands half-way between the two. Which is nearest to the original? Karl Lachmann (Zur den Nibelungen und zur Klage, Anmerkungen, 1836) decided in favour of A. He applied to the *Nibelungenlied* the method which Friedrich August Wolf had used to resolve the *Iliad* and *Odyssey* into their elements. The poem, according to Lachmann, consisted of two hundred popular ballads, originally handed down orally, but written down about 1190 or 1200. This original is lost, and A—as its roughness of form shows—is nearest to it; all other MSS., including B and C, are expansions of A. The great authority of Lachmann made this opinion the prevalent one, and it still has its champions. It was first seriously assailed by Adolf Holtzmann (Untersuchungen über das Nib., Stuttgart, 1834), who argued that the original could not have been strophic in form—the fourth lines of the strophes are certainly often of the nature of "padding"—that it was written by Konrad (Krohnert of the Klage), writer to Bishop Pilgrimm of Passau about 970–984, and that of existing MSS. C is nearest to this original, B the copy of a MS. closely akin to C, and A an abbreviated, corrupt copy of B. This view was adopted by Friedrich Zarncke, who made C the basis of his edition of the *Nibelungenlied* (Leipzig, 1856). A new hypothesis was developed by Karl Bartsch in his Untersuchungen über das Nibelungenlied (Leipzig, 1865). According to this the original was an assonance poem of the 12th century, which was changed between 1190 and 1200 by two separate poets into two versions, in which pure rhymes were substituted for the earlier assonances. The original of the *Nibelungenlied* and *Der Nibelung-Nôl* respectively, Bartsch’s subsequent edition of the *Nibelung-Nôl* (1st ed., Leipzig, 1870) was founded on B, as the nearest to the original. To this view Zarncke was so far converted that in the 1887 edition of his *Nibelungenlied* he admitted that C shows signs of recension and that the B group is purer in certain details. As a result of all this critical study Herr Abeling comes to the following conclusions. The poem was first written down by a wandering minstrel about 971 to 991, was remodelled about 1140 by Konrad, who introduced interpolations in the spirit of chivalry and was perhaps responsible for the metre; during the wars and miseries of the next fifty years manners and taste became barbarized and the fine traditions of the old popular poetry were obscured, and it was under this influence that, about 1190, a jongleur (Spielmann) revised the poem, this recension being represented by group B. After 1190, during the Golden Age of the art poetry (Kunstdichtung) of the Minnesingers (q.v.), a professional poet (Rudolf von Emst?) again remodelled the poem, introducing further interpolations, and changing the title from *Der Nibelung-Nôl* into *Das Nibelungenlied*, an version being the basis of the group C. The MS. A, as proved by its partial excellence, is based directly on Konrad’s work, with additions borrowed from B.

1 Bartsch and others ascribe its authorship, with much plausibility, to an Austrian knight of the race of Kurtenberg, the earliest of the courtly lyricists, whose verses are written in the Nibelungen strophe. Thus compare Kurtenberg’s lyric (Lachmann and Haupt, Des Minnesanges Frühling, 4th ed., F. Vogt, Leipzig, 1888)—

"Ich zoch mir einen valken mère dann ein jár"

with the *Nibelungen Nôl* (Bartsch) Art. I, 13:

"es trumte Kriemhilde.

Wie sie züge einen valken, stark soen‘ und wilde."

Theodor Abeling (Das Nibelungenlied und seine Literatur (Leipzig, 1907) gives a full bibliography, embracing 1272 references from 1756 to 1905. There are English translations of the poem in Barham (1887), Margaret Armour (prose, 1897) and Alice Horton (1898).

**NICEA, or NICE** (mod. Isnik., i.e. d’Isera) an ancient town of Asia Minor, in Bithynia, on the Lake Ascania. Antigonus built the city (316 B.C.) on an old deserted site, and soon afterwards Lystrimachus changed its name from Antigonia to Nicaea, calling it after his wife. Under the Roman empire it was the seat of Nicomedia the title of metropolis of Bithynia. Strabo describes the ancient Nicaea as built regularly, in the form of a square, with a gate in the middle of each side. From a monument in the centre of the city all the four gates were visible at the extremities of great cross-streets. After Constantine became the capital of the empire Nicaea grew in importance, and after the conquest of Constantinople by the Crusaders it was the temporary seat of the Byzantine emperor; the double line of walls with the Roman gates is still well preserved. The possession of the city was disputed between the Greeks and the Turks. It remained an important city for some time after its final incorporation in the Ottoman empire; but became subsequently an insignificant village.

**NICEA, COUNCIL OF.** The Council of Nicea (A.D. 325) is an event of the highest importance in the history of Christianity. Its convocation and its course illustrate the radical revolution which the position of this religion, within the confines of the Roman empire, had undergone in consequence of the Edict of Milan. Further, it was the first ECCUMENICAL council, and this fact shows that it was the first attempt to fix the criteria of Christian orthodoxy by means of definitely formulated pronouncements on the content of Christian belief—the acceptance of these criteria being made a *sine qua non* of membership of the Church. Moreover, it admitted the principle that the state might employ the secular arm to bring the Christian subjects of the Roman world-empire under the newly codified faith. Thus the Nicene Council is an important stage in the development of the state-church, though the completion of that edifice was delayed till the reign of Theodosius the Great. The relation of the emperor Constantine to the assembly was in itself a step in the direction of that independent treatment of ecclesiastical affairs, which, in the following centuries, created the peculiar type of the Byzantine state-church.

From his accession Constantine had shown himself the friend of the Christians; and, when his victory over Licinius (A.D. 323) gave him undisputed possession of the crown, he adhered to this religious policy, distinguishing and fortifying the Christian cause by gratuities and grants of privilege. This propitiatory attitude originated in the fact that he recognized Christianity—which had successfully braved so many persecutions—as the most vital and widening of religions, and as the power of the future. Consequently he directed his energies toward the establishment of a positive relationship between it and the Roman state. But the Church could only maintain its great value for the politician by remaining the same compact organism which it had proved itself to be under the stormy reign of Diocletian. Scarcely, however, did it find itself in the enjoyment of external peace, when violent feuds broke out in its midst, whose extent, and the virulence with which they were waged, threatened to dismember the whole religious body. Donatism in the West was followed by the Arian struggle in the East. The former had been successfully arrested, though it survived in North Africa till the 5th century. The conflict kindled by the
Nicæa, Council of

Alexandrian presbyter Arius (q.e.) assumed greater dimensions and a more formidable character. Constantine at first attempted to restore quiet in Alexandria by a formal denunciation of the epistle of Bishop Hosius of Cordova, but his admonitions were fruitless. Accordingly, since other debateable points were at issue, he had recourse to an institution previously evolved by the Christian Church—the convocation of a synod to pronounce on burning questions—qualifying it, however, to correspond with the altered circumstances. He convened a council, designed to represent the whole Church of the empire, at Nicæa in Bithynia, a town situated no great way from the imperial summer-residence of Nicomedia and within easy reach by sea of the Oriental bishops. Among the various estimates of the number of dele-
gates, the statement of Athanasius, who speaks of 318 members, has dominated the tradition. In consequence of the vast dis-
tances, the West was but weakly represented. From Spain, Hosius—the above-mentioned bishop of Cordova—made his appearance; from Gaul, Nicasius of Dijon; from Dalmatia, Domnus of Stridon; from Italy, Marcus of Calabria with two presbyters as deputies of the Roman bishop Silvester; and from North Africa, Cæcilian of Carthage. Thus an immense majority of the synod bailed from the East. The bishops of the three most important metropolitan sees of the West were not represented. The city of Alexandria, Eustathius of Antioch and Macarius of Jerusalem, while a prominent rôle was also played by Eusebius, bishop of the imperial city Nicomedia, and his erudite namesake, Eusebius of Caesarea. Of the other prelates not a few had distinguished themselves as confessors in the later persecution, and still bore the honourable traces of their sufferings. Since the bishops were accompanied by priests, Nicæa witnessed an array of clerics such as had never before been mustered in a single place. Among the attendant clergy, the still youthful deacon Athanasius, destined to succeed Alexander in the see of Alexandria, was prominent as the most powerful antagonist of the Arians (see ANTHANASII). The synod met in the imperial palace from the 20th of May to the 25th of July. What order of procedure obtained, and in whom the presidency was vested, are problems which admit of no certain solution: the one indisputable fact is that Constantine—who, at his appearance, was accorded a ceremonious reception, and himself delivered an address on the occasion—exercised a decided influence on the discussions. The deliberations on the Arian question passed through several distinct stages before the final condemnation of Arius and his doctrines. The first was the synod clearly standing in regard to this problem—the relationship of Christ to God—was held only by the attenuated group of Arians and a far from numerous section of delegates, who adhered without unshaken conviction to the Alexandrian view. The bulk of the members occupied a position between these two extremes. They rejected the formulae of Arius, and declined to accept those of his opponents; that is to say, they were merely competent to establish negations, but lacked the capacity, as yet, to give their attitude of compromi-
se a positive expression. In the main they perpetuated the line of Origen. That the majority of the council should have adopted this neutral tendency is easily intelligible when we consider the state of theology at that period. True, at Nicæa this majority eventually acquiesced in the ruling of the Alex-
drians; yet this result was due, not to internal conviction, but partly to indifference, partly to the pressure of the imperial will—a fact which is mainly demonstrated by the subsequent history of the Arian conflicts. For if the Nicæan synod had arrived at its final decision by the conscientious agreement of all non-Arians, then the confession of faith there formulated might indeed have evoked the continued antagonism of the Arians, but must necessarily have been characterised by all else. This, however, was not the case; in fact, the creed was assailed by those very bodies which had composed the laïques-faïre centre at Nicæa; and we are compelled to the conclusion that, in this point, the voting was no criterion of the inward convictions of the council. In the synod, an Arian confession of faith was first brought forward and read; but it aroused such a storm of indignation that obviously, in the interests of a restoration of ecclesiastical peace, there could be no question of its acceptance. On this, Eusebius of Caesarea dissolved the baptismal creed of his community; and this met with the imperial approval. Since the creed dated from a period anterior to the outbreak of the Arian struggle, its reception would have been equivalent to a declaration on the part of the council that it declined to define its position with reference to the controversy of the hour. That the greater number of delegates were not disinclined to adopt this subterfuge, so congenial to their standpoint, and to shelve the actual solution of the whole problems by recognition of this or some similar neutral formula, is extremely probable. But this Arius himself saw the thing, if the aforesaid prelates were eluded in any such mode, it was inevitable from the very nature of the case, that they should rise again in an accentuated form, and that consequently no pacification could be expected from this policy. Since the Eastern Church subscribed to the Alex-
drian solution of the question, he drew the natural deduction and concluded that he had here a genuine presentment of the feeling of the Church, which, if it received official sanction, might be justly expected to restore peace to the Christian community. But, in pronouncing for this view, he was careful not to elide himself from the formulation of a novel confession: for it was imperative to have the aforesaid points ascertained in the articles of faith. Accordingly he proposed that the Caesarean creed should be modified by the insertion of the Alexandrian passwords—as if for the purpose of more accurate definition— and by the deletion of certain portions. That he appreciated the import of these alterations, or realized that this revision was virtually the proclamation of a new doctrine, is scarcely probable. The creed thus evolved—the expression byōdiarios is of Western origin—was finally signed by all the deputies with the exception of the bishops Theonus of Marmarica and Secundus of Ptolemias: The Arians had submitted the two reluctant prelates with the presbyter Arius, were banished to Ilyria; Eusebius of Nicomedia and Theognis of Nicæa were also driven into exile, and at the same time the works of Arius were condemned to be burned under pain of death. But this artificial unity was no ratification of peace: in fact, it paved the way for a struggle which convulsed the whole empire. For it was the proclamation of the Nicene Creed that first opened the eyes of many bishops to the significance of the problem there treated; and its explanation led the Church to force itself by the submission of theoretical views in compliance with those principles, enunciated at Nicæa, to which, in the year 325, she had pledged herself without guile. In addition to the Arian impediment, there was the schism of Bishop Miletus of Lycopolis in the Thebaid, whose settlement Constantine had added to the programme of the council. He and Peter, bishop of Alexandria, had come into conflict over the treatment of the "backsliders" (laïps) in the Diocletian perse-
cution; and their strife acquired additional bitterness from the fact that it was extended to cover the prerogatives of the Alexandrian bishopric. Peter had composed a treatise advocating moderate principles and censuring the courtship of martyrdom for its own sake, then gone so far as to save himself by flight. Miletus, on the other hand, represented the most rigorous school, and allowed himself high-handed infringements of the law. When this had resulted in his deposition by a synod, a faction still adhered to him, and the Miletians became a schis-
matic community; and such they remained even after the death of Peter (321), who demonstrated by his martyrdom that his counsels of moderation were not prompted by cowardice. This Miletian schism made for disorder in the ecclesiastical life of Egypt all the more because its followers sided with Arius. The Nicene Council broke the strength of the movement by great concessions to the Miletian bishops, and, at the same time, expressly recognized the supreme rights of the Alexandrian see over Egypt, Libya and the Pentapolis. Since, in the resolution dealing with this point (canon vi.), reference was made to the analogous and undisputed suzerainty of the Roman see—over.
NICANDER—NICARAGUA

the ten suburban provinces, attached to the diocese of Rome and including middle and lower Italy, with the islands of Sicily, Corsica and Sardinia—this decision enshrines an important piece of evidence for the history of the papacy. On this opportunity, his ancient privileges were restored to the bishop of Jerusalem, who, in consequence of the political history of the Holy Land, had been subordinate to the metropolitan of Caesarea (canon vii.). The path was smoothed for the readmittance of the Novatians (Cathari) into the church, by recognizing, in this case, their clergy, with the bare stipulation that the laying-on of hands should follow their written promise to be faithful to the doctrine of the Catholic Church (canon viii.).

A final schism was to follow. The Pope, ante-dating the Coffe (16th century) had decided, as to the celebration of the Easter festival, the synod committed itself so as to pronoun in favour of the Alexandrine cycle—a settlement which entailed such important results in practical life that it was communicated to the Christian churches by Constantine in a circular letter. The problem, whether a baptism, performed by heretics in the name of Christ or the Trinity, should rank as a baptism or not, had given rise to an animated controversy between the Roman bishop Stephen, who answered in the affirmative, and Cyprian of Carthage, who gave an equally weighty negative answer. The Roman synod, merely declaring the nullity of baptisms imparted by the adherents of Paul of Samosata (canon xix.).

An important provision, in point of ecclesiastical law, was that the chiroty of a bishop required the presence of at least three other bishops of his province, while the confirmation of the choice remained at the disposal of the metropolitan (canon iv.). A further regulation was that two provincial synods should be held annually (canon vi.); but a law enacting the celibacy of the clergy was rejected at Nicea, since Faophutus; an aged bishop of Egypt who had been put to death in persecution, warned his colleagues against the danger of imposing too arduous a yoke upon the priesthood, and defended the sanctity of marriage.

As Constantine had convened the synod, so he determined its conclusion. A brilliant banquet in the imperial palace—of which Eusebius of Caesarea gives an enthusiastic account—marked its close, after which the bishops were granted their return. The admonitions to peace with which he dismissed them proved unavailing for the reasons indicated above; but the reputation of the first ecumenical council suffered no abatement in consequence.

NICANDER (2nd cent. B.C.), Greek poet, physician and grammarian, was born at Claros, near Colophon, where his family held the hereditary priesthood of Apollo. He flourished about Attalus III. of Pergamum. He wrote a number of works both in prose and verse, of which two are preserved. The lost, Theriac, is an hexameter poem (182 lines) on the nature of venomous animals and the wondrous which they inflict. The other, Alexipharmacis, consists of 630 hexameters treating of poisons and their antidotes. In his facts Nicander followed the physician Apollodorus. Among his lost works may be mentioned: Alexelica, a prose history of Aetolia; Lysimachena, a mythological epic, used by Ovid in the Metamorphoses and epitomized by Antoninus Liberalis; Georgica and Melissourgica, of which considerable fragments are preserved, said to have been imitated by Virgil (Quintilian x. 1. 56). The works of Nicander were praised by Cicero (De oratore, i. 16), imitated by Ovid, and frequently quoted by Pliny and other writers. His reputation does not seem justified; his works, as Plutarch says (De antididis poeotis, 16), have nothing poetical about them except the metre, and the style is bombastic and obscure; but they contain some interesting information as to ancient belief on the subjects treated.

Editions.—J. G. Schneider (1792, 1816): O. Schneider (1866) (with the Scholia); H. Klauer, "De Diicendi Genere nicheini—Nicandri" ( Dissertationes Philologicae Vindebonenses, vi. 1896).

The Scholia (from the Göttingen MS.) have been edited by G. Wentzel in Abhandlungen der k. Gesellschaft der Wiss., zu Göttingen, xxxvii. (1892). See also W. Vollrath, Nicander und Ovid (Groningen, 1909 fol.).

NICANOR, Greek grammarian, son of Hermias of Alexandria (200-240), lived during the reign of Hadrian. He chiefly devoted himself to the study of punctuation of which the difference of meaning caused by it. Hence he was nicknamed "the Punctuator" (δς otyyjaras). He is known to have written on the punctuation of Homer and Callimachus. He was possibly the author of a work Ιππει Μεροβογοον (On the Change of Names of Places), of which some fragments are preserved in C. W. Müller, Fragmenta Historiorum Graecorum., iii. 632.

Edition of the Ilid and Odyssyy fragments by L. Friedländer (1890) and W. Wentzel (1878) respectively.

NICARAGUA, Republic of Central America, bounded on the N. by Honduras, E. by the Caribbean Sea, S. by Costa Rica, and W. by the Pacific Ocean (for map, see CENTRAL AMERICA). Pop. (1905), about 550,000; area 49,200 sq. m. Nicaragua forms an irregular equilateral triangle with its base stretching for 280 m. along the Caribbean Sea from Cape Gracias à Dios southwards to the San Juan delta, and its apex at the Coseguina volcano, on the Bay of Fonseca, which separates Nicaragua on the Pacific side from Salvador. The frontier which separates the republic from Honduras extends across the continent from east-north-east to west-south-west. It is defined by the river San Juan which, about 2 m. from its mouth, flows into the Pacific, and is followed by the river Negro to the Bay of Fonseca. In accordance with the treaty of 1838, which was confirmed in 1888 by the United States president, acting as arbitrator, and more fully defined in 1896, the boundary towards Costa Rica is drawn 2 m. S. of the San Juan river and Lake Nicaragua, as far as a point parallel to the centre of the western shore of the lake. It is then continued northward for the short distance which intervenes between this point and the northwestern headland of Salinas Bay, on the Pacific.

Physical Features.—The coasts of Nicaragua are strikingly different in configuration. The low, swampy and monotonous shore of the Caribbean, with its numerous lagoons and estuaries, and its fringe of reefs and islets, contains only three harbours: Gracias à Dios, Bluefields or Blewfields, and Greytown (San Juan del Norte). Its length, from Cape Gracias à Dios to the San Juan delta, is nearly 300 m. The Pacific coast, measuring some 200 m. from the Bay of Fonseca to Salinas Bay, is bold, with numerous anchorages, of which the most important, the only safe anchorage, are the best harbours of the republic—the southern arm of the Bay of Fonseca (g.n.), Corinto, Brito and San Juan del Sur.

The surface of the country is naturally divided into five clearly distinct zones: (1) the series of volcanic peaks which extend parallel to the Pacific at a little distance inland; (2) the plains and lakes of the great depression which lies to the east of these mountains and stretches from sea to sea, between the Bay of Fonseca and the mouths of the San Juan; (3) the main cordillera, which skirts the depression on the east, and trends north-west from Monkey Point or Puerto Fredon on the Pacific to the river San Juan, on the borders of the Central American and the Mosquito Reserves, on the Pacific; (4) the plateaux which slope gradually away from the main cordillera towards the Caribbean; (5) the east or Mosquito coast, with its low-lying hinterland. The last-named region has to a great extent had a separate history; and it was only in 1894 that the Mosquito Reserve, a central enclave which includes more than half of the littoral and hinterland, was incorporated in the republic and renamed the department of Zelaya. (See MOSQUITO COAST.)

Though situated almost on the western edge of the country, and greatly inferior, both in continuity and in mean altitude, to the main mountains, the eastern cordillera is ainda in importance to the cordillera itself. It consists for the most part of isolated igneous peaks, sometimes connected by low intervening ridges which form a terminator or barrier, with the Coseguina range, and in the extreme south-east with the low wooded archipelago of Solentiname and Cichicaste near the head of the San Juan river. Between these two extremes the chief courses, proceeding southwards, are: the Matlices chain, comprising El Viejo (3400 ft.), Santa Clara, Telica, Orotte, Las Pilas, Axocod, Momotombo (4127 ft.), all crowded close together between the Bay of Fonseca and Lake
Managua; Masaya or Popocatepetl (which was active in 1670, 1782, 1857 and 1902, and attains a height of 2972 ft.), and Mommbacho (5933 ft.), near Granada; lastly, in Lake Nicaragua the two islands of Granada and Ometepe (flat topped, 5640 ft.) and Madera. On the 20th of January 1835 Coeiguena was the scene of one of the most tremendous eruptions on record. The outflow from Lake Nicaragua was entirely closed off by an impulsive accumulation of volcanic dust and ashes, first welling up as a vast area, which comprised Jamaica, southern Mexico and Bogotá. After a long repose Ometepe also burst out again on the 19th of June 1853, when the lavas from a new crater began to flow, but they were continued for some time to the west, and then directed over the whole island. In the Maribios district occur several volcanic lakes, such as that of Masaya, besides numerous infernolos, low craters or peaks still emitting sulphurous vapour and smoke, and at night often lighting up the whole land with bluish flames.

In the great lacustrine depression of Nicaragua is collected all the drainage of the whole southern part of the continent. There are 19 basins, of which the sheet basin of Lake Nicaragua, the depression is partly escaped by the sheet river, is itself formed by the orographic basin of the river Dint, which runs through the whole length of the country.

The accumulation of waters which pour down into the depression are gathered into the two basins of Lake Managua and Lake Nicaragua. Both basins have a maximum depth of some 260 ft. Lake Managua, the more northerly, has a length of 30 m., and varies in breadth from 8 to 10 m. Its area is about 575 sq. m., and the river Dint, a portion of its overflow escapes southwards into the larger and Lake Nicaragua, through the Panayloa channel. Steamers ply on both lakes, and there are rail connections between the town of Tipitapa, at its northern extremity. Here there is a waterfall of 13 ft. The existence of ancient lacustrine surfaces, upheaved between the two basins by volcanic agencies or left dry by some event, seems to indicate that the lakes were formerly united. Now, however, Lake Managua is almost a closed basin in the dry season, when the stream in parts of the Panayloa channel sinks to a mere rivulet. The surface of Lake Nicaragua is maintained after the rains is 110 ft. above sea-level. The lake is 100 m. long, and has a maximum breadth of 45 m. and an area of 2970 sq. m. It is thus the largest sheet of water in Central America, and bordering the borders of Bolivia and Peru. Towards the San Juan outlet its depth decreases to 6 or 8 ft., owing to the vast accumulation of the silt washed down into the lake by its principal Costa Rican affluent, the Rio Grande, and the lake is again shallow. Under the influence of the intermittent trade-winds Lake Nicaragua rises and falls regularly, whence the popular notion that it was a tidal lake. It is also exposed to the dangerous Papagayos tornadoes, caused by the prevailing north-westly winds meeting opposite currents from the Pacific. It is drained on the south by the San Juan river, which flows generally east by south to the Caribbean Sea.

The distance from the lake to the principal or Colorado mouth of the river is 95 m., and the average width of the channel 1500 ft. Near its mouth the main stream branches out into a wide delta. Navigation is greatly impeded by shifting banks of silt, and especially by five large islands which traverse the river near its delta. It is often asserted that these rapids were artificially formed by the Spaniards themselves to prevent the buccaneers from penetrating to Lake Nicaragua. But Herrera (Dc. iii. book 2, chap. 3) speaks of the campesinos and Cordillera Cordobeses, the Circumnavigators of the lake, from descending the San Juan in 1522; and although the English traveller Gage states that in his time (17th century), at least, the Indians were familiar with the whole route, there is little doubt that the rapids are natural obstructions.

The main Nicaraguan cordillera, which flanks the depression on the east, has often been called the Cordillerada de los Andes, from its supposed continuity with the mountain-chains of Panama and the west coast of South America, but this supposition is not sustained. The San Juan valley completely separates the mountains of Panama from the main Nicaraguan system. This severance, it is true, may be accounted for geologically and some geologists see, in the five rapids of the San Juan, remnants of a connecting ridge which the river has swept away. But the evidence for past continuity is inconclusive, while there can be no doubt about the present severance of the two massifs, which is distinctly visible from different parts of Nicaragua. Thus the important section which terminates at Monkey Point is commonly called the Cordillerade Oyolita. The summits of the main cordillera seem nowhere to exceed 8000 ft.; the declivity is through the lakes, and gradual towards the Caribbean. Along the shores of the lakes the cordillera may be described as an extensive range consisting of two northern, which are divided by a great longitudinal valley. The lower series, which adjoins the lakes, rises near Lake Managua, and marches parallel to the main crest of the cordillera as far as the northern base of the Yola, which is situated near the village of Nueve, due east of Managua, where the eastern ridge of the Yola section has a more easterly direction.

On the east, the main cordillera abuts upon the region of plateaux and savannas, which occupies nearly half of the area of Nicaragua. It is likely that this region was once a uniform tableland, level still sinks. But the relief of the tableland has been wholly changed by fluvial action. The great rivers which flow eastward to the sea have cut valleys, which are the fundamental features of the region. The cultivated areas of Nicaragua are generally flat and interspersed with high plateaus, ridges and isolated hills. Large tracts of these uplands have never been adequately explored, and consist of virgin forest and prairie. The principal river is the Segovia, which rises in the Cordillera de los Moscos, near the town of Prinzapolca, and passes the town of Yolita, where it rises as far as 85° W., and constitutes the frontier until it reaches the sea at Cape Gracias a Dios, after a course of more than 450 m., during which it receives many tributaries. Its basin is narrow and its headwaters are formed by the internal drainage of the main upland. Its nomenclature, like that of many lesser streams in the plateau region, is somewhat confusing; for while the Spanish colonists were settling beside its headwaters the mid-streams were hardly known except to the native Indians, and the lower reaches were frequented by buccaneers, often of British or Dutch origin. In addition to the three names of Segovia, Coco or Cocos, and Wanks, which are applicable to the whole, different parts have from time to time received the names of Caballub, Cenbraga, Cape River, Encuentro, Gracias, Herbias, Oro, Pantasma, Portillo Liso, Tapacap, Tepaneca, Somoro, Yankes and Yoro. Other important names of the country are the Mayal, the Carona and the Ometepe island, which is of great importance in the vicinity of the Rio spite.

Geology, fauna and flora of Nicaragua may be studied in connection with that of the neighbouring countries (see CENTRAL AMERICA). The climate is mild and healthy for Europeans on the uplands, such as those of Segovia and Chontales, which have a mean elevation of 2000 to 3000 ft. above sea-level. But elsewhere it is distinctly tropical, with two seasons—hot from May to November and cool from December to April. The rainfall is greatest to the north and dry throughout the winter months. The mean annual temperature is about 80° Fahr., falling to 70° at night and rising to 90° at noon in summer. Nicaragua comes within the zone of the wet north-east trade-winds, which sweep inland from the Atlantic. The rainfall is heavy along the west side of the lacustrine basin, with an annual mean at Ixvas of 106 in., but this figure is sometimes greatly exceeded on the east coast, where rain is common even in the dry season. Observations made at Greytown in 1890 showed the extremes of temperature to be 89° Fahr. in September for the maximum and 70° Fahr. in January for the minimum; the rainfall for the whole year was 106 in., and the minimum 10 in., while the maximum (52 sq. in.) and the driest, May (4-9 in.). Earthquakes are felt at times on the Pacific slope, but in Nicaragua they are less violent than in the neighbouring countries.

Inhabitants.—Accurate statistics as to the growth and distribution of the population cannot be given, and the figures given below are based on estimates which can only be approximately correct. The census of 1882 gave the total as 275,816; this appears to have risen in 1890 to 375,000, in 1900 to 500,000, and in 1905 to 550,000, or 11 inhabitants per sq. m. There can thus be no doubt that the population is increasing with extraordinary rapidity, although there is hardly any immigration. The population of Europeans is estimated to be about 1200, and tends to increase. Spanish and German elements preponderate in the foreign colonies. The most densely peopled region and the focus of civilization is the lacustrine depression and the surrounding uplands. Here are all the large towns, and bither European settlers were attracted from the first by the temperate climate, rich soil, and natural waterways. The development of Nicaragua, unlike that of most American countries (notably Brazil and the United States), has been hastened by the great river, the Segovia, the east coast of Central America being the point termed the residences of the first Spanish conquerors, many of whom were Galicians, and the negro slaves introduced during the colonial period. Intermarriage with British, Dutch, and French with Caribs and Creoles has further complicated the ethnology of the country, producing "Indians" with fair hair and blue eyes, and half-castes with European features and Indian or negrooid coloration, or with European
coloration and Indian or negroid features. The prevailing language is a degenerate form of Spanish, nearer to Galician than to Castilian. Most of the native dialects have ceased to exist, but a corrupt form of English is spoken on parts of the east coast. All who speak Spanish are classed as Ladinos; the half-castes generally are termed Mestizos; and the name of Sambos or Zambo is confined to the descendants of Indian and negro parents; these are also incorrectly called Caribs. The number of the uncivilized Indians, whose villages are situated in distant parts of the plateau, is usually estimated at 30,000; but this would seem to be an exaggeration. Pure-blooded Indians are not numerous, as whole districts were depopulated and whole tribes exterminated by the Spanish colonists and the buccaneers. A few may be descendants of the Aztecs and Mayas, whose temples, sculptures, burial-grounds, &c., have not yet been fully explored. For a general account of this ancient civilization and of the Indian tribes see Central America and Mexico: Archaeology. A collection of Nicaraguan antiquities is preserved in the National Museum at Washington, U.S.A.; and the archaeological collection brought to Europe by Dr W. Lehmann in 1910 was exhibited in the Berlin Museum of Fine Arts.

Chief Towns and Communications.—The capital is Managua (pop. 1905, about 30,000); other important towns are Leon (45,000), Granada (25,000), Masaya (20,000), Chinandega (12,000), and the seaport of Bluefields (about 8,000). The smaller towns are described in separate articles. At the beginning of the 20th century, Nicaragua had few good roads, and none at all east of the main cordillera. Transport in the plateau region was mainly effected by means of mules, over the roughest of tracks. But between 1900 and 1905 contracts were signed for the construction of three highways, leading respectively from Matagalpa, from Nueva Segovia and from the Piso mining district to the head of steam navigation on the Segovia, about 160 m. above Cape Gracias. These highways were to be linked to the western system by 79 m. of road connecting Matagalpa with Momotombo. For the construction and upkeep of these new roads 10 per cent. of the tolls collected on all caravans and ox convoys over eighteen years old. There are 160 m. of state railways, running from Corinto to Leon, Managua, Granada and Dirizamba, with branches to El Tambo and Montebello. Contracts for additional lines were signed between 1900 and 1905. The steamers which ply on the great lakes and the San Juan, besides other vessels which visit the principal Caribbean and Pacific ports, are national property; but from the 1st of January 1905 all the state railways were leased to a syndicate for fifteen years and the steamers for twenty-five years. There are also 20 m. of private railway near the mouth of the Rio Grande, and private steam tramways on the western shore of Lake Nicaragua. Corinto is the principal point of entry for foreign trade and is visited by a large number of vessels. About 2,100 of the 2,100 vessels of 550,000 tons (including coasters) which annually enter the ports of the republic. The coasting trade is restricted to vessels of under 250 tons. At the beginning of the 20th century most of the ocean-going steamers were owned by British, French, or the United States; British enterprise being chiefly represented by schooners trading from Jamaica to Bluefields and Grijalva. Nicaragua is a member of the international postal union, and the several provinces have a fairly complete telegraphic and telephonic system.

Industries and Commerce.—The principal agricultural product is coffee, the yield of which increased from 4,282,300 lb in 1880 to 11,382,300 lb in 1890, and 28,400,000 lb in 1900. Coffee is grown principally in the Matagalpa region, on the uplands of the interior. The plantations are chiefly owned and managed by Germans, and the product is of good quality; but coffee-planting, like most Nicaraguan industries, suffers from the scarcity of labour. On the Caribbean coast bananas are cultivated and largely exported to the United States. In 1903 more than 2,000,000 banches were consigned to the United States. The production of sugar cane has been often tried but with little success. Sugar is grown and there are many small sugar factories, but little of the output is exported. The cacao export is also small; tobacco, rice, beans and other crops are grown for local consumption. The citrus fruits, which have been formed. Dye-woods and indigo are exported, but the demand for vegetable dyes has decreased. Cattle-rearing is successful, but the cattle are small and of little value. The fishing industry and the fisheries being important articles of export. Cheese and butter are manufactured in large quantities for home consumption. Horses and pigs are also reared, but not sheep. In 1899 the government sold about 3,500 acres of public land for 9,900/. The cattle and live-stock of the republic is of high quality. The drinking-water is derived from the natural springs. The fact that Nicaragua has not a state monopoly. From the 1st of January 1904 it was leased to a syndicate of distillers for six years. Gold-mining is carried on along the Caribbean littoral. In 1898 the gold dust and bar exports from Bluefields were of the value of £2,576; in 1900, £62; and in 1907, £65,000. Copper, coal, petroleum, silver and precious stones are also found, and there seems little reason to doubt that the mineral resources of the republic are exceedingly rich. Nicaragua possesses a number of iron mines, besides those of Honduras. Other industries include manufactures of leather, boots and shoes, furniture, bricks and pottery, cigars and cigarettes, beer, wine and spirits, candles and soap. The largest and most important of these is the sugar industry. The principal crops of the country are sugar cane, coffee, maize, tobacco, rice, beans, cotton, and rubber. There are also many industries connected with cattle and hides, dyes and other products. The principal imports are cotton and woolen goods, machinery and hardware, flour, beer, wine, spirits and drugs. The United States and Great Britain send annually about 60% and 10% respectively of the imports. The value of 8% of the exports. The average yearly value of the foreign trade is about £1,200,000—exports, £700,000; imports, £500,000.

Money, Weights, and Measures.—There is one bank of issue, the Bank of London and Central America, which has a capital of £260,000 (£130,300 paid). The monetary unit is the silver peso or dollar of 100 cents, which weighs 25 grammes, .900 fine. The current coinage, however, present no continuous or clear view of the national receipts and disbursements. Revenue and expenditure vary considerably, but neither often falls below £300,000 or rises above £500,000. In 1886 the republic contracted a railway loan in London to a limit of £285,000 at 6% interest, and in July 1894 the interest fell into default. In 1895 an arrangement was made for the purchase of the interest at 80% of its face value, and the creation of "coffee warrants" to be used in lieu of direct tax duties. In the four years 1897–1900 the sales of these warrants amounted to 1,028,990 gold pesos or (at 3d., the average rate for this period) £61,600. In July 1905 the outstanding amount of the debt was £253,600. In 1905 a further loan of 12,500,000 francs (£500,000) was raised in Paris at 5% The internal debt amounts to about £400,000.

Constitution and Administration.—The former constitution, proclaimed on the 4th of July 1845 and amended on the 10th of December 1866, was superseded on the 30th of March 1895, when a new constitution was promulgated. By this instrument the legislative power is vested in a single chamber of 36 members (instead of 40, as under the old constitution), elected by universal male suffrage for six years (instead of four). The executive is entrusted to a president similarly chosen for six years (instead of four) and aided by a cabinet representing the five ministries of foreign affairs and education, finance, internal administration and justice, war and marine, and public works. For administrative purposes the republic is divided into 13 departments and 2 comarcas, each under a political head who acts as military commandant and controls education, finance, &c. The administration of justice is entrusted to numerous courts of first instance, three courts of appeal, and a supreme court. The active army of 4,000 men can be increased to 40,000 in war. All able-bodied citizens between the ages of seventeen and fifty-five are compelled to serve one year with the colours and are then enrolled in the reserve. Roman Catholicism is the prevailing religion and the Roman Catholic church has the religious endowment or other special privilege from the state. The bishop of Leon, whose diocese is included in the archiepiscopal province of Guatemala, is the spiritual head of the Roman Catholics. There are numerous elementary schools, at which the teaching is free and compulsory, besides ten colleges for secondary or technical education, and two universities.

History.—For a general account of the Spanish administration during the colonial period, i.e. up to 1821, and of the subsequent attempts to unite all the Central American republics in a single
Dr Roberto Sacasa. Under Carazo's administration the boundary question between Nicaragua and Costa Rica had been settled by arbitration, the president of the United States acting as arbitrator. While Dr Sacasa was president of Honduras, Salvador and Guatemala signed a treaty, under which the United States of Central America were to be formed. The president of Nicaragua adhered to this treaty, but the National Congress refused to ratify it. Sacasa was overthrown by a revolution in 1893, and was succeeded by a provisional government, which in its turn was deposed soon after by another uprising, at the head of which was General José Santos Zelaya. His position was strengthened by the facts that he was related to President Barrios by marriage and that he was president in 1898 for another term of four years. Under his government the incorporation of the Mosquito Reserve into the territory of Nicaragua took place. In 1895 occurred the Hatch incident, which led to the occupation of the port of Corinto by a British fleet. Mr Hatch, British pro-vice-consul at Bluefields, being accused of conspiracy against the Nicaraguan government, was arrested, along with other British subjects, and expelled. For this action Nicaragua was required to pay an indemnity of $15,000. An attempt to overthrow Zelaya was made in February 1897, but it was crushed after several days of fighting. There were occasional disturbances, subsequently, but none sufficient to overturn President Zelaya, who was again re-elected in 1902 and 1906.

1 General Medina and other officers were tried by a Nicaraguan court-martial for the murder of Grace and Cannon, but were acquitted on the 28th of January 1910.
west coast from Naples to Reggio di Calabria. Pop. (1901) 13,671 (town), 18,150 (commune). It is situated on the isthmus between the gulfs of S Eufemia and of Squillace, the narrowest part of Calabria, 970 ft. above sea-level, and commands a fine view. The ruined castle served as the place of imprisonment of Frederick II.'s son Henry. The place suffered greatly from the earthquake of 1638, which also destroyed the Benedictine abbey of S Eufemia, founded by Robert Guiscard.

NICCOLI, NICCOLO DE' (1365—1437), Italian humanist, was born and died at Florence. He was one of the chief figures in the company of learned men which gathered round Cosimo de' Medici, who played the part of Augustus to Niccolò Machiavelli. His scholarship and classical literature consisted in his work as a copyist and collator of ancient MSS.; he corrected the text, introduced divisions into chapters, and made tables of contents. His lack of critical faculty was compensated by his excellent taste; in Greek (of which he knew very little) he had the assistance of Ambrogio Traversari. Many of the most valuable MSS. in the Laurentian library are by his hand, amongst them those of Lucrètius and of twelve comedies of Plautus. Niccoli's private library was the largest and best in Florence; he also possessed a small but valuable collection of ancient works, which, after a course of lapsed time, had been replaced and enlarged to an inestimable critic, and could not bear the slightest contradiction; his quarrels with Filippo, Guarino and especially with Traversari created a great sensation in the learned world at the time. His hypercritical spirit (according to his enemies, his ignorance of the language) prevented him from writing or speaking in Latin; his sole literary work was a short tract in Italian on Latin Orthography, which he withdrew from circulation after it had been violently attacked by Guarino.

See the Life in Traversari Epistolae (ed. L. Mehus, 1759); G. Voigt, Die Wiederbelebung des klassischen Alterthums (1893); G. Zippel, Nicolò Niccoli (Florence, 1890).

NICOLITE, a mineral consisting of nickel arsenide, NiAs, containing 43.9% nickel and 56.1% arsenic. Crystals are hexagonal, but are rare and indistinct. It usually occurs as compact masses. A characteristic feature is the pale copper-red colour, with metallic lustre, on the uneven fractured surfaces. It is opaque and brittle, and the streak is brownish-black. The specific gravity is 7.3, and the hardness 5. Small quantities of sulphur, iron and cobalt are usually present, and sometimes the arsenic is largely replaced by antimony. Nicolaite contains variable amounts of copper and iron, and forms an isomorphous species breithauptite (nickel antimonide). Niccolite occurs with ores of cobalt, silver and copper at Annaberg and Schneeberg in Saxony, at Sangerhausen and Mansfeld in Prussian Saxony and other localities; it has occasionally been found in Cornwall and Scotland. The original arite (aarite) is from Mount Ar (Aar) near Pic du Midi d'Ossau in the Pyrenees.

The names niccolite (J. D. Dana, 1868) and nickeline (F. S. Beudant, 1832) refer to the presence of nickel (Lat. nicolum). Owing to its copper-red colour the mineral is commonly called "copper-nickel," the German equivalent of which, Kupfernickel, was used as early as 1604.

(L. J. S.)

NICE, a city of France, the chief town of the department of the Alpes Maritimes, and previous to 1860 the capital of the county of Nice (Nizza) in the province of Sardinia, 739 m. by rail from Paris. Pop. (1901) 127,027, of whom 105,109 were permanent residents; in winter-time there is a large influx of visitors. It occupies a fine position at the mouth of the Paillon (Pailleone): a stream (often dried up in summer) which, after a course of over 10 m., enters the northern end of the Baie des Anges. A steep, isolated limestone hill, 308 ft. in height, running back for some distance from the shore, forms the historical nucleus of the town. Formerly crowned by a castle, which, previous to its destruction by the duke of Berwick in 1706, was one of the strongest fortresses on the coast, it is now laid out as a public pleasure-ground, and planted with aloes, cactus, agave and palm. Towards its south-west corner stands a tower (Tour Bellelade or Clérisy) dating, it is said, from the 4th century. The old town stretches along the western base of the hill; the "town of the 18th century" occupies the ground farther west, which slopes gently towards the Paillon; and away to the north-east and north and west beyond the stream lie the ever-growing quarters of the modern city. To the east of the hill, and thus out of sight of the more fashionable districts, the commercial quarter surrounds the port. The whole frontage of Nice is composed of fine embankments: the Quai des Ponchettes, constructed in 1770 round the base of the castle hill, is continued westward by the Quai du Midi to the public gardens and the municipal casino, whence the Promenade des Anglais (so called because it was begun in 1822—1824 at that time, the French were regarded as Englishmen) a boulevard 55 ft. wide, extends for more than a mile to the suburbs. The cliff Quai du Voeu, a modern Gothic building with two towers 213 ft. high, erected by the town in 1835 to commemorate its preservation from cholera. The secular buildings include the town hall, the prefecture, the theatres, the hospitals, the lycée (founded by the Jesuits in the 17th century), the natural history museum, the library (especially rich in theology), and, at some distance from the town, the astronomical and meteorological observatory on Mont Gros (1220 ft.). The industrial establishments comprise perfumery factories, distilleries, oil-works, furniture and woodwork factories, confectionery works, soap-works, tanneries and a national tobacco factory employing several hundred persons. Besides the vine, the trees principally cultivated in the neighbourhood are the olive, the orange, the mulberry and the carob; and the staple exports are oil, agricultural produce, fruits and flowers.

Nice now joins on the north-east the ancient episcopal town of Cimiez, in which are situated the largest and most elegantly appointed hotels. Reckoning from east to west the town is surrounded by a girdle of beautiful towns—Carabacel, St Etienne, St Philippe and St Beaufremettes, on the hill of the Porte d'armée and Montboron, Riquier and St Roch, the last partly occupied by barracks. The entrances to the port of Nice and the outer pier have been improved; that of the outer port is 300 ft. wide, and that of the inner 220 ft. The area of the port is about 75 acres, the length of quayage available 3380 ft., the depth of water 20 ft., its trade, mostly coastal, being shared principally between French and Italian vessels, the arrivals being about 1235 vessels of some 300,000 tons annually. Nice is an episcopal see (first mentioned at the end of the 4th century) which since 1860 is in the ecclesiastical province of Aix en Provence. It is the headquarters of a military division formed part of the corps d'armée of Marseilles. Protected towards the north by hills which rise stage behind stage to the main ridge of the Alps, Nice is celebrated for the mildness of its climate. The mean temperature is 60°Fahr., that of winter being 49°, of spring 60°, of summer 72° and of autumn 63°. For a few nights in winter the mercury sinks below freezing point, but snow is practically unknown, falling, on an average, only half a day in the year. The highest reading of the thermometer is rarely above 90°. There are sixty-seven days with rain in all the year but it usually falls in heavy showers which soon leave the sky clear again, though the whole annual amount exceeds 32 in. Fine days and rainy days are almost equally distributed throughout the different seasons. The winds are very variable, sometimes changing several times a day. Apart from the ordinary land and sea breezes, the most frequent is the east wind, which is especially formidable during autumn. The south-west wind (called Libeccio, or wind of Lybia) is moist and warm; the north-east (or Gregaou, Greek), which is happily
NICE—NICEPHORUS

rare, brings storms of hail and even snow in winter. The mistral (from the north-west) and the tramontana (from the north) are generally stopped by the mountains; but when they do reach the city they raise intolerable dust-storms. For two thousand years the climate of Nice has been considered favourable in chest complaints. Those who are requiring rest, and those suffering from gout, asthma, catarrh, rachitic affections, scrofula, gout, also experience benefit; but the reverse is the case when heart disease, nervous disorders or ophthalmia are concerned. Autumn is the best season; in spring the sudden changes of temperature demand great care. Means of passing the time pleasantly are fairly abundant. The city is at its liveliest during the carnival festivities, in which, as at Rome, battles are waged with sweetmeats and flowers.

History.—Nice (Nicoæa) was founded about two thousand years ago by the Phocæans of Marseilles, and received its name in honour of a victory (sieg) over the neighbouring Ligurians. It soon became one of the busiest trading stations on the Ligurian coast; but as a city it had an important rival in the town of Cemenelum, which continued to exist till the time of the Lombard invasions, and has left its ruins at Cimiez, 2½ m. to the north. In the 7th century Nice joined the Genoese league formed by the towns of Liguria. In 729 it repulsed the Saracens; but in 859 and 880 they pillaged and burned it, and for the most part of the 10th century remained masters of the surrounding country. During the middle ages Nice had its share in the wars and disasters of Italy. As an ally of Fisa it was the enemy of Genoa, and both the Genoese and the Fisans endeavoured to subdue it; but in spite of all it maintained its municipal liberties. In the course of the 13th and 14th centuries it fell more than once into the hands of the counts of Provence; and at length in 1388 it placed itself under the protection of the counts of Savoy. The maritime strength of Nice now rapidly increased till it was able to cope with the Barbary pirates; the fortifications were largely extended and the roads to the city improved. During the struggle between Francis I. and Charles V. great damage was caused by the passage of the armies invading Provence; pestilence and famine raged in the city for several years. It was in Nice that the two monarchs in 1558 concluded, through the mediation of Paul III., a truce of ten years; and a marble cross set up to commemorate the arrival of the pope still gives its name, Croix de Marbre, to part of the town. In 1543 Nice was attacked by the united forces of Francis I. and Barbarossa; and, though the inhabitants, with admirable courage, repulsed the assault which succeeded the terrible bombardment, they were ultimately compelled to surrender, and Barbarossa was allowed to pillage the city and to carry off 2500 captives. Pestilence appeared again in 1550 and 1580. In 1660 Nice was taken by the duke of Guise. By opening the ports of the cession to all nations, and proclaiming full freedom of trade, Charles Emmanuel in 1656 gave a great stimulus to the commerce of the city, whose noble families took part in its mercantile enterprises. Captured by Catinat in 1691, Nice was restored to Savoy in 1696; but it was again besieged by the French in 1705, and in the following year its citadel and ramparts were demolished. The treaty of Utrecht in 1713 once more gave the city back to Savoy; and in the peaceful years which followed the "new town" was built. From 1744 till the peace of Aix-la-Chapelle (1748) the French and Spaniards were again in possession. In 1775 the king of Sardina, Histoire de Nîmes et des Alpes Maritimes depuis 21 siècle (Paris, 1862); E. Tiessrand, Histoire civile et religieuse de la cité de Nice (2 vols., Nice, 1862); Cartulaire de l'ancienne cathédrale de Nice (Tunis, 1888).

NICE, an adjective which in present usage has two main meanings: (1) fastidious, particular, precise or scrupulous, and (2) pleasant, kind or agreeable. The first meaning has been common since the 16th century, the second only since the end of the 18th. In O. Fr., from which the English form was adapted, the word is niche or nice, which are derivatives of Lat. necius, not knowing, ignorant. The development in meaning is doubtful; some authorities take it as (1) foolish, (2) foolishly precise, (3) delicate, (4) pleasant. Skeat suggests an early confusion with the word "nesh," soft, delicate, still surviving dialectically.

NICEPHORUS, the name of three emperors of the East. NICEPHORUS I., emperor 802–811, was a native of Selceucia in Pisidia, who was raised by the empress Irene to the office of logothetes or lord high treasurer. With the help of the patricians and eunuchs he contrived to dethrone and exile Irene, and to be elected emperor in her stead. His sovereignty was endangered by Bardanes, one of his ablest generals, who revolted and received support from other commanders, notably the later emperors Leo the Armenian and Michael the Amorian. But Nicephorus gained over the latter two, and by inducing them and Bardanes to disband completed the submission of Bardanes, who was relegated to a monastery. A conspiracy headed by the patrician Arsaber had a similar issue. Nicephorus, who needed large sums to strengthen his military force, set himself with great energy to increase the empire's revenue. By his rigorous imposts he alienated the favour of his subjects, and especially of the clergy, whom he otherwise sought to control firmly. In 803 and 810 he made a treaty with Charlemagne, by which the limits of the two empires were amicably fixed. Venice, Istria, the Dalmatian coast and the islands of the coast of the East, while Rome, Ravenna and the Pentapolis were included in the Western realm. By withholding the tribute which Irene had agreed to pay to Harun-al-Rashid, Nicephorus committed himself to a war with the Saracens. Compelled by Bardanes's disloyalty to take the field himself, he sustained a severe defeat at Crasus in Phrygia (805), and the subsequent inroads of the enemy into Asia Minor induced him to make peace on condition of paying a yearly contribution of 30,000 gold pieces. By the death of Harun in 809, Nicephorus was left free to deal with the Bulgar king, Krum, who was harassing his northern frontiers. In 811 Nicephorus invaded Bulgaria and drove Krum to ask for terms, but in a night attack he allowed himself to be surprised and was slain along with a large portion of his army. Krum is said to have made a drinking-cup of Nicephorus's skull.

NICEPHORUS II. (Phocas), emperor 963–969, belonged to a Cappadocian family which had produced several distinguished generals. He was born about 912, joined the army at an early age, and, under Constantine VII., became commander on the eastern frontier. In the war with the Saracens he began with a severe defeat (956), which he retrieved in the years following by victories over the Saracens. In 961 a peace was made with Krum, who was defeated at Pegana, and in 964 Nicephorus invested the Cappadocian province. After receiving the usual honors of a triumph, he returned to the east with a large and well-equipped army. In the campaigns of 962–63 by brilliant strategy he forced his way through Cilicia into Syria and captured Aleppo, but made no permanent conquests. Upon the death of Romanus II. he returned to Constantinople to defend himself against the intrigues of the minister Bringas. With the help of the regent Theophano and the patriarch, he received supreme command of the eastern forces, and became proclaimed emperor by these emperors. In 967 he stormed Constantinople, deposed the domestic patrician and crowned himself emperor. When he returned to the east, he was opposed by the patrician Nicephorus, who opposed the election of Michael II. as co-emperor. After recovering the city and being crowned he continued to wage numerous wars. In 964–66 he definitely conquered Cilicia and again overran Mesopotamia and Syria, while the patrician Nicephorus recovered Cyprus. In 968 he reduced most of the fortresses in Syria, and after the fall of Antioc and Aleppo (969), which were recaptured by his lieutenants, secured his triumph by a peace. After retiring to the retired frontier he began a war against the Bulgarians, to whom the Byzantines had of late been paying tribute (967), and by instigating an attack from the
NICEPHORUS CALLISTUS—NICHOLAS, ST.

Russians distracted their attention effectively. Nicephorus was less successful in his western wars. After renouncing his tribute to the Fatimite caliphs, he sent an expedition to Sicily under Nicetas (964–65), but was forced by defeats on land and sea to evacuate that island completely. In 970 he made peace with the Saracens of Kairawan and turned to defend himself against their common enemy, Otto I. of Germany, who had attacked the Byzantine position in Italy; but after some initial successes his generals were defeated and driven back upon the southern coast. Owing to the care which he lavished upon the proper maintenance of the army, Nicephorus was compelled to exercise rigid economy in other departments. He retrenched the court largesses and curtailed the immunities of the clergy, and although himself of an ascetic disposition forbad the foundation of new monasteries. By his heavy imposts and the debasement of the coinage he forfeited his popularity with the rest of the community, and gave rise to riots. Last of all, he was forsaken by his wife, and, in consequence of a conspiracy which she headed with his nephew John Zimisces, was assassinated in his sleeping apartment.

Nicephorus was the author of an extant treatise on military tactics which contains valuable information concerning the art of war in his time.

NICEPHORUS III. (Botaniates), emperor 1078–1081, belonged to a family which claimed descent from the Roman Fabii and rose to be commander of the troops in Asia. He revolted in 1078 from Michael VII, and with the connivance of the Turks marched upon Nicaea, where he assumed the purple. In face of another rebellious general, Nicephorus Bracciano, his election was ratified by the clergy of Nicaea. With the help of Alexius Comnenus he drove out of the field Byzantines and other rivals, but failed to clear the invading Turks out of Asia Minor. Nicephorus ultimately quarrelled with Alexius, who used his influence with the army to depose the emperor and banish him to a monastery.

In the years of his reign he had entirely given himself over to debauchery.

See Gibbon, Decline and Fall (ed. Bury, 1896); Finlay, Hist. of Greece; Bury, A History of the Later Roman Empire (1893); and G. Leonardt, Kaiser Nicephorus II. (Halle, 1887).

NICEPHORUS CALLISTUS XANTHOPoulos, of Constantinople, the last of the Greek ecclesiastical historians, flourished 1310–1315. His Historia Ecclesiastica, in eighteen books, brings the narrative down to 610; for the first four centuries the author is largely dependent on his predecessors, Eusebius, Socrates, Sozomen, Theodoret and Evagrius, his additions showing very little critical faculty; for the later period his labours, based on documents now no longer extant, to which he had free access, though he used them also with small discrimination, are much more valuable. A table of contents of other five books, continuing the history to the death of Leo the Philosopher in 911, also exists, but whether the books were ever actually written is doubtful. Some modern scholars are of opinion that Nicephorus appropriated and passed off as his own the work of an unknown author of the 10th century. The plan of the work is good and, in spite of its fables and superstitious absurdities, contains important facts which would otherwise have been unknown. The history of the Latin Church receives little attention. Only one MS. of the history is known; it was stolen by a Turkish soldier from the library at Bud and was taken to Constantinople, where it was bought by a Christian and eventually reached the imperial library at Vienna. Nicephorus was also the author of lists of the emperors and patriarchs of Constantinople, of a poem on the capture of Jerusalem, and of a synopsis of the Scriptures, all in fables; and of commentaries on liturgical poems.

Works in J. P. Migne, Patrologia Graeca, ccxxv–ccxvii; see also F. C. Baur, Die Epochen der kirchlichen Geschichtsschreibung (1852); C. Krumbacher, Geschichte der byzantinischen Literatur (1897); Wetzer and Welte's Kirchenlexikon, ix. (Freiburg im Breisgau, 1893).

PATRIARCHA (c. 758–829). Byzantine historian and patriarch of Constantinople (806–815). His father Theodorus, one of the secretaries of the emperor Constantine Copronymus, had been scourged and banished for his zealous support of image-worship, and the son inherited the religious convictions of the father. He was secretary to the imperial commissions at the council of Nicaea in 787, which witnessed the triumph of his opinions; but, feeling dissatisfied with court life, he retired into a convent. In 806 he was suddenly raised by the emperor Nicephorus I. to the patriarchate of Constantinople, and this office he held until 815, when he accepted deposition and banishment. The patriarchate of Nicephorus I. was a general knapsack which was passed on and which at last was filled with the body of Leo the Armenian in the previous year. He retired to the cloister of St Theodore, which he himself had founded, and died there in 829. After his death he was included among the saints of the orthodox church.

Nicephorus is the author of a valuable compendium (Breviarium Historicum) of Byzantine history from 602 to 770, of a magnum Chronologia ecclesiastica, and a compendium of the history of the Turks, in J. P. Migne, Patrologia Graeca, c.; edition of the compendia and life by C. de Boor (1880), Teubner series; see also F. Hirsch, Byzantinische Studien (1876); H. Hergenrother, Photos (1867); and Krumbacher, Geschichte der byzantinischen Literatur (1897); Wetzer and Welte's Kirchenlexikon, ix. (Freiburg im Breisgau, 1893).

Niche (through Fr. niche from Ital. nicchia, nicchio, shell; possibly from Lat. nilius, a sea-shell; cf. "napkin" from mappa), in architecture a recess sunk in a wall, generally for the reception of a statue. The niche is sometimes terminated by a bracket or corbel, but more commonly by a canopy, and was an interesting element and a tabernacle.

NICOL, JOHN (1833–1894), Scottish man of letters, son of the astronomer J. P. Nicol (1804–1889), was born on the 8th of September 1833, and educated at Glasgow and Balliol College, Oxford, where he had a brilliant career. After taking his first-class in classics, he remained at Oxford as a coach. With Albert Venn Dicey, Thomas Hill Green, Swinburne and others, he formed the Old Mortality Society for discussions on literary matters. In 1863 he was made professor of English literature at Glasgow. He had already made a reputation as an acute critic and a successful lecturer, and his influence at Glasgow was very marked. He visited the United States in 1865, and in 1882 he wrote the article on American literature for the ninth edition of the Encyclopedia Britannica—a article which is a good example of his pungent (sometimes unduly pungent) style. He left Glasgow for London in 1884, and died on the 11th of October 1894. Among his best works were his drama Hannibal (1873), The Death of Themistocles, and other Poems (1881), his Byron in the "English Men of Letters" series (1886), his Robert Burns (1882) and Carlyle's Character (1890).

A Memoir by Professor Knight was published in 1896.

NICHOLAS, ST., bishop of Myra, in Lycia, a saint honoured by the Greeks and the Latins on the 6th of December. His cult is celebrated on the basis of his history. All the accounts that have come down to us are of a purely legendary character, and it is impossible to find any single incident confirmed historically. The main facts of his life are usually given as follows. He was bishop of Myra in the time of the emperor Diocletian, was persecuted, tortured for the faith, and kept in prison until the more tolerant reign of Constantine, and was present at the council of Nicaea. It should be observed that this last circumstance is ignored by almost all the Latic authors, and that St Athanasius, who knew all the notable bishops of the period, never mentions Nicholas, bishop of Myra. The oldest known monument of the cult of St Nicholas seems to be the church of SS Priscaus and Nicholas built at Constantinople by the emperor Justinian (see Procopius, De aedifici. i. 6). In the West, the name of St Nicholas appears in the 9th century martyrologies, and churches dedicated to him are to be found at the beginning of the 11th century. It is more especially, however, from the time of the removal of his body to Bari, in Apulia, that his cult became popular. The inhabitants of Bari organized an expedition, seized his remains by means of a ruse, and transported them to Bari, where they were received in triumph on the 9th of May.
Nicholas, the name of five popes, and one anti-pope.

Nicholas I., sometimes called The Great, and certainly the most commanding figure in the series of popes between Gregory I. and Gregory VII., succeeded Benedict III. in April 858. According to the annalist Prudentius of Troyes, "he owed his election less to the choice of the clergy than to the presence and favor of the emperor Louis II. and his nobles—who could hardly have foreseen with what ability and persistency the rights of the Holy See as supreme arbiter of Christendom were to be asserted even against themselves by the man of their choice. Of the previous history of Nicholas nothing is recorded. His pontificate of nine years and a half was marked by at least three memorable contests which have left their mark in history. The first was that in which he supported the claims of the unjustly degraded patriarch of Constantinople, Ignatius; the history of the conflict cannot be related here, but two of its incidents, the excommunication of Photius, the rival of Ignatius, by the pope in 855, and the counter-deposition of Photius himself, who had been absolved by Nicholas, by Photius in 867, were steps of serious moment towards the permanent separation between the Eastern and the Western Church. The second great struggle was that with Lothair, the king of Lorraine (second son of the emperor Lothair I., and brother of the emperor Louis II.), about the divorce of his wife Theutberga or Thietberga. The king, who desired to marry his mistress Waldrada, had brought a grave charge against the life of his queen before her marriage; with the help of Archbishops Gunther of Cologne and Thietgaud of Treves, a confession of guilt had been extorted from Thietberga, and after the marriage, that of Aix-la-Chapelle finally authorized Lothair, on the strength of this confession, to marry again. Nicholas ordered a fresh synod to try the cause over again at Metz in 863; but Lothair, who was present with his nobles, anèré secured a judgment favourable to himself, whereupon the pope not only quashed the whole proceedings, but excommunicated and deposed Gunther and Thietgaud, who had been audacious enough to bring to Rome in person the "libellus" of the synod. The archbishops appealed to Louis II., then at Benevento, to obtain the withdrawal of their sentence by force; but, although he actually occupied the Leonine city (864), he was unsuccessful in obtaining any concession, and had to withdraw to Ravenna. Thietberga herself was now induced to write to the pope a letter in which she declared the invalidity of her own marriage, and urged the cause of Lothair, but Nicholas, not without reason, refused to accept statements which had too plainly been extorted, and wrote urging him to maintain the truth steadfastly, even to the death if need were; for, since Christ is the truth, whosoever dies for the truth assuredly dies for Christ. The objection of Lothair was prevented only by the death of Nicholas. The third great ecclesiastical cause which marks this pontificate was that in which the indefeasible right of bishops to appeal to Rome against their metropolitans was successfully maintained in the case of Rothad of Soissons, who had been deposed by Hincmar of Reims. It was in the course of the controversy with the great and powerful Neustrian archbishop that papal recognition was first given (in 863) to the False Decretals, which had probably been brought by Rothad to Rome in the preceding year (see Decretals). At an early period in his reign it also became necessary for Nicholas to administer discipline to John of Ravenna, who seems to have relied not only on the prestige of his famous see but also on the support of Louis II. After lying under excommunication for some time he made a full submission. Nicholas was the pope to whom Boris, the newly converted king of Bulgaria, addressed himself for practical instruction in some of the difficult moral and social problems which naturally arose during a transition from heathenism to Christianity. The pope's letter in reply to the hundred and six questions and petitions of the barbarian king is perhaps the most remarkable literary relic of Nicholas I. now extant. He died on the 3rd of November 867, and was succeeded by Adrian II. The epistolae of Nicholas I. are printed in Migne, Patrologia Lat., vol. LIX, p. 769 seqq. See F. Gregorovius, Rome in the Middle Ages, vol. iii. (Eng. trans., London, 1900-1902); H. Lämmer, Nikolaus I. und die byzantinische Staatskirche seiner Zeit (Berlin, 1857); J. Roy, Saint-Nicolas I. (Paris, 1900); J. Richerich, Papi Nikolaus I. (Bern, 1903); A. Greimser, Die Anschauungen des Papstes Nikolaus I. über das Verhältnis von Staat und Kirche (1909). (X.)

Nicholas II., pope from December 1058 to July 1061, was a Burgundian named Gerard, who, at the time of his election to the bishopric of Florence. He was set up by Hildebrand, with the support of the emperor-regent Agnes and of the powerful Duke Godfrey of Lorraine, against Benedict X., the nominee of the Roman nobles, and was crowned at Rome, after the expulsion of Benedict, on the 24th of January 1059. His pontificate was signalized by the continuance of the policy of ecclesiastical reform associated with the name of Hildebrand (afterwards Gregory VII.). To secure his position he at once entered into relation with the Normans, now firmly established in southern Italy, and later in the year the new alliance was cemented at Rome. On the 5th of September Nicholas II. accompanied by Hildebrand, came to Treves. There, the abbot Humbert and the abbot Desiderius of Monte Cassino, solemnly invested Robert Guiscard with the duchies of Apulia, Calabria and Sicily, and Richard of Aversa with the principality of Capua, in return for oaths of fealty and the promise of assistance in guarding the rights of the Church. The first fruits of this arrangement, which was based on no firmer foundation than the forged "Donation of Constantine" (q.v.), but destined to give to the papacy a position of independence towards both the Eastern and Western Empires, was the reduction in the autumn, with papal aid, of Lucca, where the anti-pope had taken refuge, and the end of the subordination of the papacy to the Roman nobles.

Meanwhile, Peter Damian and Bishop Anselm of Lucca had been sent by Pope Nicholas to Milan to adjust the difference between the Patarenes and the archbishop and clergy. The result was a fresh triumph for the papacy, Archbishop Wido, in face of the ruinous conflict in the Church of Milan, being forced to submit to the terms proposed by the legates, which involved the principle of the subordination of Milan to Rome; the new relation was advertized by the unwilling attendance at Milan of Wido and the other Milanese bishops at the council summoned to the Lateran palace in April 1059. This council not only continued the Hildebrandine reforms by sharpening the discipline of the clergy, but marks an epoch in the history of the papacy by its famous regulation of future elections to the Holy See (see
NICHOLAS

Lateran Councils, and Conclave). Its most important immediate result was the revival of strained relations with the empire, due to the fact that the emperor's traditional rights in the matter of papal elections had been completely ignored. Stephen, cardinal priest of S. Chrysogonus, was sent to the German court to attempt to allay the consequent ill-feeling, but was not received. Pope Nicholas, moreover, had offended the German bishops by what they regarded as arbitrary interference with their rights: he had refused to send the pallium of Archbishop Siegfried of Mainz; he had sent a sharp letter of admonition to Archbishop Anno of Cologne. The resulting opposition culminated in a synod of German bishops, perhaps early in 1061 (its date and place of meeting are unknown), at which the decrees of the pope, including the new electoral law, were annulled, while he himself was deposed and his name ordered to be expunged from the canon of the Mass. That these resolutions were not followed by any further action was due to the war of parties in Germany, which enabled the papacy to ignore a demonstration of opinion to which no effect could be given.

Nicholas II. died at Florence in July 1061. Personally he was one of the least important of the popes, and the great importance of the events of his pontificate is due to the fact that, as Peter Damian wrote (Epist. i. 7), he possessed in Hildebrand, Cardinal Humbert and Bishop Boniface of Albano acumen et potentiam, nesciendum est ad quos réturnus usque sese revocet. His Diplomata, epistolae, decreta are in Migne, Patrologia, Lat. 143, pp. 1301-1366. See the article "Nikolaus II." by C. Mihrt in Herzog-Hauck, Realencyklopädie (3rd ed., Leipzig, 1903), with bibliography. A complete edition of Potthast's edition, with editio princeps, is in Hist. Med. Acta. (2d ed., Berlin, 1896), p. 856; and Ulysses Chevalier, Répertoire des sources hist. bibliogr. (Paris, 1905), vol. 3447, s.v. "Nicolaus II." (X.)

Nicholas III. (Giovanni Gaetano Orsini), pope from the 25th of November 1277 to the 22nd of August 1280, was a Roman nobleman, who served as papal legate and cardinal-deacon of St Nicola in carceri Tulliano by Innocent IV., protector of the Franciscans by Alexander IV., inquisitor-general by Urban IV., and succeeded John XXII., largely through family influence, after a six-months' vacancy in the Holy See. His brief pontificate was marked by several important events. A born politician, he greatly strengthened the papal position in Italy. He concluded a concordat with Rudolph of Habsburg in May 1278, by which the Romagna and the exarchate of Ravenna were guaranteed to the pope; and in July he issued an epoch-making constitution for the government of Rome, which forbade foreigners taking civil office. Nicholas issued the bull Exultat on the 14th of August 1279 to settle the strife within the Franciscan order between the parties of strict and loose observance. He repaired the Lateran and the Vatican at enormous cost, and erected a beautiful country house at Soriano near Viterbo. Nicholas, though a man of learning and strength of character, brought just reproach on himself for his efforts to found principalities for his nephews and other relatives. He died from a stroke of apoplexy and was succeeded by Martin IV. See "Les Registres de Nicolas III." published by Jules Gay in Bibliothèque des écoles françaises d' Athènes et de Rome (Paris, 1896-1905); A. (Bochum, 1880); G. Palmieri, Introiti ed esily di Papa Niccolò III. (Rome, 1889). (C. H. Ha.)

Nicholas IV. (Girolamo Masci), pope from the 22nd of February 1288 to the 4th of April 1292, a native of Ascoli and a Franciscan monk, had beenlegate to the Greeks under Gregory X. in 1272, succeeded St Bonaventura as general of his order in 1274, was made cardinal-priest of Sta Prassede and Latin patriarch of Constantinople by Nicholas III., cardinal-bishop of Palestrina by Martin IV., and succeeded Honorius IV. after a término of two years in the papacy. He was a pious, pénitent-loving monk with no ambition save for the church, the crusades and the extirpation of heresy. He steered a middle course between the factions at Rome, and sought a settlement of the Sicilian question. In May 1280 he crowned Charles II. king of Naples and Sicily after the latter had expressly recognized papal suzerainty, and in February 1291 concluded a treaty with Alphonso III. of Aragon and Philip IV. of France looking toward the possibility of a crusade to recover the holy land. The loss of Prolemas in 1291 stirred the pope to renewed energy for a crusade. He sent the celebrated Franciscan missionary, John of Monte Corvino, with some companions to labour among the Tartars and Chinese. He issued an important constitution on the 18th of July 1289, which granted to the cardinals one-half of all income accruing to the Roman see and a share in the financial management, and thereby paved the way for that independence of the college of cardinals which, in the following century, was to be of detriment to the papacy. Nicholas died in the palace which he had built beside Sta Maria Maggiore, and was succeeded by Celestine V.

Nicholas V. (Tommaso Parentucelli or Tommaso da Carpi, later of Sarnazzia), pope from the 6th of March 1447 to the 24th of March 1455, was born at Sarnazzia, where his father was a physician, in 1398. He early studied at Bologna, where the bishop, Nicholas Albergati, was so much struck with his ardour for learning that he gave him the chance to pursue his studies further, by sending him on a tour through Germany, France and England. He distinguished himself at the council of Ferrara-Florence, and in 1444 was made bishop of Bologna by Pope Eugenius IV., who soon afterwards named him as one of the legates charged to negotiate at the convention of Frankfort an understanding between the Holy See and the Empire with regard to the re-forming decrees of the council of Basel. His successful diplomacy was rewarded, on his return to Rome, with the title of cardinal priest of Sta Susanna (December 1446). He was elected pope in succession to Eugenius IV. on the 6th of March of the following year, taking the name of Nicholas in honour of his early benefactor.

The eight years of his pontificate were important in the political, scientific and literary history of the world. With the German king, Frederick III., he made the Concordat of Vienna, or Aschaffenburg (February 17, 1448), by which the decrees of the council of Basle were abrogated so far as Germany was concerned; and in the following year he secured a still greater triumph when the resignation of the anti-pope Felix V. (April 7), and his own recognition by the rump of the council of Basel, assembled at Lausanne, put an end to the papal schism. The next year, 1459, Nicholas held a jubilee at Rome; and the offerings of the numerous pilgrims who thronged to Rome gave him the means of furthering the cause of culture in Italy, which he had so much at heart. In March 1452 he crowned Frederick III. as emperor in St Peter's, the last occasion of the coronation of an emperor in sacred Rome.

Under the generous patronage of Nicholas humanism made rapid strides. He employed hundreds of copyists and scholars, giving as much as ten thousand guénden for a metrical translation of Homer, and founded a library of nine thousand volumes. Nicholas himself was a man of vast erudition, and his friend Aeneas Silvius (later Pope Pius II.) said of him that "what he does not know is outside the range of human knowledge." He was compelled, however, to add that the lustre of his pontificate would be forever dulled by the tragic fall of Constanctipole, which the Turks took in 1453. The pope bitterly felt this catastrophe as a double blow to Christendom and to Greek letters. "It is a second death," wrote Aeneas Silvius,
NICHOLAS—NICHOLAS I.

"to Homer and Plato." Nicholas preached a crusade, and endeavoured to reconcile the mutual animosities of the Italian states, but without much success.

Nicholas conceived great plans for beautifying and developing Rome. He restored the walls and numerous churches, and began the rebuilding of the Vatican and St Peter's. In undertaking these works Nicholas was moved by no vulgar motives, his idea being "to strengthen the weak faith of the people by the greatness of that which it sees." The Romans, however, appreciated neither his motives nor their results, and in 1452 a formidable conspiracy for the overthrow of the papal government, under the leadership of Stefano Porcaro, was discovered and crushed. This revelation of disaffection, together with the fall of Constantinople, darkened the last years of Nicholas; "As Thomas of Sarzana," he said, "I had more happiness in a day than now in a whole year." He died on the 24th of March 1455.

Nicholas V. (Pietro Raimonducci), antipope in Italy from 1328 to 1330 during the pontificate of John XXII. At Avignon, was a native of Corbara in the Abruzzi. He joined the Franciscan order after separating from his wife in 1316, and became famous as a preacher. He was elected through the influence of the excommunicated emperor, Louis the Bavarian, by an assembly of priests and laymen, and consecrated at St Peter's on the 12th of May 1328 by the bishop of Venice. After spending four months in Rome, he withdrew with Louis to Viterbo and thence to Pisa, where he was guarded by the imperial vicar. He was excommunicated by John XXII. in April 1329, and sought refuge with Count Boniface of Donoratico near Fiambio. Having obtained assurance of pardon, he presented a confession of his sins first to the archbishop of Pisa, and then (25th of August 1330) to the pope at Avignon. He remained in honourable imprisonment in the papal palace until his death in October 1333.

Nicholas (1841—), King of Montenegro and the Berda, was born at the village of Nieghus, the ancient home of the reigning family of Petrovitch-Nieghus, on the 25th of September 1841. His father, Mirko Petrovitch, a celebrated Montenegrin warrior, was elder brother to Danilo II., who led no male offspring. After 1653, when land Hungarians arrived, the bishop, became hereditary in the Petrovitch family, the sovereign power had descended from uncle to nephew, the vladikas belonging to the order of the "black clergy" who are forbidden to marry. A change was introduced by Danilo II., who declined the episcopal office, married and declared the principality hereditary in the direct male line. Mirko Petrovitch having resigned his claim to the throne, his son was nominated heir, and the old system of succession was thus accidentally continued. Prince Nicholas, who had been trained from infancy in martial and athletic exercises, spent a portion of his early boyhood at Trieste in the household of the Kutchfitch family, to whom his mother belonged, the princess Darinka, wife of Danilo II., belonged. The princess was an ardent advocate of French culture, and at her suggestion the young heir of the vladikas was sent to the academy of Louis le Grand in Paris. Unlike his contemporary, King Milan of Servia, Prince Nicholas was little influenced in his tastes and habits by his Parisian education; the young mountaineer, whose keen patriotism, capability for leadership and poetic talents early displayed themselves, showed no inclination for the pleasures of the French capital, and eagerly looked forward to returning to his native land. He was still in Paris when, in consequence of the assassination of his uncle, he succeeded as prince (August 13, 1860). In 1862 Montenegro was engaged in an unfortunate struggle with Turkey; the prince distinguished himself during the campaign, and on one occasion narrowly escaped with his life. In the period of peace which followed he carried out a series of military, administrative and educational reforms. In 1867 he met the emperor Napoleon III. at Paris, and in 1868 he undertook a journey to Russia, where he received an affectionate welcome from the tsar, Alexander II. He afterwards visited various parts of Berlin and efforts to enlist the sympathies of the Russian imperial family were productive of important results for Montenegro; considerable subventions were granted by the tsar and tsaritsa for educational and other purposes, and supplies of arms and ammunition were sent to Cettigne. In 1871 Prince Dolgorouki arrived at Montenegro on a special mission from the tsar, and distributed large sums of money among the people. In 1869 Prince Nicholas, whose authority was now firmly established, succeeded in preventing the impetuous mountaineers from his kingdom from an insurrection against the Russian government (see CATTARO); similarly in 1870 he checked the martial excitement caused by the outbreak of the Greco-Turkish War. In 1876 he declared war against Turkey; his military reputation was enhanced by the ensuing campaign, and still more by that of 1877-78, during which he captured Nikshitch, Antvari and Dulceingo. The war resulted in a considerable extension of the Montenegrin frontier and the acquisition of a seaboard on the Adriatic. In 1883 Prince Nicholas visited the sultan, with whom he subsequently maintained the most friendly relations; in 1896 he celebrated the bicentenary of the Petrovitch dynasty by a splendid gala. The same year he attended the coronation of the tsar Nicholas II; in May 1898 he visited Queen Victoria at Windsor. In 1900 he assumed the title of "Royal Highness." On the 28th of August 1910, during the celebration of his jubilee, he assumed the title of king, in accordance with a petition from the Skupshina. He was at the same time gazetted field-marshal in the Russian army, an honour never previously conferred on any foreigner except the great duke of Wellington. The descendant of a long line of warriors, gifted with a fine physique and a commanding presence, a successful military leader and a graceful poet, King Nicholas possessed many characteristics which awoke the enthusiasm of the impressionable Servian race, while his merits as a statesman received general recognition. His system of government, which may be described as a benevolent despotism, was perhaps that best suited to the character of his subjects. His historical dramas, poems and ballads hold a recognized place in contemporary Slavonic literature; among them are—Balkanska Tsrarica and Knjaz Arsonilii (dramas); Haidana, Polini Avensarego and Penik i Vila (poems); Skuphine Pesme i Nova Kola (miscellaneous poems). In November 1870 Prince Nicholas married Milena, daughter of the vevoie Petar Vukotich. Of his three sons, the eldest, Prince Danilo, married (July 27, 1890) Duchess Julita (Militza) of Mecklenburg-Strelitz; of his six daughters, Princess Militza married the Duke Peter Nikolaievich, Princess Stana, Duke George of Leuchtenberg, Princess Helena, King Victor Emmanuel III. of Italy, and Princess Anka, Prince Francis Joseph of Battenberg. (J. D. B.)

Nicholas I. [Nikolai Pavlovich], emperor of Russia (1796-1855), eighth child of the emperor Paul I. and his wife Maria Fyodorova, was born at Tsarskoie-Selo on the 25th of June (July 6, N.S.) 1776. He was only five years old when his father's murderer brought his brother Alexander I. to the throne (1801). In the following year his education was entrusted to M. von Lambsdorff, director of the 1st cadet corps and ex-governor of Courland, a man of character and wide knowledge, who superintended it for the next fifteen years. But Nicholas had as little taste for learning as his brother Constantine. The royal pupils spent their lesson hours, as Nicholas afterwards confessed, partly in dreaming, partly in drawing all sorts of nonsense, in the end "cramming just enough to scrape through their examinations without discredit." His chief bent was in the direction of everything connected with military
NICHOLAS I.

matters. Religious training was confined to instruction in the forms of the Orthodox Church and the repetition of prayers by rote; dogmatic questions Nicholas neither understood nor cared about; and, in spite of his reverence for his brother Alexander, the latter’s mysticism had not the faintest influence upon him.

Though a colonel in his cradle and a general since 1808, the grand-duke Nicholas did not see any active service until 1815 when he was allowed to join the Russian head-quarters in France but not to take part in any fighting. It is characteristic of him that from this time onwards he never wore civilian dress. In 1815 he was with the Allies in Paris, and in the following year set out on the grand tour, visiting Moscow and the western provinces of Russia, Berlin (where his engagement to Princess Charlotte Louise, daughter of Frederick William III., was arranged) and England, where his handsome presence and charming address created a profound impression. On the 1/13th of July 1817 took place at St Petersburg his marriage to Princess Louise (Alexandra Feodorovna), the beauty. When those intimate relations between the courts of Berlin and St Petersburg which were later to become of great international importance. On the 17/20th of April 1818 their first child, the future emperor Alexander II., was born. In the autumn Nicholas was placed in command of the 2nd brigade of the 1st division of the Guard. In 1819 the emperor Alexander first mentioned his intention to abdicate in favour of Nicholas, Constantine consenting to stand aside; but he took no steps to initiate his prospective heir in affairs of state, and the grand-duke continued to be confined to the leisurely duties of a youth. In 1820 a further important step in the matter of the succession was taken in the divorce of Constantine from the grand-duchess Anne and his re-marriage to Johanna Grudzinska (see CONSTANTINE PAVLOVICH). In January 1822 it was decided in a family council, with the knowledge though not in the presence of Nicholas, that Constantine’s petition to be relieved of the burden of the crown, for which he felt himself unfitted, should be granted. It was not, however, until August 1823 that the emperor drew up the necessary papers, in the presence of the metropolitan Philaret and other witnesses, and deposited them in sealed packets, to be opened at his death. Nicholas was taken to open the sealed packets, and he himself took the oath to Constantine, and, with characteristic contempt for constitutional forms, usurped the functions of the senate and council of state by himself ordering its imposition on the regiments stationed in St Petersburg. But Constantine refused to come to St Petersburg, or to do more than himself take the oath to Nicholas as emperor, and write assuring him of his loyalty. The result was a three weeks’ interregnum, of which the discontented spirits in the army took advantage to bring to a head a plot that had long been hatching in favour of constitutional reform. When on the 14th of December the troops who had already taken the oath to Constantine were ordered to take another to Nicholas, it was easy to persuade them that this was a treasonable plot against the true emperor. The Moscow regiment refused to take the oath, and part of it marched, shouting for Constantine and “Constitution,” to the square before the Senate House, where they were joined by a company of the Guard and the sailors from the warships. In this crisis Nicholas showed high personal courage, if little decision and initiative. It was entirely uncertain how many, and which, regiments could be trusted. For hours he stood, or sat on horseback, amid the surging crowd, facing the mutinous soldiers—who had loaded their muskets and formed square—while effort after effort was made to bring them to reason, sometimes at the cost of life—as in the case of Count Mlodorovich, military governor of St Petersburg, who was established within a few yards of the riot while arguing with the mutineers. Nicholas was saved by the very belief of the conspirators in the universal sympathy of the army with their aims. Had the mutinous troops early in the day received the order to attack, they would have carried the waverers with them; but they hesitated to fire on comrades whom they expected to see march over to their side; and when at last the emperor had steadied his heart to use force, a few rounds of grape-shot sufficed to quell the mutiny. The chief conspirators—Prince Shchepkin-Kostovski, Suthoff, Ryleyev, Prince Sergius Trubetskoi, Prince Obolenski and others—were arrested the same night and interred in the fortress of St Petersburg. In the meantime, however, the army was too large for the whole of it to be involved in the mutiny. So, though they were 121 of them and their trial had concluded by the 12th of June. Some were condemned to death, others to solitary confinement in fortresses, others to the Siberian mines and colonies. Of the latter many were accompanied by their wives, though the Russian law allows divorce in the case of such sentences; the emperor unwillingly allowed the devoted wives to go, but decreed that any children born to them in Siberia would be illegitimate. Firmly seated on his throne, Nicholas proceeded to fill up the gaps in his education by studying the condition of his empire. In spite of his reverence for his brother’s memory, he made a clean sweep of “the angel’s Bible.” Societies, and other paraphernalia of official hypocrisy; as for Alexander’s projects of reform, the pitiful legacy of a life of unfulfilled purposes, these were reported upon by committees, considered and shelved. Nicholas too saw the need for reform; the Decembrist conspiracy had burnt that into his soul; but he had his own views as to the reform needed. The state was corrupt, disorganized; what was wanted was not more liberty but more discipline. So he put civil servants, professors and students into uniform, and for little offences had them marched to the guard-house; thought was disciplined by the censorship, the army by an unceasing round of parades and inspections. The one great gift of Nicholas I. to Russia, a gift which he really believed would be welcome because it would bring every subject into immediate contact with the throne, was—the secret police, the dreaded Third Section. The crowning fault of Nicholas was, however, that he would not delegate his authority; whom could he trust but himself? In this he resembled his contemporary the emperor Francis I. But Francis would “sleep upon” a difficult problem; Nicholas never slept. His constitution was of iron, his capacity for work prodigious; reviews and parades, receptions of deportations, visits to public institutions, then eight or nine hours in his

5 i.e. of the Private Chancery of the emperor.
NICHOLAS I.

653

cabinet reading and deciding on reports and despatches—such
was his ordinary day's work. Yet, in spite of all this, his activity
could not but prove the narrow limits of autocratic power.
Under the "Iron Tsar" the outward semblance of authority
was perfectly maintained; but behind this imposing façade
the whole structure of the Russian administrative system con-
tinued to rot and crumble. The process was even hastened;
for the emperor's stern discipline crushed out all independence
of initiative and silenced all honest criticism. The secret police
provided but a poor substitute for the assistance which an
argus-eyed and articulate public opinion gives to the efficient
working of a constitutional system; for the greatest of autocrats
has but two eyes, and it is no difficult task to deceive him.
Thus it came about that, as Professor Schiemann puts it,
"Potemkin's scenery was brought out again," and Nicholas
walked with conscious self-approval through a Russia seemingly
well ordered, but in fact merely temporarily prepared for each
stage of his progress.

War is the ultimate and sharpest test of the soundness of a
state, and to this test Russia was submitted soon after the
accession of Nicholas, who could not be blind to the revelations
that resulted, though he drew the wrong moral. These re-
velations had, indeed, begun before the outbreak of the war
with Turkey in 1828. The new tsar had devoted especial
attention to the reform and reconstruction of the navy, which
under Alexander I. had been suffered to decay. Yet the newly
organized squadron which in 1827 set out on the cruise which
ended with the battle of Navarino only reached Plymouth with difficulty,
and there had to be completely refitted. The disastrous Balkan
campaign of 1828 was an even more astounding revelation of
corruption, disorganization and folly in high places; and the
presence of the emperor did nothing to mitigate the attendant
evils. He was indefatigable, in war as in peace, in parading and
inspecting; the weary and starving soldiers were forced to turn
out amid the marshes of the Dobrudzcha as spick and span as on
the parade grounds of St Petersburg; but he could do nothing
to set order in the confusion of the commissariat, which caused
the troops to die like flies of dysentery and scurvy; or to remedy
the scandals of the hospitals, which inflicted on the wounded
unspeakable sufferings. On the other hand, his presence was
sufficient to hamper the initiative of Prince Wittgenstein,
the nominal commander-in-chief; for Nicholas was constitutionally
incapable of leaving him a free hand. This was one reason
for the failure of the opening campaign.1 Another was more
creditable to the tsar's heart than to his head; he turned from
the sight of wounds and blood, and would not make up his
mind to sanction operations which, at the cost of a few hundred
lives, would have saved thousands who perished miserably of
disease.2

These were the leading principles which underlay
Nicholas's domestic and foreign policy from first to last:
to discipline Russia, and by means of a disciplined Russia to
discipline the world. So far as the latter task was concerned,
he again sharply divided the issues which Alexander had con-
fused. The mission of Russia in the West was, in accordance
with the principles of the Holy Alliance as Nicholas interpreted
them, to uphold the cause of legitimacy and autocracy against
the Revolution; her mission in the East was, with or without
the support of Europe, to advance the cause of Orthodox
Christianity, of which she was the natural protector, at the
expense of the decaying Ottoman empire. The sympathy of
Europe with the insurgent Greeks gave the tsar his opportunity.
The duke of Wellington was sent to St Petersburg in 1826 to
congratulate the new tsar on his accession and arrange a concert
in the Eastern Question. The upshot proved the diplomatic
value of Nicholas's apparent sincerity of purpose and charm of
manner; the "Iron Duke" was to the "Iron Tsar" as soft
iron to steel; Great Britain, without efficient guarantees for the
future, stood committed to the policy which ended in the de-
struction of the Ottoman sea-power at Navarino and the march
of the Russians on Constantinople. By the treaty of Adrianople
in 1829 Turkey seemed to become little better than a vassal
state of the tsar, a relation intensified, after the first revolt of
Mehemet Ali, by the treaty of Unkia-Skelessi in 1833 (see
MEHEMET ALI). In the West, meanwhile, the revolutions of
1830 had modified the balance of forces. Nicholas himself
proposed an armed intervention of the Alliance in order "to
restore order in Belgium and France;" and when his allies
held back even proposed to intervene alone, a project rendered
impossible by the outbreak of the great insurrection in Poland,
which tied the hands of all three powers (see POLAND: History).
In the circumstances, Nicholas was forced to give a grudging
recognition to the title of Louis Philippe as king of the French;
his recognition of that of Leopold, king of the Belgians, was
postponed until King William of the Netherlands had finally
resigned his rights. Then, the insurrection in Poland once
crushed, and Poland itself scarce surviving even as a geographical
expression,4 he drew the three eastern autocratic powers together
in a new "Holy Alliance" by the secret convention of Berlin
(3rd Oct. 1833) reaffirming the right and duty of intervention at
any moment of a dismembered or divided Ottoman empire.
Nicholas, whose relations with Austria, cemented at Münchgrätz and Berlin, was
renewed, after the accession of the emperor Ferdinand, at
Prague and Töplitz (1835); on the latter occasion it was decided
"without difficulty" to suppress the republic of Cracow, as
a centre of revolutionary agitation.5 The Triple Alliance
was now, in the tsar's opinion, "the last anchor of safety for the
monarchical cause." To its maintenance he had sacrificed his
religious convictions and the traditions of Russian policy
in consenting to uphold the integrity of Turkey; a sacrifice
perhaps the less hard to make since, as he added, the Ottoman
empire no longer existed.6 He allowed himself to be persuaded
by Metternich to support the cause of Don Carlos in Spain,7
and so early as May 1837, in view of the agitation in Hungary,
he announced that "in every case" Austria might count on
Russia.

These cordial ties were loosened, however, by the fresh crisis
in the Eastern Question after 1838. Metternich was anxious
to summon a European conference to Vienna, with a view to placing
Turkey under a collective guarantee. To Nicholas this seemed
to be a blow aimed at Russia, and he refused to be a party to it.8
Moreover, in view of the tendency of Austria to forget the con-
ventions of Münchgrätz and Töplitz, and to approach the
maritime powers, he determined to checkmate her by himself
coming to an agreement with Great Britain, in order to settle
the Eastern Question according to his own views: a double gain,
if by this means Queen Victoria (a "legitimate" sovereign) could
be drawn away from her unhappy alliance with the Jacobin Louis
Philippe. This is the explanation of those concessions in the
Eastern Question which ended in the Quadruple Alliance
of 1840 and the humilication of Louis Philippe's government (see
Europe, 1840, vii. p. 178; 9).

The new Anglo-Russian entente led in 1844 to a visit of the

1 Martens, Russia, viii. 164, &c., especially the autograph mem.
of the tsar on the English nurse, Miss Lyon, of her sufferings
during the siege of Warsaw in 1794—Schiemann, i. 181.
2 This convention was not acted upon till 1846.
3 Conversation with Count Cieolomel (Feb. 13, 1833) in Martens
4 Ib. p. 475.
5 Ib. p. 481.
6 Nicholas himself ascribed his hatred of Poles and Jews to the
stories told him by his English nurse, Miss Lyon, of her sufferings

Nicholas I.

Nicholas was soon to have personal experience of the perjury of Austria. It was a small matter that Count Prokesch-Osten, the Austrian ambassador, was discovered to be supplying a "foul Jew" editor with copy; more serious was Austria's attitude in the troubles that led up to the Crimean War. Gratitude, in the tsar's opinion, should have made her neuter not friendly; the revelation of her ingratitude came upon him with the shock of a painful surprise. The first cause of all the evils that followed was his attitude towards Napoleon III. He was forced to recognize the new French empire, but he would recognize no more than the fact of its existence (du fait en lui-même); he refused to address the emperor of the French as a brother sovereign. He attempted, moreover, to revive the function of the triple alliance as guardian of Europe against French aggression. The resentment of Napoleon awakened the slumbering Eastern Question by recalling to him the ancient claims of Russia to the succession of the Holy Places, and this aroused the pride of the Orthodox tsar, their guardian by right of faith and in virtue of a clause of the treaty of Kucha Kainardji (1774), as interpreted in the light of subsequent events. Nicholas could not believe that Christian powers would renounce his claim to protect the Christian subjects of the sultan; he believed he could count on the friendship of Austria and Prussia; as for Great Britain, he would try to come to a frank understanding with her (hence the famous conversations with Sir Hamilton at the Foreign Office on the 9th and 14th of January 1853, reviving the "Sick Man of Europe") in the light of his assurance of Baron Brunnow, his ambassador in London, that the influence of Cobden and Bright, the eloquent apostles of peace, was enough to prevent her from appealing to arms against him.

The disillusionment that followed was profound. In October 1853 Nicholas met his brother monarchs of the triple alliance at Warsaw for the last time. In December, at the conference of Vienna, Austria had already passed over to the enemy. Prussia was wavering, neutral indeed, but joining the other powers in a guarantee of the integrity of Turkey (4th April 1854), urging the tsar to accept the decisions of the Vienna conference, and on his refusal signing a defensive alliance with Austria (April 20, 1854), which included among the casus belli the incorporation in Russia of the banks of the Donube and a Russian march on Constantinople. Thus Nicholas, the pillar of the European alliance, found himself isolated and at war, or potentially at war, with all Europe. The invasion of the Crimea followed, and with it a fresh revelation of the corruption and demoralization of the Russian system. At the outset Nicholas had grimly remarked that "Generals January and February" would prove his best allies. These acted, however, impartially; and if thousands of British and French soldiers perished of cold and disease in the trenches before Sevastopol, the tracks leading from the centre of Russia into the Crimea were marked by the bones of Russian dead. The revelation of his power was the spirit of the Iron Tsar, and on the end of March 1855 he threw away the life which a little ordinary care would have saved.

The character of the emperor Nicholas was summed up with great insight by Queen Victoria in a letter to the king of the Belgians, written during the tsar's visit to England (June 11, 1844). "He is stern and severe—with fixed principles of duty which nothing on earth will make him change; very clever I do not think him, and his mind is an uncivilized one; his education has been neglected; politics and military concerns are the only things he takes great interest in; the arts and all softer occupations are of no importance to him. There is no great man, even in his most despotic acts, from a sense that that is the only way to govern; he is not, I am sure, aware of the dreadful cases of individual misery which he so often causes, for I can see by various instances that he is kept in utter ignorance of many things, which his people carry out in most corrupt ways, while he thinks that he is extremely just . . . and I am sure much never reaches his ears, and (as you observed) how can it? He is, I should say, too frank, for he talks so openly before people, which he should not do, and with difficulty restrains himself. There is no man who should be beloved; there is no man who would desire me to remove him. . . . I am inclined to believe; then his feelings are very strong; he feels kindness deeply. . . . He is not happy, and that melancholy which is visible in the countenance made me sad at times; the sternness of the eyes goes very much off when you know him, and changes according to his being put out or not. . . . He is bald now, but in his cherisher Garde uniform he is magnificent still, and very striking." The emperor was a kind husband and father, and his domestic life was very happy. He had seven children: (1) the emperor Alexander II. (g.v.); (2) the grand-duchess Maria (1819-1876), Duchess of Leuchtenberg; (3) the grand-duchess Ekaterina (1829-1892), consort of King Charles of Würtemberg; (4) the grand-duchess Alexandra (1832-1844), married to Prince Frederick of Hesse-Cassel; (5) the grand-duke Constantine Nikolayevich (1827-1892); (6) the grand-duke Nicholas Nikolayevich (1831-1891); (7) the grand-duke Michael Nikolayevich (b. 1832). The second son of the latter, the grand-duke Michael Mikhailovich (b. 1861), who was morganatically married, his wife bearing the title of Countess Torby, took up his residence in England.

Authorities.—All other works on Nicholas I. have been more or less superseded by Professor Theodor Schiemann's Geschichte Russlands unter Kaiser Nikolaus I., of which the 1st vol. Kaiser Alexander I. und die Ergebnisse seiner Lebensarbeit, was published at Berlin in 1904; the 2nd, carrying the history of Nicholas's reign down to the revolutions of 1830, in 1908. It is based on a large mass of published material, and compiled from many of the chief archives. Many of the accession of Nicholas and of the Decabrist conspiracy given in chapte. xiii. of vol. x. of the Cambridge Modern History, and tells for the first time that the Decabrist movements in the Russian-Turkish War of 1828-29. The great Recueil des traités conclus par la Russie of T. T. de Martens (St Petersburg, 1874-1900) contains admirable introductory essays, based on the unpublished Russian archives, and giving much information and character. The study, though not completed, is still in course and contains many documents are published for the first time in Schiemann's work; some, from the archives of Count Nessedorfe, are published in the Lettres et papiers du Chancelier Comte de Nessedorfe, t. vi. sec. For other works see bibliographies attached to the chapters of Russia in vol. x. and xi. of the Cambridge Modern History.
Nicholas II. (1868–1918), emperor of Russia, eldest son and successor of Alexander III., was born at St Petersburg on the 18th of May 1868. He received the ordinary education of Russian grand-dukes, under the direction of General Danovich, assisted by M. Pobédonostsev and other eminent professors. Among these was an Englishman, Mr Charles Heath, for whom he had great respect and affection. By the death of his grandfather, Alexander II., in 1881, he became heir-apparent (cesarevich). Though he received, like all the heirs-apparent to the Russian throne, a certain amount of military training, his personal tastes did not lie in that direction, nor did he show any inclination for the study of Russian literature and history, which he continued to pursue with zeal and success. In the month he married Princess Alix of Hesse (a grand-daughter of Queen Victoria), to whom he had been betrothed in the presence of his father during the latter's last illness. Eighteen months later the coronation took place at Moscow with great pomp, but a gloom was thrown over the festivities by the unfortunate incident of the Khodinsko Polye, a great open space near the city, where a popular fête had been prepared and where, from defective police arrangements, a large number of men, women and children, roughly estimated at 2000, were crushed and trampled to death. Nicholas II., followed in the footsteps of his father, seeking to preserve peace in foreign relations, and continuing in home affairs, though in a much milder form, the policy of centralization and Russification which had characterized the previous reign. His pacific tendencies were shown by his systematic opposition to all bellicose excitement, by his maintaining M. de Giens in the post of minister of foreign affairs, by his offering the post, on the death of that statesman, to M. de Staël, by his restraining France from dangerous adventures, and by initiating the Peace Conference at the Hague. To these ought perhaps to be added the transformation of the Franco-Russian entente cordial into a formal alliance, since the alliance in question might be regarded as favourable to the preservation of the status quo in Europe. In the internal administration during the first years of his reign he introduced by his personal influence, and without any great change in the laws, a more humane spirit towards those of his subjects who did not belong by language and tradition to the dominant nationality, and who were not members of the Eastern Orthodox Church; but he disappointed the men of liberal views by giving it to be clearly understood soon after his accession that he had no intention of circumscribing and weakening the autocratic power by constitutional guarantees or parliamentary institutions. In spite, however, of his desire for peace he let his country drift into the disastrous war with Japan; and notwithstanding his sincere attachment to the principles of bureaucratic autocracy, it was he who granted the constitutional reforms which altered the whole political outlook in Russia (see Russla).

Nicholas of Basel (d. 1397), a prominent member of the Beghard community, who travelled widely as a missionary and propagated the teachings of his sect. Though vigorously sought after by the Inquisition he eluded its agents for many years until in 1307 he was seized in Vienna, and burned at the stake as a heretic, together with two of his followers, John and James. A considerable legend has attached itself to Nicholas through the persistent but mistaken identification of him with the mysterious "Friend of God from the Oberland," the "double" of Rulman Merswin, the Strassburg banker who was one of the leaders of the 14th-century German mystics known as the Friends of God. In Merswin's Story of the First Four Years of a New Life, he writes: "Of all the wonderful works which God had wrought in me I was not allowed to tell a single word to anybody until the time when it should please God to reveal to a man in the Oberland to come to me. When he came to me God gave me the power to tell him everything." The identity and personality of this "Friend of God," who bulks so largely in the great collection of mystical literature, and is everywhere treated as a half supernatural character, is one of the most difficult problems in the history of mysticism. The tradition, dating from the 15th century and supported by the weighty authority of the Strassburg historian Karl von den Hoven (Von der Wathen), is founded on a statement by Nicholas, but is now discredited by all scholars. A. Jundt (Les Amis de Dieu, 1879) shared Preger's view that the Friend was a great unknown who lived in or near Chur (Coire) in Switzerland. But since Denifle's researches (see especially Der Gottesfreund im Oberlande und Nikolaus von Basel, 1870) the belief has gained ground that the "Friend" is not a historical personage at all. Apart from the collection of literature ascribed to him and Merswin there is no historical evidence of his existence. The accounts of his life say that about 1343 he was forbidden to reveal his identity to anyone save Rulman Merswin. And all the particulars of the life of a single author which have been assumed, especially by Denifle, that "the Friend of God" was a literary creation of Merswin and that the whole collection of literature is the work of Merswin (and his school), tendency-literture designed to set forth the ideals of the movement to which he had given his life. Thus "the great unknown" from the Oberland is the ideal character, "who illustrates how God does his work for the world and for the church through a divinely trained and spiritually illuminated layman," just as William Langland in England about the same time drew the figure of Robin Goodfellow.

To rescue Merswin from the charge of deceit involved in this theory, Jundt puts forward the suggestion, more ingenious than convincing, that Merswin was a "double personality," who in his primary state wrote the books ascribed to him, and in his secondary state became "the Friend of God from the Oberland," writing the other treatises. A third hypothesis is that advanced by Karl Rieder (Der Gottesfreund von Oberland, Innsbruck, 1905), who thinks that not even Merswin himself wrote any of the literature, but that his secretary and associate Nicholas of Löwen, head of the House of St John at Grindelwald, after the retreat founded by Merswin for the circle, worked over all the writings which emanated from different members of the group but bore no author's names, and to glorify the founder of the house attached Merswin's name to some of them and out of his imagination created "the Friend of God from the Oberland," whom he named as the writer of the others. As his design took shape he expanded the supernatural element and made the narratives autobiographical. There is much in this contention that is sound, but Rieder seems to go unnecessarily far in denying altogether that Merswin wrote any of the mystical books. The conclusion remains that the literature must be treated as tendency-writing and not as genuine biography and history.

Nicholas of Guildford (fl. 1250), English poet, the supposed author of The Owl and the Nightingale, an English poem of the 13th century. This work, which displays genuine poetical and imaginative qualities, is written in the south-western dialect, and is one of the few 13th-century English poems not devoted entirely to religious topics. The nightingale sitting on a branch covered with blossom sees the owl perched on a bough overgrown with ivy, and proceeds to abuse him for his general habits and appearance. The birds decide to refer the consequent dispute to Master Nicholas de Guildford, who is skilled in such questions, but they first of all engage in a regular débat in the French fashion. The owl is the best logician, but the nightingale has a fund of abuse that equalizes matters. Finally, when the argument threatens to become a fight, the wren
interferes, and the two go to the house of Master Nicholas at Port-
	
tisham in Dorset. He judges, they say, many right judgments, and

compiles and writes much wisdom, and it is lamentable that so

learned and worthy a man should gain no prebent from his

bishop. The poet, whoever he was, wrote the octosyllabic

couplet with ease and smoothness. He borrows something from

Alexander of Neckham's De naturis rerum, and was certainly

familiar with contemporary French poetry. The piece is a

general allegory of the contest between asceticism and a more

cheerful view of religion, and is capable of a particular applica-
tion to the differences between the regular orders and the secular

clergy. The quatrain immediately before that is a place of song and mirth,

while the owl maintains that much weeping for his many sins is man's best

preparation for the future.

There are two MSS. of the Hyle and the Nightingale, MS. Cotton

Caligula A ix. (British Museum), dating from the first half of the 13th

century, and MS. Arch. I. 29, Jesus College, Oxford, written

about half a century later. In the Jesus College MS. the poem is

immediately preceded by a religious poem entitled La Passyunn Jhu

Christ, which, according to a note on it, once possessed an additional

quaternion insertion. It was written by John of Guildford, perhaps a

relation of Nicholas.

The Owl and the Nightingale has been edited from the Cotton MS.

chiefly for the Roxburghe Club (1838) by Joseph Stevenson, and for

the Percy Society (1845) by T. Wright; the best modern edition

is that of T. Stratmann (Krefeld, 1868), who collated the two MSS.

See also B. Ten Brink, Early English Literature (trans. H. M. Kennedy, pp. 214-

218); Coxe, English Prose Writers (Cambridge, 1832), and

in the Cambridge History of Literature, vol. i. For some textual

criticism see A.E. Egge in Modern Language Notes (Baltimore, January,

1887).

Nicholas, Sir Edward (1593–1666), English statesman, eldest

son of John Nicholas, a member of an old Wiltshire family,

was born on the 4th of April 1593. He was educated at Salisbury

grammar school, Winchester College and Queen's College, Oxford. After

studying law at the Middle Temple, Nicholas became secretary to Lord

Loud, warden and admiral of the Cinque ports, in 1618, and continued in a similar

employment under the duke of Buckingham. In 1625 he became secretary to the

admiralty; shortly afterwards he was appointed an extra

clerk of the privy council with duties relating to admiralty

business, and from 1633 to 1641 he was one of the clerks in

ordinary to the council. In this situation Nicholas had much

business to transact in connection with the levy of ship-money;

and in 1641, when Charles I. went a hunting, a heavy

liability rested on the secretary who remained in London to keep

the king informed of the proceedings of the parliament. On

the return of Charles to the capital Nicholas was knighted, and

appointed a privy councillor and a secretary of state, in which

capacity he attended the king while the court was at Oxford,

and carried out the business of the treaty of Uxbridge. Through-

out this troubled period he was one of Charles's wisest and most

loyal advisers; he it was who arranged the details of the king's

surrender to the Scots, though he does not appear to have had

advised or even to have approved of the step; and to him also

fell the duty of treating for the capitulation of Oxford, which

included permission for Nicholas himself to retire abroad with his

family. He went to France, being recommended by the

king to the confidence of the prince of Wales. After the king's

death Nicholas remained on the continent concerting measures on

behalf of the exiled Charles II. with Hyde and other royalists,

but the hostility of Queen Henrietta Maria deprived him of any

real influence in the councils of the young sovereign. He lived

at the Hague and elsewhere in a state of poverty which hampered

him power to serve Charles, but which the latter did nothing

to relieve. He returned to England at the Restoration; but

although Charles had formally appointed him secretary of state in

1654, this office was now conferred on another, and Nicholas

had to content himself with a grant of money and the offer of a

peergage, which his poverty compelled him to decline. He

retired to a country seat in Surrey which he purchased from

a son of Sir Walter Raleigh, and here he lived till his death in

1660. By his wife Jane, a daughter of Henry Jay, an alderman of

London, he had several sons and daughters; his younger

brother Matthew Nicholas (1594–1661) was successively dean of

Bristol, canon of Westminster and dean of St Paul's.

See The Nicholas Papers, edited by G. F. Warner (Camden Society, London,

1886–1897), containing Nicholas's correspondence and some

autobiographical memoranda. Private correspondence between

Nicholas and Charles Davenant at the times of John Evelyn,

edited by W. Bray (London, 1827); The Edgerton MSS., and

the Ormonde Papers contain many references to Nicholas.

Nicholas (or Nicles), Henry (or Hendrik) (c. 1501–c.

1580), founder of the sect called "the Family of Love," was born

in 1501 or 1502, at Münster, where he was married and carried

on the business of a ferryman. As a boy he was subject to visions,

and at the age of twenty-seven charges of heresy led to his

imprisonment. About 1530 he removed with his family to

Amsterdam, where he was again imprisoned on a charge of

complicity in the Münster revolution of 1534–1535. About 1539

he experienced a call to found his "Familia Caritatis." Remov-

ing to Embden, he lived there and prospered in business for

twenty years, though he travelled with commercial as well as

missionary objects into the Netherlands, England and elsewhere.

The date of his sojourn in England has been placed as early as

1552 and as late as 1569. In 1579 he was living at Loving

College, where probably he died a year or two later. His

documents seem to have been derived largely from the Dutch

Anabaptist David Joris or George, who died in 1556; but they have

mainly to be inferred from the jotted accounts of hostile writers. The

outward trappings of his system were merely Anabaptist; but he

anticipated a good many later speculations, and his followers

were accused of asserting that all things were ruled by nature

and not directly by God, of denying the dogma of the Trinity,

and repudiating infant baptism. They held that no man should

be put to death for his opinions, and apparently, like the later

Quakers, they objected to the carrying of arms and to anything

like an oath; and they were quite impartial in their repudiation

of all other churches and sects, including Brownists and

Baptists.

Nicholas's principal disciple in England was one Christopher

Vitel, and towards 1579 the progress of the sect especially in the

eastern counties provoked literary attacks, proclamations and

parliamentary bills. But Nicholas's followers escaped the

gallows and the stake, for they combined with some success the

wisdom of the serpent and the harmlessness of the dove. They

would only discuss their doctrines with sympathizers; they

showed every respect for authority, and considered outward con-

formity a duty. This quietist attitude, while it saved them from

molestation, hampered propaganda; and though the "Family"

existed until the middle of the 17th century, it was then swallowed

up by the Quakers. In the eyes of the Unitarians, all of which
denominations may have derived some of their ideas through the "Family" from the

Anabaptists.

The list of Nicholas's works occupies nearly six columns in the

Dict. Nat. Biog. See also Bellfort Bax, Rise and Fall of the

Anabaptists, pp. 327–380 (1903); and Strype's Works, General

Index. (A. F. P.)

Nicholas, John (1745–1826), English printer and author,

was born at Islington on the 2nd of February 1745. He edited

the Gentleman's Magazine from 1788 till his death, and in the

pages of that periodical, and in his numerous volumes of

Anecdotes and Illustrations, he made invaluable contributions to the personal

history of English men of letters in the 18th century. He

was apprenticed in 1757 to "the learned printer," William Bowyer,

whom he eventually succeeded. On the death of his friend and

master in 1777 he published a brief memoir, which afterwards

grew into the Anecdotes of William Bowyer and his Literary

Friends (1789). As his materials accumulated a work of

anecdotal literary history of the century, based on a large

collection of important letters. The Literary Anecdotes of the

18th Century (1812–1815), into which the original work was

expanded, forms only a small part of Nicholas's production. It

was followed by the Illustrations of the Literary History of the

18th Century, consisting of Authentic Memoirs and Original

Letters of Eminent Persons, which was begun in 1817 and com-

pleted by his son John Bowyer Nichols (1779–1863) in 1858.
The Anecdotes and the Illustrations are mines of valuable information on the authors, printers and booksellers of the time. Nichol's other works include: A Collection of Royal and Noble Wills (1780); Select Collection of Miscellaneous Poems (1782), with subsequent additions, in which he was helped by Joseph Warton and by Bishops Percy and Lowth; Bibliotheca Topographica Britannica (1780–1790); with Richard Gough, The Progresses and Public Processions of Queen Elizabeth (1788); and the important History and Antiquities of the Town and County of Leicester (1795–1815). Nichol's was a fellow of the Society of Antiquaries, a trustee of many city institutions, and in 1804 he was master of the Stationers' Company. He died on the 26th of November 1826. John Bowyer Nichol continued his father's various undertakings, and wrote, with other works, A Brief Account of the Guildhall of the City of London (1810). His eldest son, John Gough Nichol (1806–1873), was also a printer and a distinguished antiquary, who edited the Gentleman's Magazine from 1851 to 1856, and the Herald and Genealogist from 1863 to 1874, and was one of the founders of the Camden Society.

A full Memoir of John Nichols by Alexander Chalmers is contained in the Illustrations, and a bibliography in the Anecdotes (vol. vi.) is supplemented in the later work. See also R. C. Nichols, Memoirs of J. & J. Nichols (1874).

NICHOLSON, Henry Alleyne (1844–1899), British palaeontologist and zoologist, son of Dr John Nicholson, a biblical scholar, was born at Penrhyn on the 11th of September 1844. He was educated at Appleby Grammar School and at the universities of Göttingen (Ph.D., 1866) and Edinburgh (D.Sc., 1867; M.D., 1866). Geology had early attracted his attention, and his first publication was a thesis for his D.Sc. degree On the Geology of Cumberland and Westmoreland (1868). In 1871 he was appointed professor of natural history in the university of Toronto, in 1874 professor of biology in the Durham College of Science and in 1875 professor of natural history in the university of St Andrews. This last post he held until 1882, when he became regius professor of natural history in the university of Aberdeen. He was elected F.R.S. in 1897. His original work was mainly on fossil invertebrata (graptolites, stomatoparids and corals); but he did much field work, especially in the Lake district, where he laboured in company with Professor R. Harkness and afterwards with Dr J. E. Marr. He was awarded the Lyell Medal by the Geological Society in 1888. He died at Aberdeen on the 19th of January 1899. There are discussions of his work in the Publications—Biographical and Life-History of the Earth (1877); Manual of Zoology (of which there were 7 editions) and other text-books of Zoology; Manual of Palaeontology (1872, 3rd ed., 2 vols., with R. Lydekker, 1883); Monograph of the Silurian Fossils of the Gower District; in A Sce., with R. A. Lydekker (1878–1880); Monograph of the British Stomatoparids in Palaeograph Soc. (1886–1892).

Obituary, by Dr G. J. Hinde, in Geol. Mag. (March 1899).

NICHOLSON, John (1822–1857). Anglo-Indian soldier and administrator, son of Alexander Nicholson, a north of Ireland physician, was born on the 11th of December 1822 and educated at Dunganon College. He was presented with a cadetship in the Bengal infantry in 1839 by his uncle Sir James Hogg, and served in the first Afghan War of 1839–42; he distinguished himself in the defence of Ghazni, and was one of the prisoners who were carried to Bamiyan and escaped by bribing the guard upon General Pollock's successful advance. It was in Afghanistan that Nicholson first met Sir Henry Lawrence, who got him the appointment of political officer in Kashmir and subsequently on the Punjab frontier. In 1847 he was given charge of the Sind Sagar district, and did much to pacify the country after the first Sikh War. On the seizure of Multan by Mulraj, he rendered great service in securing the country from Attock, and was wounded in an attack upon a tower in the Margalla Pass, where a monument was subsequently erected to his memory. On the outbreak of the second Sikh War, he was appointed political officer to Lord Gough's force, when he rendered great service in the distribution of intelligence and in furnishing supplies and boats. On the annexation of the Punjab he was appointed deputy commissioner of Bannu. He became a kind of legendary hero, and many tales are told of his stern justice, his tireless activity and his commanding personality. In the course of five years he reduced the most turbulent district on the frontier to such a state of quietude that no crime was committed or even attempted during his last year of office, a condition of things never known before or since. On one occasion, being attacked by a gharzi, he snatched the musket from the hand of a sentry and shot the man dead; on another occasion he put a price on the head of a notorious outlaw, and finding every one afraid to earn it, rode single-handed to the man's village, met him in the street and cut him down. But besides being a severe ruler, Nicholson was eminently just. A criminal had no chance of escaping him, so able and determined was his investigation; and a corrupt official could not long evade his vigilance; but he was never delinquent in his punishments, and gave offenders a chance to redeem their character. He would go personally to the scene of a crime or a legal dispute and decide the question on the spot. Every man in his district, whether mountain tribesman or policeman, felt that he was controlled by a master hand, and the natives said of him that "the tramp of his war-horse could be heard from Attock to the Khyber." Lord Roberts says of him in Forty-One Years in India: "Nicholson impressed me more profoundly than any man I had ever met before, or have ever met since. I have never seen any one like him. He was the beau ideale of a soldier and a gentleman." It is little wonder that the natives worshipped him as a god under the title of Nikalsain. Nicholson, however, had a fiery temper and a contempt for red tape, which made him a somewhat intractable subordinate. He had a serious quarrel with Sir Neville Chamberlain, and was continually falling out with Sir John Lawrence, who succeeded his brother Henry as ruler of the Punjab.

It was when the Mutiny broke out in May 1857 that Nicholson was able to show the metal that was in him, and he did more than any other single man to keep the Punjab loyal and to bring about the fall of Delhi. When the news of the rising at Meerut arrived, Nicholson was with Edwardes at Peshawar, and they took immediate steps to disarm the doubtful regiments in that cantonment. Together they opposed Sir John Lawrence's proposal to abandon Peshawar, in order to concentrate all their strength on the siege of Delhi. In June Nicholson was appointed to the command of a movable column, with which he again disarmed two doubtful regiments at Phillaur. In July he made a forced march of 41 miles in a single day in the terrific heat of the Punjab summer, in order to intercept the mutineers from Sialkot, who were marching upon Delhi. He caught them on the banks of the Ravi near Gurdaspur, and utterly destroyed them, thus successfully achieving what hardly any other man would have attempted. In August he had pacified the Punjab and was free to reinforce General Wilson on the Ridge before Delhi. An officer of the 2nd served in the Sikh army under his brother, who gave the following word picture of him as he appeared at this time:

"He was a man cast in a giant mould, with massive chest and powerful limbs, and an expression ardent and commanding, with a dash of roughness; features of stern beauty, a long black beard, and deep sombre voice. There was something of immense strength and talent and resolution in his whole frame and manner, and a power of ruling men on high occasions which no one could escape noticing. He was a man in whom manhood was combined with sin, who was never found out in one of less imposing mien, sometimes as an offence to the more unbending of his countrymen, but made him almost worshipped by the plant Asians."

Before Nicholson's arrival the counsels of the commanders based at Delhi, like those in India, suffered from irresolution and timidity. As General Wilson's health declined, his caution became excessive, and Nicholson was specially sent by Sir John Lawrence to put more spirit into the attack. His first exploit after his arrival was the victory of Najafgarh, which he won over the rebels who were attempting to intercept the British siege train from Ferozepore. After marching through a flooded country scarcely practicable for his guns, Nicholson, with a force of 3500 troops, defeated 6000 disciplined sepoys after an hour's fighting, and thenceforth put an end to all attempts of the enemy to get in the rear of the British position on the Ridge. Nicholson grew fiercely impatient of General Wilson's
procrastination, and at one time was thinking of appealing to the army to set Wilson aside and elect a successor; but at last, on the 13th of September, he forced Wilson to make up his mind to the assault, and he himself was chosen to lead the attacking column. On the morning of the 14th he led his column, 1000 strong, in the attack on the Kashmir gate, and successfully entered the streets of Delhi. But in trying to clear the ramparts as far as the Lahore Gate, he undertook a task beyond the powers of his weary troops. In encouraging them as they hesitated, he turned his back on the advancing line of shot and was shot in the back. The wound was mortal, but his magnificent physique allowed him to linger for nine days before finally succumbing on the 23rd of September.

His best epitaph is found in the words of Sir John Lawrence's Mutiny Report:

"Brigadier-General John Nicholson is now beyond human praise and human reward. But so long as British rule shall endure in India his fame can never pass. He seems especially to have been raised up for this juncture. He crowned a bright, though brief, career by dying of the wound he received in the moment of victory at Delhi. The Chief Commissioner does not hesitate to affirm that without John Nicholson Delhi could not have fallen."

**NICHOLSON, WILLIAM** (1753-1813). English writer on natural philosophy, was born in London in 1753, and after leaving school made two voyages as midshipman in the East India service. He subsequently entered an attorney's office, but, having become acquainted, in 1775, with Josiah Wedgwood, he lived for some years at Amsterdam as agent for the sale of pottery. On his return to London, he was induced by Thomas Chalmers to devote himself to the composition of light literature for periodicals, assisting that writer also with some of his plays and novels. Meanwhile he employed himself on the preparation of An Introduction to Natural Philosophy, which was published in 1781 and was at once successful. A translation of Voltaire's Elements of the Newtonian Philosophy soon followed, and he now entirely devoted himself to scientific pursuits and philosophical journalism. In 1784 he was appointed secretary to the General Chamber of Manufacturers of Great Britain, and he was also connected with the Society for the Encouragement of Naval Architecture, established in 1773 to aid the improvement of machinery and its construction of various machines for comb-cutting, file-making, cylinder printing, &c.; he also invented an arreometer. In 1800 he began in London a course of public lectures on natural philosophy and chemistry, and about this period he made the discovery of the decomposition of water by the voltaic current. In 1797 the Journal of Natural Philosophy, Chemistry and the Arts, generally known as Nicholson's Journal, the earliest work of the kind in Great Britain, was begun; it was carried on till 1814. During the later years of his life Nicholson's attention was chiefly directed to waterworks engineering at Portsmouth, at Gosport and in Southwark. He died in London on the 21st of May 1815.

Besides considerable contributions to the Philosophical Transactions, Nicholson wrote translations of Fourcroy's Chemistry (1785) and Chaptal's Chemistry (1798), First Principles of Chemistry and a Chemical Dictionary (1795); he also edited the British Encyclopaedia, or Dictionary of Arts and Sciences (6 vols. 8vo, London, 1809).

**NICHOLSON, WILLIAM** (1784-1844). Scottish painter, was born at Newcastle-on-Tyne. Having settled in Edinburgh, he painted portraits both in oil and water-colour; and along with Thomas Hamilton the architect he was one of the founders and most vigorous promoters of the Scottish Academy, of which he became the first secretary (1826-1833). In 1818 he published a series of etchings entitled Portraits of Distinguished Living Characters of Scotland, including Sir Walter Scott, Lord Jeffrey, Robert Burns and Professor Wilson.

**NICIAS** (d. 414 B.C.), a soldier and statesman in ancient Athens, inherited from his father Niceratus a considerable fortune invested mainly in the silver mines of Laurium. Evidence of his wealth is found in the fact that he had no less than 1000 slaves whom he hired out. He gravitated naturally to the aristocratic party, and was several times colleague with Pericles in the strategia. On the death of Pericles he was left leader of the aristocrats against the advanced party of Cleon (q.v.). He made use of his wealth both to buy off enemies (especially informers) and to acquire popularity by the magnificent way in which he discharged various public services, especially those connected with the state religion, of which he was a strong supporter. In the field he displayed extreme caution, and prior to the great Sicilian expedition achieved a number of minor military successes. In 421 he took a prominent part in the涂抹 of the Peloponnesian War (q.v.). He now entered with varying success upon a period of rivalry with Alcibiades, the details of which are largely matters of conjecture. So bitter was the strife that the ostracism of one seemed inevitable, but by a temporary coalition they secured instead the banishment of the demagogue Hyperbolus (417). In 415 he was appointed with Alcibiades and Lamachus to command the Sicilian expedition, and, after the flight of Alcibiades (q.v.) and the death of Lamachus, was practically the sole commander, the much more capable Demosthenes, who was sent to his aid, being apparently of comparatively little weight. How far it is just to attribute to his excessive caution and his blind faith in omens the disastrous failure it is difficult to say. At all events it is clear that the management of so great an enterprise was a task far beyond his powers. He was a man of conventional respectability and mechanical piety, without the originality which was required to meet the crisis which faced him. His popularity with the aristocratic party in Athens is, however, strikingly shown by the lament of Thucydides over his death: "He assuredly, among all Greeks of my time, least deserved to come to so great a pitch of ill-fortune, considering his exact performance of established duties to the divinity" (vi. 8; Grote's version).

Besides Thucydides see Plutarch's Nicias and Diod. xii. 83; also the general authorities on the history of Greece, and the article Peloponnesian War.

**NICIAS, son of Nicomedes**, an Attic painter of the 4th century B.C. Pliny (xxv. 131) gives a list of his works. He was associated with Praxiteles, whose statues he coloured, thus adding to their value.

**NICKEL** (symbol Ni). Atomic weight 58-69 (O = 16)), a metallic element. It has been known from the earliest times, being employed by the Chinese in the form of an alloy called pakfong. It was first isolated in an impure condition in 1751 by A. F. Cronstedt from nickelite, and his results were afterwards confirmed by T. O. Bergman in 1775 (De niccolo, opusc. 2, p. 231; 3. p. 459; 4. p. 374). It occurs in the uncombined condition and alloyed with iron in meteorites; as sulphide in millerite and nickel blende, as arsenide in niccolite and coanithite, and frequently in combination with arsenic and antimony in the form of complex sulphides. In recent years it has been found in considerable quantities in New Caledonia in the form of a hydrated silicate of nickel and magnesia approximating to the constitution NiO, MgOSiO2-nH2O (J. Garnier, 1865), and in Canada in the form of nickelferous pyrrhotines, which consist of sulphides of iron associated with sulphides of nickel and copper, embedded in a matrix of gneiss. At the present time nickel is obtained practically entirely from garnierite and the nickelferous pyrrhotines. When the former is used it is roasted with calcium sulphate or alkali waste to form a matte which is then blown in a Bessemer converter or heated in a reverberatory furnace with a silicone flux with the object of forming a rich nickel sulphide. This sulphide is then by further heating converted into the oxide and finally reduced to the state of metal by ignition with carbon in clay crucibles. The process adopted for the Canadian ores, which are poor in copper and nickel, consists in a preliminary roasting in heaps and smelting in a blast furnace in order to obtain a matte, which is then further smelted with a silicious flux for a rich matte. This rich matte is then mixed with coke and salt-cake and melted down in an open heart furnace. The nickel sulphide so obtained is then roasted to oxide and reduced to metal. For a wet method of extraction
of the matte see Christolfe and Boulhiet, French Patent 111591 (1876). L. Mond (Jour. Soc. Chem. Ind. 1895, p. 945) has obtained metallic nickel from the Canadian mattes by first roasting them and then eliminating copper by the action of sulphuric acid, the product so obtained being then exposed to the reducing action of producer gas at about 180–200°C, where it decomposes, the nickel being deposited and the carbon monoxide returned to the volatilizer. For an electrolytic method of treating mattes, see T. Uike, Moniteur scient., 1897, 49, p. 450. The metal as obtained by industrial methods rarely contains more than about 99.995% of nickel, the chief impurities being copper, iron, cobalt, silicon and carbon.

The following tables show the output of nickel from Canada and the shipments of nickel ore from New Caledonia in recent years:

The reduction of the oxide by hydrogen may be accomplished either by direct reduction or by two stages. The firststage is the reduction of the oxide to nickel by hydrogen at about 100°C, the second stage is the decarburization of the reduced nickel by hydrogen at about 450°C. The reduced nickel is then passed into a "volatilizer" and exposed to the action of carbon monoxide at about 80°C, the nickel carbonyl so formed being received in a chamber heated to about 350°C, where it decomposes, the nickel being deposited and the carbon monoxide returned to the volatilizer. For the electrolytic method of treating mattes, see T. Uike, Moniteur scient., 1897, 49, p. 450. The metal as obtained by industrial methods rarely contains more than about 99.995% of nickel, the chief impurities being copper, iron, cobalt, silicon and carbon.

Nickel Oxides. - Several oxides of nickel are known. A suboxide, NiO (7), described by W. Muller (Ber., 1889, 2, p. 1159), is not yet known. The monoxide, NiO, occurs naturally as bunsenite, and is obtained artificially when nickel hydroxide, carbonate, nitrate or sulphate is heated. It may also be prepared by the action of oxygen on nickel metal in nickel oxide with hydrogen at about 200°C (H. Moissan, Ann. Chem. Phys., 1897, 21, p. 190), or by heating nickel chloride with sodium carbonate and extracting the fused mass with water. It is a green powder which becomes yellow when heated. It dissociates at a red heat, and is readily reduced to the metal when heated with carbon or in a current of hydrogen. It is readily soluble in acids, forming salts, the rate of solution being rapid if the oxide is in the amorphous condition, but slow if the oxide is crystalline. The hydroxide, Ni(OH)₂, is obtained in the form of a greenish amorphous powder when nickel salts are precipitated by the caustic alkalies. It is readily soluble in water, forming a solution of a moderately alkaline character. Nickel chloride with hydrogen peroxide at about 50°C. It has all the reactions of hydrogen peroxide, and S. Tanatani (Ber., 1909, 42, p. 1510) regards it as Ni₃O₄. An oxide of nickel and nickel carbide has been obtained by heating nickel chloride in a current of moist oxygen at about 400°C (H. Bäubing, Comptes rendus, 1878, 87, p. 1082), or by heating the sesquioxide in a current of hydrogen at about 150°C (H. Moissan, Ann. Chem. Phys., 1890, 21, p. 199). The former method yields greyish, metallic-looking, microscopic crystals, the latter a grey amorphous powder. A hydrated form, NiO₂·2H₂O, is obtained when the monoxide is fused with a solution of nickel peroxide at a red heat and the fused mass extracted with water.

Nickel Salts. - Only one series of salts is known, namely those corresponding to the monoxide. In the anhydrous state they are usually of a yellow colour, whilst in the hydrated condition they are green. They may be recognized by the brownish violet colour they impart to a borax beam when heated in an oxidizing flame. The caustic alkalies added to solutions of nickel salts give a pale green precipitate of the hydroxide, insoluble in excess of the precipitant. This latter reaction is hindered by the presence of many organic acids (tartaric acid, citric acid, &c.). Potassium cyanide gives a green precipitate of the hydroxide, insoluble in excess of potassium cyanide, forming a double salt, Ni(CN)₂·2KCN, which remains unaltered when boiled with excess of potassium cyanide in presence of air (cf. COBAL). Ammonium sulphide precipitates black nickel sulphide in part, which is soon converted by the excess of potassium cyanide, forming a dark-coloured solution. Ammonium hydroxide gives a green precipitate of the hydroxide in solution.

See Rothwell's Mineral Industry (1908), pp. 666, 670. The metal may also be obtained on the small scale by the reduction of the oxide by hydrogen or by carbon, by ignition of the oxalate or of nickel ammonium oxalate (J. J. Berzelius), by reduction of the chloride in a current of hydrogen (E. Pélégot), by electrolysis of nickel ammonium sulphate (Winkler, Zeit. anorg. Chem., 1894, 3, p. 241), and by reduction of the chloride with calcium carbide.

It is a greyish white metal, and is very malleable and ductile. Its specific gravity varies according to the method employed for its preparation, the extreme values being 8.279 and 9.25. It melts between 1400–1600°C. Its specific heat increases with rise of temperature, the mean value from 15° to 1000°C being approximately 0.534°C (A. Naccari, Gaz., 1888, 18, p. 13). It is magnetic, but loses its magnetism when heated, the loss being complete at about 340–350°C. On the physical constants see H. Copaux, Comptes rendus, 1905, 140, p. 651. Nickel occludes hydrogen readily, is attacked by the halogen elements, and oxidizes easily when heated in air. In the massive state it is unacted upon by dry air, but if moistened with acidified water, oxidation takes place slowly. When obtained by reduction processes at a low temperature as possible the finely divided metal so formed is pyrophoric, and according to P. Schützenger (Comptes rendus, 1891, 113, p. 172) dry hydrochloric acid gas converts this form into nickel chloride and a volatile compound of composition NiHCl. It decomposes water at a red heat. According to E. St Edme (Comptes rendus, 1886, 106, p. 1079) sheet nickel is passive to nitric acid, and the metal remains passive even when heated to redness in a current of hydrogen. On the reduction of organic compounds by hydrogen in the presence of metallic nickel see P. Sabatier and J. B. Senderens, Ann. Chim. Phys., 1905 [8], 4, pp. 319, 433. It rapidly oxidizes when fused with caustic soda, but is scarcely acted upon by caustic potash (W. Dittmar, Jour. Soc. Chem. Ind., 1884, 3, p. 10). Hydrochloric and sulphuric acids are almost without action on the metal, but it dissolves readily in dilute nitric acid. Nickel salts are antiseptic; they arrest fermentation and stop the growth of plants. Nickel carbonyl, however, is extremely poisonous. On the toxic properties of nickel salts see A. Riche and Laborde, Jour. Pharm. Chem., 1888, [5], 17, pp. 1, 59, 97.

Nickel is used for the manufacture of domestic utensils, for crucibles, coinage, plating, and for the preparation of various alloys, such as German silver, nickel steels such as invar (nickel, 35.7%; carbon, 0.4%, 94.3%), and has a negative coefficient of thermal expansion, and constant (nickel 45.7%, copper, 35.3%), which has a negative thermal coefficient of its electrical resistance.

Compounds.
Nickname—Nicobar Islands

(Liebig). M. Illinski and G. v. Knorre (Ber., 1858, 15, p. 159) separates the metals by adding nitric acid to a solution of cobalt nitrate, precipitating the precipitate with potassium carbonate, warming to dryness, and dissolving in a 10% solution of hydrochloric acid. Nickel hydroxide is obtained by precipitation of the precipitate with ammonia and warming to dryness. The final product is nickel carbonate, which is obtained by treating the nickel hydroxide with a 20% solution of hydrochloric acid. Nickel carbonate is then heated in a muffle furnace at 600°C for 4 hours, resulting in the formation of metallic nickel, which is the reducing agent effecting the reduction of oxygen to water. Nickel is obtained by dissolving the nickel carbonate in a 20% solution of hydrochloric acid.

Nickel fluoride, NiF₃, obtained by the action of hydrofluoric acid on nickel chloride, crystallizes in yellowish green prisms which volatilize at 130°C. Nickel fluoride is dissolved in water with the alkaline fluorides to form double salts. Nickel chloride, NiCl₂, is obtained in the anhydrous condition by heating the hydrated salt to 140°C, or by gently heating the finely divided metal in a current of chlorine gas, forming golden yellow scales. It is easily reduced when heated in hydrogen. It forms crystalline compounds with ammonia and the organic bases. It is soluble in alcoholic solution, the hydrates of which are known, viz. monohydrate, dihydrate, and trihydrate; the latter being formed by reacting the material with the solution of the oxide or carbonate in hydrochloric acid. Nickel chloride in solution is soluble in water, forming a black compound which readily oxidizes in moist air, forming a basic nickel sulfate. The precipitated precipitate is soluble in phosphoric acid and some other acids. Nickel chloride is obtained from nickel carbonate in water solution. The precipitate is formed as a black powder when any of its hydrates are heated. When heated with carbon it is reduced to the chloride. It forms hydrated compounds containing one, two, five, and six molecules of water. The heptahydrate is obtained by dissolving the metal or its oxide, hydroxide or carbonate in water and adding alcohol, allowing the solution to crystallize between 10° and 20°C. It is a yellow crystalline powder which readily oxidizes in moist air.

Nickel sulfate, NiSO₄·6H₂O, is obtained by dissolving the metal in dilute nitric acid and concentrating the solution between 40° and 50°C. It crystallizes in green mobile liquid by passing carbon monoxide over reduced nickel at a temperature of about 60°C. L. Mond, Langer and Quincke, Journ. Chem. Soc., 1893, 71, p. 427. It decomposes with explosive violence when heated rapidly. Dewart and Jones, Journ. Chem. Soc., 1903, p. 203, have made an exhaustive study of the subject related that nickel sulfate, dissolved in water, forms nickel hydroxide and liberating hydrogen and carbon monoxide. Hydrochloric and hydrobromic acids are without action; hydroiodic acid decomposes slowly. With aromatic hydrocarbons in the presence of anhydride of sulfuric acid, a large evolution of hydrochloric acid gas, and an aldehyde is formed; at 100°C, on the other hand, anthraquinone derivatives are produced.
supplementing the information obtained from the Andamanese regarding cyclones in the Bay of Bengal. From 1869 to 1888 an observer was stationed in the Nicobar, and in Nanquet the climate was frosty but not excessively so. During the first year observations were recorded only in a more or less desultory way until 1897, when the station was removed to Mus in Car Nicobar. The climate is unhealthy for Europeans. The islands are exposed to the strong South-West monsoon and after the precipitation has ceased it has not been subjected to a systematic examination by the Indian Forest Department like that of the Andamans, and indeed the forests are fewer in quantity and quality, and their value is much less. The absence of a large number of species of fruit-trees has been compensated by the introduction of the European and American varieties, and the fruit-trees are carefully and successfully cultivated. As with the geology and the flora, certain phases of the fauna of the islands have been extensively reported. The mammals are not numerous. In the Outer Nicobarese areas are a large number of shrews (Cladosobates nuc.), bats, and flying-foxes, but it is doubtful if the "wild" pig is indigenous; cattle, when introduced and left, have caused much damage. The native birds include the rare Leed, the megapod (Megalopodius nuc.), edible-nest-building swallows (Collocalia nidificus), the hackled and pied pigeons (Caloenas nuc. and Carphophaga bicolor), a parrot (Psittacornis caniceps) and an oriole (Orchis macarronia). Owls, snake and thrush have been identified, and the fresh-water fish are reported to be of the types found in Sumatra.

Notices. —The Nicobarese may be described as a Far Eastern race, having generally the characteristics of the less civilized tribes of the Malay Peninsula and the south-eastern portion of the Asiatic continent, and speaking varieties of the Mon-Khmer group of languages, though the several dialects that prevail are mutually unintelligible. Their figure is not graceful, and, owing to their habit of diluting the lips by betel-chewing, the adults of both sexes are often repulsive in appearance. Though short according to the standard of whites (average height, man, 5 ft. 3 in.; woman, 5 ft.), the Nicobarese are a fine, well-developed race, and live to seventy or eighty years of age. Their mental capacity is considerable, though there is a great difference between the sluggish inhabitant of Great Nicobar and the keen trader of Car Nicobar. The religion is an undisguised animism, and all their frequent and elaborate ceremonies and festivals are connected with their religion. For a long time they were noted for their piracy and cruel, cruel, and though they show great want of feeling in the "devil murders" —ceremonial murders of one of themselves for grave offences against the community, which are now being gradually put down —still on the whole the Nicobarese are a quiet, inoffensive people, friendly to each other, and not quarrelsome, and by inclination friendly and not dangerous to foreigners. The old charge of cannibalism may be generally said to be quite untrue. Tribes can hardly be distinguished, but there are distinctively chieftain territorial. All the different dialects observed in the mainland have had several kinds of Nicobarese may with some confidence be referred to habitat and the physical difficulties of communication. Such government as there is, is by the village; but the village chiefs have not usually much power, though such authority as they have has always been maintained by the foreign Powers who have possessed the islands. The clothing, when not a caricature of European dress, is of the scantiest, and the wagging tails in which the loin cloths are tied behind early gave rise to fanciful stories that the inhabitants were naked and tailed. The houses are good, and often of considerable size. The natives are well fed, live with them, and they never cultivate cereals, exercise some care and knowledge over the coco-nut and tobacco, and have had much success with the foreign fruits and vegetables introduced by the missionaries. The staple article of trade has always been the ubiquitous coco-nut, of which it is computed that 15 million are produced annually, 10 million being taken by the people, and 5 million exported about equally from Car Nicobar and the rest of the islands. The usual cheap European goods are imported, the foreign trade being carried on with the native traders of the neighbouring Asiatic countries. There is an established internal trade, chiefly between the older islands and Chowra, for pots (which are only made there) and racing and other canoes.

History. —The situation of the Nicobars along the line of a very ancient trade route has caused them to be reported by traders and seamen through all historical times. In the 17th century the islands began to attract the attention of missionaries. At various times France, Denmark, Austria and Great Britain all had more or less shadowy rights to the islands, the Danes being the most persistent in their efforts to occupy the group, until in 1869 they relinquished their claims in favour of the British, who, at once began to put down the piracies of the islanders, and established a penal settlement, numbering in all about 350 persons, in Nancowry harbour. The health of the convicts was always bad, though it improved with length of residence and the adoption of better sanitary measures; and an attempt to found a Chinese colony having failed in 1884 through mismanagement, the settlement was withdrawn in 1888. There are native agencies at Nancowry harbour and on Car Nicobar, both of which places are gazetted ports. At the latter is a Church of England mission station under a native Indian catechist attached to the diocese of Rangoon.

NICOL, J.—NICOL, W.

NICOL, JAMES (1810–1870), Scottish geologist, was born at Traquair, near Innerleithen, in Peeblesshire, on the 12th of August 1810. His father, the Rev. James Nicol (1769–1810), was minister of Traquair, and acquired some celebrity as a poet. Educated at Edinburgh University (1829), James Nicol attended the lectures of Jameson, and thereby gained a keen interest in geology and mineralogy, and he pursued their study in the universities of Bonn and Berlin. After returning home he worked zealously at the local geology and obtained prizes from the Highland Society for essays on the geology of Peeblesshire and Roxburghshire; he subsequently extended his researches over various parts of Scotland, and in 1844 published his able Guide to the Geology of Scotland. In 1847 he was appointed assistant secretary to the Geological Society of London, in 1849 professor of geology in Queen's College, Cork, and in 1853 professor of natural history in the University of Aberdeen, a post which he retained until a few months before he died, on the 8th of April 1879. During these years he carried out important researches on the southern uplands of Scotland and on the structure of the Highlands. In the former region he gave the first clear account of the succession of the fossiliferous Lower Palaeozoic rocks (1848–1852); and when he came to deal with the still older Highland rocks he made out the position of the Torridon sandstone and Durness limestone and their relations to the schists and gneisses. His matured views, although advanced by Mr. Arthur Murison, have subsequently been substantiated by Professor C. Lyell and others.

The more important of his papers were: "On the Structure of the North-Western Highlands" (Quart. Journ. Geol. Soc., 1861), and "On the Geological Structure of the Southern Grampians" (ib., 1865). He contributed the articles "Mineralogy" and "Mining" to the ninth edition of the Encyclopaedia Britannica. Among his other works were Manual of Mineralogy (1849); Elements of Mineralogy (1858, 2nd ed., 1871); Geology of the Highlands of Scotland (1858); and Geology and Scenery of the North of Scotland (1863).
1851. Nothing is known of his early history beyond the fact that, after amassing a small competence as a popular lecturer on natural philosophy, he settled in Edinburgh to live a very retired life in the society of his apparatus alone. Besides the invention of the prism known by his name ("A method of increasing the divergence of the two rays in calcareous spars, so as to produce a single image," New Edin. Journ., 1828), he devoted himself chiefly to the examination of fluid-filled cavities in crystals, and of the microscopic structure of various kinds of fossil wood. His skill as a working lapidary was very great; and he prepared a number of lenses of garnet and other precious stones, which he preferred to the achromatic microscopes of the time.

NICOLAI, CHRISTOPH FRIEDRICH (1733–1811), German author and bookseller, was born on the 18th of March 1733 at Berlin, where his father, Christoph Gottlieb Nicolai (d. 1752), was the founder of the famous Nicolaische Buchhandlung. He received a good education, and in 1749 went to Frankfort-on-Oder to learn his father's business, finding time also to become acquainted with English literature. In 1752 he returned to Berlin, and began to take part in literary controversy by defending Milton against the attacks of J. C. Gottsched. His Briefe über den feinern Zustand der schönen Wissenschaften in Deutschland, published anonymously in 1755 and reprinted by G. Ellinger in 1804, were directed against both Gottsched and Gottsched's Swiss opponents, Johann Jakob Bodmer and Johann Jakob Breitinger; his enthusiasm for English literature won for him the friendship of Lessing and Moses Mendelssohn. In 1758 Mendelssohn established in 1759 the Bibliothek der schönen Wissenschaften, a periodical which he conducted until 1760. With Lessing and Mendelssohn Nicolai founded in 1759 the famous Briefe, die neueste Literatur betreffend; and from 1765 to 1792 he edited the Allgemeine deutsche Bibliothek. This latter periodical served as the organ of the so-called "popular philosophers," who warred against authority in religion and against what they conceived to be extravagance in literature. The new movement of ideas represented by Herder, Goethe, Schiller, Kant and Fichte, Nicolai was incapable of understanding, and he made himself ridiculous by foolish misrepresentation of the aims of these writers. Of Nicolai's independent works, perhaps the only one which has some historical value is his Anekdoten von Friedrich II. (1788–1792). His romances are forgotten, although Das Leben und die Meinungen des Herrn Magistrus Sebaldis Nutshanker (1775–1778), and his satire on Goethe's Werther, Freuden des jungen Werthers (1775), had a certain reputation in their day. Between 1788 and 1796 Nicolai published in 12 vols. a Beschreibung einer Reise durch Deutschland und die Schweiz, which bears witness to the narrow conservatism of his views in later life. He died in Berlin on the 11th of January 1811.

Nicolai's Bildniss und Selbstbiographie was published by M. S. Löwe in the Bildnisse jetz lebender Berliner Gelehrter, in 1806. See also L. F. G. von Gocking, F. Nicolai's Leben und literarischer Nachlass (1800); J. Minck, Lessings Jugendfreunde in J. Kürscher's Deutsche Nationalliteratur, vol. xxii. (1835); O. Hoffmann, Herders Briefwechsel mit Nicolai (1887); E. Friedel, Zur Geschichte der Nicolaischen Buchhandlung (1894); and E. Altenkrüger, F. Nicolai's Jugendjahre (1894).

NICOLAI, OTTO (1810–1840), German composer, was born on the 9th of June in Königsberg. He studied music in Berlin and in 1833 became organist to the German embassy in Rome. There his operas Enrico II (1839) and II Temporale (1840) were produced, besides some church music, a series of songs, and a number of compositions for the pianoforte. He was subsequently appointed Hof Kapellmeister at the Berlin Opera House; and there, only two days before he died (on the 11th of March 1840), was performed his brilliant opera, The Merry Wives of Windsor, which is now remembered.

NICOLAS, SIR NICHOLAS HABERT (1700–1840), English antiquary, fourth son of John Harris Nicolais (d. 1844), was born at Dartmouth on the 10th of March 1790. Having served in the navy from 1812 to 1816, he studied law and was called to the bar at the Inner Temple in 1825. His work as a barrister, however, was confined principally to peccage cases before the House of Lords, and his time was mainly devoted to genealogical and historical studies. In 1831 he was made a knight of the order of the Guelphs, and in 1832 chancellor and knight-commander of the order of St Michael and St George, being advanced to the grade of the grand cross in 1840. He became a member of the council of the Society of Antiquaries in 1826, but soon began to criticize the management of the society's affairs, and withdrew in 1828. He then criticized the Record Commission, which he regarded as too expensive. These attacks, which brought him into controversy with Sir Francis Palgrave, led in 1836 to the appointment of a select committee to inquire into the public records. He was also responsible for several reforms at the British Museum. In 1852 Nicolas married Sarah (d. 1867), daughter of John Davison of Loughton, Essex, a reputed descendant of the Tudor statesman William Davison. By her he left two sons and six daughters. Pecuniary difficulties compelled him to leave England, and he died near Boulogne on the 3rd of August 1848. Although a sharp and eager controversialist Nicolas was a genial and generous man, with a great knowledge of genealogical questions.

NICOLAI DAMASCENUS, Greek historian and philosopher of Damascus, flourished in the time of Augustus and Herod the Great, with both of whom he was on terms of friendship. He instructed Herod in rhetoric and philosophy, and had attracted the notice of Augustus when he accompanied his patron on a visit to Rome. Later, when Herod's conduct aroused the suspicions of Augustus, Nicolai was sent on a mission to bring about a reconciliation. He survived Herod, and it was through his influence that the succession was secured for Archelaus; and since his death the title of his birth, is withdrawn. These fragments of his universal history (Ἰστορία καθολικὴ) from the time of the Assyrian empire to his own days, his autobiography, and his life of Augustus (Βίος Καράποο) have been preserved, chiefly in the constants of Constantine Porphyrogenitus. Nicolai also wrote comedies and tragedies, paraphrased and wrote commentaries on parts of Aristotle, and was himself the author of philosophical treatises.

FRAGMENTS IN C. MILLER, Fragmenta historiorum Graecorum, iii.; see also F. NAVET, Nicolai von Damascus (1853), containing an account of his life and writings, and translation of the fragments.

NICOLAUS OF LYRA (c. 1265–1349), French commentator, was born in Lire, now Vieille-Lyre, in the department of Eure, Normandy. He entered the Franciscan order at Verneuil about 1300, and studied at Paris, where, becoming a doctor some time before 1309, he taught for many years. From 1319 he was provincial of his order in France, and was present in that capacity at the general chapter at Périgueux (1322). In 1325 he was provincial of Burgundy, and as executor of the estate of Jeanne of Burgundy, widow of King Philip VI, he founded the college of Burgundy at Paris, where he died in the autumn of 1349, being buried in the chapter hall of the convent of the Cordeliers. Among the authentic works of Nicolaus of Lyra are: (1) two commentaries on the whole Bible, one (Postilla literaria, 1322–1331) following the literal sense, the other (Postilla mystica seu moralis, 1339) following the mystic sense. There are numerous editions (1342–1542; Douai, 1617; Antwerp, 1634). (2) Tractatus de genetivis et nominativis (Lat. vulg. Hebraica veritatis, 1333. (3) Two treatises against the Jews. (4) A theological treatise on the Beatific Vision, directed against pope John XXII. (1334), unpublished. (5)
Contemplatio de vita S. Francisci, a book of devotions. Nicolas was above all a commentator. His exegesis, which was dominated by his polemics against the Jews, is characterized by a fidelity to the literal sense, the comparison with the Hebraic text, the direct use of Jewish commentators, a very independent attitude towards traditional interpretations, and a remarkable historical and critical sense. In all this he resembled Roger Bacon. His works, especially the Postilla litteralis, were very popular in the 14th and 15th centuries, but produced few imitators.

NICOLAY, the name of a French family of Vivarais which came rapidly into legal prominence at the end of the 15th century. Jean Nicolay (d. 1527), son of a bailli of Bourg-Saint-Andéol, became councillor at the parliament of Toulouse and afterwards at the Grand Council, chancellor of the kingdom of Naples, Maître des Requêtes, and, finally, first president of the Chambre des Comptes of Paris (1506). This last post was filled continuously up to the Revolution by his descendants. Antoine Chrétien de Nicolay (1712-1777) became marshal of France in 1775. His brother, Aymar Chrétien François Michel (1721-1760), bishop of Verdun, was first almoner of Marie Josephe of Saxony, wife of the dauphin Louis (d. 1762), and her influential counsellor. Aymar's bibliographic justifications pour servir à l'histoire des premiers présidents de la Chambre des Comptes (1873), and Histoire de la maison de Nicolay (1875).

NICOLE, PIERRE (1625-1695), one of the most distinguished of the French Jansenists, was the son of a provincial barrister, and was born at Chartres. Sent to Paris in 1642 to study theology, he soon entered into relations with the Jansenist community at Port Royal (q.e.) through his aunt, Marie des Anges de Soulaire, who was for a short time abbess of the convent. Some scruple of conscience forbade him to proceed to the priesthood, and he remained throughout life a “clerk in minor orders,” although a profound theological scholar. For some years he was a master in the “little school” for boys established at Port Royal, and had the honour of teaching Greek to young Jean Racine, the future poet. But his chief duty was to act, in collaboration with Antoine Arnauld, as general editor of the controversial literature put forth by the Jansenists. He had a large share in collecting the materials for Pascal’s Provincial Letters (1656); in 1658 he translated the Lettres into Latin, under the title of Dialogus de foris Christianismi. When Arnauld began a series of letters, Les Imaginaires, intended to show that the heretical opinions commonly ascribed to the Jansenists really existed only in the imagination of the Jesuits. His letters being violently attacked by Desmarets de Saint-Sorlin, an erratic minor poet who professcd great devotion to the Jesuits, Nicole replied to him in another series of letters, Les Visionnaires (1666). In the course of these he observed that poets and dramatists were no better than “public poisoners.” This remark stung Racine to the quick; he turned not only on his old master, but on all his friends, and declared that he had told him — did more honour to his heart than to his head. About the same time Nicole became involved in a controversy about transubstantiation with the Huguenot Claude; out of this grew a massive work, La Perpétuité de la foi de l’église catholique touchant l’eucharistie (1669), the joint effort of Nicole and Antoine Arnauld. But Nicole’s most popular production was his Essais de morale; a series of short discussions on practical Christianity. The first volume was published in 1671, and was followed at irregular intervals by others; altogether the series numbers fourteen volumes. In 1691 a translated version of this work in the French was forced to fly to Belgium in company with Arnauld. But the two soon parted. Nicole was elderly and in poor health; the life of a fugitive was not to his taste, and he complained that he wanted rest. “Rest,” answered Arnauld, “when you have eternity to rest in!” In 1683 Nicole made a rather ambiguous peace with the authorities, and was allowed to come back to Paris. There he continued his literary labours up to the last; he even composed, in opposition to the Jesuits, when death overtook him on the 16th of November 1695.

Nicole was one of the most attractive figures of Port Royal. Many stories are told of his quaint absent-mindedness and unreadiness in conversation. His books are distinguished by exactly opposite qualities; they are singularly simple and copious to excess. Hence they were exceedingly popular with Mme de Sévigné and readers of her class. No other Jansenist writer, not even Pascal, was so successful in impressing the possession of Port Royal before the world. And although a modern appetite quells before fourteen volumes on morality, there is much solid sense and practical knowledge of human nature to be found in the Essais de morale. Several abridgments of the work were made, notably a Choix des essais de morale de Nicole, ed. Silvestre de Sacy (Paris, 1857).

Nicole’s life is told at length in the 4th volume of Sainte Beuve’s Port-Royal. (St. C.)

NICOLLE, ROBERT (1814-1877), Scottish poet, was born on the 7th of January, 1814, at the farm of Little Tullybeltane, in the parish of Auchtergaven, Perthshire. When Robert was five years old his father was reduced to poverty. He became a day-labourer, and was only able to give his son a very slight education. At sixteen the boy was apprenticed to a grocer and wine-merchant at Perth. In 1833 he began to contribute to Johnstone’s Magazine (afterwards Tall’s Magazine), and in the next year his apprenticeship was cancelled. He visited Edinburgh, and was kindly received there, but obtained no employment. He then tried his fortune in the printing business, but in 1836 he became editor of the Leeds Times. He held pronounced Radical opinions, and overtaxed his slender physical resources in electioneering work for Sir William Molesworth in the summer of 1837. He was obliged to resign his editorship, and died at the house of his friend William Tait, at Trinity, near Edinburgh, on the 7th of December 1837, in his twenty-fourth year. He had published a volume of Poems in 1835; and in 1844 appeared a further volume, Poems and Lyrics, with an anonymous memoir of the author by Mrs C. I. Johnstone. The best of his lyrics are those written in the Scottish dialect. They are simple in feeling and expression, genuine folk-songs.

An eloquent appreciation of his character and his poetry was included in Charles Kingsley’s article on “Burns and his School” in the North British Review for November 1851. See also P. R. Drummond, Life of Robert Nicolle, Poet (1884).

NICOLL, SIR WILLIAM ROBERTSON (1853— ), Scottish Nonconformist divine and man of letters, was born at Auchindoir, Aberdeenshire, on the 10th of October 1851, the son of a Free Church minister. He graduated M.A. at Aberdeen in 1870, and studied for the ministry at the Free Church College there until 1874, when he was ordained minister of the Free Church at Dufftown. Three years later he moved to Kelso, and in 1884 became editor of the Expositor. In 1886 he founded the British Weekly, a Nonconformist organ which obtained great influence over opinion in the free churches. Robertson Nicoll secured many writers of exceptional talent for his paper, to which he was himself a considerable contributor, the papers signed "Claudius Clear" being among those from his hand. He also founded and edited the Bookman (1891, &c.), and acted as chief literary adviser to the publishing firm of Hodder & Stoughton. Among his other enterprises were The Expositor’s Bible and The Theological Educator. He edited The Expositor’s Greek Testament (1897, &c.), and a series of Contemporary Writers (1894, &c.), and of Literary Lives (1904, &c.). He wrote a history of The Victorian Era in English Literature, and edited, with T. J. Wise, Literary Anecdotes of the Nineteenth Century. The knighthood bestowed on him at the birthday honours in 1906 was an apt recognition of his long and able devotion to the “journeyman work” of literature.

A list of his publications is included in a monograph on Dr Nicoll by Jane T. Sollister ("New Century Leaders," 1903).

NICOLAS RICHARD, Sir Richard, Lord of the Manor of Fenchurch and Notting Hill, an English governor, was born probably at Amthill, Bedfordshire, England, in 1624. He commanded a royalist troop of horse during the Civil War, and on the defeat of the king went into exile. Soon after the Restoration he became governor of the Bedchamber to the duke of
York, through whose influence he was appointed in 1664 on a commission with Sir Robert Carr (d. 1667), George Cartwright and Samuel Maverick, to conquer New Netherland from the Dutch and to regulate the affairs of the New England colonies and settle disputes among them. The expedition set sail from Portsmouth on the 25th of May 1664, and New Amsterdam was surrendered to Nicolls on the 8th of September. Under authority of a commission from the duke of York, Nicolls assumed the position of deputy-governor of New Netherland (New York). His policy was vigorous but tactful, and the transition to the new regime was made smoothly and with due regard to the interests of the conquered people. They were guaranteed in the retention of their property rights, their laws of inheritance, and the enjoyment of religious freedom. The English system of law and administration was at once introduced into Long Island, Staten Island and Westchester, where the English element already predominated, but the change was made much more slowly in the Dutch sections. A code of laws, known as the "Duke's Laws," drafted by the governor with the help of his secretary, Matthias Nicolls (c. 1630-1687), and dated the 12th of March, was proclaimed at Hempstead, Long Island, on the 1st of March 1665, and was immediately put in force. The code, which was compiled from the codes of the New England colonies, and it provided for trial by jury, for proportional taxation on property, for the issuance of new patents for land and for land tenure only by licence from the duke. Nicolls returned to England in the summer of 1668 and continued in the service of the duke of York. He was killed in the naval battle of Southwold Bay on the 28th of May 1672.

Nicolson, William (1655-1727), English divine and antiquary, was educated at Queen's College, Oxford (M.A., 1679; fellow, 1679-1682). After visiting Leipzig to learn German he was made prebendary of Carlisle in 1681, archdeacon in 1682. Twenty years later he was appointed bishop of the same diocese, where he remained until his translation to Derry in 1718. In 1727 he was nominated archbishop of Cashel and Emly, but died before he could assume charge. Nicolson is remembered by the impulsion of his temperament, which led him into a good deal of strife as a bishop, and more happily by his zeal in collecting and guarding manuscripts and other official documents. For this purpose he had special rooms built at Derry. His chief works were the Historical Library (English, 1696-97-99; Scottish, 1703; Irish, 1724; complete later editions, 1732 and 1776), and LegeS Marchandiorum, or Border Laws (1703, new ed., 1747).

Nicomachus, a Neo-Pythagorean, was an imitated and assigned position mathematician, born at Gerasa in Arabia Petraea, flourished about a.d. 100. In his musical treatise he mentions Thrasylus (d. 36), the astrologer and confidant of Tiberius, and his Arithmetical was translated by Apuleius, who wrote under Antoninus Pius and Marcus Aurelius. He is the author of two extant treatises: (1) Ἀριθμητικὴ εἰσαγωγή (Introduction to Arithmetic), a metaphysical account of the theory and properties of numbers, and the first work in which arithmetic was treated quite independently of geometry, and (2) Μαθηματικὴ ἀρμοδιότης (Manual of Harmony), complete in one book, to which are erroneously appended as a second book some fragments probably belonging to a larger treatise On Music now lost. It is the oldest authority on the Pythagorean theory of music. Photius (cod. 187) also mentions a work by Nicomachus called Ἀριθμητικὴ εἴσαγωγή Α'. Matthias may have been a cousin of Richard Nicolls; his family were of Islip, Oxford; he was secretary of the province, held various judicial positions, and was mayor of New York City in 1672. Matthias's son William (1657-1723), a lawyer, was a member of the New York assembly in 1702-1703 and 1707-1708; he received a royal patent for what is now the town of Islip on Long Island. Descendants of Richard and of Matthias Nicolls spell the name "Nicol.

Θεολογία (The Theology of Arithmetic), written in a spirit of Pythagorean mysticism and Oriental superstition, and setting forth the application of arithmetic, or rather of the first ten numbers, to the origin and attributes of the gods. But the extract from Photius is now generally attributed to Iamblichus. Other works of Nicomachus were: a Life of Pythagoras and a Collection of Pythagorean Doctrines, the chief source of the life of Pythagoras and the account of his philosophy by Iamblichus. Eutropeus—Introduction to Arith. by R. Hoche (1866); Manual of Harmony, by C. de Jan in Musici scriptores Graeci (1895), with account of Nicomachus and his works, and French translation, with bibliography and notes, by C. E. Ruelle (1881); Theology of Arithm. by A. Pistelli, (according to Photius, G. Pistelli, and G. Cantor, Vorlesungen über Geschichte der Mathematik, i. (1894) p. 400, and J. Gow, A Short History of Greek Mathematics (1884), p. 88, both of whom give summaries of the Arithm.}

Nicomachus, of Thebes, Greek painter, of the early part of the 4th century, was a contemporary of the greatest painters of Greece; Vitruvius observes that if his fame was less than theirs, it was the fault of fortune rather than of demerit. Pliny (xxxv. 108) gives a list of his works; among them a "Rape of Persephone," "Victory in a Quadriga," a group of Apollo and Artemis, and the "Mother of the Gods seated on a Lion." Pliny tells us that he was a very rapid worker and used but four colours (the last seems impossible). Plutarch mentions his paintings as possessing the Homerímerit of ease and absence of effort.

Nicomedes I., son of Zipoetes, king of Bithynia (c. 275-248 B.C.). He made himself master of the whole country and put to death his brother, who had set himself up as an independent ruler. He reorganized and enlarged the kingdom, founded the great city of Nicomedia as the capital, and fought successfully for some time with Antiochus of Syria. His reign seems to have been prosperous and uneventful; the year of his death is uncertain.

Livy xxxvii. 16; Justin xxv. 2; Mommsen in C. Müller, Frag. hist. Graec. iii. 535.

Nicomedes II., Epiphanes, king of Bithynia, 140-92 B.C., fourth in descent from Nicomedes I., was the son of Prusias II. He was so popular with the people that his father sent him to Rome. Here he was so much favoured by the senate that Prusias sent an emissary to Rome with secret orders to assassinate him. But the emissary revealed the plot, and persuaded the prince to rebel against his father. Supported by Attalus II., king of Pergamum, he was completely successful, and ordered his father to be put to death at Nicomedia. During his long reign Nicomedes adhered steadily to the Roman alliance, and assisted them against Aristonicus of Pergamum. He made himself for a time master of Paphlagonia, and in order to have the claim on Cappadocia (on the death of Attalos VI.), who had fled to him when Mithradates the Great endeavoured to annex the country. When her two sons died, Nicomedes brought forward an impostor as aclaimant to the throne; but the plot was detected. The Romans refused to recognize the claim, and required Nicomedes to give up all pretensions to Cappadocia and to abandon Paphlagonia.

Appian, Mithrad. 4:7; Strabo xiii. 624, 646; Diod. Sicc. xxxii. 20, 21; Justin xxxiv. 4:4 xxxvii. 1:2.

Nicomedes III., Philopator, king of Bithynia, 91-74 B.C., was the son and successor of Nicomedes II. His brother Socrates, assisted by Mithradates, drove him out, but he was reinstated by the Romans (90). He was again expelled by Mithradates, who defeated him on the river Amuceus (or Amnias) in Paphlagonia. This led to the first Mithradatic War, as the result of which Nicomades was again restored (84). At his death he bequeathed his kingdom to the Romans, a legacy which subsequently brought about the third Mithradatic War.

Justinian ii, Apian, Mithrad. 7. 10-20, 57, 60; Mommsen in C. Müller, Frag. hist. Graec. iii. 541; Plutarch, Sulla, 22, 24; Eutropius vi. 6.

Nicomedia [mod. Izmil], an ancient town at the head of the Gulf of Astacus, which opens on the Propontis, was built in 264 B.C. by Nicomedes I. of Bithynia, and has ever since been one of the chief towns in this part of Asia Minor. It was the metropolis of Bithynia under the Roman empire (see Nicæa), and
Diocletian made it the chief city of the East. Owing to its position at the convergence of the Asiatic roads to the new capital, Nicomedia retained its importance even after the foundation of Constantinople and its own capture by the Turks (1338).

See C. Texier, Asie mineure (Paris, 1839); V. Cécet, Turquie d'Asie (Paris, 1894).

NICOPOLIS, or ACTIA NICOPOLIS, an ancient city of Epirus, founded 31 b.c. by Octavian (Augustus) in memory of his victory over Antony and Cleopatra at Actium. The colony, composed of settlers from a great many of the towns of the neighbouring countries (Ammbracia, Anactorium, Calydon, Argos Amphphilicum, Leucas, &c.), proved highly successful, and the city was considered the capital of southern Epirus and Acarnania, and obtained the right of sending five representatives to the Amphictyonic council. On the spot where Octavian's own tent had been pitched he erected a sanctuary to Neptune adorned with the beaks of the captured galleys; and in further celebration of his victory he instituted the so-called Actian games in honour of Apollo Actius. The city was restored by the emperor Julian, and again after the Gothic invasion by Justinian; but in the course of the middle ages it was supplanted by the town of Prevesa. The ruins of Nicopolis, now known as Palaeo-prevesa (Old Prevesa), lie about 3 m. north of that city, on a small bay of the Gulf of Arta (Sinus Ambracius) at the narrowest part of the isthmus of the peninsula which separates the gulf from the Ionian Sea. The site is remarkable, and several objects are two theatres (the larger with twenty-seven rows of seats) and an aqueduct which brought water to the town from a distance of 27 m.

Nicopolis was also the name of (1) a city in Cappadocia in the valley of the Lycus, founded by Pompey on the spot where he defeated Mithrdates; (2) a city in Egypt, founded by Octavian 24 B.C. to commemorate his final victory over Antony; and (3) a city in Thrace (Nikup) at the junction of the latrus with the Danube, founded by Trajan in memory of his victory over the Dacians.

NICOSIA, the capital of Cyprus, situated in the north central part of the island. Pop. (1901) 14,752 (Moslem, 601; Christian, 8759). Its earliest name was Ledra, but Leucos, son of Potelyme Soter (280 B.C.), is said to have restored it and changed its name to Leuteon, Leucothen or Levcosia. A mile S.W. of the town lies the very large Bronze Age necropolis known as Hagia Paraskevi, which has been repeatedly explored with valuable results. The circuit of the city was reduced in 1567, under the direction of the Venetian engineer G. Savorgnano, from 9 m. to 3 m.; eighty churches and a number of fine houses were sacrificed. The new walls were given a circular shape, with eleven bastions and three gates. Water is supplied to the city from the qanat at the foot of the central range. The residence of the high commissioner, the government offices, hospital, central prison and the new English church are without the walls. The fosse has been planted, and part of it used as an experimental garden. Carriage roads have been completed to Kyrenia, Xytraia, Famagusta, Larnaca, Limassol and Morphou. The principal monuments of the Lusignan period are the fine cathedral church of St Sophia, an edifice of French Gothic, at once solid and elegant (the towers were never completed); the church of St Catherine, an excellent example of the last years of the 12th century (both these are now mosques); and the crypt of St Nicolas of the English (now a grain store), built for the order of the Knights of St Thomas of Acre. A gateway of no great importance is nearly all that remains of the palace last used by the Venetian provveditori. It dates from the end of the 15th century. There is a museum, with a valuable catalogue. The chief industries are tanning and hand weaving, both silk and cotton.

NICOSIA, a city and episcopal see (since 1816) of Sicily, in the province of Catania, 21 m. by road N. of the railway station of Leonforte (which is 49 m. W. of Catania) and 42 m. W.N.W. of Catania direct, 880 ft. above sea-level. Pop. (1911) 16,004.

The town retains a thoroughly medieval appearance, with a fine Norman cathedral and some other interesting churches, among them S. Maria Maggiore, with a reredos by Antonio Gagini.

A Lombard dialect is still spoken here, and the town is less modernized in every respect than any other in Sicily. The Sicel town of Herbita is usually placed here, but without sufficient reason, and the origin of Nicosia is unknown. It was destroyed by the Saracens and repopulated by the Normans.

NICOTERA, GIOVANNI (1828-1894), Italian patriot and politician, was born at San Biagio on the 9th of September 1828. Joining the party of young Italy he was among the combatants at Naples in May 1848, and was at San Pancrazio with Garibaldi during the defence of Rome. After the fall of Rome he fled to Piedmont, where he organized the expedition to Sapi in 1857, but shortly after his arrival there he was defeated and severely wounded by the Bourbon troops. Condemned to death, but reprieved through the intervention of the British minister, he remained a prisoner at Naples and at Favignana until 1860, when he joined the Franco-Sicilian expedition to Palermo. Sent by Garibaldi to Tuscany, he attempted to invade the Papal States with a volunteer brigade, but his followers were disarmed and disbanded by Ricasoli and Cavour. In 1862 he was with Garibaldi at Aspromonte; in 1866 he commanded a volunteer brigade against Austria; in 1867 he invaded the Papal States from the south, but the defeat of Garibaldi at Mentana put an end to his enterprise. His parliamentary career dates from 1860.

During the first ten years he engaged in violent opposition, but from 1870 onwards he joined in supporting the military reforms of Ricasoli. Upon the ascent of the Left in 1876, Nicotera was rewarded with the post of Minister of the Interior, and with remarkable firmness. He was obliged to resign in December 1877, when he joined Crispi, Cairoli, Zanardelli and Baccarini in forming the "pentarchy" in opposition to Depretis, but he only returned to power thirteen years later as minister of the interior in the Rudini cabinet of 1891. On this occasion he restored the system of unimomial constituencies, resisted the socialist agitation, and pressed, though in vain, for the adoption of drastic measures against the false bank-notes put in circulation by the Roman bank. He fell with the Rudini cabinet in May 1892, and died at Vico Equense on the 10th of June 1894.

See V. Giordano, La vita ed i discorsi di Giovanni Nicotera (Salerno, 1878); Mauro, Biografia di Giovanni Nicotera (Rome, 1886; German trans., Leipzig, 1886); and Mario, In memoria di Giovanni Nicotera (Florence, 1894).

NICOTINE, C15H24N2, an alkaloid, found with small quantities of nicotinamide, C15H14N2O, nicotinic, C15H23N2, and nicotelline, C15H18N3, in tobacco. The name is taken from Nicotiana, the tobacco plant, so called after Jean Nicot (1530-1600), French ambassador at Lisbon, who introduced tobacco into France in 1560. These four alkaloids exist in combination in tobacco chiefly as malates and citrates. The alkaloid is obtained from an aqueous extract of tobacco by distillation with slaked lime, the distillate being acidified with oxalic acid, concentrated to a syrup and decomposed by potash. The free base is extracted by ether and fractionated in a current of hydrogen. It is a colourless oil, which boils at 247° C. (754 mm.), and when pure is almost odourless. It has a sharp burning taste, and is very poisonous. It is very hygroscopic, dissolves readily in water, and rapidly undergoes oxidation on exposure to air. The free alkaloid is strongly laevorotatory. F. Ratz (Monats., 1905, 26, p. 1241) obtained the value [α]D = -169·54° at 20°; its salts are dextro-rotatory. It behaves as a di-acid as well as a di-tertiary base.

On oxidation with chromic or nitric acids, or potassium permanganate, it yields nicotinic acid or β-pyridylcarboxylic acid, C5H5O2N; alkaloid potash, C15H18N3O2; nicotinamide, C15H23N2O, and hydrogen peroxide oxycyanidine, C15H16N4O. Oxidation of its isomethylhydroxide with potassium permanganate yields trigonelline, C1H12N2O (A. Pictet and P. Ganequand, Ber., 1897, 30, 2117). It gives rise to various decomposition products such as pyridine, picoline, &c., when its vapour is passed through a red-hot tube. The hydrochloride on heating with hydrochloric acid gives methyl chloride (B. Blau, Ber., 1893, 26, p. 531). Hydroiodic acid and phosphorus at high temperature give a dihydro-complex, whilst sodium and alcohol give hexa- and octo-hydro derivatives. Nicotine may be recognized by the addition of a drop of 30% ferric chloride, the mixture being allowed to stand for one hour and the solid residue then moistened by a drop of concentrated

NICOPOLIS—NICOTINE 665
NICHEROY—NIDIFICATION

sulphuric acid, when an intense rose-red colour is produced (L. Schindelmesser, Pharm. Zentralh. 1899, 40, 740).

The constitution of nicotine, which was first described by A. Pinner (see paper in the Berichte, 1891 to 1895). With bromine in acetic acid solution at ordinary temperature, nicotine yields a perbromide, 

$$\text{C}_9\text{H}_7\text{Br}_2\text{N}_2\text{O}_2\text{Br}_2$$

which with sulphur dioxide, followed by potassium tetrachloroplatinate, gives a violet colloid. From which 

$$\text{C}_9\text{H}_7\text{N}_2\text{O}_2\text{Br}_2$$

is obtained by distillation over zinc dust. By heating nicotine with bromine in hydrobromic acid solution for some hours at 100°C., dibromocotinine hydrobromide, 

$$\text{C}_9\text{H}_7\text{N}_2\text{O}_2\text{Br}_2$$

is formed. Bromocotinine on hydrolysis yields oxalic acid, methylamine, and \(\beta\)-methyl pyridyl ketone: 

$$\text{C}_9\text{H}_7\text{Br}_2\text{N}_2\text{O}_2\text{H}+\text{O}^+ = \text{H}_2\text{CO}_2+\text{CH}_3\text{NH}_2+\text{C}_4\text{H}_4\text{N}^-\text{COCH}_2+2\text{HBr};$$

whilst dibromocotinine yields methylamine, malonic acid, nicotine, and nicotine, from which cotinine, 

$$\text{C}_9\text{H}_7\text{N}_2\text{O}_2+\text{4H}^+ = \text{CH}_3\text{NH}_2+\text{C}_4\text{H}_4\text{N}^-\text{COOH}+\text{C}_4\text{H}_4\text{N}^-\text{COH}+2\text{HBr},$$

or if heated with zinc and caustic potash, methylamine and pyridyl-\(\beta\)-dioxobutyric acid. Thus the groupings 

$$\text{C}-\text{C}-$$

exist in the molecule, and the alkaloid is to be represented as \(\text{C}-\text{pyridyl-N-methyl-pyrollidine.}\)

This result has been confirmed by its synthesis by A. Pictet and P. Crépeux (Comptes rendus, 1903, 137, p. 860) and Pictet and Rountree (Chem. News, 1903, 37, p. 1325). Acetyl nicotine condenses when boiled in its mucate, which by dry distillation gives \(\text{N}-\beta\)-pyridylpyrrol.

By passing the vapour of this compound through a red-hot tube, it yields the isomeric \(\alpha\)-pyridylpyrrol, the potassium salt of which with methylamine gives a substance identical both in the pyridyl and pyrrol nuclei. By distillation over lime, the methyl group is removed from the pyridyl ring, and the resulting \(\alpha\)-pyridyl-N-methylpyrrol gives nicotine on reduction. This base is resolved into its active component by \(\beta\)-tartratic acid, \(\text{N}-\text{nicotine-d-tartrate.}\)

Nicotine crystallizes on cooling in needles which melt at 147°C. and is readily soluble in hot water.

NICHEROY, or Niteroi, a city of Brazil and capital of the state of Rio de Janeiro, on the E. shore of the Bay of Rio de Janeiro, opposite the city of that name. Pop. (1890) 34,669, (1900 estimate) 35,000. A railway connects the city with the interior, following the Cantareira line, now a part of the Lopo-ldina system, a branch of which runs north-eastward to Macabé, on the coast, and another northward from Nova Friburgo to a junction with the railway lines of Minas Gerais. Niteroi is practically a residential suburb of Rio de Janeiro. It occupies, in great part, the low alluvial plain that skirts the shores of the bay and fills the valleys between numerous low wooded hills. The site is shut off from the sea coast by a range of high rugged mountains. The shore line of the bay is broken by large, deeply indented bays (that of Jurujuba being nearly surrounded by wooded hills), shallow coves, and sharp promontories. Within these bays are beaches of white sand, called praias, such as the Praia da Icarahy, Praia das Flechas and Praia Grande, upon which face low tile-covered residences surrounded with gardens. The city consists of a number of these partially separated districts—Praia Grande, Sao Domingos, Icarahy, Jurujuba, Santa Rosa, Sao Lourenco, Ponta d'Airea and Barreto—all together covering 8 or 9 m. of the shore. An electric street railway connects all the outlying districts with the city and serves as the terminal stations of Praia Grande and Sao Domingos. The city is characterized by the construction and style of its buildings—low, heavy walls of broken stone and mortar, plastered and coloured outside, with an occasional facing of glazed Lisbon tiles, and covered with red tiles. Among the public buildings are several churches and hospitals (including the Jurujuba yellow-fever hospital and the Barreto isolation hospital), the government palace, a municipal theatre and a large Salesian college situated in the suburbs of Santa Rosa on an eminence overlooking the lower bay. Several large islands fill the upper bay near the eastern shore; some are used as coal deposits for the great steamship companies, and one (Flores) is used as an immigrants' depot. There is a small, rocky and picturesque island nearer the harbour entrance, which is crowned by a small chapel, dedicated to Nossa Senhora da Boa Viagem. Manufactures include cotton and woollen fabrics, tobacco, spirits, soap and tiles. The first settlement on the east side of the Bay of Rio de Janeiro dates from 1671, when a chapel was erected at Praia Grande, in the vicinity of an Indian village. The settlement did not become a village until 1819, when it was named Villa Real da Praia Grande. In 1834 the city and municipal district of Rio de Janeiro was separated from the province, and Praia Grande became the capital of the latter in the following year. In 1836 it was raised to the dignity of a city and received the appropriate name of Nictheroy, from the Indian name Nytari, “hidden water.” In the naval revolt of 1893-94 the older districts of the city suffered much damage from desultory bombardments, but the insurgents were too few to take possession. Soon afterwards the seat of government was removed to Petropolis, where it remained until 1903, when Nictheroy again became the capital of the state.

NIDIFICATION (from Lat. nidus), the process of making a nest, (see NEST). Nidification is with most birds the beginning of the breeding season, but with many it is a labour that is scamped if not shirked. Some of the auk tribe place their single egg on a bare ledge of rock, where its peculiar conical shape is but a precarious safeguard when rocked by the wind or stirred by the thronging crowd of its parents' fellows. The stone-curlew and the goatsucker deposit their eggs without the slightest preparation of the soil on which they rest; yet this is not done at haphazard, for no birds can be more constant in selecting, almost to an inch, the very same spot which year after year they choose for their procreative nest. In marked contrast to such artless care stand the wonderful structures which others, such as the tailor-bird, the bottle-titmouse or the fantail-warbler, build for the comfort or safety of their young. But every variety of disposition may be found in the class. The apteryx seems to entrust its abnormally big egg to an excavation among the roots of a tree-fern; while a band of female ostriches scrape holes in the desert-sand and therein promiscuously drop their eggs and leave the task of incubation to the male. Some megapodes bury their eggs in sand, leaving them to come to maturity on the surface of the sand. The foster and then raise a huge hobbled of dead leaves wherein they deposit their eggs, and the young are hatched without further care on the part of either parent. Some of the grebes and rails seem to avail themselves in a less degree of the heat generated by vegetable decay and, dragging from the bottom or sides of the waters they frequent fragments of aquatic plants, form of them a rude half-floating mass which is piled on some growing water-weed— but these birds do not spurn the duties of maternity.

Many of the gulls, sandpipers and plovers lay their eggs in a shallow pit which they hollow out in the soil, and then as incubation proceeds add straw and leaves to form a low breastwork of earth. The ringed plover commonly places its eggs on shingle, which they so much resemble in colour, but when breeding on grassy uplands it paves the nest-hole with small stones. Pigeons mostly make an artless platform of sticks so loosely laid together that their pearly treasures may be perceived from beneath by the inquisitive observer. The magpie, as though self-conscious that its own thieving habits may be imitated by its neighbours, surrounds its nest with a hedge of thorns. Very many birds of almost every group bore holes in some sandy cliff, and at the end of incubation add soil or leaves to cover the low breastwork of earth. Such breeding, too, is very various in character: thus, while the shelduck and the sand-martin supply the softest of materials—the one of down from her own body, the other of feathers collected...
by dint of diligent search—the kingfisher forms a couch of the undigested spiny fish bones which she ejects in pellets from her own stomach. Other birds, such as the woodpeckers, hew holes in living trees, even when the timber is of considerable hardness, and therein establish their nursery. Some of the swifts secrete from their salivary glands a fluid which rapidly hardens as it dries on exposure to the air into a substance resembling isinglass, and thus furnish the "edible birds' nests" that are the delight of Chinese epicures. In the architecture of nests, however, the secrete seems to play an important part. By its aid they are enabled to moisten and bind the otherwise refractory twigs and strands, and glue them to their place. Spiders' webs also are employed with great advantage for the purpose last mentioned, but perhaps chiefly to attach fragments of moss and lichen so as to render the whole structure less obvious to the eye of the spoiler. The tailor-bird deliberately spins a thread of cotton and therewith stitches together the edges of a pair of leaves to make a receptacle for its nest. Beautiful, too, is the felt fabricated of fur or hairs by the various species of titmouse, while many birds ingraft it into a compact mass both animal and vegetable fibres, forming an admirable non-conducting medium which guards the eggs from the extremes of temperature outside. Such a structure may be open and cup-shaped, supported from below as that of the chaffinch and goldfinch, domed like that of the wren and bottle-titmouse, sling hammock-wise as in the case of the golden-crested wren and the orioles, or suspended by a single cord as with certain grosbeaks and humming-birds.

Certain warblers (Aeslon Thamnolia) invariably lay a piece of snake's slough in their nests—to repel, it has been suggested, marauding birds who may thereby fear the neighbour-hood of a deadly enemy. The clay-built edifices of the swallow and martin are known to everybody, and the nuthatch plasters up the gaping mouth of its nest-hole till only a postern large enough for entrance and exit, but easy of defence, is left. In South America the oven-birds (Furnaridae) construct on the branches of trees globular ovens, so to speak, of mud, wherein the eggs are laid and the young hatched. The flamingo erects in the marshes it frequents a mound of earth sometimes 2 ft. in height, with a cavity atop. The females of the hornbills submit to incarceration during this interesting period, the males frequenting them by a barrier of mud, leaving only a small window to admit air and food.

But though in a general way the dictates of hereditary instinct are rigidly observed by birds, in many species a remarkable degree of elasticity is exhibited, or the rule of habit is rudely broken. Thus the falcon, whose ordinary eyrie is on the beetling cliff, will for the convenience of procuring prey condescend to lay its eggs on the ground in a marsh, or appropriate the nest of some other bird in a tree. The golden eagle, too, remarkably adapts itself to circumstances, now rearing its young on a precipitous ledge, now on the arm of an ancient monarch of the forest and again on a treeless plain, making a humble home amid grass and herbage. Herons will breed according to circumstances in an open fen, on sea-banks or (as is most usual) on lofty trees. Such changes are easy to understand. The instinct of finding food for the family is predominant, and where most food is there will the feeders be gathered together. This explains, in all likelihood, the associated bands of ospreys or fish-hawks, which in North America breed (or used to breed) in large companies where sustenance is plentiful, though in the Old World the same species brooks not the society of anything else. But there are of eminently social predilections. In Europe, apart from sea-fowls—whose congregations are universal and known to all—only the heron, the fieldfare and the rook habitually flock during the breeding season; but in other parts of the world many birds unite in company at that time, and in none possibly is this habit so strongly developed as in the ains of the neotropical region, the republican swallow of North America and the sociable grosbeak of South Africa, which last joins nest to nest until the tree is said to be broken down under the accumulated weight of the common edifice.

In the strongest contrast to these amiable qualities is the parasitic nature of the cuckoos of the Old World and the cowbirds of the New. The egg of the parasite is introduced into the nest of the dupe, and after the necessary incubation by the fond fool of a foster-mother the interloper successfully counterfeits the heirs, who perish miserably, victims of his superior strength. The whole process has been often watched, but the reflective naturalist will pause to ask how such a state of things came about, and there is not much to satisfy his inquiry. Certain it is that some birds, whatever by mistake, or perhaps by design, do not infrequently lay their eggs in the nests of others. It is within the knowledge of many that pheasants' eggs and partridges' eggs are often laid in the same nest, and gulls' eggs have been found in the nests of eider-ducks and vice versa; a redstart and a pied flycatcher will lay their eggs in the same convenient hole—the forest being rather deficient in such accommodation; an owl and a duck will resort to the same nest-box, set up by a scheming woodman for his own advantage; and the starling, which constantly dispossesses the green woodpecker, sometimes discovers that the rightful heir of the domicile has to be brought up by the intruding tenant. In all such cases it is not possible to say which species is so constituted as to obtain the mastery, but it is not difficult to conceive that in the course of ages that which was driven from its home might thrive through the fostering of its young by the invader, and thus the abandonment of domestic habits and duties might become a direct gain to the evicted householder.

(A. N.)

Nests and Coloration.—The correlation between nests and the coloration of the birds has been investigated by A. R. Wallace. According to the different kinds of dwellings, the eggs are of different colors, the males being duller than the females, the eggs of the males being of the same color as the nest, the females' eggs differing from the nest and from one another. The correlation, however, is not always steady; the eggs of certain species are of the same color as the nest, and these are always females. The Eskimo eggs are of the same color as the nest, and the male is usually the duller of the two, while the female's eggs are of a different color. The nests of the birds are usually of the same color as the eggs, and they are usually dull in color. The eggs of the birds are usually of a different color from the nest, and the male is usually the duller of the two, while the female's eggs are of a different color from the nest and from one another. The correlation, however, is not always steady; the eggs of certain species are of the same color as the nest, and these are always females. The Eskimo eggs are of the same color as the nest, and the male is usually the duller of the two, while the female's eggs are of a different color from the nest and from one another.
whether they be deposited in holes in the bare ground or in open nests in a tree. The eggs of the goshawk are white, but those of its small relation, the sparrowhawk, are always bloomed, the nest of both being similar. In the same kind of position, but regarding the almost common cases of spotted eggs in holes or covered nests, of which so many groups of birds furnish examples either wholly or in part, it has been suggested that the species in question has been in many instances digitally renovated and not yet got rid of the ancestral habit of secreting and despositing pigment.

**Length of Time of Incubation.**—Most of the smaller Passeres seem to hatch their young in from 13-15 days. The shortest period, only 10 days, is recorded of the small *Zosterops coelestes*; the largest, amounting to about 8 weeks, is that of some of the larger Ratitae, penguins, and Ostriches. The development of the young of the long-tailed ducks, is that by W. Evans (*Ibis*, 1891, pp. 52-53; and 1892, pp. 55-58). Speaking broadly, the largest birds lay the largest eggs and require the longest time for incubation, but there are very many exceptions, and only birds of the same group can be scholar and each other. The domestic fowl takes 21 days, but the pheasant, though so very nearly allied, takes 2 or 3 days longer, and even the small partridge requires 24 days. The mallard takes 26, the domestic duck, the musk duck 35 days, like most of the swans. The commonest with 13 to 14 days, seems to have adapted itself to the short period of its foster parents.

The naturalist still affords ample opportunities of experimental investigation and comparison. The condition of the newly hatched birds also varies extremely. The *Nidifuga* are born with their eyes open, are thinly clothed with neosplines of simple structure, leave the nest, and feed all day. The young of the *Nidifugi* take time to be born blind, remain a long time in the nest and have to be fed by their parents. As a whole, the *Nidifuga* comprise most of the phylogenetically older groups; but many of these may include some close relatives having a development of the *Nidifuga*: for instance, some Aegidae, the pigeons, Spheniscus, Tubinares, Ciconiace. For detail see *Birds: Classification*. While in the first category the sense organs, tegumentary and locomotory organs are far advanced, these are retarded in the *Nidifuga*, the development of these structures being shifted on to the postembryonic period. Yet the length of the incubation is by no means always long as the *Nidifuga*, when compared with equal-sized birds.

**Niebuhr, Barthold Georg** (1776-1831), German statesman and historian, son of Karsten Niebuhr (q.v.), was born at Copenhagen on the 27th of August 1776. From the earliest age young Niebuhr was distinguished by extraordinary curiosity, and from 1794 to 1796, being already a finished classical scholar, was acquainted with several modern languages, he studied at the University of Kiel. After quitting the university he became private secretary to Count Schimmelmann, Danish minister of finance. But in 1798 he gave up this appointment and travelled in Great Britain, spending a year at Edinburgh studying agriculture and physical science. In 1799 he returned to Denmark, where he entered the state service; in 1800 he married and settled at Copenhagen. In 1804 he became chief director of the National Bank, but in September 1806, he resigned this for a similar appointment in Prussia. He arrived in Prussia on the eve of the catastrophe of Jena. He accompanied the fugitive government to Königsberg, where he rendered considerable service in the commissariat, and was afterwards still more useful as commissioner of the national debt and by his opposition to ill-considered schemes of taxation. He was also for a short time Prussian minister in Holland, where he endeavoured without success to obtain a contract to loan the arm. The extreme sensibilities of his temperament, however, disqualified him for politics; he proved impracticable in his relations with Hardenberg and other ministers, and in 1810 retired for a time from public life, accepting the more congenial appointment of royal historiographer and professor at the university of Berlin.

He commenced his lectures with a course on the history of Rome, which formed the basis of his great work *Römische Geschichte*. The first two volumes, based upon his lectures, were published in 1812, but attracted little attention at the time owing to the absorbing interest of political events. In 1813 Niebuhr's own attention was diverted from history by the uprising of the German people against Napoleon; he entered the *Landwehr* and ineffectually sought admission into the regular army. He edited for a short time a patriotic journal, called the *Coriolan*, and then, in 1815, returned to his native soil and engaged in various minor negotiations. In 1815 he lost both his father and his wife. He next accepted (1816) the post of ambassador at Rome, and on his way thither he discovered in the cathedral library of Verona the long-lost *Institutes of Gaius*, afterwards edited by Savigny, to whom he communicated the discovery under the impression that he had found a portion of *Ulpian*. During his residence in Rome Niebuhr discovered and published fragments of Cicero and Livy, aided Cardinal Mai in the publication of *Ciceronis De Republica*, and shared in framing the plan of the great work on the topography of ancient Rome by Christian J. von Bunsen and Ernst Platner (1773-1855), to which he contributed several chapters. He also, on a journey home from Italy, deciphered in a palimpsest at St Gall the fragments of Flavius Merobaudes, a Roman poet of the 5th century. In 1823 he resigned the embassy and established himself at Bonn, where the remainder of his life was spent, with the exception of some visits to Berlin as councillor of state. He here rewrote and republished (1827-1828) the first two volumes of his *Roman History*, and composed a third volume, bringing the narrative down to the end of the First Punic War, which, with the help of a fragment written in 1811, was edited after his death (1832) by Johannes Classen (1805-1871). He also assisted in August Bekker's edition of the Byzantine historians, and delivered courses of lectures on ancient history, ethnography, geography, and on the French Revolution. In February 1830 his house was burned down, but the greater part of his books and manuscripts were saved. The revolution of July in the same year was a terrible blow to him, and filled him with the most dismal anticipations of the future of Europe. He died on the 2nd of January 1831.

Niebuhr's *Roman History* counts among epoch-making histories both as marking an era in the study of its special subject and for its momentous influence on the general conception of history. "The main results," says Leonhard Schmitz, "arrived at by the inquiries of Niebuhr, such as his views of the ancient population of Rome, the origin of the plebs, the relation between the patricians and plebeians, the real nature of the ager publicus, and many other points of interest, have been acknowledged by all his successors." Other alleged discoveries, such as the construction of early Roman history out of still earlier ballads, have not been equally fortunate; but if every positive conclusion of Niebuhr's had been refuted, his claim to be considered the first who dealt with the ancient history of Rome in a scientific spirit would remain unimpaired, and the new principles introduced by him into historical research would lose nothing of their importance. He suggested, though he did not elaborate, the theory of the myth, so potent an instrument for good and ill in modern historical criticism. He brought in inference to supply the place of discredited tradition, and showed the possibility of writing history in the absence of original records. By his theories of the disputes between the patricians and plebeians arising from original differences of race he drew attention to the immense importance of ethnological distinctions, and contributed to the revival of these divergences as factors in modern history. More than all, perhaps, since his conception of ancient Roman story made laws and manners of more account than shadowy lawgivers, he undesignedly influenced history by popularizing that conception of it which lays stress on institutions, tendencies, and social traits to the neglect of individuals.

Niebuhr's personal character was in most respects exceedingly attractive. His heart was kind and his affections were strong;
he was magnanimous and disinterested, simple and honest. He had a kindling sympathy with everything lofty and generous, and framed his own conduct upon the highest principles. His chief defect was an over-sensitiveness, leading to peevish and unreasonable behaviour in his private and official relations, to hasty and unbalanced judgments of persons and things that had given him annoyance, and to a despondency and discouragement which might perhaps have been avoided had he might have effected as a philo-

The principal authority for Niebuhr's life is the Lebensnachrichten über B. G. Niebuhr, aus Briefen desselben und aus Erinnerungen einiger seiner nächsten Freunde, by Dorothea Hersler (3 vols., 1838–

Niebuhr, Karsten (1723–1815), German traveller, was born at Lüdingworth, Lauenburg, on the southern border of Holstein, on the 17th of March 1733, the son of a small farmer. He had little education, and for several years of his youth had to do the work of a peasant. His bent was towards mathematics, and he managed to obtain some lessons in surveying. It was while he was working at this subject that one of his teachers, in 1760, proposed to him to join the expedition which was being sent out by Frederick V. of Denmark for the scientific exploration of Egypt, Arabia and Syria. To qualify himself for the work of surveyor and geographer, he studied hard at mathematics for a year, and after that he set out, with the intention of acquiring some knowledge of Arabic. The expedition sailed in January 1761, and, landing at Alexandria, ascended the Nile. Proceeding to Suez, Niebuhr made a visit to Mount Sinai, and in October 1762 the expedition sailed from Suez to Jeddah, journeying thence overland to Mocha. Here in May 1763 the philologist of the expedition, van Haven, died, and was followed shortly after by the naturalist Forskål. Sana, the capital of Yemen, was visited, but the remaining members of the expedition suffered so much from the climate or from the mode of life that they returned to Mocha. Niebuhr seems to have saved his own life, by adopting the native habits as to dress and food. From Mocha the ship was taken to Bombay, the artist of the expedition dying on the passage, and the surgeon soon after landing. Niebuhr was now the only surviving member of the expedition. He stayed fourteen months at Bombay, and then returned home by Muscat, Bushire, Shiraz and Persepolis, visited the ruins of Babylon, and thence went to Bagdad, Mosul and Aleppo. After a visit to Cyprus he made a tour through Palestine, crossing Mount Taurus to Brussa, reaching Con-

Niebuhr, K.—Niederwald

469

stantinople in February 1767 and Copenhagen in the following November. He married in 1773, and for some years held a post in the Danish military service which enabled him to reside at Copenhagen. In 1778, however, he accepted a position in the civil service of Holstein, and went to reside at Meldorf, where he died on the 26th of April 1815.

Niebuhr was an accurate and careful observer, had the instincts of the scholar, was animated by a high moral purpose, and was rigorously conscientious and anxiously truthful in recording the results of his observation. His works have long been classics on the geography, the people, the antiquities and the archaeology of much of the district of Arabia which he traversed. His first volume, Beschreibung von Arabien, was published at Copenhagen in 1777, 4to, 2 vols., and was intended to defraying the expenses of the abundant illustrations. This was followed in 1774–1778 by two other volumes, Reisebeschreibung von Arabien und anderen umliegenden Ländern. The fourth volume was not published till 1837, long after his death, under the editorship of Niebuhr's daughter. He also undertook the task of bringing out the work of his friend Forskål, the naturalist of the expedition, under the titles of Descriptions animalium, Flora Aegyptiaco-Arabica, and Icones rerum naturalium (Copen-

hagen, 1775–1776). To a German periodical, the Deutschen Museum, Niebuhr contributed papers on the interior of Africa, the political and military condition of the Turkish empire, and other subjects.

French and Dutch translations of his narratives were published during his lifetime, and a condensed English translation, by Robert Heron, of the first three volumes in Edinburgh (1792). His son Boris, who published above the title of his father a memoir written by Sir George Cornwall Lewis's Essay on the Credibility of the Early Roman History. See further J. E. Sands, History of Classical Scholarship (1908), i. pp. 75–82.

Niederbronn, a town of Germany, in the imperial province Alsatia-Lorraine, on the Falkensteiner Bach, situated under the eastern slope of the Voges, 12 m. N.W. from Haguenau by rail. Pop. (1905) 3120. It contains an Evangelical and a Roman Catholic church, a convent of the Sisters of the Divine Redeemer, and a high-grade and other schools. Niederbronn is one of the best-known watering-places in the Voges. Its brine springs, with a hydrophatic establishment attached, are specific in cases of gout, obesity and liver disorders. Here, on the 26th of July 1813, the first engagements between the French and in the Franco-German war took place. There are several ruined castles in the neighbourhood, the most noteworthy of which is one on the Wesenburg (1415 ft. high) erected in the 14th century. Various Celtic and Roman antiquities have been found around Niederbronn.

See Kuhn, Les Eaux de Niederbronn (3rd ed., Strassburg, 1860); Mathis, Aus Niederbronn's Alten Zeiten (Strassburg, 1901); and Kriehn, Das Wassertal Niederbronn (Strassburg, 1902).

Niederlahnstein, a town of Germany, in the Prussian province of Hesse-Nassau, situated on the right bank of the Rhine at the confluence of Lahn, 3 m. S.E. from Coblenz by the railway to Ems, and at the junction of lines to Hochheim and Cologne. Pop. (1905) 4551. It has two Roman Catholic churches. The chief industries are the making of machinery and shipbuilding. Niederlahnstein obtained civic rights in 1332, and was until 1803 on the territory of the electors of Trier. Here on the 1st of January 1814 a part of the Russian army crossed the Rhine. In the vicinity are the Johanniskirche, a Romanesque church restored in 1857, and the Allerheiligenberg, where stands a chapel, once a famous place of pilgrimage.

Nieder-Selters, a village of Germany, in the Prussian province of Hesse-Nassau, situated in a well-wooded country on the Ems, 12 m. S.E. from Limburg by the railway to Frankfort-on-Main. Pop. (1900) 1339. Here are the springs of the famous Selters or Seltzer water, employed as specific in cases of catarrh of the respiratory organs, the stomach and bladder. Until 1866 the springs belonged to the duke of Nassau; since this date they have been the property of Prussia. They became famous in the earlier part of the 19th century, although they had been known many times previously.

See Grossmann, Die Heilquellen des Taunus (Wiesbaden, 1887).

Niederwald, a broad hill in Germany, in the Prussian province of Hesse-Nassau, on the right bank of the Rhine, between that river and the Weser, opposite Bingen, forming the south-western apex of the Taunus range. Its summit is clothed with dense forests of oak and beech, while its southern and western sides, which descend sharply to Rüdesheim and Assmannshausen on the Rhine, are covered with vineyards, and produce some of the finest wines of the district. At the edge of the forest, on the crest of the hill above Rüdesheim, stands the gigantic "Germania" statue, the national monument of the war of 1870–71, which was unveiled on the 28th of September 1883 by the emperor William I, in the presence of all the rulers in Germany or their representatives. It was designed by Johannes Schilling, and the bronze figure of Germania is 33 ft. high; the
pedestal is adorned with allegorical figures and portraits of German princes and generals. Cogtooth mountain railways run up the hill from Rüdesheim and Assmannshausen. See Spielmann, *Niederland und Nationaldenkmal* (Wiesbaden, 1898).

**Niehaus, Charles Henry** (1855— ), American sculptor, of German parentage, was born at Cincinnati, Ohio, on the 24th of January 1855. He was a pupil of the McMicken School of Design, Cincinnati, and also studied at the Royal Academy, Munich, returning to America in 1881; in 1885, after several years in Rome, he established his studio in New York City. In 1906 he became a National Academician. His principal works are: a statue of President Garfield, for Cincinnati; the Hahnemann Memorial, in Washington; Moses* and *Gibbons,* for the Congressional Library, and "James A. Garfield," "John J. Ingalls," "William Allen," and "Oliver P. Morton," for Statuary Hall, Capitol, Washington; "Hooker" and "Davenport," Statu-Hoys, Hartford, Connecticut; the Astor Memorial doors, Trinity Church, New York; "General Forrest," Memphis, Tennessee; Generals Sherman and Lee, and William the Silent; "The Scraper; or Greek Athlete using a Strigil;" statues of Lincoln, Farragut and McKinley, at Muskegon, Michigan; a statue of McKinley and a lunette for McKinley's tomb, at Canton, Ohio; and "The Driller," at Titusville, Pennsylvania, in memory of Colonel E. L. Drake, who, in 1859, sank the first oil well in Pennsylvania.

**Nieul, Alexandre** (1802—1869), marshal of France, was born at Metz on the 4th of October 1802, and entered the École Polytechnique in 1821, whence he passed to the engineer school at Metz, becoming lieutenant in the Engineers in 1827 and captain in 1833. At the storming of Constantinople he led the engineer detachment with one of the storming parties, and his conduct gained for him the rank of *chef de bataillon* (1837). In 1840 he was promoted lieutenant-colonel, and in 1846 colonel, and his next war service was as chief of staff to General Vaillant during the siege of Rome (1849), after which he was made general of brigade and director of engineer services at headquarters. In 1851 he became a member of the Committee of Fortification, and in the following year a member of the council of state, and in 1853 general of division. In the first part of the Crimean War he was employed in the expedition to the Baltic, and directed engineer operations against Bomarsund, but early in 1855 he was sent to the Crimea, where he succeeded General Bizot as chief of engineers. For some years he had been the most trusted military advisor of Napoleon III., and he was now empowered to advise the generals on the spot in accordance with the wishes of the sovereign and the home government. This delicate and difficult task Nieul managed to carry out with as much success as could be expected, and he had the credit of directing the large operations against the Malakoff (see Crimean War). His reward was the grand cross of the Legion of Honour. From 1855 to 1859 he was employed at headquarters, and also served in the senate. In the war against the Austrians in the latter year (see *Italian Wars*) Nieul commanded the IV. corps, and took a brilliant part in the battles of Magenta and Solferino. On the field of battle of Solferino he was made a marshal of France. After service for some years in a home command, he became minister of war (1867). In this capacity he drafted and began to carry out a far-reaching scheme of army reform, based on universal service and the automatic creation of large reserves, which needed only time to mature. He also rearmed the whole of the army with the chassepot rifle. But he did not live to complete the development of his system. He died on the 13th of August 1869 in Paris, and a year later the Franco-German War destroyed the old imperial army upon which the new formations were to have been grafted.

**Niello** (the Italian form of Lat. *nigellum,* diminutive of *niére,* "black;" Late Gr. *μελανέω,* a method of producing delicate and minute decoration on a polished metal surface by incised lines filled with a black metallic amalgam. In some cases it is very difficult to distinguish niello from black enamel; but the black substance differs from true enamel in being metallic, not vitreous. Our knowledge of the process and materials employed in niello-work is derived mainly from four writers,—Eracus the Roman (a writer probably of the 11th century), Theophilus the monk, who wrote in the 12th or 13th century, and, in the 16th century, Benvenuto Cellini* and Giorgio Vasari.* The design was cut with a sharp graving tool on the smooth surface of the metal, which was usually silver, but occasionally gold or even bronze. An alloy was formed of two parts silver, one-third copper and one-sixth lead; to this mixture, while fluid in the crucible, powdered sulphur in excess was added; and the brittle amalgam, when cold, was finely pounded, and sealed up in large quills for future use. A solution of borax to act as a flux was brushed over the metal plate and thoroughly worked into its incised lines. The powdered amalgam was then shaken out of the quills on to the plate, so as to completely cover all the engraved pattern. The plate was now carefully heated over a charcoal fire, fresh amalgam being added, as the powder fused, upon any defective places. When the powder had become thoroughly liquid, so as to fill all the lines, the plate was allowed to cool, and the whole surface was scraped, so as to remove the superfluous niello, leaving only what had sunk into and filled up the engraved pattern. Last of all the nielloed plate was very highly polished, till it presented the appearance of a smooth metal surface enriched with a delicate design in fine grey-black lines. This process was chiefly used for silver work, on account of the vivid contrast between the whiteness of the silver and the darkness of the niello. As the slightest scratch upon the metal received the niello, and became a distinct black line, ornament of the most minute and refined description could easily be produced.

The earliest specimens of niello belong to the Roman period. Two fine examples are in the British Museum. One is a bronze statuette of a Roman general, nearly 2 ft. high, found at Barking Hall in Suffolk. The dress and armour have patterns partly inlaid in silver and partly in niello. The dark tint of the bronze rather prevents the niello from showing out distinctly. This statuette is apparently a work of the 1st century. The other example is not earlier than the 4th century. It is a silver casket or lady's toilet box, in which were found an ampulla and other small objects, enriched with niello-work.

From Roman times till the end of the 6th century the art of working in niello was never lost, and was constantly practised in some part at least of Europe, while in Russia and India it has survived to the present day. From the 6th to the 12th century a large number of massive and splendid works in the precious metals were produced at Byzantium or under Byzantine influence, many of which were largely decorated with niello; the silver dome of the baldacchino over the high altar of S. Sophia was probably one of the most important of these. Niello is frequently mentioned in the inventories of the treasures belonging to the great basilicas of Rome and Byzantium. The Pala d'Oro at St. Mark's, Venice, 10th century, owes much of its refined beauty to niello patterns in the borders. This art was also practised by Bernward, artist-bishop of Hildesheim (ob. 1023); a fine silver paten, decorated with figures in niello, attributed to his hand, still exists among the many rich treasures in the church of Hanover Palace. Other nielli, probably the work of the same bishop, are preserved in the cathedral of Hildesheim. In France, too, judging both from existing specimens of ecclesiastical plate and many records preserved in church inventories, this mode of decoration must have been frequently applied all through the middle ages: especially fine examples once existed at Notre Dame, Paris, and at Cluny, were the columns of the sanctuary were covered with large plaques of silver in the 11th century, each plaque being richly ornamented with designs in niello. Among the early Teutonic and Celtic races, especially from the 8th to the 11th centuries, both in Britain and other countries, niello was

2 Trattato dell' orficeria.
3 Tre arti del disegno.
frequently used to decorate the very beautiful personal ornaments of which so many specimens enrich the museums of Europe. The British Museum possesses a fine fibula of silver decorated with a simple pattern in niello and thin plates of repoussé gold. This, though very similar in design to many fibulae from Scandinavia and Britain, was found in a tomb at Kerch (Panticapaeum). Several interesting gold rings of Saxon workmanship have been found at different times, on which the owner's name and ornamental patterns are formed in gold with a background of niello. One with the name of Ethelwulf, King of Wessex (837–840), is now in the British Museum (see figure). Another in the Victoria and Albert Museum has the name of Allstan, who was bishop of Sherborne from 823 to 867. The metal-workers of Ireland, whose skill was quite unrivalled, practised largely the art of niello from the 10th to the 12th century, and possibly even earlier. Fine croziers, shrines, vessels, and other objects of Irish workmanship, and of niello-work, exist in considerable numbers. From the 13th to the 16th century but little niello-work appears to have been produced in England. Two specimens have been found, one at Matlask, Norfolk, and the other at Devizes, which seem the character of niello-work for which appear to be English. They are both of gold, and seem to be the covering plates of small pendant reliquaries about 1 in. long, dating about the end of the 15th century. One has a crucifix between St John the Baptist and a bishop; the other, that found at Devizes, contains the two latter figures, but no crucifix. It is, however, in Italy that the art of niello-work was brought to greatest perfection. During the whole medieval period it was much used to decorate church plate, silver altar-frontals, and the like. The magnificent frontals of Pistoia cathedral and the Florence baptistery are notable instances of this. During the 15th century, especially at Florence, the art of niello-work was practised by almost all the great artist-goldsmiths of that period. Apart from the beauty of the works they produced, this art had a special importance and interest from its having led the way to the invention of printing from engravings on metal plates (see LINE-ENGRAVING). Vasari's account of this invention, given in his lives of Pollaiuolo and Maso Finiguerra, is very interesting, but he is wrong in asserting that Maso was the first worker in niello who took proofs or impressions of his plates. An important work of this sort, described at length by Vasari and wrongly ascribed by him to Maso Finiguerra (g.v.), still exists in the Opera del Duomo at Florence. It is a pax with a very rich and delicate niello picture of the coronation of the Virgin; the composition is very full, and the work almost microscopic in minuteness; it was made in 1452. Impressions from it are preserved in the British Museum, the Louvre and other collections. The British Museum possesses the finest existing example of 15th-century German niello. It is a silver beaker, covered with graceful scroll-work, forming medallions, in which are figures of cupids employed in various occupations (see Shaw's Dresses and Decorations of the Middle Ages, 1858, vol. ii.).

AUTHORITIES.—The Archaeological Journal of 1862 (vol. xii. p. 329) has an excellent monograph on the subject, see also vol. xii. p. 79 and vol. iv. p. 247: Archaeologia, xxxi. 240; Merrifield, Ancient Practice of Painting, vol. i. (1849) (gives MSS. of Erasmus and other early writers); Catalogue of Museum of Royal Irish Academy: Let Nielles à la cath. d'Avignon (Paris, 1890); Alvin, Nielles de la bibliothèque roy. de Belgique (1857); Duchesne, Nielles des orfèvres florentins (1826); Passavant, Le Peintre-graveur (1860–1884); Ottley, History of Engraving (1816) and Collection of Facsimiles of Prints (1826); Cresson, Seu et sculptura Niellorum (Genoa, 1858); (Prato, 1823), and Storia della calcolografia (Prato, 1831); Lanzi, Storia pittorica, ep. i. sec. iii. (1809); Baldinucci, Professioni dei disegni (1670); L'Arte del foggiare e Origini dell' incisione a rame (1802); Labarte, Arts of the Middle Ages (1855); Texier, Dictionnaire de l'orfèvrerie p. 1822 (Paris, 1857); Bartsch, Le Peintre-graveur, xiii. 1-35; Rumohr, Untersuchung der Gründe für die Annahme, &c. NIEM, NIEJM (Niem, or Niemczewicz), Dietrich op (c. 1345–1418), medieval historian, was born at Niecehim, a small town subject to the see of Paderborn. He became a notary of the papal court of the rota at Avignon, and in 1376 went with the Curia to Rome. Urban VI. here took particular notice of him, made him an abreviarius to the papal chancery, and in 1383 took him with him on his visit to King Charles at Naples, an expedition which led to many unpleasant adventures, from which he escaped in 1385 by leaving the Curia. In 1387 he is again found among the court of the pope, and in 1395 Pope Boniface IX. appointed him to the bishopric of Verden. His attempt to see, however, met with successful opposition; and he had to resume his work in the chancery, where his name again appears in 1403. In the meantime he had helped to found a German hospice in Rome, which survives as the Instituto dell' Anima, and had begun to write a chronicle, of which only fragments are extant. His chief importance, however, lies in the part he took in the controversies arising out of the Great Schism. He accompanied Gregory XII. to Lucca in May 1406, and, having in vain tried to draw the popes together by moderation, he joined the Roman and Avignon electors at Pisa, the pope elected by the council of Pisa (Alexander V.) and to his successor John XXIII., resuming his place at the Curia. In view of the increasing confusion in the Church, however, he became one of the most ardent advocates of the appeal to a general council. He was present at the council of Constance as adviser to the German "nation." He died at Maastricht on the 22nd of March 1418.

Niem wrote about events in which he either had an intimate personal share or of which he was in an excellent position to obtain accurate information. His most important works are the Nemus unionis and the De schismate. Of these the first, compiled at Lucca after his death with the help of his son-in-law, is incomplete, and the latter, which had fallen into his hands during the negotiations for union : papal pronouncements, pamphlets, letters written and received by himself, and the like. The De schismate libri III., completed on the 29th of May 1416, describes the history of events since 1376 as Niem himself had seen them. It was continued in the Historia de vita Johannes XXIII. Other works are De bono regimine Rom. pontificis, dedicated to the new pope (John XXIII.;); De modis uniiundi ac reformandii ecclesiam et De difficultate reformations in concilio universalis, advocating the convocation of a council, to which the pope is to bow; Contra dumpossas Wiclifœcum Pragae, against the Hussites; In quo ac principe imperii, a glorification of the empire, in view of the convocation of the council of Constance: Aviamenta pulcherrima de unione et reformatione membrorum et capitis fenda, a programme of church reform based on his experiences of the evils of the Italian system.

For bibliography see Potthast, Bibl. hist. medii aevi (2nd ed., Berlin, 1896), p. 851, s.n. "Theodoricus de Niem"; and generally see the article on Niem by Theodor Lindner in Allgemeine deutsche Biographie (Leipzig, 1886); and Erel, Dietrich von Nieheim (Leipzig, 1887).

NIEMCEWICZ, JULIAN USRIN (1758–1841), Polish scholar, poet and statesman, was born in 1757 in Lithuania. In the earlier part of his life he acted as adjutant to Kosciusko; was among those who, with them at the fatal battle of Maczkowce (1772), and shared his captivity at St Petersburg. On his release he travelled for some time in America, where he married. After the Congress of Vienna he was secretary of state and president of the constitutional committee in Poland, but in 1830–1831 he was again driven into exile. He died in Paris on the 21st of April 1841. Niemcewicz tried many styles of composition. His comedy The Return of the Deputy (1790) enjoyed a great reputation, and his novel, John of Tenczyn (1829), in the style of Scott, gives a vivid picture of Polish life of the 16th century.

Niemcewicz published a collection of memoirs for ancient Polish history (6 vols., 1822–1825). But he is now best remembered by his Historical Songs of the Poles (Warsaw, 1816), a series of lyrical compositions in which the chief heroes are of the golden age of Sigismund I., and the reigns of Stephen Bathori and Sobieski.

His collected works were published in 12 vols. at Leipzig (1838–1840).
NIENBURG ON THE SAALE—NIETZSCHE

NIENBURG, a town of Germany, in the duchy of Anhalt, situated at the influx of the Bode into the Saale, 6 m. N. of Bernburg on the railway Calbe-Könnern. Pop. (1908) 3748. It contains a beautiful Gothic Evangelical church, an old castle, once monastery (founded 975, dissolved 1540), and now devoted to secular uses, and a classical school. The industries embrace iron-founding and machine-making, malting and tanning.

NIENBURG ON THE WESER, a town of Germany, in the Prussian province of Hanover, situated on the Weser, 33 m. N.W. from Hanover by the railway to Bremen. Pop. (1906) 9638. It has an Evangelical and a Roman Catholic church, a classical school and an agricultural college. Its industries consist chiefly in glass-blowing, distilling, biscuit-making and the manufacture of manures. The town is mentioned as early as 1225. It was fortified in the 12th century, obtained municipal rights in 1569, and passed in 1842 to the house of Lüneburg. It was occupied by the imperialists from 1572 to 1634, and by the French during the Seven Years' War. The walls were dismantled by order of Napoleon I. in 1807.

See Gade, Geschichte der Stadt Nienburg an der Weser (1862).

NIEPCE, JOSEPH NICÉPHORE (1765–1833), French physicist, and one of the inventors of photography, was born at Châlon-sur-Saône on the 7th of March 1765. In 1792 he entered the army as a sub-lieutenant, and in the following year he saw active service in Italy. Ill-health and failing eyesight compelled him to resign his commission before he had risen above the rank of lieutenant; but in 1795 he was nominated administrateur des domaines of the district of Nice, and he held the post until 1801. Returning in that year to his birthplace, he devoted himself along with his elder brother Claude (1763–1828) to mechanical and chemical researches; and in 1811 he directed his attention to the rising art of lithography. In 1813 the idea of obtaining sun pictures first suggested itself to him in this connexion; and in 1816 he learned that L. J. M. Daguerre was working in the same direction. In 1829 the two united their forces, and to perfecter au perfectionnement de la découverte inventée par M. Niepce et perfectionnée par M. Daguerre” (see also PHOTOGRAPHY). Niepce died at Gras, his property near Châlon, on the 3rd of July 1833. A nephew, CLAUDE FÉLIX ABEIL NIEPCE DE SAINT-VICTOR (1805–1870), served with distinction in the army, and also made important contributions towards the advancement of the art of photography; he published Recherches photographiques (Paris, 1855) and Traité pratique de gravure héliographique sur acier et sur verre (Paris, 1860).

NIEREMBERG, JUAN EUSEBIO (1595–1658), Spanish Jesuit and mystic, was born at Madrid in 1595. In 1614, joined the Society of Jesus, and subsequently became lector in Scripture at the Jesuit seminary in Madrid, where he died on the 7th of April 1658. He was highly esteemed in devout circles as the author of De la afición y amor de Jesús (1630), and De la afición y amor de María (1630), both of which were translated into Arabic, Flemish, French, German, Italian and Latin. These works, together with the Prodigios del amor divino (1641), are now forgotten, but Nieremberg's version (1656) of the Imitation is still a favourite, and his eloquent treatise, De la hermosura de Dios y su amabilidad (1649), is the last classical manifestation of mysticism in Spanish literature. Nieremberg has not the enraptured vision of St Theresa, nor the philosophic significance of Luis de León, and the unvarying sweetness of his style is cloying; but he has exaltation, intuition, insight, and his book forms no unworthy close to a great literary tradition.

NIERSTEIN, a village of Germany, in the grand duchy of Hesse-Darmstadt, on the left bank of the Rhine, 8 m. S. from Mainz by the railway to Worms. Pop. (1905) 4445. It contains a Roman Catholic and a Protestant church, an old Roman bath—Stronabath—between the springs. It is famous for its wines, in which a large export traffic is carried on. Originally a Roman settlement, and was a royal residence under the Carolingian rulers. Later it passed from the emperor to the elector palatine of the Rhine.

NIETZSCHE, FRIEDRICH WILHELM (1844–1900), German philosopher, was the son of the pastor at Rücken, near Leipzig, where he was born on 15th October 1844, He was educated at Schulpolte, and studied the classics at the universities of Bonn and Leipzig. In 1869, while still an undergraduate, he was, on F. W. Ritschel's recommendation, appointed to an extraordinary professorship of classical philology in the university of Basel, and rapidly promoted to an ordinary professorship. Here he almost immediately began a brilliant literary activity, which gradually assumed a more and more philosophical character. In 1876 eye (and brain) trouble caused him to obtain sick leave, and, finally, in 1879, to be pensioned. For the next ten years he lived in various health resorts, in considerable suffering (he declares that the year contained for him 200 days of pure pain), but dashing off, at the pressure, the brilliant essays on which his fame rests. Towards the end of 1888, after recovering from an earlier attack, he was pronounced hopelessly insane, and in this condition he remained until he died on the 25th of August 1900. Nietzsche's writings must be understood in their relation to these circumstances of his life, and as the outcome of a violent revolt against them on the part of an intensely emotional and nervous temperament. His philosophy, consequently, is neither systematic in itself nor expounded in systematic form. It is made up of a number of points of view which successively appeared acceptable to a personality whose self-appreciation varies more and more upon the imagination, and exhibits neither consecutiveness nor consistency. Its natural form is the aphorism, and to this and to its epigrammatic brilliance, vigour, and uncompromising revolt against all conventions in science and conduct it owes its persuasiveness. Revolt against the whole civilized environment in which he was brought up is the keynote of Nietzsche's literary career. His revolt against Christian faith and morals turns him into a profoundly atheist "free-thinker," and preacher of a new “master” morality, which transposes the current valuations, deposes a somewhat venerated Antichrist, and ruthlessely tramples under foot the servile herd of the weak, degenerate and poor in spirit. His revolt against the theory of state supremacy turns him into an anarchist and individualist; his revolt against modern democracy into an aristocrat. His revolt against conventional culture leads him to attack D. F. Strauss as the typical "Philistine of culture"; his revolt against the fashion of pessimism to demand a new and more robust affirmation of life, not merely although, but because, it is painful. Indeed, his very love of life may itself be regarded as an ingenuine revolt against the toils that were inexorably closing in around himself. Indeed, effects are more or less spiritual revolt also against the sources of his own inspiration: he turns his back upon the man, whose intimate friend and enthusiastic admirer he had been, and denounces him as the musician of decadent emotionalism; he rejects his "educator" Schopenhauer's pessimism, and transforms his will to live into a "Will to Power." Nevertheless his reaction does not in this case really carry him beyond the ground of Schopenhauerian philosophy, and his own may perhaps be most truly regarded as the paradoxical development of an inverted Schopenhauerism. Other influences which may be traced in his writings are those of modern naturalism and of a somewhat misinterpreted Darwinism ("strength" is generally interpreted as physical endowment, but it has sometimes to be reluctantly acknowledged that the physically feeble, by their combination and cunning, prove stronger than the "strong"). His writings in their chronological order are as follows: Die Geburt der Tragödie aus dem Geiste der Musik (1872); Umzäumung der Betrachtungen (1873–1876) (Strass—Vom Nutzen und Nutzlosen der Geschichte für das Leben—Schopenhauer als Erlieber—Richard Wagner in Bayreuth); Menschliches, Allzumenschliches (1876-1880); Morgenröte (1881); Die fröhliche Wissenschaft (1882); Also sprach Zarathustra (1883–1884); Duskens von Gott und der Welt (1880); Zur Genealogie der Moral (1883); Der Fall Wagner (1888); Göttersdämmerung (1888); Nietzsche contra Wagner, Der Antichrist, and Poems first appeared in the complete edition of his works, which also contains the notes for Wille

NIEPOORT (Flem. Nieuwpoort), a town of Belgium in
the province of West Flanders. Pop. (1904) 3780. It was
the port of Ypres, and is situated on the Yser about 10 m. S.
of Ostend. It was strongly fortified in the middle ages and its
siege by the French in 1488–1489 is an episode of its heroic period.
Under its walls in 1600 Maurice of Nassau defeated the Archduke
Albert and the Spaniards. It contains an ancient cloth market,
a fine town-hall and an old church, and outside is a lighthouse
dating from 1276. Nièvre was raised to a lordship in 1165, and the
firstdiseased of the town dates only from 1526. It has a fine
pier extending 1500 yds. out to sea and flanking the entrance
to the Yser, which has been canalized. The bathing is excellent,
and in the season the place is largely frequented by visitors.

NIÈVE, a department of central France, formed from
the old province of Nivernais with a small portion of the Orléanais.
It is bounded N.W. by Loiret, N. by Yonne, E. by Côte d'Or,
E. and S.E. by Saône-et-Loire, S. by Allier and W. by Cher.
Pop. (1906) 313,972. Area, 2639 sq. m. Nièvre falls into three
regions differing in elevation and in geological formation. In
the east are the granitic mountains of the Morvan, one of the
most picturesque portions of France, containing Mont Prénélay
(2787 ft.) and several lesser heights. The north and centre are
occupied by plateaux of Jurassic limestone with a maximum elevation
of 1400 ft. The west and south-western part of the
department is a district of plains, composed mainly of tertiary
formations with alluvial deposits, and comprising the valleys
of the Loire and the Allier. The lowest level of the department
is 446 ft., at the exit of the Loire. Nièvre belongs partly to the
basin of the Loire, partly to that of the Seine. The watershed
dividing these two basins follows the general slope of the depart-
ment from S.E. to W.—from Mont Prénélay to the Puisaye,
the district in the extreme north-west. Towards the west the
limits of Nièvre are marked by the Allier-Loire valley—the
Loire striking across the south-west corner of the department
by Decize and Nevers and then continuing the line of its great
affluent the Allier northwards by Fourchambault, La Charité,
Pouilly and Cosne. Secondary feeders of the Loire are the
Nièvre, which gives its name to the department, and the Aron,
whose valley is traversed by the Nivernais Canal. The largest
tributary of the Seine in Nièvre is the Yonne, which rises in
the south. An Engle's by Clamecy, and carried along with it
the northern part of the Nivernais Canal. The Cure, the principal
affluent of the Yonne (which, however, it does not unite
till after it has left the department), is the outlet of a lake, Lac
des Settons, which serves as a reservoir for the regulation of
the river and the canal. Owing to its greater elevation and the
retention of the rain-water on its impermeable surface in the
shape of ponds and streams, Morvan shows a mean temperature
6° F. lower than that of the western district, which, in the valley
of the Loire, is almost identical with that of Paris (52° F.).
At Nevers the annual rainfall amounts to only 21 in., but
in Morvans it is nearly three times as great.

The principal cereals are oats and wheat; potatoes are
also largely grown. Much land is given over to pasture and
the cultivation of various kinds of forage, and the fattening
of cattle is a thriving agricultural industry. The Nivernais
and Cherolais are the chief breeds. The rearing of sheep and
draught-horses is also of importance. Vines are grown in the
valley of the Loire and in the neighbourhood of Clamecy.
The white wines of Pouilly on the Loire are widely known. Nièvre
abounds in forests, the chief trees being the oak, beech, hornbeam,
elm and chestnut. Coal is mined at Decize, and gypsum, building
stone, and kaolin are among the quarry products. The best-
known mineral springs are those of Pouyges and St Honoré.
Of the iron-works for which Nièvre is famous, the most important
are those of Fourchambault. At Imply there are large steel-
works. The government works of La Chaussade at Guérigny
make chains, anchors, armour-plates, &c. There are also
manufactories of agricultural implements and hardware, pottery,
manufactories of porcelain, and faience (at Nevers), tile-works,
chemical works, paper-mills and saw-mills, as well as numerous
tanneries, boot and shoe factories, cloth manufactories and oil
works (colza, poppy and hemp). In the Morvan district a large
part of the population is engaged in the timber industry; the
logs carried down by the streams to Clamecy are then put into
boats and conveyed to Paris.

A great deal of the traffic is by water: the canal along the
left bank of the Loire runs through the department for 38 m.,
and the Nivernais canal extends 48 m. The Paule canal, owned
by the Paris-lyons-Méditerranée Company, whose main line
to Nîmes follows the valley of the Loire and Allier throughout
the department. Nièvre is divided into 4 arrondissements
(Nevers, Château-Chinon, Clamecy and Cosne being its capitals),
25 cantons, 313 communes. It forms the diocese of Nevers,
and part of the educational district of Dijon and of the
region of the VIII. corps d'armée. Its court of appeal is at Bourges.
The most noteworthy towns are Nevers, the capital, Clamecy,
Fourchambault, Cosne, La Charité and Decize. Varzy and
Tannay have fine churches of the 14th, 15th, 16th centuries respectively, and there is an interesting church,
chiefly Romanesque in style, at St Pierre-le-Moûtier.

NIFO, AGOSTINO [Augustinus Niphus] (c. 1473–1538
or 1545). Italian philosopher and commentator, was born at Japoli
in Calabria. He settled for a time at Sezza and subsequently
proceeded to Padua, where he studied philosophy. He lectured
at Padua, Naples, Rome and Pisa, and won so high a reputation
that he was deputed by Leo X. to defend the Catholic doctrine
of Immortality against the attack of Pomponazzi and the
Alexandrians. In return for this he made Count Palatine,
with the right to call himself by the name Medici. In his early
thoughts he followed Averroes, but afterwards modified his
views so far as to make himself acceptable to the orthodox
Catholics. In 1495 he produced an edition of the works of
Averroes; with a commentary compatible with his acquired
orthodoxy. In the great controversy with the Alexandrians
he opposed the theory of Pomponazzi that the rational soul
is inseparably bound up with the material part of the individual,
and hence that the death of the body carries with it the death
of the soul. He insisted that the individual soul, as part of
absolute intellect, is indestructible, and on the death of the
body is merged in the eternal unity.

His principal philosophical works are De immortality animi
(1518 and 1524); De intellectu et daemonibus; De infinitate primiti
motoris quaesito et Opuscula moralia et politica. His numerous
commentaries on Aristotle were widely read and frequently reprinted,
the best-known edition being one printed at Paris in 1654 in fourteen
volumes (including the Opuscula).

NIGDEH (Arab. Nakdkah), the chief town of a sanjak of
the same name in the Konia vilayet of Asia Minor, situated on
the Kaisariye-Cilician Gates road. It is remarkable for the beauty
of its buildings, dating from almost all ages of the Seljuk period.
After the fall of the Cilician state (of which it was one of
the principal cities), Nigdeh became independent, and,
according to Ibn Batuta, ruined, and did not pass into Ottoman
hands till the time of Mahomed II. It represents no classical
town, but, with Bor, has inherited the importance of Tyana,
whose site lies about 10 m. S.W. A Hittite-inscribed monument, brought perhaps from Tyana, has been found at Nigel. The population (20,000) includes a large Greek and a small Armenian community. The Orthodox metropolitan of Iconium resides here.

NIGEL (d. 1169), bishop of Ely, head of the exchequer in the reigns of Henry I. and Henry II., was brought into the exchequer in early life (1130). Soon after his uncle Roger of Salisbury secured him the bishoppate of Ely, much to the disgust of the monks. Nigel was at first retained in Stephen's service; but, like his uncle and his brothers, incurred the suspicion of leaning towards the Angevin interest, when Roger of Salisbury and Alexander of Lincoln were arrested by Stephen (January 1130). Nigel attempted to maintain himself in his see by force of arms, but he was forced to fly to the empress at Gloucester. He was reconciled to Stephen in 1145 and restored to his see; but he now became involved in a quarrel with the powerful Henry of Winchester. Ranulph, his first treasurer and representative at Ely, had been extortionate and dishonest, and the monks accused Nigel, probably with some justification, of spending the estates and treasures of the see in maintaining knights and gaining court influence. Henry of Winchester, who can have had little sympathy with bishops of Nigel's type, took up their quarrel, and Nigel was forced to go to Rome. Fortunately, both in these quarrels and in all his difficulties with Stephen, he secured the strong and uniform support of the Roman Curia. At the accession of Henry II. (1154) he himself was summoned to reorganize the exchequer. He was the only surviving minister of Henry I., and his knowledge of the exchequer business was unrivalled. This was the great work of his life. It is to the work of his son Richard, the Dialogus de Scaccararie, that we are indebted for our knowledge of the procedure of the exchequer as it was left by Nigel. The bishop took little part in politics, except as an administrator. In 1166 his health was broken by a paralytic seizure. Except for another quarrel with his monks, who accused him of despoiling their church and gained the ear of Pope Adrian, the last part of his life was laborious and uneventful.

See Dr Liedermann's Einleitung in den Dialogus de Scaccararie; J. H. Round's Geoffrey of Mandeville.

NIGER, GAIUS PESCENNIIUS, governor of Syria under the emperor Commodus. On the death of Pertinax (A.D. 193), he was saluted emperor by the troops at Antioch, but unaccountably delayed marching on Rome until he learned that Septimius Severus, one of the rival claimants, had assumed the offensive. He then strongly garrisoned Byzantium and the principal towns of Asia Minor, but after his legate Aemilianus had been defeated and slain near Cyzicus he himself was driven from Nicaea and routed near the Cilician Gates. Having failed in an effort to escape towards the Ephrates, he was brought back and put to death in 194.

Aelius Spartianus, Pescennius Niger; Dio Cassius lxiii. 8; lxiii. 13. 14.

NIGER, a great river of West Africa, inferior only to the Congo and Nile among the rivers of the continent, and the only river in Africa which, by means of its tributary the Benue, affords a waterway uninterrupted by rapids, and available for all kinds of draught steamers, to the far interior. Rising within 150 m. of the mouth of a mountainous zone which marks the N.E. frontiers of Sierra Leone and French Guinea, it traverses the interior plateaus in a vast curve, flowing N.E., E. and S.E., until it finally enters the Gulf of Guinea through an immense delta. Its total length is about 2600 m. About 250 m. from its mouth it is joined by the Benue, coming from the east from the mountainous region of Adamawa. From its mouth to the limit of navigability from the sea the river is in British territory; above that point it flows through French territory.

The source of the Niger lies in 9° 5' N. and 10° 47' W., and the most northerly point of the great bend is about 17° N. The area of the Niger basin, excluding the arid regions with a slope towards the stream, has been calculated by Dr. A. Bludau at 584,000 sq. m. The river is known locally under various names, the most common being Joliba (a Mandingo word meaning Great River) and Kworra or Quorra. By the last name the Niger was known in its lower reaches before its identity with the upper river was established. The stream considered the chief source of the Niger is called the Tembi. A narrow watershed separates it from the headwaters of the streams flowing south-west through Sierra Leone. The birthplace of the Niger is in a deep ravine 2800 ft. above sea-level. From a moss-covered rock a tiny spring issues and has made a pool below. This little stream is the Tembi, which within a short distance is joined by two other rivulets, the Taminconco and Falico, which have their origin in the same mountainous district. After flowing north for about 100 m., the river turns eastward and receives several tributaries from the south. At its confluence with the Tankisso (a northern tributary), 210 m. from its source, the river has attained dimensions sufficient to earn for itself the title Joliba. Taking at this point a decided trend northward, the Niger, 100 m. lower down, at Bamako—the first considerable town on its banks—has a depth of 6 ft. with a breadth of 1300 ft. Seven or eight miles below Bamako the Satuba rocks mark the end of what may be considered the upper river. From this point the navigable portion of the Niger begins. Thirty miles below Satuba are the rapids of Tulimandio, but these are navigable when the river is at its highest, namely from July to October. A little lower down is Kullkoro, from which point the bed of the stream for over 1000 m. is fairly free from impediments, and the river is navigable to the point where it turns to the left on the main stream, with which they are connected by channels conveying the water in one direction or the other according to the season. At high water most of these are united into one general inundation. The largest lake, Faguibini, is nearly 70 m. long by 12 m. broad, has high shores and reaches a depth exceeding, in parts, 160 ft. It is not until Kabara, the port of Timbuktu, is reached, a distance of 450 m. from Sansandig, that the labyrinth of lakes, creeks and backwaters ceases. Below Kabara the river reaches its most northerly point. At Bamba it is shut in by steep banks and narrows to 600 to 700 yds., again spreading out some distance down. At Barka (200 m. from Timbuktu) the stream turns south-east and preserves that direction throughout the remainder of its course. At Tossaye, just before the bend becomes pronounced, the Baror and Chabar rocks reduce the width of the river to less than 500 ft., and at low water the strength of the current is a serious danger to navigation. Below Timbuktu for a considerable distance the Niger receives no tributaries; from the north none until the region of the Sahara is passed. In places the desert approaches close to the river on both banks and immense sand deserts extend far into the interior.

At Ansongo, 430 m. below Timbuktu, the navigable reach of the middle Niger, in all 1057 m., ends. Four huge flint rocks bar the river at Ansongo and effectually prevent further navigation except in very small vessels. From Ansongo to Say, some 250 m., the river flows through several rocky passes, the current attaining great velocity. Throughout this distance the river is a hopeless labyrinth of rocks, islands, reefs and rapids. From Say, where the stream is about 700 yds. in breadth, to Bussa, there is another navigable stretch of water extending 300 m. After the desert region is past the Niger receives the waters of the river Sokoto, a considerable stream flowing from the north-east. Some distance below this confluence are the Bussa rapids, which can only be navigated with considerable difficulty. These
rapids—though not such a hindrance to navigation—are of a more dangerous character than any encountered between Ansongo and Say. In one pass, some 34 yds. wide, shut in between two large reefs, a good half of the waters of the Niger flings itself over with a tremendous roar” (Hourst). The rapids extend for 50 m. or more; in a less obstructive form they continue to Rabbaba, but light-draught steamers ascending the stream during flood season experience little difficulty in reaching Bussu. A little above Rabbaba the river makes a loop south-west, at the head of the loop being (right bank) Jebba. Here the river is bridged by the railway from Lagos. Sixty miles lower down is the mouth of the (left hand) tributary the Kaduna, a river of about 500 m., which gives access to Zungeru, the headquarters of the British administration in Northern Nigeria. The head waters of the Kaduna are not far from Kano. Below the mouth of the Kaduna, on the right bank of the Niger, is Baro, the starting-point of a railway to Kano. In 7° 40' N. 6° 45' E., the Niger is joined by its great tributary the Benue. At their confluence the Niger is about three-quarters of a mile broad and the Benue rather more than a mile. The united stream forms a lake-like expansion about 2 m. in width, dotted with islands and sandbanks; the peninsula at the junction is low, swampy, and intersected by numerous channels. On the whole, the Niger is an easily navigable river, on which large and light-draught vessels (g.o.), an important commercial centre. The stream, as far south as Idah (Ida), a town on the east bank, rushes through a valley cut between the hills, the sandstone cliffs at some places rising 150 ft. high. Between Idah and Onitsha, 80 m., the banks are lower and the country flatter, and to the south of Onitsha the whole land is laid under water during the annual floods. Here may be said to begin the great delta of the Niger, which, extending along the coast for about 120 m., and 140 or 150 m. inland, forms one of the most remarkable of all the swampy regions of Africa. The river breaks up into an intricate network of channels, dividing and subdividing, and intercrossing not only with each other but with the branches of other streams, so that it is exceedingly difficult to say where the Niger delta ends and another river system begins. The Rio Nun is a direct continuation of the line of the undivided river, and is thus the main mouth of the Niger.

From the sea the only indication of a river mouth is a break in the dark green mangroves which here universally fringe the coast. The crossing of the bar requires considerable care, and the ebbs and tides the outward current of 35 knots per hour. For the first 20 m. (or as far as Sunday Island), the limit of the sea tide in the dry season) dense lines of mangroves 40, 50, or 60 ft. in height shut in the channel; then palm and other trees begin to appear, and the widening river has regular banks. East of the Nun the estuaries known as the Brasse, Sombrero, New Calabar, Bonny, Opobo or (Iro), &c. (with the exception, perhaps, of the first-named), seem to derive most of their water from independent streams such as the Orashi, rising in about 0° N., which is, however, linked with the Niger by the Onita Creek in 5° N. Behind the town of Okrika, some 30 m. up the Bonny river, the swampy ground gives place to firm land, partially forest-clad. West of the Nun all the estuaries up to the Forcados seem to be true mouths of the great river, while the Benin river, though linked to the others by transverse channels, may be more properly regarded as an independent stream. (See BENN.) In this direction the largest mouth is the Forcados, a noble stream with a safe and relatively deep bar. Its banks in its lower course are densely wooded, but the beach is sandy and almost free from marsh and malaria. The mouth is 2 m. wide. It has supplied the Nun river as the chief channel of the Niger system till about 12 m. above the point where the river flows for 1000 ft. It has a more or less uniform character throughout, but there are as the Nun mouth. Moreover, the Forcados bar shifts little laterally, and within the bar is a natural harbour with an area of 3 to 4 sq. m. having a depth of 30 ft. at low water spring tides. From the mouth of the Forcados to the main stream is 105 m., with a minimum depth in the dry season of 7 ft. A northern arm affords ocean-going vessels access to Wari and Sapele. The other western mouths of the Niger have as a rule shallow and difficult bars. The delta is the largest in Africa and contains about 14,000 sq. m.

The Benue is far the most important of the affluents of the Niger. The name signifies in the Batta tongue ‘Mother of Waters.’ The river rises in Adamawa in about 7° 40' N. and 13° 15' E., the Benue. It is joined by the stream of the Buri-Buri, which ascends nearly to 3000 ft. above the sea, being separated by a narrow water parting from one of the headstreams of the Logone, whose waters flow to Lake Chad. In its upper course the Benue is a mountain torrent, over 2000 ft. above sea level, and flows over it is connected by the Kebbi or Mayo Kebbi, a right-hand tributary whose confluence is in about 9° 8' N., 13° 4' E. The Kebbi, fed by many torrents rising in the eastern versant of the Mandara Hills, issues from the densely forested end of the hills, and, flowing north-east, occupies an extensive depression in the moderately elevated plateau east of the Mandara Hills, and are cut by 10° N., 15° E. The central part of the marshes forms a deep lake, whence there is a channel going northward to the Logone and navigable for some months during the year. The Kebbi flows west, and soon after leaving Tuburi passes through a rocky barrier marked by a series of rapids and a fall of 165 ft. Below these observations it is almost useless for navigation with the Benue has a depth of not less than 6 ft. In places, at Lere and Bifara, it widens into lake-like dimensions. Below the Kebbi the confluence of the Benue, now a considerable river, turns north-west, but during the dry season is only interrupted by a confluence of lakes and springs, and the next year round by boats drawing not more than 23 ft. For some 40 m. below the confluence the river has an average width of 180 to 200 yds., and flows with a strong steady current, although a broad strip of wateredy only on one side. At Calabar, where the river is joined by the Jarobi, which, rising in the Adamawa Mountains S.E. of Ngaundere, flows almost due north. About 50 m. below the junction of the Faro will, the course of the river changes southward, and the current of the Benue forms the lower course of the river from the sea and at an altitude of 600 ft. Here the width of the stream increases at flood time to 1000 or 1500 yds., and though it narrows at the some river changes rapidly, the Brown’s Bank, the Cameroons, is never more than 13 ft. below normal, where it widens into a large Several other tributaries both from the north and the south, but they are not of great importance. It flows downwards to the Niger with comparatively unconstricted current, its valley, wider for the most part, is marked by chains, but the middle of the salt-water lagoon, the remnant of an arm of the sea which in the tertiary age covered the northern Sudan and southern Sahara as far east as Blima. Lake Fagubini is regarded as a remnant of the
ancient course of the upper river. When the upper Niger had this
direction, the Wadi Taifassasent, now a dried-up river of the central
Sahara, which rose in the Ahbaran mountains, is believed to have
formed the upper course of the existing lower Niger. While the
upper and lower parts of the Niger have all the appearance of ancient
streams, the middle Niger is the product of a "it has not past, it scarcely has a present" (see R. Chudeau, Sahara
soudanais, Paris, 1900).

Vague ideas of the existence of the river were possessed by the
ancients. The great river flowing eastward reached by the
Nasamomians as reported by Herodotus can be no
other than the Niger. Pliny mentions a river Nigiris,
of the same nature with the Nile, separating Africa
and Libya, and founded for the Nile in its northward
progress, and it is improbable that this is the modern Niger. In
Ptolemy, too, appears along with Girs (possibly the Shari) a
certain Niger (Nirap) as one of the largest rivers of the interior;
but so vague is his description that it is impossible definitely
to identify it with the Niger. Arabian geographers, such as
Ibn Batuta, who were acquainted with the middle course of
the river, called it the Nile of the Negroes. At the same time
contradictory opinions were held as to the course of the stream.
It was supposed by some geographers to run west, an opinion
probably first stated by Idrisi, which was followed by the
geoographers of the 11th century, Western Europe,
given by the geographers of Egypt and the Niger of the Negroes a
common source in the Mountain of the Moon. Fountains from the
mountain formed two lakes, whence issued streams which
united in a very large lake. From this lake two streams issued
to the east, between 15° and 20° E. (see Rennell's map in
Horne-mann's Travels, 1802). To Rennell the Benue was an east-
flowing continuation of the Niger. The imagined existence
of mountains—called Keng in the west and Komri (Lunar) in the
east—stretching in a high and unbroken chain across Africa
and inhabited by the negroes gave rise to the expectations of
possible southern bend to the Niger.

That the vast network of rivers on the Guinea coast, of which
the Nun was the chief, known as the Oil Rivers, formed the delta
of the Niger does not appear to have been suspected before the
beginning of the 19th century. Consequentially it was from the
direction of its source that the river was first explored in modern
times. In 1795 Mungo Park (57.) was sent out by the African
Association, and was the first European to see and describe the
upper river. Park landed at the Gambia, and struck the Niger
near Bagu (a town some distance above Sannasand) on the
20th of July 1796, where he beheld it " glittering in the morning
sun as broad as the Thames at Westminster and flowing slowly
to the eastward " (Travels, 1st ed. p. 194). He descended the
river some distance, and on his return journey went up stream
as far as Bamako. In 1805 Park returned to Africa for the
purpose of descending the Niger to its mouth. He started as
before from the Gambia, reached the Niger, sailed down the
river past Timbuktu, and on the eve of the successful accomplish-
ment of his undertaking lost his life during an attack on his boat
by the natives at Bussa (Nov. or Dec. 1805). Park held to the
Nile as the connexion of the two Niles, in 1800 he had
C. G. Reichard, a German geographer, had suggested that the
Rio Nun was the mouth of the Niger. Owing to Park's death
the results of his second journey were lost, and the work had to
be begun afresh. In 1822 Major A. G. Laing (who had reached
Timbuktu by way of Tripoli) obtained some accurate information
concerning the sources of the river, and in 1828 the French
explorer René Caillié went by boat from Jenné to the port of
Timbuktu. In 1826 Bussa was reached from Benin by Hugh
Clapperton, and his servant Richard Lander. On Clapperton's
return to Leiden, and his brother John led in 1830 an
expedition which went overland from Badagy to the Niger.
Canoing down the river from Yawari—60 m. above Uma—
to the mouth of the Rio Nun they finally settled the doubt as to
the lower course of the stream. In 1832 Macgregor Laird established
the African Steamship Company, and Richard Lander and
R. A. K. Oldfield (as members of its first expedition) ascended
the Niger to Rabba, and the Benue as far as Dagbo (80 m.).
In 1841 an expedition, consisting of three steamers of the British
navy, under Captain (afterwards Admiral) H. D. Trotter,
went up to Ega (Egam), but was forced to return owing to sickness
and conduct.

Heinrich Barth (1851–1854) made known to Europe
the course of the river from Timbuktu to Say. Barth sailed down
from Sarajaya (situated on a tributary stream south-west of
Timbuktu) to Kabara; then skirted the left bank to a small
town called Bornu in 10° N., and the right thence to Say. In
1850–1851 the German E. R. Flegel ascended the Niger
to Gomba opposite the confluence of the Sokoto river with the
main stream, and about 70 m. below Barth's southmost point.
Zweifel and Moustier, sent out by M. Vermineck, a Marseilles
sailor and navigator (1853), reached the southern part of the Niger
in 1885 the Tembi source was visited by Captain Brouet, a French
officer. Indeed the additions to the knowledge of the Niger
during the last two decades of the 19th century were largely
the work of French officers engaged in the extension of French
influence throughout the western Sudan. From 1880 onwards
Colonel (afterward General) Gallieni took a leading part in the
operations on the upper river, where in 1883 a small gunboat, the
Niger, was launched for the protection of the newly established
French posts. In 1885 a voyage was made by Captain Delanneau
in 1816 James McQueen correctly divined that there was a
great west-flowing tributary (the Benue) to the Niger, and that after
its confluence the river ran south to the Atlantic. See his View of
Northern Central Africa (1801) and Geographical Survey of Africa
(1803).
past the ruins of Sansandig, as far as Diafarabe. In 1887 the gunboat made a more extended voyage, reaching the port of Timbuktu, and correcting the mapping of the river down to that point. In 1894-1895 attention was directed to the middle and lower Niger, to which several expeditions started from the coast of Guinea. A still more important expedition, under Lieutenant Hurst, the Kehbi from Timbuktu in January 1896, navigated the Niger from that point to its mouth, executing a careful survey of the river and the various obstructions to navigation. A voyage made in 1897 by Lieutenant de Chevigné showed that at low water the section between Timbuktu and Ansongo presents great difficulties, but the voyage from Timbuktu to Say was again successfully accomplished in 1899 by Captain Grandeyre. In 1901 Captain E. Lenfant ascended the river with a flotilla from its mouth to Say, and he demonstrated the normal practicability of the route, despite the Bussa rapids. This delta of the Niger has been partially surveyed since it became British territory by various ship captains, officials of the Royal Niger Company and others, including Sir Harry Johnston, sometime British consul for the Oil Rivers.

In addition to the main stream, the Niger basin was made known by exploration during the last quarter of the 19th century and the early years of the 20th. The journeys of the German traveller G. A. Krause (north from the Gold Coast, 1886-1887) and the French Captain Binger (Senegal to Ivory Coast, 1887-1889) first defined its southern limits by revealing the unexpected northward extension of the basins of the Guineo-coast streams, especially the Volta and Komoe, a fact which explained the absence of important tributaries within the Niger bend. This was crossed for the first time, in its fullest extent, by Colonels P. L. Monteil (French) in 1890-1891. At the eastern end of the basin much light has been thrown on the system of the Benue. In 1851 Barth crossed the Benue at its junction with the Faro, but the region of its sources was first explored by Flegel (1882-1884), who traversed the whole southern basin of the river and reached Goundane. Other German travellers added to the knowledge of the southern tributaries, the Tschoppa, Donga, and others, which drain the rains bring down a large body of water from the highlands of southern Adamawa. British travellers who have done work in the same region are Sir W. Wallace, L. H. Moseley, W. P. Hewby, P. A. Talbot and Captain Claud Alexander. The last-named two were members of an expedition led by Lieut. Boyd-Alexander, who himself crossed Africa from the Niger to the Nile. Messrs Talbot and Claud Alexander surveyed the country between Ibi on the Benue and Lake Chad, mapping (1904) a considerable part of the Gongola.1 In 1854 the Benue itself was ascended 400 m. by the "Pléiad" expedition, and in 1878-1879 an English river vessel ascended the Benue (afterwards "Sir Claude") Macdonald, further progress towards the Tuburi marsh being prevented by the shallowness of the water. The upper basin of the Benue was also traversed by the French expeditions of Mizon (1892) and Maistre (1892-1893), the latter passing to the south of the Tuburi marsh without definitely settling the hydrographical question connected with it. This was accomplished by Captain Lenfant in 1905. He ascended the Kehbi and discovered the Lafa fall, continuing up the river to its point of issue from Tuburi. Crossing the marshes he found and navigated the river leading to the Lafa fall, the Kehbi, and the Kebbi to Ibara by Majiast (afterwards Sir Claude) Macdonald, further progress towards the Tuburi marsh being prevented by the shallowness of the water. The upper basin of the Benue was also traversed by the French expeditions of Mizon (1892) and Maistre (1892-1893), the latter passing to the south of the Tuburi marsh without definitely setting the hydrographical question connected with it. This was accomplished by Captain Lenfant in 1905. He ascended the Kehbi and discovered the Lafa fall, continuing up the river to its point of issue from Tuburi. Crossing the marshes he found and navigated the river leading to the Lafa fall, the Kehbi, and the Kebbi to Ibara by Majiast (afterwards Sir Claude) Macdonald, further progress towards the Tuburi marsh being prevented by the shallowness of the water.

The delta of the Niger has been partially surveyed since it became British territory by various ship captains, officials of the Royal Niger Company and others, including Sir Harry Johnston, sometime British consul for the Oil Rivers.

The Nile, a British protectorate in West Africa occupying the lower basin of the Niger and the country between that river and Lake Chad, including the Fula empire (i.e. the Hausa States) and the greater part of Bornu. It embraces most of the territory in the square formed by the meridians of 5° and 14° E. and the parallels of 14° and 14° N., and has an area of about 338,000 sq. mi. The protectorate is bounded W., N. and E. by French possessions (Dahomey, Upper Senegal and Niger colony, and Chad territory), S.E. by the German colony of Cameroon and S. by the Atlantic.

Physical Features.—The country is divisible, broadly, into three zones running parallel with the coast: (1) the delta, (2) forest region, giving place to (3) the plateau region. The coast line, some 500 m. in length, extends along the Gulf of Guinea from 2° 46' 55" E. to 8° 45' E. ending at the Rio del Rey, the point where the great bend eastwards of the continent ceases and the large inland basins of the confluence of the Congo and Ubangi rivers begins. This delta is divided into three parts at its N.W. corner and flows thence S.E. to the Atlantic, receives, 250 m. from the sea, the Benue, which, rising in the mountains of Adamawa south of Lake Chad, flows west across the plateau. Into the huge delta of the Niger several other rivers (the "Oil Rivers") empty themselves; the chief being, on the west, the Benin (q.v.), and on the east the Brass. East of the Niger delta is that formed by the Imo or Opobo, Bonny and other streams, and still farther east is the Calabar estuary, mainly formed by the Cross river (q.v.). West of the Niger delta are several inland streams forming a large inland drainage system which here line the coast. The most westerly of these streams, the Ogun, enters the Lagos lagoon, which is connected by navigable waterways with the Niger (see Lagos).

The delta region is swampy, and forms, for a distance of from 40 to 70 m. inland, a network of interlacing creeks and broad sluggish channels fringed with monotonous mangrove forests. The main rivers are navigable for ocean-going steamers for a distance of from 15 to 40 m. from their mouths. Beyond the delta firm ground takes the place of mud and the mangroves disappear. The land rises gradually at first, becoming, however, in places very steep. The rivers on the eastern side are much obstructed by rapids.

The Niger at its confluence with the Benue is not more than 250 ft. above the sea. North of this point are hills forming the walls of the plateau which extends over the centre of the

1 Captain Claud Alexander died of fever in northern Nigeria on the 30th of November 1904. His brother, Lieut. Boyd Alexander, in a subsequent expedition across Africa was murdered in Wadai on the 2nd of April 1910.
protectorate and is part of the great plateau of North Africa. This plateau, broken only by the valleys of the rivers, does not attain an elevation approaching that of the plateau of the southern half of the continent, the culminating point (apart from particular mountain districts), situated in about 10° N., reaching a height of 3000 ft. only. The valleys of the Niger and Benue, especially the latter, are very much lower, the town of Yola on the Benue, some 400 m. inland, lying at an altitude of little over 600 ft. The surface is generally undulating, with isolated "table mountains" of granite and sandstone often rising abruptly from the plain. It is clothed largely with thin forest, but becomes more open to the north until, near the French frontier, the arid steppes bordering the Sahara are reached. Much of the country north of Zaria (11° N.) is covered with heavy loose sand. The most mountainous districts are northern Bauchi (a little north of 10°), where heights of 6000 to 7000 ft. occur; parts of Muri, along the north bank of the Benue; and the southern border of the Benue basin, where the hills (consisting of ironstone, quartz and granite) appear rich in minerals. The mountainous area covers some 50,000 sq. m. On the east, the plateau sinks to the plains of Bornu (q.v.), which extend to Lake Chad. Tributaries of the Niger traverse the western portion of the country, the most noteworthy being the Gulbin Kebbi or Sokoto river and the Kaduna, which flows through a valley not more than 500 ft. above the sea. The north-eastern part of the country drains to Lake Chad by the Waube or Yo, an intermittent stream, which in its lower course forms the Anglo-French boundary. The western portion of Lake Chad (q.v.) belongs to the protectorate, which contains no other large lake. The water parting between the Chad and Niger systems runs N.W. and S.E. from about Katsina in 13° N. to the Bauchi hills. Of the tributaries of the Benue the most important is the Gongola. During the dry season most of the small rivers cease running and the water in the larger streams is low. The great rise of the Niger within the protectorate takes place in August and September and there is a second rise about the beginning of the year.

Geology.—The fundamental formation consists of crystalline rocks. From the edge of the coast belt to near the confluence of the Benue and Niger they are overlain by unfossiliferous sandstones, lying undisturbed and possibly of the age of the sandstones of the Congo basin. Limestones, with fossils indicating a Tertiary age, have been found near Sokoto. Superficial deposits occur on the coast belt. Recent alluvium and a thick deposit of black earth border the upper reaches of the Benue and cover wide areas around Lake Chad.

Climate.—The country lies wholly within the tropics. The climate of the coast-lands is moist and hot, and extremely unhealthy, malarial fever being prevalent and deadly. The annual rainfall in the delta regions varies between 100 and 140 or more inches; the mean temperature is over 80° F. The heat does not vary greatly, rarely
sinking below 70°, and not often exceeding 100° in the shade. The direction of the prevailing wind is S.W. Though unfavourable for the permanent residence of white men, the interior is much less deadly than the coast-lands. The northern part is a land of tornadoes. At the beginning of the rainy season, the desert winds often drive clouds of red dust. At this period the nights are cold, and in the northern January and February are cold even in the day-time, while frosts are experienced in the neighbourhood of Lake Chad. The temperature in the southern parts, though subject to the same changes as along the coast, but the range is far greater, varying from a shade minimum of 99° to a shade maximum of 107°. The rainfall is much scantier on the shores of Lake Chad, averaging only 9 inches a year. In Nigeria about 50 in. a year. There is evidence of the increasing desiccation of the whole country north of the forest belt. This desiccation is partly attributable to the unrestricted felling of wood practised for many years. Along the northern border of the protectorate this has resulted in the encroachment of the Saharan desert over once fertile districts.

The natives of the northern regions do not suffer to any extent from fever unless they move to a part of the country some distance from their home. Leprosy is common, especially in the inland towns; while ophthalmitis is prevalent in the north, especially among the poor and negroes. At times the natives expose themselves to the blinding dust from the deserts and the excessive glare of the sun reflected from the burning sand.

Fauna and Flora.—The animals of Nigeria include the hyæna, antelope of the West-African species, masai, all living in the forest, gazelle and smaller game. Monkeys are numerous in the forests, and snakes are common. The camel is found in the northern parts of the country. The common animals of the savannah are the hippopotamus and crocodile. The manatus is also found. The birds include the ostrich, marabout, vultures, kites, hawks, ground horn-bill, great bustard, guinea fowl, partridge, lesser bustard, quail, snipe, duck, widgeon, teal, geese of various kinds, partridges, doves, blue, bronze and green pigeons, and many others. Domestic animals include the horse and donkey in the plateaux, but baggage animals are rare in the coast-lands, where the tecta fly is found. Mosquitoes are also abundant throughout the country. Herds of cattle and flocks of sheep and goats are numerous throughout the country.

The mangrove is the characteristic tree of the swamps. North of the swamps the oil palm (Elaeist guineensis) florishes abundantly. It is common as far as about 7° N. Rubber vines, mahogany, ebony and many valuable timber trees are found in the forest zone. Other trees, found chiefly on the plateaux, are the baobab, the shea-butter tree, clove, jatropha, palm, including the date and dum palm (Hyphaene), the tamarind, and, in the arid regions, the acacia and mimosa.

Inhabitants.—The population of Nigeria is estimated at 15,000,000. The Europeans (mostly British) number about a thousand, and are civil servants, soldiers, traders or missionaries. In the delta district and the forest zone the inhabitants are typical negroes. Besides the people of Benin, the coast tribes include the Jekri, living on the lower part of the Benin river and akin to the Yoruba, the Ijos, living in the delta east of the main mouth of the Niger, and the Iboos, occupying a wide tract of country just above the delta and extending for 100 m. east from the Niger to the Cross river. South of the Iboos live the Aros, a tribe of relatively great intelligence, who dominated many of the surrounding tribes and possessed an oracle or ju-ju of reputed great power. On the middle Cross river live the Akuna-kunas, an agricultural race, and in the Calabar region are the Efiks, Ibibios and Kwas. All these tribes are fetish worshippers, though Christian and Moslem missionaries have made numerous converts. The Efiks, a coast tribe which has come much into contact with white men, have adopted several European customs, and educated Efiks are employed in government service. The great secret society called Egbo (q.v.) is an Efik institution. Each tribe has a different ju-ju, and each speaks a separate language or dialect, the most widely diffused tongues being the Ibo and Efik, which have been reduced to writing. In general little clothing is worn, but none of the tribes go absolutely nude. In colour the majority are dark chocolate, others are coal-black (a tint much admired by the natives themselves) or dark yellow-brown. Cannibalism, human sacrifices and other revolting practices common to the tribes, are being gradually stamped out under British control.

Trial by ordeal and domestic slavery are still among the recognized institutions.

In the northern parts of Nigeria the inhabitants are of more mixed blood, the negro substratum having been to a great extent driven out by the northern races of the continent. The most important race in Northern Nigeria is that of the Hausa (q.v.), among whom the superior classes adopted Mahommedanism in the 14th and 15th centuries. While the lower classes remained pagan, a fairly civilized system of administration, with an efficient judicial and fiscal organization, was established in the Hausa territories. The Hausa are keen traders and make excellent soldiers.

At the beginning of the 19th century the Hausa territories were conquered by another dominant Mahomedan race, the Fulas (q.v.), who founded the province of Bauchi as many as sixty native languages are spoken.

In Bornu (q.v.) the population consists of (1) Berberi or Kanuri, the ruling race, containing a mixture of Berber and negro blood, with many less indigenous tribes; (2) so-called Arabs, and (3) Fula. The country to the back of Lagos is largely inhabited by Yorubas (q.v.), and the people of Borgu according to some native traditions claim to have had a Coptic origin.

Towns.—A large proportion of the population dwells in towns. The towns are capitals of the district, with a population of about 50,000; Calabar (q.v.), pop. about 15,000, known as Old Calabar and Duke Town, on the Calabar river; Opobo, on the Opobo river; and Brass Town, in the vicinity of the same river; Brass Town contains a fine church, the gift of a native chief. The places are east of the Nun or main mouth of the Niger, where, on the western bank, is Akassa. Here are important engineering works and a slip for repairing ships. Further west at the Forcados mouth of the Niger is a town of the same name, which is the principal port for entry of the river. Benin (q.v.), about 60 m. inland from the mouth of the Benin river, and Benin, about 50 m. N.W. of Calabar, were noted ju-ju towns and have large populations. Warri and Sapele are towns in the Benin district. Owo, some 50 m. N. of Benin city, is an important trade centre for the Yoruba country, in which are the large cities of Aseokuta, Ibadan and Ilorin, all separately noticed. On the Niger at the head of the delta are Asaba (west bank) and Onitsha (east bank); Iddah (Ida), in the palm-oil zone; Lokoja on the west bank opposite the confluence with the Benue, and the headquarters of the protectorate's military force; Baro, on the east bank, 70 m. above Lokoja, the river terminus of the Northern Nigeria railway; Egba, Mureji (at the Kaduna confluence), Jebba and Bussa (q.v.). The administrative headquarters of Northern Nigeria are at Zungeru, on the Kaduna river, in 6° N. 40° E., 9° 48' 32" N.

Apart from the sea and river ports and the towns in Yorubaland, there are two chief centres of trade in the interior of the Niger. They are the capitals of various states founded by the Hausa. Of these cities the most important is Kano (q.v.), the great emporium of trade for the central Sudan, where Taurag and Arab from the south and the Niger merchant meet from the Niger. Lake Chad and the far southern regions. It is situated in 12° N. and 8° 32' E. Some 220 m. W.N.W. of Kano is Sokoto, on a tributary of the Niger of the same name. On a hill near the religious and political centre of the Fulas, some importance among the Hausa towns are Bauchi (or Yakoba), pop. over 50,000, 140 m. S.E. of Kano; Zaria (q.v.), pop.
NIGERIA

about 60,000, 82 m. S.S.W. of Kano; Katsena (g.g.), 84 m. N.W. of Kano; Hadeija, near the N. end of the Kano-N. track, 25 m. N.W. of Egga on the Niger; and Yola (g.g.) on the Benue near the German frontier. Jegga, 85 m. S.W. of Sokoto, is an important entrepôt for trade from the hinterland of the country. In the various parts of the country, the most important rivers are the Benue and the Niger. The chief towns on the Benue are Kuka (g.g.) on Lake Chad, and Maidugari, some 70 m. S.W. of that lake. Most of these towns are capitals of provinces and residences of native princes subordinate to the British administration. There is no more picturesque sight than the Benue steamer passing by the town.

In addition to the towns mentioned there are many others containing populations of from 10,000 to 20,000, the bulk of the inhabitants of the Hausa countries being town dwellers.

Steamers and small launches on the Benue and the Niger are the chief means of communication, but, in consequence of the lowness of the water between October and May, navigation is then only possible for shallow draught stern-wheel steamers and launches. From the Forcados mouth of the Niger steamers ascend the main stream as far as Jebba, a distance of 530 m. and, at some risk, to Fort Goldie, 30 m. farther up at the foot of the Busa rapids. Steamers can also ascend the Benue to Barijuko, 380 m., above the confluenče of that river, and the Niger at Lokokja. It is also possible by this route to proceed by small boat via the Shari system to Lake Chad. The Kaduna from its confluence with the Niger can be ascended by steamer 50 m. to Baro, 30 m. to Zaria, 60, 000, and 120 m. to Baroqoto. Steamers can also be worked up the Benue and the Niger so as to reach Lokoja, 20,000, on the river by river steamers. The Niger is navigable up to Baro- Jega and Zaria to Kano—a distance of about 400 m.

Good roads connect some of the great Hausa cities, and Kano and Kuka are starting points for caravans across the Sahara to the Mediterranean. There are also old established caravan routes from Kano to Ashanti and neighbouring countries.

Regular communication is maintained with Europe by steamers running between Liverpool and Forcados, Bonny and Calabar, the steamers calling at other West African ports en route. The time occupied between Liverpool and Forcados is about seventeen days.

Other steamers ply between the ports named (and others in the protectorate) by telegraph. A good line of communication between Brass and Bonny and Europe by submarine cable, and land lines from Calabar to Lagos and from Lagos to Koko, Lokoja, and Kano are being also effected with the telegraph system of French West Africa.

Agriculture.—The natives of the coast region cultivate yams and other food plants, but in that district agriculture properly scarcely exists, the fruit of the oil-palm being an easy means of obtaining almost everything that the natives require. In the plains of the north, inhabited by Hausa and by agricultural pegan tribes, and in the fertile river valleys, agriculture is regularly carried on. Rice and wheat are cultivated in many parts, though the staple food is guineagum. Sweet potatoes, ground nuts, yams, onions and other vegetables are largely grown. Of fruits, dates, pomegranates, citrons and bananas abound in certain areas. The shea-butter tree supplies an excellent oil for lamps, and also for cooking, though it is only used by the poorer classes. The most important vegetable products are cotton and indigo, which are universally grown. Tobacco and kola nuts are also cultivated in many districts.

Mineral Products.—Tim ore of excellent quality is found in the province of Bauchi, alkali salts are abundant in Kano province; iron pyrites and yellow ocheres are found in Kontogara and other provinces, kaolin is found in the south-central regions. Silver and lead have been found in the Benue area.

Trade.—Throughout Nigeria local trade is active and has shown rapid development. The growth of the trade has been fostered by the improvement of communications which is taking place. Export trade in the delta and forest regions is almost entirely confined to the jungle produce, the most important articles being palm kernels and palm oil. The introduction of rice and gum copal, come next in importance. Cotton is also grown for export. The quantity of palm oil exported annually exceeds 12, 000 tons, valued at £60,000; cotton about 60,000, valued at £60,000. Of palm kernels 50,000 to 70,000 tons are shipped yearly, with an average value of £1,000,000. The value of the rice export is £100,000. The gold trade (import and exports) of Southern Nigeria (exclusive of Lagos) increased from £1,656,000 in 1894-1895 to £3,454,000 in 1905. In 1906 the total trade, inclusive of Lagos, was valued at £6,299,000—imports £2,985,000 and exports £3,314,000.

In Northern Nigeria up to the moment of the British occupation, the foreign trade was chiefly in the hands of Tripoli Arabs whose chief article of export is turmeric, and who sold this raw drug to the markets of Kuka and Kano tea, sugar and other European goods, taking away the skins and feathers which constituted the principal articles of export to the Mediterranean coast. There was one important trade in the south—indigo, whose value in 1898 was £4,000, and a large trade in the great indusius Hausa population carried for great distances through the western and central states of the Sudan. The principal articles of this trade are salt, kola nuts, ivory, leather, sodium carbonates and spices. The centre of the cloth manufacture is Kano. The cloth is made of the cotton grown in the country, woven on small hand-looms and dyed either with indigo or with a magenta dye obtained from the bark of a tree. If the Hausa history, which exists in written form, be correct, the manufacture of this cloth has been carried on in Kano since the 9th century. Kano and the district around it clothes half the population of the Sudan. The kola nut, chewed by the natives, is exchanged for medicinal drugs, and the Cotonou, Niger traders from Ashanti, Accra and Yorubaland frequenting the markets of Jegga. Salt and "potation" are imported from Absen and Kano, and ivory, ostrich feathers and leather goods are exported to Tripoli in exchange for the cotton and rice on which the white world is almost entirely dependent. The commerce of Kano comes hither from the forest regions, and are of the same class as the forest products of the south. Rubber constitutes at present the most important export. The cultivation of cotton is however indigenous to the country. Inquiries made under the auspices of the British Cotton Growing Association have led to the conclusion that Northern Nigeria offers the most promising field contained within the empire for the growth of cotton required to render Lancashire looms independent of foreign supplies. Steps have been taken to stimulate the native industry, and it is hoped that cotton may take the place in Northern Nigeria which palm oil and kernels occupy in the coast zone. Any great expansion in the cotton trade is however dependent on the development of cheap and efficient means of transport—hence the importance, commercially, of the Baro-Kano railway, with its base on the navigable Niger. With the increase of transport facilities it is probable that the trade with the Mediterranean coasts will also be diverted to the south, and profitable minor branches of trade would be formed in leather, ostrich feathers, gums, fibres, &c. The importia from Great Britain, which come via Forcados, are mostly cotton goods, provisions and hardware. The importation of spirits is prohibited north of 7° N.

History.

Of the early history of the races inhabiting the coast lands little is known. The Beni appear to have been the most powerful race at the time of the discovery of the coast by the Portuguese in the 15th century, and the kings of Benin in the 17th century ruled a large part of the south-western portion of the existing British protectorate (see BENIN). The Benin influence does appear to have extended much further than the boundaries of Nigeria. In the greater part of the delta region each town owned a different chief and there was no one dominant tribe. Among these people, who occupied a low position even among the degenerate coast negroes, and who were constantly raided by the more virile tribes of the interior, trading stations were established by the Portuguese, and later on by other Europeans, British traders appearing as early as the 17th century. There was no assertion of political rights by the white men, who were largely at the mercy of the natives, and who rarely ventured far from Lokoja or the "factories" established on the various rivers and estuaries.

By the end of the 18th century British enterprise had almost entirely displaced that of other nations on the Niger coast. But the principal trade of all Europeans was still in slaves.
After the abolition of the slave-trade in the 19th century palm oil formed the staple article of commerce, and the various streams which drain the Niger coast near the mouth of the great river became known as the "Oll Rivers." The opening up of the interior was in the meantime promoted, chiefly by the efforts of British travellers and merchants. Mungo Park traced the Niger from Segu to Bussa, where he lost his life in 1805. From Bussa to the sea the course of the river was first made known in 1830 by the brothers Richard and John Lander. Major Dixon Denham and Captain Hugh Clapperton entered the country now known as Northern Nigeria from the north in 1823, crossing the desert from Tripoli. Clapperton in 1826-1827 made a second journey, approaching the same territory from the Guinea coast. Dr. Barth, travelling under the auspices of the British government, entered the country from the north and made the journeys, lasting over two years between 1832 and 1855, of which he has left the record that still remains the principal standard work for the interior. Macgregor Laird first organized in 1832 the navigation of the river Niger from its mouth to a point above the Benue confluence. During the next twenty-five years expeditions were despatched into the interior, and a British consul was posted at Lokoja. Possession was also taken, in 1861, of Lagos island, with the object of checking the slave trade still being carried on in that region. But the deadly climate discouraged the first efforts of the British government, and, after the parliamentary committee of 1865 had recommended a policy which would render possible the ultimate establishment of British influence from the coast, the consulate of Lokoja was abandoned.

It was re-established a few years later to meet the still steadily growing requirements of British trade upon the river. In 1880 the influence of the international "scramble for Africa" made itself felt by the establishment under the recognized protection of the French government of two French firms which opened upwards of thirty trading stations on the Lower Niger. The establishment of these firms was admittedly a political move which coincided with the extension of French influence from Senegal into the interior. Nearly at the same time a young Englishman, George Goldie-Taupman, afterwards better known as Sir George Goldie (g.v.), having some private interests on the Niger, conceived the idea of amalgamating all local British interests and creating a British province on the Niger. To effect this end the United African Company was formed in 1879, and trade was pushed upon the river with an energy which convinced the French firms of the futility of their less united efforts. They yielded the field and allowed themselves to be bought out by the United African Company in 1884. At the Bedina Conference held in 1884-1885 the British government was able to state that Great Britain alone possessed trading interests on the Lower Niger, and in June 1885 a British protectorate was notified over the coast lands known as the Oll Rivers. Germany had in the meantime established itself in Cameroon, and the new British protectorate extended along the Gulf of Guinea from the British colony of Lagos on the west to the new German colony on the east, where the Rio del Rey marked the frontier. In the following year, 1886, the United African Company received a royal charter under the title of the Royal Niger Company. The territories which were placed by the charter under the control of the company were those immediately bordering the Lower Niger in its course from the confluence at Lokoja to the sea. On the coast they extended from the Forcados to the Nun mouth of the river. Beyond the confluence European trade had not at that time penetrated to the interior.

The interior was held by powerful Mahommedan rulers who had imposed a military domination upon the indigenous races and were not prepared to open their territories to European intercourse. To secure British political influence and to preserve a possible field for future development, the Niger Company had negotiated treaties with some of the most important of these rulers, and the nominal extension of the company's territories was carried over the whole sphere of influence thus secured. The movements of Germany from the south-east, and of France from the west and north, were thus held in check, and by securing international agreements the mutual limits of the three European powers concerned were definitely fixed. The principal treaties relating to the German frontiers were negotiated in 1886 and 1893; the Anglo-French treaties were more numerous, those of 1890 and 1898, which laid down the main lines of carved border between French and British possessions on the northern and western frontiers of Nigeria, having been supplemented by many lesser rectifications of frontier. (See AFRICA, § 5.) It was not until 1900 that the whole of the frontier between Nigeria and the French and German possessions had been definitely demarcated. Thus, mainly by the action of the Royal Niger Company, a territory of vast extent, into which the chartered company itself was not able to carry either administrative or trading operations, was secured for Great Britain. In 1897, at a time when disputes with France upon the western frontier had reached a very active stage, the company entered upon a campaign against the Mahommedan sovereign of Nupe. This campaign would, no doubt, have led to important results had the company retained its administrative powers. In the expedition a force of 500 Hausa, drilled and trained by the company, and led by thirty white officers—of whom some were lent for the occasion by the War Office—decisively defeated a force of some thousands of native troops, led by the emir of Nupe himself. The capital town of Bida was taken and the emir deposed. From Bida the expedition marched to Illorin, where again the whole district submitted to the authority of the company. In Illorin the campaign had some lasting effect. In Nupe, on the northern side of the river, the company was unable to occupy the territory conquered, things shortly reverted to their previous condition. When the company's troops were withdrawn the deposed emir returned and reoccupied the throne, leaving the situation to be dealt with after the territories of the company had been transferred to the crown.

The complications to which the pressure of foreign nations, and especially of France, on the frontiers of the territories gave rise, became at this period so acute that the resources of a private company were manifestly inadequate to meet the possible necessities of the position. Relations with France on the western border became so strained that in 1897 Mr Chamberlain, who was then secretary of state for the colonies, thought it necessary to raise a local force, afterwards known as the West African Frontier Force, for the special defence of the frontiers of the West African dependencies. In these circumstances it was judged advisable to place the territories of the Royal Niger Company, where, from Bida this expedition marched to Lokoja, where was proclaimed a protectorate under the name of Northern Nigeria.

The company, during its tenure of administrative power under the charter, had organized its territories south of the confluence into trading districts, over each of which there was placed a European agent. The executive powers in Africa were entrusted to an agent general with three provincial district superintendents. There was a small judicial staff directed by a resident judge, and there was a native constabulary of about 1000 men, trained and drilled by white officers. The company kept also upon the river a fleet of about
thirty steamers. The entire direction of the proceedings of the company was, however, in the hands of the council in London, and the administrative control of the territories was practically from first to last vested in the person of Sir George Goldie. The local work of the representatives of the company was mainly commercial. When, on the surrender of the charter, Sir George Goldie withdrew from the company, the administrative element disappeared. No administrative records were handed over, and very little machinery remained. Two enactments, however, bore testimony to the legislation of the company. One, which by force of circumstances remained inoperative, was the abolition of the legal status of slavery, proclaimed in the year of Queen Victoria's jubilee (1897). The other, more practical, which has remained in operation to the present day, confirmed and enforced by the succeeding administration, was the absolute prohibition of the trade in spirits beyond the parallel of 7° N.

While the development of the Royal Niger Company's territories was proceeding in the manner described, the regions under direct British control were also being opened up and new and order introduced. In 1893, when the Niger Oil Rivers Protectorate was changed to that of Niger Coast Protectorate, a regular administration was established (subject to the Foreign Office in London) under Sir Claude Macdonald, who was succeeded as commissioner and consul-general in 1896 by Sir Ralph Moor (1860-1900). Under these official peace was gradually established between various tribes, trade routes opened and progress made in civilization. The work was one of extreme difficulty, largely because there was no central native authority with which to deal. Small local factions had constantly to be employed to break up slave-raiding gangs and reduce to order tribes which blocked trade routes or made war on other tribes living peaceably under British protection. The most serious military operations were against the Beni, a peaceful mission to the king of Benin having been massacred in the bush in January 1897. The operations were completely successful and the Benin country was added to the protectorate (see BENIN). In 1900, as stated, the southern portion of the Niger Company's territories was added to the protectorate, the change in administration being effected without difficulty of any kind. Sir Ralph Moor continued in office to govern the country under the style of high commissioner. The efforts of the administration to better the condition of the natives without undue interference with customary law met with encouraging results, and the submission of the Aros to the government in 1902 brought to an end the system of tribal warfare for the purpose of making slaves, while the enforcement of a proclamation of 1901 prohibiting the buying, pawning or selling of slaves had a salutary effect. Trade steadily developed, and owing to the large sums paid as duty on imported spirits, the revenue of the protectorate was sufficient to cover the expenditure.

In Northern Nigeria in 1900 the establishment of British authority remained still to be effected. The man selected for the post of first high commissioner was Colonel—afterwards better known as Sir Frederick—Lugard, who had conducted one of the Royal Niger company's most successful expeditions into the western portion of the interior and had already been employed by the British government to raise and organize the West African Frontier Force. The transfer of influence from the company to the government was officially effected on the 1st of January 1900, on which day the Union Jack was hoisted at Lokoja, and the formation of a local administration was entered upon. The number of civilians in the employ of the government was very small, and the administrative machinery had to be evolved under the pressure of a somewhat acute military situation. The headquarters of the West African Frontier Force had been at Jebba, not far from the point at which Mungo Park had lost his life upon the river. Neither Jebba nor Lokoja was considered suitable for the permanent capital of the protectorate, and survey parties were sent out, with strict orders to avoid conflict with the nominally friendly natives, to find a more suitable site. This was selected on a bend of the Kaduna river in the south-western corner of the province of Zaria, at a place of which the native name of Zungeru was retained. The ruler of Zaria, while professing friendliness, was, however, unable or unwilling to restrain the rulers of Kontagora and Nupe from aggression. These two potentates raided for slaves to the borders of the rivers and openly threatened the British position on the Niger. The Ashanti War of 1900 claimed the dispatch of a strong detachment of the West African Frontier Force, and it was not until the return of the troops in 1901 that Nupe and Kontagora could be effectively dealt with. In that year both provinces were subdued, their emirs deposed, and letters of appointment given to new emirs, who undertook to rule in accordance with the requirements of humanity, to abolish slave-raiding and slave dealing, and to acknowledge the sovereignty of Great Britain. Illorin and Borgu with a portion of Kabba were already under British rule. The rulers of other neighbouring provinces offered their allegiance, and by the end of the year 1901 nine provinces, Illorin, Kabba, Ashanti, Lower Benue, Upper Benue, Nupe, Katsina, Borgu and Zaria had accepted the British occupation. These territories, with the exception of Zaria, were all in the more or less immediate neighbourhood of the valleys of the Niger and the Benue, and Zaria bordered upon the Kaduna. For all these territories an initial system of administration was organized, and British residents were appointed to each province. Seventeen legislative proclamations were enacted in the first year dealing with the immediate necessities of the position, and providing for the establishment of a supreme and provincial court, the administration of justice, the legalisation of all contracts of justice, and dealing with questions of slavery, importation of liquor and firearms, land titles, &c. In the autumn of 1901 the emir of Yola, the extreme eastern corner of the territories bordering upon the Benue, was, in consequence of the aggressions upon a trading station established by the Niger Company, dealt with in the same manner as the emirs of Nupe and Kontagora, and a new emir was appointed under British rule. In 1902 Bauchi and Bornu were brought under British rule. In Bauchi the emir was deposed and a new emir was appointed. In Bornu the extension of British authority was very willingly accepted as a guarantee of good treatment of the natives. The emir of Bornu was restored to the throne under British protection. Military stations were established in Bornu and in Bauchi, and both provinces were included in the system of British administration. Later in the same year an act of treachery culminating in the murder of a British resident, Captain Moloney, in the province of Nassarawa, led to the military subjugation of that province. The murderer fled northwards through Zaria to Kano, which was still an independent Mahommedan state. The emir of Zaria was found to be in treasonable correspondence with the emir of Kano. It was thought desirable to arrest and despatch him, and his prime minister was temporarily appointed to administer the province under British protection. To all these provinces British residents were appointed, and British legislative enactments became applicable to them all. By the end of the year 1902 British administration had been extended to the whole of the provinces in the south, east and west of the protectorate. The important Mahommedan states of Sokoto, Gando, Kano and Katsena remained independent. These states were regarded as the stronghold of Fulani supremacy. The emir of Sokoto held the position of religious as well as political head of all the lesser states of Northern Nigeria, and in response to friendly overtures on the part of the British administration had declared that between Sokoto and Great Britain there could be nothing but war. Katsena was the centre of local learning, while Kano was at once the commercial and the military centre of power. By the end of 1902 it had become evident that a trial of strength between the Mahommedan powers and the new British administration was inevitable. The Mahommedan rulers were themselves of comparatively recent date. In fighting them there was no question of fighting the whole country. On the contrary it was presumed with justice that their overthrow would be hailed
with satisfaction by many of the subject peoples. Every attempt was made to settle the question at issue by conciliatory methods, but these having failed, a campaign against Kano and Sokoto was entered upon in January 1903. It was entirely successful. The capital of Kano, a walled and fortified town of great extent and formidable strength, fell to a British expedition in February of 1903. Sokoto submitted after a battle which took place on the 17th of May. The sultan fled, and on the 21st of May a new sultan, chosen by the council of elders, was installed by the British high commissioner, after he had publicly accepted the conditions imposed by the British government. These conditions were that all rights of conquest acquired by the Fulani throughout Northern Nigeria passed to Great Britain, that for the future every sultan and emir and principal officer of state should be appointed by Great Britain, that the emirs and chiefs so appointed should obey the laws of the British government, that they should no longer buy and sell slaves, nor enslave people, that they should import no firearms, except flint-locks, that they should enforce no sentences in their courts of law which were contrary to humanity, and that the British government should in future hold rights in land and taxation. When these conditions were accepted by the Fulani chiefs the supremacy of Great Britain was established over the entire country. Katsena and Gando followed the example set to them by Kano and Sokoto. Sokoto, the capital of the emirates of Katsena and Pagan, now hold their appointments under the British crown and take the oath of allegiance to the British sovereign.

It remained to organize the territories for British rule, to institute a reformed system of taxation, to establish courts of justice, and to open the country to civilized occupation. The following account of the legislation carried into force up to 1907 shows in effect what was done in that direction. After the conquest of the Hausa States in 1900-1903 the king's writ ran—with the exception of a few districts inhabited by primitive savages—through the whole area known as Northern Nigeria. The lands of the inhabitants of the country were ceded by laws based upon a more accurate knowledge of local conditions and rendered possible by the effective administration which had been set up throughout the country.

Courts of Law and Administration of Justice.—A superior court was set up with jurisdiction over all non-natives and government employed. Its jurisdiction over natives was limited to the two centres of administration named "cannons," and to such neighbouring territories as might be included by regulation within a feasible distance of those centres. It could, however, try any case in any province by special warrant of the high commissioner. The whole country was divided into seventeen provinces, in each of which there was a provincial court presided over by the resident in charge, whose assistants were commissioners of the court. They submitted all cases coming before them of importance to the court for decision. The attorney-general, as a court of appeal, and no sentence exceeding six months could take effect without his confirmation. Cases decided by the commissioner were subject to the review of the court of king's bench, if he so decided. A criminal code was drawn up, together with a criminal procedure proclamation. Native courts were established by warrant at all the chief native towns with varying powers. They were of two classes, the "Alkalis' Court," presided over by trained Mahomedan jurists, and "Judicial Councils," under the leading chiefs and natives presided over by the emir or other native ruler. In these courts native law and customs (principally the Moslem law of feud and inheritance) were largely allowed. The laws of the country might declare a penalty to be enforceable which was contrary to the laws of humanity or opposed to any specific proclamation of the protectorate. With the exception of two or three of the most enlightened chiefs, the criminal powers of these courts were restricted, but in civil actions they had full scope. No native court could carry a sentence of death into execution without the concurrence of the resident. The criminal code also sanctioned the establishment of government courts (Zungeru and Lokoja), chiefly for the purpose of enforcing sanitary and municipal regulations. These were affiliated to the superior court.

Lands and Minerals.—These constitute the main asset of the government. In the first instance, as following upon conquest or potential conquest, the Fulani emirs who were appointed by government and were accorded great trust and power by letter of appointment in which (in addition to rights of legislation, taxation and other powers inherent in suzerainty) the ultimate title to all land was transferred from the Fulani dynasty and vested in the British. Private ownership was not interfered with, but all waste lands became the property of the crown, and no non-native could acquire title except as from government. Similarly the right of the crown to minerals (subject to the sharing of proceeds assigned to the Niger Company by the deed of transfer) was vested in the government, and the terms upon which licences to prospect or mine could be given were fixed by legislation. Land titles were also registered by law. The right of natives to smelt iron and the question of compensation for any other existing mining industry or for surface disturbance was left to the discretion of government.

In practice the maintenance of the legal status of slavery, in so far as all British courts were concerned. This decree had been promulgated before the transfer of the administration, but had existed merely on paper. Every slave could claim his freedom if his master had lived since April 1864; the descendants of slaves were made free by proclamation, and the institution of domestic slavery remained justiciable by the native courts; which in this matter were very carefully supervised by the British administration.

In the earlier years of the administration the tolls upon trade in transit, which had existed from time immemorial and had become the means of much extortion, were made a monopoly of the government, and were reorganized on an equitable and popular basis. To these were added certain licences (e.g. on canoes, &c.). In 1902 a complete reorganization of the direct taxation of the country was introduced. The innumerable taxes upon agriculture and industry of the most various kinds produced more or less directly the land and general tax—in its nature an income tax—and the jangali or cattle tax upon nomad herdsmen. The imposition of this tax involved a rough and ready assessment of every village in the country, and it was only when the system of local government practised under native rule gave place to a carefully regulated method of assessment. At its initiation the proceeds were divided into two parts: one absolutely exempt for the benefit of the native administration, and a means was thus found of creating a legitimate revenue for the native chiefs to supersede the proceeds of slave-raiding and slave-dealing, and of oppression and extortion, by which they had hitherto supplied their needs. As in India, the village with its lands and cultivation was constituted the unit of assessment, and the provinces were divided into districts under native headsmen responsible for the collection of the tax, and its transmission to the provincial government. They were advised by the attorney-general, as a court of appeal, and no sentence exceeding six months could take effect without his confirmation. Cases decided by the commissioner were subject to the review of the court of king's bench, if he so decided. A criminal code was drawn up, together with a criminal procedure proclamation. Native courts were established by warrant at all the chief native towns with varying powers. They were of two classes, the "Alkalis' Court," presided over by trained Mahomedan jurists, and "Judicial Councils," under the leading chiefs and natives presided over by the emir or other native ruler. In these courts native law and customs (principally the Moslem law of feud and inheritance) were largely allowed. The laws of the country might declare a penalty to be enforceable which was contrary to the laws of humanity or opposed to any specific proclamation of the protectorate. With the exception of two or three of the most enlightened chiefs, the criminal powers of these courts were restricted, but in civil actions they had full scope. No native court could carry a sentence of death into execution without the concurrence of the resident. The criminal code also sanctioned the establishment of government courts (Zungeru and Lokoja), chiefly for the purpose of enforcing sanitary and municipal regulations. These were affiliated to the superior court.

With the exception of two or three of the most enlightened chiefs, the criminal powers of these courts were restricted, but in civil actions they had full scope. No native court could carry a sentence of death into execution without the concurrence of the resident. The criminal code also sanctioned the establishment of government courts (Zungeru and Lokoja), chiefly for the purpose of enforcing sanitary and municipal regulations. These were affiliated to the superior court.

Military and Police.—The defensive force—the Northern Nigeria Regiment of the West African Frontier Force—is constituted by law, and the proclamation contains a military code based on the Army Act with modifications necessary in local circumstances. The code provides also for the division of the state into military districts, each under the command of a major, the appointment of which is in the discretion of the high commissioner. The police, on the other hand, are more or less equally divided between the provinces (including the establishment at each cannon), and while their interior economy is under the control of the resident of the province, the police are supervised by the superintendent of police, appointed by the high commissioner. In 1907 there were 136 native constables, 125 European officers, 258 European constables, and 1,521 native constables. They are paid by the government and are subject to the control of the resident of the province. A district superintendent is appointed to each province.

Miscellaneous Enactments.—A variety of other enactments deals with matters of lesser importance of administration. Commodities of inquiry may be appointed by the high commissioner to investigate the conduct
of an individual or department and take evidence on oath. Discipline on board of steamers is prescribed by the Marine Discipline Act.

The preservation of wild animals and birds in accordance with international agreement is enforced by law. The importation of arms of precision is forbidden, except by permits in conformity with the Brussels Act, and in further application of that act certain weapons of war are prohibited or restricted, and the possession of arms remaining generally prohibited.

The cantonments are regulated by a municipal ordinance, establishing rates and laying down various regulations for order and sanitation. In order to prevent hydrophobia dogs may only be kept under certain restrictions. Patents, marriages (of non-natives), &c., &c., form the subject of other laws.

Administrative Divisions.—For administrative purposes the territories were at first divided into seventeen provinces: Sokoto, Lagos, Kano, Bornu, Eastern Nigeria, Western Nigeria, Borgu, Kontagora, Nasserawa, Muri, Yola, Bassa, Kabbia, Illorin, Nupe. Of these Sokoto and Gando, Kano and Katsena, Bornu East and Bornu West have been carried a step further in organization and now form three double provinces, each under the charge of a first-class resident. Illorin, Nupe and Kabbia have been formed into one province called the Niger province, and also placed under the charge of a first-class resident, and it is intended to continue this process so as to make finally eight first-class provinces of the whole territory. The first-class residents of the double provinces are assisted by about twelve residents and assistant residents of sub-province rank. In the amalgamated states of the Niger Province of administration remains intact, and is carried on under British supervision by native emirs and officials. In the pagan states there is no organized system of native administration, and the British residents are responsible for good government.

Amalgamation of Lagos and Southern Nigeria.—The political reasons which had resulted in the Nigerian territories being divided into three distinct administrations no longer existing, it was decided to unite them under one government, and as a first step in that direction Sir Walter (then Mr) Egerton was in 1904 appointed both governor of Lagos and high commissioner of Southern Nigeria. This was followed in February 1906 by the elevation of the four provinces under the banner of "the Colony and Protectorate of Southern Nigeria," with headquarters at Lagos town. The former colony and protectorate of Lagos (q.v.) became the western or Lagos province of the new administration.

In the year the amalgamation was effected the revenue reached a record figure, the amount collected being £1,088,000, to which Lagos province contributed £424,000. Over 80% of the revenue was derived from customs. In the same year the expenditure from revenue was £1,036,000.

Northern Nigeria Railway.—In Northern Nigeria, which continued for the time being an independent part of the lands of the Protectorate, Sir Percy Girouard ascended, at the beginning of 1907, succeeded as high commissioner by Sir Percy Girouard. In August of that year the British government, on administrative, strategic and commercial grounds, came to a decision to build a railway which should place the important cities of Zaria and Kano in direct communication with the perennially navigable waters of the Lower Niger. In view of the approaching unification of Southern and Northern Nigeria, the money needed, about £1,250,000, was raised as a loan by Southern Nigeria. The route chosen for the line was that advocated by Sir Frederick Lugard. This important work, essential for the welfare of the northern territories, was begun under the superintendence of Sir Percy Girouard,1 the builder of the Wadi Halfa-Khartum railway. At the same time the decision was taken to continue the Lagos railway till it effected a junction with the Kano line near Zungeru, the Niger being bridged at Jebba.

Land Tenure.—Sir Percy Girouard devoted much attention to land tenure, probably the most important of the questions concerning imperial policy in West Africa. He adopted the land policy of Sir F. D. Lugard, and recommended "a declaration in favour of the enforcement of the Primitive Right..." This was in accordance with native laws—that the land is the property of the people, held in trust for them by their chiefs, who have not the power of alienation. Thereafter the secretaries for the colonies appointed a strong committee, which, after hearing much evidence, issued a report in April 1910 in substantial agreement with the governor's recommendations. This policy was adopted by the Colonial Office. By this means the natives of Nigeria were secured in the possession of their land—the government imposing land taxes, which are the equivalent of rent. This exclusion of the European land speculator and denial of the right to buy and sell land and of freehold tenure was held by all the authorities to be essential for the moral and material welfare of the inhabitants of a land where the duty of the white man is mainly that of administration and his material advantages lie in trade. (See an article on "Land Tenure in West Africa" in The Times, May 24, 1910.)

Night, that part of the natural day of twenty-four hours during which the sun is below the horizon, the dark part of the day from sunset to sunrise (see DAY). The word in O. Eng. takes two forms, night and night, the latter form apparently being early Indo-European in origin, and the word night existing in various forms to Indo-European languages. The root is usually taken to be nakt-, to perish, the word meaning the time when the light fails (cf. Gr. νυκτ-, Lat. nux, death, noxere, to hurt). It was customary to reckon periods of time by nights, and we still use "fortnight" (O. Eng. fouertynyn niht, fourteen nights), but "se'n-night" (seven nights) has been displaced by "week" (q.v.).

NIGHTINGALE, FLORENCE (1820-1910), younger daughter of William Edward Nightingale of Embly Park, Hampshire, and Lea Hurst, Derbyshire, was born at Florence on the 13th of May 1820, and named after that city, but her childhood was spent in England, chiefly in Derbyshire. From her earliest years her strong love of nature and animals manifested itself. Her games, too, were characteristic, for her great delight was to nurse and bandage her dolls. Her first living patient was a shepherd's dog. From tending animals she passed to human beings, and wherever there was sorrow or suffering was she sure to be found. Her most ardent desire was to use her talents for the benefit of humanity. She had a natural shrinking from society; and though her social position necessitated her presentation at Court, her first care in town was spent in examining hospitals, reformatories and other charitable institutions. This was followed by a tour of inspection of foreign hospitals. At that time England was sadly behind-hand in matters of nursing and sanitation, and Miss Nightingale, who desired to obtain the best possible teaching for herself, went through a course of training in the Institute of Protestant Deaconesses at Kaiserswerth. She remained there six months, learning every detail of hospital management with a thoroughness rarely equalled. Miss Nightingale neglected nothing that could make her proficient in her self-chosen task. From Kaiserswerth she went to Paris, where she studied the system of nursing reform and management in the hospitals under the charge of the sisters of St. Vincent de Paul. After her return to England she devoted herself to reorganizing the Goernesses' Sanitarium in Harley Street (now the Home for Gentlewomen during Temporary Illness), which was at that time badly managed and in great need of funds. Miss Nightingale grudged neither time nor money to this work, and she had the satisfaction of placing it on a thoroughly satisfactory basis.

In the year 1854 England was stirred to its depths by the report of the sufferings of the sick and wounded in the Crimea. There was an utter absence of the commonest preparations to carry out the first and simplest demands in a place set apart
to receive the sick and wounded of a large army. - The condition of the large barracks-hospital at Scutari was deplorable. A royal commission of inquiry was appointed, a patriotic fund opened, and money flowed in fast. To Miss Nightingale this proved the trumpet-call of duty. She wrote to Sidney Herbert, secretary at war, and offered her services. Her letter crossed with one from him inviting her to proceed to the Crimea. She set out on the 24th October with a staff of thirty-seven nurses, partly volunteers, partly professionals trained in hospitals. They reached Scutari in the midst of November, in time to receive the Balaklava wounded. A death-rate of 10.5 per 10,000 was recorded. A story of 600 from Inkerman. The story of Miss Nightingale's labours at Scutari is one of the brightest pages in English annals. She gave herself, body and soul, to the work. She would stand for twenty hours at a stretch to see the wounded accommodated. She regularly took her place in the operation-room, to hearten the sufferers by her presence and sympathy, and at night she would make her solitary round of the wards, lamp in hand, stepping here and there to speak a kindly word to some patient. Soon she had 10,000 men under her charge, and the general superintendence of all the hospitals on the Bosphorus. Daily the effects of the measures adopted were seen in a lowered death-rate. In February 1855 it was as high as 45%, before many months it had sunk to 2. For a time Miss Nightingale was herself prostrated with fever, but she refused to leave her post, and remained at Scutari till Turkey was evacuated by the British in July 1856. The enthusiasm aroused in England by Miss Nightingale's labours was indescribable. A man-of-war was ordered to bring her home, and London prepared to give her a triumphal reception; but she returned quietly in a French ship, crossed to England, and escaped to her country home before the news of her return could leak out. The experiences of those terrible months permanently affected Miss Nightingale's health, but the quiet life she afterwards led was full of usefulness. With the £50,000 raised in recognition of her services she founded the Nightingale Home for training nurses at St Thomas's and King's College Hospitals. She also turned her attention to the question of army sanitary reform and army hospitals, and to the work of the Army Medical College at Chatham. In 1858 she published her Notes on Nursing, which gave an enormous stimulus to the study of this subject in England. According to Miss Nightingale murder was the least of the rigours of Army life. Insanitary and ill-planned the effects of trivially the effects of the measures adopted were seen in a lowered death-rate. In February 1855 it was as high as 45%, before many months it had sunk to 2. The cock alone sings, and there is no reason to suppose that the cause and intent of his song differ in any respect from those of other birds' songs (see SONGBIRD). In great contrast to the nightingale's pre-eminently the voice is the inconspicuous coloration of its plumage, which is alike in both sexes, and is of a reddish-brown above and dull greyish-white beneath, the breast being rather darker, and the rufous tail showing the only bright tint.

The range of the European nightingale, *Daulus lucetitia*, is peculiar. In Great Britain it is abundant in suitable localities to the south-east of a line stretching from the valley of the Exe, through Kent, to the Isle of Wight, and thence to the north of Ireland. Its presence in Wales is doubtful or intermittent, and it is extremely improbable that it has ever reached Scotland. On the continent of Europe it does not occur north of a line stretching irregularly from Copenhagen to the northern Urals, and it is absent in Brittany; over south Europe otherwise it is abundant. It reaches Persia, and is a winter visitor to Arabia, Nubia, Abyssinia, Algeria and as far south as the Gold Coast. The larger eastern *D. philomela*, sometimes called the threshold nightingale or Sprosser of German bird-catchers, is russet-brown in both sexes, and is a summer visitor to northern Europe. The tree nightingale, a true nightingale, is probably the Perse-Arabic bullfinch of poets.

The nightingale reaches its English home about the middle of April, the males (as is usual among migratory birds) arriving some days before the females. On the coasts being joined by their partners, the work for which the long and hazardous journey of both has been undertaken is speedily begun, and before long the nest is completed. This is of a rather uncommon kind, being placed on or near the ground, the outworks consisting chiefly of a great number of dead leaves ingeniously applied together so that the plane of each is mostly vertical. In the midst of the mass is wrought a deep cup-like hollow, neatly lined with fibrous roots, but the whole is so loosely constructed, and depends for lateral support so much on the stems of the plants, among which it is generally built, that a very slight touch disturbs its beautiful arrangement. Herein from four to six eggs of a deep olive colour are duly laid, and the young hatched. The nestling plumage of the nightingale differs much from that of the adult, the feathers above being tipped with a buff spot, just as in the young of the redbreast, hedge-sparrow and redstart, thereby showing the natural affinity of all these forms. Towards the end of summer the nestlings disperse, and take to the air, with a tinkling song.

The name nightingale has been vaguely applied to several other birds. The so-called "Virginian nightingale," is a species of grose-beak (g.v.); the "Pekin nightingale" or "Japanese nightingale" (Liothrix rufous) inhabiting the Himalayas and China, not Japan at all.

The nightingale holds a place in classical mythology. Proene and Philomela were the daughters of Pandion, king of Attica, who in a quarrel for war which she rendered him by Tereus, her hus-

The cock alone sings, and there is no reason to suppose that the cause and intent of his song differ in any respect from those of other birds' songs (see SONGBIRD). In great contrast to the nightingale's pre-eminently the voice is the inconspicuous coloration of its plumage, which is alike in both sexes, and is of a reddish-brown above and dull greyish-white beneath, the breast being rather darker, and the rufous tail showing the only bright tint.

The range of the European nightingale, *Daulus lucetitia*, is peculiar. In Great Britain it is abundant in suitable localities to the south-east of a line stretching from the valley of the Exe, through Kent, to the Isle of Wight, and thence to the north of Ireland. Its presence in Wales is doubtful or intermittent, and it is extremely improbable that it has ever reached Scotland. On the continent of Europe it does not occur north of a line stretching irregularly from Copenhagen to the northern Urals, and it is absent in Brittany; over south Europe otherwise it is abundant. It reaches Persia, and is a winter visitor to Arabia, Nubia, Abyssinia, Algeria and as far south as the Gold Coast. The larger eastern *D. philomela*, sometimes called the threshold nightingale or Sprosser of German bird-catchers, is russet-brown in both sexes, and is a summer visitor to northern Europe. The tree nightingale, a true nightingale, is probably the Perse-Arabic bullfinch of poets.

The name nightingale has been vaguely applied to several other birds. The so-called "Virginian nightingale," is a species of grose-beak (g.v.); the "Pekin nightingale" or "Japanese nightingale" (Liothrix rufous) inhabiting the Himalayas and China, not Japan at all.

much smaller. The flower clusters spring from the stems at the side of, or opposite to, the insertion of a leaf. The corolla is rotate, of a lilac-blue colour with a green spot at the base of each segment, or sometimes white, and bears the yellow sessile anthers united at their margins so as to form a cone in the centre of the flower. The flowers are succeeded by ovate scarlet berries, ½ in. long, which in large doses appear to be poisonous or, to say the least, dangerous to children, cases of poisoning by them having occurred. Solanum dulcamara is subject to the same parasitic fungus (Phytophthora infestans) as the potato, and may serve as a medium for communicating the spores to the potato if not removed from the hedges of the fields where potatoes are grown. The plant derives its names of "bittersweet" and Dulcamara from the fact that its taste is at first bitter and then sweet. It is a native of Europe, North Africa and temperate Asia, and has been introduced into North America. The dried young branches are known in pharmacy under the name dulcamara.

Dulcamara contains a bitter principle yielding by decomposition a sugar dextrose and the alkaloid solanine. It also contains another glucoside dulcamarin, which when boiled with dilute acid splits up into sugar and dulcamaretin. Solanine appears to exert a depressant action on the vagus nerve and an excitant action on the medulla oblongata.

Solanum nigrum differs from S. Dulcamara in having white flowers in small umbels and globose black berries. It is a common weed in gardens and waste places, growing about 12 or 18 in. high, and has ovate, entire or subulate or toothed leaves. Two varieties of the plant, one with red and the other with yellow berries, are sometimes met with, but are comparatively rare. The berries have been known to produce poisonous effects when eaten by children, and owe their properties to the presence of solanine. In Réunion and Mauritius the leaves are eaten like spinach.

Deadly nightshade, dwale or belladonna (Atropa belladonna) is a tall bushy herb of the same natural order (fig. 2). It grows to a height of 4 or 5 ft., having leaves of a dull green colour, with a black shining berry fruit about the size of a cherry, and a large tapering root. The plant is a native of central and south Europe, extending into Asia, and is found in Spain, Italy, and England, chiefly on chalk and limestone, from Westmorland and southwards. The entire plant is highly poisonous, and accidents not infrequently occur through children and unwary persons eating the attractive-looking fruit. Its leaves and roots are largely used in medicine, on which account the plant is cultivated, chiefly in south Germany, Switzerland and France (see Belladonna).

The name nightshade is applied to plants of different genera in other countries. American nightshade is Physolacca decandra (pokeweed, &c.). The three-leaved nightshade is an American species of Trillium. The Malabar nightshade is Basella, which is widely used as a pot-herb in India. Enchanter's nightshade is Circaea lutetiana, a small, glandular, softly-haired plant, common in damp woods, with slender, erect or ascending stems, paired ovate leaves with long stalks, and small white flowers in terminal racemes, succeeded by a brown or black fruit, as with white nightshade, a natural order Ongraceae, and is not known to possess any poisonous property; the name seems to have been given to it in the first place in mistake for a species of Mandragora (see Mandragora).

NIGRA—NIHILISM

Fig. 1.—Bittersweet (Solanum Dulcamara). § nat. size. 1, Flower; 2, fruits, § nat. size; 3, berry, cut across, enlarged; 4, seed, much enlarged.

Fig. 2.—Deadly Nightshade (Atropa belladonna). Flowering branch, § nat. size. 1, Flower, after removal of the corolla, § nat. size; 2, corolla, with stamens, cut open and flattened, § nat. size; 3, cross section of ovary, much enlarged.

NIHILISM, the name commonly given to the Russian form of revolutionary Socialism, which had at first an academic character, and rapidly developed into an anarchist revolutionary movement. It originated in the early years of the reign of Alexander II., and the term was first used by Turgueniev in his celebrated novel, Fathers and Children, published in 1862. Among the students of the universities and the higher technical schools Turgueniev had noticed a new and strikingly original type—young men and women in slovenly attire, who called in question and ridiculed the generally received convictions and respectable conventionalities of social life, and who talked of reorganizing society on strictly scientific principles. They reversed the traditional order of things even in trivial matters of external appearance, the males allowing the hair to grow long and the female adeptes cutting it short, and adding sometimes the
NIHILISM

additional badge of blue spectacles. Their appearance, manners and conversation were apt to shock ordinary people, but to this they were profoundly indifferent, for they had raised themselves above the level of so-called public opinion, despised Philistine respectability, and rather liked to scandalize people still under the influence of what they considered antiquated prejudices. For aesthetic culture, sentimentalism and refinement of every kind they had a profound and undisguised contempt. Professing extreme utilitarianism and delighting in paradox, they were ready to declare that a shoemaker who distinguished himself in his craft was a greater man than a Shakespeare or a Goethe, because humanity had more need of shoes than of poetry.

Thanks to Turguiev, these young people came to be known in common parlance as "Nihilists," though they never ceased to protest against the term as a calumniuous nickname. According to their own account, they were simply earnest students who desired reasonable reforms, and the peculiarities in their appearance and manner arose simply from an excusable neglect of trifles in view of graver interests. In reality, for the name we may apply to them, they were the extreme representatives of a curious moral awakening and an important intellectual movement among the Russian educated classes (see ALEXANDER II., of Russia).

In material and moral progress Russia had remained behind the other European nations, and the educated classes felt, after the humiliations of the Crimean War, that the reactionary regime of the emperor Nicholas must be replaced by a series of drastic reforms. With the impulsiveness of youth and the recklessness of infancy, they went headlong in their revolutionary movement, their elders, and their reforming zeal naturally took an academic, pseudo-scientific form. Having learned the rudiments of positivism, they conceived the idea that Russia had outruled the religious and metaphysical stages of human development, and was ready to enter on the positivist stage. She ought, therefore, to throw aside all religious and metaphysical conceptions, and to regulate her intellectual, social and political life by the pure light of natural science. Among the antiquated institutions which had to be abolished as obstructions to real progress, were religion, family life, private property and centralized administration.

Religion was to be replaced by the exact sciences, family life by free love, private property by collectivism, and centralized administration by a federation of independent communes.

Such doctrines could not, of course, be preached openly under a paternal, despotic government, but the press censure had become so permeated with the prevailing spirit of enthusiastic liberalism, that they could be artfully disseminated under the disguise of literary criticism and fiction, and the public very soon learned the art of reading between the lines. The work which had perhaps the greatest influence in popularizing the doctrines was a novel entitled STIGMATA, and the author himself, Tchernishevi, was sentenced to imprisonment in Tchernishevi, one of the academic leaders of the movement, and published with the sanction of the authorities!

Since the time of Peter the Great, Russia had been subjected to a wonderful series of administrative and social transformations, and it seemed to many people quite natural that another great transformation might be effected with the consent and cooperation of the autocratic power. The doctrines spread, therefore, with marvellous rapidity. In the winter of 1861-1862 a high official wrote to a friend who had been absent from Russia for a few months: "If you returned now you would be astonished at the progress which the opposition—one might say, the revolutionary party—has made. . . . The revolutionary ideas have taken possession of all classes, all ages, all professions, and they are publicly expressed in the streets, in the barracks, and in the government offices. I believe the police itself is carried away by them." Certainly the government was under the influence of the prevailing enthusiasm for reform, for it liberated all the serfs, endowed them liberally with arable land, and made their democratic communal institutions independent of the landed proprietors; and it was preparing other important reforms in a similar spirit, including the extension of self-government in the rural districts and the towns, and the reorganization of the antiquated judicial system and procedure according to the modern principles adopted in western Europe.

The programme of the government was extensive enough and liberal enough to satisfy, for the moment at least, all reasonable reformers, but the well-intentioned, self-confident young people to whom the term Nihilists was applied were not reasonable. They wanted an immediate, thorough-going transformation of the existing order of things according to the most advanced socialistic principles, and in their youthful, reckless impatience they determined to undertake the work themselves, independently of and in opposition to the government. As they had no means of seizing the central power, they adopted the method of endeavouring to bring about the desired political, social and economic changes by converting the masses to their views.

They began, therefore, a propaganda among the working population of the towns and the rural population in the villages. The propagandists were recruited chiefly from the faculty of physical science in the universities, from the Technological Institute, and from the medical schools, and a female contingent was supplied by the midwifery classes of the Medico-Surgical Academy. Those of each locality were personally known to each other, but there was no attempt to establish among them hierarchical distinctions or discipline. Each individual had entire freedom as to the kind and means of propaganda to be employed. Some disguised themselves as artisans or ordinary labourers, and sought to convert their uneducated fellow-workmen in the industrial centres, whilst others settled in the country towns and villages, where there was less danger of detection among the recently emancipated peasantry by telling them that the tsar intended they should have all the land, and that his benevolent intentions had been frustrated by the selfish landed proprietors and the dishonest officials. Landlords and officials, it was suggested, should be got rid of, and then the peasants would have arable, pastoral and forest land in abundance, and would not require to pay any taxes. To persons of a certain education the agitators sought to prove that the general economic situation was desperate, that it was the duty of every conscientious citizen to help the people in such a dilemma, and that the first step towards the attainment of this devoutly to be wished consummation was the limitation or destruction of the uncontrolled supreme power. On the whole the agitators had very little success, and not a few of them fell into the hands of the police, several of them being denounced to the authorities by the persons in whose interest they professed to be acting; but the great majority were so obstinate and so ready to make any personal sacrifices, that the arrest and punishment of some of their number did not deter others from continuing the work. Between 1861 and 1864 there were less than twenty native Nihilists, and all the rest that most of the accused were condemned to imprisonment, or to compulsory residence in small provincial towns under police supervision.

The activity of the police naturally produced an ever-increasing hostility to the government, and in 1866 this feeling took a practical form in an attempt on the part of an obscure individual called Karakozov to assassinate the emperor. The attempt failed, and the judicial inquiry proved that it was the work of merely a few individuals, but it showed the dangerous character of the movement, and it induced the authorities to take more energetic measures. For the next four years there was an apparent lull, during which only one political trial took place, but it was subsequently proved that the Nihilists during this time were by no means inactive. An energetic agitator called Netchaiev organized in 1869 a secret association under the title of the Society for the Liberation of the People, and when he suspected of treachery one of the members he caused him to be assassinated. This crime led to the arrest of some members of the society, but their punishment had very little deterrent effect on the Nihilists in general, for during the next few years there was a recrudescence of the propaganda among the labouring classes. Secret circles were created and provided with secret printing-presses in many of the leading provincial towns, notably in Moscow,
NIIGATA

Nijni-Novgorod, Penza, Samara, Saratov, Kharkof, Kiev, Odessa, Rostov on the Don and Taganrog; and closer relations were established with the revolutionary Socialists in western Europe, especially with the followers of Bakunin, who considered that a great popular rising should be brought about in Russia as soon as possible. Bakunin's views did not, it is true, obtain unanimous acceptance. Some of the Nihilists maintained that things were not yet ripe for a rising of the masses, that the pacific propaganda must be continued for a considerable time, and that before attempting to overthrow the existing social organization some idea should be formed as to the order of things which should take its place. The majority, however, were too importunate and missed the last drop of blood and to the last breath. "In accordance with the fashionable doctrine of evolution, the reconstruction of society on the tabula rasa might be left, it was thought, to the spontaneous action of natural forces; or, to use a Baconian phrase, to natura naturans."

To this and similar declarations of irreconcilable hostility the government replied by numerous arrests, and in the winter of 1877-1878 no less than 197 agitators, selected from 2000 arrested on suspicion, were tried publicly in St Petersburg by a tribunal specially constituted for the purpose. Nearly all of them were condemned to imprisonment or exile, and the revolutionary organization in the north was paralysed, but a few energetic leaders who had escaped arrest reorganized their scattered forces and began the work anew. They constituted themselves into a secret executive committee, which endeavoured to keep in touch with, and partially direct, the independent groups in the provincial towns. Though they never succeeded in creating an efficient centralized administration, they contrived to give to the movement the appearance of united action by assuming the responsibility for terrorist crimes committed by persons who were in reality not acting under their influence. During these years, 1878, 1879, and 1880, these terrorist crimes were of frequent occurrence. General Trepopov, prefect of St Petersburg, was shot by Vera Zasulitch under pretence of presenting a petition to him; General Mezentsov, chief of the political police, was assassinated in broad daylight in one of the principal streets of St Petersburg, and an attempt was afterwards made on the life of his successor, General Drenten; Prince Krapotkin, governor of the province of Kharkof, was assassinated for having introduced stricter prison discipline with regard to political prisoners; a murderous attack was made on the emperor in front of the Winter Palace by an ex-student called Sokolov; repeated attacks were made by blowing up the train conveying the Imperial family from the Crimea to St Petersburg; and a dynamite explosion, by which ten people were killed and thirty-four wounded, took place in the Winter Palace, the Imperial family owing their escape to the accident of not sitting down to dinner punctually at the usual hour. Assassination was used also by the agitators against confederates suspected of giving information to the police, and a number of gendarmes were murdered when effecting arrests. Above all, the fear of these crimes a proclamation was issued by the executive committee, explaining the motives and accepting the responsibility.

When repressive measures and the efforts of the police were found insufficient to cope with the evil, Alexander II. determined to try a new system. Count Loris Melikof was entrusted with semi-dictatorial powers, relaxed the severity of the police régime, and endeavoured to obtain the support of all loyal Liberals by holding out the prospect of a series of reforms in a liberal sense. His conciliatory methods failed signaly, and were repaid by an attack on his life. A semblance of parliamentary institutions was not what the Anarchists wanted. They simply redoubled their activity, and hatched a plot for the assassination of the emperor. In March 1881 the plot was successful. Alexander II., when driving in St Petersburg, was mortally wounded by the explosion of small bombs, and died almost as soon as he had reached the Winter Palace. On the following day the executive committee issued a bombastic proclamation, in which it declared triumphantly that the tsar had been condemned to death by a secret tribunal on 26th August 1879, and that two years of effort and painful losses had at last been crowned with success. Though this put an end to the policy of killing Anarchists by kindness, and one of the first acts of the new reign was a manifesto in which Alexander III. announced very plainly that he had no intention of limiting the autocratic power, or making concessions of any kind to the revolutionary party. The subsequent history of the movement presents little that is interesting or original, merely a continual but gradually subsiding effort to provoke local disturbances with a view to bringing about sooner or later a general rising of the masses and the overthrow not only of the government, but also of the existing social and economic régime. A sort of revolution was under way; the young men, by the late years of the reign of Alexander II. had been largely shattered and dispossessed by experience. The revolutionary propaganda temporarily led to a serious situation in the early years of the reign of Tsar Nicholas II., but a new era opened for Russia with the inauguration of parliamentary government.

The following criminal statistics of the movement during six and a half years of its greatest activity (from 1st July 1881 to 30th June 1888) are taken from unpublished official records:

Number of affairs examined in the police department 1500
Number of persons punished 3046

These 3046 punishments may be divided into the following categories:

<table>
<thead>
<tr>
<th>Type</th>
<th>Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Death</td>
<td>20</td>
</tr>
<tr>
<td>Penal servitude</td>
<td>128</td>
</tr>
<tr>
<td>Exile in Siberia</td>
<td>681</td>
</tr>
<tr>
<td>Exile under police supervision in European Russia</td>
<td>1500</td>
</tr>
<tr>
<td>Lesser punishments</td>
<td>717</td>
</tr>
</tbody>
</table>

From the beginning of the movement up to 1902 the number of Anarchists condemned to death and executed was forty-eight, and the number of persons assassinated by the Anarchists was thirty-nine. There is no reason to suspect the accuracy of these statistics, for they were not intended for publication. They are taken from a confidential memorandum presented to the Emperor.

(D. M. W.)

NIIGATA, the chief town of the province of Echigo, Japan, Pop. (1903) 58,821. It lies on the west coast of the island of Nippon, on a narrow strip of sandy ground between the left bank of the Shinano and the sea, which though close at hand is shut out from view by a low range of sandhills. It occupies an area of rather more than 1 sq. m., and consists of five long parallel streets intersected by cross-streets, which in most cases have canals running down the middle and communicating with the river, so that the internal traffic of the city is mainly carried on by water. The houses are usually built with gables to the street, and roofs and verandas project so as to keep the windows and footpaths from being blocked up by the heavy winter snows. Niigata was originally chosen as one of the five open ports—Nagasaki, Kobe, Yokohama, Niigata and Hakodate—but it failed, chiefly owing to a bar which prevents the entry of vessels
of any size. The town has been brought within the railway circuit, and the production of petroleum has been developed in the district. Ehisa, on the island of Sado, was opened as a supplementary harbour of refuge, but not as a trading port. There is a large manufacture of lacquer-ware in the town. The foreign trade is entirely in the hands of Japanese merchants. During winter Niigata suffers from a terribly severe climate; the summers, moreover, are excessively hot.

Nijar, a town of south-eastern Spain, in the province of Almeria; on the southern slope of the Sierra Alhamilla, and on the river Aratil, which flows into the Mediterranean Sea 60 m. S.W. Po! (1892). 94, 342. Dispite its isolated location and lack of communication, Nijar is a place of some commercial importance. Lead, iron and manganese are mined in the neighbouring mountains; the fertile plain watered by the Aratil yields an abundance of wheat, fruit, olives and esparto grass; and fine porcelain and woollen and cotton goods are manufactured in the town.

Nijmegen, Nimjogen, Nyjegen or Nimwegen, a town in the province of Gelderland, Holland, on the left bank of the Waal, 243 m. by rail E. by S. of Tiel. It has regular steamboat communication with 15 different harbours, and steamers connect it with the North Sea. Pop. (1904) 49,342. Nijmegen is very prettily situated on the slopes of five low hills rising from the river-side. It stands up with a boldness quite unusual in a Dutch town, and steps are even necessary to lead to the higher portions of the town. In 1877–1884 the old town walls were demolished, a promenade and gardens taking their place, and since then a new quarter has grown up on the south side with a fine open space called the Emperor Charles’s Plain. On the east of the town is the beautiful park called the Valkhof, which marks the site of the old palace of the Carolingian emperors. The palace was still inhabitable in 1787, but was ruined by the French bombardment of 1794, and only two portions of it remain. These are a part of the choir of the 12th-century palace-church, and a sixteen-sided baptistry originally consecrated by Pope Leo III. in 759 and rebuilt in the 12th or 13th century. Close by is the lofty tower of the Belvedere, dating from 1460. The Groote Kerk of St Stephen forms with its tall square tower one of the most striking features in the general views of the town. Originally built about 1273, it dates in its present condition mainly from the 16th and 17th centuries. In the choir is the fine monument of Catherine of Bourbon (d. 1499), wife of Adolphus of Egmont, duke of Gelderland, with a brass of the duchess, and the heraldic achievements of the house of Bourbon. There is also a fine organ. The interesting Renaissance town-hall was built in 1534 (restored in 1879). It is adorned with the effigies of kings and emperors who were once benefactors of Nijmegen. Inside are to be found some fine wood-carving, tapestries, pictures and a curious safe in which the town charters were so jealously preserved that the garrison used to be called out and the city gates closed whenever they were consulted. There is also an interesting museum of antiquities. Other buildings of note are the theatre (1830), the Protestant hospital, the Roman Catholic or Canisius hospital (1866), and the old weigh-house and Flesher’s Hall, probably built in 1612 and restored in 1885. Between 1656 and 1678 Nijmegen was the seat of a university. Beer, Prussian blue, leather, tin, pottery, cigars, and gold and silver work are the chief industrial products, and there is a considerable trade by rail and river.

Nikāya ("collection"), the name of a division of the Buddhist canonical books. There are four principal Nikāyās, making together the Sutta Pātakā ("Basket of Discourses"), the second of the three baskets into which the canon is divided. The fifth or miscellaneous Nikāya is by some authorities added to this Pātakā, by others to the next. The first two Nikāyās, called respectively Dīgha and Majjhima (Longer and Shorter), form one book, a collection of the dialogues of the Buddha, the longer ones being included in the former, the shorter ones in the latter. The third, called the Anguttara (Progressive Addition), rearranges the doctrinal matter contained in the Dialogues in groups of ethical concepts, beginning with the units, then giving the pairs, then the groups of three, four, five, etc., up to ten. In the Dialogues the arrangement in such numbered groups is frequent. In an age when books, in our modern sense, were unknown, it was a practical necessity to invent and use aids to memory. Such were the repetition of memorial tags, of cues (as now used for a precisely similar purpose on the stage), to suggest what is to come. Such were also these numbered lists of technical ethical terms. Religious teachers in the West had similar groups—the seven deadly sins, the ten commandments, the four cardinal virtues, the seven Sacraments, and many others. These are only now, since the gradual increase of books, falling out of use. In the Buddhist canon it was found convenient by the early Buddhists to classify almost the whole of their psychology and ethics in this manner. And the Anguttara Nikāya is based on that classification. In the last Nikāya, the Samyutta (The Clusters), the same doctrines are arranged in a different set of groups, according to subject. All the Logia (usually of the master himself, but also of his principal disciples) on any one point, or in a few cases as addressed to one set of people, are here brought together. That was, of course, a very convenient arrangement then. It saved a teacher or scholar who wanted to familiarize himself with one subject from the trouble of repeating over, or getting some one else to repeat over for him, the whole of the Dialogues or the Anguttara. To us, now, the Samyutta seems full of repetitions; and we are apt to forget that they are there for a very good reason.

During the time when the canon was being completed there was great activity in learning, repeating to oneself, rehearsing in company and discussing these three collections. But there was also considerable activity in a more literary direction. Hymns were sung; lyrics were composed, tales were told, the results of some exciting and interesting talk were preserved in summaries of exegetical exposition. A number of these have been fortunately preserved for us in twenty-two collections, mostly of very short pieces, in the fifth or miscellaneous Nikāya, the Khuddaka Nikāya.

The text of the Dialogues fills about 2000 pages 8vo in the edition prepared for the Pali Text Society, of which five volumes out of six had been published in 1909, and the first had been translated into English. The Samyutta, of about the same size, and the Anguttara, which is a little smaller, have both been edited. Of the twenty-two miscellaneous books twenty have been edited (see Rhys Davids, American Lectures (1896), pp. 66-70); five have been translated into English, and two more into German.

NIKE, in Greek mythology, the goddess of victory (G. victor). She does not appear personified in Homer; in Hesiod (Theog. 384) she is the daughter of the giant Pallas and Styx, and is sent to fight on the side of Zeus against the Titans. Nike does not appear to have been the object of a separate cult at Athens. She was at first inseparably connected and confounded with Pallas Athena, the dispenser of victory, but gradually separated from her. As an attribute of both Athena and Zeus she is represented as a small figure carried by those divinities in their hand. Athena Nike was always wingless, Nike as a separate goddess winged. In works of art she appears carrying a palm branch or a wreath (sometimes a Hermes staff as the messenger of victory); erecting a trophy or recording a victory on a shield; hovering with outspread wings over the victor in a competition, since her functions referred not only to success in war, but to all other human undertakings. In fact, Nike gradually came to be recognized as a sort of mediator of success between gods and men.

At Rome the goddess of victory (Victoria) was worshipped from the earliest times. Evander was said to have erected a temple in her honour on the Palatine before the foundation of Rome itself (Dion. Halic. i. 32, 33). With the introduction of the Greek gods, Victoria became merged in Nike. She always had a
firm hold over the Roman mind, and her popularity lasted till the end of paganism. Special games were held in her honour in the circus, and generals erected statues of her after a successful campaign. She came to be regarded as the protecting goddess of the senate, and her statue (originally brought from Tarentum and set up by Augustus in memory of the battle of Actium) in the Curia Julia (Dio Cassius II, 22; Suetonius, Aug. 100) was the cause of the final combat between Christianity and paganism towards the end of the 4th century. Victoria had altars in camp, a special set of worshippers and colleges, a festival on the 1st of November, temples at Rome and throughout the empire. The Sabine goddess Vicuna and Vica Pota, one of the divi indigetes (see divi indigetes), were in time merged with various figures on the victoria (Livy xxxix. 14). Representations of Nike—Victoria in Greek and Graeco-Roman art are very numerous. The statue of Nike at Olympia by Paeonius has been in great part recovered.

See A. Baudrillard, Les Divinités de la victoire en Grèce et en Italie (1894), whose view that in the 5th century Nike became detached from Athena, although Athena Nike still continued to exist, is supported by Miss J. E. Harrison (Classical Review, April 1895) and L. R. Farnell (Cults of the Greek States I, 1896), but opposed by E. Sikes (C.R., June 1895), who holds that "while Nike was a late copy of Athena, there is no evidence that the victory cannot have originated, either at Athens or elsewhere, from an aspect of Athena"; F. Studzicka, Die Siegestoyl (Leipzig, 1890); and the Fränkische Museum zu Nürnberg (Bilder über das Cultusbild der Athena Nike (Vieja, 1879); G. Boissier, La fin du paganisme (1891); Gibbon, Decline and Fall, ch. 28.

In the article Greek Art, fig. 32 represents Nike pouring water over a sacrificial ox; fig. 36 the floating Nike of Paeonius; figs. 61, 62 (Pl. iii.), the winged Nike of Samothrace; the running or flying figure (fig. 19) is also possibly a Nike.

NIKISCH, ARTHUR (1855—), Hungarian conductor, became known as a musical prodigy at an early age, making a public performance as a pianist at eight years old. He studied at the Vienna Conservatoire from 1866 to 1873, and while there he composed a symphony and other works. For a while engaged as a violinst, but in 1877 he began as assistant conductor at the Leipzig opera and two years later became chief conductor. His success there, and his reputation as the producer of the more modern types of music as well as of classical masterpieces led to his being appointed conductor of the symphony orchestra at Boston, U.S.A., from 1880 to 1893; and subsequently, after having been director at the Budapest opera, he was made conductor at the Leipzig Gewandhaus. His fame was now widespread, and he made successful visits to London, Paris and other capitals, his ability as a pianoforte accompanist being recognized no less marked than his brilliance as director of an orchestra.

NIKITIN, ATHANASIUS, of Tver (fl. 1468-1474), Russian merchant, traveller and writer, the earliest known Russian visitor to India. He started in 1468 on his "wanderings beyond the Three Seas" (Caspian, Euxine and Indian Ocean), and descended the Volga, passing by Uglich, Kostroma, Nizhny Novgorod, Kazan, Sarai and Astrakhan. Near the latter he was attacked and robbed by Tartars; but he succeeded in reaching Derbent, where he joined Vasili Tapin, the envoy of Ivan III. of Moscow to the shah of Shirvan; from Nizhny Novgorod he had travelled with Hasan Bey, the Shirvan shah's ambassador, returning to his master with a present of falcons from Ivan. At Derbent Nikitin vainly endeavoured to get means of returning to Russia; failing in this, he went on to Batu, where he notices the "eternal fires," and thence over the Caspian to Bokhara. Here he stayed six months, after which he made his way southward, with several prolonged stoppages, to the Persian Gulf, through Mazanderan province and the towns of Amul, Demavend, Ray (near Tehran), Kazan, Nain, Yazd, Sirjan, Tarun, Lar and Bandar, opposite New (equator) to Persia. From here he travelled by sea to Gujarat, Cambay and Chaul in western India. Landing at Chaul, he seems to have travelled to Ummr in Aurangabad province, south-east of Surat, and thence to Beder, the modern Ahmedabad. Here, and in adjacent regions, Nikitin spent nearly four years; from the little he tells us, he appears to have made his living by horse-dealing. From Beder he visited the Hindu sanctuary ("their Jerusalem") of Perwattam. He returned to Russia by way of Calicut, Dabul, Muscat, Hormuz, Lar, Shiraz, Yazd, Isfahan, Kashan, Sultanabad, Tabriz, Trebizond and Kaffa (Theodosia), in the autumn. He has left us descriptions of western Indian manners, customs, religion, court-ceremonies, festivals, warfare and trade, of some value; but the text is corrupt, and the narrative at its best is confused and meagre. His remarks on the trade of Hormuz, Cambay, Dabul, Ceylon, Pegu and China; on royal progresses and other functions, both ecclesiastical and civil, at Beder; and on the wonders of the great fair at Perwattam—as well as his comparisons of things Russian and Indian—deserve special notice.

Two MSS. are known: (1) in the library of the cathedral of St. Cyril at Moscow; (2) in the library of the Tent of the Tendai Monastery (Treato-Sergievskaya Lavra) near Moscow. See also the edition by Pavel Mikhailovich Stroev in Sofiiskii Vremennik (A. 862-1534), pt. ii. pp. 145-154 (Moscow, 1820-1821); and the English version in India in the 15th Century, pp. xxxiv.-lxxv.: 1-32 (separately paginated). Nikitin's being the third narrative in the volume, translated and edited by Count Wielhorski; London, Hakluyt Society, 1857.

NIKKO, one of the chief religious centres of Japan. The name belongs properly to the district, but is as commonly applied to the principal village, Hachi-ishi, which is 91 m. N.E. of Tokyo by rail. The district is high-lying, mountainous and beautiful, and is in favour for summer residence. The chief objects of interest are the temple of Futarasan (Mount of Brightness), a Shinto temple seems to have existed at Nikko from time immemorial, and in 767 its first Buddhist temple was founded by Shodo Sho-nin (the subject of many strange legendary adventures); but the main celebrity of the place is due to the sepulchres and sanctuaries of Ieyasu and Iemitsu, the first and third shoguns of the Tokugawa dynasty. Ieyasu was buried with amazing pomp in 1617, and Iemitsu, his grandson, was slain in 1650 while visiting his tomb. From 1644 to 1668 the "birds" of Nikko were always princes of the imperial house; and the "sixth road" of Nikko was always kept in its original form, with a censer, a censer and an enclosure. Though the magnificent abbots' residence was destroyed by fire in 1871, and the temples have lost most of their ritual and much of their material splendour, enough remains to astonish by elegance and bewilder by variety of decorative detail. Of the numerous structures which cluster round the shrine of Ieyasu, it is sufficient to mention the cylindrical copper column (1643), a guardian against evil influences, 42 ft. high, adorned at the top with a series of lotus flowers, from the petals of which hang small bells; a five-storied pagoda (1639), 104 ft. high, with the signs of the zodiac carved round the base; the gate of the Two Dragons, which has as figures of unicorns, lions, tigers, elephants, mythical animals and tree-peonies; the vermilion-coloured timber enclosure to which this gate gives entrance, with three great storehouses, a sumptuous stable for the sacred horses, and a finely fashioned granite cistern (1618) for holy water; and the Yo-mei-mon gate, which with the contiguous cloister is covered with the most elaborate carving, and gives access by way of another gate (Kara-Mon) to the court in the midst of which stands the last and most sacred enclosure. This, known as the Tamagoh; is a quadrangle of girt trellis-work 50 yds. square; within it stands the "chapel" or oratory (or rather a series of chambers), in the decoration of which gilding and black lacquer have been lavishly employed. The tomb of Ieyasu lies apart about two hundred steps higher up the hills, in the shadow of tall cryptomerias—a single light-coloured bronze urn or casket standing on a circular base of three steps with a stone table in front on which rests a censer, a lotus-cluster and a stork with a candlestick in its mouth, the whole enclosed by a high stone wall. Somewhat similar are the tomb of Iemitsu and its surroundings; and though the art displayed is of an inferior character, the profusion of buildings and embellishments is very great. From Ieyasu's tomb to a spot on the hill on which the tomb stands, is completely covered to the summit with trees of various tints. There are numerous temples and shrines of minor interest in the locality.

NIKOLAYEV, a town, seaport and chief naval station of Russia on the Black Sea, in the government of Kherson, 40 m. N.W. of the city of Kherson. Pop. (1881) 35,000; (1897) 77,210; (1897) 92,060. Nikolayev stands a little above the
confluence of the Ingul with the Bug, at the head of the liman, or estuary, of the Bug, and is the natural outlet for the basin of that river. The estuary, which is 25 m. long, enters that of the Dnieper. The entrance to the double estuary is protected by the fortress of Ochakov and by the fort of Kinburn, erected on a narrow headland opposite, while several forts surround Nikolayev on both sides of the Bug and protect it from an attack by land. Over the bar at Ochakov the water has been deepened to 25 ft., and over the bar of the Dnieper to 20 ft. by dredging. The town, which occupies two flat peninsulas between the Bug and the Ingul, extends up the banks of the latter, while its suburbs reach still farther up the estuaries of its tributaries. The town is divided into one another at right angles. The bank of the Ingul is taken up with shipbuilding yards, docks, slips and various workshops of the admiralty for the construction of armour-plates, guns, boilers, etc. On the river there is a floating dock for armoured ships. Before the Crimean War the activity of the dockyards was very great; the suburbs—which belong to the admiralty—were bound to supply the necessary hands to the number of 3000 every day, and all the inhabitants had to perform compulsory service. Since 1870 the construction of armoured ships and torpedoes has been carried on at Nikolayev. Nikolayev was the chief port for the Russian volunteer fleet, which sailed to and fro between this port and Vladivostok until the Russo-Japanese War of 1904-05. Nikolayev has steam flour-mills, iron and machinery works, saw-mills, soap, tobacco, vinegar, carriage and agricultural machinery works. The foreign exports consist almost entirely of cereals, especially wheat and rye, with a little sugar, iron and manganese ore and oilcake. The total value reaches £7,000,000 to £9,000,000 annually. Navigation is maintained during the whole winter by the aid of a powerful ice-breaker. Nikolayev is the chief market for the governments of Kherson, Poltava, Kharkov, Esterhazy and parts of Kiev, Kursk and Podolia. In addition to the naval harbour, there are the harbour of the Russian Steamship Company and the coating harbour, made in 1893; while large storehouses stand close to the commercial port, 2 m. from the town, at Popovaya-Balka on the Bug. The educational institutions include an artillery school, a school of navigation, two technical schools, an astronomical and meteorological observatory, museums and libraries, and a hydrographical institute. Amongst the public buildings, the cathedral, which contains some good Italian pictures, the theatre, the artillery arsenal, the admiralty and other state buildings are worthy of mention.

The remains of the Greek colony Olbia have been discovered close to the confluence of the Ingul with the Bug, 10 m. S. of Nikolayev. In medieval times the country was under the Lithuanians, and subsequently under the Zaporozian Cossacks. Russian colonists settled in the locality about the end of the 18th century, and after the fall of Ochakov, Prince Potemkin established (1789) a wharf on the Ingul which received the name of Nikolayev. (P. A. K.; J. T. B.)

NIKOLAYEVSK, a town of East Siberia, in the Maritime province, on the left bank of the Amur, 20 m. above its outflow into the Gulf of Amur, in 53° 8' N. Pop. (1897) 8200. It is defended by a fort and batteries. Founded in 1851, Nikolayevsk was formerly the capital of the Maritime province.

NIKOLAYEVSK, a town of Russia, in the government of Samara, on the right bank of the Iriz, 40 m. from the Volga and 100 m. S.W. of the town of Samara. Pop. (1897) 32,524. Its inhabitants are mostly Raskolniks (i.e. Nonconformists), who have numerous monasteries along the river, and members of the United Greek Church, with about 2000 Tatars. The chief occupations are agriculture and Eve stock breeding.

Under the name of Metchetnoff, Nikolayevsk was founded in 1762 by Raskolniks who had fled to Poland and returned when Catherine II. undertook to grant them religious freedom. In 1828 serious persecutions began, with the result that the monasteries were closed with the exception of three, which were handed over in 1829 and 1836 to the United Greek Church. In 1835 the name of the town was changed to Nikolayevsk.

NIKOLAYEVS KAYA, SLOBODA, a town of Russia in the government of Astrakhan, 3 m. from the left bank of the Volga, opposite Kamyshin, and 110 m. N. of Tsarsitsyn. Pop. (1897) 20,000. It dates from the end of the 18th century, when a number of Little Russians settled there for the transport of salt from Lake Elton. It is one of the chief centres on the lower Volga for the trade in corn and salt.

NIKOLSBURG (Czech, Mikulov), a town of Austria, in Moravia, 53 m. S. of Brünn by rail. Pop. (1900) 8091. It is situated at the foot of the Polau Mountains and near the border of Lower Austria. It possesses a château of Prince Dietrichstein-Menlowitz, a considerable arsenal and a large arsenal of rubber. The town was formerly inhabited by Lituans, a tribe of Lithuanian origin, which possessed a notable asylum for Waldenses. The modern inhabitants, who are mainly Germans, are mostly of Magyarian stock. The place was called Mikowiez in the 13th century, and is first mentioned in 1383. In 1828 the place was destroyed by fire. The town is famous for its fine cathedral, with a very elaborate and highly carved Gothic façade. The church contains a number of fine pictures, including a copy of the Madonna of an unknown artist of the 13th century. The town is noted for its wine and its famous porcelain, which is still produced in the town.

NIKON [NIEZT MININ] (1605-1682), 6th patriarch of Moscow, Russian, was a son of a peasant farmer named Min, born on the 7th of May 1605 in the village of Valmanovo, 90 versts from Nizhny Novgorod. Missery pursued the child from his cradle, and prematurely hardened a character not naturally soft; he ran away from home to save his life from an inhuman stepmother. But he gave promise betimes of the energy and thoroughness which were to distinguish him throughout his life, and contrived to teach himself reading and writing. When he was but twenty his learning and talents obtained for him a cure of souls. His eloquence attracted attention, and, through the efforts of some Moscow merchants, he was transferred to a patrician parish in the capital. Shortly afterwards, seeing in the loss of his three little children a providential warning to seek the higher life, he first persuaded his wife to take the veil and then withdrew himself first to a desolate hermitage on the isle of Anzersky on the White Sea, and finally to the Kozhuzersky monastery, in the diocese of Novgorod, of which he became abbot in 1643. On becoming a monk he took the name of Nikon. In his official capacity he had frequently to visit Moscow, and in 1640 made the acquaintance of the pious and impressionable Tsar Alexius, who fell entirely under his influence. Alexius appointed Nikon archimandrite, and later patriarch, of the wealthy Novosospassky monastery at Moscow, and in 1648 metropolitan of Great Novgorod. Finally (1st of August 1652) he was elected patriarch of Moscow. It was only with the utmost difficulty that Nikon could be persuaded to become the arch-pastor of the Russian Church, and he only yielded after imposing upon the whole assembly a solemn oath of obedience to him in everything concerning the dogmas, canons and observances of the Orthodox Church.

Nikon's attitude on this occasion was not affectionate, but the wise determination of a would-be reformer to secure a free hand. Ecclesiastical reform was already in the air. A number of ecclesiastical dignitaries, known as the party of the protopopes (deans), had accepted the responsibility for the revision of the church service-books inaugurated by the late Patriarch Joasaph, and a few other very trivial rectifications of certain ancient observances. But they were far too timid to attempt anything really effective. Nikon was much bolder and also much more liberal. He consulted the most learned of the Greek prelates abroad; invited them to a consultation at Moscow; and finally the scholars of Constantinople and Kiev opened the eyes of Nikon to the fact that the Moscow service-books were heterodox, and that the icons actually in use had very widely departed from the ancient Constantinopolitan models, being for the most part imitations of later Polish and Frankish (West European) models. He at once (1654) summoned a properly qualified synod of experts to re-examine the service-books revised by the Patriarch Joasaph, and the majority of the synod decided that "the Greeks should be followed rather than our own ancients." A second council, held at Moscow in 1656, sanctioned the revision of the
service-books as suggested by the first council, and anathematized the dissident minority, which included the party of the protopopes and Paul, bishop of Kolomna. Heavy weight came with the fullest ecumenical authority, Nikon's patriarchal staff descended with crushing force upon the heterodox. His scheme of reform included not only service-books and ceremonials but the use of the "new-fangled" ikons, for which he ordered a house-to-house search to be made. His soldiers and servants were charged first to gouge out the eyes of these "heretical counterfeits" and then carry them through the town in derision. He also issued a ukaz threatening with the severest penalties all who dared to make or use such ikons in future. This ruthless measure goes far to explain the trouble that entered in with the "Old Ritualists" and the "Old Believers," as they now began to be called, ever afterwards regarded Nikon and all his works.

From 1652 to 1658, Nikon was not so much the minister as the colleague of the tsar. Both in public documents and in private letters he was permitted to use the sovereign title. Such a free use did he make of his vast power, that some Russian historians have suspected him of the design of establishing a particular national papacy; and he himself certainly maintained that the spiritual was superior to the temporal power. He enriched the numerous and splendid monasteries which he built with valuable liberalties. His empires were subject to the predominant power, and the Orient for precious Greek and Slavonic MSS., both sacred and profane. But his severity raised up a whole host of enemies against him, and by the summer of 1658 they had convinced Alexius that the sovereign patriarch was eclipsing the sovereign tsar. Alexius suddenly grew cold towards his "own familiar friend." Nikon thereupon publicly divested himself of the patriarchal vestments and shut himself up in the Voskresensky monastery (19th of July 1658). In February 1660 a synod was held at Moscow to terminate the "wickedness" of the Muscovite Church. Nikon, who had now been put out a pastor for nearly two years. The synod decided not only that the new patriarch should be appointed, but that Nikon had forfeited both his archiepiscopal rank and his priest's orders. Against the second part of this decision, however, the great ecclesiastical expert Epiphani Slavenitsky protested energetically, and ultimately the whole inquiry collapsed, the scrupulous tsar shrinking from the enforcement of the decrees of the synod for fear of committing mortal sin. For six years longer the Church of Muscovy remained without a patriarch. Every year the question of Nikon's deposition became more complicated and confusing. Almost every month a new petty controversy was excited. His empires were subject, and no two authorities agreed. At last the matter was submitted to an ecumenical council, or the nearest approach to it attainable in the circumstances, which opened its sessions on the 18th of November 1666 in the presence of the tsar. On the 12th of December the council pronounced Nikon guilty of reviling the tsar and the whole Muscovite Church, of deposing Paul, bishop of Kolomna, contrary to the canons, and of beating and torturing his dependants. His sentence was deprivation of all his sacerdotal functions; henceforth he was to be known simply as the monk Nikon. The same day he was put into a sledge and sent as a prisoner to the Therapontov Belyezovskaya monastery. Yet the very council which had deposed him confirmed all his reforms and anathematized all who should refuse to accept them. Nikon survived the tsar (with whom something of the old intimacy was resumed in 1671) five years, expiring on the 17th of August 1681.

S. Ikonnikov, New Materials concerning the Patriarch Nikon (Russ.) (St Petersburg, 1899); William Palmer, The Patriarch and the Tsar (London, 1871-1876).

NIKOPOL, a town of Russia, in the government of Ekaterinoslav, on the right bank of the Dniester, 70 m. S.S.W. of the town of Ekaterinoslav. It was formerly called Nikitin Rog, and occupies an elongated peninsula between two arms of the Dniester at a point where its banks are low and marshy, and has been for centuries one of the places where the middle Dniester can most conveniently be crossed. Its inhabitants, 21,892 in 1900, are Little Russians, Jews and Mennonites, who carry on agriculture and shipbuilding. The old seokas, or fortified camp, of the Zaporogian Cossacks, brilliantly described in N. V. Gogol’s novel Taras Bulba (1834), was situated a little higher up the river. Numbers of graves in the vicinity recall the battles which were fought for the possession of this important strategic point. One of them, close to the town, contained, along with other Scythian antiquities, the well-known precious vase representing the capture of wild horses. Even now Nikopol, which is situated on the highway from Ekaterinoslav to Kherson, is the point where the "salt-highway" of the Chemaks (Little Russian salt-carts) crosses the Dniester. Nikopol is, further, one of the chief places on the lower Dniester for the export of corn, linseed, hemp and wool.

NIKOPOLI, or NICOPOLIS (Turkish, Nhigebolu or Nebul), the chief town of a sub-prefecture in the district of Plevna (Plevon), Bulgaria. Pop. (1908) 5,236, including 3,339 Turks and 1,615 Bulgarians. Nikopoli is picturesquely situated on the south bank of the Danube, where it receives the Osem. Until the creation of a new port at Somovit, in the neighbourhood, Nikopoli served as an outlet for the trade of Plevna, Lovtcha and other towns in the interior, the principal export being cereals. The following are the chief points in the modern history of the place:—capture of the fortress by Sigismund of Hungary in 1392 and 1395; defeat of Sigismund and his hosts in 1396 by Bayezid I.; siege of the town by King Ladislaus I. of Hungary in 1444; defeat of the Turks by Balbo in 1571 and by the Howitzers in 1598; capture of the town by Pasvan-oglu in 1777; occupation of the fortress by the Russians under Kamensky in 1810; destruction of the Turkish flotilla and storming of the Turkish camp by Govarov in 1829; capture and burning of the town by the Russians under Krudener on the 15th of June 1877.

NIKSHICH (also written Nikshitch and Nikshiti; Croatian, Nikšić), a town of Montenegro, lying in a flat plain enclosed by lofty mountains on the north-west, and watered by the river Zeta. Pop. (1900) about 3,500. Owing to the prevalence of floods, a good vineyard, a gift from Russia, was raised on the river, and the mountain road which leads to Podgorica, 60 m. S.E. Nikshich consists of a mass of white houses, dominated by the belfry and the pale yellow cupola of its cathedral, another gift from Russia. This building is chiefly Byzantine in style, and, though hardly beautiful, is the most impressive and by far the largest of Montenegrin churches. Close by stands a barrack-like royal palace; and a little beyond the town are the ruins of an old castle. As Nikshich possesses a brewery and a clothmill, besides the chief mart of Western Montenegro for timber, hides, farm-produce and livestock, it ranks second in commercial importance to Podgorica. About 7 m. S.E. is the celebrated shrine of Ostrog (see MONTEGRO). Nikshich was included in the Turkish province of Herzegovina until 1876, in which year it was stormed by the Montenegrins, led by Prince Nicholas in person. In 1878 the Montenegrin possession was ratified by the treaty of Berlin.

NILE, the longest river of Africa, and second in length of all the rivers of the globe, draining a vast area in north-east Africa, from the East African lake plateau to the shores of the Mediterranean. Although falling short of the length of the Mississippi-Missouri (2,454 m. according to the estimate of General Tillo1), the Nile is at the head of all rivers as regards the length of its basin, which extends through 35° of latitude or 2,450 m. in a direct line, with a waterway of about 4,000 m. The Nile proper, i.e. from the outlet at Victoria Nyanza to the sea, is 4,247 m. long.

1 General Alexi A. Tillo (1839-1900), Russian scientist and geographer, author of works on geodesy, meteorology, &c.
The Name.—The early Egyptians called this river by a name which was probably pronounced Hap. It seems to be connected with a root meaning “concealed,” “mysterious.” This survived as a religious designation down to the fall of paganism. The “great river” was also a frequent name for the main stream, and this became the usual name of the Nile in late times as Jer-o and continued in use amongst the Copts. In the Bible the Nile is regularly named Yco (the, “he”), from the contemporary Egyptian Yor, “river.” The origin of the Greek and Roman name Νέιος, Νίλος, is quite unknown. Μυστήριος in the Odyssey is the name of the Nile (masc.) as well as of the country (fem.). The Arabs preserved the classical name of the Nile in the proper name En-Nil (النيل), or Nil-Misr (نيل مصر), the Nile of Misr (Egypt).

The same word signifies indigo.

The modern Egyptians commonly call the river El-Bahr, “the sea,” a term also applied to the largest rivers, and the inundation “the Nile,” En-Nil; and the modern Arabs call the river Bahr-en-Nil, “the river Nile.”

Basin of the River.—The Nile system is a simple one with three principal divisions: (1) the main stream running south to north, and fed by the great lakes of East Central Africa; (2) the equatorial tributary rivers draining the country north-east of the Congo basin; (3) the Abyssinian affluents. The extent of the basin of the Nile is clearly indicated on the map. Its area is estimated at 1,107,227 sq. m., which compares with the 1,425,000 sq. m. area of the Congo basin. The smaller basin of the longer river is due to its narrowing through the Sahara. Southward the basin includes the northern part of the plateau between the two “Rift” valleys which traverse that part of Africa, and also that portion of the Albertine (or western) “Rift” valley which lies north of the Mfumbiro mountains. That part of the plateau within the Nile basin is occupied by the Victoria Nyanza and its affluents. These affluents drain a comparatively small part of this plateau, which stretches south to Lake Nyasa. The most remote feeder of the Nile in this direction does not extend farther than 3° 20’ S. West and W.S.W. of Victoria Nyanza, however, the Nile basin reaches 3° 50’ S. (264 m. south of the equator) and 20° 15’ E., following the crest of the hills which dominate the north-eastern shores of Lake Tanganyika and the eastern shores of Lake Kivu. Turning north-westward from this point the Nile basin crosses the mountainous region of Mfumbiro and includes that of Ruwenzori. Its limit is marked by the western wall of the

1"En-Nil is the river (lit. the inundation) of Egypt: Es-Sagharn sayes—‘But as to the nil [indigo] with which one dyes, it is an Indian word Arabicized ‘ (“The Mishb of El-Fayymi)."
Albertine Rift valley, in which lie the Albert Edward and Albert Nyanzas. For a considerable distance the water-parting between the Congo and the Nile is close to the Albert Nyanza and to the Nile as it flows from that lake, but not far north of Wadelai (2° 46' E.), the Nile and the Nile basin spread westward over the wide area drained by the Bahir-Ghazal and its tributaries. In this region there is no well-marked watershed between the Congo and Nile systems, which interlace. Further north the limit of the valley is marked by the hills of Darfur. Below that point the valley of the Nile extends but a mile or two into the desert.

The south-eastern limits of the Nile basin extend nearly to the western escarpment of the eastern Rift valley—the dividing plateau being a narrow one. North of the equator a bend is made westward to Mt. Elgon which raises the northern limit of its water towards Lake Rudolf. From Mt. Elgon the Nile watershed is some distance to the west of that lake, while to its north a turn is made again, the watershed including a great part of the Abyssinian highlands. Beyond 15° N. it follows a line generally parallel to the west shore of the Red Sea, except where diverted to the west by the basin of the Khor Baraka.

Sources of the Nile.—The question of the sources of the Nile opens up a number of very famous problems. The Unsinkable Nile of Du Faur, the Victoria Nyanza (q.e.), is the great reservoir whence issues the Nile on its long journey to the Mediterranean. But if the source of a river be considered to be the most remote headstream (measured by the length of course) then the sources of the Nile are the upper branches of the Kagera. Among the feeders of Victoria Nyanza the Kagera is by far the most important, both for length of course and for the volume of water contributed. The name of Lake Victoria, then, is not merely a title of convenience, but the name of a region. The Kagera and its tributaries, the more important of which are the Nyabarongo, the Ruvuvu, and the Raphia, are the chief branches uniting to form the Kagera, and of these the most important for the volume of water carried is said to be the Nyabarongo. The Nyabarongo is formed by the union of various mountain streams, the Ruvuvu, and the Raphia, being the chief. The Rukarara rises in about 2° 20' S., 29° 20' E., at an elevation of some 7000 ft., in a picturesque and bracing region immediately east of the Albertine Rift valley. The Nyabarongo first flows southeasterly through the plateau of Elgon, and then southward, which is its main course, and finally, on reaching 2° 20' S. unites with the Akanyaru just west of 30° E. The Akanyaru, which comes from the south-west, has been sometimes considered to be the larger stream, but according to Dr. Richard Kandt it carries decidedly less water, while its course is shorter than that of the Nyabarongo. The combined stream takes an easterly and southerly direction, flowing in a swampy valley and joining a little west of 31° E. the third branch of the Kagera, the Ruvuvu, coming from the south. The source of the Ruvuvu is in about 2° 55' S., 29° 56' E., but its most southern tributary, and the most distant, is the Nyabarongo. The Nyabarongo rises in about 3° 45' S., 29° 50' E., and flows north-east, joining the Ruvuvu, which has hitherto had an easterly direction, in about 30° 25' E., 3° 10' S. From this point the Ruvuvu flows north-west to join the Raphia. From this confluence the combined stream of the Kagera flows north and north-west in a valley stream with small lakes until almost 1° S., when it turns east, and finally empties itself into Victoria Nyanza just north of 1° S., the mouth forming a small projecting delta. Its lower course is navigable by shallow draught steamers. The total length of the Kagera, reckoning from the source of the Nyabarongo, is some 430 m. Its volume is stated to vary between 21,000 and 54,000 cub. ft. per second. All the other feeders of Victoria Nyanza are small and often intermittent rivers, the largest being probably the Nzoia, which enters on the north-east from the plateaus south of Mount Elgon. (The rivers which enter Albert Edward and Albert Nyanzas and, with those lakes, form the western sources of the Nile, are dealt with under Albert Edward and Albert Nyanzas.)

The Victoria or Somerset Nile.—The ridge of high land which forms the northern shore of Victoria Nyanza is broken at its narrowest part, where the pent-up waters of the lake—through which a drift from the Kagera jet into the Nile outlet is just perceptible—have forced a passage at the northern end of a beautiful bay named Napoleon Gulf. At this spot, 30 m. north of the equator, at an altitude of 3704 ft., the Nile issues from the lake between cliffs 200 m. and more in height, and forms a narrow gorges. From this point on the river becomes a much greater. The escaping water precipitates itself over a rocky ledge with a clear fall of 161 ft. The falls, some 400 yds. across, and 130 yds. high, are deeply cut into the soft shales by which they are named the Ripon Falls, after Earl de Grey and Ripon (afterwards 1st marques of Ripon), president of the Royal Geographical Society in 1859. The Victoria or Somerset Nile, as this section is called, has at one time a depth of nearly 30 ft. and at another only about 1 ft. From this point to the upper end, the river is one of much grandeur. The escaping water precipitates itself over a rocky ledge with a clear fall of 161 ft. The falls, some 400 yds. across, and 130 yds. high, are deeply cut into the soft shales by which they are named the Ripon Falls, after Earl de Grey and Ripon (afterwards 1st marques of Ripon), president of the Royal Geographical Society in 1859. The Victoria or Somerset Nile, as this section is called, has at one time a depth of nearly 30 ft. and at another only about 1 ft. From this point to the upper end, the river is one of much grandeur. of the Abai the majority join it on its left bank. The Bashiko, Jamma and Muger, which reach the Abai in the order named, drain the country east of the main stream between the basins of the Takaze and the Abai, their waters being conducted in the mountains which form the watershed between the Nile and the Lake Rudolf basin. Next comes the Disdessa, a large stream rising near the head-waters of the Baro (the main upper branch of the Goang or Bahr el-Aswad) and forming the boundary between the Abyssinian hills. All these affluents are perennial, as is the Balossa or Yebis, a right-hand tributary which reaches the Abai below the junction with the Tana. Four miles below Famaika the river is joined on its left bank by the Teresero. This affluent receives on its right bank two considerable tributaries from the Abyssinian heights, the Dinder, a very long but not perennial stream, and the Rakel, waterless in the dry season, copiously richly charged with sediment during the rains from June to September. At this period the discharge of the Blue Nile rises from less than 200 to over 10,000 cub. metres per second, thus greatly enlarging that of the White Nile, itself, which is only about 800 cub. metres during the floods above the confluence. The length of the Blue Nile is about 850 m. The country, El Geizia, enclosed in the triangle formed by the junction of the White and Blue Niles forms the Nile portion of the Anglo-Egyptian Sudan. The flood season preserves, however, the name of Abai, and at its confluence with the Nile has a breadth in flood time of over 900 yds. The Abai and its tributaries, like many of those which empty into the Nile, rise after a time of uninterrupted rainfall. In its lower course the Abai runs completely dry, but higher up water may be found in deep pools, hollowed out of the sand bed of the stream by the river when in flood. These pools are full of jawbone and crocodile remains which remain imprisoned until the return of the flood. The country comprised between the Nile proper, the Abai and the Blue Nile is identified with the island of Meröe of ancient history.

The Cataracts.—Downstream the Abai junction the Nile continues its course to the Mediterranean, traversing a distance of over 1600 m. without receiving a single tributary on either bank. The river here is wide and slow, and its waters, laden with the remains of the vast floodplains of the Nubian desert, are of a deep brownish colour. Below Khartoum, in lat. 18° 27' E., the river, flowing in a slightly sinuous course, becomes narrower and deeper, and its latitude is given as 19° 0'. At Abu Zeid (about 13° 5' N.) for a distance of nearly 4 m. the river is extremely broad and shallow, being fordable at low water. Fifteen miles lower down, at Goa Aba Goma—which is the northern limit of the suck vegetation—the river is divided into two channels by Abba Island, wooded, narrow and 28 m. long. On Abba Island lived, for some years before 1861, Mohammed Ahmed, the Mahdi.

The Blue Nile.—Five hundred and twenty miles below the Sobat mouth and 1652 m. from Ripon Falls, in 15° 37' N., the White Nile is joined by its greatest eastern affluent the Bahr-el-Azrak or Blue Nile. This river, which runs northwards, is the Anglo-Egyptian Sudan, while on the western bank of the Nile is Omdurman, the former Mahdist capital. The Blue Nile, or Abai as it is called in Abyssinia, joins the White Nile in 11° N. and 37° E., and flowing northwards 70 m. enters Lake Tana (q.v.) near its south-west corner, to issue again at the south-east end. The Abai and its tributaries drain a great part of the Abyssinian plateau, and its waters sink below the line of the northern foothills of the Banat, and end in Lake Tana, through the dam of the Aswak Dam. The Abai itself on leaving Lake Tana makes a great semicircular sweep S.E. to N.W., from the highlands of Ethiopia to the plains of Sennar. In this section of its course its swirling waters reach a height of 140 ft. above sea-level, and at the point of its confluence with the Blue Nile at Khartoum, 1300 ft. above sea-level. Of the tributaries

1 At Khartoum the water of the one river is of a greenish-grey colour, that of the other is clear and blue, except when in flood, if when it flows a chocolate brown from its alluvial burden.

2 The fall in the river-bed, as given in these pages, is an approximation derived from barometric readings only.
In a length of 3 m, the river fell 161 ft. Since the completion of the great Aswan dam the Nile has been practically constant. The greatest rise (Dec.) is only 40’ higher than the lowest level reached at the middle of June, after which the rise is slow. In July and August the river is fully 80’, and in September the beginning of October. By using the water stored by the Asuan dam in the months following high Nile, the river lower down has been, since 1902, replenished at times of low water to meet the needs of cultivation. The great Aswan dam, which is exceeding the height of the cataract. Upstream from the dam a lake some 100 m. in length has been formed. The Aswan Dam was opened on the 20th of December, 1898, by King Edward VII on the right bank, with a ceremony that above Aswan. The valley is comparatively narrow, being an almost level depression in a limestone plateau—the area of fertility ends where the land ceases to be irrigated by the river. At Edfu, 68 ft. from its source, the river is 5000 ft. wide, carrying, according to some, the flow of the water, and at Assiut, 274 m. below Edfu, is another barrage fulfilling the same purpose. Cairo, the capital of Egypt, is built on the eastern bank of the Nile 12 m. north of the apex of the delta.

At the beginning of the delta the Nile separates into two channels, the Rosetta and the Dumiatta, which join the Mediterranean at its south-east angle. At the bifurcation is a double barrage, by means of which the water can be dammed to the height required for forcing the river into the canals which irrigate the delta. Of the two branches the Dumiatta is the more important. Both are separated by a small sandbank. Beyond the coast-line, which is low and sandy, are a number of salt marshes or lagoons. Whilst the Dumiatta branch is gradually silt ing up, the Rosetta branch is scouring out a way towards the sea. Along the bed of full flood the depth of the water in either branch is about 23 ft.

**Hydrography.**—The fertility and prosperity of Egypt and the northern part of the Sudan being entirely dependent on the irrigation of the flood, the variation in the height of the Nile affects the water-supply of the delta in a very important manner. The river varies in height at different seasons of the year is of vital importance. (In Egypt) the height of the flood has been recorded annually, as the chief event of the year since at least 3600 B.C. Above the Rosetta the Nile traverses a region of heavy rainfall and the water-supply is super abundant. It is from Victoria, Albert and Albert Edward Nyanzas and their feeders, and in a lesser degree from the Baher-el-Ghazal, that this river obtains its constant supply of water throughout the year. The great lakes and the region of swamps, containing a large proportion of the water they receive, act as natural reservoirs and prevent the lower Nile from ever running dry in summer. The Abyssinian branches are the chief cause of the Nile flood. In the equatorial regions rainfall varies from 30 to 80 in. during the year with a mean of about 50. It is heaviest in the months of January, February, March and April, and again in October and November. The most rainy periods of the lake plateau (where alone occurs a rainfall of 60 in. and over) lie along the eastern edge of the Albertine Rift valley, and west and north of Victoria Nyanza. These rains feed Albert Edward Nyanza, which, by means of the Chaguru river, supply a great part of the water of Victoria Nyanza. The water in the Victoria Nyanza begins to rise in January, the rise becomes marked, is at its height in July, at the beginning of the fall, and begins to subside in September. The Baher-el-Jebel is at its lowest in March and April and at its highest in September. The seasonal supply of the Baher-el-Ghazal does not vary very greatly, the maximum rises which occur in November and December, however, has but a slight discharge. The Obat, from December to March, is at its lowest, and is in flood from June to October, during which period the water (milky colored) which it pours into the Nile equals in volume that of the main stream. It is the colour of the Obat water which gives its name to the White Nile. The Blue Nile, at its confluence at Khartoum, begins to rise in June and is in flood from July to October; the Obat is also in flood during the same months. The great difference in the supply of water from the equatorial regions and from Abyssinia arises from the fact that the first-named district is one of heavy rain practically all the year round; whereas in the other the rainfall is concentrated in the months of June to September. Reduced to its simplest expression, the Nile system may be said to consist of a great steady flowing river fed by the rains of the tropics, controlled by the existence of a vast sea of swamps and reservoirs of fresh water. (IRRIGATION: Egyt.)

At Assuan the average depth of the river is 30 ft. only. At Khartoum it is 245 ft. At Assuan the Nile is lowest in April and May and highest in August and September. Its minimum depth is 18 ft. and its maximum depth 29 ft.

1 In ancient times the delta was watered by seven branches; five of these branches are now canals not always navigable. The ancient branches were, beginning at the west, the Canopic, Bobitine, Sebenitic, Pharaonic, Mendesian, Tanitic and Pelusiac, of which the modern Rosetta and Dumiatta branches represent the Bobitine and Patnithic.

2 By Sir Hanbury Brown, inspector-general of irrigation, Lower Egypt, 1892–1903.

3 Egyptian Irrigation (p. 29), by Sir W. Willcocks (London, 1899).

4 Between Assuan (Shelli) and Wadi Halfa the river is, however, the main highway, there being no railway between the places named.
the chief channel of trade and commerce. Steamers first ascended the Nile above the cataracts (to Korosko) in 1820. It was not till 1846 that a steamboat was placed on the White Nile.

(W. E. G.; F. R. C.)

**Story of Discovery.**—Few problems in geographical research exercised for so long a period so potent an influence over the imaginations of man as that of the origin of the Nile. The ancient Egyptians, as is apparent from the records on their monuments, were acquainted with the main stream as far south as the junction of the White and Blue Niles. They appear also to have known the Blue Nile up to its source and the White Nile as far south as Lake Tana, influenced by the knowledge acquired by Ptolemy. But, throughout the centuries, the White Nile and the Niger issue from a great lake, the Niger flowing west, the Nile north. Hence arose much confusion, the Senegal estuary being regarded by its discoverers (1445) as the mouth of a western branch of the Nile. Even until the early years of the 19th century the belief persisted in a connexion between the Nile and the Niger (see further Niger). Portuguese explorers and missionaries, who in the 15th and 16th centuries visited the east coast of Africa and Abyssinia, gained some information about the equatorial lake region and the Nile, the extent of the knowledge that they possessed being brought together by Pigafetta, Italian traveller and historian (1533–1603) published in 1580. It was not, however, till the 17th century that the sources of the Blue Nile were visited by Europeans. In 1615 Pedro Paez, a Portuguese priest, was shown them by the Abyssinians. Ten years later another Portuguese priest, Jeronimo Lobo, also visited the sources and left a vivid description of the rise of the river and its passage through Lake Tana. An English version of the accounts of Paez and Lobo—written by Sir Peter Wyche—was published in 1650 by order of the Royal Society, of which Sir Peter was an original Fellow. Between 1625 (the date of Lobo’s visit) and 1770, some attempts were made by French and other travellers to explore the Blue Nile, but they ended in failure. In the last-named year James Bruce (q.v.) reached Abyssinia, and in November 1772 he arrived in Egypt, having visited the source of the Blue Nile and followed it, in the main, to its confluence with the White Nile. On returning to Europe Bruce was mortified to find that whilst he was still in Egypt the French geographer D’Anville had (1772) issued a new edition of his map of Africa in which by a careful study of the writings of Paez and Lobo he had anticipated Bruce’s discoveries, D’Anville’s map is singularly accurate, if we remember the scanty information at his disposal. To Bruce, nevertheless, belongs the honour of being the first white man to trace the Blue Nile to its confluence with the White Nile. He himself, considering that the Blue Nile was the main branch of the river, claimed to be the discoverer of the long-sought caput Nile.3

From the time of Bruce, interest in the Nile problem grew rapidly. The Englishman W. G. Browne (q.v.) when in Darfur (1794–1796) heard that the Abiad rose far south in the Mountains of the Moon, but he makes no mention of the great lakes, and in Major Rennell’s map of 1809 there is no hint of equatorial lakes at the Abiad sources. During the French occupation of Egypt the river from the sea to Assuan was accurately surveyed, the results being embodied in Jacotin’s *Atlas de l’Egypte* (1807). In 1812–1814 J. L. Burckhardt, the Orientalist, went up the Nile to Korosko, travelled thence across the desert to Berger and Shendi, and crossing the Athara made his way to the Red Sea. It was, however, due to the initiative of Mehemet Ali, Pasha of Egypt, that the White Nile was explored. In 1820–22 a military expedition under Ismail Pasha, a son of Mehemet Ali, which was joined by the French scientist Frédéric Caillaud (who had visited Meroë in 1819) ascended the river to the

---

1 The two lakes afterwards received the names Lake of Crocodiles and Lake of Cataracts.

2 Francisco Alvarez, a priest, who was in Abyssinia 1520–1526, afterwards wrote (about 1550) an account of Abyssinia in which he reproduced the Athara and a part of the main Nile.

3 Bruce, however, acknowledged in his *Travels* that the Abiad (White Nile) at its confluence with the Blue Nile was the larger river. The Abiad, he writes, "preserves its stream always undiminished, because rising in latitudes where there are continual rains, it therefore suffers not the decrease the Nile does by the six months’ dry weather."
NILE

confluence of the White and Blue Niles, founded the city of Khartum, and ascended the Blue Nile to Fazokli. In 1847 Adolphe Ignant, a Belgian in the service of the British African Association, ascended the White Nile 132 m. above Khartum, being the first white man to do so since the 1st century A.D. Then followed three Egyptian expeditions sent in 1839-41 and 1842 by Mehemet Ali up the White Nile. The first expedition reached, on the 28th of January 1840, a point 6° 30' N., the second and third pressed further south, reaching 4° 42' N.—or the foot of the rapids above Gondokoro. A Turkish officer, Selim Bimbaashi, commanded the expeditions, and among the members were the Frenchmen Thibaut (a convert to Islam and for nearly forty years French consular agent at Khartum), D'Arnaud and Sabatier, and a German, Ferdinand Werne. The last-named wrote a scientific account of the second expedition and drew a map of the Nile between Khartum and Gondokoro. An Austrian Roman Catholic mission was established in the Sudan, and in 1850 one of its members, Dr Ignatz Knobloch, sent to Europe reports, gleaned from the natives, of the existence of great lakes to the south. About the same time two Protestant missionaries, Ludwig Krapf and John Rebmann, stationed on the Zanzibar coast, sent home reports of a vast inland sea in the direction where the Nile sources were believed to be. This sea was supposed to extend from 6° 30' to 13° 30' S. These reports revived interest in Palaeontological Geography. The exploration of the Bahr-el-Ghazal by John Petherick, Miss Tinne and her companions, and others followed the opening up of the White Nile (see Bahr-el-Ghazal). The general result of the work carried on from the north was that by 1858 the Nile system was known as far south as the rapids at Bedden.

On the 3rd of August 1858 the English explorer J. H. Speke (q.v.) discovered the large nyansa (lake), which he rightly conceived to be the head reservoir of the White Nile, and which in honour of the queen of England he named Victoria Nyanza. Colonel Grant (q.v.) continued his exploration of the river. He made an ascent of the Zanzibar coast in search of these sources of the Nile, which Rebmann and Krapf had called the Sea of Unyamwezi. These reports proved to be exaggerated accounts of three distinct lakes—Nyasa, Tanganyika and Victoria Nyanza. In 1860 Speke returned to Zanzibar accompanied by J. A. Grant (q.v.), bent on solving the problem of the Nile. In spite of great difficulties he made his way to Uganda, on the north-west of Victoria Nyanza, and (without exploring the lake) succeeded in reaching its outlet. On the 28th of July 1862 Speke stood by the Ripon Falls—the birthplace of the Nile. Here Speke and Grant paddled down the Nile a short distance, but before reaching Lake Kioga they were stopped by hostile natives and compelled to go westward to Unyoro. There they heard of another great lake further west, but the king of Unyoro refused them permission to visit it. In the end they ascended the Kafu river to its confluence with the Nile and then down the main stream to the Karuma Rapids. Here Speke and Grant left the river, and travelled overland east of the stream, which they did not strike again until just above the Ausa confluence. Then they travelled down the Nile to Gondokoro, reached on the 15th of February 1863.

This remarkable journey virtually solved the Nile problem so far as the source of the main stream was concerned, but there remained much to be done before the hydrography of the whole Nile basin was made known. At Gondokoro Speke and Grant met Mr (afterwards Sir Samuel) Baker 1 and his wife—a Hungarian lady—who had journeyed thither to afford the explorers help. To Baker Speke communicated the news he had heard concerning the western lake, and this lake Baker determined to find. On the 26th of March 1863 Baker and his wife left Gondokoro, and despite much opposition, especially from slave-dealers, followed, in the reverse direction, the route of Speke and Grant as far as Unyoro, whence they journeyed west. On the 14th of March 1864 they struck the lake (Albert Nyanza) on its S.E. side. They paddled up the lake to the point where a large river coming from the east poured its waters into that lake. This stream, which they rightly conjectured to be the Speke's Nile, made its course up to the Murchison Falls. Thence they went overland to the Karuma Rapids, and so back to Gondokoro by their old tracks. It fell to the lot of General C. G. Gordon (when that officer administered the Egyptian Equatorial provinces) and his assistants to fill up the gap left by Speke and Baker in the course of the main stream. In 1874-75 two English engineer officers—Lieut. (afterwards Colonel Sir Charles M.) Watson and Lieut. H. Chippendale—followed the river between Gondokoro and Albert Nyanza; in 1876 an Italian, Romolo Gregor Pasha, circumnavigated that lake, proving Baker's estimate of its extent to be vastly exaggerated; Gordon in the same year traced the river between Murchison Falls and Karuma Rapids, and an American, Colonel C. Chaillé-Long followed (1874) the Nile from the Ripon Falls to the Karuma Rapids, discovering in his journey Lake Kioga (which he named Ibrahim). In this manner the identity of the Victoria Nile with the river which issued from the Albert Nyanza was definitely established.

In 1874 H. M. Stanley (q.v.) went to Africa with the object of completing the work left unfinished by David Livingstone, with a view, if possible, of discovering the ultimate sources of the Nile. He first ascended the Blue Nile to Khartum, and after sailing up the river to an estimated distance of 600 miles (a.d. 1875) he turned back to the head of Lake Tana, and followed the River Choa (q.v.) to Lake Victoria before turning to the north, and reaching Lake Albert by way of Lake George. Here he was joined by Leopold M. Stanley (q.v.), who had reached Lake Albert by way of the Gambia. On the 2nd of October 1877 Leopold was killed by the Bahr-el-Jebel Arabs, and his brother Henry M. Stanley followed his route so far as Lake Albert. Stanley had already ascended the Nile to the source of the Blue Nile, and during his travels had discovered (1) Albert Edward Nyanza, and traced the river (Semiliki) which connects it with Albert Nyanza. The Semiliki had been discovered, and its lower course followed in 1884 by Emin Pasha. Thus at length the riddle of the Nile was read, though much was still to do in the matter of scientific survey, and in the exploration of the valley of the Sobat (q.v.). The Kagera had been partly explored by Stanley (1875), by whom it was called the Alexandra Nile, and between 1891-98 its various branches were traced by the German travellers Oscar Baumann, Richard Kandt and Ferdinand Kühne. In 1890-91 H. G. Thompson navigated the same river in the wake of a Frenchman.

A British officer, Colonel C. Delmé-Radcliffe, made a detailed survey of the Kagera from 30° E. to its mouth. The Kioga system was surveyed in 1907-1908 by Lieut. C. E. Fishbourne. A trigonometrical survey of the upper river was begun by Colonel M. G. Talbot, director of Sudan surveys, in 1906, and other surveys were made by Captains H. G. Lyons, director-general of the Egyptian survey department. A fish-survey of the waters of the Nile was also undertaken.

The Removal of Sudd.—As already stated, the sudd above the Sobat confluence seems to have stopped the Roman centurions sent by the emperor Nero to explore the Nile. When the river above the Sobat was again reached by white men (1840) the stream was clear of sudd, and so continued until 1863-64, when both the Bahr-el-Jebel and the Bahr-el-Zeral became blocked by floating masses of vegetation. When Baker proceeded to Gondokoro in 1870 he thus described the increase that neglect had caused in the obstruction: "The immense number of floating islands that were constantly passing down the stream of the White Nile had no exit; thus they were sucked under the original obstruction by the force of the stream, which passed through some mysterious channel, until the subterranean passage became choked with a wondrous accumulation of vegetable matter. The entire river became a marsh, through which, by the great pressure of water, the stream was sent through immeasurable small channels. In fact, the White Nile had disappeared." Baker, who had to cut through 50 m. of sudd in his passage to Gondokoro, urged to Khedive

1 Baker and his wife had in 1861-62 explored the Atbara (its upper waters) and other eastern tributaries of the Nile.

2 In the map issued in 1875 to illustrate Schenewerk's "The Heart of Africa, Victoria Nyanza is shown as five small lakes.
NILE, BATTLE OF THE

Ismaïl to reopen the Nile. This work was efficiently done by Ismaïl Ayoub Pasha, and the White Nile was clear for large vessels when Gordon reached Khartum in 1874. The river did not long remain free. The capture of Assuan by the French in 1879 gave them access from the south on account of sud. It was cleared in 1879-1880 by officials in the Egyptian service, but had again accumulated in 1884. In consequence of the Mahdist movement nothing could then be done on the river, and work on the canal was in hand again until 1899, when, by direction of Sir William Garstin, the Egyptian inspector-general of irrigation, an expedition under Major Malcolm Peake reached the site of the dam on which the Naharain from the Bahr-el-Ghazal confluence almost to Gondokoro. During 1900 a channel was cut through the northern and heaviest portion of the sud. It was one of much difficulty, some of the blocks being 11 feet thick and floated out on barges. To remove the obstruction the surface was first burnt; then trenches were cut dividing the sud into blocks 10 ft. square, and these were floated out on barges and towed by gunboats working from below. For a distance of 17½ m. of Shambe (i.e. about midway between the Ghazal confluence and Gondokoro) the true bed of the river could not, in many places, be found, but Major Peake forced a passage to Gondokoro through a spill channel or series of shallow lakes lying west of the main stream. In 1901 Lieut. Drury, a British naval officer, removed many of the remaining blocks of sud, opening a navigation a further 147 m. of the river. Thereafter, the Sudan waterway was cleared of weeds and silt, so that the channel was continually open, and the removal of the sud "undoubtedly checked the fall in the river levels which would otherwise have taken place."

Political Relations.—Explored in part by Egyptian government expeditions, the upper Nile as far south as Albert Nyanza became subject, between 1840 and 1882, to Egypt. Possession of the greater part of the river above Wadi Halfa then fell to the followers of the Mahdi. In 1890-98 an Anglo-Egyptian army reconquered the country, and from Victoria Nyanza to the Mediterranean the main river came under British or Egyptian administration. The west bank of the Bahr-el-Jebel, as far north as 9° 30′ N., was in 1894 taken on by the British. In reply to the Egyptian attack at the mouth of the Nile by the French, Sir William Garstin was despatched by the government of Egypt to clear the removal of the sud. The effect of the sud-cutting operations on the supply of water available for irrigation purposes in the lower river was apparently very slight. Sir William Garstin, in his report, speaks of the removal of the sud "undoubtedly checked the fall in the river levels which would otherwise have taken place."

Authoritative.—For the story of exploration see the works of Bruce, Speke, Grant, Baker and other travellers (whose books are mentioned in the bibliographical notices). Their achievements, and those of ancient and medieval explorers, are ably summarized in The Story of Africa, vols. ii. and iii., by Dr Robert Brown (London, 1833-1891), and The Nile Quest, by Sir Harry Johnston (London, 1903). See also J. Partsch, Das Arabists Buch: "Uber das Studium des Ostens" (1915); the works of Capitn Nili, by Richard Kandl (Berlin, 1904). Latest additions to geographical knowledge are recorded in the Geographical Journal (London, 1895-1910). The results of the great Egyptian explorations and the Nile fauna and geology and climate see: The Physiography of the River Nile and its Basin, by Captain H. G. Lyons, director-general, survey department, Egypt (Cairo, 1906), an authoritative work, and numerous other publications of the Survey and Public Works Departments. "Notes on the History of the Nile and its Valley," by W. F. Hume, in Geog. Jnl. (Jan. 1906); Egyptian Irrigation (2nd ed., London, 1899) and the Nile Reservoir Dam at Assuan and After (London, 1901), both by Sir William Wulfscocks; the Annual Reports (1899 and after) of the Egyptian Public Works Department, by Sir William Garstin and others, and those on Egypt and the Sudan by Lord Cromer and Sir Eldon Gorst (London; official publications); the Blue Book Egypt No. 2, 1904, which is a report by Sir William Garstin on the basin of the upper Nile, dealing at length with the lake area, the Nile affluents and the main river as far south as Khartum, from which the Nile basin was divided both topographically and climatically. W. Garstin and Captain Lyons give full bibliographical notices. The study of the zoology of the Nile valley was the special object of a Swedish scientific expedition in 1901, under the direction of Professor Nordenfalk, published as The Zoology of the Nile, pt. iii., appearing in 1909. For the botanical and other aspects of the Nile valley, see the works of Petherick, Hegelius, Schweinfurth, Junginger, and Heim. The Nile basin as studied by the Survey Department, Cairo, in 1898. It is in six sheets on a scale of 1:2,500,000, with inset maps showing political divisions, distribution of rainfall and of vegetation. (F. R. C.)

NILE, BATTLE OF THE.

This was fought between the British and French fleets on the 1st of August 1795 in the headwaters of the Nile. The peace of Campo Formio, signed on the 17th of October 1797, had left France without an opponent in arms on the continent. War with Great Britain still continued, and for a time the Directory appeared to be intent on its schemes for an invasion of Ireland. Napoleon, fresh from his Italian victories, was appointed to command, and he made a round of inspection of Brest and the Channel ports. But all this show of activity was designed to cover the preparations for an attack on Great Britain "from behind"—in India and by way of Egypt. The French naval forces at Toulon were got ready slowly in spite of Napoleon's urging and with the defects inevitable in the impoverished state of the arsenal. Thirty-six thousand soldiers, including the best of the army of Italy, were to be embarked from the southern French ports and from the9

From the British point of view it appeared quite certain that a great offensive movement was about to be made by the French reached both Earl St Vincent, the commander-in-chief of the Mediterranean fleet, and the British government. Since Spain had entered into alliances with France in 1796, the British fleet had not cruised in the Mediterranean but had been occupied in blocking the Spanish ships at Cadiz. On the 2nd of May 1798 St Vincent detached Nelson, then the junior rear-admiral, with his flag into the Mediterranean, with three sail of the line and frigates to make a reconnaissance at Toulon. On the 17th of May a small French corvette was captured near Cape St. Vincent, and from the crew Nelson learnt that the French were still in the harbour. He could gain no information as to the aim of the armament. Napoleon enforced strict secrecy by not letting even the most important officers of the dockyard know whither he was bound. On the 2nd of May the British government had written to St Vincent stating their wish that a part of his fleet should be sent into the Mediterranean. The first lord of the admiralty, Lord Spencer, told him that he might either go himself or send a subordinate. If the latter course was followed Nelson was indicated as the officer to be chosen. Reinforcements were sent to him to enable him to provide both for the rendezvous in the Mediterranean and for the blockade of Cadiz. St Vincent had already selected Nelson, and when the reinforcements arrived he despatched Captain Troubridge with the inshore squadron engaged in watching Cadiz—"the choice fellows," as he described them, of his fleet—to join Nelson at Toulon. The ships were replaced by others similarly painted, so that the Spaniards might see no difference and therefore be unable to send news to their ally. Troubridge left on the 24th of May with as many vessels as would bring Nelson's whole command up to thirteen 7's and a frigate ship.

While these measures were being taken to intercept him, Nelson had put to sea on the 9th of May with fifteen sail of the line, twelve frigates and some two hundred transports. He sailed down the eastern side of Corsica and Sardinia to pick up the detachments which were to join him from the first-named island and from Civita Vecchia. On the evening of the 20th a gale from the N.W. brought some confusion on his flock of ships, but as he continued his course at S.W. His flagship the "Vanguard" (74) was dismasted and compelled to anchor at San Pietro to reft. His frigates were separated from him by the weather, and the captains made for Gibraltar, concluding that the admiral would go there to reft. The departure of his frigates left Nelson without vessels for scouting and had a material influence on the campaign. The "Vanguard" was made ready by the 27th of May, and resumed her station off Toulon. On the 7th of June Nelson was joined by Troubridge. Calms hampered his pursuit of the French, whom he now knew to be at sea, but on the 14th he was off Civita Vecchia; on the 17th he was at Naples, where he heard that the French had been seen going south, and made arrangements to obtain water and stores without going on shore. On the 20th he was at Messina, where he first got definite information of the movements of the enemy. The French had appeared off Malta on the 9th and had occupied the island, which was surrendered to them on the 17th by the treachery of the French and Italian members of the order. Pushing on in the hope of finding them on the coast of the island, Nelson was off Cape Passaro on the 22nd, and learnt that the French had sailed from the island. His instructions directed him to guard against possible French attacks on Sicily, or even an attempt to pass the Straits of Gibraltar and sail for Ireland.
NILE, BATTLE OF THE

But Nelson knew that the Neapolitan government had no fears for Sicily and that the westerly winds would prevent the French from going to Gibraltar. On a view of all the circumstances, and after consultation with those of his captains in whose judgment he had the most confidence, he came to the just conclusion that they were bound for Egypt. He therefore sailed for Alexandria on the most direct route eastward along the coast of Africa. The information given him at Cape Passaro was that the French had left Malta on the 16th; the actual date was the 19th. Napoleon, whose frigates had sighted the British squadron, and who knew that he might be pursued, did not take the direct route, but steered toward the north-east along the shore of Crete. Thus it happened that on the night of the 22nd of June the fleet crossed another’s tracks. Want of look-out vessels prevented Nelson from detecting the neighbourhood of his enemy. The French with their convoy going more slowly on the longer route to the north, and the active British squadron on the direct route to the south, both headed for Egypt, with barely 60 m. of sea between them, but neither aware of the position of the other.

On the 28th of June Nelson reached Alexandria to find the port occupied by a few Turkish ships. It was from Nelson that the Turkish authorities gained their first knowledge of the impending invasion. Nelson, misled by the false date given him at Cape Passaro, and being unable to reconnoitre the position of the enemy, came to the erroneous conclusion that he was mistaken in supposing that the French were on the way to Egypt, and that they must be bound for some other part of the eastern Mediterranean. On the 29th of June he sailed from Alexandria, standing to the north-east. His topsails were still in sight to the north-east when the French appeared coming from the north-west. They sighted the coast on the 29th to the west of Alexandria, and on the 1st of July they occupied the anchorage and town. While Nelson was ranging along the coast of Asia Minor, seeking for news of them and finding none, on his way back to Sicily, the French were landing their army. The British squadron reached Syracuse on the 19th of July. Here Nelson was able to obtain water and stores and clear indications that the French had gone to Egypt. On the 24th he sailed, and on the 1st of August was again off Alexandria. The battle of the Pyramids had been fought on the 21st, and Napoleon was master of Egypt. The news of the British admiral was that the French fleet had left the coast in the interval of his absence. Brueys, the French admiral, had had a choice of three courses open to him—to enter the old harbour of Alexandria, to sail for Corfu then occupied by the French or to take a strong anchorage on the coast and prepare to repel attack. To enter the harbour was difficult for large ships, and to leave it by its one narrow entrance in the presence of even an inferior force would have been impossible. Brueys therefore decided against that course. He did not sail for Corfu, partly because some of the army stores were still in his ships and partly because his squadron, ill fitted from the first, was short of provisions, and no more could as yet be obtained from the shore. He therefore stationed himself with thirteen of his ships of the line in the roadstead of Aboukir, some 15 m. north-east of Alexandria, between the island of Aboukir and the Rosetta mouth of the Nile. Here he was found on the evening of the 1st of August when the British fleet came in sight. The French line of thirteen ships was anchored to the east of Aboukir, now called Nelson’s Island, in a curve stretching to the south-east. It consisted of the “Guerrier” (74), the “Conquérant” (74), the “Spartiate” (74), the “Aquilon” (74), “Souverain Peuple” (74), “Franklin” (80), “Ombre” (80), Admiral Brueys’s flagship “Tonnant” (80), “Heureux” (74), “Timoléon” (74), “Guillaume Tell” (80), “Mercure” (74) and “Généreux” (74), counting from the west end. The French ships had begun the voyage short-handed and many men were absent on shore filling the water-casks. They fought with a half to two-thirds of their complements, which suffered from the bad training and inexperience of the French republican navy. A council of flag officers and captains was being held in the “Orient” when the British squadron appeared.

When the enemy was sighted Nelson at once gave the order to attack. All the possibilities of battle had been fully discussed between him and his captains. Much controversy of a rather idle character has taken place as to assigning the credit for the actual course adopted; it was almost dictated to men so experienced and capable as the British captains and their admiral by the position of the enemy. If the French had been anchored so near the shore that it was not possible to pass between them and it, the British ships, coming from the west with a westerly wind, would have passed outside of them, endeavouring to anchor one on the bow and the next on the quarter of each French ship. Thus they might have been crushed before the ships in the rear and to leeward were driven ashore. As it was, the French were so placed that there was room for the British ships to pass between them and the land. Therefore it was possible for the first comers of the British squadron to pass inside the French ships, to anchor there, and to allow the next comers to anchor outside so as to put the enemy’s van between two fires. This dispositions was not without its drawbacks, for it entailed the risk that the British ships might fire into one another while directing their guns on an object between them. The result was, the nearer the French the battle began sundown and was continued in the dark. Yet it had the advantage that it produced an intense concentration of fire. In the circumstances it had the peculiar advantage, of which, however, the British captains may not have been aware, that as the French were very short-handed they were unable to work both broadsides to the full. It is to this fact that we must attribute the comparatively small loss suffered by the British ships in an attack which, if made against a well-appointed enemy, must have been extremely costly. Whether by previous arrangement with Nelson, or because he acted on the facts before him, the first British captain to come into action, Captain Foley of the “Goliath” (74), had passed inside the French, and anchored abreast of the second of them, the “Conquérant.” The “Zealous” (74), under Captain Hood, anchored on the bow of the first Frenchman, the “Guerrier.” The “Audacious” (74), under Captain Davidge Gould, anchored between the “Zealous” and “Goliath.” The “Theseus” (74), under Captain Miller, anchored inside of the third French ship, the “Spartiate.” The “Orion” (74), under Captain Saumarez, anchored abreast of the fifth French vessel, the “Souverain Peuple.” Then Nelson, in his flagship the “Vanguard” (74), the sixth British ship to come into action, anchored on the outside of the French line abreast of the “Spartiate” already engaged with the “Theseus.” The “Minotaur” (74), under Captain Thomas Louis, and the “Defence” (74), under Captain Peyton, anchored next to the “Vanguard” and opposite the fourth French ship, the “Aquilon,” and the “Souverain Peuple,” already engaged with the “Orion.” Thus eight British 74’s which had only to fight one broadside at a time were thrown on five undermanned French 74’s, which had to fight both and were speedily crushed. One British vessel, the “Culloden” (74), under Captain Troubridge, grounded on the shoal at Aboukir, and could not get into action. She served as a beacon to the vessels coming behind her. As the French van was silenced, and the fresh vessels came up from the British rear, the attack was carried down the French line. About 9.30 P.M. the “Orient” was seen to be in flames, and at 10 P.M. she blew up. The explosion imposed a brief suspension of battle, but the fire was soon renewed. By midnight the battle was over. In the course of the next day the “Guillaume Tell,” the “Généreux” and two frigates succeeded in escaping, but they were the only survivors of the fleet attacked in the roadstead of Aboukir.

The destruction of the French fleet, which isolated Napoleon in Egypt, had profound political influence in Europe. The total loss of the British squadron was 218 killed and 678 wounded. The loss of the French was never exactly ascertained, but it was certainly very much greater. Admiral Brueys was killed on the quarter-deck of his flagship, and Nelson received a wound in the head from a landridge shot which disabled him.

NILES—NIMES

NILES, a city of Trumbull county, Ohio, U.S.A., on the Mahoning river, at the mouth of the Meander and Mosquito creeks, about 55 m. E.S.E. of Cleveland. Pop. (1890) 4289; (1900) 7488 (2104 foreign-born); (1910) 8361. It is served by the Baltimore & Ohio, the Erie and the Pennsylvania railways, and by an interurban electric system. Coal and iron-ore are abundant in the vicinity, and the city's principal manufactures are sheet steel, sheet iron, tin, metal lath, boilers and railway cars.

The municipality owns and operates its waterworks and electric-lighting plant. It is situated in the meandering valley of the south-east Wyan, and again, in 1895, it was named (1834) in honour of Hezekiah Niles (1777-1839), the founder and editor of the weekly Niles's Register (1811-1849).

NIGLAI, or NVLYGHAU ("blue bull"), the largest antelope (Boselaphus tragocamelus) found in India, where it represents the kudu and eland group of Agrica. Only the bulls have horns, and these are short and insignificant. The general colour of the old bulls is bluish grey, but younger bulls and cows are browner. The nilgai is about the size of a mule (see Antelope).

NIGLIRIS, THE, or NEILGHERRYS (Blue Mountains), a range of hills in southern India, which gives its name to a district of the Madras Presidency. The Nilgiris are really a plateau rather than a range, rising abruptly from the plains on most sides, with a general elevation of about 6500 ft. above the sea.

The District of the Nilgiris is the smallest administrative district in Madras. It formerly consisted exclusively of a mountain plateau lying at an average elevation of 6500 ft., with an area of about 725 sq. m. In 1873 this was increased by the addition of the Chittar valley in the Satpura range, and again, in 1877, by other portions of the Wynaad, making a total area of 985 sq. m.

The administrative headquarters is at Ootacamund, which is also the summer capital of the government of Madras. The summit of the Nilgiri hills is an undulating plateau, frequently breaking into lofty ridges and steep rocky eminences. The descent to the plains is sudden and abrupt, the average fall from the crest to the general level below being about 6000 ft., save on the north, where the base of the mountains rests upon the elevated land of Wynaad and Mysore, standing between 2000 and 3000 ft. above sea-level. The Ochterlony valley and Wynaad country consist of a series of broken valleys, once forest-clad throughout, but now studded with tea and coffee-gardens.

The highest mountain peaks are—Dodabetta, 8760 ft.; Kudialkad, 8502; Bebovillatteen, 8488; Makurti, 8402; Davarsolobetta, 8380; Kunda, 8353; Kundamogg, 7816; Ootacamund, 7361; Tambrabetta, 7292; Hokabetta, 7267. There are six well-known passes or ghats by which the district communicates with the neighbouring plains, three of which are practicable to wheeled traffic. The chief rivers are the Moyar, Paikara and Calicut, none of which are navigable. The forests consist of fine timber trees, such as dsf (Shorea robusta), kina (Pterocarpus Marsupium), jack (Artocarpus integrifolia), blackwood (Dalbergia latifolia) and teak. Eucalyptus and Australian wattle have been extensively planted in the higher grounds of the Wynaad. The hills were first explored by British officers in 1814, and in 1821 the first English house was built on the plateau. The hill tribes include the Todas, the Badagas, the Kotas, the Kurumbas and the Irulas (q.v.). The total population of the district in 1901 was 1111,437, showing an increase of 11.7% in the decade. The commercially important products are coffee, tea and chincha. Coffee cultivation was introduced about 1841. One of its chief seats is the Ochterlony valley. The Madras government commenced the experimental cultivation of Chincha on the Nilgiris in 1860, and several private chincha gardens were laid out, owing to the success of the government experiment. The climate of the Nilgiri hills is almost unrivalled for equability of temperature. The average is 58° F. The approach from the plains is by the branch of the Madras railway from Podanur to Mettapollem, whence a metre-gauge line on the rack principle has been constructed to Coonoor, with an extension to Ootacamund. The chief educational institution is the Lawrence Asylum at Ootacamund maintained by government. The military quarters are at Wellington.

See Nilgiris District Gazetteer (Madras,1908).

NILSSON, CHRISTINE (1843- ), Swedish singer, was born at Wedelsbro, near Wexiö, Sweden, on the 20th of August 1843. Her father was a poor working man, and she used as a girl to sing and perform on the violin at popular gatherings. In 1857 a wealthy man, M. Tornérhjelm, perceiving the unusual beauty of her voice while she was performing at a fair in Ljungby, gave her a home and gave her a proper musical education, and in 1860 she was heard in the concert halls in Stockholm and Upsala, and then went to Paris, where, after four years' study, she made her début in the rôle of Violetta at the Théâtre Lyrique on the 27th of October 1864. Between that date and 1872, when she married M. Auguste Rouzaud, she was the leading prima donna. Her first appearance in London was in 1867. A year later, on the 9th of March, she made her first appearance in the Paris Opera House as Ophélie in Hamlet; and she visited the United States in 1870. She sang in St Petersburg in 1872; to Amsterdam in 1873-1874 and in 1882; in Germany and Austria between 1870 and 1877; and in the next few years in Spain and Scandinavia; but after her marriage her appearances in public were rare. M. Rouzaud died in 1882, and five years afterwards Madame Nilsson married Count A. de Casa Miranda, and finally retired from the stage.

NIMAR, a district of British India, in the Nerbudda division of the Central Provinces. The administrative headquarters are at Khandwa; but the capital in Mahomedian times was Burhanpur. Area, 4273 sq. m. Pop. (1901) 329,615, showing an increase of 14.7% in the decade. The district consists of two portions of the Nerbudda and Tapti valleys, separated by a section of the Satpura range, about 15 m. in breadth. On the highest peak, about 850 ft. above the plain and 1800 above sea-level, stands the fortress of Asirgarh, commanding a pass which has for centuries been the chief highway between Upper India and the Deccan. The district contains extensive forests, but the only tract reserved by government is the Punsar forest, which extends for about 120 m. along the south bank of the Nerbudda, and contains young teak, besides sđj (Terminalia tomentosa) and anjan (Hardwickia binata). The staple crops are cotton and indi; gajah or Indian hemp, is also allowed to be grown under government supervision. The Great Indian Peninsula railway runs through the district, and a branch of the Rajputana line from Indore joins it at Khandwa. There are factories for ginning and pressing cotton at Khandwa, and manufacture of gold-embroidered cloth at Burhanpur.

The name Nimar, derived from that of the ancient province, is also applied to a district in the state of Indore, lying W. of the British district on both banks of the Nerbudda. Area, 3871 sq. m.; pop. (1901) 257,110. From 1823 onwards this tract, then belonging to Sindia, was under British management; in 1861 it was ceded in full sovereignty to the British, but in 1867 it passed to Holkar as the result of an exchange of territory.

See Nimar District Gazetteer (Allahabad, 1908).

NIMES, a city of southern France, capital of the department of Gard, 174 m. S. by W. of Lyons on the Paris-Lyon railway, between Avignon and Montpellier. Pop. (1906) 70,708. Nimes, important alike for its industries and for its archaeological treasures, lies at the foot of the Garrigues, a range of stony and barren hills which limit it on the north and west. The most prominent of these is the Mont Cavalier, the summit of which is crowned by the Tour Magne, a ruined Roman tower commanding a fine view of the town and its surroundings. To the south and east the town overlooks the monotonous plain traversed by the Viste, and for the most part given over to the cultivation of the vine. Nimes covers a large area, owing to the fact that its population is housed in low buildings, not in the lofty tenements which are found in most of the industrial towns of France. The central and oldest part is circled by shady boulevards, which occupy the site of the old fortifications. Here are to be found the majority of the Roman remains for which Nimes is remarkable. The most celebrated is the amphitheatre, the best preserved...
though not the largest in France. It dates from the 1st or 2nd century A.D., and was used as a fortress for some time during succeeding centuries. Occupied during the middle ages by a special quarter, with even a church of its own, it was cleared in 1800, and since then has been well kept in repair. It is built of large stones fitted together without mortar. In form it is elliptical, measuring approximately 440 by 336 ft. externally; the arena is 227 by 126 ft. The elevation (70 ft. in all) consists of a ground story of 60 arches, an upper story of 60 arches and an attic with arcades pierced with holes for supporting the telarium or awning. The building, which was capable of holding nearly 24,000 spectators, Nimes must have been one of the finest of its kind. Of the arches 96 are at each of the cardinal points; and 124 doorways gave exit from the 35 tiers of the amphitheatre to the inner galleries. Originally designed for gladiatorial shows, naval spectacles, chariot races, wolf or boar hunts, the arena has in recent times been used for bull-fights. The celebrated Maison Carrée, a temple in the style of the Parthenon, but on a smaller scale, 82 ft. long by 40 wide, is one of the finest monuments of the Roman period, and according to an inscription is dedicated to Gaulus and Lucius Caesar, adopted sons of Augustus, and dates from the beginning of the 1st century A.D. It contains a collection of antique sculptures and coins. The so-called temple of Diana, which adjoins the Fountain Gardens, was probably a building connected with the neighbouring haths of which remains are visible. Two Roman gates, the Porte d'Auguste, consisting of two large archways flanked by two smaller ones and dating from A.D. 16, and the Porte de France are still preserved. The Tour Magne (Turris Magna) is still 92 ft. in height, and was formerly a third higher. Admittedly the oldest monument of Nimes, it has been variously regarded as an old signal tower, a treasure house or a mausoleum. Attached to the ramparts erected by Augustus, and turned into a fortress in the middle ages by the counts of Toulouse, the Tour Magne was restored about 1840. Near the Tour Magne has been discovered the reservoir from which the water conveyed by the Pont du Gard (see AQUEDUCT) was distributed throughout the city.

When it still possessed its capital, the temple of Augustus, the basilica of Plotina erected under Hadrian, the temple of Apollo, the baths, the theatre, the circus, constructed in the reign of Nero, the Campus Martius and the fortifications built by Augustus, Nimes must have been one of the handsomest of the Roman cities of Gaul. The cathedral (St Castor), occupying, it is believed, the site of the temple of Augustus, is partly Romanesque and partly Gothic in style. The church of St Paul, a modern Romanesque building, is adorned with frescoes by Hippolyte and Paul Flandrin; St Baudile (modern Gothic) is of note for the two stone spires which adorn its façade; and the court-house has a fine Corinthian colonnade and a pediment. Other buildings of note are the old citadel (dating from 1687, and now used as a central prison), and the former lycée, which contains the public library and the museums of epigraphy, of archaeological models of the Roman and Romanesque periods, and of natural history. The town also has a collection of paintings. The esplanade in front of the court-house has in the centre a handsome fountain with five marble statues by James Pradier. The Fountain Gardens, in the north-west of the town, owe their peculiar character as well as their name to a spring of water which after heavy rains is copious enough not only to fill the ornamental basins (constructed in the 18th century with balustrades and statues on ancient foundations) but also to form a considerable stream. Neither the spring, however, nor the Vistre into which it discharges, is sufficient for the wants of the city, and water has consequently been brought from the Rhone, a distance of 17 m. A beautiful avenue, the Boulevard de la République, runs south for nearly 1 m. from the middle walk of the garden. Nimes has erected monuments to the "Children of Garden" (by A. Mercié), to Alphonse Daudet and to the Provençal poet Jean Reboul, natives of the town.

The city is the seat of a bishop, a prefect, a court of appeal and a court of assizes, and has tribunals of first instance and of commerce, a board of trade-arbitrators, an exchange, a chamber of commerce and a branch of the Bank of France. Its educational establishments include lycées and training colleges for both sexes, and schools of music and art. At the close of the middle ages the industries of Nimes were raised to a state of great prosperity by a colony from Lombardy and Tuscany; and, though the plague, the Wars of Religion and the revocation of the edict of Nantes were all sufficiently disastrous in their effects, before the Revolution about half of the whole community, or from 10,000 to 12,000 persons, had come to be engaged in manufactures, chiefly that of silk. Upholstery materials, shawls, carpets, handkerchiefs, tapes and brocades, brandies and armagnacs, leather, hand-woven materials, machine and boots are now manufactured, and there are a number of foundries. Nimes is, besides, one of the great southern markets for wine and brandy, and there is a good trade in grain, groceries and colonial wares. Quarries of hard limestone, used as the material for the amphitheatre and other buildings by the Romans, are still worked in the vicinity.

Nîmes, the ancient Nemausus, derived its name from the sacred wood in which the Volcae Arecomici (who of their own accord surrendered to the Romans in 121 B.C.) were wont to hold their assemblies. Strabo states that it was the metropolis of a district containing twenty-four dependent towns, and that it was independent of the proconsuls of Gallia Narbonensis. Constituted a colony of veterans by Augustus, and endowed with numerous privileges, it built a temple and struck a medal in honour of its founder. The medal, which afterwards furnished the type for the coat of arms granted to the town by Francis I., bears on one side the heads of Caesar Augustus and Vipsanius Agrippa (the former crowned with laurel), while on the other there is a crocodile chained to a palm-tree, with the legend Col. Nemausus. The statue of Agrippa who built the public baths at Nîmes, the temple of Diana and the aqueduct of the Pont du Gard. The city-walls, erected by Augustus, were nearly 4 m. in circuit, 30 ft. high and 10 ft. broad, flanked by ninety towers and pierced by ten gates. Hadrian on his way back from Britain erected at Nîmes two memorial trophies of his benefactress Plotina. In the very height of its prosperity the city was ravaged by the Vandals; the Visigoths followed, and turned the amphitheatre into a stronghold, which at a later date was set on fire along with the gates of the city when Charles Martel drove out the Saracens. Nîmes was again pillaged by the Franks under the protection of Pippin the Short; and in 1185 it passed to the counts of Toulouse, who restored its prosperity and enclosed it with ramparts whose enceinte, less extensive than that of Augustus, may still be traced in the boulevards of the present day. The city took part in the crusade against the Albigenses in 1207. Under Louis VIII. it received a royal garrison into its amphitheatre; under Louis XI. it was captured by the duke of Burgundy, and in 1420 was recovered by the dauphin (Charles VII.). On a visit to Nîmes Francis I. enriched it with a university and a school of arts. By 1538 about three-fourths of the inhabitants had become Protestants; and in 1567 a massacre of Catholics took place on St Michael's day. From the accession of Henry IV. till the revocation of the edict of Nantes (1685) the Protestant community devoted itself to active industry; but after that disastrous event great numbers went into exile or joined the Camisards. Louis XIV. built a fortress (1687) to keep in check the disturbances caused by the rival religious parties. Nîmes passed unharmed through the storms of the Revolution; but in 1815 Trestaillon and his bandit followers pillaged and burned and plundered and massacred the Bonapartists and Protestants. Since then the city has remained divided into two strongly marked factions—Catholics and Protestants—though with no repetition of such scenes.

See H. Bazin, Nîmes Gallo-Romain (Nîmes, 1801); L. Menard, Histoire civile, ecclesiasitique et littéraire de la ville de Nîmes; R. Peyre, Nîmes, Arles et Orange (Nîmes, 1903).

Nîmes, Councils of (Concilium Nemenense). Of the four councils held at Nîmes those of 886 and 1284 are relatively unimportant. The synod of 394 adopted seven canons on discipline, which were first printed in 1743 and have not as yet
NIMROD—NINEVEH

made their way into the great collections. At the council of July 1066 Pope Urban II. presided, and sixteen disciplinary canons were adopted, which have many points of contact with the canons of the council of Clermont.

See, for the first council of Nimes, Lauchert, pp. 183-185; for the others, Hardouin vi. 1. 397, vii. 2. 1744 ff., vii. 903 ff.; full titles under Council. (W. W. R. *)

NIMROD (*nimrod, *nimré; Septuagint, Νιμρόδ; various reading in Gen. x. 8, Νιμρόδ; Vulg. Nimrod). Nimrod is only mentioned in the two consecutive paragraphs of Gen. x. 8-12, and the words מָרָד "the land of Nimrod," and 1 Chron. i. 10 quotes a portion of the third, the most important reference, Gen. x. 8-12. The last-named is ascribed to one of the oldest writers of the Pentateuch, the Yahwist; but not perhaps to the oldest stratum of his work (Ball, Sacred Books of the Old Testament). In Gen. x. 8, as Jabal was the inventor of music, so Nimrod was the first warrior, gibbor, the first hunter, "he became a mighty hunter, gibbor qayidh, before Yahweh, so that it is said, A mighty hunter before Yahweh like Nimrod," the first builder of cities and ruler of a widespread domain, "the beginning of his kingdom was Babel, Erec, Accad and Calneh in the land of Shinar. Out of that land he went forth into Assyria," and built Nineveh, Rehoboth-ir, Calah and Resen between Nineveh and Calah (the same is the great city)." The general statement that Assyria was originally an offshoot and dependence of Babylon is substantially in accordance with Assyrian and Babylonian authorities. As the chapter stands, Nimrod is a descendant of Ham, cf. verses 6 and 8; but as Babylon and Assyria were Semitic, cf. verses 21, 22, and as verses 6, 7, on the one hand, and verses 8-12, on the other, come from different documents, we must distinguish at least two consecutive paragraphs, and regard the "Cush" of verse 8 as the Babylonian Cush or Cassites, a people quite distinct from the Cush of verse 6, which is Ethiopia; the text and interpretation of portions of Gen. x. 8-12 are doubtful. The "mighty hunter before Yahweh" has been variously explained as "a divinely great hunter" (Surrell); "a hunter in defiance of Yahweh" (Holzinger); "a hunter with the help of Yahweh" or "of some deity whose name has been replaced by Yahweh," (Gunkel, Genesis, p. 82).

The name Nimrod has not been found in any ancient (say older than 2000 B.C.) non-Israelite document or inscription; and there is not convincing evidence for identifying Nimrod with any of the names found in such documents. In the absence of evidence, the theories are naturally endless, especially as both the legendary and the historical heroes of the ancient East were often "mighty hunters." Nimrod would suggest a Jew or Syrian the idea of "rebels," "mr=rebels;" but this is not likely to be the etymology. By regarding the "N" as performative, Nimrod has been identified with Merodach, the god of Babylon (Pinches, Hastings's Bible Dict). He has also been identified with Gilgamesh, the hero of the epic which contains the Babylonian Deluge story (Jergas, Das A.T., im Licht des alten Orients), with various historical kings of Babylon, with Orion, &c., &c. As the name Nmrd (Petrie, Nemarti) frequently occurs in Egyptian documents of the XXIInd Dynasty, c. 2037-2000 (Petrie, Hist. of Egypt, ii. 242, &c.), the story of Nimrod is sometimes (E. Meyer ap. Holzinger, Genesis) conjectured to be of Egyptian origin. Some support might be obtained for this view by supposing Cush in verse 8 to be Ethiopia as in verse 6; but it seems impossible to reconcile it with the statements in Genesis and Micah which connect Nimrod with Babylon and Assyria. It is possible that the Nebrod of the Septuagint (similarly Philo and Josephus) is the more ancient form of the name (Cheyne, Encyl. Bibl.).

It is possible that Enoch (Ency. Bibl. article "Nimrod") is generally regarded as far too sweeping. Ball, Sacred Books of the Old Testament, marks verse 9, which describes Nimrod as "a mighty hunter," as a later addition, giving a mistaken explanation of the gibbor of verse 8.

Many later legends gathered round Nimrod; Philo, De gigantibus, § 15, alleges more suo. Nimrod stands for treachery or desertion, according to the derivation from mrd mentioned above. According to Josephus, Ant. l iv. 2, Nimrod built the city of Babel. According to the Rabbis (Tzemah u Reenah, Hershon's tr., p. 59), Nimrod cast Abraham into the fire because he refused to worship idolatry; God, however, delivered him. Nimrod, in the form Nimrod=Nimroud, is an element in many modern place-names in western Asia. (W. H. BE.)

NINE MEN'S MORRIS, known also as Morelles and Merelles, an ancient English game played with 9 counters a side on a board marked with four squares, one within the other. The middle points of the three inside squares are connected by straight lines, and, in a variation of the game, the corners also. The players, whose counters are of different colours, place these alternately one by one upon the intersections of the lines, the object of each being to get three of his own men in line, in which case he may have the power of knocking or, if remaining from the board, any one of his opponent's men, although he may not take one of a row of three, unless there are no others. When all 18 counters have been placed on the board they are moved to adjacent unoccupied intersections. When all but three of a player's men have been captured he is allowed to jump or hop to any vacant point he chooses. As soon as a player is reduced to two men he loses.

In the time of Shakespeare (Midsummer Night's Dream, Act 11, Scene 1) the game was commonly played out of doors.

NINEVEH (Heb. נינֵה; in classical authors Nínus, Ninus; I.XX. Nínus, Nínue: Assyrian Nin or Ninda), the best known and most famous of the renowned cities of the Assyrian empire. There was a quarter or suburb of the old Babylonian city of Lagash whose name was written in the same way; this may possibly have been the home of those settlers from Babylonia who gave its name to the Assyrian city. The name was carried elsewhere, probably by Assyrian settlers, and we meet with Ninec in Asia Minor (Th. Ndrdeke, Hermes, v. 464, n. 2). Philiostorus calls a Hierapolis, ἑρατίας Nínus but it must not be confounded with the Egyptian Nī-γ, Assur-bani-pal Nī, the frontier city to the east of Egypt's greatest extension, where Tethmosis (Thothmes) III. hunted elephants, probably situated on the Euphrates. This, or an adjacent town, may be the origin of Ctesias's statement (απ. Diol. ii. 3) that Nineved stood on the Euphrates, the Arabic geographer Yaqut places a Nineved on the lower Euphrates near Babylon, and this may be a colony from the great Nineved, or possibly the Ninā of Lagash.

The derivation of the name is uncertain. The name Ninā was borne also by the goddess Ishtar, whose worship was the special cult of Nineved, and Ninā may well be a hypocoristicon of Ninā. The ideogram for Nineved, as also for the Lagash city, 𒈦𒈦, is a fish enclosed in the sign for house, possibly indicating a fish pond, sacred to Ishtar. As the Semitic.nim means a fish, a play upon nānā and Nīnā is suggested, but the name is not Semitic. A derivation from the root "u with a meaning like "lowland" is doubtful, unless we are sure that the name is Semitic, and that the Lagash city also lay low.

Nineved was situated at the N.W. angle of an irregular trapezoid of land which lay between the rivers Husur (Khausar, Choser) on the N.W., Gomāl on the N.E. and E., Upper Zāb on the S.E. and S. and Tigris on the S. and W. In extent this plain is 25 m. by 15 m., and contains the ruins of Nineved at Kuyunjik and Nehi Yānūs, of Dur Sargon at Khorsabad to the N.E. of Calah at Nimrood to the S. as well as of other towns not yet identified. The whole plain has a gradual slope from the low range of Jebel Maqtab and the hill of Ain-es-safra on the N.E. to the Tigris on the S.W. This plain was, for those days, amply protected on three sides by the two rapid broad streams of the Tigris and its tributary Zāb, by the hills on the N.E. and the river Gomāl at their base. The weak N.W. side was partly covered by the Husur, an impassable flood in winter but easily fordable in summer. The floods caused by the Husur were frequent and destructive, on one occasion sweeping away the palace terrace at Nineved and exposing the tombs of the kings, on another isolating Khorsabad. A great series of dams was therefore constructed (mapped and described in Topography).
of Nineveh, "J.R.A.S. xiv. 318 ff.) which flooded the cliffs and filled the ditches and moats of Nineveh. One of these ditches can be traced over 2 m. with a breadth of 200 ft., and was lined with a rampart on the city side.

The city on the river side of the Tigris extended about 2½ m., its north wall measured 7000 ft., the eastern wall was nearly 3 m. long and the southern about 1000 ft. The city thus formed a long narrow strip along the Tigris, pierced at right angles by the Husur, the waters of which, by closing the great dam in the eastern wall, could be sent round the moats to the N. and S. The Tigris may have swept the western wall, though now a wide belt of sand has accumulated beyond the wall in the ruins and its plain, with channels partially shifting. The actual extent of the city may be reckoned at about 1800 acres, or about two-thirds the size of Rome within Aurelian's Wall. At the rate of 50 sq. yds. to a person, it would have held a population of 175,000; but the extent of the palaces, gardens, &c., forbid us to imagine any such multitude except as refugees during a siege. Outside this city proper lay wide outskirts (kāblu) which were divided into quarters each with a separate governor (šaknu). Further afield lay the Rēhit-Ninūa, in which some have recognized the Rebo-both-Ir of Gen. x. 11 (Ninūa is often replaced by Nābū, and Ninūa by Nābūkudur), a city of considerable extent to which extended and included the site of Khorsabad, before Sargon II built his city of Dūr-Sargon there. Across the Tigris, connected by a bridge, lay an extensive district, probably now replaced by Mōsul. As Esarhaddon entered Nineveh, on his triumphal return from Sidon, through Rēhit-Ninūa, it is probable that this name covered the western suburbs. The walled city formed a sort of Arcopolis, and it is difficult to say exactly how far the name of Nineveh should be extended. Few traces of private houses have been found within the walls, but as deeds of sale speak of houses in Nineveh, which were bound on three sides by other houses, there must have been continuous streets within the area denoted by that name. Great emphasis has been laid on the agreement of a tetrapolis, formed by Nineveh, Khorsabad, Calah and Keramis, with the dimensions given by Diodorus and with the phrase "an exceeding great city of three days' journey" (Jonah iii. 3). Admitting that this whole area was thickly inhabited and might be regarded by those at a distance as one city, and that the district may well have had a common name, which could hardly be Assur, there is yet no native evidence that Nineveh extended so far. Assyrians have just spoken of "returning the walls of each city as was strongly fortified towards the interior as on the outside. Each had its own šaknu, and the governor of Nineveh stands below the governors of Assur and Calah in official lists. In deeds of sale "the road to Calah" is as often named as the "king's highway" to Arbela or Assur.

The history of Nineveh is, of course, bound up with that of Assyria in general. Later Assyrian writers professed to carry back its foundation to the creation of the world, but we lack any historical evidence of its age or early history. We may conjecture that it was founded by settlers from Babylon in Ninī, and the statement that Ninid built it from Babylonias, along with Calah, Reboboth-Ir and Resen, shows that this opinion was early held. We are, however, still without evidence that this was its first occupation. The mention of Gudea's building a temple for Ishtar in Ninī (2800 B.C.) may refer to the Lagash city and an inscription of Dungi, king of Ur (2700 B.C.), said to have been found at Nineveh, might have been carried there by some antiquary king. We reach firm ground with the statement of Khammurabi (2375 B.C.) that he "made the waters of Ishtar to become nineveh in E-mes-līs-mās," the temple of Ishtar there (Code IV, 60-62). We have just spoken of "returning the gracious protecting god to Assur," and spells the name Nu-um-a, there can be no doubt that Nineveh is meant. Shalmaneser I., in his zikkīt inscriptions (L. W. King, Records of the Reign of Tukulti-Ninib II. p. 131), c. 1300 B.C., records his restoration of the temple of Ishtar of Nineveh, which had been built by Samsi-Addad (Shamsi-Addad) and restored once before by Assur-uballit. Which Samsi-Addad (out of six at least) this was, and which Assur-uballit we are not told; the first of the former name known to us was a contemporary of Khammurabi and, if he built the temple first, Khammurabi may have plundered it and then restored it again; but an even earlier Samsi-Addad may be meant. Dushratta, king of Mitanni, about 1400 B.C., in the Tell el-Amarna letters offers to send to the king of Egypt an image of Ishtar of Nineveh; from which it has been inferred that Nineveh was then under foreign rule. The same letters mention Shaushash as goddess of Nineveh. A statue of a female nude figure found at Nineveh bears an inscription showing it to have been in the palace of Assur-bēl-kala (1300 B.C.), who is therefore supposed to have resided in Nineveh. Assur-resh-ishi, son of Assur-resh-ishi, built the temple of Ishtar, probably in Nineveh. Assur-sunsin-apli (885 B.C.) restored the temple E-mas-mas of Ishtar at Nineveh, but removed his residence to Calah. Shalmaneser II. set out on several of his expeditions from Nineveh, but in the latter part of his reign resided at Calah, and when rebellion broke out under his son Assur-danin-apli Nineveh sided with the rebel prince. Sennacherib records that several of his royal ancestors had been buried in Nineveh and they presumably had resided there. At the commencement of his reign Sennacherib found Nineveh a poor place. A store-house for vessels and a renowned temple, an armoury or storehouse, were the chief buildings, containing all the art objects which the front had served as foundations of the palaces hitherto built, but the platforms had been wrecked and the palaces were in decay. Sennacherib restored and enlarged the northern platform now covered by the Kuyunjik mound and built his palace on the south-western portion of it. It has been only partially excavated, though seventy-one rooms were opened, and it is the grandest architectural effort of Assyria. The bas-reliefs with which the walls are adorned are unrivalled in antiquity, for variety of subject, breadth of composition, truth of presentation and artistic literary merit. The accuracy with which building operations are portrayed, and a sense of landscape, are great advances even on the superb work of Sargon's palace at Khorsabad. On the adjoining platform to the south, now Nebi-Yunus, Sennacherib erected an arsenal for military supplies. Nineveh was badly supplied with water for drinking; the inhabitants had to "turn their eyes to heaven for the rain," but Sennacherib conducted water by eighteen canals from the hills into the Husur and distributed its waters round the moats and into store tanks, or ponds, within the city. He laid out a fine park or Paradise, for pleasure and for recreation. The chase on the stags, the magnificent "triumphant way" sixty-two cubits broad and forbade any householder to encroach upon the street. Sennacherib made Nineveh his court residence and, after his destruction of Babylon and the influx of the enormous booty brought back from his conquests, it must have been the most magnificent and wealthiest city of the East.

Esarhaddon began to rebuild Babylon and so departed from his father's purpose to make Nineveh the metropolis of the empire, but he did not altogether neglect the city. He rebuilt the temple of Assur at Nineveh, and a palace for himself now covered by the Nebi-Yunus mound and so insufficiently explored. Thither Assur-hani-pal brought the rebel Egyptian vassals Necho and Sharru-Ludari, the Elamite kings, the booty and captives of his continual conquests. He rebuilt the temples and a palace for himself north of Sennacherib's on the site of the latter's harem; which was adorned with extraordinary variety and richness. His sculptures are at the highest range of original and effective delineation in antiquity. Especially is his palace famous for the celebrated library, of which Sennacherib had made a commencement. Tens of thousands of clay tablets, systematically arranged on shelves, contained the classics of the Babylonian literature for which his scribes ransacked and copied the treasures of all then known centres of literary life.

Very little trace is left of the fortunites of Nineveh during the reigns of the sons of Assur-hani-pal. Nineveh, according to Herodotus, was besieged by Cyaxares and the Medes but saved by Medes and the Scythians some twenty or more years before the Medes in alliance with Nabopolassar, king of Babylon,
finally took it, c. 606 B.C. Much conjecture has been lavished upon the varying accounts which have reached us of the capture, but it seems probable that a heavy flood or the besiegers burst the great dam and while thus emptying the moats launched a fleet against the west wall on the inside and thus breached the defences.

It may be of interest to record the names of the governors of Nineveh: Nergal-mudadnik, 835 B.C.; Ninib-mukin-ahha, 790–761 B.C.; Sennacherib, 722–705 B.C.; Nabû-dîn-erpuš, 704 B.C.; Ahi-ilai, 649 B.C., officiated as Eponymos for the year.

If, as generally admitted, the ruins of Mespila and Larissa "described" by Xenophon, Anab. iii. 4, 7 sq. were those of Kuyunjik and Nimrud, we may conclude that there was no inhabited city on the spot at the time of the march of the Greeks with Cyrus (cf. Strabo xvi. p. 243). The name of Nineveh (Syriac Ninveh; Arabic Ninawā, Nīnawā) continued, even in the middle ages, to be applied to a site opposite Mosul on the east bank of the Tigris, where huge mounds and the traces of an ancient city wall bore witness of former greatness. Copious references to these mentions are collected in Tuch, *De Nino Urbe* (Leipzig, 1845). Ibn Jubiur, p. 237 sq., followed by Ibn Batuta, ii. 137, gives a good description of the ruins and the great shrine of Jonah as existing in the 12th century. The name of Ninawā applied, not to the ruins, but to the Rustak (fields and hamlets) on the site (Baladhuri, p. 331; Ibn Haukal, p. 145; Yaqut, ii. 694).

A very complete summary of the traditions will be found in Lincke, "Ninveh," in Geschichte und Sage der Mutterreichen nach 606–607.

The explorations of Sir A. H. Layard at Kuyunjik (1845–1847 and 1849–1851) definitely located the city, in confirmation of ancient tradition and the identifications of Rich and others. Excavations were carried on by Rawlinson, 1853–1855; H. Rassam, 1854; G. Smith, 1873–1874 and 1876; Rassam again, 1877–1883; E. A. Wallis Budge, 1888–1890; and King, 1903.

The enormous mound of Kuyunjik now separated from that of Nebi-Yunus by the deep and rapid Khausar, marks the site of the palace of Sennacherib and Assur-bani-pal. The mound of Nebi-Yunus is crowned by the "Tomb of Jonah," a sacred shrine to the modern inhabitants, and could not be explored; but by sinking a shaft within the walls of a private house, some sculptured slabs were recovered, and the Turkish government later opened out part of a palace of Esarhaddon. Excavations at two of the great city gates showed them to have been erected by Shalmaneser.

BIBLIOGRAPHY.—The architecture of these palaces is exhaustively treated in Ferguson's *Palaces of Nineveh and Persepolis Restored,* and in Perrot and Chipiez, *Art in Chaldea and Assyria.* Each palace was in its day a city, and the external walls are still standing in high places. The many topographical details furnished by exploration when compared with the building inscriptions and the indications given by deeds of sale will doubtless enable us ultimately to map out the principal features of the ancient city, but much more systematic exploration is needed, as well as further publication of existing documents.

(C. H. W. J.)

NING-PO—NING-PO-FU, i.e. City of the Peaceful Waves), a great city of China, the principal emporium of trade in the province of Chekiang, standing in a fine plain bounded by mountains towards the west, on the left bank of the Ning-po river, about 16 m. from its mouth, in 29° 40' N., 121° 4' E. It was visited by Portuguese traders as early as 1522, and is one of the five seaports which were thrown open to foreign trade in 1842 by the treaty of Nanking. The population of the city and suburbs is estimated from 400,000 to 500,000. Ning-po is surrounded by a fine old wall, 25 ft. high and 16 ft. broad, pierced by six gates and two passages for ships in its circuit of 4 to 5 m. Just within the walls there is a considerable belt of open ground, and in many places the ramparts are thickly covered with jasmine and holly-suckle. In ascending the river a stranger's eye is first caught by the numerous huge ice-houses with high thatched roofs and by the tall white crows of the T'ien-feng-t' a or Ning-po pagoda or obelisk—which rises to a height of 160 ft., and has fourteen stories and seven tiers of windows, and unfortunately has been stripped of its galleries and otherwise damaged. Another striking structure in the heart of the city is the Drum Tower, dating from before the 15th century. As is natural in a place long celebrated for its religious and educational pre-eminence, there is no lack of temples, monasteries and colleges, but few of these are of any architectural significance. Brick is the ordinary building material, and the buildings themselves are mostly of one storey. Silks, cottons, carpets, furniture, white-wood carvings and straw hats are the chief products of the local industry. Large salt-works are carried on in the vicinity, and thousands of fishermen are engaged, mainly between April and July, in catching cuttle-fish. In spite of the powerful competition of Shanghai, Ning-po has a valuable foreign trade. It is regularly visited by the vessels of the China Navigation Company and the Chinese Merchants' Steam Navigation Company. From 216,192 tons in 1873 the tonnage of the port has increased to 220,000 tons in 1904. The chief exports are 1,519,763 tons, as compared with 2,143,560 in 1900 and 1,657,400 in 1904. Straw or grass hats, straw mats, samshu (from the Shao-sing district), Chinese drugs, vegetable tallow and fish are among the chief exports; in 1904 the hats numbered 2,125,566, though in 1863 they had only amounted to 40,000, and the mats, mainly despatched to south China, average from 1,000,000 to 2,000,000. Missions are maintained in Ning-po by the Roman Catholic church, by the Church Missionary Society (1848), the American Presbyterian, the Reformed Westleys, and the Chinese Inland Mission (1837). A hospital was instituted in 1843. After the storming of Chenaik—the fortified town at the mouth of the river—on the 10th of October 1841, the British forces quietly took possession of Ning-po on the 12th. In 1864 the Taipings held the town for six months.

NINIAN, ST., a Briton, probably from Strathclyde, who was trained at Rome and founded a church at Whithorn on the west side of Wigtown Bay. Whithorn has been identified with the Leukopibia of Ptolemy, but this is uncertain. Bede, writing three centuries after Ninian, ascribes the name Ad Caelidinum Casbon to the fact that he lived at the church of Ninian, which was built of stone.

We are told by Bede that St Ninian dedicated his church to St Martin of Tours, who died between 337 and 400, but Alired of Rievaulx is our only authority for the statement that St Martin supplied him with masons. The population of the north shore of the Solway Firth at the beginning of the 5th century were probably either Picts or Goildes or a blend of both, and naturally hostile to the Romanized Britons. Bede records that Ninian preached among the Picts within the Mounth, which indicates that he was acquainted with the Pictish language. The legends of the Irish and the Britons, according to the Irish of Ireland and the Britons of Scotland, which are generally paralleled in that country by the church of Whithorn. The date of Ninian's death is given by Archbishop Ussher as 432, but there is no authority for this statement.

NINIB, the ideographic designation of a solar deity of Babylonia. The phonetic designation is uncertain—perhaps Annisht. The cult of Ninib can be traced back to the earliest period of Sumerian history. According to a text from Nippur at Shurpula (Shirgulla, also known as Lagash), he appears as Nin-girsu, that is, "the lord of Girsu," which appears to have been a quarter of Shirgulla. He is closely associated with Bel (g.), or En-lil of Nippur, as whose son he is commonly designated. The combination points to the amalgamation of the district in which Ninib was worshipped with the one in which Bel was the chief deity. This district may have been Shirgulla and surrounding places, which, as we know, fell at one time under the control of the rulers of Nippur.

Ninib appears in a double capacity on the epithets bestowed on him, and in the hymns and inscriptions addressed to him. On the one hand he is the healing god who releases from sickness and the ban of the demons in general, and on the other he is the god of war and of the chase, armed with terrible weapons. It is not easy to reconcile these two phases, except on the assumption
that he has absorbed in his person various minor deities, representing different phases of the sun, just as subsequently Shamash absorbed the attributes of practically all the minor sun-deities.

In the systematized pantheon, Ninib survives the tendency towards centralizing all sun cults in Shamash by being made the symbol of a certain phase of the sun. Whether this phase is that of the summer solstice or of the springtime with which beneficent qualities are associated, or that of the noonday sun or of the summer solstice, bringing suffering and destruction in its wake, is still a matter of dispute, with the evidence on the whole in favour of the former proposition. At the same time, the possibility of a confusion between Ninib and Nergal (q.v.) must be admitted, and perhaps we are to see the solution of the problem in the recognition of two diverse schools of theological speculation, the one assigning to Ninib the rôle of the spring-tide solar deity, the other identifying him with the sun of the summer solstice. In the astral-theological system Ninib becomes the planet Saturn. The swine seems to have been the animal sacred to him, or to have been one of the symbols under which he is represented. The consort of Ninib was Gula (q.v.).

**Ninus**, in Greek mythology, the eponymous founder of Nineveh (q.v.), and thus the city itself personified. He was said to have been the son of Belos or Bel, to have conquered in seventeen years the whole of western Asia with the help of Aráeus, king of Arabia, and to have founded the first empire. During the siege of Bactra he met Semiramis, the wife of one of his officers, Onnes, whom he took from her husband and married. The fruit of the marriage was Ninias, i.e. "The Ninivite." After the death of Ninus, Semiramis, who was accused of causing it, erected to him a temple-tomb, nine stades high and ten stades broad, near Babylon. According to Castor (ap. Synell. p. 167) his reign lasted fifty-two years, its commencement falling 2189 B.C. according to Ctesias. Another Ninus is described by some authorities as the last king of Nineveh, successor of Sardanapalus.

**Nioe**, in Greek mythology, daughter of Tantalus and Dione, wife of Amphion, king of Thebes. Proud of her numerous family, six daughters and six sons, she boasted of her superiority to her friend Leto, the mother of the Olympian gods, Apollo and Artemis. As a punishment Apollo slew his son Niobe and Artemis her daughters. Their bodies lay for nine days unburied, for Zeus had changed the people to stone; on the tenth day they were buried by the gods. Out of pity for her grief, the gods changed Niobe herself into a rock on Mount Sipylos in Phrygia, in which form she continued to weep (Hom. Iliad, xxiv. 602-617; Apollodorus iii. 5; Ovid, *Metam.* vi. 430-432). The names and number of her children, and the time and place of their death, are variously given. This "Niobe," described by Pausanias (i. 21) and Quintus Smyrnaeus (i. 203-306), both natives of the district, was the appearance of a cliff on Sipylos when seen from a distance and from the proper point of view (see Jebb on Sophocles, *Antigone*, 831). It is to be distinguished from an archaic figure still visible, carved in the northern side of the mountain near Magnesia, to which tradition has given the name of Niobe, but which is really intended for Cybele.

According to some, Niobe is the goddess of snow and winter, whose children, slain by Apollo and Artemis, symbolize the ice and snow melted by the sun in spring; according to others, she is an earth-goddess, whose progeny—vegetation and the fruits of the soil—is dried up and slain every summer by the shafts of the sun-god. Burmeister regards the legend as an incident in the struggle between the followers of Dionysus and Apollo in Thebes, in which the former were defeated and driven back to Lydia. Heffter builds up the story around the dripping rock in Lydia, really representing an Asiatic goddess, but taken by the Greeks for an ordinary woman. Emmann, who interprets the name as "she who prevents increase," in contrast to Leto, who made women prolific, considers the main point of the myth to be Niobe's loss of her children. He compares her story with that of Lamia, who, after her children had been slain by Zeus, retired to a lonely cave and carried off and killed the children of others. The appearance of the rock on Sipylos gave rise to the story of Niobe having been turned to stone. The tragedians used her story to point the moral of the instability of human happiness; Niobe became the representative of human nature, liable to lapse in prosperity and forgetfulness of the respect and submission due to the gods.

The tragic story of Niobe was a favourite subject in literature and art. Aeschylus and Sophocles wrote tragedies upon it; Ovid has described it at length in his *Metamorphoses*. In art, the most famous representation was a marble group of Niobe and her children, taken by Susius to Rome and set up in the temple of Apollo Sosianus (Pliny, *Nat. Hist.* xxxvi. 4). What is probably a Roman imitation of this work was found in 1583 near the Lateran, and is now in the Ufizzi gallery at Florence. In ancient times it was disputed whether the original was the work of Praxiteles or Scopas, and modern authorities are not agreed as to its identity with the group mentioned by Pliny.

On the whole subject see C.E. Burmeister, *De fabula quae de Niobe ejusque libris agit* (Wismar, 1836); L. Curtze, *Fabulae Niobae Thebaeae* (Corbach, 1836); W. Heßler in *Zeitschrift für Gymnasial- und Volkslehrer* (1865); E. Heydreich, *Die Amphion* (1884); H. Heydreich, *Klassische Antiquitäten* (1885); E. Thramer, *Fergusons* (1888); C. Friederichs, *Praxiteles und die Niobegruppe* (1884); A. Mayerhöfer and H. Oldenbourg, *Die Fluren- und Vasenbilder des Niobengruppen* (1888); A. Ohlrich, *Niobegruppe* (1885); H. Stark and D. Stark, *Nach dem griechischen Oriens* (1874); G. Weber, *Le Sipylos et ses monuments* (1880); W. Ramsay, *Sipylos and Cybele," in *Journal of Hellenic Studies*, iii. 1882; A. Frazer's *Passamonti*, iii. 555; for vase-paintings, see F. Prisse's *Vasenbildern* (1875). For further literature on the subject, see A. Feurer's mythological bibliography in C. Burckhardt's *Jahresbericht über die Forschritte der klassischen Alterthums- und vorhistorischen Wissenschaften*, vol. xxv. (1861); the various derivations of the name and interpretations of the legend are given in Emmann's article in Roscher's *Lexikon der Mythologie*.

The ancient Ast. *fig. 29* (from an Orvieto vase) represents the slaying of the children of Niobe by Apollo and Artemis; *fig. 78* (Pl. VI.), Niobe shielding her youngest daughter.

**Niort**, a city of western France, chief town of the department of Deux-Sèvres, 42 m. E.N.E. of La Rochelle on the railway to Saumur. Pop. (1906) 20,538. Niort is situated on the left bank of the Sèvre Niortaise, partly in the valley and partly on the slopes of the enclosing hills. The tower of the church of Notre-Dame (15th and 16th centuries) has a spire 246 ft. high, with bell-turrets adorned with statues of the evangelists, and at the base a richly decorated façade in the Renaissance style; and the north doorway shows a balustrade, of which the balusters form the inscription *O Mater Dei, memento mei*. St André, with a fine window in the apse, and St Hilaire, which contains some beautiful frescoes, both date from the 15th century. Of the old castle, whose site is partly occupied by the prefecture, there remains the donjon—two large square towers united by a central building, flanked by turrets, built when Henry II. of England or Richard Coeur de Lion. The platform on the top affords a fine view of the public garden (one of the most picturesque in France) and the valley of the Sèvre. The old town-hall, Renaissance in style, is wrongly known as the Alénoir palace, after Eleanor of Guînes; it contains a collection of antiquities. The house is still shown in which Madame de Maintenon is erroneously stated to have been born. Near Niort are the fine feudal ruins of the fortress of Courdroy-Salbart.

Niort is the seat of a prefect and a court of assizes, and has tribunals of first instance and of commerce, a popular assembly, a middle arbitration, lycées, a gymnasium, a college, a seminary, a Jesuit establishment, and a branch of the Bank of France. Tanning, currying, shammy-dressing, glove-making and the manufacture of brushes and boots and shoes are the staple industries.

Up to the 7th century the Niort plain formed part of the Gulf of Poitou; and the mouth of the Sèvre lay at the foot of the hills now occupied by the town which grew up round the castle erected by Henry Plantagenet in 1155. The place was captured by Louis VIII. in 1224. By the peace of Brétigny it was ceded to the English; but its inhabitants revolted against the Black Prince, and most of them were massacred when his troops recovered the town by assault. In 1573 Duguesclin regained
possession of the town for the French. Protestantism made numerous proselytes at Nior, and Gaspard de Coligny made himself master of the town, which successfully resisted the Catholic forces after the Battle of Jarnac, but surrendered without striking a blow after that of Moncontour. Henry IV. rescued it from the League. It suffered severely by the revocation of the edict of Nantes.

NIPIGON [NEEPEIGN, or NIPIGON], a lake and river of Thunder Bay district, Ontario, Canada. The lake is 30 m. N. of the bay of the same name on Lake Superior, at an altitude of 832 ft. above the sea. It is 70 m. long and 50 m. wide; contains over 1000 islands, is very deep, and has a much-indented shore-line meandering for 550 m. The river, which drains the lake, descends several hundred feet in the 40 m. of its course and is the largest stream flowing into Lake Superior. It is widely known for the excellence of its trout fishing.

NIPISSING, a lake of the district of the same name in Ontario, Canada, situated nearly midway between Lake Huron and the Ottawa river, at an altitude of 644 ft. above the sea. It is of irregular shape, with bold shores, and contains many islands; from the north it receives the waters of Sturgeon river. It is 50 m. in length and 20 in breadth; discharges its waters by a very broad confluence on the Ottawa river, forming the Ottawa river, a tributary of the Ottawa. It has been proposed as the summit level of the projected Ottawa and Georgian Bay canal, an important project rendered difficult by the numerous rapids both on French river and on the Ottawa. With the Ottawa, Mattawa and French, it formed the old voyageur route from Montreal to the Great Lakes.

NIPUR, one of the most ancient of all the Babylonian cities of which we have any knowledge, the special seat of the worship of the Sumerian god, En-lil, lord of the storm demons. It was situated on both sides of the Shatt-en-Nil canal, one of the earliest courses of the Euphrates, between the present bed of that river and the Tigris, almost 100 m. S.E. of Bagdad, in 32° 7' N. 45° 10' E. It is represented by the great complex of ruin mounds known to the Arabs as Nuffar, written by the earlier explorers Niffer, divided into two main parts by the dry bed of the old Shatt-en-Nil (Arakhat). The highest point of these ruins, a conical hill rising about 100 ft. above the level of the surrounding plain, N.E. of the canal bed, is called by the Arabs Bint el-Amir or "prince's daughter." Here very brief and unsatisfactory excavations were conducted by Sir A. H. Layard in 1851, which seemed, however, beyond means of the inscribed bricks discovered, to identify the site. The university of Pennsylvania began systematic excavations in 1889 under the direction of Dr John P. Peters. With some intermissions these excavations were continued until 1900 under the original director and his successors, Dr John Henry Haynes and Dr H. V. Hilprecht. The result of their work is a fairly continuous history of Nippur, and especially of its great temple, E-kur, from the earliest period.

Originally a village of reed huts in the marshes, similar to many of those which can be seen in that region to-day, Nippur underwent the usual vicissitudes of such villages—floods and conflagrations. For some reason habitation persisted at the same spot, and gradually the site rose above the marshes, partly as a result of the mere accumulation of débris, consequent on continuous habitation, partly through the efforts of the inhabitants. As these began to develop in civilization, they substituted, at least so far as their shrine was concerned, buildings of mud-brick for reed huts. The earliest age of civilization, which we may designate as the clay age, is marked by rude, hand-made pottery and thumb-marked bricks, flat on one side, concave on the other, gradually becoming through several fairly brief stages. The exact form of the sanctuary at that period cannot be determined, but it seems to have been in some way connected with the burning of the dead, and extensive remains of such cremation are found in all the earlier, pre-Sargonic strata. There is evidence of the succession on this site of different peoples, varying somewhat in their degrees of civilization. One stratum is marked by painted pottery of good make, similar to that found in a corresponding stratum in Susa, and resembling the early pottery of the Aegean region more closely than any later pottery found in Babylonia. This people gave way in time to another, markedly inferior in the manufacture of pottery, but superior, apparently, as builders. In one of these earlier strata, of very great antiquity, there was discovered, in connexion with the shrine, a conduit built of bricks, in the form of an arch. Somewhere, apparently, in the 4th millennium B.C., we begin to find inscriptions written on clay, in an almost linear script, in the Sumerian tongue. The shrine at this time stood on a raised platform and apparently contained, as a characteristic feature, an artificial mountain or peak, a so-called zigurat, the precise shape and size of which we are, however, unable to determine. So far as we can judge from the inscriptions, the peak was of stone, and we cannot say what period for that matter, political hegemony, but was distinctively a sacred city, important from the possession of the famous shrine of En-lil. Inscriptions of Lugal-zaggisi and Lugal-kigub-nidudu, kings of Erech and Ur respectively, and of other early pre-Semitic rulers, on door-sockets and stone vases, show the veneration in which the ancient shrine was then held and the importance attached to its possession, as giving a certain stamp of legitimacy. So on their votive offerings some of these rulers designate themselves as patres, or over-priests, of En-lil. Early in the 3rd millennium B.C. the Semitic rulers of Akkad, or Agade, and numerous votive objects of Alu-usharissi (Urumush or Rimush), Sargon and Naram-Sin testify to the veneration in which they also held this sanctuary. En-lil was in fact adopted as the Bel or great god of the Semitic pantheon. The last monarch of this dynasty, Naram-Sin, rebuilt both the temple and the city walls, and in the accumulation of débris now marking the ancient site his remains are found about half way from the top to the bottom. To this Akkadian occupation succeeded an occupation by the first Semitic dynasty of Ur, and the constructions of Ur-Gur or Ur-Engur, the great builder of Babylonian temples, are superimposed immediately upon the constructions of Naram-Sin. Ur-Gur gave to the temple its final characteristic form. Partly razing the constructions of his predecessors, he erected a terrace of unplastered bricks, some 40 ft. high, covering a space of about 8 acres, near the northwestern edge of which, towards the western corner, he built a zigurat, or stage-tower, of three stages of unburned brick, faced with kiln-burned bricks laid in bitumen. On the summit of this artificial mountain stood, apparently, as at Ur and Eridu, a small chamber, the special shrine or abode of the god. Access to the stages of the zigurat from the court beneath, was had by an inclined plane on the southeast side. To the north-east of the zigurat stood, apparently, the House of Bel, and in the courts below the zigurat stood various other buildings, shrines, treasure chambers and the like. The whole structure was roughly orientated, with the corners towards the cardinal points of the compass. Ur-Gur also rebuilt the walls of the city in general on the line of Naram-Sin's walls.

The restoration of the general features of the temple of this and the immediately succeeding periods has been greatly facilitated by the discovery of a sketch map on a fragment of a clay tablet. This sketch map represents a quarter of the city to the eastward of the Shatt-en-Nil canal, which was enclosed within its own walls, a city within a city, forming an irregular square, with sides roughly 2700 ft. long, separated from the other quarters of the city, as from the surrounding country to the north and east, by canals on all sides, with broad quays along the walls. A smaller canal divided this quarter of the city itself into two parts, in the south-eastern part of which, in the middle of its S.E. side, stood the temple, while in the N.W. part, along the stage of the zigurat, from the court beneath, was built by a proper plan, consisting of an outer and inner court (each covering approximately 8 acres), surrounded by double walls, with zigurat on the north-western edge of the latter.

The temple continued to be built upon or rebuilt by kings of various succeeding dynasties, as shown by bricks and votive objects bearing the inscriptions of the kings of various dynasties of Ur and Isin. It seems to have suffered severely in some
Nippur

manner at or about the time of the Elamite invasions, as shown by broken fragments of statutory, votive vases and the like, from that period, but at the same time to have won recognition from the Elamite conquerors, so that Eríku (Sem. Rim-Sin, biblical Arioch), the Elamite king of Larsa, styles himself "shepherd of the land of Nippur." With the establishment of the Babylonian empire, under Khammurabi, early in the 2nd pre-Christian millennium, the religious as well as the political centre of influence was transferred to Babylon, Mariakú became the Bel or lord of the pantheon, many of En-lil's attributes and myths were transferred to him, and finally that Nippur was to some extent a sub-centre in the extending Cossaean dynasty, however, shortly after the middle of the 2nd millennium, E-kur was restored once more to its former splendour, several monarchs of that dynasty built upon and adorned it, and thousands of inscriptions, dating from the time of those rulers, have been discovered in its archives. After the middle of the 12th century follows another long period of comparative neglect, but with the conquest of Babylonia by the Assyrian Sargon, at the close of the 8th century B.C., we meet again with building inscriptions, and under Assur-bani-pal, about the middle of the 7th century, we find the temple of E-kur restored to its former splendour, and finally, toward the end of the 5th century, the ziggurat of that period being 190 ft. by 128 ft. After that E-kur appears to have gradually fallen into decay, until finally, in the Seleucid period, the ancient temple was turned into a fortress. Huge walls were erected at the edges of the ancient terrace, the courts of the temple were filled with houses and streets, and the ziggurat itself was curiously built over in a cruciform shape, and converted into an acropolis for the fortress. This fortress was occupied and further built upon until the close of the Parthian period, about A.D. 250; but under the succeeding rule of the Sassanids its turn fell into decay, and the ancient sanctuary became, to a considerable extent, a mere place of sepulture, only a little village of mud huts huddled about the ancient ziggurat continuing to be inhabited. The store-house quarter of the temple town had not been explored as late as 1900.

As at Tello, so at Nippur, the clay archives of the temple were found not in the temple proper, but on an outlying mound. South-eastward of the temple quarter, without the walls above described, and separated from it by a large basin connected with the Shatt-en-Nil, lay a triangular mound, about 25 ft. in average height and 130 ft. in diameter. In this were found large numbers of inscribed clay tablets (it is estimated that upwards of 40,000 tablets and fragments have been excavated in this mound alone), dating from the middle of the 3rd millennium B.C. onward into the Persian period, partly temple archives, partly school exercises and text-books, partly mathematical tables, with a considerable number of documents of a more distinctly literary character. For an account of one of the most interesting fragments of a literary or religious character, found at Nippur, see below.

The great complex of ruin mounds lying S.W. of the Shatt-en-Nil canal, larger in extent and mass than the N.E. complex, had not up to 1900 been so fully explored as the mounds in the N.E. Almost directly opposite the temple, however, a large palace was excavated, apparently of the Cossaean period, and in this neighbourhood and further southward on these mounds large numbers of inscribed tablets of various periods, including temple archives of the Cossaean and commercial archives of the Persian period, were excavated. The latter, the "books and papers" of the house of Murashu, commercial agents of the government, throw light on the condition of the city and the administration of the country in the Persian period, the 5th century B.C. The former gives us a very good idea of the organisation of an ancient temple. The whole city of Nippur appears to have been at that time merely an appanage of the temple. The temple itself was a great landowner, possessed of both farms and pasture land. Its tenants were obliged to render careful accounts of their administration of the property entrusted to their care, which were preserved in the archives of the temple. We have also from these archives lists of goods contained in the temple treasuries and salary lists of temple officials, on tablet forms specially prepared and marked off for periods of a year or less.

On the upper surface of these mounds was found a considerable Jewish town, dating from about the beginning of the Arabic period onward to the 10th century A.D., in the houses of which were large numbers of incantation bowls. Jewish names, appearing in the Persian documents discovered at Nippur, show, however, that Jewish settlement at that city dates in fact from a much earlier period, and the discovery on some of the tablets found there of the name of the canal Kabari suggests that the Jewish settlement of the exile, on the canal Chebar, to which Ezkiel belonged, may have been somewhere in this neighbour- ing region. H. Hilbrecht believes that the Kabari was the Shatt-en-Nil. Of the history and conditions of Nippur in the Arabic period we learn little from the excavations, but from outside sources it appears that the city was the seat of a Christian bishopric as late as the 12th century A.D.

The excavations at Nippur were the first to reveal to us the extreme antiquity of Babylonian civilization, and, as already stated, they give us the best consecutive record of the development of that civilization, with a continuous occupancy from a period of unknown antiquity, long ante-dating 5000 B.C., onward to the middle ages. But while Nippur has been more fully explored in this respect than the Babylonian site at the Tigris, in the valley of Lagash, still only a small part of the great ruins of the ancient site had been examined in 1900. These ruins have been particularly fruitful in inscribed material, especially clay tablets, many of them from the very earliest periods; but little of artistic or architectural importance has been discovered. Excavation at Nippur is particularly difficult and costly by reason of the in-accessibility of the site, and the dangerous and unsettled condition of the surrounding country, and still more by reason of the immense mass of later débris under which the earlier and more important Babylonian remains are buried.

See A. H. Layard, Nineveh and Babylon (1853); John P. Peters, Nippur (1897); H. V. Hilprecht, Excavations in Assyria and Babylonia (1904); Clarence S. Fisher, Excavations at Nippur (1st pt. published 1901); E. F. Peters, Excavation of the Temple of E-kur (1905); H. Hilbrecht, "Nippur," in The Pennsylvania Academy of Sciences, a monumental edition of the cuneiform texts found at Nippur, with brief introductions and notes of a more general character (1883, 1885, 1889, 1891 fol.). For a plan of the Parthian palace see Architecture, vol. ii, p. 291.

The Nippur Deluge Fragment.—From among the many tablets and fragments of tablets discovered at Nippur one of more than ordinary interest was published in 1910. Though mutilated portions of only a few of its lines have been preserved, and the text contains no proper name, it is clear that the tablet represents part of a Babylonian version of the Deluge Legend.1 The portion of the story covered by the text relates to the warning given by Ea to Ut-napishtim, the Babylonian equivalent of the Hebrew Noah. The god here states that he is about to send a deluge, which will cause destruction to all mankind, and he gives directions for the building of a great ship in which "the beasts of the field and the birds of heaven" may be saved, along with Ut-napishtim and his family; he fixes the size of the ship and directs that it should be covered with a strong roof or deck. The text bears a general resemblance to the two well-known Assyrian versions on tablets in the British Museum, but it has been claimed that its phraseology presents a closer parallel to the biblical version of the Deluge story in the "Priestly Code."2 For several years the existence of Babylonian versions of the legend had been detected among collections of tablets dating from the earlier Persian periods, and the argument of one such version belongs to the period of the First Dynasty of Babylon,3 and part of a still earlier Semitic version of another portion of the Gilgamesh Epic has also been recovered.4 The new fragment from Nippur has given rise to considerable discussion, in view of the light it provides on the prehistory of Sumerian literature; cf. Scheil, Recueil de travaux, xx. 55 ff. For another fragment of the Atar-akhis-legend of the same period, see Cuneiform Texts in the British Museum, pt. vi, and cf. Zimmern, Zeits. für Assyriol., xiv. 275 ff.

4. For other Semitic legendaries of this early period, see Cuneiform Texts in the British Museum, pt. xv. (1902), pls. i.-vi., and cf. King, The Seven Tables of Creation, p. xxixvii. i.
The town of Niriz is situated in a plain 7 m. from the southeastern point of the lake, and about 150 m. from Shiraz, and has a population of about 9000. The people of Niriz were stanch followers of the Báb (see Bábí-Násí), and rose against the government in 1850 and in 1852, with disastrous results. Niriz was formerly known for its manufacture of steel from iron ore brought from Parpa, 40 m. E.

NIRVANA, the term in Buddhist theology, meaning literally "blowing out" or "dying out," Skt. nírvāṇa, to blow, for a calm or sinless state or condition of the mind reached by a dying out or extinction of sin (see Buddhānitya).

NISARD, JEAN MARIE BECQUELON DÉSIRÉ (1806-1888), French archeologist and critic, was born at Châtillon-sur-Seine on the 20th of March 1806. In 1826 he joined the staff of the Journal des Débats, but subsequently transferred his pen to the National. Under the empire he was inspector-general of education (1852) and director of the École normale (1857-1867). His literary reputation was actually established by his Histoire de la littérature française (1844-1861), which secured his election to the Academy (1850). His other works include Études d'histoire et de littérature (1859-1864), and Les Quatre grands historiens latins (1875). In all his books he vigorously supported the department of Sumerian romanticism. He died at San Remo on the 27th of March 1888.

NISBETT, LOUISA CRANSTOUN (1812-1838), English actress, was the daughter of Frederick Hayes Macnamara, an actor, whose stage name was Morduant. As Miss Morduant she had considerable experience, especially in Shakespearean leading parts, before her first London appearance in 1829 at Drury Lane as Widow Cleerly in Andrew Cherry's (1762-1812) Soldier's Daughter. Her beauty and high spirits made her at once a popular favourite in a large number of comedy parts, until in 1831 she was married to Captain John Alexander Nisbet and retired. Her husband, however, was killed the same year by a fall from his horse, and she was compelled to reappear on the stage in 1832. She was the original Lady Gay Spunker of London Assurance (1841). In 1844 she withdrew again from the stage to marry Sir William Boothby, Bart., but on his death (1846), returned to play Lady Teaze, Portia, Constantia in the Love Chase, Helen and Julia in the Hunchback. It was in the first of these parts that she made her final appearance in 1851. She died on the 15th of January 1858.

NISH (also written as Nîsh), the capital of the Nineveh district, of Servia, lying in a plain among the southern mountains, on the left shore of the Nishava, a tributary of the Morava. Pop. (1900) 24,451. Among Servian cities, Nish is only surpassed by Belgrade in commercial and strategic importance; for it lies at the point where several of the chief Balkan highroads converge, and where the branch railway to Salonica leaves the main line between Belgrade and Constantinople. The administration of the Servian railways has its factory for repairing engines and principal store of materials in the city, which also possesses an iron foundry. The king and the government reside for at least three months in the year in Nish, where also the national assembly, before the constitution of 1901, was regularly held. It is the see of a bishop, the seat of the district prefecture and a tribunal, and the headquarters of the territorial militia corps, having besides a large number of regular troops in garrison. There is a small obsolete fortress on the right bank of the Nishava, believed to have been erected on the site of the Roman Naisus. The surrounding hills (Vinik, Goritsa, Kamenitsa) were, after 1886, fortified by modern earthworks.

After the Turks were driven from the city in 1875, it was in many respects modernized; but something of its former character is preserved in the ancient Turkish palace, mosque and fountain, the maze of winding alleys and picturesque houses in the older quarters, and, on market days, by the medley of peasant costumes—Bulgarian, Albanian and Rumanian, as well as Servian. The ancient Roman city Naisus was mentioned as an important place by Ptolemy of Alexandria. Under its walls was fought in A.D. 260 the great battle in which Emperor Claudius destroyed the army of the Goths. It was at Naisus that

NIRIZ—NISH

is said to have thrown up a disputed problem of biblical criticism. According to its discoverer it represents the oldest account of the Babylonian Deluge story extant; and he considers it of fundamental importance for determining the age of Israel's earliest traditions, since he would regard it as having been written "before Abraham had left his Babylonian home in Ur of the Chaldees."

Beyond the fact that it was found at Nippur during the fourth of the American expeditions, there does not appear to be any exact record of its provenance; and, in order to determine its date, it is necessary to rely on the external and internal evidence furnished by the tablet itself. A number of hymns and prayers addressed to the chief Babylonian gods, and written throughout in the Sumerian language, have been found at Nippur, and these may be dated in the era of the kings of Ur and Isin, since some of them are mentioned by name in the petitions. To the latter part of this period Professor Hilprecht would assign the new Deluge fragment. It is natural that under the Sumerian revival, which characterized the united kingdom of Sumer and Akkad, the ancient ritual should have been revived and the Sumerian service-books adapted for the use of the reigning monarch. Sumerian, in fact, predominated, not only on the historical monuments, but also on the literary deluge; and the tendency was against assigning the newly discovered Semitic legend to the period of these early Sumerian texts. It has already been noted that the earliest deluge-fragment previously recovered dates from the latter half of the First Dynasty of Babylon, when the Western Semites had succeeded in establishing their authority throughout the greater part of the country. But, to judge from the photographic reproduction of the Nippur tablet, the characters upon it do not appear to resemble those in use at the time of the First Dynasty, nor those of the period of the Dynasties of Ur and Isin. On purely epigraphic grounds the suggestion has indeed been advanced that it should be assigned to the Kassite period (not earlier than 1700 B.C.), during which a very large number of the tablets found at Nippur were inscribed. 1

But, even so, the fragment is one of the most interesting that has been recovered on the site of Nippur. For it strikingly illustrates the fact that the temple of En-lil, like that of the Sun-god at Sippar and the other great temples in Babylonia, possessed a body of mythological and religious texts, which formed subjects for study and comment among the priests.

It was by the collection and reproduction of such documents that the ancient scribes attempted to connect the local mythology with the Semitic legend. Such a connection allows of a number of interpretations for the name En-lil, and furnishes a key to the understanding of the tablet itself.

The text of this Deluge fragment also furnishes one more proof of the existence of parallel versions of the same legend. In some instances, as in the great Creation Series of Babylon, the later scribes subjected the different versions to processes of editing, with the result that the earlier forms gave place to the redactions of a militant priesthood. But where no theological or local prejudices were involved, the tendency to a faithful reproduction of the earlier texts prevailed. Thus the resemblances which have been claimed between the Nippur Deluge fragment and the version of the Priestly Code in Genesis, in this case furnishing no significant evidence as to the latter's date. The possibility that Hebrew traditions were subject to Babylonian influence from the period of the Canaanite conquest has long been recognized, and to the Exilic and post-Exilic Jew the mythology of Babylon may well have presented many familiar features.

NIRIZ, or NARIRZ, a district and town in the province of Fars, Persia. The district has 24 villages and extends from near Istahbamat, south of the Bakhtegan lake, to about 50 m. E. Water is scarce and the plain is not much cultivated in consequence. The produce consists of some grain, cotton, tobacco, &c., but fruit is more abundant. Here, as in the neighbouring Dibaj district, villages situated in the hills are called madan (mine), and some travellers have their itineraries indicated a mine in localities where there is none.

1 It has also been pointed out that the employment of the sign PI for wa and the use of s for s, cited in support of the earlier date, survived in the Kassite period.
Constantine the Great was born in a.D. 274. Though the emperor Julian improved its defences, the town was destroyed by the Huns under Attila, in the 5th century, but Justinian did his best to restore it. In the 9th century the Bulgarians became masters of Nisibis, but had to cede it to the Hungarians in the 11th century, from whom the Byzantine emperor Manuel I. reconquered it in 1173. Towards the end of the 12th century the town was in the hands of the Servian prince Stephen Nemanya, who received it from the Byzantine emperor Frederic Barbarossa in 1189, as a Crusader. In 1357 the Turks captured Nisibis for the first time from the Servians. In 1445 the allied armies of the Hungarians under Hunyady and the Servians under George Brankovich, retook it from the Turks, but in 1456 it again came under Turkish dominion, and remained for more than 300 years the most important Turkish military station on the road between Hungary and Constantinople. In the frequent wars between Austria and Turkey during the 17th and 18th centuries the Austrians captured Nisibis twice (in 1689 and 1739), but were not able to retain it for long. The Servians having, in the beginning of the 19th century, successfully cleared Servia of Turks, were emboldened to attack Nisib in 1809, but were repulsed with great loss. The Turks raised as a monument of their victory a high tower composed entirely of the heads of the Servians slain in the battle of Nish. The remains of this monument are still kept up. It stands half a mile to the east from Nish, and is called to this day by the Turkish name “Tyele-Koula,” “the Tower of Skulls.” In the Russo-Turkish War the Servian army, under the personal command of King Milan, besieged Nish, and forced it to capitulate on the 20th January 1878. The Berlin congress decided that it should remain with Servia.

**NISHĀPŪR,** a province of Persia, situated between Meshed and Sabzevar, in northern Khorasan. The older name of the district was Abarshehr. It has a population of from 130,000 to 140,000, is divided into twelve districts, and pays a yearly revenue of about £1,200. It produces much grain and cotton, and is considered one of the most fertile districts of Persia. One of its subdivisions is that of Bār-i-Mādan, with chief place Mādan (situated 32 m. N.W. of the city of Nishāpur, at an elevation of 3100 ft., in 36° 28′ N., 58° 20′ E.), where the famous mines are which have supplied the world, in the beginning of the last 2000 years. The province used to be one of the administrative divisions of Khorasan, but is now a separate province, with a governor appointed by the shah.

**NISHĀPŪR** (Old Pers. Nīn-shāpūr-nīr, New Pers. nīr, nīl = good; Arab. Nisīsābūr), the capital of the province of Nishāpur, Persia, situated at an elevation of 3920 ft., in 36° 12′ N., and 58° 40′ E., about 40 m. west of Meshed. The second element of the name is that of the traditional founder Shāhīpur, or Sapor of the Western historians. Some accounts name the first (241-272), others the second Shāhīpur (309-370). It was known to the four great cities of Khorasan, rivalling Rhage (Khages), “the mother of cities,” in importance and population, but is now a small and comparatively unimportant place with a population of barely 15,000. It has post and telegraph offices and a lively trade in wool, cotton and dry fruits (almonds, pistachios).

Eastward of the present city, amongst the mounds and ruins of the old town, in a dilapidated chamber adjoining a blue-domed building over the grave of an imamzadeh, is the tomb of the astronomer-poet Omar Khayyam, an uninsight heap of plaster without inscription, and probably fictitious. Near it is the grave of the celebrated poet and mystic Farīd ud-dīn Attār, who was killed by the Mongols when they captured the city c. 1220.

Nishāpur was an important place during the 5th century, for Yazdegird II. (438-457) mostly resided there. During the latter Sassanids it is seldom mentioned, and when the Arabs came to Khorasan (641-642) it was of little importance that, as Tabari relates, it did not even have a garrison. Under the Tabibriz (820-872) it became a flourishing town and rose to great importance during the Samanids (874-990). Toghrul, the first ruler of the Seljuk dynasty, made Nishapur his residence in 1037. In 1153 the Ghuzz Turkomans overran the country and partly destroyed town and suburbs. In 1208 most of the town was destroyed by an earthquake. The town was hardly rebuilt when it was again destroyed, this time by the Mongols (April 1221) and so effectually that, completely levelled to the ground, it was turned into a vast barley field. The city was again rebuilt, suffered again at the hands of the Mongols (1269) and from another great earthquake (1286), and never again rose to its former greatness.

**Nisibis** in the Assyrian inscriptions as Nisib, a strongly fortified city and fortress in the north of Mesopotamia, near the point where the Mygdonius (mod. Jaghjagha) leaves the mountains by a narrow defile. The modern Nisib or Nasibin consists of some 4000 inhabitants, largely Jews, who pay tribute to the Shammar Bedouins. The neighbourhood, we are informed by Arab writers, was at one time richly wooded, but is now somewhat marshy and unhealthy. According to the Arabic geographer, Yaqut, Persian scorpions were thrown into the place when it was besieged by Anushirwan, his nephew, in the 13th century. The church of St. James, belonging to a small community of Jacobite Christians, and a few pillars and blocks of masonry are the only remains of the former greatness of the town.

The site of Nisibis, on the great road between the Tigris and the Mediterranean, and commanding like the mountain country to the north and the fertile plain to the south, gave it an importance which continued during the period of its existence. The Parthian and the Seleucid empires. From 149 B.C. to A.D. 14 Nisibis was the residence of the kings of Armenia, and there Tigranes had his treasure-houses. The place figured frequently as a frontier fortress in the wars of the Romans with Parthia and the Parthians, and with the Persian king Artaxerxes II. and his citadel very strongly. Ceded to the Parthians by Hadrian, it became a Roman colony (Septimia Colonia Nisibis) under Septimius Severus. It was heroically defended against Shapur (Sapor) II., who unsuccessfully besieged it twice. In the peace made by Jovian, however, it passed into the hands of the Persians, who established a strong colony there (A.D. 364). Nisibis early became the seat of a Jacobite bishop and of a Nestorian metropolitan, and under the Arabs (when it continued to flourish and became the centre of the district of Diyār Rib`ā) the population of the town and neighbourhood was still mostly Christian, and included numerous monasteries. Arab geographers and travellers of the middle ages speak in high terms of the gardens of Nisibis, and the magnificent returns obtained by the agriculturists. According to Mokaddasi (ob. 1024), acorns, preserved fruits and manufactured articles such as carriages and inkstands were exported. The town was so heavily taxed by the Hamdanid princes at Mosul that the Arab tribe of the Banu Habib, although blood relations of the Hamdanids, migrated into media. It is a terrible sight to see the town, which was once a place where, when the Persians or the Parthians attacked it, the Christians, attracted other emigrants from Nisibis, and at last began to avenge themselves by yearly raids upon their old home. Ibn Haukal goes on to say that finally the Hamdanids took possession of the town and sold it to the Turks. The original inhabitants were compelled those who remained to substitute corn for their profitable fruit crops. This destroyed the prosperity of Nisibis, and the district which extended about 20 miles north and south of Nisibis (Nasib) appeared for the last time in history in 1839, when the Egyptians under Ibrahim Pasha defeated the Turkish army under Haziz Pasha on the 24th of June in a battle at which von Moltke was present.

**Nisi Prius,** in English law, a term used to denote generally all actions tried before judges of the king's bench division. For the history and meaning of this term see Assize. As a rule actions only are tried at nisi prius, and a judge is said to sit at nisi prius when he sits, usually in the king's bench division, for the trial of actions. By a resolution passed by the judges of the king's bench division in 1894 it was declared that the utmost importance that there should be at least three courts of nisi prius sitting together, in order to avoid possible legal y causes, one for common jury causes, and one for causes without juries (see the Annual Practice).

**Nisi Prius Record** was before the Judicature Acts the name of the formal copy of proceedings showing the history of the case up to the decision of the court. After the Judicature Acts the name was retained for the result of the trial, and delivered by the officer of the court to the successful party, whose possession of the postea was his right to judgment. Since the Judicature Acts there is no nisi prius record in England, but the name is retained to denote the deposit of copies of the pleadings for the use of the judge, and there is no postea, the certificate of the associate or master as to the result of the trial superseding it.

**Nissus,** in Greek mythology, king of Megara, brother of Aegeus, king of Athens. When Minos, king of Crete, was on his way to
attack Athens to avenge the murder of his son Androgeus, for which Aegeus was directly or indirectly responsible, he laid siege to Megara. He finally gained possession of the city through the treachery of the king’s daughter Scylla, who, enamoured of Minos, pulled out the golden (or purple) lock from her father’s head, on which his life and the safety of his subjects depended. See Frazer, Golden Bough, iii. 1900, p. 358.

Megara was captured, and Nisus, who died fighting (or slew himself), was changed into a sea-eagle. Minos, disgusted at Scylla’s treachery, tied her to the rudder of his ship, and afterwards cast her body ashore on the promontory called after her Scyllaueum; or she threw herself into the sea and swam after Minos, constantly pursued by her father, until at last she was changed into a ciris (a bird or a fish). In Virgil, Scylla, the daughter of Nisus, is confused with the sea-monster, the daughter of Phorcys. Nisus was the eponymous hero of the harbour of Nisaea, and local tradition makes no mention of his betrayal by his daughter. According to Roscher (in his Lexikon der Mythologie), who identifies the ciris with the heron, the story of Nisus and Scylla (like those of Aëdon, Procne, Philomela and Tereus) was invented to give an aetiological explanation of the characteristics of certain birds. The birds were regarded as originally human beings, whose acts and characters were supposed to account for certain habits of the birds into which they had been changed.

E. Siecke, De Niso et Scylla in aves mutatis (progr. Berlin, 1884), holds that the purple or golden hair of Nisus is the sun, which reflected the sun’s heat and thereby kept the citadel warm. Although rough in style, partisan in character and sometimes incorrect in detail, the book is the work of a man who had an intimate knowledge of the events which he relates, who possessed a clear and virile mind, and who above all was not a recluse but a man of action. They are dedicated to Charles the Bald, at whose request they were written.

The Historiae has been printed several times. Perhaps the best edition is in Band ii. of the Monumenta Germaniae historicà. Scriptoribus edita (Berlin, 1868—9). This edition has been translated into German by J. von Jasmund (Berlin, 1851—4; new edition by W. Wattenbach. Leipzig, 1888); and into French in Tome iii. of Guizot’s Les Monumens (Paris, 1824).

See O. Kunzelmüller, Nithard und sein Geschichtswerk (Jena, 1873); G. Meyer von Knobau, Über Nithards vier Bücher Geschichten (Leipzig, 1866); and W. Wattenbach, Deutschlands Geschichtsquellen, Band i. (Berlin, 1904).

NITHARD—NITRIC ACID

NITHARD (d. 844), Frankish historian, was the illegitimate son of Angilbert, the friend of Charlemagne, by Bertha, a daughter of the great emperor. He was educated at the imperial court and became abbot of St Riquier in commendam, never taking the vows. Little else is known about his life, but he appears to have served his cousin, Charles the Bald, on peaceful errands and also on the field of battle. He fought for Charles at Fontenoy in June 841, and died as the result of wounds received whilst fighting for him against the Northmen near Angoulême. The date of his death was probably the 14th of June 844. In the 11th century his body, with the fatal wound still visible, was found in the grave of his father, Angilbert. Nithard’s historical work consists of four books on the history of the Carolingian empire under the turbulent sons of the emperor Louis I., especially during the troubled period between 840 and 843. This Historiae or De dissensionibus filiorum Ludovici pii is valuable for the light which it throws upon the causes which led to the disintegration of the Carolingian empire. Although rough in style, partisan in character and sometimes incorrect in detail, the books are the work of a man who had an intimate knowledge of the events which he relates, who possessed a clear and virile mind, and who above all was not a recluse but a man of action. They are dedicated to Charles the Bald, at whose request they were written.

The Historiae has been printed several times. Perhaps the best edition is in Band ii. of the Monumenta Germaniae historicà. Scriptoribus edita (Berlin, 1868—9). This edition has been translated into German by J. von Jasmund (Berlin, 1851—4; new edition by W. Wattenbach. Leipzig, 1888); and into French in Tome iii. of Guizot’s Les Monumens (Paris, 1824).

NITHSDALE, WILLIAM MAXWELL, 5TH EARL (1676—1744), Jacobite leader, was a member of the family of Maxwell (q.v.), being a son of Robert, 4th earl (d. 1696) and a collateral relative of James, 3rd earl of Cowan, who was created 5th earl of Nithsdale in 1620. He became famous by his loyalty to the royalist tradition of his family, and by the heroism of his wife Winifred, daughter of William Herbert, 1st marquess of Powis. After becoming earl in 1698 he served the exiled house of Stuart in secret, was suspected as a Jacobite conspirator, and was much molested on that account. In 1712 he resigned his estate to his son William (d. 1776), reserving a life rent to himself. When the Jacobite rising took place in 1715 he joined his friends in the north of England and was taken prisoner at Preston, being sent to London for trial. The countess of Nithsdale, who was at Terrigal when she heard of the capture of her husband, followed him to London, making part of the journey on horseback in bitter winter weather. The earl and the other Jacobites were brought to trial in Westminster Hall on the 19th of January 1716, and condemned to death on the 9th of February. The execution was fixed for the 24th. The countess presented a petition to George I., which he refused to receive, and when she knelt before him and took hold of the skirts of his coat he dragged her half across the room before he could break away. Finding that no pardon could be obtained the countess laid a plain request to be permitted to live at the Tower of London. With the help of her two Jacobite ladies, Mrs Morgan and Mrs Mills, she very cleverly extricated her husband from his cell on the night before the day fixed for the execution by disguising him as a woman. The earl escaped from England and was followed by the countess, but not till she had gone back to Scotland to rescue important legal papers which proved the transfer of the estate to their son. The earl and countess went to Rome after a short stay in France. In Rome they were attached to the court of the Pretender and lived in poverty and obscurity. The earl died on the 20th of March 1744, and the countess in 1749. Their son, William Maxwell, who succeeded to the earldom, spent the last years of his life in the French capital, where he died in 1778. He was succeeded by Charles, 6th earl, his son.

See Sir A. Fraser, The Book of Carlaverock (Edinburgh, 1873).

NITRE, the name given to naturally occurring potassium nitrate; "cubic nitre" is sodium nitrate. The word is adapted from Lat. nitrum, which is itself adapted from Gr. νιτρος. These words were originally applied to the naturally occurring sodium carbonate; the connexion with potassium nitrate (sal petrae or sal petraus) may be traced to Raimon Lull’s name sal nitri, which substance, however, he distinguished from nitrum. In the 16th century the ancient nitrum became altered to natron, a term still used for native sodium carbonate, while nitrum, and its adaptation nitre, were retained for potassium nitrate or salt-petre (q.v.).

NITRIC ACID (aqua fortis), HNO₃, an important mineral acid. It is mentioned in the De inventione veritatis ascribed to Geber, wherein it is obtained by calcining a mixture of nitre, alum and blue vitriol. It was again described by Albert le Grand in the 13th century (see U. of Paris, 1276), who prepared it by heating niter and clay and called it "cauca." Glabur described the process in common use to-day, viz. by heating nitre with strong sulphuric acid. Its true nature was not determined until the 18th century, when A. L. Lavoisier (1776) showed that it contained oxygen, whilst in 1785 H. Cavendish determined its constitution and showed that it could be synthesized by passing a stream of electric sparks through moist air. The acid is found to exist to a slight extent in the free condition in some waters, but chiefly occurs in combination with various metals, as nitrates, obtained in particular nitre or salt-petre, KNO₃, and Chile salpetre, NaNO₃. It is formed when a stream of electric sparks is passed through moist air, and in the oxidation of nitrogenous matter in the presence of water.

For experimental purposes it is usually obtained by distilling potassium or sodium nitrate with concentrated sulphuric acid. The acid so obtained usually contains more or less water and some dissolved nitrogen peroxide which gives it a yellowish red colour. It may be purified by redistillation over barium and silver nitrates, followed by treatment of the distillate with a stream of oxygenized air. The product so obtained is then redistilled under diminished pressure, and finally distilled again in a strongly heated and evacuated apparatus (V. Vley and Manley, Phil. Trans., 1828, A. 291, p. 365). On the large scale it is obtained by distilling Chile salpetre with concentrated sulphuric acid in horizontal cast iron stills, the vapours being condensed in a series of much

NITHARD—NITRIC ACID 711
NITROBENZENE, \( \text{C}_6\text{H}_5\text{NO}_3 \), the simplest aromatic nitro compound. It was first isolated in 1834 by E. Mitscherlich (Pogg. Ann., 1834, 31, p. 625), and is prepared commercially by the gradual addition of benzene to a well-cooled mixture of concentrated nitric and sulphuric acids, the oily product being separated, washed with alkali, and then distilled. It also results in the oxidation of aniline by monopersulphuric acid (H. Caro, Bull. Soc. Chim., 1856, p. 845) or by potassium peroxymagnesium (E. Bamberger, Ber., 1893, 30, p. 469); by the oxidation of nitrobenzene (below) with atmospheric oxygen; or by the decomposition of benzene diazonium nitrate mercury nitrite, \( \text{Hg(NO}_2\text{)}_2\text{C}_6\text{H}_5\text{N}_2\text{O}_7 \), with copper powder (A. Hantsch, Ber., 1900, 33, p. 2551). It is a yellowish liquid possessing a strong smell of oil of bitter almonds. It boils at 206°C, and melts at 3-6°C (C.E. Linebarger, Amer. Chem. Jour., 1896, 18, p. 437). The products of its electrolytic reduction vary with the conditions: in sulphuric acid solution it yields para-anisole (L. Gattermann, Ber., 1893, 26, p. 1844); in alcoholic alkaline solution it yields aniline, and with potassium hydroxide and benzidine; in ammoniacal alcoholic solution, phenylhydrzone. With chlorine, in the presence of iodine or antimony chloride, it yields meta-chloronitrobenzene. Hydrobromic acid at 185-190°C. converts it into di- and tri-bromonitrobenzene. It occasionally acts as an oxidizing agent, as in the preparation of quinoline and fuchsine. It is used commercially for the preparation of aniline and benzidine; and in perfumery (oil of mirbane).

**Dinitrobenzenes, \( \text{CH}_2\text{(NO}_2\text{)}_2 \).**—Ortho-dinitrobenzene is formed in small quantity in the rapid action of nitric acid on metal. Para-dinitrobenzene results from the action of nitro-sulphuric acid on bismuth triphenyl (A. Gilleimier, Ber., 1897, 30, p. 2844). It forms colourless crystals which melt at 116-6°C and boil at 319°C (773 mm.). On boiling with an alcoholic caustic solution, it yields a meta-chloronitrobenzene which, by the direct nitration of nitrobenzene with fuming nitric acid, the product being poured into water and redistilled (Small, J. Soc. Chem. Ind., 1878, 37, 275), it yields aniline and meta-chloronitrobenzene which melt at 276°C. It is used for the preparation of meta-phenylene diamine. Para-dinitrobenzene results from the action of nitric peroxide on an ethereal solution of quinone dioxime (R. Oliveri-Tortorici, Gazz., 1900, 30, i. p. 515). It crystallizes in colourless needles, which melt at 171-172°C. It is only slightly soluble in cold water and cold alcohol.

**Trinitrobenzenes, \( \text{CH}_3\text{(NO}_2\text{)}_3 \)—Asymmetric.** (a.) trinitrobenzenes result from the reaction of nitric and sulphuric acids on para-dinitrobenzene. It forms yellow crystals, which melt at 57-5°C. When boiled with dilute aqueous caustic soda it yields Zeil's nitrophenol. Symmetrical (1.3.5) trinitrobenzene is formed by the further nitration of meta-dinitrobenzene with fuming sulphuric and nitric acids; by the action of hydrochloric acid on sodium malonyl aldehyde (H. B. Hill and J. Torray, Ber., 1895, 28, p. 2958), or by the action of water on 2.4.6-trinitrobenzoic acid (German patent 77244). It crystallizes in prisms which melt at 121°C. It yields addition compounds, with aniline and naphthalene, and combines directly with potassium methyldithiono and potassium cyanogen ester. All these potassium ferricyanide oxidizes it to picric acid.

**Nitrobenzene, \( \text{C}_6\text{H}_5\text{NO} \), was first obtained by the action of nitrosyl bromide on diphenyl (Small, Jour., 1854, 3, p. 1638). It results, with other products, in the oxidation of phenyl diazonium chloride with alkaline potassium ferricyanide; of \( \beta \)-phenylhydroxylamine with chronic acid mixture (E. Bamberger, Ber., 1893, 26, pp. 473, 483, 1894, 27, p. 1340), or of aniline by monopersulphuric acid (German patent 1010755). It exists in two crystalline forms. Nitric acid passed into its chloriform solution...
Nitro Compounds

Nitro Compounds

Concentrated caustic potash decomposes into carbon monoxide and hydroxylamine. It combines with aromatic aldehydes in the presence of alcoholic potash to form addition products which are converted by acids into styryl derivatives (J. Thiele, Ber., 1890, 23, p. 1833). Nitrotoluene, C6H5NO2, is a colourless liquid which boils at 114° C. Nitroform (trinitromethane), CH₃(NO₂)₃, is obtained in the form of its ammonium salt by the decomposition of trinitroacetone with water (L. Schischkoff, Ann., 1857, 193, p. 364). It is a colourless crystalline solid which melts at 55° C. and has the properties of a strong acid. The potassium salt is formed by the action of potassium ethylate on tetrinitromethane (A. Hantzsch, Ber., 1899, 32, p. 631). It is a deep yellow coloured solid, which is readily soluble in water. It explodes when heated. The silver salt, obtained by shaking an ether solution of nitroform with freshly prepared, slightly moist silver oxide, reacts with methyl iodide to form methyl nitroformate, (CH₃O)₂C(NO₂)I. Tetranitromethane, CH₃(NO₂)₄, obtained by adding nitroform to a hot mixture of nitric and sulphuric acids, is a crystalline solid, which melts at 127° C. Chloropicrin, C₈H₇NO₂, is a liquid of suffocating odour obtained by the action of nitric acid and chloride of lime on many organic compounds. It boils at 234° C.

Aromatic Nitro Compounds

The aromatic nitro compounds are generally obtained by the direct action of nitric acid. Substitution takes place usually in the nucleus and only rarely in the side chain, and according to the conditions of the experiment and the nature of the compound acted upon, one or more nitro groups enter the molecule. The reaction is generally carried out in the presence of sulphuric acid, which is used to absorb the water formed during the process of nitration. Nitro compounds have also been prepared by the action of cuprous oxide on diazonium salts (T. Sandmeyer, Ber., 1887, 20, p. 1494); by the action of copper powder on the double salt formed by the addition of potassium metanitroic acid to diazonium nitrates; and by the oxidation of primary aromatic amines (E. Bamberger, Ber., 1893, 26, p. 496). The mono-nitro compounds are stable and distill without decomposition; they have a pale yellow colour and possess an agreeable odour. Most of the poly-nitro compounds are not volatile, but undergo decomposition on heating. The nitro group in the aromatic series is bound very firmly in the molecule and is not readily exchanged for other groups. Several different products may be obtained by the reduction of the aromatic nitro compounds, the substances formed in any particular case depending on the conditions of experiment. In acid solution, amines are obtained, in alkaline solution, azoxy, azo and hydrazo compounds, and in neutral solution hydroxylamino compounds. The electrolytic reduction of the aromatic nitro compounds gives rise to substituted hydroxylamines which are immediately transformed into aminophenols or amines.

For the nitrobenzenes see Nitrobenzene, C₆H₅(CH₃)NO₂. Three isomers exist, the ortho- and para- compounds being the chief products of the direct nitration of toluene. They may be separated by fractional distillation. The ortho-compound melts at 10-5° C. and boils at 218° C., the para-compound melts at 35° C. and boils at 260° C., and the meta-nitro-derivative (melting at 16° C.) is obtained by nitrating acetophenone and then replacing the amino group by hydrogen.

Phenylnitromethane, C₆H₅CH₂NO₂, isomeric with the nitrobenzene, is prepared by the action of concentrated nitric acid on allyl nitrite. It is a colourless oily liquid which boils at 225°-227° C., is somewhat soluble in water, and does not give a coloration with ferric chloride. It readily forms a sodium salt, from the aqueous solution of which on the addition of a mineral acid an isomeric solid form of the nitro compound (melting at 84° C.) is precipitated. This solid form gradually passes, on standing, into the oily variety. It is probably a hydroxy-compound, since it gives a red-brown colour with ferric chloride, reacts with phenyl isocyanate and with phosgene to chlorophenylchloride, and with benzoyl chloride yields dibenzhydroxyazomethane, C₇H₅CO-NH-OCOCH₃. Thus the solid form is probably to be represented as CH₃:CH:NO:OH or CH₃:CH:N=O (see further, A. Hantzsch on Pseudo-acids, Ber., 1899, 32, p. 575, 1902, 35, pp. 210, 226, 1001, 1906, 39, pp. 139, 1073 et seq.).

The nitric acids, R-C(NO₂)NO₂, may be prepared by the action of nitric acid on the primary nitroparaffins; by the action of hydroxylamine on the dibromonitroparaffins; and by the action of nitrogen peroxide on the α-sinositro fatty acids (Ber., 1905, 38, p. 519). They are colourless liquids (1° C. p. 518). They are colourless liquids (1° C. p. 518). They are colourless liquids (1° C. p. 518). They are colourless liquids (1° C. p. 518). Nitrogen

A. Hantzsch and O. Graul (Ber. 1898, 31, p. 2854) described several series of salts of the nitrolucic acids, with particular reference to ethynitrolucic acid. They discriminate between the red or erythro-salts, which are well crystallized, very explosive and unstable compounds, and which regenerate the colourless nitric acid on the addition of dilute mineral acids, and the leuco-salts, which are colourless salts obtained by warming the erythro-salts and exposing them to the air. These salts cannot be converted either into the red salts or into the free acid. An intensely yellow acid salt is described, as is also a very unstable colourless salt which could not be examined further owing to its very labile nature. The following structural formulae are assigned to these compounds:

\[
\text{R-C}^\equiv \text{NO} \quad \text{R-C}^\equiv \text{NO}^\circ \quad \text{R-C}^\equiv \text{NO}_2 \quad \text{R-C}^\equiv \text{NO}_3
\]

nitric acid; erythro-salt; leuco-salt; basic nitroso-octane.

The acid salts are obtained by the addition of one molecule of alkali to two molecules of the acid in concentrated alcoholic solution at a low temperature. They are unstable compounds which readily split into the red salt and the free acid on standing.

The pseudo-nitrolucic acid, RR':C(NO)(NO)_, may be obtained by the action of nitrous acid on the secondary nitroparaffins; by the action of silver nitrate on such bromo-nitrosoparaffins as contain the bromine and the nitroso group united to the same carbon atom (O. Piloty, Ber., 1902, 35, p. 3093); and by the action of nitric oxide on ethereal solutions of ketoximes (R. Scholl, Ber., 1888, 21, p. 308; G. Born, Ber. 1896, 29, p. 93). They exhibit an intense blue colour when in the liquid condition or dissolved in alkali and exposing them to the air.

They are unstable with chromic acid; they yield dinitrohydrocarbons, and on reduction with hydroxylamine (in alkaline solution) or with potassium sulphide give ketoximes, RR':C: NOH (R. Scholl and K. Landsteiner, Ber., 1896, 29, p. 87).

RR':C(NO)_2.OH \rightarrow RR':C(NH.OH) \rightarrow RR':C: NOH + HO.NH.

Nitrosobenzenecarbons have been prepared in the aliphatic series by the oxidation of the corresponding hydroxylamino compounds. Nitroso-tertiary butane, (CH_3)C=NO, is formed when the corre- sponding hydroxylamine is oxidised by sulphuric monoper acid (E. Bamberger, Ber., 1903, 36, p. 686). A nitrosocetane (CH_3)C(NO)(CH_3)CH_3, has been obtained by O. Piloty and Ruff (Ber., 1898, 31, p. 459) from nitro-isobutylxyl by reducing it to the corresponding hydroxylamino compound with aluminium amalgam and oxidising this with chromic acid mixture. It is a colourless solid which melts at 54° C, to a deep blue liquid. Numerous nitroso compounds are met with in the aromatic series.

Nitrogen [symbol N, atomic weight 14.01, O]=16. A non-metallic chemical element, first isolated in 1772 by D. Rutherford, who showed that on removing oxygen from air a gas remained, which was incapable of supporting combustion or respiration. Nitrogen forms approximately 79% by volume (or 77% by weight) of the atmosphere; actual values are: % by volume—79.97 (Regnault), 79.20 (Dumas); % by weight—76.87 (Regnault), 77.00 (Dumas), 77.02 (Lévy), 76.90 (Stas), 77.01 (Marignac). No absolutely accurate determinations appear to have been made recently. Free nitrogen is also found in some natural waters and has been recognized in certain nebulae. In the combined state nitrogen is fairly widely distributed, being found in nitrile, Chile salt-petreum, ammonium salts and in various animal and vegetable tissues and liquids. It is invariably present in soils, where compounds are formed by nitrifying bacteria.

Nitrogen may be obtained from the atmosphere by the removal of the oxygen with which it is there mixed. This may be effected by burning phosphorus in a confined volume of air, by the action of an alkaline solution of pyrogalol on air, by passing air over heated copper, or by the action of copper on air in the presence of ammoniacal solutions.

It is also prepared by heating ammonium nitrite (or a mixture of sodium nitrite and ammonium chloride); NH.NO_2 = 2H_2O + N_2; by heating a mixture of ammonium nitrate and chloride (the chlorine which is simultaneously produced being absorbed by milk of lime or by a solution of sodium hydroxide); 4NH.NO_2 + 2NH.CI = 5N_2 + CO_2 + 12H_2O; by heating ammonium dichromate (or a mixture of sodium dichromate and chromic oxide); 2NH.Cr_2O_7 = CrO_3 - 2H_2O + N_2; or by passing chlorine into a concentrated solution of ammonia (which should be present in considerable excess): 8NH_3 + 3Cl_2 = 6NH_4Cl + N_2; by the action of hypochlorites or hypo- bromites on ammonia: 3NaOBr-2NH_3 = 3NaBr+3H_2O+N_2; and by the action of manganese dioxide on ammonium nitrate at 180-200° C. It is also formed by the reduction of nitric and nitrous acids by hydrogen in the presence of platinitized asbestos at a red heat (G. v. Knorre and Electrick. Ber. 1872, 32, p. 66) by the oxidation of hydroxylamine (ibid., 1900, 33, p. 30); and by the electrolysis of hydrazine and its salts (E. Ch. Szarvasy, Jour. Chem. Soc., 1900, 77, p. 603).

The chief importance of nitrogenous compounds depends upon their assimilation by living plants, which, in their development, absorb these compounds from the soil, wherein they are formed mainly by the action of nitrifying bacteria. Since these compounds are essential to plant life, it becomes necessary to replace the amount abstracted from the soil, and hence a demand for nitrogenous manures was created. This was met in a very large measure by deposits of natural nitre and the products of artificial nitrifies, whilst additional supplies are available in the ammonical liquors of the gas-manufacturer, &c. The possible failure of the nitre deposits led to attempts to convert atmospheric nitrogen into manures by processes permitting economic success. Combination can be made in five directions, viz. to form (1) oxides and nitric acids, (2) ammonia, (3) readily reducible nitrates, (4) cyanides, (5) cyanamides. The first three will be treated here; for the others see PERSIC Acid and CYANAMIDE.

The combination of nitrogen with oxygen was first effected by Cavendish in 1785, who employed a spark discharge. The process was developed by Madame Lefebre in 1859; by Meissner in 1863, who found that moist gases gave a better result; and by Prim in 1882, who sparked the gases under pressure; it was also used by Lord Rayleigh in his isolation of argon (q.v.). It was not, however, a commercial success, and the same result attended Siemens and Halbe's application of the silent discharge. More effective was the electric arc. In 1892 Sir W. Crookes showed that the arc brought about combination; and in 1897 Lord Rayleigh went into the process more fully. But the first careful working-out of the conditions was made in 1900 by A. McDougall and F. Howles, who, employing a high tension alternating arc, showed that the effectiveness depended upon the temperature. The commercial manufacture of nitric acid was attempted by C. S. Bradley and D. R. Lovejoy at Niagara Falls, who passed atmospheric air, or air enriched with oxygen, about a high tension arc made as long as possible; but the company (the Atmospheric Products Company) was a failure. Better results have attended the process of K. Birkeland and S. Eyde, which is being worked on a large scale at Notodden, Norway. The arc is produced by leading a current of about 5000 volts equatorially between the poles of an electromagnet; this produces what is practically a disk of flame, 6 ft. in diameter and having a temperature of about 3000°. The disk really consists of a series of successive arcs which increase in size until they burst. The first product of the reaction is nitric oxide, which on cooling with the residual gases produces nitrogen peroxide. The cooled gases are then passed through water to form nitric acid, the gases being sent in the contrary direction. Nitric acid (up to 50%) is formed in the first tower, and weaker acids in the successive ones; the last tower contains milk of lime which combines with the gases to form calcium nitrate and nitrate (this product, being unsuitable as a manure, is decomposed with the acid, and the evolved gases sent back). It was found advantageous not to work for acid but for a basic calcium nitrate (normal calcium nitrate being very deliquescent); for this purpose the acid is treated with the requisite amount of milk of lime. In the process of the Badische Oel- und Soda-Fabrik, the arc, which is said to be 30 to 50 ft. long, is formed in a long tube, and the gases are sent round the arc by obliquely injecting them. A 30% acid is said to be formed. I. Moscicki and J. von Kowalski have patented a process wherein the arc is formed at two vertical
NITROGEN

concentric copper electrodes and rotated by an electromagnet; it is worked at Vevey, Switzerland. The Rankin process, of which very little is known, produces the arc with much lower current.

The conversion of nitrogen into ammonia by electricity has received much attention, but the commercial aspect appears to have been first worked out by de Hemptinne in 1900, who used both the spark and the silent discharge on mixtures of hydrogen and nitrogen, and found that the pressure and temperature must be kept low and the spark gap narrow. J. Schütz in 1903 employed Dowson gas as a source of hydrogen, and induced combination by means of platinum and the silent discharge. Several non-electrical processes have been devised. In 1862 Fleck passed a mixture of steam, nitrogen and carbon monoxide over red-hot lime, whilst in 1904 Wolterek induced combination by passing steam and air over red-hot iron oxide (peat is used in practice). In de Lambilly's process air and steam is led over white-hot coke, and carbon dioxide or monoxide removed from the escaping gases according as ammonium formate or carbonate is wanted.

The residual gas is then passed through a tube containing porous materials, such as wood- or bone-charcoal, powdered pumice or spongy platinum, then mixed with steam and again forced through the previously heated tube. (1) \( \text{N}_2 + 3\text{H}_2 + 2\text{CO} + 2\text{H}_2\text{O} = 2\text{H}_2\text{CO}_3\text{NH}_2 \) (Ammonium formate). (2) \( \text{N}_2 + 3\text{H}_2 + 2\text{CO} + 2\text{H}_2\text{O} = 2\text{H}_2\text{CO}_2\text{NH}_2 \) (Ammonium carbonate).

The best temperature for the first reaction is between 80°C and 130°C, and for the second between 40°C and 66°C. In another process, which originated with C. Kaiser (Abst. J.C.S., 1907, ii. p. 862), calcium is heated in a current of hydrogen, and nitrogen passed over the hydride so formed; this gives ammonia and calcium nitride, the latter of which gives up its nitrogen as ammonia and reforms the hydride when heated in a current of hydrogen.

The fixation of nitrogen as a nitride has not been attended with commercial success. H. Mehner patented heating the oxides of silicon, boron or magnesium with coal or coke in an electric furnace, and then passing in nitrogen, which forms, with the metal liberated by the action of the carbon, a readily decomposable nitride.

Nitrogen is a colourless, tasteless and odourless gas, which is only very slightly soluble in water. It is slightly lighter than air. Lord Rayleigh in 1894 found that the density of atmospheric nitrogen was about 1% higher than that of chemically prepared nitrogen, a discovery which led to the isolation of the rare gases of the atmosphere (see Arcron). The values obtained are shown below:

Nitrates are a very inert gas: it will neither burn nor support the combustion of ordinary combustibles. It combines directly with lithium, calcium and magnesium when heated, whilst nitrates of the rare earth metals are also produced when their oxides are mixed with magnesium and heated in a current of nitrogen (C. Malignon, Comptes rendus, 1900, 131, p. 837).

Nitrogen has been liquefied, the critical temperature being \(-149^\circ\text{C}\) and the critical pressure \(27.54\text{ atm}\). The liquefied gas boils at \(-195.5^\circ\text{C}\), and its specific gravity at its boiling point is \(0-8103\) (E. C. C. Baly and G. F. Donnan, Jour. Chem. Soc., 1902, 81, p. 912).

**Compounds.**

Nitrogen combines with hydrogen to form ammonia, \(\text{NH}_3\), hydrazine, \(\text{N}_2\text{H}_4\), and azomelone, \(\text{N}_2\text{H}\) (gaseous); the other known hydrides, \(\text{NH}_{2}\text{H}_3\), \(\text{NH}_{2}\text{H}_4\), \(\text{NH}_{2}\text{H}_5\), etc., are all unstable.

Nitrogen trihydride, \(\text{N}_3\text{H}_3\), discovered by P. L. Dulong in 1811 (Schweigg. Journ., 1811, 8, p. 302), and obtained by the action of chlorine or hydrochloric acid on ammonium chloride, or by the electrolysis of ammonium chloride solution, is a very yellowish yellow oil. It possesses an extremely pungent smell, and its vapour is extremely irritating to the eyes. It is a most dangerous explosive (see D. L. Chapman and L. Vodden, Jour. Chem. Soc., 1909, 95, p. 158).

Chlorine oxide, \(\text{Cl}_2\text{N}=\text{N}_2\), was discovered by F. Raschig in 1906 (see Azomelone); the corresponding iodine compound had been obtained in 1906 by A. Hantzsch (Ber., 1907, p. 522). For the so-called nitrogen oxide see Azomelone.

Nitrogen forms five oxides, viz. nitrous oxide, \(\text{N}_2\text{O}\), nitric oxide, \(\text{NO}\), nitrogen trioxide, \(\text{NO}_3\), nitrogen dioxide, \(\text{NO}_2\), and nitrogen pentoxide, \(\text{N}_2\text{O}_5\). They may be represented by the formulas: \(\text{NO}_2\), \(\text{NO}_3\), hyponitrous acid, \(\text{H}_2\text{NO}_2\text{N}=\text{N}_2\), nitrous acid, \(\text{H}_2\text{NO}_2\), and nitric acid, \(\text{HNO}_3\) (gaseous). The first four oxides are gases, the fifth is a solid.

Nitrous oxide, \(\text{N}_2\text{O}\), isolated in 1776 by J. Priestley, who obtained it by heating nitrogen oxide with iron, may be prepared by heating ammonia nitrate at 170-260°C, or by reducing a mixture of nitric and sulphuric acid with zinc. It is a colourless gas, which is practically odourless, but possesses a sweetish taste. It is some-
NITROGLYCERIN

Nitroglycerin, $\text{C}_3\text{H}_5\text{N}_3\text{O}_9\text{,}$ was first obtained in 1846 by A. Sobrero (Mem. Acad. Torino, 1847) by acting with a mixture of strong nitric and sulphuric acids on glycerin. The reaction proceeds in several stages, mono- and finally tri-nitrate being produced, the final stage requiring sulphuric acid as a dehydrator. When pure it is a very pale yellow oil of sp. gr. 1.614 at 4°C and 1.00 at 15°C. One gram of the nitroglycerin does not dissolve in 100 cc. of water but yields about 8 parts of an oil, the rest being a residue of about 1-5%. The mixture of absolute alcohol or 18 c.c. of wood spirit, and it is scarcely at all soluble in glycerin itself, but mixes in all proportions with ether, acetone, ethyl acetate and benzene.

In the manufacture of glycerin is dropped in a very thin stream into a mixture of 3 parts of nitric (sp. gr. 1-5) and 5 parts of sulphuric acid (sp. gr. 1-84), the containing vessel being cooled by a water jacket and the acid mixture agitated by a stream of cooled air, the temperature being kept at about 15°C. A considerable excess of acids is used for the completion of the reaction, and finally the reaction mixture is agitated with about 8 parts of the oil to the mixture to 1 of glycerin. The higher the strength of the acids the higher the yield of nitroglycerin and the smaller the loss by solution in the waste acids. In recent practice by the use of phosphorus pentachloride the mixture of acids contain less than 1% of water. The action is very rapid, and the product, which rises to the top of the acids, is separated and washed successively with cold and then tepid water, and finally with water made slightly alkaline with sodium carbonate or hydroxide, to remove all adhering or dissolved acids which otherwise render the product very unstable. Nitroglycerin dissolves a little water and then appears thick or milky. Generally it is ether...
NITZSCH, G. W.—NITZSCH, K. I.

dried, after being separated from the wash water, by means of common salt, upon a layer of which the nitroglycerin is run a millimetre pressure or it is filtered through, or it is filtered through a mass of dry or similar dry and porous material.

Under ordinary pressure it boils at above 200° C. (L. de Bruyn). If gradually heated it begins to vaporize and decompose at about 130°, and as a rule it detonates when heated slightly above this temperature, previously giving off some red fumes.

A little vapour is given off at ordinary temperatures and pressures, and when under a few millimetres pressure it rapidly vaporizes below 100° C. The freezing-point is uncertain, owing perhaps to the existence of two modifications, as suggested by Kast (Zeits. f. ges. Schiess- u. Sprengstoff, 1827; also S. Nauckhoff, Zeits. f. ang. Chem., 1898, Heft 1 and 2). It is frequently given as 43° to 46° F. (about 6° to 8° C.), and it is stated to be more sensitive to percussion when frozen (Belstein). It crystallizes in (long needles) more easily when gently agitated during the cooling, or when mixed with such substances as kieselguhr. At one time it was transported all over America in a frozen condition without serious accidents, and according to Sir F. Nathan (Jour. Soc. Chem. Ind., 1908, 27, p. 5) it is safer to export in the frozen state. To prevent the freezing of nitroglycerin in dynamite it has been proposed to add various substances, such as chlorodinitroglycerin, nitrated diglycerin or tetranitrodiglycerol, and also mono- and di-nitroglycerin. The latter two have been studied by C. W. Will (Ber., 1908, 7, p. 497), who obtained two isomeric di-nitroglycerins, one of which is eminently crystallizable and the other fluid. Both are sensitive to percussion, but a little less so than nitroglycerin. The crystals exist in two forms, neither of which is strictly explosive. It appears that an addition of di-nitroglycerin to nitroglycerin would materially retard its freezing or lessen its sensitivity (see also C. Claassen, Ger. Pat. 210990 (1908)).

The liquid when soaked into a porous combustible substance like blotting-paper burns rapidly and quietly, and when struck with a hammer on a hard surface violently detonates; when a little of the liquid is spread on an anvil and struck, the portion immediately under the hammer only will, as a rule, detonate, the remainder being scattered. Some solutions of nitroglycerin (in ether, acetone, &c.) burn quietly, and the same is the case when it is held in solution or suspension in a colloidal substance, as gelatinized guncotton, &c.

Strong sulphuric acid dissolves nitroglycerin, and this solution on being poured into water yields dinitroglycerin (see Will, loc. cit.) and also some mononitroglycerin. When the solution in the strong acid is allowed to stand, some nitric acid is first evolved, and as the temperature rises this is followed by a general decomposition of the substance, though not necessarily an explosive one. Shaken with methylated alcohol its nitroglycerin content dissolves in the alcohol; the measurement of the volume of this gas is a convenient mode of estimating nitroglycerin. Ammonium hydroxide has no appreciable action at ordinary temperatures, but strong solutions of sodium or potassium hydroxides tend to a decomposition, with rise of temperature, in which some nitrate and always some nitrate is produced. Some glycerin may be re-formed, but with very strong alkaline solutions little of the glycerin molecule escapes destruction, oxalic acid and several other products resulting. Alcoholic solutions of the alkalis also produce much nitric acid along with some formate and acetate. Calcium or potassium sulphides and potassium hydroxide completely reduce nitroglycerin to glycerin, oxalic acid and sulphur being oxidized and some precipitated. Hydroxide acid reduces it to glycerin and nitric oxide. Aniline and similar bases are oxidized and partially nitrated by nitroglycerin, with the production of a nitroso nitroglycerine.

The first attempts to utilize the explosive power of nitroglycerin were made by Nobel in 1863; they were only partially successful until the plan, first applied by General Picot in 1854, of developing the force of gunpowder in the most rapid manner and to the maximum extent, through initiative detonation, was applied by Nobel to nitroglycerin. Even then, however, the liquid nature of the substance, though advantageous in one or two directions, constituted a serious obstacle to its safe transport and storage and to its efficient employment; it was therefore not until Nobel produced plastic solid preparations containing the liquid substance, which consisted of nitroglycerin, clay, and about 10% of sulphur, and finally kieselguhr in a fine state of division, capable of absorbing and retaining considerable quantities of it, that it could be employed as a blasting agent (see Explosives, Dynamite, Cordeite).

Therapeutics.—Nitroglycerin has a sweet burning taste and is decidedly poisonous. Its vapour produces violent headache, and the same effect is often caused by handling compositions containing it. Prior to its use as an explosive, its alcoholic solution found application in medicine under the name of glicolone. Although its phosphorescent property rendering it the source of nitrates such as amylnitrite, taken internally. The explanation that is in an alkaline medium at body heat nitroglycerin yields a nitrite, probably as a preliminary stage of resolution. Nitroglycerin shaken up with warm very dilute alkaline solutions, as sodium carbonate, for a few minutes only, always yields sufficient nitrite to give the diazoreaction; and, as stated, strong alkaline solutions always produce some nitrite as one of the decomposition products. This gradual conversion in the tissues is a valuable property of nitroglycerin, as its effects take longer to manifest themselves than is the case with amyl nitrite and other nitrates. Nitroglycerin is valuable as a preventive in cases of cardiac pain, such as angina pectoris, and it is also used in other conditions where it is desirable to reduce the arterial tension. The British Pharmacopoeia contains a liquor trinitriti (1%), and tablets made up with chocolate, each containing one-hundredth of a grain.

NITZSCH, GREGOR WILHELM (1790-1861), German classical scholar, brother of Karl Immanuel Nitzsch, was born at Wittenberg on the 22nd of November 1790. In 1827 he was appointed professor of ancient literature at the University of Kiel, but in 1832 was dismissed by the Danish government for his German sympathies. In the same year he accepted a similar post at Leipzig, which he held till his death on the 22nd of July 1861. Nitzsch is chiefly known for his writings on the Homeric epic. In opposition to Wolf and Lachmann, he maintained that the Iliad and Odyssey were not an aggregate of single short poems, but long complete poems, composed by one and the same author according to a uniform plan with a central dramatic idea.

NITZSCH, KARL WILHELM (1818-1880), became professor of history at Königsberg in 1862, and at Berlin in 1872.

The most important of his works were: Erklaernde Anmerkungen zu Homer's Odyssey, I-xiii. (1826-1840); Die Sagepoesie der Griechen (1842); Beiträge zur Geschichte der epischen Poesie der Griechen (pub. 1862, ed. C. W. Nitzsch). See memoir by F. Lüblcr (1864); C. Bursian, Geschichte der klassischen Philologie in Deutschland (1883) and J. E. Sandys, Hist. of Class. Schol. iii. (1908), p. 105.

NITZSCH, KARL IMMANUEL (1787-1868), Lutheran divine, was born at the small Saxon town of Borna near Leipzig in 1787. His father, Karl Ludwig Nitzsch (1751-1831), who at that time was pastor and superintendent in Borna and afterward in Schlochet, became director (1817) of the seminary for preachers, has also left a name of some distinction in the theological world by a number of writings, among which may be mentioned a work entitled De discriminatione revolutionarum imperatoriae et didacticarum prolusiones academicae (2 vols., 1830). Theologically, he represented a combination of supernaturalism and rationalism (supernatural rationalism or a Kantian rational supernaturalism). Karl Immanuel was sent to study at Schulpforta in 1803, whence he proceeded to the university of Wittenberg in 1806. In 1809 he graduated, and in 1810 he became a Privatdozent at the university. Having become diaconus at the Schleswirch in 1811, he showed remarkable energy and zeal during the bombardment and siege of the city in 1813. In 1817 he was appointed one of the preceptors in the preachers' seminary which had been established at Wittenberg after the suppression of the university. From 1820 to 1822 he was superintendent in Kemberg, and in the latter year he was appointed professor ordinarius of systematic and practical theology at Bonn. Here he remained until called to succeed Marheineke at Berlin in 1847; subsequently he became university preacher, rector of the university, provost of St Nicolai (1854) and member of the supreme council of the church, in which last capacity he was one of the ablest and most active promoters of the Evangelical Union. He died on the 21st of August 1868. He represented the Vermittlungsstoeologie of the school of Schleiermacher.
NIU-CHWANG—NIVERNAIS

His son, FRIEDRICH AUGUST NITSCHE (b. 1832), was made professor ordinarius of theology at Giessen in 1868 and at Kiel in 1872. He was the author of Grundris der christl. Dogmengeschichte (1870, incomplete) and Das System des Bodhidrisht (1872—2 vols., other hands).

Carl Nitzsche's principal works are: System der christlichen Lehre (1829; 6th ed., 1851; Eng. trans., 1840), Praktische Theologie (1847—60; 2nd ed., 1863—68), Akademische Verträge über christliche Glaubenslehre (1858) and several series of Predigten. "He took as his starting-point the fundamental thought of Schleiermacher, that religion is not doctrine but life, direct consciousness, feeling. At the same time he sought to bring religious feeling into closer connexion with knowledge and volition than Schleiermacher had done, and he laid the foundation for the recognition of a necessary and radical union of religion with morality, treating both dogmatics and ethics together accordingly in his System der christlichen Lehre" (Otto Pfleiderer, Development of Theology, p. 123). His Protestantische Beantwortung, a reply to the Symbolik of Johann Adam Möhler (1766—1838), which originally appeared in the Studien u. Kritiken, of which he was one of the founders, may also be mentioned.

See Herzog-Hauck, Realencyklopädie, and the Allgemeine deutsche Biographie; F. Lichtenberger, History of German Theology in the Nineteenth Century, pp. 185—196.

NIU-CHWANG, a city of China, in the Manchurian province of Sheng-king (Liao-tung), in 40° 33’ N. and 129° 57’ E., about 35 m. (50 m. by water) from the mouth of the Gulf of Liao-tung, on the coast is now a small branch of the main entrance of the Liao-ho. The population is estimated at 80,000. The city proper is a comparatively unimportant place with broken-down walls, but it is surrounded by a number of large and flourishing suburbs. About the beginning of the Ta-ts’ing dynasty (1644) Niu-chwang was the chief port on the river, but in the reign of K’ien-lung, owing mainly to physical changes, it was supplanted by T’ien-chwang-tai farther down the stream, and towards the close of the 18th century this had in turn to give place to Ying-tsze still nearer the mouth. In ignorance of these facts Niu-chwang (now a small town reached by a flat-bottomed river boat) has been chosen as one of the ports to be opened to foreign trade by the treaty of Tien-tsin; and, though Ying-tsze had of necessity to be adopted as the site of the foreign settlements, Europeans still continue to speak of it as the port of Niu-chwang. Ying-tsze (otherwise known as Ying-k’ou, Niu-k’ou and in Mandarin as Muh-k’ou-ying) lies on the left bank of the Liao-ho on the lowest dry portion of the plain, not much above high-water mark. The British settlement immediately above the town has a river frontage of 1000 yds., opposite the deepest of the reaches, and runs back 300 yds. The Gulf stream, which pierces the mouth of the river there is an extensive bar of hard mud which can only be crossed by certain channels at high tide, when it is covered by from 18 to 20 ft. of water; and the port is altogether closed by ice for four or five months of the year, between November and May. Niu-chwang has shown considerable vigour as a port of trade, sharing in the general prosperity of the provinces of Manchuria, of which it is the outlet. It was opened to foreign trade in 1838. In 1864 the total value of trade was $200,124; in 1878 $3,060,134, in 1898 $4,634,470, while in 1904 the figures reached £4,950,805. The principal exports (20%) are beans, bean-cake, bean-oil and wild silk. The bean-cake is a popular article of food with the natives of Kwang-tung and Fu-chien, and is also largely employed for manuring the rice and sugar fields in the neighbourhood of Shanghai, Amoy, Swatow, &c. Of imports (71%) the principal are cotton yarn and cotton cloth, most of the latter being drawn from the United States in preference to English-made goods. The number of resident foreigners is about 150. Railways connect the port with Tientsin and Peking on the one hand, and with the Russian territories lying to the north on the other. In 1890 Niu-chwang was occupied by Japanese troops, and the town was included in the cession of territory originally granted by the treaty of peace. By a supplementary convention it was retroceded by the Japanese under pressure of France and Russia. Niu-chwang suffered considerably from the disturbances of 1900 and again during the Russo-Japanese war. In 1900 the Russians attacked the town, and took possession of the port, and administered affairs until they in turn were driven out by Japanese. At the conclusion of the war the Japanese restored the port to China.

Nieuw (Shang-hai In and we Nieuw-Fekai, as the natives call it), an island in the South Pacific Ocean, 14 m. long by 10 m. wide, in 15° 10’ S., 160° 47’ W. The entire island is an old coral reef upreared 200 ft., honeycombed with caves and seamed with fissures. The soil, though thin, is, as in other limestone islands, very rich, and coco-nuts, tara, yams and bananas thrive. There is an abundant rainfall, but owing to the porous nature of the soil the water percolates into deep caves which have communication with the sea, and becomes brackish. The natives, a mixed Polynesian and Melanesian people of Samoan speech, are the most industrious in the Pacific, and many of the young men go as labourers to other islands. The consequent minority of males has been destructive of the sexual morality of the women, which formerly stood high. The natives are keen traders, and though uncouth in manners when compared with their nearest neighbours, the Tongans and Samoans, are friendly to Europeans. Their hostility to Captain Cook in 1774, which earned him the name of Savage for the island, was due to their fear of foreign disease, a fear that has since been justified. The population (1901) is slightly decreasing. The natives are all Christians, and the majority have learned to read and write, and to speak a little English. On the top of the town is the Missionary Society. They wear European clothes. The island became a British protectorate on the 20th of April 1900, and was made a dependency of New Zealand in October 1900, the native government, of an elected "king" and a council of headmen, being maintained. In 1900 there were thirteen Europeans on the island. The exports are copra, fungus and straw hats, which the women plait very cleverly.

See T. H. Hood, Notes of a Cruise in H.M.S. "Fawn" (Edinburgh, 1853); J. L. Brenchley, Jottings during the Cruise of the "Curazo" (London, 1873); B. H. Thomson, Savage Island (London, 1902).

NIVELLES (Flem. Nyvel), a town of Belgium in the province of Brabant, situated on the Thines r. m. S. of Brussels. Pop. (1904) 12,109. It is a busy little place with many industries, notably the manufacture of parchment. The town is supposed to owe its origin to the foundation of a convent on the spot by Itta or Iduberge, wife of Pippin of Lippain. The Romanesque church of St Gertrude, named after Itta's daughter, dates from the 11th century, but has been badly restored and is disfigured by a heavy tower. On the top of the tower is the effigy of the townspeople Jean de Nivelles, a celebrated baron of the 15th century whose title eventually became merged in that of the count de Hornes (Horn). The church is supposed to occupy the site of Itta's convent. Close to Nivelles is Seneffe, where Condé defeated William of Orange in 1674, and at Nivelles itself the French under Marceau defeated the Austrians in 1704.

NIVERNAIS, LOUIS CHARLES BARBON MANGINI MAZARIN, Dec de (1716—1708), French diplomatist and writer, was born in Paris on the 16th of December 1716, son of Philippe Jules Francois, duc de Nevers, and Maria Anne Spinola, and great-nephew of Cardinal Mazarin. He was educated at the Collège Louis le Grand, and married at the age of fourteen. He served in the campaigns in Italy (1733) and Bohemia (1740), but had to give up soldiering on account of his weak health. He was subsequently ambassador at Rome (1748—1752), Berlin (1755—1756) and London, where he negotiated the treaty of Paris (10th of February 1763). From 1787 to 1790 he was a member of the Council of State. He did not emigrate during the revolution but lost all his money and was imprisoned in 1793. He recovered his liberty after the fall of Robespierre, and died in Paris on the 25th of February 1798. In 1743 he was elected to the Academy for a poem entitled Délire, and from 1763 he devoted the greater part of his time to the administration of the duchy of Nevers and to belles-lettres. He wrote much and with great facility; but his writings are of little value, his Fables being his best pro-
ductions. His *Oeuvres complètes* were published in Paris in 1796; an edition of his *Oeuvres posthumes* was brought out in Paris by François de Neufchâtel in 1807, and his *Correspondance secrète* was published in Paris by de Lescure in 1866.

**NIXIE**, or **NIXY**, a female water-sprite. The word is adapted from Ger. *Nixe*, the male water-sprite being *Nix*. The general term covering both the male and female is “nicker,” a kelpie. This also appears in Dutch *nijkerk.* The Old Teutonic *nikus* may be connected with the root which appears in Gr. *nixèr* or *nixote* to wash.

**NIXON, JOHN** (1815–1890), English mining engineer and colliery proprietor, was born at Barlow, Durham, on the roth of May 1815, the son of a farmer. He was educated at the village school, and at an academy in Newcastle-on-Tyne, where he distinguished himself in mathematics. Leaving school at fourteen, he worked on his father’s farm for two years, and then apprenticed himself to Mr Joseph Gray, one of the leading mining engineers in the north of England, and agent to the second marquis of Bute; subsequently he obtained employment as “overman” at one of the Bute collieries in Durham. In 1839 an advertisement drew him to the South Wales coalfield, where he was engaged in mine-surveying, and whence he proceeded to France as engineer to a coal and iron company. Returning to England, he noticed while travelling on one of the Thames steamers that the Welsh coal in use gave off no smoke and was preferred to north country coal both on this ground and because of its greater power-producing efficiency. His experience in France now suggested to him that a profitable market for this coal might be established among the French iron-founders and manufacturers generally who had hitherto imported English north country coal. For some time he was unable to procure any of this special Welsh coal. Eventually, however, by expending all his small savings he secured a cargo, freighted a small craft, and sent it across to Nantes, where with some difficulty he persuaded the local manufacturers to try it on the understanding that he bore the expense of the experiments. These tests, carried out under Nixon’s personal directions, proved highly successful, and in due course the French government gave him a contract for Welsh coal for the French navy. Nixon’s visit to Nantes laid the foundations of the Welsh steam-coal trade, English manufacturers and shipowners benefited, and it is a matter of regret that he was not given a proper share in the development of the vast possiblities which his early experiments suggested. He died in London on the 3rd of June 1890.

**NIZAM**, the hereditary title of the reigning prince of Hyderabad (q.v.) in India, derived from an Arabic word meaning order, or administration. The same word is found in *Nasim*, applied to the Nawab of Bengal, and in *Nizamat*, the old term for criminal jurisdiction. *Nizam-ul-Mulk* ( = “administrator of the kingdom”) was the title of Asaf Jah, the founder of the dynasty, a very able soldier and minister of the court of Aurangzeb, who was appointed governor of the Deccan in 1713, and established his independence before his death in 1748.

**NIZAMI** (1141–1203). Nizam-ud-din Abū Mahommaded Ilyâs bin Vicn, Persian poet, was born 535 A.H. (1141 A.D.). His native place, or at any rate the abode of his father, was in the hills of Kum, but as he spent almost all his days in Ganja in Arrâl (the present Elizavetpol) he is generally known as Nizâmi of Ganja or Ganjavâl. The early death of his parents, which illustrated to him in the most forcible manner the unsteadliness of all human existence, threw a gloom over his whole life, and fostered in him that earnest piety and fervent love for solitude and meditation which have left numerous traces in his writings, and are a noteworthy fact that the once so devout a powerful antidote against the enticing favours of princely courts, for which he, unlike most of his contemporaries, never sacrificed a tittle of his self-esteem. The religious atmosphere of Ganja, besides, was most favourable to such a state of mind; the inhabitants, being zealous Sunnites, allowed nobody to dwell among them who did not come up to their standard of orthodoxy, and it is therefore not surprising to find that Nizâmi abandoned himself at an early age to a stern ascetic life, as full of intolerance to others as dry and unprofitable to himself. He was rescued at last from his two misfortunes by his own genius, which, not being able to give free vent to its poetical inspirations under the crushing weight of bigotry, claimed a greater share in the legitimate enjoyments of life and the appreciation of the beauties of nature, as well as a more enlightened faith of tolerance, benevolence, and liberality. The first poetical work in which Nizâmi embodied his thoughts on God and man, and all the experiences he had gained, was necessarily a didactic character, and very appropriately styled *Makhzanul Assir*, or “Storehouse of Mysteries,” as it bears the unmistakable stamp of Sufi speculations. It shows, moreover, a remarkable resemblance to Nizâm Khosrâu’s ethical poems, *Sanât’s Hadîkat-ul-ahâmât*, or “Garden of Truth.” The date of composition, which varies in the different copies from 552 to 582 A.H., must be fixed in 574 or 575 (1178–1179 A.D.). Although the *Makhzan* is mainly devoted to philosophic meditations, the propensity of Nizâmi’s genius to purely epic poetry, which was soon to assert itself in a more independent form, makes itself felt even here, all the twenty chapters being interspersed with short tales illustrative of the maxims set forth in each. His claim to the title of the foremost Persian romanticist he fully established only a year or two after the *Makhzan* by the publication of his first epic masterpiece *Khosrav and Shirin*, composed, according to the oldest copies, in 576 A.H. (1180 A.D.). As in all his following epopees the subject was taken from what pious Moslems call the time of “heathendom”—here, for instance, from the old Sassanian story of Shâh Khosrâv Parviz (Chosroes Parvez), his love affairs with the princess Shirîn of Armenia, his jealousy against the architect Ferhad, for some time his successful rival, of whom he got rid at last by a very ingenious trick, and his final reconciliation and marriage with Shirîn. The work, which runs through no less than 50 books, was written in perfect Persian, and Nizâmi never chose a strictly Mahomedan legend for his works of fiction. Nothing could prove better the complete revolution in his views, not only on religion, but also on art. He felt, no doubt, that the object of epic poetry was not to teach moral lessons or doctrines of faith, but to depict the good and bad tendencies of the human mind, the struggles and passions of men; and indeed in the whole range of Persian literature only Firdusî and Fâhîr-uddîn As‘ad Jârfân, the author of the older epopee *Wis n. Rûmîn* (about the middle of the 11th century), can compete with Nizâmî in the wonderful delineation of human characters, and the perfect mastery of the art of poetry, especially of the joys and sorrows of a loving and beloved heart. *Khosrav and Shirin* was inscribed to the reigning atâbeg of Azerbaijan, Abû Ja‘far Mahommaded Pahlavan, and his brother Kizîl Arslân, who, soon after his accession to the throne in 582 A.H., showed his gratitude to the poet by summoning him to his court, loading him with honours, and bestowing upon him the revenue of two villages, Hamd and Nîjan. Nizâmî accepted the royal gift, but his resolve to keep aloof from a servile court-life was not shaken by it, and he forthwith returned to his quiet retreat. Meanwhile his genius had not been dormant, and two years after his reception at court, in 584 A.H. (1185 A.D.), he completed his *Divân*, or collection of kasîdas and ghazals (mostly of an ethical and parentetic character), which are said to have numbered 20,000 distichs, although the few copies which have come to us contain only a very small number of...
NIZHNE-TAGILSK—NIZHNY-NOVGOROD

verses. About the same time he commenced, at the desire of the ruler of the neighbouring Shirván, his second romantic poem, the famous Bedouin love-story of "Laila and Majnun," which has so many points in common with Ariosto's "Orlando Furioso," and finished it in the short space of four months. A more heroic subject, and the only one in which he made a certain attempt to rival Firouz, was selected by his poet for his third epopee, the "Iskandarnáma," or "Book of Alexander," also called "Sharafija" or "Isháináma-í-Ishandari" ("The Fortunes of Alexander"), which is split into two divisions. The first or semi-historical part shows the events of Alexander's operations in the west, while the second, of a more ethical tendency, describes him in the character of a prophet and philosopher, and narrates his second tour through the world and his adventures in the west, south, east and north. There are frequent Súfí allegories, just as in the Mahbín; and quite imbued with pantheistic ideas is, for instance, the final episode of the first part, the mysterious expedition of Alexander to the fountain of life in the land of darkness. As for the date of composition, it is evident, from the conflicting statements in the different MSS., that there must have been an edition of this work in the latter part of the fourteenth century, and dedicated to the prince of Mosul, Zzz.uddin Mas'ud, the latter made for the atábeg Nusrat-uddin Abú Bakr of Azerbaijan after 593 A.D., since we find in it a mention of Nizámí's last romance "Hafí Paíkor," or the "Seven Beauties," which comprises seven tales related by the seven favourite wives of the Sassánían king Bahrâm-gúr. This poem, which was written 593 A.D., at the request of Nür-uddin Arslán of Mosul, the son and successor of the abovementioned "İzz-uddín, Nizámí returned once more from his excursion into the field of heroic deeds to his old favourite domain of romantic fiction, and added a fresh laurel crown of immortal fame with which the unanimous consent of Eastern and Western critics has adorned his venerable head. The most interesting of the seven tales is the fourth, the story of the Russian princess, in which we recognize at once the prototype of Gozzi's well-known "Turandot," which was afterwards adapted by Schiller for the German stage. The five mathnavís, from the Mahbín to the Hafí Paíkor, form Nizámí's so-called "Quintupile" ("Khamsa") or "Five Treasures" ("Panz Gaîg"), and have been taken as pattern by all the later epic poets in the Persian, Turkish, Chagháuti and Hindustání languages. Nizámí's daughter, by an unknown lover, was given to Ahmad Meshref, son of the Fáríndast-čehro of Bákhtíyar Kháyání, 12th to 13th century.

The fullest account of Nizámí is given in Dr W. Bacher's "Nizámí's Leben und Werke" (Leipzig, 1871; English translation by S. Robinson, London, 1873; reprinted in the same author's "Persian Poetry for English Readers," 1883, pp. 103-244). All the details of Bacher's work are corrected and amplified in his "A Catalogue in the British Museum of the Persian MSS. in the British Museum" (1881), I, 563-691. The most valuable of the MSS. is Add. 6961; Khosrau and Shírin (liethographed, Lahore, 1871; German translation by Hümmer and Shírin, ein persisches romantisches Gedicht, Leipzig, 1809; Laila and Majnun (liethographed, Lucknow, 1871; English translation by J. Atkinson, London, 1836); Hafí Paíkor (liethographed, Bombay, 1848; Lucknow, 1873; the fourth tale at Geben and Erdmann, "Hafí Paíkor und andere Geschichten," Fürstentöchter, Kassan, 1844); Iskandarnáma, first part, with commentary (Calcutta, 1812 and 1825; text alone, Calcutta, 1853, lithographed); with the following additional MSS., 1860 to 1875; English translation by H. Wilberforce Clarke, London, 1881; compare also Erdmann, "De expéditione Russorum Berdaom versus, Kassan, 1826, and Charmoy, "Expédition d'Alexandre contre les Russes," Saint-Petersbourg, 1829); Iskandarnáma-í-Bakht, second part, edited by Dr Spranger (Calcutta, 1852 and 1896). (H. E.)

NIZHNE-TAGILSK, popularly known as Tagil, a town and iron-works of Russia, in the government of Perm, stands in a longitudinal valley on the eastern side of the Ural Mountains, within a few miles of the place where the Tagil, cutting through the eastern wall of the valley, escapes to the lowlands to join the Tura, a tributary of the Tobol. The southern part of this valley is occupied by the upper Tagil, and its northern portion by the upper Tura, from which the Tagil is separated by a low watershed. Pop. (1897) 30,000, all Great-Russians and chiefly Nonconformists. The town is connected by railway (the first in Siberia) with Perm and Ekaterinburg, the latter distant 88 m. to the S.S.E. It was founded in 1725 by the Russian mine-owner Demidov, and is still the property of his family. Nizhne-Tagilsk is a central foundry for a number of iron-mines and other works scattered in the valley of the Tagil and its tributary the Salda. Gold, platinum and copper are also mined at Nizhne-Tagilsk. The town carries on a brisk corn trade. The inhabitants make wooden boxes and trays, which are sent to the fairs of Irbit and Nizhny-Novgorod.

NIZHNY-NOVGOROD or NIZHNY-Novgorod, abbreviated into NIZHEGOROD, a government of Central Russia, bounded by the governments of Vladimir on the W., Kostroma and Vyatka on the N. and N.E., Kazan and Simbirsk on the E., and Penza and Tambov on the S., with an area of 19,792 sq. m., two-thirds below on the right and the rest on the left bank of the Volga. The smaller portion, with the exception of the better-drained lands close to the river, is a low, flat, marshy region, covered with thick forests and sandy hills, and thinly peopled. The space between the Oka and the Volga, in the west, is also flat and forest-grown. The best part of the government is that to the east of the Oka; it is hilly, traversed by deep ravines and better drained, and has patches of fertile black earth in the south. The government is drained by the Volga with its tributaries, the Kerzhnetas and the Vetyuga on the left, and the Sura (with the Pyana) and the Oka on the right. These and their numerous tributaries offer great facilities both for navigation and for the transportation of timber. Numerous small lakes dot the government, especially in the north, and close upon two-fifths of its entire surface is still covered with forests, which occupy nearly the whole of the Zavoljy (to the north of the Volga), and extend without a break for 50 and 80 m. to the west and south-west respectively. The climate is severe, especially in the Zavoljy, where the average yearly temperature is 5-6 Fahr. lower than at Nizhniy. Besides the Carboniferous, Permian and Triassic deposits, numerous lacustrine deposits are found in patches, chiefly in the south-east, as also in the south-west and north. They are overlain with Cretaceous black clays and sandstones. Thick strata of Tertiary sands, containing petrified wood, are found in the Ardatov district, and over the whole lie Glacial deposits, sandy gravels and clays.

Black earth, known as the "black earth of the plateau," prevails on the high plains between the river valleys in the south-east; the "valley black earth," even more fertile than the former, covers the gently-sloping portions of the territory, also in the south-east. More or less sandy clays are met with everywhere, and there are large patches of sand. Iron ores (brown and spheronicritic), alabaster, limestone, sand (used for glass), salt and phosphorites are the chief useful minerals. There are also extensive deposits of peat.

The population increased from 1,376,000 in 1880 to 1,502,292 in 1897; of these 847,245 were women and 140,347 lived in towns. The estimated pop. in 1906 was 1,832,000. They consist of Russians, to the extent of 88%; Mordvinians, to the number of 53,100; Cheremisses, 6,700; with Tatars and Chuvashews. Of the total number in 1897, 1,525,735 were Orthodox and Old Believers, 5,548 Russians, and 5,388 Jews. The birth-rate (53 in 1900) and the death-rate (41 in 1900) are high. A little over 53% of the area is available for agriculture, and of this 59% is owned by noblemen and 16% only by the peasantry, the remainder being owned by merchants and others. Of the cultivable land owned by the peasantry 55% is under crops, but of similar land owned by noblemen only 30% is cultivated. The principal crops are wheat, rye, oats, barley, peas and potatoes. In some years the yield is quite insufficient for the population, and every year over 100,000
persons quit their villages in quest of temporary work in neighbouring governments. The semtvo or district council of Nizhniy-Novgorod supports an agricultural school, an experimental farm, and an agency for the purchase of improved seeds and machinery. The live-stock industry is inferior, as many as 41% of the peasant families having no horses, and 24% no cows. The domestic trades, such as the making of cutlery, felts, woollens, leather goods, wooden wares (sledges, spoons, boxes, window-frames, &c.), gloves, wirework, hardware, mats and sacks, are widely practised; 70% of the male working population among the peasants earn their livelihood in this way, as well as by shipping. This last is an industry of considerable magnitude, goods being shipped and unshipped to the annual value of over £5,000,000. Many of the villages and towns have each its own specialty, those in the district of Semenov being famous for wooden spoons, in Gorbatov for cutlery and locks, in Balakhna for spindles, in Makaryev for fancy boxes, in Arzamas, Knyaginin and Sergach for furs and leather goods. The Mordvinians and Cheremisses keep bees. Fruit and vegetables are cultivated along the Oka and the Volga. The factories are steadily developing, iron and machinery works, flour-mills, potteries, tanneries, shipbuilding yards, sawmills and distilleries are the more important. Education, owing to the efforts of the semtvo, is in a better condition than in many of the surrounding counties. Nizhniy-Novgorod, as the capital of the administration, is supplied by the railroad from Moscow (272 m. by rail E. of Moscow). It occupies an advantageous position on the great artery of Russian trade, at a place where the manufactured and agricultural products of the basin of the Oka meet the metal wares from that of the Kama, the corn and salt brought from the south-eastern governments, the produce of the Caspian fisheries, and the various wares imported from Siberia, Central Asia, Caucasus and Persia. It has thus become a seat of the great Makaryevskaya fair (see below), and one of the chief commercial centres of Russia. Its importance was still further increased during the latter part of the 19th century in consequence of the growth of manufacturing industry in the Oka basin, the rapid development of steamboat traffic on the Volga and its tributaries, the extension of the Russian railway system and the opening of Central Asia for trade.

Nizhniy-Novgorod consists of three parts: the upper city, including the Kremlin; the lower town, or Nizhniy Bazaar; and "the Fair," with the suburb of Kunavino. The upper city is ringed by three walls, which rise as steep ramps 40 ft. (12 m.) above sea-level (above the right bank of both the Oka and the Volga. The Kremlin, or old fort, occupies one of these hills facing the Volga. It was begun in the second half of the 14th century, but was erected chiefly in the beginning of the 16th, on the site of the old palisaded fort, and has a wall 2300 yds. long, and 65 to 95 ft. high, with eleven towers; it contains the courts, the governor’s residence, the arsenal, barracks, the military gymnasion of Count Arakcheev (transferred from old Novgorod), a small museum and two cathedrals, Preobrazhenski and Arkhangelski. These last were erected in 1225 and 1222 respectively, and have been rebuilt more than once; the present structures, in somewhat poor taste, date from 1829-1834 and 1732 respectively. The Preobrazhenski cathedral retains several relics of the past, such as holy pictures of the 14th and 17th centuries and a Bible of 1408; Minin, the hero of Nizhniy (see below) lies buried there. The Kremlin is adorned with a square, containing a monument to Minin and Pozharsky erected in 1826, and pretty boulevards have been laid out along its lower wall. The view from the Kremlin of the broad Volga, with its low-lying and far-spreading left bank, is one of its most beautiful. The town is also rich in its museums and libraries. Of the numerous small churches in the city, one of the most curious is the Makaryevskaya fair (1897), which was erected in 1330 and destroyed by a land-slip in 1596—and has several antiquities and a library which formerly contained very valuable MSS., now at St Petersburg. Another monastery, that of Blagoveshchensk (1370, rebuilt 1647), is situated on the right bank of the Oka. Its old churches have been destroyed by fire, but it has a very ancient holy picture—probably the oldest in Russia, dating from 993, which attracts many pilgrims. In 1914 a town-house and a monument to "Tsar" Alexander II. were built in the principal square of the upper town. Besides the Kremlin, the upper town contains the best streets and public buildings. Five descents lead from it to the lower town, planted on the alluvial terrace, 30 to 35 ft. above the banks of the Oka and the Volga, and in the centre of a very lively traffic. Piles of salt line the salt wharves on the Oka; farther down are the extensive storehouses and heaps of grain of the corn wharves; then comes the steamboat quay on the Volga, opposite the Kremlin, and still farther east the timber wharves. The fair is held on the flat sandy tongue of land between the Oka and the Volga, connected with the town by only a bridge of boats 20 yds. long, which is taken to pieces in winter. The shops of the fair, 4000 in number, built of stone in regular rows, are surrounded by a canal, and cover half a square mile. Outside this inner fair are nearly 4000 more shops. Several buildings have been erected, and Institutions established, in connexion with the fair, e.g. the house of the committee (1890), banks, a theatre, a circus, a new semicircular canal and a second floating bridge, underground galleries, a water-supply, an electrical tramway, temperature tea-shops and restaurants kept by the Society of Tradesmen. The Siberian harbour is conspicuous during the fair on account of its accumulations of tea boxes and temporary shelters, in which the different kinds of tea are tried and appraised by tasters. The point of the peninsula is occupied by the storehouses of the steamboat companies, while metal wares and corn are discharged on a long island of the Oka, at the iron harbour and in Grebnowskaya harbour. An island in the Volga is the place where various kinds of rough wares are landed. The railway from Moscow has its terminus close to the fair buildings, to the south of which is the suburb of Kunavino, widely known now as the "Fair," as a place for amusements of the lowest kind during the fair. On the fair side the Alexander Nevski cathedral was erected in 1881, and there too is the older "Fair" cathedral of 1822.

The climate of Nizhniy is harsh and continental, the yearly average temperature being 39° Fahr. (10°-6° in January and 64° in July), and the extreme thermometric readings -40° and 104° Fahr. The town has a settled population of (1897) 90,053 inhabitants, who are nearly all Great-Russians, and many of them Nonconformists. The mortality exceeds the birth-rate. The educational institutions include a military school, a technical school, a theological seminary, and two schools for sons and daughters of the clergy.

The manufactures include steam flour-mills, iron and machinery works, manufactories of ropes and candles, distilleries and potteries. Shipbuilding, especially for the transport of petroleum on the Caspian Sea, and steamboat building, have recently advanced considerably. Nizhniy is the chief station of the Volga steamboat traffic. The first steamer made its appearance on the Volga in 1821, but it was not till 1845 that steam navigation began to assume large proportions. The merchants carry on a brisk trade, valued (apart from that of the fair) at more than £2,000,000 of purchases and £1,800,000 of sales; the principal items are corn (£500,000 to £500,000), salt, iron, tea, fish, groceries and manufactured goods.

The chief importance of the city is due to its fair, which is held from the 29th of July to the 10th of September. From remote antiquity Russian merchants were wont to meet in summer with those from the East at different places on the Volga, between the mouths of the Oka and the Kama—the fair changing its site with the increasing or decreasing power of the nation. Some traces of the ancient fair are still to be seen on the peninsula in the middle Volga, and the old town is still the seat of the fair. From 1641 its seat was at a monastery 55 m. below Nizhniy and close to Makaryev (whence its present name). The situation, however, being in many ways inconvenient, and a conflagration having destroyed the shops at Makaryev, the fair was transferred in 1875 to its present locality at Nizhniy-Novgorod.
The goods mostly dealt in were cotton, woolen, linen and silk stuffs (35 to 38 % of the whole), iron and iron wares, furs and skins, pottery, salt, corn, fish, wine and all kinds of manufactured goods. The Russians, who in the four following years dominated the whole trade, bought from Asia—tea (imported via Kakhia and via Canton and Suez), raw cotton and silk, leather wares, madder and various manufactured wares—do not exceed 10 or 11%. Manufactured wares include both those brought to the trade from inside Russia and those substantially imported from western Europe. The total turnover of goods sold and "ordered" amounts to nearly 361 millions sterling annually. The former category dropped, however, from 26 millions in 1851 to 14 millions in 1856.

In 1860, the Russian manufacturers depending chiefly on the barter-trade in tea at Kakhia, their production was regulated principally by fluctuations of the price of tea. The cost of the cotton takes the lead, and the prospective output for the year of the mills of central Russia is determined at the fair by the price of raw cotton imported from Asia, by the price of tea, and by the results which have become known during the fair. The same holds good with regard to all other stuffs, the prices of wool (provisionally established at the earlier fairs of south-western Russia) being usually settled at Nizhniy, as well as those of raw silk.

The whole of the iron production of the Urals depends also on the same fair. The "caravans" of boats laden with iron-ware, starting from the Urals works in the spring, reach Nizhniy in August, after a stay of 6 months. The fair supplies the lower Volga and the purchases of iron made at Nizhniy for Asia and middle Russia determine the amount of credit that will be granted for the next year's business. The volume of the iron trade is one of the factors which Flooding of the Volga entirely depend. The fair thus influences directly all the leading branches of Russian manufacture. It exercises a yet greater influence on the corn and salt trades throughout Russia, and still more on the trade in furs. The importance of the fair depends entirely on the conditions of the Siberian and Turkestan merchants obtain at the fair.

The Makaryevskaya fair attracts no fewer than 400,000 people from all parts of Russia every year.

Two other fairs of some importance are held at Nizhniy—one for wooden wares on the ice of the Okha, and another, in June, for horses.

**History.**—The confluence of the Oka and the Volga, inhabited in the 9th century by Moroodvan tribes, became in the 11th century a centre of trade and a stopping place for caravans. In 1115, it was built a fort called "Nizhniy" ("lower city"), which supplied the lower Volga and the Urals with iron and iron wares. The town was the centre of the Volga trade with China and the Middle East, and was a stopping place for caravans.

There are two fairs of some importance held at Nizhniy—one for wooden wares on the ice of the Okha, and another, in June, for horses.

Nizhniy-Novgorod had at one time two academies, Greek and Slav, and took part in some of the literary movements of the end of the 18th century; its theatre also was of some importance in the history of the Russian stage.

The name of the tenth patriarch Noah corresponds to the tenth pre-historic Babylonian king, Xushturu in Berossus, Ut-napištim or Atrahasis in the cuneiform tablets, the hero of the Babylonian flood story.

Gen. ix. 12-27 is a distinct episode, and has no necessary connexion with the narrative of the Deluge. Probably, as Gunkel, Dillmann and others suggest, it came originally from a cycle of stories different from that which contained the account of the Flood. There are some apparent inconsistencies. Noah is called "the husbandman." The proper rendering of verse 20 is "and Noah, the husbandman, was the first to plant a vineyard," the English version rendering it "Noah is the husbandman, and he planted a vineyard," is incorrect. It seems, therefore, that in the original context Noah had been described as "the husbandman," a title in no way suggested by Gen. vi. 9-ix. 19. Moreover, even after making allowance for lack of experience as to the effect of the new product, drunkenness and exposure hardly tally with the statement that "Noah was a just man and perfect in his generations, and Noah walked with God," vi. 9. This indeed comes from the late Priestly Code; but we are also told in the earlier story that "Noah found favour in the eyes of the Lord," vi. 8.

The name also occurs in the Bible (92, Noah, Noé) for the daughter of Zelophehad, of the tribe of Manasseh. Zelophehad having only daughters, the case is made the occasion of laying down the law that where there are no sons daughters inherit, but must marry within their own tribe (Num. xxxvi. 33, xxvii. 1, xxxvi. 11; Josh. xvii. 3, all Priestly Code).

**NOAILLES,** the name of a great French family, derived from the castle of Noailles in the territory of Ayen, between Brive and Turenne in the Limousin, and claiming to date back to the 11th century. It did not obtain fame until the 16th century, when its head, Antoine de Noailles (1507–1562), became admiral of France, and was ambassador in England during three important years, 1553–1556, maintaining a gallant but unsuccessful rivalry with the Spanish ambassador, Simon Renard. Henri (1554–1623), son of Antoine, was a commander in the religious wars, and was made comte d'Ayen by Henry IV. in 1593. 

Anne (d. 1678), the grandson of the first count, played an important part in the Fronde and the early years of the reign of Louis XIV., became captain-general of the newly won province of Roussillon, and in 1665 was made duc d'Ayen, and peer of France. 

The sons of the first Duke raised the family to its greatest fame. The eldest son, Anne Jules (1650–1708), was one of the chief generals.
of France towards the end of the reign of Louis XIV., and, after raising the regiment of Noailles in 1689, he commanded in Spain during the war of the Spanish succession, and was made marshal of France in 1693. A younger son, Louise Antoine (1631-1709), was made archbishop of Paris in 1695, holding this high dignity till his death; he was made a grandee of France in 1721. The name of Noailles occurs with almost confusing reiterated throughout the 18th century. Adrien Maurice (1678-1766), the third duke, served in all the most important wars of the reign of Louis XV. in Italy and Germany, and became a marshal in 1734. His last command was in the war of the Austrian succession, when he was beaten by the English at the battle of Dettingen in 1743. He married Françoise d'Aubigné, a niece of Madame de Maintenon and two of his sons also attained the rank of marshal of France. The elder, Louis (1713-1793), who bore the title of duc d'Ayen till his father's death in 1766, when he became Due de Noailles, served in most of the wars of the 18th century without particular distinction, but was nevertheless made a marshal in 1775. He refused to emigrate during the Revolution, but escaped the guillotine by dying in August 1793, before the Terror reached its height. On the 4th Thermidor (July 22) the aged duchesse de Noailles was executed with her daughter-in-law, the duchesse d'Ayen, and her granddaughter, the vicomtesse de Noailles. Jean Paul François (1739-1824), the fifth duke, was in the army, but his tastes were scientific, and for his eminence as a chemist he was elected a member of the Academy of Sciences in 1766, and was made a grandee of France in 1776 in memory of his father's death, and duc de Noailles on his father's in 1793. Having emigrated in 1792, he lived in Switzerland until the Restoration in 1814, when he took his seat as a peer of France. He had no son, and was succeeded as duc de Noailles by his grand-nephew, Paul (1802-1889), who won some reputation as an author, and who became a member of the French Academy in the place of Chateaubriand in 1849. The grandfather of Paul de Noailles, and brother of the fifth duke, Emmanuel Marie Louis (1743-1822), marquis de Noailles, was ambassador at Amsterdam from 1770-1776, at London 1776-1783, and at Vienna from 1783.

One other branch of the family deserves notice. Philippe (1715-1794), comte de Noailles, afterwards duc de Mouchy, was a younger brother of the fourth duke, and a more distinguished soldier than his brother. He served at Minden and in other campaigns, and was made a marshal of France in 1792. He was in great favour at court, and his wife was first lady of honour to Marie Antoinette, and was nicknamed by her Madame Étiquette. This court favour brought down punishment in the days of the Revolution, and the marshal and his wife were guillotined on the 22nd of January 1794. His two sons, the prince de Poix and the vicomte de Noailles, were members of the Constituent Assembly.

Bundled with other Maras and the vicomte of Noailles and prince of Poix (1752-1819), was born on the 21st of November 1752. In 1789 he was elected deputy of the States-General by the nobility of the barilages of Amiens and Ham, but was compelled to resign in consequence of the death of the comte de Noailles, due to the mob of Nantes at Versailles. He left the country for some time, but returned to France and took part in the revolution on the 10th of August 1792. He was, however, forced to quit the country once more to the fate of his father and mother. Returning to France in 1800, he lived quietly at his residence at Mouchy during the empire. At the Restoration he was brought again into favour and became a peer of France in the 172nd edition of 1819.

Louis Marie (1756-1804), vicomte de Noailles, was the second son of the marshal. He served brilliantly under La Fayette in America, and was the officer who concluded the capitulation of Yorktown. He was elected to the States-General in 1789. He began the famous "orgie," as Mirabeau called it, on the 4th of August, when all privileges were abolished, and with d'Alguillon proposed the abolition of titles and liverys in June 1791. He supported the revolution and became a deputy to America, and became a partner in Bingham's bank at Philadelphia. He was very successful, and might have lived happily had he not accepted a command against the Austrians, at Lorraine, under which he conducted a brilliant defence of the mole St Nicholas, and escaped with the garrison to Cuba; but in making for Havana his ship was attacked by an English frigate, and after a long engagement he was severely wounded. He died on the 23rd of January 1792.

NOAKHALI, a town and district of British India, in the Chittagong division of eastern Bengal and Assam. The town, also known as Suddaram, is on a small river channel 10 m. from the sea. Pop. (1901) 6250. The District of Noakhali has an area of 1644 sq. m.; pop. (1901) 1,141,172. The district consists of an alluvial tract of mainland, together with several islands at the mouth of the Meghna. In general, each home-stead is surrounded by a thick grove of betel- and coco-nut palms, and in the north-western tracts dense forests of betel-nut palms extend for miles. Rice is the greatest crop of cultivation. The district is very fertile; and, with the exception of some sandbanks and recent accretions, every part of it is under continuous cultivation. The process of alluvion is gradually but steadily going on, the mainland extending seawards. Noakhali is peculiarly liable to destructive floods from the sea, generally caused by southerly gales or cyclones occurring at the time when the Meghna is swollen by heavy rains, and at flood-tides—the tidal bore being sometimes 20 ft. high, and moving at the rate of 15 m. an hour. The cyclone and storm-wave of the 31st of October 1856 was greatly disastrous, sweeping over the whole delta of the Meghna. The loss of human life was estimated at 100,000. The east of the district is served by the Assam-Bengal railway.

The Mahommmedan population of the islands at the mouth of the Meghna practised piracy up to a comparatively recent date, and at the beginning of the 17th century Portuguese pirates, under Sebastian Gonzales, occupied Sandiwip. They were ultimately reduced to subjection by Shaista Khan, the governor of Bengal, about the middle of the century; and their descendants have sunk to the level of the natives surrounding them, who have lost the customs and language they have, for the most part, adopted. They are Christians, and retain the old Portuguese names. About 1756 the East India Company established factories in Noakhali and Tippera, the ruins of some of which still remain.

NOBEL, ALFRED BERNHARD (1833-1896), Swedish chemist and engineer, was the third son of Emmanuel Nobel (1801-1872), and was born at Stockholm on the 21st of October 1833. At an early age he went with his family to St Petersburg, where his father started torpedo works. In 1839 these were left to the care of the second son, Ludvig Emilianus (1831-1888), by whom they were greatly enlarged, and Nobel, returning to Sweden with his father, devoted himself to the study of explosives, and especially to the manufacture and utilization of nitroglycerin. He found that when that body was incorporated with an absorbent, inert substance like kieselguhr it became safer and more convenient to manipulate, and this mixture he patented in 1867 as dynamite. He next combined nitroglycerin with another high explosive, gun-cotton, and obtained a transparent, jelly-like substance, which was a still more powerful explosive than dynamite. Blasting gelatin, as it was called, was patented in 1867, and was followed by similar combinations, modified by the addition of potassium nitrate, wood-pulp and various other substances. Some thirteen years later Nobel produced ballistite, one of the earliest of the nitroglycerin smokeless powders, containing in its latest forms about equal parts of gun-cotton and nitroglycerin. This powder was a precursor of cordite, and Nobel's claim that his patent covered the latter was the occasion of vigorously contested law-suits between him and the British Government in 1894 and 1895. Cordite also consists of nitroglycerin and gun-cotton, but the form of the latter which he invented wished for mixtures of ether and alcohol, whereas Nobel contemplated using a less nitrated form, which is soluble in such mixtures.

The question was complicated by the fact that it is in practice impossible to prepare either of these two forms without admixture of the other; but eventually the courts decided against Nobel. From the manufacture of dynamite and other explosives, and from the exploitation of the Baku oil-fields, in the development of which he and his brothers, Ludvig and Robert Häjalmar (1859-1906), took a leading part, he amassed an immense fortune. He died at Saint-Cloud on the 10th of December 1896 at San Remo, he left the bulk of it in trust for the establishment of five prizes, each worth several thousand pounds, to be awarded annually without distinction of nationality.
The first three of these prizes are for eminence in physical science, in chemistry and in medical science or physiology; the fourth is for the most remarkable literary work *dans le sens d'idéalisme*; and the fifth is to be given to the person who shall, in some way or another, render the greatest service to the cause of international brotherhood, in the suppression or reduction of standing armies, or in the establishment or furtherance of peace congresses.

*See Les Prix Nobel en 1901* (Stockholm, 1904).

**Nobili, Leopoldo** (1784–1835), Italian physicist, born at Reggio nell’Emilia in 1784, was in youth an officer of artillery, but afterwards became professor of physics in the architectural museum at Florence, the old habitat of the Accademia del Cimento. His most valuable contributions to science consist in the suggestion of the constant combination of two needles for galvanometers, and in the invention of the so-called thermo-multiplier used by him and M. Melloni. In 1826 he described the prismatically-coloured films of metal, known as Nobili’s rings, deposited electrolytically from solutions of lead and other salts when the anode is a polished iron plate and the cathode is a fine wire placed vertically above it. His papers were mostly published in the *Bibliothèque universelle* of Geneva. He died at Florence in August 1835.

**Nobilior, Marcus Fulvius**, Roman general, a member of one of the most important families of the plebeian Fulvian gens. When he reached the age of 103 a.c. he nobility, in some way or another, rendered the greatest service to the cause of international brotherhood, in the suppression or reduction of standing armies, or in the establishment or furtherance of peace congresses.

order—the *populus*, *patres*, patricians—has all the characteristics which we commonly expect to find in a privileged order. It is a minority, a minority strictly marked out by birth from other members of the commonwealth, a minority which seems further, though this point is less clearly marked, to have had on the whole the advantage in point of wealth. When we are first entitled to speak with any kind of certainty, the non-privileged class possess a certain share in the election of magistrates and the making of laws. But the privileged class alone are eligible to the greatest offices of the state; they have in their hands the exclusive control of the national religion; they have the exclusive enjoyment of the common land of the state—in Teutonic phrase, the *fælæand*. A little research shows that the origin of these privileges was a very simple one. Those who appear in later times as a privileged order among the people had once been the whole people. The patricians, *patres*, housefathers, goodmen—so lowly is the origin of that proud name—were once the whole Roman people, the original inhabitants of the Roman hills. They were the true *populus Romanus*, alongside of whom grew up a secondary Roman people, the *plebs* or commons. As new settlers came, as the people of conquered towns were moved to Rome, as the character of Romans was granted to some allies and forced upon some enemies, this *plebs*, sharing some but not all of the rights of citizens, became a non-privileged order alongside of a privileged order. As the non-privileged order increased in number, the numbers of the privileged order diminished. Since exclusive body must do, lessened, the larger body gradually put on the character of the nation at large, while the smaller body put on the character of a nobility. But their position as a nobility or privileged class arose solely because a class with inferior rights to their own grew up around them. They were not a nobility or a privileged class as long as there was no less privileged class to distinguish them from. Their exclusive possession of power has made the commonwealth in which they bore rule an aristocracy; but they were a democracy among themselves. We see indeed faint traces of distinction among the patricians themselves, which may lead us to guess that the equality of all patricians may have been won by struggles of unrecorded days, not unlike those in which recorded days brought about the equality of patrician and plebeian. But at this we can only guess. The Roman patricians, the true Roman *populus*, appear at our first sight of them as a body democratic in its own constitution, but standing out as an order marked by very substantial privileges indeed from the other body, the *plebs*, also democratic in its own constitution, but in every point of honour and power the marked inferior of the *populus*. The old Roman order thus grew, or rather shrank up, into a nobility by the growth of a new people by their side which they declined to admit to a share in their rights, powers and possessions. A series of struggles raised this new people, the *plebs*, to a level with the old people, the *populus*. The gradual character of the process is not the least instructive part of it. There are two marked stages in the struggle. In the first the plebeians strive to obtain relief from laws and customs which were actually oppressive to them, while they were profitable to the patricians. When this relief has been granted, and while they have never gained a point of wealth, which the plebeians win political equality with the patricians. In this second struggle, too, the ground is won bit by bit. No general law was ever passed to abolish the privileges of the patricians; still less was any law ever passed to abolish the distinction between patrician and plebeian. All that was done was done step by step. First, marriage between the two orders was legalized. Then one law admitted plebeians to one office, another law to another. Admission to military command was won first, then admission to civil jurisdiction; a share in religious functions was won, while other points of advantage followed, chiefly the religious offices which carried no political power with them, always remained the exclusive property of the patricians, because no special law was ever passed to throw them open to plebeians. In this gradual way every practical advantage on the part of the patricians was taken away. But the result did not lead to the abolition of all distinctions between the orders. Patricians and plebeians went on as orders defined by law, till the distinction died out in the confusion of things under the empire, till at last the word "patrician" took quite a new meaning. The distinction, in truth, went on till the advantage turned to the side of the plebeians. Both could not be patricians; a plebeian could not wield the great powers vested in the tribunes of the commons. These were greater advantages than the exclusive patrician possession of the offices of *interrex*, *res sacra* and the higher flamens. And, as the old distinction survived in law and religion after all substantial privileges were abolished, so presently a new distinction arose of which law and religion knew nothing, but which became in practice nearly as marked and quite as important as the older one.

This was the growth of the new nobility of Rome, that body, partly patrician, partly plebeian, to whom the name nobilis strictly belongs in Roman history. This new nobility gradually became as well marked and as exclusive as the old patriciate. But if differed from the old patriciate in this, that, while the privileges of the old patriciate rested on law, or perhaps rather on immemorial custom, the privileges of the new nobility rested wholly on a sentiment of which men could remember the beginning. Or it would be more accurate to say that the new nobility had really no privileges at all. Its members had no legal advantages over other citizens. They were a social caste, a body with its own large and inclusive offices. By the rest of Rome, they were not men, but the new men, and in keeping, all high offices and political power in its own hands the new privileges, even of an honorary kind, as the nobles did enjoy by law belonged to them, not as nobles, but as senators and senators' sons. Yet practically the new nobility was a privileged class; it felt itself to be so, and it was felt to be so by others. This nobility consisted of all those who, as descendants of curule magistrates, had the *jus imaginum*—that is, who could point to forefathers ennobled by office. That is to say, it consisted of the remains of the old patriciate, together with those plebeian families any members of which had been chosen to curule offices. These were naturally those families which had been patrician in some other Italian city, but which were plebeian at Rome. Many of them equalled the patricians in wealth and antiquity of descent, and as soon as inter-marriage was allowed they became in all things their social equals. The practical result of the Licinian reform was that the great plebeian families became, for all practical purposes, patrician. They separated themselves from the mass of the plebeians to form a single body with the surviving patricians. Just as the old patricians had striven to keep plebeians out of high offices, so the new nobility for their part strived to keep the new nobles, men who had not the *jus imaginum*, out of high office. But there was still the difference that in the old state of things the plebeian was shut out by law, while in the new state of things no law shut out the new man. It needed a change in the constitution to give the consulsiphip to Lucius Sextius; it needed only union and energy in the electors to give it to Gaius Marius.

The Roman case is often misunderstood, because the later Roman writers did not fully understand the case themselves. The new nobility, or nobility as they called themselves, that is, the patrician and plebeian, was something like the struggle between the nobility and the people at large in the later days of the commonwealth. In a certain sense he knew better; at any rate, he often repeats the words of those who knew better; but the general impression given by his story is that the plebeians were a low mob and their leaders factious and interested ringleaders of a mob. The case is again often misunderstood because the words "patrician" and "plebeian," like so many other technical Roman and Greek words, have come in modern language to be used in a way quite unlike their original sense. The word "plebeian," in its strict sense, is no more contemptuous than the word *commoner* in England. The *plebs*, like the English commons, contained families differing widely in rank and social position, among them those families which, as soon as an artificial barrier broke down, joined with the patricians to form the new
nobility. The whole lesson is lost if the words “patrician” and “plebeian” are used in any but their strict sense. The Catuli and Metelli, among the proudest nobles of Rome, were plebeians, and as such could not have been chosen to the purely patrician office of praetor, Arigulianus of Jupiter. Yet even in greater antiquity in Roman history the words “patrician” and “plebeian” are often misapplied by being transferred to the later disputes at Rome, in which they are quite out of place.

We may now compare the history of nobility at Rome with its history in some other of the most famous city-commonwealths. Thus at Athens its history is in its main outlines very much the same as its history at Rome up to a certain point, while there is nothing at Athens which at all answers to the later course of things at Rome. We find that the Athenians, at any rate, for a long time, had no division of the older settlement, a nobility which had once been the whole people, was gradually shorn of all exclusive privilege, and driven to share equal rights with a new people which had grown up around it. The reform of Cleisthenes (q.e.) answers in a general way to the reform of Licinius, though the different circumstances of the two cities hinder us from carrying out the parallel into detail. But both at Rome and at Athens we see, at a stage earlier than the final reform, an attempt to set up a standard of wealth, either instead of or alongside of the older standard of birth. This same general idea comes out both in the way in which the Cornelian law of Solon, though the application of the principle is different in the two cases. Servius made voting power depend on income; by Solon the same rule was applied to qualification for office. By this change power is not granted to every citizen, but it is put within the reach of every citizen. No man can change his forefathers, but the poor man may haply become richer. The Athenian eleration, who were thus gradually brought down from their privileged position, seem to have been quite as proud and exclusive as the Roman patricians; but when they lost their privileges they lost them far more thoroughly, and they did not, as at Rome, practically hang on many of them to a new nobility, of which they formed part, though not the whole. While at Rome the distinction of patrician and plebeian was never wiped out, while it remained to the last a legal distinction even when practical privilege had turned the other way, at Athens, the democracy had reached its full growth, the distinction seems to have had no legal existence whatever. At Rome down to the last it made a difference whether the candidate for office was patrician or plebeian, though the difference was in later times commonly to the advantage of the plebeian. At Athens, at the beginning of the democracy, the euperat was neither better nor worse off than another man.

But, what is of far greater importance, there never arose at Athens any body of men which at all answered to the nobilities of Rome. We see at Athens strong signs of social distinctions, even at a late period of the democracy; we see that, though the people might be led by the low-born demagogue—using that word in its strict and not necessarily dishonourable meaning—their votes most commonly fell on men of ancient descent. We see that men of birth and wealth often allowed themselves a strange license, which their lower brothers could never have. But we see no sign of the growth of a body made up of patricians and leading plebeians who continued to keep office to themselves by a social tradition only less strong than positive law. We have at Athens the exact parallel to the state of things when Apollus Claudius shrank from the thought of the consulsiphip of Galus Licinius; we have no exact parallel to the state of things when Quintus Metellus shrank from the thought of the consulsipship of Galus Marius. The cause of the difference seems to be that, while the origin of the patriciate was exactly the same at Rome and at Athens, the origin of the common was different. The four Ionic tribes at Athens seem to have answered very closely to the three patrician tribes at Rome; but the Athenian demos grew up in a different way from the Roman plebs. If we could believe that the Athenian demos arose out of the union of the other Attic towns with Athens, this would be an exact analogy to the origin of the Roman plebs; the eleration would be the Athenians and the demos the Atticans (Arraias). But from such glimpses of early Attic history as we can get the union of the Attic towns would seem to have been completed before the constitutional struggle began. That union would answer rather to the union of the three patrician tribes of Rome. Such hints as we have, while they set before us, just as at Rome, a state of things in which small landed proprietors are burdened with debt, also set before us the Attic demos as, largely at least, a body of various origins which had grown up in the city. Cleisthenes, for instance, enfranchised many slaves and strangers, a course which certainly formed no part of the platform of Licinius, and which reminds us rather of Gnaeus Flavius somewhat later. On the whole it seems most likely that the kernel of the Roman plebs was rural or belonged to the small towns admitted to the Roman franchise, the Attic demos, largely at least, though doubtless not wholly, arose out of the mixed settlers who had come together in the city, answering to the mestox of later times. If so, there would be no place in Athens for those great plebeian houses, once patrician in some other commonwealth, out of which the later Roman nobilities was so largely formed.

Thus the history of nobility at Athens supplies a close analogy to the earlier stages of its history at Rome, but it has nothing answering to its later stages. At Sparta we have a third instance, that of a people whose distinction of classes was due to conquest, the local character of the distinction lived on much longer than it did at Rome. We hardly look on the Spartans as a nobility among the other Lacedaemonians; Sparta rather is a ruling city bearing away over the other Lacedaemonian towns. But this is exactly what the original Roman patricians, the settlers on the three oldest hills, were in the beginning. The so-called cities (polites) of the plebians answered pretty well to the local plebeian tribes; the distinction is that the plebians never became a united corporate body like the Roman plebs. Sparta to the last remained what Rome was at the beginning, a city with a opolus (hopos) but no plebs. And, as at Rome, the early rich distinguished themselves from the plebians, there were demos and ineriores, like the oferiores and minores gentes at Rome. Only at Rome, where there was a plebs to be striven against, these distinctions seem to have had a tendency to die out, while at Sparta they seem to have had a tendency to widen. The Spartan patriciate could afford to disfranchise some of its own members.

The other old Greek cities, as well as those of medieval Italy and Germany, would supply us with endless examples of the various ways in which privileged orders arose. Venice, a city more fully furnished than any others with the economic necessities of the Eastern empire and not of the Western, gives us an example than which none is more instructive. The renowned patriciate of Venice was as far removed as might be from the character either of a nobility of conquest or of a nobility of older settlement. Nor was it strictly a nobility of office, though it had more in common with that than with either of the other two. As Athens supplies us with a parallel to the older nobility of Rome without any parallel to the later, so Venice supplies us with a parallel to the later nobility of Rome without any parallel to the earlier. Athens has Fabii and Claudii, but no Catulli or Metelli; Venice has Catuli and Metelli, but no Fabii or Claudii.

In one point, however, the Venetian nobility differed from either the older or the newer nobility of Rome, and also from the older nobilities of the medieval Italian cities. Nowhere else did nobility so distinctly rise out of wealth, and that wealth gained

\[726\]
by commerce. In the original island territory of Venice there could be no such thing as landed property. The agricultural plebeian of old Rome and the feudal noble of contemporary Europe were both of them at Venice impossible characters. The Venetian nobility is an example of a nobility which gradually arose out of the mass of the people as certain families step by step drew all political power into their own hands. The *plebes* did not gather round the *pares*, neither were they conquered by the *pares*; the *pares* were developed by natural selection out of the *plebes*, or, more strictly, out of the ancient *populus*. The *commune* was the efficient style of the commonwealth, changed into the *seigniori* of Venice. Political power was gradually confined to those whose forefathers had held political power. This was what the later nobility of Rome was always striving at, and what they did to a great extent practically establish. But, as the exclusive privileges of the nobility were never recognized by any legal or formal act, men like Gaius Marius would ever and anon thrust themselves in. The privileges which the Venetian nobility took to themselves were established by acts which, if not legal, were at least formal. The Roman nobility, resting wholly on sufferance, was overtaken by a mutilation of its original form and was successively left by members of distinguished families, descendants of ancient magistrates, who were already beginning to be looked on as noble. The series of revolutions already spoken of first made descent from former councillors a necessary qualification for election to the council; then election was abolished, and the council consisted of all descendants of its existing members who had reached the age of twenty-five. Thus the *optimates* of Venice strove to do: they established a nobility whose one qualification was descent from those who had held office in past times. This is what the nobility of office, if left unchecked, naturally grows into. But the particular way in which oligarchy was finally established at Venice had some singular results. Some of the great families which were already looked on as noble were not represented in the council at the time of the shutting; of others some branches were represented and others not. These families and branches of families, however noble they might be in descent, were thus shut out from all the political privileges of nobility. When one branch of a family was admitted and one shut out we have an analogy to the patrician and plebeian Claudi, though the distinction had come about in quite another way.

And in the Great Council itself we have the lively image of the aristocratic popular assembly of Rome, the *populus*, that of the *curiae*, where every man of patrician birth had his place. The two institutions are the same, only the way in which they came about is exactly opposite. The assembly of *curiae* at Rome, originally the democratic assembly of the original people, first grew into an aristocratic assembly, and then died out altogether as a new Roman people, with its own assembly, grew up by its side. It was a primitive institution which gradually changed its character and made its way by other and newer powers, when it became altogether unsuited to the times. The Great Council of Venice was anything but a primitive institution; it was the artificial institution of a late age, which grew at the expense of earlier institutions, of the prince on the one side and of the people on the other. But the two different roads led to the same result. The Great Council of Venice, the *curiae* of Rome, were each of them the assembly of a privileged class, an assembly in which every member of that class had a right to a place, an assembly which might be called popular as far as the privileged class was concerned, though rigidly oligarchic as regarded the excluded classes. But, close as the likeness is, it is merely a superficial likeness, because it is the result of opposite causes working in opposite directions. It is like two men who are both for a moment in the same place, though their faces are turned in opposite ways. If the later *nobilitas* of Rome had established an assembly in which every one who had the *jus imaginum* had a vote and none other, that would have been a real parallel to the shutting of the Venetian Great Council; for it would have come about through the working of causes with which essentially the same.

The nobility which was thus formed at Venice is the very model of a civic nobility, a nobility which is also an aristocracy. In a monarchy, despotic or constitutional, there cannot in strictness be an aristocracy, because the whole political power cannot be vested in the noble class. But in the Venetian commonwealth the nobility was a real aristocracy. All political power was vested in the noble class; the prince sank to a magistrate, keeping only some of the outward forms of sovereignty; the mass of the people were shut off altogether from the government. As on earth ever fully carried out the literal meaning of aristocracy as the rule of the best, these civic nobilities come nearer to it than any other form of government. They do really seem to engender a kind of hereditary capacity in their members. Less favourable than either monarchy or democracy to the growth of occasional great men, they are more favourable than either to the constant supply of a succession of able men, qualified to carry on the work of government. Their weak point lies in their necessary conservatism; they cannot advance and adapt themselves to changed circumstances, as either monarchy or democracy can. When, therefore, their goodness is gone, their corruption becomes worse than the corruption of either of the other forms of government.

All this is signally shown in the history both of Venice and of other aristocratic cities. But we are concerned with them now only as instances of one form of nobility. The civic aristocracies did not all arise in the same way. Venice is the best type of one way in which they rose; but it is by no means the only way. In not a few of the Italian cities nobility had an origin and ran a course quite unlike the origin and the course which were its lot at Venice. The nobles of many cities were simply the nobles of the surrounding country changed, sometimes greatly against their will, into citizens. Such a nobility differed far more widely from either the Roman or the Venetian patriciate than they differed from one another. It wanted the element of legality, or at least of formality, which distinguished both these bodies. The privileges of the Roman patriciate, whatever we may call them, were not usurpations; and, if we call the privileges of the Venetian nobility usurpations, they were stealthy and peaceful usurpations, founded on something other than mere violence. But in many Italian cities the position of the noble, if it did not begin in violence, was maintained by violence, and was often overthrown by violence. They remained, in short, as unruly and isolated within the walls of the cities as they had ever been without. A nobility of this kind often gave way to a democracy which either proved as turbulent as itself, or else grew into an oligarchy ruling under democratic forms. Thus at Florence the old nobles became the opposite to a privileged class. The process which at Rome gradually gave the plebeian a political advantage over the patrician was carried at Florence to a far greater length at a single blow. The whole noble order was disfranchised; to be noble was equivalent to being shut out from public office. But something like a new nobility presently grew up among the commons themselves; there were *popoloni grossi* at Florence just as there were noble plebeians at Rome. Only the Roman commons, great and small, never shut out the patricians from office; they were satisfied to share office with them. In short, the shutting out of the old nobility was, if not the formation of a new nobility, at least the formation of a
new privileged class. For a certain class of citizens to be condemned, by virtue of their birth, to political disfranchisement is as flatly against every principle of democracy as for a certain class of citizens to enjoy exclusive rights by reason of birth. The Florentine democracy was, in truth, rather to be called an oligarchy, if we accept the best definition of democracy (see Thucydides vi. 39), namely, that it is the rule of the whole, while oligarchy is the rule of a part only.

It is in these aristocratic cities, of which Venice was the most fully developed model, that we can best see what nobility really is. It is in these cities that the nobility is in its purest form—nobility to which no man can rise and from which no man can come down except by the will of the noble class itself. In a monarchy, where the king can ennoble, this ideal cannot be kept. Nor could it be kept in the later nobility of Rome. The new man had much to strive against, but he could sometimes thrust himself through, and when he did his descendants had their juss imaginum. But at Venice neither prince nor people could open the door of the Great Council; only the Great Council itself could do that. That in the better times of the aristocracy nobility was not uncommonly granted to worthy persons, that in its wretched later days there were complete changes, was the affair of the aristocratic body itself. That body, at all events, could not be degraded save by its own act. But these grants and sales led to distinctions within the ranks of the noble order, like those of which we get faint glimpses among the Roman patricians. The ducal dignity rarely passed out of a circle of specially old and distinguished families. But this has often been the case with the high magistracies of commonwealths whose constitutions were purely democratic.

From this purest type of nobility, as seen in the aristocratic commonwealths, we may pass to nobility as seen in states of greater extent—that is, for the most part in monarchies.

There are two marked differences between the two.

They are differences which seem to be inherent in the difference between a republic and a monarchy, but which it would be truer to say are inherent in the difference between a body of men packed close together within the walls of a city and a body of men—if we can call them a body—scattered over a wide territory. The member of a civic nobility is more than a member of an order; he is a member of a corporation: he has rights, powers, he has hardly any being, apart from the body of which he is a member. He has a vote in making the laws or in choosing those who make them; but when they are made he is, if anything, more strictly bound by them than the citizen of the non-privileged order. To be a fraction of the corporate sovereign, if it had its gains, had also its disadvantages; the Venetian noble was fettered by burthens, restrictions and suspicions from which the Venetian citizen was free. The noble of the large country, on the other hand, the rural noble, as he commonly will be, is a member of an order, but he is hardly a member of a corporation; he is isolated; he acts apart from the rest of the body and wins powers for himself apart from the rest of the body. He shows a tendency—a tendency whose growth will be more or less checked according to the strength of the central power—to grow into something of a lord or even a prince on his own account, a growth which may advance to the scale of a German elector or stop at that of an English lord of a manor. Now many of these tendencies were carried into those Italian cities where the civic nobility was a half-tamed country nobility; but they have no place in the true civic aristocracies. Let us take one typical example. In many parts of western Europe the right of private war long remained the privilege of every noble, as it had once been the privilege of every freeman. And in some Italian cities, the right, or at least the privilege, of private war was continued within the city walls. But no power of imagination can conceive an acknowledged right of private war in Rome, Venice or Bern.

The other point of difference is that, whatever we take for the origin and the definition of nobility, in most countries it became something that could be given from outside, without the need of any consent on the part of the noble class itself.

In other words, the king or other prince can ennoble. We have seen how much this takes away from the true notion of nobility as understood in the aristocratic commonwealths. The nobility is no longer all-powerful; it may be constrained to admit within its own body members for whose presence it has no wish. Where this power exists the nobility is no longer in any strictness an aristocracy; it may have great privileges, great influence, even great legal powers, but it is not the real ruling body, like the true aristocracy of Venice.

In the modern states of western Europe the existing nobility succeeds to a feudal past, and its origin in personal service to the prince. And this nobility by personal service to the prince has often supplanted an older nobility, as already for the origin of which was, in some cases at least, strictly immemorial. In this way the later nobility of the thegnas was in England substituted for the older nobility of the earls. Now the analogy between this change and the change from the Roman patriciate to the later Roman nobilitas is obvious. In both cases the older nobility gives way to a new; and in both cases the newer nobility was a nobility of office. Under a kingly government office bestowed by the sovereignty is what counts; and again office is held, or rather it is kept, by a class of people holds in a popular government. This new nobility of office supplanted, or perhaps rather absorbed, the older nobility, just as the later nobilitas of Rome supplanted or absorbed the old patriciate. In our first glimpse of Teutonic institutions, as given us by Tacitus, this older nobility appears as strictly immemorial (see Waizt, Deutsche Verfassungsgeschichte, i. 185 sq.), and its immemorial character appears also in the well-known legend in the Rigsmal-saga of the separate creation of jarl, karl and thrall. These represent the three classes of mankind according to old Teutonic ideas—the noble, the simple freeman and the bondman. The kingly house, where there is one, is not a distinct class; it is simply the noblest of the noble. For, as almost everywhere else, this Teutonic nobility admits of degrees, though it is yet harder to say in what the degrees of nobility consisted than to say in what nobility consisted itself.

The older nobility is independent of the possession of land; it is independent of office about the sovereign; it is hard to say what were the powers and privileges attached to it; but of its existence there is no doubt. But in no part of Europe can the existing nobility trace itself to this immemorial nobility of primitive days; the nobility of modern days, the nobility which we see to-day, is independent of land, of office about the sovereign, of power received from the people. This latter nobility is to-day generally called by the name nobilitas or nobility of office, which expresses the view that it is of the office which holds the nobility.

But what is the office? The nobleman in modern Europe is that man who is the lord of his estate, a name which expresses the idea that the nobleman’s office is his property. The lord of the estate is the lord of the soil, a name which expresses the idea that the nobleman’s office is the soil.

The old English word for the lord of the soil, the word to which the modern French title seigneur is a backformation, is seigneur, and the word to which the modern title prince is a backformation, is prince.

In England the nobility of the thegnas was to a great extent personally displaced, so to speak, by the results of the Norman Conquest. But the idea of nobility did not greatly change. The English thegn sometimes yielded to, sometimes changed into, the Norman baron, using that word in its widest sense, without any violent alteration in its position. The notion of holding land of the king became more prominent than the notion of personal service done to the king; but, as the land was held by the tenure of personal service, the actual relation hardly changed. But the connexion between nobility and the holding of land comes out in the practice by which the lord so constantly took the name of his lordship. It is in this way that the prefixes de and von, descriptions in themselves essentially local, have become in other lands badges of nobility. This notion has died out in England by the dropping of the
preposition; but it long lived on wherever Latin or French was used. And before long nobility won for itself a distinguishing outward badge. The device of hereditary coat-armour, a growth of the 12th century, did much to define and mark out the noble class throughout Europe. As it could be acquired by grant of the sovereign, and as, when once acquired, it went on from generation to generation, it answers exactly to the *jus imaginum* at Rome, the hereditary badge of nobility conferred by the election of the people. Those who possessed the right of coat-armour by immemorial use, or by grant in regular form, formed the class of nobility or gentry, words which, it must be remembered, are strictly of the same meaning. They held whatever privileges or advantages had attached in different times and places to the rank of nobility or gentry. In England indeed a variety of causes hindered nobility or gentry from ever obtaining the importance which they obtained, for instance, in France. But perhaps no cause was more important than the growth of the peerage. That institution at once set up a new standard of nobility, a new form of the nobility of office. The peer—in strictness, the peer in his own person only, not on his estate—was a hereditary title in the sense that it is, without legal advantage over others and the same by birth and by gentry thus became divorced in a way in which they are not in any other country. Those who would elsewhere have been counted as the nobility, the bearers of coat-armour by right, were hindered from forming a class holding any substantial privilege. In a word, the growth of the peerage hindered the existence in England of any nobility in the continental sense of the word. The esquires, knights, lesser barons, even the remote descendants of peers, that is, the *noblesse* of other countries, in England remained gentlemen, but not noblemen—simple commoners who, is, without legal advantage over others and the same by birth and by gentry who had no *jus imaginum* to boast of. There can be no doubt that the class in England which answers to the *noblesse* of other lands is the class that bears coat-armour, the gentry strictly so called. Had they been able to establish and to maintain any kind of privilege, even that of mere honorary precedence, they would exactly answer to continental nobility. That coat-armour has been lavishly granted and often assumed without right, that the word “gentleman” has acquired various secondary senses, proves nothing; that is the natural result of a state of things in which the *status* of gentry carries with it no legal advantage, is not merely right but right by social grounds. If coat-armour, and thereby the rank of gentry, has been lavishly granted, some may think that the rank of peerage has often been lavishly granted also. In short, there is no real nobility in England; for the class which answers to foreign nobility has so long ceased to have any practical privileges that it has long ceased to be looked on as a nobility, and the word nobility has been transferred to another class which has nothing answering to it out of the three British kingdoms. This last

1 This statement is mainly interesting as expressing the late Professor Freeman's view; it is, however, open to serious criticism. Coat-armour was in itself not necessarily a badge of nobility at all; it could be, and was, worn by people having no pretensions to be "gentlemen," and this is true both of England and the continent. In general it was a very bad mark of distinction, not a primary sense of the word. No "grant" was necessary; it was assumed by all and sundry who had occasion to use it, though a reasonable convention forbade one man to assume the device of another. Later on the coat of arms took on the character of a family personal favour or gratitude. This again was not at the outset an exclusive right of the crown; it was common for a leader in battle to grant to some one not of his family, who had specially distinguished himself, the right to bear the whole or part of his coat of arms, undifferenced. On the other hand, many undoubted "gentlemen" never assumed arms at all. The claim of the heralds to the exclusive right of arms is an instance of the growth of the common notion that the right to this depend on grant or recognition by themselves as officers of the crown, is of comparatively late growth. See further the article **GENTLEMAN**, W. A., *Oxford*.
political view monarchy and nobility are strongly opposed. Even the modified form of absolute monarchy which has existed in some Western countries, while it preserves, perhaps even strengthens, the social position of a nobility, destroys its political power. Under the fully-developed despotsim of the East a real nobility is impossible; the prince raises and thrusts down as he pleases. It is only in a commonwealth that a nobility can really rule; that is, it is only in a commonwealth that the nobility can really be an aristocracy. And even in a democratic commonwealth the sentiment of nobility may exist, though all legal privilege has disappeared, and it is not unlikely that, as the traditional feeling may give the members of certain families a strong preference, to say the least, in election to office. We have seen that this was the case at Athens; it was largely the case in the democratic cantons of Switzerland; indeed the nobility of Rome itself, after the privileges of the patricians were abolished, rested on no other foundation. (E. A. F.)

AUTHORITIES.—Selden's Titles of Honor (London, 1672) remains the best comparative account in the English language of the nobility of various countries up to his date. For England see E. P. Shirley, Noble and Gentle Men (1860); Gneist, Adel and Ritterschaft in England (Berlin, 1853); Sir George Sitwell, 'The English Gentleman,' in the Nineteenth Century (2nd series, 1909); and D. H. Robertson, The Noble Birth of the English Race (1893). For France A. C. Fox-Davies' Armorial Families (Edinburgh, 1893, and subsequent editions) represents an unbiographic attempt to create the idea of a noblesse in the United Kingdom. For the origin and growth of the nobility in Italy see A. M. Delaere, Manuel des origines et institutions des familles nobles françaises (Paris, 1892), and P. Guglihermo, Essai sur l'origine de la noblesse en France au moyen âge (1902); for their later status and privileges, A. de Toecqueleur, L'Adéologie et la Révolution (1896), and H. L. du Faurier, Les origines de la France contemporaine, pt. 1. L'Ancien Régime (1875 ff.). For the German and Austrian nobility, see v. Strantz, Gesch. des deutschen Adels (2nd ed., Waldenburg, 1891); von Maurer, Uber das Wesen des ältesten Adels der Stadt Stämme (Munich, 1846); Rose, Der Adel Deutslands und seine Stellung im deutschen Reich (Berlin, 1883); G. Meyer, Lehrbuch des deutschen Staatsrechts (5th ed., Leipzig, 1890), and the Gotha Genealogisches Handbuch. For the nobility of the British Empire, the magnificent folio volumes of Count Pomponio LaIeta, famiglie italiane, continued by various editors (Milan, 1819-1907); for Spanish, Fernandez de Henestronc, Hist. genealogica, t. l-iv. (1862-1907). The authoritative manual for the royal houses and the "higher nobility" of Europe is the Almanach de Gotha, published yearly. See also the articles "TITLES OF HONOUR," "FEUDALISM," "GENTLEMAN," etc.

NOBLE, SIR ANDREW (1832— ), British physicist and artillerist, was born at Greenock on the 15th of September 1832, and was educated at Edinburgh Academy and at the Royal Military Academy, Woolwich. In 1849 he entered the Royal Artillery, attaining the rank of captain in 1855, and in 1857 he became secretary to the Royal Artillery Institution. About this time the question of the supersession of the old smooth-bore by rifled guns was coming to the fore, and on the appointment of the Select Committee on Rifled Cannon in 1856 to report on the matter, he was chosen its secretary, a capacity in which he devised an ingenious method for comparing the probable accuracy of the shooting attainable with each type of gun. In 1850 he was appointed Assistant-Inspector of Artillery, and in the following year he became a member of the Ordnance Select Committee and of the Committee on Explosives, serving on the latter for twenty years, until its dissolution. About the same time he was prevailed upon by Sir William, afterwards Lord Armstrong, to leave the public service and take up a post at Elswick. Here, in the first instance, he was put in charge of the ordnance department, but it was not long before his organization and administrative ability and scientific attainments enlarged the sphere of his influence, and he eventually became chairman of the company. Immediately on his appointment he began a systematic investigation of the phenomena which occur when a gun is fired, some of his first experiments being designed to discover with accuracy the pressures attained in the largest guns of that time. About 1862 he invented his chronoscope for the measurement of exceedingly small intervals of time, and began to apply it in ballistic experiments for ascertaining the velocity with which the shot moves along the barrel of a gun with different powders and different charges. Then he joined Sir Frederick Abel in a classical research on "Fixed Gunpowder," the experimental work being largely carried on at Elswick, and the conclusions they arrived at had a great effect on the progress of gunnery, for they showed how increased muzzle velocities were to be attained without increased pressures in the gun. These inquiries, in fact, enabled Elswick in 1877 to turn out the 6-in. and 8-in. guns, with velocities of over 2000 ft. per second, that obliged the British government finally to give up the antiquated muzzle-loaders to which it had so obstinately adhered. Later, when the era of nitro or "smokeless" powders had begun, Captain Noble was an early advocate of their advantages, and when the government was led to the necessity of selecting a powder of that character for the naval and military services of Great Britain, Elswick extended its hospitality to the committee that invented cordite, and gave the members facilities, which were not offered by the government, for the necessary experimental work. Even after the powder was invented and the committee dissolved, inquiries—which it was nobody's official business to make, and which therefore were not made officially—were continued at Elswick to ascertain how by suitable modifications in form, composition, &c., cordite might then be performed. In 1883 he became a member of the committee appointed in 1890 by Lord Lansdowne to consider, among other things, the excessive erosion alleged by some of the powder's critics to be produced by it in the barrels of the guns in which it is used. He was made C.B. in 1881, promoted to be K.C.B. in 1893, and was created a baronet among the Coronation honours in 1902; he was also the recipient of many foreign decorations and scientific honours, including a Royal medal from the Royal Society in 1886, and the Albert medal of the Society of Arts in 1909. He published a number of his scientific papers in a collected form as Artillery and Explosives in 1896.

NOBLESVILLE, a city and the county-seat of Hamilton county, Indiana, U.S.A., on the White river, about 20 m. N. by E. of Indianapolis. Pop. (1890) 3054; (1900) 4792 (226 negroes); (1910) 5753. It is served by the Lake Erie & Western, the Central Indiana and the Indiana Union (electric) Tracton railways. It is in the natural gas region of the state, and has various manufactures. It was settled about 1825 and incorporated as a town in 1851.

NOCERA IMPERATORE, formerly NOCERA DEI PAGANI (anc. Nuceria Alfeata, q.b.), a town and episcopal see of Campania, Italy, in the province of Salerno, at the foot of Monte Albino, 23 m. E.S.E. of Naples by rail, 135 m. above sea-level. Pop. (1901) 11,933 (town); 20,064 (commune). Nocera is connected with Codola on the line from Naples to Avellino by a branch railway (3 m.). In the old castle Helena, the widow of Manfred, died after the battle of Benevento, and here Urban VI. imprisoned the cardinals who favoured the antipope Clement VII. Two miles to the E. near the village of Nocera Superiore is the circular church of Sta Maria Maggiore, dating from the 4th century. Its chief feature is its dome, ceiled with stone internally; but covered externally with a false roof. It is supported by 46 ancient columns, and in its construction resembles S Stefano Rotondo in Rome. The walls are covered with frescoes of the 14th century. At an early date the city became an episcopal see, and in the 12th century it sided with Innocent II. against Roger of Sicily, and suffered severely for its choice. A colony of Saracens introduced by Frederick II. probably gave rise to the epithet ("of the pagans") by which it was so long distinguished, as well as to the town of Pagani, which lies about 1 m. to the west. In 1503 Pope Urban VII. was besieged in the castle of Charles of Durazzo. Nocera was the birthplace of Solimena the painter and of Hugo de' Pagani, the founder of the Templars; and in the list of its bishops appears the name of Paulus Jovius.

NOCERA UMBRA (anc. Nuceria Camellaria), a town and episcopal see in the province of Perugia, Italy, 12 m. by rail N. by E. of Foligno, 1706 ft. above sea-level. Pop. (1901) 2685 (town); 7848 (commune). It has some old churches, containing pictures and frescoes; in the cathedral is a large altarpiece by Nicolo Alunno. Three miles to the south-east of the town are mineral springs.
NOCTURN—NOEGGERATH

NOCTURN, or Nocturne (Lat. nocturnus, or belonging to the night, next), in the Roman Church, one of the three divisions of the office of matins, corresponding with the vigils, beginning at 9 p.m. midnight and 3 a.m. respectively. The service consists of psalms, lessons and antiphons (see Breviary). The term "nocturne" is applied to a musical composition, especially one written for the piano, and resembling to the earlier "serenade," of a quiet, dreamy and romantic character. The name and style are said to have originated with John Field (1782–1837). The best-known compositions of this kind are the pianoforte pieces of Chopin. J. McNell Whistler also introduced the term into painting by using the name for some of his night-pieces. A "nocturnal" is an instrument for finding the hour of the night by observation of the relative positions of the pole-star and other stars, generally the pointers of Ursae Major. The British Museum contains a fine nocturnal made about 1560 by Humphry Cole (see Navigation).

NOODY, the name applied, originally by sailors, to a sea-bird, from its showing so little fear of man as to be accounted stupid. It is the Siera stolid a Linnaeus, and the Anous stolidus of modern ornithology, having the figure of a Tern (q.v.), and belonging to the sub-family Sterininae, but is heavier in flight, with shorter wings and the tail less deeply forked. The plumage is of a uniform sooty hue, excepting the crown of the head, which is light grey. The Noddy is very generally distributed throughout the tropical or nearly tropical oceans, but occasionally wanders into colder climates, and has been met with even in the Irish Sea. It breeds, often in association with a musical compositor, and nesting islets, commonly making a shallow nest of sea-weed or small twigs. Howard Saunders (Proc. Zool. Society, 1876, pp. 669-672) admits four other species of the genus: Anous tenuirostris, supposed to be confined to the southern part of the Indian Ocean, from Madagascar to West Australia; A. melanogenys, often confounded with the last, but having nearly as wide a range as the first; and A. leucocephalus, hitherto known only from Torres Strait and the Southern Pacific. These three have much resemblance to A. stolidus, but are smaller in size, and the two latter have the crown white instead of grey. The fourth species, A. caeruleus (with which he includes the A. cinctus of some authors), differs not inconsiderably, being of a dove-colour, lighter on the head and darker on the back, the wings bearing a narrow white bar, with their quill-feathers blackish-brown, while the feet are reddish and the webs yellow. Three more species—A. superciliosus from the Caribbean Sea and Gulf of Mexico, A. plumbeigularis from the Red Sea, and A. galapagensis from the Galapagos—have been added by R. Bowlder Sharpe (Philos. Transactions, cvii. pp. 408, 409), according to whom (Proc. Zool. Society, 1878, p. 272) A. cinctus of the Eastern Pacific is distinct from A. caeruleus of Australia and the Southern Pacific (A. N.).

NODE (Lat. nodus, a loop), in astronomy, one of two opposite points at which a heavenly body passes through the principal co-ordinate plane to which its motion is referred. In the case of the heavenly bodies this plane is commonly that of the ecliptic, but, in special cases, the plane through the origin parallel to the earth's equator or the plane of a planet's orbit is used. The ascending node is that at which the body moves from the south or negative towards the north or positive side of the plane. The moon's nodes are the points in which its path intersects the plane of the ecliptic. In the geometry of curves, a node is the name given to the loop formed by a continuous curve crossing itself, the point of crossing termed a "double point," and at it there are two non-coincident tangents to the curve; the remaining species of double points, termed "acnode," "spinode" or "cusp," admits of two coincident tangents (see CURVE).

NOIDIER, CHARLES (1770–1844), French author, was born on the 20th of April 1780 at Besançon. His father, on the outbreak of the Revolution, was appointed mayor of Besançon and consequently chief police magistrate; he seems to have rather lent himself as an instrument to the tyranny of the Jacobins that they shared their principles; but his son was for a time an ardent citizen, and is said to have been a club member when he could at the most have been twelve years old. In 1793 Charles saved the life of a lady guilty of sending money to an émigré, by declaring to his father that if she were condemned he would take his own life. He was sent to Strassburg, where he lived in the house of Eulogius Schneider, the notorious Jacobin governor of Alsace, but a good Greek scholar. During the Terror his father was guillotined, and Charles, a prisoner in a Paris jail, was visited by the English and German. His love of books began very early, and he combined with it a strong interest in natural science. He became librarian in his native town, but his exertions in the cause of suspected persons brought him under suspicion. An inspection of his papers by the police, however, revealed nothing more dangerous than a dissertation on the antennae of insects. Entomology continued to be a favourite study with him, but he varied it with philology and pure literature and even political writing. For a skit on Napoleon, in 1803, he was imprisoned for some months. He then quitted Paris, whither he had gone after losing his position at Besançon, and for some years lived a very unsettled life at Besançon, Dôle, where he married, and in other places in the Jura. During these wanderings he wrote Le Peintre de Salzbourg, journal des émotions d'un cœur souffrant, suivi des Méditations du cloître (1803). The hero, Charles, who is a variation of the Werther type, desires the restoration of the monasteries, to afford a refuge from the woes of the world. In 1811 Nodier appears at Laibach as editor of a polyglot journal, the Illyrian Telegraph, published in French, German, Italian and Slav. On the evacuation of the Illyrian provinces he returned to Paris, and the restoration found him a royalist, though he retained something of republican sentiment. In 1824 he was appointed to the librarianship of the Bibliothèque de l'Arseanal. He was elected a member of the Academy in 1833, and made a member of the Legion of Honour in 1843, a year before his death on the 27th of January 1844. These twenty years at the arsenal were by far the most important and fruitful of Nodier's life. He had much of the Bohemian in his composition. But he had the advantage of a settled home in which to collect and study rare books; and he was able to supply a centre and encouragement to a kind of literature greater than what he himself was, or seemed to be inclined to imitate, the so-called Romanticists of 1830—and to colour their tastes and work very decidedly with his own predilections. Victor Hugo, Alfred de Musset and Sainte-Beuve all acknowledged their obligations to him. He was a passionate admirer of Goethe and of Shakespeare, and had himself contributed to the personal literature that was one of the leading traits of the Romantic school.

His best and most characteristic work, some of which is exquisite in its kind, consists partly of short tales of a more or less fantastic character, partly of sensational and far-fetched narratives, the nearest analogue to which in English is to be found in some of the papers of De Quincy. The best examples of the latter are to be found in the volume entitled Souvenirs de la vie d'un bibliophile, published in 1829 and afterwards continued. Of his tales the best are Scharra, ou les démons de la nuit (1821); Trilby, ou le lazard d'Argail (1822); L'histoire du roi de Bohême et de ses sept châteaux (1830); La Fée aux miettes (1832); Inés de las Sierras (1838); Légende se Sœur Blatris (1838), together with some fairy stories published in the year of his death, and Francedes Columnas, which appeared after it. The Souvenirs de jeunesse (1832) is interesting but untrustworthy, and the Dictionnaire universel de la langue française (1853), which, in the days before Littre, was one of the most useful of its kind, is said to have been not wholly or mainly Nodier's work. Nodier published also 12 vols. (1832), but at that time much of the author's best work had not appeared, and it included but a part of what was actually published. Nodier found an Indigent Biographer in Prosper Mérimée on the occasion of the younger man's admission to the academy.

An account of his share in the Romantic movement is to be found in Georg Brandes's Main Currents in Nineteenth Century Literature. Têtes de ruminants, collection de livres (1844), which is a catalogue of the books in his library, contains a life by Francis Wey and a complete bibliography of his numerous works. See also Sainte-Beuve, Portraits littéraires, vol. ii; Philippe Fizeau, Lettres de Charles Nodier (1841); and A. Estignard, Correspondance intitulée de Charles Nodier, 1786–1844 (1876), containing his letters to Charles Weiss.

NOEGGERATH, JOHANN JACOB (1788–1877), German mineralogist and geologist, was born at Bonn on the 10th of
October 1788. In 1814–1815 he became commissioner of mines for some of the Rhine Provinces, and in 1818 professor of mineralogy and afterwards professor of geology, director of the Museum of Natural History and chief of the mining department in the university at Bonn. He obtained a very fine collection of minerals for the museum, was eminently successful as a teacher, and achieved a wide reputation among mining engineers. The following are his more important publications: Über aufrecht im Gehirngestein eingeschlossene fossile Baumstämmte und andere Vegetabilien (1810–1821); Das Gebrige in Rheinland-Westphalen, nach mineralogischem und chemischen Bezug (4 vols., 1822–1826); Die Entstehung der Erde (1843); and Der Laacher See und seine vulkanischen Umgebungen (1870). The Carboniferous plant Noggerathia, allied to the Zamias and Cycads, was named after him. He died at Bonn on the 11th of September 1877.

NOEL, RODEN BERKELEY Wriothesley (1834–1894) English poet, son of Noel, Lord Barham, afterwards Earl of Gainsborough, was born on the 27th of August 1834. He was educated at Trinity College, Cambridge, where he graduated M.A. in 1858. He then spent two years travelling in the East. He married in 1863 Alice de Broër, daughter of the director of the Ottoman Bank in Beirut. The third child of this marriage, Eric, who died at the age of five, is commemorated in Roden Noel's best-known book of verse, A Little Child's Monument (1881). His other works are Behind the Veil, and other Poems (1883), The Life of Faust (1884), The Faustian Wives (1884), and Songs of the Heights and Deeps (1885), A Modern Faust, and other Poems (1888), Poor People's Christmas (1890) and My Sea, and other Poems (1896). Roden Noel's versification was unequal and sometimes harsh, but he has a genuine feeling for nature, and the work is permeated by philosophic thought. The latter part of his life was spent at Brighton, but he died at Mainz, on the 26th of May 1894. His other works include a drama in verse, The House of Ravensburg (1897), a Life of Byron (1890, "On the Wings of Night" series), a selection of Thomas Otway's plays (1888) for the "Mermaid" series, and critical papers on literature and philosophy. His Collected Poems were edited (1892) by his sister, Victoria Buxton, with a notice by J. Addington Symonds, which had originally appeared in the Academy (19th of Jan. 1890) as a review of The Modern Faust. The selection (1892) in the series of Canterbury Poets has an introduction by Robert Buchanan.

NOETUS, a presbyter of the church of Asia Minor about a.D. 230, was a native of Smyrna, where (or perhaps in Ephesus) he became a prominent representative of the particular type of Christology now called modalistic monarchianism or patri-passionism. His views, which lead to his excommunication from the Asiatic Church, are known chiefly through the writings of Hippolytus, his contemporary at Rome, where he settled and had a large following. He accepted the fourth Gospel, but regarded its statements about the Logos as allegorical. His disciple Cleomenes held that God is both invisible and visible; as visible He is the Son.

NOGARET, GUILLAUME DE (d. 1313), councillor and keeper of the seal to Philip IV of France, was born between 1260 and 1270. His father was a citizen of Toulouse, and was, so it was claimed, condemned as a heretic during the Albigensian crusade. The family held a small ancestral property of service origin at Nogaret, near Saint Felix de Caramon, from which it took its name. In 1297 Guillaume was professor of jurisprudence at the university of Montpellier, and in 1298 he became a member of the Curia Regis at Paris. His name is mainly connected with the quarrel of Philip IV with Pope Boniface VIII. In 1300 he was sent with an embassy to Boniface, of which he has left a picturesque but highly coloured account. His real ascendancy over the king dates from February 1303, when he persuaded Philip to consent to the plan of seizing Boniface and bringing him forcibly from Italy to a council in France which should depose him. On the 7th of March he received, with three others, a secret commission from the royal chancery to "go to certain places... and make such treaties with such persons as seemed good to them." On the 12th of March a solemn royal assembly was held in the Louvre, at which Guillaume de Nogaret read a long series of accusations against Boniface and demanded the calling of a general council to try him. Soon afterwards he went to Italy. By the aid of a Florentine spy, Nogaret gathered a band of adventurers and of enemies of the Gaetani (Boniface's family) in the Apennines. The great Colonna house, at bitter feud with the Gaetani, was his strongest ally, and Sciarra Colonna accompanied Nogaret to Anagni, Boniface's birthplace. On the 7th of September, with their band of some sixteen hundred men, Nogaret and Colonna surprised the little town. Boniface was taken prisoner. Sciarra wished to kill him, but Nogaret's policy was to take him to France and compel him to summon a general council. The tide soon turned, however. On the 9th a concerted rising of the townspeople in Boniface's favour put Nogaret and his company to flight. He died at Rome on the 11th of October saved Nogaret. The election of the timid Benedict XI. was the beginning of that triumph of France which lasted through the Avignon captivity. Early in 1304 Nogaret went to Languedoc to report to Philip IV., and was rewarded by gifts of land and money. Then he was sent back with an embassy to Benedict XI. to demand absolution for all concerned in the struggle with Boniface VIII.

Benedict refused to meet Nogaret, and excepted him from the general absolution which he granted on the 15th of May 1304, and on the 7th of June issued against him and his associates at Anagni the bull Flagitiosum. Nogaret replied by apologies for his conduct based upon attacks upon the memory of Boniface, and when Benedict died on the 7th of July 1304 he pointed to his death as a witness to the justice of his cause. French influence was successful in getting a Frenchman, Bertrand de Got (Clement V.) elected as Benedict's successor. The threat of proceedings against the memory of Boniface was renewed to force Clement to absolve Nogaret, and Clement had given way on this point when the further question of an inquiry into the condition of the Templars was brought forward by Philip as a preliminary to their arrest and the seizure of their property in October 1307. Nogaret was active in getting the renegade members of the order to give evidence against their fellows, and the whole proceedings against them bear traces of his unscrupulous and merciless pen. Clement's weak and ineffective resistance to this still further delayed the agreement between him and Philip. Nogaret had become keeper of the seal this year in succession to Pierre de Belleperche. His talents as an advocatus diaboli were given still further employment in the trial of Guichard, bishop of Troyes, charged with various crimes, including witchcraft and inconstancy, which was begun in 1308 and lasted till 1313. The trial was successful in bringing before the secular court the strength and success of the French monarchy, for the threat of a trial of Boniface were fulfilled. Absolution was obtained from Clement on the 27th of April 1311. Guillaume de Nogaret was to go on the next crusade and visit certain places of pilgrimage in France and Spain as a penance, but never did so. He died in 1313 "with his tongue horribly thrust out," according to the chronicler Jean Desnouelles. He retained the seals till his death and was occupied with the king's affairs concerning Flanders as late as the end of March 1312.

See E. Renan in Histoire littéraire de la France, xxvii. 233; R. Holzmann, Wilhelm von Nogaret (Freiburg, 1898). For the sources consult Dom Bouquet, Recueil de historiens des Gaules et de la France, vols. xx–xxiii. Annales régis Edwar correlation is based on the understanding that the text is a continuation of the previous one. The beginning of the text is not clear, but it seems to be about the life of a person named Noel. The text mentions the writing of a book on philosophy and the life of a person named Nogaret. The text also mentions the death of Nogaret and the election of a new pope.
Nogent preserves three Gothic churches and the remains of the old priory of St Denis, and there are statues of General St Pol, killed at Sevastopol, and of the poet Rémy Belleau (16th century), a native of the town. The town has a sub-prefecture, a tribunal of first instance, a communal college and institution for deaf mutes.

Nogent-sur-Marne, a town of northern France, in the department of Seine, on a hill on the right bank of the Marne, 6 m. E. of Paris by rail. Pop. (1906) 11,463. The Eastern railway here crosses the Marne valley by a viaduct 875 yds. in length. Nogent has a Gothic church, with a tower of the Romanesque period, in front of which there is a monument to Wattelo, who died here in 1721. Chemical products are manufactured. The fine situation of the town gained it the name of Beauté, and Charles V. built a château here (demolished in the 18th century) which was presented by Charles VII to Agnes Sorel with the title of Dame de Beauté. An island in the Marne to the south of the town is still known as the Île de Beauté.

Nogent-sur-Seine, a town of north-central France, capital of an arrondissement in the department of Aube, on the left bank of the Seine, 35 m. N.W. of Troyes on the Paris-Bellfort line. Pop. (1906) 3791. The river at this point forms an island, which supports a stone bridge of the 17th century. The chief building is the church of St Laurent (1431-1534). A lateral portal in the Flamboyant style and the Renaissance tower at the west end are remarkable remains of the church of the seigneur and has a tribunal of first instance. There is trade in grain, flour, fodder, wood and cattle. Nogent-sur-Seine was in 1814 the scene of fighting between the French and Austrians.

Nogi, Kiten, Count (1849-1900), Japanese general, was born in Choshu. He commanded a brigade at the battle of Kinchow (1894) and the subsequent capture of Port Arthur from the Chinese; but the most memorable events of his career were the siege of Port Arthur by the third army corps of Japan under his command in the Russo-Japanese War (1904-5), and the south flank marching made by the same army in the battle of Mukden.

Noirmoutier, an island of western France, belonging to the department of Vendée, and protecting the Bay of Bourgneuf on the south-west. Pop. (1906) 8388. The area amounts to 22 sq. m., one-sixth dunnes. Between the island and the mainland is a sandbank laid bare at low water, and crossed by an embankment and carriage road some 23 m. long. It was not till about 1766 that it was found possible to walk across to the island, which lies from N.N.W. to S.E.E., and is 12 m. long, its breadth varying from 1 m. in the north part to 3 or 4 m. in the north. It appears to be formed of alluvial deposits gradually accumu-

lated round a rock of no great size situated at the meeting-place of the Gasoncy and Brittany currents. Fishing, agriculture, oyster-breeding and work in the salt marshes also occupy the inhabitants. There are two communies, Noirmoutier and Barbâtre. Noirmoutier, which has a small port, has about 2165 of its 6644 inhabitants gathered together in a little town with narrow and winding streets. Its castle was once the residence of the abbess of Her. In the church (12th, 14th and 19th centuries) there is a crypt of the 11th century. A mile to the north of the town lies a pleasant woods gradually becoming picturesque by the La Chaise woods (evergreen oaks and pines), and a grand confusion of rocks, among which lie charming beaches. A dolmen, several menhirs, and the ruins of a Gallo-Roman villa with its hot baths show that the island must have been occupied at an early date; but the first fact in its recorded history is the foundation of the Benedictine monastery of Her by St Philibert about 680. From this monastery the name Noirmoutier (Heri monasterium, Hormoutier) is derived. It had already attained to great prosperity when it was pillaged by the Normans in 825 and 845. In 1005 the abbey of Notre Dame la Blanche was built at the north extremity of the island to take the place of a Cistercian convent established in the Île du Pilier, at that time attached to Noirmoutier by a dike. This abbey was ruined by the Protestants in 1562. In the 15th, 16th and 17th centuries the island belonged to the family of La Tremoille, and in 1656 the territory was made a duchy. In 1676 the island was captured by the Dutch. Having been seized by Charette during the war of Vendée, it was recovered by the Republican general, Haxo, who caused the Vendean leader, d'Elbée, to be shot.

Noise (a word of doubtful origin, O. Fr. noiz; Lat. nosis, which points to Lat. nausea, sickness, as the origin; others take Lat. noxia, harm, as the source), an excessive, offensive, persistent or startling sound. By the common law of England freedom from noise is essential to the full enjoyment of a dwelling house and acts which affect that enjoyment may be actionable as nuisances. But it has been laid down that a nuisance by noise, supposing malice to be out of the question, is emphatically a question of degree (Gawnt v. Finney, 1872, 8 Ch. Ap. 8). The noise must be exceptional and unreasonable. The ringing of bells, the barking of dogs, or the discharge of firearms, guns, reports, cannon, or rockets, and other similar noises, are nuisances. The O. Fr. anoi, ausi (modern ennui) is an adaptation of Lat. in odio esse, venire or habere, to be sick, tired of anything (odium, disgust, hatred). The word has no connexion with Lat. nocere, to hurt.

Nokes (Norke, Noah, Noakes), James (d. 1692), an English actor, whose laughter-arousing genius is attested by Cibber and other contemporaries. Sir Martin Mar-all, Sir Davy Dunch and Sir Credulous Easy were among his favourite parts. His success as the Nurse in Nevil Payne's Fatal Jealousy was so great that he was known as the Nurse. He was a great favorite of Charles II. The O. Fr. noz, nozzi (modern noun) is an adaptation of Lat. in odio esse, venire or habere, to be sick, tired of anything (odium, disgust, hatred). The word has no connexion with Lat. nocere, to hurt.

Nola, a city and episcopal see of Campania, Italy, in the province of Caserta, pleasantly situated in the plain between Mount Vesuvius and the Apennines, 16½ m. E.N.E. of Naples, 121 ft. above sea-level. Pop. (1901) 11,927 (town); 14,511 (commune). It is served by the local railway from Naples to Baiano, and is 22 m. from Naples by the main line via Cencello. The more conspicuous buildings are the ancient Gothic cathedral (restored in 1866, and again in 1870 after the interior was destroyed by fire), with its lofty tower, the cavalry barracks, the ex-convent of the Capuchins at a little distance from the city, and the convent of the monastery of the Nuns, which contains the famous Oscan inscription known as the Cipuss Abellanus (from Abella, the modern Avella, g.e.) and some Latin inscriptions relating to a treaty with Nola regarding a joint temple of Hercules. Two fairs are held in Nola, on the 14th of June and the 12th of November; and the 26th of July is devoted to a great festival in honour of St Paulinus, one of the early bishops of the city, who invented the church bell (campana, taking its name from Campania). The church erected by him in honour of St Felix in the 4th century is extant in part. There is a monument (1587) to Giordano Bruno, the free-thinker, who was born at Nola in 1548.

Nola (Νόλα) was one of the oldest cities of Campania, variously said to have been founded by the Ausones, the Chalcidians and the Etruscans. The last-named were certainly in Nola about 500 B.C. At the time when it sent assistance to Neapolis against the Roman invasion (326 B.C.) it was probably occupied by Oscans in alliance with the Samnites. The Romans made themselves masters of Nola in 313 B.C., and it was thenceforth faithful to Rome. In the Second Punic War it thrice bade defiance to Hannibal, but in the Social War it was betrayed into the hands of the Samnites, who kept possession till Marius, with whom they had sided, was defeated by Sulla, who in 80 B.C. subjected it with the rest of Samnium. Seven years later it was stormed by Spartacus. Whatever punishment Sulla may have inflicted, Nola, though it lost much of its importance, remained a
municipium with its own institutions and the use of the Ocean language. It became a Roman colony under Augustus, who died at Nola. Sacked by Germanic in 455, and by the Saracens in 806 and 904, captured by Manfred in the 13th century, and damaged by earthquakes in the 15th and 16th, Nola lost much of its importance. The revolution of 1802 under General Pepe began at Nola. The sculptor Giovanni Marliano was a native of the city; and some of his works are preserved in the cathedral.

Nola lay on the Via Popillia from Capua to Nuceria and the south, and a branch road ran from it to Abella and Abellinum. Mommsen (Corpus inscr. Lat. x. 142) further states that roads must have run direct from Nola to Neapolis and Pompeii, but Kiepert's map annexed to the volume does not indicate them. In the days of its independence it issued an important series of coins, and in luxury it vied with Capua.

Its territory was very fertile, and this was the principal source of its wealth. A large number of vases of Greek style were manufactured here and have been found in the neighbourhood. Their material is of pale yellow clay with shining black glaze, and they are decorated with skilfully drawn red figures. Of the ancient city, which occupied the same site as the modern town, hardly anything is now visible, and the discoveries of the ancient street pavement have not been noted with sufficient care to enable us to recover the plan. Numerous ruins, an amphitheatre, still recognizable, a theatre, a temple of Augustus, &c., existed in the 18th century, and have since disappeared.

Kiepert's Geschichte des Korans (1901) and published it additions at Göttinngen. In 1861 he began to lectured at the university of this town, where three years later he was appointed extraordinary professor. In 1868 he became ordinary professor at Kiel, and in 1872 was appointed to the chair of Oriental languages at Strassburg, which he resigned in 1906. Nöldeke's range of studies has been wide and varied, but in the main his work has followed the two lines already indicated by his prize essay, Semitic languages, and the history and civilization of Islam. While a great deal of his work (e.g. his Grammatic der neuassyrischen Sprache (1874), and his translations from the Arabian of Tabari, 1881-1882) is meant for specialists, many of his books are of interest to the general reader. Several of his essays first appeared in the Encyclopædia Britannica, and his article on the Koran, with some others, was republished in a volume called Oriental Sketches. The articles dealing with Persia were republished in a German volume, Ausfuhrung der persischen Geschichte (Leipzig, 1857). Among his best-known works are: Das Leben Mohammeds (1863); Beiträge zur Koranhistorie der alten Araber (1864); Die attischettischir die lateinische Geschichte der Perser (1867); and his Grammatik des klassischen Arabisch (1866); Fünf Mo'alloqa'ali, übersetzt und erklärt (1890-1901); and Beiträge zur semitischen Sprachwissenschaft (1904). He has contributed frequently to the Zeitschrift der deutschen morgenländischen Gesellschaft, the Göttingische gelehrte Anzeigen and the Expositor.

NOLLI, a coast village of Liguria, Italy, in the province of Genoa, from which it is 36 m. S.W. by rail, 13 ft. above sea-level. Pop. (1901) 1885. It is a town of considerable antiquity, now decayed, and has an ancient church of S. Paragorio, once the cathedral, a Romanesque basilica dating from the 11th century, with interesting works of art. The diocese has been united with that of Savona.

See A. d'Andrade, Relazione dell'Ufficio Regionale per la conservazione dei monumenti del Piemonte e della Liguria (Turin, 1890), 100 seq.

NOLLEKENS, JOSEPH (1737-1823) British sculptor, was born on the 11th of August 1737 in Dean Street, Soho, London, where his father, a native of Antwerp, the "old Nollekens" of Horace Walpole, was a painter of some repute. In his thirteenth year he entered the studio of the sculptor Pedler, Schoolkens, and practised drawing and modelling with great assiduity, ultimately gaining various prizes offered by the Society of Arts. In 1760 he went to Rome, and he executed a marble bas-relief, "Timoleea before Alexander," which obtained a prize of fifty guineas from that society in 1762. Garrick and Sterne were among the first English visitors who sat to him for busts; among his larger pieces belonging to this early period perhaps the most important is the "Mercury and Venus chiding Cupid." Having returned to England in 1770, he was admitted an associate of the Royal Academy in 1773 (somewhat shortened, in 1772, the year in which he married Mary, the second daughter of Saunders Welch. By this time he had become known to George III., whose bust he shortly afterwards executed, and henceforward, until about 1816, he was the most fashionable portrait sculptor of his day. He himself thought highly of his early portrait of Sterne. Among many others may be specially named those of Pitt, Fox, the prince of Wales (afterwards George IV.), Canning, Perceval, Benjamin West and Lords Castlereagh, Aberdeen, Erksine, Egremont and Liverpool. He elaborated a number of marble groups and statues, amongst which may be mentioned those in the National Gallery; amongst his most admired workmanship, are deficient in vigour and originality, and the drapery is peculiarly weak. The most prominent personal characteristic of Nollekens seems to have been his frugality, which ultimately developed into absolute miserliness. Mrs Nollekens died in 1817, and the sculptor himself died in London on the 25th of April 1823, leaving a large fortune.

Nollekens is the Latinized form of the Dutch Nolleken, a technical term of English law, the meaning of which varies as it is used with reference to civil or criminal cases. In civil cases it applied only to actions in the king's bench division, and there signified a formal undertaking by the plaintiff that he intended to proceed no further with the action (se ulterioris nolle prosequi). The more modern practice in such cases is to proceed by way of discontinuance. In proceedings either by indictment or by information, a nolle prosequi or stay of proceedings may be entered by the attorney-general. The nolle prosequi is a matter purely for his discretion, and will not be granted except he believes the case to be procedurally good. The object of it generally is to obtain a stay of proceedings against an accomplice in order to procure his evidence. This object is, however, more usually effected by the prosecution offering no evidence and the judge directing an acquittal.

In the United States the term bears the same meaning as in England, with one exception. The attorney-general has not the same discretion with which English law invests him. Although in some states the prosecuting officer may enter a nolle prosequi at his discretion, in others the leave of the court must be obtained.

NOLLET, JEAN ANTOINE (1700-1770), French physicist, of peasant origin, was born near Noyon (Oise) on the 19th of November 1700. He entered holy orders and ultimately attained the rank of abbe; but his tastes all lay in the direction of experimental research, especially on the subject of electricity. In 1734 he was admitted a member of the London Royal Society, four years later he entered the Academy of Sciences at Paris, and in 1753 he was appointed to the newly-instituted chair of experimental physics in the Collège de Navarre. In addition to many memoirs he wrote Essai sur l'électricité des corps (1747), Recherches sur les cousses particulières des phénomènes électriques (1749 and 1754), Recueil de lettres sur l'électricité (1753), L'Art de faire les chapeaux (1764) and L'Art des expériences (1770). He died at Paris on the 24th of April 1770.
NOMAD—NONCONFORMIST

NOMAD (Gr. νομάς, νομάδες, wandering), a wanderer. The word is particularly used of tribes which shift continually from place to place in search of pasture (Gr. réμα). The νομάδες of ancient Greek writers meant particularly the pastoral tribes of North Africa; hence the Latin name of the Numidians (see NUMIDIA).

NOME, a mining town about 12 m. W. of Cape Nome, on the S. shore of Seward Peninsula, Alaska, in 1900 the largest settlement in the District. Nome (1900) 1,248; (1910) 6,000. A gold rush was found near Nome on Anvil Creek in September 1898, and diggings in the ocean beach were first worked in July 1899. The rush to Nome in 1900 was one of the most remarkable stampedes in American mining history; the town soon had hotels, banks, stores, several newspapers and weekly mails from the States, and for part of the year there were, it was estimated, 20,000 inhabitants. This rapidity of growth and the isolation of the settlement raised prices to extraordinary heights, and in other respects created economic conditions remarkable even among Alaskan mining camps. By 1903 the population had greatly decreased, and in subsequent years the winter population averaged about 3,500, the summer population from 7,000 to 8,000.

In 1905 the gold output of the Nome region amounted to about $2,500,000, nearly all from placers, though some quartz mining was done. A municipal government and local police force were early organized after the fashion of American mining communities, and United States soldiers from the St Michael reservation aided in the preservation of order. The greatest drawback to the town's prosperity is the lack of any good harbour nearer than Point Barrow, 1,585 m. N. The town attimes 9 ft. high on the beach, render harbour improvements at Nome almost impossible. There is connexion with Seattle by steamer (since 1904) in about 83 days. In 1901 the town was incorporated under the laws of the United States. It is the north-western terminus of the United States military telegraph. It was first called Anvil City; the name "Nome" is derived from Cape Nome, first so called on a chart dated 1840, and said to have been a draughtsman's mistake for the query "N Name" on the original chart.

NOMENOE, or NOMINEOE (d. 851), duke of Brittany. The date of his birth is not known, and his origin is obscure; all that is known is that he was of Breton race. In the hope of pacifying Brittany, Louis the Debonair named him count of Vannes in 819 and governor or duke of Brittany in 826. Throughout the reign of Louis, Nomenoe's fidelity to the emperor never flagged; he put down several attempted insurrections, and maintained peace in Brittany for fifteen years. But in 841 he resolved to make himself independent of Charles the Bald. In 843 Charles made a vain attempt to subdue Brittany. In 844 Nomenoe invaded Maine, and in 845 the emperor was completely defeated at Ballon near Bain-de-Bretagne. In the following year Charles recognized the independence of Brittany. Having resolved to detach the duchy from the ecclesiastical province of Tours, Nomenoe accused the Frankish bishops of Vannes, Quimper, Dol and Léon of simony at the council of Couteloue in 848, replaced them by Bretons, and erected Dol into a metropolitan see. In 849 Nomenoe attacked the Frankish county of Anjou. Charles retaliated by establishing a garrison at Rennes; but Nomenoe seized Rennes, Nantes and, finally, the whole of Upper Brittany, and ravaged Maine. In 851 he seized Anjou and invaded Beauce; but he died suddenly, leaving as his successor his son Erripod.

NOMENTANA, VIA, an ancient road of Italy, leading N.E. from Rome to Nomentum (q.v.), a distance of 14 m. It originally bore the name Via Ficulensis, from the old Latin village of Ficulea, about 8 m. from Rome. It was subsequently prolonged to Nomentum, but never became an important highroad, and merged in the Via Salaria (see SALARIA, VIA) a few miles beyond Nomentum. It is followed as far as Nomentum by the modern highroad, but some traces of its pavement still exist.

See T. Ashby in Papers of Brit. School at Rome, iii. 38 sqq. (T. As.)

NOMENTUM (mod. Mentana), an ancient town of Italy, 14 m. N.E. of Rome by the Via Nomentana. It was a Latin town, but was by some considered to be Sabine, and, like Ficulina and Ficulea, was excluded from the first region by Augustus, who made the Anio its northern boundary. Nomentum received the civitas sine suffragio after the last war of the Latins against Rome (335 B.C.); in its municipal constitution the chief magistrate even in imperial times bore the title of dictator. Flury and Martial often praise the fertility of its neighbourhood. The site of the town is well protected by ravines except on the east; no ancient remains exist in situ, but inscriptions and other relics have been found.

See T. Ashby in Papers of the British School at Rome, iii. 68 sqq. (T. As.)

NONIMALISM (from Lat. nomen, name), the name of one of the two main tendencies of medieval philosophy, the other being Realism. The controversy between nominalists and realists arose from a passage in Boëthius' translation of Porphyry's Introduction to the Categories of Aristotle, which propounded the problem of genera and species, (1) as to whether they subsist in things or only in the mind; (2) whether, if subsistent, they are corporeal or incorporeal; and (3) whether separated from sensible things or placed in them. The Realists held that universals alone have substantial reality, existing ante rem; the Nominalists that universals are mere names invented to express the qualities of particular things and existing post rem; while the Conceptualists, mediating between the two extremes, held that universals are concepts which exist in our minds and express real similarities in things themselves. Though a strong realist tendency is evident in the System of Eriugena (9th century), the controversy was not definitively settled till the 11th century: it lasted till the middle of the 12th, when the first period of scholastic philosophy ends. Under an appearance of much vain subtlety the controversy about universals involved issues of the greatest speculative and practical importance: realism represented a spiritual, nominalism an anti-spiritual, view of the world; while realism was evidently favourable, and nominalism unfavourable, to the teaching of the Church on the dogmas of the Trinity and the Eucharist. Nominalism was a doctrine of sceptics and suspected heretics, such as Berengar of Tours and Roscellinus. Even Abelard's mediating doctrine of conceptualism (q.v.) was sufficiently near to obvious ideas to involve him in lifelong persecution. The principles of the great orthodox philosophers of the later scholastic period which begins in the 13th century, Albertus Magnus and Thomas Aquinas, were those of moderate realism. When nominalism was revived in the 14th century by the English Franciscan, William of Occam, it gave evidence of a new tendency in thought, a distrust of abstractions and an impulse towards direct observation and inductive research, a tendency which had its fulfilment in the scientific movement of the Renaissance. Occam's dictum "Entia non multiplicanda praeter necessitatem" was inspired by a spirit similar to that of Bacon. Though nominalism is properly a medieval theory, the tendency has passed over into modern philosophy: the term "nominalist" is often applied to thinkers of the empirical, sensationalist school, of whom J. S. Mill may be taken as the chief representative.

(H. S.)

NONCONFORMIST, a term denoting historically (a) those persons who at the beginning of the 17th century refused to conform to certain practices, e.g. the wearing of the surplice, kneeling at the reception of the Sacrament, &c., of the Church of England; (b) those who, after the passing of the Act of Uniformity 1662, to those who refused to conform to the practices of the Church of England, and were excluded from all privileges, and were refused the liberty of being members of the church. In current usage the term "nonconformist" is applied in Great Britain to any member of a church not conforming to the ceremonies, worship and doctrines ("forms") of the Church of England, and is generally used of a member of the so-called Free Churches, or Protestant Dissenters, and is not usually applied to Roman Catholics. The name can also be applied, in other countries, to those who do not belong to the established religion. Strictly a "dissenter" is one who dissents from the church as an "established" body, or who
NONCONFORMITY

NONCONFORMITY, LAW RELATING TO. For the history of the gradual relief of nonconformists in England from their disabilities see ENGLISH HISTORY, BAPTISTS, CONGREGATIONALISM, METHODISM, FRIENDS, SOCIETY OF, etc.; also OATH. It is possible to trace the growth of nonconformity apart from its history, that is, the matters in which the law as to nonconformists still differs from that applicable to members of the Church of England. The differences may be conveniently grouped under six heads.

(1) Judicial Notice.—The courts, both temporal and spiritual, take judicial notice of matters of general knowledge of the past, the crown being head of the law and of the church. Where the tenets and authorities of a nonconformist body come in question, they must be proved by evidence. By Lord Lyndhurst's act, the Marriage Act 1839 of the Oath Act 1839, the Act 1871, the Act 1878 of the Archbishop of Canterbury the act of the archbishop of the archbishopric in York of both of which the same person is judge. Similar matters arising in nonconformist bodies can only be tried by the ordinary secular courts, and generally depend upon whom has been appointed by the church to which is not in accordance with the rules governing the particular body of which he is a minister. A nonconformist body is in law nothing more than a voluntary association of persons members of an established building as the tribunal assented to by them. But the law is subject in the last degree to the courts of the realm. In cases of a church which have entirely under the cognizance of the spiritual courts, but by the Ecclesiastical Courts Jurisdiction Act 1860 any person guilty of breaking in churches or chapels of the Church of England or Ireland, or in any church or chapel of any religious denomination, is liable on conviction to be attainted and to be dealt with under the Clergy Discipline Act 1892.

(2) Status of Ministers.—A nonconformist minister is not in holy orders, and his church is not a religious body. But his position is honored somewhat when it is recognized at a limited extent. By the Toleration Act, 1 Will. & Mar., c. 18, a minister, preacher or teacher of a nonconformist congregation is exempt from certain parliamentary offices, as that of churchwarden. He is also exempt from serving in the reserve forces or on a jury. These privileges only attach where the place of worship of which he is a minister has been duly registered (the Places of Worship Registration Act 1853), unless in the case of bodies subject to special legislation, as in the case of the Unitarians, or not subject to any such legislation as the Established Church.

(3) Burial.—By the Burial Laws Amendment Act 1880, funeral and burial are no longer left to the discretion of the church. But in such a case notice must be given in a specified form, which is unnecessary where the burial service is conducted by a clergyman of the Church of England. (5) Parish Offices.—By 1 Will. & Mar. c. 42, 1832, the clerk of a parish church is the minister's subordinate. His duties consist of conducting the legal acts of the church and he may execute his office by deputy. His acceptance of office is made optional by the act; there is nothing to prevent his discharging his duties if he so wishes to do so. This seems to be still the law, although a declaration was substituted in the case of the Statutory Declarations Act 1835, s. 9.

NONCONFORMITY—NONJURORS

British Colonies.—In crown colonies ecclesiastical jurisdiction may be conferred by the sole authority of the crown. In colonies which have parliaments representing the crown, the metropolitan bishop jurisdiction or coercive legal authority over suffragan bishops or over any other person. In colonies of the former kind the Church of England may still preserve the privileges which it is open to hold as a religious body as long as it can show that it is in the same position as any other religious body, simply a voluntary association. Since the Irish Church Act 1869 the Church of England has been recognized by the law of the Church of England in colonies which have representative government.

NONFEASANCE, MISFEASANCE, MALFEASANCE. The expressions "nonfeasance" and "misfeasance," and occasionally "malfeasance," are used in English law with reference to the discharge of public obligations existing by common law, custom or statute. The rule of law laid down is that no action lies for nonfeasance, i.e. for failure or refusal to perform the obligation, but that an action lies for misfeasance, i.e. for negligently and improperly performing the obligation.

The doctrine was formerly applied to certain callsings carried on publicly (see R. v. Kilderby, 1669, 1 Will. S. 311, 312). At present the terms misfeasance and nonfeasance are often used with reference to the conduct of municipal authorities with reference to the discharge of their statutory obligations; and it is an established rule that an action lies in favour of persons injured by misfeasance, i.e. by negligence in discharge of the duty; but that in the case of nonfeasance the remedy is either action by indictment or mandamus or by the particular procedural method by which the tribunal is last established in the case of failure to repair public highways; but in other cases the courts are astute to find evidence of carelessness in the discharge of public duties and on that basis to award damages to individuals who have suffered thereby. Misfeasance is also used with reference to the conduct of directors and officers of joint-stock companies. The word misfeasance is sometimes used as equivalent to mala praxis by a medical practitioner.

NOMEN MARCELLUS, Latin grammarian and lexicographer, flourished at the end of the 3rd or the beginning of the 4th century A.D. He is often called the "Peripatetic of Thubursicuim" (in Numidia, probably his birth-place). He is the author of a sort of lexicon called De compendiosa doctrina, in 20 sections or chapters, the first twelve of which deal with language and grammar, the remaining eight with special subjects (navigation, costume, food, arms). The work is a compilation from commentaries on the authors quoted (whom Nonius only knows at second hand) and from existing dictionaries and grammars. Nonius is especially indebted to Verrius Flaccus and Aulus Gellius. He adds a number of recent fragments from old dramatists, annalists, satirists and anti-arian writers. It is remarkable that in the quotations from the authors cited Nonius always follows the same order, beginning with Plautus and ending with Varro and Catu. The grammarians Priscian and Fulgentius borrowed largely from his book; and in the 5th century a certain Julius Tryphonianus Sabinus brought out a revised and annotated edition.

NONJURORS. The name given to those benefited clergy of the Church of England who refused to take the oaths of allegiance to William and Mary in 1689. They were about four hundred in number, and included William Sancroft, archbishop of Canterbury, and many others. The "Seven Bishops," Thomas Ken of Peterborough and Francis Turner of Ely, together with three other bishops, Robert Frampton of Gloucester, William Thomas of Worcester and William Lloyd of Norwich (who is sometimes confused with his namesake, the bishop of St Asaph, one of the
NONNUS

"Seven Bishops "). Other distinguished nonjurors among the clergy were: William Sherlock, master of the Temple, Jeremy Collier, the ecclesiastical historian, Charles Leslie, the controversialist, George Hickes, dean of Worcester, Nathanael Spinknes, John Fitwilliam the convectorial and the dean, the devotional writer. The most famous nonjurors among the laymen were Henry Dodwell, Camden professor of history at Oxford, Robert Nelson, Henry Hyde, second earl of Clarendon, and Roger North, the lawyer. Afterwards their number was augmented by the refusal of William Law, author of The Serious Call, Thomas Carte, the historian, Thomas Hearne, the antiquary, and others, to take the oaths of allegiance to George I. Ken, the most eminent of the nonjurors, disapproved of their subsequent proceedings, and Sherlock and Dodwell afterwards took the required oaths, the former becoming dean of St Paul’s.

Believing in the doctrine of non-resistance to established authority, the nonjurors argued that James II. was still the rightful king, and likened the position of William to that of Cromwell. Taking examples from the Old Testament and from the practice of the early church, their antagonists traversed these arguments, and a long and voluminous controversy followed. Many have thought that the position of the nonjurors was inconsistent, and Dr Johnson said, “I never knew a non-juror who could reason,” although he appears to have excepted Leslie from this general condemnation. The nonjurors did not treat the nonjurors harshly. With the approval of William III., Gilbert Burnet, bishop of Salisbury, attempted to reconcile them to the new order; and it was only when the generous terms offered by Burnet had been refused, that, in February 1700, they were deprived of their sees and other benefices. Although they had only a small following among the mass of the people, who were not required to take the oaths of allegiance, Sanchof and his colleagues claimed to represent the true Church of England, and requested James II. in his exile to nominate two new bishops to carry on the episcopal succession. James chose Hicks and Tho. Hawkins, and in 1713 these two bishops were consecrated at Waltham, as bishops of Thetford and Ipswich respectively. A further consecration took place in 1713 when Collier, Spinknes and Samuel Hawes (d. 1729), were consecrated “bishops at large.”

In 1718 the introduction of a new communion office with some “usages” taken partly from primitive liturgies, and partly from the first prayer-book of Edward VI. caused a schism among the nonjurors, dividing them into “Usagers” and “Non-Usagers.” The four “usages” were: The mixed chalice, prayers for the faithful departed, prayer for the desecrant of the Holy Eucharist, and the Prayer, offering the elements to the Father as symbols of His Son’s Body and Blood. Accepting the “usages” the two bodies united in 1731, but other dissensions followed, although the episcopal succession was maintained until the death of a bishop named Charles Booth in 1805. The last nonjuror is supposed to have been James Yeovell, who died in 1875. Public worship was conducted in chapels or “oratories,” and sometimes in private houses.

In Scotland the nonjurors included the greater part of the clergy of the Episcopal Church, which ceased to be the state church of the country. In these three years most of their English colleagues were ardent Jacobites, and were punished for sharing in the risings of 1715 and 1745, and in other Jacobite movements. The Scottish clergy maintained their attitude of resistance to the government until the death of Prince Charles Edward Stuart in 1788, when the bishops met at Aberdeen, and unananimously agreed to submit to the government of King George III. A large number of the Presbyterians in Scotland, principally found among the Cameronians, also refused to take the oaths of allegiance to William and Mary; but as their reasons for this refusal were quite different from those of the episcopal nonjurors, they are not usually referred to by this name (see CAMERONIANS).

NONNUS—NONPAREIL

NONNUS (Egyptian for “saint”), Greek epic poet, a native of Panopolis (Akhmim) in the Egyptian Thebaid, probably lived at the end of the 4th or the beginning of the 5th century A.D. His principal work is the Dionysiaka, an epic in forty-eight books, the main subject of which is the departure of Dionysus to India, and his return. The earlier portions treat of the rape of Europa, the battle of the giants, the mythical history of Thebes, and it is not until the eighth book that the birth of the god is described. Other poets had already treated the subject, and since the time of Alexander it had gained popularity from the favourite comparison of the king with the god and of his enemies with the giants. In its vast and formless luxuriance, its beautiful but artificial versification, its delineation of action and passion to the entire neglect of character, the poem resembles the epics of India. Like his countryman Claudian, Nonnus is a writer of copious learning and still more copious fancy, whose faults are those of the age in which he lived. His chief merit consists in the systematic perfection to which he brought the Homeric hexameter. But the very correctness of the versification renders it monotonous. His influence on the vocabulary of his successors was likewise very considerable.

We also possess under his name a paraphrase (serebola) of the Gospel of St John, which is chiefly interesting as apparently indicating that Nonnus in his later years was a convert to Christianity. The style is not inferior to that of his epic, but is more embellished in imitation of the Iliad and Odyssey, and produces an impression of extreme bombast and want of taste. According to an epigram in the Palatine Anthology (ix. 198), Nonnus was also the author of a Battle of the Giants, and four lines of the Bassarica (on the subject of Dionysus) have been preserved in Stephanus of Byzantium.

Editio princeps (1569); H. Köchly (‘Teubner’ series, with critical introduction and full index of names, 1881); the most generally useful edition is that by the comte de Marcellus (1866), with notes and prolegomena, and a French prose translation. On the metre, see J. G. Herrmann, Orphica (1865), p. 690; A. Ludwig, Beiträge zur Kenntnis des Dionysiaca (1858), c. 71, on the metre. Hutslin, Studien über die Dithyrambaben des Nonnus (1891), p. 125, on the metre; C. Lehrs, Quaestiones episcopica (1897), pp. 255-320, chiefly on metre questions; on the sources, R. Köhler, Über die Dithyrambaben des Nonnus (1853), a short and connected analysis of the poem, with a comparison of the earlier and later myths; see also I. Nigrisoli, Studio critico . . . Nonnus Panopoli, with short bibliography (1903). The paraphrase on St John (editio princeps, c. 1505) is edited by F. Passow (1834) and A. Scheindler (1851), with complete index.

NONPAREIL, the name under which, from its supposed matchless beauty, a little cage-bird, chiefly imported from New Orleans, was known in America. It is said to be a greater number known from the adventurers of the Louisiana Expedition (Jefferson, i. 132). It is the Emberiza ciris of Linnaeus, and the Cyanospiza ciris of most recent ornithologists, belonging to a small group, now included with the buntings and finches, although some authors have regarded it as a tanager (p.t.). The cock has the head, neck and lesser wing-coverts bright blue, the upper part of the back yellow, deepening into green, and the lower parts generally, together with the rump, bright scarlet, tinged on the latter with purple. This gorgeous colouring is not assumed until the bird is at least two years old. The hen is green above and yellow beneath; and the younger cocks present an intermediate plumage between the adults of both sexes. The species, which is often also called the painted bunting, after wintering in Central America or Mexico, arrives in the Southern states of the American Union in April, but does not ordinarily proceed to the northward of South Carolina. In Louisiana, where it is generally known to the French-speaking inhabitants as the Papel—as it was to the Spaniards of Florida as the Mariposa pintada (painted butterfly)—it is said to be very abundant; and on its appearance in spring advantage is, or was, taken of the pugnacious disposition of the males to capture them as great numbers by means of the ladder, a large net placed in connexion with a cage-trap that they instantly fall into the latter on attacking what they conceive to be a rival. Belonging to the same genus as the nonpareil is the indigo-bird, Cyanospiza cyanus, which, as a summer visitor, is widely diffused from the Missouri to the Atlantic, and extends into the provinces of
Ontario and New Brunswick, being everywhere regarded with favour. Though wanting most of the bright hues of its congeners, the indigo-bird has yet much beauty, the adult cock being nearly all over of a deep blue, changing, according to the light, to green. The hen is bred to the westward and pure-white beneath. The "pintailed nonpareil" of aviculture (Erythura prasina) is a somewhat similarly coloured but really very different bird; the male has a long sharp tail, and the species belongs to the Placidæ (see Weaver-Bird).

**NONPAREIL** (Fr. non, and pareil, like, Lat. par), having no equal, unrivalled. Apart from its uses as a descriptive name for particularly fine kinds of fruit, &c., and of certain birds, moths and butterflies, the chief application in English is, in printing, to a size of type between "emerald" and "ruby," in the United States of America between "minion" and "agate" (see Typography).

**NONSUIT** (Fr. non sult, he does not pursue), in law the name given to a judgment whereby an issue is determined against the plaintiff. It was a term peculiar to the English common-law courts before the Judicature Acts, and was simply the expression of the opinion of the court that, apart from the merits, the plaintiff's case was incomplete. It did not in any way act as a bar to his bringing another action for the same cause. It might be entered either at the wish of the plaintiff himself (to save him from the expense of a suit) or by the court for the defendant or by direction of the court against the will of the plaintiff. Although judgment of nonsuit still exists, it has, since the Judicature Acts, the same effect as a judgment on the merits, unless the court otherwise directs. This effect of a nonsuit was specially provided for by the rules of the Supreme Court of 1875.

**NOODT, GERHARD** (1647-1725), Dutch jurist, was born at Nijmegen in 1647. Educated at Leiden, Utrecht and Franeker, he became a professor of law at Leiden. As a writer on jurisprudence he acquired a wide reputation. His Latin style was modelling himself on the best writers, and his numerous works soon rose to the rank of standard authorities. Two of his political treaties were translated into French by Jean Barbeyrac, and appeared at Amsterdam in 1707 and 1714, under the respective titles of **Pouvoir des souverains et Liberté de conscience**.

The first edition of his collected works was published at Leiden in 1724 and the last in 1767. That of 1735 and those subsequent contain a life of the author by Barbeyrac.

**NOON, midday, twelve o'clock.** The O. Eng. noun, Nor. noun, Dutch noen, are all from Lat. nona sc. hora, the ninth hour, i.e. according to the Roman system, three o'clock p.m. (see Day). The early uses of noon till the 13th and 14th centuries are either as translating the Latin, especially with reference to the Crucifixion, or as equivalent to the canonical hour of "nones" (see Breviary). The ordinary word for twelve o'clock was middag; midday, also the equivalent of the canonical hour "sexi." Both the office and the meal taken about that time were shifted to an earlier hour, and by the 14th century the ordinary use of "noon" is that current to-day.

For "nones" (i.e. noone, sc. dies) in the Roman calendar, see Calendar.

**NOTA,** an ancient town of Sardinia, 22 m. by road S.S.W. of Carales. It was founded, according to Paussanias (x. 17, 5), by the Iberians under Norax, son of Hermes, and was the most ancient town in the island. The discoveries made on the site have, however, shown that it was certainly of Phoenician origin. In Roman times too, we find the milestones on the road from Nora to Bilita and even on that from Nora to Carales reckoned from Nora (Corp. inscr. Lat. x. 831; Ephemcris epigraphica, viii. 180), but the authors and the sepulchral inscriptions found here give us no information as to its juridical condition. The town occupied a characteristically Phoenician site, a small peninsula jutting to the mainland by an isthmus half a mile wide and sandy. Excavations have led to the discovery of a few Phoenician buildings, the foundations of a temple of Tanit, of a road, of quay walls at the water's edge and of a watch-tower on the extremity of the peninsula, which rises to some 150 ft. above the sea. Two cemeteries were found, one of the 7th-6th century B.C., consisting of tombs cut in the rock for inhumation, while in the other, going down to the 4th century B.C., cremation is the rule; there are ossuaries placed in holes in the sand, with a stone and a tile over each. A quantity of small objects, gems, ivories, glass, vases, terracottas, &c., were found in some of them Egyptian, in others Greek, influence and importation are apparent. To the Roman period belong an aqueduct, bringing the water from the neighbouring hills—one pier of it rests upon a destroyed nuraghe—scanty remains of an amphitheatre, a theatre, considerable ruins of concrete foundations (perhaps of villas by the sea) and a watch-tower on the promontory close to the Phoenician tower. A full description of the site and the excavations is given by G. Patroni in Monumenti dei Lincei, xiv. (1905), 111. On the Jathmus is the curious small church of S. Evasio, a nave and two aisles divided by heavy square pillars. At the festival of the saint (May 1-4), his body is brought in procession from the cathedral at Cagliari; the festival is much frequented by people from all parts of Sardinia. (T.A.S.)

**NORBA,** an ancient town of Latium (Adiectum), Italy. It is situated 1 m. N.W. of the modern Norma, 1.75 ft. above sea-level, on the west edge of the Velsian Mountains or Monti Lepini, above a precipitous cliff, with a splendid view over the Pomptine Marshes. It was a member of the Latin League of 499 B.C., and captured by the Romans in 492 B.C., as an important fortress guarding the Pomptine Marshes. It was the place of detention for the Carthaginian hostages, and was captured and destroyed by Sulla's troops during the civil wars at the end of 82 B.C. Some revival in prosperity took place later. From excavations begun in 1901 it seems clear that the remains now visible on the site are entirely Roman. The well-preserved walls are in the polygonal style, 1 3 m. in circuit, and are entirely embankment walls, not standing free above the internal ground level. Remains of a massive tower, and of several gateways (notably the Porta Grande, defended by a tower) exist. Within, the remains of several buildings, including the substructions of two temples, one dedicated to Juno Lucina, have been examined. At the foot of the cliff are the picturesque ruins of the medieval town of Nainfa (12th-13th centuries) abandoned owing to the malaria. The remains of a primitive settlement, on the other hand, have been discovered on the mountain-side to the S.E., above the 13th-century abbey of Valvisciolo, where there is a succession of terraces supported by walls of polygonal work, and approached by a road similarly supported. Here a quantity of primitive Latin pottery has been found. The necropolis of this settlement was probably the extensive one found at Candacu (8th-6th century B.C.), near the railway station of Sermoneta, which belongs also to the 8th-6th century B.C., terminating thus at the precise date at which the Roman city of Norba began to exist.

See L. Savigini and R. Mengarelli in Notizie degli scavi (1901), 514; (1903) 299, 289; (1904) 407; and Atti del Congresso storico (Rome, 1903), vol. v. (Archaeologia) 255. (T. As.)

**NORBANUS, GAIO,** surnamed BULBUS (or BALBUS), Roman politician, was a sedulous and turbulent democrat. In 103 B.C., when tribune of the people, he accused Q. Servilius Caepio of having brought about the defeat of his army by the Cimbri through rashness, and also of having plundered the temple of Tolosa. Caepio was condemned and went into exile. About ten years later Norbanus himself was accused of treason on account of the disturbances that had taken place at the trial of Caea, but the eloquence of M. Antonius, grandfather of the triumvir, procured his acquittal. In 89 Norbanus as praetor successfully defended Sicily against the Italian socii. During the civil war between Marius and Sulla he sided with the former, but was defeated by Sulla at mount Tifata near Capua, and again by Metellus at Faventia in Cisalpine Gaul (82). He fled to Rhodes, where he committed suicide, while the Rhodians were debating whether to hand him over to Sulla.

See Mommsen, Hist. of Rome, bk. iv. ch. v.; Greenidge, Hist. of Rome.

**NORCIA** (anc. Nursia), a town and episcopal see of the province of Perugia, Italy, 29 m. E.N.E. of Spoleto by road, and 40 m. W.
NORD—NORDAU

739

of Ascoli Piceno, 1860 ft. above sea-level, on the south-west foot-slopes of the Monti Sibillini, still surrounded by old walls. Pop. (1901) 4261 (town), 9534 (commune). There are a cathedral, the church of St Benedict and other churches, with Romanesque 14th-century façades; the town-hall; and the prefecture, with Romanesque arcades. Much Injury was done by earth- quakes in 1730 and 1839. The ancient Nursia was a Sabine city, though close to the Umbrian border. Its inhabitants fought in 43 B.C. at Cambrai. The early Christians were mostly fisherfolk and merchants, and were sometimes seen erecting a monument in honour of those who fell. It was governed by octoviri like other Sabine towns and became a municipium under the empire. At Ancarano near Norcia was situated a small pagus; remains of a temple were found there in 1880, which from the character of the objects seems to have been destroyed in the 5th century B.C. The tombs of the district have also produced interesting early bronzes, &c., some of which go back to the 7th century B.C., and a fine funeral couch decorated with sculptured pieces of bone. M. Guardabassi in Notizie degli scavi, 1876, 13 sqq.; 1880, 6 sqq.; A. Pasquini in and dei Lincei, i. (1891) 230. The town was the birthplace of Q. Sertorius (d. 72 B.C.), of Vespasia, mother of the emperor Vespasian of Plotina, wife of the emperor Trajan, and of St. Benedict, founder of the Benedictine order, and of his sister Scholastica. The town is famous for its pork and its cloth (the term norcineria for a pork butcher’s shop is indeed used in Rome) and produces bricks and earthenware.

See F. Patrizi Forti, Memorie storiche di Norcia (Norcia, 1869).

NORD, the most northern of the departments of France, formed chiefly out of Flanders, French Hainault and the district of Artois. A. sq. m. Its population (1,895,861 in 1906), which includes a large proportion of Belgians, ranks next to that of Seine among French departments. Its length from south-east to north-west is 112 m.; its breadth nowhere exceeds 40 m., and contracts to 4 where it is crossed by the Lys. Bounded N.W. and N. for 21 m. by the North Sea, it has Belgian territory on the N.E. and E., the departments of Aisne and Somme on the S. and Pas-de-Calais on the W. The Flanders portion west of the Scheldt is very flat, the isolated hill at Cassel, only 535 ft. high, looking north towards Dunkirk over a stretch of fertile lowlands, the Watervinger and the Moëvres, separated by a line of sand-dunes from the sea, by which about a thousand years ago they were still covered. The reclamation of this district, now covered by a network of canals, was begun as early as the 12th century. South-east of the Scheldt the country resembles the neighbouring Ardennes, is better wooded, and contains the highest point in the department (873 ft.). The greater part of Nord is in the Scheldt basin, but certain portions belong to those of the Sambre (Meuse), the Oise (Seine) and the little coast-streams the Aa and the Yser. The Scheldt, flowing by Cambray, Bouchain, Douai, Valenciennes and St Amand, is divided by the Sambre passes Lille, receiving the Sambre, which touches Douai, Marchiennes and St Amand. The Lys, which does not join the Scheldt till it has entered Belgium, passes Armentières, and receives the Deule, on which Lille, the capital, is situated. The Sambre passes Landrecies and Maubeuge. The Aa falls into the port at Gravelines. The climate of Nord is colder than that of France in general, the mean temperature being 49° or 50° F. The average annual rainfall is about 28 in.

In agricultural and industrial importance Nord is the first of French departments. In the hilly region of the south-east stock-raising flourishes; in the central portion the characteristic crop is wheat, with mixed farming prevails in the north-west. Cereals (especially wheat and oats) and potatoes are grown in abundance. Among minor crops, flax, tobacco, chicory and hops may be mentioned. Market-gardening and horticulture are practised on a considerable scale in some localities. The mineral wealth of the department lies principally in its coal mines forming part of the Valenciennes basin, the most important in France, which extends into Belgium and Pas-de-Calais. The textile industry is particularly active around Lille, Roubaix and Tourcoing which spin and weave cotton and wool, as also around Fourmies which is especially a weaving town. Other important centres are Armentières (cloth-weaving), Dunkirk (flax, jute and hemp-spinning), Cambrai (batiste and other delicate fabrics), Douai, Avesnes, le Cateau and Caudry. Other great industries are brewing, flour-milling, glass, brick, pottery and sugar manufacture, alcohol-distilling, dyeing, iron-founding and steel production and other branches of the metallurgical industry carried on at Denain, Hautmont, Maubeuge, Valenciennes, Douai, Raismes, &c. Dunkirk and Gravelines equip (1907) near Lille, Caudry (10,047), near Cambrai, and Aniche the chief port of the department, which is served by the Northern railway. Its system of inland navigation is highly developed and attains a length of 320 m., comprising a line of waterways from the Scheldt to the North Sea at Dunkirk, with which the coal basin of Valenciennes is linked up by way of the canalized Scheldt and the textile region of Lille by means of the Deûle canal and the canalized Lys. To these must be added the canalized Sambre and other less important waterways.

The department is divided into seven arrondissements (Avesnes, Cambrai, Douai, Dunkirk, Hazebrouck, Lille, Valenciennes) with 67 cantons and 667 communes. It forms the archiepiscopal diocese of Cambrai and part of the region of the L. army corps (headquarters at Lille) and of the educational division of Lille. Its court of appeal is at Douai. The most noteworthy places are Lille, Cambrai, Douai, Dunkirk, Valenciennes and Anzin, Tourcoing, Roubaix, Avesnes, Halluin, Armentières, Maubeuge, Condé-sur-Saucourt, Fourmies, Hazebrouck, Gravelines, St Amand-les-Eaux, Berges, Le Cateau, Comines, Denain, Cassel and Bavaux, which are separately noticed. Other populous industrial towns not mentioned above are Loos (pop. 1934) and Hauvourdin (1897) near Lille, Caudry (10,047), near Cambrai, and Aniche which serve the northern departments of France by rail. Bailleul (pop. in 1906, 72,08), Bavaux and Berges, which have fine bellfries of the 13th century, structures characteristic of the architecture of the department; Hondschoote, scene of a victory of the French over the allies in 1793, which has a church of the 15th and 16th centuries with a fine tower and spire; and Fiamars which preserves a curious ruined stronghold of the Roman occupation.

NORDAU, MAXIMILIAN (1849— ), German author and philosopher, was born of Jewish parents at Budapest on the 29th of July 1849. He studied medicine and travelled widely through Europe until 1878, when he settled down as a practitioner in his native town. In 1880 he removed to Paris, and in addition to his professional work took up the study of art, literature and social questions. His investigations were marked by a critical accuracy which endeavoured to weigh data and deduce results with a fearless disregard of conventional ideas. In his Entartung he applied the theory of physical degeneration to the intellectual side of civilized man, and endeavoured to show that in art, literature and social evolution there is decadence and bysteria; confused aesthetic theory, mysticism in thought, so-called “realism” in art, all alike indicate the vain spasmodic struggle of an effete civilization. In die konventionellen Lagen der Kulturgeschichte (1884), the same destructive method is applied to politics and to social science. Yet Nordau was not a pessimist. In the Paradoxe psychologiques (1885) he expressed his profound and reasoned conviction that the “Degeneration” of the time was only temporary. This optimism was seen in his enthusiastic support of Dr Herzl’s Zionist movement. In connexion with the British government’s offer of land for a Jewish settlement in East Africa, there was a fundamental difference of opinion among the various Jewish societies. Herzl and Nordau were accused of giving up the idea of returning to Palestine, and substituting the African scheme. This idea provoked great hostility, and at a Zionist Ball in Paris (19th of December 1903) a Jew named Louban Chain Selli fired two shots at Nordau unsuccessfully. The outrage drew from Herzl a letter (The Times, 22nd of December) which clearly set forth the view held by himself and Nordau as to the ultimate destiny of the Zionist Movement.

WOKS.—Novels and Stories: Seifenblasen, Federzeichnungen und Geschichten (1879); Die Krankheit des Jahrhunderts (1889);
NORDEN—NORDENSKJÖLD

Gefühlshomödie (1892); Die Dreihochschlacht (1897); Logomathismus (1904). Drama: Die neuen Journalisten (in collaboration with F. Gross, 1880); Der Krieg der Millionën (1862); Das Recht zu Leben (2nd ed., 1894); Die Kugel (1894); and Doktor Kohn (1895). He published also Von Kremi zur Alhambra (1880), an account of his travels, and three works descriptive of Paris and the Parisians—Pariser Studien aus dem wahren Mülardenlaute (1878); Paris unter der Regierung Napoleon III.; and Fünf Tage vor Napoleon. For two further volumes of criticism, Zeitgenössische Franzosen, literaturgeschichtliche essays (Berlin, 1901); and Von Kunst und Künstlern (Leipzig, 1905).

NORDEN, JOHN (1548–1627), English topographer, was the first Englishman who designed a complete series of county histories and geographies. His earliest known work of importance was the Description of the British Isles (1596). The MS. of this in the British Museum (Harl. 570) has corrections, &c., in Lord Burleigh's handwriting. In 1595 he wrote a Chronographical Description of ... Middlesex, Essex, Surrey, Sussex, Hampshire, S. W. Gowery, and Jersey, dedicated to Queen Elizabeth; the MS. of this is in the British Museum, Addit. MSS. 31, 783. In 1596 he published his Preparatio to ... Speculum Britanniae, dedicated to Burleigh, and in 1598 his Herfordshire (Lambeth Libr. MSS. 521). Before his death he had completed in manuscript five of his county accounts; three of these studies were printed long after his death by Charles Norden Secty. of the British Museum in 1840 by Sir Henry Ellis from a MS. at Hatfield (see also British Museum Addit. MSS. 33, 769); Northampshire, known to have been finished in 1610, but only published in 1720; Cornwall, likewise finished in 1610, published in 1728 (see Harl. MSS. 6252). Of Kent and Surrey even the MSS. are now lost; parts of the latter are perhaps identical with sections of the Chronographical Description of ... of which he was appointed surveyor of the crown woods and forests in Berkshire, Devon, Surrey, &c.; in 1605 he obtained the surveyorship of the duchy of Cornwall; in 1607, after a careful survey, he composed his valuable Description of the Honour of Windsor, with fine maps and plans in colour, dedicated to James I. (see Harl. MSS. 3749). In 1608 he was mainly occupied with the surveying of crown woods, especially in Surrey, Berkshire and Devon, and with the writing of his works on forest culture—Considerations touching ... raising ... of Coppices, and ... Relation ... Procedings upon ... Commission concerning new forests, to which he added in 1613 his Observations concerning Crown Lands and Woods (see Egerton MSS. 806; Ashmole MSS. 1148; and Lansdowne MSS. 165). In 1612 he was appointed surveyor of the royal forests in Kent, Sussex, Hampshire, Berkshire, Dorset, Wiltshire, Somerset, Devon and Cornwall; in 1616 and 1617 he appears surveying the soke of Kirkton in Lindsey, as well as various manors and lands belonging to Prince Charles, afterwards Charles I. (see Cambridge University Library, Fv. iv. 30; London, British Museum Addit. MSS. 6027); his last works were a survey of Sheriff Hutton manor, Yorks, in 1624 (Harl. MSS. 6288), and England, an intended guide for English travellers, a series of tables to accompany Speed's county maps, executed in 1625, shortly before his death.

Norden's maps of London and Westminster (in his Speculum Britanniae of 1593) are the best representations known of the English metropolis under the Tudors; his maps of London (also from the Spec. Brit. of 1593), of Essex (1594, 1840), of Hertfordshire (1598, 1723) and of Cornwall (published in 1728; see above) are also noteworthy; in the last-named the roads are indicated for the first time in English topography. Norden also executed maps of Hampshire, Hertfordshire, Kent, Middlesex, Surrey and Sussex, for the fifth edition (1607) of Camden's Britannia, also maps of Middlesex, Essex, Hants, and Dorset, compiled from the Surveyors' maps and Tracts of 1607, and the accurate important cartographical works of his are lost: e.g. his Map ... of ... Battles fought in England from ... William the Conqueror to ... Charles II., in 16 sheets, formerly in the Bodleian Gallery, Oxford, of which some part is probably preserved in the Impressions of England, an appendix to the Prospect of the most Famous Parts of the World, by J. Speed (1675); and his View of London, in 8 sheets, made c. 1640, was published by John Green in 1699, and also by A. Walkinshaw and Peter Bristow (1887). The important Crace collection at the British Museum contains an earlier View of London by Norden (1600), and an 1804 reprint of the View of London Bridge; a map of Surrey by Norden, said to have been copied by Speed and Kip in Camden's Britannia of 1607, has also disappeared.

Besides the works noticed above, see the accounts of Norden by C. Bateman in Speculum Britanniae, pars Cornwall (1728), and by Sir H. Ellis in Spec. Brit., pars Essex (Camden Society, 1840); also H. H. Wheatley in Harrison's Description of England (New Shakspere Society, 1877), and C. H. Coote's article in the Dict. Nat. Bio 

NORDEN, a town of Germany, in the Prussian province of Hanover, 4 m. from the North Sea and 20 m. by rail N. of Emden. Pop. (1905) 6717. It has a 16th-century town hall and its parish church was built in 1445. Gin, sugar, chocolate, coffee, tobacco and machinery are manufactured. Norddeich, a small port 4 m. N.W., is the shipping place for passengers bound for Norderney. Norden was first mentioned in 842.

NORDENSKJÖLD, NILS ADOLF ERIK, BARON (1832–1901), geographer and Arctic explorer, was born at Helsingfors, 18th November 1832. His ancestors came originally from Sweden, but for some generations had been settled in Finland. His father, Nils Gustav Nordenskjold, was both a mineralogist and a traveller. Nordenskjold entered the university of Helsingfors in 1849, and applied himself specially to chemistry and mineralogy. In 1853 he accompanied his father to the Ural Mountains and the Caspian Sea. He rose to be a mining engineer by 1856. On his return he received minor appointments both at the university and the mining office, but an unguarded speech at a convivial entertainment in 1855 drew the attention of the Russian authorities to his political views, and led to his dismissal. He then visited Berlin, continuing his mineralogical studies, and in 1856 obtained the Alexander travelling stipend at the university of Helsingfors and planned to expend it in geological research in Siberia and Kamchatka. Before starting he took his master's and doctor's degrees (1857), but he again aroused the suspicion of the authorities by his criticism of the government. In 1857 he succeeded in obtaining leave to return to his home country and was deprived of the right of ever holding office in the university. Settling at Stockholm he thenceforward became practically a Swedish citizen. He soon received an offer from Otto Torell, the geologist, to accompany him on an expedition to Spitsbergen. To the observations of Torell on glacial phenomena Nordenskjold added the discovery at Bell Sound of remains of Tertiary plants, and on the return of the expedition he received the appointment of professor and curator of the mineralogical department of the Swedish State Museum. In 1861 he took part in Torell's second Spitsbergen expedition, which yielded some important geological results. He returned to Spitsbergen a third time in 1863, and was unfortunately involved in a collision between the steamers Offa and Seraph, which injured him severely; but he continued the same quarter promoted by the Swedish academy of science in 1864, Nordenskjold was the leader. Three years later, chiefly through the support of the Swedish government and Oscar Dickson, who contributed largely towards the later expeditions of 1872 and 1875, he headed a well-organized expedition in the iron steamer "Sofia," and reached the highest northern latitude (81° 42') then attained in the eastern hemisphere. Arctic exploration had now become his all-absorbing object in life, and in 1870, with three young naturalists, he visited the vast inland ice-sheet of Greenland. His next expedition in 1872 did not answer expectation, for the tenders were caught in the ice, and the crews of the three vessels were forced to winter in Spitsbergen. In 1875-1876, however, a successful voyage eastwards, including the ascent of the Yenisei, led him to attempt the discovery of the long-sought North-East Passage. This he accomplished in the voyage of the "Vega," navigating for the first time the northern coasts of Europe and Asia. Starting from Karlskrona on the 22nd of June 1878, the "Vega" doubled Cape Chelyuskin in the following August, and after being frozen in at the end of September near Birgus Strait, completed the voyage successfully in the following summer. He edited a monumental record of the expedition in five octavo volumes, and himself wrote a more popular summary in two volumes.

On his return to Sweden he received an enthusiastic welcome, and in April 1880 was made a baron and a commander of the Order of the Nordstjerna. In 1883 he again visited the east coast of Greenland, and succeeded in taking his ship through the great ice barrier, a feat attempted in vain during more than three centuries. Baron Nordenskjold also made a notable reputation
in the field of historical geography by his Fascimile Atlas (1839) and Peripitus (1847). The former contains reproductions of the most important geographical charts printed during the 15th and 16th centuries, and the latter, a work of far greater research, deals with the history of early cartography and the sailing charts in use among mariners during the middle ages. He died at Stockholm on the 12th of August 1901.

**NORDERNEY** (i.e. "northern island"), an island of Germany, in the North Sea, the largest of the East Friesland group, belonging to the Prussian province of Hanover. Pop. (1905) 3888. It is 8 m. long and about 1 1/2 m. broad, and supports a seafaring and fishing population. It is reached by steamer from Bremen, Bremen-Hamburg, Blankenese, or Hamburg by road from the mainland. The village at the S.W. end of the island is one of the most popular sea-bathing places in Germany, and is visited annually by some 26,000 visitors. On the S. side rises a lighthouse 175 ft. high, while the E. end of the island is filled with sand dunes ranging in height from 50 to 75 ft. Norderney is immortalized by its association with Heinrich Heine's Nordsuecholder.

See Berenberg, Das Nordsuehbad Norderney (Norden, 1895); C. Rietschel, Geschichte der Insel Norderney 1398-1711 (1896); and the article FRISIAN ISLANDS.

**NORDFJORD**, an inlet of the west coast of Norway, penetrating the land for 50 m. in an easterly direction, its mouth being 115 m. by sea. N. of Bergen (51' 50' N.). No part of Norway affords finer scenery than the inner ramifications of this fjord among the snowy mountains of the northern Jotulsdalsbre. Driving-roads penetrate the mountains from Visnes eastward to the Gudbrandsdal, from Utvik southward to Vadheim on the Sogne Fjord, and from Faleide northward to Hellesylt (Geiranger Fjord) and Ojle (Flurandsfjord). Nordfjordeid is a large village on the outer fjord, at the mouth of Hornindalen. Olden is one of the favourite centres on the inner part of the fjord. A small but powerful breed of horses is peculiar to the Nordfjord district.

**NORDHAUSEN**, a town of Germany, in the province of Prussian Saxony. It is situated on the Zorge at the south base of the Harz Mountains, and at the west end of the Goldene Aue (Golden Plain), a fruitful valley watered by the Helme, 60 m. by rail W. of Halle, on the main line to Frankfurt-on-Main and Cassel, and at the junction of railways to Erfurt and Blankenheim. Pop. (1885) 27,083; (1905) 29,882. It is built partly on the slope of a small hill, partly in the plain, and the lower and lower parts of the town are connected by flights of steps. Among its eight churches the most noteworthy are the Roman Catholic cathedral, late Gothic with a Romanesque crypt, and the Protestant church of St Blasius, containing two pictures by Lucas Cranach. Near the medieval town hall stands a Roland's column, the ancient symbol of free commercial intercourse and civic liberty. The town has a museum of antiquities and various public monuments, notably a fountain by Ernst Rietschel in the corn market, and another to Luther in the market square. There are statues of the emperor Frederick I. and of Prince Bismark. The chief importance of the place arises from its distilleries, which annually yield about 10,000,000 gallons of "Korn Schnapps," a spirit somewhat akin to whisky. The breweries are also important and there are manufactures of leather, tobacco and cigars, cotton, linen goods, carpets, cheney, malt and chemicals. Nordhausen is sometimes called the Cincinnati of Germany on account of its extensive export trade in pork, corned beef, ham and sausages. There is also a large trade in corn.

Nordhausen is one of the oldest towns in North Germany. It possessed a royal palace in 874 and a convent was founded here in 962. It was destroyed by Henry the Lion, duke of Saxony, in 1180, but was soon rebuilt and was made a free imperial town in 1251. In this and the following century several diets and other assemblies were held here. The protector (Vogt) of the town was the elector of Saxony and later for a few years (1702-1715) the elector of Brandenburg. Nordhausen accepted the reformed doctrines in 1522. It was annexed by Prussia in 1803 and again in 1815, having in the meantime belonged to the kingdom of Westphalia.

**NORDSTREM**, Georg Forstmann, Urkundliche Geschichte der Stadt Nordhausen bis 1250 (Nordhausen, 1828-1840) and Kleine Schriften zur Geschichte der Stadt Nordhausen (Nordhausen, 1855); Lesser, Historische Nachrichten von Nordhausen, edited by Forstmann (Nordhausen 1830). See also: A. Renandt, Beschreibung der Stadt Nordhausen (Halle, 1886); T. Eckart, Gedementsblatter aus der Geschichte der ehemaligen freien Reichstadt Nordhausen (Leipzig, 1895); Heine, Nordhausen and Preussen (Nordhausen, 1902); and Girschner, Lokalfiihrer der Nordhäuser Unterwerfung (Nordhausen, 1895).

**NORDICA, LILIAN** (1839- ), American operatic soprano, née Norton, was born at Farmington, Maine, and trained as a singer at Boston, and later at Milan. As Madame Nordica she made her operatic début at Brescia in 1879, and from that time took high rank among the prima donnas, appearing in all the principal capitals in Europe, and also in America.

**NORDIN, CARL GUSTAF** (1749-1812), Swedish statesman, historian and ecclesiastic. In 1774 he was made doceni of Gothic antiquities at Upsala University in consequence of his work on the treatise, Monumenta svedonesium et heldorrtium aevi falsa merique suscita. Summoned to Stockholm in 1782 by Gustavus III. to edit a Swedish Corpus diplomaticum, half an hour's private conversation with the young priest convinced Gustavus that Nordin's proper place was by his side in the political arena. But he employed Nordin quite differently from his episcopal colleague Olaf Wallqvist. While the bishop publicly defended the royal measures, Nordin became the king's private adviser. In politics Nordin was a royalist from pure conviction. To him a parliament seemed little better than a mob. He was one of the king's secret managers during the troublesome and dangerous riksdag of 1789, but advised caution and compared the estate of clergy, which at one time held the balance between the jarring orders, to ice which might be walked upon but could not be driven over. He was appointed a member of an ecclesiastical commission for reforming the church in 1787, in which capacity he was virtually minister of public worship. In 1791-1792 he became a leading member of the financial and general committees of the riksdag. After the king's death Nordin shared in the general disgrace of the Gustavians and lived in retirement at the little town of Hernösand, where he held the post of lector at the gymnasiun. But he reappeared prominently on the political scene during the riksdag of 1800, and in 1805 was consecrated bishop of Hernösand. Though he lacked the brilliant qualities of his rival Wallqvist, Nordin had the same alertness and penetration, and was infinitely more stable and disinterested. One of the most learned men of his day, he devoted his spare time to history, and discovered that many of the oldest and most cherished Scandinavian MSS. were clever forgeries. Like Jean Hardouin he got to believe that a great deal of what is called classical literature was compiled by anonymous authors at a much later date, and he used frequently to startle his colleagues, the Gustavian academicians, by his audacious paradoxes.

He left behind him a colossal collection of MSS., the so-called Nordiska Samlingarna, which were purchased and presented to Upsala university by Charles XIV, and form the groundwork of the well-known Scriptores chronicorum medii aevi. Nordin published during his lifetime Handliger till upplyningen av svenska krigshistorien (Stockholm, 1787-1788). His academical addresses came out at Stockholm in 1818 under the title Minnen och namnkunniga svenska män. His Dagbok did not appear till 1868.

**NÖRDLINGEN**, a town of Germany, in the kingdom of Bavaria, on the Eger, 40 m. N. of Augsburg by rail and at the junction of lines to Buchloe and Dombühl. Pop. (1905) 8512. It was formerly a free imperial town, owning a territory 35 sq. m. in extent, and is still surrounded with walls and towers. The Evangelical church of St George is a Gothic structure erected in the 15th century and restored in 1880. It has paintings by Hans Schäufelein, who was a native of Nördlingen, and a tower 290 ft. high. The Late Gothic town hall has a collection of pictures and antiquities. The chief manufactures of the town
NORE—NORFOLK, EARLS OF

are linen goods, soap, malt, and agricultural implements, and a brisk trade is carried on in cattle, grain and geese. From 988, when first mentioned, to 1351 Norfolk was subject to the bishops of Regensburg, but about 1215 it became a free city of the Empire. It was annexed to Bavaria in 1803.

Nördlingen was the scene of two great battles in the Thirty Years’ War (q.v.). In the first, which was fought on the 5th and 6th of September 1634, the hitherto invincible Swedish army, commanded by Duke Bernhard of Saxe Welmar and Marshal Horn, was defeated with great loss by a somewhat superior army of Imperialists and Spaniards under General Gallas, Horn and 3000 men being made prisoners and 6000 killed or mortally wounded. The battle was fought on the plain of Alberheim. The French army, similarly arrayed, but with a few battalions attached to the cavalry wings, was more heterogeneous than the German, being composed of French, Hessian, German mercenaries, and Liégeois. After a cannonade in which it suffered more severely than its entrenched enemy, the French centre furiously attacked the village of Allerheim; the fighting here was very heavy, and on the whole in favour of the Germans, although Mercy was killed. The right wing of the French cavalry was swept off the field by Johann von Weert’s charge, but the German troopers, intoxicated with success, dispersed to plunder. On the French left, meanwhile, Turenne saved the day. Fighting cautiously at first with his leading line to gain time for his second to come up, he then charged and broke up the hostile right wing of cavalry, while some battalions of infantry scaled the hill and captured the Bavarian guns. Unlike Weert the marshal kept his troops in hand, and swung round upon the Bavarian infantry behind Allerheim, who were at the same time cannonaded by their lost guns. A prolonged fight now ensued, in which the Bavarians had the worst of it, and Weert, returning at last to the field, dared not attempt to engage afresh. The armies met, and half a mile apart, but in the morning the Bavarians were found to have retreated. Nothing was gained by the victors but the trophies and the field of battle, and the losses of both sides had been enormous. Enghien had only 1500 of his foot in hand next day. Nördlingen, therefore, is a classical instance of the unprotected and costly bataille range of the 17th century.

See Besselsch, Geschichte der Stadt Nördlingen (Nördlingen, 1851), and Mayer, Die Stadt Nördlingen, ihr Leben und ihre Kun: im Lichte der Vorsie (Nördlingen, 1860).

NORE, THE, a sandbank at the mouth of the river Thames, England, marked by various buoys and by a lightship, with revolving light. This ship lies 3 m. from the nearest point on the Kent coast, about the same distance from the Essex coast, and 471 m. below London Bridge. The first light was placed here as an experiment by Mr Hamlin, its patentee, in 1731. In 1797 the neighbouring anchorage was the scene of a mutiny in the British fleet then lying here, well known in history as the Mutiny of the Nore.

NORFOLK, EARLS AND DUKES OF. The 1st earl of Norfolk was THOMAS MOWBRAY, 1st duke of Norfolk (c. 1366–1399), who forfeited the earldom when he revolted against William in 1375; the 2nd was HUGH BISHO (d. 1377), one of Stephen’s supporters, to whom the earldom was granted by this king before 1141. Hugh’s grandson, HUGH (d. 1225), the 3rd earl of this line, married Matilda, daughter of William Marshal, earl of Pembroke, and from the Marshals their son ROGER (d. 1270), the 4th earl, inherited the office of lord of England. This powerful family of Bigod retained the earldom until ROGER, the 5th earl, died childless in December 1346.

The next earl of Norfolk was THOMAS OF BROUGHTON (1300–1338), a younger son of Edward I, to whom the earldom was granted in 1312 by his half-brother, Edward II. In addition to the estates which he had previously belonged to the Bigods Thomas received the office of marshal. He joined Queen Isabella when she landed in England in 1326, and was one of the group of nobles who brought about the deposition of Edward II. He died in August 1338, leaving no son. The survivor of his two daughters, Margaret (c. 1320–1400), who was countess of Norfolk in her own right, married John de Segrave, 3rd lord Segrave (d. 1383), and had issue by him. One of the offspring, Thomas, the wife of John de Mowbray, 4th lord Mowbray (d. 1368), and the mother of two sons John and Thomas. In 1397 the countess Margaret was created duchess of Norfolk, and at the same time her grandson Thomas Mowbray was made duke of Norfolk.

THOMAS MOWBRAY, 1st duke of Norfolk (c. 1366–1399), became Baron Mowbray and Baron Segrave when his elder brother John died in February 1382; about the same time Richard II. created him earl of Nottingham, a title held by his dead brother and 1358 was severe annulment of England for life. For some years he enjoyed the favour and companionship of the king, but differences arose between them, and in 1387 Nottingham began to act with Thomas of Woodstock, duke of Gloucester, his own brother-in-law, Richard Fitzalan, earl of Arundel, and the party of nobles who wished to deprive the king of his power. They routed the royal favourite Robert de Vere, earl of Oxford, at Radcot Bridge, and Richard was at their mercy. Owing partly to Nottingham’s moderate counsels the suggestion to depose him was not carried out, but in the “merciless parliament” of 1388 his favours were “appealed” of treason and were sentenced to death. For nearly two years the chief power was in the hands of the lords appellant, as Nottingham and his friends were called, but in 1389 the king regained his authority. He detached Nottingham from his colleagues and made him warden of the Scotch marches; later he became captain of Calais and the royal lieutenant in the north-east of France. Richard took him to Ireland in 1394 and soon afterwards sent him to arrange a peace with France and his marriage with Isabella, daughter of King Charles VI. But the earl’s supreme service to the king was in 1397 when he defended and in the “appeal” of treason and were sentenced to death. For nearly two years the chief power was in the hands of the lords appellant, as Nottingham and his friends were called, but in 1389 the king regained his authority. He detached Nottingham from his colleagues and made him warden of the Scotch marches; later he became captain of Calais and the royal lieutenant in the north-east of France. Richard took him to Ireland in 1394 and soon afterwards sent him to arrange a peace with France and his marriage with Isabella, daughter of King Charles VI. But the earl’s supreme service to the king was in 1397 when he defended and

earfed for himself to Germany, Hungary and Bohemia. At once he left England for Dordrecht, and after passing some months in wanderings he reached Venice, where he died on the 22nd or 27th of September 1399. The concluding scene of the duke’s life in England forms the staple material of act i. of Shakespeare’s Richard II. Norfolk left estates in nearly all the English counties. His wife was Elizabeth (c. 1372–1425),
daughter of Richard Fitzalan, earl of Arundel, by whom he had two sons, Thomas and John, and two daughters.

His elder son, Thomas Mowbray (1385-1405), became earl of Nottingham and earl marshal on his father's death, but he was not allowed to assume the title of duke of Norfolk. He quarrelled with Richard Beauchamp, earl of Warwick, over the precedence of their respective earldoms, and left the court in anger when Henry IV. decided in favour of Warwick. At this time (1405) Richard le Scrope, archbishop of York, and other northern potentates were preparing to rise against the king. The earl marshal joined them, was taken prisoner at Shipton Moor, and was beheaded at York on the 8th of June 1405.

John Mowbray (1390-1432), 2nd duke, brother of the last-named, now became earl marshal and earl of Nottingham. He sat in judgment upon Richard, earl of Cambridge, and the other rebels in 1415, and went to France with Henry V. He took part in the siege of Harleux, but illness prevented him from fighting at Agincourt. He saw service in France in subsequent years, and after Henry's death he was a member of the English governing council. In 1424 he followed Humphrey, duke of Gloucester, on his campaign in Hainaut, and in 1425 he secured his recognition as duke of Norfolk. He died on the 19th of October 1432 at Epworth, where his father had founded a Cistercian priory. By his wife Catherine, daughter of Ralph Neville, 1st earl of Westmorland, he left an only son, the 3rd duke.

John Mowbray, 3rd duke (1415-1461), became warden of the Scottish marches; he also served as a soldier and an administrator. He was prominent in the fierce rivalry between the houses of York and Lancaster about 1450; he joined Richard, duke of York, to whom he was related; he aided the Yorkist cause in Norfolk and in London, and it was he who in November 1453 demanded an inquiry into the administration of Edmund Beaufort, duke of Somerset. In 1459 he appeared on the Lancastrian side and took the oath of allegiance to Henry VI. and to his son Edward at Coventry, but soon he was again figuring as an active Yorkist. He was a member of the deputation which in March 1461 asked the duke of York (Edward IV.) to take the crown, and he fought at the second battle of St Albans and also at Towton, where one authority says he saved the day for the Yorkists.

John Mowbray, 4th duke (1444-1476), who had already been created earl of Surrey, a title formerly held by his ancestors, the Fitzalans, was the only son of the preceding. The names both of John and of his father appear frequently in the Paston Letters, as both dukes in turn seized Caister castle, which had been left by Sir John Fastolf to John Paston, and the 4th duke held it against the Pastons for some years. On his death in 1476 the dukedom became extinct, but the title was revived for his son, who married Richard, duke of York, the younger son of Edward IV. Richard was created duke of Norfolk and made earl marshal, but when he was murdered in 1483 the dukedom again became extinct, the earldom having reverted to the crown on the death of Anne.

The illustrious family of Howard (q.v.), members of which have been dukes of Norfolk from 1483 to the present day, with the exception of two periods during which the title was forfeited, was connected with the family of Mowbray.

John Howard, 1st duke of Norfolk (c. 1430-1485), was the son of Sir Robert Howard by his wife Margaret, daughter of Thomas Mowbray, the first duke of that family. In 1455 John Howard was sent to parliament as member for Norfolk, although he "had no livery in the shire"; in 1461 he was knighted; and in 1470, although he appears to have been a consistent Yorkist, he was created a baron by Henry VI. He was treasurer of the royal household from 1467 to 1474, and went to France with Edward IV. in 1475. After Edward's death, however, he supported Richard III., who created him duke of Norfolk and made him earl marshal of England. He was killed at Bosworth whilst fighting for this king on the 22nd of August 1485, and the title thus suffered attainer. He is frequently mentioned in the Paston Letters.

His son, Thomas Howard, afterwards 2nd duke (1443-1524), shared his father's fortunes; he fought at Barnet for Edward IV. and was made steward of the royal household and created earl of Surrey in 1483. Taken prisoner at Bosworth he was attainted and remained in captivity until January 1489, when he was released and restored to his earldom but not to the dukedom of Norfolk. He was then associated with the maintenance of order in Yorkshire and with the defence of the Scottish borders; he was made lord treasurer and a privy councillor in 1501, and he helped to arrange the marriage between Margaret, the daughter of Henry VII., and James IV. of Scotland. Henry VIII., too, employed him on public business, but the earl grew jealous of Wolsey, and for a short time he absented himself from court. He commanded the army which defeated the Scots at Flodden in September 1513, and was created duke of Norfolk in February of the following year, with precedence as of the creation of 1483. In the later years Norfolk worked more harmoniously with Wolsey. He was guardian of England during Henry's absence in France in 1520, and he acted as lord high steward at the trial of his friend Edward Stafford, duke of Buckingham, in 1521. Among his sons were William, 1st Lord Howard of Effingham, and Sir Edward Howard (c. 1477-1513), lord high admiral, who defeated the French fleet off Brest in August 1512, and lost his life during another engagement in April 1513.

Thomas Howard, 3rd duke (1473-1554), eldest son of the 2nd duke, married in 1495 Anne (1475-1512), daughter of Edward IV., thus becoming a brother-in-law and one of the few marrying Anne's sister Elizabeth. He became lord high admiral in 1513, and led the van of the English army at Flodden in September, being created earl of Surrey in February 1514. In 1513 he took for his second wife Elizabeth (d. 1539), daughter of Edward Stafford, duke of Buckingham. In 1520 Surrey went to Ireland as lord-deputy, but soon vacated this post to command the troops which sacked Morlaix and ravaged the neighbourhood of Boulogne in 1522; afterwards he raided and devastated the south of Scotland. He succeeded his father in May 1524, and as the most powerful nobleman in England he headed the party hostile to Cardinal Wolsey. He favoured the divorce of Henry VIII. from Catherine of Aragon, and the king's marriage with his niece Anne Boleyn. In 1529 he became president of the council, but in a few years his position was shaken by the fate of Anne Boleyn, at whose trial and execution he presided as lord high steward. But his military abilities rendered him almost indispensable to the king, and in 1536, just after the rising known as the Pilgrimage of Grace had broken out, he was despatched into the north of England; he temporized with the rebels, and brought them to a surrender, and then, as the first president of the council of the north, punished them with great severity. Sharing in the general hatred against Thomas Cromwell, Norfolk arrested the minister in June 1540. He led the English army into Scotland in 1542 and into France in 1544, but the execution of Catherine Howard, another of his nieces who had become the wife of the king, had weakened his position. His son Henry Howard, earl of Surrey (q.v.), was arrested on a charge of treason; Norfolk himself suffered the same fate as accessory to the crime. In January 1547 Surrey was executed; but Henry, in a subsequent investigation, was convicted by a bill of attainder, but owing to the death of the king the sentence was not carried out. Norfolk remained in prison throughout the reign of Edward VI., but in August 1553 he was released and restored to his dukedom. Again taking command of the English army he was sent to suppress the rebellion which had broken out under Sir Thomas Wyatt, but his men fled before the enemy. He acted as lord high steward at the trial of John Dudley, duke of Northumberland; and he died on the 25th of August 1554. Norfolk was a brutal and licentious man, but was a supporter of the Roman church, being, as he himself admits, "quick against the sacramentaries." As a soldier he was serviceable to Henry VIII., but as a diplomatist he was a failure, being far inferior to Wolsey and to Cromwell. He had two sons, Henry, earl of Surrey, and Thomas (c. 1528-1582), who in 1559 was created Viscount Howard of
Bindon, a title which became extinct in 1611. His only daughter Mary (d. 1557) married Henry, duke of Richmond, the natural son of Henry VIII.

Thomas Howard, 4th duke (1536–1572), son of Henry Howard, earl of Surrey, was born on the 10th of March 1536. His tutor was John Foxe, the martyrologist. Soon after Elizabeth became queen in 1558, he sent the young duke to take part in the war against the Scots and their French allies, but the conclusion of the treaty of Edinburgh in July 1560 enabled him to return to the court in London. Having married and lost three wives, all ladies of wealth and position, Norfolk was regarded as a suitable husband for Mary queen of Scots, who had just taken refuge in England. He prevailed over the commission appointed by Elizabeth to inquire into the relations between the Scottish queen and her subjects; and although he appears to have believed in Mary’s guilt he was anxious to marry her. Among the Scots Maitland of Lethington favoured the proposed union; Mary herself consented to it; but Norfolk was unwilling to take up arms, and while he delayed Elizabeth ordered his arrest, and he was taken to prison in October 1560. In August 1570, after the suppression of the rising in the north of England, the duke was released; but he entered into communication with Philip II. of Spain regarding the proposed invasion of England by the Spaniards. After some hesitation Norfolk placed himself at the head of the conspirators; and in return for his services he asked the king of Spain “to approve of my own marriage with the Queen of Scots” (q.v.). But the young earl of Norfolk’s treachery was revealed to Lord Burghley, and in September 1571 he was arrested. He was beheaded on the 2nd of June 1572.

It is noteworthy that he always regarded himself as a Protestant. Norfolk’s first wife, Mary (1540–1557), daughter and heiress of Henry Fitzalan, 12th earl of Arundel, bore him a son, Philip, who in consequence of his father’s attainder was not allowed to succeed to the dukedom of Norfolk, but became 13th earl of Arundel in succession to his maternal grandfather in 1586. Norfolk left two other sons, Thomas Howard, created earl of Suffolk in 1663, and Lord William Howard (q.v.).

In 1660 the dukedom was restored by act of parliament to Thomas Howard, 4th earl of Arundel (1627–1677), a descendant of the 4th duke. The 5th duke was succeeded by his brother Henry (1628–1684), the friend of John Evelyn, who had been already created earl of Norwich; in 1672 he was made earl marshal, and this dignity was entailed on his male heirs.

Charles Howard, 11th duke (1746–1813), was the son of Charles Howard (1720–1780), who succeeded his cousin, Edward Howard (1686–1777), 10th duke of Norfolk in 1777, and who wrote Historical Anecdotes of some of the Howard Family (1769 and 1790). He married on 15 March 1777 the Earl of Suffolk's eldest daughter, Anne, and in 1777 was created Baron Howard of Effingham. On 25 June 1777 he was created Earl of Arundel and the title was suspended from the family, henceforth passing to the line of his eldest son, Henry Howard, 5th earl of Arundel.

The 13th duke’s eldest son, Henry Granville Fitzalan Howard (1815–1860), succeeded to the title. He was a devoted Roman Catholic, left the Liberal party and resigned his seat in parliament rather than support the Ecclesiastical Titles Bill of 1850. He edited the Lives of Philip Howard, earl of Arundel, and of Anne Ducas, his wife (1857 and 1861). He was succeeded by his son Henry Fitzalan Howard, 15th duke (b. 1847), who was postmaster-general from 1893 to 1900, first Lord Mayor of Sheffield in 1893, went out to the South African War in 1900, and whose position as head of the English Roman Catholics and as premier duke and Earl Marshal made him for many years conspicuous in public life. His only son by his first wife, a daughter of Baron Donington, died in early life; but by his second marriage (1894) to the daughter and heiress of Lord Harries he had a son born in 1908.

Norfolk, an eastern county of England, bounded N. and E. by the North Sea, S.E. and S. by Suffolk and W. by Cambridgeshire and Lincolnshire. The area is 2,044 square miles, and the population (1901) was 529,744. The county being the fourth in size in England. The surface falls into two divisions. The eastern and central portions consist of undulating plain with rising ground skirting the river valleys and low chalk downs in the north. For the most part this section is fertile and well wooded, but there are some expanses of heath land. The principal rivers are the Yare and its tributaries the Wensum, Bure and Waveney, the last forming a large part of the boundary with Suffolk. In the west the county includes part of the Fen country (q.v.), where the principal rivers are the Great Ouse and its tributaries the Little Ouse or Brandon river, which also forms part of the Suffolk boundary, the Wissey and the Nar. The flat fens are crossed by innumerable navigable and drainable channels. They are comprised within that portion of the whole district known as the Bedford Level, and extend from Welney and Hilgay Fens near the junction of the Great and Little Ouse northward to the Wash.

The watershed is nearly in the centre of the county. The middle eastern portion is a low-lying flat area lifted slightly towards the coast in such a way that some of the tributary streams of the Bure rise very near the sea but flow to the sea at a point not far from the coast. Here occur the well-known Norfolk Broads, shallow mires, having their low banks covered with luxuriant reeds and other water-plants, and possessing much of the beauty of an individual character. More of them are connected with pike, harea and other coarse fish, and harbour innumerable waterfowl, including the water-hen, heron, bittern, king-fisher, mallard, teal and snipe. They are frequented by sportsmen, but still more by boating parties, and at Yarmouth, Wroxham Bridge, Acle and elsewhere sailing boats with cabins, and other boats, are hired in large numbers. Annual regattas are held on several Broads. The Broads are generally not wide and many of the main watercourses are only navigable by small craft. The most common craft are the flat-bottomed "cabin" or "cabin-barge," "Spirit" and "Skeg." the largest Broads, the river Bure, being navigable for a few miles above the town of Wroxham. The deep water of all the Broads is used for boating.

The Bure joins the Yare at Yarmouth, at the seaward end of Breydon Water, which does not rank among the Broads. Following the Bure upwards, a small stream is found uniting it with Filby, Rollesby and Ormesby Broads to the north, which form one sheet of water of irregular shape. The Thurne stream then enters from the same direction, draining Heigham Sound, Hickling Broad, Horsey Mere and Martham Broad. The second of these is the largest of all, measuring some 3 miles in length by one at its widest part. The next tributary, the Ant, drains Barton and Stalham Broads. Closely adjoining the upper Bure itself, there are Ranworth Broad, Horning Broad, and Salhouse, Hoveton and Wroxton Broads almost adjoining. South of Ranworth, on a tributary, is South Walsham Broad. Adjacent to the Yare towards Norwich is Rockland Broad. Between the Waveney and Lowestoft Oulton Broad is formed (in Suffolk; see Lowestoft). The eastern two-thirds of the boundary of the county is formed by tidal water. There are a few bays or inlets, and on the eastern coast no river mouths. For the most part the coast-line is flat and low, and has been greatly encroached on by the sea, several villages having been engulfed since the Conquest. From the
mouth of the Yare to Happisburgh the shore is skirted by sand-banks. Thence for 20 m. it is formed of cliffs consisting of clay and masses of embedded rocks, the average height being about 50 ft., although in some cases an altitude of 200 ft. is reached. These cliffs are succeeded by a low shingly or sandy coast stretching as far as St. Edmund’s Point. The shores of the Wash are formed of mudbanks, which are left at low water. West of Lynn a considerable extent of land has been reclaimed from the sea in modern times, and farther south an old Roman embankment stretches into Lincolnshire. At various points off the coast there are submarine forests, especially in Brancaster Bay, and there are large sand dunes and extensive areas of beach. The shores of the Yare and the River Yare are divided by the Fens. Fossilized remains of large mammals are sometimes dragged up by the nets of fishermen, and mammotus tusks measuring from 6 to 9 ft. have been found at Knole Sand off Happisburgh. The fine sandy beaches and healthy climate have contributed to the fine growth of such popular watering-places as Cromer, Yarmouth and Hunstanton, while Mundesley and Wells-next-the-Sea are lesser resorts.

Geology.—The prevailing rock formation in Norfolk is the chalk, which is widely exposed and forms the western and southern boundaries of the county and underlies the Tertiary deposits in the eastern part, the general dip of the rocks being towards that direction. Pliocene deposits predominate in the eastern third of the county; while a narrow belt of gravel and sand extends along the coast from the Yarmouth border. Oxford Clay and Corallian beds have been proved by boring at Lynn, but the oldest formation to appear at the surface is the Kimmeridge Clay. The cliffs along the coast of the Wash from Hunstanton to King’s Lynn and south to Downham, where it has been dug for bricks and tiles. The Lower Greensand, which forms the picturesque escarpment overlooking the Fen-land and the Wash, is represented by the Greensand and the bedded sands of the Winchelsea or Carstone (up to 40 ft.), locally known as the “Gingerbread stone,” which is quarried at Snettisham and elsewhere as a building stone. Below the Carstone are the Snettisham Clay beds, dug for brick-making at that village and at Dersingham and Heacham. Hard sandstone, with flints in the upper part and occasional marl beds, is exposed at Docking, Hillington and Methwold. The Upper Chalk (about 800 ft.), lying above the flint beds, is the peculiarly characteristic rock known as “paramoudras”; it has been largely exploited for lime and whiting, and the flints have been worked from prehistoric times. Dressed flints are still used for facing walls in churches and other buildings, and are known under the name of “London flints.” The county is intersected by the Roman roads which are known in England. Eocene strata, Reading Beds (46 ft.) and London Clay (310 ft.) have been proved to lie beneath younger deposits at Yarmouth. Pliocene deposits, sands, gravels and clays are exposed along the coast from Weybourne and Cromer to Happisburgh and in the river valleys over most of the eastern part of the county.

The lower subdivision of the Norwich Clay Series (25-100 ft.), exhibits numerous local peculiarities to which distinctive names have been applied, as the “Fluvio-Marine beds” of Bramerton and Thorpe, the “mammaliferous crag,” the “Weybourne crag” and the “Chillesford Clays,” &c. The upper sub-division, the Cromer Forest Beds, contains the bones of large mammouths, and one of the giant beaver, sabre-toothed tiger and many others, as well as the transported stumps of trees. Next in order come the glacial clays, sands and gravels, which contain much material derived from the strata of the county and hence greatly influence the scenery. There is a lower “ till ” with boulders and an upper chalky boulder clay, sometimes with sands and gravels between; glacial gravels overlie the clays in large sheets as at Norwich, Moulton and Dereham. The drift is thicker in the east than in the west,—very interesting exposures occur on the cliffs about Cromer. Later valley gravels occupy some of the stream courses, and along the coast sits the Fen landscape from the Fenland to the Fens.

Climate and Agriculture.—On account of the exposed position of the coast to east and north-east winds, the climate, especially in winter and early spring, is much colder than in the adjacent counties. The air is, however, generally dry, and unhealthy fogs are not common, except in the marshy districts. The cynd is a characteristic mist which sometimes rolls up like smoke from the sea over the eastern parts. Norfolk contains a greater variety of soil than any other county in England. In the north and west the soil is generally chalky; towards the south-east it is a light sand, assuming occasionally the form of blowing sand, but elsewhere capable of cultivation and of average fertility. In the centre and east the prevailing soil is loam, chiefly light and workable, but sometimes composed of stiff chalky boulder clay. Alluvial clays and loams occur on the borders of Lincolnshire and Cambridgeshire, and stretch along the river valleys. The marsh lands along the coast are subject to inundation, but afford capital pasturage. Farming is in an advanced condition, and, by means of draining, subsoil ploughing, &c, excellent crops are raised. The farms are for the most part large and commodious, and the farms are often surrounded by a belt of field. A large acreage is given to oats, and the crop is generally one of small quantity. A large acreage is given to oats, which is still carried on at Norwich and also shawl weaving, although the staple trade of the town is now boots and shoes. Silk is also manufactured at Yarmouth, Wymondham and North Walsham. Flour-mills are numerous all over the county, and there are agricultural implement works at Norwich, Lynn, Thetford, East Harling, North Walsham, Walsingham, and East Dereham. Lime-burning, brick-making, tanning, malting and brewing are carried on in various districts. There are extensive mustard and starch works at Norwich. One of the chief hindrances to commercial progress is the dangerous nature of the sea-coast, and the lack of harbours. A large trade, however, is carried on at Yarmouth. The other principal port is Lynn, and there is a small trade at Cromer and Wells. The ancient and flourishing ports of Great Yarmouth, Lowestoft and Great Yarmouth are mentioned. Eastern railway, the principal lines of which are those from London and Ipswich to Norwich and Yarmouth, from Ely to Norwich and Yarmouth, Ely to Lynn, Lynn to Swaffham and Dereham, Norwich to Norfolk and Union and Walsingham to Great Yarmouth, and branch lines. The Midland & Great Northern joint line, from Lynn, serves Cromer, Norwich, North Walsham and Yarmouth. The railway lines are connected with the port of Yarmouth and the Great and Little Ouse, with many of the drainage-cuts which are navigable, with Lynn.

Population and Administration.—The area of the ancient county is 1,308,439 acres, with a population in 1891 of 454,516, and in 1901 of 460,120. The area of the administrative county is 1,514,612. The county contains 33 hundreds. The municipal boroughs are—King’s Lynn (pop. 3,288); Norwich, a city and county borough and the county town (111,733); Thetford (4613); and Yarmouth, properly Great Yarmouth, a county borough (51,316). The urban districts are Cromer (3781), Diss (3745), Downham Market (2472), East Dereham (5545), Hunstanton (1983), North Walsham (3081), Thorpe (3250), Swaffham (3371), Walsoken (3250), Wells-next-the-Sea (2494). Among other towns may be mentioned Fakenham (2007), Holt (1844), Wymondham (4733). The county is in the south-eastern circuit, and assizes are held at Norwich. There are two courts of quarter sessions, and 25 petty sessional divisions. Each of the four municipal boroughs has a separate commission of the peace and separate court of quarter sessions. The total number of civil parishes is 700. Norfolk is mainly in the diocese of Norwich, with small parishes in those of Ely and Lincoln; it contains 607 ecclesiastical parishes or districts, wholly or in part. For parliamentary purposes the county is divided into six divisions (North-Western, South-Western, Northern, Eastern, Mid, and Southern), and also includes the parliamentary
of the Norman invasion of Norwich formed part of Earl Ralph's earldom, but it offered no active resistance to the conqueror, who built a castle at Norwich, and bestowed the earldom of East Anglia on Earl Ralph. The forfeited estates of Earl Ralph had passed at the time of the Domesday Survey to Roger Bigod, ancestor of the earls of Norfolk, whose line expired in 1066. The Norfolk fief of Count Alan later formed part of the Norman fief, the latter's office, as the honour of Eye; Hermer de Ferrière's fief became the barony of Wormegay, afterwards held by the Bardsley; Hugh de Montfort's fief, as the honour of Haughley, was afterwards attached to the office of constable of Dover. The Howard family settled in the county from the 15th century, Thomas Howard being created Duke of Norfolk for his services at Flodden. Castle Acre was a seat of the earls of Warenne; Paston of the Pastons; Attleborough of the Mortimers; Caister of the Fastolfs.

The shire-system was not definitely established in East Anglia before the Conquest, but the Domesday boundaries of Norfolk are fairly well defined. Some of these remain unchanged. As early as 290, the whole fief of Norwich was held in the Norman fief, the latter's office, as the honour of Eye; Hermer de Ferrière's fief became the barony of Wormegay, afterwards held by the Bardsley; Hugh de Montfort's fief, as the honour of Haughley, was afterwards attached to the office of constable of Dover. NORFOLK—NORFOLK ISLAND

(a seat of King Edward VII), Holkham, Rainham, Costessey, Gunton, Houghton and Shadwell, are of more modern date. The Holkham estate was the scene of the agricultural work of Thomas William Coke, earl of Leicester (d. 1842), who successfully proved that wheat could be profitably grown in this part of the county, and also made great improvements in live stock. Agriculture, beet and various kinds of marketing, and the birthplace of Nelson; Paston and Oxnead, successive seats of the Paston family whose Letters are famous; and Ket’s Oak near Hethersett, W. of Norwich, where Robert Ket took oath as leader of the agrarian rebellion of 1549.

Emerson, Pictures of East Anglian Life (London, 1888), and other works; Rev. A. Jessopp, Arcady (London, 1887), and other works; Quarterly Review (London, 1897), where other literature is cited; G. C. Davies, Norfolk Broads and Rivers (Edinburgh, 1893).

NORFOLK, a city of Madison county, Nebraska, U.S.A., on the north branch of the Elkhorn river, 2 m. from its mouth, and about 75 m. S.W. of Sioux City. Pop. (1900) 3883 (622 foreign-born); (1910) 6025. It is served by the Union Pacific, the Chicago & North Western (of which it is a division headquarters), and the Chicago, St. Paul, Minneapolis & Omaha railways. The city is the seat of the Northern Nebraska Insane Asylum. Cereals, alfalfa and fruit are raised in the surrounding country.

The site was first permanently settled in 1856. Norfolk was incorporated as a city in 1886; it became a city of the first class in 1909.

NORFOLK, a city and port of entry of Norfolk county, Virginia, U.S.A., on the northern side of the Elizabeth river (an arm of the Chesapeake Bay) and at the mouth of its eastern branch, and on the Albemarle and Chesapeake and the Dismal Swamp canals, about 90 m. S.E. of Richmond. Pop. (1890) 34,371; (1900) 46,624, of whom 1705 were foreign-born and 20,230 were negroes; (1910 census) 67,452. It is served by the Atlantic Coast Line, the Seaboard Air line, the Southern, the New York, Philadelphia & Norfolk, the Chesapeake & Ohio, the Norfolk & Western, the Norfolk & Southern and the Virginia railways, by many steamship lines, by ferry to Portsmouth (immediately opposite), Newport News, Old Point Comfort and Hampton, and by electric lines to several neighbouring towns. The Norfolk and Portsmouth Belt Line encircles the two cities, and connects the various trunk lines. Among the prominent buildings and institutions are the Custom House, the Federal Building, Marine Hospital, St Christopher’s Hospital, St Vincent’s Hospital, Norfolk Protestant Hospital, Sara Leigh Hospital, Norfolk Public Library, Norfolk Academy, Cotton Exchange, City Market, and the various banks. The Navy Yard, the Norfolk Naval Shipyard, the Norfolk Navy Yard, and the Norfolk Naval Base are of immense importance. One of the most important manufacturing industries is grading, roasting, cleaning and shelling peanuts (in 1905 valued at $791,750). In 1900 the value of the factory products was $4,691,779; in 1905 it was $5,900,120, the city ranking third among the cities of the state in value of factory products.

Norfolk was founded in 1682 in pursuance of an act of the Virginia Assembly passed in 1680 to establish towns for the encouragement of trade; it was incorporated as a borough in 1736 by a royal charter, was chartered as a city in 1845, its charter being revised in 1887 and 1884, and received a new charter in 1906 (amended in 1908), under which there are a mayor (elected for four years), a common council, a board of aldermen and a board of control of three members, which has charge of public works, streets, sewers, drains and water supply, the police and fire departments, the work of the board of health, etc. Norfolk is administratively independent of Norfolk county. In 1906 the town of Berkley (incorporated in 1890; pop. in 1900, 4988) was annexed. During the War of Independence Norfolk was bombarded on the 1st of January 1776 by the British under John Mutfay, 4th Earl of Dunmore (1732-1809); much of the town was burned by the American troops to prevent Dunmore from establishing himself here. In 1835 it suffered severely from yellow fever. At the outbreak of the Civil War the city was abandoned, and the navy yard was burned by the Federals in April 1861; Norfolk was then occupied until the 9th of May 1862 by Virginia troops, first under General William Booth Taliaferro (1822-1868) and later under General Benjamin Huger (1806-1877). Five miles from Norfolk and with Norfolk as its headquarters was held from the 26th of April to the 30th of November 1861 the Jamestown Ter-Centennial Exposition, celebrating the first permanent English settlement in America at Jamestown, Virginia.

NORFOLK ISLAND, an island in the Pacific Ocean, about 800 m. E. of the nearest point of New South Wales, in 29° S., 167° 56‘ E. It stands on a submarine tableland extending about 18 m. to the N. and 25 m. to the S., and has itself an area of 8228 acres or 133.3 sq. m. The islets of Nepean and Philip lie near it. Its high cliff-bound coast is difficult of access. With a general elevation of 400 ft. above the sea the island rises in the N.W. to 1950 ft. in the double summit of Mount Pitt. The soil, of decomposed basalt, is wonderfully fertile. The rich undulating pasture-land with clumps of trees and copes resembles a park. Oranges, lemons, grapes, passion fruit, figs, pine-apples, guavas and other fruits grow abundantly; while potatoes, onions, maize and arrowroot can be cultivated. The Norfolk Island pine ( Araucaria excels a) is a magnificent tree, with a height sometimes exceeding 200 ft. and a girth of 30. A small species of palm is known as the Norfolk Island cabbage. Tree-ferns are abundant. The flora is most closely associated with that of New Zealand, and the avifauna indicates the same connexion. Within the island are the islets of Poor Knights, the Whanganui Island, and the Queen Charlotte Island, which belong to Australian genera are apparently immigrants, while those which occur on the island in common with New Zealand would be incapable of such distant migration. The climate is healthy, the thermometer rarely sinking below 65° F. The island is a station of the British Pacific cable. It was discovered in 1774 by Captain Cook, and was taken by Philip King of the “Stirling” and twenty-four convicts from New South Wales. This settlement was abandoned in 1805, but in 1826 the island was made a penal settlement from New South Wales. In 1846, 104 Pacific islanders took the place of the convicts. Forty of them soon returned to Pircarn Island, and the remainder deteriorated owing to intermarriage. The administration of justice by an elected magistrate was unsatisfactory. Crime was rarely punished, and debts were not recoverable. A remedy was attempted in 1896 by an improvement in the government. The island was brought under the immediate administration of New South Wales; a chief magistrate, appointed by the governor of New South Wales, took the place of the elected magistrate, and an elected council of twelve elders superseded the general gathering of the adult population. In 1867 a Melanesian missionary was appointed, and in 1882 a church was erected to the memory of Bishop Patteson, with windows designed by Burne-Jones and executed by William Morris.
NORICUM (Noricus ager), in ancient geography, a district bounded on the N. by the Danube, on the W. by Raetia and Vindelicia, on the E. by Pannonia, on the S. by Pannonia and Italy, corresponding to the greater part of the modern Styria and Carinthia, and part of Austria, Bavaria and Salzburg. The original population appears to have consisted of Illyrians, who after the great emigration of the Gauls became subordinate to various Celtic tribes, chief amongst them being the Taurisci, probably called Norici by the Romans from their capital Noreia (Neumarkt). The country is mountainous and the soil poor, but it was rich in iron, and supplied material for the manufactories of arms in Pannonia, Moesia and northern Italy. The famous Noric steel was largely used for the Roman weapons ("Noricus basii," Horace, Odes, i. 16. 9). The inhabitants were a brave and warlike people, who paid more attention to cattle-breeding than to agriculture, although it is probable that the Romans, by draining the marshes and cutting down timber, increased the fertility of the soil. Gold and salt were also found in considerable quantities; the plant called zuliuca (the wild or Celtic nard) grew in abundance, and was used as a perfume (Pliny, Nat. Hist. xxi. 20. 43). Noricum was the southern outpost of the northern or Celtic peoples and the starting-point of their attacks upon Italy. It is in Noricum that we first hear of almost all these Celtic inventions. Archaeological researches, particularly in recent years, have established the fact that the Romans were no strangers to the inhabitants of Noricum, and have shown that for centuries before recorded history there was a vigorous civilization. The Hallstatt cemeteries contained weapons and ornaments from the Bronze age, through the period of transition, up to the fully-developed Iron age. Professor Ridgeway (Early Age of Greece, i. ch. 5) has made out a strong case for the theory that in Noricum and the neighbouring districts was the cradle of the Homeric Achaeans. For a long time the Noricans enjoyed independence under princes of their own, and carried on commerce with the Romans. In 48 B.C. they took the side of Caesar in the civil war against Pompey. In 16, having joined with the Pannonians in invading Hخاریa, they were defeated by Publius Silius, proconsul of Illyricum. From this time Noricum is called a province, although not organized as such, but remaining a kingdom with the title regnun Noricum. It was under the control of an imperial procurator. It was not until the reign of Marcus Antoninus that the Legio II. Pia (afterwards called Italica) was stationed at Noricum, and the commander of the legion became the governor of the province. Under Diocletian, Noricum was divided into Noricum ripense (along the Danube) and mediterraneum (the southern mountainous district) and in 305 Noricum fell under a praeses, and both belonged to the diocese of Illyria in the prefecture of Italy. The Roman colonies and chief towns were Virunum (near Marisalas), Ovilava (Wels), Celeia (Cilliis), Juvavum (Salzburg), Lauriacum (Lorch, at the mouth of the Enns, the ancient Anisus).

(2nd ed., 1881) p. 290; Smith’s Dict. of Gk. and Roman Geog. (1873); Mary B. Peake, The General Civil and Military Administration of Noricum and Raetia (Chicago, 1907); full references to ancient authorities in A. Holder, All-celtischer Sprachkampf ii. (1913), (J. H. F.)

NORMAN, SIR HENRY WYLIE (1826-1904), field-marshall and colonial governor, was born on the 2nd of December 1826, and entered the Indian army at the age of seventeen. In 1840 his father, who had been for many years a merchant in Cuba, became a partner in a mercantile house in Calcutta, where he was joined by his son in 1842. In 1844 the latter obtained a cadetship. He went through the second Sikh campaign and having attracted the favourable notice of Sir Colin Campbell was selected by him to accompany an expedition against the Kohat Pass Affghans in 1850 as officiating brigade-major. The subaltern of twenty-four was given a substantive appointment in this capacity for a splendid deed of gallantry, which is recorded by Sir Charles Napier in the following terms: “In the pass of Kohat a sepoy picket, descending a precipitous mountain under fire and the rolling of large stones, had some men killed and wounded. Four of the latter, dreadfully hurt, crept under some rocks for shelter. They were not missed until the picket reached the bottom, but were then discovered by our glasses, high up and helpless. Fortunately the enemy did not see them, and some sepoys volunteered a rescue, headed by Norman of the 31st Native Infantry and Ensign Murray of the 70th Native Infantry. These brave men—would that the names of all were known to me for record!—ascended the rocks in defiance of the enemy, and brought the wounded men down.” Norman served in numerous frontier expeditions between 1850 and 1854, and in the suppression of the Sonthal rebellion of 1855-56. In the Mutiny campaign he was constantly engaged, being present at the siege of Delhi, the relief of Lucknow and a number of other affairs. As adjutant-general of the Delhi Field Force he was one of the leading spirits of the siege, and afterwards became its chief chronicler. Altogether he was mentioned twenty-five times in despatches. He afterwards became assistant military secretary for Indian affairs at the Horse Guards, military secretary to the government of India, military member of the viceroy’s council and member of the secretary of state for India’s council. In 1883 Sir Henry began his colonial career as governor of Jamaica, an appointment from which he was transferred in 1888 to the governorship of Queensland. Here he remained until 1895, when he came home to act as Home, cotton and colonial secretary. In 1895 he was appointed governor of the British Raj. In 1896 he was appointed governor of Bengal, and in 1898 governor-general of India. In 1898 he was again governor of Bengal, and in 1899 became viceroy of India, a post he held until 1901. He died on the 26th of October 1904.

NORMAN, a city and township (coextensive) and the county-seat of Norman county, Oklahoma, U.S.A., about 2 m. N. of the Canadian river, and 18 m. S. by E. of Oklahoma City. Pop. (1890) 787; (1900) 2225; (1910) 3724. It is served by the Atchison, Topeka & Santa Fé railway. It is the seat of the university of Oklahoma (chartered, 1892; opened 1894; coeducational), which includes a college of arts and sciences, schools of applied science, medicine, pharmacy, mines and fine arts, and a preparatory school, and in 1908 had 56 instructors and 790 students. The Oklahoma Insane Asylum is in the city. Cottonseed oil, flour and ice are manufactured, and the neighbouring region produces much cotton, Indian corn, oats, alfalfa and wheat. Norman county, of which the city is the county-seat, was made in 1889, and Norman was chartered as a city in 1902.

NORMANBY, CONSTANTINE HENRY PHEPPS, 1ST MARQUESS OF (1797-1863), British statesman and author, son of Henry, 1st earl of Mulgrave (1755-1831), was born on the 15th of May 1797. The 1st earl (who was created baron in 1794 and earl in 1812), was a distinguished soldier, and Pitt’s chief military adviser; and he held the offices of chancellor of the Exchequer (1796), secretary for foreign affairs (1805), first lord of the admiralty (1807-1810), and master of the ordnance (1810-1818). In 1792 he inherited the earlier Irish barony of Mulgrave—created in 1677 for his father, Constantine (1722-1775) grandson of Sir Constantine Phipps (1656-1723), the lord chancellor of Ireland—from his elder brother Constantine (1744-1792), a distinguished naval captain. His son, the future marquess, passed through Harrow and Trinity College, Cambridge, and sat for the family borough of Scarborough as soon as he attained his majority. But, speaking in favour of Catholic emancipation, and dissenting in other points from the family politics, he resigned his seat, and went to live in Italy for some two years. Returning in 1821, he was elected for H serge, and made a considerable reputation by political pamphlets and by his speeches in the house. He was returned for Malton at the general election of 1826, becoming a supporter of Canning. He was already known as a writer of romantic tales, The English in Italy (1823); in the same year he made his appearance as a novelist with Malilda, and in 1828 he produced...
NORMANDY

another novel, Yes and No. Succeeding his father as earl of Mulgrave in 1831, he was sent out as governor of Jamaica, and was afterwards appointed lord-lieutenant of Ireland (1835-1839). He was created marquess of Normanby in 1838, and held successively the offices of colonial secretary and home secretary in the last years of Lord Melbourne's administration. In March 1846 to 1852 he was ambassador at Paris, and from 1854 to 1858 minister at Florence. The publication in 1857 of a journal kept in Paris during the stormy times of 1848 (A Year of Revolution), brought him into violent controversy with Louis Blanc, and he came into conflict with Lord Palmerston and Mr Gladstone, after his retirement from the public service, on questions of French and Italian policy. He died in London on the 28th of July 1863. He had married in 1818 the daughter of Lord Ravensworth, and was succeeded as 2nd marquess by his son, George (1819-1900), a liberal politician, who became governor of Queensland (1871-1874), New Zealand (1874-1879), and Victoria (1879-1884).

NORMANDY, a province of old France, bounded on the N.E. by the river Bresle, which falls into the Channel at Tréport and separates Normandy from Picardy, and then roughly by the Epte, which divides the Vexin into two parts. From the confluence of the Epte and Seine to Ivry, the boundary between Normandy and the Ile-de-France is artificial; it is afterwards practically determined by the course of the Eure and the Sarthe. But from there to the sea Normandy is separated by a narrow strip of land by the banks of the Loir. The county of Bretteville by the sea, which lies between the line of the Loir and the coast, is nominally a part of Brittany; it lies fairly regularly in the direction from E. to W. The boundary between the coast of Normandy and that of Brittany is formed by the mouth of the Couesnon. Normandy is washed by the English Channel and lies opposite to England. The northern part of the coast consists of cliffs, which cease at the mouth of the Seine, the estuary of which is 12 km. wide from Havre to Trouville; the coast of Calvados consists of rocks and beaches; that of the peninsula of Cotentin is sandy on the eastern side and granite on the west; in the north it forms height of 50 m. at the point of Barneville and the cape of La Hague a kind of concave arc in which lies the harbour of Cherbourg.

Historical Geography.—In the time of Caesar the country which has since gone to form Normandy was inhabited by several tribes of the Gauls, the Caleti, who lived in the district of Caux, the Velicioni, in the Vexin, the Lexovi, in the Lieuvain, the Uselli in Cotentin; these names have been preserved for A.D. 958 by Caesar. At the beginning of the 5th century, when the Notitia provinciarum was drawn up, Normandy corresponded to the Province Lugudunensis Secunda, the chief town of which was Rouen (Caesar: Rotomagensis). It included seven provinces of the kingdom of Rouen: those of Bayeux (C. Bajoceastium), Lisieux (C. Lexorionum), Coutances (C. Constantia), Avranches (C. Abricanum), Sées (C. Sees), and Évreux (C. Evreux). The western ecclesiastical province of Caletus has been included in Normandy since the 5th century. It formed the ecclesiastical province of Rouen, with six suffragan sees. For civil purposes, the province was divided into a number of pago; the civitas of Rouen formed the pago Rotomagensi (Rouen); the pago Calicetii (p. Caletii) (Caux); the pago Villicessus (Vexin); the pago Telouco (Talou); that of Bayeux the pago Bajoceastii (Bassin); and the Olixo Saxoniz; that of Lisieux the pago Lexivismus (Lieuvain); that of Coutance the pago Corinensis and p. Contimonti (Cotentin); that of Avranches the pago Abricanus (Avranchin); that of Sées the pago Osmentis (Hémius), the pago Sagensiz and p. Carbonensiz (Corbœu); and that of Évreux the pago Erivocis (Évreux); the pago circa Humberni (Caletus). The possession of the Normans in the country that Normandy owes its name, from the 10th century onwards it formed a duchy, roughly coextensive with the ecclesiastical province of Rouen. Under the feudal regime, the energy of the Norman dukes prevented the formation of many powerful lordships, and there are few worthy of note, save the countships of Evreux, Harcourt, Le Perche and Mortain.

The duchy of Normandy was created by Richard I. in 1198. The territory of the duchy was bounded in 1203 by King Philip II of France in the 16th century the gouvernement of Normandy; the extent of this gouvernement did not, as a matter of fact, correspond exactly to that of the duchy, for Le Perche, which belonged to the duchy of Normandy, was ceded to the government of Maine, while the Thimerais, which belonged to the countship of Blois, was joined to the gouvernement of Normandy. In the 17th century this gouvernement was divided into the généralités or intendances of Basse-Seine, Eure, Calvados, Manche and Orne.

History.—The prosperity of Normandy in Roman times is proved by the number and importance of the towns which existed there at that time. The most important was Lillébonne (Julubona), chief town of the Caleti, the Roman antiquities of which are famous. The evangelization of Normandy did not take place before the 3rd century: the first bishop of Rouen, about 260, seems to have been St Mallanus; it is possible, however, that before this date there were a few Christian communities in Normandy, as seems to be proved by the existence of St Nicarius, who was martyred in the Vexin.

The province of Lugudunensis Secunda, which at the end of the 5th century formed part of the kingdom of Syagrius, was conquered by Clovis before 506, and during the Merovingian times followed the fortunes of Neustria. In the 9th century this country was ravaged by the Northmen, who were constantly going up and down the Seine, and later on it was formally ceded to them. During these invasions Rouen was occupied several times, notably in 876 and 885.

The definitive establishment of the Normans, to whom the country owes its name, took place in 911, when by the treaty of Saint-Clair-sur-Epte, concluded between King Charles the Simple of France and Roll of Rollo, chief of the Normans, the territory comprising the town of Rouen and a few pago situated on the sea-coast was ceded to the latter; but the terms of the treaty are ill-defined, and it is consequently almost impossible to find out the exact extent of this territory or to know whether Brittany was at this time made a feudal dependency of Rouen. But the chronicler Dudo of Saint-Quentin's statement that Rollo married Gisela, daughter of Charles the Simple, must be considered to be legendary. In 924 Rollo received from the king of France Bessin and Maine. Although baptized, he seems to have preserved certain pagan customs. The history of Normandy under Rollo and his immediate successors is very obscure, for the legendary work of Dudo of Saint-Quentin is practically our only authority.

Rollo died in 927, and was succeeded by his son William "Long Sword," born of his union more danoix with Foppa, daughter of count Bèrenger; he showed some attachment to the Scandinavian language, for he sent his son William to Bayeux to learn Norse. The first two dukes also displayed a certain fidelity to the Carolingian dynasty of France, and in 936 William "Long Sword" did homage to Louis IV, d'Outremer. He died on the 17th of December 942, assassinated by the count of Flanders.

During the minority of his successor, Duke Richard, King Louis IV, who was making an expedition into Normandy, was captured by his troops and handed over to the English. From this time onwards the dukes of Normandy began to enter into relations with the dukes of France; and in 938 Duke Richard married Hugh the Great's daughter. He died in 966. At the beginning of the reign of his son, Richard II (966-1026), there was a rising of the peasants, who formed assemblies with a view to establishing fresh laws for the management of the forests. This attempt at insurrection, described by William of Jumièges, and treated by many historians, on the authority of the poet Wace, as a sort of democratic movement, was put down with the utmost severity. (p. 5). In 975 he seems to have been poisoned by his brother, Robert the Magnificent, or the Devil (1027-1039), who succeeded him. In 1031 Robert supported King Henry I of France against his brother Robert, who was laying claim to the throne, and in return for his services received the French Vexin. The duke died on a pilgrimage to Jerusalem, leaving as his heir an illegitimate son, William, born of his union with the daughter of a tanner of Falaise.

William was very young when his father started for the Holy Land, leaving him under the protection of the king of France. In 1037 Henry I. had to defend the young duke against an army of English nobles, whom he succeeded in beating at Val-Éclusines. In the following year the king of France was in his turn supported by the duke of Normandy in his struggle against Geoffrey Martel, count of Anjou; the two allies besieged
Moulines (1048); and the war was continued between the duke of Normandy and the count of Anjou by the siege of Alençon, which was taken by Geoffrey Martel, then retook by William, and that of Domfront, which in 1049 had to surrender to Duke William.

In 1054 William the Bastard married Matilda, daughter of Baldwin V., count of Flanders, in spite of the opposition of Pope Leo IX., who only gave his consent on condition that William and Matilda should each build an abbey: under these conditions were built the Abbaye-aux-Hommes and the Abbaye-aux-Dames at Caen. The king of France had at first protected William, but before long became alarmed at his ambitions; the first sign of his feeling of rivalry with the duke was the encouragement he gave to the Duke William Busus, count of Eu and Montreuil, who claimed the ducal crown. In 1054 he invaded Normandy with his brother Odo and this count, but Odo was beaten at Mortemer. In 1058 the king of France, joined by Geoffrey Martel, count of Anjou, tried to revenge himself, but was beaten at the ford of Varaville (1058).

Towards the same time took place the annexation of Maine to Normandy, for a short period only. Herbert II., the young count of Maine, who was a vassal of the count of Anjou, did homage to William the Bastard between 1055 and 1060, perhaps after the defeat of Geoffrey Martel; he promised to marry one of William's daughters, and to give his sister Margaret to the duke's son, Robert Curthose, on the understanding that, if he died leaving no children, the countship was to fall to William. After his death, the people of Maine revolted (1063), choosing as their lord Walter de Mantes, count of Vexin; but William the Bastard, after one campaign, succeeded in imposing the authority of Normandy. Three years later, William took possession of Anjou, of which he was crowned king in 1066. Normandy now became the scene of William's quarrels with his son, Robert Curthose, who laid claim to Normandy and Maine, and with the aid of King Philip I. of France succeeded in defeating his father at Gerberoy in 1070.

William the Conqueror died on the 7th of September 1087, and was buried in the church of St Etienne at Caen. After his death his eldest son, Robert Curthose, kept Normandy and Maine, and his second son, William Rufus, became king of England. In 1091 William Rufus made a vain attempt to recover Normandy; but in 1096 Robert departed on a crusade and pledged the duchy to his brother for 10,000 livres. When Robert returned, William Rufus had just died, and his younger brother, Henry Beauclerc, had already taken possession of the crown. Henry's ambition of uniting Normandy to England; in 1105, with the aid of Helias, count of Maine, and the son of Geoffrey Martel, count of Anjou, he took and burnt Bayeux, but failed to take Falaise. On the 28th of September 1106, by the help of William, count of Evreux, Robert, count of Meulan, Robert de Varenne, and Helias, count of Maine, he defeated his brother at Tinchebrai, took him prisoner, and seized Normandy. Duke Robert passed the rest of his life in captivity and died in 1134.

From 1106 to 1204 Normandy remained united to England. According to Ordericus Vitalis, whose Historia ecclesiastica is a chronicle of the greatest interest for the history of Normandy in the 11th and 12th centuries, Henry Beauclerc governed the two kingdoms wisely, checking the nobles, and protecting the Church and the common people. He carried on hostilities against the king of France and William Clito, son of Robert Curthose, whose claim to the duchy of Normandy was upheld by Louis VI., and won an important victory over his opponents at Brémule in Normandy (1119). After the disaster of the White Ship (1122), in which the Atheling William lost his life, Henry's only surviving child was a daughter, Matilda, wife of the emperor Henry V. In 1127 Matilda married Geoffrey the Fair, eldest son of Fulk V., count of Anjou. After the death of Henry I. in 1135, a struggle arose between Matilda, who claimed the kingdom of England and the duchy of Normandy in the name of her son Henry Plantagenet, and Theobald, count of Champagne, grandson of William the Conqueror on the side of his mother Adela, the candidate of the Normans of Normandy, while the Norman party in England supported Stephen, brother of Theobald. In 1144 Theobald, whose position had been much weakened since the taking of the castle of Rouen, gave up his rights in Normandy to Matilda's husband Geoffrey, count of Anjou, in favour of Henry Plantagenet. Between 1139 and 1145 Geoffrey, with French and Flemish help, gradually subdued Normandy, and on his death, in 1151, his son Henry Plantagenet was master of Normandy as well as count of Anjou. In 1152, by his marriage with Eleanor, duchess of Aquitaine, the divorced wife of Louis VII. of France, Aquitaine also was secured to himself and his descendants. Finally, in 1153, he was recognized by Stephen of Blois as heir to the throne of England. The duchy of Normandy, though nominally in feudal dependence on the king of France, 1156 became part of the great Angevin empire, of which the power and resources were more than equal to that of the French kings. The perennial struggle, dating from this period, between the kings of England and France is dealt with elsewhere (see FRANCE: History, and ENGLISH HISTORY).

From the first the French kings were fully conscious of the menace of the Angevin power. The reign of Louis VII. was occupied by the struggle against Henry II. In 1158 he committed the blunder of concluding a treaty with Henry, by which he ceded his rights in Anjou. In 1159 the marriage of Henry to the Countess of Eu was nullified, and his wife, the French Vexin as her dowry. The Vexin was consequently the scene of hostilities in 1159 and 1165. In 1173 Louis VII., resuming the policy of his grandfather and father, took advantage of the strife which broke out in the family of the king of England, and took the part of Henry II.'s sons who were in revolt against their father. He negotiated with Henry Short Mantle, duke of Normandy, as though he was king of England, but owing to his weakness did not gain any serious advantage. In 1173 he abjured the sign of Verneuil, in 1174 that of Rouen, and was no more successful in the matter.

Philip Augustus (1180-1223) pursued the same policy with greater tenacity and success. He began by taking part against Henry II. with his son and successor, Richard Cœur de Lion, who obtained the throne on the death of Henry II. in 1189. From the point of view of Normandy, the most important events of Richard's reign were: the truce of Issoudun, by which Philip Augustus kept the Norman Vexin which he had just conquered (1193), the building of Richard of Château-Gaillard (1196), and finally the defeat of Philip Augustus by Richard at Couvres in Normandy (1198). On the death of Richard at Chalus in 1190 the position of Philip Augustus was critical. This situation was modified under the reign of John Lackland, Richard's brother, who had himself crowned duke of Normandy at Rouen (April 25, 1199). Philip Augustus set up in opposition to him Arthur of Brittany, son of Geoffrey and grandson of Henry II., and the first phase of the struggle between the kings of France and England continued until the treaty of Goulart (1200). But in 1202 Philip made a fresh attempt to seize the continental possessions of the kings of England. An excuse for reopening hostilities offered itself in the abduction, by John, of Isabel of Angoulême, the betrothed of Hugh le Brun, son of the count of La Marche. The barons appealed to Philip Augustus, who summoned John to appear before the royal judges; he failed to appear, and was consequently condemned by default, as a disloyal vassal, to have all the fiefs which he held in France confiscated (April 1202). The confiscation, a purely legal and formal operation, was followed by the actual conquest.

In June 1202 Philip Augustus invaded Normandy and besieged the castle of Arques, near Dieppe; at the same time Arthur of Brittany was taken prisoner by John at Mirebeau, near Poitou, and imprisoned in the castle of Falaise, from which he was removed to Rouen and died, probably assassinated by John's orders. The conquest of Normandy began with the occupation of Château-Gaillard after an eight months' siege (September 1202-April 1204); the rest of Normandy was taken during the following months, Rouen surrendering in 1204 but
obtaining a guarantee of her privileges. The conquest of Normandy by the French was not, however, recognized officially till the treaty of Paris (1259).

Normandy enjoyed a time of comparative prosperity under French rule, up to the time of the Hundred Years' War. The institution of the Estates of Normandy even assured her a sort of independence. In 1320 the duchy of Normandy was revived in favour of John, son of King Philip VI.

Owing to her geographical position, Normandy suffered heavily from the Hundred Years' War. In 1346 Edward III, at the instance of Godefrid d'Harcourt lord of Saint-Sauveur, invaded Normandy, landing at Saint-Vast-la-Hougue (July 12); and arriving at Caen on the 27th of July, he laid waste the country as far as Poissy. After the accession of John II. (1350), Normandy was again separated from the crown and given as an appanage to the dauphin Charles. The treaty of London (1359) stipulated for its cession to England, but the provisions of the treaty were modified by those of the treaty of Brétigny (1360), and it remained in the possession of France.

One of the chief feudatories of Normandy, Charles the Bad, grandson of Louis X. le Hutin, and a claimant to the crown of France, was in 1365, owing to his continued treachery, deprived of the countship of Longueville, and in 1378 of all his other possessions in Upper and Lower Normandy. The most striking event of the war between the French and English which took place in Normandy during the reign of Charles V. was the siege of Saint-Sauveur-le-Vicomte, which was occupied by the English, and only surrendered after a siege of several years.

The opening years of the reign of Charles V (1380-1422) were marked by a revolt which broke out at Rouen against the aids which the royal government had tried to impose (1381); a cloth-merchant was proclaimed king of Rouen, and Charles was obliged to go in person to Rouen to put down the insurrection. In 1415 the war with England was resumed: an English army of 60,000 men landed on the 14th of August at the mouth of the Seine, took Harfleur on the 16th of September, and finally defeated the army of the king of France at Agincourt.

During the following years the whole of Normandy was occupied, Rouen holding out for nearly six months (July 29, 1418—January 13, 1419), and Henry V. of England entrusted the administration of Normandy to a special council. In spite of the moderation of the duke of Bedford's government, Normandy, ruined by the war, was in a state of great distress, and in the years following the treaty of Troyes (1420) there was a continual resistance offered to the English. This resistance became general after the expeditions of Joan of Arc and the treaty of Arras; at the end of 1435 the whole district of Caux, and in 1436 that of the Val de Vire revolted; Mont-Saint-Michel, which had never been taken by the English, continued to resist, and in order to keep guard over it the English built Granville. But Normandy was not recovered by the French till after the sack of Fougères (1440). Cotentin was reconquered by Richmond (see Arthur, duke of Brittany) and the duke of Brittany; Rouen surrendered on the 29th of October 1449. In face of these successes of the French, an English army was sent into Normandy under the leadership of Thomas Kyriel; it landed at Cherbourg and marched across Cotentin to Bayeux, but was met at Formigny (April 13, 1450) by the count of Clermont and utterly routed. Shortly afterwards Caen, and finally Cherbourg, capitulated.

After the French conquest, the history of Normandy is less eventful. In 1515 Normandy was given as an appanage to Charles, brother of King Louis XI. who was deprived of it in 1547. The kings of France tried to win the support of Normandy by certain favours, such as maintaining the provincial Estates and the University of Caen, founded by the kings of England, and transforming the Exchequer of Normandy into a permanent court of justice (1499) which was called the Parlement of Normandy and sat at Rouen in the famous Palais de Justice. Among the measures which contributed to the increase of the prosperity of Normandy should be noted the construction in 1752 of the Hâvre de Grace.

During the 16th century the Protestant Reformation met with some success in Normandy, where the Wars of Religion caused a certain amount of disturbance. The Reformation movement began with Pierre Bar in 1528, and the first apostle of the Reformation at Rouen was François Legay, called Bois-normand. In 1562 the town of Rouen was taken by the Calvinists, but retaken in the same year by the Catholics. Caen received the Reformed religion in 1531, and Alençon in 1582. In the massacre of Saint Bartholomew's day (1572) more than 10,000 victims were slaughtered by the Catholics.

In spite of the success of Protestant ideas, however, the Catholic party of the League succeeded after 1588 in establishing itself in Normandy, and King Henry IV. had to conquer it by force of arms. The most famous engagements during this expedition were the victories of Henry IV. at Arques and Ivry, but he failed to take Rouen, which was defended by Alexander Farnese, duke of Parma, and only surrendered after the abjuration of the king.

A history of Normandy in the 17th and 18th centuries contains few events of note, except for a few attempts at landing made by the English, such as Bedford's expeditions (2 vols., 1833-1836); in 1578 the English admiral Anson attacked Cherbourg, and in 1750 Admiral Rodney bombaraded Havre. From 1790 dates the creation of the departments, when Normandy ceased to have a separate political existence, and her history becomes one with that of France.

(R. La.)

NORMANS, the softened form of the word "Northman," applied first to the people of Scandinavia in general, and afterwards specially to the people of Norway. In the form of "Norm" (Norrmannen, Normannus, Normaund) it is the name of those colonists from Scandinavia who settled themselves in Gaul, who founded Normandy, who adopted the French tongue and French manners, and who from their new home set forth on new errands of conquest, chiefly in the British Islands and in southern Italy and Sicily. From one point of view the expeditions of the Normans may be looked on as continuations of the expeditions of the Northmen. As the name is etymologically the same, so the people are by descent the same, and they are still led by the old spirit of war and adventure. But in the view of general history Normans and Northmen must be carefully distinguished. The change in the name is the sign of a thorough change, if not in the people themselves, yet in their historical position. Their national character remains largely the same; but they have adopted a new religion, a new language, a new system of law and society, new thoughts and feelings on all matters. Like as the Norman still is to the Northman, the effects of a settlement of Normans are utterly different from the effects of a settlement of Northmen. There can be no doubt that the establishment of the Norman power in England was, like the establishment of the Danish power, greatly helped by the essential kindred of Normans, Danes and English. But it was helped only silently. To all outward appearance the Norman conquest of England was an event of an altogether different character from the Danish conquest. The one was a conquest by a people whose tongue and institutions were still palpably akin to those of the English. The other was a conquest by a people whose tongue and institutions were palpably different from those of the English. The Norman settlers in England felt no community with the earlier Danish settlers in England. In
fact the Normans met with the steadiest resistance in a part of England which was largely Danish. But the effect of real, though unacknowledged, kindred has none the less an important practical effect. There can be no doubt that this hidden working of kindred between conquerors and conquered in England, as compared with the utter lack of all fellowship between conquerors and conquered in Sicily, strongly came out of several ways. First, there was a difference between the Norman conquest of England and the Norman conquest of Sicily.

These two conquests, wrought in the great island of the Ocean and in the great island of the Mediterranean, were the main works of the Normans after they had fully put on the character of a Christian and French-speaking people, in other words, after they had changed from Northmen into Normans. The English and the Sicilian settlements form the main Norman history of the 12th century. The 10th century is the time of the settlement of the Northmen in Gaul, and of the change in religious and language of which the softening of the name is the outward sign. By the end of it, any traces of heathen faith, and even of Scandinavian speech, must have been mere survivals. The new creed, the new speech, the new social system, had taken such deep root that the descendants of the Scandinavian settlers were better fitted to be the armed missionaries of all these things than the neighbours from whom they had borrowed their new possessions. With the zeal of new converts they set forth on their new errand very much in the spirit of their heathen forefathers. If Britain and Sicily were the greatest fields of the enterprise, they were very far from being the only fields. The same spirit of enterprise which brought the Northmen into Gaul seems to carry the Normans out of Gaul into every corner of the world. Their character is well painted by a contemporary historian of their exploits. He sets the Normans before us as a race specially marked by cunning, despising their own inheritance in the hope of winning a greater, eager after both gain and dominion, given to imitation of all kinds, holding a certain mean between lavishness and greediness—that is, perhaps uniting, as they certainly did, these two seemingly opposite qualities. Their chief men, he adds, were specially lavish through their desire of good report. They were, moreover, a race skillful in flattery, given to the study of eloquence, so that the very boys were orators, a race altogether unbridled unless held firmly down by the yoke of justice. They were enduring of toil, hunger, and cold whenever fortune laid it on them, given to hunting and hawking, delighting in the pleasure of horses, and of all the weapons and garb of war. Several of these features stand out very clearly in Norman history. The cunning of the Normans is plain enough; so is their Impatience of restraint, unless held down by a yoke of justice. The greater or lesser lavishness of their conduct is marked. Little of original invention can be traced to any strictly Norman source; but no people were ever more eager to adopt from other nations, to take into their service and friendship from any quarter men of learning and skill and eminence of every kind. To this quality is perhaps to be attributed the fact that a people who did so much, who settled and conquered in so large a part of Europe, has practically vanished from the face of the earth. If Normans, as Normans, now exist anywhere, it is certainly only in that insular fragment of the ancient duchy which still holds itself down by a yoke of justice. As for lavishness, it was found in studii inserviis in tantum, ut etiam ipsos pueros quasi rhetores attendan, quae quidem, nisi judicium pretium, effrenatisse est; laboris, ineditis, algoris, ubi futura expendit, patiendi, venationi accepiturn exercitia inserviis. They were great in all the arts, military, legal, oratory. They were conquerors, but they were also admirers of their own dukes. Elsewhere, as the settlers in Gaul became French, the emigrants from Gaul became English, Irish, Scottish, and whatever we are to call the present inhabitants of Sicily and southern Italy. Every-

1 Geoffrey Malaterra, i. 3 "Est quippe gens astutissima, in- juriarum ultrix, spelius alius lucrandi, patrios agros vilipendens, quae et dominationis aida, cujuslibet rei simulatrix, interfateta et avariaetiam quodam modum habens. Principes vero delevit effrenatae similitudo, lamae largissimi, gens adulator sciens, eloquentissima in studii inserviis in tantum, ut etiam ipsos pueros quasi rhetores attendan, quae quidem, nisi judicium pretium, effrenatisse est; laboris, ineditis, algoris, ubi futura expendit, patiendi, venationi accepiturn exercitia inserviis."

2 This view of Ranulf Flamard's work, which on Freeman's authority superseded the older view, which attributed the feudal organization of England to the Conqueror himself, was subjected to a destructive criticism by Mr. J. H. Round in his Feudal England. (Ed.)
confiscations, his grants, all that he did, was a logical deduction from one or two legal principles, arbitrary certainly in their conception, but strictly carried out to their results. Even Norman lawlessness in some sort took a legal shape. In the worst days of anarchy, in the minority of William or under the no-reign of Robert, the robber-baron could generally give elaborate reasons for every act of wrong that he did.

It is perhaps less wonderful that this characteristic should have been left out in a picture of the Normans in Apulia and Sicily than if it had been left out in a picture of the Normans in Normandy and England. The circumstances of their Apulian and Sicilian occupancy were certainly less and too local to bring out this feature of their character so strongly as it was brought out by the circumstances of their English conquest. Possibly the same cause may have kept the chronicler from enlarging on their religious character; yet in Sicily at least they might pass for crusaders. Crusaders in fact they were before crusades were preached. Norman warriors had long before helped the Christians of Spain in their warfare with the Saracens of the Peninsula, and in Sicily it was from the same enemy that they won the great Mediterranean island. Others had done a kindred work in a more distant field as helpers of the Eastern emperors against the Turks of Asia. The Normans might pass for religious warriors, and they might really be so; it needed greater ingenuity to set forth the invasion of England as a missionary enterprise designed for the spiritual good of the benighted islanders. The Norman, a strict observer of forms in all matters, attended to the forms of religion with special care. No people were more bountiful to ecclesiastical bodies on both sides of the Channel; the foundation of a Benedictine monastery in the 11th century, of a Cistercian monastery in the 12th seemed almost a matter of course on the part of a Norman prince. The conqueror beyond doubt sincerely aimed at being a religious reformer both in his duchy and in his kingdom, while it is needless to say that his immediate successor was exceptionally ungodly, whether among Normans or among other men. But among their countrymen generally strict attendance to religious observances, a wide bounty to religious foundations, may be set down as national characteristics. On the other hand, none were less inclined to submit to encroachments on the part of the ecclesiastical power, the Conqueror himself least of all.

We thus see in the Scandinavian settlers in Gaul, after they had put on the outward garb of their adopted country, a people restless and entering above all others, adapting and spreading abroad all that they could make their own in their new land and everywhere else—a people in many ways highly gifted, greatly affecting and modifying at the time every land in which they settled, but, wherever they settled, gradually losing themselves among the people of the land. The Norman, as a visible element in the country, has vanished from England, and he has vanished from Sicily. The circumstances of his settlement in his two great fields of conquest were widely different; his position when he was fully established in his two inaural realms was widely different; yet the effect has been almost in both cases. Neither island has for ages been in any sense a Norman land, and the tongue which the Norman brought with him into both has not for ages been spoken in either. Norman influence has been far stronger in England than in Sicily, and signs of Norman presence are far more easily recognized. But the Norman, as a distinct people, is as little to be seen in the one island as in the other. His disappearance in both cases is an illustration of one of the features which we have spoken of in the Norman character, the tendency which in fact made Normans out of Northmen, the tendency to adopt the language and manners of the people among whom they found themselves. But, as far as outward circumstances are concerned, we may say that the same effect has been brought about by different and almost opposite causes. The whole circumstances of the conquest of England constrained the conquerors to become Englishmen in order to establish themselves in the conquered land. In William's theory, the forcible conquest of England by strangers was an untoward accident. The lawful heir of the English crown was driven against his will to win his rights by force from outside. But he none the less held his crown as an English king succeeding according to English law. Moreover, every Norman to whom he granted lands and offices held them by English law in a much truer sense than the king held his; he was deemed to step into the exact position of his English predecessor, whatever that might be. This legal theory worked together with other causes to wipe out all practical distinction between the conquerors and the conquered in a wonderfully short time. By the end of the 12th century the Normans in England might fairly pass as Englishmen, and the island had largely adopted the use of the English language. The fashionable use of French for nearly two centuries longer was far more a French fashion than a Norman tradition. When the tradition of speaking French had all but died out, the practice was revived by fashion. Still the tradition had its effect. The fashion could hardly have taken root except in a land where the tradition had gone before it.

The Normans in England therefore became Englishmen, because there was an English nation into which they could be assimilated. In the Norman occupation of Sicily, on the contrary, there assuredly was no Sicilian nation for them to be absorbed into. While the Normans in England were lost among the people of the land, the Normans in Sicily were lost among their fellow-settlers in the land. The Normans who came into Sicily must have been much less purely Norman than the Normans who came into England. The army of Duke William was undoubtedly very far from being wholly made up of Normans, but it was a Norman army; the element which was not Norman, though considerable, was exceptional. But it happened that the conquerors of Sicily were Normans in more than merely being commanded by Norman leaders. They were almost as little entitled to be called pure Scandinavians as the Saracens whom they found in the island were entitled to be called pure Arabs. The conquest of England was made directly from Normandy, by the reigning duke, in a comparatively short time, while the conquest of Sicily grew out of the earlier and far more gradual conquest of Apulia and Calabria by private men. The Norman settlements at Aversa and Capua were the work of adventurers, making their own fortunes and gathering round them followers from all quarters. They fought simply for their own hands, and took what they could by the right of the stronger. They started with no such claim as Duke William put forth to justify his invasion of England; their only show of legal right was the papal grant of conquests that were already made. The conquest of Apulia, won bit by bit in many years of what we can only call freebooting, was not a national Norman enterprise like the conquest of England, and the settlement to which it led could not be a national Norman settlement in the same sense. The Sicilian enterprise had in some respects another character. By the time it began the freebooters had grown into princes. Sicily was won by a duke of Apulia and a count of Sicily. Still there was a wide difference between the duke of the Normans and the duke of Apulia, between an hereditary prince of a hundred and fifty years' standing and an adventurer who had carved out his duchy for himself. And, besides this, warfare in Sicily brought in higher motives and objects. Though crusades had not yet been preached, the strife with the Mussulman at once brought in the crusading element; to the Christian people of the island they were in many cases real deliverers; still, the actual process and gathering round them followers from all quarters by which Apulia had been won. Duke William was undisputed master of England at the end of five years; it took Count Roger thirty years to make himself undisputed master of Sicily. The one claimed an existing kingdom, and obtained full possession of it in a comparatively short time; the other formed for himself a dominion bit by bit, which rose to the rank of a kingdom

1 Roger de Hauteville, the conqueror of Sicily, was a brother of the first four dukes or counts of Apulia, and was invested with the countship of Sicily by the pope before starting on his adventure.
NORMANS

in the next generation. When Count Roger at last found himself lord of the whole island, he found himself lord of men of various creeds and tongues, of whom his own Norman followers were but one class out of several. And the circumstances of his conquest were such that the true Normans among his following could not possibly lose themselves among the existing inhabitants of the island, while everything tended to make them lose themselves among their fellow-adventurers of other races, among whose Norman, the old conquer, which other elements gathered, they could hardly have been a dominant element.

As far as concerned the lands in which the settlements were made, the difference lay in this, that, as has already been said, while there was an English nation, there was no Sicilian nation. The characteristic point of Norman rule in Sicily is that it is the rule of princes who were foreign to all the inhabitants of the island, but who were not more foreign to the inhabitants of the island than different classes of them were to one another. The Norman conqueror found in Sicily a Christian and Greek-speaking people and a Mussulman and Arab-speaking people. The relations between the two differed widely in different parts of the island, according to the way in which the Saracens had become possessed of different towns and districts. In one place the Christians were in utter bondage, in another they were simply tributary; still, everywhere the Mussulman Saracen formed the ruling class, the Christian Greek formed the subject class. We speak of the Saracen very much as we speak of the Norman; for of the Mussulman masters of Sicily very many must have been only artificial Arabs, Africans who had adopted the creed, language and manners of Arabia. In each case the Arab or the Norman was in the centre of the island, and all the other elements gathered and which gave its character to the whole. Besides these two main races, Greek and Saracen, others came in through the Norman invasion itself. There were the conquerors themselves; there were the Italians, in Sicily known as Lombards, who followed in their wake; there were also the Jews, whom they may have found in the island, or who may have followed the Norman into Sicily, as they certainly followed him into England. The special character of Norman rule in Sicily was that all these various races flourished, each in its own fashion, each keeping its own creed, tongue and manners, under the protection of a common sovereign, who belonged to none of them but who did impartial justice to all. Such a state of things might seem degradation to the Mussulman, but it was deliverance to the native Christian, while to settlers of every kind from outside it was an opening such as they could hardly find elsewhere. But the growth of a united Sicilian nation was impossible; the usual style to express the inhabitants of the island is "omnes or universi Siciliae populi." In the end something like a Sicilian nation did arise; but it arose rather by the dying out of several of the elements in the country, the Norman element among them, than by any such fusion as took place in England. That is, as has been already said, the Norman as such has vanished in two different ways. In England the Norman duke came in as a foreign intruder, without a native supporter to establish his rule over a single nation in its own land. He could not profess to be, as the count of Sicily could honestly profess to be, a deliverer to a large part of the people of the land. But, coming in by a title which professed to be founded on English law, establishing his followers by grants which professed no less to be founded on English law, he planted a dynasty, and established a dominant order, which could not fail to become English. The Normans in England did not die out; they were merged in the existing nation. The Normans in Sicily, so far as they did not die out, were merged, not in a Sicilian nation, for that did not exist, but in the common mass of settlers of Latin speech and rite, as distinguished from the older inhabitants, Greek and Saracen. The Norman conquest of England was at the moment a blessing. But the gradual and indirect results of the Norman conquest of England are easily to be seen to this day, and they have been largely, though indirectly, results for good. Its chief result has been, not so much to create anything new as at once to modify and to strengthen what was old, to call up older institutions to a new life under other forms. But whatever it has done it has done silently; there has not been at any time any violent change of one set of institutions for another. In Sicily and southern Italy there is hardly any visible Norman influence, except the great historic fact which we may call the creation of Sicily and southern Italy in their modern sense. The coming of the Norman ruled that these lands should be no longer seen as part of a smaller Italy. Its name sent over to Sicily as northern Italy, but that they should politically belong to the same group of states as the kingdoms and principalities of feudal Europe. William assuredly did not create the kingdom of England; Roger assuredly did create the kingdom of Sicily. And yet, notwithstanding all this, and partly because of all this, real and distinct Norman influence has been far more extensive and far more abiding in England than it has been in Sicily.

In Sicily then the circumstances of the conquest led the Norman settlers to remain far more distinct from the older races of the land than they did in England, and in the end to lose themselves, not in those older races of the land, but in the settlers of other races who accompanied and followed them. So far as there ever was a Sicilian nation at all, it might be said to be called into being by the emperor-king Frederick II. In his day a Latin element finally triumphed; but it was not a Norman or French-speaking element of any kind. The speech of the Lombards at last got the better of Greek, Arabic and French; how far its ascendency could have been built on any survival of an earlier Latin speech which had lived on alongside of Greek and Arabic this is not the place to inquire.

The language and nomenclature of the Normans in the two countries forms a remarkable contrast, and illustrates the circumstances of the two as they have just been sketched. The chroniclers of the conquest of Apulia and the Norman conquest of the North of England are the followers of the conquerors from Hauteville. It was the natural name for a body of men who must, by the time the conquest of Sicily was over, have been mixed, but whose kernel was Norman, whose strength and feelings and traditions all came from a Norman source. But if we turn to Hugo Falcandus, the historian of Sicily in the 12th century, the Norman name is hardly found, unless when it is used historically to point out that in Normandy the Normans were the older. As a kind of middle name, was of Norman descent. Of the various "Sicilii populii," we hear of Greeks, Saracens, Lombards, sometimes of Franchi, for by that time the greater part of the settlers had been mixed with the Franchi and Frischi, and the Franchi had become of Norman descent. There is a distinction between Christians and Saracens; among Christians there seems to be again a distinction between Greeks and Latins, though perhaps without any distinct "Sicilii Franchi Latinii," and again a distinction between "Sicilii Lombardi" and "Franci"; but Normans, as a separate class, do not appear. In England there is no room for such subtleties. Virtually all of the people of England, and particularly the Normans, could say with the Norman and the French names to express the followers of William. In the English chronicles "French" is the only name used. It appears also in the Bayeux Tapestry, and it is the only word used when any legal distinction had to be drawn between classes of Englishmen. "Franci" and "Angli" are often opposed in Domesday and other documents, and the formula went on in charters long after all real distinction had passed away. That is to say, there were several words for what it is now a single word: "French" or "Francesi" and "French"—the last name taken in all the followers of the Conqueror; there were no purposes for which there was any need to distinguish Frenchmen from Norman, or Normans from people or from others who spoke the French tongue. We can see also that, though several languages were in use in England during the time of the Norman rule, yet England was not a land of many languages, in the same sense which Sicily was. In the 12th century three languages were certainly spoken in London; yet London could not call itself the "city of threefold speech," as Palermo did. English, French, Latin, were all in use in England; but the distinction was rather the "English tongue" or the "seven tongue" than that they were used by three distinct races or even classes. No doubt there was a class that knew only English; there may have been a better small body among the Normans, who had acquired a pretended to high cultivation would speak all as a matter of course; Bishop Gilbert Foliot, for instance, was eloquent in all three. But in Sicily we see the quite different phenomenon of three, four, five classes of men living side by side, each speaking his own name, speaking its own tongue. If a man of one people knew the speech of any of the others, he knew it strictly as a foreign language. Before the Norman Conquest England had two official tongues; documents
were drawn up sometimes in English, sometimes in Latin, now and then in both. And the same usage went on after the Conquest; the uncultured King's court became cultivated; and a widespread code of manners under the first Angevins, but it is in favour of Latin that it dies out. French, the language which the Normans brought with them, did not become an official language in England till after strictly Norman rule had passed away. French documents are unknown till the days of Richard the Lionheart. It was a fashion to keep in Latin, and it was not till then the fashion had come in, that is, till deep in the 13th century. So it was in Sicily also; of all the tongues of Sicily French was the most needful in daily life. Of the Normans' Latinized name of Norman, and vulgar, as the Normans did officialism acknowledge even French, much less Italian, as a fit tongue for solemn documents. In England, English, French, Latin, were the three tongues of a single nation; they were their vulgus, its courtly and its learned tongue, and so many of these was fast giving way to the vulgar. In Sicily, Greek, Arabic, Latin and its children were the tongues of distinct nations; French might be the polite tongue, the Norman could not be set down as a vulgar tongue, Arabic even less than Greek.

The different positions then which the conquering Norman took in his two great conquests of England and of Sicily amply illustrate the way in which he could adapt himself to any circumstances in which he found himself, the way in which he could adopt whatever suited his purpose in the institutions of any other people, the way in which he commonly lost his national being in that of some other people. From England, moreover, he spread into Scotland, Wales and Ireland, and in each land his settlement put on a somewhat different character, according to the circumstances. From England he took the Normans, or Normans of England, as he might be called, as a mere visitor, and oddly enough he came as a visitor along with those whom he had himself overcome in England. Both Normans and English came to Scotland in crowds in the days of Margaret, Edgar and David, and Scottish national feeling sometimes rose up against them. In Scotland again the Norman settlers were lost in the mixed nationality of the country, but not till they had modified many things in the same way in which they modified things in England. They gave Scotland nobles and even kings; Bruce and Balliol were both of the true Norman type of a conqueror; Bruce, it may be doubted, but he was of the stock of the Francigenae of the Wale.

Conquest. In Wales the Norman came as a conqueror, more strictly a conqueror than in England; he could not claim Welsh crowns or Welsh estates under any fiction of Welsh law. The Norman settler in Wales, therefore, did not to any perceptible extent become a Welshman; the existing relations of England and Wales were such that he in the end became an Englishman, but he seems not to have been the same in doing Wales as he was in England. At least Giraldus Cambrensis, the Norman Welshman or Welsh Norman that Giraldus was, was certainly more alive to the distinction between Normans and English than any other of his contemporaries.

Ireland. The Norman was more purely a conqueror than anywhere else; but in Ireland his power of adaptation caused him to sink in a way in which he sank nowhere else. While some of the Norman settlers in Ireland went to swell the mass of the English of the Pale, others threw in their lot with the native Irish, and became, in the well-known saying, *Hibernis ipsis Hibertis* (see e.g. the article Burc).

Norman architecture in England and in Sicily.

There is yet one point in which we may profitably go back to our comparison between England and Sicily. Both countries are rich in works of architecture raised during the time of Norman rule. And the buildings of both lands show an instructive light on the Norman national character, as we have seen. The Norman Conquest in England and the Norman Spanish Conquest in Sicily in any style of architecture which makes use of the arched construction, can be less like one another than the buildings of the Norman kings in England and the buildings of the Norman kings in Sicily. In Sicily the Normans found the two most outwardly civilized of the nations of Europe, the two which had as yet carried the arts to the highest pitch. The Roman Greek and Greek Roman had taught the column to bear the cupola; the Saracen had taught it to bear arches of his own favourite pointed shape. Out of these elements the Saracens of Sicily had made a style, grand, serious, and strong, as constructed, rich and graceful in its characteristic detail. With the Saracens and the Greek as his subjects, the Norman had really no need to build arches; he had had them in his blood; he could build basilicas and cupolas, he could work for him instead of for any other. The palaces and churches of the Norman kings at Palermo and Monreale and Cefalu and Messina are in style simply Saracenic; they were most likely the work of the Saracens and their Saracenic workmen. Models in these buildings, as in those of Aquitaine, the pointed arch is the surest sign of Saracenic influence; it must never be looked for in the structures of the conquerors. The only style of form of art the pointed style of Sicily has nothing in common. A Sicilian church has nothing in common with a French or an English church; it is sometimes purely Oriental, sometimes a basilica with Italy in its veins, etc. If we saw the Saracen, others, the Greek gave the mosaic decorations of its walls. In such a case the ruling people, rather the ruling dynasty, had really nothing to add to what they found ready for them. They had simply to make it their own. On the other hand, the Normans did really bring in a new style of their own, their own form of Romanesque, differing widely indeed from the Saracenic style which they found. The characteristics of the Saracenic style, such as the cupola, are to be found in the Lombard buildings of northern Italy. But it took firm root on Norman soil; it made its way to England and became the style of England at an early stage of its growth, and from that time it went on developing and improving. In both Sicily and England we find, as in the case by which, throughout northern Europe, the Romanesque styles came to the Gothic. Thus the history of architecture in England and in Sicily is one history; it is the history of the art in Sicily during the same time. There were no Greeks or Saracens in England; there was no Greek or Saracen skill. England indeed had, possibly in a somewhat ruder form, the earlier style of Romanesque once common to England with Italy, Gaul and Germany. To this style it is no wonder that the Normans preferred their own, and that style therefore supplanted the older one. A comparison of Norman buildings in England and in Normandy will show that there is a peculiar style of the Normans, a style by the earlier style of England; but the modification was so slight, and it in no way affected the general character of the style. Thus in England we have the style of Normandy with very considerable Norman modifications, the architecture of England in that century was Norman with a very slight English modification. The difference then is plain. Where, as in Sicily, the Normans felt that they could not improve, they simply adopted the style of the country. Where, as in England, they felt that they could improve, they substituted for the style of the country their style is that is, what is the style that the Normans had adopted, which they had made thoroughly their own, and which they went on improving in England no less than in Normandy. That is, the discerning Norman, as ever, adapted himself, but he did it himself in England, not in Normandy, and that style is in England which he found himself. And this comes out the more clearly if we compare Norman work in England and in Sicily with Norman work in at least some parts of Apulia. At Bari, Trani and Bitonto we see a style which Italian and strictly Norman elements are really mingled. The great churches of those cities are wholly unlike those of Sicily: but, while some features show us that we are in Italy, there are some slight, even if not even of the Saracen, others distinctly carry us away to Caen and Peterborough. It is plain that the Norman settlers in Apulia were not so deeply impressed with the local style as they were in Sicily, while they thought much more of it than they thought of the local style of England in each of the three cases there is adaptation, but the amount of adaptation differs in each case according to local circumstances. In Normandy itself, the Norman, as we have seen, was in a sense a foreigner; it is French of a remarkably good type. The buildings of the latest French style keep a certain purity and sobriety in Normandy which they do not keep elsewhere.

(F. A. F.)

For a bibliography of the Normans and Normandy see Ullman, Chevalier, Répertoire des sources hist. du moyen-âge. Topobibliogr. (Montbéliard, 1903), ii, 2140; also, for sources for the Norman invasion of France, Mollinier, Sources de l'hist. de France (Paris, 1901), 1, 593; the following notes on history of art have been taken by André Du Chesne in his Hist. Normannor scritptores antiqui. 858-1220, &c. (Paris, 1919). Of modern works may be mentioned Le Normandie by Edouard Martin, Die Normandie heute by Karl Kulturkampen im Mitteleller (Berlin, 1875); A. NORMANTON—NORRIS, JOHN

His son Henry regained some of his father's lands and entered upon court life, being a member of parliament under Edward V. When Mary's reign he was one of those who were in daily attendance with the duty of the princess Elizabeth, and when the princess became queen she amply repaid the kindness which Norris had shown to her when he was her guardian at Woodstock. In 1566 he was knighted and was sent as ambassador to France, where he remained until 1570, and in 1572 he was created Baron Norris of Rycote. He died in June 1601. By his wife Margaret (d. 1599), daughter of John, Lord Williams of Thame, Norris had six sons, all of whom distinguished themselves in the field. The Norris monument, with figures of Lord and Lady Norris and their six sons, is in St Andrew's Chapel in Westminster Abbey.

The eldest son, Sir William Norris, died in Ireland in December 1570, leaving a son Francis (1570-1623), who succeeded to his grandfather's barony and also to the estates of his uncle Sir Edward Norris. In 1611 Francis was created earl of Berkshire. He left no sons and the earldom became extinct, but the barony descended to his daughter Elizabeth (d. 1643), the wife of Edward Wray (d. 1658). Their daughter Bridget (1627-1657) married as his second wife Montagu Bertie, 2nd earl of Lindsey, and as her third marriage (1654-1659) became Baron Norris (or Norreys) in 1657, and in 1660 was made Duke of Grafton. His descendants the Berties, earls of Abingdon, still hold this barony, and are the present representatives of the family of Norris.

Sir Edward Norris (d. 1603), the 1st Lord Norris's third son, served with the English troops in the Netherlands from 1583 to 1588. He is chiefly remembered owing to his fierce quarrel with Philip, count of Hohenlohe (1550-1606), called Hollock by the English, in August 1586 at Gettrydenberg (see J. L. Motley, The United Netherlands, vol. ii.). In 1590 he sailed with his brother Sir John and Sir Francis Drake on the expedition to Spain and Portugal, and from 1590 to 1599 he was governor of Ostend.

Sir Thomas Norris (1556-1599), another son of the first lord, went as a soldier to Ireland in 1579 and acted for a few months as president of Connaught. He fought against the Fitzgeralds and also in Ulster; in 1583 he became vice-president of Munster, and in 1597 he succeeded his brother, Sir John Norris, as president. The three remaining brothers were: Sir Henry Norris (1554-1599), who fought in the Netherlands and then in Ireland, where he was killed in 1599. Sir Francis Norris (1563-1604), who was killed in Britain in 1599, and Sir John Norris (g.s.).

Two other members of another branch of this family remain to be mentioned, namely, Sir William Norris and his brother Sir John. Sir William Norris (c. 1657-1702), having been created a baronet, was sent some time to the strength of England. He came by the command to the ebxpedition in 1701. The embassy, however, was a total failure: Norris was unable to make terms, and he died on the voyage to England.

Sir John Norris (c. 1660-1749) entered the navy and saw a good deal of service during the war with France under William III. and Anne. Under George I. he was sent several times with a fleet into the Baltic Sea to forward the policy of this king by giving the Danes a victory. At the Russians at Parnawa in 1719 he became an admiral and commander-in-chief. Norris, who was known as "foul-weather Jack," was a member of parliament from 1708 until his death.

NORRIS, JOHN (1657-1721), English philosopher and divine, was born at Collingbourne-Kingston in Wiltshire. He was educated at Winchester and Exeter College, Oxford, being subsequently elected to a fellowship at Trinity Hall. His first important work was Idea of Happiness (1680), in which, with Plato, he places the highest happiness or fruition of the soul in the contemplative love of God. Malebranche's Recherche de la vérité, which had appeared in 1674, made a strong impression upon him. Malebranche, he says, "is indeed the great Galileo of the intellectual world." He had also studied the works of Descartes himself, and most of what had been written for and against Cartesianism. Of English thinkers, More and Cudworth,
NORRIS, SIR J.—NORRIS, W. E.

the so-called Cambridge Platonists, had influenced him most; and in 1685 his study of their works led to a correspondence with the former, published after his death by Norris as an appendix to his Platonically conceived essay on The Theory and Regulation of Love (1688). He also corresponded with Mrs Astell (q.v.) and Lady Masham, the friend of Locke, to whom he addressed his Reflections upon the Conduct of Human Life (1689). Some time before this Norris had taken orders, and in 1689 he was presented to the living of Newton St. Lo, in Somerset.

In 1690 he published a volume of Discourses upon the Beatitude, followed by three more volumes of Practical Discourses between 1690 and 1698. The year 1690 is memorable as the year of the publication of Locke's Essay, and the book came into Norris's hands just as his volume of Discourses was passing through the press. He at once appreciated its importance, but its whole temper was alien from the modes of thought in which he had been reared, and its main conclusions moved him to keen dissent. He hastened to "review" it in an appendix to his sermons. These Cursory Reflections constitute Norris the first critic of the Essay; and they anticipate some of the arguments that have since been persistently urged against Locke from the transcendental side. Though holding to the "grey-headed, venerable doctrine" of innate ideas as little as Locke himself, Norris finds the criticism in the first book of the Essay entirely inconclusive, and points out its inconsistency with Locke's own doctrine of evident or intuitively perceived truths. He also suggests the possibility of subconscious ideas, on which Leibnitz laid so much stress in the same connexion.

He next complains that Locke neglects to tell us "what kind of these ideas these are which are let in at the gate of the senses." In other words, while giving a metaphorical account of how we come by our ideas, Locke leaves unconsidered the intellectual nature of the ideas or of thought in itself. Unless we come to some conclusion on this point, Norris argues, we have little chance of being right in our theory of how ideas "come to be united to our mind." He also saw the weakness of Locke's doctrine of nominal essences, showing how it ignores the relation of the human mind to objective truth, and instancing mathematical figures as a case "where the nominal essence and the real essence are all one." The last twenty years of Norris's life were spent at Bemerton, near Salisbury, the former home of George Herbert, to the living of which he had been transferred in 1691. In 1691-1692 he was engaged in controversy with his old enemies the "Separatists," and with the Quakers, his Malebranchian theory of the divine illumination having been confounded by some with the Quaker doctrine of the light within.

In 1697 he wrote An Account of Reason and Religion, in which he maintained the"truth of all points of Christian doctrine," and that "Christianity not more Mysterious." Norris adopts the distinction between things contrary to reason and things above reason, and maintains that the human mind is not the measure of truth. Reason, according to him, is nothing but the exact measure of truth, that is to say, divine reason, which differs from human reason only in degree, not in nature. In 1701 appeared the first volume of the systematic philosophical work by which he is remembered, An Essay towards the Theory of the Ideal or Intelligible World. The first volume treats the intelligible world absolutely; the second, which appeared in 1704, contains it in relation to the human mind and to objective truth, and instancing mathematical figures as a complete exposition of the system of Malebranche, in which Norris refutes the assertions of Locke and the sensualists. In 1708 Norris wrote A Philosophical Discourse concerning the Natural Immortality of the Soul, defending that doctrine against the assaults of Dodwell. After this he wrote little. He died at Bemerton, and a monument was erected to his memory in the parish church, with an inscription in which he is spoken of as one who "bene latuit."

Norris was neither an original thinker nor a master of style. His philosophy is hardly more than an English version of Malebranche, enriched by wide reading of "Platonic" thinkers of every age and country. His style is too Scholastic and self-involved. His Theory of the Intelligible World is an attempt to explain the objective nature of truth, which he blamed Locke for leaving out of regard. By the intelligible world Norris understands the system of ideas eternally existing in the mind of God, according to which the material creation is fashioned. This is a commoner version of the Malebranchian theory that the second person of the Trinity, the light which lighteth every man that cometh into the world. For it is these ideas and their relations that are alone the object-matter of science; whenever we know, it is of them we attend. Material things, as he sees, are but dark to us, except so far as the fact of their existence is revealed in sensation. The matter which we see that we know is the idea of matter; what we believe is the idea of belief.

When stripped of its semi-mythical form of statement, Norris's empirical assertion of the ideal nature of thought and its complete distinction from sense as such may be seen to contain an important truth. As the disciple and correspondent of More, he is, in a sense, the heir of the Cambridge Platonists, while, as the first critic of Locke's Essay, he may be said to open the protest of the church to the independent tendencies of that work. He occupies a place, therefore, in the succession of philosophers and mystical thinkers of whom Copleston is the last eminent example.

NORRIS, SIR JOHN (c. 1547-1597), English soldier, was the second son of Henry Norris, Baron Norris of Rycote, and gained his earliest military experience in the civil wars in France. In 1573 he went to Ulster with Walter Devereux, earl of Essex, winning fame by his conduct in the guerilla wars against the Irish, and being responsible for the massacre on the island of Rathlin in July 1575; and in July 1577 he crossed over to the Netherlands to assist the Dutch against the Spaniards.

Having added to his reputation by his valour at the battle of Rymenant, Norris, who in 1576 had been created viscount of Ulster, and in July he was sent to Ireland as lord president of Munster; he accompanied the lord deputy, Sir John Perrot, on a campaign in Ulster, and spoke eloquently in the Irish parliament; but he disliked his work and soon obtained his recall. In August 1585 he was again in the Netherlands, commanding the English army of 4,400 men which Elizabeth had sent to serve against the Spaniards. During his successful relief of Grave in April 1586 he was wounded, and just after this event he was knighted by the governor-general, the earl of Leicester; but he and Leicester were soon at variance, and many complaints of his conduct were sent to England. After taking part in the battle of Zutphen in October 1586 Sir John was recalled to England, but in 1587 he went again to the Netherlands and was soon quarrelling with his new superior, Peregrine Bertie, Lord Wilsoughby de Eresby, and with Sir William Stanley. In 1588, when the Spanish Armada was expected, he was marshal of the camp at Tilbury; later in the same year he served the queen as ambassador to the Dutch states, and in 1590 he and Sir Francis Drake led the fleet which ravaged the coasts of Spain and Portugal. In 1591, and again in 1593, he aided Henry IV. of France in his struggle with the League in Britain; and in May 1595 he landed again in Ireland, where he was still lord president of Munster. But this time he was entrusted with more extensive powers and was to assist the lord deputy, Sir William Russell, in subjugating Ulster. He did not, however, work harmoniously with Russell; his health was failing and the gigantic task was too much for him. After fighting and negotiating with the O'Neills in Ulster, and warning in Connaught, he asked for his recall. This was not granted, but he was supplied in his military command; and he retired to Munster and died at Millow on the 3rd of July 1597. His monument is in the church of Tattenham, Berkshire.

NORRIS, WILLIAM EDWARD (1837— ), English novelist, was born on the 18th of November 1847, the son of W. Norris, chief justice of Ceylon. He was educated at Eton, and called to the bar at the Inner Temple in 1874. His first story, Heaps up Heaps, appeared in 1871, and was followed by a long series of novels, many of which first appeared in the Temple Bar and Cornhill magazines. The best of his numerous novels are Mademoiselle de Mersac (1880), Matrimony (1881), No New
NORRISTOWN—NORTH, SIR D.

Thing (1883), My Friend Jim (1886), The Rogue (1888), The Despoit Lady (1895), Matthew Austin (1895), The Widower (1898), Nature's Comedian (1904), Pauline (1906).

NORRISTOWN, the borough and the county-seat of Montgomery county, Pennsylvania, U.S.A., on the Schuylkill river, at the mouth of Stony Creek, opposite Bridgeport, and about 18 m. N.W. of Philadelphia. Pop. (1910 census) 27,875.

Norrinston is served by the Pennsylvania, the Philadelphia & Reading and the Stony Creek railways, by interurban electric railway to Philadelphia and Reading, and by the Schuylkill canal, and is connected by bridge with the borough of Bridgeport (pop. in 1910, 3860), where woollen and cotton goods are manufactured. Norristown is a residential suburb of Philadelphia, and commands fine views of the Schuylkill Valley. It has a State Hospital for the Insane (opened 1880), a fine County Court House, a general hospital, a Friends' Home, a home for aged women, St Joseph's Protectory (Roman Catholic) for girls, and the Norristown and McCann public libraries; in Montgomery cemetery are the tombs of General Winfield Scott Hancock and General John Frederick Hartranft (1830-1889), a distinguished Federal officer in the Civil War and governor of Pennsylvania in 1873-1879. Valley Forge is less than 6 m. distant to the W. The borough has a large trade with the surrounding country, which is supplied with goods to agriculture and abounds in limestone. Among Norristown's manufactures are hosiery and woollen goods; in 1905 its total factory product was valued at $5,025,243, an increase of 44.5% over the value in 1900.

Norrinston was founded in 1785, and was named in honour of Isaac Norris (c. 1671-1733), a friend of William Penn and a member of the Pennsylvania legislature, who had owned the land on which the borough is built. Norristown was incorporated as a borough in 1812, and its boundaries were extended in 1853.

Norrköping, a town and port of Sweden, in the district (län) of Östergötland, 113 m. S.W. of Stockholm by the Mälardal railway. Pop. (1880) 26,735; (1900) 41,508. It occupies both banks of the Motala, the wide and rapid emisary of lake Vättern, close to its outlet in the Bräviken, an inlet of the Baltic. Having been burned by the Russians in 1719 and visited by further fires in 1812, 1822 and 1826, the whole town has a modern appearance, with wide and regular streets. Among the more conspicuous buildings are St Olaf's church (erected by Gustavus Adolphus in 1616 and rebuilt in 1767-1767); St Hedvig's, built by the German colony in 1670; the town hall, dating from the beginning of the 18th century; the central school, with science rooms and technical and weaving schools. Norrköping is the fourth town in population and industrial importance in Sweden. The falls in the river afford motive power to the cloth and cotton mills (spinning and weaving)—the staple industries—and 10 factories for sugar, paper, lithography, tobacco and carpenters, joinery works and breweries. There are also shipbuilding yards and docks. Fine granite is quarried at Graafverso, 7½ m. N. The inlet of Bräviken affords excellent harbour accommodation, with from 33 ft. to 17½ ft. of water below the bridges in the town. The town returns two members to the second chamber of the Riksdag (parliament).

A bull of Pope Lucius III. shows that Norrköping existed in 1185. At the meeting of the states in 1604 Duke Charles assumed the Swedish crown as Charles IX.; and not long afterwards Duke John of Östergötland introduced German craftsmen into Norrköping, and thus originated its industrial activity. Under Charles XII. the town suffered not only from war but from pestilence, 2700 of its inhabitants perishing in 1710-1711. After the Russian invasion of 1710 the population was only 1000.

NORTH, BARONS. The English title of Lord North of Kirktling was created for Edward North (c. 1496-1564), son of Roger North, a London citizen, in 1554; he was a successful lawyer, clerk of the parliament (1531) and chancellor of the court of augmentations (1545). His second son was Sir Thomas North (q.v.), and he was succeeded as 2nd baron by his son Roger (1530-1600), a prominent courtier and soldier of Queen Elizabeth's day, who married the daughter of Lord Chancellor Rich, and whose eldest son, Sir John (c. 1551-1597), predeceased him. Dudley North, 3rd Baron North (1581-1660), son of Sir John North and of Dorothy, daughter and heiress of St. Valentine Dale, was born in 1581 and succeeded his grandfather, the 2nd Baron North, at the age of nineteen. He was educated at Cambridge, and married in 1599 Frances, daughter of Sir John Brockett of Brockett Hall in Hertfordshire. He travelled in Italy, took part in the campaign of 1602 in the Netherlands, and on his return became a conspicuous figure at court, excelling in athletic exercises as well as in poetry and music, and gaining the friendship of Prince Henry. In 1606, while returning from Eridge to London, he discovered the springs of Tunbridge Wells, which cured North himself of a complaint and quickly became famous. He also recommended the Epsom springs to the public. He supported and subscribed to the expedition to Guiana made by his brother Roger North (c. 1582-c. 1653) in 1610, and when Roger departed without leave Dudley was imprisoned for two days in the Fleet. In 1626 he attached himself to the party of Lord Saye and Sele in the Lords, who were in sympathy with the aims of the Commons; and when the civil war broke out he was on the side of the parliament. In 1641 he was a member of the Lords' committee on Religion, and served on the committee to consider the king's attainder. In 1644, finally voting for the ordinance in January 1645. He was placed on the admiralty commission in 1645, and acted as lord lieutenant for Cambridgeshire. He was one of the small group of Lords who continued attendance in the House of Peers, and on the 19th of December 1648, with three others, visited Fairfax, when they "cast down their honours at his Excellency's feet " and protested their desire not to retain any privileges prejudicial to the public interest.¹ He passed the rest of his life in retirement at Kirktling in Cambridgeshire, with his sons, daughters and grandchildren, finding employment with many airy entertainments as poetry, writing essays, building and designing villas and making paintings as his business.° He wrote A Forest of Varieties (1649), a miscellany of essays and poems, another edition of which was published in 1659 under the title of A Forest promiscuous of various Seasons' Productions. He died on the 16th of January 1666. North is described as "full of spirit and flame," of imperious temper but of well-balanced judgment, Lord Holland declaring that "he knew no man less swayed with passion and sooner carried with reason and justice." He left, besides one daughter, two sons, the elder of whom, Sir Dudley, succeeded him as 4th Baron North.

The eldest son, Charles (d. 1601), was created Lord Grey of Rolleston during his father's life, and succeeded his father as 5th Baron North; and on the death of his son, William, 6th Lord North, without issue, in 1734, the barony of North went to a cousin, Francis North, 3rd. Baron, afterwards 1st earl of Guilford. The title of Lord North is that by which the 2nd earl of Guilford, prime minister from 1770 to 1782, is best known in history (see Guilford, Barons and Earls of). George Augustus, 3rd earl of Guilford (d. 1802), left three daughters, and the barony of North fell into abeyance till 1847 when it vested in Susan, Baroness North (1797-1864), wife of John Hope, 2nd Viscount Lyndhurst. Her eldest son, Lord Hope, took the name of North when his step-grandfather died in 1882, and her death son William Henry John North (b. 1836) succeeded as 11th baron, the title now being separate from that of Guilford.

NORTH, SIR DUDLEY (1641-1691), English economist, was 4th son of Dudley, 4th Lord North, who published, besides other things, Passages relating to the Long Parliament, 1 Gardiner's Civil War, iv 285. ² Roger North's Autobiography, ed. by A. Jessop, 68.
of which he had himself been a member. He was born on the
16th of May 1641. In his early years he was carried off by
gipsies and recovered with some difficulty by his family—an
incident curiously similar to that which befell Adam Smith in
his infancy. He engaged in foreign trade, especially with
Turkey, and spent a number of years at Constantinople and
Smyrna. Some notices of the manners and customs of the east
were printed from his papers by his brother. Having returned
to London with a considerable fortune, he continued to prosecute
trade with the Levant. His ability and knowledge of commerce
attracted the attention of the government, and he was further
recommending himself by the influence of his brother Lord Guilford.
Duke of Buckingham, under Charles II. he was one of the
sheriffs forced on the city of London with an express view to
securing verdicts for the crown in state trials. He was knighted
and was appointed a commissioner of customs, afterwards of
the treasury, and again of the customs. Having been elected
a member of parliament under James II., “he took,” says
Roger North, “the place of manager for the crown in all matters
of revenue.” After the Revolution he was called to account
for his alleged unconstitutional proceedings in his office of
sheriff. He died on the 31st of December 1691.
His tract entitled Discourses upon Trade, principally directed
to the case of the interest, quantity, elhfection and increase of money
was published anonymously in 1691, and was edited in 1856 by
J. R. M'Culloch in the Select Collection of Early English Tracts
on Commerce printed by the Political Economy Club of London.
In this thorough-going and emphatic assertion of the free-trade
doctrines against the system of prohibitions which had gained
strength by the Revolution, North shows that wealth may
exist independently of gold or silver, its source being human
industry, applied either to the cultivation of the soil or to
manufactures. It is a miracle to suppose that stagnation of
trade arises from want of money; it must arise either from a
glut of the home market, or from a disturbance of foreign
ccommerce, or from diminished consumption caused by poverty.
The export of money in the course of traffic, instead of diminishing,
increases the national wealth, trade being only an exchange
of superfluities. Nations are related to the world just in the
same way as cities to the state or as families to the city. North
emphasizes more than his predecessors the value of the home
trade. With respect to the interest of capital, he maintains that
it depends, like the price of any commodity, on the proportion
of productive to the capital; that the relative increase of capital, and
cannot be brought about by arbitrary regulations, as had been proposed by Sir Josiah Child
and others. In arguing the question of free trade, he urges that
every advantage given to one interest over another is injurious to
the public. No trade is unprofitable to the public; if it
were, it would be given up; when trades thrive, so does the public,
of which they form a part. Prices must determine themselves,
and cannot be fixed by law; and all forcible interference
with them does harm instead of good. No people can
become rich by state regulations,—only by peace, industry,
freedom and unimpeded economic activity. It will be seen
how closely North’s view of things approach to that embodied
some eighty years later in Adam Smith’s great work. North
is named by Wilhelm Roscher as one of that “great triumvirate”
which in the 17th century raised the English school of economists
to the foremost place in Europe, the other members of the
group being Locke and Petty.

NORTH, MARIANNE (1830-1890), English naturalist and
flower-painter, was born at Hastings on the 24th of October 1830,
the eldest daughter of a Norfolk baronet, Sir John North (1817-1893).
She trained as a vocalist under Madame Sainton Dolby, but her voice failed, and she then devoted
herself to painting flowers. After the death of her mother in
1855 she constantly travelled with her father, who was then
member of parliament for Hastings; and on his death in 1869
she resolved to realize her early ambition of painting the flora
distant countries. In 1871-1872 with this object she went
Canada, the United States and Japan, and spent a year
in Brazil, where she did much of her work at a hut in the depths
of a forest. In 1875, after a few months at Tenerife, she
began a journey round the world, and for the two years was occupied in
painting the flora of California, Japan, Borneo, Java and Ceylon.
The year 1878 she spent in India, and after her return she
exhibited a number of her drawings in London. Her subsequent
offer to present the collection to the botanical gardens at Kew,
and to erect a gallery for their reception, was accepted, and the
new buildings, designed by James Ferguson, were begun in
the same year. At Darwin’s suggestion she went to Australia in
1880, and for a year painted there and in New Zealand.
Her gallery at Kew was opened in 1882. In 1883, after a visit by
her to South Africa, an additional room was opened at the Kew
gallery, and in 1884-1885 she worked at Seychelles and in Chile.
Miss North died at Alderly in Cheshire on the 30th of August
1890. The scientific accuracy with which she represented plant
life in all parts of the world gives her work a permanent value.

NORTH, ROGER (1653-1734), English lawyer and biographer,
was the sixth son of the 4th Baron North. He acquired a good
practice at the bar, being helped by his elder brother Francis,
who became lord chancellor and was created Baron Guilford
(elder brothers), and in 1684 he became solicitor-general. But the Revolution
stopped his advancement, and he retired to his estate of
Northamptonshire, where he was a vigorous supporter of
the daughter of Sir Robert Gayer. He collected books, and
was constantly occupied in writing. But he is best known
for his Lives of the Norths, published after his death, together
with his own autobiography (see the edition in Bohn’s Standard
Library, 1890, by Jessopp), a classic authority for the period.
He died at Rougham on the 1st of March 1734, leaving a family
from whom the Norths of Rougham are descended.

He is to be distinguished from Roger North (1588-1652), brother of the 3rd baron, one of the captains who sailed with Raleigh in 1617
and marrying the daughter of Sir Robert Gayer. He collected books, and
was constantly occupied in writing. But he is best known
for his Lives of the Norths, published after his death, together
with his own autobiography (see the edition in Bohn’s Standard
Library, 1890, by Jessopp), a classic authority for the period.
He died at Rougham on the 1st of March 1734, leaving a family
from whom the Norths of Rougham are descended.

NORTH, SIR THOMAS (1552?-1601?), English translator
of Plutarch, second son of the 1st Baron North, was born about
1553. He is supposed to have been a student of Peterhouse,
Cambridge, and was entered at Lincoln’s Inn in 1575. In
1574 he accompanied his brother, Lord North, on a visit to the French
court. He served as captain in the year of the Armada, and was
knighted about three years later. His name is on the roll of
justices of the peace for Cambridge in 1592 and again in 1597,
and he received a small pension (240 a year) from the queen
in 1603. His Plutarch was published in 1663, with a supplement of other translated biographies.
He translated, in 1552, Guevara’s Reloj de Principes (commonly
known as Libro Aureo), a compendium of moral counsels
chiefly compiled from the Meditations of Marcus Aurelius, under
the title of Diial de Princes. The English of this work is one of the
earliest specimens of the ornate, copious and pointed style
for which educated young Englishmen had acquired a taste
in their Continental travels and studies. North translated from a French
copy of Guevara, but seems to have been well acquainted with the
Spanish version. The book had already been translated
by Lord Berners, but without reproducing the theatrical
artides of the original. North’s version, with its mannerisms
and its constant use of antithesis, set the fashion which was to culminate
in Lyly’s Euphues. His next work was The Morall Philosophie
de Doni (1570), a translation of an Italian collection of eastern
fables. The first edition of his translation of Plutarch, from the
French of Jacques Amyot, appeared in 1570. The first edition
was dedicated to Queen Elizabeth, and was followed by other editions
in 1595 and 1603, containing in each case fresh Lives.
If it is one of the most impressive works of North, I have no
of North. His vigorous English on contemporary writers, and some critics have called
him the first master of English prose. The book formed
the source from which Shakespeare drew the materials for his
Julius Caesar, Coriolanus and Antony
and Cleopatra. It is in
the last-named play that he follows the Lives most closely,
whole speeches being taken direct from North.

North’s Plutarch was reprinted for the “Tudor Translations”
(1893), with an introduction by George Wyndham.
NORTH ADAMS, a city of Berkshire county, Massachusetts, U.S.A., situated at the junction of the N. and S. branches of the Hoosac river, and the Boston & Maine (at the W. terminus of the Hoosac Tunnel) and the Boston & Albany railroads, in the extreme N.W. part of the state. Pop. (1905) 22,150; (1910) 22,019. Area, 109 sq. m. In the city are the villages of North Adams, Greylock and Blackinton. Within the city limits are a natural bridge across Hudson Brook, 50-60 ft. high, and ruins of Fort Massachusetts, which was captured in 1746 by French and Indians under the command of Pierre Le Moyne, Sieur d'Iberville, and the Riggs Family. North Adams is the seat of a state Normal School (1897). Among its manufactures are cotton (especially print) and woolen goods, and boots and shoes. In 1900 the factory products of the city were valued at $10,741,495, and in 1905 at $8,035,705. North Adams secured incorporation as an independent township in 1878. Township government was abandoned and city government was organized in 1865; in 1900 part of Williamstown was annexed.

NORTHALLERTON, a market town in the Richmond parliamentary division of the North Riding of Yorkshire, England, 30 m. N.W. from York by the railway. It is situated in a hollow, which is a small plain, with an irregular outline, and with a small stream flowing through it. The town consists of a considerable agricultural trade, and there are motor-engineering works. In the neighbourhood of Northallerton is the priory of Mount Grace, a Carthusian foundation of 1397. It consists of an outer court entered through a gatehouse, the church and chapter-house, with other buildings lying on the north side, partly surrounded by monastic dwelling-houses. These houses, with gardens attached, also surround three sides of the cloister court, which lies north of the outer court. In the vicinity are a monks' well and a ruined chapel of the 16th century.

Northallerton (Alvetune, Allerton) is said to have been a Roman station and afterwards a Saxon "burg," but nothing is known with certainty about it before the account given in the Domesday Survey, which shows that before the Conquest Earl Edwin had held the manor, but that the Normans had destroyed it so utterly that it was still waste in 1086. Soon after his accession William Rufus gave it to the bishop of Durham, whose successors continued to hold it until it was taken over by the ecclesiastical commissioners in 1865. As a borough by prescription Northallerton returned two members to the parliament of 1298, but was not represented again until 1640, when its ancient privileges were restored. The Municipal Reform Act of 1832 reduced the number of members to one, and in 1885 the town was disfranchised. The first account of the borough and its privileges is contained in an inquisition taken in 1333 after the death of Anthony, bishop of Durham, which shows that the burgesses held the town with the markets and fairs at a fee-farm rent of 40 marks yearly, and that they had two reeves who sat in court with the bishop's bailiff to hear the disputes of the townspeople. This form of government continued until 1851, when a local board was formed, which in 1894 was superseded by an urban district council. A weekly market on Wednesday was granted by King John to the bishop in 1205. A subsequent bishop obtained a grant of a fair on St Bartholomew's day, which according to Camden (circa 1585), had become almost "the most thronged" cattle fair in England, but is no longer held. In 1317 the town was burnt by the Scots under Robert Bruce, although the burgesses paid 3000 marks that it might be spared. In consequence they were exempted from taxes in 1319.

See Victoria County History, Yorkshire; C. J. D. Ingledew, The History and Antiquities of Northallerton in the County of York (1858); J. L. Saywell, The History and Annals of Northallerton (1885).

NORTH AMERICA. In the article AMERICA a brief geographical survey is taken of the two continents which bear this name; and their points of similarity and contrast are broadly indicated. When North America is compared with the northern continents of the Old World, an important correspondence is found between it and the greater part of Eurasia; but here the corresponding parts are reversed, right and left, like the two hands. The Laurentian highlands agree with Scandinavia and Finland, both having a great deal of water, and large stretches of water bodies (the Great lakes in North America; the southern Baltic, with Onega, Ladoga, &c. in Europe) occupy depressions that are associated with the boundary between the very ancient lands and their less ancient covering strata. The old worn-down and re-elevated Appalachian mountains of south-eastern North America agree well with the Hercynian mountains of similar history in middle Europe (Ardenne, Slate mountains of the middle Rhine, &c.), each range entering the sea at its Atlantic end (in Nova Scotia and Newfoundland; in Brittany, Wales and Cornwall), and dipping under younger formations at its inland end. Certain younger ranges are dimly recognized as mountains because they are mostly submerged in the American mediterra-
neanies (Gulf of Mexico and Caribbean Sea), but of great absolute relief and with crests rising in the larger West Indian islands—may be compared with the younger ranges of southern Europe (Pyrenees, Alps, Caucasus) bordering the classic Mediterranean and the seas farther east. The central plains of North America correspond well with the plains of Russia and western Siberia; both stretch from great enclosed water bodies on the south to the Arctic Ocean, and both are built of undisturbed Palaeozoic strata toward the axis of symmetry and of younger strata away from it. Finally, the Western highlands of North America may be compared with the great mountain complex of central and eastern Asia. In this remarkable succession of resemblances we find one of the best proofs of the continental unity of Eurasia. Moreover, the resemblances thus described controvert the idea, prevalent when geology was less advanced than to-day, that the New World of civilized discovery is an "old world" geologically, and that the Old World of history is geologically "new." Both worlds are so old, and both share so well the effects of successive climatic changes, that neither can regard the other as older or younger than itself.

There are several climatic similarities between North America and Eurasia. The Appalachians and the Hercynian mountains of middle Europe both contain extensive coal deposits of similar geological age, thus indicating a climatic and geographic resemblance at a time of great antiquity. The Laurentian highlands and the Scandinavian highlands were both heavily and repeatedly glaciated in recent geological times, and the ice sheets that crept out on all sides from those centres spread far over the lower lands to the south and away from the axis of symmetry towards the continental interior, scouring the highlands and leaving them rocky and barren, stirring extensive drift deposits over the peripheral areas, and thus significantly modifying their form and drainage; while the much loftier mountain ranges of western America and central Asia suffered, singularly enough, a far less extensive glaciation. At the present time, the plentiful and well-distributed rainfall of the continental border on either side of the Atlantic is succeeded by an increasing aridity towards the continental interior, until the broad plains towards the distant mountain complexes are comparatively barren or even desert. Within each greater mountain area extensive interior drainage basins are found holding salt lakes, and the recently determined former extension of these lakes in Central Asia agrees with the well-proved extension of Pleistocene lacustrine conditions in western North America.

The following sketch of the geological development of North America considers the larger physiographic divisions already indicated.

The extensive area of ancient crystalline rocks (Archean), stretching from Labrador past Hudson Bay to the Arctic Ocean, is of greatly disordered structure, and hence must have once had a
mountainous form. Moreover, the crystalline texture and deformed foliation of the crust that is but a few miles deep beneath the surface of an earlier time, for only at great depths can such texture and foliation be acquired. Both these lines of evidence lead to the conclusion that the whole of the Laurentian system is the result of a long period of erosion and dissection which has cut into the Palaeozoic and Mesozoic cover of the region. All the work of persisting erosion during a long continuance of dry land conditions, and hence that the region must be regarded as a worn-down mountain system. The worn-down old land is generally over lying relatively high points, and the lowest points, being more subject to the processes of erosion, have been most completely denuded of the Palaeozoic cover. This province must, however, be set aside from the undisturbed Laurentian region because of the repeated disturbances which have taken place. The oldest fossils found in the rocks of the region have been assigned to the pre-Cambrian system.

The earliest important mountain-making disturbances interrupted the conditions of deposition in Cambrian time, and produced what has been called the Green Mountain system. A later, and probably greater, disturbance, with its climax at the close of Carboniferous time, established the Appalachian Mountain system; but, as understood to-day, the "Appalachian revolution" of the older geologists is not, through the earlier epochs of the system, from the period of Cambrian time, the last important mountain-making disturbances occurred in the Mesozoic era, and produced the Appalachian Mountain system of to-day. The Appalachian mountains of to-day are chiefly the result of the Tertiary elevation and dissection of the previously worn-down mass—the additional height thus gained in Tertiary time to the pre-existent subdued mountain groups making them now the loftiest areas of the range, as in the White Mountains of New Hampshire (Mount Washington, 6293 ft.) and the Black Mountains of North Carolina (Mount Mitchell, 6711 ft.), which are the remains of the old Appalachian system, and which are nearly parallel to and closely associated with the axes of the earlier disturbances, but it lies somewhat to the north-west of its predecessors, and therefore involves considerable areas of flat-lying strata on the side of the previously disturbed belt from New York to Alabama, thus producing what is known as the Allegheny plateau (altitudes, 2000 to 4000 ft.). It should be added that the Ozark plateau of Missouri and the Ouachita mountains on the south, in Arkansas and farther west, are related to one another in much the same way as the Allegheny plateau and the middle ranges of the Appalachians—the two pairs corresponding to a condition of the earth's crust when the pre-Cambrian sea which once covered the continent had been more or less completely removed. The Tertiary movement of land was a long-lasting process, perhaps intermediate as long as the whole of Carboniferous time. A subordinate period of deposition and deformation occurred early in the Mesozoic time, marked by the accumulation and disturbance of several basins of Newark formation, roughly corresponding to the Triassic of Europe.

The Appalachians themselves were formed along the continent, beginning with the pre-Cambrian sea, which in the region of the modern New England coast was at that time probably a shallow warm sea, as indicated by the presence of coral reefs in the rocks of the region. As the coastline was carried northwards, the climate became colder, the sea was submerged beneath a conglomeration of various sediments, and finally the climate became cold enough to permit the development of the great glaciers of the Pleistocene period. The glaciers were large and moved slowly, and as they retreated they left behind them a great number of glacial landforms, such as drumlins, eskers, and till sheets. The Appalachians were uplifted during this period, and the resulting mountains were scoured and worn away by the action of the glacial ice. The resulting landscape is characterized by a number of large mountain ranges, such as the Appalachian Highlands and the Allegheny Plateau. These mountains are separated by valleys, such as the Great Valley of Virginia, which were formed during the erosion of the glacial deposits.

The Appalachians are a long and complex mountain range, stretching from Newfoundland to Alabama, and from the east coast to the interior of the United States. They are one of the oldest mountain systems in the world, and their history is a rich tapestry of geologic events. The region is rich in natural resources, including coal, iron ore, and timber, and it has been an important center of economic activity for centuries. The region is also home to a diverse range of flora and fauna, including species that are found nowhere else in the world. The Appalachian Mountains are a place of natural beauty and mystery, and they continue to fascinate and inspire people to this day.
sometimes styled the Cordilleras of North America (the Rocky Mountains being the eastern member of the system in the United States and Canada), differ from the Laurentian and Appalachian ranges in their much more regular mountain direction; there are no great undulations, nor are there any mountain ranges running at right angles to the main range. In other words, the Rocky Mountains are not a range of mountains in the middle of a great upland, but a great upland bounded on three sides by mountain chains. The upper ranges of the upper levels of the great upland thus become mountain chains, and the chief mountain uplands are really great mountain chains.

The Cordilleras of North America are, as is well known, the most peculiarly mountainous regions of the world. Lower mountain ranges, having been denuded of their upper portions, leave high, intricately dissected areas, having sharp ridges and narrow valleys. The mass of the ranges is elevated in an undulating manner, with the result that the region is divided into many smaller areas, each more or less isolated. The result is a great variety of relief and a great diversity of climate, the result being a diverse flora and fauna.

Furthermore, the Cordilleras of North America are a mountain chain of great length, running from Alaska to Mexico, and having a width of about 600 miles at its greatest extent. The mountains, as we have seen, are elevated in an undulating manner, and the result is a great variety of climate and a great diversity of flora and fauna.

In conclusion, the Cordilleras of North America are a mountain chain of great length, running from Alaska to Mexico, and having a width of about 600 miles at its greatest extent. The mountains, as we have seen, are elevated in an undulating manner, and the result is a great variety of climate and a great diversity of flora and fauna.
the eastern and the western areas have been extensively demuded, even to the point of being reduced to peninsulas. Their present altitude has been reduced by the sea to the level of 200 fathoms, to which elevation, they are now considered to be as a later elevation movement. The great river basins, for which North America is famous, have thus been formed between this and the eastern range, and the drainage of a vast area (about 1,240,000 sq. m.) for discharge to the south, while the Saskatchewan and Mackenzie gather their waters from somewhat less extensive areas in the north. Pleistocene glaciers and ice caps partially covered the eastern half of North America and the Drainage basins of the Atlantic, portions of the Gulf and of the Pacific, Winnipeg districts with extensive deposits of ice-land or water-lake drift, furnishing a generally smooth surface and a fertile soil: here and there as in some other cases.

The traditional continuity of the Cordilleras of North and South America has been broken by investigations in the isthmian portion of the northern continent. The structural peculiarities of the Basin and Range in the Great Basin, where it extends only to the east and west belt of great volcanoes by which the plateau of central Mexico is terminated on the south. The ranges of the Andes fail to reach Panama, and the Atro is a long island separating the Atlantic, and favourable to the growth of corals along the shores. Fringing and elevated reefs are known on many of the islands. The Bahamas are the slightly overlapping parts of a broad platform of coral and other calcareous marine deposits, of which the greater area constitutes extensive shallow banks which, rising by a steep slope, on the north-east to great depths in the Atlantic. The lownands of Yucatan resemble Florida in being the emerged part of a much larger area, of which an equal portion is still under water in the shelf around the Gulf of Mexico. All this region is luxuriantly productive and is admirably supplied with water by rivers which would be desert, like the Sahara, if replaced by lowlands.

The active volcanoes on the Pacific slope have built many cones and uplands, and some of their historic eruptions have been of terrible violence. Thus Lake Nicaragua, 90 miles in length and 85 in breadth, was drained and the island of Ometepe, one of the largest composed of volcanic debris, is now an island, and the body of the lake is a mere shallow depression, with a diameter of 8 to 9 miles. Gulf of Fonseca extends to the western ocean, raising the level of the lake behind the barrier and turning its discharge eastward to the Caribbean Sea across what was once the interoceanic isthmus.

The successive crustal movements by which the land area of what we now know as North America has been increased and connected through which the broader part of the continent is drained. The movements that resulted in the emergence of the Plains had the effect of engraving many ancient rivers of moderate size upon trunks of unusual dimensions. The Mississippi system, some of whose eastern branches probably date from early Mesozoic time, received great reinforcements by the addition of many long western branches in early tectonic time, roughly contemporaneous with the uplift of the Rocky Mountains, and the Gulf of Mexico, the river of the Gulf of Mexico, has been extended to the sea. The present headwaters of this river-trunk to which the name of Mississippi is applied, and which for that reason have gained an undue subjective importance, are of relatively modern date, as they are controlled by the aboriginal glacial deposits of northern Minnesota. The evolution of the Mackenzie resembles that of the Mississippi in a very general way, although some of its eastern branches are highly reduced in volume on account of its course through the Great Slave Lake, a colder climate, under a greater intervals, discharge, and overflows recur every spring. The Nelson and the St Lawrence systems, draining eastward to Hudson Bay and St Lawrence Gulf, receive drainage from a large area of the western United States, bisected by the Cordillera system under a simpler plan of continental growth; and there is much reason for thinking that this simpler plan obtained until the occurrence of those changes, in association with the Glacial period, whereby sea waters gained access to the depressions that now hold the bays and sounds of the north-eastern coast. In exemplification of the rule that the larger ocean receives the drainage of the smaller, the continental area, the rivers that flow into the Gulf of Mexico below those belonging to the Atlantic. The greatest is the Yukon, of farther Canada and inner Alaska, one of the great rivers of the eastern United States, drains a vast area of the basin for fields.

The Fraser drains much of the mountainous area of southern British Columbia, as the Columbia drains that of the north-western United States; the latter is peculiar in that one of its headwaters rises at the eastern limits of the Rocky Mountains, enters the Columbia, and flows westward through the ranges. The Colorado discharges a muddy current into the Gulf of California; but for the aridity of the drainage area its volume would be much larger. This is true of the Rio Grande, and there it would be better justified if so much of its basin were not semi-arid.

The most remarkable lacustrine region of the continent, rivaling that of Central America, forms a lake on the flanks of the Labradorian highland; here, in addition to ten large lakes, there are hundreds of medium size, and many thousand small lakes. They are peculiar in occupying a region of moderate relief, and the evaporation in recent geological time (unless in the case of Lake Superior), and thus in contrasting with the great African lakes which occupy rift-valleys or graben of comparatively recent fracture. The Laurentian lakes are further characterized by an intimate association with the ice-sheets of the Glacial period; but while glacial erosion and drift obstruction suffice to account for the smaller lakes, it is very probable that broad upland areas, with corresponding lake basins, were occupied as other processes in producing the great lakes. The northern Cordilleran region contains many beautiful lakes of moderate size in deep basins among the crowded ranges of northern mountains. Their size has not been much reduced. The basins among the sparsely inhabited middle and southern Cordilleras, in the United States and Mexico, contain many lakes that occupy shallow depressions on the mountains, and not all of them, it seems, have been formerly occupied by lakes of much greater size, some of which overflowed, implying a climate moister than that of to-day, probably correlated with the glacial climate of the regions farther north. Lakes in volcanic craters or behind volcanic barriers occur in Central America, while Florida possesses many small lakes in limestone basins. The following table is taken from Russell’s Lakes of North America:—

The climatic features of North America are best appreciated when considered as exhibiting modifications of those general climatic conditions which prevail in consequence of the globular form of the earth as a whole. In January, when the isotherms of 68° to 70° F. stretch almost from sea to sea in the north torrid zone, a mean temperature of zero or less invades the region north-west of Hudson Bay, which thus resembles north-eastern Asia in departing greatly from the mean temperature of the western ocean, and in bringing upon the northern lands an extension of frigid conditions that have no analogue in the southern or oceanic hemisphere. In July, when the isotherms of 40° and 50° have a tolerably direct course around the latitudes of the continent on the north, a great middle area of North America becomes warmer than the seas on the east and west, having a mean of over 80°, and in part over 90°. In January the Hudson Bay region is 30° colder than the mean of its own latitude, about 60° colder than the mean of the corresponding southern latitude; while in July the Arizona-Mexican region is 20° above the mean of its own latitude, about 40° above the mean of the corresponding southern latitude. In both winter and summer the isotherms are more closely crowded while crossing the continent than while crossing the adjacent oceans; or, in other words, the polumal temperature gradient is stronger on the land than on the ocean, and all these features should be regarded as inherent characteristics of the climate of North America in virtue of its being a continent chiefly in temperate latitudes.

An associated feature of continental climate found in North America is the transition from tundralike to grassland type, with the results indicated by the temperature zero isotherm, which is reduced to 40° to the north of the Great Lakes, and to 50° in the south. The range between the means of January and July exceeds 40° for the largest part of the lands, and 70° for much of the northern lands; the range in the south is much smaller. The northern lands are the basic areas in the northern hemisphere the range is little more than 20°, and in the southern hemisphere it is probably less than 10°. It must appear from this that if the largest part of North America is any thing near as abominable as the northern limits and in the Novem er, the winter cold is severe and the summer heat is excessive over much of the North American continent.

The several members of the terrestrial planid system, including
In the trade winds of a broadened torrid zone, the stormy westerly winds of middle latitudes and the irregular winds of the polar regions, are well exemplified over North America; but, as is the case with the system of monsoons, the broadening of the latitude is better seen in the drift of the clouds than in the movement of the surface winds, which are much modified by the changes from hill to valley, from mountain to plain. Nevertheless the prevalence of the general southward movement of the weather is obvious, as shown by the steady drift of the smoke from the factories of the Mississippi valley toward the Atlantic ocean near the American coast, where strong seasonal changes of temperature are carried forward by the westerly winds. It is particularly in this respect that the general climatic resemblances between the eastern United States and the European sub-tropical provinces for eastern Canada and western Europe are strikingly unlike in seasonal variations of temperature. Labrador is about 10° cooler than northern Germany in July, but nearly 40° colder in January.

The distribution of rainfall is in general controlled by the prevailing course of the winds. The West Indies receive abundant rain from the passing trades. In Mexico and Central America the eastern slopes are favored by easterly, and the western slopes by westerly winds; there come chiefly from the east (maximum over 100 in. in Guatemala and adjacent parts). Farther north the reverse holds true; the Pacific slope north of 40° latitude has an abundant rainfall (maximum over 200 in. on the mountains of California). The rainfall of the Mississippi valley is deficient. There are large areas of deficient rainfall (less than 20 in.) in the interior of the continent, where the intermontane basins and the piedmont plains that slope eastward from the mountains in middle latitude are, as a general rule, more arid because they are depressed by the winds from the west, and are infrequently disturbed by moisture from the Gulf of Mexico, where the wind is caught by the mountains, or from the Atlantic ocean near the American coast, where strong seasonal changes of temperature are carried forward by the westerly winds. It is particularly in this respect that the general climatic resemblances between the eastern United States and the European sub-tropical provinces for eastern Canada and western Europe are strikingly unlike in seasonal variations of temperature. by its size alone, although it has not in this respect the extraordinary importance of Europe. The continent has the good fortune to lie chiefly in a temperate rather than in the tropics, in temperate latitudes to be much nearer to Europe than Asia. Whatever may have been the first home of the aboriginal inhabitants, the dominating people of to-day are derived from the leading countries of the Old World. Not only so; temperate North America has become the most progressive part of the continent because of receiving its new population chiefly from the most advanced nations of middle western Europe—Great Britain, France and Germany; while the torrid islands and the narrowing southern mainland of North America have been settled chiefly from the British Isles and southern Europe; and the inhospitable northern lands are hardly entered at all by newcomers, except in the recently discovered goldfields of the far north-west. From the plantation of colonies on the eastern coast, the movement inland has been governed to a remarkable degree by physiographic factors, such as form, climate and products. The cities of the Atlantic harbours and of the adjacent lowlands still take a leading part in industry and commerce, because of their longer establishment and of their relation to Europe. The uplands, ridges and mountains of the Appalachian system—the foreland of a century ago—remain rather thinly occupied except at certain centres where ore or other earth-product attracts an industrial population. Beyond the Appalachians the middle interior contains a very large proportion of habitable land. It was long ago recognized as a land of great promise, and it is to-day a land of great performance, covered with a network of railways, yielding an enormous product of grain, and developing industries of all kinds. Indeed, within and closely around an area marked by the St Lawrence system on the north, the Ohio on the south, and stretching from the Atlantic coast between the Gulf of St Lawrence and Chesapeake Bay inland to the Great Lakes and as far west as the Mississippi, the population, industry, progress, wealth and power of North America—the focus of attention from all other parts of the continent. The regions of the far north and north-east, including the greater part of the Laurentian highland and the extreme northern stretch of the medial plains and the western highlands, remain and will long remain thinly populated. The furs of wild animals are their characteristic product. Timber is taken from their more accessible forests; but only in mining districts do the population notably increase, as in the iron region around Lake Superior and the gold and silver mining regions. The outlying parts of the continent remain for the most part the domain of savage tribes, speaking many different languages, holding little intercourse with each other, and frequently engaged in intertribal wars, have given place in little more than two centuries to a great population of European origin, whose dominant parts speak one language, whose arts are highly advanced, whose home intercourse is most active, and whose foreign commerce had attained unexpected proportions at the opening of the 20th century.

Two centuries ago the aboriginal population of North America would have deserved description before the immigrant population. To-day the aborigines are displaced from nearly all the valuable parts of the continent. Never very numerous, they are now decreasing; many tribes are already extinct, many more are almost so. Those which remain less diminished are in the Far North or North-West where nature is rigorous; or in the tropical forests of Central America, where nature is too wet and too hot; or in the more desert parts of the Middle West where nature is arid. The replacement of the native races by the foreign has too often been harsh, cruel and bloody. It has been an interchange of civilians and savages, the former having little intercourse with the latter, and frequently engaged in intertribal wars, have given place in little more than two centuries to a great population of European origin, whose dominant parts speak one language, whose arts are highly advanced, whose home intercourse is most active, and whose foreign commerce had attained unexpected proportions at the opening of the 20th century.

NORTHAMPTON, EARLS OF

West of the Mississippi in middle latitudes the population rapidly decreases in density, and over a large extent of the semi-arid plains it must long remain sparse. The settlements bordering the plains on the east for a long time marked the “Frontier” of civilization, for the vast stretch of dry country was a serious hindrance to further advancement. But the pioneers have now crossed many railways leading to the Cordilleran region—the “Far West” —in large part too rugged or too arid for occupation, but rich in minerals from one end to the other, the seat of many mining camps of unstable population, and containing numerous permanent settlements in the intermontane basins. Great irrigation enterprises, conducted under the National Reclamation Service of the United States, are employing all available water supplies for agriculture; but large areas must remain permanently desert. One of the more northerly is a basin near the farther edge of the ocean, which has a rich soil and a climate that promises to be dry and sunny. The increase is rapid in the new states and the territories to which the pioneers have been moving. But the delay in the more southern states and territories is greater because of the many obstacles in the way, and the proportionate gains neither political nor social standing in the New World.

Two centuries ago the aboriginal population of North America would have deserved description before the immigrant population. To-day the aborigines are displaced from nearly all the valuable parts of the continent. Never very numerous, they are now decreasing; many tribes are already extinct, many more are almost so. Those which remain less diminished are in the Far North or North-West where nature is rigorous; or in the tropical forests of Central America, where nature is too wet and too hot; or in the more desert parts of the Middle West where nature is arid. The replacement of the native races by the foreign has too often been harsh, cruel and bloody. It has been an interchange of civilians and savages, the former having little intercourse with the latter, and frequently engaged in intertribal wars, have given place in little more than two centuries to a great population of European origin, whose dominant parts speak one language, whose arts are highly advanced, whose home intercourse is most active, and whose foreign commerce had attained unexpected proportions at the opening of the 20th century.

NORTHAMPTON, EARLS AND MARQUEESSES OF. The title of Northampton was created in the reign of King Henry fifth, and was given to the Duke of Bedford, the founder of the house of Bedford. It was, however, not until 1372 that it was confirmed to the earl, and then only upon the death of the last member of the royal family. The title of earl of Northampton was created in 1351, and was held by various noblemen until 1372, when it was confirmed to the earl of Oxford by the king. The title of marquess of Northampton was created in 1627, and was held by various noblemen until 1735, when it was confirmed to the earl of Oxford by the king.

In 1372 William de Bohun (c. 1310-1360), a distinguished soldier, son of Humphrey de Bohun, 4th earl of Hereford and Essex, was created earl of Northampton, and his son Humphrey, who succeeded, fell heir in 1361 to the earldoms of Hereford and Essex, which then became united under that of Hereford. The titles, however, became extinct at his death in 1372.

In 1547 William Parr (1513-1571), son of Sir Thomas Parr and brother of Catherine Parr, was created marquess of Northampton, and though attained in 1533 was recreated marquess in 1559. He took part in suppressing the rising in the north of England in 1537, and after serving as member of parliament for Northamptonshire was made Baron Parr in 1539. In December 1543, just after his sister had married the king, he was summoned to the court of Henry VIII as a member of the council. In 1544 he was created earl of Northampton. In 1545 he was appointed one of the commissioners for the annexe of the clergy, and in 1547 he was made a judge. He was also a member of the council for the reform of the Roman Catholic law, Henry Bourchier, who had died in March 1540. Under Edward VI., who called him “his honest uncle,” Parr was equally prominent, being lord-lieutenant of five of the eastern counties, and being great chamberlain from 1550 to 1553. He favoured the claim of Lady Jane Grey to the English throne and consequently the accession of Queen Mary was quickly followed by his attainder. Although sentenced to death he was pardoned
and released from prison at the end of 1553. After enjoying the favour of Queen Elizabeth, Northampton died at Warwick on the 28th of October 1571. He left no children and his marquessate became extinct. In 1604 Henry Howard (see below) was created earl of Northampton, his title dying with him. It next passed into the Compton family, where it has since remained. The 1st earl of Northampton in this line, William Compton (d. 1630), who received the title in 1618, was a great-grandson of the Sir William Compton (1482–1528) who was with Henry VIII at the Field of the Cloth of Gold, and his son the 2nd earl is noticed below. The 9th earl, Charles Compton (1760–1828), was created a marquess in 1812, receiving at the same time the titles of Earl Compton and Baron Wilmington. His son Spencer Joshua Alwyne, the 2nd marquess (1790–1851), was president of the Royal Society from 1838 to 1848; the latter’s son Lord Alwyne Compton (1825–1906) was bishop of Ely from 1886 to 1905. The 5th marquess (b. 1851), son of the 4th marquess (1818–1897), was, as Earl Compton, a Liberal member of parliament from 1889 to 1897.

Henry Howard, earl of Northampton (1544–1614), was the second son of Henry Howard, earl of Surrey, the poet, and of Lady Frances Vere, daughter of the 5th earl of Oxford, and younger brother of Thomas Howard, 4th duke of Norfolk. He was educated first by Foxe the martyrlogist, afterwards by John White, bishop of Lincoln, with whom he acquired Romanist opinions, and finally at the charge of Queen Elizabeth at King’s College and Trinity Hall, Cambridge, where he obtained his M.A. degree in 1564, subsequently in 1568 being incorporated M.A. at Oxford. The discovery of his brother’s plot to marry Mary, Queen of Scots, and of his own correspondence with her, deprived him of Elizabeth’s favour, and he was arrested more than once on suspicion of harbouring treasonable designs. In 1583 he published a work entitled A Defensive against the Poison of supposed Prophecies, an ostensible attack upon astrology, which, being declared to contain heresies and treason, led to his imprisonment. On regaining his liberty he is said to have travelled in Italy. His flattery of the queen in lengthy epistles met with no response, and his offer to take part in the national defence against the Spanish invasion was refused. He attached himself, however, both to Essex and to Robert Cecil, and through the influence of the latter was in 1600 again received by Elizabeth. At the close of the queen’s reign he joined with Cecil in courting the heir to the throne in Scotland, the main object of his long letters of advice, which James termed “Asiatic and endless volumes,” being to poison the royal mind against Sir Walter Raleigh and other rivals, whom he at the same time hoped to ensnare into compromising relations and correspondence with Spain. These methods, which could not influence Elizabeth, were completely successful with James, and on the latter’s accession to the crown Howard was made a privy councillor, on the 1st of January 1604 lord warden of the Cinque Ports, and on the 13th of March earl of Northampton and Baron Howard of Marnhull in Dorset; on the 24th of February 1605 he was given the Garter and on the 29th of April was appointed Lord Privy Seal. In 1609 he was elected high steward of the university of Oxford, and in 1612 chancellor of Cambridge university. The same year he was appointed one of the commissioners of the treasury. He was one of the judges at the trials of Raleigh and Lord Cobham in 1603, of Guy Fawkes in 1605, and of Garnet in 1606, in each case pressing for a conviction. In 1604 he was one of the commissioners who composed the treaty of peace with Spain, and from that date he received from the Spanish Court a pension of £1,000. The climax of his career was reached when he assisted his great-niece, Lady Essex, in obtaining her divorce from her husband in order to marry the favourite Somerset, whose mistress she already was, and whose alliance Northampton was eager to secure for himself. He obtained the divorce by the decree of a special commission, and when Sir Thomas Overbury’s influence seemed likely to prevent Somerset completing the marriage project, he caused the former to be imprisoned in the Tower. Shortly afterwards Overbury died from the effects of poison administered by the direction of Lady Essex; and the close intimacy which existed between the latter and Northampton, together with his appointment of Sir Gervase Elwes or Helwys, a friend of his own, as the keeper of the victim, leaves his name tarnished with the blackest suspicions. The discovery of the crime was not made till some little time after Overbury had succumbed, and meanwhile Northampton’s own death anticipated his fall, together with that of Somerset, from power. He advised against the summoning of parliament in 1614, and when forced to do so opposed Henry’s proposed dissolution; he died unmarried on the 15th of June 1614, when his title became extinct, and was buried in the chapel of Dover Castle, the monument erected above his grave being subsequently removed to the chapel at Greenwich College. His will shows that he died a Roman Catholic.

Northampton, who was one of the most unscrupulous and treacherous characters of the age, was nevertheless distinguished for his learning, artistic culture and public charities. He built Northumberland House in London and superintended the construction of the fine house of Audley End. He founded and planned several hospitals. Bacon included three of his sayings in his “Apophthegms,” and chose him as “the learnedest councilor” in the kingdom to present to the king his Advancement of Learning. He was the author of a Treatise of Natural and Moral Philosophy (1569; MS. in the British Museum), History of Prophecies (1578; MS. in the British Museum), and of the famous Apophthegms (1589; MS. in the British Museum), and of The Discourses of Natural and Moral Philosophy, vol. 1. In Somers Tracts (ed. 1806), i. 136, his opinions on the union between England and Scotland are recorded. See the life in Surrey’s and Wyatt’s Poems, ed. by G. F. Nott (1815), and Sidney Lee’s article in the Dict. Nat. Biog.

Spenser Compton, 2nd earl of Northampton in the Compton line (1605–1643), was the son of William, 1st earl, lord president of the marches, whose father had been created Baron Compton by Elizabeth, and of Elizabeth, daughter and heir of Sir John Spencer, lord mayor of London. On the 3rd of November 1616 he was created a Knight of the Bath, and was elected for Ludlow in the parliament of 1621, the same year being appointed master of the robes to the prince of Wales and attending the latter in the adventure to Spain in 1623. He warmly supported the king in the Scottish expeditions, at the same time giving his advice for the summoning of the parliament, which “word of four syllables” he declared was “like the dew of heaven.” On the outbreak of the Civil War he was entrusted with the execution of the commission of array in the Midlands. After varying success and failure in the Midlands he fought at Edgehill, and after the king’s return to Oxford was given, in November 1642, the military supervision of Banbury and the neighbouring country. He was attacked in Banbury by the parliamentary forces on the 22nd of December, but relieved by Prince Rupert the next day. In March 1643 he marched from Banbury to relieve Lichfield, and having failed there proceeded to Stafford, which he occupied. Thence on the 19th of March, accompanied by three of his sons, he marched out with his troops and engaged Sir John Gell and Sir William Brereton at Hopton Heath. He put to flight the enemy’s cavalry and took eight guns, but in the moment of victory, while charging too far in advance, he was surrounded by the parliament soldiers. To these who offered him quarter he answered that “he scorned to take quarter from such base rogues and rebels as they were,” whereupon he was despatched by a blow on the head. Clarendon describes his loss as a great one to the cause. Northampton married Mary, daughter of Sir Francis Beaumont, by whom besides two daughters he had six sons, of whom the eldest, James (1622–1681), succeeded him as earl. Henry Compton (1672–1713) became bishop of London, and Charles, William and Spencer all distinguished themselves in the king’s cause. The 3rd earl’s third

NORTHAMPTON

son Spencer (1737-1743) was a favourite of George II. and in 1728 was created earl of Wilmington, a title which became extinct at his death.

See the article in the *Dict. of Nat. Biog.* by C. H. Firth; E. B. G. Warburton's *Life of Prince Rupert*; S. R. Gardiner's *Hist. of England and of the Civil War*; *Thomason Tracts*, E. 99 (18) [Hopton Heath and Middle Colne]; E. 111 (17), E. 110 (8) 1642 [Proceedings at Banbury], E. 83 (47) [speech].

NORTHAMPTON, a municipal, county and parliamentary borough and the county town of Northamptonshire, England, 66 m. N.W. by N. from London by the London & North Western railway; served also by a branch of the Midland railway. Pop. (1891) 75,075, (1901) 87,021. It lies in a slightly undulating district mainly on the north bank of the river Nene. The main roads converging upon the town meet near the centre in a spacious market-place, where stands a fountain on the site of the ancient cross destroyed by the fire of 1675 which levelled a great part of the town. There were formerly seven ancient parish churches, but only four remain. Of these All Saints church was rebuilt after the fire of 1675, but retains its Decorated embattled tower, with which the style of the later building scarcely harmonizes, the principal feature being the fine Ionic portico. The church of St Giles was originally a cruciform structure of the beginning of the 12th century, but has been greatly changed, and besides a rich Norman doorway contains specimens of Early English, Decorated and Perpendicular work. St Peter's, near the site of the ancient castle, is supposed to be of the same date with it, and its interior is a fine specimen of Norman architecture. St Sepulchre's, one of the four round churches still remaining in England, may have been built by the Knights Templars at the close of the 11th century. There are several modern parish churches. Northampton is the seat of a Roman Catholic bishop, and there is a pro-cathedral, designed by A. W. Pugin (1864). In the neighbourhood of the town there were a Cluniac priory of St Andrew, a house (Delapré) for nuns of the same order, and one for Augustinian canons dedicated to St James; but the first has disappeared, the site of the second is occupied by a modern mansion, and of the third there are only slight fragments. Some portions of the castle were re-erected on a new site after their destruction when the Castle station was built by the London & North Western Railway Company. In the populous parish of Hardingstone, S. of the town, is one of the original Eleanor crosses, of which only three remain out of twelve erected by Edward I. to mark the resting-places of his queen's body on its way from Harby (Nottinghamshire) to burial at Westminster. The chief public buildings of Northampton are a town hall, county hall, county council room, corn exchange, antiquarian and geological museum, free library and barracks. The free grammar school was founded in 1552; the Northampton and county modern and technical schools were incorporated with it in 1894. There are a Roman Catholic convent with schools, and various charity schools. The charitable foundations include St John's hospital, founded in the 12th century; St Thomas's hospital, founded in 1450 in honour of Thomas à Becket, an infirmary, asylum, dispensary, &c. There is a race-course north of the town. The staple trade is the manufacture of boots and shoes, which is very large. There are also considerable currying and tanning works, breweries, iron foundries, and brick and tile works. The cattle market is extensive. The county borough was created in 1888. The municipal borough is under a mayor, 8 aldermen and 24 councillors. Area, 3469 acres. British and Roman remains have been discovered near Northampton (Hamstone, Northstone), and it became the chief settlement of the Angle tribes who pushed their way up the Nene in the early part of the 6th century. It was occupied by the Danes in the reign of Edward the Elder and is said to have been burnt by Sweyn in 1010. In the reign of Edward the Confessor the town was re-built by his great-grandson in his 33rd year. In his time the number had decreased to 47 in 1086, a new borough containing 40 burgesses had been formed. The burgesses rendered yearly to the sheriff £50, 10s. "which belonged to his farm," and was probably the beginning of the fee farm which they were allowed to pay directly to the king in 1185 and which was then increased from £100 to £120. Forty marks of this farm were pardoned by Richard III. in 1484 because "the town had come to such ruin" that the bailiffs had to pay more than £53 from their own goods. The mayor was the chief officer in the 13th century, and Henry VI. granted the incorporation charter in 1460 under the title of mayor, bailiffs and burgesses. The town has been represented by two members since 1395. Tanning was an industry of Northampton in the time of Edward I., and in 1675 a law was made by the corporation forbidding strangers to purchase hides in the town except on fair-days. Boots and shoes are known to have been made here in the reigns of John and Edward I., although probably only for the use of the town-people, and by the 17th century Northampton was one of the most noted places in England for their manufacture.

Northampton has been the meeting-place of several important councils and parliaments. In the wars between John and his barons the castle withstood a siege by the latter, but in 1264 it was occupied by the barons under the earl of Leicester. In the Wars of the Roses it was the scene of the battle in which Henry VI. was defeated and taken prisoner in 1460. During the Civil Wars of the 17th century it was held for the parliament by Lord Brooke. In 1675 the town suffered severely by fire, 600 houses being destroyed.

See *Victoria County History, Northampton; C. H. Hartshorn, Historical Memorials of Northampton* (1845).

NORTHAMPTON, ASSIZE OF, a short code of English laws issued in 1176, is drawn up in the form of instructions to six committees of three judges each, which were to visit the six circuits into which England was divided for the purpose. Though purporting to be a reissue of the Assize of Clarendon (1166), it contains in fact many new provisions. As compared with the earlier assize it presupposes greater severity of punishment for criminal offences; arson and forgery were henceforth to be crimes about which the jurors are to enquire; and those who failed at the ordeal were to lose a hand as well as a foot. In what is perhaps the most important section we may probably see the origin of the possessory action of *mort d'ancist*, an innovation scarcely less striking than the institution of the *novel disseizin* in the winter of 1166. The justices were also ordered to try proprietary actions commenced by the king's writ for the recovery of land held by the service of half a knight's fee or less. In their fiscal capacity they were to enquire into escheats, churches, lands and women in the king's gift. The royal bailiffs were to answer at the exchequer for rents of assize and all the perquisites which they made in their offices, and apparently the duty of enforcing this provision was entrusted to the justices. As a result of the rebellion of 1173-1174 it was provided that the tax of fealty should be taken by all, 4, to wit, barons, knights, freeholders and even villeins (rustici), and that any one who refused should be arrested as the king's enemy, and the justices were to see that the castles whose demolition had been ordered were completely razed.

NORTHAMPTON, a city and the county-seat of Hampshire county, Massachusetts, U.S.A., situated on the Connecticut river, about 16 m. N. of Springfield. Pop. (1910 census) 104,341. The city has an area of 35:3 sq. m. The chief village, Northampton, is on the New York, New Haven & Hartford, and the Boston & Maine railways. It lies on the border of the meadow-land, and with its irregular, semi-rural streets, and venerable trees is considered one of the prettiest villages in New England. Northampton is about 12 m. E. and 11 m. N.W. of Northampton (Hampshire, Mass.), 75m. N.E. of Boston, 23 m. W. of Holyoke (95 ft.), which may be ascended by carriage road and mountain railway, and the summit of which commands a magnificent view. The city is the seat of a state hospital for the insane;
of the Clarke School for the Deaf (1867, founded by John Clarke of Northampton); of Smith College, one of the foremost colleges for women in the country; of the Mary A. Burnham School for Girls (1871), a preparatory school chiefly for Smith College, founded by Miss Mary A. Burnham; and of the Miss Clarke School (preparatory) for girls. Besides the college library, there are in Northampton two public libraries, the Clarke (1850) and the Forbes (1854). The Forbes library was established with funds left by Charles E. Forbes (1795-1881), from 1848 to 1881 a justice of the state supreme court. The People's Institute was started as a Home-Culture Clubs movement by George W. Cable, who became a resident of Northampton in 1886. The Smith Charities is a peculiar institution, endowed by Oliver Smith (1766-1842) of Hatfield, who left an estate valued at $370,000 in 1864, to be administered by a board of three trustees, chosen by electors representing the towns of Northampton, Hadley, Hatfield, Amherst and Williamsburg in Hampshire county and Greenfield and Whately in Franklin county—the beneficiaries of the will. The will was contested by Smith's heirs, but in 1847 was sustained by the supreme judicial court of Massachusetts. Of the total sum, $200,000 was to accumulate until it became $400,000. Of this $30,000 was to found Smith's Agricultural School at Northampton, which opened for instruction in 1903, and an income of $10,000 was to be paid to the American Colonization Society, but in 1903 this amount was increased to $20,000 by the will, and the $10,000 was incorporated with the Agricultural School fund; and $36,000 was devoted to indigent boys and girls, indigent young women and indigent widows. The remainder of Smith's property was constituted a contingent fund to defray expenses and keep the principal funds intact.

Florence, a village on the Mill river in the city limits, is a manufacturing village, silk being its principal product, and cutlery and brushes being of minor importance. The value of the city's factory products increased from $4,776,820 in 1900 to $6,776,381 in 1905, or 22.3%. Northampton was founded in 1656, and was incorporated as a city in 1833. In September 1786, at the time of the Shays Rebellion, the New Hampshire Gazette (still published; daily edition since 1896) was established here in the interest of the state administration. Jonathan Edwards was pastor here from 1727 to 1750. Caleb Strong (1745-1819), a member of the Federal Constitutional Convention of 1787, and governor of Massachusetts in 1800-1807 and 1812-1816; Joseph Hawley (1723-1788), one of the most prominent patriots of western Massachusetts; Timothy Dwight; Arthur (1736-1805), Benjamin, and John (1728-1873) Tyng, prominent philanthropists and anti-slavery men; and William D. Whitney were natives of Northampton.

NORTHAMPTONSHIRE, an east midland county of England, bounded N. by Lincolnshire, N.W. by Rutland and Leicestershire, W. by Warwickshire, S.W. and S. by Oxfordshire, S.E. by Buckinghamshire, and E. by Bedfordshire, Huntingdonshire and Cambridgeshire. The area is 1,003 sq. m. The surface is undulating and somewhat monotonous, notwithstanding that the country is richly cultivated and in some parts finely wooded. Elevations over 700 ft. are few. The most picturesque scenery is found in the western and south-western districts. For long Northamptonshire has been famed for its ash trees, and there are also some very old oaks, such as that associated with Cowper's posthumous poem—"Yardley Oak," in Yardley Chase near Northampton, as well as a few fine avenues of elm. The north-eastern extremity belongs to the great Fen District. The county forms the principal watershed of central England, nearly all the more important rivers of this region having their sources within its boundaries. The Avon, with a westerly course, forms for some distance the northern boundary of the county, till near Lilbourne it passes into Warwickshire. The Nene passes southward past Northampton, whence it takes an easterly course, skirting the eastern boundary of the county. The Welland flows in an easterly direction, forming the boundary of the county with Leicester, Rutland and Lincoln. The Cherwell, rising in a spring at Charwelton, where it is crossed by a very ancient bridge, passes into Oxfordshire, and then forms for a considerable distance the southernmost portion of the county. A branch of the river is the river Chet, which, after passing through the town of Daventry, the largest town in the county, turns southward into Northamptonshire; the Leam forms a portion of the boundary with Warwickshire. The Ouse, which rises near Brackley, soon afterwards leaves the county, but again touches it near Stony Stratford, separating it for some distance from Buckinghamshire.

Geology.—With the exception of the superficial glacial and river deposits, all the rocks exposed in the county are of Jurassic age; these rocks are seen in a series of cliffs on the southern borders, and outcrops being from south-west to north-east. The oldest rocks exposed belong to the Liassic formation; they come to the surface over a large area in the south-west and centre, around Banbury, Daventry and Market Harborough, and by the removal of the overlying Oolitic strata they are exposed along the rivers and stream courses near Towcester, Northampton, Wellingborough and Kettering. The Lower Lias, blue clay with limestone bands and cement stones, has few exposures; it has been cut through by the railways at Kilsby and Catesby, and at Braunston it is dug for brick-making. The Middle Lias consists of grey micaceous marls, sandstones and clays, and even limestones, as at Kettering, where at the top is the marlstone or "rock bed," used as a building stone and for road metal. The Upper Lias is again a blue argillaceous series of strata, with limestones and cement stones; it is employed for building, and is often used in structure-making. In the south-east to south-west is an elevated tract of Oolitic rocks which contrasts strongly with the low-lying grass-covered Liassic ground. The lowest part of the Oolitic series is the Permian Beds, an important source of iron ore, with from 9 to 12 ft. of workable beds at Blisworth, Kettering, Northampton, Thrapstone, Towcester and Wellingborough. The flaggy sandstone of Duston (variable beds) belonging to the Upper part of the Northampton sands is known as the Lower Estuarine Beds; these are white and reddish clays and sands. In the north-east part of the county from about Maldon, the Lincolnshire Limestone is developed at the expense of the Northampton Sand; the well-known building stone of Barnack (Barnack Rag) and Weldon belong to this horizon; a hard shelly variety is known as Weldon or Stamford Limestone. Locally known as the Hunsbury Sand, it is a series of flaggy strata, the Collyweston slates. The Great Oolite series comprise the Upper Estuarine Beds, the Great Oolite Limestone, Great Oolite Clay, Forest Marble and Cornbrash (very fissile at Rushden). On the south-east border a belt of Oxford Clay occupies the surface; good exposures occur in the brick-fields about Peterborough. Glacial sands and gravels, including the great Chalky Boulder Clay, occur in patches on the older rocks, as at Hillmorton, and fill up old channels of the rivers sometimes as a considerable depth, as in the valley of the Ouse at Furtho, where the Boulder Clay is 100 ft. thick. Borings have revealed the existence of Rhetic and Keuper rocks resting on the Oxford Clay, but the entire country beneath the Carboniferous strata probably consists of Permian Beds. Gayton and Northampton the Carboniferous and possibly Old Red Sandstone strata have been proved, but no Coal Measures were encountered. The water-bearing strata of Northamptonshire include the Permian Beds, the Lower Estuarine Beds, the Oolitic beds and ironstone beds of the Inferior Oolite, and the Cornbrash and Great Oolite Limestone.

Climate and Agriculture.—The climate of Northamptonshire is mild and genial, while the absence of lofty hills renders it much drier than many other inland districts. The mean annual rainfall at Wellingborough is 27.2 ins. The prevailing soil is a rich brown but light and crumbling mould, sometimes with a rocky subsoil. The richest soil is the black mould of the fen country, which is specially suited for growing grasses, as are all the heavier soils. Nearly all the land is capable of cultivation, although there is some stiff wet soil on the slopes of the hills. Nearly nine-tenths of the total area, a high proportion, is under cultivation, and of this considerably over three-fifths is in permanent pasture, the acreage devoted to this use increasing steadily. Less than one-fifth is under grain crops, and the area decreases. Wheat and barley are the principal grain crops. The fattening of cattle is the chief occupation of the Northamptonshire farmer. The favourite stock for breeding purposes is the shorthorn, but the commonest breed in the county is the Durham, and the Border and Irish cattle in the spring and summer fatten them on the rich pastures, a few being retained and fed for the Christmas market. In autumn additional cattle are brought in to eat the coarse grass off the pastures, and these are usually retained during winter. The most common breed of sheep on the rich pastures is the improved Leicester, which is preferred on account of its length.
of wool; but the Southdown, on account of its superior flesh, is also largely kept.

Manufactures.—The iron industry is of considerable importance, though only a small proportion of the metal is smelted in the county. The industry is carried on in the central part of the county, as in the Kettering, Wellingborough and Thrapston districts, and in the north near Stamford. But Northamptonshire is more famous for its manufacture of boots and shoes, which is chiefly prosecuted in the towns and villages of the central and southern districts, and along the eastern border. This trade occupies some three-quarters of the total number of hands employed in factories in the county.

Communications.—The main line of the London & North Western railway passes through the south-western portion of the county, with an alternative route to Northampton, and branches to Peterborough and elsewhere. With it are connected at Bletsow Junction the East and West Junction railway to Towcester, Woodford and Stratford-on-Avon, and the Northampton and Banbury Junction railway, which Central main line, crossing the county in the south, has connexion with the Great Western railway at Banbury from Woodford. The Midland railway serves Wellingborough, Kettering and Northampton, and an important junction of systems is effected at Peterborough, which is served by the Midland Northern railway. Branch lines of this and the Midland system complete the railway communications of the county. The Grand Junction Canal, which is connected with the Oxford Canal, enters the county at Braunston on the borders of Warwickshire, and passes by Daventry and Billesworth into Buckinghamshire, a branch connecting it with Northampton. The Grand Union Canal unites with the Oxford and Kennet and Avon lines at Daventry, and a branch north from the Leicester Canal at Foxton, branches passing to Welford and Market Harborough.

Population and Administration.—The area of the county is 641,992 acres, with a population in 1801 of 392,183 and in 1901 of 338,024. The area of the administrative county of Northampton is 583,148 acres, and that of the administrative county of the soke of Peterborough 53,464 acres. In Domesday the county is mentioned as containing 30 hundreds, but it then included a considerable part of Rutland. These divisions were first reduced to 28, and in the reign of Henry II. to 20, their present number. The administrative counties include four municipal boroughs, namely, Brackley (pop. 2467), Daventry (3790), Higham FERRERS (2540) and Peterborough (30,572), together with the municipal and county borough of Northampton (67,021). The urban districts are: Desborough (3578), Finedon (2991), and Peterborough (4314). There are two parliamentary boroughs, Peterborough (2404), Raunds (3811), Rothwell (4193), Rushden (12,453), Wellingborough (18,412). There are one court of quarter sessions and nine petty sessional divisions. The borough of Northampton and the liberty of the soke of Peterborough have each a separate court of quarter sessions and a separate commission of the peace. The total number of civil parishes is 346, of which 33 are in the soke of Peterborough. The ancient county contains 297 entire ecclesiastical parishes or districts, wholly or in part, of most of them in the diocese of Peterborough; but small parts of the counties fall within the dioceses of Oxford, Ely and Worcester. For parliamentary purposes the county is divided into four divisions (Northern, Eastern, Mid and Southern), and includes the parliamentary borough of Northampton, and part of the parliamentary borough of Peterborough, each returning one member, except the borough of Northampton, which returns two members.

History.—At some time in the 7th century the district which is now Northamptonshire suffered a simultaneous invasion by the West Saxons from the south and the Anglian tribes from the north. The relics discovered in the county testify to a mingling of races, at the soke of the county, and run north until it joins the river never spread farther north than a line from Daventry to Warwick, and with the extension of the Mercian kingdom under Penda and the conversion of the midland districts ceased altogether. The abbey at Medehamsted (now Peterborough) was begun by Peada in 655, and about the same time foundations were established at Peaak, Weedon Beck, Castor and Oundle. In 870 the district was overrun by the Danes, and Northampton was one of the five Danish boroughs; until 921 it was recovered by Edward the Elder, who fortified Towcester in that year. In the 11th century Northamptonshire was included in Tosti's northern earldom; but in 1065, together with Huntingdonshire, it was detached from Northumbria and bestowed on Wulfric. The only monastic foundation which survived the Conquest was Peterborough. Norman castles existed at Rockingham, Barnwell, Lilbourne and Northampton.

As a shire Northamptonshire was probably of Danish origin, representing in the 10th century the area which owed allegiance to Northampton as a political and administrative centre. In 921 this area extended to the Welland, the present northern limits of the county, and at the time of the Domesday Survey the boundaries were identical with those of the present; Northamptonshire is first mentioned by name in the Historia Elenis, in connexion with events which occurred at the close of the 10th century.

The Gild roll of the time of William I. and the Domesday Survey of 1086 mention 28 hundreds in Northamptonshire, and part of Rutland is assessed under this county. By 1316 the divisions had undergone considerable changes, both in name and in extent, and had been reduced to their present number, 30, except in Rutland. They have remained practically unaltered. The names of the hundreds point to primitive meeting-places, gradually superseded by villages and towns, and the court for Fawsley hundred met under a large beech tree in Fawsley Park until the beginning of the 18th century, when it was transferred to Everdon. The shire-court originally met at Northampton.

Northamptonshire was originally included in the diocese of Lincoln. The archdeaconry of Northampton is mentioned in the 12th century, and in 1291 included the deaneries of Peterborough, Northampton, Brackley, Oundle, Higham, Daventry, Preston, Weldon, Rothwell and Haddon. The diocese of Peterborough was created in 1541, and in 1835 the archdeaconry of Oakham was formed and included in this county the first and second deaneries of Peterborough and the deaneries of Oundle, Weldon and Higham Ferrers. Northampton archdeaconry now includes the first, second and third deaneries of Brackwell and Rothwell; the first and second deaneries of Haddon and Preston, and the deaneries of Daventry, Northampton and Weldon.

At the time of the Domesday Survey the chief lay-tenant in Northamptonshire was Robert, earl of Mortain, whose fief crested to the crown in 1106. The estates of William Paynel, founder of the abbey of St James at Northampton, also escheated to the crown in the 12th century. Holdenby House was built by Sir Christopher Hatton, privy councillor to Queen Elizabeth, and Yardley Hastings was named from the Hastings, formerly earls of Pembroke. Higham Ferrers was the seat of the Ferrers family; Braybrook Castle was built by Robert de Braybrook, a favourite of King John; and Burghley House gave the title of baron to William Cecil.

Northampton was a favourite meeting-place of the councils and parliaments of the Norman and Plantagenet kings. In 1215 John was besieged in Northampton Castle by the barons, and in 1264 Henry III. captured the castle from the younger Simon de Montfort. During the Wars of the Roses Henry VI. was defeated at Northampton in 1460. In the Civil War of the 17th century the county declared almost unanimously for the parliament. A royalist garrison was placed at Towcester by Prince Rupert in 1644, but almost immediately withdrawn.

The iron-mines and stone- quarries of Northamptonshire were worked in Roman times, but the former were entirely neglected from the Plantagenet period until their re-discovery in 1859, while the two most famous quarries, those of Barnack and Stanion, were exhausted about the 16th century. The wool and leather industries flourished in Norman times. In the 17th century the weaving industry declined in the Northampton district, but became very flourishing about Kettering. Other early industries were charcoal-burning, brick and tile manufacture and brewing. The industries of whip-making, pipe-making, silk-weaving and paper-making were introduced in the 17th and 18th centuries.

In 1290 Northamptonshire returned two members to parliament, and in 1295 Northampton also returned two members.
In 1547 Brackley and Peterborough returned each two members, and in 1557 Higham Ferrers returned one member. Under the act of 1832 the county returned four members in two divisions, and Brackley and Higham Ferrers were disfranchised.

Antiquities.—Although Northamptonshire was rich in monastic foundations, remains, except of the Abbey church of Peterborough, afterwards the cathedral, are of small importance. At Geddington, and also at Hardingham, near Northampton, there is an Eleanor cross, erected by Edward I. to the memory of his queen, in good preservation. For the architecture of its churches Northampton holds a place scarcely inferior to any other English county. To the Saxon period belong the tower of Earls Barton church, which stands on an eminence, probably the mound of an old English strong-house; the tower and other portions at Brigstock; the ground plan and other portions at Wittering; the remarkable towers at Barnack, and Brixworth church, constructed in part of Roman materials, and by some believed to include part of a Roman basilica. Of Norman, besides the cathedral of Peterborough, the finest examples are St Peter's and St Sepulchre's, Northampton, and the tower of Castle church. St Mary's church, Higham Ferrers, formerly collegiate, Early English and Decorated, is one of the finest churches in the county, and, as specially noteworthy among many beautiful buildings, there may be mentioned the churches at Irthlingborough and Lowick, with their lantern towers, Wartington, a very fine specimen of Early English work, Rushden, St Mary's; Barnwell Castle, constructed in the church of the castle at Easton Maudit, Percy, author of the Reliques, and afterwards Bishop of Dromore, was recto.

A gateway at Rockingham, and earth-works at Higham Ferrers and Brackley are worthy of mention. Some castellated ruins remain of the castle at Fotheringhay, famous as the scene of the imprisonment, trial and execution of Mary, Queen of Scots. Barnwell Castle, founded by William the Conqueror, an interesting example of the defensive construction of the period, is still a fine ruin, which includes four of the round towers and a circular fortification of stone. Holkham Hall, the residence of Christopher Hatton (1540-1591) was born, and where Charles I. was staying when he was carried away by Cornel Joyce, is largely restored. Among ancient mansions are Castle Ashby, the seat of the Comptons, the oldest portion belonging to the reign of Henry VIII.; Althorp, the seat of the Spencer's, of various dates; Drayton House, of the time of Henry VI.; the vast pile of Burghley House, Stamford, founded by Lord Burleigh (1553), but more than once altered and enlarged; and Kirby Hall, a beautiful Elizabethan building once the residence of Sir Christopher Hatton. See Victoria County History, Northamptonshire.

North Berwick—North Cape

NORTH BERWICK—NORTH CAPE

In 1547 Brackley and Peterborough returned each two members, and in 1557 Higham Ferrers returned one member. Under the act of 1832 the county returned four members in two divisions, and Brackley and Higham Ferrers were disfranchised.

NORTH CAPE (Nordkapp), a promontory on the island Magerö off the north coast of Norway in 79° 10' 30" N., 25° 45' E., 78 m. N.E. of Hammerfest. Knivskjaerodden, an island a little to the west, actually reaches a point a little farther north than the North Cape, and Nordkyn, 45 m. E., is the northern extremity of the mainland (71° 7' N.). The desolate cape, rising abruptly
over 1000 ft. from the sea, is frequently visited during the summer period of the “midnight sun,” but travellers are often prevented from seeing this phenomenon by adverse atmospheric conditions.

NORTH CAROLINA, a South Atlantic state of the United States of America, situated between latitudes 33° 51' 37" (the southernmost point of the southern boundary—35° is the northernmost) and about 36° 54' 25.5" N., and between longitudes 75° 27' W. and 84° 20' W. It is bounded N. by Virginia, E. and S.E. by the Atlantic Ocean, S. and S.W. by South Carolina, S. also by the Georgia and S.W. ridge across Tennessee. North Carolina has an extreme length from E. to W. of 5941 m. It is greater than that of any other state east of the Mississippi River. Its total area is 52,426 sq. m., of which 3686 sq. m. are water surface.

Physical Features.—The state lies wholly within the three leading topographical regions of the eastern portion of the United States: the Coastal Plain Region, which occupies approximately the eastern half, the Piedmont Plateau Region, which occupies about 20,000 sq. m. in the middle, and the Appalachian Region, which occupies about 5000 sq. m. In the western part of the state the Big Smoky Mountain Chain, an outer coast line is formed by a chain of long narrow barrier beaches from which project capes Hatteras, Lookout and Fear, whose outlying shoals are known for their dangers. Between Hatteras and Lookout is Raleigh Bay and between Lookout and Fear is Onslow Bay; between the chain of islands and the deeply indented mainland Currituck, Albemarle, Pamlico and other sounds form an extensive area, especially to the northward, of shallow, brackish and almost tideless water. Projecting into these sounds and between the estuaries of rivers flowing into them are extensive tracts of swamp land—the best known of these is Dismal Swamp, which lies mostly in Virginia and is about 30 m. long and 10 m. wide. Through most of the Coastal Plain Region, which extends inland from 80 to 150 m., the country continues very level or only slightly undulating, and rises to the westward at the rate of little more than 1 ft. to the mile. Along the W. border of this region, however, the slope becomes greater and there are some hills. The "Fall Line," the boundary between the Coastal Plain and the Piedmont Plateau, has a very irregular course across North Carolina, but lies in a general S.W. direction from the Unaka and Northampton counties to Anson county on the South Carolina border and marks a rapid increase in elevation of about 200 ft. The Piedmont Plateau Region extends from this line to the Blue Ridge Escarpment, toward which its mean elevation increases at the rate of about 3½ ft. to the mile. It is traversed from N.E. to S.W. by a series of ridges which in the E. portion produce only a general undulating surface but to the westward become higher and steeper until the country assumes a bold and rugged aspect. The S.E. face of the Blue Ridge Escarpment, which rises precipitously 1200-1500 ft. or more above the Piedmont Plateau, forms the S.E. border of North Carolina's Appalachian Mountain Region, which includes the high Unaka Mountain Range, segments of which are known by such local names as Iron Mountains, Bald Mountains and Great Smoky Mountains. These ranges reach their culmination in this state, and with a series of more or less interrupted cross ranges constitute the greatest masses of mountains in the E. half of the United States. Four peaks along the Blue Ridge have an elevation exceeding 5000 ft.—one of these, the Grandfather, rises 5904 ft. and about thirty peaks in the Unaka and S.W. dieral cross ranges exceed 6000 ft., the highest being Mount Mitchell or Mitchell Dome (6711 ft.), of the Black Mountains, a short cross range extending N. from the Blue Ridge through Yancey County. Other noteworthy peaks are Black Brother (6690 ft.) and Hairry Bear (6681 ft.), the next highest mountains. Many of the neighbouring mountain ridges have uniform crests, but a greater number terminate in numerous peaks, some sharp, rugged and rocky, but more of them rounded domes. Throughout the whole region the slopes vary greatly: the N.W. slope of the Blue Ridge is almost imperceptible, or confounded with the numerous mountain slopes that rise above it. As a rule the mountain slopes are well graded and subdued, but a few are steep and some are precipitous. The numerous valleys are usually narrow and deep, though few, if any, descend to less than 2000 ft. above the sea.

The Blue Ridge is the principal water parting of the state. West of it the Hiwassee, the Little Tennessee and the French Broad rivers flow, or N.W. into Tennessee. Farther N. are the headwaters of the New River, which drains eastern North Carolina. On the S.E. slope of the Blue Ridge rise the Broad, the Catawba and the Yadkin, which flow for some distance a little N. of E., then turn to the N.W. and rise into the Piedmont Plateau, turn to the S.S.E. and across the boundary line into South Carolina, in which state their waters reach the Atlantic. In the N.W. part of the Piedmont Plateau Region, and a little to the N. of the most N.E. corner of the Yadkin, the N.E. rises the Dan, which in its N.N. point extends into Virginia, where it becomes a tributary of the Roanoke, in which its waters are returned to North Carolina near the "Fall Line." The other principal rivers—the Cape Fear, the Neuse and the Tar—rise in the N.E. part of the Piedmont Plateau Region, have their S.E. courses wholly within the state, and, with the Roanoke, drain the Coastal Plain Region. In the Mountain Region are dozens of streams. Certain Plat species, have been observed numerous falls and rapids which afford a total water power unequalled perhaps in any other state than Maine on the Atlantic Coast, the largest being on the Yadkin, Roanoke and Catawba; and in crossing some of the mountain streams especially to the N.W. of the state, one sees narrow gorges that are much admired for their scenery. In contrast with the rivers of those regions those of the Coastal Plain are sluggish, and are shown in their mouths to the east.
clams are caught in the sounds, in the lower courses of the rivers flowing into them, or in the neighbouring waters of the sea.

Agriculture.—Until the Civil War agriculture was about the only industry in the state, and as late as 1860, in the midst of the war, it was still the leading one; but from 1880 to 1900 the ratio of agriculturists to all inhabitants of the state has steadily decreased. In the last ten years the percentage of farm land in the state has increased from 75.3 to 64.1%. The land included in farms is estimated to be about 224,743,530 acres. Of the total land surface of the state, the percentage of farm land that was improved increased from 26.5 in 1870 to 36.6 in 1900. Throughout the period of the state's history, the agricultural conditions have been influenced by the topography and climate of the state, as well as by the development of railroads and the colonization of western lands. The state's agricultural industry has been characterized by a strong emphasis on cotton production, which has been a major economic driver for much of the state's history. However, more recently, there has been a shift towards diversification, with an emphasis on produce and other agricultural products.

Minerals.—At the beginning of the 20th century a great number of banks and other financial institutions were established in North Carolina to lend money to farmers, and most of them in such small quantities as to be of little or no commercial value, and in 1902 the total value of the products of the mines and quarries was only $27,476; but in 1907 their combined value was $112,107. In the latter year, 75% of the gold ore was found in the county of Wake, and 75% of the silver ore was found in the county of Iredell. The State Geological and Economic Survey has made a careful study of the fishes of North Carolina, of the shad fisheries, of oyster culture, and of the development of terrapin. Beaufort the United States Bureau of Fisheries has a marine biological laboratory, established in 1901 for the study of the aquatic fauna of the south-east coast.

The principal crops are cotton, Indian corn, tobacco, hay, wheat, sweet potatoes, apples and pears. The yield of cotton increased from 62,901,790 lb in 1869 to 307,500,000 lb in 1899. In 1899 29,588 bales of cotton were produced. The total area of the state in cotton land is 45,556,000 bales; 570,000 acres to wheat, with a crop of 5,415,000 bushels; and 196,000 acres to oats, with a crop of 3,234,000 bushels.

The principal minerals are gold, silver, and corundum. The gold was mined here before any European settlement of the country seems proved by numerous excavations and by huge heaps on which are large oak and chestnut trees, some fallen and decayed. The gold was also found in the river bottoms in the counties of Surry and Caswell. The corundum, or sapphire, is found in the state in the counties of Surry and Caswell. The corundum, or sapphire, is found in the state in the counties of Surry and Caswell. The corundum, or sapphire, is found in the state in the counties of Surry and Caswell.
NORTH CAROLINA

deposits the importance of those of North Carolina greatly declined. It was along the coast of North Carolina that Europeans in 1585 made the first discovery of iron ore within the present limits of the United States. Iron ores are widely distributed within the state, and the first attempts to work them were made when the mining of it was an industry of relatively great importance. In 1808 the product amounted to 42,522 long tons (all magnetite), and was valued at $76,877; almost the entire product is from the Carolinas. The two small areas in which bituminous coal occurs; one in the basin of the Dan and one in the basin of the Deep. Very little coal was produced in the state in the 18th century. In 1863, 30,000 short tons were obtained for the relief of the Confederate government, an amount which up to 1905, when the yield was only 1557 short tons (falling off from 7000 short tons in 1904), had been a record. In 1905, only 14,962 tons was produced in the state; the most valuable immediate product of the state's mines and quarries for nearly every year from 1890 to 1908 was building stones of granite and gneiss, which are found in all parts of the state. The granite quarries are chiefly in Gaston, Iredell, Rowan, Surry and Wilkes counties. The value of the building stone increased from $150,000 in 1892 to $800,177 (of which $764,272 in granite) in 1908. Coal also is widely distributed in the state; the most extensive beds are in the south-western counties, Swain and Cherokee.

GEOLOGICAL STRUCTURE.-During the quarter of a century between 1880 and 1905 a great change was wrought in the industrial life of the state by the phenomenal growth of cotton manufacturing. A cotton mill was erected in Lincoln county about 1813, and by 1840 about 250 were in the state. State. When the War was over, the abnormally high price of cotton made cotton raising for more than a decade a great assistance to the people in recovering from the economic effects of the previous long depression. In 1870 the value of cotton raised in the state was $11,897. In 1890, when the cotton market was in a low condition, it was $11,170. In 1905, the cotton crop amounted to $25,488,721. In 1890 the lumber and timber products, valued at $5,867,472, ranked second among the state's manufactures; but in 1905 their value had increased to $11,221,370. The value of the state's factory product for 1900 was $85,274,054, and that for 1905, $112,520,776, an advance of 36.1%. The cotton mills are mostly in the Piedmont Plateau region; Durham, Durham county, and Forsyth county, are leading centers of the state's manufactures, and High Point (pop. in 1900, 4163) in Randolph is noted for its manufacture of furniture.

CIVIL GOVERNMENT.-The first building was begun in the state in 1586 with the Raleigh & Gaston line, opened from Raleigh to Gaston in 1834 and extended to Weldon in 1852. A longer line, that from Wilmington to Weldon, was completed in 1840. But the greatest period of construction was from 1880 to 1905, when the total mileage was increased from 1,846 m. to 3128 m., or 1642 m., which was more than one-third of all that had been built up to the year 1905, when the total mileage was 4454.14. The principal systems of railroads are the Atlantic and Gulf, Atlantic, Southern and the Seaboard Air Line. By means of its navigable waters and safe harbours the state has an extensive coastering trade. The harbours along the sounds and in some of the counties are well protected from the storms of the ocean by the long chain of narrow islands in front, but navigation by the largest vessels is interrupted by shoals in the sounds, and especially by bars crossing the inlets between islands. The channel leading to the harbour of Wilmington has been cleared to a depth of 20 ft. or more by dredging and by the construction of jetties and an immense dam, works which were begun by the state in 1823 but from 1828 were carried on from time to time by the U.S. government. The harbour, once navigable to Weldon and the Cape Fear river to Fayetteville; the Neuse is navigable for small vessels only to Newbern.

Population.-The population of North Carolina increased from 1,399,759 in 1880 to 1,617,949 in 1890, or 15.6%; to 1,836,810 in 1900, a further increase of 17.1%; and to 2,265,871 in 1910, an increase of 16.5% since 1900. Of the total in 1900 only 4492, or less than 1/10 of 1% were foreign-born, nearly half of these being Germans or English. Of the total, 1,853,493 were white, and 624,469 negroes, 568 Indians and 51 Chinese. Nearly one-fourth of the Indians are Cherokees, who occupy, for the most part, the Qualla Reservation in Swain and Jackson counties, not far from the south-western extremity of the state. The others, numbering in 1907 nearly 5000, living mostly in Robeson county, are of mixed breed and have been named the Croatans, or the other name (probably baseless) that they are the descendants of John White's lost colony of 1587. The Cherokees have no ambition to accumulate property, but both they and the Croatans have been generally peaceable and many of them send their children to school—for the Croats the state provides separate schools. The Baptist and Methodist churches are the leading religious denominations in the state; but there are also Presbyterians, Lutherans, members of the Christian Connexion (O'Kellys), Disciples of Christ (Campbellites) Episcopalians, Friends, Roman Catholics, Moravians and members of other denominations. The Croats have comparatively few. The state of the Carolinas there was not a town in North Carolina that had a population of 1000, and the urban population of the state was exceptionally small at the beginning of the rapid rise of the manufacturing industries about 1860. In 1900 the urban population (in places having 4000 inhabitants or more) was 152,019, or 8% of the total; the semi-urban (in incorporated places having less than 4000 inhabitants) was 186,258 or 9.8% of the total; and the rural (outside of incorporated places) was 1,195,782 or 70.8% of the total. Between 1890 and 1900 the urban population increased 56.6% and the semi-urban 67.6% while the rural increased only 6.5%.

The principal cities are Wilmington, Charlotte, Asheville, Raleigh (the capital), Greensboro, Winston and Newbern.

Administration.—North Carolina has been governed under the charters of 1665 and 1665 (1665-1719), under commissions and instructions from the crown (1729-1776), and under the state constitutions of the 18th of December 1776 (amended in 1835, 1856, and in the Secession Convention of 1861) and of April 1868 (amended in 1872-1873, 1875, 1879, 1888 and 1890). The present constitution, as amended, prescribes that no congregation of the people of the state may be called by the legislature unless by the concurrence of two-thirds of all the members of each house followed by an affirmative vote of a majority of the electors voting on the question; and that an amendment to the constitution may be adopted only by a three-fifths of each house followed by an affirmative vote of a majority of electors voting on the question. The suffrage provisions containing the famous "grandfather clause" (in Art vi. section 4), were adopted in the form of a constitutional amendment, ratified in August 1905, and in effect on the 1st day of July 1906. All persons, of whatever sex, who can read and write any portion of the constitution in the English language and have paid on or before the 1st of May the poll tax for the previous year. An exception to the educational requirement is made in favour of any male person who was, on the 1st day of January 1867, or at any time prior thereto, entitled to vote under the laws of any state in the United States wherein he then resided, and in favour of lineal descendants of such persons. This exception remained in force until the 1st of December 1908, after which time all who were on the list became (unless disqualified because convicted of felony) life voters, but new applicants had to stand the educational test.

Perhaps the most notable feature about the administration is the weakness of the governor's position. He is elected by popular vote for four years, and cannot succeed himself in office. His power is limited by a council of state, a relic of colonial days. This body is not, however, a special board, as in Maine, New Hampshire, and Massachusetts, but a kind of administrative cabinet as in Iowa, consisting of the secretary of state, the auditor, the treasurer, and the superintendent of education.
public instruction, and advising the governor in the administration of his office. Judges, heads of departments, and executive boards are elected, and there is the legal sanctity of the government to effect the confirmation of the Senate is necessary. Furthermore, in North Carolina the governor has no veto power. In addition to the executive officials mentioned above there are a lieutenant-governor, an attorney-general, a Bureau of Labor Statistics, established in 1857, and a Corporation Commission, which in 1899 supervised the Railroad Commission, established in 1891. The governor and the lieutenant-governor must at the time of their election be at least thirty years of age, and must have been citizens of the United States for five years and residents of the state for three years. Senators of the General Assembly are elected biennially, beginning on the Wednesday after the first Monday in January. The Senate is composed of fifty members elected biennially by senatorial districts as nearly as possible equal to one another in population, and the House of Representatives (in the Constitution of 1776 called the House of Commons) of one hundred and twenty, elected biennially and chosen by counties according to their population, each county having at least one representative, no matter how small its population. A senator must at the time of his election be at least 25 years of age, and must have resided in the state for at least two years, and a resident in his district for one year immediately preceding his election; and a representative must be a qualified elector of the state and must have resided in his county for at least one year immediately preceding his election. The pay for both senators and representatives is four dollars per day for a period not exceeding sixty days; should the session be prolonged the extra service is without compensation. Extra sessions, called by the governor on the advice of the council of state, are limited to twenty days, but may be extended under the same limitations in regard to compensation. The Senate may sit in the court of impeachment to try cases presented by the House, and a two-thirds vote is necessary for conviction.

There is a supreme court consisting of a chief justice and four associates, elected by popular vote for eight years, and a superior or circuit court, composed of sixteen judges elected by the people in each of the sixteen districts for a term of years.

The county officials are the sheriff, a coroner, a treasurer, a register of deeds, a surveyor and five commissioners, elected for two years. The commissioners supervise the penal and charitable institutions of the state, and their functions are similar to those of the board of supervisors in most states. Subordinate to them are the township boards of trustees, composed of a clerk, and two justices of the peace.

By the constitution personal property to the value of $500 and any homestead to the value of $1000 is exempt from sale for debt, except for taxes on the homestead, or for obligations contracted for the purchase of said premises. Under the revised code (1905) a wife may hold property which she had acquired before marriage free from any obligation of her husband, but in general she is not permitted to make contracts affecting either her personal or real estate without the written consent of her husband. Neither can the husband convey real estate without his wife's consent, and a widow may dissent from her husband's will at any time within six months after the probate of the same, the effect of such dissent being to allow her the right of one-third of her deceased husband's property interest. The same rule applies if the wife is the sole heir by descent.

The constitution prescribes that "all marriages between a white person and a negro, or between a white person and a white person of negro descent to the third generation inclusive, are hereby forever prohibited." Until 1905 the only grounds for an absolute divorce were adultery, natural impotence, and pregnancy of the wife at the time of marriage; but an amendment of 1907 allows a divorce whenever there has been a separation of husband and wife for ten successive years, provided the parties have lived in the state for that period and the parties have been divorced on the ground of cruelty. Children under twelve years of age in any factory or manufacturing establishment is unlawful, the working of children between the ages of eight and fourteen, and that they be employed as apprentices and have attended school for at least four months during the preceding year; and no boy or girl under fourteen is to work in such places during night time. An anti-convict law of 1897 makes the sale or purchase within the state of the sale of 50% of an article to raise or lower the price of that article with the intention of injuring a competitor. On the 26th of May 1908 the people of the state voted against a injunction act against beer and wine, and the prohibition act thus approved went into effect on the 1st of January 1909. State prohibition had been defeated in 1881 by a vote of 257,792 for 1,379,000 and in 1891 by 342,354 for 1,000,000 and in 1903 the Watts Law enacted rural prohibition, giving towns local option, under which many of the towns voted "no license"; and in 1905 severe police regulations were provided for towns in which saloons were licensed.

Charitable and Penal Institutions.—In the systematic care of the dependent and defective classes North Carolina was one of the first states in the Union. An orphan and blind asylum was established at Morganton in 1845, and another for the deaf and dumb at Morganton in 1844; by a law of 1897 every deaf child of sound mind must attend, between the ages of eight and fifteen, a state school for the deaf. The_supreme Court held that an act of 1899, by a law of 1908 every blind child (between seven and seventeen), if of sound mind and body, must attend some school for the blind (at Mechanicsville, N.C.); the homes of the State Board of Education at Morganton and Wadesboro, the State Industrial School for boys at Raleigh; these became a state Institution in 1891. In 1908 a state tuberculosis sanatorium was opened near Aberdeen, Moore county. The state also takes good care of the unfortunate among the negro race. The Institute for the Colored Deaf, Dumb and Blind (1867) at Raleigh and the Eastern Insane Hospital (1880) near Goldsboro are the oldest institutions of the kind for negroes in the world; in connexion with the last there is an epileptic colony for negroes. The Asylum for Insane at Oxford (1872) is supported partly by the Masonic Order and partly by the state. A movement begun by the Confederate Veterans Association in October 1889 resulted in the establishment of a hospital for the blind at Morganton, the convicts are released into the work of the state. The lease system does not prevail, but the farming out of convict labour is permitted by the constitution; such labour is especially valuable for the correction of such prisoners, which now are being used at all times cared for and guarded by state officials. A reformatory for white youth between the ages of seven and sixteen, under the name of the Stonewall Jackson Manual Training and Industrial School, was opened at Concord in 1909, and in March 1909 the Foukoll Reformatory and Manual Training School for negro youth was provided for. Charitable and penal institutions are under the supervision of a Board of Public Charities, appointed by the governor for a period of six years, the terms of the different members expiring in different years. Private institutions for the care of the insane, idiots, feeble-minded and inebriates may be established, and their licences may be granted by the County Board of County and each term of the "Horseman of the South" by his wise reforms. He kept the public schools going through the Civil War, having advised against the disturbance of the public instruction and the superintendent of education. The present school system is supervised by a state board of education consisting of the governor, lieutenant-governor, secretary of state, treasurer, auditor, attorney-general, and superintendent of public instruction. In the counties there is a board of education and there is also a local school committee of three in each township. The compulsory attendance at school of children between the ages
of eight and fourteen for sixteen weeks each year by a state law is optional with each county. A state library commission was established in 1909.

Among the earliest steps toward the establishment of the state system of education is the university of North Carolina at Chapel Hill, chartered in 1789 and opened in 1795, one of the oldest state universities in the country and one of the oldest universities in the South; it consists of the college, the grammar school, and the preparatory school (the department of medicine, 1890, part of whose work is done at Raleigh) and the department of pharmacy (1897). In 1907-1908 it had 75 instructors and 775 students. Other state educational institutions are the College of Agriculture and Mechanical Arts (1886) at Raleigh, which in 1907-1908 had 42 instructors and 436 students; the State Normal and Industrial College (1892) for women, at Greensboro; and the State Industrial College for Colored (1889) at Durham. For the higher education of the negroes the state supports an Agricultural and Mechanical College (1891) at Greensboro, and normal and industrial schools at Fayetteville, Elizabeth City and Winston. The most important sectarian schools are the North Carolina Wesleyan College, opened 1834 as a "manual labour and classical institute", as a college, 1835) at Wake Forest, 16 m. north of Raleigh, with 371 students in 1907-1908; Davidson College (Presbyterian, 1837) at Davidson, with 308 students (1907-1908); Biddle University (Presbyterian) at Charlotte, for negroes; Greensboro Female College (Methodist Episcopal, South; 1846); Guilford College (coeducational; Society of Friends, 1837) near Greensboro; Trinity College (coeducational, Methodist, 1852) at Durham; Lenoir College (Lutheran, 1890) at Hickory; Catawba College (Reformed, 1851) at Newton; Waverlyville College (Methodist Episcopal, 1873) at Waverlyville; Elon College (Methodist, 1854); Belmont College (Roman Catholic, 1877), under the charge of Benedictines, at Belmont; Shaw University (Baptist, 1865), for negroes, at Raleigh; and Livingston College (Methodist Episcopal, 1895), for negroes, at Raleigh.

Finance.—The revenues of the state come from two sources; about two-thirds from taxation and about one-third in all from the earnings of the penitentiary, from the fees collected by state officials, from the proceeds from the sale of state publications, and from the dividends from stock and bonds. The state owned, in 1909, 30,002 shares of stock in the North Carolina Railroad Company,1 a market value (1907) of $5,580,372 (the stock being quoted at $186), and an annual income of $120,014 and $126,666 shares of stock in the Atlantic & North Carolina Railroad Company, from which the annual income is $31,665. In addition to the ordinary general property taxes, all parts of the state, with the exception of a few counties, levy an income tax on individuals and a general sales tax and an income tax. North Carolina is one of the few states to experiment with the inheritance tax, but the last law dealing with that subject was repealed in 1893. The total receipts of the general fund for the fiscal year 1907 were $2,665,293, and the total disbursements for the same year were $2,665,282.

The state debt at the close of the fiscal year 1907 amounted to $6,880,540. It may be divided into three parts: that contracted between 1848 and 1861 for the construction of roads, railroads and canals; that contracted during the Civil War for other than war purposes; and that contracted during the Reconstruction era, amounting to $4,010,719, from the second or Reconstruction debt. In the impoverished condition it was impossible for the people to bear the burden, so an act was passed in 1879 scaling part of the debt 60% part of it 75% and part of it 85%. The remainder, $12,805,000, and an additional $82,480,000 held by the United States, was impaired the obligation of a contract, but under the Eleventh Amendment to the Constitution of the United States the bondholders could not bring suit against the state in Federal Courts. The state could do so, however, and in 1904, certain creditors having given ten of their bonds to South Dakota, the case of South Dakota versus North Carolina came before the Supreme Court. The court decided, four judges dissenting, that North Carolina must pay the amount due or suffer her railway bonds to be seized and sold to satisfy the judgment (192 U.S. Reports, 286. See also 108 U.S. 76).

History.—The history of North Carolina may be divided into four main periods: the period of discovery and early colonization (1520-1663); the period of proprietary rule (1663-1720); the period of royal rule (1729-1776); and the period of statehood (from 1776).

It is possible that some of the early French and Spanish explorers visited the coast of North Carolina, but no serious attempt was made by Europeans to establish a settlement until near the close of the 16th century. After receiving from Queen Elizabeth a patent for colonization in the New World, Sir Walter Raleigh, in April 1584, sent Philip Amadas, or Amidas (1559-1611), and Arthur Barlowe (c. 1559-c. 1620) to discover in the region bordering on Florida a suitable location for a colony. They returned in September with a glowing account of what is now the coast of North Carolina, and on the 9th of April 1585 a colony of about 108 men under Ralph Lane (c. 1530-1603) sailed from Plymouth in a fleet of seven small vessels commanded by Sir Richard Grenville. The colony was established at the north end of Roanoke Island on the 17th of August, and about a week later Grenville returned to England. Threatened with famine and with destruction from hostile Indians, the entire party was forced to return to England. Of the adventurers, Virginia Dare (b. 18th August 1587), was the first English child born in America. White soon returned to England for supplies, and having been detained there until 1591 he found upon his return no trace of the colony except the word "Croatian" carved on a tree; hence the colony was supposed to have gone away with some friendly Indians, possibly the Hatteras tribe, and proof of the assumption that these whites mingled with Indians is sought in the presence in Robeson county of a mixed people with Indian habits and occasional English names, calling themselves "Croatian." The gunner, White's grand-daughter, Virginia Dare (b. 18th August 1587), the duke of Albemarle (1668-1760), and six other favourites of Charles II. By a second charter issued in 1665 the limits were extended to 29° and 30° 36′.

The proprietors had all the powers of a county palatine and proposed to establish a feudal and aristocratic form of government. To this end John Locke drafted for them in 1669 the famous Fundamental Constitutions providing for the division of the province into eight counties and each county into seigniories, baronies, precipices and colonies, and the division of the land among hereditary nobles who were to grant three-fifths of it to their freemen and govern through an elaborate system of feudal courts. But these constitutions, several times revised, actually served only as a theoretical standard for the proprietors and were abrogated altogether in 1693, and the colonists were governed by instructions which granted them much greater privileges. From the very beginning the territory tended to divide into two distinct sections, a northern and a southern. The northern section was first called Albemarle, then "that part of our province of Carolina that lies north and east of Cape Fear," and about 1689 North Carolina. Settled largely by people from Pennsylvania, this section came to be closely associated with the continental colonies. The southern section, influenced by its location, by the early settlers from Barbados, and by its trade connections, was brought into rather more intimate relations with the island colonies and with the mother country. The proprietors struggled in vain to bring about a closer union. In 1691
one governor was placed over both settlements, but it was found necessary to appoint a deputy for North Carolina, and finally in 1712 again to allow her a governor of her own. So long as the intervening territory was a wilderness no effort was made to define the boundary line. The first steps were taken in that direction just after the close of the proprietary period in 1720, but the work was not completed until 1815.¹

The first permanent English colony in North Carolina was established at Albemarle on the Chowan river about 1660 by people from Virginia. The colony grew rapidly, and at the close of the colonial period (1767) the population numbered approximately 150,000, including English Protestants, French Protestants, the Iroquois, and about 40,000 negroes. According to Dr Weeks "the earliest settlers . . . were not religious refugees, . . . they came to the province not from religious but economic motives."

The proprietary period (1663-1729) was a turbulent one, in spite of the supposedly peaceful influence of the Quakers. Six out of sixteen governors or deputy-governors were driven from office between 1674 and 1712, and there were two uprisings which have been deemed worthy of the term rebellion. The first, under John Culpeper in 1677, was primarily economic in character, the chief grievance being the payment of an export duty on tobacco. It was evidently influenced by the recent uprising in Virginia under Nathaniel Bacon. The insurrection of dissenters (1708-1711), which was headed by Thomas Carey, who was deputy-governor while the trouble was brewing, was in opposition to the establishment of the Church of England; it was ultimately unsuccessful, the Church was established in 1711, a law was passed which deprived Quakers of the privilege of serving on juries or holding public office, and the establishment was continued until the War of Independence. A war with the Tuscarora Indians, in 1711-1712, resulted in the defeat of the Indians and the removal of the greater part of the tribe to New York, where they became the sixth nation of the Iroquois confederacy.

North Carolina did not join South Carolina in the revolution of 1719 (see SOUTH CAROLINA), but remained under proprietary rule until 1729. In that year an act was passed by parliament establishing an agreement with seven of the Lords Proprietors for the surrender of their claims to both provinces. They were allowed $77,500 for their rights and £5000 for arrears of quit rent, which was accepted with enthusiasm. The proprietors then passed an act of one-eighth undivided share until 1744, when he gave up his claim in return for a large strip of land in North Carolina lying between latitude 35° 34' and the Virginia line (36° 30'). So that while the king was governmental head of the whole of North Carolina from 1729 to 1776 he was, after 1744, territorial lord of only the southern half. The political history during the royal period is, like that of the other colonies, the story of a constant struggle between the representatives of the people and the representatives of the crown. The struggle was especially bitter during the administrations of the last three royal governors, Arthur Dobbs (1684-1765), William Tryon (1729-1788) and Josiah Martin (1737-1786). There were disputes over questions of government, of commerce, of finance and of religion. The ship which brought stamps and stamped paper to Wilmington in 1766 was not permitted to land, and the stampmaster was compelled by the people to take an oath that he would not exercise the functions of his office. Through the vigilance of Governor Tryon, however, the Assembly was prevented from sending delegates to the Stamp Act Congress. The colonists were also angered by the attempt to

¹ Between 1735 and 1746 the southern boundary was first definitely established by a joint commission of North Carolina, South Carolina, and Georgia. The line was resurveyed in 1764, and in 1772 it was extended; parts of the line were resurveyed under acts of the assembly of 1803, 1804, 1806, 1813, 1814 and 1815, and by an act of 1810 the last extension, to the Tennessee line, was confirmed and established. According to the charter the northern boundary was to be the line of 36° 30', but the surveys (of 1728, 1749 and 1779) were not strictly correct, and the actual line runs irregularly from 36° 33' 15" at its eastern to 36° 34' 25.5" at its western end. The boundary between North Carolina and Tennessee was surveyed in 1799 and 1821. Enforce the acts of trade and navigation and by the parliamentary statute of 1764 forbidding the issue of bills of credit; and the Scotch-Irish among them in particular were aroused by the repeal of an act of 1771 allowing Presbyterian ministers to perform the marriage ceremony and of another act of the same year for the establishment of Queen's College in Mecklenburg county for Presbyterians. In the "back country" extortionate fees, excessive taxes, and the oppressive manner of collecting them brought about a popular uprising, known as the Regulation, which was organized by the Iroquois, and about 40,000 negroes. According to Dr Weeks "the earliest settlers . . . were not religious refugees, . . . they came to the province not from religious but economic motives."

The proprietary period (1663-1729) was a turbulent one, in spite of the supposedly peaceful influence of the Quakers. Six out of sixteen governors or deputy-governors were driven from office between 1674 and 1712, and there were two uprisings which have been deemed worthy of the term rebellion. The first, under John Culpeper in 1677, was primarily economic in character, the chief grievance being the payment of an export duty on tobacco. It was evidently influenced by the recent uprising in Virginia under Nathaniel Bacon. The insurrection of dissenters (1708-1711), which was headed by Thomas Carey, who was deputy-governor while the trouble was brewing, was in opposition to the establishment of the Church of England; it was ultimately unsuccessful, the Church was established in 1711, a law was passed which deprived Quakers of the privilege of serving on juries or holding public office, and the establishment was continued until the War of Independence. A war with the Tuscarora Indians, in 1711-1712, resulted in the defeat of the Indians and the removal of the greater part of the tribe to New York, where they became the sixth nation of the Iroquois confederacy.

North Carolina did not join South Carolina in the revolution of 1719 (see SOUTH CAROLINA), but remained under proprietary rule until 1729. In that year an act was passed by parliament establishing an agreement with seven of the Lords Proprietors for the surrender of their claims to both provinces. They were allowed $77,500 for their rights and £5000 for arrears of quit rent, which was accepted with enthusiasm. The proprietors then passed an act of one-eighth undivided share until 1744, when he gave up his claim in return for a large strip of land in North Carolina lying between latitude 35° 34' and the Virginia line (36° 30'). So that while the king was governmental head of the whole of North Carolina from 1729 to 1776 he was, after 1744, territorial lord of only the southern half. The political history during the royal period is, like that of the other colonies, the story of a constant struggle between the representatives of the people and the representatives of the crown. The struggle was especially bitter during the administrations of the last three royal governors, Arthur Dobbs (1684-1765), William Tryon (1729-1788) and Josiah Martin (1737-1786). There were disputes over questions of government, of commerce, of finance and of religion. The ship which brought stamps and stamped paper to Wilmington in 1766 was not permitted to land, and the stampmaster was compelled by the people to take an oath that he would not exercise the functions of his office. Through the vigilance of Governor Tryon, however, the Assembly was prevented from sending delegates to the Stamp Act Congress. The colonists were also angered by the attempt to
inhabitants of the county to form a military and civil organization independent of the crown of Great Britain which should operate until the Provincial Congress should otherwise provide or the British parliament should "resign its unjust and arbitrary pretensions with respect to America." The "Mecklenburg Declaration," which it is alleged was passed on the 20th of the same month by the same committee, "dissolves the political bonds which have connected the county with the mother country," "proclaims the people of the same allegiance from all allegiance to the British Crown," declares them "a free and independent people," and abounds in other phrases which closely resemble phrases in the great Declaration of the 4th of July 1776.

The Resolutions were published in at least two newspapers only a few days after they were passed. As for the "Declaration," the original records of the transactions of Mecklenburg county were destroyed by fire in 1800, but it is claimed that a copy of the "Declaration" was made from memory in the same year, and when in 1819, a controversy had arisen as to where the movement for independence originated, this copy was published, first in the Raleigh Register and North Carolina Gazette and then in many other newspapers. Several aged men also testified that they had heard a declaration of independence read at Charlotte, the county-seat, in March or April 1776, and still carried to the Continental Congress. Thomas Jefferson and John Adams, however, declared that they had never heard of it before, and both believed it spurious. But Jefferson was charged with plagiarism by those who wished to disprove the correctness of his narrative. In 1830, there was discovered a proclamation of Governor Martin, dated the 8th of August 1775, in which he mentioned a publication in the Cape Fear Mercury of a series of resolutions by a committee of Mecklenburg county delegates to the Provincial Congress, to be presented to the latter in the name of the county. Another stage of the controversy was reached in 1835–1847 when the Mecklenburg Resolutions of the 31st of May 1775 were discovered either in part or in full in newspaper files. There seems practically no basis for the contention that a declaration of independence was adopted on the 20th other than the tradition that independence was declared by the Mecklenburg Committee on that day, and the occasional references in print, even before 1819, to a declaration of independence in the county in 1775. Those who believe the "Declaration" to be spurious would no more argue the nonexistence of the Resolutions than those who believe the Resolutions might easily be thought of as a declaration of independence, that Governor Martin in all probability had knowledge only of these and not of the alleged "Declaration," and that the dates of publication in the Raleigh and Charleston newspapers, and the politics of those papers, show that the Resolutions are authentic. In July 1905 there appeared in Collier's Weekly (New York) what purported to be a facsimile reproduction of a copy of the Cape Fear Mercury which was referred to by Governor Martin in which contained the "Declaration"; but this was proved a forgery.

The first and the second provincial congress did little except choose delegates to the Continental Congress and the management of affairs passed in large measure from the royal government to the several county committees. The third provincial congress, which met on the 21st of August 1775, still required its members to sign an oath of allegiance to King George III, but formed a provisional government consisting of a provincial council and six District Committees of Safety. The first sanction of independence by any body representing the whole province was given by the fourth provincial Congress on the 12th of April 1776, and the same body immediately proceeded to the consideration of a new and permanent form of government. Their labours ended, however, in another provincial government by a Council of Safety, and the drafting of North Carolina's first state constitution was left to a constitutional convention which assembled at Halifax on the 12th of November.

North Carolinians fought under Washington at Brandywine and Monmouth and played a still more important part in the Southern campaigns of 1778–1781. The state was twice invaded, in 1780 and 1781, and two pitched battles were fought upon her soil, Moore's Creek on the 27th of February 1776 and Guilford Court House on the 13th of March 1781.

The territory now comprising the state of Tennessee belonged to Carolina under the charters of 1663 and 1665, and fell to North Carolina when the original province was divided. To this territory settlers, many of them from North Carolina, had gone immediately before and during the War of Independence, and had organized a practically independent government. In 1776 this was formally annexed to North Carolina, but in 1784 the state ceded this district to the national government on condition that it should be accepted within two years. The inhabitants of the district, however, objected to the cession, especially to the terms, which, they contended, threatened them with two years of anarchy; declared their independence of North Carolina and organized for themselves the state of Franklin. But the new state was weakened by factions, and after a brief and precarious existence it was forced into submission to North Carolina by which in 1790 the territory was again ceded to the national government with the proviso that no regulation made or to be made by Congress should tend to the emancipation of slaves (see TENNESSEE).

North Carolina sent delegates to the Philadelphia Constitutional Convention of 1787, but the state convention, at Hillsboro, called to pass upon the constitution for North Carolina, did not meet until the 21st of July 1788, when ten states had already ratified. On the first day of this convention the opponents to the constitution, among whom were most of the delegates from the western counties, were ready to reject it without debate, but yielded to a proposal for discussing it clause by clause. In this discussion, which was continued for nine days, the document was most strongly opposed because it contained no bill of rights and on the ground that it would provide for such a strong central government that the state governments would ultimately be sacrificed. At the conclusion of the debate the convention by a vote of 84 to 54 declared itself unwilling to ratify the constitution because a bill of rights had been added and it had been amended in several other particulars so as to guarantee certain powers to the states. By reason of this rejection the relations of North Carolina with the other states were severed upon the dissolution of the Confederation, and it took no part in the first election or in the organization of the new government. However, there was a speedy reaction against the opposition which had in no small measure been inspired by fear of a requirement that debts be paid in gold and silver. A second convention met at Fayetteville in November 1789 and the constitution was speedily ratified (on the 13th) by a vote of 195 to 77.

The period from 1790 to 1835 was marked by a prolonged contest between the eastern and the western counties. When the state constitution of 1776 was adopted the counties were so nearly equal in population that they were given equal representation in the General Assembly, but the equality in population disappeared in the general westward movement, and in 1790 the West began to urge a new division of the state into representative districts according to population and taxation. This was doubly urged by West Carolina, which had a different attitude as the East opposed its projects for internal improvements for which the West had the greater need. In 1823 the West called an extra-legal convention to meet at Raleigh, and delegates from 24 of the 28 western counties responded, but those from the far West, in which there were practically no slaves, wished free white population to be made the basis of representation, while those from the Middle West demanded the adoption of the basis for the national House of Representatives and the convention made only a divided appeal to the people. Ten years later, however, at the election of assemblymen, 33 of the western counties polled an extra-legal vote on the question of calling a constitutional convention, and 30,000 votes were cast for it to only 1000 against it. The effect of this was that in January 1835 the legislature passed a bill for submitting the question legally to all the voters of the state, although this bill itself limited the proposed convention's power relating to representation by providing that it should so amend the constitution that senators be chosen by districts according to public taxes, and that commoners be apportioned by districts according to Federal representation, i.e. five slaves to be counted equal to three whites. When the popular vote was taken, in the following April, every eastern county gave a majority against the convention, but the West, even with the limitation which was decided
favourable to the East, voted strongly for it and carried the election with a total majority in the state of 586 votes. Again, however, the advantage was with the East, for the delegates were chosen by counties, two from each; but in the convention, which was in session at Raleigh from the 4th of June to the 11th of July, the East made some concessions: such as the popular election of the governor (who had previously been elected by the two houses of the legislature), the disfranchisement of free negroes, and the abolition of representation from 6 boroughs, 4 of which were in the East. The number of senators was reduced to 50, the number of commoners to 120, and the manner of choosing senators and commoners was changed as directed in the act providing for the convention. The electorate gave its approval to the revision by a vote of 26,771 to 21,066, and with this the agitation over representation ceased.

The fundamental points of difference between North Carolina and South Carolina were exemplified in the slavory conflict. South Carolina led the extreme radical element in the South and was the first state to secede. North Carolina held back, worked for a compromise, sent delegates to the Washington Peace Convention in February 1861, and did not secede until the 20th of May 1861, after President Lincoln’s call for troops to preserve the Union. Liberal support was given to the Confederacy, both in men and supplies, but Governor Vance, one of the abest of the Southern war governors, engaged in acrimonious controversies with President Jefferson Davis, contending that the general government of the Confederacy was encroaching upon the prerogatives of the separate states. Owing to the dispute between the leader, the state convention dissolved and the invasion until near the close of the war. Wilmington was captured by the Federals in February 1865; General Sherman’s army crossed the southern boundary in March; a battle was fought at Bentonville, March 19-21; Raleigh was entered on April 13; and the Confederates under General Joseph E. Johnston surrendered near Durham Station, in Durham county, on the 26th.

Reconstruction was a costly experience here as in other Southern states. Jonathan Worth (1852-1869), elected governor under the presidential plan in 1865, was an honest and capable official, but the government established in accordance with the views of Congress in 1868 was corrupt, inefficient and tyrannical. Carpet-baggers, negroes and unscrupulous native whites, known as scalawags, were in control of affairs, while the people of wealth, refinement and education were disfranchised. Governor William Woods Holden (1818-1823; governor 1868-1870) was so weak and tyrannical that he was impeached by the legislature in December 1870. Under his successor, Tod R. Caldwell (1818-1874), there was some improvement in the condition of affairs, and in 1875 a constitutional convention, in session at Raleigh, with the Democrats slightly in the majority, amended the constitution, their work being ratified by the people at the state election in 1876. The native white element completely regained possession of the government in the following year, when the Democrats came into office under Governor Zebulon B. Vance. Since that time the most interesting feature in the political history has been the rise and fall of the People’s party. The hard times which followed the financial panic of 1893 made it possible for them, in alliance with the Republicans, to carry the state in the election of 1894. Afterwards their strength declined, because the people came more prosperous, because the national Democratic party in 1896 and 1900 adopted their views on the money question, and because of the unpopularity of a coalition with Republicans, which made it necessary to give the coloured people a share of the offices. The race question was the chief issue in the election of 1898, the Democrats were successful, and what amounted to a negro disfranchising amendment to the constitution was adopted in August 1900. In 1907 there was a serious clash between the state authorities and the Federal judiciary, arising from an act of the legislature of that year, which fixed the maximum railway fare at 2½ cents a mile and imposed enormous fines for its violation. The two principal railway corporations, the Southern and the Seaboard Air Line, contends that the act was clearly contrary to the 14th Amendment to the Federal Constitution in that it denied the equal protection of law. The promise of the railways to give to every purchaser of a ticket a rebate check until the question of the validity of the act should be decided by the courts was not satisfactory to the state authorities, who arrested a ticket agent of the Southern railway, convicted him of violating the law, and sentenced him to the chain-gang for a year. Thereupon the attorneys for the railway applied to Judge Jeter Connelly Pritchard (b. 1857) of the United States Circuit Court for a writ of habeas corpus; this was granted and the prisoner was released. The governor of the state, Robert Brodax Glenn (b. 1854), nevertheless urged the state courts and attorneys to proceed with the prosecution of other ticket agents, and threatened to resist with the force of the state any further interference of Federal judiciary; but in March 1908 the Supreme Court of the United States declared the North Carolina rate law unconstitutional on the ground that it was confiscatory.

1 Burrington was appointed in 1730, but did not arrive in the province until February 1731. Either Everard held over or the president of the council was acting-governor from 1729-1731.
NORTHCOTE—NORTH DAKOTA

779

BIBLIOGRAPHY.—For physical description, resources, industries, &c., see North Carolina Agriculture, North Carolina and North Dakota (Raleigh, 1896); North Carolina Geological Survey Reports (Raleigh, 1852, sqq.); the publications of the North Carolina Geological and Economic Survey (Raleigh, 1893, sqq.), e.g. Water Powers in North Carolina (1899), by G. F. Swain, Joseph H. Holmes and E. W. Myers; Gold Mining in North Carolina and other Appalachian States (1897), by H. B. C. Nitze and A. J. Wilkins, The Tin Deposits of the Carolinas (1903), by J. H. Pratt and D. B. Sterrett, Building and Ornamental Stones: North Carolina (1907), by E. G. Watson (revised); The Fishes of North Carolina (1907), by Hugh M. Smith, and History of the Gems found in North Carolina (1908), by G. F. Kunz; Report of the Secretary of Agriculture in Relation to the Forests, Rivers and Mountains of the Southern Appalachian Region (Washington, 1902); Climatology of North Carolina (Raleigh, 1892); and H. Thompson, From the Cotton Field to the Cotton Mill, a Study of the Industries of North Carolina (New York, 1899). The latter work is very valuable for the student of industrial history. There are some interesting observations on the changes in social conditions resulting from the growth of the cotton-manufacturing industry.

John W. Moore, History of North Carolina (2 vols., Raleigh, 1880); S. M. Watts, North Carolina (2 vols., 1884); and J. S. Basset, Constitutional Beginnings of North Carolina (Baltimore, 1894); The Regulators of North Carolina (Washington, 1894); and Slavery in the State of North Carolina (Baltimore, 1899), are all trustworthy. S. B. Weeks deals with the religious history in his Religious Development in the Province of North Carolina (Baltimore, 1892), Church and State in North Carolina (Baltimore, 1893) and Southern Quakers and Slavery (Baltimore, 1896); he is anti-Anglican, but judicious. E. F. H. Clark, The Transition of North Carolina from Colony to Commonwealth (Baltimore, 1898), based on the public records, is accurate, though dull. There is a considerable controversy concerning the Mecklenburg Declaration of Independence. The Mecklenburg Declaration of Independence (New York, 1907) is the best presentation of the view generally adopted by competent historians that the alleged Declaration of the 20th of May, 1775, is spurious; G. W. Graham, The Declaration of Independence (New York, 1905), and J. W. Moore, Defense of the Mecklenburg Declaration of Independence (1909), are perhaps the best of the attempts to prove the same declaration genuine. The best account of the colonists of the Old South in the Revolution is Hugh Thomas, History of North Carolina (2 vols. Philadelphia, 1812), which deals with the period before 1771 and is meagre and full of errors; F. X. Martin, History of North Carolina (4 vols., New York, 1859), which deals with the period before 1775, contains much irrelevant matter and is of little value; F. L. Hawks, History of North Carolina (2 vols. Fayetteville, N. C., 1857-1858), written from the established church point of view, the best and fullest treatment of the proprietary period (1663-1729); and W. D. Cooke (ed.), Revolutionary History of North Carolina (Raleigh and New York, 1853), containing a defense of a regulator of the Defenders. For the Reconstruction period see J. D. Newman, North Carolina and Reconstruction (1906); Report of the Joint Select Committee to Inquire into the Condition of Affairs in the late Insurrectionary States, being the 42nd Congress, 1st session, House Report 23 (13 vols., Washington, 1872); a series with which to compare these volumes: and Why the Solid South? or Reconstruction and Its Results (Baltimore, 1890). The chief published sources are The Colonial Records of North Carolina (10 vols., Raleigh, 1829-1837), The Documentary History of North Carolina (vols. 11-20, 1776-1788; other vols., in continuation of the colonial series, Winston (11-15) and Goldsboro (16-20), 1865-1902; the series is to be continued). The best bibliography is in V. E. West, Bibliography of Historical Literature of North Carolina (Cambridge, 1895).

NORTHCOTE, JAMES (1746-1831), English painter, was born at Plymouth on the 22nd of October 1746. He was apprenticed to his father, a poor watchmaker of the town, and during his spare hours was diligent with brush and pencil. In 1769 he left his father and started as a portrait-painter. Four years later he went to London and was admitted as a pupil in the house of households and House of Commons. At the same time he attended the Academy schools. In 1775 he left Reynolds, and about two years later, having acquired the requisite funds by portrait-painting in Devonshire, he went to study in Italy. On his return to England, three years later, he revisited his native county, and then settled in London, where Opie and Fuseli were his rivals. He was elected associate of the Academy in 1786, and full academicians in the following spring. The "Young Princes murdered in the Tower," his first important historical work, dates from 1786, and it was followed by the "Burial of the Princes in the Tower," both paintings, along with several others, being executed for Boydell's Shakespeare gallery. The "Death of Wat Tyler," now in the Guildhall, was exhibited in 1787; and shortly afterwards Northcote began a set of ten subjects, entitled "The Modest Girl and the Wanton," which were completed and engraved in 1796. Among the productions of Northcote's later years are the "Entombment" and the "Agony in the Garden," besides many portraits, and several animal subjects, like the "Leopards," the "Dog and Herron," and the "Lion"; these latter were more successful than the artist's efforts in the higher departments of art, as was indicated by Fuseli's caustic remark on examining the "Angel opposing Balaam." — Northcote, you are an angel at an ass, but an ass at an angel. The works of the artist number about two thousand, and he made a fortune of £4,000. He died on the 13th of July 1831.

Northcote was emulous of fame as an author, and his first essays in literature were contributions to the Artiz, edited by Prince Hoare. In 1770 he published a series of seven poems, The Saviour of Old North Carolina (1st ed., 1788; 2nd ed., 1818), and his old manuscript edition of the poems of Reynolds. His Fables—the first series published in 1828, the second posthumously in 1833—were illustrated with woodcuts by Harvey from Northcote's own designs. In the production of his Life of Reynolds, his last work, which appeared in 1830, he was assisted by William Hazlitt, who previously, in 1826, had given to the public in the New Monthly Magazine his recollections of Northcote's pungent and cynical "conversations," the bitter personalities of which caused much trouble to the painter and his friends.

NORTH DAKOTA, one of the North Central states of the American Union, between 45° 35' and 49° N., and 96° 25' and 104° 3' W. It is bounded N. by the Canadian provinces of Saskatchewan and Manitoba, S. by South Dakota, W. by Montana and E. by Minnesota, from which it is separated by the Missouri River. North Dakota has an extreme length, E. and W., of 360 m., an extreme width, N. and S., of 210 m., and a total area of 70,837 sq. m., of which 654 sq. m. are water surface.

Topography.—North Dakota lies in the Prairie Plains and Great Plains physiographic provinces. The escarpment of the Coteau du Missouri is the dividing line, that portion to the N. and E. lying in the Prairie Plains, that to the S.W. in the Great Plains. The surface presents few striking topographic features, and may be subdivided into three vast plains or prairie tablelands. They have been named the parents of the two famous, most together constituting the Prairie Plains portion of the state. The lowest of these plains is the valley of the Red river, and this valley extends along the eastern edge of the state and varies in width from 25 to 70 m. Its elevation is 965 ft. at
Wahpeton, in the extreme S.E.; 903 ft. at Fargo; 836 ft. at Grand Forks; and 798 ft. at Pembina, in the extreme N.E., which is the lowest point within the state. To the W. of this valley lies a second plain, ranging in height from 1200 to 1600 ft. above sea level, and here met the traveller, in the S. to 1000 ft. in the N. This plain is separated from the Red river valley in the N. by an abrupt slope rising to a height of from 300 to 500 ft. above the surrounding country, and called the Manitoba escarpment, because the greater part of it lies in the province of Manitoba. The Pembina Mountains, low hills near the international boundary and about 30 m. W. of the Red river, form a portion of this escarpment. From these hills southward the ridge gradually becomes less abrupt until in Walsh county it vanishes into prairie. The ascent to the upper plain then becomes very gentle, though the full height of 400 or 500 ft., until it reaches the southeastern portion of Sargent county and changes into the more abrupt Coteau des Prairies, a plateau about 2000 ft. above the sea. The second plain, while not so level as the Red river valley, contains but one group of hills, the Turtle Mountains; these rise from 300 to 400 ft. above the general level, near the centre of the northern boundary. The prairies in this second table-land are gently rolling, and are covered with drift from the continental ice-sheet of the glacial period. They are bounded on the W. by a ridge from 300 to 400 ft. in height and from 20 to 50 m. in width, which roughly marks the divide between the lands of the plains and the prairies to the S. and the grazing lands of the W. The northern portion of this ridge forms the water-parting between the streams that empty into Hudson Bay and those that flow into the Gulf of Mexico. To the W. of this ridge lies the third and highest plain within the state, the so-called Coteau du Missouri. It occupies nearly one half of the state, and rises gradually westward until it attains a general level of about 2700 ft. East of the Missouri river this region is covered with glacial drift, and is noticeably different from the more level lands of the lower plains. The ice-sheet worked its way west in the black and blue ground, filling the ravines with debris until the surface has a billowy appearance. As the Missouri river marks approximately the lower edge of the ice-sheet, the region W. of this stream is almost free from glacial deposits and presents a strong contrast to the rest of the state. The billowy plains still remain in places, but in the vicinity of streams the billows give way to deep ravines. The sands and clays found here are fine and soft, and as there is scant vegetation to protect the hillsides they are easily eroded by the rains. As a result, the surface has been carved into fantastic forms. The early French explorers called the region les terres mauvaises, on account of its stony character. And in this, the French equivalent, "the Bad Lands," this appellation still remains. High winds and seas of burning lignite coal have aided the rains in giving the Bad Lands their peculiar configuration. Prairie fires or spontaneous combustion have ignited many coal seams. Some have already burnt out; others still emit smoke and sulphurous fumes from the crevices in the hillsides, and through the fissures may be seen the glowing coal and rock. The earth surface above these natural furnaces has been hardened, cracked and sometimes melted into a reddish slag, called scoria, which, seen in its accumulation to lava, gives the impression of an incorrect impression that the region was once the centre of volcanic disturbances. The picturesque effect of this sculpturing by water, wind and fire is greatly enhanced by the brilliant colours along the faces of the hills and ravines—grey, yellow, black and every shade of red and brown. Here too are found petrified forests and other evidences of a vegetable growth that has long ago disappeared. The lands are bad for the traveller and the farmer, but not for the ranchman. A few miles from the streams the country is less broken, and there are deep grassy valleys, in which the animals may find shelter in winter. Cattle sometimes congregate in cold weather around a burning coal seam and enjoy the warmth. The lignite in this region also warms the ranchman's cabin, being easily mined where a seam is exposed in the walls of a ravine or on the side of a hill.

North Dakota has a mean elevation of 1900 ft. The highest point in the state, about 3500 ft., is in the southern part of Bowman county, east of the Little Missouri river.

**Rivers.—** There are three drainage systems within the state: the Red river of the North (in the S.W. corner), the Souris, river and its tributaries, and the Missouri river and its tributaries. The Red river flows in a winding channel along the eastern margin of the state, empties into Lake Winnebago in Canada, thence reaching Hudson Bay through the Nelson river. Its tributaries are small, and are remarkable chiefly for the fact that they at first flow in a direction almost opposite to that of the main stream, and then recede in a south-westerly direction. Next to the Souris, river, the Park and the Pembina rivers are the most important of these streams. The Mouse, or Souris, river rises in Canada, crosses the international boundary near the meridian of 102° W. long., and flows for about 150 m. into North Dakota, where it is joined by the Missouri river. The Missouri river, the longest in the state, and the most important, crosses the western boundary near the 48th parallel, and after pursuing a winding course in a general south-easterly direction, leaves the state near the centre of its southern boundary. The James river, flowing southward into South Dakota, is the Missouri's only important eastern tributary within the state. From the W. the Missouri receives the waters of the Little Missouri, Cannon Ball, Heart and Knife rivers. All that portion of the state lying W. of the Pembina Mountains and E. of the Missouri river valley is practically without river drainage, and for its surface and sub-surface drainage, Devil's Lake, an irregular body of water about 40 m. in length and with an area of 400 sq. m., is of great importance. This lake, which is 50 ft. in depth, is strongly saline. The entire region W. of the Red river valley and E. of the Missouri river is dotted with small lakes. The Missouri river and its tributaries, and the waters of the Mouse and Missouri rivers are dotted with small lakes. The morainic belts and other obstructions in the drift plains hem in the lakes, and the interfluves are dotted with "slack water lakes," varying in diameter from a few yards to several miles. All the lakes of the state are of this character, and many are strong with salt and alkali. The drift plains also contain numerous shallow hollows, locally termed "pots" and "wet holes," which receive the drainage of their vicinity and form sloughs.

**Prairie and Flora.—** Before the advent of the white man, herds of bison covered the plains. The prairie dog and the prairie chicken were numerous. The exception of deer and bears, large game is to be found only in the Bad Lands. Here are found the lynx, the "mountain lion" or puma, the prairie and timber wolves, the jack rabbit, the prairie chicken, and the prairie dog. The prairie grass, 2 ft. high, is the dominant vegetation. A few fur-bearing animals, the mink, beaver and raccoon, still remain. The prairie dog is found everywhere. Among the lakes, sloughs and stubble-fields of the prairies, teal, ducks, geese and gulls are found in abundance. Other prairie birds are the prairie chicken, and there are a great many birds that sing while flying; among them are the horned lark, bobolink, Smith's longspur and chestnut collared longspur, lark-sparrow, lark-bunting and Sprague's pipit.

The flora of North Dakota is typical of a semi-arid country. The prevailing plant-colour is a greyish green, due to a hard dry crust which veils the plants, and causes the exception of exception of deer and bears, large game is to be found only in the Bad Lands. Here are found the lynx, the "mountain lion" or puma, the prairie and timber wolves, the jack rabbit, the prairie chicken, and the prairie dog. The prairie grass, 2 ft. high, is the dominant vegetation. A few fur-bearing animals, the mink, beaver and raccoon, still remain. The prairie dog is found everywhere. Among the lakes, sloughs and stubble-fields of the prairies, teal, ducks, geese and gulls are found in abundance. Other prairie birds are the prairie chicken, and there are a great many birds that sing while flying; among them are the horned lark, bobolink, Smith's longspur and chestnut collared longspur, lark-sparrow, lark-bunting and Sprague's pipit.

The peculiar bow shape of these western tributaries of the Red river is due to the fact that these streams originally flowed S.E. into Lake Manitoba, now extinct. As the waters of the lake gradually receded, the rivers reached it by pushing their channels eastward through what was once its bed. The southern part of the lake bottom was finally uplifted by a movement of the earth crust, and the waters of the S. and E. streams were thus drained, and continued to recede, and the tributaries, in cutting their way through the sediments, followed the slope of the land and gradually turned northward.

Soil fertility settlers found the bones of the bison scattered over the prairies, and after the construction of railways the gathering and shipping of these for use in sugar refining and in the manufacture of starch and glue, has been of great importance. Between January and August 1889 a single dealer at Minot shipped 1200 tons, which sold at $8 a ton.
only on Turtle Mountains, in the vicinity of streams, and in a few other places. Six million acres of the state are forested. The woodland area is estimated at 600 sq. m., or less than 1% of its entire surface. No other state in the Union has such a relatively small area of forest. By an executive proclamation, which came into effect in 1890, the state takes over all timber on land belonging to the government valued at $21,249,328.

Forest. - The forest timber, which is chiefly of the coniferous kind, is valued at $31,300,000. The Black Leg spruce exhibit a vegetation typical of semi-arid regions. Cottonwoods flourish along the Little Missouri river, and in sheltered ravines growing along the Missouri, as well as along the streams. The larger trees are covered with a protective covering of some sort of resin. Poplars grow in the valleys, and the cactus and sage brush are common. The faces of buttes and ravines that are turned toward the sun are usually devoid of vegetation. Cottonwoods are unprotected from the wind, which often comes with great force from the west. These trees are sheltered with a variety of shrubs, particularly the willows and the poplars.

Water. - The Missouri river is the most important water course, and is navigable for 200 miles from St. Louis, Missouri. Lake Manley is the largest lake in the state, and is navigable for 25 miles. The lake is 76 miles long, and covers 43,000 acres.

Agriculture. - Agriculture is by far the most important industry of the state, and, owing to climatic conditions, it is rigidly limited to a few staple crops. The growing season is too short for maize or tobacco. Potatoes, wheat, flaxseed, and hay are the most important products. In 1905, 5,135,029 acres were cultivated, of which 4,463,992 acres were in wheat, 2,687,347 acres in flaxseed, and 700,000 acres in hay. The yield of wheat in 1905 was 7,760,333 bushels, valued at $10,542,640. The value of the farm property in the same decade rose from $11,261,982 in 1899 to $19,933,819 in 1909. The total area under cultivation increased from 1899 to 1909 from 21,249,328 to 27,740,975 acres.

The average size of the farms (excluding farms under 3 acres with products valued at less than $500) was 277.4 acres in 1899 and 349.6 acres in 1909. The larger farms, those of 500 acres and over, were operated by their owners, 15.2% by part owners and 7.2% by tenants. Hay and grain formed the principal source of income, 28.8% of the total receipts, and wheat 26.8% of the total receipts.
